Medicare Program; Merit-Based Incentive Payment System (MIPS) and Alternative Payment Model (APM) Incentive Under the Physician Fee Schedule, and Criteria for Physician-Focused Payment Models

AGENCY: Centers for Medicare & Medicaid Services (CMS), HHS.

ACTION: Final rule with comment period.

SUMMARY: The Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) repeals the Medicare sustainable growth rate (SGR) methodology for updates to the physician fee schedule (PFS) and replaces it with a new approach to payment called the Quality Payment Program that rewards the delivery of high-quality patient care through two avenues: Advanced Alternative Payment Models (Advanced APMs) and the Merit-based Incentive Payment System (MIPS) for eligible clinicians or groups under the PFS. This final rule with comment period establishes incentives for participation in certain alternative payment models (APMs) and includes the criteria for use by the Physician-Focused Payment Model Technical Advisory Committee (PTAC) in making comments and recommendations on physician-focused payment models (PFPMs). Alternative Payment Models are payment approaches, developed in partnership with the clinician community, that provide added incentives to deliver high-quality and cost-efficient care. APMs can apply to a specific clinical condition, a care episode, or a population. This final rule with comment period also establishes the MIPS, a new program for certain Medicare-enrolled practitioners. MIPS will consolidate components of three existing programs, the Physician Quality Reporting System (PQRS), the Physician Value-based Payment Modifier (VM), and the Medicare Electronic Health Record (EHR) Incentive Program for Eligible Professionals (EPs), and will continue the focus on quality, cost, and use of certified EHR technology (CEHRT) in a cohesive program that avoids redundancies. In this final rule with comment period we have rebranded key terminology based on

feedback from stakeholders, with the goal of selecting terms that will be more easily identified and understood by our stakeholders.

DATES: *Effective date:* The provisions of this final rule with comment period are effective on January 1, 2017.

Comment date: To be assured consideration, comments must be received at one of the addresses provided below, no later than 5 p.m. on December 19, 2016.

ADDRESSES: In commenting, please refer to file code CMS–5517–FC. Because of staff and resource limitations, we cannot accept comments by facsimile (FAX) transmission. You may submit comments in one of four ways (please choose only one of the ways listed):

1. *Electronically.* You may submit electronic comments on this regulation to <http://www.regulations.gov>. Follow the “Submit a comment” instructions.
2. *By regular mail.* You may mail written comments to the following address ONLY: Centers for Medicare & Medicaid Services, Department of Health and Human Services, Attention: CMS–5517–FC, P.O. Box 8013, Baltimore, MD 21244–8013.

Please allow sufficient time for mailed comments to be received before the close of the comment period.

3. *By express or overnight mail.* You may send written comments to the following address ONLY: Centers for Medicare & Medicaid Services, Department of Health and Human Services, Attention: CMS–5517–FC, Mail Stop C4–26–05, 7500 Security Boulevard, Baltimore, MD 21244–1850.

4. *By hand or courier.* Alternatively, you may deliver (by hand or courier) your written comments ONLY to the following addresses prior to the close of the comment period:

- a. For delivery in Washington, DC—Centers for Medicare & Medicaid Services, Department of Health and Human Services, Room 445–G, Hubert H. Humphrey Building, 200 Independence Avenue SW., Washington, DC 20201.

(Because access to the interior of the Hubert H. Humphrey Building is not readily available to persons without Federal government identification, commenters are encouraged to leave their comments in the CMS drop slots located in the main lobby of the building. A stamp-in clock is available for persons wishing to retain a proof of filing by stamping in and retaining an extra copy of the comments being filed.)

- b. For delivery in Baltimore, MD—Centers for Medicare & Medicaid Services, Department of Health and Human Services, 7500 Security Boulevard, Baltimore, MD 21244–1850.

If you intend to deliver your comments to the Baltimore address, call telephone number (410) 786–7195 in advance to schedule your arrival with one of our staff members.

Comments erroneously mailed to the addresses indicated as appropriate for hand or courier delivery may be delayed and received after the comment period.

For information on viewing public comments, see the beginning of the **SUPPLEMENTARY INFORMATION** section.

FOR FURTHER INFORMATION CONTACT: Molly MacHarris, (410) 786–4461, for inquiries related to MIPS. James P. Sharp, (410) 786–7388, for inquiries related to APMs.

I. Executive Summary

1. Overview

The Medicare Access and CHIP Reauthorization Act of 2015 (MACRA)

(Pub. L. 114–10, enacted April 16, 2015), amended title XVIII of the Social Security Act (the Act) to repeal the Medicare sustainable growth rate, to reauthorize the Children's Health Insurance Program, and to strengthen Medicare access by improving physician and other clinician payments and making other improvements. This rule finalizes policies to improve physician and other clinician payments by changing the way Medicare incorporates quality measurement into payments and by developing new policies to address and incentivize participation in Alternative Payment Models (APMs). These unified policies to promote greater value within the healthcare system are referred to as the Quality Payment Program.

The MACRA, landmark bipartisan legislation, advances a forward-looking, coordinated framework for health care providers to successfully take part in the CMS Quality Payment Program that rewards value and outcomes in one of two ways:

- Advanced Alternative Payment Models (Advanced APMs).
- Merit-based Incentive Payment System (MIPS).

The MACRA marks a milestone in efforts to improve and reform the health care system. Building off of the successful coverage expansions and improvements to access under the Patient Protection and Affordable Care Act (Affordable Care Act), the MACRA puts an increased focus on the quality and value of care delivered. By implementing MACRA to promote participation in certain APMs, such as the Shared Savings Program, Medical Home Models, and innovative episode payment models for cardiac and joint care, and by paying eligible clinicians for quality and value under MIPS, we support the nation's progress toward achieving a patient-centered health care system that delivers better care, smarter spending, and healthier people and communities. By driving significant changes in how care is delivered to make the health care system more responsive to patients and families, we believe the Quality Payment Program supports eligible clinicians in improving the health of their patients, including encouraging interested eligible clinicians in their successful transition into APMs. To implement this vision, we are finalizing a program that emphasizes high-quality care and patient outcomes while minimizing burden on eligible clinicians and that is flexible, highly transparent, and improves over time with input from clinical practices. To aid in this process, we have sought feedback from the

health care community through various public avenues and solicited comment through the proposed rule. As we establish policies for effective implementation of the MACRA, we do so with the explicit understanding that technology, infrastructure, physician support systems, and clinical practices will change over the next few years. In addition, we are aware of the diversity of clinician practices in their experience with quality-based payments. As a result of these factors, we expect the Quality Payment Program to evolve over multiple years in order to achieve our national goals. In the early years of the program, we will begin by laying the groundwork for expansion towards an innovative, outcome-focused, patient-centered, resource-effective health system. Through a staged approach, we can develop policies that are operationally feasible and made in consideration of system capabilities and our core strategies to drive progress and reform efforts. Thus, due to this staged approach, we are finalizing the rule with a comment period. We commit to continue iterating on these policies.

The Quality Payment Program aims to do the following: (1) Support care improvement by focusing on better outcomes for patients, decreased provider burden, and preservation of independent clinical practice; (2) promote adoption of alternative payment models that align incentives across healthcare stakeholders; and (3) advance existing efforts of Delivery System Reform, including ensuring a smooth transition to a new system that promotes high-quality, efficient care through unification of CMS legacy programs.

This final rule with comment period establishes the Quality Payment Program and its two interrelated pathways: Advanced APMs and the MIPS. This final rule with comment period establishes incentives for participation in Advanced APMs, supporting the Administration's goals of transitioning from fee-for-service (FFS) payments to payments for quality and value, including approaches that focus on better care, smarter spending, and healthier people. This final rule with comment period also includes definitions of Qualifying APM Participants (QPs) in Advanced APMs and outlines the criteria for use by the Physician-Focused Payment Model Technical Advisory Committee (PTAC) in making comments and recommendations to the Secretary on physician-focused payment models (PFPs).

MIPS is a new program for certain Medicare-participating eligible

clinicians that will make payment adjustments based on performance on quality, cost and other measures, and will consolidate components of three existing programs—the Physician Quality Reporting System (PQRS), the Physician Value-based Payment Modifier (VM), and the Medicare Electronic Health Record (EHR) Incentive Program for eligible professionals (EPs). As prescribed by Congress, MIPS will focus on: Quality—both a set of evidence-based, specialty-specific standards as well as practice-based improvement activities; cost; and use of certified electronic health record (EHR) technology (CEHRT) to support interoperability and advanced quality objectives in a single, cohesive program that avoids redundancies. Many features of MIPS are intended to simplify and integrate further during the second and third years.

2. Quality Payment Program Strategic Objectives

We solicited and reviewed over 4000 comments and had over 100,000 physicians and other stakeholders attend our outreach sessions. Through this outreach, we created six strategic objectives to drive continued progress and improvement.

These objectives guided our final policies and will guide our future rulemaking in order to design, implement and evolve a Quality Payment Program that aims to improve health outcomes, promote smarter spending, minimize burden of participation, and provide fairness and transparency in operations. These strategic objectives are as follows: (1) To improve beneficiary outcomes and engage patients through patient-centered Advanced APM and MIPS policies; (2) to enhance clinician experience through flexible and transparent program design and interactions with easy-to-use program tools; (3) to increase the availability and adoption of robust Advanced APMs; (4) to promote program understanding and maximize participation through customized communication, education, outreach and support that meet the needs of the diversity of physician practices and patients, especially the unique needs of small practices; (5) to improve data and information sharing to provide accurate, timely, and actionable feedback to clinicians and other stakeholders; and (6) to ensure operational excellence in program implementation and ongoing development. More information on these objectives and the Quality Payment Program can be found at QualityPaymentProgram.cms.gov.

With these objectives we recognize that the Quality Payment Program provides new opportunities to improve care delivery by supporting and rewarding clinicians as they find new ways to engage patients, families and caregivers and to improve care coordination and population health management. In addition, we recognize that by developing a program that is flexible instead of one-size-fits-all, clinicians will be able to choose to participate in a way that is best for them, their practice, and their patients. For clinicians interested in APMs, we believe that by setting ambitious yet achievable goals, eligible clinicians will move with greater certainty toward these new approaches of delivering care. To these ends, and to ensure this program works for all stakeholders, we further recognize that we must provide ongoing education, support, and technical assistance so that clinicians can understand program requirements, use available tools to enhance their practices, and improve quality and progress toward participation in alternative payment models if that is the best choice for their practice. Finally, we understand that we must achieve excellence in program management, focusing on customer needs, promoting problem-solving, teamwork, and leadership to provide continuous improvements in the Quality Payment Program.

3. One Quality Payment Program

Clinicians have told us that they do not separate their patient care into domains, and that the Quality Payment Program needs to reflect typical clinical workflows in order to achieve its goals of better patient care. Advanced APMs, the focus of one pathway of the Quality Payment Program, contribute to better care and smarter spending by allowing physicians and other clinicians to deliver coordinated, customized, high-quality care to their patients within a streamlined payment system. Within MIPS, the second pathway of the Quality Payment Program, we believe that the unification into one Quality Payment Program can best be accomplished by making connections across the four pillars of the MIPS payment structure identified in the MACRA legislation—quality, clinical practice improvement activities (referred to as “improvement activities”), meaningful use of CEHRT (referred to as “advancing care information”), and resource use (referred to as “cost”)—and by emphasizing that the Quality Payment Program is at its core about improving the quality of patient care. Indeed, the

bedrock of the Quality Payment Program is high-quality, patient-centered care followed by useful feedback, in a continuous cycle of improvement. The principal way MIPS measures quality of care is through evidence-based clinical quality measures (CQMs) which MIPS eligible clinicians can select, the vast majority of which are created by or supported by clinical leaders and endorsed by a consensus-based process. Over time, the portfolio of quality measures will grow and develop, driving towards outcomes that are of the greatest importance to patients and clinicians. Through MIPS, we have the opportunity to measure quality not only through clinician-proposed measures, but to take it a step further by also accounting for activities that physicians themselves identify: Namely, practice-driven quality improvement. The MACRA requires us to measure whether technology is used meaningfully. Based on significant feedback, this area is simplified into supporting the exchange of patient information and how technology specifically supports the quality goals selected by the practice. The cost performance category has also been simplified and weighted at zero percent of the final score for the transition year of CY 2017. Given the primary focus on quality, we have accordingly indicated our intention to align these measures fully to the quality measures over time in the scoring system (see section II.E.6.a. for further details). That is, we are establishing special policies for the first year of the Quality Payment Program, which we refer to as the “transition year” throughout this final rule with comment period; this transition year corresponds to the first performance period of the program, calendar year (CY) 2017, and the first payment year, CY 2019. We envision that it will take a few years to reach a steady state in the program, and we therefore anticipate a ramp-up process and gradual transition with less financial risk for clinicians in at least the first 2 years. In the transition year in 2017, we will test this performance category alignment, for example by allowing certain improvement activities that are completed using CEHRT to achieve a bonus score in the advancing care information performance category with the intent of analyzing adoption, and in future years, potentially adding activities that reinforce integration of the program. Our hope is for the program to evolve to the point where all the clinical activities captured in MIPS across the four performance categories reflect the single, unified goal of quality improvement.

4. Summary of the Major Provisions

a. Transition Year and Iterative Learning and Development Period

We recognize, as described through many insightful comments, that many eligible clinicians face challenges in understanding the requirements and being prepared to participate in the Quality Payment Program in 2017. As a result, we have decided to finalize transitional policies throughout this final rule with comment period, which will focus the program in its initial years on encouraging participation and educating clinicians, all with the primary goal of placing the patient at the center of the healthcare system. At the same time, we will also increase opportunities to join Advanced APMs, allowing eligible clinicians who chose to do so an opportunity to participate.

Given the wide diversity of clinical practices, the initial development period of the Quality Payment Program implementation would allow physicians to pick their pace of participation for the first performance period that begins January 1, 2017. Eligible clinicians will have three flexible options to submit data to MIPS and a fourth option to join Advanced APMs in order to become QPs, which would ensure they do not receive a negative payment adjustment in 2019.

In the transition year CY 2017 of the program, this rule finalizes a period during which clinicians and CMS will build capabilities to report and gain experience with the program. Clinicians can choose their course of participation in this year with four options.

(1) Clinicians can choose to report to MIPS for a full 90-day period or, ideally, the full year, and maximize the MIPS eligible clinician's chances to qualify for a positive adjustment. In addition, MIPS eligible clinicians who are exceptional performers in MIPS, as shown by the practice information that they submit, are eligible for an additional positive adjustment for each year of the first 6 years of the program.

(2) Clinicians can choose to report to MIPS for a period of time less than the full year performance period 2017 but for a full 90-day period at a minimum and report more than one quality measure, more than one improvement activity, or more than the required measures in the advancing care information performance category in order to avoid a negative MIPS payment adjustment and to possibly receive a positive MIPS payment adjustment.

(3) Clinicians can choose to report one measure in the quality performance category; one activity in the improvement activities performance

category; or report the required measures of the advancing care information performance category and avoid a negative MIPS payment adjustment. Alternatively, if MIPS eligible clinicians choose to not report even one measure or activity, they will receive the full negative 4 percent adjustment.

(4) MIPS eligible clinicians can participate in Advanced APMs, and if they receive a sufficient portion of their Medicare payments or see a sufficient portion of their Medicare patients through the Advanced APM, they will qualify for a 5 percent bonus incentive payment in 2019.

We are finalizing the 2017 performance period for the 2019 MIPS payment year to be a transition year as part of the development period in the program. For this transition year, for MIPS the performance threshold will be lowered to a threshold of 3 points. Clinicians who achieve a final score of 70 or higher will be eligible for the exceptional performance adjustment, funded from a pool of \$500 million.

For full participation in MIPS and in order to achieve the highest possible final scores, MIPS eligible clinicians are encouraged to submit measures and activities in all three integrated performance categories: Quality, improvement activities, and advancing care information. To address public comments on the cost performance category, the weighting of the cost performance category has been lowered to 0 percent for the transition year. For full participation in the quality performance category, clinicians will report on six quality measures, or one specialty-specific or subspecialty-specific measure set. For full participation in the advancing care information performance category, MIPS eligible clinicians will report on five required measures. For full participation in the improvement activities performance category, clinicians can engage in up to four activities, rather than the proposed six activities, to earn the highest possible score of 40.

For the transition year CY 2017, for quality, clinicians who submit one out of at least six quality measures will meet the MIPS performance threshold of 3; however, more measures are required for groups who submit measures using the CMS Web Interface. For the transition year CY 2017, for quality, higher measure points may be awarded based on achieving higher performance in the measure. For improvement activities, attesting to at least one improvement activity will also be sufficient to meet the MIPS performance threshold in the transition year CY

2017. For advancing care information, clinicians reporting on the required measures in that category will meet the performance threshold in the transition year. These transition year policies for CY 2017 will encourage participation by clinicians and will provide a ramp up period for clinicians to prepare for higher performance thresholds in the second year of the program.

Historical evidence has shown that clinical practices of all sizes can successfully submit data, including over 110,000 solo and small practices with 15 or fewer clinicians who participated in PQRS in 2015. The transition year and development period approach gives clinicians structured, practical choices that can best suit their practices.

Resources will be made available to assist clinicians and practices through this transition. The hope is that by lowering the barriers to participation at the outset, we can set the foundation for a program that supports long-term, high-quality patient care through feedback and open communication between CMS and other stakeholders.

We anticipate that the iterative learning and development period will last longer than the first year, CY 2017, of the program as we move towards a steady state; therefore, we envision CY 2018 to also be transitional in nature to provide a ramp-up of the program and of the performance thresholds. We anticipate making proposals on the parameters of this second transition year through rule-making in 2017.

b. Legacy Quality Reporting Programs

This final rule with comment period will sunset payment adjustments under the current Medicare EHR Incentive Program for EPs (section 1848(o) of the Act), the PQRS (section 1848(k) and (m) of the Act), and the VM (section 1848(p) of the Act) programs after CY2018. Components of these three programs will be carried forward into MIPS. This final rule with comment period establishes new subpart O of our regulations at 42 CFR part 414 to implement the new MIPS program as required by the MACRA.

c. Significant Changes From Proposed Rule

In developing this final rule with comment period, we sought feedback from stakeholders throughout the process, including through Requests for Information in October 2015 and through the comment process for the proposed rule from April to June 2016. We received thousands of comments from a broad range of sources including professional associations and societies, physician practices, hospitals, patient

groups, and health IT vendors, and we thank our many commenters and acknowledge their valued input throughout the proposed rule process. In response to comments to the proposed rule, we have made significant changes in this final rule with comment period, including (1) bolstering support for small and independent practices; (2) strengthening the movement towards Advanced Alternative Payment Models by offering potential new opportunities such as the Medicare ACO Track 1+ (3) securing a strong start to the program with a flexible, pick-your-own-pace approach to the initial years of the program; and (4) connecting the statutory domains into one unified program that supports clinician-driven quality improvement. These themes are illustrated in the following specific policy changes: (1) The creation of a transition year and iterative learning and development period in the beginning of the program; (2) the adjustment of the MIPS low-volume threshold; (3) the establishment of an Advanced APM financial risk standard that promotes participation in robust, high-quality models; (4) the simplification of prior “all-or-nothing” requirements in the use of certified EHR technology; and (5) the establishment of Medical Home Model standards that promote care coordination.

We intend to continue open communication with stakeholders, including consultation with tribes and tribal officials, on an ongoing basis as we develop the Quality Payment Program in future years.

d. Small Practices

As outlined above, protection of small, independent practices is an important thematic objective for this final rule with comment. For 2017, many small practices will be excluded from new requirements due to the low-volume threshold, which has been set at less than or equal to \$30,000 in Medicare Part B allowed charges or less than or equal to 100 Medicare patients, representing 32.5 percent of pre-exclusion Medicare clinicians but only 5 percent of Medicare Part B spending. Stakeholder comments suggested setting a higher low-volume threshold for exclusion from MIPS but allowing clinicians that would be excluded by the threshold to opt in to the program if they wished to report to MIPS and receive a MIPS payment adjustment for the year. We considered this option but determined that it was inconsistent with the statutory MIPS exclusion based on the low-volume threshold. We anticipate that more clinicians will be

determined to be eligible to participate in the program in future years.

MACRA also provides that solo and small practices may join “virtual groups” and combine their MIPS reporting. Many commenters suggested that we allow groups with more than 10 clinicians to participate as virtual groups. As noted, the statute limits the virtual group option to individuals and groups of not more than 10 clinicians. We are not implementing virtual groups in the transition year CY 2017 of the program; however, through the policies of the transition year and development period, we believe we have addressed some of the concerns expressed by clinicians hesitant to participate in the Quality Payment Program. CMS wants to make sure the virtual group technology is meaningful and simple to use for clinicians, and we look forward to stakeholder engagement on how to structure and implement virtual groups in future years of the program.

In keeping with the objectives of providing education about the program and maximizing participation, and as mandated by the MACRA, \$100 million in technical assistance will be available to MIPS eligible clinicians in small practices, rural areas, and practices located in geographic health professional shortage areas (HPSAs), including IHS, tribal, and urban Indian clinics, through contracts with quality improvement organizations, regional health collaboratives, and others to offer guidance and assistance to MIPS eligible clinicians in practices of 15 or fewer MIPS eligible clinicians. Priority will be given to practices located in rural areas, defined as clinicians in zip codes designated as rural, using the most recent Health Resources and Services Administration (HRSA) Area Health Resource File data set available; medically underserved areas (MUAs); and practices with low MIPS final scores or in transition to APM participation. The MACRA also includes provisions requiring an examination of the pooling of financial risk for physician practices, in particular for small practices. Specifically, section 101(c)(2)(C) of MACRA requires the Government Accountability Office (GAO) to submit a report to Congress, not later than January 1, 2017, examining whether entities that pool financial risk for physician practices, such as independent risk managers, can play a role in supporting physician practices, particularly small physician practices, in assuming financial risk for the treatment of patients. We have been closely engaged with the GAO throughout their study to better

understand the unique needs and challenges faced by clinicians in small practices and practices in rural or health professional shortage areas. We have provided information to the GAO, and the GAO has shared some of their initial findings regarding these challenges. We look forward to further engagement with the GAO on this topic and to the release of GAO’s final report. Using the knowledge obtained from small practices, other stakeholders, and the public, as well as from GAO, we continue to work to improve the flexibility and support available to small, underserved, and rural practices. Throughout the evolution of the Quality Payment Program that will unfold over the years to come, CMS is committed to working together with stakeholders to address the unique challenges these practices encounter.

Using updated policies for the transition year and development period, we performed an updated regulatory impact analysis, including for small and solo practices. With the extensive changes to policy and increased flexibility, we believe that estimating impacts of this final rule with comment period using only historic 2015 quality submission data significantly overestimates the impact on small and solo practices. Although small and solo practices have historically been less likely to engage in PQRS and quality reporting, we believe that small and solo practices will respond to MIPS by participating at a rate close to that of other practice sizes. In order to quantify the impact of the rule on MIPS eligible clinicians, including small and solo practices, we have prepared two sets of analyses that assume the participation rates for some categories of small practices will be similar to those of other practice size categories. Specifically, our primary analysis assumes that each practice size grouping will achieve at least 90 percent participation rate and our alternative assumption is that each practice size grouping will achieve at least an 80 percent participation rate. In both sets of analyses, we estimate that over 90 percent of MIPS eligible clinicians will receive a positive or neutral MIPS payment adjustment in the transition year, and that at least 80 percent of clinicians in small and solo practices with 1–9 clinicians will receive a positive or neutral MIPS payment adjustment.

e. Advanced Alternative Payment Models (Advanced APMs)

In this rule, we finalize requirements we will use for the purposes of the incentives for participation in Advanced

APMs, and the following is a summary of our finalized policies. The MACRA defines APM for the purposes of the incentive as a model under section 1115A of the Act (excluding a health care innovation award), the Shared Savings Program under section 1899 of the Act, a demonstration under section 1866C of the Act, or a demonstration required by federal law.

APMs represent an important step forward in the Administration's efforts to move our healthcare system from volume-based to value-based care. APMs that meet the criteria to be Advanced APMs provide the pathway through which eligible clinicians, who would otherwise participate in MIPS, can become Qualifying APM Participants (QPs), and therefore, earn incentive payments for their Advanced APM participation. In the proposed rule, we estimated that 30,000 to 90,000 clinicians would be QPs in 2017. With new Advanced APMs expected to become available for participation in 2017 and 2018, including the Medicare ACO Track 1 Plus (1+), and anticipated amendments to reopen applications for or modify current APMs, such as the Maryland All-Payer Model and Comprehensive Care for Joint Replacement (CJR) model, we anticipate higher numbers of QPs—approximately 70,000 to 120,000 in 2017 and 125,000 to 250,000 in 2018.

As discussed in section II.F.4.b. of this final rule with comment period, we are exploring development of the Medicare ACO Track 1+ Model to begin in 2018. The model would be voluntary for ACOs currently participating in Track 1 of the Shared Savings Program or ACOs seeking to participate in the Shared Savings Program for the first time. It would test a payment model that incorporates more limited downside risk than is currently present in Tracks 2 or 3 of the Shared Savings Program but sufficient financial risk in order to be an Advanced APM. We will announce additional information about the model in the future.

This rule finalizes two types of Advanced APMs: Advanced APMs and Other Payer Advanced APMs. To be considered an Advanced APM, an APM must meet all three of the following criteria, as required under section 1833(z)(3)(D) of the Act: (1) The APM must require participants to use CEHRT; (2) The APM must provide for payment for covered professional services based on quality measures comparable to those in the quality performance category under MIPS and; (3) The APM must either require that participating APM Entities bear risk for monetary losses of a more than nominal amount

under the APM, or be a Medical Home Model expanded under section 1115A(c) of the Act. In this rule, we finalize proposals pertaining to all of these criteria.

To be an Other Payer Advanced APM, as set forth in section 1833(z)(2) of the Act, a payment arrangement with a payer (for example, Medicaid or a commercial payer) must meet all three of the following criteria: (1) The payment arrangement must require participants to use CEHRT; (2) The payment arrangement must provide for payment for covered professional services based on quality measures comparable to those in the quality performance category under MIPS and; (3) The payment arrangement must require participants to either bear more than nominal financial risk if actual aggregate expenditures exceed expected aggregate expenditures; or be a Medicaid Medical Home Model that meets criteria comparable to Medical Home Models expanded under section 1115A(c) of the Act.

We are completing an initial set of Advanced APM determinations that we will release as soon as possible but no later than January 1, 2017. For new APMs that are announced after the initial determination, we will include Advanced APM determinations in conjunction with the first public notice of the APM, such as the Request for Applications (RFA) or final rule. All determinations of Advanced APMs will be posted on our Web site and updated on an ad hoc basis, but no less frequently than annually, as new APMs become available and others end or change.

An important avenue for the creation of innovative payment models is the PTAC, created by the MACRA. The PTAC is an 11-member independent federal advisory committee to the HHS Secretary. The PTAC will review stakeholders' proposed PFPMs, and make comments and recommendations to the Secretary regarding whether the PFPMs meet criteria established by the Secretary. PTAC comments and recommendations will be reviewed by the CMS Innovation Center and the Secretary, and we will post a detailed response to them on the CMS Web site.

(i) QP Determination

QPs are eligible clinicians in an Advanced APM who have a certain percentage of their patients or payments through an Advanced APM. QPs are excluded from MIPS and receive a 5 percent incentive payment for a year beginning in 2019 through 2024. We finalize our proposal that professional services furnished at Critical Access

Hospitals (CAHs), Rural Health Clinics (RHCs), and Federally Qualified Health Centers (FQHCs) that meet certain criteria be counted towards the QP determination using the patient count method.

We finalize definitions of Medical Home Model and Medicaid Medical Home Model and the unique standards by which Medical Home Models may meet the financial risk criterion to be an Advanced APM.

The statute sets thresholds for the level of participation in Advanced APMs required for an eligible clinician to become a QP for a year. The Medicare Option, based on Part B payments for covered professional services or counts of patients furnished covered professional services under Part B, is applicable beginning in the payment year 2019. The All-Payer Combination Option, which utilizes the Medicare Option as well as an eligible clinician's participation in Other Payer Advanced APMs, is applicable beginning in the payment year 2021. For eligible clinicians to become QPs through the All-Payer Combination Option, an Advanced APM Entity or eligible clinician must participate in an Advanced APM under Medicare and also submit information to CMS so that we can determine whether payment arrangements with non-Medicare payers are an Other Payer Advanced APMs and whether an eligible clinician meets the requisite QP threshold of participation. We are finalizing our methodologies to evaluate eligible clinicians using the Medicare and All-Payer Combination Options.

We are finalizing the two methods by which we will calculate Threshold Scores to compare to the QP thresholds and make QP determinations for eligible clinicians. The payment amount method assesses the amount of payments for Part B covered professional services that are furnished through an Advanced APM. The patient count method assesses the amount of patients furnished Part B covered professional services through an Advanced APM.

We are finalizing our proposal to identify individual eligible clinicians by a unique APM participant identifier using the individuals' APM, APM Entity, and TIN/NPI combinations, and to assess as an APM Entity group all individual eligible clinicians listed as participating in an Advanced APM Entity to determine their QP status for a year. We are finalizing that if an individual eligible clinician who participates in multiple Advanced APM Entities does not achieve QP status through participation in any single APM Entity, we will assess the eligible

clinician individually to determine QP status based on combined participation in Advanced APMs.

We are finalizing the method to calculate and disburse the lump-sum APM Incentive Payments to QPs, and we are finalizing a specific approach for calculating the APM Incentive Payment when a QP also receives non-FFS payments or has received payment adjustments through the Medicare EHR Incentive Program, PQRS, VM, or MIPS during the prior period used for determining the APM Incentive Payment.

We are finalizing a modified policy such that, following a final determination that an Advanced APM Entity group or eligible clinician is determined to be a Partial Qualifying APM Participant (Partial QP), the Advanced APM Entity—or eligible clinician in the case of an individual determination—will make an election on behalf of all of its eligible clinicians in the group of whether to report to MIPS, thus making all eligible clinicians in the Advanced APM Entity group subject to MIPS payment adjustments; or not report to MIPS, thus excluding all eligible clinicians in the APM Entity group from MIPS adjustments. We finalize our proposals to vet and monitor APM Entities, Advanced APM Entities, and eligible clinicians participating in those entities. We are finalizing a definition for PFPMs and criteria for use by the PTAC in fulfilling its responsibility to evaluate proposals for PFPMs.

We are finalizing an accelerated timeline for making QP determinations, and will notify eligible clinicians of their QP status as soon as possible, in advance of the end of the MIPS performance period so that QPs will know whether they are excluded from MIPS prior to having to submit information to CMS for purposes of MIPS.

We are finalizing the requirement that MIPS eligible clinicians, as well as EPs, eligible hospitals, and CAHs under the existing Medicare and Medicaid EHR Incentive Programs demonstrate cooperation with certain provisions concerning blocking the sharing of information under section 106(b)(2) of the MACRA and, separately, to demonstrate engagement with activities that support health care providers with the performance of their CEHRT such as cooperation with ONC direct review of certified health information technologies.

f. Merit-Based Incentive Payment System (MIPS)

In establishing MIPS, this final rule with comment period will define MIPS participants as “MIPS eligible clinicians” rather than “MIPS EPs” as that term is defined at section 1848(q)(1)(C) and used throughout section 1848(q) of the Act. MIPS eligible clinicians will include physicians, physician assistants, nurse practitioners, clinical nurse specialists, certified registered nurse anesthetists, and groups that include such clinicians who bill under Medicare Part B. The rule finalizes definitions and requirements for groups. In addition to finalizing definitions for MIPS eligible clinicians, the rule also finalizes rules for the specific Medicare-enrolled clinicians that will be excluded from MIPS, including newly Medicare-enrolled MIPS eligible clinicians, QPs, certain Partial QPs, and clinicians that fall under the finalized low-volume threshold.

For the 2017 performance period, we estimate that more than half of clinicians—approximately 738,000 to 780,000—billing under the Medicare PFS will be excluded from MIPS due to several factors, including the MACRA itself. We estimate that nearly 200,000 clinicians, or approximately 14.4 percent, are not one of the eligible types of clinicians for the transition year CY 2017 of MIPS under section 1848(q)(1)(C) of the Act. The largest cohort of clinicians excluded from MIPS is low-volume clinicians, defined as those clinicians with less than or equal to \$30,000 in allowed charges or less than or equal to 100 Medicare patients, representing approximately 32.5 percent of all clinicians billing Medicare Part B services or over 380,000 clinicians. Additionally, between 70,000 and 120,000 clinicians (approximately 5–8 percent of all clinicians billing under the Medicare Part B) will be excluded from MIPS due to being QPs based on participation in Advanced APMs. In aggregate, the eligible clinicians excluded from MIPS represent only 22 to 27 percent of total Part B allowed charges.

This rule finalizes MIPS performance standards and a minimum MIPS performance period of any 90 continuous days during CY 2017 (January 1 through December 31) for all measures and activities applicable to the integrated performance categories. After consideration of public comments, this rule finalizes a shorter than annual performance period in 2017 to allow flexible participation options for MIPS eligible clinicians as the program begins

and evolves over time. For performance periods occurring in 2017, MIPS eligible clinicians will be able to pick a pace of participation that best suits their practices, including submitting data, in special circumstances as discussed in section II.E.5. of this rule, for a period of less than 90 days, to avoid a negative MIPS payment adjustment. Further, we are finalizing our proposal to use performance in 2017 as the performance period for the 2019 payment adjustment. Therefore, the first performance period will start in 2017 and consist of a minimum period of any 90 continuous days during the calendar year in order for clinicians to be eligible for payment adjustment above neutral. Performance in that period of 2017 will be used to determine the 2019 payment adjustment. This timeframe is needed to allow data and claims to be submitted and data analysis to occur in the initial years. In subsequent years, we intend to explore ways to shorten the period between the performance period and the payment year, and ongoing performance feedback will be provided more frequently. The final policies for CY 2017 provide flexibilities to ensure clinicians have ample participation opportunities.

As directed by the MACRA, this rule finalizes measures, activities, reporting, and data submission standards across four integrated performance categories: Quality, cost, improvement activities, and advancing care information, each linked by the same overriding mission of supporting care improvement under the vision of one Quality Payment Program. Consideration will be given to the application of measures and activities to non-patient facing MIPS eligible clinicians.

Under the requirements finalized in this rule, there will be options for reporting as an individual MIPS eligible clinician or as part of a group. Some data may be submitted via relevant third party intermediaries, such as qualified clinical data registries (QCDRs), health IT vendors,¹ qualified registries, and CMS-approved survey vendors.

¹ We also note that throughout this final rule, as in the proposed rule, we use the terms “EHR Vendor” and “Health IT Vendor.” First, the use of the term “health IT” and “EHR” are based on the common terminology within the specified program (see 80 FR 62604; and the advancing care information performance category in this rule). Second, we recognize that a “health IT vendor” may or may not also be a “health IT developer” and, in some cases, the developer and the vendor of a single product may be different entities. Under the ONC Health IT Certification Program (Program), a health IT developer constitutes a vendor, self-developer, or other entity that presents health IT for certification or has health IT certified under the Program. Therefore, for purposes of this final rule, we clarify that the term “vendor” shall also include

Within each performance category, we are finalizing specific requirements for full participation in MIPS which involves submitting data on quality measures, improvement activities, and use of certified EHR technology on a minimum of any continuous 90 days up to the full calendar year in 2017 in order to be eligible for a positive MIPS payment adjustment. It is at the MIPS eligible clinician's discretion whether to submit data for the same 90-day period for the various measures and activities or for different time periods for different measures and activities. Note that during the 2017 transition year, MIPS eligible clinicians may choose to report a minimum of a single measure in the quality performance category, a single activity in the improvement activities performance category or the required measures in the advancing care information performance category, in order to avoid a negative payment adjustment. For full participation in MIPS, the specific requirements are as follows:

(i) Quality

Quality measures will be selected annually through a call for quality measures process, and a final list of quality measures will be published in the **Federal Register** by November 1 of each year. For MIPS eligible clinicians choosing full participation in MIPS and the potential for a higher payment adjustment, we note that for a minimum of a continuous 90-day performance period, the MIPS eligible clinician or group will report at least six measures including at least one outcome measure if available. If fewer than six measures apply to the individual MIPS eligible clinician or group, then the MIPS eligible clinician or group will only be required to report on each measure that is applicable.

Alternatively, for a minimum of a continuous 90-day period, the MIPS eligible clinician or group can report one specialty-specific measure set, or the measure set defined at the subspecialty level, if applicable. If the measure set contains fewer than six measures, MIPS eligible clinicians will be required to report all available measures within the set. If the measure set contains six or more measures, MIPS eligible clinicians can choose six or more measures to report within the set.

developers who create or develop health IT. Throughout this final rule, we use the term "health IT vendor" or "EHR vendor" to refer to entities that support the health IT requirements of a MIPS eligible clinician participating in the proposed Quality Payment Program. This use is consistent with prior CMS rules, see for example the 2014 CEHRT Flexibility final rule (79 FR 52915).

Regardless of the number of measures that are contained in the measure set, MIPS eligible clinicians reporting on a measure set will be required to report at least one outcome measure or, if no outcome measures are available in the measure set, report another high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures) within the measure set in lieu of an outcome measure.

(ii) Improvement Activities

Improvement activities are those that support broad aims within healthcare delivery, including care coordination, beneficiary engagement, population management, and health equity. In response to comments from experts and stakeholders across the healthcare system, improvement activities were given relative weights of high and medium. We are reducing the number of activities required to achieve full credit from six medium-weighted or three high-weighted activities to four medium-weighted or two high-weighted activities to receive full credit in this performance category in CY 2017. For small practices, rural practices, or practices located in geographic health professional shortage areas (HPSAs), and non-patient facing MIPS eligible clinicians, we will reduce the requirement to only one high-weighted or two medium-weighted activities. We also expand our definition of how CMS will recognize a MIPS eligible clinician or group as being a certified patient-centered medical home or comparable specialty practice to include certification from a national program, regional or state program, private payer or other body that administers patient-centered medical home accreditation. As previously mentioned, in recognition of improvement activities as supporting the central mission of a unified Quality Payment Program, we will include a designation in the inventory of improvement activities of which activities also qualify for the advancing care information bonus score, consistent with our desire to recognize that EHR technology is often deployed to improve care in ways that our programs should recognize.

(iii) Advancing Care Information Performance Category

Measures and objectives in the advancing care information performance category focus on the secure exchange of health information and the use of certified electronic health record technology (CEHRT) to support patient engagement and improved healthcare quality. We are maintaining alignment

of the advancing care information performance category with the other integrated performance categories for MIPS. We are reducing the total number of required measures from eleven in the proposed rule to only five in our final policy. All other measures would be optional for reporting. Reporting on all five of the required measures would earn the MIPS eligible clinician 50 percent. Reporting on the optional measures would allow a clinician to earn a higher score. For the transition year, we will award a bonus score for improvement activities that utilize CEHRT and for reporting to public health or clinical data registries.

Public commenters requested that the advancing care information performance category allow for reporting on "use cases" such as the use of CEHRT to manage referrals and consultations ("closing the referral loop") and other practice-based activities for which CEHRT is used as part of the typical workflow. This is an area we intend to explore in future rulemaking but did not finalize any such policies in this rule. However, for the 2017 transition year, we will award bonus points for improvement activities that utilize CEHRT and for reporting to a public health or clinical data registry, reflecting the belief that the advancing care information performance category should align with the other performance categories to achieve the unified goal of quality improvement.

(iv) Cost

For the transition year, we are finalizing a weight of zero percent for the cost performance category in the final score, and MIPS scoring in 2017 will be determined based on the other three integrated MIPS performance categories. Cost measures do not require reporting of any data by MIPS eligible clinicians to CMS. Although cost measures will not be used to determine the final score in the transition year, we intend to calculate performance on certain cost measures and give this information in performance feedback to clinicians. We intend to calculate measures of total per capita costs for all attributed beneficiaries and a Medicare Spending per Beneficiary (MSPB) measure. In addition, we are finalizing 10 episode-based measures that were previously made available to clinicians in feedback reports and met standards for reliability. Starting in performance year 2018, as performance feedback is available on at least an annual basis, the cost performance category contribution to the final score will gradually increase from 0 to the 30 percent level required

by MACRA by the third MIPS payment year of 2021.

(v) Clinicians in MIPS APMs

We are finalizing standards for measures, scoring, and reporting for MIPS eligible clinicians across all four performance categories outlined in this section I.E.5.h of this final rule with comment period. Beginning in 2017, some APMs, by virtue of their structure, will not meet statutory requirements to be categorized as Advanced APMs. Eligible clinicians in these APMs, hereafter referred to as MIPS APMs, will be subject to MIPS reporting requirements and the MIPS payment adjustment. In addition, eligible clinicians who are in Advanced APMs but do not meet participation thresholds to be excluded from MIPS for a year will be subject to the scoring standards for MIPS reporting requirements and the MIPS payment adjustment. In response to comments, in an effort to recognize these eligible clinicians' participation in delivery system reform and to avoid potential duplication or conflicts between these APMs and MIPS, we finalize an APM scoring standard that is different from the generally applicable standard. We finalize our proposal that MIPS eligible clinicians who participate in MIPS APMs will be scored using the APM scoring standard instead of the generally applicable MIPS scoring standard.

(vi) Scoring Under MIPS

We are finalizing that MIPS eligible clinicians have the flexibility to submit information individually or via a group or an APM Entity group; however, the MIPS eligible clinician will use the same identifier for all performance categories. The finalized scoring methodology has a unified approach across all performance categories, which will help MIPS eligible clinicians understand in advance what they need to do in order to perform well in MIPS. The three performance category scores (quality, improvement activities, and advancing care information) will be aggregated into a final score. The final score will be compared against a MIPS performance threshold of 3 points. The final score will be used to determine whether a MIPS eligible clinician receives an upward MIPS payment adjustment, no MIPS payment adjustment, or a downward MIPS payment adjustment as appropriate. Upward MIPS payment adjustments may be scaled for budget neutrality, as required by MACRA. The final score will also be used to determine whether a MIPS eligible clinician qualifies for an additional positive adjustment factor for

exceptional performance. The performance threshold will be set at 3 points for the transition year, such that clinicians engaged in the program who successfully report one quality measure can avoid a downward adjustment. MIPS eligible clinicians submitting additional data for one or more of the three performance categories for at least a full 90-day period may qualify for varying levels of positive adjustments.

In future years of the program, we will require longer performance periods and higher performance in order to avoid a negative MIPS payment adjustment.

(vii) Performance Feedback

We are finalizing a process for providing performance feedback to MIPS eligible clinicians. Initially, we will provide performance feedback on an annual basis. In future years, we aim to provide performance feedback on a more frequent basis, as well as providing feedback on the performance categories of improvement activities and advancing care information in line with clinician requests for timely, actionable feedback that they can use to improve care. We are finalizing our proposal to make performance feedback available using a web-based application. Further, we are finalizing our proposal to leverage additional mechanisms such as health IT vendors and registries to help disseminate data contained in the performance feedback to MIPS eligible clinicians where applicable.

(viii) Targeted Review Processes

We are finalizing a targeted review process under MIPS wherein a MIPS eligible clinician may request that we review the calculation of the MIPS payment adjustment factor and, as applicable, the calculation of the additional MIPS payment adjustment factor applicable to such MIPS eligible clinician for a year.

(ix) Third Party Intermediaries

We are finalizing requirements for third party data submission to MIPS that are intended to decrease burden to individual clinicians. Specifically, qualified registries, QCDRs, health IT vendors, and CMS-approved survey vendors will have the ability to act as intermediaries on behalf of MIPS eligible clinicians and groups for submission of data to CMS across the quality, improvement activities, and advancing care information performance categories.

(x) Public Reporting

We are finalizing a process for public reporting of MIPS information through the Physician Compare Web site, with

the intention of promoting fairness and transparency. We are finalizing public reporting of a MIPS eligible clinician's data; for each program year, we will post on a public Web site, in an easily understandable format, information regarding the performance of MIPS eligible clinicians or groups under MIPS.

5. Payment Adjustments

We estimate that approximately 70,000 to 120,000 clinicians will become QPs in 2017 and approximately 125,000 to 250,000 clinicians will become QPs in 2018 through participation in Advanced APMs; they are estimated to receive between \$333 million and \$571 million in APM Incentive Payments for CY 2019. As with MIPS, we expect that APM participation will drive quality improvement for clinical care provided to Medicare beneficiaries and to all patients in the health care system.

Under the policies finalized in this rule, we estimate that, between approximately 592,000 and 642,000 eligible clinicians will be required to participate in MIPS in its transition year. In 2019, MIPS payment adjustments will be applied based on MIPS eligible clinicians' performance on specified measures and activities within three integrated performance categories; the fourth category of cost, as previously outlined, will be weighted to zero in the transition year. Assuming that 90 percent of eligible clinicians of all practice sizes participate in the program, we estimate that MIPS payment adjustments will be approximately equally distributed between negative MIPS payment adjustments (\$199 million) and positive MIPS payment adjustments (\$199 million) to MIPS eligible clinicians, to ensure budget neutrality. Positive MIPS payment adjustments will also include an additional \$500 million for exceptional performance payments to MIPS eligible clinicians whose performance meets or exceeds a threshold final score of 70. These MIPS payment adjustments are expected to drive quality improvement in the provision of MIPS eligible clinicians' care to Medicare beneficiaries and to all patients in the health care system. However, the distribution could change based on the final population of MIPS eligible clinicians for CY 2019 and the distribution of scores under the program. We believe that starting with these modest initial MIPS payment adjustments, representing less than 0.2 percent of Medicare expenditures for physician and clinical services, is in the long-term best interest of maximizing

participation and starting the Quality Payment Program off on the right foot, even if it limits the upside during the transition year. The increased availability of Advanced APM opportunities, including through Medical Home models, also provides earlier avenues to earn bonus payments for those who choose to participate.

6. The Broader Context of Delivery System Reform and Healthcare System Innovation

In January 2015, the Administration announced new goals for transforming Medicare by moving away from traditional FFS payments in Medicare towards a payment system focused on linking physician reimbursements to quality care through APMs (<http://www.hhs.gov/about/news/2015/01/26/better-smarter-healthier-in-historic-announcement-hhs-sets-clear-goals-and-timeline-for-shifting-medicare-reimbursements-from-volume-to-value.html#>) and other value-based purchasing arrangements. This is part of an overarching Administration strategy to transform how health care is delivered in America, changing payment structures to improve quality and patient health outcomes. The policies finalized in this rule are intended to continue to move Medicare away from a primarily volume-based FFS payment system for physicians and other professionals.

The Affordable Care Act includes a number of provisions, for example, the Medicare Shared Savings Program, designed to improve the quality of Medicare services, support innovation and the establishment of new payment models, better align Medicare payments with health care provider costs, strengthen Medicare program integrity, and put Medicare on a firmer financial footing.

The Affordable Care Act created the Center for Medicare and Medicaid Innovation (Innovation Center). The Innovation Center was established by section 1115A of the Act (as added by section 3021 of the Affordable Care Act). The Innovation Center's mandate gives it flexibility within the parameters of section 1115A of the Act to select and test promising innovative payment and service delivery models. The Congress created the Innovation Center for the purpose of testing innovative payment and service delivery models to reduce program expenditures while preserving or enhancing the quality of care provided to those individuals who receive Medicare, Medicaid, or CHIP benefits. See <https://innovation.cms.gov/about/index.html>. The Secretary may through rulemaking

expand the duration and scope of a model being tested if (1) the Secretary finds that such expansion (i) is expected to reduce spending without reducing the quality of care, or (ii) improve the quality of patient care without increasing spending; (2) the CMS Chief Actuary certifies that such expansion would reduce (or would not result in any increase in) net program spending under applicable titles; and (3) the Secretary finds that such expansion would not deny or limit the coverage or provision of benefits under the applicable title for applicable individuals.

The Innovation Center's portfolio of models has attracted participation from a broad array of health care providers, states, payers, and other stakeholders, and serves Medicare, Medicaid, and CHIP beneficiaries in all 50 states, the District of Columbia, and Puerto Rico. We estimate that over 4.7 million Medicare, Medicaid, and CHIP beneficiaries are or soon will be receiving care furnished by the more than 61,000 eligible clinicians currently participating in models tested by the CMS Innovation Center.

Beyond the care improvements for these beneficiaries, the Innovation Center models are affecting millions of additional Americans by engaging thousands of other health care providers, payers, and states in model tests and through quality improvement efforts across the country. Many payers other than CMS have implemented alternative payment arrangements or models, or have collaborated in the Innovation Center models. The participation of multiple payers in alternative delivery and payment models increases momentum for delivery system transformation and encourages efficiency for health care organizations.

The Innovation Center works directly with other CMS components and colleagues throughout the federal government in developing and testing new payment and service delivery models. Other federal agencies with which the Innovation Center has collaborated include the Centers for Disease Control and Prevention (CDC), Health Resources and Services Administration (HRSA), Agency for Healthcare Research and Quality (AHRQ), Office of the National Coordinator for Health Information Technology (ONC), Administration for Community Living (ACL), Department of Housing and Urban Development (HUD), Administration for Children and Families (ACF), and the Substance Abuse and Mental Health Services Administration (SAMHSA). These

collaborations help the Innovation Center effectively test new models and execute mandated demonstrations.

7. Stakeholder Input

In developing this final rule with comment period, we sought feedback from stakeholders and the public throughout the process such as in the 2016 Medicare PFS Proposed Rule; the Request for Information Regarding Implementation of the Merit-based Incentive Payment System, Promotion of Alternative Payment Models, and Incentive Payments for Participation in Eligible Alternative Payment Models (hereafter referred to as the MIPS and APMs RFI); listening sessions; conversations with a wide number of stakeholders; and consultation with tribes and tribal officials through an All Tribes' Call on May 19, 2016 and several conversations with the CMS' Tribal Technical Advisory Group. Through the MIPS and APMs RFI published in the **Federal Register** on October 1, 2015 (80 FR 59102 through 59113), the Secretary of Health and Human Services (the Secretary) solicited comments regarding implementation of certain aspects of the MIPS and broadly sought public comments on the topics in section 101 of the MACRA, including the incentive payments for participation in APMs and increasing transparency of PFPs. We received numerous public comments in response to the MIPS and APMs RFI from a broad range of sources including professional associations and societies, physician practices, hospitals, patient groups, and health IT vendors. On May 9, 2016, we published in the **Federal Register** a proposed rule for the Merit-based Incentive Payment System and Alternative Payment Model Incentive under the Physician Fee Schedule, and Criteria for Physician-Focused Payment Models (81 FR 28161 through 28586). In our proposed rule, we provided the public with proposed policies, implementation strategies, and regulation text, in addition to seeking additional comments on alternative and future approaches for MIPS and APMs. The comment period closed June 27, 2016.

In response to both the RFI and the proposed rule, we received a high degree of interest from a broad spectrum of stakeholders. We thank our many commenters and acknowledge their valued input throughout the proposed rule process. We discuss and respond to the substance of relevant comments in the appropriate sections of this final rule with comment period. In general, commenters continue to support establishment of the Quality Payment Program and maintain optimism as we

move from FFS Medicare payment towards an enhanced focus on the quality and value of care. Public support for our proposed approach and policies in the proposed rule focused on the potential for improving the quality of care delivered to beneficiaries and increasing value to the public—while rewarding eligible clinicians for their efforts. In this early stage of a new program, commenters urged CMS to maintain flexibility and promote maximized clinician participation in MIPS and APMs. Commenters also expressed a willingness and desire to work with CMS to increase the relevance of MIPS activities and measures for physicians and patients and to expand the number and scope of APMs. We have sought to adopt these sentiments throughout relevant sections of this final rule with comment period. Commenters continue to express concern with elements of the legacy programs incorporated into MIPS. We appreciate the many comments received regarding the proposed measures and activities and address those throughout this final rule with comment period. We intend to work with stakeholders to continually seek to connect the program to activities and measures that will result in improvement in care for Medicare beneficiaries. Commenters also continue to be concerned regarding the burden of current and future requirements. Although many commenters recognize the reduced burden from streamlined reporting in MIPS compared to prior programs, they believe CMS could undertake additional steps to improve reporting efficiency. We appreciate provider concerns with reporting burden and have tried to reduce burden where possible while meeting the intent of the MACRA, including our obligations to improve patient outcomes through this quality program.

In several cases, commenters made suggestions for changes that we considered and ultimately found to be inconsistent with the statute. In keeping with our objectives of maintaining transparency in the program, we outline in the appropriate sections of the rule suggestions from commenters that were considered but found to be inconsistent with the statute.

Commenters have many concerns about their ability to participate effectively in MIPS in 2017 and the program's impacts on small practices, rural practitioners, and various specialty practitioner types. We have attempted to address these concerns by including transitional policies and additional flexibility in relevant sections of the final rule with comment period to

encourage participation by all eligible clinicians and practitioner types, and avoid undue impact on any particular group.

Commenters present substantial enthusiasm for broadening opportunities to participate in APMs and the development of new Advanced APMs. Commenters suggest a number of resources should be made available to assist them in moving towards participation in APMs and have submitted numerous proposals for enhancing the APM portfolio and shortening the development process for new APMs. In particular, commenters urged us to modify existing Innovation Center models so they can be classified as Advanced APMs. We appreciate commenters' eagerness to participate in Advanced APMs and to be a part of transforming care. While not within the scope of this rule, we note that CMS has developed in conjunction with this rule a new strategic vision for the development of Advanced APMs over the coming years that will provide significantly enhanced opportunities for clinicians to participate in the program. We thank stakeholders again for their considered responses throughout our process, in various venues, including comments to the MIPS and APMs RFI and the proposed rule. We intend to continue open communication with stakeholders, including consultation with tribes and tribal officials, on an ongoing basis as we develop the Quality Payment Program in future years.

II. Provisions of the Proposed Regulations and Analysis of and Responses to Comments

A. Establishing MIPS and the Advanced APM Incentive

Section 1848(q) of the Act, as added by section 101(c) of the MACRA, requires establishment of MIPS. Section 101(e) of the MACRA promotes the development of, and participation in, Advanced APMs for eligible clinicians.

B. Program Principles and Goals

Through the implementation of the Quality Payment Program, we strive to continue to support health care quality, efficiency, and patient safety. MIPS promotes better care, healthier people, and smarter spending by evaluating MIPS eligible clinicians using a final score that incorporates MIPS eligible clinicians' performance on quality, cost, improvement activities, and advancing care information. Under the incentives for participation in Advanced APMs, our goals, described in greater detail in section II.F of this final rule with comment period, are to expand the

opportunities for participation in both APMs and Advanced APMs, improve care quality and reduce health care costs in current and future Advanced APMs, create clear and attainable standards for incentives, promote the continued flexibility in the design of APMs, and support multi-payer initiatives across the health care market. The Quality Payment Program is designed to encourage eligible clinicians to participate in Advanced APMs. The APM Incentive Payment will be available to eligible clinicians who qualify as QPs through Advanced APMs. MIPS eligible clinicians participating in APMs (who do not qualify as QPs) will receive favorable scoring under certain MIPS categories.

Our strategic objectives in developing the Quality Payment Program include: (1) Improve beneficiary outcomes through patient-centered MIPS and APM policy development and patient engagement and achieve smarter spending through strong incentives to provide the right care at the right time; (2) enhance clinician experience through flexible and transparent program design and interactions with exceptional program tools; (3) increase the availability and adoption of alternative payment models; (4) promote program understanding and participation through customized communication, education, outreach and support; (5) improve data and information sharing to provide accurate, timely, and actionable feedback to clinicians and other stakeholders; (6) deliver IT systems capabilities that meet the needs of users and are seamless, efficient and valuable on the front- and back-end; and (7) ensure operational excellence in program implementation and ongoing development.

C. Changes to Existing Programs

1. Sunsetting of Current Payment Adjustment Programs

Section 101(b) of the MACRA calls for the sunsetting of payment adjustments under three existing programs for Medicare enrolled physicians and other practitioners:

- The PQRS that incentivizes EPs to report on quality measures;
- The VM that provides for budget neutral, differential payment adjustment for EPs in physician groups and solo practices based on quality of care compared to cost; and
- The Medicare EHR Incentive Program for EPs that entails meeting certain requirements for the use of CEHRT.

Accordingly, we are finalizing revisions to certain regulations

associated with these programs. We are not deleting these regulations entirely, as the final payment adjustments under these programs will not occur until the end of 2018. For PQRS, we are revising § 414.90(e) introductory text and § 414.90(e)(1)(ii) to continue payment adjustments through 2018.

Similarly, for the Medicare EHR Incentive Program for EPs we are amending § 495.102(d) to remove references to the payment adjustment percentage for years after the 2018 payment adjustment year and add a terminal limit of the 2018 payment adjustment year.

We did not make changes to 42 CFR part 414, subpart N—Value-Based Payment Modifier Under the PFS (§§ 414.1200 through 414.1285). These regulations are already limited to certain years.

The following is a summary of the comments we received regarding sunsetting current payment adjustment programs:

Comment: Several commenters expressed appreciation for CMS's decision to streamline the prior reporting programs into MIPS.

Response: We appreciate the commenters support for our proposals.

Comment: Some commenters were confused by the term “sunsetting,” the timeline for when the prior programs “end,” and whether there would be an overlap in reporting.

Response: Because of the nature of regulatory text and statutory requirements, we cannot delete text from the public record in order to end or change regulatory programs. Instead, we must amend the text with a date that marks an end to the program, and we refer to this as “sunsetting.” We would also like to clarify that the PQRS, VM, and Medicare EHR Incentive Program for FFS EPs will “end” in 2018 because that is the final year in which payment adjustments for each of these programs will be applied. As the commenters noted, however, the reporting periods or performance periods associated with the 2018 payment year for each of these programs occur prior to 2018. As discussed in section II.E.4. of this final rule with comment period, beginning in 2017, MIPS eligible clinicians will report data for MIPS during at minimum any period of 90 continuous days within CY 2017, and MIPS payment adjustments will begin in 2019 based on the 2017 performance year. Eligible clinicians may also seek to qualify as QPs through participation in Advanced APMs. Eligible clinicians who are QPs for the year are not subject to the MIPS reporting requirements and payment adjustment.

We plan to provide additional educational materials so that clinicians can easily understand the timelines and requirements for the existing and the new programs.

Based on the comments received we are finalizing the revision to PQRS at § 414.90(e) introductory text and § 414.90(e)(1)(ii) and to the Medicare EHR Incentive Program at § 495.102(d) as proposed.

2. Supporting Health Care Providers With the Performance of Certified EHR Technology, and Supporting Health Information Exchange and the Prevention of Health Information Blocking

a. Supporting Health Care Providers With the Performance of Certified EHR Technology

We proposed to require EPs, eligible hospitals, and CAHs to attest (as part of their demonstration of meaningful use under the Medicare and Medicaid EHR Incentive Programs) that they have cooperated with the surveillance and direct review of certified EHR technology under the ONC Health IT Certification Program, as authorized by 45 CFR part 170, subpart E. Similarly, we proposed to require such an attestation from all eligible clinicians under the advancing care information performance category of MIPS, including eligible clinicians who report on the advancing care information performance category as part of an APM Entity group under the APM scoring standard.

As we note below, it is our intent to support MIPS eligible clinicians, eligible clinicians part of an APM Entity, EPs, eligible hospitals, and CAHs' (hereafter collectively referred to in this section as “health care providers”) participation in health IT surveillance and direct review activities. While cooperating with these activities may require prioritizing limited time and other resources, we note that ONC will work with health care providers to accommodate their schedules and consider other circumstances (80 FR 62715). Additionally, ONC has established certain safeguards that can minimize potential burden on health care providers in the event that they are asked to cooperate with the surveillance of their certified EHR technology. Examples of these safeguards, which we described in the proposed rule (81 FR 28171), include: (1) Requiring ONC-Authorized Certification Bodies (ONC-ACBs) to use consistent, objective, valid, and reliable methods when selecting locations at which to perform randomized surveillance of certified

health IT (80 FR 62715); (2) allowing ONC-ACBs to use appropriate sampling methodologies to minimize disruption to any individual provider or class of providers and to maximize the value and impact of ONC-ACB surveillance activities for all providers and stakeholders (80 FR 62715); and (3) allowing ONC-ACBs to excuse a health care provider from surveillance and select a different health care provider under certain circumstances (80 FR 62716).

As background to this proposal, we noted that on October 16, 2015, ONC published the 2015 Edition Health Information Technology (Health IT) Certification Criteria, 2015 Edition Base Electronic Health Record (EHR) Definition, and ONC Health IT Certification Program Modifications final rule (“2015 Edition final rule”). The 2015 Edition final rule made changes to the ONC Health IT Certification Program that enhance the testing, certification, and surveillance of health IT. Importantly, the rule strengthened requirements for the ongoing surveillance of certified EHR technology and other health IT certified on behalf of ONC. Under these requirements established by the 2015 Edition final rule, ONC-ACBs are required to conduct more frequent and more rigorous surveillance of certified technology and capabilities “in the field” (80 FR 62707).

The purpose of in-the-field surveillance is to provide greater assurance that health IT meets certification requirements not only in a controlled testing environment, but also when used by health care providers in actual production environments (80 FR 62707). In-the-field surveillance can take two forms: First, ONC-ACBs conduct “reactive surveillance” in response to complaints or other indications that certified health IT may not conform to the requirements of its certification (45 CFR 170.556(b)). Second, ONC-ACBs carry out ongoing “randomized surveillance” based on a randomized sample of all certified Complete EHRs and Health IT Modules to assess certified capabilities and other requirements prioritized by the National Coordinator (45 CFR 170.556(c)). Consistent with the purpose of ONC-ACB surveillance—which is to verify that certified health IT performs in accordance with the requirements of its certification when it is implemented and used in the field—an ONC-ACB's assessment of a certified capability must be based on the use of the capability in the live production environment in which the capability has been implemented and is in use (45 CFR

170.556(a)(1)) and must use production data unless test data is specifically approved by the National Coordinator (45 CFR 170.556(a)(2)). Throughout this section, we refer to surveillance by an ONC-ACB as “surveillance.”

On October 19, 2016, ONC will publish the ONC Enhanced Oversight and Accountability final rule, which enhances oversight under the ONC Health IT Certification Program by establishing processes to facilitate ONC's direct review and evaluation of the performance of certified health IT in certain circumstances, including in response to problems or issues that could pose serious risks to public health or safety (see the October 19, 2016 **Federal Register**). ONC's direct review of certified health IT may require ONC to review and evaluate the performance of health IT in the production environment in which it has been implemented. Throughout this section, we refer to actions carried out by ONC under the ONC Enhanced Oversight and Accountability final rule as “direct review.”

When carrying out ONC-ACB surveillance or ONC direct review, ONC-ACBs and/or ONC may request that health care providers supply information (for example, by way of telephone inquiries or written surveys) about the performance of the certified EHR technology capabilities the provider possesses and, when necessary, may request access to the provider's certified EHR technology (and data stored in such certified EHR technology) to confirm that capabilities certified by the developer are functioning appropriately. Health care providers may also be asked to demonstrate capabilities and other aspects of the technology that are the focus of such efforts.

In the Quality Payment Program proposed rule, we explained that these efforts to strengthen surveillance and direct review of certified health IT are critical to the success of HHS programs and initiatives that require the use of certified health IT to improve health care quality and the efficient delivery of care. We explained that effective ONC-ACB surveillance and ONC direct review is fundamental to providing basic confidence that the certified health IT used under the HHS programs consistently meets applicable standards, implementation specifications, and certification criteria adopted by the Secretary when it is used by health care providers, as well as by other persons with whom health care providers need to exchange electronic health information to comply with program requirements. In particular, the need to

ensure that certified health IT consistently meets applicable standards, implementation specifications, and certification criteria is important both at the time the technology is certified (by meeting the requirements for certification in a controlled testing environment) and on an ongoing basis to ensure that the technology continues to meet certification requirements when it is actually implemented and used by health care providers in real-world production environments. We explained that efforts to strengthen surveillance and direct review of certified EHR technology in the field will become even more important as the types and capabilities of certified EHR technology continue to evolve and with the onset of Stage 3 of the Medicare and Medicaid EHR Incentive Programs and MIPS, which include heightened requirements for sharing electronic health information with other providers and with patients. Finally, we noted that effective surveillance and direct review of certified EHR technology is necessary if health care providers are to be able to rely on certifications issued under the ONC Health IT Certification Program as the basis for selecting appropriate technologies and capabilities that support the use of certified EHR technology while avoiding potential implementation and performance issues (81 FR 28170–28171).

For all of these reasons, the effective surveillance and direct review of certified health IT, and certified EHR technology as it applies to providers covered by this provision, provide greater assurance to health care providers that their certified EHR technology will perform in a manner that meets their expectations and that will enable them to demonstrate that they are using certified EHR technology in a meaningful manner as required by sections 1848(o)(2)(A)(i) and 1886(n)(3)(A)(i) of the Act. We stressed in the proposed rule (81 FR 28170–28171), however, that such surveillance and direct review will not be effective unless health care providers are actively engaged and cooperate with these activities, including by granting access to and assisting ONC-ACBs and ONC to observe the performance of production systems (see also the 2015 Edition final rule at 80 FR 62716).

Accordingly, we proposed that as part of demonstrating the use of certified EHR technology in a meaningful manner, a health care provider must demonstrate its good faith cooperation with authorized surveillance and direct review. We proposed to revise the definition of a meaningful EHR user at § 495.4 as well as the attestation

requirements at § 495.40(a)(2)(i)(H) and § 495.40(b)(2)(i)(H) to require EPs, eligible hospitals, and CAHs to attest their cooperation with certain authorized health IT surveillance and direct review activities as part of demonstrating meaningful use under the Medicare and Medicaid EHR Incentive Programs. Similarly, we proposed to include an identical attestation requirement in the submission requirements for MIPS eligible clinicians under the advancing care information performance category proposed at § 414.1375.

We proposed that health care providers would be required to attest that they have cooperated in good faith with the authorized ONC-ACB surveillance and ONC direct review of their health IT certified under the ONC Health IT Certification Program, as authorized by 45 CFR part 170, subpart E, to the extent that such technology meets (or can be used to meet) the definition of CEHRT. Under the terms of the attestation, we stated that such cooperation would include responding in a timely manner and in good faith to requests for information (for example, telephone inquiries and written surveys) about the performance of the certified EHR technology capabilities in use by the provider in the field (81 FR 28170 through 28171). It would also include accommodating requests (from ONC-ACBs or from ONC) for access to the provider's certified EHR technology (and data stored in such certified EHR technology) as deployed by the health care provider in its production environment, for the purpose of carrying out authorized surveillance or direct review, and to demonstrate capabilities and other aspects of the technology that are the focus of such efforts, to the extent that doing so would not compromise patient care or be unduly burdensome for the health care provider.

We stated that the proposed attestation would support providers in meeting the requirements for the meaningful use of certified EHR technology while at the same time minimizing burdens for health care providers and patients (81 FR 28170 through 28171). We requested public comment on this proposal.

Through public forums, listening sessions, and correspondence received by CMS and ONC, and through the methods available for health care providers to submit² technical concerns related to the function of their certified EHR technology, we have received requests that ONC and CMS assist providers in mitigating issues with the performance of their technology,

including issues that relate to the safety and interoperability of health IT. Our proposal was designed to help health care providers with these very issues by strengthening participation in surveillance and direct review activities that help assure that their certified EHR technology performs as intended. However, the comments we have received, and which we discuss below, suggest that the support that the policy provides for health IT performance was not understood by some stakeholders. For this reason, we are adopting a modification to the title and language describing this policy in this final rule with comment period to reflect the intent articulated in the proposed rule and to be responsive to the concerns raised by commenters.

As we have explained, our proposal to require that health care providers cooperate with ONC-ACB surveillance of certified health IT and ONC direct review of certified health IT reflects the need to address technical issues with the functionality of certified EHR technology and to support health care providers with the performance of their certified EHR technology. By cooperating with these activities, health care providers would assist ONC-ACBs and ONC in working with health IT developers to identify and rectify problems and issues with their technology. In addition, a health care provider who assists an ONC-ACB or ONC with these activities is also indirectly supporting other health care providers, interoperability goals, and the health IT infrastructure by helping to ensure the integrity and efficacy of certified health IT products in health care settings. To more clearly and accurately communicate the context and role of health care providers in these activities, and consistent with our approach to clarifying terminology and references, we have adopted new terminology in this final rule with comment period that focuses on the requirements for the health care provider rather than ONC or ONC-ACB actions and processes. In this section, the activities to be engaged in by health care providers in cooperation with ONC direct review or ONC-ACB surveillance are intended to support health care providers with the performance of certified EHR technology. We therefore use the phrase “Supporting Providers with the Performance of Certified EHR technology activities” (hereinafter referred to as “SPPC activities”) to refer to a health care provider’s actions related to cooperating in good faith with ONC-ACB authorized surveillance and, separately or collectively as the context

requires, a health care provider’s actions in cooperating in good faith with ONC direct review.

Notwithstanding the terminology used in this final rule with comment period, and to avoid any confusion for health care providers engaging with ONC-ACBs or ONC in the future, we note that, when communicating with health care providers about the surveillance or direct review of certified health IT, ONC-ACBs and ONC will use the terminology in the 2015 Edition final rule, the ONC Enhanced Oversight and Accountability final rule, or other relevant ONC rulemakings and regulations, if applicable. In particular, a request for cooperation made by an ONC-ACB to a health care provider will not refer to “SPPC activities.” Rather, the request will typically refer to the ONC-ACB’s need to carry out “surveillance” of the certified health IT used by the health care provider. Similarly, if ONC requests the cooperation of a health care provider in connection with ONC’s direct review of certified health IT, as described in the ONC Enhanced Oversight and Accountability final rule scheduled for publication in the **Federal Register** on October 19, 2016, ONC will not use the terminology “SPPC activities.” Rather, ONC will request the cooperation of the health care provider with ONC’s “direct review” or “review” of the certified health IT. In addition, throughout this final rule with comment period, we use the term “health IT vendor” to refer to third party entities supporting providers with technology requirements for the Quality Payment Program. In this section, we instead use the term “health IT developer” to distinguish between these third parties and those developers of a health IT product under the ONC rules. In order to maintain consistency with the ONC rules, we use the term “health IT developer” for those that have presented a health IT product to ONC for certification.

We received public comment on the proposals and our response follows.

Comment: Several commenters expressed concern that the proposed attestation would be unduly burdensome for health care providers. A number of commenters stated that requiring health care providers to engage in SPPC activities related to their certified EHR technology would place a disproportionate burden on providers relative to other stakeholders who share the responsibility of advancing the use of health IT and the exchange of electronic health information. More specifically, several commenters stated that SPPC activities related to a provider’s certified EHR technology

could disrupt health care operations. According to one commenter, this disruption may be especially burdensome for small practices who may need to engage a third party to assist them in cooperating in good faith to a request to assist ONC or an ONC-ACB, such as evaluating the performance of certified EHR technology capabilities in the field. Another commenter requested clarification on how evaluations of certified EHR technology would be conducted in production environments without disturbing patient encounters and clinical workflows.

Commenters offered a number of suggestions to reduce the potential burden of this proposal on health care providers. First, some commenters strongly endorsed the safeguards established by ONC—including methods used to select locations, such as sampling and weighting considerations and the exclusion of certain locations in appropriate circumstances. In addition, one commenter recommended that, where ONC-ACB surveillance or ONC direct review involves evaluating certified EHR technology in the field, the ONC-ACB surveillance or ONC direct review should be scheduled 30 days in advance and at a time that is convenient to accommodate the health care providers’ schedules, such as after hours or on weekends. The commenter suggested that this would avoid disruption both to administrative operations and patient care.

Response: We understand that, if a request to assist ONC or an ONC-ACB is received, cooperating in good faith may require providers to prioritize limited time and other resources—especially for in-the-field evaluations of certified EHR technology. As we explained in the proposed rule, we believe that several safeguards established by ONC will minimize the burden of these activities (81 FR 28171). We note that under the 2015 Edition final rule, randomized surveillance is limited annually to 2 percent of unique certified health IT products (80 FR 62714). To illustrate the potential impact of these activities, for CY 2016 ONC estimates that up to approximately 24 products would be selected by each of its three ONC-ACBs, for a maximum of 72 total products selected across all ONC-ACBs (80 FR 62714). While ONC-ACB surveillance may be carried out at one or more locations for each product selected, we believe the likelihood that a health care provider will be asked to participate in the ONC-ACB surveillance of that product will in many cases be quite small due to the

number of other health care providers using the health IT product. Further, the 2015 Edition final rule states that ONC-ACBs may use appropriate sampling methodologies to minimize disruption to any individual or class of health care providers and to maximize the value and impact of randomized surveillance for all health care providers and stakeholders (80 FR 62715). In addition, we reiterate that if an ONC-ACB is unable to complete its randomized surveillance of certified EHR technology at a particular location—such as where, despite a good faith effort, the health care provider at a chosen location is unable to provide the requisite cooperation—the ONC-ACB may exclude the location and substitute a different location for observation (see ONC 2015 Edition final rule 80 FR 62716). ONC has also explained that in many cases in-the-field evaluations of certified EHR technology may be accomplished through an in-person site visit or may instead be accomplished remotely (80 FR 62708). Thus, in general, we expect that health care providers will be presented with a choice of evaluation approaches and be able to choose one that is convenient for their practice.

We also understand the concerns expressed by some commenters that engaging in SPPC activities should not unreasonably disrupt the workflow or operations of a health care provider. In consultation with ONC, we expect that in most cases ONC and ONC-ACBs will accommodate providers' schedules and other circumstances, and that in most cases providers will be given ample notice of and time to respond to requests from ONC and ONC-ACBs. We note that in some cases it may be necessary to secure a health care provider's cooperation relatively quickly, such as if a potential problem or issue with certified EHR technology poses potentially serious risks to public health or safety (see the ONC Enhanced Oversight and Accountability final rule scheduled for publication in the **Federal Register** on October 19, 2016).

Finally, through public comment on the proposed rule, we note that in addition to these specific concerns expressed and addressed regarding SPPC activities, stakeholders share a general concern over the risks and potential negative impact of transitioning to MIPS and upgrading certified health IT in a short time without adequate preparation and support. Stakeholders are particularly concerned about this impact on solo practitioners, small practices, and health care providers with limited resources that may be providing vital

access to health care in under-served communities. As noted previously, we believe the safeguards and policies established for ONC-ACBs' activities, discussed above, mitigate the risk of disruption to health care providers under normal circumstances. However, consistent with our overall approach for implementing new programs and requirements such as the Quality Payment Program and historically under the EHR Incentive Programs, we are modifying our final policy from the proposal to allow for additional flexibility for health care providers.

Our proposed policy would require health care providers to attest that they cooperated in good faith with ONC-ACB surveillance and ONC's direct review of certified health IT in order to demonstrate they have used certified EHR technology in a meaningful manner. In this final rule with comment period, we are finalizing a modified approach that splits the SPPC activities into two parts and draws a distinction between cooperation with ONC direct review and cooperation with ONC-ACB surveillance requests.

We are finalizing as proposed the requirement to cooperate in good faith with a request relating to ONC direct review of certified health IT. We do not believe it is appropriate to modify this requirement because ONC direct review is designed to mitigate potentially serious risk to public health and safety and to address practical challenges in reviewing certified health IT by an ONC-ACB. However, we are finalizing a modification to the requirement to cooperate with a request relating to ONC-ACB surveillance, which is different from ONC direct review (see discussion above). The modification to ONC-ACB surveillance will allow providers to choose whether to participate in SPPC activities supporting ONC-ACB surveillance of certified EHR technology.

As described in this section, ONC direct review focuses on situations involving (1) public health and safety and (2) practical challenges for ONC-ACBs, such as when a situation exceeds an ONC-ACB's resources or expertise. We maintain that cooperation in ONC direct review, when applicable, is important to demonstrating that a health care provider used certified EHR technology in a meaningful manner as required by sections 1848(o)(2)(A)(i) and 1886(n)(3)(A)(i) of the Act as stated in the proposed rule (81 FR 28170 through 28171).

We are therefore finalizing a two part attestation that splits the SPPC activities. As it relates to ONC direct review, the attestation is required. As it

relates to ONC-ACB surveillance, the attestation is optional. The attestations are as follows:

- Health care providers must attest that they engaged in good faith in SPPC activities related to ONC direct review by: (1) Attesting their acknowledgment of the requirement to cooperate in good faith with ONC direct review of their health information technology certified under the ONC Health IT Certification Program if a request to assist in ONC direct review is received; and (2) if a request is received, attesting that they cooperated in good faith in ONC direct review of health IT under the ONC Health IT Certification Program to the extent that such technology meets (or can be used to meet) the definition of certified EHR technology.
- Optionally, health care providers may attest that they engaged in good faith in SPPC activities related to ONC-ACB surveillance by: (1) Attesting their acknowledgement of the option to cooperate in good faith with ONC-ACB surveillance of their health information technology certified under the ONC Health IT Certification Program if a request to assist in ONC-ACB surveillance is received; and (2) if a request is received, attesting that they cooperated in good faith in ONC-ACB surveillance of health IT under the ONC Health IT Certification Program, to the extent that such technology meets (or can be used to meet) the definition of certified EHR technology.

As noted previously, only a small percentage of providers are likely to receive a request for assistance from ONC or an ONC-ACB in a given year. Therefore under this final policy, for both the mandatory attestation and for the optional attestation, a health care provider is considered to be engaging in SPPC activities related to supporting providers with the performance of certified EHR technology first by an attestation of acknowledgment of the policy and second by an attestation of cooperation in good faith if a request to assist was received from ONC or an ONC-ACB. However, we reiterate that the attestation requirement as it pertains to cooperation with ONC-ACB surveillance is optional for health care providers.

Operationally, we expect that the submission method selected by the health care provider will influence how these attestations are accomplished (see section II.E.5.a on MIPS submission mechanisms for details or the 2015 EHR Incentive Programs final rule (80 FR 62896–62901)). For example, a Medicaid EP attesting to their state for the EHR Incentive Programs may be provided a series of statements within the

attestations system. In this case the attestation would be offered in two parts. For the first part, in order to successfully demonstrate meaningful use, the EP must attest that they engaged in SPPC activities related to ONC direct review of certified EHR technology, first by their acknowledgement of the policy, and second by attesting that they cooperated in good faith with ONC direct review of the certified EHR technology if a request to assist was received. For the second part in this example, the Medicaid EP *may* choose to attest that they engaged in SPPC activities related to ONC-ACB surveillance of certified EHR technology, including attesting to having cooperated in good faith if a request to assist was received, or the EP may choose not to so attest.

A health care provider electronically submitting data for MIPS would be required to use the form and manner specified for the submission mechanism to indicate their attestation to the first part, and may indicate their attestation to the second part if they so choose. CMS and ONC will also offer continued support and guidance both through educational resources to support participating in and reporting to CMS programs, and through specific guidance for those health care providers who receive requests related to engaging in SPPC activities.

Comment: Several commenters opposed any in-the-field observation of a health care provider's certified EHR technology and insisted that such observations be conducted with the developer of the certified EHR technology instead. Some commenters questioned the need to perform observations of certified EHR technology in production environments, observing that health care providers and other users of certified EHR technology often depend on the developer of the certified EHR technology to deliver required functionality and capabilities. One commenter recommended that the observation of certified EHR technology be limited to the use of test systems and test data rather than observation of production systems and data.

Several commenters stated that health care providers should not be required to cooperate with on-premises observation of their certified EHR technology because an ONC-ACB should be able to access and evaluate the performance of certified health IT capabilities using remote access methods. By contrast, other commenters stated that remote observation could create security risks and that all observations should be conducted on the premises, preferably

under the direction of the health care provider's clinical staff.

Response: To provide adequate assurance that certified EHR technology meets applicable certification requirements and provides the capabilities health care providers need, it is critical to determine not only how certified EHR technology performs in a controlled testing environment but also how it performs in the field. Indeed, a fundamental purpose of ONC-ACB surveillance and ONC direct review is to allow ONC-ACBs and ONC to identify problems or deficiencies in certified EHR technology that may only become apparent once the technology has been implemented and is in use by health care providers in production environments (80 FR 62709). These activities necessarily require the cooperation of the clinicians and other persons who actually use the capabilities of certified EHR technology implemented in production environments, including health care providers. (See 81 FR 28170–71). This cooperation ultimately benefits health care providers and is critical to provider success in the Medicare and Medicaid EHR Incentive Programs and MIPS because it provides confidence that certified EHR technology capabilities will function as expected and that health care providers will be able to demonstrate compliance with CMS program requirements.

We decline to limit health care providers' engagement in SPPC activities to any particular form of observation, such as on-premises or remote observation of certified capabilities. We note that in the 2015 Edition final rule, ONC explained the observation of certified health IT capabilities in a production environment may require a variety of methodologies and approaches (80 FR 62709). In addition, as the comments suggest, individual health care providers are likely to have different preferences and should have the flexibility to work with an ONC-ACB or ONC to identify an approach to these activities that is most effective and convenient. In this connection, we have consulted with ONC and expect that, where feasible, a health care provider's preference for a particular form of observation will be accommodated.

For similar reasons, we decline to limit engagement in SPPC activities to the use of test systems or test data. The use of test systems and test data may be allowed in some circumstances, but may not be appropriate in all circumstances. For example, a problem with certified EHR technology capabilities may be difficult or impossible to replicate with

test systems or test data. More fundamentally, limiting cooperation to observations of test systems and test data may not provide the same degree of assurance that certified EHR technology used by health care providers (for example, production systems used with production data) continue to meet applicable certification requirements and function in a manner that supports health care providers participation in the EHR Incentive Programs and MIPS.

Comment: One commenter suggested that health care providers who engage in SPPC activities be able to file a formal complaint with ONC or CMS in the event that the ONC-ACB were to "handle matters inappropriately," and that the ONC-ACB should not be permitted to continue its activities until the complaint has been resolved.

Response: If a provider has any concerns about the propriety of an ONC-ACB's conduct, including in connection with a request to assist in ONC-ACB surveillance of certified health IT or during in-the-field surveillance of the certified EHR technology, the health care provider should make a formal complaint to ONC detailing the conduct in question. For further information, we direct readers to ONC's Web site: <https://www.healthit.gov/healthitcomplaints>.

Comment: A number of commenters were opposed to or raised concerns regarding this proposal on the grounds that requiring health care providers to engage in SPPC activities would violate the HIPAA Rules. Relatedly, a number of commenters stated that requiring providers to give ONC or ONC-ACBs access to their production systems may be inconsistent with a health care organization's privacy or security policies and could introduce security risks. A few commenters stated that observation of certified EHR technology in the field would violate patients' or providers' privacy rights or expectations. Some of these commenters expressed the view that any requirement to engage in SPPC activities would be an unjustified governmental invasion of privacy or other interests.

Response: As noted in the Quality Payment Program proposed rule and in the 2015 Edition final rule, in consultation with the Office for Civil Rights, ONC has clarified that as a result of ONC's health oversight authority a health care provider is permitted, without patient authorization, to disclose PHI to an ONC-ACB or directly to ONC for purposes of engaging in SPPC activities in cooperation with a request to assist from ONC or an ONC-ACB (81 FR 28171; 80 FR 62716). Health

care providers are permitted without patient authorization to make disclosures to a health oversight authority (as defined in 45 CFR 164.501) for oversight activities authorized by law (as described in 45 CFR 164.512(d)), including activities to determine compliance with program standards, and ONC may delegate its authority to ONC-ACBs to perform surveillance of certified health IT under the Program.³ This disclosure of PHI to an ONC-ACB does not require a business associate agreement with the ONC-ACB since the ONC-ACB is not performing a function on behalf of the covered entity. In the same way, a provider, health IT developer, or other person or entity is permitted to disclose PHI directly to ONC, without patient authorization and without a business associate agreement, for purposes of ONC's direct review of certified health IT or the performance of any other oversight responsibilities of ONC to determine compliance under the Program.

We disagree with commenters who maintained that the disclosure of PHI to ONC or an ONC-ACB could be inconsistent with reasonable privacy or other organizational policies or would otherwise be an unjustified invasion of privacy or any other interest. As noted, the disclosure of this information would be authorized by law on the basis that it is a disclosure to a health oversight agency (ONC) for the purpose of determining compliance with a federal program (the ONC Health IT Certification Program). In addition, we note that any further disclosure of PHI by an ONC-ACB or ONC would be limited to disclosures authorized by law, such as under the federal Privacy Act of 1974, or the Freedom of Information Act (FOIA), as applicable.

Comment: Several commenters requested clarification concerning the types of production data that ONC or an ONC-ACB would be permitted to access (and that a health care provider would make accessible to ONC, or the ONC-ACB) when assessing certified EHR technology in a production environment. Several commenters recommended that production data be limited to the certified capabilities and not extend to other aspects of the health IT.

Response: A request to assist in ONC-ACB surveillance or ONC direct review may include in-the-field surveillance or direct review of the certified EHR technology to determine whether the

capabilities of the health IT are functioning in accordance with the requirements of the ONC Health IT Certification Program. We note that it is common for certified EHR technology to be deployed and integrated with other technologies (including technologies that produce data used across multiple systems and components). Therefore, we believe it is feasible that determining whether certified EHR technology is operating as it should could mean, for example, ONC reviewing whether the certified EHR technology does not operate as it should when it interacts with other technologies. We also refer commenters to the 2015 Edition final rule and the ONC Enhanced Oversight and Accountability final rule for more information about the scope of ONC-ACB surveillance and ONC direct review, and for a discussion about the types of capabilities that may be subject to ONC-ACB surveillance and ONC direct review.

Comment: A commenter observed that while the proposed attestation would be retrospective, health care providers may be unaware of the requirement to engage in SPPC activities until they are presented with the attestation statement. The commenter suggested that health care providers be required to attest only that they will prospectively engage in SPPC activities.

Response: The attestation is retrospective because it is part of health care provider's demonstration that it has used certified EHR technology in a meaningful manner for a certain period. Based on our consultation with ONC, the health care providers will be made aware of both their obligation to cooperate if they are contacted to assist in ONC direct review of certified health IT and their option to cooperate if they are contacted to assist an ONC-ACB in surveillance of certified health IT. Thus, we believe that health care providers will be able to appropriately engage in SPPC activities for CMS programs and attest to their cooperation.

Comment: A commenter urged that health care providers be held harmless if engagement in SPPC activities results in a finding that their certified EHR technology no longer conforms to the requirements of the ONC Health IT Certification Program due to the actions of the certified EHR technology developer.

Response: ONC-ACB surveillance and ONC direct review provide an opportunity to assess the performance of certified EHR technology capabilities in a production environment to determine whether the technology continues to perform in accordance with the requirements of the ONC Health IT

Certification Program. This analysis will necessarily be focused on the performance of the technology, which may require the consideration of a provider's use of the technology. However, health care providers that cooperate with the analysis of the performance of certified EHR technology are not themselves subject to ONC or an ONC-ACB's authority under, as applicable, the surveillance requirements of the 2015 Edition final rule, or the direct review requirements of the ONC Enhanced Oversight and Accountability final rule. As such, no adverse finding or determination can be made by ONC or an ONC-ACB against a provider in connection with ONC direct review or ONC-ACB surveillance. If ONC or an ONC-ACB determined that the performance issue being analyzed arose solely from the provider's use of the technology and not from a problem with the technology itself, ONC or an ONC-ACB would not make a nonconformity finding against the health IT, but may decide to notify the provider of its determination for information purposes only. We do acknowledge, however, that if in the course of ONC-ACB surveillance or ONC direct review, ONC became aware of a violation of law or other requirements, ONC could share that information with relevant federal or state entities. If a certified health IT product is determined to no longer conform with the requirements of the ONC Health IT Certification Program and the health IT's certification were to be terminated by ONC or withdrawn by an ONC-ACB, there exists a process by which an affected health care provider may apply for exception from payment adjustments related to CMS programs on the basis of significant hardship or exclusion from the requirement. For example, we direct readers to CMS FAQ# 12657⁴ related to hardship exceptions for the EHR Incentive Programs related to the certification of a health IT product being terminated or withdrawn.

Comment: Multiple commenters suggested that, in lieu of the proposed attestation, we provide incentives to encourage voluntary participation in SPPC activities, such as counting voluntary participation towards an eligible clinician's performance score for the advancing care information category of MIPS.

Response: We have considered the commenters' suggestion but conclude

³ See, 45 CFR 164.512(d)(1)(iii); 80 FR 62716 and ONC Regulation FAQ #45 [12-13-045-1]. Available at <http://www.healthit.gov/policy-researchers-implementers/45-question-12-13-045>.

⁴ CMS FAQ#12657 "What if your product is decertified?": <https://questions.cms.gov/faq.php?isDept=0&search=decertified&searchType=keyword&submitSearch=1&id=5005>.

that it would be impracticable for two main reasons. First, a key component of the oversight of certified EHR technology is the randomized surveillance of certified EHR technology by ONC-ACBs. To ensure a representative sample, we believe it is important that all health care providers are required to use certified EHR technology as an EP, eligible hospital, or CAH under the Medicare and Medicaid EHR Incentive Programs and as a MIPS eligible clinician under the advancing care information performance category be part of the pool from which ONC-ACBs select locations for in-the-field surveillance, not only those who volunteer for participation. Second, as we explained in connection with commenters' concerns regarding the potential impact of SPPC activities on providers, we anticipate that the opportunity for health care providers to participate in randomized surveillance of their certified EHR technology will arise relatively infrequently due to the relatively small number of practices and other locations that would be selected for this type of ONC-ACB surveillance. This means that only a limited number of health care providers would have an opportunity to participate in this way for reasons outside the control of the health care provider. Consequently, health care providers would not have an equal opportunity to participate in these activities, which would make adopting an incentive within the scoring methodology for these activities potentially unfair to providers who are participating in CMS programs but are not selected by the randomized selection process. This would unfairly skew scores in a manner unrelated to a health care provider's performance in a given program. For these reasons we decline to adopt such an arrangement.

Comment: Multiple commenters stated that this proposal was premature because ONC has yet to finalize the ONC Health IT Certification Program: Enhanced Oversight and Accountability proposed rule. Commenters urged us to withdraw the proposal until such time as any changes to the ONC Health IT Certification Program have been finalized.

Response: We recognize that the pendency of the ONC Health IT Certification Program: Enhanced Oversight and Accountability proposed rule, which outlines the policies for ONC direct review of certified health IT, at the time of our proposal may have been challenging for some commenters. However, health care provider engagement in SPPC activities is important regardless of whether a request to assist relates to ONC direct

review of certified health IT or ONC-ACB surveillance of certified health IT. As we have explained, we expect health care providers will engage in SPPC activities because doing so is fundamental to ensuring that certified EHR technology performs in a manner that supports the goals of health care providers seeking to meet the requirements of the MIPS and Medicare and Medicaid EHR Incentive Programs. We further believe that the publication of the ONC Enhanced Oversight and Accountability final rule in concert with the flexibilities finalized in this final rule with comment period, as well as the timeline for implementation of these policies, which apply to reporting periods beginning in CY 2017, supports resolution of this concern.

Comment: A commenter stated that the proposed attestation would compel meaningful EHR users to cooperate with far-ranging or unbounded inquiries into their certified health IT. Other commenters expressed similar concerns and pointed to what they perceived as the broad range of issues that could be subject to ONC's direct review under the ONC Health IT Certification Program: Enhanced Oversight and Accountability proposed rule.

Response: We reiterate that, whatever form engagement in SPPC activities may take, any conclusions by ONC or ONC-ACBs will necessarily be focused on the performance of the technology. Moreover, as we have explained, health care providers will only be required to attest their engagement in SPPC activities in relation to requests received to assist in ONC direct review of certified capabilities of their health IT that meet (or can be used to meet) the definition of certified EHR technology. Further, because a health care provider's attestation will be retrospective as noted previously, the attestation relates only to acknowledgment if no request was received or the health care provider's cooperation with requests for assistance that have already been received at the time of making the attestation. The attestation requirement does not require that health care providers commit to engaging in unknown future activities.

Comment: A commenter requested more information about the circumstances that would trigger direct review of certified EHR technology. Separately, the commenter recommended that such review be conducted only as part of an audit of a health care provider's demonstration of meaningful use or an eligible clinician's reporting for the advancing care information performance category.

Response: ONC determines the requirements for and circumstances

under which health IT may be subject to ONC-ACB surveillance or ONC direct review under the ONC Health IT Certification Program. We refer the commenter to the 2015 Edition final rule (80 FR 62601) for a discussion of existing requirements related to the observation of certified health IT by ONC-ACBs and to the ONC Enhanced Oversight and Accountability final rule (scheduled for publication in the **Federal Register** on October 19, 2016) for a discussion of ONC's direct review activities. To be effective, ONC-ACB surveillance or ONC direct review of SPPC activities must be timely to identify an issue with the certified health IT. If these actions are limited to the timing of retrospective audits of a health care provider's compliance with program requirements, they may not reflect the current implementation of the technology in a production setting where the issue exists. For these reasons, it is not appropriate for a health care provider's cooperation to be limited to the context of a program audit on prior participation.

Comment: To assist health care providers in complying with the proposed attestation, a commenter recommended that any requests for engagement in SPPC activities be clearly labeled as such so as to differentiate them from other types of communications.

Response: We acknowledge this commenter's concern that, to support health care providers engaging in SPPC activities, a request to assist should be designed to clearly inform the recipient as to the purpose of the communication and avoid, as much as possible, the request being inadvertently overlooked or unnoticed. We have consulted with ONC and clarify that ONC-ACBs currently initiate contact with health care providers for randomized surveillance by emailing the person or office holder of a practice or organization that is the primary contact for the health IT developer whose product is being surveilled or reviewed. The contact information is supplied by the developer, and ONC-ACBs would not ordinarily contact a health care provider directly unless they are identified by the developer as being the most appropriate point of contact for a practice location. However, we note that in addition to clarity on the point of contact, clarity within the request itself is essential for the health care provider engaging in SPPC activities. This relates not only to clarity as to the purpose of the request, but also in relation to the mandatory and optional SPPC activities which are differentiated based on if the request is for ONC direct review of

certified health IT or ONC-ACB surveillance of certified health IT.

As program guidance is developed, CMS and ONC will work to ensure that requests from ONC and ONC-ACBs provide clear context and guidance for health care providers when requesting that health care providers engage in SPPC activities as part of their participation in CMS programs.

Comment: A commenter stated that some EHR contracts specifically prohibit customers or users of certified EHR technology from providing ONC or ONC-ACBs with access to the technology or data.

Response: Developers of certified health IT are required to cooperate with ONC program activities such as ONC direct review or ONC-ACB surveillance of certified health IT, which includes furnishing information to ONC or an ONC-ACB that is necessary to the performance of these activities (*see* 80 FR 62716-18) in order to obtain and maintain certification of health IT. Access to certified health IT that is under observation by ONC or an ONC-ACB, together with production data relevant to the certified capability or capabilities being assessed, is essential to this process. For example, in the 2015 Edition final rule, ONC stated that a health IT developer must furnish to the ONC-ACB upon request, accurate and complete customer lists, user lists, and other information that the ONC-ACB determines is necessary to enable it to carry out its surveillance responsibilities (80 FR 62716). If a health care provider reasonably believes that it is unable to engage in SPPC activities due to these or other actions of its health IT developer, the health care provider should notify ONC or the ONC-ACB, as applicable. If the developer has indeed limited, discouraged, or prevented the health care provider from cooperation in good faith with a request to assist ONC direct review, the health care provider would not be required to cooperate with such activities unless and until the developer removed the contractual restrictions or other impediments.

Comment: A commenter expressed concern about sharing data with ONC or an ONC-ACB without a clear description of the data to be accessed.

Response: The nature of the data that will need to be accessed by ONC or an ONC-ACB will be made clear to the health care provider at the time that their cooperation is sought. To alleviate any concerns commenters may have, we will work with ONC to provide guidance to ONC-ACBs and to providers, as necessary, to address issues such as the communication

protocols to be used when requesting a health care provider's engagement in SPPC activities.

Comment: Several commenters requested additional guidance on specific actions health care providers would be expected to take to engage in SPPC activities and cooperate in good faith with a request to assist if so requested. One commenter recommended that CMS and ONC create a check-list tool that clinicians could use to track their compliance with the required activities.

Response: As specified in the proposed rule, engaging in SPPC activities and cooperation in good faith may simply require the provision of information, such as in response to telephone inquiries and written surveys, about the performance of the certified EHR technology being used. Engagement in SPPC activities and cooperation in good faith might also involve facilitating requests (from ONC or ONC-ACBs) for access to the certified EHR technology (and related data) as deployed in the provider's production environment and to demonstrate capabilities and other aspects of the technology that are the focus of the ONC-ACB surveillance or ONC direct review.

Because assistance with ONC-ACB surveillance or ONC direct review will typically be carried out at a practice or facility level, we expect that it will be rare for a health care provider to be directly involved in the conduct of many of these activities, including in-the-field observations of certified EHR technology capabilities. To comply with the attestation requirements, a health care provider should establish to their own satisfaction that appropriate processes and policies are in place in their practice to ensure that all relevant personnel, such as a practice manager or IT officer, are aware of the health care provider's obligation to engage in SPPC activities related to requests to assist in ONC direct review of certified health IT and the health care provider's option to engage in SPPC activities related to requests to assist in ONC-ACB surveillance of certified health IT. This includes understanding the requirement to cooperate in good faith with a request to assist in ONC direct review if received. Health care providers should also ensure that appropriate processes and policies are in place for the practice to document all requests and communications concerning SPPC activities as they would for other requirements of CMS programs in which they participate. We note that for a health care provider participating in a CMS program as an individual, if that

health care provider practices at multiple locations or switches locations throughout the course of a year, they would only need to make inquiries about any requests to assist in ONC direct review of certified health IT during the period in which the eligible clinician or EP worked at the practice.

We acknowledge the commenter's desire for a checklist tool to provide greater certainty for clinicians. However, as ONC explained in the 2015 Edition final rule, an evaluation of certified health IT in a production environment may require a variety of methodologies and approaches (80 FR 62709) and individual health care providers are able to express different preferences and should have the flexibility to work with ONC or an ONC-ACB to identify an effective approach that is most convenient. Because the specific actions required will be addressed on a case-by-case basis, the development of a checklist tool may not be feasible. Rather, as noted previously, if any request is made, ONC or an ONC-ACB will work directly with the health care provider to provide clear guidance on the actions needed to assist in the request. The health care provider would then retain any such documentation concerning the request for their records as they would for other similar requirements in CMS programs.

Comment: A commenter asked how ONC-ACBs will identify themselves and how a health care provider will be able to verify that it is not dealing with an imposter.

Response: Each health IT developer contracts with one or more ONC-ACBs to provide certification services. As such, health IT developers should be familiar with the processes used by their ONC-ACB(s) and have existing practices for communicating with the personnel of their ONC-ACB(s). A health care provider can, on receipt of a request to assist an ONC-ACB, contact their health IT developer and request information about the identity of the ONC-ACB personnel that will carry out the activities. Health care providers should, before providing access to their facility or the certified health IT, request that the ONC-ACB personnel provide appropriate identification that matches the information about the ONC-ACB provided by the provider's certified health IT developer.

Comment: Several commenters requested that we elaborate on the requirements for engaging in SPPC activities "in good faith" and for permitting timely access to certified EHR technology.

Response: Health care providers are required to attest to engaging in SPPC

activities which requires that they cooperate in good faith and in a timely manner with a request to assist in ONC direct review of certified health IT if such a request is received. A health care provider may also optionally attest to engaging in SPPC activities, including having cooperated in good faith, in response to a request to assist an ONC-ACB with surveillance of certified health IT. This includes cooperating in a manner that aids and assists ONC or an ONC-ACB to perform ONC direct review or ONC-ACB surveillance activities to the extent that such cooperation is practicable and not unduly burdensome to the provider. As previously mentioned, the particular needs of any request for assistance from ONC or an ONC-ACB may vary depending on a wide range of factors. In addition, "in good faith" is necessarily dependent upon the particular facts and circumstances of the health care provider who attests. For example, a request for assistance may relate to a capability the health care provider does not have enabled in their EHR as it is not needed for their unique practice, which might be costly, time consuming, or otherwise unreasonable for the provider to enable solely for the purposes of ONC direct review of that function. In such a case, the health care provider who communicates these limitations to ONC, and maintains documentations of the request and these circumstances related to their practice, may be found to have cooperated in good faith based on this documentation. However, if the health care provider received such a request and provided no response to the request and did not retain documentation of these circumstances, they may be found not to have cooperated in good faith.

Comment: One commenter asked us to clarify that a health care provider will have satisfied the requirements of the proposed attestation in the event that the health care provider was never approached by ONC or an ONC-ACB with a request for assistance during the relevant reporting period.

Response: In the circumstances the commenter describes, the health care provider would be able to attest to both the mandatory attestation (related to ONC direct review) and the optional attestation (related to ONC-ACB surveillance) on the basis that they acknowledge the policy. In other words, for the mandatory attestation, the health care provider that receives no request related to ONC direct review could successfully meet the attestation requirement by attesting that they acknowledge the requirement to cooperate in good faith with all requests

for assistance with ONC direct review of their certified EHR technology. Likewise, a health care provider that did not receive a request for assistance with ONC-ACB surveillance during the reporting year but still seeks to attest to the optional attestation would attest that they are aware of the option to cooperate in good faith with all requests for assistance in ONC-ACB surveillance. We have revised the regulation text provisions at §§ 495.4, 495.40(a)(2)(i)(H), 495.40(b)(2)(i)(H), and 414.1375(b)(3)(i) to state that a health care provider engages in SPPC activities by cooperating in good faith with the ONC-ACB surveillance or ONC direct review of its certified EHR technology, to the extent that the health care provider receives a request from an ONC-ACB or ONC during the relevant reporting period; and that in the absence of any requests being made during the reporting period, the health care provider would demonstrate their engagement in the SPPC activities simply by attesting that they are aware of the SPPC policy.

Comment: Several commenters requested clarification regarding the documentation that would be required to demonstrate compliance with the terms of the attestation so that health care providers could plan and prepare for an audit of this requirement. Among other topics, commenters requested guidance on expected documentation requirements related to a health care provider's responsiveness to requests for engagement in SPPC activities and the extent of cooperation required.

Response: We acknowledge commenters' concerns about required documentation in cases of an audit. We clarify that we will provide guidance to auditors relating to this final rule with comment period and the attestation process in a similar manner as guidance is provided for other requirements under current CMS programs. This instruction includes requiring auditors to work closely with health care providers on identifying the appropriate supporting documentation applicable to the health care provider's individual case. We further stress that audit determinations are made on a case by case basis, which allows us to give individual consideration to each health care provider. We believe that such case-by-case review will allow us to adequately account for the varied circumstances that may be relevant.

Comment: Commenters requested clarification concerning the effective date of the attestation requirement and, more specifically, the period to which an attestation that a health care provider engaged in SPPC activities would apply.

Several commenters expressed concerns related to the timing of the attestation, noting that health care providers may submit attestations for reporting periods that have already begun or that will have begun prior to the effective date of this final rule with comment period.

Response: We understand the commenters' concerns and are finalizing the requirement to attest to engagement in SPPC activities for health care providers for MIPS performance periods or EHR reporting periods beginning on or after January 1, 2017. The requirement includes only requests to engage in SPPC activities received after the effective date of this final rule with comment period. In other words, if a health care provider receives a request from ONC or an ONC-ACB to engage in SPPC activities before the effective date of this final rule with comment period, the attestation requirement will not apply to that request, and the health care provider is not required to cooperate with the request.

After review and consideration of public comment, we are finalizing revisions to the definition of a meaningful EHR user at §§ 495.4 and 414.1305 to include "engaging in activities related to supporting providers with the performance of certified EHR technology."

We are finalizing modifications to the attestation requirements at § 495.40(a)(2)(i)(H) and (b)(2)(i)(H) to require an EP, eligible hospital or CAH to attest that they engaged in SPPC activities by attesting that they: (1) Acknowledge the requirement to cooperate in good faith with ONC direct review of their health information technology certified under the ONC Health IT Certification Program if a request to assist in ONC direct review is received; and (2) if requested, cooperated in good faith with ONC direct review of their health information technology certified under the ONC Health IT Certification Program, as authorized by 45 CFR part 170, subpart E, to the extent that such technology meets (or can be used to meet) the definition of CEHRT, including by permitting timely access to such technology and demonstrating its capabilities as implemented and used by the EP, eligible hospital, or CAH in the field.

Additionally, we are finalizing that, optionally, the EP, eligible hospital, or CAH may also attest that they engaged in SPPC activities by attesting that they: (1) Acknowledge the option to cooperate in good faith with ONC-ACB surveillance of their health information technology certified under the ONC Health IT Certification Program if a

request to assist in ONC-ACB surveillance is received; and (2) if requested, cooperated in good faith with ONC-ACB surveillance of their health information technology certified under the ONC Health IT Certification Program, as authorized by 45 CFR part 170, subpart E, to the extent that such technology meets (or can be used to meet) the definition of CEHRT, including by permitting timely access to such technology and demonstrating its capabilities as implemented and used by the EP, eligible hospital, or CAH in the field.

We are also finalizing at § 404.1375(3) that the same attestations be made by all eligible clinicians under the advancing care information performance category of MIPS, including eligible clinicians who report on the advancing care information performance category as part of an APM Entity group under the APM scoring standard, as discussed in section II.E.5.h. of this final rule with comment period (*see* 81 FR 28170–71).

b. Support for Health Information Exchange and the Prevention of Information Blocking

To prevent actions that block the exchange of information, section 106(b)(2)(A) of the MACRA amended section 1848(o)(2)(A)(ii) of the Act to require that, to be a meaningful EHR user, an EP must demonstrate that he or she has not knowingly and willfully taken action (such as to disable functionality) to limit or restrict the compatibility or interoperability of certified EHR technology. Section 106(b)(2)(B) of MACRA made corresponding amendments to section 1886(n)(3)(A)(ii) of the Act for eligible hospitals and, by extension, under section 1814(l)(3) of the Act for CAHs. Sections 106(b)(2)(A) and (B) of the MACRA provide that the manner of this demonstration is to be through a process specified by the Secretary, such as the use of an attestation. Section 106(b)(2)(C) of the MACRA states that the demonstration requirements in these amendments shall apply to meaningful EHR users as of the date that is 1 year after the date of enactment, which would be April 16, 2016.

As legislative background, on December 16, 2014, in an explanatory statement accompanying the Consolidated and Further Continuing Appropriations Act,⁵ the Congress advised ONC to take steps to “decertify products that proactively block the sharing of information because those practices frustrate congressional intent, devalue taxpayer investments in

certified EHR technology, and make certified EHR technology less valuable and more burdensome for eligible hospitals and eligible providers to use.”⁶ The Congress also requested a detailed report on health information blocking (referred to in this final rule with comment period as “the Information Blocking Report”). In the report, which was submitted to the Congress on April 10, 2015,⁷ ONC concluded from its experience and available evidence that some persons and entities—including some health care providers—are knowingly and unreasonably interfering with the exchange or use of electronic health information in ways that limit its availability and use to improve health and health care.⁸

We explained in the proposed rule that the demonstration required by section 106(b)(2) of the MACRA must provide substantial assurance not only that certified EHR technology was connected in accordance with applicable standards during the relevant EHR reporting period, but that the health care provider acted in good faith to implement and use the certified EHR technology in a manner that supported and did not interfere with the electronic exchange of health information among health care providers and with patients to improve quality and promote care coordination (81 FR 28172). We proposed that such a demonstration be made through an attestation (referred to in this section of the preamble as the “information blocking attestation”), which would comprise three statements related to health information exchange and information blocking, which were described in the proposed rule (81 FR 28172). Accordingly, we proposed to revise the definition of a meaningful EHR user at § 495.4 and to revise the corresponding attestation requirements at § 495.40(a)(2)(i)(I) and (b)(2)(i)(I) to require this attestation for all EPs, eligible hospitals, and CAHs under the Medicare and Medicaid EHR Incentive Programs, beginning with attestations submitted on or after April 16, 2016. Further, we proposed this attestation requirement (at § 414.1375(b)(3)(ii)) for all eligible clinicians under the advancing care information performance category of MIPS, including eligible

clinicians who report on the advancing care information performance category as part of an APM Entity group under the APM scoring standard, as discussed in section II.E.5.h of the proposed rule (81 FR 28181).

We invited public comment on this proposal, including whether the proposed attestation statements could provide the Secretary with adequate assurances that an eligible clinician, EP, eligible hospital, or CAH has complied with the statutory requirements for information exchange. We also encouraged public comment on whether there are additional facts or circumstances to which eligible clinicians, EPs, eligible hospitals, and CAHs should be required to attest, or whether there is additional information that they should be required to report.

Comment: A number of commenters expressed strong support for this proposal and urged us to finalize the information blocking attestation as proposed. Commenters anticipated that such an attestation would discourage information blocking; encourage more robust sharing of information among all members of a patient’s care team; increase demand for more open and interoperable health IT platforms and systems; and strengthen efforts to enhance health care quality and value, including the capturing and sharing of information about quality, costs, and outcomes. One commenter stated that the information blocking attestation would also help independent physicians compete by deterring predatory information sharing policies or practices, especially by large health systems or hospitals.

Many commenters expressed partial support for this proposal but voiced concerns about the particular content or form of the information blocking attestation as proposed. Several commenters stated that the language of the attestation was unclear and should provide more detail regarding the specific actions health care providers would be required to attest. Conversely, several commenters (including some of the same commenters) believe that the language of the attestation was too prescriptive. Some commenters recommended revising or removing one or more of the three statements that comprise the attestation. A few commenters suggested that we finalize only the first statement—which mirrors the statutory language in section 106(b)(2) of the MACRA—and contended that the other statements were unnecessary or, alternatively, go beyond what section 106(b)(2) requires.

Some commenters were opposed in principle to requiring health care

⁶ 160 Cong. Rec. H9047, H9839 (daily ed. Dec. 11, 2014) (explanatory statement submitted by Rep. Rogers, chairman of the House Committee on Appropriations, regarding the Consolidated and Further Continuing Appropriations Act, 2015).

⁷ ONC, *Report to Congress on Health Information Blocking* (April 10, 2015), available at https://www.healthit.gov/sites/default/files/reports/info_blocking_040915.pdf.

⁸ *Id.* at 33.

⁵ Public Law 113–235.

providers to attest to any statement regarding information blocking. Most of these commenters insisted that such a requirement would impose unnecessary burdens or unfair obligations on health care providers, who, in the view of the commenters, are seldom responsible for information blocking.

The majority of commenters, whether they supported or opposed the proposal, stressed that certain factors that prevent interoperability and the ability to successfully exchange and use electronic health information are beyond the ability of a health care provider to control. Many of these commenters stated that EHR vendors should be required to submit an information blocking attestation because they have greater control over these factors and, in the experience of some commenters, are more likely to engage in information blocking.

Response: After consideration of the comments as well as the statutory provisions cited above, and in consultation with ONC, we believe the proposed attestation requirement is an appropriate and effective means to implement the demonstration required by section 106(b)(2) of the MACRA; we are therefore finalizing this requirement as proposed, as discussed in greater detail below and in our responses to specific comments that follow.

As many commenters recognized, the information blocking concerns expressed by Congress are serious and reflect a systemic problem: A growing body of evidence establishes that persons and entities—including some health care providers—have strong incentives to unreasonably interfere with the exchange and use of electronic health information, undermining federal programs and investments in the meaningful use of certified EHR technology to improve health and the delivery of care.⁹ While effectively

⁹ See, for example, Julia Adler-Milstein and Eric Pfeifer, *Information Blocking: Is it occurring and what policy strategies can address it?*, Milbank Quarterly (forthcoming Mar 2017) (reporting results of national survey of health information leaders in which 25 percent of respondents experienced routine information blocking by hospitals and health systems and over 50 percent of respondents experienced routine information blocking by EHR vendors); American Society of Clinical Oncology, *Barriers to interoperability and information blocking* (2015), http://www.asco.org/sites/www.asco.org/files/position_paper_for_clq_briefing_09142015.pdf (describing a growing number of reports from members concerning information blocking and stating that preventing these practices “is critically important to ensuring that every patient with cancer receives the highest quality health care services and support”); David C. Kendrick, Statement to the Senate, Committee on Health, Education, Labor, and Pensions, *Achieving the promise of health information technology: information blocking and potential solutions*,

addressing this problem will require additional and more comprehensive measures,¹⁰ section 106(b)(2) of the MACRA represents an important first step towards increasing accountability for certain types of information blocking in the specific context of meaningful EHR users.

The proposed information blocking attestation consists of three statements that contain several specific representations about a health care provider’s implementation and use of certified EHR technology. These representations, taken together, will enable the Secretary to infer with reasonable confidence that the attesting health care provider acted in good faith

Hearing (Jul 23, 2015), available at <http://www.help.senate.gov/hearings/achieving-the-promise-of-health-information-technology-information-blocking-and-potential-solutions> (describing information blocking as “intentional interruption or prevention of interoperability” by providers or EHR vendors and stating “we have so many specific experiences with inappropriate data blocking . . . that we have created a nomenclature [to classify the most common types].”); David C. Kibbe, Statement to Senate, Committee on Health, Education, Labor, and Pensions, *Achieving the promise of health information technology: information blocking and potential solutions*, Hearing (Jul 23, 2015), available at <http://www.help.senate.gov/hearings/achieving-the-promise-of-health-information-technology-information-blocking-and-potential-solutions> (testifying that despite progress in interoperable health information exchange, “information blocking by health care provider organizations and their EHRs, whether intentional or not, is still a problem”); H.R. 6, 114th Cong. § 3001 (as passed by House of Representatives, July 10, 2015) (prohibiting information blocking and providing enforcement mechanisms, including civil monetary penalties and decertification of products); see also H.R. Rep. No. 114–190, pt. 1, at 126 (2015) (reporting that provisions of H.R. 6 “would refocus national efforts on making systems interoperable and holding individuals responsible for blocking or otherwise inhibiting the flow of patient information throughout our healthcare system.”); Connecticut Public Act No. 15–146 (enacted June 30, 2015) (making information blocking an unfair trade practice, authorizing state attorney general to bring civil enforcement actions for penalties and punitive damages); ONC, *Report to Congress on Health Information Blocking* (April 10, 2015), available at https://www.healthit.gov/sites/default/files/reports/info_blocking_040915.pdf (“[B]ased on the evidence and knowledge available, it is apparent that some health care providers and health IT developers are knowingly interfering with the exchange or use of electronic health information in ways that limit its availability and use to improve health and health care. This conduct may be economically rational for some actors in light of current market realities, but it presents a serious obstacle to achieving the goals of the HITECH Act and of health care reform.”)

¹⁰ See ONC, *FY 2017: Justification of Estimates for Appropriations Committee*, https://www.healthit.gov/sites/default/files/final_onc_cj_fy_2017_clean.pdf (2016), Appendix I (explaining that current law does not directly prohibit or provide an effective means to investigate and address information blocking by EHR vendors, health care providers, and other persons and entities, and proposing that Congress prohibit and prescribe appropriate penalties for these practices, including civil monetary penalties and program exclusion).

to support the appropriate exchange of electronic health information and therefore did not knowingly and willfully limit or restrict the compatibility or interoperability of certified EHR technology.

We believe that this level of specificity is necessary and that a more generalized attestation would not provide the necessary assurances described above. This does not mean, however, that the information blocking attestation imposes unnecessary or unreasonable requirements on health care providers. To the contrary, we have carefully tailored the attestation to the demonstration required by section 106(b)(2) of the MACRA. In particular, the attestation focuses on whether a health care provider acted in good faith to implement and use certified EHR technology in a manner that supports interoperability and the appropriate exchange of electronic health information. Recognizing that a variety of factors may prevent the exchange or use of electronic health information, and consistent with the focus of section 106(b)(2) on actions that are knowing and willful, this good faith standard takes into account health care providers’ individual circumstances and does not hold them accountable for consequences they cannot reasonably influence or control.

For these and the additional reasons set forth in our responses to comments immediately below, and subject to the clarifications therein, we are finalizing this attestation requirement as proposed.

Comment: A number of commenters, several of whom expressed support for our proposal, regarded the language of the attestation as quite broad and stated that additional guidance may be needed to enable health care providers to understand the actions they would be required to attest.

Response: We agree that health care providers must be able to understand and comply with program requirements. For this reason, the information blocking attestation consists of three statements related to health information exchange and the prevention of health information blocking. These statements—which we are finalizing at § 495.40(a)(2)(i)(I) for EPs, § 495.40(b)(2)(i)(I) for eligible hospitals and CAHs, and § 414.1375(b)(3)(i) for eligible clinicians—contain specific representations about a health care provider’s implementation and use of certified EHR technology. We believe that these statements, taken together, communicate with appropriate specificity the actions health care providers must attest to in order to

demonstrate that they have complied with the requirements established by section 106(b)(2) of the MACRA. To provide further clarity, we set forth and explain each of these statements in turn below.

- *Statement 1:* A health care provider must attest that it did not knowingly and willfully take action (such as to disable functionality) to limit or restrict the compatibility or interoperability of certified EHR technology.

This statement mirrors the language of section 106(b)(2) of the MACRA. We note that except for one illustrative example (concerning actions to disable functionality), the above statement does not contain specific guidance as to the types of actions that are likely to “limit or restrict” the compatibility or interoperability of certified EHR technology, nor the circumstances in which a health care provider who engages in such actions does so “knowingly and willfully.” The information blocking attestation supplements the foregoing statement with two more detailed statements concerning the specific actions a health care provider took to support interoperability and the exchange of electronic health information.

- *Statement 2:* A health care provider must attest that it implemented technologies, standards, policies, practices, and agreements reasonably calculated to ensure, to the greatest extent practicable and permitted by law, that the certified EHR technology was, at all relevant times: (1) Connected in accordance with applicable law; (2) compliant with all standards applicable to the exchange of information, including the standards, implementation specifications, and certification criteria adopted at 45 CFR part 170; (3) implemented in a manner that allowed for timely access by patients to their electronic health information (including the ability to view, download, and transmit this information); and (4) implemented in a manner that allowed for the timely, secure, and trusted bi-directional exchange of structured electronic health information with other health care providers (as defined by 42 U.S.C. 300jj(3)), including unaffiliated health care providers, and with disparate certified EHR technology and vendors.

This statement focuses on the manner in which a health care provider implemented its certified EHR technology during the relevant reporting period, which is directly relevant to whether the health care provider took any actions to limit or restrict the compatibility or interoperability of the certified EHR technology. By attesting to

this statement, a health care provider represents that it acted in good faith to implement its certified EHR technology in a manner that supported—and did not limit or restrict—access to and the exchange of electronic health information, to the extent that such access or exchange was appropriate (that is, practicable under the circumstances and authorized, permitted, or required by law). More specifically, the health care provider represents that it took reasonable steps (including working with its health IT developer and others as necessary) to verify that its certified EHR technology was connected (that is, implemented and configured) in accordance with applicable standards and law.

In addition to verifying that certified EHR technology was connected and accessible during the relevant reporting period, a health care provider must represent that it took reasonable steps to implement corresponding technologies, standards, policies, practices, and agreements to enable the use of certified EHR technology, including by patients and by other health care providers, and not to limit or restrict appropriate access to or use of information in the health care provider’s certified EHR technology. For example, actions to limit or restrict compatibility or interoperability could include implementing or configuring certified EHR technology so as to limit access to certain types of data elements or to the “structure” of the data, or implementing certified EHR technology in ways that limit the types of persons or entities that may be able to access and exchange information, or the types of technologies through which they may do so.

- *Statement 3:* A health care provider must attest that it responded in good faith and in a timely manner to requests to retrieve or exchange electronic health information, including from patients, health care providers (as defined by 42 U.S.C. 300jj(3)), and other persons, regardless of the requestor’s affiliation or technology vendor.

This third and final statement builds on a health care provider’s representations concerning the manner in which its certified EHR technology was implemented by focusing on how the health care provider actually *used* the technology during the relevant reporting period. By attesting to this statement, a health care provider represents that it acted in good faith to use the certified EHR technology to support the appropriate exchange and use of electronic health information. This includes, for example, taking reasonable steps to respond to requests to access or exchange information,

provided that such access or exchange is appropriate, and not unreasonably discriminating on the basis of the requestor’s affiliation, technology vendor, or other characteristics, as described in the statement.

We provide further discussion and analysis of the foregoing statements and their application in our responses to the specific comments summarized in the remainder of this section. We believe that these statements, taken together, provide a clear and appropriately detailed description of a health care provider’s obligations under section 106(b)(2) of the MACRA, will enable them to demonstrate compliance to the satisfaction of the Secretary, and will promote fair and consistent application of program requirements across all attesting health care providers.

Comment: Several commenters asked us to identify the specific actions and circumstances that would support a finding that a health care provider has knowingly and willfully limited or restricted the compatibility or interoperability of certified EHR technology. Some commenters inquired whether this determination would turn on a health care provider’s individual circumstances or other case-by-case considerations, such as a health care provider’s practice size, setting, specialty, and level of technology adoption. Commenters also asked whether other circumstances could justify limitations or restrictions on the compatibility or interoperability of certified EHR technology. For example, a commenter asked whether an office-based clinic that periodically turns its computer network off overnight to perform system maintenance would be deemed to have limited the interoperability of its certified EHR technology on the basis that other health care providers might be unable to request and retrieve records during that time. Commenters gave other potential justifications for blocking access to or the exchange of information, such as privacy or security concerns or the need to temporarily block the disclosure of sensitive test results to allow clinicians who order tests an opportunity to discuss the results with their patients prior to sharing the results with other health care providers.

One commenter suggested that we approach this question in the manner described in the Information Blocking Report, which focuses on whether actions that interfere with the exchange or use of electronic health information have any objectively reasonable justification.

Response: The compatibility or interoperability of certified EHR

technology may be limited or restricted in ways that are too numerous and varied to catalog. While section 106(b)(2) of the MACRA specifically mentions actions to disable the functionality of certified EHR technology, other actions that are likely to interfere with the exchange or use of electronic health information could limit or restrict compatibility or interoperability. For example, the Information Blocking Report describes certain categories of business, technical, and organizational practices that are inherently likely to interfere with the exchange or use of electronic health information.¹¹ These practices include but are not limited to:

- Contract terms, policies, or other business or organizational practices that restrict individuals' access to their electronic health information or restrict the exchange or use of that information for treatment and other permitted purposes.

- Charging prices or fees that make exchanging and using electronic health information cost prohibitive.

- Implementing certified EHR technology in non-standard ways that are likely to substantially increase the costs, complexity, or burden of sharing electronic health information (especially when relevant interoperability standards have been adopted by the Secretary).

- Implementing certified EHR technology in ways that are likely to "lock in" users or electronic health information (including using certified EHR technology to inappropriately limit or steer referrals).

Such actions would be contrary to section 106(b)(2) only when engaged in "knowingly and willfully." We believe the purpose of this requirement is to ensure that health care providers are not penalized for actions that are inadvertent or beyond their control.

To illustrate these concepts, we consider several hypothetical scenarios raised by the commenters. First, we consider the situation suggested by one commenter in which a health care provider disables its computer network overnight to perform system maintenance. In this situation, the health care provider knows that the natural and probable consequence of its actions will be to prevent access to information in the certified EHR technology and in this way limit and restrict the interoperability of the technology. However, we recognize that

health IT requires maintenance to ensure that capabilities function properly, including in accordance with applicable standards and law. We also appreciate that in many cases it may not be practicable to implement redundant capabilities and systems for all functionality within certified EHR technology, especially for physician practices and other health care providers with comparatively less health IT resources and expertise. Assuming that a health care provider acts in good faith to disable functionality for the purpose of performing system maintenance, it is unlikely that the health care provider would knowingly and willfully limit or restrict the compatibility or interoperability of the certified EHR technology. We note that our assumption that the health care provider acted in good faith presupposes that it did not disable functionality except to the extent and for the duration necessary to ensure the proper maintenance of its certified EHR technology, and that it took reasonable steps to minimize the impact of such maintenance on the ability of patients and other health care providers to appropriately access and exchange information, such as by scheduling maintenance overnight and responding to any requests for access or exchange once the maintenance has been completed and it is otherwise practicable to do so.

Next, we consider the situation in which a health care provider blocks access to information in its certified EHR technology due to concerns related to the security of the information. Depending on the circumstances, certain access restrictions may be reasonable and necessary to protect the security of information maintained in certified EHR technology. In contrast, restrictions that are unnecessary or unreasonably broad could constitute a knowing and willful restriction of the compatibility or interoperability of the certified EHR technology. Because of the complexity of these issues, determining whether a health care provider's actions were reasonable would require additional information about the health care provider's actions and the circumstances in which they took place.

As a final example, we consider whether it would be permissible for a health care provider to restrict access to a patient's sensitive test results until the clinician who ordered the tests, or another designated health care professional, has had an opportunity to review and appropriately communicate the results to the patient. We assume for purposes of this example that,

consistent with the HIPAA Privacy Rule, the restriction does not apply to the patient herself or to the patient's request in writing to send this information to any other person the patient designates. With that assumption and under the circumstances we have described, it is likely that the health care provider is knowingly restricting interoperability. We believe that the restriction may be reasonable so long as the health care provider reasonably believes, based on its relationship with the particular patient and its best clinical judgment, that the restriction is necessary to protect the health or wellbeing of the patient. We note that our analysis would be different if the restriction were not based on a health care provider's individualized assessment of the patient's best interests and instead reflected a blanket policy to block access to test results until released by the ordering physician. Similarly, while clinical judgment and the health care provider-patient relationship are entitled to substantial deference, they may not be used as a pretext for limiting or restricting the compatibility or interoperability of certified EHR technology.

The examples provided in this section of the final rule with comment period are intended to be illustrative. We reiterate the need to consider the unique facts and circumstances in each case in order to determine whether a health care provider knowingly and willfully limited or restricted the compatibility or interoperability of certified EHR technology.

Comment: One commenter asked whether the requirement that certified EHR technology complies with federal standards precludes the use of other standards for the exchange of electronic health information.

Response: In general, while certified EHR technology must be connected in accordance with applicable federal standards, this requirement does not preclude the use of other standards or capabilities, provided the use of such standards or capabilities does not limit or restrict the compatibility or interoperability of the certified EHR technology.

Comment: Several commenters requested that we clarify our expectations for timeliness of access to or exchange of information.

Response: As we have explained, whether a health care provider has knowingly and willfully limited or restricted the interoperability of certified EHR technology will depend on the relevant facts and circumstances. While for this reason we decline to

¹¹ ONC, *Report to Congress on Health Information Blocking* (April 10, 2015) at 13, available at https://www.healthit.gov/sites/default/files/reports/info_blocking_040915.pdf.

adopt any bright-line rules, we reiterate that a health care provider must attest that it responded in good faith and in a timely manner to requests to retrieve or exchange electronic health information. What will be “timely” will of course vary based on relevant factors such as a health care provider’s level of technology adoption and the types of information requested. For requests from patients, we note that while the HIPAA Privacy Rule provides that a covered entity may take up to 30 days to respond to a patient’s written request for access to his or her PHI maintained by the covered entity, it is expected that the use of technology will enable the covered entity to fulfill the individual’s request in far fewer than 30 days.¹² Where information requested or directed by a patient can be readily provided using the capabilities of certified EHR technology, access should in most cases be immediate and in all cases as expeditious as is practicable under the circumstances.

Comment: Many commenters stated that health care professionals and organizations should not be held responsible for adherence to health IT certification standards or other technical details of health IT implementation that are beyond their expertise or control. According to these commenters, requiring health care providers to attest to these technical implementation details would unfairly place them at financial risk for factors that are beyond the scope of their medical training. Additionally, many commenters took the position that EHR vendors are in the best position to ensure that certified EHR technology is connected in accordance with applicable law and compliant with applicable standards, implementation specifications, and certification criteria.

Response: We reiterate that a health care provider will not be held accountable for factors that it cannot reasonably influence or control, including the actions of EHR vendors. Nor do we expect health care providers themselves to have any special technical expertise or to personally tend to the technical details of their health IT implementations. We do expect, however, that a health care provider will take reasonable steps to verify that the certified EHR technology is connected (that is, implemented and configured) in accordance with applicable standards and law and in a manner that will allow the health care

provider to attest to having satisfied the conditions described in the information blocking attestation. In this respect, a health care provider’s obligations include communicating these requirements to health IT developers, implementers, and other persons who are responsible for implementing and configuring the health care provider’s certified EHR technology. In addition, the health care provider should obtain adequate assurances from these persons to satisfy itself that its certified EHR technology was connected in accordance with applicable standards and law and in a manner that will enable the health care provider to demonstrate that it has not knowingly and willfully take action to limit or restrict the compatibility or interoperability of certified EHR technology.

Comment: Several commenters supported the attestation’s emphasis on the bi-directional exchange of structured electronic health information. Multiple commenters suggested that this requirement would expand access to relevant information by members of a patient’s care team, allowing them to deliver more effective and comprehensive care, enhance health outcomes, and contribute directly to the goals of quality and affordability. As an example, commenters stated that the bi-directional exchange of information among pharmacists and other clinicians can provide important information for comprehensive medication management.

Other commenters opposed or raised concerns regarding this aspect of our proposal, stating that bi-directional information exchange may not be feasible for many health care providers or may raise a variety of technical and operational challenges and potential privacy or security concerns.

Some commenters requested that CMS clarify the term “bi-directional exchange” and the actions a health care provider would be expected to take to satisfy this aspect of the attestation. One commenter inquired specifically whether bi-directional exchange could include using a health information exchange or other intermediary to connect disparate certified EHR technology so that users could both send and receive information in an interoperable manner. If so, the commenter asked whether a health care provider would be expected to participate in multiple arrangements of this kind (and, if so, how many).

Multiple commenters stated that it is not appropriate to allow bi-directional exchange in all circumstances and that privacy, security, safety, and other

considerations require health care providers to restrict the types of information that the certified EHR technology will accept and the persons or other sources of that information.

Response: We appreciate that bi-directional exchange of information presents challenges, including the need to validate the authenticity, accuracy, and integrity of data received from outside sources, mitigating potential privacy and security risks, and overcoming technical, workflow, and other related challenges. We also acknowledge that accomplishing bi-directional exchange may be challenging for certain health care providers or for certain types of information or use cases. However, a significant number of health care providers are already exchanging some types of electronic health information in a bi-directional manner. Based upon data collected in 2014, approximately one-fifth of non-federal acute care hospitals electronically sent, received, found (queried), and were able to easily integrate summary of care records into their EHRs.¹³ We also note that meaningful EHR users are required to use certified EHR technology that has the capacity to “exchange electronic health information with, and to integrate such information from other sources,” as required by the 2014 and 2015 Edition Base EHR definitions at 45 CFR 170.102 and corresponding certification criteria, such as the transitions of care criteria (45 CFR 170.314(b)(1) and (2) (2014 Edition) and 45 CFR 170.315(b)(2) (2015 Edition)).

We expect these trends to increase as standards and technologies improve and as health care providers, especially those participating in Advanced APMs, seek to obtain more complete and accurate information about their patients with which to coordinate care, manage population health, and engage in other efforts to improve quality and value.

We clarify that bi-directional exchange may include using certified EHR technology with a health information exchange or other intermediary to connect disparate certified EHR technology so that users could both send and receive information in an interoperable manner. Whether a health care provider could participate in

¹² HHS Office for Civil Rights, *Individuals’ Right under HIPAA to Access their Health Information* 45 CFR 164.524, <http://www.hhs.gov/hipaa/for-professionals/privacy/guidance/access/index.html> (last accessed Sept. 6, 2016).

¹³ Charles D. Swain M Patel V. (August 2015) Interoperability among U.S. Non-federal Acute Care Hospitals. ONC Data Brief, No. 25 ONC: Washington DC. https://www.healthit.gov/sites/default/files/briefs/onc_databrief25_interoperability16final_081115.pdf Similar data for office-based physicians will be available in 2016. ONC, *Request for Information Regarding Assessing Interoperability for MACRA*, 81 FR 20651 (April 8, 2016).

arrangements of this kind, or multiple arrangements, would depend on its particular circumstances, including its technological capabilities and sophistication, its financial resources, its role within the local health care community, and the availability of state or regional health information exchange infrastructure, among other relevant factors. A health care provider is not obligated to participate in every information sharing arrangement or to accommodate every request to connect via a custom interface. On the other hand, a health care provider with substantial resources that refuses to participate in any health information exchange efforts might invite scrutiny if, combined with other relevant facts and circumstances, there were reason to suspect that the health care provider's refusal to participate in certain health information exchange efforts were part of a larger pattern of behavior or a course of conduct to knowingly and willfully limit the compatibility or interoperability of the certified EHR technology.

Comment: Several commenters were concerned about the requirement to respond to requests to retrieve or exchange electronic health information. Commenters stated that health care providers may have difficulty responding to requests from unaffiliated health care providers or from EHR vendors with whom they do not have a business associate agreement.

A few commenters were concerned that health care providers may be penalized for limiting or restricting access to information despite not knowing whether an unaffiliated health care provider or EHR vendor is authorized or permitted to access a patient's PHI. Another commenter noted that some state laws require written patient consent before certain types of health information may be exchanged electronically. Some commenters contested the technical feasibility of exchanging information with unaffiliated health care providers and across disparate certified EHR technologies, explaining that federally-adopted standards such as the Direct standard do not support such robust information sharing. In particular, there is no widely-accepted and standardized method to encode requests in Direct messages, which means that a receiving system will often be unable to understand what information is being requested.

Response: The ability to exchange and use information across multiple systems and health care organizations is integral to the concept of interoperability and, consequently, to a health care provider's

demonstration under section 106(b)(2) of the MACRA. Consistent with its attestation, a health care provider must implement technologies, standards, policies, practices, and agreements reasonably calculated to ensure, to the greatest extent practicable and permitted by law, that the certified EHR technology was, at all relevant times implemented in a manner that allowed for timely access by patients to their electronic health information (including the ability to view, download, and transmit this information) and implemented in a manner that allowed for the timely, secure, and trusted bi-directional exchange of structured electronic health information with other health care providers, including unaffiliated providers, and with disparate certified EHR technology and vendors.

We recognize that technical, legal, and other practical constraints may prevent a health care provider from responding to some requests to access, exchange, or use electronic health information in a health care provider's certified EHR technology, even when the requester has permission or the right to access and use the information. We reiterate that in these circumstances a health care provider probably would not have knowingly and willfully limited or restricted the compatibility or interoperability of the certified EHR technology. We expect that these technical and other challenges will become less significant over time and that health care providers will be able to respond to requests from an increasing range of health care providers and health IT systems.

In response to the concerns regarding the disclosure of PHI without a business associate agreement, we remind commenters that the HIPAA Privacy Rule expressly permits covered entities to disclose PHI for treatment, payment, and operations. We refer commenters to numerous guidance documents and fact sheets issued by the HHS Office for Civil Rights and ONC on this subject.¹⁴ We also caution that mischaracterizing or misapplying the HIPAA Privacy Rule or other legal requirements in ways that are likely to limit or restrict the compatibility or interoperability of

certified EHR technology might be inconsistent with the requirements of section 106(b)(2) of the MACRA and a health care provider's information blocking attestation. As an example, a health system that maintains a policy or practice of refusing to share PHI with unaffiliated health care providers on the basis of generalized and unarticulated "HIPAA compliance concerns" could be acting contrary to section 106(b)(6) and the information blocking attestation. The same would be true were a health care provider to inform a patient that it is unable to share information electronically with the patient's other health care professionals "due to HIPAA."

Comment: A small number of commenters, primarily health IT developers, recommended that any requirements to exchange information be limited to the use of certified health IT capabilities required by the 2015 Edition health IT certification criteria or 2014 Edition EHR certification criteria (45 CFR 170.102), as applicable. In contrast, a commenter stated that a significant amount of health information is exchanged through means other than the standards and capabilities supported by ONC's certification criteria for health IT. The commenter cited as an example the widespread use of health information exchanges (HIEs) and network-to-network exchanges, which may or may not incorporate the use of certified health IT capabilities. The commenter insisted that these approaches should not be regarded as information blocking and should be treated as evidence that a health care provider is supporting and participating in efforts to exchange electronic health information. Another commenter stated that the requirement to respond to requests to retrieve or exchange electronic health information should be satisfied by connecting certified EHR technology to a network that can be accessed by other health care providers.

Response: We decline to limit the attestation to the use of certified health IT capabilities or to give special weight to any particular form or method of exchange. As observed by the commenters, certified EHR technology may be implemented and used in many different ways that support the exchange and use of electronic health information. A health care provider's use of these forms and methods of exchange may be relevant to determining whether it acted in good faith to implement and use its certified EHR technology in a manner that supported and did not limit or restrict the compatibility or interoperability of the technology. As an example, certified

¹⁴ See, e.g., HHS Office for Civil Rights, *Understanding Some of HIPAA's Permitted Uses and Disclosures*, <http://www.hhs.gov/hipaa/for-professionals/privacy/guidance/permitted-uses/index.html> (last accessed Sept. 1, 2016); see also Lucia Savage and Aja Brooks, *The Real HIPAA Supports Interoperability*, Health IT Buzz Blog, <https://www.healthit.gov/buzz-blog/electronic-health-and-medical-records/interoperability-electronic-health-and-medical-records/the-real-hipaa-supports-interoperability/> (last accessed Sept. 1, 2016).

EHR technology may come bundled with a health information service provider (HISP) that limits the ability to send and receive Direct messages to certain health care providers, such as those whose EHR vendor participates in a particular trust network. To overcome this or other technical limitations, a health care provider may participate in a variety of other health information sharing arrangements, whether to expand the reach of its Direct messaging capabilities or to enable other methods of exchanging and using electronic health information in its certified EHR technology. We believe that these and similar actions may be relevant to and should not be excluded from the consideration of the health care provider's overall actions to enable the interoperability of its certified EHR technology and to respond in good faith to requests to access or exchange electronic health information.

Comment: Some commenters recommended that we revise the language of the attestation in whole or in part. Most of these commenters suggested removing certain language or statements, or combining them, to make the requirements of the attestation easier to understand or comply with. One commenter suggested that we abandon the proposed language and adopt the commenter's alternative language, which would require health care providers to attest that they established a workflow for responding to requests to retrieve or exchange electronic health information and did not knowingly or willfully limit or restrict the compatibility or interoperability of certified EHR technology during the development or implementation of the workflow, or in any subsequent actions related to the workflow.

Response: We appreciate commenters' suggestions, but for the reasons we have explained, we do not believe it is appropriate to remove or to further simplify the language of the attestation. Although we do not adopt the alternative language suggested by one commenter, we observe that the actions the commenter describes are consistent with our expectation that health care providers implement certified EHR technology in a manner reasonably calculated to facilitate interoperability, to the greatest extent practicable, and respond in good faith to requests to retrieve or exchange information.

Comment: Several commenters claimed that the proposed attestation is not necessary because most health care providers are not knowingly or willfully engaging in actions to limit or restrict the interoperability or compatibility of certified EHR technology, or to

otherwise interfere with the exchange or use of electronic health information. Some of these commenters, while acknowledging that some health care providers may be engaging in actions that could limit or restrict the interoperability or compatibility of certified EHR technology, maintained that such actions are justified or are beyond a health care provider's control. Some commenters supported an attestation for hospitals or health systems but not for physicians, on the basis that the majority of individual EHR users are not engaging in information blocking.

Response: The belief that health care providers do not engage in information blocking is contradicted by an increasing body of evidence and research, by the experience of CMS and ONC, and by many of the comments on this proposal.¹⁵ It is also inconsistent with section 106(b)(2) of the MACRA, which is entitled "Preventing Blocking The Sharing Of Information" and expressly requires health care providers to demonstrate that they did not knowingly and willingly take action to limit or restrict the interoperability of certified EHR technology.

We need not contemplate whether health systems or any other class of health care provider is more predisposed to engage in information blocking, because the attestation we are finalizing implements section 106(b)(2) of the MACRA, which extends to all MIPS eligible clinicians, eligible clinicians part of an APM Entity, EPs, eligible hospitals, and CAHs.

Comment: Some commenters suggested that, in lieu of an attestation, that CMS allow health care providers to demonstrate compliance with section 106(b)(2) by reporting on objectives and measures under the Medicare and Medicaid EHR Incentive Programs or the advancing care information performance category of MIPS. Commenters noted that health care providers participating in these programs must utilize CEHRT, including application programming interfaces (APIs) that provide access to patient data, and that participation in these programs should itself provide an adequate assurance that health care providers are not knowingly and willfully limiting or restricting the compatibility or interoperability of certified EHR technology.

Response: We do not believe that a health care provider's reporting of objectives and measures can provide the

demonstration required by section 106(b)(2) of the MACRA. The compatibility or interoperability of certified EHR technology may be limited or restricted in numerous and varied ways that are difficult to anticipate and that may not be reflected in objectives and measures under the EHR Incentive Programs and MIPS, which address a broad range of aspects related to the use of certified health IT. It is therefore entirely possible that a health care provider could implement and use certified EHR technology and meet relevant objectives and measures while still engaging in many actions that limit or restrict compatibility or interoperability. While in theory we could specify additional objectives and measures specifically related to the prevention of health information blocking, at this time we believe a less burdensome and more effective way to obtain adequate assurances that health care providers have not engaged in these prohibited practices is through the information blocking attestation we proposed and are finalizing.

Comment: Many commenters stated that EHR vendors, not health care providers, are the primary cause of existing barriers to interoperability and information exchange. Many of these commenters stated that EHR vendors are engaging in information blocking, with some commenters alleging that EHR vendors are routinely engaging in these practices. Commenters alleged that EHR vendors are unwilling to share data in certain circumstances or charge fees that make such sharing cost-prohibitive for most physicians, which poses a significant barrier to interoperability and the efficient exchange of electronic health information.

For these reasons, many commenters suggested that CMS or ONC to require EHR vendors and other health IT developers to attest to an information blocking attestation or to impose other requirements and penalties on developers to deter them from limiting or restricting the interoperability of certified EHR technology and to encourage them to proactively facilitate the sharing of electronic health information. For example, commenters supported the decertification of EHR vendors that charge excessive fees or engage in other practices that may constitute information blocking.

Response: We agree that eligible clinicians, EPs, eligible hospitals, and CAHs are by no means the only persons or entities that may engage in information blocking. However, requirements for EHR vendors or other health IT developers are beyond the

¹⁵ See, for example, Julia Adler-Milstein and Eric Pfeifer, et al. referenced in this final rule with comment period.

scope of section 106(b)(2) of the MACRA and this rulemaking.

We note a series of legislative proposals included in the President's Fiscal Year 2017 Budget would prohibit information blocking by health IT developers and others and to provide civil monetary penalties and other remedies to deter this behavior.¹⁶ In addition, ONC has taken a number of immediate actions to expose and discourage information blocking by health IT developers, including requiring developers to disclose material information about limitations and types of costs associated with their certified health IT (see 45 CFR 170.523(k)(1); see also 80 FR 62719) and requiring ONC-ACBs to conduct more extensive and more stringent surveillance of certified health IT, including surveillance of certified health IT "in the field" (see 45 CFR 170.556; see also 80 FR 62707). ONC has also published resources, including a new guide to EHR contracts that can assist health care providers to compare EHR vendors and products and negotiate appropriate contract terms that do not block access to data or otherwise impair the use of certified EHR technology.¹⁷

Comment: Several commenters requested clarification regarding the documentation that would be required to demonstrate compliance with the terms of the attestation so that health care providers could both better understand and prepare for an audit of this requirement. Among other topics, commenters requested guidance on expected documentation requirements related to particular technologies or capabilities as well as a health care provider's responsiveness to requests to exchange information.

Response: We acknowledge commenters' concerns about required documentation in cases of an audit. To alleviate those concerns, we clarify that we will provide guidance to auditors relating to the final policy and the attestation process. This instruction should include requiring auditors to

¹⁶ See ONC, FY 2017: Justification of Estimates for Appropriations Committee, https://www.healthit.gov/sites/default/files/final_onc_cj_fy_2017_clean.pdf (2016), Appendix I (explaining that current law does not directly prohibit or provide an effective means to investigate and address information blocking by EHR vendors, health care providers, and other persons and entities, and proposing that Congress prohibit and prescribe appropriate penalties for these practices, including civil monetary penalties and program exclusion).

¹⁷ ONC, *EHR Contracts Untangled: Selecting Wisely, Negotiating Terms, and Understanding the Fine Print* (Sept. 2016), available at https://www.healthit.gov/sites/default/files/EHR_Contracts_Untangled.pdf.

work closely with health care providers on the supporting documentation needed applicable to the health care provider's individual case. We further stress that audit determinations are made on a case by case basis, which allows us to give individual consideration to each health care provider. We believe that such case-by-case review will allow us to adequately account for the varied circumstances that may be relevant to assessing compliance.

Comment: Some commenters stated that it would be inappropriate for ONC or an ONC-ACB to perform surveillance of a health care provider's certified EHR technology to determine whether the health care provider is limiting or restricting interoperability.

Response: The scope of ONC-ACB surveillance or, if finalized, ONC's review of a health care provider's certified EHR technology is limited to determining whether the technology continues to perform in accordance with the requirements of the ONC Health IT Certification Program. Because this oversight focuses on the performance of the technology itself, not on the actions of health care providers or users of the technology, we do not anticipate that information obtained in the course of such ONC-ACB surveillance or ONC review would be used to audit a health care provider's compliance with its information blocking attestation. As a caveat, we acknowledge that if ONC became aware that a health care provider had submitted a false attestation or engaged in other actions in violation of federal law or requirements, ONC could share that information with relevant federal entities.

Comment: Some commenters asked how often attestations would be required (for example, once per year). Commenters also stated that the information blocking attestation should apply prospectively, possibly beginning with reporting periods commencing in 2017, to provide reasonable notice to affected parties.

Response: MIPS eligible clinicians, eligible clinicians part of an APM Entity, EPs, eligible hospitals, and CAHs must submit an information blocking attestation covering each reporting period during which they seek to demonstrate that they were a meaningful EHR user or for which they seek to report on the advancing care information performance category. We agree that the attestation requirements should apply only to actions occurring after the effective date of this final rule with comment period. For this reason and to promote alignment with other reporting requirements, we are

finalizing the information blocking attestation for attestations covering EHR reporting periods and MIPS performance periods beginning on or after January 1, 2017.

After review and consideration of public comment, we are finalizing the attestation requirement as proposed. We are finalizing this requirement for EPs, eligible hospitals, and CAHs under the Medicare and Medicaid EHR Incentive Programs and for eligible clinicians under the advancing care information performance category in MIPS, including eligible clinicians who report on the advancing care information performance category as part of an APM Entity group under the APM scoring standard. We are finalizing this requirement for attestations covering EHR reporting periods and MIPS performance periods beginning on or after January 1, 2017.

We have revised and are finalizing the proposed regulation text accordingly. Specifically, we are finalizing the revisions to the definition of a meaningful EHR user at § 495.4 and we are adding the same to the definition of a meaningful EHR user for MIPS at § 414.1305. We are finalizing the attestation requirements at § 495.40(a)(2)(i)(I) and (b)(2)(i)(I) to require such an attestation from EPs, eligible hospitals, and CAHs as part of their demonstration of meaningful EHR use under the Medicare and Medicaid EHR Incentive Programs. We are also finalizing § 414.1375(b)(3) to require this attestation from all eligible clinicians under the advancing care information performance category of MIPS, including eligible clinicians who report on the advancing care information performance category as part of an APM Entity group under the APM scoring standard as discussed in section II.E.5.h. of this final rule with comment period.

D. Definitions

At § 414.1305, in subpart O, we proposed definitions for the following terms:

- Additional performance threshold.
- Advanced Alternative Payment Model (Advanced APM).
- Advanced APM Entity.
- Affiliated practitioner.
- Affiliated practitioner list.
- Alternative Payment Model (APM).
- APM Entity.
- APM Entity group.
- APM Incentive Payment.
- Attestation.
- Attributed beneficiary.
- Attribution-eligible beneficiary.
- Certified Electronic Health Record Technology (CEHRT).

- CMS-approved survey vendor.
- CMS Web Interface.
- Covered professional services.
- Eligible clinician.
- Episode payment model.
- Estimated aggregate payment amounts.
- Final score.
- Group.
- Health Professional Shortage Areas (HPSA).
- High priority measure.
- Hospital-based MIPS eligible clinician.
- Improvement activities.
- Incentive payment base period.
- Low-volume threshold.
- Meaningful EHR user for MIPS.
- Measure benchmark.
- Medicaid APM.
- Medical Home Model.
- Medicaid Medical Home Model.
- Merit-based Incentive Payment System (MIPS).
- MIPS APM.
- MIPS eligible clinician.
- MIPS payment year.
- New Medicare-Enrolled MIPS eligible clinician.
- Non-patient facing MIPS eligible clinician.
- Other Payer Advanced APM.
- Other payer arrangement.
- Partial Qualifying APM Participant (Partial QP).
- Partial QP patient count threshold.
- Partial QP payment amount threshold.
- Participation List.
- Performance category score.
- Performance standards.
- Performance threshold.
- Qualified Clinical Data Registry (QCDR).
- Qualified registry.
- QP patient count threshold.
- QP payment amount threshold.
- QP Performance Period.
- Qualifying APM Participant (QP).
- Rural areas.
- Small practices.
- Threshold Score.
- Topped out non-process measure.
- Topped out process measure.

Some of these terms are new in conjunction with MIPS and APMs, while others are used in existing CMS programs. For the new terms and definitions, we note that some of them have been developed alongside policies of this regulation while others are defined by statute. Specifically, the following terms and definitions were established by the MACRA: APM, Eligible Alternative Payment Entity (which we refer to as an Advanced APM Entity), Composite Performance Score (which we refer to as final score), Eligible professional or EP (which we

refer to as an eligible clinician), MIPS Eligible professional or MIPS EP (which we refer to as a MIPS eligible clinician), MIPS adjustment factor (which we refer to as a MIPS payment adjustment factor), additional positive MIPS payment adjustment factor (which we refer to as additional MIPS payment adjustment factor), Qualifying APM Participant, and Partial Qualifying APM Participant.

These terms and definitions are discussed in detail in relevant sections of this final rule with comment period.

E. MIPS Program Details

1. MIPS Eligible Clinicians

We believe a successful MIPS program fully equips clinicians identified as MIPS eligible clinicians with the tools and incentives to focus on improving health care quality, efficiency, and patient safety for all their patients. Under MIPS, MIPS eligible clinicians are incentivized to engage in proven improvement measures and activities that impact patient health and safety and are relevant for their patient population. One of our strategic goals in developing the MIPS program is to advance a program that is meaningful, understandable, and flexible for participating MIPS eligible clinicians. One way we believe this will be accomplished is by minimizing MIPS eligible clinicians' burden. We have made an effort to focus on policies that remove as much administrative burden as possible from MIPS eligible clinicians and their practices while still providing meaningful incentives for high-quality, efficient care. In addition, we hope to balance practice diversity with flexibility to address varied MIPS eligible clinicians' practices. Examples of this flexibility include special consideration for non-patient facing MIPS eligible clinicians, an exclusion from MIPS for eligible clinicians who do not exceed the low-volume threshold, and other proposals discussed below.

a. Definition of a MIPS Eligible Clinician

Section 1848(q)(1)(C)(i) of the Act, as added by section 101(c)(1) of the MACRA, outlines the general definition of a MIPS eligible clinician for the MIPS program. Specifically, for the first and second year for which MIPS applies to payments (and the performance period for such years) a MIPS eligible clinician is defined as a physician (as defined in section 1861(r) of the Act), a physician assistant, nurse practitioner, clinical nurse specialist (as such terms are defined in section 1861(aa)(5) of the Act), a certified registered nurse

anesthetist (as defined in section 1861(bb)(2) of the Act), and a group that includes such professionals. The statute also provides flexibility to specify additional eligible clinicians (as defined in section 1848(k)(3)(B) of the Act) as MIPS eligible clinicians in the third and subsequent years of MIPS. As discussed in the proposed rule (81 FR 28177 through 28178), section 1848(q)(1)(C)(ii) and (v) of the Act specifies several exclusions from the definition of a MIPS eligible clinician, which includes clinicians who are determined to be new Medicare-enrolled eligible clinicians, QPs and Partial QPs, or do not exceed the low-volume threshold pertaining to the dollar value of billed Medicare Part B allowed charges or Part B-enrolled beneficiary count. In addition, section 1848(q)(1)(A) of the Act requires the Secretary to permit any eligible clinician (as defined in section 1848(k)(3)(B) of the Act) who is not a MIPS eligible clinician the option to volunteer to report on applicable measures and activities under MIPS. Section 1848(q)(1)(C)(vi) of the Act clarifies that a MIPS payment adjustment factor (or additional MIPS payment adjustment factor) will not be applied to an individual who is not a MIPS eligible clinician for a year, even if such individual voluntarily reports measures under MIPS. For purposes of this section of the final rule with comment period, we use the term "MIPS payment adjustment" to refer to the MIPS payment adjustment factor (or additional MIPS payment adjustment factor) as specified in section 1848(q)(1)(C)(vi) of the Act.

To implement the MIPS program we must first establish and define a MIPS eligible clinician in accordance with the statutory definition. We proposed to define a MIPS eligible clinician at § 414.1305 as a physician (as defined in section 1861(r) of the Act), a physician assistant, nurse practitioner, and clinical nurse specialist (as such terms are defined in section 1861(aa)(5) of the Act), a certified registered nurse anesthetist (as defined in section 1861(bb)(2) of the Act), and a group that includes such professionals. In addition, we proposed that QPs and Partial QPs who do not report data under MIPS, low-volume threshold eligible clinicians, and new Medicare-enrolled eligible clinicians as defined at § 414.1305 would be excluded from this definition per the statutory exclusions defined in section 1848(q)(1)(C)(ii) and (v) of the Act. We intend to consider using our authority under section 1848(q)(1)(C)(i)(II) of the Act to expand the definition of a MIPS eligible

clinician to include additional eligible clinicians (as defined in section 1848(k)(3)(B) of the Act) through rulemaking in future years.

Additionally, in accordance with section 1848(q)(1)(A) and (q)(1)(C)(vi) of the Act, we proposed to allow eligible clinicians who are not MIPS eligible clinicians, as defined at proposed § 414.1305, the option to voluntarily report measures and activities for MIPS. We proposed at § 414.1310(d) that those eligible clinicians who are not MIPS eligible clinicians, but who voluntarily report on applicable measures and activities specified under MIPS, would not receive an adjustment under MIPS; however, they would have the opportunity to gain experience in the MIPS program. We were particularly interested in public comments regarding the feasibility and advisability of voluntary reporting in the MIPS program for entities such as RHCs and/or FQHCs, including comments regarding the specific technical issues associated with reporting that are unique to these health care providers. We anticipate some eligible clinicians that will not be MIPS eligible clinicians during the first 2 years of MIPS, such as physical and occupational therapists, clinical social workers, and others that have been reporting quality measures under the PQRS for a number of years, will want to have the ability to continue to report and gain experience under MIPS. We requested comments on these proposals.

The following is a summary of the comments we received regarding our proposed definition of the term MIPS eligible clinician and our proposal to allow eligible clinicians who are not MIPS eligible clinicians the option to voluntarily report measures and activities for MIPS.

Comment: Commenters supported the option for RHCs and FQHCs to voluntary report, but noted that RHCs and FQHCs may not have experience using EHR technology or the resources to invest in CEHRT and requested that CMS adjust for the social determinants of health status.

Response: We appreciate the feedback on the role of socioeconomic status in quality measurement. We continue to evaluate the potential impact of social risk factors on measure performance. One of our core objectives is to improve beneficiary outcomes, and we want to ensure that complex patients as well as those with social risk factors receive excellent care.

Comment: Several commenters expressed support for the proposed definition of a MIPS eligible clinician and the proposal to allow eligible

clinicians who are not MIPS eligible to voluntarily report, which encourages interdisciplinary and team-based services necessary to address the full spectrum of patient and family needs and quality of life concerns throughout the care continuum and across health system and community-based care settings. One commenter expressed appreciation for CMS using practitioner-neutral language and including nurse practitioners.

Response: We appreciate the support from commenters.

Comment: In regard to the definition of a MIPS eligible clinician, one commenter recommended that certified registered nurse anesthetists be removed from the list of MIPS eligible clinicians because there are not applicable measures for their job duties and they do not treat diseases. Another commenter requested that CMS align the definition of an eligible clinician in both the Medicare and Medicaid programs because nurse practitioners do not qualify for the Medicare EHR Incentive Program for Eligible Professionals, but do qualify for the Medicaid EHR Incentive Program for Eligible Professionals. One commenter expressed concern with the inclusion of nurse practitioners and physician assistants in the definition of a MIPS eligible clinician due to such providers needing to purchase and implement an EHR system in a short timeframe and requested that CMS postpone the inclusion of nurse practitioners and physician assistants.

Response: We appreciate the recommendations from the commenters and note that section 1848(q)(1)(C)(i) of the Act defines a MIPS eligible clinician, for the first and second MIPS payment years, as a physician (as defined in section 1861(r) of the Act), a physician assistant, nurse practitioner, clinical nurse specialist (as such terms are defined in section 1861(aa)(5) of the Act), a certified registered nurse anesthetist (as defined in section 1861(bb)(2) of the Act), and a group that includes such professionals. We do not have discretion under the statute to amend the definition of a MIPS eligible clinician by excluding clinician types that the statute expressly includes, such as certified registered nurse anesthetists, nurse practitioners, and physician assistants. We note, however, that several policies may alleviate the concerns of commenters regarding the availability of applicable measures and activities, and health IT implementation costs. For example, as discussed in section II.E.3.c. of this final rule with comment period, we are finalizing a higher low-volume threshold to ensure

that MIPS eligible clinicians who do not exceed \$30,000 of billed Medicare Part B allowed charges or 100 Part B-enrolled Medicare beneficiaries are excluded from MIPS. Also, we note that while non-patient facing MIPS eligible clinicians are not exempt from participating in MIPS or a performance category entirely, as discussed in section II.E.1.b. of this final rule with comment period, we are establishing a process that applies, to the extent feasible and appropriate, alternative measures or activities for non-patient facing MIPS eligible clinicians that fulfill the goals of the applicable performance category. In addition, as discussed in section II.E.6.b.(2) of this final rule with comment period, we may re-weight performance categories if there are not sufficient measures applicable and available to each MIPS eligible clinician to ensure that MIPS eligible clinicians, including those who are non-patient facing, who do not have sufficient alternative measures and activities that are applicable and available in a performance category are scored appropriately.

In addition, we recognize that under MIPS, there will be more eligible clinicians subject to the requirements of EHR reporting than were previously eligible under the Medicare and/or Medicaid EHR Incentive Program, including hospital-based MIPS eligible clinicians, nurse practitioners, physician assistants, clinical nurse specialists, and certified registered nurse anesthetists. Since many of these non-physician clinicians are not eligible to participate in the Medicare and/or Medicaid EHR Incentive Program, we have little evidence as to whether there are sufficient measures applicable and available to these types of MIPS eligible clinicians under our proposals for the advancing care information performance category. As a result, we have provided additional flexibilities to mitigate negative adjustments for the first performance year (CY 2017) in order to allow hospital-based MIPS eligible clinicians, nurse practitioners, physician assistants, clinical nurse specialists, certified registered nurse anesthetists, and other MIPS eligible clinicians to familiarize themselves with the MIPS program. Section II.E.5.g.(8) of this final rule with comment period describes our final policies regarding the re-weighting of the advancing care information performance category within the final score, in which we would assign a weight of zero when there are not sufficient measures applicable and available.

Comment: One commenter requested for suppliers of portable x-ray and

independent diagnostic testing facility services to be excluded from the definition of a MIPS eligible clinician and recommended that CMS create an alternate pathway allowing for adequate payment updates to reflect the rising cost of care.

Response: We note that the MIPS payment adjustment applies only to the amount otherwise paid under Part B with respect to items and services furnished by a MIPS eligible clinician during a year. As discussed in section I.E.7. of this final rule with comment period, we will apply the MIPS adjustment at the TIN/NPI level. In regard to suppliers of portable x-ray and independent diagnostic testing facility services, we note that such suppliers are not themselves included in the definition of a MIPS eligible clinician. However, there may be circumstances in which a MIPS eligible clinician would furnish the professional component of a Part B covered service that is billed by such a supplier. For example, a radiologist who is a MIPS eligible clinician could furnish the interpretation and report (professional component) for an x-ray service, and the portable x-ray supplier could bill for the global x-ray service (combined technical and professional component) or bill separately for the professional component of the x-ray service. In that case, the professional component (billed either on its own or as part of the global service) could be considered a service for which payment is made under Part B and furnished by a MIPS eligible clinician. Those services could be subject to MIPS adjustment based on the MIPS eligible clinician's performance during the applicable performance period. Because, however, those services are billed by suppliers that are not MIPS eligible clinicians, it is not operationally feasible for us at this time to associate those billed allowed charges with a MIPS eligible clinician at an NPI level in order to include them for purposes of applying any MIPS payment adjustment.

Comment: One commenter indicated that the status of pathologists working in independent laboratories is unclear with regard to the definition of a MIPS eligible clinician and requested clarification as to whether or not they would be included given that they were considered EPs under PQRS.

Response: We note that pathologists, including pathologists practicing in independent laboratories, are considered MIPS eligible clinicians and thus, required to participate in MIPS and subject to the MIPS payment adjustment. The MIPS payment adjustment applies only to the amount

otherwise paid under Part B with respect to items and services furnished by a MIPS eligible clinician during a year, in which we will apply the MIPS adjustment at the TIN/NPI level (see section I.E.7. of this final rule with comment period). For items and services furnished by a pathologist practicing in an independent laboratory that are billed by the laboratory, such items and services may be subject to MIPS adjustment based on the MIPS eligible clinician's performance during the applicable performance period. For those billed Medicare Part B allowed charges we are able to associate with a MIPS eligible clinician at an NPI level, such items and services furnished by such pathologist would be included for purposes of applying any MIPS payment adjustment.

Comment: A few commenters encouraged CMS to expand the list of MIPS eligible clinicians further to promote integrated care. One commenter suggested that we include certified nurse midwives as MIPS eligible clinicians. Another commenter encouraged CMS to ensure that specialists can successfully participate in the MIPS. One commenter indicated that MIPS accommodates the masses of physicians, but falls short in including consulted clinicians. A few commenters requested that we expand the definition of a MIPS eligible clinician to include therapists, dietitians, social workers, and other Medicare Part B suppliers as soon as possible in order for such clinicians to earn positive MIPS payment adjustments. One commenter recommended that the definition of MIPS eligible clinician be expanded to include all Medicare supplier types, including ambulatory services.

Response: We appreciate the suggestions from the commenters and will take them into account as we consider expanding the definition of a MIPS eligible clinician for year 3 in future rulemaking. We interpret the comment regarding consulted clinicians to refer to locum tenens and clinicians contracted by a practice. We note that contracted clinicians who meet the definition of a MIPS eligible clinician are required to participate in MIPS. In regard to locum tenens clinicians, they bill for the items and services they furnish using the NPI of the clinician for whom they are substituting and, as such, do not bill Medicare in their own right for the items and services they furnish. As such, locum tenens clinicians are not MIPS eligible clinicians when they practice in that capacity.

Comment: One commenter indicated that it is feasible to include physical

therapists in the expanded definition of a MIPS eligible clinician given that physical therapists have been included in PQRS since 2007. The commenter noted that there will be a negative impact on the quality reporting rates of physical therapists if they are excluded from MIPS in 2017 and 2018. Another commenter recommended that CMS define provisions for physical therapists, occupational therapists, and speech language pathologists as soon as possible in order to provide sufficient time for building new systems for operation in year 3 of MIPS. A few commenters requested clarification on how MIPS will apply to physical therapists, occupational therapists, and speech language pathologists working with Medicare beneficiaries. One commenter suggested that therapists participating in MIPS should be scored using the same scoring weights for the quality and cost performance categories that apply to MIPS eligible clinicians in the first 2 years. The commenter noted that the same transition scoring would be fair and could mitigate severe penalties for clinicians new to MIPS.

Response: We appreciate the concerns and recommendations from the commenters. In regard to expanding the definition of a MIPS eligible clinician for year 3, we will consider the suggestions from the commenters. We anticipate that some eligible clinicians who will not be included in the definition of a MIPS eligible clinician during the first 2 years of MIPS, such as physical and occupational therapists, clinical social workers, and others that have been reporting quality measures under the PQRS for a number of years, will want to have the ability to continue to report and gain experience under MIPS. We note that eligible clinicians who are not included in the definition of a MIPS eligible clinician during the first 2 years of MIPS (or any subsequent year) may voluntarily report on measures and activities under MIPS, but will not be subject to the MIPS payment adjustment. We do intend however to provide informative performance feedback to clinicians who voluntarily report to MIPS, which would include the same performance category and final score rules that apply to all MIPS eligible clinicians. We believe this informational performance feedback will help prepare those clinicians who voluntarily report to MIPS.

Comment: Some commenters requested that CMS allow facility-based clinicians who provide outpatient services, such as physical therapists, occupational therapists, and speech language pathologists, to participate in MIPS and earn MIPS payment

adjustments by the third year of the program. One commenter expressed concern that without inclusion in the Quality Payment Program, these facility-based clinicians would be disadvantaged. Another commenter expressed concern that the criteria for including non-physician clinicians later in MIPS are not clear and recommended that clarity be provided, including performance categories that are specific to each specialty and type of practice.

Response: We appreciate the concerns and recommendations from the commenters, and will take them into account as we consider expanding the definition of a MIPS eligible clinician for year 3 in future rulemaking.

Comment: One commenter did not support the expanding of the definition of a MIPS eligible clinician in year 3. The commenter noted that none of their physical therapists operate on the use of CEHRT and switching in year 3 would require significant capital and personnel. The commenter recommended postponing any expansion until year 4 or 5.

Response: We appreciate the commenter expressing concerns and recognize that eligible clinicians and MIPS eligible clinicians will have a spectrum of experiences with using EHR technology. As we consider expanding the definition of a MIPS eligible clinician to include additional eligible clinicians in year 3, we will consider how such eligible clinicians would be scored for each performance category in future rulemaking.

Comment: One commenter recommended that CMS convene a technical expert panel of eligible clinicians who will not be included in the definition of a MIPS eligible clinician during the first 2 years of MIPS to help adapt the Quality Payment Program to their needs.

Response: We thank the commenter for the suggestion and will consider the recommendation as we consider expanding the definition of a MIPS eligible clinician to include additional eligible clinicians for year 3 in future rulemaking and prepare for the operationalization of the expanded definition. We are committed to continuously engage stakeholders as we implement MIPS, and establish and operationalize future policies.

Comment: One commenter expressed concern about the difficulties hospital-based clinicians have had reporting under PQRS and recommended offering hospital-based clinicians more flexibility in adopting MIPS.

Response: As previously noted, we recognize that there may not be sufficient measures applicable and

available for certain performance categories for hospital-based MIPS eligible clinicians participating in MIPS. In section II.E.5.g.(8)(a)(i) of this final rule with comment period, we describe the re-weighting of the advancing care information performance category when there are not sufficient measures applicable and available for hospital-based MIPS eligible clinicians.

Comment: A few commenters expressed concerns that our MIPS proposals focused on clinicians in large groups or who are hospital-based and did not include non-physician clinicians. One commenter requested that non-physician clinicians be recognized for their critical role in the health delivery system and providing high quality, low cost health care to the Medicare population.

Response: We disagree with the commenters and note that the definition of a MIPS eligible clinician includes non-physician clinicians such physician assistants, nurse practitioners, clinical nurse specialists, and certified registered nurse anesthetists. As previously noted, in future rulemaking, we will consider expanding the definition of a MIPS eligible clinician to include additional eligible clinicians starting in year 3.

Comment: A few commenters requested clarification regarding whether or not Doctors of Chiropractic would be able to participate in MIPS. Another commenter appreciated that Doctors of Chiropractic are included as MIPS eligible clinicians, but believed that chiropractors would be put at a severe disadvantage in participating in MIPS or APMs due to CMS' restrictions on chiropractic coverage. The commenter encouraged CMS to expand the billing codes for Doctors of Chiropractic to cover the full scope of licensure.

Response: We note that chiropractors are included in the definition of "physician" under section 1861(r) of the Act, and therefore, are MIPS eligible clinicians. In regard to the comment pertaining to the expansion of billing codes for chiropractors, we note that such comment is out-of-scope given that we did not propose any billing code policies in the proposed rule.

Comment: One commenter requested clarification on whether or not participation in MIPS is mandatory.

Response: We note that clinicians who are included in the definition of a MIPS eligible clinicians as defined in section II.E.1.a. of this final rule with comment period are required to participate in MIPS unless they are excluded from the definition of a MIPS eligible clinician based on one of the

three exclusions described in sections II.E.3.a., II.E.3.b., and II.E.3.c. of this final rule with comment period.

Comment: One commenter requested clarification on how CMS will treat hospitalist services under MIPS, specifically, what measures will they report, whether the hospital's PFS payment amount for the hospitalists' services will be subject to the MIPS payment adjustment, and how hospitalists should report data since they do not have an office practice or an EHR to participate.

Response: We note that hospitalists are required to participate in MIPS unless otherwise excluded. As discussed in section II.E.6.b.(2) of this final rule with comment period, we may re-weight performance categories if there are not sufficient measures applicable and available to each MIPS eligible clinician to ensure that MIPS eligible clinicians, including hospitalists, who do not have sufficient alternative measures and activities that are applicable and available in a performance category are scored appropriately. For hospitalists who meet the definition of a hospital-based MIPS eligible clinician, section II.E.5.g.(8)(a)(i) of this final rule with comment period describes the re-weighting of the advancing care information performance category within the final score, in which we would assign a weight of zero when there are not sufficient measures applicable and available for hospital-based MIPS eligible clinicians. In section II.E.5.b.(5) of the proposed rule (81 FR 28192), we sought comment on the application of additional system measures, which would directly impact hospitalists, and intend to address such policies in future rulemaking. Also, we note that the MIPS payment adjustment would be applied to the Medicare Part B payments for items and services furnished by a hospital-based MIPS eligible clinician.

Comment: Some commenters expressed concern regarding the exclusion of pharmacists under MIPS and APMs, and indicated that the payment models would prevent program goals from being met unless all practitioners, including pharmacists, are effectively integrated into team-based care. A few commenters noted that pharmacists are medication-use experts in the health care system, and directly contribute toward many of the quality measures under both MIPS and Advanced APMs. Because pharmacists are neither MIPS eligible clinicians nor required practitioners under APMs, pharmacist expertise and contributions may be underutilized and/or unavailable to certain patients. A few

commenters recommended that the definition of a MIPS eligible clinician include pharmacists given that they are a critical part of a patient care team, in which they can provide a broad array of services to patients and have a role in optimizing patient health outcomes as the number and complexity of medications continues to rise. One commenter recommended that the Quality Payment Program include metrics and payment methodologies that recognize services provided by pharmacists and align with other CMS and CDC programs.

Response: We appreciate the suggestions from the commenters. We note that we do not have discretion under the statute to include clinicians who do not meet the definition of a MIPS eligible clinician. Thus, pharmacists would not be able to participate in MIPS.

Comment: One commenter requested that CMS clarify whether or not MIPS requirements would apply to clinicians who are not Medicare-enrolled eligible clinicians. Another commenter expressed concern that the proposed rule did not address how MIPS payment adjustments would be applied for clinicians who are not Medicare-enrolled eligible clinicians.

Response: We note that clinicians who are included in the definition of a MIPS eligible clinician and not otherwise excluded are required to report under MIPS. However, a clinician who is not included in the definition of a MIPS eligible clinician can voluntarily report under MIPS and would not be subject to the MIPS payment adjustment. Also, we note that eligible clinicians who are not Medicare-enrolled eligible clinicians are not required to participate in MIPS, and would not be subject to the MIPS payment adjustment given that the MIPS payment adjustment is applied to Medicare Part B payments for items and services furnished by a MIPS eligible clinician.

Comment: One commenter requested information on how locum tenens clinicians will be assessed under MIPS.

Response: As previously noted, locum tenens clinicians bill for the items and services they furnish using the NPI of the clinician for whom they are substituting and, as such, do not bill Medicare in their own right for the items and services they furnish. As such, locum tenens clinicians are not MIPS eligible clinicians when they practice in that capacity.

Comment: One commenter noted that facility-based clinicians in California face unique challenges under state law and recommended that rather than

automatically using an eligible clinician's facility's performance as a proxy for the quality and cost performance categories as proposed, CMS should develop a voluntary option to allow eligible clinicians who meet criteria to be considered a facility-based clinician.

Response: We appreciate the suggestions from the commenter and will consider them as we develop policies for applying a facility's performance to a MIPS eligible clinician or group.

Comment: One commenter suggested that the types of eligible clinicians who are not included in the definition of a MIPS eligible clinician in 2017 and who have been submitting PQRS measures for years, should be allowed to voluntarily participate in 2017 and earn MIPS payment adjustments if they complete a successful attestation.

Response: We thank the commenter for their suggestion and note that clinicians not included in the definition of a MIPS eligible clinician have the option to voluntarily report on applicable measures and activities under MIPS. However, the statute does not permit such clinicians to be subject to the MIPS payment adjustment. Should we expand the definition of a MIPS eligible clinician in future rulemaking, such clinicians may be able to earn MIPS payment adjustments beginning as early as the 2021 payment year.

Comment: A few commenters recommended that certified anesthesiologist assistants be included in the definition of a MIPS eligible clinician. One commenter stated that such inclusion would provide the clarification that certified anesthesiologist assistants are health care providers, increase the amount of quality reporting under MIPS, and ensure certified anesthesiologist assistant participation in APMs. The commenter noted that if certified anesthesiologist assistants are not included in the definition of a MIPS eligible clinician, patient access to care would be restricted. Another commenter requested clarification regarding whether or not anesthesiologist assistants would be excluded from MIPS reporting in 2017.

Response: We appreciate the suggestion from the commenters and note that section 1861(bb)(2) of the Act specifies that the term "certified registered nurse anesthetist" includes an anesthesiologist assistant. Thus, anesthesiologist assistants are considered eligible for MIPS beginning with the CY 2017 performance period.

Comment: One commenter requested that audiologists remain active stakeholders in the MIPS implementation process, although they may not be included in the program until year 3.

Response: We appreciate the recommendation from the commenter and note that we are committed to actively engaging with all stakeholders during the development and implementation of MIPS.

Comment: One commenter suggested that CPC+ clinicians should be waived from MIPS if the group TIN is participating in CPC+.

Response: We appreciate the suggestion from the commenter, but note that the exclusions in this final rule with comment period only pertain to new Medicare-enrolled eligible clinicians, QPs and Partial QPs who do not report on applicable MIPS measures and activities, and eligible clinicians who do not exceed the low-volume threshold. We refer readers to section II.E.5.h. of this final rule with comment period, which describes the APM scoring standard for MIPS eligible clinicians participating in MIPS APMs; such provisions are applicable to MIPS eligible clinicians participating in CPC+.

Comment: One commenter requested that CMS allow psychiatrists who participate in ACOs or who work at least 30 percent of their time in eligible integrated care settings to opt out of the reporting requirements to avoid a negative MIPS payment adjustment. Another commenter recommended that CMS exempt from the definition of a MIPS eligible clinician those clinicians participating in all Alternative Payment Models defined in Category 3 of the HCPLAN Alternative Payment Models Framework. The commenter indicated that the exemption should include all upside-gain sharing only models defined in the Framework, including patient-centered medical home models, bundled payment models, and episode of care models.

Response: We note that the statute only allows for certain exclusions for MIPS, two of which are for QPs and Partial QPs participating in an APM or other innovative payment model is not in itself sufficient for an eligible clinician to become a QP or Partial QP. As described in section II.F. of this final rule with comment period, only eligible clinicians who are identified on CMS-maintained lists as participants in Advanced APMs and meet the relevant QP or Partial QP threshold may become QPs or Partial QPs.

After consideration of the public comments we received, we are finalizing the following policies. We are

finalizing the definition at § 414.1305 of a MIPS eligible clinician, as identified by a unique billing TIN and NPI combination used to assess performance, as any of the following (excluding those identified at § 414.1310(b)): A physician (as defined in section 1861(r) of the Act), a physician assistant, nurse practitioner, and clinical nurse specialist (as such terms are defined in section 1861(aa)(5) of the Act), a certified registered nurse anesthetist (as defined in section 1861(bb)(2) of the Act), and a group that includes such clinicians. We are finalizing our proposed policies at § 414.1310(b) and (c) that QPs, Partial QPs who do not report on applicable measures and activities that are required to be reported under MIPS for any given performance period in a year, low-volume threshold eligible clinicians, and new Medicare-enrolled eligible clinicians as defined at § 414.1305 are excluded from this definition per the statutory exclusions defined in section 1848(q)(1)(C)(ii) and (v) of the Act. In accordance with section 1848(q)(1)(A) and (q)(1)(C)(vi) of the Act, we are finalizing our proposal at § 414.1310(b)(2) to allow eligible clinicians (as defined at § 414.1305) who are not MIPS eligible clinicians the option to voluntarily report measures and activities for MIPS. Additionally, we are finalizing our proposal at § 414.1310(d) that in no case will a MIPS payment adjustment apply to the items and services furnished during a year by individual eligible clinicians, as described in paragraphs (b) and (c) of this section, who are not MIPS eligible clinicians including eligible clinicians who are not MIPS eligible clinicians, but who voluntarily report on applicable measures and activities specified under MIPS.

b. Non-Patient Facing MIPS Eligible Clinicians

Section 1848(q)(2)(C)(iv) of the Act requires the Secretary, in specifying measures and activities for a performance category, to give consideration to the circumstances of professional types (or subcategories of those types determined by practice characteristics) who typically furnish services that do not involve face-to-face interaction with a patient. To the extent feasible and appropriate, the Secretary may take those circumstances into account and apply alternative measures or activities that fulfill the goals of the applicable performance category to such non-patient facing MIPS eligible clinicians. In carrying out these provisions, we are required to consult

with non-patient facing MIPS eligible clinicians.

In addition, section 1848(q)(5)(F) of the Act allows the Secretary to re-weight MIPS performance categories if there are not sufficient measures and activities applicable and available to each type of MIPS eligible clinician. We assume many non-patient facing MIPS eligible clinicians will not have sufficient measures and activities applicable and available to report under the performance categories under MIPS. We refer readers to section II.E.6.b.(2) of this final rule with comment period for the discussion regarding how we addressed performance categories weighting for MIPS eligible clinicians for whom no measures exist in a given category.

To establish policies surrounding non-patient facing MIPS eligible clinicians, we must first define the term “non-patient facing.” Currently, the PQRS, VM, and Medicare EHR Incentive Program include two existing policies for considering whether an EP is providing patient-facing services. To determine, for purposes of PQRS, whether an EP had a “face-to-face” encounter with Medicare patients, we assess whether the EP billed for services under the PFS that are associated with face-to-face encounters, such as whether an EP billed general office visit codes, outpatient visits, and surgical procedures. Under PQRS, if an EP bills for at least one service under the PFS during the performance period that is associated with face-to-face encounters and reports quality measures via claims or registries, then the EP is required to report at least one “cross-cutting” measure. EPs who do not meet these criteria are not required to report a cross-cutting measure. For the purposes of PQRS, telehealth services have not historically been included in the definition of face-to-face encounters. For more information, please see the CY 2016 PFS final rule for these discussions (80 FR 71140).

In the Stage 2 final rule (77 FR 54098 through 54099), the Medicare EHR Incentive Program established a significant hardship exception from the meaningful use payment adjustment under section 1848(a)(7)(A) of the Act for EPs that lack face-to-face interactions with patients and those who lack the need to follow-up with patients. EPs with a primary specialty of anesthesiology, pathology or radiology listed in the Provider Enrollment, Chain, and Ownership System (PECOS) as of 6 months prior to the first day of the payment adjustment year automatically receive this hardship exemption (77 FR 54100). Specialty codes associated with these specialties

include 05-Anesthesiology, 22-Pathology, 30-Diagnostic Radiology, 36-Nuclear Medicine, 94-Interventional Radiology. EPs with a different specialty are also able to request this hardship exception through the hardship application process. However, telehealth services could be counted by EPs who choose to include these services within the definition of “seen by the EP” for the purposes of calculating patient encounters with the EHR Incentive Program (77 FR 53982).

In the MIPS and APMs RFI (80 FR 63484), we sought comments on MIPS eligible clinicians that should be considered non-patient facing MIPS eligible clinicians and the criteria we should use to identify these MIPS eligible clinicians. Commenters were split when it came to defining and identifying non-patient facing MIPS eligible clinicians. Many took a specialty-driven approach. Commenters generally did not support use of specialty codes alone, which is the approach used by the Medicare EHR Incentive Program. Commenters indicated that these codes do not necessarily delineate between the same specialists who may or may not have patient-facing interaction. One example is cardiologists who specialize in cardiovascular imaging which is also coded as cardiology. On the other hand, as one commenter mentioned, physicians with specialty codes other than “cardiology” (for example, internal medicine) may perform cardiovascular imaging services. Therefore, using the specialty code for cardiology to identify clinicians who typically do not provide patient-facing services would be both over-inclusive and under-inclusive. Other commenters identified specialty types that they believe should be considered non-patient facing MIPS eligible clinicians. Specific specialty types included radiologists, anesthesiologists, nuclear cardiology or nuclear medicine physicians, and pathologists. Others pointed out that certain MIPS eligible clinicians may be primarily non-patient facing MIPS eligible clinicians even though they practice within a traditionally patient-facing specialty. The MIPS and APMs RFI comments and listening sessions with medical societies representing non-patient facing MIPS eligible clinicians specified radiology/imaging, anesthesiology, nuclear cardiology and oncology, and pathology as inclusive of non-patient facing MIPS eligible clinicians. Commenters noted that roles within specific types of specialties may need to be further delineated between patient-facing and non-patient facing

MIPS eligible clinicians. An illustrative list of specific types of clinicians within the non-patient facing spectrum include:

- Pathologists who may be primarily dedicated to working with local hospitals to identify early indicators related to evolving infectious diseases;
- Radiologists who primarily provide consultative support back to a referring physician or provide image interpretation and diagnosis versus therapy;
- Nuclear medicine physicians who play an indirect role in patient care, for example as a consultant to another physician in proper dose administration; or
- Anesthesiologists who are primarily providing supervision oversight to Certified Registered Nurse Anesthetists.

After reviewing current policies, we proposed to define a non-patient facing MIPS eligible clinician for MIPS at § 414.1305 as an individual MIPS eligible clinician or group that bills 25 or fewer patient-facing encounters during a performance period. We considered a patient-facing encounter as an instance in which the MIPS eligible clinician or group billed for services such as general office visits, outpatient visits, and procedure codes under the PFS. We intend to publish the list of patient-facing encounter codes on a CMS Web site similar to the way we currently publish the list of face-to-face encounter codes for PQRS. This proposal differs from the current PQRS policy in two ways. First, it creates a minimum threshold for the quantity of patient-facing encounters that MIPS eligible clinicians or groups would need to furnish to be considered patient-facing, rather than classifying MIPS eligible clinicians as patient-facing based on a single patient-facing encounter. Second, this proposal includes telehealth services in the definition of patient-facing encounters.

We believed that setting the non-patient facing MIPS eligible clinician threshold for individual MIPS eligible clinician or group at 25 or fewer billed patient-facing encounters during a performance period is appropriate. We selected this threshold based on an analysis of non-patient facing Healthcare Common Procedure Coding System (HCPCS) codes billed by MIPS eligible clinicians. Using these codes and this threshold, we identified approximately one quarter of MIPS eligible clinicians as non-patient facing before MIPS exclusions, such as low-volume and newly-enrolled eligible clinician policies, were applied. The majority of clinicians enrolled in Medicare with specialties such as

anesthesiology, nuclear medicine, and pathology were identified as non-patient facing in this analysis. The addition of telehealth to the analysis did not affect the outcome, as it created a less than 0.01 percent change in MIPS eligible clinicians categorized as non-patient facing.

Therefore, the proposed approach allows the definition of non-patient facing MIPS eligible clinicians, to include both MIPS eligible clinicians who practice within specialties traditionally considered non-patient facing, as well as MIPS eligible clinicians who provide occasional patient-facing services that do not represent the bulk of their practices. This definition is also consistent with the statutory requirement that refers to professional types who typically furnish services that do not involve patient-facing interaction with a patient.

In response to the MIPS and APMs RFI, some commenters believed that MIPS eligible clinicians should be defined as non-patient facing MIPS eligible clinicians based on whether their billing indicates they provide face-to-face services. Commenters indicated that the use of specific HCPCS codes in combination with specialty codes, may be a more appropriate way to identify MIPS eligible clinicians that have no patient interaction.

We also proposed to include telehealth services in the definition of patient-facing encounters. Various MIPS eligible clinicians use telehealth services as an innovative way to deliver care to beneficiaries and we believe these services, while not furnished in-person, should be recognized as patient-facing. In addition, Medicare eligible telehealth services substitute for an in-person encounter and meet other site requirements under the PFS as defined at § 410.78.

The proposed addition of the encounter threshold for patient-facing MIPS eligible clinicians was intended to minimize concerns that a MIPS eligible clinician could be misclassified as patient-facing as a result of providing occasional telehealth services that do not represent the bulk of their practice. Finally, we believed that this proposed definition of a non-patient facing MIPS eligible clinician for MIPS could be consistently used throughout the MIPS program to identify those MIPS eligible clinicians for whom certain proposed requirements for patient-facing MIPS eligible clinicians (such as reporting cross-cutting measures) may not be meaningful.

We weighed several options when considering the appropriate definition of non-patient facing MIPS eligible

clinicians for MIPS; and some options were similar to those we considered in implementing the Medicare EHR Incentive Program. One option we considered was basing the non-patient facing MIPS eligible clinician's definition on a set percentage of patient-facing encounters, such as 5 to 10 percent, that was tied to the same list of patient-facing encounter codes discussed in this section of this final rule with comment period. Another option we considered was the identification of non-patient facing MIPS eligible clinicians for MIPS only by specialty, which might be a simpler approach. However, we did not consider this approach sufficient for identifying all the possible non-patient facing MIPS eligible clinicians, as some patient-facing MIPS eligible clinicians practice in multi-specialty practices with non-patient facing MIPS eligible clinician's practices with different specialties. We would likely have had to develop a separate process to identify non-patient facing MIPS eligible clinicians in other specialties, whereas maintaining a single definition that is aligned across performance categories is simpler. Many comments from the MIPS and APMs RFI discouraged use of specialty codes alone. Additionally, we believed our proposal would allow us to more accurately identify MIPS eligible clinicians who are non-patient facing by applying a threshold to recognize that a MIPS eligible clinician who furnishes almost exclusively non-patient facing services should be treated as a non-patient facing MIPS eligible clinician despite furnishing a small number of patient-facing services.

In the MIPS and APMs RFI (80 FR 63484), we also requested comments on what types of measures and/or improvement activities (new or from other payment systems) we should use to assess non-patient facing MIPS eligible clinicians' performance and how we should apply the MIPS performance categories to non-patient facing MIPS eligible clinicians. Commenters were split on these subjects. A number of commenters stated that non-patient facing MIPS eligible clinicians should be exempt from specific performance categories under MIPS or should be exempt from MIPS as a whole. Commenters who did not favor exemptions generally suggested that we focus on process measures and work with specialty societies to develop new, more clinically relevant measures for non-patient facing MIPS eligible clinicians.

We took these stakeholder comments into consideration. We note that section 1848(q)(2)(C)(iv) of the Act does not

grant the Secretary discretion to exempt non-patient facing MIPS eligible clinicians from a performance category entirely, but rather to apply to the extent feasible and appropriate alternative measures or activities that fulfill the goals of the applicable performance category. However, we have placed safeguards to ensure that MIPS eligible clinicians, including those who are non-patient facing, who do not have sufficient alternative measures that are applicable and available in a performance category are scored appropriately. We proposed to apply the Secretary's authority under section 1848(q)(5)(F) of the Act to re-weight such performance categories score to zero if there is no performance category score or to lower the weight of the quality performance category score if there are not at least three scored measures. Please refer to section II.E.6.b.(2)(b) in the proposed rule for details on the re-weighting proposals. Accordingly, we proposed alternative requirements for non-patient facing MIPS eligible clinicians across the proposed rule (see sections II.E.5.b., II.E.5.e., and II.E.5.f. of the proposed rule for more details). While non-patient facing MIPS eligible clinicians will not be exempt from any performance category under MIPS, we believe these alternative requirements fulfill the goals of the applicable performance categories and are in line with the commenters' desire to ensure that non-patient facing MIPS eligible clinicians are not placed at an unfair disadvantage under the new program. The requirements also build on prior program components in meaningful ways and are meant to help us appropriately assess and incentivize non-patient facing MIPS eligible clinicians. We requested comments on these proposals.

The following is a summary of the comments we received regarding our proposal that defines non-patient facing MIPS eligible clinicians for MIPS as an individual MIPS eligible clinician or group that bills 25 or fewer patient-facing encounters (including telehealth services) during a performance period.

Comment: A few commenters supported the proposed definition of non-patient facing MIPS eligible clinicians.

Response: We appreciate the support from commenters.

Comment: One commenter requested that pathologists (as identified in PECOS) be automatically identified as non-patient facing MIPS eligible clinicians at the beginning of each year. The commenter noted that it seems reasonable to use PECOS to identify non-patient facing specialties.

Response: We appreciate the commenter expressing the importance for MIPS eligible clinicians to be identified as non-patient facing MIPS eligible clinicians at the beginning of each year. We believe that it would be beneficial for individual MIPS eligible clinicians and groups to know in advance of a performance period whether or not they qualify as a non-patient facing MIPS eligible clinician. For purposes of this section, we are coining the term "non-patient facing determination period" to refer to the timeframe used to assess claims data for making eligibility regarding non-patient facing status. We define the non-patient facing determination period to mean a 24-month assessment period, which includes a two-segment analysis of claims data regarding patient-facing encounters during an initial 12-month period prior to the performance period followed by another 12-month period during the performance period.

The initial 12-month segment of the non-patient facing determination period would span from the last 4 months of a calendar year 2 years prior to the performance period followed by the first 8 months of the next calendar year and include a 60-day claims run out, which will allow us to inform eligible clinicians and groups of their non-patient status during the month (December) prior to the start of the performance period. We believe that the initial non-patient facing determination period enables us to make eligibility determinations based on 12 months of data that is as close to the performance period as possible while informing eligible clinicians of their non-patient facing status prior to the performance period. The second 12-month segment of the non-patient facing determination period would span from the last 4 months of a calendar year 1 year prior to the performance period followed by the first 8 months of the performance period in the next calendar year and include a 60-day claims run out, which will allow us to inform additional eligible clinicians and groups of their non-patient status during the performance period.

Thus, for purposes of the 2019 MIPS payment adjustment, we will initially identify individual eligible clinicians and groups who are considered non-patient facing MIPS eligible clinicians based on 12 months of data starting from September 1, 2015 to August 31, 2016. In order to account for the identification of additional individual eligible clinicians and groups that may qualify as non-patient facing during the 2017 performance period, we will conduct another eligibility

determination analysis based on 12 months of data starting from September 1, 2016 to August 31, 2017.

Comment: One commenter requested that CMS consider allowing physicians in other specialties to declare by exception that they deserve a similar exemption as those that are identified in the proposed rule as non-patient facing MIPS eligible clinicians, which can be confirmed by CMS through coding analysis.

Response: We disagree with the approach described by the commenter because the statute does not provide discretion in establishing exclusions other than the three exclusions specified in section II.E.3. of this final rule with comment period. Also, we note that non-patient facing MIPS eligible clinicians are identified based on an analysis we conduct using claims data to determine such status; this is not a status that clinicians make an election for purposes of MIPS.

Comment: Many commenters expressed concerns that the threshold set forth in the proposed definition of a non-patient facing MIPS eligible clinician (for example, an individual MIPS eligible clinician or group that bills 25 or fewer patient-facing encounters during a performance period) was too low. The commenters believed that many clinicians in certain specialties would be classified as patient-facing even though clinicians in those specialties are predominately non-patient facing. One commenter stated that MIPS eligible clinicians with such a low number of patient-facing encounters may not realize they would be considered patient-facing and subject to additional reporting requirements. Many commenters recommended alternative options for establishing a threshold relating to the billing of patient-facing encounters, including the following: A threshold of 50 or fewer patient-facing encounters; a threshold of 100 or fewer patient-facing encounters, which would represent a somewhat larger portion of the MIPS eligible clinician's practice, averaging approximately two patient-facing encounters per week; and a threshold of 150 or fewer billed Medicare patient-facing encounters. Other commenters suggested that CMS consider automatically designating certain specialties, such as anesthesiology or radiology, as non-patient facing unless a clinician in such specialty bills more than 100 patient-facing encounters. One commenter suggested that CMS base the threshold on a percentage of patients seen (for example, 80 percent of services furnished are determined to be non-patient facing) or claims or allowed

charges (for example, 85 percent of claims or charges are for non-patient facing services), or a combination of the two percentage-based options.

Response: We thank the commenters for expressing their concerns and recommendations regarding the proposed threshold used to define a non-patient facing MIPS eligible clinician. Based on the comments indicating that the proposed threshold would misclassify certain specialties that are predominately non-patient facing, and in order to more accurately identify MIPS eligible clinicians who are non-patient facing, we are modifying our proposal and increasing the threshold to determine when a MIPS eligible clinician is considered non-patient facing. Therefore, we are finalizing a modification to our proposal to define a non-patient facing MIPS eligible clinician as an individual MIPS eligible clinician that bills 100 or fewer patient-facing encounters (including Medicare telehealth services defined in section 1834(m) of the Act) during the non-patient facing determination period, and a group provided that more than 75 percent of the NPIs billing under the group's TIN meet the definition of a non-patient facing individual MIPS eligible clinician during the non-patient facing determination period. We believe that the 100 or fewer billed patient-facing encounters as a threshold more accurately reflects a differentiation of annual patient-facing encounters between MIPS eligible clinicians who furnish a majority of patient-facing services and considered patient-facing and MIPS eligible clinicians who provide occasional patient-facing services that do not reflect the bulk of services provided by the practice or would traditionally be considered non-patient facing. This modified threshold that applies at the individual level would reduce the risk of identifying individual MIPS eligible clinicians as patient-facing who would otherwise be considered non-patient facing. Similarly, the modified threshold that applies at the group level as previously noted, would reduce the risk of identifying groups as patient-facing that would otherwise be considered non-patient facing. Also, we considered increasing the threshold based on different approaches. As previously described, one option was basing the definition of a non-patient facing MIPS eligible clinician on a set percentage of patient-facing encounters, such as 5 to 10 percent, that was tied to the same list of patient-facing encounter codes discussed in this section of the final rule

with comment period. We did not pursue this approach because a percentage would not apply consistency, which could miscategorize MIPS eligible clinicians who would otherwise be considered patient-facing. Another option we considered was the identification of non-patient facing MIPS eligible clinicians only by specialty, which might be a simpler approach. However, we did not consider this approach sufficient for identifying all the possible non-patient facing MIPS eligible clinicians, as some patient-facing MIPS eligible clinicians practice in multi-specialty practices with non-patient facing MIPS eligible clinician's practices with different specialties. We would likely have had to develop a separate process to identify non-patient facing MIPS eligible clinicians in other specialties, whereas maintaining a single definition that is aligned across performance categories is simpler. Thus, we did not modify our approach along these lines.

Comment: In regard to the illustrative list of specific types of clinicians within the non-patient facing spectrum outlined in the proposed rule, one commenter requested that CMS remove the reference to anesthesiologist supervision and ensure that the Quality Payment Program would not impose any unnecessary supervision. The commenter noted that physician supervision of nurse anesthetists did not improve care outcomes and was therefore unnecessary. Another commenter stated that most anesthesiologists should be designated as non-patient facing and recommended that CMS reconsider the non-patient facing determination criteria while another commenter requested that CMS ensure the equal treatment of certified registered nurse anesthetists and anesthesiologists when determining who qualifies as a non-patient facing MIPS eligible clinician. One commenter suggested that CMS publish the list of patient-facing services as quickly as possible in order for anesthesiologists to determine if they are considered non-patient facing MIPS eligible clinicians. The commenter requested that CMS provide details on how it estimated that a majority of anesthesiologists would qualify as non-patient facing.

Response: We appreciate the suggestions from commenters regarding the types of MIPS eligible clinicians to be considered non-patient facing. We want to clarify that our proposed definition of a non-patient facing MIPS eligible clinician did not include the identification of any specific type of physician or clinician specialty, and note that the statutory definition of an

anesthesiologist does not specify a supervision requisite as a requirement. However, our proposed definition of a non-patient facing MIPS eligible clinician is based on a methodology that would allow us to more accurately identify MIPS eligible clinicians who are non-patient facing by applying a threshold to recognize that a MIPS eligible clinician who furnishes almost exclusively non-patient facing services should be treated as a non-patient facing MIPS eligible clinician despite furnishing a small number of patient-facing services. Our methodology used to identify non-patient facing MIPS eligible clinicians included a quantitative, comparative analysis of claims and HCPCS code data. Contrary to the commenter's belief, we believe that our proposed definition of a non-patient facing clinician would not capture the majority of MIPS eligible clinicians or groups within specialties such as anesthesiology, pathology, radiology, and nuclear medicine who may provide a small portion of services that would be considered patient-facing, but would otherwise be considered non-patient facing MIPS eligible clinicians. As a result of this dynamic, we are finalizing a modification to our proposed definition of a non-patient facing MIPS eligible clinician. As previously noted, we will identify MIPS eligible clinicians who are considered non-patient facing in advance of the performance period.

Comment: One commenter requested that MIPS eligible clinicians within the interventional pain management specialty be exempt from negative, but not positive, MIPS payment adjustments. The commenter noted that MIPS will destroy independent practices and increase the costs of Medicare, making Medicare insolvent even sooner than expected.

Response: We thank the commenter for the suggestion. We note that the statute does not grant the Secretary discretion to exclude non-patient facing MIPS eligible clinicians from the requirement to participate in MIPS. However, non-patient facing MIPS eligible clinicians will benefit from other policies that we are finalizing throughout this final rule with comment period such as reduced performance requirements and lower performance threshold. Accordingly, we describe alternative requirements for non-patient facing MIPS eligible clinicians across this final rule with comment period (see sections II.E.5.b., II.E.5.e., and II.E.5.f. of this final rule with comment period for more details). We disagree with the comment regarding MIPS negatively impacting independent practices. We

believe that independent practices will benefit from other policies that we are finalizing throughout this final rule with comment period such as reduced performance requirements and lower performance threshold.

Comment: One commenter requested that CMS abandon the term “non-patient facing” in reference to MIPS eligible clinicians or physician specialties. The commenter indicated that the patient-facing/non-patient facing terminology is appropriate for describing the Current Procedural Terminology (CPT) code, but not appropriated for describing a clinician relative to quality improvement.

Another commenter recommended that CMS consider an alternative term to “non-patient facing” as it applies to anesthesiologists. One commenter expressed concern that the term non-patient facing diminishes the importance of specialists.

Response: We appreciate the commenters expressing their concerns regarding the use of the term “non-patient facing” and as a result of the concerns from commenters, we are interested in obtaining further input from stakeholders regarding potential terms that could be used to describe “non-patient facing” under MIPS. Therefore, we are seeking additional comment on modifying the terminology used to reference “non-patient facing” MIPS eligible clinicians for future consideration. What alternative terms could be used to describe “non-patient facing”?

Comment: One commenter indicated that the proposed definition of non-patient facing clinicians is overly stringent and does not recognize a number of “hybrid” physicians such as nuclear cardiologists, who split time between patient-facing and non-patient facing activity. The commenter requested an alternative pathway for “hybrid” physicians in order for nuclear cardiologists and others to successfully participate in MIPS, which is important for medical specialists with no alternative payment models. As an interim solution, the commenter requested that the reporting period be shortened and be flexibility for MIPS eligible clinicians to select the reporting period within the applicable calendar year.

Response: We thank the commenter for expressing concerns and recognize that MIPS eligible clinicians in certain specialties may not have a majority of their services categorized as non-patient facing. We want to ensure that MIPS eligible clinicians, including non-patient facing MIPS eligible clinicians are able to participate in MIPS

successfully and thus, in this final rule with comment period, we not only establish requirements for MIPS eligible clinicians in each performance category, but we apply, to the extent feasible and appropriate, alternative measures or activities that fulfill the goals of each performance category. In sections II.E.5.b., II.E.5.e., and II.E.5.f. of this final rule with comment period, we describe the alternative requirements for non-patient facing MIPS eligible clinicians. Also, as described in section II.E.4. of this final rule with comment period, we are finalizing a modification to the MIPS performance period to be a minimum of one continuous 90-day period within CY 2017.

Comment: Several commenters indicated that the definition of a non-patient facing MIPS eligible clinician is inadequate since the definition is dependent on the codes that define patient-facing encounters, which are not yet available. The commenters requested that CMS provide the applicable CPT codes as soon as possible in order for affected MIPS eligible clinicians to have sufficient time to assess the alignment of the codes. One commenter recommended that only evaluation and management services (the denominators of the cross-cutting measures as specified in Table C: Proposed Individual Quality Cross-Cutting Measures for the MIPS to Be Available to Meet the Reporting Criteria Via Claims, Registry, and EHR Beginning in 2017 of the proposed rule (81 FR 28447 through 28449)) be considered when determining whether a MIPS eligible clinician provides face-to-face services. The commenter indicated that the inclusion of other services, particularly 000 global codes, will inappropriately classify many radiologists as patient-facing and put small and rural practices at a distinct disadvantage.

Response: We thank the commenters for their support and expressing their concerns. While we did not propose specific patient-facing encounter codes in the proposed rule, we considered a patient-facing encounter to be an instance in which the MIPS eligible clinician or group billed for items and services furnished such as general office visits, outpatient visits, and procedure codes under the PFS. We agree with the commenters that a non-patient facing MIPS eligible clinician is identified based on the evaluation and management of services, which reflects the list of patient-facing encounter codes. We note that the denominators, as specified in Table C of the proposed rule, used for determining the non-patient facing status of MIPS eligible

clinicians are the same as the denominators of the cross-cutting measures. Based on our experience with PQRS, we believe that the use of patient-facing encounter codes is the most appropriate approach for determining whether or not MIPS eligible clinicians are non-patient facing. We intend to publish a list of patient-facing encounters on the CMS Web site located at QualityPaymentProgram.cms.gov.

In regard to the comment pertaining to misclassification, we note that the definition of non-patient facing MIPS eligible clinicians creates a minimum threshold for the quantity of patient-facing encounters that MIPS eligible clinicians or groups would need to furnish to be considered patient-facing, rather than classifying MIPS eligible clinicians as patient-facing based on a single patient-facing encounter. This approach allows for the definition of non-patient facing MIPS eligible clinicians to include both MIPS eligible clinicians who practice within specialties traditionally considered non-patient facing as well as MIPS eligible clinicians who provide occasional patient-facing services that do not represent the bulk of their practices. We believe our modified policy will allow us to more accurately identify MIPS eligible clinicians who are non-patient facing by applying a threshold in recognition of the fact that a MIPS eligible clinician who furnishes almost exclusively non-patient facing services should be treated as a non-patient facing MIPS eligible clinician despite furnishing a small number of patient-facing services.

Comment: One commenter requested clarification on whether or not the definition of a patient-facing encounter includes procedures such as peripheral nerve blocks (64400–64530) and epidural injections (62310–62319).

Response: We intend to publish the list of patient-facing encounters on the CMS Web site located at QualityPaymentProgram.cms.gov,

which will include procedures such as peripheral nerve blocks (64400–64530) and epidural injections (62310–62319).

Comment: One commenter requested that CMS justify how 25 or fewer patient-facing encounters was determined as the threshold for non-patient facing MIPS eligible clinicians.

Response: As previously noted, we believed that setting the non-patient facing MIPS eligible clinician threshold for individual MIPS eligible clinician or group at 25 or fewer billed patient-facing encounters during a performance period was appropriate. We selected this threshold based on an analysis of

non-patient facing HCPCS codes billed by MIPS eligible clinicians. Using these codes and this threshold, we determined that approximately one quarter of MIPS eligible clinicians would be identified as non-patient facing before MIPS exclusions, such as the low-volume threshold and new Medicare-enrolled eligible clinician policies, were applied. Based on our analysis, a significant portion of clinicians enrolled in Medicare with specialties such as anesthesiology, nuclear medicine, and pathology were identified as non-patient facing in this analysis. We believe that our approach allows the definition of non-patient facing MIPS eligible clinicians, to include both MIPS eligible clinicians who practice within specialties traditionally considered non-patient facing, as well as MIPS eligible clinicians who provide occasional patient-facing services that do not represent the bulk of their practices.

However, as discussed above, we are finalizing a modification to our proposal to define a non-patient facing MIPS eligible clinician as an individual MIPS eligible clinician that bills 100 or fewer patient-facing encounters (including Medicare telehealth services defined in section 1834(m) of the Act) during the non-patient facing determination period, and a group provided that more than 75 percent of the NPIs billing under the group's TIN meet the definition of a non-patient facing individual MIPS eligible clinician during the non-patient facing determination period. When we applied our prior methodology to make determinations at the group level, the percentage of MIPS eligible clinicians classified as non-patient facing at the group level was higher because at the group level, MIPS eligible clinicians with less than 100 encounters who would otherwise be considered patient-facing (for example, pediatricians) are included in the group level calculation for the non-patient facing determination. Thus, there would be more specialists classified as non-patient facing when we make determinations at the group level, particularly when the percentage of specialists identified as non-patient facing at the group level is compared to the overall percentage of individual MIPS eligible clinicians. We note that the reason for the increase in the number of non-patient facing determinations is due to individual MIPS eligible clinicians in groups who have with less than 100 encounters would be classified as non-patient

facing and would otherwise be considered patient-facing.

Comment: Several commenters disagreed with CMS's proposal to apply the same billing threshold for patient-facing encounters to both individual MIPS eligible clinicians and groups. One commenter noted that such a policy would force groups of non-patient facing MIPS eligible clinicians to be required to report on inapplicable outcomes and cross-cutting measures if several individuals' rare face-to-face patient encounters are summed as a group (for example, a group of 10 physicians with 2 to 3 face-to-face patient encounters per year per MIPS eligible clinician). Another commenter specifically indicated that if the proposed non-patient facing threshold is applied at a group level, specialties such as diagnostic radiology, pathology, nuclear medicine, and anesthesiology would be considered patient-facing even though practices in these specialties could be considered non-patient facing if evaluated individually.

A few commenters indicated that when the proposed threshold is applied to groups without scaling the threshold by the number of clinicians in a group, a single individual clinician could push the entire group into the patient-facing category, even if the other individual clinicians in the group would, otherwise, be considered non-patient facing. One commenter indicated that the proposed definition of a non-patient facing MIPS eligible clinician would impact small and rural practices whose general radiologists perform more interventional procedures even though such patient-facing encounters represent only a very small fraction of the group's total Medicare services.

Several commenters provided alternative options for determining how the definition of non-patient facing MIPS eligible clinicians could be applied to groups. One commenter suggested scaling the patient-facing encounter threshold by the number of clinicians in a group practice while another commenter suggested doing so by patient-facing encounter codes. A few other commenters recommended one or more of the following alternatives: (1) Apply a patient-facing encounter threshold that is proportional to the group size, and, for non-patient facing MIPS eligible clinicians who meet the definition, identify such MIPS eligible clinicians at the beginning of the performance year; (2) classify groups based on whether the majority of individual MIPS eligible clinicians meet the threshold; (3) compare a group's average number of patient-facing encounters to the threshold, where a

group's average would be defined by the total number of patient-facing encounters billed by the group divided by the number of MIPS eligible clinicians in the group and as a result, would not be skewed by a few MIPS eligible clinicians; or (4) redefine a non-patient facing MIPS eligible clinician by using the threshold of 50 or fewer patient-facing encounters per individual such that, if 51 percent or more members of the group individually fall below the threshold, then the entire group is considered non-patient facing.

Response: We thank the commenters for expressing their concerns regarding the proposed definition of a non-patient facing MIPS eligible clinician. Based on the comments received, we recognize that having a similar threshold applied at the individual and group levels would inadvertently identify groups composed of certain specialties or multi-specialties as patient-facing that would traditionally be considered non-patient facing or provide occasional patient-facing services that do not represent the bulk of their group. Thus, we are modifying our proposed definition of a non-patient facing MIPS eligible clinician to establish two separate thresholds that apply at the individual and group level.

Specifically, we are modifying our proposal to define a non-patient facing MIPS eligible clinician for MIPS as an individual MIPS eligible clinician that bills 100 or fewer patient-facing encounters (including Medicare telehealth services defined in section 1834(m) of the Act) during the non-patient facing determination period, and a group provided that more than 75 percent of the NPIs billing under the group's TIN meet the definition of a non-patient facing individual MIPS eligible clinician during the non-patient facing determination period.

In regard to the threshold applying at the group level, we recognize that groups vary in size and composition and thus, we believe that a percentage-based approach applies such a threshold equally across all types of groups. Also, we believe that a percentage-based threshold for groups is a more appropriate and accurate approach for distinguishing between groups composed of certain specialty or multi-specialty practices that should be considered non-patient facing. We are establishing a percentage-based threshold pertaining to groups above 75 percent in order to succinctly identify whether or not the majority of services furnished by groups are non-patient facing. We are specifying that more than 75 percent of the NPIs billing under the group's TIN would need to meet the

definition of a non-patient facing individual MIPS eligible clinician in order for the group to be considered non-patient facing because such a threshold is applicable to any group size and composition and clearly delineates which groups furnish primarily non-patient facing services while remaining consistent with the individual-level threshold. For purposes of defining a non-patient facing MIPS eligible clinician as it relates to groups, we believe that more than 75 percent is an adequate percentage threshold. Based on the comments received regarding the establishment of a separate non-patient facing threshold for groups, we are seeking additional comment on our modified policy for future consideration, which determines that a group would be considered non-patient facing if more than 75 percent of the NPIs billing under the group's TIN meet the definition of a non-patient facing individual MIPS eligible clinician during the non-patient facing determination period.

Comment: One commenter indicated that clarification is needed on how the requirements for each performance category would apply to clinicians who do not have face-to-face encounters with patients.

Response: We refer readers to sections II.E.5.b., II.E.5.e., and II.E.5.f. of this final rule with comment period, which describe the requirements for each performance category pertaining to non-patient facing MIPS eligible clinicians.

Comment: One commenter inquired about whether or not CMS would be able to distinguish claims for patient-facing encounters from claims for non-patient facing encounters to ensure that Part B claims for non-patient facing encounters are not subject to the MIPS payment adjustment.

Response: The statute makes it clear that the MIPS payment adjustment applies to the amount otherwise paid under Medicare Part B charges with respect to items and services furnished by a MIPS eligible clinician during a year. We note that here is no carve-out for amounts paid for claims for non-patient facing services given that the statute does not grant the Secretary discretion to establish such a carve-out through rulemaking.

Comment: One commenter requested that CMS include safeguards that prevent unintended consequences of scoring newly introduced quality measures. Specifically, the commenter indicated that the three proposed population-based measures have rarely been, or ever, reported by physician anesthesiologists. The three measures—Acute Conditions Composite (Bacterial

Pneumonia, Urinary Tract Infection and Dehydration), Chronic Conditions Composite (Diabetes, Chronic Obstructive Pulmonary Disease or Asthma, Heart Failure) and All-cause Hospital Readmission Measure are measures that the physician anesthesiologist would have little control over, especially since these measures are calculated by CMS using administrative claims data. The commenter indicated that the use of these measures would place anesthesiology at a disadvantage to other MIPS eligible clinicians. The commenter expressed concern that attribution of these measures to individual physician anesthesiologists may prove to be equally or less transparent than current measures under VM.

Response: We appreciate the commenter's concerns and note that, as discussed in section II.E.5.b.(4) of this final rule with comment period, we are establishing alternative requirements under the quality performance category for non-patient facing MIPS eligible clinicians. As discussed in section II.E.6.b.(2) of this final rule with comment period, we may re-weight performance categories if there are not sufficient measures applicable and available for each MIPS eligible clinician in order to ensure that all MIPS eligible clinicians, including those who are non-patient facing, are scored appropriately. Lastly, as discussed in section II.E.5.b.(6) of this final rule with comment period, we note that 2 of the 3 proposed population measures are not being finalized. In section II.E.8.e. of this final rule with comment period, we describe a validation process for claims and registry submissions to validate whether MIPS eligible clinicians have submitted all applicable measures when MIPS eligible clinicians submit fewer than six measures.

Comment: One commenter requested clarification on how MIPS incentives or penalties would be applied when facilities (for example, hospitals) bill and collect the Medicare Part B payments through reassignment from their hospital-based MIPS eligible clinicians. The commenter indicated that as hospitals continue to employ primary care clinicians and specialists and bill payers on their behalf, hospitals are concerned that their Medicare Part B payments will be subject to MIPS payment adjustments for poor final scores. The commenter inquired about whether a hospital-based clinician would be required to participate in MIPS. The commenter recommended that CMS consider the consequences of applying a MIPS payment adjustment

factor that may adversely affect financially vulnerable hospitals, such as safety net hospitals.

Response: We appreciate the commenter expressing concerns. We note that the requirements described in this final rule with comment period apply to MIPS eligible clinicians participating in MIPS as individual MIPS eligible clinicians or groups and do not apply to hospitals directly. In regard to the commenter's concern about the MIPS payment adjustment affecting financially vulnerable hospitals and safety net hospitals, section 1848(q)(6)(E) of the Act provides that the MIPS payment adjustment is applied to the amount otherwise paid under Part B for the items and services furnished by a MIPS eligible clinician during a year (beginning with 2019). Thus, the MIPS payment adjustment would apply to payments made for items and services furnished by MIPS eligible clinicians for Medicare Part B charges billed such as those under the PFS, but it would not apply to the facility payment to the hospital itself under the inpatient prospective payment system (IPPS) or other facility-based payment methodology. We refer readers to sections II.E.1.c. and II.E.1.d. of this final rule with comment period, which address MIPS eligible clinicians who practice in Method I CAHs, Method II CAHs, RHCs, and FQHCs.

Comment: A commenter suggested that CMS focus on inpatient care, rather than outpatient care, because savings are more achievable in the inpatient setting (particularly in the last 6 months of life). The commenter noted that the MIPS program should track hospitals, rather than clinicians.

Response: We appreciate the suggestions from the commenter and will consider them into consideration in future rulemaking.

Comment: Several commenters supported the inclusion of telehealth services as patient-facing encounters. A few commenters described the potential benefits of telehealth, including: Increasing access to health care services that otherwise may not be available to many patients, reducing avoidable hospitalizations for nursing facility residents who otherwise may not receive early enough treatment, and providing an option to help address clinician shortages. Another commenter expressed concern that telehealth would become common and is not a viable substitute for face-to-face patient care.

A few commenters discussed the definition of telehealth. One commenter recommended a revision to the current Medicare telehealth definition to reflect simple, plain language for MIPS

reporting and suggested the following, "Telehealth means a health care service provided to a patient from a provider at other location." Another commenter requested that CMS define and adopt a technology neutral definition of telehealth that would allow MIPS eligible clinicians to report the full range of evidence-based telehealth services they provide, rather than limiting MIPS telehealth reporting to be "Medicare eligible telehealth services" as defined at 42 CFR 410.78. One commenter requested that CMS expand the definition, use, and reporting of telehealth services, and clearly distinguish between MIPS eligible clinicians who are and are not patient-facing (for example, radiology, physician-to-physician consult). Another commenter suggested that CMS publish, at the beginning of a performance year, a comprehensive list of each telehealth service cross-mapped to whether it is determined to be patient-facing or non-patient facing.

Also, a few commenters recommended that telehealth services should be restricted to true direct patient encounters (which would count toward a threshold of patient-facing encounters) and exclude the use of telehealth services by clinicians to consult with one another. One commenter disagreed with the eligibility criteria for telehealth services in contributing towards the scoring of the four performance categories and recommended that CMS treat telehealth services the same as all other in-person services for purposes of calculating MIPS program requirements.

Response: We appreciate the support from commenters regarding our proposal to include telehealth services in the definition of patient-facing encounters. We note that telehealth services means the Medicare telehealth services defined in section 1834(m) of the Act. Under the PFS and for purposes of this final rule with comment period, Medicare telehealth services that are evaluation and management services (the denominators for the cross-cutting measures) are considered patient-facing encounters, which will be made available at *QualityPaymentProgram.cms.gov*. The list of all Medicare telehealth services is located on the CMS Web site at <https://www.cms.gov/Medicare/Medicare-General-Information/Telehealth/Telehealth-Codes.html>. For eligible telehealth services, the use of telecommunications technology (real-time audio and video communication) substitutes for an in-person encounter. Services furnished with the use of telecommunications technology that do not use a real-time

interactive communication between a patient and clinician are not considered telehealth services. Such services encompass circumstances in which a clinician would be able to assess an aspect of a patient's condition without the presence of the patient or without the interposition of another clinician. In regard to the recommendation from commenters requesting CMS to modify the definition of telehealth, we note that section 1834(m) of the Act defines Medicare telehealth services and we believe this is the appropriate definition for purposes of delineating the scope of patient-facing encounters.

Comment: One commenter requested that the registration process for non-patient facing MIPS eligible clinicians be very clear, and noted that it is difficult to register in more than one place with multiple logins and passwords. The commenter requested that CMS make sure that the personnel handling the Quality Payment Program Service Center have knowledge of areas such as pathology and radiology. The commenter also recommended that CMS reach out to the specialty clinician community in order for specialists to know that they need to register.

Response: We did not propose a registration process for non-patient facing MIPS eligible clinicians. All MIPS eligible clinicians who meet the definition of a non-patient facing MIPS eligible clinician will be considered non-patient facing for the duration of a performance period. In order for non-patient facing MIPS eligible clinicians to know in advance of a performance period whether or not they qualify as a non-patient facing MIPS eligible clinician, we will identify non-patient facing individual MIPS eligible clinicians and groups based on the 24-month non-patient facing determination period. The non-patient facing determination period has an initial 12-month segment that would span from the last 4 months of a calendar year 2 years prior to the performance period followed by the first 8 months of the next calendar year and include a 60-day claims run out, which will allow us to inform MIPS eligible clinicians and groups of their non-patient facing status during the month (December) prior to the start of the performance period.

For purposes of the 2019 MIPS payment adjustment, we will initially identify individual MIPS eligible clinicians and groups who are considered non-patient facing MIPS eligible clinicians based on 12 months of data starting from September 1, 2015 to August 31, 2016. In order to account for the identification of additional individual MIPS eligible clinicians and

groups that may qualify as non-patient facing during the 2017 performance period, we will conduct another eligibility determination analysis based on 12 months of data starting from September 1, 2016 to August 31, 2017. In regard to the suggestion regarding the Quality Payment Program Service Center, we strive to ensure that any MIPS eligible clinician or group that will seek assistance through the Quality Payment Program Service Center will be provided with adequate and consistent information pertaining to the various components of MIPS.

After consideration of the public comments we received, we are finalizing a modification to our proposal to define a non-patient facing MIPS eligible clinician for MIPS at § 414.1305 as an individual MIPS eligible clinician that bills 100 or fewer patient-facing encounters (including Medicare telehealth services defined in section 1834(m) of the Act) during the non-patient facing determination period, and a group provided that more than 75 percent of the NPIs billing under the group's TIN meet the definition of a non-patient facing individual MIPS eligible clinician during the non-patient facing determination period. As noted above, we believe that it would be beneficial for individual MIPS eligible clinicians and groups to know in advance of a performance period whether or not they qualify as a non-patient facing MIPS eligible clinician.

We establish the non-patient facing determination period for purposes of identifying non-patient facing MIPS eligible clinicians in advance of the performance period using historical claims data. This eligibility determination process will allow us to identify non-patient facing MIPS eligible clinicians prior to or shortly after the start of the performance period. In order to conduct an analysis of the data prior to the performance period, we are establishing an initial non-patient facing determination period consisting of 12 months. The initial 12-month segment of the non-patient facing determination period would span from the last 4 months of a calendar year 2 years prior to the performance period followed by the first 8 months of the next calendar year and include a 60-day claims run out, which will allow us to inform MIPS eligible clinicians and groups of their non-patient facing status during the month (December) prior to the start of the performance period. The second 12-month segment of the non-patient facing determination period would span from the last 4 months of a calendar year 1 year prior to the performance period followed by the first

8 months of the performance period in the next calendar year and include a 60-day claims run out, which will allow us to inform additional eligible clinicians and groups of their non-patient status during the performance period.

Thus, for purposes of the 2019 MIPS payment adjustment, we will initially identify individual MIPS eligible clinicians and groups who are considered non-patient facing MIPS eligible clinicians based on 12 months of data starting from September 1, 2015 to August 31, 2016. In order to account for the identification of additional individual MIPS eligible clinicians and groups that may qualify as non-patient facing during the 2017 performance period, we will conduct another eligibility determination analysis based on 12 months of data starting from September 1, 2016 to August 31, 2017.

Similarly, for future years, we will conduct an initial eligibility determination analysis based on 12 months of data (consisting of the last 4 months of the calendar year 2 years prior to the performance period and the first 8 months of the calendar year prior to the performance period) to determine the non-patient facing status of individual MIPS eligible clinicians and groups, and conduct another eligibility determination analysis based on 12 months of data (consisting of the last 4 months of the calendar year prior to the performance period and the first 8 months of the performance period) to determine the non-patient facing status of additional individual MIPS eligible clinicians and groups. We will not change the non-patient facing status of any individual MIPS eligible clinician or group identified as non-patient facing during the first eligibility determination analysis based on the second eligibility determination analysis. Thus, an individual MIPS eligible clinician or group that is identified as non-patient facing during the first eligibility determination analysis will continue to be considered non-patient facing for the duration of the performance period regardless of the results of the second eligibility determination analysis. We will conduct the second eligibility determination analysis to account for the identification of additional, previously unidentified individual MIPS eligible clinicians and groups that are considered non-patient facing.

In addition, we consider a patient-facing encounter as the evaluation and management services (the denominators for the cross-cutting measures). Lastly, as noted above, we are finalizing our proposal to include Medicare telehealth services (as defined in section 1834(m) of the Act) in the definition of patient-

facing encounters. We intend to publish a list of patient-facing encounters on the CMS Web site located at *Quality PaymentProgram.cms.gov*.

c. MIPS Eligible Clinicians Who Practice in Critical Access Hospitals Billing Under Method II (Method II CAHs)

Section 1848(q)(6)(E) of the Act provides that the MIPS payment adjustment is applied to the amount otherwise paid under Part B for the items and services furnished by a MIPS eligible clinician during a year (beginning with 2019). In the case of MIPS eligible clinicians who practice in CAHs that bill under Method I (“Method I CAHs”), the MIPS payment adjustment would apply to payments made for items and services billed by MIPS eligible clinicians under the PFS, but it would not apply to the facility payment to the CAH itself. In the case of MIPS eligible clinicians who practice in Method II CAHs and have not assigned their billing rights to the CAH, the MIPS payment adjustment would apply in the same manner as for MIPS eligible clinicians who bill for items and services in Method I CAHs.

Under section 1834(g)(2) of the Act, a Method II CAH bills and is paid for facility services at 101 percent of its reasonable costs and for professional services at 115 percent of such amounts as would otherwise be paid under Part B if such services were not included in outpatient CAH services. In the case of MIPS eligible clinicians who practice in Method II CAHs and have assigned their billing rights to the CAHs, those professional services would constitute “covered professional services” under section 1848(k)(3)(A) of the Act because they are furnished by an eligible clinician and payment is “based on” the PFS. Moreover, this is consistent with the precedent CMS has established by applying the PQRS and meaningful use payment adjustments to Method II CAH payments. Therefore, we proposed that the MIPS payment adjustment does apply to Method II CAH payments under section 1834(g)(2)(B) of the Act when MIPS eligible clinicians who practice in Method II CAHs have assigned their billing rights to the CAH. We requested comments on this proposal.

The following is a summary of the comments we received regarding our proposal that the MIPS payment adjustment does apply to Method II CAH payments under section 1834(g)(2)(B) of the Act when MIPS eligible clinicians who practice in Method II CAHs have assigned their billing rights to the CAH.

Comment: One commenter requested clarification regarding whether or not clinicians who are part of a CAH would be considered a group and required to participate MIPS.

Response: We note that clinicians meeting the definition of a MIPS eligible clinician unless eligible for an exclusion, are generally required to participate in MIPS. For MIPS eligible clinicians who practice in Method I CAHs, the MIPS payment adjustment would apply to payments made for items and services that are Medicare Part B charges billed by MIPS eligible clinicians, but it would not apply to the facility payment to the CAH itself. For MIPS eligible clinicians who practice in Method II CAHs and have not assigned their billing rights to the CAH, the MIPS payment adjustment would apply in the same manner as for MIPS eligible clinicians who bill for items and services in Method I CAHs. Moreover, in this final rule with comment period, we are finalizing our proposal that the MIPS payment adjustment does apply to Method II CAH payments under section 1834(g)(2)(B) of the Act when MIPS eligible clinicians who practice in Method II CAHs have assigned their billing rights to the CAH. We note that if a CAH is reporting as a group, then MIPS eligible clinicians part of a CAH would be considered a group as defined at § 414.1305.

Comment: Several commenters stated that CMS must address the problems with Method II Critical Access Hospital reporting prior to Quality Payment Program implementation, particularly relating to the attribution methodology and data capture issues. For example, commenters suggested that CMS examine whether there are mechanisms for better capturing information on MIPS eligible clinicians from the CMS-1450 form. Another commenter expressed concerns that Method II CAH participation in PQRS did not work as planned and the same issues may affect Method II CAH participation in the Quality Payment Program such as attribution issues may arise when any portion of the items and services furnished by eligible clinicians are excluded from Medicare’s claims data database. The commenter believed that cost and quality measures are skewed because most patients attributed to Method II CAH facilities are institutionalized, causing them to appear to have much higher costs and lower quality than the average, and because not all CAH services are reported on CMS-1500 claim forms. Specifically, commenters indicated that Method II CAHs see only a small portion of their services reimbursed

under Medicare Part B, including hospital inpatient, swing bed, nursing home, psychiatric and rehabilitation inpatient, and hospital outpatient services rendered in non-CAH settings. Services rendered for outpatients in the CAH setting (for example provider-based clinic, observation, emergency room, surgery, etc.) are reimbursed through Part A and are exempt from the Quality Payment Program. The commenters noted that this results in beneficiaries who are less acute and low cost to the Medicare program (those seen in clinic settings and those who have avoided inpatient and post-acute care settings) being excluded in the Quality Payment Program attribution, with only potentially high-cost beneficiaries being counted. Therefore, while a CAH-based eligible clinician may have a substantial portion of his or her patient population in a low-cost category, the use of the PQRS attribution methodology for MIPS could still easily result in the MIPS eligible clinician being reported as high-cost if only high-cost patients are included in the Quality Payment Program attribution. The commenters recommended that all Method II CAH ambulatory services be included in the attribution methodology of the Quality Payment Program.

For Method II claims, this would involve scrubbing outpatient claims for services reported with professional revenue codes (96X, 97X and 98X) that are matched up with the applicable CPT codes. Commenters recommended an alternative, in which the Method II CAHs could be benchmarked only against themselves. Commenters indicated that the penalties would be relatively small, given that Method II CAHs bill primarily under Part A, but the publishing of these negative scores on Physician Compare will cause patients to seek care elsewhere, further destabilizing the rural delivery system.

Response: We appreciate the commenters expressing their concerns and note that MIPS eligible clinicians who practice in Method II CAHs may be eligible for the low-volume threshold exclusion, in which such eligible clinicians who do not exceed \$30,000 of billed Medicare Part B allowed charges or 100 Part B-enrolled Medicare beneficiaries would be excluded from MIPS. We believe this exclusion will benefit eligible clinicians who practice in Method II CAHs. We refer readers to section II.E.10. of this final rule with comment period for final policies regarding public reporting on Physician Compare.

Comment: One commenter suggested that CMS delay the start of the MIPS program for MIPS eligible clinicians

who practice in Method II CAHs and have assigned their billing rights to the CAH.

Response: We appreciate the suggestion from the commenter. However, we do not deem it necessary or justifiable to delay the participation of MIPS eligible clinicians who provide services in Method II CAHs and have assigned their billing rights to the CAH given that Method II CAHs were required to participate in PQRS and the Medicare EHR Incentive Program.

Comment: One commenter indicated that many clinicians who practice in Method II CAHs would provide their clinical care in RHCs/FQHCs, and as such, their only qualifying Part B charges would be documented in the CAH's inpatient CEHRT. The commenter noted that while PQRS was mandated for these clinicians, facilities face difficulty creating quality PQRS reports based on extremely limited encounters. The commenter also indicated that it is overly burdensome to require these low-volume "inpatient only" CAH providers to participate in the MIPS program until inpatient CEHRT software is required through the certification process to produce NQF measure reports (on a clinician by clinician basis) relevant to any and all CMS quality programs. The commenter recommended that all clinicians who practice in Method II CAHs be exempt from reporting under MIPS, similar to the provisions established under the EHR Incentive Program that exempt hospital-based EPs from the application of the meaningful use payment adjustment.

Response: We appreciate the concerns expressed by the commenter regarding MIPS eligible clinicians who practice in Method II CAHs and note that clinicians meeting the definition of a MIPS eligible clinician, unless eligible for an exclusion, are generally required to participate in MIPS (section II.E.3. of this final rule with comment period describes the provisions pertaining to the exclusions from MIPS participation). For MIPS eligible clinicians who practice in Method II CAHs and have not assigned their billing rights to the CAH, the MIPS payment adjustment would apply to payments made for items and services billed by MIPS eligible clinicians under the PFS, but it would not apply to the facility payment to the CAH itself. However, for MIPS eligible clinicians who practice in Method II CAHs and have assigned their billing rights to the CAH, the MIPS payment adjustment applies to Method II CAH payments under section 1834(g)(2)(B) of the Act.

In section II.E.5.g.(8)(a)(i) of this final rule with comment period, we noted that CAHs (and eligible hospitals) are subject to meaningful use requirements under sections 1886(b)(3)(B) and (n) and 1814(l) of the Act, respectively, which were not affected by the enactment of the MACRA. CAHs (and eligible hospitals) are required to report on objectives and measures of meaningful use under the EHR Incentive Program, as outlined in the 2015 EHR Incentive Programs final rule. The objectives and measures of the EHR Incentive Programs for CAHs (and eligible hospitals) are specific to these facilities, and are more applicable and better represent the EHR technology available in these settings. Section 1848(a)(7)(D) of the Act exempts hospital-based EPs from the application of the payment adjustment under the EHR Incentive Program and section 1848(a)(7)(B) of the Act provides the authority to exempt an EP who is not a meaningful EHR user from the application of the payment adjustment if it is determined that compliance with the meaningful EHR user requirements would result in a significant hardship, such as in the case of an EP who practices in a rural area without sufficient internet access. The MACRA did not maintain these statutory exceptions for the advancing care information performance category under MIPS. Thus, the exceptions under sections 1848(a)(7)(B) and (D) of the Act are limited to the meaningful use payment adjustment under section 1848(a)(7)(A) of the Act and do not apply in the context of the MIPS program.

Section 1848(q)(5)(F) of the Act provides the authority to assign different scoring weights (including a weight of zero) for each performance category if there are not sufficient measures and activities applicable and available to each type of MIPS eligible clinician, including hospital-based clinicians. Accordingly, as described in section II.E.5.g.(8)(a)(i) of this final rule with comment period, we may assign a weight of zero percentage for the advancing care information performance category for hospital-based MIPS eligible clinicians. Under MIPS, we define a hospital-based MIPS eligible clinician as a MIPS eligible clinician who furnishes 75 percent or more of his or her covered professional services in sites of service identified by the Place of Service (POS) codes 21, 22, and 23 used in the HIPAA standard transaction as an inpatient hospital, on campus outpatient hospital or emergency room setting in the year preceding the performance period. Consistent with the

EHR Incentive Program, we will determine which MIPS eligible clinicians qualify as "hospital-based" for a MIPS payment year.

Comment: One commenter requested that CMS address data capture issues for CAHs that may be required to participate in the MIPS and examine whether there are mechanisms for better capturing information on eligible clinicians from the CMS-1450 form. Some CAHs have reported issues with capturing full information about eligible clinicians from the institutional billing form used by CAHs (UB-04/CMS-1450). Under existing billing rules, CAHs may bill one CMS-1450 per day, with claims from multiple providers are combined into one submission.

Response: We appreciate the commenter expressing these concerns and intend to address operational and system-infrastructure issues experienced under previously established CMS programs and ensure that MIPS eligible clinicians have an improved experience when participating in the MIPS program.

After consideration of the public comments we received, we are finalizing our proposal that the MIPS payment adjustment will apply to Method II CAH payments under section 1834(g)(2)(B) of the Act when MIPS eligible clinicians who practice in Method II CAHs have assigned their billing rights to the CAH.

d. MIPS Eligible Clinicians Who Practice in Rural Health Clinics (RHCs) and/or Federally Qualified Health Centers (FQHCs)

As noted in section II.E.1.d. of the proposed rule (81 FR 28176), section 1848(q)(6)(E) of the Act provides that the MIPS payment adjustment is applied to the amount otherwise paid under Part B with respect to the items and services furnished by a MIPS eligible clinician during a year. Some eligible clinicians may not receive MIPS payment adjustments due to their billing methodologies. If a MIPS eligible clinician furnishes items and services in an RHC and/or FQHC and the RHC and/or FQHC bills for those items and services under the RHC's or FQHC's all-inclusive payment methodology, the MIPS adjustment would not apply to the facility payment to the RHC or FQHC itself. However, if a MIPS eligible clinician furnishes other items and services in an RHC and/or FQHC and bills for those items and services under the PFS, the MIPS adjustment would apply to payments made for items and services. We note that eligible clinicians providing services for a RHC or FQHC as an employee or contractor is paid by

the RHC or FQHC, not under the PFS. When a MIPS eligible clinician furnishes professional services in an RHC and/or FQHC, the RHC bills for those services under the RHC's all-inclusive rate methodology and the FQHC bills for those services under the FQHC prospective payment system methodology, in which the MIPS payment adjustment would not apply to the RHC or FQHC payment. Therefore, we proposed that services rendered by an eligible clinician that are payable under the RHC or FQHC methodology would not be subject to the MIPS payments adjustments. However, these eligible clinicians have the option to voluntarily report on applicable measures and activities for MIPS, in which the data received would not be used to assess their performance for the purpose of the MIPS payment adjustment. We requested comments on this proposal.

The following is a summary of the comments we received regarding our proposal that services rendered by an eligible clinician that are payable under the RHC or FQHC methodology would not be subject to the MIPS payments adjustments.

Comment: Several commenters supported CMS' proposal that items and services furnished by a MIPS eligible clinician that are payable under the RHC or FQHC methodology would not be subject to the MIPS payment adjustments.

Response: We appreciate the support from commenters.

Comment: One commenter noted that it is unclear what the participation requirements are for MIPS eligible clinicians who practice in FQHCs.

Response: In this final rule with comment period, we note that items and services furnished by a MIPS eligible clinician that are payable under the RHC or FQHC methodology would not be subject to the MIPS payments adjustment. These MIPS eligible clinicians have the option to voluntarily report on applicable measures and activities for MIPS. If such MIPS eligible clinicians voluntarily participate in MIPS, they would follow the requirements established for each performance category. We note that the data received from such MIPS eligible clinicians would not be used to assess their performance for the purpose of the MIPS payment adjustment. However, items and services furnished by a MIPS eligible clinician that are billed Medicare Part B charges by the MIPS eligible clinician would be subject to the MIPS payment adjustment. Also, we note that such MIPS eligible clinicians who furnished items and services that

are billed Medicare Part B allowed charges by such MIPS eligible clinicians may be excluded from the requirement to participate in MIPS if they do not exceed the low-volume threshold as described in section II.E.3.c. of this final rule with comment period.

Comment: Several commenters agreed with voluntary reporting of MIPS data for FQHC and RHC clinicians as described in the proposed rule, and recommended that quality reporting requirements should be matched with HRSA measures. Commenters noted that drawing conclusions from the initial data could be problematic based upon coding and documentation differences compared to other clinicians reporting MIPS data. One commenter requested that CMS not request FQHCs and RHCs to voluntarily submit data. The commenter indicated such organizations have neither the IT support nor administrative staff to submit extended data.

Response: We thank the commenters for expressing their concerns regarding the comparability of data submitted by MIPS eligible clinicians who practice in RHCs and FQHCs. We want to reiterate that such MIPS eligible clinicians have the option to decide whether or not they voluntarily participate in MIPS.

Comment: A few commenters requested CMS to ensure that FQHC clinicians are not subject to MIPS for the limited number of FQHC-related claims submitted under the PFS. Alternatively, one commenter requested that fee service claims for non-specialty services furnished by clinicians practicing in FQHCs or RHCs not be counted when determining eligibility for the low-volume threshold.

Response: We appreciate the concern expressed by the commenter and note that section 1848(q)(6)(E) of the Act provides that the MIPS payment adjustment is applied to the amount otherwise billed under Medicare Part B charges with respect to the items and services furnished by a MIPS eligible clinician during a year. With respect to the comment regarding the low-volume threshold, we refer readers to section II.E.3.c. of this final rule with comment period, in which we establish a low-volume threshold to identify MIPS eligible clinicians excluded from participating in MIPS. We disagree with the recommendation that the fee for service claims for non-specialty items and services furnished by clinicians practicing in FQHCs or RHCs should be excluded from the low-volume threshold eligibility determination. We believe that the low-volume threshold established in this final rule with comment period retains as MIPS eligible

clinicians those MIPS eligible clinicians who are treating relatively few beneficiaries, but engage in resource intensive specialties, or those treating many beneficiaries with relatively low-priced services. We can meaningfully measure the performance and drive quality improvement across the broadest range of MIPS eligible clinician types and specialties. Conversely, it excludes MIPS eligible clinicians who do not have a substantial quantity of interactions with Medicare beneficiaries or furnish high cost services. Clinicians practicing in a RHC or FQHC not exceeding the low-volume threshold would be excluded from the MIPS requirements.

Comment: Several commenters indicated that RHCs should be incentivized to participate and report quality data under the Quality Payment Program. One commenter indicated that the voluntary participation option is unlikely to be used without an incentive. Another commenter recommended that CMS conduct a survey of RHCs before it makes the effort to set up a voluntary reporting program that no one is likely to use. The commenter's own survey found that without incentives or penalties, very few RHCs would voluntarily participate in MIPS, and found that an incentive payment of \$10,000 per clinic per year would prompt about half of RHCs to report under MIPS. A few commenters suggested that CMS include RHCs in MIPS, as these are the only primary care system left in the country with no tie to value.

Response: We appreciate the suggestions from commenters and will consider them as we assess the volume of voluntary reporting under MIPS.

Comment: One commenter expressed concern that under CMS' proposal to exclude RHCs from MIPS, RHCs' patients will fail to benefit from the rigorous quality measurement that comparable practices under MIPS program will experience. The commenter is concerned about the growing disparities in quality and life expectancy between rural and urban patients. The commenter notes that the number of RHCs has grown from 400 in 1990 to more than 4,000 today, with new conversions continuing as more rural providers realize they can get paid more than FFS under this model.

Response: We thank the commenter for expressing concerns and note that MIPS eligible clinicians who practice in RHCs and furnish items and services that are payable under the RHC methodology have the option to voluntarily report on applicable measures and activities for MIPS.

Comment: A few commenters requested that consideration be given to phase-in requests for FQHC voluntary reporting to allow for the development of social determinants of health status measure adjustments.

Response: We appreciate the feedback on the role of socioeconomic status in quality measurement. We continue to evaluate the potential impact of social risk factors on measure performance. One of our core objectives is to improve beneficiary outcomes, and we want to ensure that complex patients as well as those with social risk factors receive excellent care.

Comment: A few commenters supported CMS' proposal to be inclusive of rural practices, but encouraged CMS to have special conditions for such rural clinicians that have not participated in PQRS, VM, or the Medicare EHR Incentive Program for EPs in the past and suggested a phased approach for full participation that protects safety net clinicians from downside risk.

Response: We appreciate the support from commenters and note that MIPS eligible clinicians who practice in RHCs and furnish items and services that are payable under the RHC methodology would not be subject to the MIPS payments adjustments for such items and services, but would have the option to voluntarily report on applicable measures and activities for MIPS. For such MIPS eligible clinicians who voluntarily participate in MIPS, the data submitted to CMS would not be used to assess their performance for the purpose of the MIPS payment adjustment.

Comment: One commenter recommended that CMS create a system permitting the voluntary reporting of performance information by excluded clinicians, and that the data reported be used to help define rural-specific measures and standards for these clinicians and for all rural clinicians. Under this system, data would be released only on an aggregate basis, protecting the privacy of individual entities reporting.

Response: We thank the commenter for the suggestions and will consider them as we establish policies pertaining to MIPS eligible clinicians who practice in RHCs and FQHCs in future rulemaking.

Comment: One commenter noted that in certain communities, clinical services are delivered in RHCs, small independent practices and community health centers, in which hospital-based services billed under the PFS may only represent a small portion of total care provided. The commenter requested that CMS develop a method for rural

clinicians such as those practicing in RHCs and FQHCs to have a meaningful avenue to participate in the Quality Payment Program. Another commenter indicated that RHCs, CAHs, and FQHCs were created to assure the availability of health care services to remote and underserved populations, and while a majority of clinicians who practice in RHCs, CAHs, and FQHCs bill under Medicare Part A, may have a limited number of encounters for which services are billed under Medicare Part B. Thus, such clinicians may exceed the low-volume threshold and therefore be subject to the MIPS payment adjustment. The commenter expressed concerns that RHCs, CAHs, and FQHCs would be negatively impacted by having their resources stretched even further if required to meet the requirements under MIPS or be subject to a negative MIPS payment adjustment. The commenter also noted that many RHCs and FQHCs have not implemented EHR technology due to the lack of available resources and struggle to recruit qualified clinicians and staff, and as a result, such clinicians and staff are disproportionately older than the average health care workforce. If RHCs and FQHCs are required to participate in MIPS and meet all requirements or be subject to a negative MIPS payment adjustment, the fiscal resources reduced by either a MIPS payment adjustment or investment in EHR technology would significantly impact and reduce the availability of services available to remote and underserved populations. The commenter recommended that CMS consider permanent exclusions for clinicians practicing in RHCs and FQHCs from the requirement to participate in the MIPS program. One commenter noted that CMS should provide exemptions from entire performance categories, not just individual measures and activities, consider the feasibility of shorter reporting timeframes, and ensure that there are free or low cost reporting options within each MIPS performance category.

Response: We appreciate the commenters expressing their concerns and providing recommendations. We will take into consideration the suggestions from commenters in future rulemaking. We note that the MIPS payment adjustment is limited to items and services furnished by MIPS eligible clinicians for billed Medicare Part B charges such as those under the PFS. We note that MIPS eligible clinicians practicing in RHCs and FQHCs will benefit from other policies that we are finalizing throughout this final rule with

comment period such as the higher low-volume threshold, lower reporting requirements, and lower performance threshold.

Comment: One commenter requested clarification on how CMS would define rural areas and suggested that CMS adopt a consistent definition for the term “small practices” across all CMS programs. The commenter suggested that a small practice be defined as having 25 or fewer clinicians. Another commenter recommended that the low-volume threshold be set at an even higher level for rural and underserved areas to ensure that MIPS does not endanger the financial stability of rural safety net practices or reduce access to services for rural Medicare beneficiaries.

Response: We note that we define rural areas as clinicians in zip codes designated as rural, using the most recent HRSA Area Health Resource File data set available as described in section II.E.5.f.(5) of this final rule with comment period. Also, in section II.E.5.f.(5) of this final rule with comment period, we define small practices as practices consisting of 15 or fewer clinicians. We are finalizing our proposed definition of small practices because the statute provides special considerations for small practices consisting of 15 or fewer clinicians. In regard to the commenter’s suggestion pertaining to the low-volume threshold, we are finalizing a modification to our proposal, which establishes a higher low-volume threshold as described in section II.E.3.c. of this final rule with comment period.

Comment: Some commenters recommended that CMS follow the recommendations of the NQF Report on Performance Measurement for Rural Low-Volume Providers and establish rural peer groups and rural-specific standards for assessment of rural provider performance in all domains. Commenters noted that the NQF developed specific recommendations for how pay-for-performance mechanisms should be implemented for rural providers. The NQF Report on Performance Measurement for Rural Low-Volume Providers sets out both overarching and specific approaches for how rural provider performance measurement should be handled. The NQF Report on Performance Measurement for Rural Low-Volume Providers also makes recommendations about rural performance measures of domains other than quality, including cost. One commenter noted that as rural-specific quality measures are developed, such measures should be both mandatory core measures and elective supplementary measures.

Response: We appreciate the recommendations provided by the commenters and will take them into consideration for future rulemaking.

Comment: One commenter agreed with the goals of the proposed rule, but believed that the proposed rule had one thematic deficiency as a result of the quality reporting constructs, which implied a dichotomy of “primary care” versus “specialist” with the correlate implication that all specialists and specialties impact value of current health care similarly (and generally adversely) and marginalized specialties as leaders in care quality and efficiency improvement. The commenter recommended that CMS create specialty-specific quality and efficiency targets that incentivize specialists caring for high risk, high-cost chronically ill patients to provide the best long-term care and coordinate care with primary care physicians (including chronic care subspecialists practicing across multiple health systems rather than as part of a larger provider entity) with each specialty having specific quality goals and efficiency targets.

Response: We appreciate the feedback from the commenter, but disagree with commenter’s assessment that our policies marginalize specialists. We will take into consideration the recommendations provided by the commenter for future rulemaking.

Comment: Due to complexity of the proposed rule and the extremely short projected turnaround time before the start of the 2017 performance period, a few commenters recommended that Frontier Health Professional Shortage Area (HPSA) clinicians should be exempt from mandatory MIPS/APM participation until 2019, when the program has had a chance to evaluate its successes and failures with respect to larger, more economically stable participants. The commenters suggested that Frontier HPSA clinicians should be allowed to voluntarily participate if they want to, but they should not be penalized due to the low-income, low-population challenges faced in extremely rural areas until payment year 2021 or later.

Response: We note that the statute does not grant the Secretary discretion to establish exclusions other than the three exclusions described in section II.E.3. of this final rule with comment period. Thus, Frontier HPSA clinicians who are MIPS eligible clinicians are required to participate in MIPS. However, we believe that Frontier HPSA clinicians will benefit from other policies that we are finalizing throughout this final rule with comment period such as the higher low-volume

threshold, lower reporting requirements, and lower performance threshold.

After consideration of the public comments we received, we are finalizing our proposal that services rendered by an eligible clinician under the RHC or FQHC methodology, will not be subject to the MIPS payments adjustments. However, these eligible clinicians have the option to voluntarily report on applicable measures and activities for MIPS, in which the data received will not be used to assess their performance for the purpose of the MIPS payment adjustment.

e. Group Practice (Group)

Section 1848(q)(1)(D) of the Act, requires the Secretary to establish and apply a process that includes features of the PQRS group practice reporting option (GPRO) established under section 1848(m)(3)(C) of the Act for MIPS eligible clinicians in a group for purposes of assessing performance in the quality performance category. In addition, it gives the Secretary the discretion to do so for the other three performance categories. Additionally, we will assess performance either for individual MIPS eligible clinicians or for groups. As discussed in section II.E.2.b. of the proposed rule (81 FR 28177), we proposed to define a group at § 414.1305 as a single Taxpayer Identification Number (TIN) with two or more MIPS eligible clinicians, as identified by their individual National Provider Identifier (NPI), who have reassigned their Medicare billing rights to the TIN. Also, as outlined in section II.E.2.c. of the proposed rule (81 FR 28177), we proposed to define an APM Entity group at § 414.1305 identified by a unique APM participant identifier. However, we are finalizing a modification to the definition of a group as described in section II.E.2.b. of this final rule with comment period and finalizing the definition of an APM Entity group as described in section II.E.2.c. of this final rule with comment period.

2. MIPS Eligible Clinician Identifier

To support MIPS eligible clinicians reporting to a single comprehensive and cohesive MIPS program, we need to align the technical reporting requirements from PQRS, VM, and EHR–MU into one program. This requires an appropriate MIPS eligible clinician identifier. We currently use a variety of identifiers to assess an individual eligible clinician or group under different programs. For example, under the PQRS for individual reporting, CMS uses a combination of TIN and NPI to assess eligibility and

participation, where each unique TIN and NPI combination is treated as a distinct eligible clinician and is separately assessed for purposes of the program. Under the PQRS GPRO, eligibility and participation are assessed at the TIN level. Under the Medicare EHR Incentive Program, we utilize the NPI to assess eligibility and participation. And under the VM, performance and payment adjustments are assessed at the TIN level. Additionally, for APMs such as the Pioneer Accountable Care Organization (ACO) Model, we also assign a program-specific identifier (in the case of the Pioneer ACO Model, an ACO ID) to the organization(s), and associate that identifier with individual eligible clinicians who are, in turn, identified through a combination of a TIN and an NPI.

In the MIPS and APMs RFI (80 FR 63484), we sought comments on which specific identifier(s) should be used to identify a MIPS eligible clinician for purposes of determining eligibility, participation, and performance under the MIPS performance categories. In addition, we requested comments pertaining to what safeguards should be in place to ensure that MIPS eligible clinicians do not switch identifiers to avoid being considered “poor-performing” and comments on what safeguards should be in place to address any unintended consequences, if the MIPS eligible clinician identifier were a unique TIN/NPI combination, to ensure an appropriate assessment of the MIPS eligible clinician’s performance. In the MIPS and APMs RFI (80 FR 63484), we sought comment on using a MIPS eligible clinician’s TIN, NPI, or TIN/NPI combination as potential MIPS eligible clinician identifiers, or creating a unique MIPS eligible clinician identifier. The commenters did not demonstrate a consensus on a single best identifier.

Commenters favoring the use of the MIPS eligible clinician’s TIN recommended that MIPS eligible clinicians should be associated with the TIN used for receiving payment from CMS claims. They further commented that this approach will deter MIPS eligible clinicians from “gaming” the system by switching to a higher performing group. Under this approach, commenters suggested that MIPS eligible clinicians who bill under more than one TIN can be assigned the performance and MIPS payment adjustment for the primary practice based upon majority of dollar amount of claims or encounters from the prior year.

Other commenters supported using unique TIN and NPI combinations to identify MIPS eligible clinicians. Commenters suggested many eligible clinicians are familiar with using TIN and NPI together from PQRS and other CMS programs. Commenters also noted this approach can calculate performance for multiple unique TIN/NPI combinations for those MIPS eligible clinicians who practice under more than one TIN. Commenters who supported the TIN/NPI also believed this approach enables greater accountability for individual MIPS eligible clinicians beyond what might be achieved when using TIN as an identifier and would provide a safeguard from MIPS eligible clinicians changing their identifier to avoid payment penalties.

Some commenters supported the use of only the NPI as the MIPS identifier. They believed this approach would best provide for individual accountability for quality in MIPS while minimizing potential confusion because providers do not generally change their NPI over time. Supporters of using the NPI only as the MIPS identifier also commented that this approach would be simplest for administrative purposes. These commenters also note the continuity inherent with the NPI would address the safeguard issue of providers attempting to change their identifier for MIPS performance purposes.

In the MIPS and APMs RFI (80 FR 63484), we also solicited feedback on the potential for creating a new MIPS identifier for the purposes of identifying MIPS eligible clinicians within the MIPS program. In response, many commenters indicated they would not support a new MIPS identifier. Commenters generally expressed concern that a new identifier for MIPS would only add to administrative burden, create confusion for MIPS eligible clinicians and increase reporting errors.

After reviewing the comments, we did not propose to create a new MIPS eligible clinician identifier. However, we appreciated the various ways a MIPS eligible clinician may engage with MIPS, either individually or through a group. Therefore, we proposed to use multiple identifiers that allow MIPS eligible clinicians to be measured as an individual or collectively through a group’s performance. We also proposed that the same identifier be used for all four performance categories; for example, if a group is submitting information collectively, then it must be measured collectively for all four MIPS performance categories: Quality, cost, improvement activities, and advancing care information. As discussed in the

final score methodology section II.E.6. of the proposed rule (81 FR 28247 through 28248), we proposed to use a single identifier, TIN/NPI, for applying the MIPS payment adjustment, regardless of how the MIPS eligible clinician is assessed. Specifically, if the MIPS eligible clinician is identified for performance only using the TIN, we proposed to use the TIN/NPI when applying the MIPS payment adjustment. We requested comments on these proposals.

The following is a summary of the comments we received regarding our proposals to use multiple identifiers that allow MIPS eligible clinicians to be measured as an individual or collectively through a group’s performance and use a single identifier, TIN/NPI, for applying the MIPS payment adjustment.

Comment: Several commenters supported the proposal to have each unique TIN/NPI combination considered a different MIPS eligible clinician and to use the TIN to identify group practices. One commenter noted that using a group’s billing TIN to identify a group is consistent with the current CMS approach under PQRS and VM, and is preferable to creating a new MIPS-specific identifier for groups.

Response: We appreciate the support from commenters.

Comment: One commenter noted that the proposed MIPS identifiers (combination of TIN/NPI, etc.) would be sufficient for individual, group, and APM reporting to MIPS, but requested that CMS establish an identifier for virtual groups. Another commenter questioned the use of these identifiers beyond their original purposes.

Response: We appreciate the feedback from the commenters. We did not propose an identifier for virtual groups, but in future rulemaking, we will take into consideration the establishment of a virtual group identifier. As noted in this final rule with comment period, the use of the identifiers enables us to identify individual MIPS eligible clinicians at the TIN/NPI level and groups at the TIN level.

Comment: A few commenters opposed the approach of creating a new MIPS eligible clinician identifier at the initiation of the Quality Payment Program because it would be premature and cause confusion. The commenter further noted that there may be times when a clinician is not MIPS eligible and then becomes MIPS eligible. Also, the commenter indicated that there is currently not a way to report the identifier on claims.

Response: We disagree with the commenter and believe that it is

essential for us to be able to identify individual MIPS eligible clinicians using a unique identifier because the MIPS payment adjustment would be applied to the Medicare Part B charges billed by individual MIPS eligible clinicians at the TIN/NPI level. We note that we will be able to identify, at the NPI level, individual eligible clinicians who are excluded from the MIPS requirements and not subject to the MIPS payment adjustment for exclusions pertaining to new Medicare-enrolled eligible clinicians and QPs and Partial QPs not participating MIPS. In our analyses of claims data, we will be able to identify individual MIPS eligible clinicians at the TIN/NPI level given that billing is associated with a TIN or TIN/NPI.

Comment: One commenter recommended the use of TINs plus alphanumeric codes as identifiers.

Response: We disagree with the commenter's suggestion to use a TIN with an alphanumeric code because it would add complexity and not facilitate the identification of individual eligible clinicians at the NPI level who are associated with a group at the TIN level. For certain exclusions (for example, new Medicare-enrolled eligible clinicians, and QPs and Partial QPs who are not participating in MIPS), eligibility determinations will be made and applied at the NPI level.

Comment: Several commenters requested that small physician practices be exempt from MIPS. A few commenters indicated that penalizing small practices would decrease access to care for patients. One commenter indicated that small groups and independent physicians are unfairly penalized and are being forced to integrate into larger hospital or corporations. Another commenter expressed concern that additional administrative duties will affect patient care and will not improve healthcare. One commenter indicated that the proposed rule was discriminatory toward solo or small group practices. The commenter noted that the financial burden of MACRA will result in the closure of many solo and small group practitioners.

Response: We appreciate the concerns expressed by the commenters. We note that the statute does not grant the Secretary with discretion to establish exclusions other than the exclusions described in section II.E.3. of this final rule with comment period. However, we believe that small practices will benefit from policies we are finalizing throughout this final rule with comment period such as the higher low-volume threshold, lower performance

requirements, and lower performance threshold.

Comment: A few commenters requested that CMS determine and state eligibility status for clinicians providing services at independent diagnostic testing facilities (IDTFs) and to provide clear, detailed guidance under what circumstances eligibility would occur under MIPS. The commenter noted that CMS has issued similar guidance under the PQRS system of "eligible but not able to participate"; however, the commenter indicated that the guidance provided in PQRS does not address all variations of billing and coding practices of IDTFs.

Response: We note that the MIPS payment adjustment applies only to the amount otherwise paid under Part B with respect to items and services furnished by a MIPS eligible clinician during a year. As discussed in section II.E.7. of this final rule with comment period, we will apply the MIPS adjustment at the TIN/NPI level. In regard to suppliers of independent diagnostic testing facility services, we note that such suppliers are not themselves included in the definition of a MIPS eligible clinician. However, there may be circumstances in which a MIPS eligible clinician would furnish the professional component of a Part B covered service that is billed by such a supplier. Those services could be subject to MIPS adjustment based on the MIPS eligible clinician's performance during the applicable performance period. Because, however, those services are billed by suppliers that are not MIPS eligible clinicians, it is not operationally feasible for us at this time to associate those billed allowed charges with a MIPS eligible clinician at an NPI level in order to include them for purposes of applying any MIPS payment adjustment.

Comment: One commenter expressed concern regarding the definition of a group (unique TIN) because large health systems and hospitals operate large medical groups spanning practices and specialties, and all of them share a TIN and EHRs. The commenter indicated that grouping all clinicians together takes away the advantages of group participation. The commenter noted that CMS should generate another way for group practices to differentiate themselves.

Response: We thank the commenter for expressing their concern. We disagree with the commenter because we believe that group level reporting is advantageous for groups in that it encourages coordination, teamwork, and shared responsibility. However, we recognize that we are not able to

identify groups with eligible clinicians who are excluded from the MIPS requirements both at the individual level and group level such as new Medicare-enrolled clinicians. We note that we could establish new identifiers to more accurately identify such eligible clinicians. For future consideration, we are seeking additional comment on the identifiers. What are the advantages and disadvantages of identifying new Medicare-enrolled eligible clinicians and eligible clinicians not included in the definition of a MIPS eligible clinician until year 3 such as therapists? What are the possible identifiers that could be established for identifying such eligible clinicians?

Comment: One commenter requested clarification about how CMS intends to treat group practices participating in MIPS in regard to satisfying the "hospital-based clinician" definition, and questioned if it would evaluate the group as a whole, or each individual within the group. And if the latter, the commenter questioned if CMS would adopt a process for scoring individuals in a group differently than the overall group. Another commenter requested that CMS consider how the definition of a group, and use of a single TIN, could represent facility-based outpatient therapy clinicians. Currently, many facility-based outpatient clinicians operate under the facility's TIN.

Response: We note that hospital-based MIPS eligible clinicians are considered MIPS eligible clinicians are required to participate in MIPS. However, section II.E.5.g.(8)(a)(i) of this final rule with comment period describes our final policies regarding the re-weighting of the advancing care information performance category within the final score, in which we would assign a weight of zero when there are not sufficient measures applicable and available for hospital-based MIPS eligible clinicians.

In regard to how the definition of a group corresponds facility-based outpatient clinicians, we noted that the MIPS payment adjustment applies only to the amount otherwise paid under Part B with respect to items and services furnished by a MIPS eligible clinician during a year, in which we will apply the MIPS adjustment at the TIN/NPI level (see section II.E.7. of this final rule with comment period). For items and services furnished by such clinicians practicing in a facility that are billed by the facility, such items and services may be subject to MIPS adjustment based on the MIPS eligible clinician's performance during the applicable performance period. For those billed Medicare Part B allowed charges we are

able to associate with a MIPS eligible clinician at an NPI level, such items and services furnished by such clinicians would be included for purposes of applying any MIPS payment adjustment.

Comment: Several commenters recommended that CMS extend groups to include multiple TINs and require that those TINs share and have access to the same EHR. Commenters noted that group reporting would be complicated by clinicians joining the group, and clinicians assigned to multiple TINs using different EHR systems. The commenters also expressed concern about the ability for groups to submit quality data under the group reporting option using different types of EHRs. Commenter requested the submission of multiple specialty specific data sets and to alter the scoring methodology.

Response: We appreciate the commenters expressing their concerns and providing their suggestions. We are finalizing the definition of a group as proposed. We disagree with commenters that the definition of a group should be modified in order to account for operational and technical data mapping issues. We believe that the finalized definition of a group provides groups with the opportunity to utilize its performance data in ways that can improve coordination, teamwork, and shared responsibility.

We do not believe that the definition of a group would create complications for eligible clinicians associated with multiple TINs. We note that individual eligible clinicians would be required to meet the MIPS requirements for each TIN/NPI association unless they are excluded from MIPS based on an exclusion established in section II.E.3. of this final rule with comment period.

Comment: One commenter requested CMS to ensure that each service provided to a patient is associated with the actual clinician furnishing that service.

Response: We note that the MIPS payment adjustment for individual MIPS eligible clinicians is applied to the Medicare Part B payments for items and services furnished by each MIPS eligible clinician. For groups reporting at the group level, scoring and the application of the MIPS payment adjustment is applied at the TIN level for Medicare Part B payments for items and services furnished by the eligible clinicians of the group.

Comment: One commenter supported CMS' proposal for optional group performance tracking and submission, but recommended that CMS provide additional guidelines for clinicians who practice under multiple identifiers. The

commenter requested additional clarification on how MIPS payment adjustments would impact clinicians working under multiple identifiers at multiple organizations.

Response: We appreciate the support from the commenter. As previously noted, individual eligible clinicians who are part of several groups and thus, associated with multiple TINs, such individual eligible clinicians would be required to participate in MIPS for each group (TIN) association unless the eligible clinician (NPI) is excluded from the MIPS. Section II.E.3.e. of this final rule with comment period describes how the exclusion policies relate to groups with eligible clinicians excluded from MIPS.

Comment: With many clinicians practicing within multiple TINs, one commenter suggested that even though it is unclear how multiple-TIN clinicians who choose individual reporting would be scored, CMS should use the clinician's highest TIN performance score for each of the four performance categories. Another commenter requested clarification on how the Quality Payment Program rule will apply to clinicians who work under multiple TINs, including the scenario where one TIN is participating in an ACO and another is not.

Response: We note that groups have to the option to report at the individual or group level. For individual eligible clinicians associated with multiple TINs, the individual eligible clinician will either report at the individual level if the group elects to report at the individual or be included in the group-level reporting if the group elects group-level reporting. As previously noted, individual eligible clinicians who are associated with multiple TINs would be required to participate in MIPS for each group (TIN) association unless the eligible clinician (NPI) is excluded from the MIPS.

Comment: One commenter noted as a reminder to CMS that using TINs as identifiers has caused some problems in the past such as the accuracy of TINs. When TINs are not accurate, performance rates and program metrics may be incorrect. The commenter recommended that CMS establish clear and efficient mechanisms for groups to resolve inconsistencies.

Response: We appreciate the feedback from the commenter and will take into consideration the commenter's suggestions in future rulemaking.

Comment: Several commenters supported the proposal to permit clinicians to report either at the individual or group level. However, one commenter expressed concern about

limitations on the ability of clinicians, in the context of group-level reporting, to report the most appropriate and meaningful specialty measures. Another commenter indicated that it was not clear how group reporting would allow for specialty specific reporting, given the lack of a TIN for individual departments within a larger faculty practice plan or physician group. The commenter noted that this could cause thousands of providers to miss out on the best use of MIPS because their facilities chose reporting measures and activities that would not reflect the care they individually provide. Therefore, the commenter suggested that CMS create a reporting option within MIPS that would allow specialty-specific groups to self-designate as "group" under MIPS even if they were part of the TIN for a larger facility practice plan or physician group. The commenter noted that this would facilitate the comparison of physicians providing a similar mix of procedures for comparison for the purpose of assigning a final score. Another commenter recommended that CMS consider the common business model where large hospitals and health systems acquire multiple physician practices.

Response: We appreciate the support from the commenters. We will consider the recommendations from the commenters in future rulemaking. We note that group-level reporting does not provide the option for groups to report at sub-levels of the group by specialty. We believe that group-level reporting ensures coordination, teamwork, and shared responsibility.

Comment: A few commenters expressed concern regarding MIPS eligible clinicians moving practices in the middle of a reporting period. One commenter recommended that if a clinician changes TINs during the course of a year, their final composite score should be attributed to their final TIN on December 31 of that year. Another commenter indicated that by using a TIN/NPI combination, CMS could accurately match reporting data to an individual clinician because often the NPI of the clinician will not change, and CMS could match the new TIN to ensure accurate attribution.

Response: We appreciate the concerns and suggestions from the commenters and note that individual MIPS eligible clinicians may be associated with more than one TIN during the performance period due to a variety of reasons with differing timeframes. In sections II.E.6. and II.E.7. of this final rule with comment period, we describe how individual MIPS eligible will have their performance assessed and scored and

how the MIPS payment adjustment would be applied if a MIPS eligible clinician changes TINs during the performance period.

Comment: One commenter expressed concern regarding how group size would be calculated, particularly how clinicians that are not subject to MIPS would be included in the size of the group.

Response: CMS does not make an eligibility determination regarding a group size. We note that groups attest to their group size for purpose of using the CMS Web Interface or a group identifying as a small practice. In order for groups to determine their group size, we note that a group size would be determined before exclusions are applied.

Comment: One commenter recommended that CMS allow validation or updating of clinicians' identifying information in the PECOS system, and not a separate system.

Response: We appreciate the suggestion from the commenter and will consider it as we operationalize the use of PECOS for MIPS.

After consideration of the public comments we received, we are finalizing the use of multiple identifiers that allow MIPS eligible clinicians to be measured as an individual or collectively through a group's performance. Additionally, we are finalizing our proposal that the same identifier be used for all four performance categories. For example, if a group is submitting information collectively, then it must be measured collectively for all four MIPS performance categories: Quality, cost, improvement activities, and advancing care information. While we have multiple identifiers for participation and performance, we are finalizing the use of a single identifier, TIN/NPI, for applying the MIPS payment adjustment, regardless of how the MIPS eligible clinician is assessed (see final score methodology outlined in section II.E.6. of this final rule with comment period). Specifically, if the MIPS eligible clinician is identified for performance only using the TIN, we will use the TIN/NPI when applying the MIPS payment adjustment.

a. Individual Identifiers

We proposed to use a combination of billing TIN/NPI as the identifier to assess performance of an individual MIPS eligible clinician. Similar to PQRS, each unique TIN/NPI combination would be considered a different MIPS eligible clinician, and MIPS performance would be assessed separately for each TIN under which an

individual bills. While we considered using the NPI only, we believe TIN/NPI is a better approach for MIPS. Both TIN and NPI are needed for payment purposes and using a combination of billing TIN/NPI as the MIPS eligible clinician identifier allows us to match MIPS performance and MIPS payment adjustments with the appropriate practice, particularly for MIPS eligible clinicians that bill under more than one TIN. In addition, using TIN/NPI also provides the flexibility to allow individual MIPS eligible clinician and group reporting, as the proposed group identifiers also include TIN as part of the identifier. We recognize that TIN/NPI is not a static identifier and can change if an individual MIPS eligible clinician changes practices and/or if a group merges with another between the performance period and payment adjustment period. Section II.E.7.a. of the proposed rule describes in more detail how we proposed to match performance in cases where the TIN/NPI changes. We requested comments on this proposal.

The following is a summary of the comments we received regarding our proposal to use a combination of billing TIN/NPI as the identifier to assess performance of an individual MIPS eligible clinician.

Comment: One commenter expressed concern that independent physicians would not fare well as a result of the proposed rule.

Response: We appreciate the concern expressed by the commenter. We believe that independent clinicians will benefit from policies we are finalizing throughout this final rule with comment period such as the higher low-volume threshold, lower performance requirements, and lower performance threshold.

Comment: One commenter found the MIPS terminology confusing and believed that tracking individual clinicians for reimbursement, as outlined in the proposed rule, would be difficult.

Response: We appreciate the feedback from the commenter and will consider the ways we can explain the MIPS requirements to ensure that information is clear, understandable, and consistent.

Comment: Several commenters requested clarification regarding how individual MIPS eligible clinicians who bill to multiple TINs would have their performance assessed. Commenters questioned if they are eligible for MIPS payment adjustment under multiple TINs, if they are expected to perform under all four categories for each TIN where they practice, and how a Partial QP and individual in a group practice

would be assessed for purposes of the 2019 MIPS payment adjustment based on the TIN/NPI combination.

Response: For MIPS eligible clinicians associated with multiple TINs, we note that MIPS eligible clinicians will need to meet the MIPS requirements for each TIN they are associated with unless they are excluded from the MIPS requirements based on one of the three exclusions (as described in section II.E.3. of this final rule with comment period) at the individual and/or group level.

Comment: One commenter questioned the benefit to clinicians reporting at the TIN/NPI level compared to the NPI level.

Response: We note that groups have the option to report at the individual (TIN/NPI) level or the group (TIN) level. Depending on the composition of groups, groups may find that reporting at the individual level may be more advantageous for the group than the reporting at the group level and vice versa. Individual eligible clinicians who are not part of a group, would report at the individual level.

Comment: To facilitate individual clinician-level information, one commenter recommended that CMS use the NPI identifier throughout the MIPS program. The commenter noted that the NPI is also used by the private sector, promoting greater alignment than would a newly created MIPS clinician identifier.

Response: We appreciate the suggestion from the commenter, but disagree with the commenter that we should establish an identifier only at the NPI level because we need to be able to not only account for individual NPIs, but we need to have a capacity that allows us to identify eligible clinicians and MIPS eligible clinicians who are associated with a group given that group level reporting is an option and scoring and MIPS payment adjustments would need be applied accordingly. As a result, we are finalizing the individual MIPS eligible clinician identifier using the TIN/NPI combination.

Comment: One commenter requested clarification on how clinicians using only a TIN will be scored, and then have their payment adjusted based on the TIN/NPI.

Response: We note that groups reporting at the group level will be assessed and scored, at the TIN level and have a MIPS payment adjustment applied at the TIN/NPI level. We note that the MIPS payment adjustment is applied to the MIPS eligible clinicians within the TIN for billed Medicare Part B charges.

After consideration of the public comments we received, we are finalizing our proposed definition of a MIPS eligible clinician at § 414.1305 to use a combination of unique billing TIN and NPI combination as the identifier to assess performance of an individual MIPS eligible clinician. Each unique TIN/NPI combination will be considered a different MIPS eligible clinician, and MIPS performance will be assessed separately for each TIN under which an individual bills. We recognize that TIN/NPI is not a static identifier and can change if an individual MIPS eligible clinician changes practices and/or if a group merges with another between the performance period and payment adjustment period. We refer readers to section II.E.7.a. of this final rule with comment period, which describes our final policy for matching performance in cases where the TIN/NPI changes.

b. Group Identifiers for Performance

We proposed the following way a MIPS eligible clinician may have their performance assessed as part of a group under MIPS. We proposed to use a group's billing TIN to identify a group. This approach has been used as a group identifier for both PQRS and VM. The use of the TIN would significantly reduce the participation burden that could be experienced by large groups. Additionally, the utilization of the TIN benefits large and small practices by allowing such entities to submit performance data one time for their group and develop systems to improve performance. Groups that report on quality performance measures through certain data submission methods must register to participate in MIPS as described in section II.E.5.b. of the proposed rule.

We proposed to codify the definition of a group at § 414.1305 as a group that would consist of a single TIN with two or more MIPS eligible clinicians (as identified by their individual NPI) who have reassigned their billing rights to the TIN. We requested comments on this proposal.

The following is a summary of the comments we received regarding our proposal establishing the way a MIPS eligible clinician may have their performance assessed as part of a group under MIPS.

Comment: Several commenters expressed concern regarding the group identifier. Commenters indicated that a group identifier restricts group reporting to TIN-level identification because TINs may represent many different specialties and subspecialists that have elected to join together for non-practice related

reasons, such as billing purposes. Commenters recommended that CMS allow TINs to subdivide into smaller groups for the purposes of participating in MIPS. A few commenters recommended that CMS expand the definition of a group to include subsets in a TIN so that groups of specialists or sub-specialists within a TIN can be allowed to group accordingly. One commenter suggested expanding the allowable group identifiers for physician groups to include a group's sub-tax identification numbers based on the Medicare PFS area or the hospital payment area in which they provide care. A few commenters encouraged CMS to consider providing additional flexibility to allow clinicians to submit group rosters of TIN/NPI combinations to CMS to define a MIPS reporting group. The commenters noted that this approach would allow a large, multispecialty group under one TIN to split into clinically-relevant reporting groups, or multiple TINs within a delivery system to group report under a common group. In addition to the options that CMS proposed regarding use of multiple identifiers to assess physician/group performance under MIPS, one commenter recommended that CMS permit groups to "split" TINs for this purpose. Another commenter noted that such flexibility would be a very useful precursor to future APM participation.

Response: We appreciate the commenters expressing their concerns and providing recommendations. We recognize that groups have varying compositions of eligible clinicians and will consider the suggestions from commenters in future rulemaking. We disagree with commenters regarding their suggested approach for defining a group because multiple sublevel identifiers create more complexity given that it would require the establishment of numerous identifiers in order to account for all types of group compositions. We note that except for groups that contain APM participants, we are not permitting groups to "split" TINs if they choose to participate in MIPS as a group. We believe it is critical to establish the definition of a group that ensures coordination, teamwork, and shared responsibility at the group level, in which our proposed definition achieves this objective. We note that groups have the opportunity to analyze its data in ways that are meaningful to the group, which may include analyses for each segment of a group to promote and enhance the coordination of care and improve the quality of care and health outcomes.

Comment: Several commenters supported the proposed approach to reduce the participation burden by allowing large groups to report as a group. One commenter requested clarification on how a group's performance and final score would be applied to all NPIs in the TIN, particularly whether CMS would assess each individual across the four performance categories and then cumulatively calculate the final score or whether CMS would assess a group-based collective set of objectives that could be met by any combination of individual clinicians inside the group to calculate the final score.

Response: In section II.E.3.d. of this final rule with comment period, we note that groups reporting at the group level (TIN) must meet the definition of a group at all times during the performance period for the MIPS payment year. In order for groups to have their performance assessed as a group across all performance categories, individual eligible clinicians and MIPS eligible clinicians within a group must aggregate their performance data across the TIN.

Comment: One commenter indicated that the scoring methodology for large TINs is ambiguous.

Response: We note that the scoring methodology for groups, regardless of size, is the same as described in section II.E.6. of this final rule with comment period.

Comment: One commenter requested further clarification of attribution of eligible activities (for example, improvement activities) for one organization with one TIN that participates in MIPS and multiple APMs.

Response: For those TINs that have MIPS eligible clinicians that are subject to the APM scoring standard, we refer readers to section II.E.5.h. of this final rule with comment period for our discussion regarding policies pertaining to the APM scoring standard.

Comment: Several commenters agreed with our proposal to not require an additional identifier for qualified clinicians and instead use a combination of MIPS eligible clinician NPI and group billing TIN. To ease the administrative burden, commenters recommended the following: have attribution of a qualified clinician to a group's billing TIN be done automatically by CMS based on billing PECOS data; do not require individual third party rights for qualified clinicians, but instead let program administrators at each health system register for their groups and automatically have access to qualified

clinicians associated with that TIN; and provide for the ability to look up statuses, eligibility, program history and other information by both individual NPI and group TIN.

Response: We appreciate the recommendations from the commenters and will consider them as we establish subregulatory guidance regarding the voluntary registration process for groups and the registration process for groups electing to use the CMS Web Interface data submission mechanism and/or administer the CAHPS for MIPS survey.

Comment: Several commenters requested that CMS consistently define “small” practices and consider additional accommodations for such practices. Commenter noted that the proposal may overburden smaller groups. There were a few commenters indicating that solo or small practices with less than 25 clinicians should be exempt from MIPS while other commenters recommended that group practices of 15 or fewer clinicians be exempt from MIPS. One commenter suggested that CMS review opportunities to provide incentives targeted around quality metrics reflective of the patient population served.

Response: We note that a small practice is defined as a practice consisting of 15 or fewer eligible clinicians. We note that the statute does not provide the discretion to establish exclusions other than the exclusions pertaining to new Medicare-enrolled eligible clinicians, QPs and Partial QPs who do not participate in MIPS, and eligible clinicians who do not exceed the low-volume threshold. However, small groups may be excluded from MIPS if they do not exceed the low-volume threshold as established in section II.E.3.c. of this final rule with comment period.

Comment: One commenter requested that post-acute and long-term care practices be considered separately in this proposal. The commenter indicated that grouping them with their specialty peers practicing in a traditional ambulatory setting creates inequities. In particular, the commenter noted that benchmarks and thresholds are not comparable due to the different natures of the types of practice.

Response: We recognize that groups will have varying compositions and note that groups have the option to report at the individual level or group level. In section II.E.3.c. of this final rule with comment period, we describe the low-volume threshold exclusion which is applied at the individual eligible clinician level or the group level. A group that would not be excluded from

MIPS when reporting at a group level may find it advantageous to report at the individual level.

After consideration of the public comments we received, we are finalizing a modification to our proposal regarding the use of a group’s billing TIN to identify a group. Thus, we are codifying the definition of a group at § 414.1305 to mean a group that consists of a single TIN with two or more eligible clinicians (including at least one MIPS eligible clinician), as identified by their individual NPI, who have reassigned their billing rights to the TIN.

c. APM Entity Group Identifier for Performance

We proposed the following way to identify a group to support APMs (see section II.F.5.b. of this rule). To ensure we have accurately captured all of the eligible clinicians identified as participants that are participating in the APM Entity, we proposed that each eligible clinician who is a participant of an APM Entity would be identified by a unique APM participant identifier. The unique APM participant identifier would be a combination of four identifiers: (1) APM Identifier (established by CMS; for example, XXXXXX); (2) APM Entity identifier (established under the APM by CMS; for example, AA00001111); (3) TIN(s) (9 numeric characters; for example, XXXXXXXXXX); (4) EP NPI (10 numeric characters; for example, 1111111111). For example, an APM participant identifier could be APM XXXXXX, APM Entity AA00001111, TIN–XXXXXXXXXX, NPI–1111111111.

We proposed to codify the definition of an APM Entity group at § 414.1305 as an APM Entity identified by a unique APM participant identifier. We requested comments on these proposals. See section II.E.5.h. of the proposed rule for proposed policies regarding requirements for APM Entity groups under MIPS.

The following is a summary of the comments we received regarding our proposal establishing the way each eligible clinician who is a participant of an APM Entity would be identified by a unique APM participant identifier.

Comment: Several commenters supported the approach to identify APM professionals by a combination of APM identifier, APM entity identifier, TIN and NPI. Commenters requested that CMS make the QP identifiers available via an application program interface (API), which would improve an APM participant’s ability to provide accurate and timely reports. However, one commenter recommended that an APM Entity group be defined using a unique

APM participant identifier composed of a combination of four, cross-referenced identifiers: APM ID, MIPS ID, TIN, and NPI. The commenter shared that their Shared Savings Program experience with their ACO Identifier has been very positive, and suggested that MIPS adopt a similar definition and use the APM–MIPS ID for day-to-day APM identification, versus the proposed alternative.

Response: We appreciate the support and suggestions from the commenters. As we operationalize the process for APM Entity identifiers, we will taking into consideration the recommendation of making the QP identifier available via an API. In regard to suggestion regarding the APM Entity group identifier, we do not believe it is necessary to create an additional MIPS ID for the purposes of tracking APM Entities under MIPS. We further note that for all APMs, the APM Entity identifiers are the same identifiers that are currently used by CMS for other purposes. For example, in the case of the Shared Savings Program, since ACOs are the participating APM Entity, the APM Entity identifier would be the same as the ACO Identifier. We believe that tracking APM Entity participation in this way is most consistent with how CMS currently tracks APM Entity participation, and eliminates any unnecessary burden of tracking any new, additional identifiers.

Comment: One commenter requested clarification on the use of the APM participant identifier and whether the APM participant identifier would be a required data element for submission.

Response: We note that the APM Identifier will be used to ensure accurate tracking of all APM participants and comprised of the four already existing identifiers that are described in this section. In regard to the data elements required for the submission of data via a submission mechanism, the required data elements will depend on the requirements for each data submission mechanism. The submission procedures for each data submission mechanism will be further outlined in subregulatory guidance.

Comment: One commenter did not support the proposal regarding how an APM Entity group would be defined. The commenter requested clarification as to why an APM participant could not be identified by a combination of TIN/ NPI, and a single character prefix or suffix to denote the eligible clinician is part of an APM entity.

Response: We appreciate the feedback from the commenter. We note that our proposal to use the APM ID, APM Entity Identifier, TIN and NPI is most consistent with how APM participation

is currently tracked within our systems. Introducing another method of identification, such as a single character prefix or suffix, would be a deviation from our already existing operational processes, and we do not foresee that such a deviation would add any program efficiencies or facilitate participant tracking.

Comment: One commenter did not support mandatory reporting and participation, and indicated that ACOs are an example of forcing participation in alternative payment models resulting in the failure to save money and difficulties to retain participants.

Response: We appreciate the concerns from the commenter and note that participation in MIPS is mandatory while participation in an ACO (or APM) is voluntary. Based on the results generated to date under the Shared Savings Program, the data suggests that the longer organizations stay in the Shared Savings Program, the more likely they are able to achieve savings. Also, the number of organizations participating in the Shared Savings Program is increasing annually.

Comment: One commenter recommended that CMS take into account the burden placed on certain subspecialties that may not and will not have the flexibility to participate in many current APMs. Another commenter recommended that CMS identify specialties and subspecialties currently unable to participate in Advanced APMs and establish ways to minimize their burden and risk of receiving a penalty under MIPS.

Response: We thank the commenters for expressing their concerns. As we develop the operational elements of the MIPS program, we strive to establish a process ensuring that participation in MIPS can be successful. Based on the experience and feedback provided by stakeholders regarding previously established CMS programs, we are improving and enhancing the user-experience for MIPS. We will continue to seek stakeholder feedback as we implement the MIPS program.

After consideration of the public comments we received, we are finalizing our proposal that each eligible clinician who is a participant of an APM Entity will be identified by a unique APM participant identifier. The unique APM participant identifier will be a combination of four identifiers: (1) APM Identifier (established by CMS; for example, XXXXXX); (2) APM Entity identifier (established under the APM by CMS; for example, AA00001111); (3) TIN(s) (9 numeric characters; for example, XXXXXXXXXX); (4) EP NPI (10 numeric characters; for example,

1111111111). For example, an APM participant identifier could be APM XXXXXX, APM Entity AA00001111, TIN-XXXXXXXX, NPI-1111111111. Thus, we are codifying the definition of an APM Entity group at § 414.1305 to mean a group of eligible clinicians participating in an APM Entity, as identified by a combination of the APM identifier, APM Entity identifier, Taxpayer Identification Number (TIN), and National Provider Identifier (NPI) for each participating eligible clinician.

3. Exclusions

a. New Medicare-Enrolled Eligible Clinician

Section 1848(q)(1)(C)(v) of the Act provides that in the case of a professional who first becomes a Medicare-enrolled eligible clinician during the performance period for a year (and had not previously submitted claims under Medicare either as an individual, an entity, or a part of a physician group or under a different billing number or tax identifier), that the eligible clinician will not be treated as a MIPS eligible clinician until the subsequent year and performance period for that year. In addition, section 1848(q)(1)(C)(vi) of the Act clarifies that individuals who are not deemed MIPS eligible clinicians for a year will not receive a MIPS payment adjustment. Accordingly, we proposed at § 414.1305 that a new Medicare-enrolled eligible clinician be defined as a professional who first becomes a Medicare-enrolled eligible clinician within the PECOS during the performance period for a year and who has not previously submitted claims as a Medicare-enrolled eligible clinician either as an individual, an entity, or a part of a physician group or under a different billing number or tax identifier. These eligible clinicians will not be treated as a MIPS eligible clinician until the subsequent year and the performance period for such subsequent year. As discussed in section II.E.4. of the proposed rule (81 FR 28179 through 28181), we proposed that the MIPS performance period would be the calendar year (January 1 through December 31) 2 years prior to the year in which the MIPS payment adjustment is applied. For example, an eligible clinician who newly enrolls in Medicare within PECOS in 2017 would not be required to participate in MIPS in 2017, and he or she would not receive a MIPS payment adjustment in 2019. The same eligible clinician would be required to participate in MIPS in 2018 and would receive a MIPS payment adjustment in 2020, and so forth. In addition, in the case of items

and services furnished during a year by an individual who is not an MIPS eligible clinician, there will not be a MIPS payment adjustment applied for that year. We also proposed at § 414.1310(d) that in no case would a MIPS payment adjustment apply to the items and services furnished by new Medicare-enrolled eligible clinicians. We requested comments on these proposals.

The following is a summary of the comments we received regarding our proposals to define a new Medicare-enrolled eligible clinician as a professional who first becomes a Medicare-enrolled eligible clinician within the PECOS during the performance period for a year and who has not previously submitted claims under Medicare either as an individual, an entity, or a part of a physician group or under a different billing number or tax identifier, that the eligible clinician would not be treated as a MIPS eligible clinician until the subsequent year and performance period for such subsequent year, that a MIPS payment adjustment would not be applied in the case of items and services furnished during a year by an individual who is not an MIPS eligible clinician, and that in no case would a MIPS payment adjustment apply to the items and services furnished by new Medicare-enrolled eligible clinicians.

Comment: One commenter recommended postponing the implementation of the “new” types of clinicians to a later effective date.

Response: We appreciate the suggestion from the commenter, but note that we do not find it necessary or justifiable to postpone the implementation of the new Medicare-enrolled eligible clinician provision.

Comment: One commenter requested clarification on how CMS would require clinicians who are new Medicare-enrolled eligible clinicians to participate in MIPS after their first 12 months of Medicare enrollment passed.

Response: We note that section 1848(q)(1)(C)(v) of the Act provides that in the case of a professional who first becomes a Medicare-enrolled eligible clinician during the performance period for a year (and had not previously submitted claims under Medicare either as an individual, an entity, or a part of a physician group or under a different billing number or tax identifier), that the eligible clinician will not be treated as a MIPS eligible clinician until the subsequent year and performance period for that year. We note that new Medicare-enrolled eligible clinicians are excluded from MIPS during the performance period in which they are

identified as being a new Medicare-enrolled eligible clinicians. For example, if an eligible clinician becomes a new Medicare-enrolled eligible clinician in April of a particular year, such eligible clinician would be excluded from MIPS until the subsequent year and performance period for that year, in which such eligible clinician would be required to participate in MIPS starting in January of the next year.

Moreover, section 1848(q)(1)(C)(vi) of the Act clarifies that individuals who are not deemed MIPS eligible clinicians for a year will not receive a MIPS payment adjustment. Accordingly, we define a new Medicare-enrolled eligible clinician as a professional who first becomes a Medicare-enrolled eligible clinician within the PECOS during the performance period for a year and who has not previously submitted claims as a Medicare-enrolled eligible clinician either as an individual, an entity, or a part of a physician group or under a different billing number or tax identifier. These eligible clinicians will not be treated as a MIPS eligible clinician until the subsequent year and the performance period for such subsequent year. Thus, such eligible clinicians would be treated as a MIPS eligible clinician in their subsequent year of being a Medicare-enrolled eligible clinician, required to participate in MIPS, and subject to the MIPS payment adjustment for the performance period of that subsequent year.

Comment: One commenter requested clarification on clinicians' eligibility under MIPS and their designation on whether they are Medicare or Medicaid-enrolled from year to year.

Response: In section II.E.1.a. of this final rule with comment period, we define a MIPS eligible clinician. Clinicians meeting the definition of a MIPS eligible clinician are required to participate in MIPS unless eligible for an exclusion as defined in section II.E.3. of this final rule with comment period. For purposes of MIPS, we are able to identify an eligible clinician who first becomes a Medicare-enrolled eligible clinician within the PECOS during the performance period for a year and who has not previously submitted claims as a Medicare-enrolled eligible clinician either as an individual, an entity, or a part of a physician group or under a different billing number or tax identifier.

Comment: Several commenters supported the exclusion of new Medicare-enrolled eligible clinicians from MIPS; however, commenters indicated that it is unreasonable to

require new Medicare-enrolled eligible clinicians to begin participating in MIPS during the next performance period, especially those that become new Medicare-enrolled eligible clinicians later in the year. The commenters recommended giving new Medicare-enrolled eligible clinicians the option of being excluded from MIPS in both the performance period in which they begin treating Medicare patients and in the following performance period. One commenter opposed CMS's proposal that clinicians newly enrolling in Medicare in 2017 would have to participate in MIPS starting January 1, 2018, and requested that CMS instead extend the window so that clinicians enrolling in Medicare in 2017 would not begin participation until January 1, 2019. Another commenter suggested that CMS consider new Medicare-enrolled eligible clinicians ineligible for MIPS until the first performance period following at least 12 months of enrollment in Medicare.

Response: We thank the commenters for expressing their concerns. While the statute does not give the Secretary discretion to further delay MIPS participation for these eligible clinicians, we note that in the transition year (CY 2017) and performance period for such year in which an eligible clinician is treated as a MIPS eligible clinician, the clinician may qualify for an exclusion under the low-volume threshold. We refer readers to section II.E.3.c. of this final rule with comment period, which further describes the low-volume threshold provision.

Comment: A few commenters supported CMS' proposal that a new Medicare-enrolled eligible clinician would not be eligible to participate in the MIPS program until the subsequent performance period.

Response: We appreciate the support from the commenters.

Comment: A few commenters offered recommendations pertaining to exemptions that CMS should consider. One commenter suggested that medical/surgical practices of 15 professionals or fewer be fully exempt from MIPS; otherwise, many Medicare patients risk losing access to physicians who have cared for them for many years. Another commenter recommended that MIPS eligible clinicians who are a Tier 1 or part of a Center of Excellence or a High Quality Provider with a private insurer should be exempt from penalties because they are a proven benefit to the system already and should not be penalized.

Response: We appreciate the commenters providing their recommendations. We note that the

suggestions are out-of-scope to proposals described in the proposed rule (81 FR 28161) and iterate that the statute only allows for limited exceptions for eligible clinicians to be exempt from the MIPS requirements.

Comment: One commenter encouraged CMS to only use exceptions and special cases as outlined in the proposed rule when absolutely necessary because the creation of exceptions, exclusions, and multiple performance pathways would introduce unnecessary reporting burden for participating MIPS eligible clinicians.

Response: We thank the commenter for the suggestion and note that in this final rule with comment period, we are finalizing our proposed exclusions pertaining to new Medicare-enrolled eligible clinicians and QPs and Partial QPs, and modifying our proposed exclusion pertaining to the low-volume threshold, as discussed in sections II.E.3.a., II.E.3.b., and II.E.3.c., of this final rule with comment period.

After consideration of the public comments we received, we are finalizing the definition of a new Medicare-enrolled eligible clinician at § 414.1305 as a professional who first becomes a Medicare-enrolled eligible clinician within the PECOS during the performance period for a year and had not previously submitted claims under Medicare such as an individual, an entity, or a part of a physician group or under a different billing number or tax identifier. We are finalizing our proposal at § 414.1310(c) that these eligible clinicians will not be treated as a MIPS eligible clinician until the subsequent year and the performance period for such subsequent year. As outlined in section II.E.4. of this final rule with comment period, we are finalizing a modification to the MIPS performance period to be a minimum of one continuous 90-day period within CY 2017. In the case of items and services furnished during a year by an individual who is not a MIPS eligible clinician during the performance period, there will not be a MIPS payment adjustment applied for that payment adjustment year. Additionally, we are finalizing our proposal at § 414.1310(d) that in no case would a MIPS payment adjustment apply to the items and services furnished during a year by new Medicare-enrolled eligible clinicians for the applicable performance period.

We believe that it would be beneficial for eligible clinicians to know during the performance period of a calendar year whether or not they are identified as a new Medicare-enrolled eligible clinician. For purposes of this section,

we are coining the term “new Medicare-enrolled eligible clinician determination period” and define it to mean the 12 months of a calendar year applicable to the performance period. During the new Medicare-enrolled eligible clinician determination period, we will conduct eligibility determinations on a quarterly basis to the extent that is technically feasible in order to identify new Medicare-enrolled eligible clinicians that would be excluded from the requirement to participate in MIPS for the applicable performance period. Given that the performance period is a minimum of one continuous 90-day period within CY 2017, we believe it would be beneficial for such eligible clinicians to be identified as being excluded from MIPS requirements on a quarterly basis in order for individual eligible clinicians or groups to plan and prepare accordingly. For future years of the MIPS program, we will conduct similar eligibility determinations on a quarterly basis during the new Medicare-enrolled eligible clinician determination period, which consists of the 12 months of a calendar year applicable to the performance period, in order to identify throughout the calendar year eligible clinicians who would be excluded from MIPS as a result of first becoming new Medicare-enrolled eligible clinicians during the performance period for a given year.

b. Qualifying APM Participant (QP) and Partial Qualifying APM Participant (Partial QP)

Sections 1848(q)(1)(C)(ii)(I) and (II) of the Act provide that the definition of a MIPS eligible clinician does not include, for a year, an eligible clinician who is a Qualifying APM Participant (QP) (as defined in section 1833(z)(2) of the Act) or a Partial Qualifying APM Participant (Partial QP) (as defined in section 1848(q)(1)(C)(iii) of the Act) who does not report on the applicable measures and activities that are required under MIPS. Section II.F.5. of the proposed rule provides detailed information on the determination of QPs and Partial QPs.

We proposed that the definition of a MIPS eligible clinician at § 414.1310 does not include QPs (defined at § 414.1305) and Partial QPs (defined at § 414.1305) who do not report on applicable measures and activities that are required to be reported under MIPS for any given performance period. Partial QPs will have the option to elect whether or not to report under MIPS, which determines whether or not they will be subject to MIPS payment adjustments. Please refer to the section II.F.5.c. of the proposed rule where this

election is discussed in greater detail. We requested comments on this proposal.

The following is a summary of the comments we received regarding our proposal that the definition of a MIPS eligible clinician does not include QPs (defined at § 414.1305) and Partial QPs (defined at § 414.1305) who do not report on applicable measures and activities that are required to be reported under MIPS for any given performance period, in which Partial QPs will have the option to elect whether or not to report under MIPS.

Comment: One commenter recommended that CMS consider presumptive QP status in the first performance year, and prospective notification of QP status based on prior year thresholds. Alternatively, if in the year following the performance year CMS determines the Advanced APM Entity has not yet met the required threshold score, the commenter indicated that CMS could either: Assign the entity’s participating clinicians a neutral MIPS score without a penalty or reward; or allow them to complete two of the four MIPS performance categories in 2018 and have the results count for 2019 payments.

Response: We refer readers to section II.F.5 of this final rule with comment period for policies regarding QP and Partial QP determinations.

After consideration of the public comments we received, we are finalizing our proposal at § 414.1305 that the definition of a MIPS eligible clinician does not include QPs (defined at § 414.1305) and Partial QPs (defined at § 414.1305) who do not report on applicable measures and activities that are required to be reported under MIPS for any given performance period in a year. Also, we are finalizing our proposed policy at § 414.1310(b) that for a year, QPs (defined at § 414.1305) and Partial QPs (defined at § 414.1305) who do not report on applicable measures and activities that are required to be reported under MIPS for any given performance period in a year are excluded from MIPS. Partial QPs will have the option to elect whether or not to report under MIPS, which determines whether or not they will be subject to MIPS payment adjustments.

c. Low-Volume Threshold

Section 1848(q)(1)(C)(ii)(III) of the Act provides that the definition of a MIPS eligible clinician does not include MIPS eligible clinicians who are below the low-volume threshold selected by the Secretary under section 1848(q)(1)(C)(iv) of the Act for a given year. Section 1848(q)(1)(C)(iv) of the Act requires the

Secretary to select a low-volume threshold to apply for the purposes of this exclusion which may include one or more of the following: (1) The minimum number, as determined by the Secretary, of Part B-enrolled individuals who are treated by the MIPS eligible clinician for a particular performance period; (2) the minimum number, as determined by the Secretary, of items and services furnish to Part B-enrolled individuals by the MIPS eligible clinician for a particular performance period; and (3) the minimum amount, as determined by the Secretary, of allowed charges billed by the MIPS eligible clinician for a particular performance period.

We proposed at § 414.1305 to define MIPS eligible clinicians or groups who do not exceed the low-volume threshold as an individual MIPS eligible clinician or group who, during the performance period, have Medicare billing charges less than or equal to \$10,000 and provides care for 100 or fewer Part B-enrolled Medicare beneficiaries. We believed this strategy holds more merit as it retains as MIPS eligible clinicians those MIPS eligible clinicians who are treating relatively few beneficiaries, but engage in resource intensive specialties, or those treating many beneficiaries with relatively low-priced services. By requiring both criteria to be met, we can meaningfully measure the performance and drive quality improvement across the broadest range of MIPS eligible clinician types and specialties. Conversely, it excludes MIPS eligible clinicians who do not have a substantial quantity of interactions with Medicare beneficiaries or furnish high cost services.

In developing this proposal, we considered using items and services furnished to Part B-enrolled individuals by the MIPS eligible clinician for a particular performance period rather than patients, but a review of the data reflected there were nominal differences between the two methods. We plan to monitor the proposed requirement and anticipate that the specific thresholds will evolve over time. We requested comments on this proposal including alternative patient threshold, case thresholds, and dollar values.

The following is a summary of the comments we received regarding our proposal to define MIPS eligible clinicians or groups who do not exceed the low-volume threshold as an individual MIPS eligible clinician or group who, during the performance period, have Medicare billing charges less than or equal to \$10,000 and provides care for 100 or fewer Part B-enrolled Medicare beneficiaries.

Comment: A few commenters supported the proposed policy to exempt MIPS eligible clinicians or groups from MIPS requirements who do not exceed the low-volume threshold of having Medicare billing charges less than or equal to \$10,000 and providing care for 100 or fewer Part B-enrolled Medicare beneficiaries. In particular, one commenter expressed support for the dual criteria of the low-volume threshold (Medicare billing charges less than or equal to \$10,000 and providing care for 100 or fewer Part B-enrolled Medicare beneficiaries).

Response: We appreciate the support from the commenters.

Comment: A significant portion of commenters expressed concern regarding our proposed low-volume threshold provision, particularly the requirement for MIPS eligible clinicians and groups to meet both the low-volume threshold pertaining to the dollar value of Medicare billing charges and the number of Medicare Part B beneficiaries cared for during a performance period. The commenters requested that CMS modify the criteria under the definition of MIPS eligible clinicians or groups who do not exceed the low-volume threshold to require that an individual MIPS eligible clinician or group would need to meet either the low-volume threshold pertaining to the dollar value of Medicare billing charges or the number of Medicare Part-B beneficiaries cared for during a performance period in order to determine whether or not an individual MIPS eligible clinician or group exceeds the low-volume threshold. Several commenters noted that such a change would provide greater flexibility for specialty clinicians.

Response: We appreciate the concerns expressed by commenters. We agree with the commenters and have modified our proposal to not require that MIPS eligible clinicians and groups must meet both the dollar value of Medicare billing charges and the number of Medicare Part B beneficiaries cared for during a performance period. Instead, we are finalizing that individual MIPS eligible clinicians and groups meet either the threshold of \$30,000 in billed Medicare Part B allowed charges or the threshold of 100 or fewer Part B-enrolled Medicare beneficiaries. Also, we believe that the modified proposal reduces the risk of clinicians withdrawing as Medicare suppliers and minimizing the number of Medicare beneficiaries that they treat in a year. We will monitor any effect on Medicare participation. Similar to the goal of the proposed low-volume threshold, we believe that this modified approach holds more merit as it retains

as MIPS eligible clinicians those MIPS eligible clinicians who are treating relatively few beneficiaries, but engage in resource intensive specialties, or those treating many beneficiaries with relatively low-priced services. We believe that the modified proposal would also ensure that we can meaningfully measure the performance and drive quality improvement across a broad range of MIPS eligible clinician types and specialties. We note that eligible clinicians who are excluded from the definition of a MIPS eligible clinician under the low-volume threshold or another applicable exclusion can still participate voluntarily in MIPS, but are not subject to positive or negative MIPS adjustments. For future consideration, we are seeking additional comment on possible ways that excluded eligible clinicians might be able to opt-in to the MIPS program (and the MIPS payment adjustment) in future years in a manner consistent with the statute.

Comment: The majority of commenters recommended that CMS increase the low-volume threshold. A significant portion of commenters requested that MIPS eligible clinicians or groups who do not exceed the low-volume threshold should have Medicare billing charges less than or equal to \$30,000 or provide care for 100 or fewer Part B-enrolled Medicare beneficiaries. Many commenters noted that raising the low-volume threshold would allow more physicians with a small number of Medicare patients to be recognized as MIPS eligible clinicians or groups who do not exceed the low-volume threshold, particularly MIPS eligible clinicians providing specialty services or high risk services. Several commenters indicated that women on Medicare receive expensive surgical care from OB/GYNs, which could cause MIPS eligible clinicians and groups to exceed the proposed low-volume threshold despite a very small number of Medicare patients. The commenters suggested that CMS exempt MIPS eligible clinicians and groups from the MIPS program who have less than \$30,000 in Medicare allowed charges per year or provide care for fewer than 100 unique Medicare Part-B beneficiaries.

A few commenters indicated that an increase in the low-volume threshold would mitigate an undue burden on small practices. One commenter stated that RHCs and such clinicians will have fewer than \$10,000 in Medicare billing charges, but many of them will have more than 100 Part B beneficiaries under their care. The commenter expressed concern that RHCs may be

burdened with MIPS requirements for a low level of Part B claims and thus, may either face penalties or the cost of implementing the MIPS requirements. A few commenters indicated that the low-volume threshold should be high enough to exempt physicians who have no possibility of a positive return on their investment in the cost of reporting.

Other recommendations from commenters included the following: align the patient cap with the CPC+ patient panel requirements, which would increase the number of Medicare Part B beneficiaries cared for to 150 (and would prevent clinicians from having two different low-volume thresholds within the same program); exclude groups from participation in MIPS based on an aggregated threshold for the group with the rate of \$30,000 and 100 patients per clinician, in which a group of two eligible clinicians would be excluded if charging under \$60,000 and caring for under 200 Medicare Part B-enrolled Medicare beneficiaries; exempt MIPS eligible clinicians for the transition year of MIPS who bill under Place of Service 20, which is the designation for a place with the purpose of diagnosing and treating illness or injury for unscheduled, ambulatory patients seeking immediate medical attention; and exempt facilities operating in Frontier areas from MIPS participation, at least until 2019 when the list of MIPS eligible clinicians expands and additional MIPS eligible clinicians are able to participate in MIPS.

There were other commenters who requested that the threshold criteria regarding the dollar value of Medicare billed charges and the number of Medicare Part B beneficiaries cared for be increased to the following: \$25,000 Medicare billed charges or 50 or 100 Part B beneficiaries; \$50,000 Medicare billed charges or 100 or 150 Part B beneficiaries; \$75,000 Medicare billed charges or 100 or 750 Part B beneficiaries; \$100,000 Medicare billed charges or 1000 Part B beneficiaries; \$250,000 Medicare billed charges or 150 Part B beneficiaries; and \$500,000 Medicare billed charges or 400 or 500 Part B beneficiaries.

Several commenters requested that CMS temporarily increase the low-volume threshold in order for small practices to not be immediately impacted by the implementation of MIPS. One commenter suggested that the threshold be increased to 250 unique Medicare patients and a total Medicare billing not to exceed \$200,000 for 5 years. Another commenter recommended that CMS set the low-volume threshold in 2019 at \$250,000 of

Medicare billing charges. The commenter explained that at such amount, the avoided penalties at 4 percent would approximately equal the \$10,000 cost of reporting and below such amount, there would not likely be a return that exceeds the costs of reporting. Below such amount, the commenter suggested CMS make MIPS participation optional, but MIPS eligible clinicians that participate would be exempt from any penalties.

Response: We appreciate the concerns and recommendations provided by the commenters. We received a range of suggestions and considered the various options. We agree with commenters that the dollar value of the low-volume threshold should be increased and that the low-volume threshold should not require MIPS eligible clinicians and groups to be required to meet both the dollar value of billed Medicare Part B allowed charges and the Part B Medicare-enrolled beneficiary count thresholds at this time. We believe it is important to establish a low-volume threshold that is responsive to stakeholder feedback. Some of the recommended options would have established a threshold that would exclude many eligible clinicians who would otherwise want to participate in MIPS. The majority of commenters suggested that the low-volume threshold be changed to reflect \$30,000 or less billed Medicare Part B allowed charges. As a result, we are modifying our proposal. We are defining MIPS eligible clinicians or groups who do not exceed the low-volume threshold as an individual MIPS eligible clinician or group who, during the low-volume threshold determination period, has billed Medicare Part B allowed charges less than or equal to \$30,000 or provides care for 100 or fewer Part B-enrolled Medicare beneficiaries. This policy would be more robust and effective at excluding clinicians for whom submitting data to MIPS may represent a disproportionate burden with a secondary effect of allowing greater concentration of technical assistance on a smaller cohort of practices. We believe that the higher low-volume threshold addresses the concerns from commenters while remaining consistent with the proposal and having a policy that is easy to understand.

Comment: A few commenters indicated that it would be difficult for psychologists to determine ahead of time if they met the low-volume threshold relating to the dollar value of \$10,000 Medicare billing charges in order to be exempt from MIPS, yet it would be relatively easy for psychologists to determine whether they

are likely to have fewer than 100 Medicare patients in a given year based on their historical volume of Medicare patients. Several commenters requested CMS to change the low-volume threshold requirement to state “\$10,000 in Medicare charges or fewer than 100 beneficiaries,” making it possible for psychologists to be exempt from MIPS, which is essential in keeping them enrolled in Medicare provider panels. A few commenters expressed concerns that if the proposed low-volume threshold was finalized as is, psychologists and psychotherapists who see Medicare beneficiaries weekly or bi-weekly would be unable to meet Medicare patients’ demand for psychotherapy, would discontinue seeing Medicare beneficiaries altogether, and would be reluctant to participate in MIPS if they were not exempted from MIPS participation. Commenters stated that CMS violates the Mental Health Parity and Addiction Equity Act of 2008 by having separate rules for medical versus psychological illnesses.

Response: As previously noted, we are finalizing a modification to proposal, in which we are defining MIPS eligible clinicians or groups who do not exceed the low-volume threshold as an individual MIPS eligible clinician or group who, during the performance period, has billed Medicare Part B allowed charges less than or equal to \$30,000 or provides care for 100 or fewer Part B-enrolled Medicare beneficiaries. Thus, a MIPS eligible clinician or a group would only need to meet the dollar value or the beneficiary count for the low-volume threshold exclusion. As a result, psychologists will be able to easily discern whether or not they exceed the low-volume threshold. In addition, we intend to provide a NPI level lookup feature prior to or shortly after the start of the performance period that will allow clinicians to determine if they do not exceed the low-volume threshold and are therefore excluded from MIPS. More information on this NPI level lookup feature will be made available at QualityPaymentProgram.cms.gov.

In regard to the comment pertaining to the Mental Health Parity and Addiction Equity Act of 2008 (MHPAEA), we note that the MHPAEA generally prevents group health plans and health insurance issuers that provide mental health or substance use disorder benefits from imposing less favorable benefit limitations on those benefits than on medical/surgical benefits. The mental health parity requirements of MHPAEA do not apply to Medicare.

Comment: One commenter indicated that the low-volume threshold is too low for a group and requested that CMS either establish a certain exclusion threshold based on group size, or exclude a group if more than 50 percent of its MIPS eligible clinicians meet the low-volume threshold. Another commenter recommended CMS to establish a low-volume threshold based upon practice size, so that solo practices and those with less than 10 clinicians are ineligible for MIPS. The commenter noted that the financial and reporting burden of participating in MIPS would be too great for such clinicians.

Response: We appreciate the concern and suggestions from the commenters and note that we are modifying our proposed low-volume threshold by increasing the dollar value of the billed Medicare Part B allowed charges and eliminating the requirement that the clinician meet both the dollar value and beneficiary count thresholds. MIPS eligible clinicians or groups that do not exceed the low-volume threshold of \$30,000 billed Medicare Part B allowed charges or provide care for 100 or fewer Part B-enrolled Medicare beneficiaries would be excluded from MIPS. We apply the same low-volume threshold to both individual MIPS eligible clinicians and groups because groups have the option to elect to report at an individual or group level. A group that would be excluded from MIPS when reporting at a group level may find it advantageous to report at the individual level.

Comment: One commenter suggested that CMS exclude Part B and Part D drug costs from the low-volume threshold determination to mitigate the impacts of MIPS on community practices in rural and underserved areas.

Response: We appreciate the suggestion from the commenter and note that the low-volume threshold applies to Medicare Part B allowed charges billed by the eligible clinician, such as those under the PFS.

Comment: One commenter stated that CMS should provide education and training to MIPS eligible clinicians and groups meeting the low-volume threshold.

Response: We are committed to actively engaging with all stakeholders, including tribes and tribal officials, throughout the process of establishing and implementing MIPS and using various means to communicate and inform MIPS eligible clinicians and groups of the MIPS requirements. In addition, we intend to provide a NPI level lookup feature prior to or shortly after the start of the performance period that will allow clinicians to determine

if they do not exceed the low-volume threshold and are therefore excluded from MIPS. More information on this NPI level lookup feature will be made available at

QualityPaymentProgram.cms.gov.

Comment: One commenter requested that a definition of “Medicare billing charges” be established under the low-volume threshold policy. The commenter also requests a modification to this term so that it reads “allowed amount” so that it is clear that the \$10,000 threshold is calculated based on \$10,000 of Medicare-allowed services.

Response: We appreciate the suggestions from the commenter and note that the low-volume threshold pertains to Medicare Part B allowed charges billed by a MIPS eligible clinician, such as those under the PFS. In order to be consistent with the statute, we assess the allowed charges billed to determine whether or not an eligible clinician exceeds the low-volume threshold. Also, we specify that the allowed charges billed relate to Medicare Part B.

Comment: One commenter noted that since MIPS eligibility is based on the current reporting period, a clinician would not definitively know if he or she is excluded until the end of the year. It would be helpful if eligibility would be based on a prior period, as is currently done for hospital-based determinations for EPs under the EHR Incentive Program. This is especially problematic for low-volume clinicians such as OB/GYN, because eligibility might change from year to year. Another commenter questioned why the low-volume threshold for a MIPS eligible clinician is calculated based on the performance year rather than basing the calculation on the previous year.

Response: We agree that it would be beneficial for individual eligible clinicians and groups to know whether they are excluded under the low-volume threshold prior to the start of the performance period and thus, we are finalizing a modification to our proposal to allow us to make eligibility determinations regarding low-volume status using historical claims data. This modification will allow us to inform individual MIPS eligible clinicians and groups of their low-volume status prior to or shortly after the start of the performance period. For purposes of this section, we are coining the term “low-volume threshold determination period” to refer to the timeframe used to assess claims data for making eligibility determinations for the low-volume threshold exclusion. We define the low-volume threshold determination period to mean a 24-month assessment

period, which includes a two-segment analysis of claims data during an initial 12-month period prior to the performance period followed by another 12-month period during the performance period. The initial 12-month segment of the low-volume threshold determination period would span from the last 4 months of a calendar year 2 years prior to the performance period followed by the first 8 months of the next calendar year and include a 60-day claims run out, which will allow us to inform eligible clinicians and groups of their low-volume status during the month (December) prior to the start of the performance period. To conduct an analysis of the claims data regarding Medicare Part B allowed charges billed prior to the performance period, we are establishing an initial segment of the low-volume threshold determination period consisting of 12 months. We believe that the initial low-volume threshold determination period enables us to make eligibility determinations based on 12 months of data that is as close to the performance period as possible while informing eligible clinicians of their low-volume threshold status prior to the performance period. The second 12-month segment of the low-volume threshold determination period would span from the last 4 months of a calendar year 1 year prior to the performance period followed by the first 8 months of the performance period in the next calendar year and include a 60-day claims run out, which will allow us to inform additional eligible clinicians and groups of their low-volume status during the performance period.

Thus, for purposes of the 2019 MIPS payment adjustment, we will initially identify the low-volume status of individual eligible clinicians and groups based on 12 months of data starting from September 1, 2015 to August 31, 2016, with a 60 day claims run out. To account for the identification of additional individual eligible clinicians and groups who do not exceed the low-volume threshold during the 2017 performance period, we will conduct another eligibility determination analysis based on 12 months of data starting from September 1, 2016 to August 31, 2017, with a 60 day claims run out. For example, MIPS eligible clinicians who may have exceeded the low-volume threshold during the first determination assessment, but fall below the threshold during the performance period because their practice changed significantly, they changed practices from a prior year, etc.

In addition, we note that the low-volume threshold exclusion is determined at the individual (TIN/NPI) level for individual reporting and at the group (TIN) level for group reporting. An eligible clinician may be identified as having a status that does not exceed the low-volume threshold at the individual (TIN/NPI) level, but if such eligible clinician is part of a group that is identified as having a status exceeding the low-volume threshold, such eligible clinician would be required to participate in MIPS as part of the group because the low-volume threshold is determined at the group (TIN) level for groups. For eligibility determinations pertaining to the low-volume threshold exclusion, we will be conducting our analysis for each TIN/NPI and TIN identified in the claims data and make a determination based on the Medicare Part B allowed charges billed. Since we are making eligibility determinations for each TIN/NPI and TIN identified in the claims data, we do not need to know whether or not a group is reporting at the individual or group level prior to our analyses. Thus, groups can use the eligibility determinations we make for each TIN/NPI and TIN to determine whether or not their group would be reporting at the individual or group level. Subsequently, groups reporting at the group level would need to meet the group requirements as discussed in section I.E.3.d. of this final rule with comment period.

Comment: One commenter requested that CMS ensure that low-volume threshold exclusion and other exclusions would not penalize practices with more pediatric, women’s health, Medicaid, or private insurance patients.

Response: We recognize that groups will have different patient populations. As previously noted, we are finalizing a modified low-volume threshold policy that will increase the number of individual eligible clinicians and groups excluded from the requirement to participate in MIPS, which would include individual eligible clinicians and groups with more pediatric, women’s health, Medicaid, or private insurance patients if they have not billed more than \$30,000 of Medicare Part B allowed charges or provided care for more than 100 Part B-enrolled Medicare beneficiaries. We note that MIPS eligible clinicians who are excluded from MIPS have the option to voluntarily participate in MIPS, but would not receive a MIPS payment adjustment.

Comment: One commenter requested more information about whether the low-volume threshold will be

eliminated in future years and if there is a potential for an incentive payment when an eligible clinician meets the low-volume threshold but elects to report anyway.

Response: We intend to monitor the low-volume threshold requirement and anticipate that the specific threshold will evolve over time. For eligible clinicians who do not exceed the low-volume threshold and are thus excluded from MIPS, they could voluntarily participate in MIPS, but would not be subject to the MIPS payment adjustment (positive or negative).

Comment: A few commenters requested clarification on the definition of the low-volume threshold including whether the \$10,000 limit pertains to all Medicare billing charges or solely Medicare Part B charges, how this low-volume threshold applies to low-volume clinicians practicing in and reporting as a group, how beneficiaries are attributed to clinicians, and if there is a timeframe in which a patient was last seen.

Response: We note that the dollar value of low-volume threshold applies to Medicare Part B allowed charges billed by the eligible clinician. We note that eligibility determinations regarding low-volume threshold exclusion are based on claims data. As a result, we are able to identify Medicare Part B allowed charges billed by the eligible clinician and the number of Part B-enrolled Medicare beneficiaries cared for by an eligible clinician during the first and second low-volume threshold determination periods. For eligibility determinations regarding the low-volume threshold exclusion, we do not consider the timeframes of when a patient was last seen. In regard to how the low-volume threshold applies to MIPS eligible clinicians in groups, we apply the same low-volume threshold to both individual MIPS eligible clinicians and groups since groups have the option to report at an individual or group level. As a result of the low-volume threshold exclusion being determined at the individual (TIN/NPI) level for individual reporting and at the group (TIN) level for group reporting, there will be some eligible clinicians with a low-volume status that does not exceed the low-volume threshold who would be excluded from MIPS at the individual (TIN/NPI) level, but if such eligible clinicians are part of a group with a low-volume status that exceeds the low-volume threshold, such eligible clinicians would be required to participate in MIPS as part of the group. Section II.E.3.d. of this final rule with comment period describes how a group's (TIN) performance is assessed and scored at the group level and how

the MIPS payment adjustment is applied at the group level when a group includes clinicians who are excluded from MIPS at the individual level.

Comment: Several commenters opposed holding individuals and groups to the same low-volume threshold standards. One commenter stated that basing the exclusion on two thresholds simultaneously would be antithetical to measurements of quality based on outcomes. The commenter noted that patient care can be very expensive and some eligible clinicians could be denied the low-volume threshold exclusion after seeing only a few very complex patients over the course of the performance period. Another commenter indicated that the proposed exclusionary criteria may lead to eligible clinicians in solo or small practices withdrawing as Medicare suppliers, or limiting the number of Medicare patients they treat over a performance period.

One commenter requested that CMS issue a clarification stating that when clinicians choose to have their performance assessed at the group level, the low-volume threshold would also be assessed at the group level. This would ensure consistent treatment. Another commenter requested clarity regarding the low-volume threshold exclusion definition for groups, and recommended that CMS apply a multiplying factor for each enrolled Medicare clinician in the group definition. One commenter recommended that CMS scale the minimum number of Part B-enrolled Medicare beneficiaries and Medicare billed charges to the number of physician group members while another commenter requested that if a practice reports as a group, the low-volume threshold should be multiplied by the number of clinicians in the group. Commenters recommended a higher threshold for groups.

A few commenters indicated that the current proposal does not provide a meaningful exclusion for small and rural practices that cannot afford the upfront investments (including investments in EHR systems) and as a result of the high costs to report for small practices, the threat of negative MIPS payment adjustments or low positive MIPS payment adjustments that do not cover the costs to report would deter small practices from participating in MIPS.

Response: We thank the commenters for their concerns and recommendations regarding the low-volume threshold. We recognize that the low-volume threshold proposed in section II.E.3.c. of the proposed rule (81 FR 28178) is a concern and as previously noted, we are

modifying our proposal by increasing the dollar value of the billed Medicare Part B allowed charges and eliminating the requirement for MIPS eligible clinicians and groups to meet both the dollar value threshold and the 100 beneficiary count. In this final rule with comment period, we continue to apply the same low-volume threshold for both individual MIPS eligible clinicians and groups. We disagree with the comment regarding a percentage-based approach for groups because groups have the option of electing to report at an individual or group level. If a group elects not to report as a group, then each MIPS eligible clinician would report individually.

In addition, we believe that the modified proposal reduces the risk of clinicians withdrawing as Medicare suppliers and minimizing the number of Medicare beneficiaries that they treat in a year. We will monitor any effect on Medicare participation in CY 2017 and future calendar years.

Comment: Several commenters expressed concern that clinicians working in solo practices or small groups, especially in rural areas and HPSAs, would have difficulty meeting the requirements for MIPS. One commenter noted that non-board-certified doctors often work in these areas and are reimbursed at a lower rate than board-certified doctors. The commenters recommended that CMS make similar concessions for this category of clinicians as it proposed to do for non-patient facing MIPS eligible clinicians in the proposed rule. One commenter requested that small practice physicians and solo physicians in HPSAs be exempt from MIPS. The commenters requested that CMS ensure that small and solo practices have an equal opportunity to participate successfully in MIPS and Advanced APMs.

Response: We appreciate the concerns expressed by commenters and recognize that certain individual MIPS eligible clinicians and groups may only be able to report on a few, or possibly no, applicable measures and activities for the MIPS requirements. In section II.E.6.b.(2) of this final rule with comment period, we describe the re-weighting of each performance category when there are not sufficient measures and activities that are applicable and available. Also, our modified low-volume threshold exclusion policy increases the dollar value of Medicare Part B allowed charges billed by an eligible clinician, which will increase the number of eligible clinicians and groups excluded from MIPS and not subject to a negative MIPS payment

adjustment, which may include additional solo or small rural or HPSA practices. We believe that rural areas, small practices, and HPSAs will benefit from other policies that we are finalizing throughout this final rule with comment period such as lower reporting requirements and lower performance threshold.

Comment: One commenter expressed concern that the MIPS program as outlined in the proposed rule would limit referrals to necessarily higher-cost small and rural providers. The commenter indicated that comparisons between small, rural practices and larger practices does not take into account differences in infrastructure and technological capabilities and patient populations which the commenter believed are more likely to be sick and poor in the rural settings. Another commenter expressed concern that rural clinicians who serve impoverished communities and do not have additional resources (for example, dieticians who can provide more hands-on care for diabetic patients) would be unfairly penalized if their patients do not comply with medical advice.

Response: We appreciate the concern expressed by the commenter and recognize that groups vary in size, clinician composition, patient population, resources, technological capabilities, geographic location, and other characteristics. While we believe the MIPS measures are valid and reliable, we will continue to investigate methods to ensure all clinicians are treated as fairly as possible within MIPS. As noted in this final rule with comment period, the Secretary is required to take into account the relevant studies conducted and recommendations made in reports under section 2(d) of the Improving Medicare Post-Acute Transformation (IMPACT) Act of 2014. Under the IMPACT Act, the Office of the Assistant Secretary for Planning and Evaluation (ASPE) has been conducting studies on the issue of risk adjustment for sociodemographic factors on quality measures and cost, as well as other strategies for including social determinants of health status evaluation in CMS programs. We will closely examine the ASPE studies when they are available and incorporate findings as feasible and appropriate through future rulemaking. Also, we will monitor outcomes of beneficiaries with social risk factors, as well as the performance of the MIPS eligible clinicians who care for them to assess for potential unintended consequences such as penalties for factors outside the control of clinicians. We believe that rural

clinicians and practices will benefit from other policies that we are finalizing throughout this final rule with comment period such as lower reporting requirements and lower performance threshold.

Comment: One commenter requested clarification as to whether or not non-patient facing MIPS eligible clinicians who are not based in a rural practice or not a member of a FQHC, but see fewer than 25 patients, would be exempt from MIPS. Another commenter requested clarification regarding whether or not the low-volume threshold applies if a physical therapist, occupational therapist, or speech-language pathologist is institution-based or nursing home-based.

Response: In both situations that the commenter raises, the clinician would be excluded from MIPS, however they would be excluded for different reasons. For the first example, the non-patient facing MIPS eligible clinician would be excluded due to seeing fewer than 25 patients, which falls below our finalized low-volume threshold exclusion. For the second example, the physical therapists, occupational therapists, or speech-language pathologist cannot be considered MIPS eligible clinicians until as early as the third year of the MIPS program.

Comment: One commenter proposed a phase-in period for small practices in addition to an increased low-volume threshold because the proposed rule did not immediately allow the opportunity for virtual groups that could provide the infrastructure to assist small practices. Additionally, the commenter believed that most small practices and solo physicians would not be ready to report on January 1, 2017. The commenter's recommended phase-in period would exempt the 40th percentile of all small and rural practices in each specialty in year 1; the 30th percentile of all small and rural practices in each specialty in year 2; the 20th percentile of all small and rural practices in each specialty in year 3; and the 10th percentile of all small and rural practices in each specialty in year 4. The commenter's recommended phase-in would be voluntary, and they believe it would provide more time for resource-limited small practices to prepare, finance new systems and upgrades, change workflows, and transition to MIPS.

Response: We appreciate the concerns and recommendations provided by the commenter. We recognize that small and rural practices may not have experience using CEHRT and/or may not be prepared to meet the MIPS requirements for each performance category. As described in this section of

the final rule with comment period, we are modifying our proposal by increasing the dollar value of billed Medicare Part B allowed charges and eliminating the requirement for MIPS eligible clinicians and groups to meet both the dollar value threshold and the 100 beneficiary count, in which groups not exceeding the low-volume threshold would be excluded from the MIPS requirements. We believe our modified low-volume threshold is less complex with potentially a singular parameter determining low-volume status and addresses the commenter's concerns by providing exclusions for more individual MIPS eligible clinicians and groups, including small and rural practices. Also, in section II.E.5.g.(8)(a) of this final rule with comment period, we describe our final policies regarding the re-weighting of the advancing care information performance category within the final score, in which we would assign a weight of zero when there are not sufficient measures applicable and available.

Comment: A few commenters expressed concern that the proposed rule favored large practices, and requested that group practices with fewer than 10 or 15 physicians be excluded from MIPS. One commenter recommended that it may be more beneficial to expand the exclusion to practices under 15 physicians, thus reducing the number of practitioners that are going to opt out of Medicare altogether following MACRA and retaining a fairer adjustment distribution among the moderate and large practices.

Response: We thank the commenters for expressing their concerns and note that we are modifying our proposed low-volume threshold to apply to an individual MIPS eligible clinician or group who, during the low-volume threshold determination period, has billed Medicare Part B allowed charges less than or equal to \$30,000 or provides care for 100 or few Part B-enrolled Medicare beneficiaries. We believe our modified proposal would increase the number of groups excluded from participating in MIPS based on the low-volume threshold, including group practices with fewer than 10 or 15 clinicians.

Comment: One commenter requested that CMS provide the underlying data that shows the distribution of spending and volume of cases on which the low-volume threshold is based. The commenter expressed concern that if the low-volume threshold is set too low, it may place too many clinicians close to the minimum of 20 attributable cases for resource use, which lacks statistical

robustness. Another commenter suggested that CMS increase the low-volume threshold, as the commenter believed that counties with skewed demographics will give clinicians no chance to avoid negative MIPS payment adjustments. The commenter requested a moratorium on the implementation of MIPS until a study can be done that examines the potential effects of the law in such counties or for CMS to exempt practices that have a patient-population with more than 30 percent of its furnished services provided to Medicare Part B beneficiaries until the effects of the law are studied on the impact to these groups.

Response: We appreciate the concerns expressed by commenters regarding the proposed low-volume threshold and intend to monitor the effects of the low-volume threshold and anticipate that the specific thresholds will evolve over time. In this section of the final rule with comment period, we are modifying our proposed low-volume threshold, in which we are defining MIPS eligible clinicians or groups that do not exceed the low-volume threshold as an individual MIPS eligible clinician or group who, during the low-volume threshold determination period, has billed Medicare Part B allowed charges less than or equal to \$30,000 or see fewer than 100 beneficiaries. In regard to the commenter's concern on having too many MIPS eligible clinicians near the minimum number of attributable cases for the cost performance category; we believe the increased low-volume threshold policy would reduce such risk and ensure statistical robustness. We also note that we have made a number of modifications within the cost performance category and refer readers to section II.E.5.e. of this final rule with comment period for the discussion of our modified policies.

Comment: One commenter requested that CMS calculate the projected data collection and reporting costs, the number of cases necessary to achieve statistical significance or reliability and comparison purposes, and the administrative costs on the agency to manage and calculate MIPS scores. With such costs in mind, the commenter requested that CMS adjust the low-volume threshold to a level such that MIPS would only apply to eligible clinicians for whom the costs of participating in the MIPS program outweighed the costs of refusing to accept Medicare patients. Otherwise, commenter was concerned that solo practitioners and small practices would opt out of treating Medicare patients.

Response: We thank the commenter for their suggestions and note that we

are modifying our proposed low-volume threshold by increasing the dollar value of billed Medicare Part B allowed charges and eliminating the requirement for MIPS eligible clinicians and groups to meet both the dollar value threshold and the 100 beneficiary count. We believe our modified proposal would increase the number of groups excluded from participating in MIPS based on the low-volume threshold and prevent the low-volume threshold from being a potential factor that could influence a MIPS eligible clinician's decision to deny access to care for Medicare Part B beneficiaries or opt out of treating Medicare Part B beneficiaries. We refer readers to section III.B. of this final rule with comment period for our discussion regarding burden reduction.

Comment: For those eligible clinicians not participating in an ACO, one commenter requested clarification on the proposed \$10,000 threshold, specifically, whether this includes payments made under the RHC all-inclusive rate (AIR) or FQHC prospective payment system. The commenter suggested that the \$10,000 threshold should only include Part B PFS allowed charges because the other payment methodologies already are alternatives to fee schedules.

Response: In this section of the final rule with comment period, we are modifying our proposed low-volume threshold to be based on a dollar value of \$30,000 of billed Medicare Part B allowed charges during a performance period or 100 Part B-enrolled beneficiary count, which would apply to clinicians in RHCs and FQHCs with billed Medicare Part B allowed charges.

Comment: A few commenters requested clarification on the low-volume threshold for clinicians who change positions frequently or work as locum tenens. The commenters requested CMS to clarify whether or not the threshold would be cumulative for these clinicians throughout the year as they bill under different TINs, or whether the threshold be specific to a TIN/NPI combination. Commenters recommended that the low-volume threshold be for a specific TIN in which a clinician may work.

Response: In sections II.E.2.a. and II.E.2.b. of this final rule with comment period, we describe the identifiers for MIPS eligible clinicians participating in MIPS at the individual or group level. For MIPS eligible clinicians reporting as individuals, we use a combination of billing TIN/NPI as the identifier to assess performance. In order to determine the low-volume status of eligible clinicians reporting individually, we will calculate the low-

volume threshold for each TIN/NPI combination. For individual MIPS eligible clinicians billing under multiple TINs, the low-volume threshold is calculated for each TIN/NPI combination. In the case of an individual eligible clinician exceeding the low-volume threshold under any TIN/NPI combination, the eligible clinician would be considered a MIPS eligible clinician and required to meet the MIPS requirements for those TIN/NPI combinations.

Comment: One commenter suggested that CMS develop a MIPS hardship exception in addition to a low-volume threshold.

Response: We thank the commenter for the suggestion. We note that the section II.E.5.g.(8)(a)(ii) of this final rule with comment period describes our final policies regarding the re-weighting of the advancing care information performance category within the final score, in which we would assign a weight of zero when there are not sufficient measures applicable and available for MIPS eligible clinicians facing a significant hardship.

Comment: One commenter stated that the low-volume threshold should also take into account total Medicare patients and billing, including Medicare Advantage enrollees, not just Part B.

Response: We appreciate the suggestion from the commenter, but note that section 1848(q)(1)(C)(iv) of the Act establishes provisions relating to the low-volume threshold, in which the low-volume threshold only pertains to the number of Part B-enrolled Medicare beneficiaries, the number of items and services furnished to such individuals, or the amount of allowed charges billed under Part B. To the extent that Medicare Part B allowed charges are incurred for beneficiaries enrolled in section 1833(a)(1)(A) or 1876 Cost Plans, those the Medicare beneficiaries would be included in the beneficiary count; however, beneficiaries enrolled in Medicare Advantage plans that receive their Part B services through their Medicare Advantage plan will not be included in allowed charges billed under Medicare Part B for determining the low-volume threshold.

Comment: Regarding partial year performance data, one commenter indicated that the low-volume reporting threshold and "insufficient sample size" standard already proposed for MIPS are adequate, and no additional "partial year" criteria would be needed. For example, a clinician who only began billing Medicare in November and did not meet the low-volume threshold would not be eligible for MIPS. Another clinician who began billing Medicare in

November who exceeds the low-volume threshold, even in such a short time period, would be eligible for MIPS. The commenter supported this approach because it is simple and straightforward and does not require any additional calculations.

Response: We appreciate the support from the commenter.

Comment: One commenter requested that CMS provide an exemption for physicians over 60 or 65 years old as they cannot afford to implement the necessary changes, particularly if they are working part-time.

Response: We appreciate the concerns expressed by the commenter and note that all MIPS eligible clinicians (as defined in section 1861(r) of the Act) practicing either full-time or part-time are required to participate in MIPS unless determined eligible for an exclusion. A MIPS eligible clinician, whether practicing full-time or part-time, who does not exceed the low-volume threshold would be excluded from participating in MIPS.

After consideration of the public comments we received, we are finalizing a modification to our proposal to define MIPS eligible clinicians or groups who do not exceed the low-volume threshold. At § 414.1305, we are defining MIPS eligible clinicians or groups who do not exceed the low-volume threshold as an individual MIPS eligible clinician or group who, during the low-volume threshold determination period, has Medicare Part B billing charges less than or equal to \$30,000 or provides care for 100 or fewer Part B-enrolled Medicare beneficiaries. We are finalizing our proposed policy at § 414.1310(b) that for a year, MIPS eligible clinicians who do not exceed the low-volume threshold (as defined at § 414.1305) are excluded from MIPS for the performance period with respect to a year. The low-volume threshold also applies to MIPS eligible clinicians who practice in APMs under the APM scoring standard at the APM Entity level, in which APM Entities that do not exceed the low-volume threshold would be excluded from the MIPS requirements and not subject to a MIPS payment adjustment. Such an exclusion will not affect an APM Entity's QP determination if the APM Entity is an Advanced APM. Additionally, because we agree that it would be beneficial for individual eligible clinicians and groups to know whether they are excluded under the low-volume threshold prior to the start of the performance period, we are finalizing a modification to our proposal to allow us to make eligibility determinations regarding low-volume status using historical data. This

modification will allow us to inform individual MIPS eligible clinicians and groups of their low-volume status prior to the performance period. We establish the low-volume threshold determination period to refer to the timeframe used to assess claims data for making eligibility determinations for the low-volume threshold exclusion. We define the low-volume threshold determination period to mean a 24-month assessment period, which includes a two-segment analysis of claims data during an initial 12-month period prior to the performance period followed by another 12-month period during the performance period. In order to conduct an analysis of the data prior to the performance period, we are establishing an initial low-volume threshold determination period consisting of 12 months. The initial 12-month segment of the low-volume threshold determination period would span from the last 4 months of a calendar year 2 years prior to the performance period followed by the first 8 months of the next calendar year and include a 60-day claims run out, which will allow us to inform eligible clinicians and groups of their low-volume status during the month (December) prior to the start of the performance period. The second 12-month segment of the low-volume threshold determination period would span from the last 4 months of a calendar year 1 year prior to the performance period followed by the first 8 months of the performance period in the next calendar year and include a 60-day claims run out, which will allow us to inform additional eligible clinicians and groups of their low-volume status during the performance period.

Thus, for purposes of the 2019 MIPS payment adjustment, we will initially identify the low-volume status of individual eligible clinicians and groups based on 12 months of data starting from September 1, 2015 to August 31, 2016. In order to account for the identification of additional individual eligible clinicians and groups that do not exceed the low-volume threshold during the 2017 performance period, we will conduct another eligibility determination analysis based on 12 months of data starting from September 1, 2016 to August 31, 2017. For example, eligible clinicians who may have exceeded the low-volume threshold during the first determination assessment, but fall below the threshold during the performance period because their practice changed significantly, they changed practices from a prior year, etc. Similarly, for future years, we will conduct an initial eligibility

determination analysis based on 12 months of data (consisting of the last 4 months of the calendar year 2 years prior to the performance period and the first 8 months of the calendar year prior to the performance period) to determine the low-volume status of individual eligible clinicians and groups, and conduct another eligibility determination analysis based on 12 months of data (consisting of the last 4 months of the calendar year prior to the performance period and the first 8 months of the performance period) to determine the low-volume status of additional individual MIPS eligible clinicians and groups. We will not change the low-volume status of any individual eligible clinician or group identified as not exceeding the low-volume threshold during the first eligibility determination analysis based on the second eligibility determination analysis. Thus, an individual eligible clinician or group that is identified as not exceeding the low-volume threshold during the first eligibility determination analysis will continue to be excluded from MIPS for the duration of the performance period regardless of the results of the second eligibility determination analysis. We will conduct the second eligibility determination analysis to account for the identification of additional, previously unidentified individual eligible clinicians and groups who do not exceed the low-volume threshold.

We recognize that the low-volume threshold determination period effectively combines two 12-month segments from 2 consecutive calendar years, in which the two 12-month periods of data that would be used for our analysis will not align with the calendar years. Also, we note that the low-volume threshold determination period may impact new Medicare-enrolled eligible clinicians who are excluded from MIPS participation for the performance period in which they are identified as new Medicare-enrolled eligible clinicians. Such clinicians would ordinarily begin participating in MIPS in the subsequent year, but under our modified low-volume threshold, are more likely to be excluded for a second year. The low-volume threshold exclusion may apply if, for example, such eligible clinician became a new Medicare-enrolled eligible clinician during the last 4 months of the calendar year and did not exceed the low-volume threshold of billed Medicare Part B allowed charges. Since the initial eligibility determination period consists of the last 4 months of the calendar year 2 years prior to the performance period

and the first 8 months of the calendar year prior to the performance period, these new Medicare-enrolled eligible clinicians could be identified as having a low-volume status if the analysis reflects billed Medicare Part B allowed charges less than \$30,000 or the provided care for 100 or fewer Part B-enrolled Medicare beneficiaries. As noted above, we will not change the low-volume status of any individual MIPS eligible clinician or group identified as not exceeding the low-volume threshold during the first eligibility determination analysis based on the second eligibility determination analysis.

d. Group Reporting

(1) Background

As noted in section II.E.1.e. of the proposed rule (81 FR 28176), section 1848(q)(1)(D) of the Act, requires the Secretary to establish and apply a process that includes features of the PQRS group practice reporting option (GPRO) established under section 1848(m)(3)(C) of the Act for MIPS eligible clinicians in a group for the purpose of assessing performance in the quality category and gives the Secretary the discretion to do so for the other performance categories. The process established for purposes of MIPS must, to the extent practicable, reflect the range of items and services furnished by the MIPS eligible clinicians in the group. We believe this means that the process established for purposes of MIPS should, to the extent practicable, encompass elements that enable MIPS eligible clinicians in a group to meet reporting requirements that reflect the range of items and services furnished by the MIPS eligible clinicians in the group. At § 414.1310(e), we proposed requirements for groups. For purposes of section 1848(q)(1)(D) of the Act, at § 414.1310(e)(1) we proposed the following way for individual MIPS eligible clinicians to have their performance assessed as a group: As part of a single TIN associated with two or more MIPS eligible clinicians, as identified by a NPI, that have their Medicare billing rights reassigned to the TIN (as discussed further in section II.E.2.b. of the proposed rule).

To have its performance assessed as a group, at § 414.1310(e)(2), we proposed a group must meet the proposed definition of a group at all times during the performance period for the MIPS payment year. Additionally, at § 414.1310(e)(3) we proposed in order to have their performance assessed as a group, individual MIPS eligible clinicians within a group must aggregate

their performance data across the TIN. At § 414.1310(e)(3), we proposed that a group electing to have its performance assessed as a group would be assessed as a group across all four MIPS performance categories. For example, if a group submits data for the quality performance category as a group, CMS would assess them as a group for the remaining three performance categories. We solicited public comments on the proposal regarding how groups will be assessed under MIPS.

The following is a summary of the comments we received regarding our proposed requirements for groups, including: Individual MIPS eligible clinicians would have their performance assessed as a group as part of a single TIN associated with two or more MIPS eligible clinicians, as identified by a NPI, that have their Medicare billing rights reassigned to the TIN; a group must meet the definition of a group at all times during the performance period for the MIPS payment year; individual MIPS eligible clinicians within a group must aggregate their performance data across the TIN in order for their performance to be assessed as a group; and a group that elects to have its performance assessed as a group would be assessed as a group across all four MIPS performance categories.

Comment: The majority of commenters were supportive of the proposed group requirements. In particular, several commenters supported our proposal to allow MIPS eligible clinicians to report across the four performance categories at an individual or group level. The commenters also expressed support for the way in which we would assess group performance.

Response: We appreciate the support from commenters.

Comment: One commenter supported CMS' recognition that MIPS eligible clinicians may practice in multiple settings and proposal to allow such MIPS eligible clinicians to be measured as individuals or through a group's performance.

Response: We appreciate the support from the commenter.

Comment: A few commenters recommended that CMS consider allowing for greater flexibility in the reporting requirements and allow MIPS eligible clinicians to participate either individually or as a group for each of the four performance categories, as it may be reasonable to report individually for some categories and as a group for other categories. One commenter indicated that reporting for the advancing care information measures via a group would be a helpful option,

but there are hurdles clinicians and health IT vendors and developers may need to overcome during the first 2 years to do so.

Response: We appreciate the feedback from the commenters. While we want to ensure that there is as much flexibility as possible within the MIPS program, we believe it is important that MIPS eligible clinicians choose how they will participate in MIPS as a whole, either as an individual or as a group. Whether MIPS eligible clinicians participate in MIPS as an individual or group, it is critical for us to assess the performance of individual MIPS eligible clinicians or groups across the four performance categories collectively as either an individual or group in order for the final score to reflect performance at a true individual or group level and to ensure the comparability of data. Section II.E.5.g.(5)(c) of this final rule with comment period describes group reporting requirements pertaining to the advancing care information performance category.

Comment: A few commenters indicated that group reporting can be challenging if the group includes part-time clinicians.

Response: We recognize that group-level reporting offers different advantages and disadvantages to different practices and therefore, it may not be the best option for all MIPS eligible clinicians who are part of a particular group. Depending on the composition of a group, which may include part-time clinicians, some groups may find meeting the MIPS requirements to be less burdensome if they report at the individual level rather than at the group level. Also, we note that some part-time clinicians may be excluded from MIPS participation at the individual level if they do not exceed the low-volume threshold (section II.E.3.c. of this final rule with comment period describes the low-volume threshold exclusion).

Comment: One commenter requested clarification regarding whether or not clinicians excluded from MIPS would also be excluded from group-level reporting.

Response: With clinician practices having the option to report at the individual (TIN/NPI) or group level (TIN), we elaborate on how a MIPS group's (TIN) performance is assessed and scored at the group level and how the MIPS payment adjustment is applied at the group level when a group includes clinicians who are excluded from MIPS at the individual level. We note that there are three types of MIPS exclusions: New Medicare-enrolled eligible clinicians, QPs and Partial QPs

who do not report on applicable MIPS measures and activities, and eligible clinicians who do not exceed the low-volume threshold (see section II.E.3. of this final rule with comment period), which determine when an eligible clinician is not considered a MIPS eligible clinician and thus, not required to participate in MIPS. The two types of exclusions pertaining to new Medicare-enrolled eligible clinicians, and QPs and Partial QPs who do not report on applicable MIPS measures and activities are determined at the individual (NPI) level while the low-volume threshold exclusion is determined at the individual (TIN/NPI) level for individual reporting and at the group (TIN) level for group reporting.

A group electing to submit data at the group level would have its performance assessed and scored across the TIN, which could include items and services furnished by individual NPIs within the TIN who are not required to participate in MIPS. For example, excluded eligible clinicians (new Medicare-enrolled, QPs, or Partial QPs who do not report on applicable MIPS measures and activities, and do not exceed the low-volume threshold) are part of the group, and therefore, would be considered in the group's score. However, the MIPS payment adjustment would apply differently at the group level in relation to each exclusion circumstance. For example, groups reporting at the group level that include new Medicare-enrolled eligible clinicians, or QPs or Partial QPs would have the MIPS payment adjustment only apply to the Medicare Part B allowed charges pertaining to the group's MIPS eligible clinicians and the MIPS payment adjustment would not apply to such clinicians excluded from MIPS based on these two types of exclusions. We reiterate that any individual (NPI) excluded from MIPS because they are identified as new Medicare-enrolled, QP, or Partial QP would not receive a MIPS payment adjustment, regardless of their MIPS participation.

We note that the low-volume threshold is different from the other two exclusions in that it is not determined solely based on the individual NPI status, it is based on both the TIN/NPI (to determine an exclusion at the individual level) and TIN (to determine an exclusion at the group level) status. In regard to group-level reporting, the group, as a whole, is assessed to determine if the group (TIN) exceeds the low-volume threshold. Thus, eligible clinicians (TIN/NPI) who do not exceed the low-volume threshold at the individual reporting level and would otherwise be excluded from MIPS

participation at the individual level, would be required to participate in MIPS at the group level if such eligible clinicians are part of a group reporting at the group level that exceeds the low-volume threshold.

We considered aligning how the MIPS exclusions would be applied at the group level for each of the three exclusion circumstances. We recognize that alignment would provide a uniform application across the three exclusions and offer simplicity, but we also believe it is critical to ensure that there are opportunities encouraging coordination, teamwork, and shared responsibility within groups. In order to encourage coordination, teamwork, and shared responsibility at the group level, we will assess the low-volume threshold so that all clinicians within the group have the same status: All clinicians collectively exceed the low-volume threshold or they do not exceed the low-volume threshold.

In addition, we recognize that individual clinicians who do not meet the definition of a MIPS eligible clinician during the first 2 years of MIPS such as physical and occupational therapists, clinical social workers, and others are not MIPS eligible. Thus, such clinicians are not required to participate in MIPS, but may voluntarily report measures and activities for MIPS. For those clinicians not MIPS eligible who voluntarily report for MIPS, they would not receive a MIPS payment adjustment. Accordingly, groups reporting at the group level may voluntarily include such eligible clinicians in its aggregated data that would be reported for measure and activities under MIPS. For groups reporting at the group level that voluntarily include eligible clinicians who do not meet the definition of a MIPS eligible clinician, they would have their performance assessed and scored across the TIN, but those clinicians would not receive a MIPS payment adjustment, regardless of their MIPS voluntary participation. We further note that these clinicians who are not eligible for MIPS, but volunteer to report, would not receive a MIPS payment adjustment.

We are finalizing our proposals regarding group requirements; however, we welcome additional comment on: How we are applying the application of group-related policies pertaining to group-level performance assessment and scoring and the MIPS payment adjustment to groups with eligible clinicians excluded from MIPS based on the three exclusions or not MIPS eligible for the first 2 years of MIPS; the advantages and disadvantages of how we are applying the application of

group-related policies when groups include eligible clinicians excluded from the requirement to participate in MIPS at the individual level; and alternative approaches that could be considered.

Comment: One commenter expressed concerns that group reporting benchmarks and comparison groups have not yet been identified.

Response: All MIPS eligible clinicians, regardless of specialty, geographic location, or whether they report as an individual or group, who submit data using the same submission mechanism would be included in the same benchmark. We refer readers to sections II.E.6.a.(2)(a) and II.E.6.a.(3)(a) of this final rule with comment period for further discussion of policies regarding quality measure and cost measure benchmarks under MIPS.

Comment: One commenter requested clarification regarding group reporting for organizations with multiple practices/specialties.

Response: As proposed, group reporting would occur and be aggregated at the TIN level. No distinct reporting occurs at the specialty or practice site level.

Comment: One commenter requested clarification on what can be expected under MIPS by small practices for which measures are not applicable.

Response: In section II.E.6.b.(2)(b) of this final rule with comment period, we describe our scoring methodology that is applied when there are a few or no applicable measures under the quality performance category for MIPS eligible clinicians or groups to report.

Comment: One commenter recommended that CMS focus regulations on large systems and practices and have fewer regulations for small practices.

Response: We believe that it is essential for our requirements pertaining to group-level reporting should be applicable to all groups regardless of size, geographic location, composition, or other differentiating factors. However, we believe that there are circumstances in which our policies should consider how different types of groups would be affected. In this final rule with comment period, we establish an exclusion for individual MIPS eligible clinicians and groups who do not exceed a low-volume threshold pertaining to a dollar value of Medicare Part B allowed charges or a Part B-enrolled beneficiary count. Also, we finalize our proposal relating to MIPS eligible clinicians practicing RHCs and FQHCs, in which services rendered by an eligible clinician that are payable under the RHC or FQHC methodology

would not be subject to the MIPS payments adjustments.

After consideration of the public comments we received, we are finalizing a modification to the following proposed policy:

- Individual MIPS eligible clinicians who choose to report as a group will have their performance assessed as part of a single TIN associated with two or more eligible clinicians (including at least one MIPS eligible clinician), as identified by a NPI, that have their Medicare billing rights reassigned to the TIN (§ 414.1310(e)(1)).

In addition, we are finalizing the following policies:

- A group must meet the definition of a group at all times during the performance period for the MIPS payment year in order to have its performance to be assessed as a group (§ 414.1310(e)(2)).

- Eligible clinicians and MIPS eligible clinicians within a group must aggregate their performance data across the TIN in order for their performance to be assessed as a group (§ 414.1310(e)(3)).

- A group that elects to have its performance assessed as a group will be assessed as a group across all four MIPS performance categories (§ 414.1310(e)(4)).

(2) Registration

Under the PQRS, groups are required to complete a registration process to participate in PQRS as a group. During the implementation and administration of PQRS, we received feedback from stakeholders regarding the registration process for the various methods available for data submission. Stakeholders indicated that the registration process was burdensome and confusing. Additionally, we discovered that during the registration process when groups are required to select their group submission mechanism, groups sometimes selected the option not applicable to their group, which has created issues surrounding the mismatch of data. Unreconciled data mismatching can impact the quality of data. To address this issue, we proposed to eliminate a registration process for groups submitting data using third party entities. When groups submit data utilizing third party entities, such as a qualified registry, QCDR, or EHR, we are able to obtain group information from the third party entity and discern whether the data submitted represents group submission or individual submission once the data are submitted.

At § 414.1310(e)(5), we proposed that a group must adhere to an election process established and required by

CMS, as described in this section. We did not propose to require groups to register to have their performance assessed as a group except for groups submitting data on performance measures via participation in the CMS Web Interface or groups electing to report the Consumer Assessment of Healthcare Providers and Systems (CAHPS) for MIPS survey for the quality performance category as described further in section I.E.5.b. of the proposed rule. For all other data submission mechanisms, groups must work with appropriate third party entities to ensure the data submitted clearly indicates that the data represent a group submission rather than an individual submission. In order for groups to elect participation via the CMS Web Interface or administration of the CAHPS for MIPS survey, we proposed that such groups must register by June 30 of the applicable 12-month performance period (that is, June 30, 2017, for performance periods occurring in 2017). For the criteria regarding group reporting applicable to the four MIPS performance categories, see section I.E.5.a. of the proposed rule.

The following is a summary of the comments we received regarding our proposal that requires a group participating via the CMS Web Interface or electing to administer the CAHPS for MIPS survey to adhere to an election process established and required by CMS.

Comment: Several commenters expressed support for CMS's effort to ease the registration burden by not requiring registration or an election process for groups other than those electing to use the CMS Web Interface or CAHPS for MIPS survey for reporting of the quality performance category.

Response: We appreciate the support from commenters regarding our proposal.

Comment: One commenter expressed concern that clinicians who attempt to use the CMS Web Interface will not know if they have patients who satisfy reporting requirements until they attempt to submit their data. The commenter did not support the registration process required in order to select the use of the CMS Web Interface as a submission mechanism. The commenter asked whether clinicians will be able to elect other options once registration for the CMS Web Interface closes.

Response: Similar to the process that has occurred in past years under the PQRS program, we intend to provide the beneficiary sample to the groups that have registered to participate via the CMS Web Interface approximately 1

month prior to the start of the submission period. The submission period for the CMS Web Interface will occur during an 8-week period following the close of the performance period that will begin no earlier than January 1 and end no later than March 31 (the specific start and end dates for the CMS Web Interface submission period will be published on the CMS Web site). This is the earliest the sample is available due to the timing required to establish and maintain an effective sample size.

We encourage groups to review the measure specifications for each data submission mechanism and select the data submission mechanism that applies best to the group prior to registering to participate via the CMS Web Interface. We want to note that groups can determine if they would have Medicare beneficiaries to report data on behalf of for the CMS Web Interface measures. Groups that register to use the CMS Web Interface prior to the registration deadline (June 30) can cancel their registration or change their selection to report at an individual or group level only during the timeframe before the close of registration.

After consideration of the public comments we received, we are finalizing the following policy:

- A group must adhere to an election process established and required by CMS (§ 414.1310(e)(5)), which includes:

- ++ Groups will not be required to register to have their performance assessed as a group except for groups submitting data on performance measures via participation in the CMS Web Interface or groups electing to report the CAHPS for MIPS survey for the quality performance category. For all other data submission methods, groups must work with appropriate third party entities as necessary to ensure the data submitted clearly indicates that the data represent a group submission rather than an individual submission.

- ++ In order for groups to elect participation via the CMS Web Interface or administration of the CAHPS for MIPS survey, such groups must register by June 30 of the applicable performance period (that is, June 30, 2017, for performance periods occurring in 2017).

Additionally, for operational purposes, we are considering the establishment of a voluntary registration process, if technically feasible, for groups that intend to submit data on performance measures via a qualified registry, QCDR, or EHR, which will enable such groups to specify whether or not they intend to participate as a group and which submission

mechanism (qualified registry, QCDR, or EHR) they plan to use for reporting data, and provide other applicable information pertaining to the TIN/NPIs. In order for groups to know which requirements apply to their group for data submission purposes in advance of the performance period or submission period, we want to establish a mechanism that would allow us to identify the data submission mechanism a group intends to use and notify groups of the applicable requirements they would need to meet for the performance year, if technically feasible. We believe it is essential for groups to be aware of their applicable requirements in advance and as a result, the only means that would allow us to inform groups is dependent on us receiving such information from groups through a voluntary registration process; otherwise, it is impossible to contact groups without knowing who they are or inform groups of applicable requirements without knowing whether or not a group intends to report at the group level and the data submission mechanism a group is planning to utilize. For groups that would not voluntarily register, we would only be able to identify such groups after the close of the submission period when data has been submitted. To address this operational facet, we are considering the establishment of a voluntary registration process similar to PQRS in that groups would make an election of a data submission mechanism; however, based on feedback we have received over the years from PQRS participants, the voluntary registration process under MIPS would not restrict group participation to the selected options, including individual- or group-level reporting or a selected data submission mechanism, made by groups during the voluntary registration process; groups would have the flexibility to modify how they participate in MIPS.

With the optional participation in a voluntary registration process, the assessment of a group's performance would not be impacted by whether or not a group elects to participate in voluntary registration. We note that if a group voluntarily registers, information provided by the group would be used to proactively inform MIPS eligible clinicians about the timeframe they would need to submit data, which would be provided to the group during the performance period. We intend to use the voluntary registration process as a means to provide additional educational materials that are targeted and tailored to such groups; and if technically feasible, provide such

groups with access to additional toolkits. We believe it is important for groups to have such information in advance in order to prepare for the submission of data. Also, we note that the voluntary registration process differs from the registration process required for groups electing to submit data via the CMS Web Interface, such that groups registering on a voluntary basis would be able to opt out of group-level reporting and/or modify their associated settings such as the chosen submission mechanism at any time. The participation of a group in MIPS via a data submission mechanism other than the CMS Web Interface or a group electing to administer the CAHPS for MIPS survey would not be contingent upon engagement in the voluntary registration process. Whether or not a group elects to participate in voluntary registration, a group must meet all of the requirements pertaining to groups. We intend to issue further information regarding the voluntary registration process for groups in subregulatory guidance.

e. Virtual Groups

(1) Implementation

Section 1848(q)(5)(I) of the Act establishes the use of voluntary virtual groups for certain assessment purposes. The statute requires the establishment and implementation of a process that allows an individual MIPS eligible clinician or a group consisting of not more than 10 MIPS eligible clinicians to elect to form a virtual group with at least one other such individual MIPS eligible clinician or group of not more than 10 MIPS eligible clinicians for a performance period of a year. As determined in statute, individual MIPS eligible clinicians and groups forming virtual groups are required to make such election prior to the start of the applicable performance period under MIPS and cannot change their election during the performance period. As discussed in section II.E.4. of the proposed rule, we proposed that the performance period would be based on a calendar year.

As we assessed the timeline for the establishment and implementation of virtual groups and applicable election process and requirements for the first performance period under MIPS, we identified significant barriers regarding the development of a technological infrastructure required for successful implementation and the operationalization of such provisions that would negatively impact the execution of virtual groups as a conducive option for MIPS eligible

clinicians or groups. The development of an electronic system before policies are finalized poses several risks, particularly relating to the impediments of completing and adequately testing the system before execution and assuring that any change in policy made during the rulemaking process are reflected in the system and operationalized accordingly. We believe that it would be exceedingly difficult to make a successful system to support the implementation of virtual groups, and given these factors, such implementation would compromise not only the integrity of the system, but the intent of the policies.

Additionally, we recognize that it would be impossible for us to develop an entire infrastructure for electronic transactions pertaining to an election process, reporting of data, and performance measurement before the start of the performance period beginning on January 1, 2017. Moreover, the actual implementation timeframe would be more condensed given that the development, testing, and execution of such a system would need to be completed months in advance of the beginning of the performance period in order to provide MIPS eligible clinicians and groups with an election period.

During the implementation and ongoing functionality of other programs such as PQRS, Medicare EHR Incentive Program, and VM, we received feedback from stakeholders regarding issues they encountered when submitting reportable data for these programs. With virtual groups as a new option, we want to minimize potential issues for end-users and implement a system that encourages and enables MIPS eligible clinicians and groups to participate in a virtual group. A web-based registration process, which would simplify and streamline the process for participation, is our preferred approach. Given the aforementioned dynamics discussed in this section, implementation for the CY 2017 performance period is infeasible as a result of the insufficient timeframe to develop a web-based registration process. We have assessed alternative approaches for the first year only, such as an email registration process, but believe that there are limitations and potential risks for numerous errors, such as submitted information being incomplete or not in the required format. A manual verification process would cause a significant delay in verifying registration due to the lack of an automated system to ensure the accuracy of the type of information submitted that is required for registration. We believe that an email registration process could become

cumbersome and a burden for groups to pursue participation in a virtual group. Implementation of a web-based registration system for CY 2018 would provide the necessary time to establish and implement an election process and requirements applicable to virtual groups, and enable proper system development and operations. We intend to implement virtual groups for the CY 2018 performance period, and we intend to address all of the requirements pertaining to virtual groups in future rulemaking. We requested comments on factors we should consider regarding the establishment and implementation of virtual groups.

The following is a summary of the comments we received regarding our intention to implement virtual groups for the CY 2018 performance period and factors we should consider regarding the establishment and implementation of virtual groups.

Comment: Many commenters supported the development of virtual groups. Some commenters noted that virtual groups are needed because some patients require multidisciplinary care in and out of a hospital and practice.

Response: We appreciate the support from commenters.

Comment: Several commenters supported CMS' decision not to implement virtual groups in year 1 in order to allow for the successful technological infrastructure development and implementation of virtual groups, but requested that CMS outline the criteria and requirements regarding the execution of virtual groups as soon as possible. Several commenters recommended that CMS use year 1 to develop the much-needed guidance and assistance that outlines the steps groups would need to take in forming virtual groups, such as drafting written agreements and developing additional skills and tools.

Response: We appreciate the support from commenters regarding the delay in the implementation of virtual groups. We intend to utilize this time to work with the stakeholder community to further advance the framework for virtual groups.

Comment: Multiple commenters expressed concern that virtual groups would not be implemented in year 1 and requested that CMS operationalize the virtual group option immediately. A few commenters indicated that the delay would impact small and solo practices and rural clinicians. Some commenters requested that in the absence of the virtual group option, small and solo practices and rural clinicians should be eligible for positive payment adjustments, but exempt from

any negative payment adjustment. The commenters stated that exempting these physicians from negative payment adjustments would better incentivize the pursuit of quality and performance improvement among solo and small practices. A few commenters recommended that all practices of 9 or fewer physicians be exempt from MIPS or APM requirements until the virtual group option has been tested and is fully operational. One commenter suggested that as an alternative to delaying the implementation of virtual groups, CMS should allow virtual groups to report performance data on behalf of small practices and HPSAs for the CY 2017 performance period.

Response: As noted in the proposed rule, we identified significant barriers regarding the development of a technological infrastructure required for successful implementation and operationalization of the provisions pertaining to virtual groups. As a result, we believe that it would be technically infeasible to make a successful system to support the implementation of virtual groups for year 1. Also, we note that clinicians who are considered MIPS eligible clinicians are required to participate in MIPS unless they are eligible for one of the exclusions established in this final rule with comment period (see section II.E.3. of this final rule with comment period); thus, a MIPS eligible clinician participating in MIPS either as an individual or group will be subject to a payment adjustment whether it is positive, neutral, or negative. The Act does not provide discretion to only apply a payment adjustment when a MIPS eligible clinician receives a positive payment adjustment. In regard to the request to allow virtual groups to have an alternative function for year 1, we intend to implement virtual groups in a manner consistent with the statute.

Comment: A few commenters recommended that CMS redirect funds from the \$500 million set aside for bonus payments to top performers toward financing a "safe harbor" for solo and small practices and rural providers.

Response: This is not permissible by statute, as the \$500 million is available only for MIPS eligible clinicians with a final score at or above the additional performance threshold.

Comment: Several commenters identified several factors CMS should consider as it develops further policies relating to virtual groups, including the following: Ensuring that virtual groups have shared accountability for performance improvement; limiting the submission mechanisms to those that

require clinicians in the virtual group to collaborate on ongoing quality analysis and improvement; maintaining flexibility for factors being considered for virtual groups; implementing a virtual group pilot to be run prior to 2018 implementation; and hosting listening sessions to receive input and feedback on this option with specialty societies and other stakeholders. Several commenters requested that CMS avoid placing arbitrary limits on minimum or maximum size, geography proximity, or specialty of virtual groups, but allow virtual groups to determine group size, geographic affiliations, and group composition. One commenter encouraged CMS to explore broad options for virtual groups outside the norm of TIN/NPI grouping. However, a few commenters recommended that virtual groups be limited to practices of same or similar specialties or clinical standards. Another commenter requested more detail on the implementation of virtual groups.

A few commenters recommended the following minimum standards for members of a virtual group: Have mutual interest in quality improvement; care for similar populations; and be responsible for the impact of their decisions on the whole group. A few commenters suggested that virtual groups should not have their performance ratings compared to other virtual groups, but instead, virtual groups should have their performance ratings compared to their annual performance rating during the initial implementation of virtual groups given that each virtual group's clinicians and beneficiaries may have varying risk preventing a direct comparison.

Response: We appreciate the suggestions from the commenters and as a result of the recommendations, we are interested in obtaining further input from stakeholders regarding the types of provisions and elements that should be considered as we develop requirements applicable to virtual groups. Therefore, we are seeking additional comment on the following issues for future consideration: The advantages and disadvantages of establishing minimum standards, similar to those suggested by commenters as noted above; the types of standards could be established for members of a virtual group; the factors would need to be considered in establishing a set of standards; the advantages and disadvantages of requiring members of a virtual group to adhere to minimum standards; the types of factors or parameters could be considered in developing a virtual group framework to ensure that virtual groups would be able to effectively use

their data for meaningful analytics; the advantages and disadvantages of forming a virtual group pilot in preparation for the development and implementation of virtual groups; the framework elements could be included to form a virtual group pilot.

As we develop requirements applicable to virtual groups, we will also consider the ways in which virtual groups will each have unique characteristic compositions and varying patient populations and how the performance of virtual groups will be assessed, scored, and compared. We are committed to pursuing the active engagement of the stakeholders throughout the process of establishing and implementing virtual groups.

Comment: Several commenters recognized the potential value of virtual groups to ease the burden of reporting under MIPS. Commenters recommended that CMS expand virtual groups to promote the adoption of activities that enhance care coordination and improve quality outcomes that are often out of reach for small practices due to limited resources; encourage virtual groups to establish shared clinical guidelines, promote clinician responsibility, and have the ability to track, analyze, and report performance results; and promote information-sharing and collaboration among its clinicians.

Response: We appreciate the suggestions from the commenters and as a result of the recommendations, we are interested in obtaining further input from stakeholders regarding the technical and operational elements and data analytics/metrics that should be considered as we develop requirements applicable to virtual groups. Therefore, we are seeking additional comment on the following issues for future consideration: The types of requirements that could be established for virtual groups to promote and enhance the coordination of care and improve the quality of care and health outcomes; and the parameters (for example, shared patient population), if any, could be established to ensure virtual groups have the flexibility to form any composition of virtual group permissible under the Act while accounting for virtual groups reporting on measures across the four performance categories that are collectively applicable to a virtual group given that the composition of virtual groups could have many differing forms. We believe that each MIPS eligible clinician who is part of a virtual group has a shared responsibility in the performance of the virtual group and the formation of a virtual group provides an opportunity for MIPS eligible clinicians

to share and potentially streamline best practices.

Comment: One commenter requested clarification on what constitutes a virtual group and how virtual groups will be formed. The commenter recommended that performance for individual MIPS eligible clinicians in virtual groups should be based on specialty-specific measures. The commenter also recommended that, when assessing performance, CMS should develop sufficient risk adjustment mechanisms that ensure MIPS eligible clinicians are only scored on the components of care they have control over, and CMS should develop robust and appropriate attribution methods. Another commenter recommended that CMS require virtual groups to demonstrate a reliable mechanism for establishing patient attribution as well as the ability to report throughout the performance period.

Response: We will consider these suggestions as we develop requirements applicable to virtual groups in future rulemaking. In regard to the commenter's request for clarification regarding what constitutes a virtual group and how they are formed, we note that section 1848(q)(5)(I) of the Act requires the establishment and implementation of a process that allows an individual MIPS eligible clinician or a group consisting of not more than 10 MIPS eligible clinicians to elect to form a virtual group with at least one other such individual MIPS eligible clinician or group of not more than 10 MIPS eligible clinicians for a performance period of a year.

Comment: One commenter suggested that virtual groups could be organized similarly to the current PQRS GPRO, in which virtual groups would have the flexibility to select both quality and resources use measures once they are further developed.

Response: We want to clarify that there is no virtual group reporting or similar option under PQRS. We note that virtual groups are not a data submission mechanism. MIPS eligible clinicians would have the option to participate in MIPS as individual MIPS eligible clinicians, groups, or, following implementation, virtual groups.

Comment: One commenter recommended the use of third-party certifications to assist with emerging virtual groups. The commenter also suggested that CMS provide bonus points for clinicians that register as virtual groups, similar to electronic reporting of quality measures.

Response: We will consider these suggestions as we develop requirements for virtual groups in future rulemaking.

Comment: A few commenters encouraged CMS to assess many of the virtual group challenges associated with EHR technology. One commenter stated that most small independent clinician offices do not use the same EHR technology as their neighbors, and virtual groups would create reporting and measurement challenges, especially with respect to the advancing care information performance category; the commenter suggested that CMS provide attestation as an option.

Another commenter indicated that the implementation of virtual groups could be unsuccessful based on the following factors: There is no necessary consistency in the nomenclature and methods used by different health IT vendors and developers, which would prevent prospective virtual group members from correctly understanding the degree and nature of the differences in approaches regarding data collection and submission; any vendor-related issues would be combined in unpredictable ways within virtual groups, causing the datasets to not correspond categorically and having inconsistent properties among the datasets; there is the prospect of a mismatch of properties for virtual group members on assessed measures, where neither excellence nor laggardly work would be clearly visible; and there is a risk of a practice joining a virtual group with "free riders," which would result in a churning of membership and a serious loss of year-to-year comparison capabilities. In order to address such issues, the commenter recommended that CMS develop a system that includes the capability for clinicians and groups to participate in a service similar to online dating service applications that would allow clinicians and groups to use self-identifying descriptors to select their true peers within similar CEHRT.

A few commenters requested clarification regarding the approved methods for submitting and aggregating disparate clinician data for virtual groups, and whether or not new clinicians should be included in virtual groups if they have not been part of the original TIN throughout the reporting year.

Response: We thank the commenters for providing suggestions and identifying potential health IT challenges virtual groups may encounter regarding the reporting and submission of data. As a result of the recommendations and identification of potential barriers, we are interested in

obtaining further input from stakeholders on these issues as we establish provisions pertaining to virtual groups and build a technological infrastructure for the operationalization of virtual groups. Therefore, we are seeking comment on the following issues for future consideration: The factors virtual groups would need to consider and address in order for the reporting and submission of data to be streamlined in a manner that allows for categorization of datasets and comparison capabilities; the factors an individual clinician or small practice who are part of a virtual group would need to consider in order for their CEHRT to have interoperability with other CEHRT if part of a virtual group; the advantages and disadvantages of having members of a virtual group use one form of CEHRT; the potential barriers that may make it difficult for virtual groups to be prepared to have a collective, streamlined system to capture measure data; and the timeframe virtual groups would need in order to build a system or coordinate a systematic infrastructure that allows for a collective, streamlined capturing of measure data.

Comment: One commenter suggested having Virtual Integrated Clinical Networks (VICN) as an alternative type of delivery system within the Quality Payment Program. The commenter further indicated that the development of VICNs can lead to better patient care and lower costs by including only physicians and other clinicians who commit to value-based care at the outset. The commenter noted that in order to participate, clinicians would have to agree to work and practice in a value-based way, with transparency of patient satisfaction, clinical outcomes, and cost results.

Response: We will consider the suggestion as we develop the framework and requirements for virtual groups.

Comment: One commenter suggested that CMS change the name of virtual groups to virtual network since a group includes coordination of a wide range of physician and related ancillary services under one roof that is seamless to patients while the term “network” implies more of an alignment of multiple group practices and clinicians operating across the medical community for purposes of reporting in MIPS.

Response: We will consider the suggestion as we establish the branding for virtual groups.

Comment: Multiple commenters did not support virtual groups being limited to groups consisting of not more than 10 MIPS eligible clinicians to form a virtual group with at least one other MIPS

eligible clinician or group of not more than 10 MIPS eligible clinicians.

Response: With regard to commenters not supporting the composition limit of virtual groups, we note that section 1848(q)(5)(I) of the Act requires the establishment and implementation of a process that allows an individual MIPS eligible clinician or a group consisting of not more than 10 MIPS eligible clinicians to elect to form a virtual group with at least one other such individual MIPS eligible clinician or group of not more than 10 MIPS eligible clinicians for a performance period of a year. Thus, we do not have the authority to modify this statutory provision.

Comment: A few commenters requested that CMS work with clinician communities as it establishes the framework for the virtual group option. Commenters recommended that CMS protect against antitrust issues that may arise regarding physician collaboration to recognize economies of scale. One commenter indicated that accreditation entities have experience with the Federal Trade Commission (FTC) rules related to clinically integrated networks formed to improve the quality and efficiency of care delivered to patients and that publicly vetted accreditation standards could guide the development of virtual groups in a manner that incentivizes sustainable growth as integrated networks capable of long-term success under value-based reimbursement.

Response: We will consider the recommendations provided as we develop requirements pertaining to virtual groups.

Comment: One commenter recommended that in future rulemaking, CMS create a unique identifier for virtual groups, allow multiple TINs and split TINs, avoid thresholds based on the number of patients treated, avoid restricting the number of participants in virtual groups, and avoid limitations on the number of virtual groups. Another commenter suggested that virtual groups should be reporting data at either the TIN level, NPI/TIN level, or APM level.

Response: We appreciate the recommendations from the commenters and as a result of the suggestions, we are interested in obtaining further input from stakeholders regarding a group identifier for virtual groups. Therefore, we are seeking additional comment for future consideration on the following: The advantages and disadvantages of creating a new identifier for virtual groups; and the potential options for establishing an identifier for virtual groups. We intend to explore this issue.

We thank the commenters for their input regarding our intention to

implement virtual groups for the CY 2018 performance period and factors we should consider regarding the establishment and implementation of virtual groups. We intend to explore the types of requirements pertaining to virtual groups, including, but not limited to, defining a group identifier for virtual groups, establishing the reporting requirements for virtual groups, identifying the submission mechanisms available for virtual group participation, and establishing methodologies for how virtual group performance will be assessed and scored. In addition, during the CY 2017 performance period, we will be convening a user group of stakeholders to receive further input on the factors CMS should consider in establishing the requirements for virtual groups and identify mechanisms for the implementation of virtual groups in future years.

(2) Election Process

Section 1848(q)(5)(I)(iii)(I) of the Act provides that the election process must occur prior to the performance period and may not be changed during the performance period. We proposed to establish an election process that would end on June 30 of a calendar year preceding the applicable performance period. During the election process, we proposed that individual MIPS eligible clinicians and groups electing to be a virtual group would be required to register in order to submit reportable data. Virtual groups would be assessed across all four MIPS performance categories. In future rulemaking, we will address all elements relating to the election process and outline the criteria and requirements regarding the formation of virtual groups. We solicited public comments on this proposal.

The following is summary of the comments we received regarding our proposals that apply to virtual groups, including: The establishment of an election process that would end on June 30 of a calendar year preceding the applicable performance period; the requirement of individual MIPS eligible clinicians and groups electing to be a virtual group to register in order to submit reportable data; and the assessment of virtual groups across all four MIPS performance categories.

Comment: A few commenters requested that CMS reconsider the deadline by which virtual groups would be required to make an election to participate in MIPS. One commenter recommended that the deadline should be 90 days before the performance period as opposed to 6 months.

Response: We will consider the recommendations as we establish the election process for virtual groups.

Comment: One commenter indicated that a registration process for the virtual group option would be an unnecessary burden and recommended that registration by virtual groups should only be required if the group participates in MIPS via the CMS Web Interface. Another commenter expressed concern that without a manageable registration system for virtual groups, there would be too many loopholes, which would add confusion to the program.

Response: We appreciate the commenters providing recommendations and we will consider the recommendations as we establish the virtual group registration process.

After consideration of the public comments we received, and with the delay of virtual group implementation, we are not finalizing our proposal to establish a virtual group election process that would end on June 30 for the CY 2017 performance period; the proposed requirement of individual MIPS eligible clinicians and groups electing to be a virtual group to register in order to submit reportable data; or the proposed assessment of virtual groups across all four MIPS performance categories.

4. MIPS Performance Period

MIPS incorporates many of the requirements of several programs into a single, comprehensive program. This consolidation includes key policy goals as common themes across multiple categories such as quality improvement, patient and family engagement, and care coordination through interoperable health information exchange. However, each of these legacy programs included different eligibility requirements, reporting periods, and systems for clinicians seeking to participate. This means that we must balance potential impacts of changes to systems and technical requirements to successfully synchronize reporting, as noted in the discussion regarding the definition of a MIPS eligible clinician in the proposed rule (81 FR 28173). We must take operational feasibility, systems impacts, and education and outreach on participation into account in developing technical requirements for participation. One area where this is particularly important is in the definition of a performance period.

MIPS applies to payments for items and services furnished on or after January 1, 2019. Section 1848(q)(4) of the Act requires the Secretary to establish a performance period (or

periods) for a year (beginning with 2019). Such performance period (or periods) must begin and end prior to such year and be as close as possible to such year. In addition, section 1848(q)(7) of the Act provides that, not later than 30 days prior to January 1 of the applicable year, the Secretary must make available to each MIPS eligible clinician the MIPS adjustment (and, as applicable, the additional MIPS adjustment) applicable to the MIPS eligible clinician for items and services furnished by the MIPS eligible clinician during the year.

We considered various factors when developing the policy for the MIPS performance period. Stakeholders have stated that having a performance period as close to when payments are adjusted is beneficial, even if such period would be less than a year. We have also received feedback from stakeholders that they prefer having a 1 year performance period and have further suggested that the performance period start during the calendar year (for example, having the performance period occurring from July 1 through June 30). We additionally considered operational factors, such as that a 1 year performance period may be beneficial for all four performance categories because many measures and activities cannot be reported in a shorter time frame. We also considered that data submission activities and claims for items and services furnished during the 1 year performance period (which could be used for claims- or administrative claims-based quality or cost measures) may not be fully processed until the following year.

These circumstances will require adequate lead time to collect performance data, assess performance, and compute the MIPS adjustment so the applicable MIPS adjustment can be made available to each MIPS eligible clinician at least 30 days prior to when the MIPS payment adjustment is applied each year. For 2019, these actions will occur during 2018. In other payment systems, we have used claims that are processed within a specified time period after the end of the performance period, such as 60 or 90 days, for assessment of performance and application of the MIPS payment adjustment. For MIPS, we proposed at § 414.1325(g)(2) to use claims that are processed within 90 days, if operationally feasible, after the end of the performance period for purposes of assessing performance and computing the MIPS payment adjustment. We proposed that if we determined that it is not operationally feasible to have a claims data run-out for the 90-day

timeframe, then we would utilize a 60-day duration in the calendar year immediately following the performance period.

This proposal does not affect the performance period per se, but rather the deadline by which claims for items and services furnished during the performance period need to be processed for those items and services to be included in our calculation. To the extent that claims are used for submitting data on MIPS measures and activities to us, such claims would have to be processed by no later than 90 days after the end of the applicable performance period, in order for information on the claims to be included in our calculations. As noted in this section, if we determined that it is not operationally feasible to have a claims data run-out for the 90-day timeframe, then we would utilize a 60-day duration. As an alternative to our proposal, we also considered using claims that are paid within 60 days after 2017, for assessment of performance and application of the MIPS payment adjustment for 2019. We solicited comments on both approaches.

Given the need to collect and process information, we proposed at § 414.1320 that for 2019 and subsequent years, the performance period under MIPS would be the calendar year (January 1 through December 31) 2 years prior to the year in which the MIPS adjustment is applied. For example, the performance period for the 2019 MIPS adjustment would be the full CY 2017, that is, January 1, 2017 through December 31, 2017. We proposed to use the 2017 performance year for the 2019 MIPS payment adjustment consistent with other CMS programs. This approach allows for a full year of measurement and sufficient time to base adjustments on complete and accurate information.

For individual MIPS eligible clinicians and groups with less than 12 months of performance data to report, such as when a MIPS eligible clinician switches practices during the performance period or when a MIPS eligible clinician may have stopped practicing for some portion of the performance period (for example, a MIPS eligible clinician who is on family leave, or has an illness), we proposed that the individual MIPS eligible clinician or group would be required to report all performance data available from the performance period. Specifically, if a MIPS eligible clinician is reporting as an individual, they would report all partial year performance data. Alternatively, if the MIPS eligible clinician is reporting with a group, then the group would report all

performance data available from the performance period, including partial year performance data available for the individual MIPS eligible clinician.

Under this approach, MIPS eligible clinicians with partial year performance data could achieve a positive, neutral, or negative MIPS adjustment based on their performance data. We proposed this approach to incentivize accountability for all performance during the performance period. We also believe these policies would help minimize the impact of partial year data. First, MIPS eligible clinicians with volume below the low-volume threshold would be excluded from any MIPS payment adjustments. Second, MIPS eligible clinicians who report measures, yet have insufficient sample size, would not be scored on those measures and activities. Refer to section II.E.6. of this final rule with comment period for more information on scoring.

To potentially refine this proposal in future years, we solicited comments on methods to accurately identify MIPS eligible clinicians with less than a 12-month reporting period, notwithstanding common and expected absences due to illness, vacation, or holiday leave. Reliable identification of these MIPS eligible clinicians would allow us to analyze the characteristics of MIPS eligible clinicians' patient population and better understand how a reduced reporting period impacts performance.

We also solicited public comment on an alternative approach for future years for assessment of individual MIPS eligible clinicians with less than 12 months of performance data in the performance year. For example, if we can identify such MIPS eligible clinicians and confirm there are data issues that led to invalid performance calculations, then we could score the MIPS eligible clinician with a final score equal to the performance threshold, which would result in a zero MIPS payment adjustment. We note this approach would not assess a MIPS eligible clinicians' performance for partial-year performance data. We do not believe that consideration of partial year performance is necessary for assessment of groups, which should have adequate coverage across MIPS eligible clinicians to provide valid performance calculations.

We also solicited comment on reasonable thresholds for considering performance that is less than 12 months. For example, we expect that some MIPS eligible clinicians will take leave related to illness, vacation, and holidays. We would not anticipate applying special policies for lack of performance related

to these common and expected absences assuming MIPS eligible clinicians' quality reporting includes measures with sufficient sample size to generate valid and reliable scores. We solicited comment on how to account for MIPS eligible clinicians with extended leave that may affect measure sample size.

We solicited comments on these proposals and approaches. The following is summary of the comments we received regarding our proposals for the MIPS performance period.

Comment: Numerous commenters believed that the first MIPS performance period should be delayed or treated as a transition year. The commenters stated that the proposed timeline for implementation was too compressed, unrealistic, and aggressive. They cited numerous educational and readiness factors for the recommended delay including: Time needed for stakeholders to digest the final rule with comment period and engage in further education and to make the necessary modifications to their practices, not overly burden their systems with such a short implementation time, and time needed to establish the administrative and technological tools necessary to meet the reporting requirements. The commenters suggested numerous alternative start dates to allow what the commenters believed would be sufficient time for MIPS eligible clinicians to prepare for reporting, ranging from a 2-year delay in implementation, using CY 2018 as the initial assessment period for MIPS, a start date no less than 15 months between the adoption of the final rule with comment period and its implementation, a start date no earlier than July 1, 2017, and lastly a start date of April 1, 2017.

Response: We appreciate the suggestions and have examined the issues raised closely. We agree with the commenters that to ensure a successful implementation of the MIPS, providing MIPS eligible clinicians' additional time to prepare their practices for reporting under MIPS is needed. Therefore, we have decided to finalize a modification of our proposal for the performance period for the transition year of MIPS to provide flexibility to MIPS eligible clinicians as they familiarize themselves with MIPS requirements in 2017 while maintaining reliability. Therefore, we are finalizing at § 414.1320(a)(1) that for purposes of the 2019 MIPS payment year, the performance period for all performance categories and submission mechanisms except for the cost performance category and data for the quality performance category reported through the CMS Web Interface, for the

CAHPS for MIPS survey, and for the all-cause hospital readmission measure, is a minimum of a continuous 90-day period within CY 2017, up to and including the full CY 2017 (January 1, 2017 through December 31, 2017). Thus, MIPS eligible clinicians will only need to report for a minimum of a continuous 90-day period within CY 2017, for the majority of the submission mechanisms. This 90-day period can occur anytime within CY 2017, so long as the 90-day period begins on or after January 1, 2017, and ends on or before December 31, 2017. We note that the continuous 90-day period is a minimum; MIPS eligible clinicians may elect to report data on more than a continuous 90-day period, including a period of up to the full 12 months of 2017. For groups that elect to utilize the CMS Web Interface or report the CAHPS for MIPS survey, we note that these submission mechanisms utilize certain assignment and sampling methodologies that are based on a 12-month performance period. In addition, administrative claims-based measures (this includes all of the cost measures and the all-cause hospital readmission measure), are based on attributed population using the 12-month period. Additionally, we are finalizing at § 414.1320(a)(2) that for purposes of the 2019 MIPS payment year, for data reported through the CMS Web Interface or the CAHPS for MIPS survey and administrative claims-based cost and quality measures, the performance period under MIPS is CY 2017 (January 1, 2017 through December 31, 2017). Please note that, unless otherwise stated, any reference in this final rule with comment period to the "CY 2017 performance period" is intended to be an inclusive reference to all performance periods occurring during CY 2017. More details on these submission mechanisms are covered in section II.E.5.a.2. of this final rule with comment period.

We believe the flexibilities we are providing in our modified proposal discussed above will provide time for stakeholders to engage in further education about the new requirements and make the necessary modifications to their practices to accommodate reporting under the MIPS. We note that the continuous 90-day period of time required for reporting can occur at any point within the CY 2017 performance period, up until and including October 2, 2017, which is the last date that the continuous 90-day period of time required for reporting can begin and end within the CY 2017 performance period.

For the second year under the MIPS, we are finalizing our proposal to require reporting and performance assessment

for the full CY performance period for purposes of the quality and cost performance categories. Specifically, we are finalizing at § 414.1320(b)(1) that for the 2020 MIPS adjustment, for purposes of the quality and cost performance categories, the performance period is CY 2018 (January 1, 2018 through December 31, 2018). We do believe, however, that for the improvement activities and advancing care information performance categories, utilizing a continuous 90-day period that occurs during the 12-month MIPS performance period will assist MIPS eligible clinicians as they continue to familiarize themselves with the requirements under the MIPS. Additionally, to allow MIPS eligible clinicians and groups adequate time to transition to technology certified to the 2015 Edition for use in CY 2018, we believe it is appropriate to allow reporting on any continuous 90-day period that occurs during the 12-month MIPS performance period for the advancing care information performance category in CY 2018. Specifically, for the improvement activities and advancing care information performance categories, we are finalizing at § 414.1320(b)(2) that the performance period under MIPS is a minimum of a continuous 90-day period within CY 2018, up to and including the full CY 2018 (January 1, 2018 through December 31, 2018).

Comment: Other commenters suggested making 2018 the first performance period for the first payment year of 2019. They stated that MIPS eligible clinicians could receive more timely feedback on their performance and still have the opportunity to make improvements in the second half of 2017 before the first performance period would begin.

Response: It is not technically feasible to establish the first performance period in 2018 and begin applying MIPS payment adjustments in 2019. Some of the factors involved include: Allowing for a data submission period that occurs after the close of the performance period, running our calculation and scoring engines to calculate performance category scores and final score, allowing for a targeted review period, establishing and maintaining budget neutrality and issuance of each MIPS eligible clinician's specific MIPS payment adjustment. Based on our experience under the PQRS, VM, and Medicare EHR Incentive Program for Eligible Professionals, all of these activities on average take upwards of 9–12 months. We will continue to examine these operational processes to add efficiencies and reduce this timeframe in future years.

Comment: Other commenters noted that MIPS eligible clinicians ideally require 18 to 24 months' time to adequately identify, adopt, and apply measures to established workflows for consistent data capture. The commenters also noted that most MIPS eligible clinicians are not yet comfortable with ICD–10 and added that there are 1491 new ICD–10 CM codes becoming effective in October 2016, and that MIPS eligible clinicians would not have sufficient time to refine processes within the proposed timeline (that is, by January 1, 2017).

Response: We are finalizing a modified CY 2017 performance period, as discussed above. We believe this will allow MIPS eligible clinicians to adequately identify, adopt, and apply measures to establish workflows for consistent data capture as they familiarize themselves with MIPS requirements in 2017. We appreciate the concern raised by the commenters on the introduction of the new ICD–10 codes. However, we note that there are numerous resources available to assist commenters on incorporating these codes into their workflows at <https://www.cms.gov/medicare/Coding/ICD10/index.html>.

Comment: Another commenter requested more time for clinicians and payers other than Medicare to make adjustments to programs and amend large numbers of significant risk-based contracts between states and health plans, and between health plans and their network delivery system individual practice associations (IPAs), groups, and clinicians. The commenter stated that this would allow time for significant contract and subcontract amendments for other payers, and system changes for metrics, claims, and benefit systems.

Response: We believe the flexibilities we are providing in the first performance period, as discussed in this final rule with comment period, will allow MIPS eligible clinicians and third party intermediaries the time needed to update their systems to meet program requirements and amend any agreements as necessary.

Comment: Some commenters were concerned that setting the performance period too soon would not give third party intermediaries, such as EHR vendors, qualified registries, health IT vendors, and others the time needed to update their systems to meet program requirements. The commenters recommended setting the performance period later to allow these third party intermediaries time to validate new data entry and testing tools and overhaul their systems to comply with 2015

edition certification requirements. Another commenter believed the proposed policies would often require the use of multiple database systems that could not be accomplished in the time required.

Response: We agree with the commenters that ensuring that third party intermediaries have sufficient time to update their technologies and systems will be a key component of ensuring that MIPS eligible clinicians are ready to meet program requirements. We believe the flexibilities we are providing in the first performance period, as discussed in this final rule with comment period, will allow third party intermediaries the time needed to update their systems to support MIPS eligible clinician participation. We note that there are no new certification requirements required for the Quality Payment Program and many health IT vendors have already begun work toward the 2015 Edition certification criteria which were finalized in October 2015. We believe that the flexibility offered and the lead time to required use of technology certified to the 2015 Edition, will mitigate these concern; however, we intend to monitor health IT development progress, adoption and implementation, and the readiness of QCDRs, health IT vendors, and other third parties supporting MIPS eligible clinician participation.

Comment: Another commenter believed a later start date would provide CMS with more time to address several issues that were absent from the proposed rule, including the development of virtual groups, improved risk-adjustment and attribution methods, further refinement of episode-based resource measures and measurement tools and enhanced data feedback to participants. One commenter stated that they believed that the government programs that regulate and support MIPS have yet to be designed, tested, and implemented. The commenter stated they do not have MIPS performance thresholds or measure benchmark data and therefore cannot prepare their office to streamline the new processes and report appropriately in 2017.

Response: We respectfully disagree with the commenter and intend to address further refinements to the MIPS program in future years. We appreciate the commenter's desire to delay the start of the MIPS until we are able to have full implementation of these factors. However, as we have noted in other sections within this final rule with comment period we intend to implement these provisions when technically feasible, as in the case of

virtual groups, and when available, as in the case of improved risk-adjustment and attribution methods as well as additional episode-based resource measures. Additionally, as noted in section II.E.10. of this final rule with comment period, we intend to provide feedback to participants as required by statute, and we will enhance these feedback efforts over time. Lastly, as indicated in section II.E.6.a. of this final rule with comment period, due to the additional factors we are incorporating to simplify our scoring methodology, we have published the MIPS performance threshold in this final rule with comment period, and we will publish the measure benchmarks where available prior to the beginning of the performance period.

Comment: Several commenters recommended that the first performance period occur later than January 1, 2017 based on commenters' analysis of the MACRA statute. Some commenters believe a delayed start date of July 1, 2017 would better match Congressional intent that the performance period be as close to the MIPS payment adjustment period as possible, while still allowing for the related MIPS payment adjustments to take place in 2019. The commenters further recommended that CMS use the time between the publication of the final rule with comment period and a delayed performance period start date to test and refine the performance feedback mechanisms for the Quality Payment Program. The commenters stated that by including the "as close as possible" language in section 1848(q)(4) of the Act, the Congress sought to urge CMS to select a performance period that will close the gap on CMS's practice of setting a 2-year look-back period for Medicare quality programs.

Response: We appreciate the commenters concerns about Congressional intent for having a performance period as close as possible to the related MIPS payment adjustments. However, we believe our proposal is consistent with section 1848(q)(4) of the Act, as a performance period that occurs 2 years prior to the payment year is as close to the payment year as is currently possible. As noted above, from our experiences under the PQRS, VM, and Medicare EHR Incentive Program for Eligible Professionals, it takes approximately 9–12 months to perform the operational processes to produce a comprehensive and accurate list of MIPS eligible clinicians to receive a MIPS payment adjustment. We will continue to assess this timeframe for efficiencies in the future.

Comment: Some commenters noted that section 1848(s) of the Act, as added by section 102 of MACRA, requires a quality measure development plan with annual progress reports, the first of which must be issued by May 1, 2017. The commenters stated that by starting the Quality Payment Program on January 1, 2017, before the first annual progress report is finalized, CMS will not have finalized key program requirements before it begins MIPS.

Response: We note that the commenters are referring to 2 separate requirements under section 1848(s) of the Act. The quality measure development plan, known as the CMS Quality Measure Development Plan (MDP), was finalized and posted on May 2, 2016, which is available at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf> and required to be updated as appropriate. In addition, the MDP Annual Report, which is to report on progress in developing measures, is required to be posted annually beginning not later than May 1, 2017. We intend to post the initial MDP Annual Report on May 1, 2017. While these statutory requirements are mandatory and support the development of the MIPS program, they are not prerequisites for the implementation of the MIPS program.

Comment: Several commenters stated that the performance period was too early and suggested that CMS create an initial transitional performance period or phase-in period for the MIPS program. These commenters recommended numerous modifications and advantages as part of the transitional or phase-in period including: Phasing in some of the performance requirements such as requiring fewer quality measures and/or improvement activities in the transition year, creation of gradual performance targets which would allow sufficient time for participants to adapt to data collection and reporting prior to increasing performance standards, and phasing in the MIPS adjustment amounts such as applying a maximum MIPS payment adjustment of 2 percent in the transition year of the program, or applying negative MIPS adjustments only to groups of MIPS eligible clinicians above a certain size. These commenters noted the advantages of a transitional or phase-in period include allowing CMS to offset its concerns around calculation of outcome and claims-based measures, the feasibility of using different reporting mechanisms, meeting statutory deadlines, postponing

changes to the advancing care information performance category and the capability of CMS' internal processes.

The commenters suggested various dates for the transitional or phase-in period such as: January 1, 2017 through June 30, 2017, July 1, 2017 through December 31, 2017, allowing MIPS eligible clinicians to select a 6-month performance period or allowing MIPS eligible clinicians to use the full calendar year with an optional look-back to January 1 in 2017. The commenters requested that CMS provide technical assistance and a submission verification process during the transition period.

Response: We agree with the commenters that there are numerous advantages to having a transitional or phase-in period for the transition year. As indicated previously in this section of this final rule with comment period, we have modified the performance period for the transition year to occur for a minimum of one continuous 90-day period up to a full calendar year within CY 2017 for all data in a given performance category and submission mechanism. We believe that this modified performance period as well as the modifications we are making to our scoring methodology as reflected in section II.E.6. of this final rule with comment period address a number of the concerns the commenters have raised. Lastly, we note that section 1848(q)(6) of the Act requires us to apply the MIPS adjustment based on a linear sliding scale and an adjustment factor of an applicable percent, which the statute defines as 4 percent for 2019. We do not have the discretion to apply a smaller adjustment factor to MIPS eligible clinicians such as only 2 percent.

Comment: Multiple commenters recommended that 2017 be utilized for reporting purposes only and not payment purposes. Their recommendations ranged from having 2017 function as a straightforward reporting year only, such as an "implementation and benchmarking" year which would still allow CMS to collect data, but would not be used for financial impacts in 2019. Other suggestions included utilizing 2017 as a beta test year for MIPS eligible clinicians, plan capabilities and system preparedness. The commenters believed that a staged approach to MACRA implementation would provide for more coordinated change within the delivery system for patients, which must remain a focus for all as we continue embracing the Triple Aim of improving the patient experience of care (including quality

and satisfaction); improving the health of populations; and reducing the per capita cost of health care. More information regarding the Triple Aim may be found at <http://www.hhs.gov/about/strategic-plan/strategic-goal-1/>.

Response: We would like to explain that MIPS is a program where payment adjustments must be applied based on each MIPS eligible clinician's total performance on measures and activities. As such, we are not able to apply MIPS payment adjustments based on reporting alone. Additionally, as we have discussed above, we have made modifications to the performance period for the transition year of MIPS, as well as to the scoring methodology, as discussed in section II.E.6. of this final rule with comment period to allow MIPS eligible clinicians the opportunity to gain experience under the program without negative payment consequences.

Comment: Other commenters urged changes to MIPS to provide flexibility for small practices. The commenters suggested a voluntary phase-in for small practices over a several-year period. Alternatively, the commenters suggested that CMS should not penalize very small practices (for example, five or fewer MIPS eligible clinicians) for a specified period of time, allowing them to implement and learn about MIPS reporting. Another commenter suggested that for the transition year of MIPS, CMS could permit small practices to be credited with full participation in MIPS based on a single quarter of successfully submitted 2017 data and permit larger practices to submit two quarters of data.

Response: We have provided considerable flexibility for small practices throughout our MIPS proposals and this final rule with comment period. Specifically, we believe our modified low-volume threshold policy, as discussed in section II.E.3.c. of this final rule with comment period, will provide small groups considerable flexibility that will address the commenters' concerns.

Comment: Some commenters were concerned with CMS statements from the proposed rule—specifically, that MIPS eligible clinicians do not have to begin reporting at the start of the performance period, suggesting that MIPS eligible clinicians will have more time to collect data, change workflows, and implement required MIPS and APM changes—create confusion as many of the MIPS program's quality measures require actions to be taken at the point of care and cannot be completed at a later date.

Response: Our comments from the proposed rule accurately reflected our proposed policies. We regret any confusion created by statements in the proposals. The commenters are correct that many quality measures are required to be reported for every encounter. It is also correct, however, that other quality measures do not require reporting of every encounter (that is, NQF 0043: Pneumonia Vaccination Status for Older Adults). In general, the performance period is a window of time to report measures and, depending on the measure, MIPS eligible clinicians may need to report for just one quarter and the specified number of encounters for a given measure, or may need multiple encounters in multiple quarters for other measures.

Comment: Some commenters stated that the proposal interrupts their current short-term course of action of meeting Meaningful Use in 2016 and requested that we utilize 2017 as a preparation year to implement, adopt, measure, monitor, and manage new measures and boost performance on measures that previously had low thresholds for which MIPS eligible clinicians have to maximize performance.

Response: We note that for those MIPS eligible clinicians who have previously participated in the EHR Incentive Program, the measures and objectives that are required under the advancing care information performance category are a reduction in the number and types of measures as previously required. More information on the advancing care information performance category can be found in section II.E.5.g. of this final rule with comment period.

Comment: There were various comments regarding the duration of the MIPS performance period. Many commenters supported the 12-month performance period and requested that CMS stick to that timeline. The commenters stated that if timelines must be changed, CMS should do so before the performance period begins. Several commenters supported the performance period of one full year versus 90 days. They believed this would lead to consistent and high-quality data submission. Another commenter generally supported the proposed performance period but cautioned CMS that any shortened performance periods could burden certain MIPS eligible clinicians whose practices vary in volume based on factors such as their geographies, specialties, and nature of the patients they treat that are outside of their control. Other commenters believed CMS should not delay the Quality Payment Program implementation or

finalize an abbreviated performance period in the transition year. These commenters suggested that CMS act immediately on the premise that implementation for 2017 should begin now with clear education and guidance in order to ensure successful transitions to the new Quality Payment Program.

Response: We appreciate the commenters' support. We believe that measuring performance on a 12-month period is the most accurate and reliable method for measuring a MIPS eligible clinician's performance. We note that we are modifying our proposal to require reporting for a minimum continuous 90-day period of time within the CY 2017 performance period for the majority of available submission mechanisms for all data in a given performance category and submission mechanism. However, we strongly encourage all MIPS eligible clinicians to submit data for up to the full calendar year if feasible for their practice. We anticipate that MIPS eligible clinicians who are able to submit a more robust data set, such as data on a 12-month period, will have the benefit of having their full population of patients measured, which will assist these MIPS eligible clinicians on their quality improvement goals.

Comment: Some commenters believed MACRA's four MIPS performance categories are adding complexity to the delivery of patient-centered care and do not increase the time medical clinicians spend with patients. Specifically, the commenters believed that there is not much of a difference between PQRS/MU and the new "quality" and "advancing care information" performance categories. The commenters added that the improvement activities performance category appears complicated and the cost performance category is intensive. The commenters proposed a solution that measurable elements be for a 90-day period during the calendar year so that measuring tools will not need to be in place at all times, resulting in less disruption and a greater focus on patients.

Response: Our intention in creating MIPS is to provide a more comprehensive and simplified system that provides value. The commenter is correct that we maintained many elements of the PQRS and EHR Incentive Program that we found through experience to be meaningful to clinicians. The requirements for the cost and improvement activities performance categories are described in sections II.E.5.e. and II.E.5.f., respectively, of this final rule with comment period. We believe these performance categories to be very low in burden. In addition, as

described in section II.E.5.e of this final rule with comment period, the cost performance category will account for 0 percent of the final score in 2019 and we are redistributing the final score weight from cost performance category to the quality performance category. Lastly, as noted above, we are allowing MIPS eligible clinicians to report on quality, improvement activities, and advancing care information performance category information for a minimum of a continuous 90-day period during the CY 2017 performance period for the majority of available submission mechanisms for all data in a given performance category and submission mechanism. In addition, the cost performance category will be calculated based on the performance period using administrative claims data. As a result, individual MIPS eligible clinicians and groups will not be required to submit any additional information for the cost performance category.

Comment: Another commenter believed a full year of quality reporting is necessary to ensure data reliability for small practices but encouraged CMS to finalize a 90-day performance period for the improvement activities and advancing care information performance categories. The commenter believed CMS could finalize a shorter performance period for quality reporting in the future if 2015 data is modeled to show sufficient reliability under a shorter performance period.

Response: We agree with the commenter and believe that measuring performance on a 12-month period is the most accurate method for measuring a clinician's performance. However, for the transition year of MIPS, we are providing flexibility while maintaining reliability and finalizing a modified performance period, as discussed above, so that MIPS eligible clinicians may familiarize themselves with MIPS requirements.

Comment: Several commenters requested that CMS define the performance period as less than a full year. The suggestions of the start date were varied including: A suggested start date of July 1, 2017, which would allow MIPS eligible clinicians enough time to review and select appropriate measures; a 9-month performance period of April 1 through December 31, 2017; a 90 day period from January 1st through March 31st of each year because the commenter believed that this shorter time frame would not differ significantly from a full-year assessment period; and a period occurring from January 15 through April 15 so that reports could be compiled and tested prior to submission. These commenters

cited various concerns, including that full calendar year reporting would be a significant departure from current reporting requirements under the EHR Incentive Program and that it would not allow for full validation and testing of EHR-generated data following software upgrades or measurement specification changes. Other commenters were concerned that the proposal to use a full calendar year for the performance period could create administrative burden for practices and limit innovation without improving the validity of the data. The commenters recommended that in future years, CMS take advantage of the flexibility granted under the MACRA statute to allow MIPS eligible clinicians to select a shorter performance period for either the MIPS program or APM incentive payments. Another commenter believed that CMS should permit MIPS eligible clinicians to select a shorter performance period if they believe it is more appropriate for their practice.

Response: We do understand and appreciate the concerns raised by commenters that the performance period for the transition year of the program may be a shorter length than 12 months. For the transition year of MIPS, we are providing flexibility while maintaining reliability and finalizing a modified performance period, as discussed above, so that MIPS eligible clinicians may familiarize themselves with MIPS requirements.

Comment: A few commenters noted that measures for the cost performance category may need to be calculated over a longer period of time in order to ensure their reliability and applicability to practices, and recommended that if CMS shortens the initial MIPS performance period, CMS should make a distinction between performance periods for performance categories where data submission is required versus those where CMS calculates measures using administrative claims data. The commenters suggested that CMS should conduct detailed analysis of VM data to determine the extent to which including data for a year rather than 6 or 9 months improves reliability and expands applicability of the measures.

Response: We appreciate the commenters' suggestions. We have not done an analysis to look at reliability of the measures using a 6-month or 9-month performance period. We will consider this approach for future rulemaking.

Comment: Another commenter recommended that CMS should also reduce the case minimums for measures as MIPS eligible clinicians will not have

sufficient time to see the same number of patients during a shortened performance period.

Response: We refer the commenter to section II.E.6.a.(2) of this final rule with comment period where we discuss the quality scoring proposals and the case minimum requirements.

Comment: Other commenters recommended a 90-day performance period for 2017 for private specialty practices, as well as a 90-day performance period for any reporting year that the practice is required to upgrade their version of CEHRT. For example, the commenters noted that in mid-2017, many MIPS eligible clinicians will be upgrading from EHR technology certified to the 2014 Edition to EHR technology certified to the 2015 Edition. The commenters stated that this can often cause data integrity issues and would continuously place the practice on a split CEHRT any year that this type of upgrade occurs. They suggested a 90-day performance period during the upgrade year would allow a practice to upgrade and attest to the most recent version and standards.

Response: We are modifying our proposal to allow reporting for a minimum of a continuous 90-day period of time within the CY 2017 performance period for the majority of available submission mechanisms for all data in a given performance category and submission mechanism. Additionally, we understand the commenters' concerns and rationale for requesting a 90-day performance period. We note that for the first performance period in 2017, we will accept a minimum of 90 days of data within CY 2017, though we greatly encourage MIPS eligible clinicians to meet the full year performance period. In order to allow MIPS eligible clinicians and groups adequate time to transition to technology certified to the 2015 Edition for use in CY 2018, we believe it is appropriate to also allow a performance period of continuous 90-day period within the CY for the advancing care information performance category in CY 2018.

Comment: Another commenter requested that CMS offer advance notice appropriate to the size of the change (for example, transitioning to new editions of CEHRTs might require years of notice, whereas annually updated benchmarks might require only a few months). The commenter requested that the proposed policies not be implemented until at least 6 months after the final rule with comment period is published.

Response: We will provide as much advance notice as is necessary when

making changes to the MIPS program. We recognize that all parties involved in the MIPS program require advance notice to make adjustments to accommodate changes.

Comment: Some commenters suggested that CMS shorten the performance period to 9 months of the calendar year, followed by 3 months of data analysis to calculate the scores and MIPS payment adjustments. The rationale for this recommendation included allowing for a number of program improvements, including reducing administrative burden in MIPS, aligning the performance period across categories, shrinking the 2-year lag period between performance and payment, and increased relevance and timeliness of feedback. The commenters also stated that this would give opportunity to set benchmarks based on more current data. Based on one commenter's polling of its members, 92 percent preferred a performance period of any 90 consecutive days compared to the proposed performance period.

Response: We considered utilizing a 9-month performance period as the commenter recommended, however we did not utilize this option since this would still require a "2-year lag" to account for the post submission processes of calculating the MIPS eligible clinician's final score, establishing budget neutrality and issuing the payment adjustment factors and allowing for a targeted review period to occur prior to the application of the MIPS payment adjustment to MIPS eligible clinicians claims. As stated above, we are modifying our proposal and finalizing that MIPS eligible clinicians will only need to report for a minimum of a continuous 90-day period in 2017, for the majority of the data submission mechanisms. We believe this flexibility will allow for a number of program improvements, including reducing administrative burden in MIPS for the transition year and will align across the quality, advancing care information, and improvement activities performance categories. In addition, we will continue working with stakeholders to improve feedback provisions under MIPS and to shorten the "2-year lag" that the commenter describes.

Comment: One commenter stated that they recognized a shorter performance period may present challenges for CMS systems and processes; therefore, they urged CMS to work with MIPS eligible clinicians to develop options and a specific plan to provide accommodations where possible.

Response: We appreciate the comment and will continue to work

closely with stakeholders throughout the Quality Payment Program.

Comment: Other commenters believed a shorter performance period would eliminate the participation burden and confusion for MIPS eligible clinicians who may switch practices mid-year and have to track and report data for multiple TIN/NPI combinations under the proposed full calendar year performance period.

Response: We agree with the commenter that the shortened minimum continuous 90-day period of time will assist in decreasing participation burden. We note that the modified performance period will not eliminate the need for tracking multiple TIN/NPIs depending upon the specific circumstances of the MIPS eligible clinician, but we agree with the commenter that it will mitigate this issue.

Comment: A few commenters recommended a 6-month performance period for MIPS with an optional look-back period for registries to increase sample size, validity and reliability and an extension of data submissions for QCDRs to April 31 following the performance period, or 4 months after the performance period to allow for the capture and analytics required for the use of risk-adjusted outcomes data.

Response: Our modified proposal of a continuous 90-day period within the CY 2017 performance period for all data in a given performance category and submission mechanism is a minimum period and we strongly encourage all MIPS eligible clinicians to report on data for a full year where possible for their practice. We believe this policy will address the commenters' concerns while maintaining reliability. Our policies regarding the performance period are described in more detail in section II.E.4. of this final rule with comment period. We note that it is not clear how a longer data submission timeframe will help with the capture of risk-adjusted data elements used in outcomes measures. In most, if not all, instances, any co-morbidities affecting the outcome for a patient would be known before or at the time the care is rendered.

Comment: One commenter suggested that if CMS rejects changing the initial performance period for 2017 to 90 days, it should implement preliminary and final performance periods, with analysis periods (from January to March) and implementation periods (from April to May), to allow MIPS eligible clinicians to evaluate their performance with the various MIPS requirements from August to September,

followed by a final performance period from October to December.

Response: We thank the commenter for their feedback. As discussed above, we are modifying our proposal to allow reporting for a minimum of a continuous 90-day period within the CY 2017 performance period for the majority of available submission mechanisms for all data in a given performance category and submission mechanism.

Comment: Many commenters stated that CMS must work to reduce the 2-year gap between the performance period and the payment year because it is burdensome, is not meaningful nor actionable as MIPS eligible clinicians will not know what they must adjust to meet benchmarks, and it hinders timely data reporting and feedback. One commenter acknowledged the operational difficulty associated with having performance periods close to MIPS payment adjustment periods, but requested that CMS work to shorten the look back period between performance assessment and adjustment.

Response: We agree with commenters that improved feedback mechanisms are always important, and we will continue working with stakeholders to provide timely and better feedback under MIPS and to shorten the "2-year gap" that the commenter describes.

Comment: There were various suggestions on the most appropriate time gap between the performance period and the payment year. Several commenters suggested that a 1-year gap would be more appropriate and others proposed a 6-month time gap. Another commenter believed, that the time lag of essentially 2 years between the performance period and the payment year severely disadvantages MIPS eligible clinicians falling below the top tier performance threshold and inflates the rating of competing MIPS eligible clinicians, who can rest on the laurels of their prior performance years. Further, the commenter noted that if a MIPS eligible clinician had an unsatisfactory performance rating, (for example, from data collected in January of 2016), and took corrective action to earn a higher rating, the efforts of that corrective action would not be available to the public for a minimum of 2 years. A few commenters believed CMS should increase the relevance and timeliness of data, which could be provided on a quarterly basis.

Response: We appreciate the commenters' feedback. We agree with the commenters that a delay between the performance period and the MIPS payment adjustment year impacts the clinicians' ability to make timely

improvements within their practice. For the initial years of MIPS, we do anticipate that this gap between the performance period and the payment adjustment year will continue to occur to allow time for submission and calculation of data, issuance of feedback, a targeted review period, calculation of final scores, and application of clinician-specific MIPS adjustments in time for the payment year.

Comment: Other commenters believed CMS should use language clarifying that the MIPS performance period begins on January 1, 2017. The commenters suggested linking the language for the performance year with the adjustment year in some way (for example, “MIPS 2017/19”, “2017 performance period (2019)”).

Response: We will ensure that all communications clearly indicate the link between the performance period and the MIPS payment adjustment year.

Comment: A few commenters expressed support for CMS’ proposal of a 90-day claims data run-out. Another commenter stated that if the proposed window is not feasible, the commenter supported a 60-day window.

Response: We appreciate the commenter’s feedback. Based on further analyses of Medicare Part B claims for 2014, we have determined that there is only a 0.5 percent difference in claims processing completeness when using 90 days rather than 60 days. Therefore, we are finalizing our alternative proposal at § 414.1325(f)(2) that the submission deadline for Medicare Part B claims, must be on claims with dates of service during the performance period that must be processed no later than 60 days following the close of the performance period.

Comment: Another commenter requested more information regarding how MIPS eligible clinicians participating for part of the performance period will be assessed against MIPS eligible clinicians participating for the full performance period. The commenter cautioned against penalizing MIPS eligible clinicians not practicing for reasons beyond their control, such as for health reasons. Other commenters expressed concern that MIPS eligible clinicians could attempt to game the system with extended leave. Other commenters supported the expectations for reporting when MIPS eligible clinicians have a break in their practice, and one commenter expressed concern about MIPS eligible clinicians who change groups because doing so may negatively impact group performance. The commenters believed a policy for exceptions may mitigate the problem

and provide consistency. Another commenter stated that MIPS eligible clinicians with less than 12 months of performance data should be assessed on the period of time for which they do report.

Response: As discussed in this final rule with comment period, we are modifying our proposal to allow reporting for a minimum of a continuous 90-day period within the CY 2017 performance period for the majority of available submission mechanisms for all data in a given performance category and submission mechanism. We would like to note that we are finalizing that individual MIPS eligible clinician or groups who report less than 12 months of data (due to family leave, etc.) would be required to report all performance data available from the performance period. For example, for the performance period in 2017, MIPS eligible clinicians who have less than 90 days’ worth of data would be required to submit all performance data that they have available. We are finalizing this proposal with modification to apply to any applicable performance period (for example, to any 90-day period). Based on the Medicare Part B data available to us, we do not intend to make any scoring adjustments based on the duration of the performance period. We recognize that a longer (that is, 12-month) performance period provides greater assurance of reliability with respect to the submitted data and therefore strongly encourage all MIPS eligible clinicians who have the ability to submit data for a period greater than 90 days, to do so.

Comment: A few commenters supported the proposed performance period, but requested that CMS increase its outreach to MIPS eligible clinicians who have not successfully reported under PQRS in the past to help them to achieve the reporting standard during this time. A few commenters stated that going forward CMS should ensure that the timeframes for annual MACRA regulations, subregulatory guidance and other agency communications are sufficient to allow MIPS eligible clinicians and health plans to act on the information in advance of the applicable performance years. For purposes of publishing the list of APMs, Medical Home Models, MIPS APMs, Advanced APMs, and eventually other-payer APMs, the commenter believed that CMS should start the process at least 15 months in advance of the applicable performance year, and finalize the list at least 9 months in advance of the applicable performance year.

Response: We appreciate the support. We have multiple mechanisms we have

employed to reach out to all MIPS eligible clinicians to provide support. We will make every effort to ensure the timeframes for agency communications are sufficient to allow MIPS eligible clinicians and health plans to act on the information in advance of the applicable performance period. Please refer to section II.F.4. of this final rule with comment period for further information on how we will make clear the status of any APM upon its first public announcement.

Comment: Other commenters urged CMS to communicate submission problems to both vendors and practices as soon as possible to allow for alternative submission mechanisms and to encourage vendors to be open about their ability to meet data submission standards.

Response: We make every effort to communicate submission problems to stakeholders through multiple communication channels including health IT vendors, specialty societies, registries, and MIPS eligible clinicians as soon as possible and will continue to do so in the future.

Comment: One commenter supported using claims paid within 60 days after the performance period.

Response: We agree and appreciate the commenters support. We are finalizing our proposal to use claims that are processed within 60 days, after the end of the performance period for purposes of assessing performance and computing the MIPS payment adjustment.

After consideration of the comments we received regarding the MIPS performance period, we are finalizing a modification of our proposal of a 12-month performance period that occurs 2 years prior to the applicable payment year. For the transition year of MIPS, we believe it is important that we provide flexibility to MIPS eligible clinicians as they familiarize themselves with MIPS requirements while maintaining reliability. Therefore, we are finalizing at § 414.1320(a)(1) that for purposes of the 2019 MIPS payment year, for all performance categories and submission mechanisms except for the cost performance category and data for the quality performance category reported through the CMS Web Interface, for the CAHPS for MIPS survey, and for the all-cause hospital readmission measure, the performance period under MIPS is a minimum of a continuous 90-day period within CY 2017, up to and including the full CY (January 1, 2017 through December 31, 2017). Thus, MIPS eligible clinicians will only need to report for a minimum of a continuous 90-day period within CY 2017, for the majority of the

submission mechanisms. This 90-day period can occur anytime within CY 2017, so long as the 90-day period begins on or after January 1, 2017, and ends on or before December 31, 2017. Additionally, for further flexibility and ease of reporting this 90-day period can differ across performance categories. For example, a MIPS eligible clinician may utilize a 90-day period that spans from June 1, 2017–August 30, 2017 for the improvement activities performance category and could use a different 90-day period for the quality performance category, such as August 15, 2017–November 13, 2017. The continuous 90-day period is a minimum; MIPS eligible clinicians may elect to report data on more than a continuous 90-day period, including a period of up to the full 12 months of 2017. We note there are special circumstances in which MIPS eligible clinicians may submit data for a period of less than 90 days and avoid a negative MIPS payment adjustment. For example, in some circumstances, MIPS eligible clinicians may meet data completeness criteria for certain quality measures in less than the 90-day period. Also, in instances where MIPS eligible clinicians do not meet the data completeness criteria for quality measures, we will provide partial credit for these measures as discussed in section II.E.6. of this final rule with comment period.

For groups that elect to utilize the CMS Web Interface or report the CAHPS for MIPS survey, we note that these submission mechanisms utilize certain assignment and sampling methodologies that are based on a 12-month period. In addition, administrative claims-based measures (this includes all of the cost measures and the all-cause readmission measure) are based on attributed population using the 12-month performance period. Accordingly, we are finalizing at § 414.1320(a)(2) that for purposes of the 2019 MIPS payment year, for data reported through the CMS Web Interface or the CAHPS for MIPS survey and administrative claims-based cost and quality measures, the performance period under MIPS is CY 2017 (January 1, 2017 through December 31, 2017). Please note that, unless otherwise stated, any reference in this final rule with comment period to the “CY 2017 performance period” is intended to be an inclusive reference to all performance periods occurring during CY 2017.

Additionally, we are finalizing at § 414.1320(b)(1) that for purposes of the 2020 MIPS payment year, the performance period for the quality and cost performance categories is CY 2018 (January 1, 2018 through December 31,

2018). For the improvement activities and advancing care information performance categories, we are finalizing the same approach for the 2020 MIPS payment year that we will have in place for the transition year of MIPS. Specifically, we are finalizing at § 414.1320(b)(2) that for purposes of the 2020 MIPS payment year, the performance period for the improvement activities and advancing care information performance categories is a minimum of a continuous 90-day period within CY 2018, up to and including the full CY 2018 (January 1, 2018 through December 31, 2018).

We are also finalizing a modification to our proposal, which was to use claims run-out data that are processed within 90 days, if operationally feasible, after the end of the performance period for purposes of assessing performance and computing the MIPS payment adjustment. Specifically, we are finalizing at § 414.1325(f)(2) to use claims with dates of service during the performance period that must be processed no later than 60 days following the close of the performance period for purposes of assessing performance and computing the MIPS payment adjustment.

Lastly, we are finalizing our proposal that individual MIPS eligible clinicians or groups who report less than 12 months of data (due to family leave, etc.) would be required to report all performance data available from the applicable performance period (for example, to any 90-day period).

5. MIPS Performance Category Measures and Activities

a. Performance Category Measures and Reporting

(1) Statutory Requirements

Section 1848(q)(2)(A) of the Act requires the Secretary to use four performance categories in determining each MIPS eligible clinician’s final score under the MIPS: Quality; cost; improvement activities; and advancing care information. Section 1848(q)(2)(B) of the Act, subject to section 1848(q)(2)(C) of the Act, describes the measures and activities that, for purposes of the MIPS performance standards, must be specified under each performance category for a performance period.

Section 1848(q)(2)(B)(i) of the Act describes the measures and activities that must be specified under the MIPS quality performance category as the quality measures included in the annual final list of quality measures published under section 1848(q)(2)(D)(i) of the Act and the list of quality measures

described in section 1848(q)(2)(D)(vi) of the Act used by QCDRs under section 1848(m)(3)(E) of the Act. Under section 1848(q)(2)(C)(i) of the Act, the Secretary must, as feasible, emphasize the application of outcome-based measures in applying section 1848(q)(2)(B)(i) of the Act. Under section 1848(q)(2)(C)(iii) of the Act, the Secretary may also use global measures, such as global outcome measures and population-based measures, for purposes of the quality performance category. Section 1848(q)(2)(B)(ii) of the Act describes the measures and activities that must be specified under the cost performance category as the measurement of cost for the performance period under section 1848(p)(3) of the Act, using the methodology under section 1848(r) of the Act as appropriate, and, as feasible and applicable, accounting for the cost of drugs under Part D.

Section 1848(q)(2)(C)(ii) of the Act allows the Secretary to use measures from other CMS payment systems, such as measures for inpatient hospitals, for purposes of the quality and cost performance categories, except that the Secretary may not use measures for hospital outpatient departments, other than in the case of items and services furnished by emergency physicians, radiologists, and anesthesiologists. In the proposed rule, we solicited comment on how it might be feasible and when it might be appropriate to incorporate measures from other systems into MIPS for clinicians that work in facilities such as inpatient hospitals. For example, it may be appropriate to use such measures when other applicable measures are not available for individual MIPS eligible clinicians or when strong payment incentives are tied to measure performance, either at the facility level or with employed or affiliated MIPS eligible clinicians.

Section 1848(q)(2)(B)(iii) of the Act describes the measures and activities that must be specified under the improvement activities performance category as improvement activities under subcategories specified by the Secretary for the performance period, which must include at least the subcategories specified in section 1848(q)(2)(B)(iii)(I) through (VI) of the Act. Section 1848(q)(2)(C)(v)(III) of the Act defines a improvement activities as an activity that relevant eligible clinician organizations and other relevant stakeholders identify as improving clinical practice or care delivery and that the Secretary determines, when effectively executed, is likely to result in improved outcomes. Section 1848(q)(2)(B)(iii) of the Act

requires the Secretary to give consideration to the circumstances of small practices (consisting of 15 or fewer professionals) and practices located in rural areas and geographic HPSAs in establishing improvement activities.

Section 1848(q)(2)(B)(iv) of the Act describes the measures and activities that must be specified under the advancing care information performance category as the requirements established for the performance period under section 1848(o)(2) for determining whether an eligible clinician is a meaningful EHR user.

As discussed in the proposed rule (81 FR 28173), section 1848(q)(2)(C)(iv) of the Act requires the Secretary to give consideration to the circumstances of non-patient facing MIPS eligible clinicians in specifying measures and activities under the MIPS performance categories and allows the Secretary, to the extent feasible and appropriate, to take those circumstances into account and apply alternative measures or activities that fulfill the goals of the applicable performance category. In doing so, the Secretary is required to consult with non-patient facing professionals.

Section 101(b) of MACRA amends certain provisions of section 1848(k), (m), (o), and (p) of the Act to generally provide that the Secretary will carry out such provisions in accordance with section 1848(q)(1)(F) of the Act for purposes of MIPS. Section 1848(q)(1)(F) of the Act provides that, in applying a provision of section 1848(k), (m), (o), and (p) of the Act for purposes of MIPS, the Secretary must adjust the application of the provision to ensure that it is consistent with the MIPS requirements and must not apply the provision to the extent that it is duplicative with a MIPS provision.

We did not request comments on this section, but we did receive a few comments which are summarized below.

Comment: Some commenters requested that MIPS begin in its most basic structure involving as few measures as possible due to the fact that the practices have little or no experience in these processes and very limited staff, particularly in smaller practices. Another commenter recommended that CMS reduce the number of MIPS measures across the four performance categories. The commenter expressed concern that the implementation time will be slow due to developing relationships with data submission vendors which will lead to practices being overwhelmed by the number of measures.

Some commenters suggested that instead of focusing on four performance categories simultaneously, CMS should focus on interoperability and making that functionality fully workable before moving on to the next step.

One commenter was very concerned that the cumulative effect of four sets of largely separate measures and activities, scoring methodologies, and reporting requirements could result in more administrative work for practices, not less, and encouraged CMS to consider additional ways to reduce the MIPS reporting burden for all practices such as reducing the number of required measures or activities in each MIPS performance category, lowering measure thresholds, establishing consistent definitions (such as for “small practices”) across categories, and providing more opportunities for “partial credit.” Other commenters urged CMS to take every possible step to dramatically simplify provisions and requirements, and to revise and develop practice-focused communications to reduce any remaining perceived complexity.

Another commenter agreed with the level of flexibility CMS has proposed for MIPS eligible clinicians by allowing them to choose the specific quality performance measures most applicable to their practice and stated that CMS should design the requirements within the performance categories to work in concert with each other to ensure meaningful quality measurement. Some commenters asked if there will be interoperability between the four MIPS performance categories.

Response: As discussed in section II.E.5.b.(3) of this final rule with comment period, we have decreased the data submission criteria for the quality performance category to a level that reduces burden while still maintaining meaningful measurements at this time. We will continue to assess this approach to improve on this aspect in the future. We appreciate the commenters’ request for simplicity and the need for clear communications. We will continue to look for ways to simplify the MIPS program in the future and will work to ensure clear communications with the MIPS eligible clinician community on all of the MIPS provisions. We note that the definition of a small practice is the same across all four performance categories and is consistent with the statute. We have codified the definition of a small practice for MIPS at § 414.1305 as practices consisting of 15 or fewer clinicians and solo practitioners.

Further, we are required by statute to utilize the four performance categories

to determine the final score. We appreciate the support and agree that the goal of the MIPS program is that the four performance categories should work in concert with one another. In addition, as discussed in section II.E.5. of this final rule with comment period, we have modified our policies to have the four performance categories work more in concert with one another.

Comment: One commenter requested that CMS simplify the MIPS to the extent practicable by further limiting the number of measures reportable under each performance category and refraining from introducing any new and previously untested measures (for example, population-based quality measures).

Response: In any quality measurement program, we must balance the data collection burden that we must impose on MIPS eligible clinicians with the resulting quality performance data that we will receive. We believe that without sufficiently robust performance data, we cannot accurately measure quality performance. Therefore, we believe that we have appropriately struck a balance between requiring sufficient quality measure data from MIPS eligible clinicians and ensuring robust quality measurement at this time. Regarding the global and population-based measures, we refer the reader to section II.E.5.b.(6) of this final rule with comment period.

Comment: One commenter stated that CMS appears to view the four MIPS categories as separate but should treat them holistically. The commenter suggested unifying definitions across all MIPS categories, such as the proposed definition of a “small practice” as consisting of 15 or fewer clinicians.

Response: We are required by statute to utilize the four performance categories to determine the final score. As the program evolves we believe the performance categories will become more streamlined and integrated. The definition of a small practice is the same across all four performance categories and is consistent with the statute. We have codified the definition of a small practice for MIPS at § 414.1305 as practices consisting of 15 or fewer clinicians and solo practitioners.

Comment: Some commenters suggested combining the improvement activities and advancing care information performance categories.

Response: Each of these performance categories is statutorily mandated, and we believe each has a distinct role in the MIPS program.

Comment: Another commenter stated that data and reporting requirements should generally be efficient, strong,

and actionable for the purposes of quality improvement, payment, consumer decision-making, and any other areas where they can be useful. Another commenter generally recommended that quality measures in the MIPS program be meaningful, that innovative science should be accommodated when achieving quality aims in areas without measures or therapies, and incentives surrounding cost should reward high-value care, not simply low cost.

Response: We appreciate the commenters' support.

We have considered the comments received and will take them into consideration in the future development of performance feedback through separate notice-and-comment rulemaking.

(2) Submission Mechanisms

We proposed at § 414.1325(a) that individual MIPS eligible clinicians and

groups would be required to submit data on measures and activities for the quality, improvement activities and advancing care information performance categories. We did not propose at § 414.1325(f) any data submission requirements for the cost performance category and for certain quality measures used to assess performance on the quality performance category and for certain activities in the improvement activities performance category. For the cost performance category, we proposed that each individual MIPS eligible clinician's and group's cost performance would be calculated using administrative claims data. As a result, individual MIPS eligible clinicians and groups would not be required to submit any additional information for the cost performance category. In addition, we would be using administrative claims data to calculate performance on a subset of the MIPS quality measures and the improvement activities performance

category, if technically feasible. For this subset of quality measures and improvement activities, MIPS eligible clinicians and groups would not be required to submit additional information. For individual clinicians and groups that are not MIPS eligible clinicians, such as physical therapists, but elect to report to MIPS, we would calculate administrative claims cost measures and quality measures, if data are available. We proposed multiple data submission mechanisms for MIPS as outlined in Tables 1 and 2 in the proposed rule (81 FR 28182) and the final policies identified in Tables 3 and 4 in this final rule with comment period, to provide MIPS eligible clinicians with flexibility to submit their MIPS measures and activities in a manner that best accommodates the characteristics of their practice. We note that other terms have been used for these submission mechanisms in earlier programs and in industry.

TABLE 1—PROPOSED DATA SUBMISSION MECHANISMS FOR MIPS ELIGIBLE CLINICIANS REPORTING INDIVIDUALLY AS TIN/ NPI

Performance category/submission combinations accepted	Individual reporting data submission mechanisms
Quality	Claims. QCDR. Qualified registry. EHR.
Cost	Administrative claims (no submission required).
Advancing Care Information	Administrative claims (no submission required). Attestation. QCDR. Qualified registry. EHR.
Improvement Activities	Attestation. QCDR. Qualified registry. EHR. Administrative claims (if technically feasible, no submission required).

TABLE 2—PROPOSED DATA SUBMISSION MECHANISMS FOR GROUPS

Performance category/submission combinations accepted	Group Reporting data submission mechanisms
Quality	QCDR. Qualified registry. EHR. CMS Web Interface (groups of 25 or more). CMS-approved survey vendor for CAHPS for MIPS (must be reported in conjunction with another data submission mechanism.) and
Cost	Administrative claims (no submission required).
Advancing Care Information	Administrative claims (no submission required). Attestation. QCDR. Qualified registry. EHR. CMS Web Interface (groups of 25 or more).

TABLE 2—PROPOSED DATA SUBMISSION MECHANISMS FOR GROUPS—Continued

Performance category/submission combinations accepted	Group Reporting data submission mechanisms
Improvement Activities	Attestation. QCDR. Qualified registry. EHR. CMS Web Interface (groups of 25 or more). Administrative claims (if technically feasible, no submission required).

We proposed at § 414.1325(d) that MIPS eligible clinicians and groups may elect to submit information via multiple mechanisms; however, they must use the same identifier for all performance categories and they may only use one submission mechanism per performance category. For example, a MIPS eligible clinician could use one submission mechanism for sending quality measures and another for sending improvement activities data, but a MIPS eligible clinician could not use two submission mechanisms for a single performance category such as submitting three quality measures via claims and three quality measures via registry. We believe the proposal to allow multiple mechanisms, while restricting the number of mechanisms per performance category, offers flexibility without adding undue complexity.

For individual MIPS eligible clinicians, we proposed at § 414.1325(b), that an individual MIPS eligible clinician may choose to submit their quality, improvement activities, and advancing care information performance category data using qualified registry, QCDR, or EHR submission mechanisms. Furthermore, we proposed at § 414.1400 that a qualified registry, health IT vendor, or QCDR could submit data on behalf of the MIPS eligible clinician for the three performance categories: Quality, improvement activities, and advancing care information. In the proposed rule (81 FR 28280), we expanded third party intermediaries' capabilities by allowing them to submit data and activities for quality, improvement activities, and advancing care information performance categories. Additionally, we proposed at § 414.1325(b)(4) and (5) that individual MIPS eligible clinicians may elect to report quality information via Medicare Part B claims and their improvement activities and advancing care information performance category data through attestation.

For groups that are not reporting through the APM scoring standard, we proposed at § 414.1325(c) that these groups may choose to submit their MIPS

quality, improvement activities, and advancing care performance category information data using qualified registry, QCDR, EHR, or CMS Web Interface (for groups of 25+ MIPS eligible clinicians) submission mechanisms. Furthermore, we proposed at § 414.1400 that a qualified registry, health IT vendor that obtains data from a MIPS eligible clinician's CEHRT, or QCDR could submit data on behalf of the group for the three performance categories: Quality, improvement activities, and advancing care information. Additionally, we proposed that groups may elect to submit their improvement activities or advancing care information performance category data through attestation.

For those MIPS eligible clinicians participating in an APM that uses the APM scoring standard, we refer readers to the proposed rule (81 FR 28234), which describes how certain APM Entities submit data to MIPS, including separate approaches to the quality and cost performance categories for APMs.

We proposed one exception to the requirement for one reporting mechanism per performance category. Groups that elect to include CAHPS for MIPS survey as a quality measure must use a CMS-approved survey vendor. Their other quality information may be reported by any single one of the other proposed submission mechanisms.

While we proposed to allow MIPS eligible clinicians and groups to submit data for different performance categories via multiple submission mechanisms, we encouraged MIPS eligible clinicians to submit MIPS information for the improvement activities and advancing care information performance categories through the same reporting mechanism that is used for quality reporting. We believe it would reduce administrative burden and would simplify the data submission process for MIPS eligible clinicians by having a single reporting mechanism for all three performance categories for which MIPS eligible clinicians would be required to submit data: Quality, improvement activities, and advancing care information performance category information.

However, we were concerned that not all third party entities would be able to implement the changes necessary to support reporting on all performance categories in the transition year. We solicited comments for future rulemaking on whether we should propose requiring health IT vendors, QCDRs, and qualified registries to have the capability to submit data for all MIPS performance categories.

As noted at (81 FR 28181), we proposed that MIPS eligible clinicians may report measures and activities using different submission methods for each performance category if they choose for reporting data for the CY 2017 performance period. As we gain experience under MIPS, we anticipate that in future years it may be beneficial for, and reduce burden on MIPS eligible clinicians and groups, to require data for multiple performance categories to come through a single submission mechanism.

Further, we will be flexible in implementing MIPS. For example, if a MIPS eligible clinician does submit data via multiple submission mechanisms (for example, registry and QCDR), we would score all the measures in each submission mechanism and use the highest performance score for the MIPS eligible clinician or group as described at (81 FR 28247). However, we would not be blending measure results across submission mechanisms. We encourage MIPS eligible clinicians to report data for a given performance category using a single data submission mechanism.

Finally, section 1848(q)(1)(E) of the Act requires the Secretary to encourage the use of QCDRs under section 1848(m)(3)(E) of the Act in carrying out MIPS. Section 1848(q)(5)(B)(ii)(I) of the Act requires the Secretary, under the final score methodology, to encourage MIPS eligible clinicians to report on applicable measures with respect to the quality performance category through the use of CEHRT and QCDRs. We note that the proposed rule used the term CEHRT and certified health IT in different contexts. For an explanation of these terms and contextual use within

the proposed rule, we refer readers to the proposed rule (81 FR 28256).

We have multiple policies to encourage the usage of QCDRs and CEHRT. In part, we are promoting the use of CEHRT by awarding bonus points in the quality scoring section for measures gathered and reported electronically via the QCDR, qualified registry, CMS Web Interface, or CEHRT submission mechanisms see the proposed rule (81 FR 28247). By promoting the use of CEHRT through various submission mechanisms, we believe MIPS eligible clinicians have flexibility in implementing electronic measure reporting in a manner which best suits their practice.

To encourage the use of QCDRs, we have created opportunities for QCDRs to report new and innovative quality measures. In addition, several improvement activities emphasize QCDR participation. Finally, we allow for QCDRs to report data on all MIPS performance categories that require data submission and hope this will become a viable option for MIPS eligible clinicians. We believe these flexible options will allow MIPS eligible clinicians to more easily meet the submission criteria for MIPS, which in turn will positively affect their final score.

We requested comments on these proposals.

The following is summary of the comments we received on our proposals regarding MIPS data submission mechanisms.

Comment: Several commenters expressed concern that, by providing too many data submission mechanisms and reporting flexibility to MIPS eligible clinicians, CMS would be allowing MIPS eligible clinicians to report on arbitrary quality metrics or metrics on which those MIPS eligible clinicians are performing well versus metrics that reflect areas of needed improvement. The commenters recommended that CMS ensure high standard final scoring, promote transparency, and enable meaningful comparisons of the clinicians' performance for specific services.

Response: We believe allowing multiple data submission mechanisms is beneficial to the MIPS eligible clinicians as they may choose whichever data submission mechanism works best for their practice. We have provided many data submission options to allow the utmost flexibility for the MIPS eligible clinician. Based on our experience with existing quality reporting programs such as PQRS, we do not believe multiple data submission mechanisms will encourage MIPS

eligible clinicians to report on arbitrary quality metrics or metrics on which those MIPS eligible clinicians are performing well versus metrics that reflect areas of needed improvement. We will monitor measure selection and performance through varying data submission mechanisms as we implement the program. However, we agree with commenters that measuring meaningful quality measures and encouraging improvement in the quality of care are important goals of the MIPS program. As such, we will monitor whether data submission mechanisms are allowing MIPS eligible clinicians to focus only on metrics where they are already performing well and will address any modifications needed to our policies based on these monitoring efforts in future rulemaking.

Comment: Another commenter supported the requirement to use only one submission mechanism per performance category. Other commenters appreciated that CMS is allowing MIPS eligible clinicians to choose data submission options that vary by performance category.

Response: We agree with the commenters and appreciate the support. We are finalizing the policy as proposed of requiring MIPS eligible clinicians to submit all performance category data for a specific performance category via the same data submission mechanism. In addition, we are finalizing the policy to allow MIPS eligible clinicians to submit data using differing submission mechanisms across different performance categories. We refer readers to section II.E.5.a.(2) of this final rule with comment period where we discuss our approach for the rare situations where a MIPS eligible clinician submits data for a performance category via multiple submission mechanisms (for example, submits data for the quality performance category through a registry and QCDR), and how we score those MIPS eligible clinicians. We further note that in that section we are seeking comment for further consideration on different approaches for addressing this scenario.

Comment: Another commenter sought clarification as to whether MIPS eligible clinicians may use more than one data submission method per performance category. The commenter recommended the use of multiple data submission methods across performance categories because there are currently significant issues with extracting clinical data from EHRs to provide to a third party for calculation. The commenter believed that requiring a single submission method may force MIPS eligible

clinicians to submit inaccurate data that does not reflect actual performance.

Response: As noted in this final rule with comment period, MIPS eligible clinicians will have the flexibility to choose different submission mechanisms across different performance categories for example, utilizing a registry to submit data for quality and CEHRT for the advancing care information performance category. MIPS eligible clinicians will need to choose however, one submission mechanism per performance category, except for MIPS eligible clinicians who elect to report the CAHPS for MIPS survey, which must be reported via a CMS-approved survey vendor in conjunction with another submission mechanism for all other quality measures. As discussed in this section of this final rule with comment period, we are finalizing policy that allows MIPS eligible clinicians to choose to report for a minimum of as few as 90 consecutive days within CY 2017 for the majority of submission mechanisms. We believe this allows for adequate time for those MIPS eligible clinicians who are not already successfully reporting quality measures meaningful to their practice via CEHRT under the EHR Incentive Program and/or PQRS to evaluate their options and select the measures and a reporting mechanism that will work best for their practice. We will be providing subregulatory guidance for MIPS eligible clinicians who encounter issues with extracting clinical data from EHRs.

Comment: A few commenters recommended that CMS reduce complexity by reducing the number of available reporting methods as health IT reduces the need to retain claims and registry-based reporting in the program. Other commenters supported the use of electronic data reporting mechanisms noted that due to the complexity of the MIPS, they were concerned that using claims data submission for quality measures may place MIPS eligible clinicians at a disadvantage due to the significant lag between performance feedback and the performance period.

Response: We appreciate the commenters' feedback. We agree that the usage of health IT in the future will reduce our reliance on non-IT methods of reporting such as claims. We do believe, however, that we cannot eliminate submission mechanisms such as claims until broader adoption of health IT and registries occurs. Therefore, we do intend to finalize both the claims and registry submission mechanisms. We also refer readers to section II.E.8.a. for final policies regarding performance feedback.

Comment: Some commenters expressed appreciation for our proposal to continue claims-based reporting for the quality performance category because this is the most convenient method for hospitals-based clinicians. The commenters explained that hospital-based MIPS eligible clinicians must use the EHRs of the hospitals in which they practice, which may limit the capabilities of these EHRs for reporting measures. Other commenters requested that CMS ensure that the option for claims reporting was available to all MIPS eligible clinicians, noting that there was only one anesthesia-related quality measure available for reporting via registry. Under such circumstances, the commenters asked CMS to ensure that MIPS did not impose excessive time and cost burdens on MIPS eligible clinicians by forcing them to use a different submission mechanism. Another commenter noted that the preservation of the claims-based reporting option will help those emergency medicine practices that have relied on this reporting option in the past make the transition to the new MIPS requirements. The commenter noted the additional administrative burden associated with registry reporting, including registration fees.

Response: We appreciate the commenters' support. We do note that we intend to reduce the number of claims-based measures in the future as more measures are available through health IT mechanisms such as registries, QCDRs, and health IT vendors, but we understand that many MIPS eligible clinicians still submit these types of measures. We believe claims-based measures are a necessary option to minimize reporting burden for MIPS eligible clinicians at this time. We intend to work with MIPS eligible clinicians and other stakeholders to continue improving available measures and reporting methods for MIPS. In addition, we are finalizing policies that offer MIPS eligible clinicians substantial flexibility and sustain proven pathways for successful participation. Those MIPS eligible clinicians who are not already successfully reporting quality measures meaningful to their practice via one of these pathways will need to evaluate the options available to them and choose which available reporting mechanism and measures they believe will work best for their practice.

Comment: A few commenters recommended that more quality measures be made available for reporting via claims or EHRs noting that there were more quality measures available for reporting by registry

compared with EHRs or claims. The commenters stated that this will push clinicians to sign up with registries, undercuts fully using EHRs, and only services the interests of organizations who manage registries.

Response: We appreciate the commenters' concern and are working with measure developers to develop more measures that are electronically based. We refer the commenter to the Measure Development Plan for more information <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>.

Additionally, in section II.E.9.(b) of this final rule with comment period, we have expanded health IT vendors' opportunities by allowing health IT vendors to submit data on measures, activities, or objectives for any of the following MIPS performance categories: (i) Quality; (ii) improvement activities; or (iii) advancing care information. In addition, the health IT vendor submitting data on behalf of a MIPS eligible clinician or group would be required to obtain data from the MIPS eligible clinician's certified EHR technology. However, the health IT vendor would be able to submit the same information the qualified registry is able to. Therefore, we do not believe there is a disparity between health IT vendors and qualified registry's quality data submission capabilities.

Comment: Other commenters stated that the use of CEHRT in all areas of the MIPS program should be required rather than just encouraged. The commenters stated that the use of CEHRT is required for participation in the Meaningful Use EHR Incentive Programs, is vitally important for ensuring successful interoperability, and is already part of the definition of a Meaningful EHR User for MIPS.

Response: We do not believe it is appropriate to require CEHRT in all areas of the MIPS program as many MIPS eligible clinicians may not have had past experience relevant to the performance categories and use of EHR technology because they were not previously eligible to participate in the Medicare EHR Incentive Program. The restructuring of program requirements described in this final rule with comment period are geared toward increasing participation and EHR adoption. We believe this is the most effective way to encourage the adoption of CEHRT, and introduce new MIPS eligible clinicians to the use of certified EHR technology and health IT overall. As discussed in section II.E.6.a.(2)(f) of this final rule with comment period, we

are promoting the use of CEHRT by awarding bonus points in the quality scoring section for measures gathered and reported electronically via the QCDR, qualified registry, CMS Web Interface, or CEHRT submission mechanisms. By promoting use of CEHRT through various submission mechanisms, we believe MIPS eligible clinicians have flexibility in implementing electronic reporting in a manner which best suits their practice.

Comment: One commenter requested information on how non-Medicare payers would route claims data to CMS for purposes of considering cost performance category data.

Response: All measures used under the cost performance category would be derived from Medicare administrative claims data submitted for billing on Part B claims by MIPS eligible clinicians and as a result, participation would not require use of a separate data submission mechanism. Please note that the cost performance category is being reweighted to zero for the transition year of MIPS. Refer to section II.E.5.e. of this final rule with comment for more information on the cost performance category.

Comment: Other commenters requested clarification on the difference between "claims" and "administrative claims" as reporting methods, citing slides 24 and 39 of the May 10th Quality Payment Program presentation, available at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Quality-Payment-Program.html>. The commenters were confused because "claims" was listed as a method of reporting but it was stated that "administrative claims" will not require submission.

Response: The "claims" submission mechanism refers to those quality measures as described in section II.E.5.b.(6) of this final rule with comment period. The claims submission mechanism requires MIPS eligible clinicians to append certain billing codes to denominator eligible claims to indicate to us the required quality action or exclusion occurred. Conversely, the administrative claims submission mechanism refers to those measures described in section II.E.5.b. for the quality performance category and section II.E.5.e. for the cost performance category of this final rule with comment period. Administrative claims submissions require no separate data submission to CMS. Rather, we calculate these measures based on data available from MIPS eligible clinicians' billings on Medicare Part B claims.

Comment: Other commenters stated that some of the measures and activities, such as the CAHPS for MIPS survey, were dependent on third party intermediaries, over which practices have little control. The commenters recommended that CMS reduce requirements that are outside of the practice's control.

Response: We believe the MIPS program has a broad span of measures and activities from which to choose. There are many measures and activities that are not dependent on a third party intermediary. We encourage MIPS eligible clinicians to report the measures and activities that are most meaningful to their practice.

Comment: Another commenter stated that if CMS were to require vendors to have the capability to submit data for all performance categories, a vendor would need adequate time to implement any required changes going forward, would need CMS to produce implementation guides for 2017 reporting as soon as possible with the capability to ask CMS clarifying questions, and would need a testing tool no later than the 3rd quarter. Several commenters did not support the proposed requirement that vendors have the capability to submit data for all MIPS performance categories. The commenters stated many product developers and product or service vendors have developed solutions tailored to specific areas of healthcare quality and performance improvement. The commenters stated that given the breadth of the proposed MIPS requirements, CMS should not require health IT companies to have the capability to submit information for all four MIPS performance categories because this task may be outside of their organizational and client priorities. Another commenter stated that while they appreciate CMS' attempts to reduce administrative burden they have a concern that third party entities will not be able to implement the necessary changes to support reporting on all performance categories in the transition year. In addition, the commenter was concerned that the additional cost of creating this functionality will be passed on to MIPS eligible clinicians in the form of higher fees for using those products and services. The commenter urged CMS to work with health IT developers, vendors, and other data intermediaries to ensure that data products and services evolve as CMS's policies evolve and to ensure adequate advanced notice of upcoming changes so that MIPS eligible clinicians will not be penalized for failing to report data the third party intermediary's technology was not updated to collect.

Response: We would like to explain that we are not finalizing a requirement that a third party intermediary submitting data on behalf of a MIPS eligible clinician or group must become qualified to submit data for multiple MIPS performance categories, nor are we finalizing a certification requirement for submission of data. We are instead finalizing specific requirements for QCDRs related to quality data submission, and for a health IT vendor or other authorized third party intermediary that is submitting data for any or all of the MIPS performance categories on behalf of a MIPS eligible clinician or group must meet the form and manner requirements for each submission method. We direct readers to section II.E.9.b. of this final rule with comment period for further discussion of health IT vendor and other authorized third party intermediaries. We direct readers to section II.E.9.a. of this final rule with comment period for further discussion of submission requirements for QCDRs.

Comment: Another commenter stated that the CMS Web Interface should have fewer down times during the first quarter submission period, following the performance period, to compensate for MIPS eligible clinicians' need to submit their files.

Response: We intend to make every effort to keep the CMS Web Interface from having down times during the first quarter submission period. In some instances, down times are required to account for necessary system maintenance within CMS. When these down times do occur, we make every effort to ensure that the down times do not occur near final submission deadlines and to notify all groups and impacted parties well in advance so they can account for these down times during the data submission period.

Comment: One commenter encouraged utilizing EHRs and claims to collect quality measure data whenever possible.

Response: We agree with utilizing EHR whenever possible and encourage the use of EHR to collect data whenever possible. However, we intend to reduce the number of claims-based measures that in future years, but we note that many MIPS eligible clinicians still submit these types of measures. We believe claims-based measures are a necessary option to minimize reporting burden for MIPS eligible clinicians. We intend to work with MIPS eligible clinicians and other stakeholders to continue improving available measures and reporting methods for MIPS.

Comment: One commenter expressed concern that multi-specialty groups

reporting through a QCDR would face challenges if multiple specialties wanted to report non-MIPS measures. This commenter believed this would require reporting via two different submission mechanisms.

Response: QCDRs are able to report both non-MIPS measures and MIPS measures. They are provided a great deal of flexibility and should be able to report for multiple specialties.

Comment: Another commenter requested clarity regarding the submission mechanisms for a group. The commenter sought flexibility to use the most appropriate submission mechanism for each of the performance categories. Another commenter suggested continuing 2017 reporting via CMS Web Interface for groups. The commenter stated that at a minimum, the CMS Web Interface reporting and EHR direct reporting should be maintained.

Response: Please refer to the final submission mechanisms in Tables 3 and 4 of this final rule with comment period for the available submission mechanisms for all MIPS eligible clinicians.

Comment: Another commenter expressed concern that CMS proposed to allow measures which are available to report via EHR technology to be reported via a QCDR, because the commenter believed this would result in unnecessary burden as practices would be required to seek another data submission vendor beyond their EHR vendor. The commenter recommended that CMS allow MIPS eligible clinicians to report quality measures and improvement activities using their certified EHR technology.

Response: MIPS eligible clinicians will have the flexibility to submit their quality measures and improvement activities using their certified EHR technology. The health IT vendor would need to meet the requirements as described in section II.E.9.b. of this final rule with comment period to offer this flexibility to their clients.

Comment: A few commenters agreed with the proposal to allow third party submission entities, such as QCDRs and qualified registries, to submit data for the performance categories of quality, advancing care information, and improvement activities. The commenters believed that allowing MIPS eligible clinicians to use a single, third party data submission method reduces the administrative burden on MIPS eligible clinicians, facilitates consolidation and standardization of data from disparate EHRs and other systems, and enables the third parties to provide timely, actionable feedback to

MIPS eligible clinicians on opportunities for improvement in quality and value. Other commenters agreed with the proposals that encourage the use of QCDRs because QCDRs are able to quickly implement new quality measures to assist MIPS eligible clinicians with accurately measuring, reporting, and taking action on data most meaningful to their practices. Another commenter stated that vendors and QCDRs should have the capability to submit data for all MIPS performance categories. The commenter believed that working through a single vendor is the only way to provide a full picture of overall performance.

Response: We thank the commenters for their support.

Comment: A few commenters expressed support for the Quality Payment Program's approach of streamlining the PQRS, VM, and EHR Incentive Program into MIPS and encouraged CMS to continue to allow existing data reporting tools to report MIPS quality data. Hospitals have already made significant investments in existing reporting tools. Other commenters supported the option to use a single reporting mechanism under MIPS. The commenters considered this a positive development, and one that would be attractive to many groups and hospitals. Some commenters noted that CMS offers significant flexibility across performance category reporting options, and supported the proposal to accept data submissions from multiple mechanisms. The commenters urged CMS to retain this flexibility in future years and to hold QCDR and other vendors accountable for offering MIPS reporting capabilities across all performance categories. One commenter was pleased that CMS is allowing flexibility in measure selection and reporting via any reporting mechanism, and report as an individual or a group. Another commenter supported the proposal allowing MIPS eligible clinicians who are in a group to report on MIPS either as part of the group or individually. This flexibility would allow low performing groups the opportunity to reap the benefits of their higher performance. Other commenters were very supportive of the use of bonus points in the quality performance category to encourage the use of CEHRT and electronic reporting of CQMs.

Response: We thank the commenters for their support on the various approaches. We would like to explain that groups must report either entirely as a group or entirely as individuals; groups may not have only some individual reporting. Groups must

decide to report as a group across all four performance categories.

Comment: Another commenter recommended that CMS adopt a clear, straightforward, and prospective process for practices to determine whether a MIPS performance category applies to their particular specialty and subspecialty.

Response: We agree with the commenter and are working to establish educational tools and materials that will clearly indicate to MIPS eligible clinicians their requirements based on their specialty or practice type.

Comment: One commenter urged CMS to offer a quality and cost performance category measure reporting option in which hospital-based MIPS eligible clinicians can use the hospital's measure performance under CMS hospital quality programs for purposes of MIPS.

Response: We appreciate the feedback and will take it into consideration for future rulemaking. We also note that in the Appendix in Table C of this final rule with comment period we have created a specialty-specific measure set for hospitalists.

Comment: Another commenter recommended that CMS and HRSA collaborate to develop a data submission mechanism that would allow MIPS eligible clinicians practicing in FQHCs to submit quality data one time for both MIPS and Uniform Data System (UDS).

Response: We intend to address this option in the future through separate notice-and-comment rulemaking.

Comment: Some commenters supported the proposed data submission mechanisms and the proposal that MIPS eligible clinicians and groups must use the same mechanism to report for a given performance category with the exception of those reporting the CAHPS for MIPS survey.

Response: We thank the commenters for their support.

Comment: Other commenters agreed with the proposal to maintain a manual attestation portal option for some of the performance categories. The commenters believed that this option provided MIPS eligible clinicians with an option of consolidating and submitting data on their own, which for some may reduce their overall cost to participate. The commenters recommended that this option remain in place for the future, but that if CMS decided to remove it, they provide EHR vendors at least 18 months' notice to develop and deploy data submission mechanisms.

Response: We appreciate the support and will take the feedback into consideration in the future.

Comment: Another commenter encouraged CMS to ensure that the reporting requirements for MIPS are aligned with each of the American Board of Medical Specialties (ABMS) Member Board's requirements for Maintenance of Certification, particularly activities required to fulfill Part IV: Improvement in Medical Practice.

Response: We align our quality efforts where possible. We intend to continue to receive input from stakeholders, including ABMS, in the future.

Comment: One commenter suggested that CMS ensure that the MIPS reporting process is simple to understand, conducive to automated reporting and clinically relevant.

Response: We believe we have made the reporting process as flexible and simple as possible for the MIPS program at this time. We have provided several data submission mechanisms, activities, and measures for MIPS eligible clinicians to choose from. We intend to continue to work to improve the program in the future as we gain experience under the Quality Payment Program.

Comment: Another commenter was appreciative that CMS outlined a data validation and auditing process in the proposed rule. The commenter requested more details about implementation, including CMS' timeline for providing performance reports to MIPS eligible clinicians.

Response: We thank the commenters for their support. We refer readers to section II.E.8.e. for information on data validation and section II.E.8.a. for information on performance feedback of this final rule with comment period.

Comment: A few commenters urged CMS to integrate patient and family caregiver perspectives as part of Quality Payment Program development. The commenters noted that value and quality are often perceived through "effectiveness" and "cost" whereas the patient typically prioritizes outcomes beyond clinical measures.

Response: We agree that the patient and family caregiver perspective is important, but note that we would expect patients and caregivers to prioritize successful health outcomes. We are finalizing the policy that the CAHPS for MIPS survey would count as a patient experience measure which is a type of high priority measure. In addition, a MIPS eligible clinician may be awarded points under the improvement activities performance category as the CAHPS for MIPS survey is included in the Patient Safety and Practice Assessment subcategory.

Comment: One commenter expressed concern that no measures exist that are useful to MIPS eligible clinicians working in multiple settings with diverse patient populations.

Response: We believe the MIPS program has a broad span of measures and activities from which to choose. There are many measures and activities that are applicable to multiple treatment facility types and diverse patient populations. We encourage MIPS eligible clinicians to report the measures and activities that are most meaningful to their practice.

Comment: One commenter stated that CMS should clarify the reporting options for nephrologists who practice in multiple settings. The commenter urged CMS to provide illustrative examples of options for nephrologists based on actual sample clinical practices.

Response: The final data submission options for all MIPS eligible clinicians are outlined in this final rule with comment period in Tables 3 and 4. We intend to provide further subregulatory guidance and training opportunities for all MIPS eligible clinicians in the future. In addition, the MIPS eligible clinician may reach out to the Quality Payment Program Service Center with any questions.

Comment: Other commenters recommended that CMS not amend the technical specifications for eQMs until MIPS eligible clinicians are required to transition to 2015 Edition CEHRT to report data for MIPS. In addition, the commenters requested that CMS maintain the eMeasure versions issued with the EHR Incentive Program Stage 2 final rule until that transition point. The commenters noted that by delaying any changes to eCQM measures until 2018, CMS will give the health IT industry and MIPS eligible clinicians the necessary time to adapt to new reporting demands and respond appropriately to new specifications.

Response: We understand the concerns of needing necessary time to adapt to new reporting requirements. Therefore, we did not make major amendments to the technical standards for eQMs. We have updated measure specification for various eQMs to align with current clinical guidelines. However, this alignment should not impact technical standards and certification requirements. We plan to update the EHR community to allow necessary time for implementers to adapt any new standards required to report eQMs in the future.

Comment: One commenter recommended that technologies such as the CMS Web Interface be available for

submission of all data, not just the quality performance category.

Response: We appreciate the feedback and note that we are expanding the ability of the CMS Web Interface to be used for submissions on improvement activities, advancing care information, and quality performance categories.

Comment: Another commenter stated that the avenue for reporting different measures requires careful consideration because there are appropriate avenues of reporting depending upon different measure types. The commenter stated that this should be taken into consideration during measure development.

Response: We appreciate the feedback and will take this suggestion into consideration in the future.

Comment: One commenter supported allowing groups to utilize a CMS-approved survey vendor for CAHPS for MIPS survey data collection in conjunction with another data submission mechanism. Another commenter proposed expanding the survey option in the future to include a CMS-approved survey vendor for CAHPS for MIPS survey data collection for MIPS eligible clinicians reporting individually.

Response: We would like to note that when a MIPS eligible clinician utilizes the CAHPS for MIPS survey they must also utilize another data submission mechanism in conjunction with it. We will take the suggestion of expanding the survey option to individuals in the future.

Comment: One commenter believed that CMS could simplify MIPS reporting by streamlining the number of submission methods and focusing on the options that are most appropriate for each performance category. The commenter recommended the following options: (1) Quality: EHR Direct, QCDR, Qualified Registry, CMS Web Interface, remove Claims; (2) Cost: Claims; (3) Improvement Activities: Attestation, Claims, EHR Direct, QCDR, qualified registry, and CMS Web Interface; (4) Advancing care information: Attestation, EHR Direct, remove QCDR, remove qualified registry, and remove CMS Web Interface.

Response: We appreciate the feedback as we are striving to balance simplicity with flexibility. We believe that by having numerous data submission mechanisms available for selection it reduces burden to MIPS eligible clinicians. The data submission options for all MIPS eligible clinicians are outlined in this final rule with comment period in Tables 3 and 4.

Comment: Some commenters opposed the lack of transparency of the claims-

based quality and cost performance category measures. The commenters recommended that CMS make the claims-based attribution of patients and diagnoses fully transparent to MIPS eligible clinicians and beneficiaries. They suggested CMS modify them so they accurately reflect each MIPS eligible clinician's contribution to quality and resource utilization.

Response: We appreciate the feedback and will take the suggestions into consideration in the future. We would like to note that information regarding claims-based quality and cost performance category measures can be found in the Appendix of this final rule with comment period under Table A through Table G under the "data submission method" tab. In addition, claims-based quality measures information may be found at QualityPaymentProgram.cms.gov.

Comment: Another commenter recommended that CMS consider allowing MIPS eligible clinicians to report across multiple QCDRs because allowing MIPS eligible clinicians to report through multiple QCDRs would permit the specificity of reporting required for diverse specialties, but without increasing the IT integration burden on MIPS eligible clinicians who might already be reporting through these registries.

Response: Many QCDRs charge their participants for collecting and reporting data. Not only might this increase the cost to MIPS eligible clinicians, but it would make the calculation of the quality score that much more cumbersome and prone to error. Errors that could occur include incorrect submission of TIN or NPI information, incomplete data for one or more measures, etc. We note, however, that MIPS eligible clinicians do have the flexibility to submit data using different submission mechanisms across the different performance categories. For example, one QCDR could report the advancing care information performance category for a particular MIPS eligible clinician, and that MIPS eligible clinician could use another QCDR to report the quality performance category.

Comment: One commenter requested that CMS clearly state the reporting requirements for each reporting mechanism for quality. The commenter noted that MIPS eligible clinicians who elect to submit four eQMs will submit that data through a QCDR, qualified registry, or EHR with the QRDA standard that is certified, and then be restricted on their ability to use the attestation mechanism for the remaining two quality measures if they elect to submit non-eQMs that do not require

certification. The commenter agreed that not all submitted measures need to be eQMs, but believed CMS needed to provide greater clarity on handling such a scenario and wanted CMS to consider the submission mechanism's ability to submit data using a single standard.

Response: The quality data submission criteria is described in section II.E.5.a.(2) of this final rule with comment period. We would like to explain that attestation is not a submission mechanism allowed for the quality performance category, rather only for the improvement activities and advancing care information performance categories. Additionally, we are finalizing our policy that MIPS eligible clinicians would need to submit data for a given performance category only one submission mechanism. We refer readers to section II.E.5.a.(2) of this final rule with comment period where we discuss our approach for the rare situations where a MIPS eligible clinician submits data for a performance category via multiple submission mechanisms (for example, submits data for the quality performance category through a registry and QCDR), and how we score those MIPS eligible clinicians. We further note that in that section we are seeking comment for further consideration on different approaches for addressing this scenario.

Comment: Some commenters agreed with the proposal of using submission methods already available in the current PQRS program because this allows QCDRs to focus on the creation of measures and adapting to final MIPS rule rather than on the submission process itself.

Response: We appreciate the commenters' support.

Comment: Several commenters noted they support the CMS goals of patient-centered health care, and the aim of the MIPS program for evidence-based and outcome-driven quality performance reporting. These commenters appreciated that the flexibility allowed in the MIPS program, including the variety of reporting options, is intended to meet the needs of the wide variety of MIPS eligible clinicians. The commenters believed, however, that the variety of reporting options can easily create confusion due to the increased number of choices and methods. Such confusion will be challenging in general, but could be especially problematic for 2017, given the short time to prepare. One commenter suggested that technical requirements for reporting options should be incorporated into CEHRT, and not added through subregulatory guidance. Another commenter stated that there are

too many reporting options, and the number of options should be reduced.

Response: We appreciate the commenters' support. We have provided several data submission mechanisms to allow flexibility for the MIPS eligible clinician. It is important to note that substantive aspects of technical requirements for reporting options incorporated into CEHRT have been addressed in section II.E.g. of this final rule with comment period. However, we intend to issue subregulatory guidance regarding further details on the form and manner of EHR submission.

Comment: One commenter recommended CMS allow each specialty group within a multi-specialty practice to report its own group data file. The commenter suggested that if this cannot be done under a single TIN, then CMS should explicitly encourage multi-specialty practices that wish to report specialty-specific measure sets and improvement activities at the group level to register each specialty group, under a different TIN for identification purposes. The commenter recognized that there may be operational challenges to implementing this recommendation and is willing to work with CMS and its vendors to develop the framework for the efficient collection and calculation of multiple data files for a single MIPS performance category from a group.

Response: We appreciate the commenters' recommendation and will take it into consideration in future rulemaking. We refer readers to section II.E.1.e. of this final rule with comment period for more information on groups.

After consideration of the comments on our proposals regarding the MIPS data submission mechanisms, we are modifying the data submission mechanisms at § 414.1325. We will not be finalizing the data submission mechanism of administrative claims for the improvement activities performance category, as it is not technically feasible at this time. All other data submission mechanisms will be finalized as proposed. Specifically, we are finalizing at § 414.1325(a) that MIPS eligible clinicians and groups must submit measures, objectives, and activities for the quality, improvement activities, and advancing care information performance categories.

Refer to Tables 3 and 4 of this final rule with comment period for the finalized data submission mechanisms. Table 3 contains a summary of the data submission mechanisms for individual MIPS eligible clinicians that we are finalizing at § 414.1325(b) and (e). Table 4 contains a summary of the data submission mechanisms for groups that are not reporting through an APM that

we are finalizing at § 414.1325(c) and § 414.1325(e). Furthermore, we are finalizing our proposal at § 414.1325(d) that except for groups that elect to report the CAHPS for MIPS survey, MIPS eligible clinicians and groups may elect to submit information via multiple mechanisms; however, they must use the same identifier for all performance categories and they may only use one submission mechanism per performance category. In addition, we are finalizing at § 414.1305 the following definitions as proposed: (1) Attestation means a secure mechanism, specified by CMS, with respect to a particular performance period, whereby a MIPS eligible clinician or group may submit the required data for the advancing care information or the improvement activities performance categories of MIPS in a manner specified by CMS; (2) CMS-approved survey vendor means a survey vendor that is approved by CMS for a particular performance period to administer the CAHPS for MIPS survey and to transmit survey measures data to CMS; and (3) CMS Web Interface means a web product developed by CMS that is used by groups that have elected to utilize the CMS Web Interface to submit data on the MIPS measures and activities.

TABLE 3—DATA SUBMISSION MECHANISMS FOR MIPS ELIGIBLE CLINICIANS REPORTING INDIVIDUALLY AS TIN/NPI

Performance category/ submission combinations accepted	Individual reporting data submission mechanisms
Quality	Claims. QCDR. Qualified registry. EHR.
Cost	Administrative claims (no submission required).
Advancing Care Infor- mation.	Attestation. QCDR. Qualified registry. EHR.
Improvement Activities.	Attestation. QCDR. Qualified registry. EHR.

TABLE 4—DATA SUBMISSION MECHANISMS FOR GROUPS

Performance category/ submission combinations accepted	Group reporting data submission mechanisms
Quality	QCDR. Qualified registry. EHR. CMS Web Interface (groups of 25 or more). CMS-approved survey vendor for CAHPS for MIPS (must be reported in conjunction with another data submission mechanism.). and Administrative claims (For all-cause hospital readmission measure—no submission required).
Cost	Administrative claims (no submission required).
Advancing Care Information.	Attestation. QCDR. Qualified registry. EHR. CMS Web Interface (groups of 25 or more).
Improvement Activities.	Attestation. QCDR. Qualified registry. EHR. CMS Web Interface (groups of 25 or more).

(3) Submission Deadlines

For the submission mechanisms described in the proposed rule (81 FR 28181), we proposed a submission deadline whereby all associated data for all performance categories must be submitted. In establishing the submission deadlines, we took into account multiple considerations, including the type of submission mechanism, the MIPS performance period, and stakeholder input and our experiences under the submission deadlines for the PQRS, VM, and Medicare EHR Incentive Programs.

Historically, under the PQRS, VM, or Medicare EHR Incentive Programs, the submission of data occurred after the close of the performance periods. Our experience has shown that allowing for the submission of data after the close of the performance period provides either the MIPS eligible clinician or the third party intermediary time to ensure the data they submit to us is valid, accurate and has undergone necessary data quality checks. Stakeholders have also stated that they would appreciate the ability to submit data to us on a more frequent basis so they can receive feedback more frequently throughout the performance period. We also note that, as described in the proposed rule

(81 FR 28179), the MIPS performance period for payments adjusted in 2019 is CY 2017 (January 1 through December 31).

Based on the factors noted, we proposed at § 414.1325(e) that the data submission deadline for the qualified registry, QCDR, EHR, and attestation submission mechanisms would be March 31 following the close of the performance period. We anticipate that the submission period would begin January 2 following the close of the performance period. For example, for the first MIPS performance period, the data submission period would occur from January 2, 2018, through March 31, 2018. We note that this submission period is the same time frame as what is currently available to EPs and group practices under PQRS. We were interested in receiving feedback on whether it is advantageous to either (1) have a shorter time frame following the close of the performance period, or (2) have a submission period that would occur throughout the performance period, such as bi-annual or quarterly submissions; and (3) whether January 1 should also be included in the submission period. We requested comments on these items.

We further proposed that for the Medicare Part B claims submission mechanism, the submission deadline would occur during the performance period with claims required to be processed no later than 90 days following the close of the performance period. Lastly, for the CMS Web Interface submission mechanism, the submission deadline will occur during an 8-week period following the close of the performance period that will begin no earlier than January 1 and end no later than March 31. For example, the CMS Web Interface submission period could span an 8-week timeframe beginning January 16 and ending March 13. The specific deadline during this timeframe will be published on the CMS Web site.

We requested comments on these proposals.

The following is a summary of the comments we received on our proposals regarding MIPS submission deadlines.

Comment: One commenter requested clarity on the first reporting deadline.

Response: The first proposed submission deadline for the qualified registry, QCDR, EHR, and attestation submission mechanisms is from January 2nd, 2018 through March 31st, 2018. For the CMS Web Interface submission mechanism, the first proposed submission deadline will occur during an 8-week period following the close of the performance period that will begin

no earlier than January 1 and end no later than March 31 (for example, January 16 through March 13, 2018). The specific deadline during this timeframe will be published on the CMS Web site.

Comment: Several commenters supported the data submission deadline of March 31 of the year following the performance period. The commenters also suggested that more frequent submissions could be useful but only if data are easy to submit. Another commenter recommended that CMS not make more frequent data submission a requirement, but allow for reporters to submit data on a more frequent basis if they so choose. The commenter saw benefit to more frequent data submission, but stated that there are some concerns CMS should consider. For example, they noted that monthly submission would not work well with the advancing care information performance category requirement that requires reporting patients' choosing to view their patient portal, as patients would have to visit the portal during the month after their appointment in order for the portal visit to count towards the measure.

Response: We appreciate the commenters' support. We intend to explore the capability of more frequent data submission to the MIPS program. As a starting point we intend to allow for optional, early data submissions for the qualified registry, QCDR, EHR, and attestation submission mechanisms. Specifically, we would allow submissions to begin earlier than January 2, 2018 for those individual MIPS eligible clinicians and groups who would like to optionally submit data early to us, if technically feasible. If it is not technically feasible to allow the submission period to begin prior to January 2 following the close of the performance period, the submission period will occur from January 2 through March 31 following the close of the performance period. Please note that the final deadline for these submission mechanisms will remain March 31, 2018. Additional details related to the technical feasibility of early data submissions will be made available at QualityPaymentProgram.cms.gov.

Comment: Some commenters were concerned about timelines for the PQRS, VM, and Medicare EHR Incentive Program for EPs. The commenters believed it was unfair to expect MIPS eligible clinicians and groups to complete full calendar year reporting in 2016 for EHR Incentive Program and PQRS and then completely switch to a new program while still completing attestations for 2016 programs.

Response: We understand the commenters' concerns and therefore have modified our proposed policy to allow more flexibility and time for MIPS eligible clinicians to transition to CEHRT and familiarize themselves with MIPS requirements. As discussed in section II.E.5.b.(3) of this final rule with comment period, we are finalizing the policy that MIPS clinicians will only need to report for a minimum of a continuous 90-day period within CY 2017, for the majority of the submission mechanisms for all data in a given performance category and submission mechanism, to qualify for an upward adjustment for the transition year.

Comment: Another commenter called for the elimination of reporting electronically to data registries unless the registries have been empirically demonstrated to improve care and reduce cost in practice.

Response: We appreciate the comment regarding the function of a qualified registry to improve care and reduce cost in practice. We agree that registries are a tool to drive value in clinical practice. For MIPS, a qualified registry or QCDR is required to provide attestation statements from the MIPS eligible clinicians during the data submission period that all of the data (quality measures, improvement activities, and advancing care information measures and activities, if applicable) and results are accurate and complete.

Comment: Another commenter believed that limiting performance category data submission to one mechanism per performance category will limit innovation and disincentivize reporting the highest quality data available. The commenter believed that if MIPS eligible clinicians could report some of the required quality measures through a QCDR, they should be allowed to do so. Other commenters supported CMS' proposal to retain reporting mechanisms available in PQRS but opposed the proposal to allow only one submission mechanism per performance category, especially for the quality performance category. The commenters stated that some MIPS eligible clinicians may need to report through multiple mechanisms, such as MIPS eligible clinicians reporting a proposed specialty-specific measure set containing measures requiring differing submission mechanisms. A few commenters requested that CMS reconsider its proposal that all quality measures used by CMS must be submitted from the same reporting method because there are limits in the applicable reporting methods for certain measures, with some specialty-specific

measure sets having very few EHR-enabled measures. These commenters believed the MIPS eligible clinicians should be able to use multiple reporting options. Another commenter urged CMS to limit the number of measure data reporting options so hospitals, health systems, and national stewards can accurately assess and benchmark performance over time. Another commenter recommended that for at least the first 3 to 5 years of the program, the submission mechanism flexibility to report measures using a variety of mechanisms remain in place.

Response: MIPS eligible clinicians may choose whichever data submission mechanisms works best for their practice. We have provided many data submission options to allow the utmost flexibility for the MIPS eligible clinician. We believe the proposal to allow multiple mechanisms, while restricting the number of mechanisms per performance category, offers flexibility without adding undue complexity. We discuss our policies related to multiple methods of reporting within a performance category in section II.E.5.a. of this final rule with comment period. We would also like to note that in section II.E.6.a. of this final rule with comment period we are seeking comment for further consideration on additional flexibilities that should be offered for MIPS eligible clinicians in this situation.

In addition, we do not believe that allowing these various submission mechanisms impacts the ability to create reliable and accurate measure benchmarks. We discuss our policies related to measure benchmarks in more detail in section II.E.6.e. of this final rule with comment period.

Comment: One commenter recommended that CMS require Medicare Part B claims to be submitted, rather than processed, within 90 days of the close of the applicable performance period, as MIPS eligible clinicians have no control over how quickly claims are processed and should not be held responsible for delays. Another commenter recommended that the submission time period be extended to 12 weeks, as more data will be required to be submitted than historically during that time period. Other commenters expressed concern with CMS' proposed submission deadline and requested a minimum 90-day submission period as MIPS eligible clinicians employed by health systems may not have access to December data until February and cumulative data even later. The commenters further believed that submission periods should be standardized regardless of submission

mechanism and suggest a submission period from January 1 through March 31. A few commenters agreed with the proposed 90-day submission period policy for submittal of data via the claims mechanism and noted that the prior deadline was often too challenging for MIPS eligible clinicians to meet.

Response: In establishing the submission deadlines, we took into account multiple considerations, including the type of submission mechanism, the MIPS performance period, and stakeholder input and our experiences under the submission deadlines for the PQRS, VM, and Medicare EHR Incentive Program. Our experience has shown that allowing for the submission of data after the close of the performance period provides either the MIPS eligible clinician or the third party intermediary time to ensure the data they submit to us is valid, accurate and has undergone necessary data quality checks. We do note, however, that as indicated previously in this final rule with comment period, we would allow submissions to begin earlier than January 2, 2018 for those individual MIPS eligible clinicians and groups who would like to optionally submit data early to us, provided that it is technically feasible. If it is not technically feasible, individual MIPS eligible clinicians and groups will still be able to submit data during the normal data submission period. Please note that the final deadline for all submission mechanisms will remain at March 31, 2018. However, for the Medicare Part B claims submission mechanism, we believe the best approach for the data submission deadline is to require Medicare Part B claims to be processed no later than 60 days following the close of the performance period.

Comment: Another commenter stated that despite MIPS data submission via the CMS Web Interface, the process of data verification prior to submission is still manual and labor-intensive. The commenter encouraged CMS to explore methods for allowing test submissions (whether throughout the performance period or during the submission window) to uncover any possible submission errors; this would provide an opportunity for CMS to give feedback to MIPS eligible clinicians and third party intermediaries in advance of the submission deadline.

Response: We appreciate the feedback and would like to note as indicated previously in this final rule with comment period, we would allow submissions to begin earlier than January 2, 2018 for those individual MIPS eligible clinicians and groups who would like to optionally submit data

early to us, if technically feasible. If it is not technically feasible to allow the submission period to begin prior to January 2 following the close of the performance period, the submission period will occur from January 2 through March 31 following the close of the performance period. Please note that the final deadline for these submission mechanisms will remain March 31, 2018.

Comment: We received comments on our request for feedback on whether it is advantageous to either (1) have a shorter time frame following the close of the performance period, or (2) have a submission period that would occur throughout the performance period, such as bi-annual or quarterly submissions; and (3) whether January 1 should also be included in the submission period. A few commenters opposed shorter reporting timeframes for MIPS eligible clinicians using the CMS Web Interface or other reporting mechanisms. The commenters recommended, in general, quarterly or semi-annual data submission periods with a minimum report of at least once annually, and subsequently a quarterly report by CMS detailing MIPS eligible clinicians' progress. The commenters recommended a real-time tool for MIPS eligible clinicians to be able to track their MIPS progress. Another commenter stated that MIPS reporting deadlines should be no earlier than 2 months following the notification of QP status. Other commenters stated that bi-annual and quarterly submission period requirements would be advantageous only if CMS intended to provide timely MIPS eligible clinician feedback on a quarterly basis. They stated that if quarterly reporting were to be required, EHR vendors would need to have upfront notice regarding changes in measures in order to prepare. One commenter expressed that clinicians must know the standards by which they will be measured in advance of the performance period and require 3 months after the performance period to scrub data before submitting. The commenter stated that quarterly data submission would be too burdensome.

Response: We appreciate the feedback and agree with the commenter that we want to strike the right balance on allowing for more frequent submissions which would allow us to issue more frequent performance feedback, while ensuring that the process that is developed is not overly burdensome. Therefore, as indicated previously in this final rule with comment period, we would allow submissions to begin earlier than January 2, 2018 for those individual MIPS eligible clinicians and

groups who would like to optionally submit data early to us, if technically feasible. If it is not technically feasible to allow the submission period to begin prior to January 2 following the close of the performance period, the submission period will occur from January 2 through March 31 following the close of the performance period. Please note that the final deadline for these submission mechanisms will remain March 31, 2018.

After consideration of the comments received on the proposals regarding MIPS submission deadlines, we are finalizing the submission deadlines as proposed with one modification. Specifically, we are finalizing at § 414.1325(f) the data submission deadline for the qualified registry, QCDR, EHR, and attestation submission mechanisms as March 31 following the close of the performance period. The submission period will begin prior to January 2 following the close of the performance period, if technically feasible. For example, for the first MIPS performance period, the data submission period will occur prior to January 2, 2018, through March 31, 2018, if technically feasible. If it is not technically feasible to allow the submission period to begin prior to January 2 following the close of the performance period, the submission period will occur from January 2 through March 31 following the close of the performance period. In any case, the final deadline will remain March 31, 2018.

We further finalize at § 414.1325(f)(2) that for the Medicare Part B claims submission mechanism, the submission deadline must be on claims with dates of service during the performance period that must be processed no later than 60 days following the close of the performance period. Lastly, for the CMS Web Interface submission mechanism, we are finalizing at § 414.1325(f)(3) the submission deadline must be an 8-week period following the close of the performance period that will begin no earlier than January 1, and end no later than March 31. For example, the CMS Web Interface submission period could span an 8-week timeframe beginning January 16 and ending March 13. The specific deadline during this timeframe will be published on the CMS Web site.

b. Quality Performance Category

(1) Background

(a) General Overview and Strategy

The MIPS program is one piece of the broader health care infrastructure needed to reform the health care system and improve health care quality,

efficiency, and patient safety for all Americans. We seek to balance the sometimes competing considerations of the health system and minimize burdens on health care providers given the short timeframe available under the MACRA for implementation. Ultimately, MIPS should, in concert with other provisions of the Act, support health care that is patient-centered, evidence-based, prevention-oriented, outcome driven, efficient, and equitable.

Under MIPS, clinicians are incentivized to engage in improvement measures and activities that have a proven impact on patient health and safety and are relevant to their patient population. We envision a future state where MIPS eligible clinicians will be seamlessly using their certified health IT to leverage advanced clinical quality measurement to manage patient populations with the least amount of workflow disruption and reporting burden. Ensuring clinicians are held accountable for patients' transitions across the continuum of care is imperative. For example, when a patient is discharged from an emergency department (ED) to a primary care physician office, health care providers on both sides of the transition should have a shared incentive for a seamless transition. Clinicians may also be working with a QCDR to abstract and report quality measures to CMS and commercial payers and to track patients longitudinally over time for quality improvement.

Ideally, clinicians in the MIPS program will have accountability for quality and cost measures that are related to one another and will be engaged in improvement activities that directly help them improve in both specialty-specific clinical practice and more holistic areas (for example, patient experience, prevention, population health). The cost performance category will provide clinicians with information needed to deliver efficient, effective, and high-value care. Finally, MIPS eligible clinicians will be using CEHRT and other tools which leverage interoperable standards for data capture, usage, and exchange in order to facilitate and enhance patient and family engagement, care coordination among diverse care team members, and continuous learning and rapid-cycle improvement leveraging advanced quality measurement and safety initiatives.

One of our goals in the MIPS program is to use a patient-centered approach to program development that will lead to better, smarter, and healthier care. Part of that goal includes meaningful

measurement which we hope to achieve through:

- Measuring performance on measures that are relevant and meaningful.
- Maximizing the benefits of CEHRT.
- Flexible scoring that recognizes all of a MIPS eligible clinician's efforts above a minimum level of effort and rewards performance that goes above and beyond the norm.
- Measures that are built around real clinical workflows and data captured in the course of patient care activities.
- Measures and scoring that can discern meaningful differences in performance in each performance category and collectively between low and high performers.

(b) The MACRA Requirements

Sections 1848(q)(1)(A)(i) and (ii) of the Act require the Secretary to develop a methodology for assessing the total performance of each MIPS eligible clinician according to performance standards and, using that methodology, to provide for a final score for each MIPS eligible clinician. Section 1848(q)(2)(A)(i) of the Act requires us to use the quality performance category in determining each MIPS eligible clinician's final score, and section 1848(q)(2)(B)(i) of the Act describes the measures and activities that must be specified under the quality performance category.

The statute does not specify the number of quality measures on which a MIPS eligible clinician must report, nor does it specify the amount or type of information that a MIPS eligible clinician must report on each quality measure. However, section 1848(q)(2)(C)(i) of the Act requires the Secretary, as feasible, to emphasize the application of outcomes-based measures.

Sections 1848(q)(1)(E) of the Act requires the Secretary to encourage the use of QCDRs, and section 1848(q)(5)(B)(ii)(I) of the Act requires the Secretary to encourage the use of CEHRT and QCDRs for reporting measures under the quality performance category under the final score methodology, but the statute does not limit the Secretary's discretion to establish other reporting mechanisms.

Section 1848(q)(2)(C)(iv) of the Act generally requires the Secretary to give consideration to the circumstances of non-patient facing MIPS eligible clinicians and allows the Secretary, to the extent feasible and appropriate, to apply alternative measures or activities to such clinicians.

(c) Relationship to the PQRS and VM

Previously, the PQRS, which is a pay-for-reporting program, defined requirements for satisfactory reporting and satisfactory participation to earn payment incentives or to avoid a PQRS payment adjustment EPs could choose from a number of reporting mechanisms and options. Based on the reporting option, the EP had to report on a certain number of measures for a certain portion of their patients. In addition, the measures had to span a set number of National Quality Strategy (NQS) domains, information related to the NQS can be found at <http://www.ahrq.gov/workingforquality/about.htm>. The VM built its policies off the PQRS criteria for avoiding the PQRS payment adjustment. Groups that did not meet the criteria as a group to avoid the PQRS payment adjustment or groups that did not have at least 50 percent of the EPs that did not meet the criteria as individuals to avoid the PQRS payment adjustment automatically received the maximum negative adjustment established under the VM and are not measured on their quality performance.

MIPS, in contrast to PQRS, is not a pay-for-reporting program, and we proposed that it would not have a "satisfactory reporting" requirement. However, to develop an appropriate methodology for scoring the quality performance category, we believe that MIPS needs to define the expected data submission criteria and that the measures need to meet a data completeness standard. In the proposed rule (81 FR 28184), we proposed the minimum data submission criteria and data completeness standard for the MIPS quality performance category for the submission mechanisms that were discussed in the proposed rule (81 FR 28181), as well as benchmarks against which eligible clinicians' performance would be assessed. The scoring methodology discussed in the proposed rule (81 FR 28220) would adjust the quality performance category scores based on whether or not an individual MIPS eligible clinician or group met these criteria and how their performance compared against the benchmarks.

In the MIPS and APMs RFI, we requested feedback on numerous provisions related to data submission criteria including: How many measures should be required? Should we maintain the policy that measures cover a specified number of NQS domains? How do we apply the quality performance category to MIPS eligible clinicians that are in specialties that may not have enough measures to meet

our defined criteria? Several themes emerged from the comments.

Commenters expressed concern that the general PQRS satisfactory reporting requirement to report nine measures across three NQS domains is too high and forces eligible clinicians to report measures that are not relevant to their practices. The commenters requested a more meaningful set of requirements that focused on patient care, with some expressing the opinion that NQS domain requirements are arbitrary and make reporting more difficult. Some commenters requested that we align measures across payers and consider using core measure sets. Other commenters expressed the need for flexibility and different reporting options for different types of practices.

In response to the MIPS and APMs RFI comments, and based on our desire to simplify the MIPS reporting system and make the measurement more meaningful, we proposed MIPS quality criteria that focus on measures that are important to beneficiaries and maintain some of the flexibility from PQRS, while addressing several of the issues that concerned commenters.

- To encourage meaningful measurement, we proposed to allow individual MIPS eligible clinicians and groups the flexibility to determine the most meaningful measures and reporting mechanisms for their practice.
- To simplify the reporting criteria, we are aligning the submission criteria for several of the reporting mechanisms.
- To reduce administrative burden and focus on measures that matter, we are lowering the expected number of the measures for several of the reporting mechanisms, yet are still requiring that certain types of measures be reported.
- To create alignment with other payers and reduce burden on MIPS eligible clinicians, we are incorporating measures that align with other national payers.
- To create a more comprehensive picture of the practice performance, we also proposed to use all-payer data where possible.

As beneficiary health is always our top priority, we proposed criteria to continue encouraging the reporting of certain measures such as outcome, appropriate use, patient safety, efficiency, care coordination, or patient experience measures. However, we proposed to remove the requirement for measures to span across multiple domains of the NQS. We continue to believe the NQS domains to be extremely important and we encourage MIPS eligible clinicians to continue to strive to provide care that focuses on: effective clinical care, communication,

efficiency and cost reduction, person and caregiver-centered experience and outcomes, community and population health, and patient safety. While we will not require that a certain number of measures must span multiple domains, we encourage MIPS eligible clinicians to select measures that cross multiple domains. In addition, we believe the MIPS program overall, with the focus on cost, improvement activities, and advancing care information performance categories, will naturally cover many elements in the NQS.

(2) Contribution to the Final Score

For the 2019 MIPS adjustment year, the quality performance category will account for 50 percent of the final score, subject to the Secretary's authority to assign different scoring weights under section 1848(q)(5)(F) of the Act. Section 1848(q)(2)(E)(i)(I)(aa) of the Act states the quality performance category will account for 30 percent of the final score for MIPS. However, section 1848(q)(2)(E)(i)(I)(bb) of the Act stipulates that for the first and second years for which MIPS applies to payments, the percentage of the final score applicable for the quality performance category will be increased so that the total percentage points of the increase equals the total number of percentage points by which the percentage applied for the cost performance category is less than 30 percent. Section 1848(q)(2)(E)(i)(II)(bb) of the Act requires that, for the transition year for which MIPS applies to payments, not more than 10 percent of the of final score shall be based on performance to the cost performance category. Furthermore, section 1848(q)(2)(E)(i)(II)(bb) of the Act states that, for the second year for which MIPS applies to payments, not more than 15 percent of the final score shall be based on performance to the cost performance category. We proposed at § 414.1330 for payment years 2019 and 2020, 50 percent and 45 percent, respectively, of the MIPS final score would be based on performance on the quality performance category. For the third and future years, 30 percent of the MIPS final score would be based on performance on the quality performance category.

Section 1848(q)(5)(B)(i) of the Act requires the Secretary to treat any MIPS eligible clinician who fails to report on a required measure or activity as achieving the lowest potential score applicable to the measure or activity. Specifically, under our proposed scoring policies, a MIPS eligible clinician or group that reports on all required measures and activities could potentially obtain the highest score

possible within the performance category, presuming they performed well on the measures and activities they reported. A MIPS eligible clinician or group who does not meet the reporting threshold would receive a zero score for the unreported items in the category (in accordance with section 1848(q)(5)(B)(i) of the Act). The MIPS eligible clinician or group could still obtain a relatively good score by performing very well on the remaining items, but a zero score would prevent the MIPS eligible clinician or group from obtaining the highest possible score.

The following is summary of the comments we received regarding our general strategy and the quality performance category contribution to the final score.

Comment: Numerous commenters supported the focus on quality in the proposed rule and our proposal that, for payment year 2019, 50 percent of the final score would be based on performance on quality measures.

Response: We thank the commenters for their support.

Comment: Other commenters were concerned with the quality performance category's final score weights decreasing to 30 percent for payment years 2021 and beyond, as some eligible clinicians will not be eligible to participate in MIPS and receive a MIPS adjustment until payment year 2021. The commenters believed this would be a disadvantage with the cost performance category final score weight increasing. The commenters noted that increasing penalties under MIPS would also place such clinicians in an unfair position. The commenters requested that CMS make appropriate considerations for such MIPS eligible clinicians.

Response: We appreciate the concerns raised that MIPS eligible clinicians who are not initially eligible to participate in MIPS and receive MIPS adjustments until payment year 2021 might have a different starting point than those MIPS eligible clinicians who begin participating in CY 2017. We note that those MIPS eligible clinicians who are not initially eligible to participate in MIPS and receive MIPS adjustments, do have the option to volunteer to report. By volunteering to report, these eligible clinicians will gain experience with the MIPS scoring system prior to being required to do so. We will, however, take the commenter's recommendation into consideration for future rulemaking.

Comment: Another commenter requested that when the time comes to include rehabilitation therapists in MIPS program, they be granted the same stepped-down percentage of scoring for

quality and stepped-up percentage of scoring for cost that are in place for those MIPS eligible clinicians participating in MIPS program in the first 2 years. Such an approach would give those MIPS eligible clinicians the same time and consideration doctors of medicine or osteopathy, doctors of dental surgery or dental medicine, physician assistants, nurse practitioners, clinical nurse specialists, and certified registered nurse anesthetists will receive during their transition to MIPS program.

Response: We would like to explain that in the first 2 years of the MIPS program, the quality weight will be higher and the cost weight will be lower. In addition, we note that those MIPS eligible clinicians who are not initially eligible to participate in MIPS in 2017 for the 2019 MIPS payment year, do have the option to voluntarily report. By volunteering to report, these eligible clinicians will gain experience with the MIPS scoring system prior to being required to do so. We thank the commenter for their feedback and will take their comments into consideration in future rulemaking.

Comment: One commenter supported CMS' proposal to incentivize MIPS eligible clinicians to use CEHRT for end-to-end electronic reporting.

Response: We thank the commenter for their support.

Comment: One commenter stated they were concerned about how different evaluation criteria have been weighed in the MIPS program. They believed there was an arbitrary nature and bias in the weighting for MIPS which they stated cannot be corrected through a change in weighting. The commenter provided an example of the scoring system including bonus points, which they believed results in an inaccurate view of real outcomes.

Response: We do not believe that the evaluation criteria we have developed and proposed for MIPS are arbitrary or biased. Moreover, as we explained in the proposed rule (81 FR 28255), bonus points are intended to recognize quality measurement priorities. We believe that recognition is necessary to focus quality improvement efforts on specific CMS goals.

Comment: Another commenter suggested for the quality performance measures that CMS adopt standards and mapping tools by ensuring that eCQM calculations are accurate. In addition, the commenter stated CMS should adopt standards to ensure different EHRs are accurately and uniformly capturing eCQMs. Another commenter recommended that CMS ensure that the eCQMs in the quality performance category align with measures used by

other payers and accrediting and certification programs (for example, NCQA), noting that if the specifications do not align, the commenter believed that shared data will not help streamline the reporting processes.

Response: We thank the commenters and agree that adopting standards to accurately and uniformly capture eQMs is essential. We currently use the Health Level Seven (HL7) standard Health Quality Measures Format (HQMF) for electronically documenting eQCM content as well as the Quality Data Model (QDM) for measure logic. We will continue to ensure industry standards are used and refined in order best capture eQCM data.

Comment: One commenter recommended that CMS consider merging the quality and cost performance categories as a ratio of quality and cost.

Response: We do not believe we have the statutory authority to merge the quality and cost performance categories. MACRA specified the four performance categories we are required to incorporate into the MIPS program.

After consideration of the comments received regarding our general strategy and the quality performance category contribution to the final score and the additional factors described in section I.E.5.b. of this final rule with comment period, we are not finalizing this policy as proposed. Rather, as discussed in section I.E.5.e. of this final rule with comment period, the cost performance category will account for 0 percent of the final score in 2019, 10 percent of the final score in 2020, and 30 percent of the final score in 2021 and future MIPS payment years, as required by statute. In accordance with section 1848(q)(2)(E)(i)(I)(bb) of the Act, we are redistributing the final score weight from cost performance category to the quality performance category. Therefore, we are finalizing at § 414.1330(b) for MIPS payment years 2019 and 2020, 60 percent and 50 percent, respectively, of the MIPS final score will be based on performance on the quality performance category. For the third and future years, 30 percent of the MIPS final score will be based on performance on the quality performance category.

(3) Quality Data Submission Criteria

(a) Submission Criteria

The following are the proposed criteria for the various proposed MIPS data submission mechanisms described in the proposed rule (81 FR 28181) for the quality performance category.

(i) Submission Criteria for Quality Measures Excluding CMS Web Interface and CAHPS for MIPS

We proposed at § 414.1335 that individual MIPS eligible clinicians submitting data via claims and individual MIPS eligible clinicians and groups submitting via all mechanisms (excluding CMS Web Interface, and for CAHPS for MIPS survey, CMS-approved survey vendors) would be required to meet the following submission criteria. We proposed that for the applicable 12-month performance period, the MIPS eligible clinician or group would report at least six measures including one cross-cutting measure (if patient-facing) found in Table C of the Appendix in this final rule with comment period and including at least one outcome measure. If an applicable outcome measure is not available, we proposed that the MIPS eligible clinician or group would be required to report one other high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures) in lieu of an outcome measure. If fewer than six measures apply to the individual MIPS eligible clinician or group, then we proposed the MIPS eligible clinician or group would be required to report on each measure that is applicable.

MIPS eligible clinicians and groups would select their measures from either the list of all MIPS measures in Table A of the Appendix in this final rule with comment period, or a set of specialty-specific measure set in Table E of the Appendix in this final rule with comment period. We noted that some specialty-specific measure sets include measures grouped by subspecialty; in these cases, the measure set is defined at the subspecialty level.

We designed the specialty-specific measure sets to address feedback we have received in the past that the quality measure selection process can be confusing. A common complaint about PQRS was that EPs were asked to review close to 300 measures to find applicable measures for their specialty. The specialty measure sets in Table E of the Appendix in this final rule with comment period, are the same measures that are within Table A of the Appendix in this final rule with comment period, however these are sorted consistent with the American Board of Medical Specialties (ABMS) specialties. Please note that these specialty-specific measure sets are not all inclusive of every specialty or subspecialty. We requested comments on the measures proposed under each of the specialty-specific measure sets. Specifically, we

solicited comments on whether or not the measures proposed for inclusion in the specialty-specific measure sets are appropriate for the designated specialty or subspecialty and whether there are additional proposed measures that should be included in a particular specialty-specific measure set.

Furthermore, in the proposed rule we noted that there were some special scenarios for those MIPS eligible clinicians who selected their measures from a specialty-specific measure set at either the specialty or subspecialty level (Table E of the Appendix in this final rule with comment period). We provided the following example in the proposed rule, where some of the specialty-specific measure sets have fewer than six measures, in these instances MIPS eligible clinicians would report on all of the available measures including an outcome measure or, if an outcome measure is unavailable, report another high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures), within the set and a cross-cutting measure if they are a patient-facing MIPS eligible clinician. To illustrate, at the subspecialty-level the electrophysiology cardiac specialist specialty-specific measure set only has three measures within the set, all of which are outcome measures. MIPS eligible clinicians and groups reporting on the electrophysiology cardiac specialist specialty-specific measure set would report on all three measures and since these MIPS eligible clinicians are patient-facing they must also report on a cross-cutting measure which is defined in Table C of the Appendix in this final rule with comment period. In other scenarios, the specialty-specific measure sets may have six or more measures, and in these instances MIPS eligible clinicians would report on at least six measures including at least one cross-cutting measure and at least one outcome measure or, if an outcome measure is unavailable, report another high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measure). Specifically, the general surgery specialty-specific measure set has eight measures within the set, including four outcome measures, three other high priority measures and one process measure. MIPS eligible clinicians and groups reporting on the general surgery specialty-specific measure set would either have the option to report on all measures within the set or could select six measures from the set and since these MIPS eligible clinicians are patient-facing one of their

six measures must be a cross-cutting measure which is defined in Table C of the Appendix in this final rule with comment period.

As noted above, the submission criteria is provided for each specialty-specific measure set, or in the measure set defined at the subspecialty level, if applicable. Regardless of the number of measures that are contained in a specialty-specific measure set, MIPS eligible clinicians reporting on a measure set would be required to report at least one cross-cutting measure and either at least one outcome measure or, if no outcome measures are available in that specialty-specific measure set, report another high priority measure. We proposed that MIPS eligible clinicians or groups that report on a specialty-specific measure set that includes more than six measures can report on as many measures as they wish as long as they meet the minimum requirement to report at least six measures, including one cross-cutting measure and one outcome measure, or if an outcome measure is not available another high priority measure. We solicited comment on our proposal to allow reporting of specialty-specific measure sets to meet the submission criteria for the quality performance category, including whether it is appropriate to allow reporting of a measure set at the subspecialty level to meet such criteria, since reporting at the subspecialty level would require reporting on fewer measures.

Alternatively, we solicited comment on whether we should only consider reporting up to six measures at the higher overall specialty level to satisfy the submission criteria. We noted that our proposal to allow reporting of specialty-specific measure sets at the subspecialty level was intended to address the fact that very specialized clinicians who may be represented by our subspecialty categories may only have one or two applicable measures. Further, we note that we will continue to work with specialty societies and other measure developers to increase the availability of applicable measures for specialists across the board.

We proposed to define a high priority measure at § 414.1305 as an outcome, appropriate use, patient safety, efficiency, patient experience, or care coordination quality measures. These measures are identified in Table A of the Appendix in this final rule with comment period. We further note that measure types listed as an "intermediate outcome" are considered outcome measures for the purposes of scoring (see 81 FR 28247).

As an alternative to the above proposals, we also considered requiring individual MIPS eligible clinicians submitting via claims and individual MIPS eligible clinicians and groups submitting via all mechanisms (excluding the CMS Web Interface and, for CAHPS for MIPS survey, CMS-approved survey vendors) to meet the following submission criteria. For the applicable 12-month performance period, the MIPS eligible clinician or group would report at least six measures including one cross-cutting measure (if patient-facing) found in Table C of the Appendix in this final rule with comment period and one high priority measure (outcome, appropriate use, patient safety, efficiency, patient experience, and care coordination measures). If fewer than six measures apply to the individual MIPS eligible clinician or group, then the MIPS eligible clinician or group must report on each measure that is applicable. MIPS eligible clinicians and groups will have to select their measures from either the list of all MIPS Measures in Table A of the Appendix in this final rule with comment period or a set of specialty-specific measure set in Table E of the Appendix in this final rule with comment period.

As discussed in the proposed rule (81 FR 28173), MIPS eligible clinicians who are non-patient facing MIPS eligible clinicians would not be required to report any cross-cutting measures. For further details on non-patient facing MIPS eligible clinician discussions, we refer readers to section II.E.1.b. of this final rule with comment period.

In addition, in the proposed rule (81 FR 28187) we discussed our intention to develop a validation process to review and validate a MIPS eligible clinician's or group's ability to report on at least six quality measures, or a specialty-specific measure set, with a sufficient sample size, including at least one cross-cutting measure (if the MIPS eligible clinician is patient-facing) and either an outcome measure if one is available or another high priority measure. If a MIPS eligible clinician or group had the ability to report on the minimum required measures with sufficient sample size and elects to report on fewer than the minimum required measures, then, as described in the proposed scoring algorithm (81 FR 28254), the missing measures would be scored with a zero performance score.

Our proposal is a decrease from the 2016 PQRS requirement to report at least nine measures. In addition, as previously noted, we proposed to no longer require reporting across multiple NQS domains. We believed these

proposals were the best approach for the quality performance category because they decrease the MIPS eligible clinician's reporting burden while focusing on more meaningful types of measures.

We also note that we believe that outcome measures are more valuable than clinical process measures and are instrumental to improving the quality of care patients receive. To keep the emphasis on such measures in the statute, we plan to increase the requirements for reporting outcome measures over the next several years through future rulemaking, as more outcome measures become available. For example, we may increase the required number of outcome measures to two or three. We also believe that appropriate use, patient experience, safety, and care coordination measures are more relevant than clinical process measures for improving care of patients. Through future rulemaking, we plan to increase the requirements for reporting on these types of measures over time.

In consideration of which MIPS measures to identify as reasonably focused on appropriate use, we have selected measures which focus on minimizing overuse of services, treatments, or the related ancillary testing that may promote overuse of services and treatments. We have also included select measures of underuse of specific treatments or services that either (1) reflected overuse of alternative treatments and services that were not evidence-based or supported by clinical guidelines; or (2) where the intent of the measure reflected overuse of alternative treatments and services that were not evidence-based or supported by clinical guidelines. We realize there are differing opinions on what constitutes appropriate use. Therefore, we solicited comments on what specific measures of over or under use should be included as appropriate use measures.

We plan to incorporate new measures as they become available and will give the public the opportunity to comment on these provisions through future notice and comment rulemaking. Under the Improving Medicare Post-Acute Transformation (IMPACT) Act of 2014, the Office of ASPE has been conducting studies on the issue of risk adjustment for sociodemographic factors on quality measures and cost, as well as other strategies for including SDS evaluation in CMS programs. We will closely examine the ASPE studies when they are available and incorporate findings as feasible and appropriate through future rulemaking. We look forward to working with stakeholders in this process. In

addition, we solicited comments on ways to minimize potential gaming, for example, requiring MIPS eligible clinicians to report only on measures for which they have a sufficient sample size, to address concerns that MIPS eligible clinicians may solely report on measures that do not have a sufficient sample size to decrease the overall weight on their quality score. More information on the way we proposed to score MIPS eligible clinicians in this scenario is discussed in the proposed rule (81 FR 28187). We also solicited comment on whether these proposals sufficiently encourage clinicians and measure developers to move away from clinical process measures and towards outcome measures and measures that reflect other NQS domains. We requested comments on these proposals.

The following is summary of the comments we received regarding our proposal on submission criteria for quality measures excluding CMS Web Interface and CAHPS for MIPS.

Comment: Many commenters expressed support for lowering the reporting threshold from nine to six quality measures, including one cross-cutting and one outcome measure, and no longer requiring that MIPS eligible clinicians report on measures that span three NQS domains.

Response: We thank the commenters for their support.

Comment: Another commenter appreciated the decreased requirement relative to PQRS of reporting on six quality measures for MIPS; however, the commenter was disappointed about our proposal to maintain an absolute minimum number of measures that MIPS eligible clinicians are required to report. The commenter believed that the current quality measures list is insufficient to cover all practice types. The commenter stated that the challenge of participating would only be exacerbated by imposition of a minimum number of measures. The commenter appreciated the lack of penalty if a MIPS eligible clinician is unable to report on the minimum requirement when they do not have applicable measures. A few commenters noted that emergency clinicians who report via claims cannot report on six measures. They stated that it was not clear from proposal whether these MIPS eligible clinicians would still be able to qualify for the full potential score available under the scoring methodology. Another commenter requested CMS provide special consideration be given to clinicians practicing at urgent care centers, including reducing the required number

of quality measures to report on from six to four.

Response: We would like to note that MIPS eligible clinicians with fewer than six applicable measures are not required to report six measures, and must only report those measures that are applicable. While claims-based reporting is one submission mechanism available, emergency clinicians also have the option to use the other submission mechanisms available to satisfy the requirements. We further note that we have revised the emergency medicine specialty-specific measure set whereby the set now includes 17 measures with 11 of them reportable via claims. Emergency medicine clinicians will be able to report measures to earn the full potential score.

Comment: Some commenters disagreed with our proposed measure threshold of six measures, and recommended maintaining the PQRS threshold of reported measures at nine. These commenters were concerned that lowering the threshold of reported measures (from nine to six) sends the wrong signal about the importance of quality measures within MIPS. The commenters believed MIPS eligible clinicians might pick and choose measures that they perform well on, providing a less comprehensive picture of quality of care. Instead, the commenters stated CMS should establish mandatory core sets of measures by specialty/subspecialty groups to signal areas where MIPS eligible clinicians should focus their attention and increase comparability across MIPS eligible clinicians. Other commenters believed a core set of measures would create unequal performance by groups of different sizes and specialties, allowing single specialty groups to report only measures specific to their practice. The commenters recommended that CMS establish benchmarks for a set of core quality measures.

Conversely, other commenters disagreed with our proposed measure threshold of six measures, and recommended that the measure threshold be lowered. Recommendations ranged from four measures, three measures or one to two measures. These commenters indicated that a reduced threshold would allow MIPS eligible clinicians to choose a few measures that will have a high impact on care improvements. Additionally, commenters were concerned that the threshold of six may burden practices that are struggling to find relevant measures and jeopardize their ability to achieve the maximum number of points under the quality performance category.

The commenters stated that fewer required measures will reduce administrative burden, better reflect the conditions and realities of medical practice, allow MIPS eligible clinicians time to focus on quality improvement, and lead to more accurate measurement and a better snapshot of quality. Some commenters requested that CMS, the Department of Health (DOH), The Joint Commission (TJC), and Det Norske Veritas (DNV) join forces to focus on meaningful improvement.

Response: We do not believe the thresholds for quality measurement should be lowered further. In any quality measurement program, we must balance the data collection burden that we must impose on MIPS eligible clinicians with the resulting quality performance data that we will receive. We believe that without sufficiently robust performance data, we cannot accurately measure quality performance. Therefore, we believe that we have appropriately struck a balance between requiring sufficient quality measure data from clinicians and ensuring robust quality measurement at this time. We want to emphasize that we are committed to working with stakeholders to improve our quality programs including MIPS. An integral part of these programs are quality measures that reflect the scope and variety of the many types of clinical practice. It is important that we offer enough quality measures that assess the various practice types and that clinicians report sufficient measures to allow a reasonable comparison of their quality performance.

We do note that for the initial performance period under the MIPS many flexibilities have been implemented, including a modified scoring approach which ensures that MIPS eligible clinicians who prefer to only submit data on one or two measures can avoid a negative MIPS adjustment. Furthermore, our modified scoring approach incentivizes high performers who have a robust data set available. We refer readers to section II.E.6. of this final rule with comment period for more details on the scoring approach.

Comment: Another commenter referenced our proposal, which stated that “if fewer than six measures apply to the individual MIPS eligible clinician or group, then the MIPS eligible clinician or group would be required to report on each measure that is applicable,” and mentioned that this statement seemed to provide no penalty. The commenter requested clarification on this language to ensure that groups would not be penalized for submitting

fewer than six measures. Another commenter requested clarification on how CMS proposes to define “applicable.” One commenter suggested that MIPS eligible clinicians should have the opportunity to pre-certify with CMS that fewer than six measures are available to them prior to the beginning of the performance period.

Response: While we expect this to occur in only rare circumstances, we would like to confirm the commenter’s understanding. If fewer than six measures apply to the MIPS eligible clinician or group, the MIPS eligible clinician or group would be required to report on each applicable measure. Additionally, groups that report on a specialty-specific measure set that has fewer than six measures would only need to report the measures within that specialty-specific measure set. Generally, we define “applicable” to mean measures relevant to a particular MIPS eligible clinician’s services or care rendered. The MIPS eligible clinician should be able to review the measure specifications to see if their services fall into the denominator of the measure. For example, if a MIPS eligible clinician who is an interventional radiologist decides to submit data via a specialty-specific measure set by selecting the interventional radiology specialty-specific measure sets, this MIPS eligible clinician would not have six measures applicable to them. Therefore, the MIPS eligible clinician would submit data on all of the measures defined within the specialty-specific measure set. MIPS eligible clinicians who do not have six individual measures available to them should select their appropriate specialty-specific measure set, because that pre-defines which measures are applicable to their specialty and provides certain assurances to them. For the majority of MIPS eligible clinicians choosing the specialty-specific measure sets provides a means to select applicable measures and, if the set includes less than 6 measures, this also assures that there is no need to report any additional measures. Furthermore, we will apply a clinical relation test to the quality data submissions to determine if the MIPS eligible clinician could have reported other measures. For more information on the clinical relation test, see section II.E.6.a.(2) of this final rule with comment period, where we discuss our validation process. Lastly, we are working to provide additional toolkits and educational materials to MIPS eligible clinicians prior to the performance period that will ease the burden on identification of which measures are

applicable to MIPS eligible clinicians. If the MIPS eligible clinician required assistance, they may contact the Quality Payment Program Service Center.

Comment: Another commenter requested that CMS add a requirement that MIPS-eligible clinicians report at least six measures, including one cross-cutting measure (if patient-facing), at least one outcome measure, and at least one high-priority measure. The commenter was concerned that high-priority measures may not be reported if they are a substitute for outcome measures.

Response: We agree with the commenter that we want to maintain an emphasis on both outcome and high priority measures within the MIPS. We will take this comment into consideration for future rulemaking.

Comment: Numerous commenters supported the proposal to encourage reporting of outcome measures over clinical process measures. One commenter noted that significant work remains to ensure measurement efforts across the health care system are focused on the most important quality issues, while other commenters recommended that future quality metrics emphasize patient care and health outcomes.

Response: We thank the commenters for their support. We intend to finalize our proposal that one of the six measures a MIPS eligible clinician must report on is an outcome measure.

Comment: One commenter recommended that patient experience and patient satisfaction should not be categorized as quality metrics since these measures and surveys include factors outside the control of the clinician. The commenter stated that patient satisfaction, while important, does not always correlate with better clinical outcomes and may even conflict with clinically indicated treatments. In addition, another commenter expressed concern that the emphasis on patient opinions and their care experiences drives up cost.

Response: We do believe it is important to assess patient experience of care, as it represents items such as communication and family engagement, which are important factors of the health care experience and these are measures that are important to patients and families. While patient experience may not always be directly related to health outcomes, there is evidence of a correlation between higher scores on patient experience surveys and better health outcomes. Please refer to <http://www.ahrq.gov/cahps/consumer-reporting/research/index.html> for more information on AHRQ studies

pertaining to patient experience survey and better health outcomes.

Comment: A few commenters supported the proposed reduction in burden in the MIPS quality performance category, but noted that MIPS eligible clinician specialties lacking validated outcome measures or “high priority” measures are likely to be at a disadvantage under this performance category because the quality performance category lacks sufficient specialty-specific quality measures. The commenters recommended that CMS work with specialty societies and measure development bodies to increase the availability of specialty-specific quality measure sets. Another commenter supported the reduced number of quality measures required for reporting, but recommended that specialty MIPS eligible clinicians not be required to report a cross-cutting measure. Some commenters supported CMS’s proposal to allow the reporting of specialty and subspecialty specific measure sets to meet the submission criteria for the quality performance category, even if it would mean a MIPS eligible clinician or group would report on fewer than six measures.

Response: We thank the commenters for their feedback. We believe that all MIPS eligible clinicians regardless of their specialty have a high priority measure available. Therefore, we intend to finalize that if a MIPS eligible clinician does not have an outcome measure available, they are required to report on a high priority measure.

Comment: Several commenters recommended eliminating the proposed requirement that an outcome measure and a cross-cutting measure be reported in the quality performance category. One commenter believed this proposal may disadvantage small or rural practices and posed challenges for QCDRs. The commenter noted that some approved QCDRs do not incorporate value codes in their data collection process, and many specialized QCDRs may not capture the data needed to report cross-cutting measures. The commenter believed the requirement for reporting on cross cutting measures also makes the 90 percent reporting threshold for QCDRs nearly impossible to meet. Another commenter stated that, until more valid and reliable outcome measures are developed, CMS should keep flexibility of measures throughout and lift the requirements that certain types of measures be reported, such as outcomes-based or cross-cutting measures. Other commenters recommended that specialty-specific measure sets lacking outcome measures be clearly marked as such and also

contain notations as to which measures would qualify as high-priority alternatives. Several commenters recommended CMS provide bonus points for these measures rather than require all participants to report on them, and that CMS not require use of any specific measure types in the initial years of the program.

Response: We appreciate the comments and have examined the policies very carefully. We have modified our proposal for the transition year of MIPS and are finalizing that for the applicable performance period, the MIPS eligible clinician or group would report at least six measures including at least one outcome measure. If an applicable outcome measure is not available, the MIPS eligible clinician or group would be required to report one other high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures) in lieu of an outcome measure. If fewer than six measures apply to the individual MIPS eligible clinician or group, then the MIPS eligible clinician or group would be required to report on each measure that is applicable. We note that generally, we define “applicable” to mean measures relevant to a particular MIPS eligible clinician’s services or care rendered.

We are not finalizing the requirement that one of the measures must be a cross-cutting measure. Although we still believe that the concept of having a common set of measures available to clinicians that they can draw from is important we understand that not all of these measures are the most meaningful to clinicians and their scope of practice. We do strongly recommend however that where appropriate, clinicians continue to perform and submit data on these measures to CMS. Lastly, while we recognize that there are limitations in the current set of available outcome measures, we believe that a strong emphasis on outcome-based measurement is critical to improving the quality of care. Due to these limitations in the available outcome measure set, we are finalizing that MIPS eligible clinician may select another high priority measure if an outcome is not available.

Comment: A few commenters recommended that CMS provide a “safe harbor” for reporting on new quality measures with innovative approaches and improvement by allowing entities to register “test measures” which would not be scored on but would count as a subset of the six quality measures with a participation credit. In addition, the commenters stated that CMS should provide a transitional period during the

first half of 2017 in which MIPS eligible clinicians can receive written confirmation from CMS that their intended measures meet the requirements. The commenter expressed concern that CMS needs to provide specifications and a scoring methodology for the population health measures to improve transparency.

Response: As noted in other sections of this final rule with comment period, we are providing a transitional year for the first performance period under the MIPS. We also note that commenters successfully reporting an appropriate specialty-specific measure set for a sufficient portion of their beneficiary population will have met all minimum reporting requirements for the quality category. We appreciate the commenter’s feedback and will incorporate their suggestion as we develop toolkits and educational materials. We refer the commenter to section II.E.5.b.(6) and II.E.6. of this final rule with comment period for information on population health measures and the MIPS scoring methodology respectively.

Comment: Another commenter urged CMS to pursue the following policies in the quality performance category: The commenter urged CMS to reconsider its proposal to require reporting on a minimum of six measures, if six measures apply. Instead, CMS should encourage the use of non-MIPS measures associated with a QCDR and/or allow MIPS eligible clinicians to select measures that directly relate to their clinical specialty and outcomes for their patients; and CMS should carefully monitor modifications to the cross-cutting measures list and ensure that at least one cross-cutting measure remains on this list for each category of MIPS eligible clinicians to allow them to remain compliant with the proposed requirements. Alternately, CMS could develop an option similar to the outcomes measures reporting requirement that would allow the MIPS eligible clinician to report a different type of measure, such as a high priority measure, if a cross-cutting measure does not apply.

Response: We thank the commenter for their feedback and will take these recommendations into consideration for future rulemaking. We would like to note that there are already a number of outcome and specialty-specific measure sets available for reporting. In addition, the cross-cutting measure requirement is not being finalized.

Comment: One commenter recommended that CMS develop a pilot program/test within the first MIPS implementation year that identifies a

core measure set that allows direct comparison among MIPS eligible clinician performance where commonly applicable metrics allow for such a measure set for specific MIPS eligible clinician specialties. The commenter supported the general flexibility of quality reporting, but was concerned that the existing proposal may not foster true comparisons and performance could vary based on the measures selected to report rather than differences in quality performance. Another commenter encouraged CMS to identify a strategy to assess the most appropriate number of measures and distribution of metrics that MIPS eligible clinicians should be required to report. The commenter believed these analyses would provide necessary information for CMS to make evidence-based decisions with regard to changes to the quality measures reporting requirements to ensure an accurate account of the quality of care individual patients are receiving.

Response: The majority of the quality measures that are being included in the MIPS program have already been utilized in PQRS for many years. In addition, we have created specialty-specific measure sets that may be utilized by specialist. We do not believe we need a pilot program as these measures have already been tested. The quality measures go through a rigorous evaluation process prior to being accepted in the MIPS program. With respect to the ideal number of measures that should be required per the commenter’s suggestion above, we believe that our final submission requirements of six measures is the appropriate number based on our experience under the PQRS, VM and Medicare EHR Incentive Programs. We will however take the commenter’s suggestion into consideration for future analyses and rulemaking.

Comment: A few commenters were concerned that using self-reported measures and tying payment to self-reported quality measures will give MIPS eligible clinicians an incentive to select and report measures on which they perform well, especially when they have a large number of measures from which to choose. The commenters were also concerned that MIPS eligible clinicians are not likely to select certain high priority measures because of unfavorable results, such as overuse measures (for example, imaging for low-back pain) or because of the effort required to collect the measure (for example, the CAHPS for MIPS survey). The commenters stated self-reporting would tend to produce compressed ranges for measures that are scored in

MIPS, which they believed would mean MIPS eligible clinicians would receive different incentive payments based on very small gradations in performance.

Other commenters expressed concern that the ability of MIPS eligible clinicians to select their own measures could result in the reliance on low-bar measures that do not drive value-based care. The commenters recommended that CMS encourage MIPS eligible clinicians to report both an outcome and a high priority measures representative of their patient populations. Another commenter stated CMS should finalize requirements that provide more explicit standards around the type and caliber of measures that MIPS eligible clinicians and groups must report. The commenter encouraged CMS to utilize variations in weighting and scoring of measures to incentivize greater reporting on clinical and patient-reported outcomes measures. The commenter supported the inclusion of patient-reported outcomes and patient experience measures in MIPS.

Other commenters recommended re-evaluation of the quality measures required by MIPS. The commenters stated that under the proposed rule, MIPS eligible clinicians participating in MIPS would choose six quality measures to report, one of which must be an outcome measure, and another a cross-cutting measure. The commenters recognized that CMS proposed this approach to reduce administrative burden and allow clinicians the flexibility to choose appropriate measures; however, was concerned that this approach may not meaningfully advance the quality of care provided to Medicare beneficiaries. The commenters stated given the financial incentive, the commenter would expect that MIPS eligible clinicians will select those measures on which they are already high-performing and on which they believe they can be at the top of the curve. Thus, they will focus more effort on the few areas that are existing strengths, and have limited incentive to drive improvement in a broad set of areas. The commenter recommended that CMS leverage the work of the Core Quality Measure Collaborative—which brought together stakeholders from America's Health Insurance Plans (AHIP), CMS and the National Quality Forum (NQF), as well as national physician organizations, employers and consumers—and select core sets of measures for each specialty to report. The commenters also proposed bonus points for clinicians who choose to report innovative, outcome-based measures in addition to the core set.

Response: We agree with the commenters that there are certain challenges in using self-reported measures rather than a core or common measure set that all clinicians would be required to submit. We also appreciate the emphasis placed on outcome measurement. We do however believe that there are certain challenges in creating a core or common measure set for clinicians, as compared to other settings, due to the various practice and specialty types that clinicians may practice under. However, we have included the measures in the core measure sets that were developed by the Core Quality Measure Collaborative in the MIPS measure set and several of the specialty-specific measure sets. Lastly, we note that as indicated in other sections of this rule the first performance period of MIPS is a transitional year. We will take these comments into consideration for future rulemaking and will continue to monitor whether clinicians select only low-bar measures or measures on which their performance is already high. We will address any changes to policies based on these monitoring activities through future rulemaking.

Comment: A few commenters recommended that CMS remove the requirement that specialists reporting under the specialty-specific measure set report a cross-cutting measure because they believed that the list of cross-cutting measures was not truly applicable to all specialties. For example, the commenters stated that emergency medicine MIPS eligible clinicians have only one proposed cross-cutting measure that is somewhat relevant: PQRS #3 1 7: High Blood Pressure Screening and Follow-Up. The commenters stated that the measure is problematic for emergency medicine because follow-up is required for any patient outside of the “normal” range. While the measure does include exclusion for patients in “emergent or urgent situations where time is of the essence and to delay treatment would jeopardize the patient’s health status,” the commenters noted that a substantial number of ED patients are inadvertently included in the universe addressed by this measure, requiring burdensome documentation, follow-up, and even unnecessary downstream medical care.

Response: We appreciate the comments and have examined the policies very carefully. As discussed above, we have modified our proposal for the transition year of MIPS. We are not requiring a cross-cutting measure but rather are finalizing that for the applicable performance period, the MIPS eligible clinician or group would

report at least six measures including at least one outcome measure. If an applicable outcome measure is not available, the MIPS eligible clinician or group would be required to report one other high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures) in lieu of an outcome measure. If fewer than six measures apply to the individual MIPS eligible clinician or group, then the MIPS eligible clinician or group would be required to report on each measure that is applicable or may report more measures that are applicable. We note that generally, we define “applicable” to mean measures relevant to a particular MIPS eligible clinician’s services or care rendered.

Comment: Some commenters urged CMS to take advantage of promoting a new set of cross-cutting quality measures—including measures generally applicable to patients with rare, chronic, and multiple chronic conditions—that would incorporate a patient-centered perspective, adding a critical patient voice to quality measurement.

Response: We appreciate the suggestion and will take into consideration in the future.

Comment: Other commenters supported the reporting criteria for cross-cutting measures and outcome measures. The commenters hoped that CMS would work with specialties that do not fall under the American Board of Medical Specialties’ board certification to develop specialty-specific measure sets for clinicians such as physical therapists, as this may help clinicians who are less familiar with the program report successfully. Additionally, the commenters supported the flexibility of reporting either the specialty-specific measure set or the six measures.

Response: We appreciate the commenters’ support. We welcome suggestions for additional specialty-specific measure sets in the future.

Comment: Another commenter urged CMS to use the recommendations of the National Academy of Medicine’s (NAM) 2015 Vital Signs report, available at <http://www.nationalacademies.org/hmd/Reports/2015/Vital-Signs-Core-Metrics.aspx>, to identify the highest priority measures for development and implementation in the MIPS program.

Response: When we identified high priority measures, we sought feedback from numerous stakeholders and we encourage commenters to submit any specific suggestions for future consideration. We will take this specific suggestion into consideration for future rulemaking.

Comment: A few commenters recommended that CMS provide clarification on how proposed specialty-specific measure sets will be scored, given many have less than the required number of measures and do not include a required outcome or high priority measure. The commenters were also concerned that many sets may not be applicable for sub-specialists, and many specialties do not have a proposed specialty-specific measure set. In addition, the commenters stated that the number of applicable measures in a specialty-specific measure set may be reduced based on the proposed submission mechanism. For example, the commenters sought clarification as to whether an urologist who reports the one eCQM in the set (PQRS 50: Urinary Incontinence: Assessment of Presence or Absence Plan of Care for Urinary Incontinence in Women) is only accountable for the one eCQM and not accountable for reporting on an outcome or high priority measure.

Response: We would like to explain that if fewer than six measures apply to the MIPS eligible clinician or group, the MIPS eligible clinician or group would be required to report on each applicable measure or may report more measures that are applicable. We note that generally, we define “applicable” to mean measures relevant to a particular MIPS eligible clinician’s services or care rendered. Additionally, groups that report on a specialty-specific measure set that has fewer than six measures would only need to report the measures within that specialty-specific measure set. Please see section II.E.6. of this final rule with comment period for more on scoring. Finally, we would like to explain that if an MIPS eligible clinician or group reports via a data submission method that only has one applicable measure reportable via that method, the MIPS eligible clinician or group is only responsible for the measure that is applicable via that method. Alternatively, if an MIPS eligible clinician or group reports via a data submission method that does not have any measures reportable via that method, the MIPS eligible clinician or group must choose a data submission method that has one or more applicable measures. Given the potential for gaming in this situation, we will monitor whether MIPS eligible clinicians appear to be actively selecting submission mechanisms and measures sets with few applicable measures; we will address any changes to policies based on these monitoring activities through future rulemaking. We will also seek to expand the availability of

measures available for reporting via all submission methods to the extent feasible.

Comment: Some commenters recommended that CMS include in the specialty-specific measure sets those cross-cutting measures that are most applicable to the specialty, rather than maintaining a separate list of cross-cutting measures and requiring MIPS eligible clinicians to refer to two lists. The commenters recommended that a geriatric measure set be created that will encourage geriatric reporting and measures directly associated with improvements in care for the elderly.

Response: We agree with the commenter and although we are not finalizing the requirement that MIPS eligible clinicians must report on a cross-cutting measure, we do still believe these measures add value. Therefore, we have incorporated the appropriate cross-cutting measures into the specialty-specific measure sets located in Table E of the Appendix in this final rule with comment period.

Comment: Another commenter noted that there may be MIPS eligible clinicians whose services overlap in one or more specialty areas, and that flexibility is therefore necessary, yet believed that, in order for payers and patients to have a clear comparison, the ability to distinguish clinicians on like metrics is critical. Thus, with regard to specialty-specific measure sets, the commenter recommended that MIPS eligible clinicians be required to select a minimum number of quality measures from within their appropriate specialty-specific measure set. The commenter recommended that CMS continue to explore specialty-specific measure sets for additional specialty and subspecialty areas in order to enhance and refine meaningful comparisons over time.

Response: If a clinician has a specialty set, by submitting all of the measures in that set (which may be fewer than six), they will potentially achieve a maximum quality score, depending on their performance. If the measure set has fewer than six measures, and the clinician reports all the measures in that set, there is not a requirement for further reporting. We thank the commenters for the suggestion and intend to work with the specialty societies to further develop specialty measure sets, specifically those that would be applicable for subspecialists.

Comment: Some commenters urged CMS to hold all MIPS eligible clinician types to the six measure requirement, suggesting that a sub-specialty could select from the broader specialty list to reach six measures, or if necessary, report cross-cutting measure to achieve

six measures if they have insufficient specialty-specific measure sets available to them.

Response: We appreciate the commenters’ suggestion and agree that it is important for clinicians to submit a sufficient number of measures. However, we are concerned that some subspecialists do not currently have a sufficient number of applicable measures to reach our 6 measure requirement; we are working with specialty societies to ensure that all specialists soon have access to a sufficient number of measures. To assure that these subspecialists report a sufficient number of measures in the interim period, we are finalizing our proposal to allow subspecialists to submit a specialty-specific measure set fully in lieu of meeting the six measure minimum requirement.

Comment: One commenter urged CMS to be more transparent on how designations used for high priority are determined. The commenter stated that since bonus points are factored into the determination of a domain or a measure’s priority, it is vital that CMS considered recommendations from measure stewards and QCDR entities for this determination.

Response: We define high priority measures as outcome, patient experience, patient safety, care coordination, cost, and appropriate use. These measures are designated and identified in rulemaking, based on their NQF designation or if the measures are not NQF endorsed, based on their NQS domain designation or measure description as defined by the measure owners, stewards and clinical experts. We welcome commenters’ feedback on high priority measure determinations in the future.

Comment: Some commenters stated that measure applicability should be determined by analyzing the MIPS eligible clinician’s claims, not just their specialty designation.

Response: We agree and intend to determine measure applicability based on claims data whenever possible. Absent claims data we would use other identifying factors such as specialty designation. Generally, we define “applicable” to mean measures relevant to a particular MIPS eligible clinician’s services or care rendered. When we initially proposed the specialty-specific measure sets we factored into consideration both of the elements the commenter suggested.

Comment: A few commenters encouraged CMS to emphasize that specialty-specific measure sets are intended as a helpful tool as opposed to a required set of submissions. The

commenters believed it is simpler for all MIPS eligible clinicians to report on six measures when they have eligible patients within the denominators of the approved measures so that everyone meets the same standards. Another commenter recommended that specialists and sub-specialists be required to meet the same program expectations including reporting on six measures. The commenter stated that if six measures are not available in the sub-specialty list, the MIPS eligible clinicians would need to report at the higher specialty level or cross-cutting measure until they reach a total of six measures. If CMS allows a lower number of quality measures for a particular specialty group in MIPS, the lower number of measures for reporting should be available to all MIPS eligible clinicians. If specialists and sub-specialists do not report on six measures, the commenter recommended that they should receive a score of zero for measures not reported.

Response: We agree with the commenters that specialty-specific measure sets are intended to be helpful to MIPS eligible clinicians under the MIPS program. While it may be simpler to require the same six measures of all MIPS eligible clinicians, we do not believe it is appropriate to hold MIPS eligible clinicians accountable for measures that are not within the scope of their practice. The specialty-specific measure sets includes measures from the comprehensive list of MIPS quality measures available (Reference Table A). Measures within the specialty-specific measure set should be more relevant for the specialists and should be easier to identify and report. If a MIPS eligible clinician does not believe the measures within a specialty-specific measure set are relevant for their practice, they can choose any six measures within the comprehensive quality measure list. If a specialty measure set is further broken out by sub-specialty exists, we would recommend that the MIPS eligible clinician should submit measures within the sub-specialty set. We have made every effort to ensure the sub-specialty set includes the relevant measures for the particular sub-specialty.

Comment: Another commenter approved of the proposed specialty-specific measures for the MIPS quality category and encouraged the creation of more specialty-specific measure sets. The commenter stated that currently, many specialty-specific measure sets have fewer than six measures, and many also do not have any outcome based measures. In addition, some of the specialty-specific measure sets have few

or no EHR submission-eligible measures. The commenter urged CMS to prioritize e-specified measures currently listed as registry-only to enable clinicians to make maximum use of their CEHRT for reporting. The commenter also requested that CMS clarify MIPS eligible clinicians' obligations for quality measure reporting when no single reporting method will meet the reporting requirements even though the full specialty-specific measure set would do so.

Response: We thank the commenter for their support of specialty-specific measure sets. It is our intent to adopt more specialty-specific measure sets over time, especially as new measures become available. Although some of the specialty-specific measure sets do not all have six measures they all contain an outcome or other high priority measure. When a MIPS eligible clinician chooses to report a specialty-specific measure set they are only required to report what is in the set and what is reportable through the selected data submission mechanism. We note, in rare situations where a MIPS eligible clinician submits data for a performance category via multiple submission mechanisms (for example, submits data for the quality performance category through a registry and claims), we would score all the options (such as scoring the quality performance category with data from a registry, and also scoring the quality performance category with data from claims) and use the highest performance category score for the MIPS eligible clinician final score. We would not however, combine the submission mechanisms to calculate an aggregated performance category score. We refer readers to section I.I.E.6. of this final rule with comment period for more information on scoring. Lastly, we agree with the commenter that eCQMs are a priority, and we intend to continue adopting additional measures of this type on the future. We intend to continue leveraging MIPS eligible clinicians' use of CEHRT for quality reporting requirements to the greatest extent possible.

Comment: A few commenters supported CMS' focus on outcome measures, and specifically supported CMS' proposal to require MIPS eligible clinicians to report on at least one outcome measure and to allow MIPS eligible clinicians to earn two additional points for each additional outcome measure reported because the commenters stated that outcome measures provide more meaning and value for Medicare beneficiaries and are critical for delivering high quality care.

Several other commenters commended CMS' plan to increase the requirements for reporting outcome measures over the next several years through future rulemaking, as more outcome measures become available. The commenter recommended that CMS consider accelerating the implementation of additional outcome or high quality measures, and expressed support for additional bonus points awarded to MIPS eligible clinicians for reporting additional outcome or high quality measures. One commenter agreed that outcome measures should be emphasized in the future, as these are the true indicators of healthcare services reflected directly on a patient's health status. Another commenter recommended that CMS develop of both clinical outcomes (for example, survival for patients with cancer and other life threatening conditions) and patient-reported outcome measures (for example, quality of life, functional status, and patient experience) to support this aim.

Response: We thank the commenters and agree; we believe outcome measures are critical to quality improvement. We will take the commenters' suggestions into consideration for future rulemaking.

Comment: Other commenters stated that if quality is based on good outcomes, MIPS eligible clinicians may deter treating the sickest patients since it will negatively impact their numbers, thereby resulting in sick patients not receiving timely and proper treatment and increasing national medical expenditures.

Response: We have confidence in the clinician community and its commitment to their patients' overall wellbeing. To date, there is no evidence from the PQRS, VM, or Medicare EHR Incentive Program for EPs that clinicians have been deterred from seeing all types of patients seeking their care. We also note that many outcomes measures are risk-adjusted to account for beneficiary severity prior to treatment. We do recognize this issue is a concern for some stakeholders and will monitor MIPS eligible clinicians' performance under the MIPS for this unintended consequence.

Comment: A few commenters recommended that CMS set limits on some of the measures that may be reported by multiple MIPS eligible clinicians with respect to one patient. For example, many beneficiaries will see multiple MIPS eligible clinicians. Hypothetically, the commenters believed it would not be appropriate for the body mass index (BMI) measure to be reported by a patient's primary care

physician, cardiologist, endocrinologist, ophthalmologist, and rheumatologist in the same year.

Response: We thank the commenters for the suggestion and will take it into consideration in the future.

Comment: Another commenter opposed CMS' overall policy to attempt to assess patient experience and satisfaction under the quality performance category of MIPS with outcomes-based measures. The commenter stated that these measures and surveys include factors that may be outside the control of the MIPS eligible clinician, such as hospital nursing and staff behavior and performance and wait times in a hospital setting due to inadequate staffing levels and physical plant design. Also, patient satisfaction, while important, does not always correlate with better clinical outcomes and may even conflict with clinically indicated treatments. Another commenter believed patients should be asked to report outcomes across a continuum of care domains including treatment benefit, side effects, symptom management, care coordination, shared decision-making, advanced care planning, and affordability.

Response: We respectfully disagree and believe that outcomes-based measures and high priority measures are critical to measuring health care quality. We thank the commenter also for their thoughts on patient satisfaction surveys, but we believe it is appropriate to measure and incentivize directly MIPS eligible clinicians' performance on patient experience surveys which uniquely present patients the opportunity to assess the care that they received. There is evidence that performance on patient experience surveys is positively correlated with better patient outcomes. We intend to continue working with stakeholders to improve available measures.

Comment: Other commenters stated the measures in the physical medicine specialty-specific measure set are all process measures and that the only way one can report on six out of seven measures is via a registry. Although the measures could be applicable to some Physical Medicine and Rehabilitation (PM&R) physicians, the commenters believed they are not applicable to all PM&R MIPS eligible clinicians. The commenters urged CMS to remove the specialty-specific measure set and work with American Academy of Physical Medicine and Rehabilitation (AAPM&R) on identifying better measurements for their specialty.

Response: If MIPS eligible clinicians find that the measures within a specialty-specific measure set are not

applicable to their practice, they may report any of the measures that are available under the MIPS program. We believe that the physical medicine specialty-specific measure set is applicable to PM&R MIPS eligible clinicians and that this policy appropriately accommodates those MIPS eligible clinicians that are unable to report the full specialty-specific measure set. Although all measures within the specialty-specific measure set may not be applicable to all PM&R clinicians, we believe that most PM&R clinicians will be able to report the measures within the set because they are relevant for most with the specialty. If an MIPS eligible clinician finds that they are unable to report the specialty-specific measure set, they are able to report any six measures from the larger quality measure set. We will continue to work with specialty societies to adjust the specialty-specific measure sets as more relevant measures become available. We also welcome specific feedback from MIPS eligible clinicians who are specialists on what quality measures would be most appropriate for their specialty-specific measure set.

Comment: Another commenter supported the reporting of specialty-specific measure sets as meeting the full requirements in the quality performance category because specialty MIPS eligible clinicians struggle to meet many other measures outside their domain and should not be penalized for not going outside their specialty by having to find additional measures to report that may not be appropriate for the care they provide.

Response: We thank the commenter for their support. We note that the only additional measure that would be calculated as part of an MIPS eligible clinician's quality score is the population-based measure which does not require any data submission, reflected in Table B of the Appendix in this final rule with comment period, which only applies to groups of 16 or greater. For more information on this measure we refer readers to the Global and Population-Based Measures section below.

Comment: Several commenters suggested that quality measurement and reporting must measure things that are clinically meaningful and should emphasize outcomes over process measures. The commenters added that quality measurement should also incorporate patient experience measures and patient-reported outcomes measures (PROMs), and quality measures should be disaggregated by race/ethnicity, gender, gender identity, sexual orientation, age, and disability status.

Another commenter recommended that patient-reported outcome measures (PROMs) be given greater weight in the MIPS program. Other commenters encouraged the inclusion of medication adherence measures beyond those currently included under the quality performance category.

Response: We agree with commenters that quality measurement must capture clinically-meaningful topics. We further agree that patient-reported measures are important and we have included a number of PROMs in MIPS. We intend to expand their portfolio in the future. We will consider the commenter's suggestions on quality measure demographics and medication adherence measures, particularly in the context of risk-adjustment, and increased weighting in the future.

Comment: A few commenters recommended that CMS provide an incentive to MIPS eligible clinicians to submit eCQMs and not deter MIPS eligible clinicians from using CEHRT for eCQMs. The commenters recommended that CMS provide an exemption on reporting a cross-cutting ensure for MIPS eligible clinicians who use CEHRT/health IT vendors to report eCQMs for the quality performance category.

Response: We thank the commenters for these suggestions. We refer the commenter to section II.E.6. of this final rule with comment period where we describe our policies for bonus points available for using CEHRT in a data submission pathway that to report patient demographic and clinical data electronically from end to end. An exemption on reporting a cross-cutting measure is not necessary considering our decision not to finalize a requirement to report a cross-cutting measure.

Comment: One commenter urged CMS to maintain greater control of the reporting under Quality Payment Program and to provide more thoroughly defined measurements. They also urged CMS to incorporate more reporting requirements that would assess the actual and overall quality of care being provided to beneficiaries.

Response: We thank the commenter for the feedback. We have structured the MIPS program to rely on the MIPS eligible clinician's choice of specialty, which remains in the clinician's control, and which we expect reflects the services that they provide, as well as the quality measures that those MIPS eligible clinicians select. The quality measures go through a rigorous review process to assure they are thoroughly defined measurements as discussed in section II.E.5.c. of this final rule with

comment period. We believe the MIPS program is designed to assess actual and overall quality of care being provided to the beneficiaries.

Comment: Other commenters stated their small staff does not have time to spend on reporting quality metrics.

Response: It has been our intention to adopt measures that are as minimally burdensome as possible. We have also adopted several other policies for smaller practices in order to ensure that MIPS does not impose significant burdens on them. We encourage the commenters to contact the Quality Payment Program Service Center for assistance reporting applicable measures.

Comment: One commenter believed that some flexibility in reporting requirements under quality would be helpful, especially for small practices, but encouraged CMS to balance the need for flexibility against the need for consistent reporting across MIPS eligible clinicians. Another commenter stated that CMS should allow small practices to report a smaller number of quality measures, at least for the initial few years.

Response: We thank the commenter. We have attempted to be flexible with the measures that we have adopted under MIPS. It has been our intention to adopt measures that are as minimally burdensome as possible. We have also adopted several other policies for smaller practices in order to ensure that MIPS does not impose significant burdens on them.

Comment: Another commenter supported narrowing the requirements for improving quality measurement and reporting for MIPS based on data collected as a natural part of clinical workflow using health information technology.

Response: We will take this comment into account in the future. We believe that electronic quality measurement is an important facet of quality programs more generally.

Comment: One commenter supported allowing flexibility for MIPS eligible clinicians to choose measures that are relevant to their type of care.

Response: We thank the commenter and agree.

Comment: Other commenters encouraged CMS and Health Resources and Services Administration (HRSA) to align the quality measurement sections of MIPS and the Uniform Data System so that FQHCs can submit one set of quality data one time for both purposes.

Response: We thank the commenters for their suggestion and will examine this option for future rulemaking. Please refer to section II.E.1.d. of this final rule

with comment period for more information regarding FQHCs.

Comment: Some commenters requested that CMS clarify the proposal to eliminate the need to track and report duplicative quality measures by modifying its proposal to require that if quality is reported in a manner acceptable under MIPS or an APM, it would not need to be reported under the Medicaid EHR Incentive Program. The commenters were concerned the programs could potentially cause the same conflict CMS specifically noted MIPS and APMs were intended to correct.

Response: We thank the commenters and have worked to eliminate duplicative measures between MIPS and other programs where possible. We intend to continue to align MIPS and the Medicaid EHR Incentive Program to the greatest extent possible. As we have noted in section II.E.5.g. of this final rule with comment period, the requirements for the Medicaid EHR Incentive Program for EPs were not impacted by the MACRA. There is a requirement to submit CQMs to the state as part of a successful attestation for the Medicaid EHR Incentive Program. While the MIPS objectives for the advancing care information performance category are aligned to some extent with the Stage 3 objectives in the Medicaid EHR Incentive Program, they are two distinct programs, and reporting will stay separate.

Comment: Another commenter stated that while the quality section discusses outcome measures, much of the measures are traditional, clinic based process measures. The commenter was unclear how such measures will drive transformation.

Response: We currently have approximately 64 outcome measures available from which MIPS eligible clinicians may choose. We do agree that more work needs to occur on outcome measure development to impact the quality of care provided. As additional outcome measures are developed, we will incorporate these for future rulemaking.

Comment: One commenter agreed that moving to more “high value” measures or “measures that matter” is important. However, the commenter recommended that neurologists be able to select measures that have the greatest value in driving improvement for their patients. The commenter stated that measures considered “high value” may differ by specialty or patient population.

Response: We appreciate the commenters support. We recommend that all MIPS eligible clinicians select

measures that have the greatest value in driving improvement for their patients.

Comment: Another commenter suggested that MIPS eligible clinicians who report different quality measures from the prior year should be requested to provide the rationale for the change. The commenter suggested that CMS request the MIPS eligible clinician report data for the same categories as the prior year to preclude the chance that a MIPS eligible clinician may be seeking to find loopholes and flaws in the system.

Response: We appreciate the suggestion and will take it into consideration for future years of the program. We will also monitor whether clinicians appear to be switching measures to improve their scores, rather than due to changing medical goals or patient populations. We will report back on the results of our monitoring in future rulemaking.

Comment: A few commenters requested that MIPS eligible clinicians reporting quality using third party submission mechanisms not certified to all available measures only be required to report from the list of measures to which the system is certified. That is, receive an exemption from standard reporting requirements similar to the flexibility built in for others who lack reportable measures.

Response: We respectfully disagree that an exemption is necessary in the circumstance the commenters describe. MIPS eligible clinicians choosing to report data via third party intermediary should select an entity from the list of qualified vendors that is able to report on the quality metrics that MIPS eligible clinician believes are most appropriate for their practice and that they wish to report to CMS.

Comment: Some commenters encouraged CMS to further evaluate the use of more than one measure, which must be an outcome measure or a high priority measure, when more than one measure exists and each measures a distinct and different health outcome; and if an applicable outcome measure is not available, another high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures) in lieu of an outcome measure should be considered. Thus, the commenters recommended that CMS consider the requirement of two (or more) outcome or high quality measures, as a component of the final score, when available.

Response: Thank you for the feedback, and we will consider this in future rulemaking. We also want to refer this commenter to section II.E.6.a.(2) of this final rule with comment period

where we describe the bonus points available for high priority measures and section II.E.5.b.(3)(a) of this final rule with comment period where we describe our interest in increasing the emphasis on outcome measures moving forward.

Comment: Other commenters urged CMS to continue to include process measures in quality reporting programs while testing relevant outcomes measures for future inclusion. Specifically, the commenters were concerned that a small number of orthopedic surgery outcomes measures currently exist and believed that more time is required to develop relevant outcomes measures before CMS emphasizes outcomes for specialty clinicians.

Response: MIPS eligible clinicians are required to submit data on an outcome measure if available, but if not, another high priority measure may be selected. We agree with the commenter that additional outcome measure development needs to occur.

Comment: A few commenters wanted to know if there would be any impacts (beyond loss of points) if a MIPS eligible clinician chooses to not report any outcome or high priority condition measures.

Response: The commenters are correct that the only impacts for not submitting outcomes or high priority measures would be a loss of points under the quality performance category.

Comment: Several commenters recommended that CMS reinstate measures group reporting as an option under MIPS. The commenters stated that by removing this option CMS has skewed reporting in favor of large group practices, the majority of whom report through the GPRO web-interface that allows for and requires reporting on a sampling of patients. One commenter noted that while measure groups are not the most popular reporting option in PQRS, MIPS eligible clinicians choosing this option have had a high success rate and that measures included in a measures group undergo a deliberate process that ensures a comprehensive picture of care is measured. One commenter indicated many oncology small practices use the measure group reporting mechanism which is less burdensome and a meaningful mechanism for quality reporting for these practices. Another commenter requested that small practices be able to continue reporting measures groups on 20 patients. Some commenters stated by doing away with the measures group quality reporting option, CMS has actually made this category more difficult for many clinicians to meet,

particularly those in small practices. Another commenter requested CMS retain the asthma and sinusitis measure groups as currently included in PQRS.

Response: We did not propose the measures group option under MIPS because, as commenters noted, very few clinicians utilized this option under PQRS. Under the MIPS, we substituted what we believe to be a more relevant selection of measures through specialty-specific measure sets. Adopting this policy also enables a more complete picture of quality for specialty practices. We do not believe the specialty-specific measure set will pose an undue burden on small practices, and may make it easier for eligible clinicians, including those in small practices, to easily identify quality measures to report to MIPS. We will continue to assess this policy for enhancements in future rulemaking.

Comment: Other commenters stated the quality requirements are ill-conceived and unworkable and the severity of illness calculations unfair (for example, if MIPS eligible clinicians do a good job preventing complications, they are punished with a low score).

Response: We believe that the quality measures we are adopting for the MIPS program will appropriately incentivize high quality care, including care that prevents medical complications. However, we will monitor the MIPS program's effects on clinical practices carefully.

Comment: Some commenters supported CMS' proposals to require MIPS eligible clinicians to report only six measures and to remove the NQS domain requirement for selecting measures as compared to the PQRS, but opposed CMS' proposed requirement that MIPS eligible clinicians report on outcomes and high priority measures. The commenters recommended that CMS incentivize outcomes based measures by assigning them more weight within MIPS. Additionally, the commenters were concerned that many specialties do not have access to outcome measures. The commenters opposed requiring patient experience and satisfaction measures for MIPS eligible clinicians, noting that evaluating patient experience is best done using confidential feedback to clinicians. The commenters would support CMS' use of the patient satisfaction surveys under the improvement activities performance category if performance was based only on administering a survey, evaluating results, and addressing the findings of the survey. The commenters encouraged CMS to give funding preference for development of measures to those

specialties with limited measures. Another commenter recommended requiring the inclusion of patient centered measures that reflect the values and interests of patients, including patient reported outcome measures, patient experience of care, cross cutting measures, and clinical outcome measures.

Response: We thank the commenters for their support. However, we do believe that outcome measures and high priority measures are critical to measuring health care quality, and are designated high priority for that reason. We thank the commenter also for their thoughts on patient satisfaction surveys, but we believe it is appropriate to measure and incentivize directly MIPS eligible clinicians' performance on patient experience surveys. We intend to continue working with stakeholders to improve available measures. We would like to explain for commenters that the CAHPS for MIPS survey is included under the quality performance category, as well as the improvement activities performance category as a high-weighted activity in the Patient Safety and Practice Assessment subcategory noted in Table H of the Appendix in this final rule with comment period.

Comment: The commenters requested further clarification on the number of measures required when specialty-specific measure sets are used. For example, if a non-patient facing MIPS eligible clinician submits all measures from a specialty-specific measure set (in Table E of the Appendix), would they still be allowed to submit other measures applicable to their practice, such as cross-cutting measures? In a scenario where an MIPS eligible clinician submits all three available measures in a specialty-specific measure set and also submits one cross-cutting measure not listed in the a specialty-specific measure set (therefore submitting a total of four measures), will the MIPS eligible clinician be penalized for not submitting six total measures? The commenters requested that the final rule with comment period include specific requirements on the number of measures required for MIPS eligible clinicians who elect to submit measures from a specialty-specific measure set.

Response: We would like to explain that our final policy for quality performance category is for the applicable continuous 90-day performance period during the performance period, or longer if the MIPS eligible clinician chooses, the MIPS eligible clinician or group will report one specialty-specific measure set, or the measure set defined at the

subspecialty level, if applicable. If the measure set contains less than six measures, MIPS eligible clinicians will be required to report all available measures within the set. If the measure set contains six or more measures, MIPS eligible clinicians will be required to report at least six measures within the set. We note that generally, we define “applicable” to mean measures relevant to a particular MIPS eligible clinician’s services or care rendered.

Regardless of the number of measures that are contained in the measure set, MIPS eligible clinicians reporting on a measure set will be required to report at least one outcome measure or, if no outcome measures are available in the measure set, report another high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures) within the measure set in lieu of an outcome measure. For the commenter’s specific questions, there is no penalty or harm in submitting more measures than required. Rather, this can benefit the clinician because if more measures than the six required are submitted, we would score all measures and use only those that have the highest performance, which can result in a MIPS eligible clinician receiving a higher score. Lastly, we note that since we are not finalizing the requirement of cross-cutting measures in the quality performance category, there is no difference in requirements for patient facing and non-patient facing clinicians in the quality performance category.

Comment: One commenter supported the flexibility provided for non-patient facing MIPS eligible clinicians; however, the commenter suggested that CMS continue to keep in mind that most measures across the MIPS components apply to patient-facing encounters. The commenter recommended that CMS work with medical specialty and subspecialty groups to determine how to best expand the availability of clinically relevant performance measures for non-patient facing MIPS clinicians, or ways to reweight MIPS scoring to provide these clinicians with credit for activities that more accurately align with their role in the treatment of a patient.

Response: We appreciate the commenters’ suggestions and will take them into consideration in future rulemaking. We would like to explain that we consistently work closely with specialty societies and intend to continue engaging with them on future MIPS policies.

Comment: Several commenters supported the decision from CMS to reduce the number of mandatory quality measures for reporting from nine to six,

and appreciated steps to clarify reporting requirements when fewer than six applicable measures are available. Some commenters believed that the best approach when directly applicable measures are not available is to minimize the number of measures required for reporting and focus instead on the measures that do apply to the clinician and patient. Additionally, these commenters stated there is value in the stratification of data across different identifiers, particularly for some gastrointestinal (GI) services with differential impacts across patient groups; however, the lack of existing data related to factors such as ethnicity and gender makes data stratification particularly difficult and often irrelevant. The commenters requested that CMS engage in an open dialogue once recommendations are received from the ASPE if they believe it necessary to move forward with proposals impacting GI care.

Response: We appreciate the commenters support. We have an open dialogue and appreciate feedback from all federal agencies and stakeholders. We will closely examine the ASPE studies when they are available and incorporate findings as feasible and appropriate through future rulemaking. We look forward to working with stakeholders in this process.

Comment: One commenter supported the goals for meaningful measurement but indicated that there are challenges to implementing policies to achieve them, including the proposed quality performance category which is overly complex, largely unattainable, lacks meaningful measures, lacks transparency and lacks appropriate risk-adjustment. The commenter recommended further collaboration with specialty societies to create policies which will engage surgeons, including surgeons who were unable to successfully participate in PQRS.

Response: We appreciate the comment. As stated above, we consistently work closely with specialty societies to solicit measures and we intend to continue engaging with them on future MIPS policies.

Comment: Some commenters requested that CMS allow flexibility around outcome measure reporting requirements and allow suitable alternatives where necessary, as many stakeholders still face barriers in the development of and use of meaningful outcome measures. The commenters discouraged CMS from assigning extra weight to outcome measures, as there is no standard methodology for reporting and risk-adjustment methodologies, which may unfairly disadvantage some

MIPS eligible clinicians and advantage others. The commenters supported comprehensive measurement and consideration of measures in the IOM/NQS Quality Domains.

Response: We appreciate the commenter’s suggestions and will take them into consideration in the future. However, to address the commenter’s concern regarding an unfair disadvantage for some eligible clinicians as it relates to the availability and reporting of outcome measures, we have provided flexibility of reporting for those eligible clinicians that do not have access to outcome measures by allowing eligible clinicians to report on high priority measures as well. Since high priority measures span all eligible clinician specialties, we do not believe some eligible clinicians will have an advantage of reporting over others.

Comment: Another commenter asked CMS to clarify whether a measure type listed as an ‘intermediate outcome’ would count equally as an ‘outcome’ measure. Another commenter recommended that intermediate outcome measures should only be counted as outcome measures if there is a strong evidence base supporting the intermediate outcome as a valid predictor of outcomes that matter to patients.

Response: We consider measures listed as an “intermediate outcome” measure to be outcome measures. In addition, it is important to note that if an applicable outcome measure is not available, a MIPS eligible clinician or group would be required to report one other high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures) in lieu of an outcome measure.

Comment: Another commenter requested clarity on whether a clinician is evaluated on the same six quality measures as the group they report in. The commenter wanted to know what happens if one of those group measures is not applicable to the clinician.

Response: MIPS eligible clinicians that report as part of a group are evaluated on the measures that are reported by the group, whether or not the group’s measures are specifically applicable to the individual MIPS eligible clinician. In addition, MIPS eligible clinicians who form a group, but have elected to report as individuals, will each be evaluated only on the measures they themselves report.

Comment: Some commenters were concerned about group reporting of quality measures in multispecialty practices. Thus, the commenters recommended that CMS allow MIPS

eligible clinicians in multi-specialty practices to report on measures that are meaningful to their specialty, and that each MIPS eligible clinician in a group be assessed individually, and all scores of the MIPS eligible clinicians reporting under the same TIN be aggregated to achieve one score for the entire practice.

Response: We appreciate the commenter's suggestions. From the example provided, we would recommend that clinicians in this situation may find reporting as individual MIPS eligible clinicians favorable over reporting as a group. We will take these recommendations into consideration in for future rulemaking.

Comment: One commenter recommended a cap of nine measures in the future if CMS believes that allowing more than the required six is needed.

Response: We appreciate the commenter's suggestion. We will take this into consideration in the future.

Comment: A few commenters applauded CMS's extensive efforts to include specialists in the quality component of MIPS. The commenters recommended that CMS determine which specialties do not have enough measures to select at least six that are not topped out and exempt those specialists from the quality category until enough measures become available. Some commenters were pleased that CMS recognized that very specialized MIPS eligible clinicians may not meet all six applicable measures.

Response: We appreciate the commenters support. MIPS eligible clinicians who do not have enough measures to select at least six measures should choose all of the measures that do apply to their practice and report them. We will conduct a data validation process to determine whether MIPS eligible clinicians have reported all measures applicable to them if the MIPS eligible clinician does not report the minimum required 6 measures. As an alternative, the MIPS eligible clinician may choose a specialty-specific measure set. If the measure set contains fewer than six measures, MIPS eligible clinicians will be required to report all available measures within the set. If the measure set contains six or more measures, MIPS eligible clinicians will be required to report at least six measures within the set. Regardless of the number of measures that are contained in the measure set, MIPS eligible clinicians reporting on a measure set will be required to report at least one outcome measure or, if no outcome measures are available in the measure set, report another high priority measure (appropriate use, patient safety, efficiency, patient experience, and care

coordination measures) within the measure set in lieu of an outcome measure. Generally, we define "applicable" to mean measures relevant to a particular MIPS eligible clinician's services or care rendered. MIPS eligible clinicians who do not have six individual measures available to them should select their appropriate specialty-specific measure set, because that pre-defines which measures are applicable to their specialty and provides protections to them. For the majority of MIPS eligible clinicians choosing the specialty-specific measure sets provides protections to MIPS eligible clinicians because we have pre-determined which measures are most applicable, based on the MIPS eligible clinicians specialty.

We do intend to provide toolkits and educational materials to MIPS eligible clinicians that will reduce the burden on determining which measures are applicable. We do not believe, however, that it is appropriate to exempt specialties from the quality performance category if they have fewer than six measures or topped out measures. Rather these specialties are still able to report on quality measures, just a lesser the number of measures. We refer the readers to section II.E.6. of this final rule with comment period for the discussion of authority under 1848(q)(5)(F) to reweight category weights when there are insufficient measures applicable and available.

Comment: A few commenters requested clarification on whether the measures are separate for each individual performance category such as quality, and advancing care information or whether one measure can apply to more than one category.

Response: Each measure and activity applies only for the performance category in which it is reported. However, some actions might contribute to separately specified activities, such as reporting a quality measure through a QCDR, which may make it easier for the MIPS eligible clinician to perform an improvement activity that also involves use of a QCDR. However, it is important to note that the CAHPS for MIPS survey receives credit in the quality and improvement activities performance categories. In addition, certain improvement activities may count for bonus points in the advancing care information performance category if the MIPS eligible clinician uses CEHRT.

Comment: One commenter stated that while CMS has provided CPT codes for consideration for PQRS in the past, it has not provided the type of CPT codes to be used for MIPS assessment.

Response: The CPT codes that have historically been available under the PQRS program will be made available for the MIPS as part of the detailed measure specifications which will be posted prior to the performance period at QualityPaymentProgram.cms.gov. More information on the detailed measure specifications is available in section II.E.5.c. of this final rule with comment period.

Comment: The commenter requested clarification as to whether a MIPS eligible clinician is obligated to report on measures if the procedures are performed in a surgery center or hospital.

Response: Yes, in the instances where those procedures or services are billed under Medicare Part B or another payer that would have services that fall under the measure's denominator, MIPS eligible clinicians are required to report on measures where denominator eligible patients are designated within the measure specification.

Comment: One commenter stated that in addressing CMS' question of whether to require one cross-cutting measure and one outcome measure, or one cross-cutting measure and one high priority measure (which is inclusive of the outcome measures), the commenter recommended that CMS allow MIPS eligible clinicians to select one cross-cutting and one high priority measure. The commenter noted that this approach gives MIPS eligible clinicians more flexibility and gives CMS time to develop additional outcome measures to choose from.

Response: We appreciate the comment. However, we believe it is important to include the requirement to report at least one outcome measure if it is available given the importance of outcome measures on assessing health care quality. As noted above, we are finalizing our proposal to require one outcome measure, or if an outcome measure is not available, another high priority measure. We are not finalizing our proposal to require one cross-cutting measure.

Comment: Some commenters did not support CMS' proposal to require the reporting of outcome/high priority measures in order to achieve the maximum quality performance category points. The commenters recommended that instead, CMS reward high priority measures with bonus points, but cap the bonus points CMS Web Interface users can earn. The commenters recommended their approach because more large practices can use the CMS Web Interface option, which includes several high priority measures, and this could favor these MIPS eligible

clinicians over those in smaller practices. Another commenter expressed concern about CMS's requirement to report on high priority, including specific outcomes based, and cross-cutting measures, and stated that those standards are currently counterproductive due to inherent difficulty with tracking outcomes in cancer care, in part because meaningful outcomes often require years of follow-up, and because sample sizes of cancer patients may be very small at the clinician level. The commenter further noted that the vast majority of oncology measures existing today are process-based versus outcomes based, rendering an adjustment period for outcomes based measures in cancer care. The commenter recommended that CMS clearly state in the final rule with comment period that the outcomes measure reporting requirement does not apply to oncology clinicians until more meaningful quality measures are developed for oncology care.

Response: We would like to explain that our proposals do include bonus points (subject to a cap) for reporting on high priority measures; we refer readers to section II.E.6.a.(2)(e) of this final rule with comment period. We believe that outcome measures and high priority measures are critical to measuring health care quality, and they are designated high priority for that reason. We intend to continue working with stakeholders to improve available measures.

Comment: Other commenters believed that in order to allow and encourage MIPS eligible clinicians to report the highest quality data available, which includes outcomes measures in EHR and registry data, and support innovation, CMS should allow MIPS eligible clinicians to report at least one of the six required quality measures under MIPS through a QCDR. Some commenters strongly encouraged CMS to move toward a streamlined set of high priority measures that align incentives and actions of organizations across the health care system. The commenters also recommended that CMS give NQF-endorsed measures priority.

Response: We thank the commenters for their feedback and intend to finalize our proposal that one of the six measures a MIPS eligible clinician must report on is an outcome measure. We also understand the concerns that not all MIPS eligible clinicians may have a high priority measure available to them. However, we do believe that all MIPS eligible clinicians regardless of their specialty have a high priority measure available for reporting.

Therefore, we intend to finalize that if a MIPS eligible clinician does not have an outcome measure available, they are required to report on a high priority measure. In addition, a QCDR is one of the data submission mechanisms available to a MIPS eligible clinician to report measures.

Comment: A few commenters encouraged CMS to provide additional time for small or mid-sized practices to transition to CEHRT and QCDRs by ensuring that there are a sufficient number of measures available for claims-based reporting, particularly in the quality performance category, in the first several performance years under MIPS.

Response: We appreciate the commenter's concerns, and while we do have the goal of ultimately moving away from the claims based submission mechanism, we do recognize that this mechanism must be maintained until electronic-based mechanisms of submission continue to develop and mature.

Comment: One commenter wanted to ensure that the proposed reporting does not detract from the patient-clinician clinical visit because it is crucial for the patient-clinician relationship.

Response: We agree that the patient-clinician encounter is paramount. Reporting can be captured through the EHR or through a registry at a later time.

Comment: One commenter stated that the proposed guidelines cannot be applied to all of the specialties and subspecialties uniformly.

Response: We are assuming that the commenter is referring to the proposed data submission requirements for the quality performance category. We are providing flexibility on the submission mechanisms and selection of measures by MIPS eligible clinicians because we understand that varying specialties have differing quality measurement needs for their practices.

Comment: Some commenters were concerned about lowering the threshold on measures and thought the measure criteria were insufficient. One commenter was also concerned that there was no requirement for reporting on a core set of measures for every primary care physician (PCP) and specialist.

Response: We respectfully disagree with the commenter. Drawing from our experiences under the sunseting programs, we believe that is more important to ensure that clinicians are measured on quality measures that are meaningful to their scope of practice as well as quality measures that emphasize outcome measurement or other high

priority areas rather than a large quantity of measures.

Comment: One commenter asked for clarification on whether six non-MIPS measures (QCDR) can be selected by a MIPS eligible clinician and be used to meet the reporting criteria.

Response: Yes, this is allowable for reporting using QCDRs as long as one of the selected measures is an outcome measure, or another high priority measure if an outcome is unavailable.

Comment: Some commenters urged CMS to ensure the proposed validation process to review and validate a MIPS eligible clinician's inability to report on the quality performance category requirements—similar to the Measure-Applicability Validation (MAV) process—is transparent. The commenters urged consultation with clinician stakeholders as CMS develops the new validation process, expressing concerns related to the MAV, including the lack of clarity in how the MAV actually functions. Another commenter recommended CMS develop a validation process that will review and validate a MIPS eligible clinician's or group's ability to report on a sufficient number of quality measures and a specialty-specific sample set—with a sufficient sample size—including both a cross-cutting and outcome measure. One commenter requested a timeframe for the validation process so they may prepare.

Response: We agree with the commenters and intend to provide as much transparency into the data validation process for the quality performance category under MIPS as technically feasible. The validation process will be part of the quality performance category scoring calculations and not a separate process as the MAV was under PQRS. We refer readers to section II.E.6.a.(2) of this final rule with comment period for more information related to the quality performance scoring process. Lastly, we are working to provide additional toolkits and educational materials to MIPS eligible clinicians prior to the performance period that will ease the burden on identification of which measures are applicable to MIPS eligible clinicians. If the MIPS eligible clinician required assistance, they may contact the Quality Payment Program Service Center.

Comment: Another commenter recommended delegating each medical specialty the task of choosing three highly desirable outcomes to focus on each year and rewarding those outcomes to promote quality in lieu of using 6–8 dimensions of meaningful use

performance combined with numerous quality indicators.

Response: We agree with the commenter that focusing on outcomes and outcome measurement is important, as we have indicated in this final rule with comment period. We are however required by statute to measure MIPS eligible clinician's performance on four performance categories, which quality and advancing care information are a part of.

Comment: One commenter stated that claims data is misleading and may corrupt attempts to analyze information with "big data" approaches, because a significant proportion of claims data only captures the first four codes that a clinician enters into the medical record. The commenter further noted that many clinicians documented numerous diagnoses into the medical record, unaware that some vendors only accept the first four diagnoses and that some EHR systems arrange diagnoses in alphabetical order despite how the clinician entered them. The commenter suggested CMS mandate no restriction on the number of diagnoses entered into the 1500 Health Insurance claim form—or at least mandate the National Uniform Claim Committee (NUCC) recommendation to expand the maximum amount of diagnoses from four to eight.

Response: Although the commenter's recommendation is outside the scope of the proposed rule, we note that we do not believe that this approach compromises either data mining or claims processing.

Comment: One commenter requested CMS provide guidance regarding the treatment of measures that assess services that are not Medicare reimbursable, such as postpartum contraception. The commenter recommended that CMS adopt the measures in the Medicaid Adult and Child Core Sets that have been specified and endorsed at the clinician level.

Response: We agree that working to align MIPS quality measures with Medicaid is important and intend to develop a "Medicaid measure set" that will be based on the existing Medicaid Adult Core Set (<https://www.medicaid.gov/Medicaid-CHIP-Program-Information/By-Topics/Quality-of-Care/Downloads/Medicaid-Adult-Core-Set-Manual.pdf>). Further, we believe it is important to have MIPS quality measure alignment with private payers and have engaged a Core Quality Measure Collaborative (<https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityMeasures/Core-Measures.html>) to develop measures to

be used both by private payers and the MIPS program. Our strategic interest is a future state where measurement in multi-payer systems, Medicaid, and Medicare can be seamlessly integrated into CMS programs.

After consideration of the comments regarding our proposal on submission criteria for quality measures excluding CMS Web Interface and CAHPS for MIPS, we are finalizing at § 414.1335(a)(1) that individual MIPS eligible clinicians submitting data via claims and individual MIPS eligible clinicians and groups submitting via all mechanisms (excluding CMS Web Interface, and for CAHPS for MIPS survey, CMS-approved survey vendors) are required to meet the following submission criteria. For the applicable period during the performance period as discussed in section II.E.5.b.(3) of this final rule with comment period, the MIPS eligible clinician or group will report at least six measures including at least one outcome measure. If an applicable outcome measure is not available, the MIPS eligible clinician or group will be required to report one other high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures) in lieu of an outcome measure. If fewer than six measures apply to the individual MIPS eligible clinician or group, then the MIPS eligible clinician or group will be required to report on each measure that is applicable. We define "applicable" to mean measures relevant to a particular MIPS eligible clinician's services or care rendered.

Alternatively, for the applicable performance period in 2017, the MIPS eligible clinician or group will report one specialty-specific measure set, or the measure set defined at the subspecialty level, if applicable. If the measure set contains fewer than six measures, MIPS eligible clinicians will be required to report all available measures within the set. If the measure set contains six or more measures, MIPS eligible clinicians will be required to report at least six measures within the set. Regardless of the number of measures that are contained in the measure set, MIPS eligible clinicians reporting on a measure set will be required to report at least one outcome measure or, if no outcome measures are available in the measure set, report another high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures) within the measure set in lieu of an outcome measure. MIPS eligible clinicians may choose to report measures in addition to

those contained in the specialty-specific measure set will not be penalized for doing so, provided such MIPS eligible clinicians follow all requirements discussed here.

In accordance with § 414.1335(a)(1)(ii), MIPS eligible clinicians and groups will select their measures from either the list of all MIPS measures in Table A of the Appendix in this final rule with comment period, or a set of specialty-specific measure set in Table E of the Appendix in this final rule with comment period. Note that some specialty-specific measure sets include measures grouped by subspecialty; in these cases, the measure set is defined at the subspecialty level.

We also are finalizing the definition of a high priority measure at § 414.1305 means an outcome, appropriate use, patient safety, efficiency, patient experience, or care coordination quality measures. These measures are identified in Table A of the Appendix in this final rule with comment period.

We are not finalizing our proposal to require MIPS eligible clinicians and groups to report a cross-cutting measure because we believe we should provide flexibility during the transition year of the program as MIPS eligible clinicians adjust to MIPS. However, we are seeking comments on adding a requirement to our modified proposal that patient-facing MIPS eligible clinicians would be required to report at least one cross-cutting measure in addition to the high priority measure requirement for further consideration for MIPS year 2 and beyond. We are interested in feedback on how we could construct a cross-cutting measure requirement that would be most meaningful to MIPS eligible clinicians from different specialties and that would have the greatest impact on improving the health of populations.

(ii) Submission Criteria for Quality Measures for Groups Reporting via the CMS Web Interface

We proposed at § 414.1335 the following criteria for the submission of data on quality measures by registered groups of 25 or more MIPS eligible clinicians who want to report via the CMS Web Interface. For the applicable 12-month performance period, we proposed that the group would be required to report on all measures included in the CMS Web Interface completely, accurately, and timely by populating data fields for the first 248 consecutively ranked and assigned Medicare beneficiaries in the order in which they appear in the group's sample for each module/measure. If the pool of eligible assigned beneficiaries is less than 248, then the group would

report on 100 percent of assigned beneficiaries. A group would be required to report on at least one measure for which there is Medicare patient data. We did not propose any modifications to this reporting process. Groups reporting via the CMS Web Interface are required to report on all of the measures in the set. Any measures not reported would be considered zero performance for that measure in our scoring algorithm.

Lastly, from our experience with using the CMS Web Interface under prior Medicare programs we are aware groups may register for this mechanism and have zero Medicare patients assigned and sampled to them. We note that should a group have no assigned patients, then the group, or individual MIPS eligible clinicians within the group, would need to select another mechanism to submit data to MIPS. If a group does not typically see Medicare patients for which the CMS Web Interface measures are applicable, or if the group does not have adequate billing history for Medicare patients to be used for assignment and sampling of Medicare patients into the CMS Web Interface, we advise the group to participate in the MIPS via another reporting mechanism.

As discussed in the CY 2016 PFS final rule with comment period (80 FR 71144), beginning with the 2017 PQRS payment adjustment, the PQRS aligned with the VM's beneficiary attribution methodology for purposes of assigning patients for groups that registered to participate in the PQRS Group Reporting Option (GPRO) using the CMS Web Interface (formerly referred to as the GPRO Web Interface). For certain quality and cost measures, the VM uses a two-step attribution process to associate beneficiaries with TINs during the period in which performance is assessed. This process attributes a beneficiary to the TIN that bills the plurality of primary care services for that beneficiary (79 FR 67960–67964). We proposed to continue to align the 2019 CMS Web Interface beneficiary assignment methodology with the measures that used to be in the VM: The population quality measures discussed in the proposed rule (81 FR 28188) and total per capita cost for all attributed beneficiaries discussed in proposed rule (81 FR 28188). As MIPS is a different program, we proposed to modify the attribution process to update the definition of primary care services and to adapt the attribution to different identifiers used in MIPS. These changes are discussed in the proposed rule (81 FR 28188). We requested comments on these proposals.

The following is summary of the comments we received regarding our proposal on submission criteria for quality measures for groups reporting via the CMS Web Interface.

Comment: Some commenters supported the general direction and intent of the proposed quality performance category, and particularly supported CMS's alignment between the CMS Web Interface measure set and the quality measure reporting and performance requirements for the Medicare Share Savings Program Tier 1 organizations. Another commenter supported national alignment of quality measures.

Response: We thank the commenters for their support.

Comment: Another commenter stated that CMS should either remove or modify some of the quality measures used as part of CMS Web Interface, as existing criteria make them difficult to achieve for large group practices and may not reflect current recommendations. The commenter provided examples of three specific measures and why they present challenges to practice in the context of large groups using CMS Web Interface. For example, the commenter stated that the depression remission measure (MH–1) measures the number of patients with major depression, as defined as an initial PHQ–9 score > 9, who demonstrate remission at 12 months, as defined as a PHQ–9 score < 5. The requirement for PHQ–9 use for evaluating patients combined with a follow-up evaluation is problematic for many large group practices. The measure must be recorded for 248 patients, a very difficult bar for large multi-specialty group practices which refer patients for treatment and follow-up to psychiatrists if they have a PHQ of 9. The measure seems to be designed for group practices that do not have this type of referral pattern to psychiatrists.

Another problematic example the commenter provided was the medication safety measure (CARE 3). The commenter stated that the score includes all medications the patient is taking, including over-the-counter and herbal medications, and therefore relies on the patient recalling and accurately reporting this information. For each medication on the list, clinicians must include the dose, route (for example, by mouth or by injection), and frequency. This measure is difficult to meet, even if medication lists are substantially complete. According to the specifications, if a multi-vitamin is listed but "by mouth" is not recorded then the encounter(s) is scored as non-performance. Finally, the commenter

believed that the blood pressure measure must be updated to reflect recent national consensus about appropriate blood pressure measurements. The commenter stated that a national consensus has developed that blood pressure should vary by age and diagnosis. However, the measure requires a strict policy of controlling to less than 140/90 for hypertensive patients, regardless of age, and 120/80 for screening purposes. These levels are not consistent with current medical evidence or opinion such as those noted in the Eighth Joint National Committee.

Response: We do not believe it appropriate to remove or modify measures, including the three mentioned by the commenter, used in the CMS Web Interface reporting. On the three specific measures the commenter listed, we have been working with the multi-stakeholder workgroup for the Core Measure Quality Collaborative (CQMC). These measures are included in the CQMC measure set for ACO and certified patient-centered medical homes. To align with the CQMC set, CMS has included these measures within the CMS Web Interface. We believe all measures within the CMS Web Interface are appropriate for the data submission method and level of reporting.

Comment: A few commenters recommended, to ensure comparability across reporting mechanisms, that CMS should allow groups reporting through the CMS Web Interface to select which six quality measures will be used to calculate the quality performance score. Currently, the CMS Web Interface requires 18 measures, so if a group performs highly on some CMS Web Interface measures but not others, their overall quality score will be lowered.

Response: We thank the commenters for this feedback, but we believe that requiring groups to report all measures included in the CMS Web Interface provides us a more complete picture of quality at a given group practice. All of the measures reported on the CMS Web Interface will be used to determine an overall quality performance category score.

Comment: Other commenters expressed that CMS Web Interface reporting should be coupled with useful reports for MIPS eligible clinicians including timely and actionable claims data in order to make value-based decisions.

Response: We do not believe it to be operationally feasible to provide claims data as part of a report for the transition year of the MIPS; however, we will work to provide as much information to MIPS eligible clinicians as possible and

will consider this request for future rulemaking.

Comment: Some commenters suggested that CMS identify a minimum number of beneficiaries to report on through CMS Web Interface based on the number of MIPS eligible clinicians in the group.

Response: We appreciate the comment, and in past years under the PQRS program there were different beneficiary sample sizes based on the size of the group, specifically a sample of 411 patients for groups 100+ and a sample of 248 patients for groups 25–99. However after additional data analysis, we found that the differing sample sizes made no impact on the group's performance, so we modified the sample to 248 patients in the CY 2015 final rule (79 FR 67789). We do not believe it reduces burden by issuing different sample sizes by groups. Rather, we believe that a larger sample size is more burdensome.

Comment: Another commenter had concerns about the statistical accuracy of the requirement for reporting the first 248 patients. The commenter had particular concerns about regional and seasonal bias for larger groups because performance measures for large groups would be based on data from patients in the first few weeks of the year.

Response: The methodology for sampling and assignment for the CMS Web Interface has been tested extensively, and we believe that the methodology appropriately controls for the biases the commenter suggests. However, we will monitor performance data reported via the CMS Web Interface.

Comment: Some commenters recommended that in addition to the proposed CMS Web Interface used to submit quality measures, a transactional Electronic Data Interchange (EDI) capability be developed to achieve CMS' goal of permitting multiple methods for submission. The commenters believed multiple technologies have benefits in different situations for various stakeholders. The commenters also suggested that the CMS Web Interface should also become usable by Medicaid, other payers and purchasers on a voluntary basis.

Response: We thank the commenters for these suggestions and will take them under consideration in the future as we continue implementing the MIPS program.

Comment: Some commenters expressed concern with the proposal to limit reporting through the CAHPS for MIPS survey and the CMS Web Interface systems to groups of 25 clinicians or more. The commenters expressed that

small practices would benefit greatly from the use of the CMS Web Interface, and limiting this option is a further burden upon solo and small practices who often do not have the resources to purchase more advanced health IT systems with more sophisticated reporting capabilities. The commenters recommended that CMS look at options that ensure solo and small practices have the same opportunities to succeed as larger groups. Another commenter proposed that CMS consider opening the CAHPS for MIPS survey reporting program to all patient-facing MIPS eligible clinicians with the exception of certain specialties such as psychiatry, addiction medicine, emergency medicine, critical care, and hospitalists.

Response: The CAHPS for MIPS survey is available for all MIPS groups. The CMS Web Interface has been limited to groups of 25 or greater because smaller groups or individual MIPS eligible clinicians have not been able to meet the data submission requirements on the sample of the Medicare Part B patients we provide.

Comment: One commenter recommended that a transactional Electronic Data Interchange (EDI) capability be developed so as to achieve CMS' goal of permitting multiple methods for submission. The commenter believed multiple technologies have benefits in different situations for various stakeholders and the industry should do the hard work now to support flexible technologies. The commenter also suggested that CMS Web Interface should also become usable by Medicaid, other payers and purchasers on a voluntary basis.

Response: We appreciate the suggestions and will take them into consideration in future rulemaking.

After consideration of the comments regarding our proposal on submission criteria for quality measures for groups reporting via the CMS Web Interface, we are finalizing the policies as proposed. Specifically, we are finalizing at § 414.1335(a)(2) the following criteria for the submission of data on quality measures by registered groups of 25 or more MIPS eligible clinicians who want to report via the CMS Web Interface. For the applicable 12-month performance period, the group will be required to report on all measures included in the CMS Web Interface completely, accurately, and timely by populating data fields for the first 248 consecutively ranked and assigned Medicare beneficiaries in the order in which they appear in the group's sample for each module or measure. If the sample of eligible assigned beneficiaries is less than 248, then the

group will report on 100 percent of assigned beneficiaries. A group will be required to report on at least one measure for which there is Medicare patient data. Groups reporting via the CMS Web Interface are required to report on all of the measures in the set. Any measures not reported will be considered zero performance for that measure in our scoring algorithm.

We are finalizing our proposal to continue to align the 2019 CMS Web Interface beneficiary assignment methodology with the measures that used to be in the VM: The population quality measure discussed in the proposed rule (81 FR 28188) and total per capita cost for all attributed beneficiaries discussed in the proposed rule (81 FR 28196). We are also finalizing our proposal to modify the attribution process to update the definition of primary care services and to adapt the attribution to different identifiers used in MIPS. These changes are discussed in the proposed rule (81 FR 28196).

(iii) Performance Criteria for Quality Measures for Groups Electing to Report Consumer Assessment of Healthcare Providers and Systems (CAHPS) for MIPS Survey

The CAHPS for MIPS survey (formerly known as the CAHPS for PQRS survey) consists of the core CAHPS Clinician & Group Survey developed by Agency for Health Care Research (AHRQ), plus additional survey questions to meet CMS's information and program needs. For more information on the CAHPS for MIPS survey, please see the explanation of the CAHPS for PQRS survey in the CY 2016 PFS final rule with comment period (80 FR 71142 through 71143). While we anticipate that the CAHPS for MIPS survey will closely align with the CAHPS for PQRS survey, we may explore the possibility of updating the CAHPS for MIPS survey under MIPS, specifically we may not finalize all proposed Summary Survey Measures (SSM).

We proposed to allow registered groups to voluntarily elect to participate in the CAHPS for MIPS survey. Specifically, we proposed at § 414.1335 the following criteria for the submission of data on the CAHPS for MIPS survey by registered groups via CMS-approved survey vendor: For the applicable 12-month performance period, the group must have the CAHPS for MIPS survey reported on its behalf by a CMS-approved survey vendor. In addition, the group will need to use another submission mechanism (that is, qualified registries, QCDRs, EHR etc.) to complete their quality data submission.

The CAHPS for MIPS survey would count as one cross-cutting and/or a patient experience measure, and the group would be required to submit at least five other measures through one other data submission mechanisms. A group may report any five measures within MIPS plus the CAHPS for MIPS survey to achieve the six measures threshold.

The administration of the CAHPS for MIPS survey would contain a 6-month look-back period. In previous years the CAHPS for PQRS survey was administered from November to February of the reporting year. We proposed to retain the same survey administration period for the CAHPS for MIPS survey. Groups that voluntarily elect to participate in the CAHPS for MIPS survey would bear the cost of contracting with a CMS-approved survey vendor to administer the CAHPS for MIPS survey on the group's behalf, just as groups do now for the CAHPS for PQRS survey.

Under current provisions of PQRS, the CAHPS for PQRS survey is required for groups of 100 or more eligible clinicians. Although we are not requiring groups to participate in the CAHPS for MIPS survey, we do still believe patient experience is important, and we therefore proposed a scoring incentive for those groups who report the CAHPS for MIPS survey. As described in the proposed rule (81 FR 28188), we proposed that groups electing to report the CAHPS for MIPS survey, would be required to register for the reporting of data. Because we believe assessing patients' experiences as they interact with the health care system is important, our proposed scoring methodology would give bonus points for reporting CAHPS data (or other patient experience measures). Please refer to the proposed rule (81 FR 28247), for further details. We solicited comments on whether the CAHPS for MIPS survey should be required for groups of 100 or more MIPS eligible clinicians or whether it should be voluntary.

Currently, the CAHPS for PQRS beneficiary sample is based on Medicare claims data. Therefore, only Medicare beneficiaries can be selected to participate in the CAHPS for PQRS survey. In future years of the MIPS program, we may consider expanding the potential patient experience measures to all payers, so that Medicare and non-Medicare patients can be included in the CAHPS for MIPS survey sample. We solicited comments on criteria that would ensure comparable samples and on these proposals.

The following is a summary of the comments we received regarding our proposed performance criteria for quality measures for groups electing to report the CAHPS for MIPS survey.

Comment: One commenter recommended that CMS should require MIPS eligible clinicians in groups to report a standard patient experience measure.

Response: We are not requiring groups to report the CAHPS for MIPS survey for the transition year of MIPS. We are aware that requiring a standard patient experience measure, such as the CAHPS for MIPS survey, can be cost-prohibitive for small groups. However, we do believe patient experience measures are important and are providing bonus points for the CAHPS for MIPS survey, as discussed in section II.E.6. of this final rule with comment period.

Comment: Some commenters requested clarification about whether the CAHPS for MIPS survey would be required for groups of 100+ MIPS eligible clinicians, as it was under PQRS. Some commenters opposed mandatory CAHPS for MIPS survey reporting under MIPS and recommended that CMS allow reporting on the CAHPS for MIPS survey to be voluntary. Another commenter opposed making the CAHPS for MIPS survey a requirement for large groups because it is a survey tool to measure outpatient practices and is not useful for many facility based practices. The commenter stated that there will be significant confusion as large groups try to determine which parts of the survey apply to them.

Response: We would like to explain that the CAHPS for MIPS survey is optional for MIPS eligible clinician groups. We recognize that while the CAHPS for MIPS survey is a standard tool used for large organizations, we know that there are challenges with the CAHPS for MIPS survey for certain specialty clinicians and clinicians who work in certain settings.

Comment: A few commenters urged CMS to include the CAHPS for MIPS survey, as well as other non-CAHPS experience of care and patient reported outcomes measures and surveys (including those that are offered by QCDRs), under the improvement activities performance category rather than the quality performance category. One commenter stated that the CAHPS for MIPS survey should be counted as a high weight improvement activities. This commenter stated that this would simplify the program and ensure that specialists have the same opportunity as primary care clinicians to earn the

maximum number of points in the quality performance category. The commenter was concerned that if CMS does not revise this proposal, specialists will be at a disadvantage as the CAHPS for MIPS survey is less relevant for specialists, especially surgeons, anesthesiologists, pathologists and radiologists. If CMS moves forward with the proposed quality requirements and bonus points for reporting on a patient experience measure, the commenter requested that CMS clarify whether the CAHPS for MIPS survey would automatically provide two bonus points or would count as the one required high priority measure that all MIPS eligible clinicians must report before bonus points are counted. The commenters recommended ensuring specialists have the same opportunity as primary care practices. Other commenters urged CMS to work closely with the transplant community and the American College of Surgeons to adopt a patient experience of care measure that is relevant to all surgeons, including transplant surgeons, and that adequately takes into account the team-based nature of transplantation and other complex surgery.

Response: We would like to explain for commenters that the CAHPS for MIPS survey is included under the quality performance category, as well as the improvement activities performance category as a high weighted activity in the Patient Safety and Practice Assessment subcategory noted in Table H of the Appendix in this final rule with comment period. In addition, the CAHPS for MIPS survey measures complement other measures of care quality by generating information about aspects of care quality for which patients are the best or only source of information, such as the degree to which care is respectful and responsive to their needs (for example, "patient-centered"); therefore, these measures are well suited to the quality performance category. We do recognize that certain specialties such as surgeons, anesthesiologists, pathologists and radiologists that do not provide primary care services may not have patients to whom the CAHPS for MIPS survey could be issued and would therefore not be able to receive any bonus points for patient experience. However, these specialties do have the ability to earn bonus points for other high priority measures. We agree with the commenters that ensuring all specialties have the ability to earn full points for the quality performance category is important. We believe that we have constructed the quality category in a manner where this is true.

Comment: Other commenters encouraged CMS to require for all MIPS eligible clinicians in groups to report the CAHPS for MIPS survey. One commenter suggested these CAHPS for MIPS survey measures transcend the core survey and include questions from the Cultural Competence supplement and the Health IT supplement. Another commenter was very concerned that the CAHPS for MIPS survey was optional under MIPS. They stated that the CAHPS for MIPS survey is the only standardized, validated tool available in the public domain to capture information about the experience of care from a patient's perspective. The commenter requested that CMS finalize this as a mandatory reporting requirement for groups of 100 or more. In addition, the commenter further requested that CMS consider developing an easier-to-administer version in the future. Another commenter stated that CMS should encourage the development and use of PROMs. Other commenters requested that CMS reconsider mandating the participation for practice groups of a certain size, such as 50 MIPS eligible clinicians.

Response: We do not believe making the CAHPS for MIPS survey mandatory to be an appropriate policy at this time, but we will consider doing so for future MIPS performance years. Rather as we have indicated at the onset of this rule, we are removing as many barriers from participation as possible to encourage clinicians to participate in the MIPS. We are mindful of the reporting burden and expense associated with patient reported measures such as CAHPS for MIPS and do not want to add a cost or reporting burden to clinicians who prefer to choose other measures. We also believe that by providing bonus points for patient experience surveys, we believe that we are still able to emphasize that patient experience is an important component of quality measurement and improvement. We also appreciate the request to consider developing an easier to administer version and will take into consideration in the future.

Comment: Other commenters urged CMS to continue exclusion of pathologists, as non-patient facing, from selection as "focal providers" about whom the CAHPS for MIPS survey asks.

Response: We thank the commenters for their feedback on non-patient facing MIPS eligible clinicians and the CAHPS for MIPS survey. We agree that non-patient facing MIPS eligible clinicians should not be considered the clinician named in the survey who provided the beneficiary with the majority of the primary care services delivered by the

group practice, that is, the "focal provider" for that survey.

Comment: Several commenters supported CMS' proposal to no longer require that larger practices report on patient experience, explaining that, historically, this measure was not intended to target emergency clinicians, yet larger emergency practices were still required to go through the time and expense of contracting with a certified survey vendor before finding out whether they were exempt from the requirement. Another commenter supported voluntary reporting of the CAHPS for MIPS survey. The commenter stated the CAHPS for MIPS survey is too long and generates low response rates. The commenter urged CMS to work with MIPS eligible clinicians, AHRQ, CAHPS stewards, and other stakeholders to develop means for obtaining patient experience data. A few commenters stated that many MIPS eligible clinicians survey their patients' satisfaction in a variety of patient care areas, and these surveys are often electronic and allow timely submission of feedback that is valuable to the overall patient care experience. The commenters suggested that CMS consider allowing MIPS eligible clinicians to survey their patients through alternative surveys.

Response: We thank the commenters for this feedback and acknowledge that there may be other potential survey methods. However, the CAHPS for MIPS survey is the only survey instrument with robust evidence support demonstrating a beneficial impact on quality. For a program of this scale that also has payment implications, we believe the CAHPS for MIPS survey is the most appropriate survey to utilize.

Comment: Some commenters stated that small practices cannot afford to pay vendors to obtain the CAHPS for MIPS survey information for bonus points.

Response: We would like to explain that the CAHPS for MIPS survey is optional for all MIPS eligible clinician groups, and that there are other ways to obtain bonus points, such as by reporting additional outcome measures.

Comment: Other commenters encouraged CMS to invest resources in evolving CAHPS instruments—or creating new tools—to be more meaningful to consumers, more efficient and less costly to administer and collect, and better able to supply clinicians with real-time feedback for practice improvement. The commenters would like this to include continuing research and implementation efforts to combine patient experience survey scores with narrative questions.

Response: We will take under advisement for future rulemaking.

Comment: Another commenter supported the proposal to use all-payer data for quality measures and patient experience surveys. The commenter supported stratification by demographic characteristics to the degree that such stratification is feasible and appropriate and thinks CMS should make this data publicly available at the individual and practice level.

Response: We thank the commenter for their support. We will take this recommendation into consideration for future rulemaking.

Comment: A few commenters stated that the potential expansion of the CAHPS for MIPS survey to all-payer data should be optional, as this could make the survey more costly and lead to it being unaffordable to those who use it in its current form. Other commenters recommended that CMS expand the CAHPS for MIPS patient sample and survey process to include additional payers, in a process similar to that used by the HCAHPS, Hospice CAHPS, and the Outpatient and Ambulatory Surgery CAHPS surveys.

Response: As we continue to evaluate the inclusion of all-payer data as part of the CAHPS for MIPS survey, we will consider the impact of implementation as well as viable options.

Comment: One commenter was concerned about the patient satisfaction surveys, particularly in the context of team-based care delivery. The commenter noted that individual scoring of patient satisfaction is prone to misassignment of both good and bad quality. Another commenter expressed concern about the numerous patient surveys because, although patient feedback is important, this feedback must be balanced by acknowledging limitations to these surveys. The commenter mentioned that selection bias and survey fatigue may become a problem. Another commenter questioned whether the CAHPS for MIPS survey was an accurate reflection of the quality of care patients received, or whether it might be biased by superficial factors. The commenter also questioned the surveys statistical validity. The commenter encouraged CMS to explore alternative means of capturing patient experience, which is different from patient satisfaction.

Response: The CAHPS for MIPS survey is optional for groups. However, because we believe assessing patients' experiences as they interact with the health care system is important, our proposed scoring methodology would give bonus points for reporting CAHPS data (or other patient experience

measures). In addition, while patient experience may not always be associated with health outcomes, there is some evidence of a correlation between higher scores on patient experience surveys and better health outcomes. Please refer to <http://www.ahrq.gov/cahps/consumer-reporting/research/index.html> for more information on AHRQ studies pertaining to patient experience survey and better health outcomes.

Comment: Another commenter stated that the CAHPS for MIPS survey should modify its wording to reflect that much work is done by a “care team” rather than a “clinician.”

Response: We thank the commenter for this feedback, which we will take into consideration for future rulemaking.

Comment: Some commenters believed that the CAHPS for MIPS survey should count for three measures, including one cross-cutting and one patient experience measure, noting that in the past, CMS has counted the CAHPS for PQRS survey as three measures covering one NQS domain. Another commenter encouraged CMS to require that MIPS eligible clinicians reporting CAHPS still submit an outcome measure, if one is available.

Response: We recognize that under the PQRS program, CAHPS surveys counted as three quality measures rather than one quality measure. To simplify our scoring and communications we are only counting the CAHPS for MIPS survey as one measure. We do note, however, that the CAHPS for MIPS survey would fulfill the requirement to report on a high priority measure, in those instances when MIPS eligible clinicians do not have an outcome measure available.

Comment: Other commenters believed that the CAHPS for MIPS survey is not designed for and is inappropriate for skilled nursing facility based MIPS eligible clinicians because in many situations the source of the information is not reliable due to the mental status of the patients being surveyed. Therefore, the commenters opposed applying bonuses and/or mandatory requirements to use such surveys in the quality performance category of MIPS until such surveys are available for MIPS eligible clinicians practicing in all settings of care.

Response: To ensure meaningful measurement of patient experiences, we plan to include the CAHPS for MIPS survey as one way to earn bonus points since we believe this survey is important and appropriate for the Quality Payment Program. However, we would like to explain that the CAHPS

for MIPS survey is optional for all MIPS eligible clinician groups, and that there are other ways for skilled nursing facilities to obtain bonus points, such as by reporting additional outcome measures or other high priority measures. We encourage stakeholders who are concerned about a lack of high priority measures to consider development of these measures and submit them for future use within the program. In addition, our strategy for identifying and developing meaningful outcome measures are in the quality measure development plan, authorized by section 102 of the MACRA (<https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>). The plan references how we plan to consider evidence-based research, risk adjustment, and other factors to develop better outcome measures.

Comment: Some commenters urged CMS to work with other stakeholders to improve upon the CAHPS for MIPS survey and/or develop additional tools for measuring patient experience. The commenters also encouraged CMS to consider ways to make the CAHPS for MIPS survey easier for patients to complete, including different options for how it is administered and employing skip logic to reduce its redundancy, and to make it more meaningful to clinicians, such as by disaggregating by different types of patients. Other commenters recommended that CMS consider having MIPS eligible clinicians report the CAHPS for MIPS survey using an electronic administration of the instrument because such tools would be more efficient for administering the survey and would offer MIPS eligible clinicians real-time feedback for practice improvement. A few commenters recommended that CMS use short-form surveys, electronic administration, and alternative instrument as a means to reduce the burden of surveying while improving utility to patients and MIPS eligible clinicians.

Response: We are exploring potential options available for the CAHPS for MIPS administration, including electronic modes of administration, for the future.

Comment: One commenter requested that clinicians have the option to use other patient satisfaction surveys, such as the surgical CAHPS survey.

Response: We thank the commenter for the suggestion and note that QCDRs would have the option to include the surgical CAHPS survey as one of their

non-MIPS measures, if they so choose. We will however take this comment into consideration for future rulemaking.

Comment: Another commenter recommended that CMS evaluate the CAHPS for MIPS survey and remove summary survey measures (SSMs) which make the survey less relevant for MIPS eligible clinicians and groups which are not delivering primary services, such as the “Access to Specialists” SSM, as the subsequent survey would be widely applicable to a large number of patient-facing MIPS eligible clinicians.

Response: We thank the commenter for the suggestion. We will continue to explore potential improvements to the CAHPS for MIPS survey in the future.

Comment: Some commenters opposed implementing the changes to the Clinician and Group survey items that AHRQ has released as CG-CAHPS 3.0, as a recent memorandum released by AHRQ indicates that the changes resulted in increased scores caused by the removal of low scoring questions and not an improvement in the experience of beneficiaries. A few commenters supported retaining lower performing CAHPS for MIPS questions as supplemental questions.

Response: We appreciate the interest in retaining survey items that AHRQ has removed from version 3.0 of CG-CAHPS, and will take that interest into consideration as we finalize the survey implementation, scoring, and benchmarking procedures for CAHPS for MIPS. It is important to note that CAHPS for MIPS will include content in addition to CG-CAHPS core items, including but not limited to shared decision-making, access to specialist care, and health promotion and education.

Comment: Other commenters recommended that the CAHPS for MIPS surveys be conducted closer to the time of a patient-clinician encounter to improve recall.

Response: We will consider the commenter’s recommendations in future rulemaking.

Comment: One commenter requested that CMS limit additional CAHPS for MIPS questions and that the CAHPS for MIPS survey either remain the same as for PQRS or that the questions remain stable for the first few program years.

Response: For the transition year of MIPS, the CAHPS for MIPS survey will primarily be the same as the current CAHPS for PQRS survey; however, as noted the survey contains additional questions to meet CMS’s program needs. We would like to note that there may be updates made in regards to those questions that meet CMS’s information

and program needs. Further, we would like to note that in future years we do anticipate that we will revise the CAHPS for MIPS survey. We anticipate these revisions will not only improve the survey, but reduce burden.

Comment: Another commenter requested clarification on how CMS can ensure the data are reliable to drive improvement when CAHPS for MIPS survey response rates are declining.

Response: Response rates to CAHPS for PQRS (the precursor to CAHPS for MIPS) are comparable to those of other surveys of patient care experiences. Under CAHPS for MIPS, we will adjust reported scores for case mix, which allows the performance of groups to be compared against the same case mix of patients. Studies have not found evidence that response rates bias comparisons of case-mix adjusted patient experience scores.

Comment: Some commenters recommended raising the threshold for the minimum number of patient CAHPS for MIPS survey responses to 30 to increase reliability.

Response: We will consider the commenter's recommendations in future rulemaking.

Comment: One commenter encouraged CMS to consider expanding the use of CAHPS for all clinicians as a tool in the quality measurement category of MIPS, with appropriate exclusions for rural and non-patient facing MIPS eligible clinicians. Additionally, the commenter encouraged CMS to expand the target population for such surveys to include the families of patients who have died, and to adapt questions from the hospice instrument so they can be used in CAHPS surveys of other settings to assess palliative care eligible clinicians and eligible clinicians who treat the patients facing the end of life in other settings other than hospice.

Response: We appreciate the recommendation and will continue to look at ways to expand the CAHPS survey.

After consideration of the comments regarding our proposed performance criteria for quality measures for groups electing to report the CAHPS for MIPS survey we are finalizing the policies as proposed. Specifically, we are finalizing at § 414.1335(a)(3) the following criteria for the submission of data on the CAHPS for MIPS survey by registered groups via CMS-approved survey vendor: For the applicable 12-month performance period, a group that wishes to voluntarily elect to participate in the CAHPS for MIPS survey measures must use a survey vendor that is approved by CMS for a particular performance period

to transmit survey measures data to CMS. The CAHPS for MIPS survey counts for one measure towards the MIPS quality performance category and, as a patient experience measure, also fulfills the requirement to report at least one high priority measure in the absence of an applicable outcome measure. In addition, groups that elect this data submission mechanism must select an additional group data submission mechanism (that is, qualified registries, QCDRs, EHR etc.) in order to meet the data submission criteria for the MIPS quality performance category. The CAHPS for MIPS survey will count as one patient experience measure, and the group will be required to submit at least five other measures through one other data submission mechanisms. A group may report any five measures within MIPS plus the CAHPS for MIPS survey to achieve the six measures threshold. We will retain the survey administration period for the CAHPS for MIPS survey November to February. Groups that voluntarily elect to participate in the CAHPS for MIPS survey will bear the cost of contracting with a CMS-approved survey vendor to administer the CAHPS for MIPS survey on the group's behalf. Groups electing to report the CAHPS for MIPS survey will be required to register for the reporting of data. Only Medicare beneficiaries can be selected to participate in the CAHPS for MIPS survey.

(b) Data Completeness Criteria

We want to ensure that data submitted on quality measures are complete enough to accurately assess each MIPS eligible clinician's quality performance. Section 1848(q)(5)(H) of the Act provides that analysis of the quality performance category may include quality measure data from other payers, specifically, data submitted by MIPS eligible clinicians with respect to items and services furnished to individuals who are not individuals entitled to benefits under Part A or enrolled under Part B of Medicare.

To ensure completeness for the broadest group of patients, we proposed at § 414.1340 the criteria below. MIPS eligible clinicians and groups who do not meet the proposed reporting criteria noted below would fail the quality component of MIPS.

- Individual MIPS eligible clinicians or groups submitting data on quality measures using QCDRs, qualified registries, or via EHR need to report on at least 90 percent of the MIPS eligible clinician or group's patients that meet the measure's denominator criteria, regardless of payer for the performance

period. In other words, for these submission mechanisms, we would expect to receive quality data for both Medicare and non-Medicare patients.

- Individual MIPS eligible clinicians submitting data on quality measures data using Medicare Part B claims would report on at least 80 percent of the Medicare Part B patients seen during the performance period to which the measure applies.

- Groups submitting quality measures data using the CMS Web Interface or a CMS-approved survey vendor to report the CAHPS for MIPS survey would need to meet the data submission requirements on the sample of the Medicare Part B patients CMS provides.

We proposed to include all-payer data for the QCDR, qualified registry, and EHR submission mechanisms because we believe this approach provides a more complete picture of each MIPS eligible clinician's scope of practice and provides more access to data about specialties and subspecialties not currently captured in PQRS. In addition, we proposed the QCDR, qualified registry, or EHR submission must contain a minimum of one quality measure for at least one Medicare patient.

We desire all-payer data for all reporting mechanisms, yet certain reporting mechanisms are limited to Medicare Part B data. Specifically, the claims reporting mechanism relies on individual MIPS eligible clinicians attaching quality information on Medicare Part B claims; therefore only Medicare Part B patients can be reported by this mechanism. The CMS Web Interface and the CAHPS for MIPS survey currently rely on sampling protocols based on Medicare Part B billing; therefore, only Medicare Part B beneficiaries are sampled through that methodology. We welcomed comments on ways to modify the methodology to assign and sample patients for these mechanisms using data from other payers.

The data completeness criteria we proposed are an increase in the percentage of patients to be reported by each of the mechanisms when compared to PQRS. We believe the proposed thresholds are appropriate to ensure a more accurate assessment of a MIPS eligible clinician's performance on the quality measures and to avoid any selection bias that may exist under the current PQRS requirements. In addition, we would like to align all the reporting mechanisms as closely as possible with achievable data completeness criteria. We intend to continually assess the proposed data completeness criteria and will consider increasing these

thresholds for future years of the program. We requested comments on this proposal.

We were also interested in data that would indicate these data completeness criteria are inappropriate. For example, we could envision that reporting a cross-cutting measure would not always be appropriate for every telehealth service or for certain acute situations. We would not want a MIPS eligible clinician to fail reporting the measure in appropriate circumstances; therefore, we solicited feedback data and circumstances where it would be appropriate to lower the data completeness criteria.

The following is summary of the comments we received regarding our proposed data completeness criteria.

Comment: The majority of commenters recommended that CMS reduce the quality reporting thresholds to 50 percent, and not proceed with the proposals to increase the threshold for successfully reporting a measure to 80 percent via claims, and 90 percent via EHR, clinical registry, QCDR, or CMS Web Interface. The commenters cited numerous concerns and justifications for a modified threshold including: The 50 percent reporting rate allows those MIPS eligible clinicians just starting to report a quicker pathway to success and to gain familiarity with the program before such a high threshold is established, an advanced announcement of an increased threshold through future rulemaking provides those MIPS eligible clinicians already reporting sufficient time to implement changes to their practice to meet the higher threshold, and the proposed thresholds would present a significant administrative burden and make higher quality scores difficult to achieve. These commenters believed a majority of MIPS eligible clinicians would struggle to meet the proposed threshold of 90 percent and that the threshold is unrealistic. Another commenter opposed CMS's proposal to increase the reporting thresholds because this leaves MIPS eligible clinicians and third party data submission vendors with very little room for expected error.

Response: We thank the commenters for their detailed feedback. Based on the overwhelming feedback received, we do not intend to finalize the data completeness thresholds as proposed. The numerous details the commenters cited on the increased burden the data completeness thresholds will impose on MIPS eligible clinicians is not intended. We agree with the commenters that some of the unintended consequences of having a higher data completeness threshold may jeopardize the MIPS

eligible clinician's ability to participate and perform well under the MIPS. We want to ensure that an appropriate yet achievable level of data completeness is applied to all MIPS eligible clinicians. Based on stakeholder feedback, for the transition year of MIPS, we will finalize a 50 percent data completeness threshold for claims, registry, QCDR, and EHR submission mechanisms. This threshold is consistent with the current PQRS program. Additionally, for the second year of MIPS, for performance periods occurring in 2018, we are finalizing a 60 percent data completeness threshold for claims, registry, QCDR, and EHR submission mechanisms. We believe it is important to incorporate higher thresholds in future years to ensure a more accurate assessment of a MIPS eligible clinician's performance on the quality measures and to avoid any selection bias. We also believe that we are providing ample notice to MIPS eligible clinicians so they can take the necessary steps to prepare for this higher threshold for MIPS payment year 2020. Lastly, we anticipate that, in the 2021 MIPS payment year and beyond, for performance periods occurring in 2019 forward, as MIPS eligible clinicians gain experience with the MIPS we would further increase these thresholds over time.

Comment: Another commenter cited specific concerns for QCDRs. The commenter believed the 50 percent threshold for QCDRs to report should be maintained for reporting and data completeness because of the proposed changes to QCDR functionality such as reporting additional performance categories and requiring MIPS eligible clinician feedback at least six times a year. Another commenter stated that the rule needs to maximize the role of QCDRs to ensure reporting and data submission are flexible, meaningful, and useful. The proposed QCDR requirement increasing from 50 to 90 percent will require reassuring MIPS eligible clinicians of the value of QCDR participation and reporting.

Response: We appreciate the commenters concerns and as mentioned previously we are modifying the data completeness threshold for individual MIPS eligible clinicians and groups submitting data on quality measures using QCDRs. For the transition year, the MIPS eligible clinician will need to report on at least 50 percent of the MIPS eligible clinician or group's patients that meet the measure's denominator criteria, regardless of payer for the performance period. We do note that for the second year of MIPS, for performance periods occurring in 2018,

we are increasing the data completeness threshold to 60 percent. We also anticipate, that in the third and future years of MIPS, for performance periods occurring in 2019 and forward, as MIPS eligible clinicians gain experience with the MIPS we would further increase these thresholds over time. Lastly, we also want to refer the commenter to section II.E.9.a. of this final rule with comment period where we discuss the requirements to become a QCDR under the MIPS.

Comment: Another commenter stated that setting a data completeness threshold of 80 or 90 percent is not achievable for practices, especially given struggles trying to meet the requirement for reporting measures for 50 percent of Medicare patients under PQRS. The commenter expressed disappointment that average reporting threshold rates from 2014 PQRS Experience Report were not disclosed. The 80 or 90 percent requirement creates additional burden as well given inclusion of all-payer data requirement. The commenter also believed that vendors will not be able to meet these more stringent requirements, especially for first performance period. The commenter urged CMS to reduce data completeness threshold to 50 percent of applicable Medicare Part B beneficiary encounters via claims and 50 percent for reporting via registry, EHR and QCDR.

Response: As noted above, for the transition year of MIPS, we will finalize a 50 percent data completeness threshold for claims, registry, QCDR, and EHR submission mechanisms. This threshold is consistent with the current PQRS program. While we can appreciate the concern raised by the commenter related to vendors' readiness, we do not anticipate that vendors will have difficulty in meeting the original proposed data completeness threshold or the modified data completeness threshold we are finalizing here. Lastly, we will include the average reporting threshold rates for future years of the PQRS Experience Report, as technically feasible.

Comment: Another commenter urged CMS to apply consistent data reporting requirements regardless of the method of data submission, as the commenter disagreed with different measure submission requirements for clinicians using a QCDR, qualified registry, or EHR. The commenter stated this consistency would allow for fair comparisons among clinicians.

Response: We agree with the commenter and would like to explain that we did not propose different data completeness threshold nor are we finalizing different data completeness

thresholds across the QCDR, qualified registry, or EHR submission mechanisms.

Comment: Another commenter stated it is necessary to maintain a 50 percent threshold until a certain level of interoperability for data exchange across registries, EHRs and other data sources has been achieved. This commenter believed that claims reporting is the most burdensome for MIPS eligible clinicians as quality data codes (QDCs) will need to be attached for each applicable claim.

Response: As noted above we are finalizing a 50 percent data completeness threshold for the transition year of MIPS. However, we do not agree that we can remain at a 50 percent threshold until interoperability is achieved. Rather we believe by providing ample notice to MIPS eligible clinicians and third party intermediaries, we can increase the thresholds over time. It is important to note that for the second year of MIPS, for performance periods occurring in 2018, we are increasing the data completeness threshold to 60 percent. We also anticipate, that for performance periods occurring in 2019 and forward, as MIPS eligible clinicians gain experience with the MIPS we would further increase these thresholds over time. Lastly, we recognize that the differing submission mechanisms have varying levels of burden on the MIPS eligible clinicians, which is why we believe that having multiple submission mechanisms as options is an important component as clinicians gain experience with the MIPS.

Comment: Other commenters recommended a 50 percent threshold to ensure quality performance category scoring does not favor large practices. The commenters were concerned that CMS' proposed scoring favors large practices that submit data through the CMS Web Interface. The commenters noted that MIPS eligible clinicians using CMS Web Interface to submit data automatically achieve all of the requirements (plus bonus points) to potentially earn maximum points, and only need to report on a sampling of patients rather than the high percentage of patients needed for other data submission methods, and that this provides an advantage for these MIPS eligible clinicians over MIPS eligible clinicians in smaller practices.

Response: While we do not agree that the MIPS quality scoring methodologies favor large practices that submit data using the CMS Web Interface, we can agree that small practices may require additional flexibilities under the MIPS. Therefore, as noted previously, we are

finalizing flexibilities for smaller practices throughout this final rule with comment period, such as reduced improvement activities requirements.

Comment: A few commenters indicated that the proposed thresholds would create an environment with little room for error, does not account for potential vendor, administrative or other problems, and will jeopardize MIPS eligible clinicians' success. These commenters noted that MIPS eligible clinicians may be deterred from reporting high priority and outcome measures and from reporting via electronic means due to the administrative burden posed by the high thresholds. The commenters stated that a 50 percent threshold still requires MIPS eligible clinicians to report on a majority of patients, and that this threshold does not encourage "gaming": Once MIPS eligible clinician workflows are in place, it is onerous to deviate from them simply to pick and choose which patients to include in which measure. The commenter stated that the higher threshold is especially burdensome for small practices without the resources to hire a full-time or part-time employee to collect and document such information.

Response: We did not intend to increase the burden on MIPS eligible clinicians or deter MIPS eligible clinicians from submitting data on high priority measures. While we can agree with the commenters that modifying existing clinical workflows can be burdensome, we believe that once these workflows are established, performing the quality actions for the denominator eligible patients becomes part of the clinical workflow and is not unduly burdensome. For the transition year of MIPS, we will finalize a 50 percent data completeness threshold for claims, registry, QCDR, and EHR submission mechanisms. This threshold is consistent with the current PQRS program. Additionally, for the second year of MIPS, for performance periods occurring in 2018, we are finalizing a 60 percent data completeness threshold for claims, registry, QCDR, and EHR submission mechanisms. We believe it is important to incorporate higher thresholds in future years to ensure a more accurate assessment of a MIPS eligible clinician's performance on the quality measures and to avoid any selection bias. We also believe that we are providing ample notice to MIPS eligible clinicians so they can take the necessary steps to prepare for this higher threshold in the second year of the MIPS. We anticipate that, for performance periods occurring in 2019 and forward, as MIPS eligible clinicians

gain experience with the MIPS we would further increase these thresholds over time.

Comment: Another commenter stated the reporting requirement of at least 90 percent of all patients (not just Medicare) is not possible and that this is equivalent to requiring MIPS eligible clinicians to report on more than six individual quality measures and is a substantial change from the 20 patient requirement for measures groups under the current PQRS rule. The commenter's stated that their group performs thousands of general and vascular surgeries each year and that devoting the time and cost to review every hospital chart, operative note and call every patient at least once 30 days post operation simply is not possible. Another commenter stated that the data completeness criteria are onerous and require MIPS eligible clinicians to report on such a high percentage of their patients limits the types of measures physicians will be able to report (for example, MIPS eligible clinicians will prefer non-resource-intensive outcome measures).

Response: We appreciate the commenters concerns and did not intend for the data completeness thresholds to limit the types of patients MIPS eligible clinicians would submit data on. We are finalizing a 50 percent threshold for the transition year, and a 60 percent threshold for the second year of the MIPS, for performance periods occurring in 2018. We do believe, however, it is important to incorporate higher thresholds in future years to ensure a more accurate assessment of a MIPS eligible clinician's performance on the quality measures and to avoid any selection bias. We also believe that we are providing ample notice to MIPS eligible clinicians so they can take the necessary steps to prepare for this higher threshold in the second year of the MIPS. We anticipate that, for performance periods occurring in 2019 and forward, as MIPS eligible clinicians gain experience with the MIPS we would further increase these thresholds over time. We will however monitor these policies to ensure that these data completeness thresholds do not become overly burdensome that they deter MIPS eligible clinicians from submitting data on their appropriate patient population.

Comment: One commenter, a small mental health clinic, cited numerous reasons for concern including clients not tolerating significant time to ask assessment questions, difficulty in finding applicable measures, medical staff's limited time with clients, difficulty in getting measures from clients seen in their homes, clinical

inappropriateness of spending entire first or second appointments gathering PQRS measures, issues with PHQ9 score improvement, and other reporting requirements including California's Medi-Cal and Mental Health Service Act requirements. The commenter suggested the continued use of the 50 percent reporting requirement under PQRS.

Response: We can appreciate the concerns raised by the commenter. We are continuing to use a 50 percent data completeness threshold similar to what was used under PQRS. We do note however that under MIPS the data completeness threshold applies for both Medicare and non-Medicare patients.

Comment: One commenter also requested that CMS release data demonstrating that raising the reporting rate is feasible for all MIPS eligible clinicians. This commenter noted the 2017 and 2018 PQRS and VBPM policies required 50 percent completeness and was a decrease from previous years, acknowledging feedback from clinicians. The commenter stated that issuing a drastic increase as clinicians shift to a new system will be problematic, and the commenter suggested remaining at 50 percent for the first few years and consider phasing in increases if it is found that 50 percent is feasible.

Response: We thank the commenters for their detailed feedback. Based on the overwhelming feedback received, we do not intend to finalize the data completeness thresholds as proposed. The numerous details the commenters cited on the increased burden the data completeness thresholds will impose on clinicians is not intended. We want to ensure that an appropriate yet achievable level of data completeness is applied to all MIPS eligible clinicians. Based on stakeholder feedback for the transition year of MIPS, we will finalize a 50 percent data completeness threshold for claims, registry, QCDR, and EHR submission mechanisms. This threshold is consistent with the current PQRS program. However, we continue to target a 90 percent reporting requirement as MIPS eligible clinicians gain experience with the MIPS we would further increase these thresholds over time.

Comment: Another commenter agreed with the proposal to include at least 90 percent of patients regardless of payer to CMS in order to provide the most complete picture of the MIPS eligible clinician's quality, especially for specialists.

Response: We thank the commenter for their support. However, based on stakeholder feedback, for the transition year of MIPS, we will finalize a 50

percent data completeness threshold for claims, registry, QCDR, and EHR submission mechanisms.

Comment: A few commenters believed that a 100 percent review is not feasible because their practice performs 10,000 procedures annually. The commenters believed that review of 25–30 procedures is more practical.

Response: Based on the overwhelming feedback received, we do not intend to finalize the data completeness thresholds as proposed. The numerous details the commenters cited on the increased burden the data completeness thresholds will impose on MIPS eligible clinicians is not intended. We want to ensure that an appropriate yet achievable level of data completeness is applied to all MIPS eligible clinicians. After consideration of stakeholder feedback, for the transition year of MIPS, we are modifying our proposal and will finalize a 50 percent data completeness threshold for claims, registry, QCDR, and EHR submission mechanisms.

Comment: Other commenters requested that CMS consider using other reporting options that do not involve collecting data from a certain percentage of patients, such as requiring clinicians to report on a certain number of consecutive patients. The commenters believed the consecutive case approach could minimize the reporting burden while allowing for the collection of information to assess performance.

Response: In the early years of PQRS we required EPs to report on a certain number of consecutive patients if the clinician was reporting a measures group. Our experience was that many EPs failed to meet the reporting requirements as they missed one or more patients in the consecutive sequence.

Comment: A few commenters supported the proposal to give scores of zero if MIPS eligible clinicians can, but fail to, report on the minimum number of measures.

Response: We thank the commenter for their support of our proposal.

Comment: Another commenter supported CMS's proposal in the quality performance category to recognize a measure as being submitted and not assign a clinic zero points for a non-reported measure when a measure's reliability or validity may be compromised due to unforeseen circumstances, such as data collection problems. The commenter recommended that CMS notify affected MIPS eligible clinicians and groups by mail if in the future a data collection or vendor submission issue arises.

Response: We intend to make every effort to notify affected MIPS eligible clinicians if data collection issues arise.

Comment: Many commenters disagreed with the proposal to include all-payer data. Several commenters believed that requiring MIPS eligible clinicians to report all-payer data goes beyond the scope of CMS's programmatic authority and need, violates clinicians' ethical duties to patient confidentiality, and violates patients' privacy rights. Other commenters stated the federal government should not be able to access the medical information of patients who are not CMS beneficiaries. Another commenter believed that MIPS eligible clinicians may be discouraged from reporting through registries, QCDRs, and EHRs due to the requirement that they report on all of their patients regardless of payer. One commenter urged CMS to remove the requirement to report all patients when reporting via registry.

Another commenter noted that MIPS eligible clinicians reporting outcomes should document all factors affecting outcomes, especially adversely affecting outcomes. The commenter stated that socioeconomic status, family support systems, cognitive dysfunction and mental health issues affect compliance and outcomes. Therefore, coding for some of these factors can be misleading, even if there are available options for diagnostic coding. The commenter noted that open access to all physician notes would jeopardize proper documentation of these issues. The commenter added that diagnostic coding must not inhibit documentation of issues and concerns for physicians, and that there must be proper acuity adjustment in measuring physician or team performance. The commenter suggested that all charts have certain areas of restricted protected access to allow documentation of such issues, and that this type of charting must be available to physicians who are not categorized as mental health professionals.

Response: We have received numerous previous comments noting that it can be difficult for clinicians to separate Medicare beneficiaries from other patients, and our intention with seeking all-payer data is to make reporting easier for MIPS eligible clinicians. We note that section 1848(q)(5)(H) of the Act authorizes the Secretary to include, for purposes of the quality performance category, data submitted by MIPS eligible clinicians with respect to items and services furnished to individuals who are not Medicare beneficiaries. Furthermore, we believe that all-payer data makes it

easier for MIPS eligible clinicians to obtain a complete view of their quality performance without focusing on one subset or another of their patient populations. We do not believe that collection of this data constitutes a violation of patient privacy. We do not believe that the collection of all-payer data will decrease MIPS eligible clinicians' utilization of registries, QCDRs, and EHRs. It is important to note that MIPS eligible clinicians may elect to report information at the aggregate level which does not have any patient-identifiable information. We agree that documentation related to outcomes is challenging and we continue to work to identify the impact of socio-demographic status on patient outcomes.

Comment: Other commenters supported the proposal to use all-payer data for quality measures and also for patient experience surveys, recognizing that these data will create a more comprehensive picture of a MIPS eligible clinician's performance. Another commenter was supportive of the proposal to require MIPS eligible clinicians reporting quality data via qualified registries or EHR to report on both Medicare and non-Medicare patients. The commenter favored the proposal because it would be administratively easier and because quality of care affects all patients, not just those covered by Medicare.

Response: We thank the commenters for the support.

Comment: A few commenters recommended that CMS phase-in the requirement to include all-payer data for the QCDR, qualified registry, and EHR submission mechanisms and suggests that for year 1 of the program, requiring only Medicare data would be a more appropriate first step.

Response: Third party intermediaries were required to utilize all payer data in PQRS. Therefore, we do not believe it should be a burden as they have already been meeting this requirement.

Comment: Other commenters asked whether reporting all-payer data is optional year 1 of the program, whether there is a minimum percentage of Medicare Part B patients required, where the benchmarks will come from, and how it will be ensured that the benchmarks are comparable across the industry. Some commenters recommended that reporting on other payers be optional and that MIPS eligible clinicians not be penalized for activities related to payers other than Medicare. The commenters stated that the law does not require reporting data on other payers' patients. The commenters believed that reporting on

all payers may skew data in favor of MIPS eligible clinicians with large private payer populations over physicians with large Medicare patient populations. A few commenters expressed concern that some practices will be required to submit data that represents all payers because Medicare populations are very different from those covered by other payers. This may create an inequitable assessment of quality performance.

Response: We would like to explain that reporting all-payer data is not optional for the transition year of MIPS. We desire all-payer data for all reporting mechanisms, yet certain reporting mechanisms are limited to Medicare Part B data. Specifically, the claims reporting mechanism relies on individual MIPS eligible clinicians attaching quality information on Medicare Part B claims; therefore, only Medicare Part B patients can be reported by this mechanism. The CMS Web Interface and the CAHPS for MIPS survey currently rely on sampling protocols based on Medicare Part B billing; therefore, only Medicare Part B beneficiaries are sampled through that methodology. In regards to the commenters concern that using all-payer data would create an inequitable assessment of the MIPS eligible clinicians' performance on quality, we respectfully disagree. Rather, we believe that utilizing all-payer data will provide a more complete picture of the MIPS eligible clinicians' performance.

Comment: A few commenters suggested that rather than collecting data from all-payers for the quality performance category under MIPS, CMS should consider the federated data model, which would allow for different datasets to feed into a single virtual dataset that would organize the data. The commenters stated this would allow analysis and comparisons across datasets without structuring all of the source databases.

Response: We thank the commenters for this feedback and will take into consideration for development in future rulemaking.

Comment: Other commenters stated that the practice of medicine will be compromised by linking payment to collection of private patient data and making it available to CMS through electronic medical records.

Response: We believe that MIPS eligible clinicians will continue to uphold the highest ethical standards of their professions and that medical practice will not be compromised by the MIPS program. Clinicians may elect to report information at the aggregate level

which does not have any patient-identifiable information.

Comment: Other commenters were very concerned that increasing the reporting threshold for quality data from 50 percent or more of Medicare patients to 90 percent or more of all patients regardless of payer is a major change that should be approached more gradually to give clinicians a chance to adapt. The commenters suggested a more gradual change, at least in the first few years, such as keeping the patient base and threshold as is (50 percent or more of the Medicare population) or even a smaller increase in threshold (maybe 60 or 75 percent of patients) but only for Medicare beneficiaries rather than all payers. Another commenter requested reporting go from 50 to 75 percent and be applied to Medicare patients only (as opposed to private insurance patients).

Response: We are modifying our proposal and finalizing a 50 percent threshold for individual MIPS eligible clinicians or groups submitting data on quality measures using QCDRs, qualified registries, via EHR, or Medicare Part B claims. In addition, we are finalizing our approach of including all-payer data for the QCDR, qualified registry, and EHR submission mechanisms because we believe this approach provides a more complete picture of each MIPS eligible clinician's scope of practice and provides more access to data about specialties and subspecialties not currently captured in PQRS.

Comment: Some commenters questioned CMS's ability to validate data completeness criteria for all-payer data under the quality performance category. They stated that because of this, all-payer completeness criteria function more like a request than a requirement. The commenters also requested information on what the auditing, notification, and appeal (targeted review) process will be specific to all-payer data completeness.

Response: We recognize that our data completeness criteria are different since we are now requiring all-payer data. However, we do not currently have the optimal capability to validate data completeness for all-payer data. Please note validation of all-payer data will therefore continue to be reviewed based on the data submission mechanism used. For example, if the quality measure data is submitted directly from an EHR for an electronic Clinician Quality Measure (eCQM), we expect completeness from EHR reports will cover all of the patients that meet the inclusion criteria for the measure, to include all-payer data found within the

EHR data set for the population attributed to that measure. If the quality data is submitted via the CMS Web Interface, we will provide the sample of patients that must be reported on to CMS, though more may be included given the all-payer allowance under MIPS. For the transition year of MIPS we expect that MIPS eligible clinicians, and especially third party intermediaries, will comply fully with the requirements we are adopting.

Comment: Another commenter was supportive of the proposal to require MIPS eligible clinicians reporting quality data via qualified registries or EHR to report on both Medicare and non-Medicare patients. The commenter favored the proposal because it would be administratively easier and because quality of care affects all patients, not just those covered by Medicare.

Response: We thank the commenter for their support.

Comment: Some commenters agreed that CMS should include all-payer data in order to push quality improvement throughout the entire health care system. The commenters were concerned, however, that including all-payer data, combined with the amount of flexibility some clinicians have in choosing which quality measures to report, may end up obscuring the quality of care actually received by Medicare beneficiaries. The commenters recommended CMS implement additional requirements or safe guards for the inclusion of all-payer data. The commenters also supported CMS raising the data completeness thresholds above what was required under PQRS and increasing these thresholds even higher in future years of MIPS. Some commenters recommended that CMS continue to encourage the creation of databases across the payer community but treat this as a long-term goal rather than yet another operational item with uncertain implications. Although commenters supported all-payer databases conceptually, they believed that operationally the United States is far from this reality.

Response: We agree that there is potential for further quality improvement by utilizing all-payer data. We also believe the MIPS program's flexibility in measure selection is an asset. We will monitor the MIPS program's impacts on care quality carefully, particularly for Medicare beneficiaries.

Comment: Some commenters suggested changing the 90 percent of patients' measures group reporting requirement to 25 patients per surgeon and suggested this will achieve statistical validity and is achievable

level of data collection. The surgery measures groups as defined in the proposal would then provide the commenter's practice with highly valuable information that could benefit all patients as the MIPS eligible clinicians review ways to operate more safely, efficiently and at a lower cost. Another commenter recommended that CMS update patient sampling requirements over time.

Response: We are modifying our proposal and finalizing a 50 percent threshold for the transition year of MIPS for individual MIPS eligible clinicians or groups submitting data on quality measures using QCDRs, qualified registries, via EHR, or Medicare Part B claims. In addition, we are finalizing our approach of including all-payer data for the QCDR, qualified registry, and EHR submission mechanisms because we believe this approach provides a more complete picture of each MIPS eligible clinician's scope of practice and provides more access to data about specialties and subspecialties not currently captured in PQRS. We have removed the measures groups referenced in the comment and replaced them with specialty-specific measure sets.

Comment: A few commenters sought clarification on scoring when a MIPS eligible clinician fails to submit data for the required 80 or 90 percent data completeness threshold; that is, where a MIPS eligible clinician reports on less than the 80 or 90 percent of patients but has a greater than zero performance rate.

Response: We appreciate the commenter seeking clarification. As discussed, we are reducing the threshold for the data completeness requirement as outlined below for the transition year of MIPS. In addition, we proposed that measures that fell below the data completeness threshold to be assessed a zero; however, in alignment with the goal to provide as many flexibilities to MIPS eligible clinicians as possible, for the transition year, MIPS eligible clinicians whose measures fall below the data completeness threshold would receive 3 points for submitting the measure. We will revisit data completeness scoring policies through future rulemaking. It is important to note that we are also finalizing to ramp up the data completeness threshold to 60 percent for MIPS, for performance periods occurring in 2018, for data submitted on quality measures using QCDRs, qualified registries, via EHR, or Medicare Part B claims. In addition, these thresholds for data submitted on quality measures using QCDRs, qualified registries, via EHR, or Medicare Part B claims will increase for

MIPS for performance periods occurring in 2019 and forward.

As a result of the comments regarding our proposal on data completeness criteria we are not finalizing our policy as proposed. Rather we are finalizing at § 414.1340 the data completeness criteria below for MIPS during the 2017 performance period.

- Individual MIPS eligible clinicians or groups submitting data on quality measures using QCDRs, qualified registries, or via EHR must report on at least 50 percent of the MIPS eligible clinician or group's patients that meet the measure's denominator criteria, regardless of payer for the performance period. In other words, for these submission mechanisms, we expect to receive quality data for both Medicare and non-Medicare patients. For the transition year, MIPS eligible clinicians whose measures fall below the data completeness threshold of 50 percent would receive 3 points for submitting the measure.

- Individual MIPS eligible clinicians submitting data on quality measures data using Medicare Part B claims, would report on at least 50 percent of the Medicare Part B patients seen during the performance period to which the measure applies. For the transition year, MIPS eligible clinicians whose measures fall below the data completeness threshold of 50 percent would receive 3 points for submitting the measure.

- Groups submitting quality measures data using the CMS Web Interface or a CMS-approved survey vendor to report the CAHPS for MIPS survey must meet the data submission requirements on the sample of the Medicare Part B patients CMS provides.

We are also finalizing to ramp up the data completeness threshold to 60 percent for MIPS for performance periods occurring in 2018 for data submitted on quality measures using QCDRs, qualified registries, via EHR, or Medicare Part B claims. We note that these thresholds for data submitted on quality measures using QCDRs, qualified registries, via EHR, or Medicare Part B claims will increase for performance periods occurring in 2019 and onward. As noted in our proposal, we believe higher thresholds are appropriate to ensure a more accurate assessment of a MIPS eligible clinician's performance on the quality measures and to avoid any selection bias. In addition, we would like to align all the reporting mechanisms as closely as possible with achievable data completeness criteria.

We are finalizing our approach of including all-payer data for the QCDR,

qualified registry, and EHR submission mechanisms because we believe this approach provides a more complete picture of each MIPS eligible clinician's scope of practice and provides more access to data about specialties and subspecialties not currently captured in PQRS. In addition, those clinicians who utilize a QCDR, qualified registry, or EHR submission must contain a

minimum of one quality measure for at least one Medicare patient.

We are not finalizing our proposal that MIPS eligible clinicians and groups who do not meet the proposed submission criteria noted below would fail the quality component of MIPS. Instead, those MIPS eligible clinicians who fall below the data completeness thresholds would have their specific measures that fall below the data

completeness threshold not scored for the transition year of MIPS. The MIPS eligible clinicians would receive 3 points for measures that fall below the data completeness threshold.

(c) Summary of Data Submission Criteria

Table 5 of the rule, reflects our final Quality Data Submission Criteria for MIPS:

TABLE 5—SUMMARY OF FINAL QUALITY DATA SUBMISSION CRITERIA FOR MIPS PAYMENT YEAR 2019 VIA PART B CLAIMS, QCDR, QUALIFIED REGISTRY, EHR, CMS WEB INTERFACE, AND CAHPS FOR MIPS SURVEY

Performance period	Measure type	Submission mechanism	Submission criteria	Data completeness
A minimum of one continuous 90-day period during CY2017.	Individual MIPS eligible clinicians.	Part B Claims	Report at least six measures including one outcome measure, or if an outcome measure is not available report another high priority measure; if less than six measures apply then report on each measure that is applicable. MIPS eligible clinicians and groups will have to select their measures from either the list of all MIPS Measures in Table A or a set of specialty-specific measures in Table E.	50 percent of MIPS eligible clinician's Medicare Part B patients for the performance period.
A minimum of one continuous 90-day period during CY2017.	Individual MIPS eligible clinicians or Groups.	QCDR Qualified Registry EHR.	Report at least six measures including one outcome measure, or if an outcome measure is not available report another high priority measure; if less than six measures apply then report on each measure that is applicable. MIPS eligible clinicians and groups will have to select their measures from either the list of all MIPS Measures in Table A or a set of specialty-specific measures in Table E.	50 percent of MIPS eligible clinician's or groups patients across all payers for the performance period.
Jan 1–Dec 31	Groups	CMS Web Interface ...	Report on all measures included in the CMS Web Interface; AND populate data fields for the first 248 consecutively ranked and assigned Medicare beneficiaries in the order in which they appear in the group's sample for each module/measure. If the pool of eligible assigned beneficiaries is less than 248, then the group would report on 100 percent of assigned beneficiaries.	Sampling requirements for their Medicare Part B patients.
Jan 1–Dec 31	Groups	CAHPS for MIPS Survey.	CMS-approved survey vendor would have to be paired with another reporting mechanism to ensure the minimum number of measures are reported. CAHPS for MIPS Survey would fulfill the requirement for one patient experience measure towards the MIPS quality data submission criteria. CAHPS for MIPS Survey will only count for one measure.	Sampling requirements for their Medicare Part B patients.

(4) Application of Quality Measures to Non-Patient Facing MIPS Eligible Clinicians

Section 1848(q)(2)(C)(iv) of the Act provides that the Secretary must give consideration to the circumstances of non-patient facing MIPS eligible clinicians and may, to the extent feasible and appropriate, take those circumstances into account and apply alternative measures or activities that fulfill the goals of the applicable performance category to such clinicians. In doing so, the Secretary must consult

with non-patient facing MIPS eligible clinicians.

In addition, section 1848(q)(5)(F) to the Act allows the Secretary to re-weight MIPS performance categories if there are not sufficient measures and activities applicable and available to each type of MIPS eligible clinician. We assume many non-patient facing MIPS eligible clinician will not have sufficient measures and activities applicable and available to report and will not be scored on the quality performance category under MIPS. We refer readers

to the proposed rule (81 FR 28247) to the discussion on how we address performance categories weighting for MIPS eligible clinicians for whom no measures exist in a given performance category.

In the MIPS and APMs RFI, we solicited feedback on how we should apply the four MIPS performance categories to non-patient facing MIPS eligible clinicians and what types of measures and/or improvement activities (new or from other payments systems) would be appropriate for these MIPS

eligible clinicians. We also engaged with seven separate organizations representing non-patient facing MIPS eligible clinicians in the areas of anesthesiology, radiology/imaging, pathology, and nuclear medicine, specifically cardiology. Organizations we spoke with representing several specialty areas indicated that Appropriate Use Criteria (AUC) can be incorporated into the improvement activities performance category by including activities related to appropriate assessments and reducing unnecessary tests and procedures. AUC are distinct from clinical guidelines and specify when it is appropriate to use a diagnostic test or procedure—thus reducing unnecessary tests and procedures. Use of AUC is an important improvement activities as it fosters appropriate utilization and is increasingly used to improve quality in cardiovascular medicine, radiology, imaging, and pathology. These groups also highlighted that many non-patient facing MIPS eligible clinicians have multiple patient safety and practice assessment measures and activities that could be included, such as activities that are tied to their participation in the Maintenance of Certification (MOC) Part IV for improving the clinician's practice. One organization expressed concern that because their quality measures are specialized, some members could be negatively affected when comparing quality scores because they did not have the option to be compared on a broader, more common set of measures. The MIPS and APMs RFI commenters noted that the emphasis should be on measures and activities that are practical, attainable, and meaningful to individual circumstances and that measurement should be as outcomes-based to the extent possible. The MIPS and APMs RFI commenters emphasized that improvement activities should be selected from a very broad array of choices and that ideally non-patient facing MIPS eligible clinicians should help develop those activities so that they provide value and are easy to document. For more details regarding the improvement activities performance category refer to the proposed rule (81 FR 28209). The comments from these organizations were considered in developing these proposals.

We understand that non-patient facing MIPS eligible clinicians may have a limited number of measures on which to report. Therefore, we proposed at § 414.1335 that non-patient facing MIPS eligible clinicians would be required to meet the otherwise applicable submission criteria, but would not be

required to report a cross-cutting measure.

Thus we would employ the following strategy for the quality performance criteria to accommodate non-patient facing MIPS eligible clinicians:

- Allow non-patient facing MIPS eligible clinicians to report on specialty-specific measure set (which may have fewer than the required six measures).
- Allow non-patient facing MIPS eligible clinicians to report through a QCDR that can report non-MIPS measures.
- Non-patient facing MIPS eligible clinicians would be exempt from reporting a cross-cutting measure as proposed at § 414.1340.

We requested comments on these proposals.

The following is summary of the comments we received regarding our proposals on the application of quality measures to non-patient facing MIPS eligible clinicians:

Comment: Several commenters supported the proposed exemption from reporting a cross-cutting quality measure for non-patient facing MIPS eligible clinicians as these measures may not be reliable, developmentally feasible, or clinically relevant as well as the allowance for non-patient facing MIPS eligible clinicians to report on specialty-specific measure sets.

Response: We agree, however, as we have noted earlier in this rule we do not intend to finalize the cross-cutting measure requirements for all MIPS eligible clinicians, including those that are determined to be non-patient facing MIPS eligible clinicians.

Comment: Another commenter wanted more details on CMS's considerations for non-patient facing MIPS eligible clinicians under the quality performance category.

Response: We thank the commenter for their question. As we are not finalizing our proposal for cross-cutting measures, we do not need to finalize our proposal for a separate designation for non-patient facing MIPS eligible clinicians at this time. We refer readers to section II.E.1.b. of this final rule with comment period for more information on non-patient facing MIPS eligible clinicians.

Comment: Other commenters proposed that CMS remove the quality measure requirement related to patient outcomes for non-patient facing MIPS eligible clinicians.

Response: We proposed to provide an exception for non-patient facing MIPS eligible clinicians from the requirement to report cross-cutting measures, but we believe that outcome measures are of critical importance to quality

measurement. Therefore, we do not believe an additional exception is appropriate.

After consideration of the comments received regarding our proposals on application of the quality category to non-patient facing MIPS eligible clinicians we are not finalizing as proposed. As previously noted in this rule, we are not finalizing the criteria proposed at § 414.1335 that MIPS eligible clinicians that are considered patient facing must report a cross-cutting measure. The only distinction within the quality performance for non-patient facing MIPS eligible clinicians as proposed at § 414.1335 is that they were not required to report a cross-cutting measure. We are therefore finalizing at § 414.1335 that non-patient facing MIPS eligible clinicians would be required to meet the otherwise applicable submission criteria that apply for all MIPS eligible clinicians for the quality performance category.

(5) Application of Additional System Measures

Section 1848(q)(2)(C)(ii) of the Act provides that the Secretary may use measures used for payment systems other than for physicians, such as measures used for inpatient hospitals, for purposes of the quality and cost performance categories. The Secretary may not, however, use measures for hospital outpatient departments, except in the case of items and services furnished by emergency physicians, radiologists, and anesthesiologists.

In the MIPS and APMs RFI, we sought comment on how we could best use this authority. Some facility-based commenters requested a submission option that allows the MIPS eligible clinician to be scored based on the facility's measures. These commenters noted that the care they provide directly relates to and affects the facility's overall performance on quality measures and that using this score may be a more accurate reflection of the quality of care they provide than the quality measures in the PQRS or the VM program.

We will consider an option for facility-based MIPS eligible clinicians to elect to use their institution's performance rates as a proxy for the MIPS eligible clinician's quality score. We are not proposing an option for the transition year of MIPS because there are several operational considerations that must be addressed before this option can be implemented. We requested comment on the following issues: (1) whether we should attribute a facility's performance to a MIPS eligible clinician for purposes of the

quality and cost performance categories and under what conditions such attribution would be appropriate and representative of the MIPS eligible clinician's performance; (2) possible criteria for attributing a facility's performance to a MIPS eligible clinician for purposes of the quality and cost performance categories; and (3) the specific measures and settings for which we can use the facility's quality and cost data as a proxy for the MIPS eligible clinician's quality and cost performance categories; and (4) if attribution should be automatic or if a MIPS eligible clinician or group should elect for it to be done and choose the facilities through a registration process. We may also consider other options that would allow us to gain experience. We solicited comments on these approaches.

The following is summary of the comments we received regarding our approaches to application of additional system measures:

Comment: The majority of commenters that discussed the potential use of facility performance supported our proposal to attribute a facility's performance to a MIPS eligible clinician for purposes of the quality and cost performance categories. Several commenters urged CMS to implement a CMS hospital quality program measure reporting option for hospital-based clinicians in the MIPS as soon as possible. Other commenters believed that using hospital measure performance in the MIPS would help clinicians and hospitals better align quality improvement goals and processes across the care continuum and reduce data collection burden. One commenter thought that attributing facility performance for the purposes of the quality and cost performance categories could encourage harmony between the performance agendas of clinicians and their facilities. Another commenter supported a streamlined measurement approach for MIPS reporting for hospital based clinicians and alignment of MIPS measures with hospital measures.

One commenter believed that hospital quality reporting should substitute for MIPS quality reporting for hospital based clinicians. While another commenter specified that hospital measures should only be used for the quality performance category, not for the cost performance category. Another commenter strongly recommended CMS either allow hospital based clinicians to use hospital quality measures for MIPS reporting, or exempt hospital based clinicians from the quality performance category until there is substantial

alignment of clinician and hospital measures. This commenter requested that such exemption be the same as the hospital based clinician exemption under the advancing care information performance category.

Response: We agree that using hospital measure performance may promote more harmonized quality improvement efforts between hospital-based clinicians and hospitals and promote care coordination across the care continuum. We are considering appropriate attribution policies for facility-based measures and will take commenter's suggestions into account in future rulemaking.

Comment: Several commenters opposed using a facility's quality and cost performance as a proxy for MIPS eligible clinicians. A few commenters did not support inclusion of other system measures at this time and stated that this could potentially create an additional burden for vendors to provide additional reporting measures which they had not previously developed or mapped out workflows for. One commenter did not support attributing a facility's performance to a MIPS eligible clinician for the quality and cost performance categories, noting that facility-level performance would not be appropriate or representative of the MIPS eligible clinician's individual performance. One commenter expressed concern that this approach would potentially benefit MIPS eligible clinicians with lower individual performance and would be a detriment for those with higher performance, for whom being assessed based on facility performance could potentially lead to lower ratings. Another commenter expressed concern that MIPS eligible clinicians substituting their institution's performance for their own might give an unfair advantage to MIPS eligible clinicians from larger systems. This commenter also requested that CMS pilot system measures prior any implementation of facility performance attribution under MIPS.

Another commenter opposed our proposed use of facility level measures for accountability at the individual level as facility performance as they believed it is not within the control of individual clinicians. Another commenter requested that facility-based MIPS eligible clinicians leverage continued expansion of specialty-specific measure sets through QCDRs and qualified registries instead of using facility-based scores. Another commenter noted that adding an additional group reporting option for facility-based MIPS eligible clinicians on top of the existing group reporting option is confusing. The

commenter therefore recommended CMS remove this reporting option from the proposal. One commenter encouraged revisiting this proposal in future years.

Response: The commenter is correct that many quality measures are not designed for team-based care in the inpatient setting, and we intend to examine how best to measure care provided by hospitalists and other team-based MIPS eligible clinicians in the future. We believe that facility-based quality measures have the potential to harmonize quality improvement efforts between hospital-based clinicians and hospitals, and promote care coordination across the care continuum. We agree that it is important to develop a thoughtful attribution policy that captures the eligible clinician's contribution and intend to develop appropriate attribution policies for facility-based measures.

Comment: One commenter requested clarification on how CMS would expect reporting of facility-based measures to work under MIPS in instances where hospitals, their practices, and their EDs all use separate EHRs. This commenter also requested clarification on CEHRT/certification requirements and what vendors would be required to do under such a scenario. Another commenter wanted to know whether MIPS eligible clinicians would be subject to a facility's performance score for quality and cost if facility-based measures were to be integrated into MIPS in future years. One commenter recommended CMS make additional information available regarding the use of facility measures for the cost performance category and publish information about the extent to which this option may improve participation by clinicians who are predicted to be unable to participate in the cost performance category of MIPS. Another commenter requested clarification on the specific MIPS eligible clinicians that would be considered facility-based MIPS eligible clinicians.

Response: We recognize that there are challenges associated with health information exchange within institutions and should we adopt policies for facility-based measures in future rulemaking, we would provide more information via subregulatory guidance. We believe that it is important to develop a thoughtful attribution policy that captures the MIPS eligible clinician's contribution and intend to develop appropriate attribution policies for facility-based measures.

Comment: One commenter requested CMS develop MIPS participation options that apply to hospital's quality

and cost performance category measures to their employed clinicians and that CMS should seek input from hospitals, clinicians, and other stakeholders to establish processes and design implementation of this option. Another commenter recommended that prior to implementing any facility-level measures into the MIPS program, CMS should work with measure stewards and applicable specialties to ensure that measure specifications are appropriately aggregated to the clinician level and are reflective of those factors within the clinician's control.

Response: We appreciate the suggestions and intend to work closely with stakeholders as we examine how best to measure care provided by hospitalists and other team-based MIPS eligible clinicians in the future. We believe that it is important to develop a thoughtful attribution policy that captures the MIPS eligible clinician's (including those employed by hospitals) contribution and intend to develop appropriate attribution policies for facility-based measures.

Comment: One commenter suggested CMS use active membership on a hospital's medical staff or proof of an employment contract that is effective for the measurement period as evidence of an existing relationship between the clinician and a facility, which will be needed in order to verify a clinician's eligibility to use facility-based measures. However, several commenters believed that claims data elements could provide sufficient proof of such a relationship. Another commenter recommended CMS use specific claims data elements such as inpatient and hospital outpatient department place-of-service codes as evidence. One commenter suggested that CMS could consider adopting some of the following criteria: the facility-based MIPS eligible clinician or group is an employee of the facility; the facility-based MIPS eligible clinician or group is not an employee of the facility, but has a contract with the facility or the privileges needed to perform services at the facility; and the MIPS eligible clinician or group is an owner, co-owner, and/or investor of the facility and performs medical services in the facility.

The same commenter proposed the following options for attribution: Option 1: The facility-based MIPS eligible clinician performed a plurality of his or her services at the facility in the performance period. This proposed method for attribution generally aligned with the Value-Based Payment Modifier two-step attribution methodology for purposes of MIPS quality and cost measurement proposed in other parts of

the MACRA rule, which attributes a given patient to a clinician if the clinician has performed a plurality of the primary care services for a patient in the performance period. Option 2: The facility-based MIPS eligible clinician or group would have a payment amount threshold or patient count threshold at the facility that meets the payment amount threshold or patient count threshold finalized for purposes of eligibility to participate in an Advanced APM.

Another commenter mentioned that in adopting additional system measures, CMS should ensure that attribution is appropriate and relevant to clinicians, to consider a methodology that enables proportional attribution that is as close a proxy for a group as possible, and to ensure that clinician performance is captured across settings.

Response: We will continue to seek opportunities to improve our attribution process including the consideration of claims based codes with place-of-service modifiers among the array of options to best attribute eligible clinicians.

Comment: The majority of commenters that supported the use of additional systems measures supported them only in cases where the facility-based clinician could elect use of the facility-based measures. They did not support automatic attribution of facility based measures. Some commenters believed that the MIPS eligible clinician should be able to elect to be attributed to the facility and also choose the appropriate facility through a registration process. One commenter noted that many MIPS eligible clinicians see patients at multiple facilities, and thus should be able to choose so which facility would most accurately align with their actual practice patterns.

One commenter recommended CMS explore the possibility of allowing some clinicians to report their skilled nursing facility (SNF) scores as their MIPS scores. Another commenter urged as much flexibility as possible in the program and believed that SNF-based measurement should always be an optional approach, particularly for those who practice in a single facility. Another commenter recommended that quality and cost performance measures under MIPS always be attributed to the SNF TIN, as incentive payment adjustments would only be applicable at the facility TIN level. Furthermore, the commenter stated that the attribution to the SNF TIN would need to be automatic for clinicians working in facility-based outpatient environments. One commenter recommends self-nomination at the TIN level because this

would allow a group to attest that it is apprised of primarily hospital-based clinicians. This commenter noted that it would ensure that only the clinicians who wish to have this level of facility alignment are included in the program. It will also permit clinicians to select which hospitals are appropriate for alignment, allows for the inclusion of multiple hospitals, and would allow for the fact that many hospitalist groups practice in multiple locations. They also stated that this option would allow clinicians to align their performance on selected measures with their hospitals, which would support the drive towards team-based, coordinated care.

One commenter noted the challenges faced by clinicians and groups that provide care across multiple facilities and recommended hospital-level risk-adjusted outcome measurement that is attributable to the principal clinician or group responsible for the primary diagnosis. Another commenter stated that as an alternative to substituting facility measures under the MIPS program, facility-based clinicians ought to be given the option of being treated as participating in an Advanced APM.

One commenter requested further clarification on the proxy scoring using facility's quality reporting. This commenter requested examples of proxy scoring, and wanted to see quality performance category scoring in practice before making a recommendation. Another commenter urged CMS to allow the use of PCHQR scores as a proxy for quality performance, for clinicians at PPS-exempt cancer hospitals. A couple of commenters urged CMS to make nearly all of the measures from CMS's hospital quality reporting and pay-for-performance programs available for use in hospital-based clinician reporting options. One commenter proposed the following criteria for evaluating measures: clinicians could use quality and cost measures for patient conditions and episode groups (currently under development) for which CMS has assigned them a clearly defined and clinically meaningful relationship under the patient relationship assignment methodology (currently under development). This commenter suggested that each evidence-based quality measure would be counter-balanced with an appropriate cost measure and that measures potentially could focus on patient safety, high quality care delivery, patient-centered care, communication, care coordination, and cost efficiency.

Several commenters suggested measures to be adopted. One commenter suggested the following: PCP notification at admission, PCP

notification at discharge, percentage of beneficiaries with appointment with a PCP within 7 days, and percentage of beneficiaries with appointment with PCP within 30 days. This commenter believed that facility based MIPS eligible clinicians' play a valuable and underutilized role in care coordination and that Medicare stakeholders will benefit by MIPS eligible clinician inclusion versus exclusion. This commenter further recommended that facility based MIPS eligible clinicians have the ability to submit via institutional metrics and suggested PCP measures. Another commenter suggested several payment and costs measures such as: The Medicare Spending Per Beneficiary Measure; Pneumonia Payment per Episode of Care; the Cellulitis Clinical Episode-based Payment Measure; the Kidney/UTI Clinical Episode-based Payment Measure; and the Gastrointestinal Hemorrhage Clinical Episode-based Payment Measure. Another commenter recommended the following measures: (1) Severe Sepsis and Sepsis Shock: Management Bundle; (2) HCAHPS (physician questions and 3-Item Care Transition Measure); (3) Hospital-wide All-Cause Unplanned Readmission; (4) NHSN Measures (including CAUTI, CLABSI, CDI, And MRSA); (4) COPD Measures (COPD 30-Day Mortality Rate and COPD Readmission Rate); (5) Pneumonia Measures (Pneumonia 30-Day Mortality Rate, Pneumonia 30-Day Readmission Rate, and Pneumonia Payment per Episode of care); (6) Heart Failure Measures (Heart Failure 30-Day Mortality Rate, Heart Failure 30-Day Readmission Rate, Heart Failure Excess Days); (7) Payment Measures (MSPB); and (8) Chart Abstracted Clinical Measures (Influenza Immunization and Admit Decision Time to ED Departure Time for Admitted Patients).

One commenter believed that clinicians who are MIPS eligible clinicians, and work primarily in either an outpatient or inpatient site—or both, as cancer care clinicians often do—should have the ability to choose the measures most relevant to them. A commenter recommended that MIPS eligible clinicians be able to align with hospitals, surgery centers, or other types of institutions to utilize patient experience survey metrics that are already collected as part of other quality reporting programs, in order to enable these metrics to be used as facility-based measures. Another commenter believed it was important for CMS to ensure that only visits, medications, tests, surgeries, and other components of maintenance for a disease that are ordered by a MIPS

eligible clinician are attributed to the MIPS eligible clinician's quality and cost scores.

One commenter urged CMS to enable a transplant surgeon and other members of the transplant team to elect to use their institution's performance rates under the outcomes requirements set forth at 42 CFR 482.80(c) and 482.82(c) as a proxy for their quality performance category score. This commenter believed that a transplant surgeon or other MIPS eligible clinician or group's election to use their institutions performance data should not be automatic but the clinician's choice. Another commenter noted that a facility-based performance option would be beneficial to those clinicians involved in palliative care, and requested CMS allow for measures such as those used under the Hospice Quality Reporting Program to be considered facility-based measures under MIPS.

Response: We would like to explain that under section 1848(q)(5)(H) of the Act we may include data submitted by MIPS eligible clinicians with respect to items and services furnished to individuals who are not individuals entitled to benefits under part A or enrolled under part B. We will take these suggestions into consideration as we move towards implementing these additional flexibilities in the future.

We will take these comments into consideration in future rulemaking.

(6) Global and Population-Based Measures

Section 1848(q)(2)(C)(iii) of the Act provides that the Secretary may use global measures, such as global outcome measures, and population-based measures for purposes of the quality performance category.

Under the current PQRS program and Medicare EHR Incentive Program quality measures are categorized by domains which include global and population-based measures. We identified population and community health measures as one of the quality domains related to the CMS Quality Strategy and the NQS priorities for health care quality improvement discussed in the proposed rule (81 FR 28192). Population-based measures are also used in the Medicare Shared Savings Program and for groups in the VM Program. For example, in 2015, clinicians were held accountable for a component of the AHRQ population-based, Ambulatory Care Sensitive Condition measures as part of a larger set of Prevention Quality Indicators (PQIs). Two broader composite measures of acute and chronic conditions are calculated using the

respective individual measure rates for VM Program calculations. These PQIs assess the quality of the health care system as a whole, and especially the quality of ambulatory care, in preventing medical complications that lead to hospital admissions.

In the CY 2015 PFS final rule with comment period (79 FR 67909), Medicare Payment Advisory Commission (MedPAC) commented that we should move quality measurement for four ACOs, Medicare Advantage (MA) plans, and FFS Medicare in the direction of a small set of population-based outcome measures, such as potentially preventable inpatient hospital admissions, ED visits, and readmissions. In the June 2014 MedPAC Report to the Congress: *Medicare and the Health Care Delivery System*, MedPAC suggests considering an alternative quality measurement approach that would use population-based outcome measures to publicly report on quality of care across Medicare's three payment models, FFS, Medicare Advantage, and ACOs.

In creating policy for global and population-based measures for MIPS we considered a more broad-based approach to the use of "global" and "population-based" measures in the MIPS quality performance category. After considering the above we proposed to use the acute and chronic composite measures of AHRQ PQIs that meet a minimum sample size in the calculation of the quality measure domain for the MIPS total performance score; see Table B of the Appendix in this final rule with comment period. MIPS eligible clinicians would be evaluated on their performance on these measures in addition to the six required quality measures discussed previously and summarized in Table A of the Appendix in this final rule with comment period. Based on experience in the VM Program, these measures have been determined to be reliable with a minimum case size of 20. Average reliabilities for the acute and chronic measures range from 0.64 to 0.79 for groups and individual MIPS eligible clinicians. We intend to incorporate a clinical risk adjustment as soon as feasible to the PQI composites and continue to research ways to develop and use other population-based measures for the MIPS program that could be applied to greater numbers of MIPS eligible clinicians going forward. In addition to the acute and chronic composite measure, we also proposed to include the all-cause hospital readmissions (ACR) measure from the VM Program as we believe this measure also encourages care coordination. In

the CY 2016 Medicare PFS final rule (80 FR 71296), we did a reliability analysis that indicates this measure is not reliable for solo clinicians or practices with fewer than 10 clinicians; therefore, we proposed to limit this measure to groups with 10 or more clinicians and to maintain the current VM Program requirement of 200 cases. Eligible clinicians in groups with 10 or more clinicians with sufficient cases would be evaluated on their performance on this measure in addition to the six required quality measures discussed previously and summarized in Table A of the Appendix of this final rule with comment period.

Furthermore, the proposed claims-based population measures would rely on the same two-step attribution methodology that is currently used in the VM Program (79 FR 67961 through 67694). The attribution focuses on the delivery of primary care services (77 FR 69320) by both primary care physicians and specialists. This attribution logic aligns with the total per capita measure and is similar to, but not exactly the same, as the assignment methodology used for the Shared Savings Program. For example, the Shared Savings Program definition of primary care services can be found at § 425.20 and excludes claims for certain Skilled Nursing Facility (SNF) services that include the POS 31 modifier). In the proposed rule (81 FR 28199), we proposed to exclude the POS 31 modifier from the definition of primary care services. As described in the proposed rule (81 FR 28199), the attribution would be modified slightly to account for the MIPS eligible clinician identifiers. We solicited comments on additional measures or measure topics for future years of MIPS and attribution methodology. We requested comments on these proposals.

The following is summary of the comments we received regarding our proposal on global and population-based measures:

Comment: Several commenters supported the importance of including sociodemographic factor risk adjustments in the quality and cost measures used to determine payments to MIPS eligible clinicians. One commenter stated that risk adjustment is a widely accepted approach to account for factors outside of the control of clinicians. Another commenter supported adjusting quality measures to reflect sociodemographic status (SDS), when appropriate, because measurement systems that do not incorporate such factors into evaluation can shift resources away from low-income communities through penalties.

The commenter requested CMS adopt adjustments to quality measures that are affected by SDS, such as readmission within 30 days of discharge. Another commenter stated that sociodemographic issues, such as the inability to purchase medication and lack of family support, can increase cost related to future MIPS eligible clinician visits, and emergency room visits and readmissions. The commenter requested a level of protection for situations beyond a clinician's control that can play a major role in an individual's health outcome.

A few commenters supported the inclusion of risk adjustment in measures and suggested that CMS examine ASPE's future recommendations. One commenter recommended that CMS examine ASPE's recommendations to consider other strategies as well such as stratification. Other commenters stated that the stakeholders affected by these decisions should have an opportunity to review the risk adjustment findings once issued by ASPE, and comment on how CMS proposes to incorporate the ASPE findings into its quality metrics.

Several commenters urged CMS to work with the National Quality Forum (NQF) on how best to proceed with risk adjustment of quality and cost measures for sociodemographic status. One commenter recommended CMS adopt the NQF recommendation to consider risk adjustment for measures that have a conceptual relationship between sociodemographic factors and outcomes.

Response: We appreciate the feedback on the role of socioeconomic status in quality measurement. We continue to evaluate the potential impact of social risk factors on measure performance. One of our core objectives is to improve beneficiary outcomes. We want to ensure that complex patients as well as those with social risk factors receive excellent care. While we believe the MIPS measures are valid and reliable, we will continue to investigate methods to ensure all clinicians are treated as fairly as possible within the program. Under the Improving Medicare Post-Acute Transformation (IMPACT) Act of 2014, ASPE has been conducting studies on the issue of risk adjustment for sociodemographic factors on quality measures and cost, as well as other strategies for including SDS evaluation in CMS programs. We will closely examine the ASPE studies when they are available and incorporate findings as feasible and appropriate through future rulemaking. We look forward to working with stakeholders in this process. We will also monitor outcomes of beneficiaries with social risk factors, as well as the performance of the MIPS

eligible clinicians who care for them to assess for potential unintended consequences such as penalties for factors outside the control of clinicians.

We additionally note that the National Quality Forum (NQF) is currently undertaking a 2-year trial period in which new measures and measures undergoing maintenance review will be assessed to determine if risk adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF will issue recommendations on inclusion of sociodemographic factors in risk adjustment. We intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for sociodemographic factors in our MIPS measures.

Comment: Several commenters recommended that CMS develop the three population health measure benchmarks in the quality performance category by specialty and region to ensure more accurate, appropriate comparisons for the measures. The commenters noted this approach would help facilitate comparisons and improve the relevance of information for patients. The commenters stated the MACRA law does not preclude CMS from considering specialties that practice in settings such as nursing homes, assisted living, or home health and treating them in a different manner, but stated it is inappropriate to assume they can be compared to other internal medicine/family physicians that practice in the ambulatory settings. Other commenters supported the proposed three population-based measures that will be calculated using claims.

Response: We appreciate the commenters' support. We continue to analyze the best means of assessing and comparing facility based clinicians in nursing homes, assisted living, or home health environments versus more routine ambulatory care settings. We will consider the feasibility of adopting disparate benchmarks for the population health measures and regional adjustments for the population health measures in the future. We appreciate the commenters support. However, as discussed in section II.E.5.b.(3) of this final rule with comment period, for the transition year the MIPS, we are not finalizing our proposal to require MIPS eligible clinicians and groups to report a cross-cutting measures because we believe we should provide flexibility for

MIPS eligible clinicians during the transition year to adjust to the program.

Comment: Another commenter requested that CMS simplify the scoring methodology in the quality performance category by removing the “population health” measures and avoiding creating different scoring subcategories—in particular creating subcategories for MIPS eligible clinicians in practices of 9 or fewer, which appears to create different definitions of “small practices” throughout the MIPS program. The commenter recommended that at a minimum, CMS should provide accommodations for MIPS eligible clinicians based on the statute’s definition of a small practice—meaning 15 or fewer professionals.

Response: We have examined the global and population-based measures closely and have decided to not finalize these measures as part of the quality performance category score. Specifically, we are not finalizing the acute and chronic composite measures of AHRQ PQIs. We will, however, calculate these measures for all MIPS eligible clinicians and provide feedback for informational purposes as part of the MIPS feedback.

Comment: Some commenters believed that system level and population-based measures should be applicable to MIPS eligible clinicians, such as pathologists, who typically furnish services that do not involve face-to-face interaction with patients. The commenters stated that activities such as blood utilization, infection control, and test utilization activities, including committee participation, should be credited to the whole group as pathology practices typically function as one unit with different members of the group having different roles. The commenters urged CMS to be flexible and not to focus exclusively on measures and activities that involve face-to-face encounters, as these would have an unfair and negative impact on the MIPS final scores of non-patient facing MIPS eligible clinician’s specialties.

Response: We agree that non-patient facing MIPS eligible clinicians need quality measures that are applicable to their practice. We encourage commenters to suggest specific additional measures that we should consider in the future.

Comment: Other commenters believed the population-based measures would be difficult without prospective enrollment that informs MIPS eligible clinicians in advance of patients that are attributed to them.

Response: We will make every effort to provide as much information as possible to MIPS eligible clinicians

about the patients that will be attributed to them. However, we do not believe prospective enrollment to be feasible at this time.

Comment: Several commenters recommended that CMS use its discretion to make proposed global and population-based measures optional under the improvement activities performance category, rather than including these VM Program measures into the MIPS quality performance category as population-based health measures: The acute composite, chronic composite, and ACR measure. The commenters were concerned that these measures are primarily intended to be used and reported at the metropolitan area or county level and have not been adequately tested, rigorously assessed for appropriate sample sizes, or risk adjusted for application at the clinician or group level. The commenters stated that the method by which reliability rates are arrived at must be transparent, and urged CMS to publicize the data supporting the proposal statement that based on the VM Program, the acute and chronic composites had an average reliability range of 0.64–0.79. The commenters recommended that if CMS moves forward with the three population health measures and does not make them optional, MIPS eligible clinician performance on any administrative claims measure should not be used for payment or be publicly reported unless they have a reliability of 0.80, which is generally considered by statisticians and researchers to be sufficiently reliable to make decisions about individuals based on their observed scores. The commenters recommended that in addition, the risk adjustment model should be developed, tested, and released for comment prior to implementation of the measures.

Another commenter did not support the measures that are reliable with a minimum case size of 20 and with an average range of 0.64 and 0.79 because the commenter stated that anything less than 0.9 is unreliable. The commenter requested that CMS not implement this criterion until a risk adjustment can be implemented. Another commenter recommended CMS reconsider its use of a minimum sample size of 20 for calculating the cost measures, as extensive work has been done on both quality measures and cost measures pointing to the need of a sample size no smaller than 100 to achieve statistical stability.

Response: We have examined the global and population-based measures closely and have decided to not finalize these measures as part of the quality performance category score.

Specifically, we are not finalizing to use the acute and chronic composite measures of AHRQ PQIs. We agree with commenters that additional enhancements need to be made to these measures for inclusion of risk adjustment. We will, however, calculate these measures for all MIPS eligible clinicians and provide feedback for informational purposes as part of the MIPS feedback.

Comment: One commenter opposed CMS’ proposal to score population based measures during the transition year of MIPS. The commenter requested CMS phase-in population-based measures during the first 2 years of MIPS as test measures with feedback (but not scored) so that MIPS eligible clinicians and CMS can learn how population level measures will impact the MIPS program.

Response: We agree with the commenter that further testing and enhancements is required for some of these measures prior to inclusion in the MIPS for payment purposes. Therefore, we are no longer requiring two of the three population health measures and are only requiring the ACR measure for groups of more than 15 instead of our proposed approach of groups of 10 or more, assuming the case minimum of 200 cases has been met, as discussed in section II.E.6. of this final rule with comment period. If the case minimum of 200 cases has not been met, we will not score this measure. The MIPS eligible clinician will not receive a zero for this measure and this measure will not apply to the MIPS eligible clinician’s quality performance category score. We will, however, calculate these measures for all MIPS eligible clinicians and provide feedback for informational purposes as part of the MIPS feedback.

Comment: Another commenter recommended assessing the ACR measure over a longer time period as the comparable measure used for hospitals is found to be reliable and valid only when using a 3-year rolling average. The commenter appreciated that this measure is limited to groups with 10 or more MIPS eligible clinicians and requires 200 cases.

Response: We believe that the measure’s limitation to groups with 16 or more MIPS eligible clinicians, as well as the requirement for at least 200 cases, ensures that the measure is sufficiently reliable for MIPS purposes. To explain, we will not apply the ACR to solo practices or small groups (groups of 15 or less). We will apply the ACR measure to groups of more than 15 who meet the case volume.

Comment: Another commenter recommended that the population-based

measures only be applied to MIPS groups.

Response: We attempted to structure the MIPS program to be as inclusive as possible for quality measurement purposes. Our intention was to ensure that as many MIPS eligible clinicians as possible could report on as many measures as possible.

Comment: Other commenters stated that MIPS is designed to determine aggregate population-based outcome measures across clinicians in a local area sharing the same hospitals and clinicians. The commenters proposed that CMS share with MIPS participants average MIPS final scores by clinician categories and cross reference comparative advanced APM performance.

Response: We do not believe MIPS is designed to determine aggregate population-based outcome measures. However, we have discretion to pursue this approach if we deem appropriate. We will consider these suggestions as we develop appropriate feedback forms for MIPS eligible clinicians. Our intention is to provide as much information as possible to MIPS eligible clinicians to assist with quality improvement efforts.

Comment: Other commenters disagreed with the proposed use of the 30-day ACR measure because they believed that doing so will potentially penalize clinicians who care for the most complex patients and those of lowest SES. They also indicated that the measure is generally inappropriate given the lack of MIPS eligible clinician control over some of the factors that lead to readmission. Another commenter believed MIPS eligible clinicians are penalized for readmissions, but not rewarded for successfully keeping people out of the hospital completely. Other commenters expressed concern for the use of the ACR measure because there are a multitude of factors that contribute to readmission making it a difficult outcome to measure. The commenters believed that there needs to be more studies prior to using the measure at the MIPS eligible clinician level, including the impact on MIPS eligible clinicians who serve disadvantaged populations. In addition, the commenters believed that the measure requires risk-adjustment for SDS factors, community factors, and the plurality of care/care coordination. The commenters sought clarity on how the triggering of an index episode and attribution of ACR to any particular MIPS eligible clinician or group larger than 10 will be relevant. Other commenters opposed the ACR measure due to concern that it is not

risk adjusted by severity level or tertiary care facility. The commenters were also concerned that MIPS eligible clinicians and hospitals are trimming back on SNF transfers to decrease bundled costs, increasing readmission rates. Some commenters recommended using National Committee for Quality Assurance's (NCQA's) ACR measure and not the ACR measure which is specified for hospitals. Other commenters urged CMS to reconsider requiring the use of the ACR measure, as they were concerned with the reliability and validity levels associated with applying the measure to a single clinician in a given year. They noted that the comparable measure for hospitals requires a 3-year rolling average to mitigate potential variability, and therefore, requested CMS explore assessing the measure over a longer time period.

Response: We appreciate the commenters' concerns and suggestions. However, we have examined the ACR measures closely and have decided to finalize the ACR measure from the VM for groups with 16 or more eligible clinicians, as part of the quality performance category for the MIPS final score. Readmissions are a potential cause for patient harm, and we believe it necessary to incentivize their reduction. We believe measuring and holding MIPS eligible clinicians accountable for readmissions is important for quality improvement, particularly given the harm that patients face when readmitted. We hold hospitals and post-acute care facilities accountable for readmissions as well; holding all clinicians accountable for readmissions incentivizes better coordination of care across care settings and clinicians.

We would like to explain that the all-cause hospital readmission measure from VM uses 1 year of inpatient claims to identify eligible admissions and readmissions, as well as up to 1 year prior of inpatient data to collect diagnoses for risk adjustment. The measure reports a single composite risk-standardized rate derived from the volume-weighted results of hierarchical regression models for five specialty cohorts. Each specialty cohort model uses a fixed, common set of risk-adjustment variables. It is important to note a couple features of the risk adjustment design developed for CMS by the Yale School of Medicine Center for Outcomes Research & Evaluation (CORE). First, the ACR measure involves estimating separate risk adjustment models for seven different cohorts of medical professionals (general medicine, surgery/gynecology,

cardiorespiratory, cardiovascular, neurology, oncology, and psychiatry because conditions typically cared for by the same team of clinicians are likely to reflect similar levels of readmission risk. The risk-adjusted readmission rates for each cohort that are then combined into a single adjusted rate. Second, for each cohort, the risk adjustment models control for age, principal diagnoses, and a broad range of comorbidities (identified from the patient's clinical history over the year preceding the index admission, not just at the time of the hospitalization). Please note that the measure has been included for the last several years in the Annual Quality Resource and Use Reports so clinician groups and clinicians can find out how they perform on the measure and use the data in the reports to improve their performance. We will not apply the readmission measure to solo practices or small groups (groups of 15 or less). We will apply the readmission measure to groups of more than 15 who meet the case volume of 200 cases. In addition, we continually reassess reliability and will monitor MIPS eligible clinicians' performance under the MIPS for unintended consequences.

It is important to note that for the VM Program, an index episode for the readmission measure is triggered when a beneficiary who has been attributed to a TIN is hospitalized with an eligible hospital admission for the measure. Note that the index admission is not directly attributed to a TIN as in the case of an episode for the Medicare Spending per Beneficiary measure; rather, index admissions are tied to the beneficiaries attributed to the TIN per the two-step methodology. Regarding evidence for whether the measure incentivizes reductions in readmissions, we refer readers to The New England Journal of Medicine article available at <http://www.nejm.org/doi/full/10.1056/NEJMsa1513024> which concluded that readmission trends are consistent with hospitals' responding to incentives to reduce readmissions, including the financial penalties for readmissions under the Affordable Care Act. With respect to SDS factors, we refer readers to our discussion above of the NQF's 2-year trial and ASPE's ongoing research. We will continue to assess the measure's results and will consider the commenter's feedback in the future.

Comment: Another commenter believed that global outcome measures and population-based measures should not be included in the MIPS quality score until there is further understanding of the reliability of volume of measurement for 20 patients, assigning accountability to the MIPS

eligible clinicians who have control, how conditions that are not treated by the surgeon will be included or excluded, how population-based measures will be used at the MIPS eligible clinician level, the reliability and validity of measures if modified, the need for risk-adjustment of the composite measures, if adjustments for safety data sheets will be considered and the potential unintended consequences for including resource utilization.

Response: We advocate the continued implementation of population-based measures and will continue to work with stakeholders to improve and expand them over time. We note that these measures have been used in other programs, such as the Medicare Shared Savings Program and for groups in the VM Program, and are aligned with the National Quality Strategy.

Comment: Some commenters urged CMS to not maintain administrative claims-based measures, which were developed for use at the community or hospital level, and often result in significant attribution issues. The commenters stated these measures tend to have low statistical reliability when applied at the individual clinician level, and at times at the group level. They are also calculated with little transparency, which confuses and frustrates MIPS eligible clinicians. The commenters stated that scores on these particular measures do not provide actionable feedback to MIPS eligible clinicians on how they can improve.

Response: We believe administrative claims-based measures are a necessary option to minimize reporting burden for MIPS eligible clinicians. The ACR measure has been used in both the Shared Savings Program and the VM Program for several years. We would like to note that at the minimum case sizes applied for the VM, average reliability for the ACSC composite measures exceed 0.40 even for TINs with one EP.

We can understand why commenters see these measures as less transparent and actionable compared to the PQRS process measures. However, this is largely driven by risk adjustment and shrinkage (in the case of the ACR measure), both of which are attempts to protect clinicians from “unfair” outcomes, albeit at the cost of decreased transparency. In the context of the QRURs, we have provided supplementary tables to the QRUR containing patient level information on admissions, including reason for admission (principal diagnosis) and whether it was followed by an unplanned readmission, to support both

more transparency as well as actionability. We intend to work with MIPS eligible clinicians and other stakeholders to continue improving available measures and reporting methods for MIPS.

We continually reassess measures and this is why we have worked with measure owner and stakeholders to improve the risk adjustment methodology for these measures. In addition, we have used these measures under the VM Program and have provided feedback to groups and individual clinicians for the last several years. Further, we apply case minimums to ensure measures are reliable for groups and individual clinicians. The measures are outcome focused and are calculated on behalf of the clinician using Medicare claims and other administrative data. In addition, they are low burden with the goal for groups and individual clinicians to invest in care redesign activities to improve outcomes for patients where good ambulatory coordination reduces avoidable admissions.

Comment: Another commenter had concerns about the proposal to include population health and prevention measures for all MIPS eligible clinicians, stating that some specialists and sub-specialists have no meaningful responsibility for population or preventive services.

Response: We believe that all MIPS eligible clinicians, including specialists and subspecialists, have a meaningful responsibility to their communities, which is why we have focused on population health and prevention measures for all MIPS eligible clinicians. Individuals’ health relates directly to population and community health, which is an important consideration for quality measurement generally and MIPS specifically. It is important to note that we are no longer requiring two of the three population health measures and are only requiring the ACR measure for groups of more than 15 instead of our proposed approach of groups of 10 or more, assuming the case minimum of 200 cases has been met, as discussed in section I.I.E.6. of this final rule with comment period. If the case minimum of 200 cases has not been met, we will not score this measure. Thus, the MIPS eligible clinician will not receive a zero for this measure, but rather this measure will not apply to the MIPS eligible clinician’s quality performance category score. We believe the ACR measure for groups of more than 15 is appropriate and will provide meaningful measurement.

Comment: Another commenter opposed using the same attribution method that was originally used for ACOs and is currently used for the VM Program for CMS’ proposal to score MIPS eligible clinicians on two or three (depending on practice size) additional ‘global’ or ‘population based’ quality measures to be gathered from administrative claims data. The commenter believed these measures potentially hold MIPS eligible clinicians, especially specialists such as ophthalmologists, responsible for care they did not provide. The measures—acute and chronic care composites and ACR—focus on the delivery of primary care, which does not apply to ophthalmology or a variety of other specialties. Therefore, specialists should be exempt from these additional measures and evaluated only on the six measures they choose to report.

Response: As noted above, the ACR and ACSC measures have been used in both the Shared Savings Program and the VM Program for several years. The ACR measure involves estimating separate risk adjustment models for seven different cohorts of medical professionals (general medicine, surgery/gynecology, cardiorespiratory, cardiovascular, neurology, oncology, and psychiatry) because conditions typically cared for by the same team of clinicians are likely to reflect similar levels of readmission risk. The measure reports a single composite risk-standardized rate derived from the volume-weighted results of hierarchical regression models for five specialty cohorts. Each specialty cohort model uses a fixed, common set of risk-adjustment variables. We believe this measure is representative of most MIPS eligible clinicians.

In addition, we have examined the global and population-based measures closely and have decided to not finalize two of these measures as part of the quality performance category score. Specifically, we are not finalizing use of the acute and chronic composite measures of AHRQ PQIs. We agree with commenters that additional enhancements need to be made to these measures for inclusion of risk adjustment. We will, however, calculate these measures for all MIPS eligible clinicians and provide feedback for informational purposes as part of the MIPS feedback.

Comment: Other commenters requested that if the three claims-based measures were instead reported by a QCDR or quality registry and included total patient population, regardless of payer, the MIPS eligible clinicians’ patient population would be better

represented and overall scores more accurate. The commenters also believed this would reduce administrative burden on CMS for the calculation of these metrics and beneficiary attribution. The commenters believed that since this is calculated by CMS and represents up to a third of the quality score, QCDRs and qualified registries would have limited ability to give MIPS eligible clinicians insight into their performances and provide benchmarking data back to MIPS eligible clinicians throughout the year, assisting with clinician's ability to judge how they are performing relative to other organizations within the registry. The commenters noted that QCDRs and qualified registries serve a critical component to MIPS eligible clinicians, allowing them to receive more timely feedback on their rates and how their rates compare to others using the same QCDR or qualified registry, so when up to a third of the quality score is based on data not calculated by the QCDR or qualified registry, it becomes challenging for that entity to provide meaningful feedback and benchmarking to the MIPS eligible clinicians on how they are performing in the overall quality category, which amounts to 50 percent of their MIPS final score.

Response: We appreciate the suggestion but we believe it is important to use CMS claims data which we know to be valid and to calculate these measures in the way with which providers are familiar, at the outset of the MIPS program. We would consider future refinements to the measure, including exploring how a registry or QCDR might be able to participate in the claims-based measures' calculation.

Comment: Some commenters supported the inclusion of ACR measure rates in the proposed global and population health measurement, and the use of telehealth to achieve goals.

Response: We thank the commenters for their support. Regarding the commenters reference to telehealth, we note telehealth can help to support better health and care at the patient and population levels. As indicated in the Federal Health IT Strategic Plan 2015–2020 (Strategic Plan) which can be found at <http://www.hhs.gov/about/news/2015/09/21/final-federal-health-it-strategic-plan-2015-2020-released.html#>, telehealth can further the goals of: transforming health care delivery and community health; enhancing the nation's health IT infrastructure; and, advancing person-centered and self-managed health.

Comment: Other commenters stated that population-based measures had low statistical reliability for practice groups

smaller than hospitals. The commenters requested that specialists and small MIPS eligible clinicians be exempt from reporting population-based measures. Another commenter stated attributing population-based measure outcomes to specific MIPS eligible clinicians is inappropriate. Further, the commenter stated MIPS eligible clinicians should only be scored on measures they choose within the quality performance category. A few commenters requested that population-based measures be removed from quality reporting, because these measures were developed for use in the hospital setting and would be unreliable when applied at the individual MIPS eligible clinician's level. Another commenter stated that global and population-based measures (PQIs specifically) should not be used until they were appropriately risk adjusted for patient complexity and socio-demographic status.

Response: We have examined the global and population-based measures closely and have decided to not finalize the acute and chronic composite measures of AHRQ PQI. Therefore, we are no longer requiring two of the three population health measures and are only requiring the ACR measure for groups of more than 15 instead of our proposed approach of groups of 10 or more, assuming the case minimum of 200 cases has been met, as discussed in section II.E.6. of this final rule with comment period. If the case minimum of 200 cases has not been met, we will not score this measure. Thus, the MIPS eligible clinician will not receive a zero for this measure, but rather this measure will not apply to the MIPS eligible clinician's quality performance category score. We believe the ACR measure for groups of more than 15 is appropriate and will provide meaningful measurement. Therefore, we respectfully disagree with the commenter's statement that MIPS eligible clinicians should only be scored on measures they choose within the quality performance category.

Comment: Some commenters did not want CMS to use global and population-based measures for accountability. The commenters remarked that CMS has not provided enough evidence that these measures have any impact on quality. The commenters found global and population-based measures confusing and frustrating because MIPS eligible clinicians have no control over appropriate measures for accountability.

Response: The purpose of the global and population-based measures is to encourage systemic health care improvements for the population being served by MIPS eligible clinicians. We

note further that we have found the PQI measures to be reliable in the VM Program with a case count of at least 20. As we noted in our proposal, we intend to incorporate clinical risk adjustment for the PQI measures as soon as feasible.

Comment: Other commenters supported the use of global and population-based measures, and supported CMS's inclusion of the acute and chronic composite measures and the ACR measure. A few commenters supported the proposal to use population-based measures from the acute and chronic composite measures and the ACR measure or AHRQ PQIs with a minimum case size of 20 and urged CMS to add a clinical risk adjustment as soon as feasible.

Response: We thank the commenters for their support.

Comment: A few commenters requested that the denominator for the quality performance category be adjusted as appropriate to reflect the inapplicability of the global and population-based measures to certain MIPS eligible clinician's practices (the commenter specifies that these measures are inappropriate for hospitalists). Another commenter requested population-based measures be removed from quality reporting, because these measures were developed for use in the hospital setting and would be unreliable when applied at the individual MIPS eligible clinicians' level. Other commenters stated that global and population-based measures (PQIs specifically) should not be used until they were appropriately risk adjusted for patient complexity and socio-demographic status.

Response: We believe these measures are important for all MIPS eligible clinicians, because their purpose is to encourage systemic health care improvements for the population being served by MIPS eligible clinicians. We believe that hospitalists are fully capable of supporting that objective. Additionally, we are using the same two-step attribution methodology that we have adopted in the VM Program, and that methodology focuses on the delivery of primary care services both by MIPS eligible clinicians who work in primary care and by specialists.

Comment: Some commenters expressed support for including more global, population-based measures that are not specialty-specific or limited to addressing specific conditions in the program, but noted that the level of accountability for population-based measures is best at the health system and community level—where the numbers are large enough—rather than at the MIPS eligible clinician level.

Response: We thank the commenters for the feedback. We will take the suggestions into consideration in future rulemaking.

Comment: Another commenter believed that the population-based measures included in the proposal were appropriate for population measurement, but could go further with respect to measuring outcomes. One commenter outlined necessary readmission scenarios to prevent graft rejection for transplant patients and urged CMS to remove the population-based measures, which indirectly include hospital readmissions, from consideration under the quality component of MIPS.

Response: We believe the ACR measure for groups of more than 15 is appropriate and will provide meaningful measurement. Please refer to the discussion above regarding the ACR measure. In addition, we have examined the global and population-based measures closely and have decided to not finalize the acute and chronic composite measures of AHRQ PQIs.

Comment: Several commenters recommended that CMS not require the submission of administrative claims-based population-based measures and stated that they tend to have low reliability at both the MIPS eligible clinicians individual and group levels. The commenters recommended that CMS make the measures optional in the improvement activities performance category or exempt small practices from the measures.

Response: We believe that claims-based measures are sufficiently reliable for value-based purchasing programs, including MIPS. We note that the quality measures and improvement activities are not interchangeable. We will consider other measures that could potentially replace claims-based measures in the future. We note that the administrative claims-based population-based measures are calculated based on Part B claims, and are not separately submitted by MIPS eligible clinicians, so do not have administrative burden associated with them.

Comment: Other commenters expressed concern that the proposal included administrative claims-based population-based measures that were previously part of the VM Program because these measures are specified for the inpatient and outpatient hospital setting and are less reliable when applied to individual MIPS eligible clinicians and groups. The commenters requested CMS decrease the threshold levels for quality reporting measures, expand exemptions, and develop payment modifier measures that have a

higher reliability at the MIPS eligible clinician level. Another commenter had concerns about taking measures from other organizational settings (for example, hospitals) for MIPS as the underlying theory and concepts, technical definitions, and parameters of use might be different in different contexts.

Response: We would like to explain that some measures are geared toward facilities and some are attributable to individuals. Please refer to the Table A of the Appendix in this final rule with comment period for the applicable measures. We have worked to adopt only MIPS eligible clinician individual or group-based measures in the MIPS program.

Comment: Another commenter recommended aligning measures for hospitals and hospitalists and limiting those measures to the quality performance category. The commenter further recommended maintaining the voluntary application of hospital measures (specifically those that could reflect the influence of hospitalists) to MIPS eligible clinicians. Some commenters encouraged CMS to align quality measures with current hospital measures because hospital staff require time and effort to maintain and report MIPS and APM data due to small staffing levels. The commenters stated aligning hospital and MIPS eligible clinician measures would reduce potential for reporting error and allow them to pursue common goals to improve quality of care delivery. Another commenter recommended that hospital, ACO, and pay for performance data be used to measure MIPS performance.

Response: We appreciate the commenter's feedback and will consider it in future years of the program.

After consideration of the comments regarding our proposal on global and population-based measures we are not finalizing all of these measures as part of the quality score. Specifically, we are not finalizing our proposal to use the acute and chronic composite measures of AHRQ PQIs. We agree with commenters that additional enhancements, including the addition of risk adjustment, needed to be made to these measures prior to inclusion in MIPS. We will, however, calculate these measures for all MIPS eligible clinicians and provide feedback for informational purposes as part of the MIPS feedback.

Lastly, we are finalizing the ACR measure from the VM Program as part of the quality measure domain for the MIPS total performance score. We are finalizing this measure with the following modifications as proposed.

We will not apply the ACR measure to solo practices or small groups (groups of 15 or less). We will apply the ACR measure to groups of 16 or more who meet the case volume of 200 cases. A group would be scored on the ACR measure even if it did not submit any quality measures, if it submitted in other performance categories.

Otherwise, then the group would not be scored on the readmission measure. In our transition year policies, the readmission measure alone would not produce a neutral to positive MIPS payment adjustment since in order to achieve a neutral to positive MIPS payment adjustment, a MIPS eligible clinician or group must submit information to one of the three performance categories as discussed in section II.E.7. of the final rule with comment period. In addition, the ACR measure in the MIPS transition year CY 2017 will be based on the performance period (January 1, 2017, through December 31, 2017). However, for MIPS eligible clinicians who do not meet the minimum case requirements the ACR measure is not applicable.

c. Selection of Quality Measures for Individual MIPS Eligible Clinicians and Groups

(1) Annual List of Quality Measures Available for MIPS Assessment

Under section 1848(q)(2)(D)(i) of the Act, the Secretary, through notice and comment rulemaking, must establish an annual list of quality measures from which MIPS eligible clinicians may choose for purposes of assessment for a performance period. The annual list of quality measures must be published in the **Federal Register** no later than November 1 of the year prior to the first day of a performance period. Updates to the annual list of quality measures must be published in the **Federal Register** not later than November 1 of the year prior to the first day of each subsequent performance period. Updates may include the removal of quality measures, the addition of new quality measures, and the inclusion of existing quality measures that the Secretary determines have undergone substantive changes. For example, a quality measure may be considered for removal if the Secretary determines that the measure is no longer meaningful, such as measures that are topped out. A measure may be considered topped out if measure performance is so high and unvarying that meaningful distinctions and improvement in performance can no longer be made. Additionally, we are not the measure steward for most of the proposed quality measures available for

inclusion in the MIPS annual list of quality measures. We rely on outside measure stewards and developers to maintain these measures. Therefore, we also proposed to give consideration to removing measures that measure stewards are no longer able to maintain.

Under section 1848(q)(2)(D)(ii) of the Act, the Secretary must solicit a "Call for Quality Measures" each year. Specifically, the Secretary must request that eligible clinician organizations and other relevant stakeholders identify and submit quality measures to be considered for selection in the annual list of quality measures, as well as updates to the measures. Although we will accept quality measures submissions at any time, only measures submitted before June 1 of each year will be considered for inclusion in the annual list of quality measures for the performance period beginning 2 years after the measure is submitted. For example, a measure submitted prior to June 1, 2016 would be considered for the 2018 performance period. Of those quality measures submitted before June 1, we will determine which quality measures will move forward as potential measures for use in MIPS. Prior to finalizing new measures for inclusion in the MIPS program, those measures that we determine will move forward must also go through notice-and-comment rulemaking and the new proposed measures must be submitted to a peer review journal. Finally, for quality measures that have undergone substantive changes, we propose to identify measures including but not limited to measures that have had measure specification, measure title, and domain changes. Through NQF's or the measure steward's measure maintenance process, NQF-endorsed measures are sometimes updated to incorporate changes that we believe do not substantively change the intent of the measure. Examples of such changes may include updated diagnosis or procedure codes or changes to exclusions to the patient population or definitions. While we address such changes on a case-by case basis, we generally believe these types of maintenance changes are distinct from substantive changes to measures that result in what are considered new or different measures.

In the transition year of MIPS, we proposed to maintain a majority of previously implemented measures in PQRS (80 FR 70885–71386) for inclusion in the annual list of quality measures. These measures could be found in Table A of the Appendix of the proposed rule: Proposed Individual Quality Measures Available for MIPS

Reporting in 2017 (81 FR 28399 through 28446). Also included in the Appendix in Table B of the proposed rule (81 FR 28447) was a list of proposed quality measures that do not require data submission, some of which were previously implemented in the VM (80 FR 71273–71300), that we proposed to include in the annual list of MIPS quality measures. These measures can be calculated from administrative claims data and do not require data submission. We also proposed measures that were not previously finalized for implementation in the PQRS program. These measures and their draft specifications are listed in Table D of the Appendix in the proposed rule (81 FR 28450 through 28460). The proposed specialty-specific measure sets are listed in Table E of the Appendix in the proposed rule (81 FR 28460 through 28522). As we continue to develop measures and specialty-specific measure sets, we recognize that there are many MIPS eligible clinicians who see both Medicaid and Medicare patients and seek to align our measures to utilize Medicaid measures in the MIPS quality performance category. We believe that aligning Medicaid and Medicare measures is in the interest of all clinicians and will help drive quality improvement for our beneficiaries. For future years, we solicited comment about the addition of a "Medicaid measure set" based on the Medicaid Adult Core Set (<https://www.medicaid.gov/medicaid-chip-program-information/by-topics/quality-of-care/adult-health-care-quality-measures.html>). We also sought to include measures that were part of the seven core measure sets that were developed by the Core Quality Measures Collaborative (CQMC). The CQMC is a collaborative of multiple stakeholders that is convened by America's Health Insurance Plans (AHIP) and co-led with CMS. The purpose of the collaborative is to align measures and develop consensus on core measure sets across public and private payers. Measures we proposed for removal can be found in Table F of the Appendix in the proposed rule (81 FR 28531) and measures that will have substantive changes for the 2017 performance period can be found in Table G of the Appendix in the proposed rule (81 FR 28531 through 28569). In future years, the annual list of quality measures available for MIPS assessment will occur through rulemaking. We requested comment on these proposals. In particular, we solicited comment on whether there are any measures that commenters believe

should be classified in a different NQS domain than what was proposed or that should be classified as a different measure type (for example, process vs. outcome) than what was proposed.

The following is a summary of the comments we received on our proposals regarding the Annual List of Quality Measures Available for MIPS Assessment.

Comment: One commenter wanted to know via what mechanism stakeholders will be made aware of the public comment period and final measure publications associated with quality measure changes under MIPS (for example, the PFS rule) in advance of the proposed annual update, and if CMS plans to do measure updates specific to MIPS. Another commenter requested clarity on when the measures and measure sets will be released.

Response: The final measure sets can be found in the Appendix of this final rule with comment period. We intend to make updates to the list of quality measures annually through future notice and comment rulemaking as necessary. At this time, we cannot provide more specificity on our rulemaking schedule, but intend to announce availability of the proposed and final measure sets through stakeholder outreach, listservs, online postings on qualitypaymentprogram.cms.gov, and other communication channels that we use to disseminate information to our stakeholders.

Comment: One commenter asked that all measures be published in a sortable electronic format, such as MS Excel or a comma-delimited format compatible with Excel.

Response: We intend to post the measures and their specifications on the Quality Payment Program Web site (qualitypaymentprogram.cms.gov). We are striving to design the Web site with user needs in mind so that users will have easy access to the information that they need.

Comment: One commenter requested clarification on the methodology for publishing, reviewing, benchmarking, and giving feedback on measures.

Response: As discussed in section II.E.5.c. of this final rule with comment period, we select measures through a pre-rulemaking process, which includes soliciting public comments, and adopt those measures through notice-and-comment rulemaking. We then collect measure data, establish performance benchmarks based on a prior period or the performance period, score MIPS eligible clinicians based on their performance relative to the benchmarks, and provide feedback to MIPS eligible clinicians on their performance. Also, as

discussed further in section II.E.10. of this final rule with comment period, we intend to publicly post performance information on the Physician Compare Web site.

Comment: One commenter requested that any proposed introduction of additional inpatient or hospital measures be published in the same place that other MIPS quality measure proposed changes are published.

Response: We agree with the commenter and will strive to ensure that all MIPS policy changes occur together. However, other rulemaking vehicles may be necessary for the Program's implementation in the future.

Comment: One commenter did not support the Quality Payment Program, believing quality measures should be developed on a state level by the physicians in the state.

Response: The Quality Payment Program is required by statute. In addition, we note that the vast majority of the measures that are being finalized were developed by the physician community.

Comment: A few commenters cautiously supported the proposal that CMS release measures by November 1 the year in advance of the performance period, noting that ideally physicians would have more time. However, numerous commenters stated that November 1 is too late in the year for quality measures to be published in the **Federal Register** to be implemented by January 1 of the following year and encouraged CMS to publish the final list of approved measures earlier to allow clinicians and vendors sufficient time to prepare for the performance period. A few commenters specifically noted the need to give EHR software vendors adequate time to update their software and establish workflows to match measures. This process takes several months, and many vendors do not update their systems with new measures until June.

Response: We understand the commenters' concern. As described above, the process for selecting MIPS quality measures entails multiple steps that begins with an annual call for measures and culminates with the publication of the annual list of quality measures in a final rule. While we strive to release the final list of quality measures as soon as feasible, we cannot do so until we have completed all of the requisite steps. With respect to commenters' statement that software developers need more adequate time to update their software to capture measures, we will work to assure that measures have been appropriately reviewed and release measures as early

as possible. In future years, CMS will release specifications for eCQMs well in advance of November 1 of the year preceding a given performance period. For example, for the 2017 performance period, we released specifications for all eCQMs that may be considered for implementation into MIPS in April 2016. We are open to commenters' suggestions for other ways that we can streamline the measure selection process to enable us to release the annual list of quality measures and/or measure specifications sooner than November 1st.

Comment: A few commenters were concerned with CMS's plan to update quality measures on a yearly basis. The commenters recommended that measures be considered in "test/pilot" mode before they are included in CMS's quality programs and rigorously evaluated for validity and accuracy during the pilot period. Further, the commenters suggested that measures should be maintained for more than 1 year, to ensure the agency has a reasonable understanding of how clinicians have performed and improved over time, as well as to determine whether CMS's priorities have been reasonably met, with respect to included quality measures.

Response: For measures that are NQF-endorsed, measures must be tested for reliability and validity. For measures that are not NQF-endorsed, we consider whether and to what extent the measures have been tested for reliability and validity. We do not take the decision to remove a measure lightly and agree with the commenters that we should take into consideration how clinicians have performed and improved over time, among other factors, when deciding to remove a quality measure from the program.

Comment: Several commenters recommended separate timelines for new measures as opposed to updated specifications and suggested that when changes to the list of MIPS quality measures are made, those changes should not be implemented until at least 18 months after they are announced and finalized. One commenter suggested that 12 months are needed for vendor implementation, and another 6 months allocated for real-world beta testing of measures to identify and resolve defects and inconsistencies in a measure update for implementation the following year. The commenter further requested a minimum of 6 months' notice prior to any reporting period for implementation of revised measures. Some commenters recommended more time, at least 6 months, to implement a new metric before being scored to allow time to

work out reporting issues with vendors. Other commenters requested that specific measure definitions be published at least 120 days prior to the start of the reporting period.

Response: We do not believe it is necessary to develop unique timelines for measures that we will consider for the program. Although we understand the commenters' point that new measures require additional consideration beyond simple changes to measure specifications, we believe we account for those considerations when developing our proposals and in consulting with the stakeholder community during the measure development process. We describe our process in detail in our Quality Measure Development Plan (<https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>).

Comment: One commenter expressed discontent with measures specifications that change in mid-season. The commenter requested that the measures be accepted based on the new or the old specifications and that neither submission be scored.

Response: We would like to note that measure specifications do not change during the performance period. Prior to the beginning of the performance period, measure specifications are shared, and only change for the next performance period or at another time indicated in rulemaking. We cannot accept multiple versions of quality measure data, so we can only accept one version of a measure's specifications during a performance period.

Comment: One commenter requested that CMS quickly notify clinicians when measures are introduced and retired. Further, other commenters were concerned about the proposed changes in quality measures. The commenters stated that this will require more resources and time to sort through all the changes.

Response: We agree and will make every possible effort to notify clinicians when we propose and adopt measures for MIPS, and will similarly notify clinicians as quickly as possible if and when we retire measures from the program, which is also done through rulemaking. Our intention is to keep clinicians as informed as possible about the quality criteria on which they will be measured, something we have done within the PQRS and other quality reporting programs.

Comment: One commenter recommended that to avoid concerns regarding uneven opportunities for

clinicians, registries, and health IT vendors, CMS should require all measures planned for inclusion in its quality reporting programs to include specifications such that any organization that would want to use those measures may do so.

Response: Measure specifications will be available on the Quality Payment Program Web site (qualitypaymentprogram.cms.gov). Additionally, to provide clarity to MIPS eligible clinicians when they select their quality measures we also will publish the numerical baseline period benchmarks prior to the performance period (or as close to the start of the performance period as possible) in the same location as the detailed measure specifications. These measure benchmarks will be published for those quality measures for which baseline period data is available. For more details on our quality performance category benchmarks, please refer to section II.E.6. of this final rule with comment period.

Comment: One commenter recommended that CMS implement a review process when it considers measures for use at a different level than the measure's intended use (for example, the clinician level). The commenter recommended this process include, but not be limited to: Convening a technical expert panel and a public comment period, and a review of measure specifications to ensure measures are feasible and scientifically acceptable in all environments and at all intended levels of measurement.

Response: As part of our measure selection process, stakeholders have multiple opportunities to review measure specifications and on whether or not they believe the measures are applicable to clinicians as well as feasible, scientifically acceptable, and reliable and valid at the clinician level. As we discussed in section II.E.5.c of this final rule with comment period, the annual Call for Measures process allows eligible clinician organizations and other relevant stakeholder organizations to identify and submit quality measures for consideration. Presumably, stakeholders would not submit measures for consideration unless they believe that the measure is applicable to clinicians and can be reliably and validly measured at the individual clinician level. The NQF convened Measure Application Partnership (MAP) provides an additional opportunity for stakeholders to provide input on whether or not they believe the measures are applicable to clinicians as well as feasible, scientifically acceptable, and reliable and valid at the

clinician level. Furthermore, we must go through notice and comment rulemaking to establish the annual list of quality measures, which gives stakeholders an additional opportunity to review the measure specifications and provide input on whether or not they believe the measures are applicable to clinicians as well as feasible, scientifically acceptable, and reliable and valid at the clinician level. Additionally, we are required by statute to submit new measures to an applicable, specialty-appropriate peer-reviewed journal.

Comment: Several commenters suggested providing a 3-year phase out period for measures being proposed for removal. CMS should provide measure owners with more detailed analysis on the use of their measures so that they can work to develop the next generation of measures and/or improve performance with measures.

Response: We allow the public to comment on any proposals for measure removals, but we do not intend to adopt a general 3-year phase-out policy at this time. We believe the MIPS program must be flexible enough to accommodate changes in clinical practice and evidence as they occur.

Comment: A few commenters commended and supported CMS for its proposal to remove unneeded measures and reduce administrative burden while still providing meaningful rewards for high quality care provided by MIPS eligible clinicians in small practices. Commenters recommended that CMS remove topped out measures, duplicative measures, and measures of basic standards of care. Another commenter suggested that CMS establish a mechanism for expeditiously changing quality measures that are no longer consistent with published best practices. Further, another commenter noted that patients are better served when eligible clinicians are able to dedicate their time and effort to recording data that is pertinent and specific to patient issues and care, and thus, the commenter recommended that CMS remove irrelevant quality measures and redundant quality measures in order to align MIPS eligible clinicians with CMS' goal to improve reporting efficiency.

Response: We intend to ensure that measures are not duplicative, and we believe that the need for some measures of basic care standards is still present given the clinical gaps evidenced by the performance rate. Measures must be removed through notice-and-comment rulemaking and are thus not expeditiously removed. Measures are reviewed in accordance with the

removal criteria discussed in the proposed rule (81 FR 28193) and a determination is made to retain or to propose for removal.

Comment: A few commenters opposed removing measures as topped out, stating that high performance on a measure should be rewarded and incentivized. Other commenters recommended that CMS consider adopting new measures addressing similar concepts to ensure that there are no gaps in measurement in distinct disease areas before removing topped out measures.

Response: We agree that we should not automatically remove measures that are topped out without considering other factors, such as whether or not removing the measure could lead to a worsening performance gap. We consider additional factors when removing measures on the basis of being "topped out." For instance, if the variance of performance on the measure indicates that there is no identified clinical performance gap, this also impacts the decision to remove measures on the basis of being "topped out." We will continue to look at topped out criteria in addition to performance gaps when selecting measures to remove. We recognize that topped out measures no longer provide information that permits the meaningful comparison of clinicians.

Comment: One commenter did not support the selection of quality measures, as the commenter believed the quality measures are surrogates for measuring true value as a clinician and lack validity.

Response: We believe quality measurement is critical to ensuring that Medicare beneficiaries and all patients receive the best care at the right time. We note further that we are required by statute to collect quality measures information, and we believe quality measurement is an opportunity for MIPS eligible clinicians to demonstrate the quality of care that they provide to their patients.

Comment: One commenter proposed that instead of the list of self-selected quality measures, CMS could establish a measure set that the agency could calculate on behalf of clinicians using administrative claims, QCDR data, and potentially other clinical data that clinicians report with their claims or through EHRs. These administrative claims-based measures should include some measures that apply to a broad scope of clinicians, and also some overuse measures (for example, imaging for non-specific low back pain). Further, the commenter suggested that CMS also could include measures from other

settings, such as inpatient hospitals, because some clinicians, such as hospitalists, may be best measured through hospital quality measures (for example, hospital readmissions). The commenter also suggested that through this approach CMS also would have more complete information to remove topped-out measures, and to prioritize measures based on performance gaps.

Response: We note that we proposed three administrative claims-based measures, and that we do accept information electronically and through QCDRs. We are researching the best way to attribute care to clinicians within facilities. We are also looking into the best method to identify topped-out measures and to quantify a decision to remove measures from the program. Finally, measures have been identified based on specialty.

Comment: Numerous commenters disagreed with the elimination of measures group reporting and asked that CMS reconsider the removal of measures groups, in order to reduce reporting burden. Further, commenters noted that measures groups are designed to provide an overall picture of patient care for a particular condition or set of services and provide a valuable means of reporting on quality. Measure groups ensure that specialties, individual physicians, and small practices have access to meaningful measures that allow physicians to focus on procedures and conditions that represent a majority of his or her practice. Another commenter expressed belief that the removal of measure groups will skew quality reporting further in favor of large group practices because the CMS Web Interface allows for reporting on a sampling of patients.

Response: We agree that there are measures to which specialists should have access to that are meaningful for their specialty, which is why we proposed replacing measure groups with specialty measure sets to ensure simplicity in reporting for specialists. We believe that the specialty measure sets are a more appropriate way for MIPS to incorporate measures relevant to specialists than measures groups. Further, we proposed specialty measures sets in an effort to align with the CQMC.

Comment: One commenter agreed with efforts to streamline the process of reviewing and identifying applicable quality measures, and supported the inclusion of specialty measure sets in Table E of the Appendix in this final rule with comment period.

Response: We appreciate the support.

Comment: One commenter encouraged CMS to move rapidly to a

core set of measures by specialty or subspecialty because the commenter believes an approach using high-value measures would enable direct comparison between similar clinicians, and would provide assurance that the comparison is based on a consistent and sufficiently comprehensive set of quality indicators. The commenter believed a core measure set should include measures of outcomes, appropriate use, patient safety, efficiency, patient experience, and care coordination.

Response: We agree that a core set of measures by specialty would be optimal when comparing similar eligible clinicians and we did incorporate the measures that were included in the core sets developed by the CQMC. CMS will continue to evaluate a core set of measures by specialty to ensure each set is diverse and indicative of CMS priorities of quality care.

Comment: One commenter recommended use of specialty- and subspecialty-specific core measure sets that would provide reliable comparative information about clinician performance than the 6 measure approach. The commenter believed that advancing the current state of performance measurement should be a top priority in MACRA implementation, and toward that end, the commenter supported using the improvement activities category to reward development of high-value measures, and in particular patient-reported outcomes.

Response: We will consider any new measure sets in the future, and welcome commenters' and other stakeholders' feedback on what measure sets we should consider in the future for MIPS. We agree that advancing performance measurement should be a top priority for MIPS, and we thank the commenter for their support of improvement activities.

Comment: One commenter recommended identifying quality measures that are specialty specific and germane to what is practiced. Another commenter recommended that CMS apply a standardized approach to ensure that measures included in the specialty measure sets are clinically relevant and aligned with updates occurring in the measure landscape.

Response: We appreciate the comment and note that identification of quality measures that are germane to clinical practice is our intent. We are adopting quality measure sets that are specialty-specific and clinically relevant to that particular specialty.

Comment: Several commenters supported the concept of measure sets, but had some concerns with the

construction of the proposed measure sets. Some of the measures included in the specialty sets are not appropriate for some specialties or subspecialties. The commenters believed the proposed rule represents more of a primary care practice focus. Further, the commenters were concerned that reporting requirements may not always reflect real differences in specialized practices. Commenters suggested these issues reflect a need that all of the measure sets should be more closely vetted by clinicians from the specialty providing the service.

Response: We worked with specialty societies to develop measure sets and will continue to work with specialty societies to further improve the existing specialty measure sets and also develop new specialty measure sets for more specialty types.

Comment: Some commenters believed the quality measures are not relevant to certain specialties. Further, one commenter expressed concern about the proposed MIPS quality measures because the commenter believed the quality measures do not reflect the unique care provided by geriatricians for their elderly patients, but rather were developed for non-elderly patient care. The commenter believed this would unfairly disadvantage geriatricians who care for sicker, older patients; who are without the resources and technology incentives to develop new, more relevant measures, and frequently practice in settings that do not have health IT infrastructure.

Response: We believe that the quality measures adopted under the Quality Payment Program are relevant to clinicians that offer services to Medicare beneficiaries, including elderly patients. We tried to align certain measures to specialty-specific services, and we welcome commenters' feedback on additional measures or specialties that we should consider in the future.

Comment: A few commenters stated that not every physician and specialty fits CMS's measure molds and that there is a lack of specialty measure sets. Further, commenters suggested that CMS identify an external stakeholder entity to maintain the proposed specialty-specific measure sets.

Response: We have identified specialty sets based on the ABMS (American Board of Medical Specialties) list. Although we realize that all specialties or sub-specialties are not covered under these categories, we encourage clinicians to report measures that are most relevant to their practices, including those that are not within a specialty set.

Comment: A few commenters stated that specialists with fewer options will be required to report on topped out measures which do not award full credit, resulting in a disadvantage. Another commenter was concerned that as groups choose the six quality measures on which they perform best, those popular measures will become inflated and quickly become "topped out." Further, commenters stated that there is little value in reporting on measures already close to being "topped out," just for the sake of reporting. One commenter suggested that CMS continue to develop more clinically relevant measures and remove those that have been topped out.

Response: As measures become topped out, we will review each measure and make a determination to retain or remove the measure based on several factors including whether the measure is a policy priority and whether its removal could have unintended impact on quality performance. We refer the commenters to section II.E.6.a. of this final rule with comment period for additional details on our approach for identifying and scoring topped out measures.

Comment: One commenter suggested that CMS carefully consider all of the specialties that will be engaged in the MIPS program in future years as measure requirements are expanded and to develop policies that provide flexibility for those physician types who may have limited outcomes measures to report. Another commenter recommended CMS ensure the availability of high priority MIPS quality measures for specialists. The commenter requested that CMS closely track whether the number of high priority MIPS measures available to specialists approximates the number available to primary care physicians. Should the measures available to specialists be considerably lower, they recommended that CMS expedite the creation of specialty specific high priority measures within its measure development process to assure parity in reporting opportunity across specialties.

Response: We are aware of the limitations in the pool of measures, and we will continue to work with stakeholders to include more measures for specialties without adequate metrics.

Comment: One commenter stated that it is difficult to evaluate the long-term negative impact the proposed rule may have because there was no information on how CMS intends to incorporate new measures into the quality category. Commenter encouraged information sharing on the intended process to evaluate newly proposed measures.

Response: As part of the PQRS Call for Measures process, we have historically outlined the criteria that we will use to evaluate measure submissions. We anticipate continuing to do so for the annual MIPS Call for Measures process as well. To the extent measures that are submitted under the annual Call for Measures process meet these criteria, we would then propose to include them in the MIPS quality measure set through notice and comment rulemaking.

Comment: A few commenters supported continued use of PQRS measures. In addition, one commenter acknowledged and expressed appreciation for CMS's addition of a comprehensive list of measures.

Response: We thank the commenters for their support and believe that the continued use of PQRS measures will help ease the transition into MIPS for many MIPS eligible clinicians. Further, the statute provides that PQRS measures shall be included in the final measure list unless removed.

Comment: Some commenters requested evidence based measures that are proven to improve quality of care, improve outcomes, and/or lower the cost of care. Further, they stressed that CMS must continue to improve measures for greater clinical relevance, clinical and patient centered measures, and avoid unintended consequences. A few commenters stated that the PQRS measures have no relevance or benefit to their practice. In addition, one commenter stated that the majority of PQRS measures do not show an evidence-based rationale or justify implementation.

Response: We believe that the measures that we have adopted fulfill the goals the commenters suggest. We further believe that any metrics that capture activities beyond the clinician's control reflect systemic quality improvements to which MIPS eligible clinicians contribute. We note further that most measures that are being implemented have gone through consensus endorsement by a third-party reviewing organization (NQF) prior to their adoption. As part of this endorsement process, the measures are evaluated for validity, reliability, feasibility, unintentional consequences, and expected impact on clinician quality performance. Furthermore, MIPS eligible clinicians also have the option of working with QCDRs to submit measures that are not included in the MIPS measure set but that may be more appropriate for their practices.

Comment: A few commenters expressed concern about the robustness of the proposed quality measures. The

commenters thought that many of the measures lack demonstrated improvement in patient care, create administrative burden for the eligible clinician to track, and will not capture quality of care provided.

Response: Most of the CMS measures are submitted by measure stewards and owners from the medical community. We continue to encourage stakeholders to submit measures for consideration during our annual call for measures. Further, we realize that measures are not the only indication of quality care. However, they are one objective way to assess quality of care patients receive. We believe this indicator will become more effective and reliable as the measure set is expanded and refined over the years.

Comment: One commenter stated that none of the 465 options for reporting measures in the proposed rule are based on scientific method. They recommended that each of the 465 options should meet three criteria. First, it should be based on scientific method. Second, there should be a plan to review and act on the data that is reported to CMS on the measure. Third, the reporting of such quality measures should be an automated function of the electronic medical record system and not impair, slow down or distract physicians participating directly in patient care.

Response: As stated previously, most of the proposed measures have been endorsed by the NQF. The endorsement process evaluates measures on scientific acceptability, among other criteria. Depending on the policy priority of the measure, CMS may include measures without NQF endorsement. All of our measures, regardless of endorsement status, are thoroughly reviewed, undergo rigorous analysis, presented for public comment, and have a strong scientific and clinical basis for inclusion.

Comment: One commenter indicated that many proposed measures have not been tested, the proposed thresholds for reliability and validity are very low, and the proposed rule does not provide specific benchmark for measures. The commenter recommended extra time to test and implement measures across programs, with an emphasis on simplicity, transparency and appropriate risk-adjustment.

Response: Most MIPS measures are NQF-endorsed, which means they have been evaluated for feasibility, reliability, and validity, or in the absence of NQF-endorsement, the measures are required to have an evidence-based focus. All of our measures, regardless of endorsement status, are thoroughly reviewed,

undergo rigorous analysis, presented for public comment, and have a strong scientific and clinical basis for inclusion. In addition, as discussed in section II.E.6. of this final rule with comment period, we intend to publish measure-specific benchmarks prior to the start of the performance period for all measures for which prior year data are available.

Comment: One commenter recommended rigorous review and updating of quality measures, including addressing how measures are related to outcomes.

Response: CMS does annual reviews of all measures to ensure they continue to be clinically relevant, appropriate, and evidence based. In the event that we determine that a measure no longer meets these criteria, then we may consider removing them from the MIPS quality measure set for future years through notice and comment rulemaking.

Comment: One commenter asked CMS to offer time-limited adoption for any MIPS measures that are not fully tested and have not been through a rigorous vetting process, as this offers four benefits: MIPS eligible clinicians will have expedited access to a greater selection of measures; measure developers could have access to a larger data set for measure testing; we will gain earlier insight into appropriateness and relevance of such measures; and MIPS eligible clinicians will gain valuable experience with the measures before performance benchmarks are established.

Response: We believe that we must ensure that all MIPS measures are clinically valid and tested prior to their use in a value-based purchasing program. All of our measures, are thoroughly reviewed, undergo rigorous analysis, presented for public comment, and have a strong scientific and clinical basis for inclusion including testing for validity, reliability, feasibility, unintentional consequences, and the expected impact on clinician quality performance.

Comment: One commenter supported the Quality Payment Program rewarding MIPS eligible clinician performance as measured by quality metrics, but expressed concern that there are few outcomes measures, particularly regarding assessment of quality of care provided across settings and providers, linking clinical quality and efficiency to a team. The commenter recommended the Quality Payment Program develop and include quality measures that reflect performance of eligible clinicians as part of a team, perhaps through composite measure groups, which

would take into account various components of quality that move toward the desired outcome. Alternatively, or in addition to such a measure, the commenter recommended that CMS work toward establishing clear associations between the clinician level measures in MIPS, facility level measures in the Hospital OQR and other provider level measures such as home health agency measures, so that all clinicians could see how one set of quality activities feeds into another, thus driving improvement across settings and providers for a given population.

Response: We would encourage the commenter to submit measures for possible inclusion under MIPS through the Call for Measures process. Further, it may be advantageous for the commenter to report through a QCDR or report as a group. We are committed to developing outcome measures and intend to work with interested stakeholders through our Quality Measurement Development Plan which describes our approach.

Comment: One commenter requested that the requirement for measures be reduced to encourage meaningful engagement and improvement in patient care. The current set of measures are not relevant to all clinicians, especially given the diversity of procedures, patient population and geographic location of clinicians. The commenter also believes that the quality measures do not align with the advancing care information, cost or improvement activities performance categories, and recommended alignment of quality and cost measures to provide information needed to increase value.

Response: We have worked to adopt numerous measures that apply to as many clinicians as possible, and we have specified in other sections of this final rule with comment period how clinicians with few or no measures applicable to their practice will be scored under the program. We believe that the measures we are adopting will encourage meaningful engagement and quality improvement, and we do not agree that reducing the number of required measures will make those goals easier for physicians to pursue. However, following the principle that the MIPS performance categories should be aligned to enhance the program's ability to improve care and reduce participation burden, we will consider additional ways to align the quality and cost performance category measures in the future as well as ways to further quality improvement through the advancing care information and

improvement activities performance categories.

Comment: One commenter suggested limiting the available measures to three detailed measures per medical discipline. The commenter suggested that the criteria for choosing measures should be that they are related to a public health goal and will ensure that patients with a chronic or life-threatening condition are given a high level of care.

Response: We believe that performance should be measured on measures that are most relevant and meaningful to clinicians. To that end, we need to balance parsimony with ensuring that there are relevant and meaningful measures available to the diverse array of MIPS eligible clinicians.

Comment: One commenter expressed concern that there is a 30-month gap between the selection of quality measures and when they are used; commenter believes Core Quality Measure Collaborative (CQMC) core measure sets need immediate integration into the final rule with comment period.

Response: Measures that are to be implemented in the program must undergo notice-and-comment rulemaking, as required by statute. Nearly all of the measures that are a part of the CQMC core measure sets are being finalized for implementation.

Comment: Several commenters stated that all measures used must be clinically relevant, harmonized, and aligned among all public and private payers and minimally burdensome to report. The commenters stated the goal of such alignment would be to reduce measure duplication and improve harmonization and, ultimately, build a national quality strategy. Commenters recommended that CMS use measure sets developed by the multi-stakeholder Core Quality Measures Collaborative, as well as ensure that specialists are well represented in the effort to align quality measures.

Response: Specialty societies are among the stakeholders that participate in the Core Measures Collaborative, and we will continue to work with specialists to align quality measures in the future. Further, nearly all of the measures that are a part of the CQMC core measure sets are being finalized for implementation.

Comment: One commenter supported the consideration of Pioneer ACO required quality measures for use in MIPS. Another commenter requested we allow quality reporting measures to be differentiated between primary care and specialty physicians. For instance, we could use the same quality reporting

structure as the Pioneer ACO Model for MIPS, and allow flexibility in measures when considering reporting by an APM.

Response: MIPS eligible clinicians have the opportunity to report by the CMS Web Interface if they are part of a group of at least 25 MIPS eligible clinicians. Pioneer ACOs were also required to use the CMS Web Interface to submit their quality measures. In addition, many of the quality measures that are included in the CMS Web Interface are available for other data submission methods as well. Therefore, MIPS eligible clinicians could report these same measures through other data submission methods if they so choose or report measures from one of the specialty-specific measure sets. If a MIPS eligible clinician participates in an APM, then the APM Scoring Standard for MIPS Eligible Clinicians Participating in MIPS APMs applies. As discussed further in section II.E.5.h of this final rule with comment period, the APM Scoring Standard outlines how the MIPS quality performance category will be scored for MIPS eligible clinicians who are APM participants.

Comment: A few commenters disagreed with being rated on things over which the commenters have no control (for example, A1c or Blood Pressure). Further, other commenters asked CMS to use quality metrics that captured activities under the physician's control and had been shown to improve quality of care, enhance access-to-care, and/or reduce the cost of care.

Response: Clinicians have the option to report measures that are more relevant where they have control of the outcome and what is being reported. We further believe that clinicians have the opportunity to influence patients' actions and outcomes on their selected metrics, which reflect systemic quality improvements of which MIPS eligible clinicians are a part.

Comment: One commenter requested patient acuity measures to modify the measures, which also alters clinician capability.

Response: We believe that the commenter is referring to the need to risk adjust measures for patient acuity. We note that we allow for risk adjustment if the measures have risk adjusted variables and methodology included in their specifications.

Comment: One commenter requested clear instructions from CMS as to how to choose quality measures since the concepts are extremely confusing. Another commenter sought clarification regarding the quality measures and submission of quality measures so that clinicians can submit the measures with

highest performance. The commenter requested that CMS clearly define which measures are cross-cutting measures and which are outcomes measures.

Response: We created the specialty sets to assist MIPS eligible clinicians with choosing quality measures that are most relevant to them. Other resources to help MIPS eligible clinicians choose their quality measures will also be available on the CMS Web site. In addition, we would encourage MIPS eligible clinicians to reach out to their specialty societies for further assistance. We would also like to note that the measure tables do indicate by use of a symbol which measures are outcomes. We are not finalizing the cross-cutting measure requirement.

Comment: One commenter recommended adequately testing new eCQMs to confirm they are accurate, valid, efficiently gathered, reflects the care given, and successfully transports using the quality reporting document architecture format. Additionally, eCQMs should be endorsed by NQF and undergo an electronic specification testing process.

Response: Thank you for your comments. We ensure that validity and feasibility testing are part of the eCQM development process prior to implementation. Although we strive to implement NQF-endorsed measures when available, we note that lack of NQF endorsement does not preclude us from implementing a measure that fulfills a gap in the measure set.

Comment: A few commenters requested only non-substantive changes in eCQM measure sets and specifications, which do not require corresponding changes in clinician workflow, should be made through annual IPPS rulemaking while substantive changes (for example, a new CQM or a change in a current CQM that requires a workflow change) should be published in MIPS rulemaking and not go live until 18 months after publication.

Response: We note that section 1848(q)(2)(D)(i)(II)(cc) of the Act requires the Secretary to update the final list of quality measures from the previous year (and publish such updated list in the **Federal Register**) annually by adding new quality measures and determining whether or not quality measures on the final list of quality measures that have gone through substantive changes should be included in the updated list. It is unclear why the commenters are suggesting that non-substantive changes to MIPS eCQM measure sets and specifications should be made through the annual IPPS

rulemaking vehicle since the IPPS proposed and final rules typically address policy changes for hospital clinicians. We would use rulemaking for the MIPS program in the future to address substantive changes to measures in the future.

Comment: A few commenters supported the development of a robust de-novo measure set of eCQMs for use by specialty MIPS eligible clinicians that are designed specifically to capture eCQM data as part of an EHR-enabled care delivery for use in future iterations of the CMS Quality Payment Program. One commenter believed eCQMs should be developed for specialties to measure process improvement and improved outcomes where data is not available in a standardized format and no national standard has been codified.

Response: We encourage stakeholders to submit new electronically-specified specialty measures for consideration during the annual call for measures.

Comment: Some commenters encouraged closer alignment between MACRA and EHR Incentive Program eCQM specifications and recommended using the same version specifications for the same performance year for MIPS and the EHR Incentive Program.

Response: We appreciate the comments; however, we note that there is no overlap between the MIPS performance periods and the reporting period for the Medicare EHR Incentive Program for EPs. We note that a subset of the eCQMs previously finalized for use in the Medicare EHR Incentive Program for EPs are being finalized as quality measures for MIPS for the 2017 performance period.

Comment: One commenter disagreed with the overall complexity of the quality performance category measures because the current available EHR software offerings do not easily automate the work of capturing measures.

Response: We understand that not all quality measurement may yet be automated and share the concerns expressed. CMS and ONC also have received similar feedback in response to its CQM certification criteria within the ONC Health IT Certification Program.

Based on this feedback, ONC has added a requirement to the 2015 Edition "CQM—record and export" and "CQM—import and calculate" criteria that the export and import functions must be executable by a user at any time the user chooses and without subsequent developer assistance to operate. This is an example of one way ONC is incentivizing more automated quality measurement through regulatory requirements. In addition, CMS and

ONC will continue to work with health IT vendors and health IT product and service vendors, as well as the stakeholders involved in measure development to support the identification and capture of data elements, and to test and improve calculations and functionality to support clinicians and other health care providers engaged in quality reporting and quality improvement.

Comment: One commenter wanted to know if CMS plans to continue adding and removing measures from the group of 64 e-measures, as these measures have not been modified for several years. They noted that adding new measures to this set will require much more than 2 months' notice in order for developers to implement them, especially given the 90 percent data completeness criteria placed on EHRs.

Response: We may propose to remove measures from the e-measures group if they meet our criteria for removal from the MIPS. We are lowering the data completeness criteria to 50 percent for the first MIPS performance period. As new eQMs are developed and are ready for implementation, we will evaluate when they can be implemented into MIPS and will consider developer implementation timeframes as well.

Comment: One commenter requested that CMS not significantly reduce the number of available eQMs as many small practices adopted EHRs for their ability to capture and report quality data and lack sufficient resources to invest in another reporting tool.

Response: We are revising the list of eQMs for 2017 to reflect updated clinical standards and guidelines. A number of eQMs have not been updated due to alignment with the EHR Incentive Program in the past. This has resulted in a number of measures no longer being clinically relevant. We believe the updated list, although smaller, is more reflective of current clinical guidelines.

Comment: One commenter noted that CMS is proposing removal of 9 EHR measures, and that while removal may be warranted, in some cases the act of removal means that there are potential gaps for those who plan to report quality using eQMs. The commenter therefore recommended CMS encourage measure developers to help fill these gaps.

Response: We would encourage measure developers to continue to submit new electronically-specified measures for potential inclusion in MIPS through the Call for Measure process.

Comment: One commenter wanted to know whether the number of measures will be expanded for electronic

reporting or whether the additional measures are going to only be offered in Registry/QCDR reporting option.

Response: In subsequent years, we expect more measures to be available by electronic reporting but that will depend partly on whether or not electronic measures are submitted via the annual Call for Measures process.

Comment: One commenter supported the creation of a computer adaptive quality measure portfolio and believed measures should be an area of significant focus in the final rule with comment period, including portability.

Response: We thank the commenter and agree that measures are an area of significant focus in this final rule with comment period. We look forward to learning more about private sector innovations in quality measurement in the future.

Comment: A few commenters supported the option, but not the requirement, that physicians select facility-based measures that are aligned with physician's goals and have a direct bearing on the physicians' practice. A commenter noted the challenge of clinicians and groups which functions across multiple facilities and recommends hospital-level risk-adjusted outcome measurement attributable to the principal physician or group responsible for the primary diagnosis.

Response: We thank the commenters for their support and the suggestion. We will consider proposing policies on this topic in the future.

Comment: Some commenters supported the distinction between hospitalists and other hospital-based clinicians from community clinicians and recommended that CMS develop a methodology for the second year of MIPS that will give facility-based clinicians the choice to use their institution's performance rates as the MIPS quality score. Another commenter recommended evaluation of 20 existing measures that represent clinical areas of relevance to hospitalists and could be adapted for MIPS, and indicates that the commenter's organization is ready to work with CMS to develop facility-alignment options.

Response: We will take this feedback into account in the future.

Comment: One commenter stated that quality measures that apply to primary care physicians should not be the same measures applied to consulted physicians.

Response: We would like to note that there is a wide variety of measures, and they do vary between those applicable to primary care physicians and to other physicians, and that all participants

may select the measures that are most relevant to them to report.

Comment: Several commenters requested that CMS accept Government Performance and Results Act (GPRA) measures that Tribes and Urban Indian health organizations are already required to report as quality measures to cut down on the reporting burden.

Response: There are many GPRA measures that are similar to measures that already exist within the program. In addition, some GPRA measures are similar to measures that are part of a CQMC core measure set. We strive to lessen duplication of measures and to align with measures used by private payers to the extent practicable. If there are measures reportable within GPRA that are not duplicative of measures within MIPS, we recommend the commenters work with measure owners to submit these measures during our annual Call for Measures.

Comment: One commenter recommended CMS provide options for specialties without a sufficient number of applicable measures such as: determining which quality measures are applicable to each MIPS eligible clinician and only holding them accountable for those measures; addressing measure validity concerns with non-MAP, non-NQF endorsed measures; establishing "safe harbors" for innovative approaches to quality measurement and improvement by allowing entities to register "test measures" which clinicians would not be scored on but would count as a subset of the 6 quality measures with a participation credit; and allowing QCDRs flexibility to develop and maintain measures outside the CMS selection process.

Response: We have intentionally not mandated that MIPS eligible clinicians report on a specific set of measures as clinicians have varying needs and specific areas of care. MIPS eligible clinicians should report the measures applicable to the service they provide. All measures, including those that are NQF endorsed, go through notice-and-comment rulemaking. In regards to non-MAP and non-NQF endorsed measures, we would like to note that these measures were reviewed by the CQMC, an independent workgroup, which includes subject matter experts in the field. Further, we would like to note that over 90 percent of the measures have gone through the MAP.

Comment: Another commenter suggested that CMS require that outcomes-based measures constitute at least 50 percent of all quality measures and that CMS accelerate the development and adoption of such

clinical outcomes-based measures, including patient survival. Some commenters also suggested that CMS utilize measures that have already achieved the endorsement of multiple stakeholders and have been evaluated to ensure their rigor (for instance, through processes like the National Quality Forum (NQF) endorsement).

Response: We encourage stakeholders to submit new specialty measures for consideration during the annual call for measures. We welcome specialty groups to submit measures for review to CMS that have received previous endorsement. Furthermore, we are committed to developing outcome measures and intend to work with interested stakeholders through our Quality Measurement Development Plan which describes our approach.

Comment: One commenter stated that it is concerning that the proposed quality performance categories fail to explicitly mention health equity as a priority. A few commenters recommended stratified reporting on quality measures by race & ethnicity, especially quality measures related to known health disparities. One commenter specifically supported stratification by demographic data categories that are required for Office of National Coordinator (ONC) for Health Information Technology-certified electronic health records (EHRs). Stratification allows for the examination of any unintended consequences and impact of specific quality performance measures on safety net eligible clinicians and essential community clinicians for potential beneficiary/patient-based risk adjustment. Further, commenters stated that stand-alone health equity quality measures should be developed and incentivized with bonus points as high priority measures. Commenter recommended patient experience to be kept as a priority measure for a bonus point in the final rule with comment period.

Response: We thank the commenter for this feedback on high-priority measures and bonus point awarded for them. It is our intent that measures actually examine quality for all patients, and some of our measures have been risk-adjusted and stratified. We look forward to continuing to work with stakeholders to identify appropriate measures of health equity.

Comment: Several commenters supported adding the Medicaid Adult Core Set, which is particularly important for people dually enrolled in Medicare and Medicaid who have greater needs and higher costs.

Response: We thank the commenters for their support, and would like to note

that we are working to align the Medicaid core set with MIPS in future years.

Comment: One commenter requested that CMS engage state Medicaid leaders to maximize measure alignment across Medicare and Medicaid, and articulate the functional intersection of various measure sets and measure set development work (§§ 414.1330(a)(1) and 414.1420(c)(2) and the Appendix in this final rule with comment period). The commenter specifically encouraged alignment efforts to focus on measures where there is a clear nexus between Medicare and Medicaid populations (§§ 414.1330(a)(1) and 414.1420(c)(2) and Appendix in this final rule with comment period). With respect to specific measures, the commenter had a particular interest in MIPS measures that relate to the avoidance of long-term skilled care in the elderly and disabled. The commenter believed that this is an area of nexus between the two programs, as the majority of newly eligible elderly in nursing facilities were unknown to the Medicaid program in the timeframe immediately leading up to the long-term care stay. The commenter believed this is a high priority for state Medicaid leaders and federal partners to engage around quality measure alignment.

Response: We intend to align quality measures among all CMS quality programs where possible, including Medicaid, and will take this comment into account in the future.

Comment: One commenter suggested that CMS engage states to maximize measure alignment across Medicare and existing State common measure sets.

Response: We work with regional health collaboratives and other stakeholders where possible, and we will consider how best to align with other measure sets in the future.

Comment: A few commenters proposed that CMS align a set of quality measures to Medicare Advantage measures to be able to compare performance between APMs, FFS, and MAOs. Other commenters supported ensuring that quality measures are aligned across reporting programs, and build from the HVBP measures set when incorporating home health into quality reporting programs.

Response: We will take these suggestions into account for future consideration.

Comment: One commenter encouraged CMS to adopt measures in the quality performance category that align with existing initiatives focused on delivering care in a patient-centric manner. In particular, the commenter suggested that CMS make sure the

quality measures align with the clinical quality improvement measures used in the Transforming Clinical Practice Initiative by the Practice Transformation Networks.

Response: We purposely aligned the measures in the Transforming Clinical Practice Initiative with those used in CMS' quality reporting programs and value-based purchasing programs for clinicians and practices. We will continue to work on alignment across such programs as they evolve in the future.

Comment: One commenter noted that CMS might also look to align with other measure sets that may be outside the health care sector such as with other local health assessment and community or state health improvement activities.

Response: We work with regional health collaboratives and other stakeholders where possible, and we will consider how best to align with other measure sets in the future.

Comment: One commenter believed that the Quality performance category should include a reasonable number of measures that truly capture variance in patient populations and that CMS should continue to review these measures on an annual basis to ensure that they are clinically relevant and address the needs of the general patient population.

Response: It is within our process that we review the measures that we are adopting for clinical relevance on an annual basis, and we appreciate commenters' focus on ensuring that measures remain clinically relevant.

Comment: One commenter did not believe current quality metrics reflect metrics that are meaningful to physicians or patients.

Response: We respectfully disagree. Most of the current quality measures have been developed by clinician organizations that support the use of thoughtfully constructed quality metrics. We continue to welcome recommendations or submissions of new measures for consideration.

Comment: One commenter noted that in order for small, private independent practices to demonstrate improved outcomes, the metrics system must be designed to account for their successes.

Response: We are committed to developing outcome measures and intend to work with interested stakeholders following the approach outlined in our Quality Measurement Development Plan. While many existing outcome measures are focused on institution level improvement (such as tracking hospital readmissions), we believe there is an opportunity to develop clinician practice outcome

measures that are designed to reflect the quality of large group, small group, and individual practice types. We welcome submissions of new outcome measures for consideration.

Comment: A few commenters suggested that CMS collect SES data for race, ethnicity, preferred language, sexual orientation, gender identity, disability status and social, psychological and behavioral health status, to stratify quality measures and aid in eliminating disparities. One commenter noted that use of 2014 and 2015 edition CEHRT would reduce burden on clinicians to collect this data.

Response: The CMS Office of Minority Health (OMH) works to eliminate health disparities and improve the health of all minority populations, including racial and ethnic minorities, people with disabilities, members of the lesbian, gay, bisexual, and transgender (LGBT) community, and rural populations. In September 2015, CMS OMH released the Equity Plan for Improving Quality in Medicare (CMS Equity Plan), which provides an action-oriented, results-driven approach for advancing health equity by improving the quality of care provided to minority and other underserved Medicare beneficiaries.

The CMS Equity Plan is based on a core set of quality improvement priorities that target the individual, interpersonal, organizational, community, and policy levels of the United States health system in order to achieve equity in Medicare quality. It includes six priorities that were developed with significant input and feedback from national and regional stakeholders and reflect our guiding framework of understanding and awareness, solutions, and actions. They provide an integrated approach to build health equity into existing and new efforts by CMS and stakeholders.

Priority 1 of the CMS Equity Plan focuses on expanding the collection, reporting, and analysis of standardized demographic and language data across health care systems. Though research has identified evidence-based guidelines and practices for improving the collection of data on race, ethnicity, language, and disability status in health care settings, these guidelines are often not readily available to health care providers and staff. Preliminary research has been conducted to determine best practices for collecting sexual orientation and gender identity information in some populations, but currently there are no evidence-based guidelines to standardize this collection.

We will facilitate quality improvement efforts by disseminating

best practices for the collection, reporting, and analysis of standardized data on race, ethnicity, language, sexual orientation, gender identity, and disability status so that stakeholders are able to identify and address the specific needs of their target audience(s) and monitor health disparities.

Comment: One commenter stated that quality measures vary between populations depending on practice location due to different outcomes. Different outcomes are due to nutrition, reliable transportation, drug addiction, safe living space, and more. Comparison between practices is difficult.

Response: We understand the commenter's concern that any single measure cannot capture the unique circumstances of a clinician's community including some of the sociodemographic factors mentioned. Our aim, however, is to drive quality improvement in all communities and we believe thoughtfully constructed measures can help all clinician practice types improve. Further, we will continue to investigate methods to ensure all clinicians are treated as fairly as possible within the program and monitor for potential unintended consequences such as penalties for factors outside the control of clinicians.

Comment: A few commenters suggested that CMS commit to measures for a set amount of time (for instance, 2–3 years) before making substantial changes. One commenter suggested that CMS adopt a broader policy of maintaining measures in MIPS for a minimum number of years (for example, at least 5 years) to limit scenarios where CMS does not have historical data on the same exact measure to set a benchmark or otherwise evaluate performance.

Response: We understand the commenter's concern. However, we do not believe it appropriate to commit to maintaining the same measures in MIPS for a substantial period of time, because we are concerned about the possibility that the measures themselves or the underlying medical science may change. We believe MIPS must remain agile enough to ensure that the measures selected for the program reflect the best available science, and that may require dropping or changing measures so that they reflect the latest best practices. For example, when a gap in clinical care no longer exists, reporting the measure offers no benefit to the patient or clinician.

Comment: One commenter encouraged CMS to indicate which measures would be on the quality measure list for more than 1 year to allow concentration of improvement

efforts over a two to three-year period. The commenter indicated that uncertainty on which measures may be included on the list each year could negatively impact improvement programs in rural areas that have fewer patients and would require a longer time to determine if interventions are successful. Another commenter requested that CMS limit additions and modifications to quality measures, especially as MIPS eligible clinicians become accustomed to reporting, to allow eligible clinicians sufficient time to meet quality metrics.

Response: We would like to note that CMS conducts annual reviews of all measures to ensure they are relevant, appropriate, and evidence based. Therefore there is potential for updates to the annual list of measures to be adopted on a yearly basis. We will make every effort to ensure that the measures we adopt for the MIPS program reflect the latest medical science, and we will also work to ensure that all physicians and MIPS eligible clinicians are fully aware of the measures that we have adopted.

Comment: A few other commenters recommended testing and comment periods before new measures are added to assess for potential unintended effects associated with healthcare disparities, including a one-year transparency (report only) period before measures are phased into incentives, a requirement for NQF endorsement.

Response: All of the measures selected for MIPS include routine maintenance and evaluation to assess performance and identify any unintended consequences. We have extensive measurement experience (such as in the PQRS) and do not believe we need to delay measure implementation to assess for unintended consequences. We further note that the NQF endorsement process is separate and apart from the MIPS measure selection process. We refer the commenter to NQF for their recommendations on enhancements to the endorsement process.

Comment: One commenter was concerned about annual changes in the performance measurement category and ability to respond to the changes in an appropriate timeframe. Commenter proposed that a minimum of 9 months, and ideally 12 months, be given to review changes to the performance categories each year.

Response: We understand commenter's concern, but we do not believe this timeline to be operationally feasible given the Program's statutory deadlines. We note that stakeholders have the ability to begin reviewing

potential changes to the quality performance category and provide comment on the potential changes with the publication of the proposed rule each year.

Comment: One commenter discussed how quality measures encourage shared decision making and patient centered care. They requested that CMS require both over treatment and under treatment of patient as specific quality measures in specific instances such as blood sugar and blood pressure.

Response: We are looking at measures for appropriate use and are working with numerous stakeholders to identify more appropriate use measures.

Comment: One commenter encouraged CMS to align quality measures of MIPS to Uniform Data System so FQHCs will be able to submit one set of quality data one time to both Uniform Data System and CMS.

Response: We thank the commenter for this suggestion.

Comment: One commenter was concerned that clinicians could select “low-bar” quality measures, or measures that are not the best representation of clinicians’ patient populations or the diseases they treat. Commenter requested that CMS monitor the selection of quality measures by clinicians.

Response: We believe that MIPS eligible clinicians should have the ability to select measures that they believe are most relevant to their practice. Further, we would like to note that we conduct annual reviews of all measures to ensure they are relevant, appropriate, and evidence based.

After consideration of the comments, correcting, and revising specific information, we are finalizing at § 414.1330(a)(1) that for purposes of assessing performance of MIPS eligible clinicians on the quality performance category, CMS will use quality measures included in the MIPS final list of quality measures. Specifically, we are finalizing the Final Individual Quality Measures Available for MIPS Reporting in 2017 in Table A of the Appendix in this final rule with comment period. Included in Table B of the Appendix in this final rule with comment period is a final list of quality measures that do not require data submission. Newly proposed measures that we are finalizing are listed in Table D of the Appendix in this final rule with comment period. The final specialty-specific measure sets are listed in Table E of the Appendix in this final rule with comment period. Measures that we are finalizing for removal can be found in Table F of the Appendix and measures that will have substantive changes for the 2017

performance period can be found in Table G of the Appendix in this final rule with comment period.

(2) Call for Quality Measures

Each year, we have historically solicited a “Call for Quality Measures” from the public for possible quality measures for consideration for the PQRS. Under MIPS, we proposed to continue the annual “Call for Quality Measures” as a way to engage eligible clinician organizations and other relevant stakeholders in the identification and submission of quality measures for consideration. Under section 1848(q)(2)(D)(ii) of the Act, eligible clinician organizations are professional organizations as defined by nationally recognized specialty boards of certification or equivalent certification boards. However, we do not believe there needs to be any special restrictions on the type or make-up of the organizations carrying out the process of development of quality measures. Any such restriction would limit the development of quality measures and the scope and utility of the quality measures that may be considered for endorsement. Submission of potential quality measures regardless of whether they were previously published in a proposed rule or endorsed by an entity with a contract under section 1890(a) of the Act, which is currently the National Quality Forum, is encouraged.

As previously noted, we encourage the submission of potential quality measures regardless of whether such measures were previously published in a proposed rule or endorsed by an entity with a contract under section 1890(a) of the Act. However, consistent with the expectations established under PQRS, we proposed to request that stakeholders apply the following considerations when submitting quality measures for possible inclusion in MIPS:

- Measures that are not duplicative of an existing or proposed measure.
- Measures that are beyond the measure concept phase of development and have started testing, at a minimum.
- Measures that include a data submission method beyond claims-based data submission.
- Measures that are outcome-based rather than clinical process measures.
- Measures that address patient safety and adverse events.
- Measures that identify appropriate use of diagnosis and therapeutics.
- Measures that address the domain for care coordination.
- Measures that address the domain for patient and caregiver experience.

- Measures that address efficiency, cost and utilization of healthcare resources.

- Measures that address a performance gap or measurement gap. We requested comment on these proposals.

The following is summary of the comments we received regarding our proposal for the Call for Quality Measures.

Comment: A few commenters supported the Call for Quality Measures approach to encouraging the development of quality measures and the list of considerations when submitting quality measures to MIPS. One commenter believed the criteria should also include: measures which span across the various phases of surgical care that align with the patient’s clinical flow: measures based on validated clinical data; measures that can be risk-adjusted and include SDS factors, if applicable; and process measures used in conjunction with outcome measure to provide a more comprehensive picture of clinical workflow and help link to improvement activities.

Response: We thank the commenter for their support and will consider including these additional factors for evaluating quality measures for potential inclusion in MIPS in the future. Further, we will consider additional measures covering the five phases of surgical care that the commenter specifies in the future. We have a rolling period for new measure suggestions, and we welcome commenters’ nominations.

Comment: One commenter recommended that the proposed rule quality measures emphasize patient experience, outcomes, shared decision making, care coordination, and other measures important to patients. One commenter believed the selection and development of measures should include patients, stakeholders, consumers and advocates. The commenter believes measures should be used to give feedback to clinicians and recommended the CAHPS for MIPS survey and clinical data registries be used to collect patient-reported data, and that individual clinician level data be collected on performance.

Response: We agree that the selection and development of measures should include patients, consumers, and advocates. We have included patients, consumers, and advocates on the selection and development of measures to promote an objective and balanced approach to this process.

Comment: One commenter recommended that CMS focus on

developing measures assessing physicians' communication with patients, care coordination, and efforts to fill practice gaps, because commenter believed these skills are more indicative of the care physicians provide than outcome measures.

Response: We thank the commenter for this feedback. We have a process in place for nominating measures for inclusion in the MIPS program, including an annual call for measures and the Measures Under Consideration (MUC) list, and we welcome stakeholders' feedback into that process.

Comment: One commenter supported the inclusion of robust quality measures. The commenter encouraged CMS to focus on including quality measures under MIPS that target shared decision making and health outcomes, including survival and quality of life. Commenter supported outcome measures, but noted in certain circumstances, where there is a well-defined link to outcomes, that process measure or intermediary outcome measures may be most appropriate.

Response: Thank you for your comment. We agree that measures that target shared decision making and health outcomes should be included in MIPS.

Comment: One commenter stated that CMS should promote the adoption of new quality measures that fill in measure gaps, accentuate the benefits of innovation, and keep pace with evolving standards of clinical care.

Response: Thank you for your comment. We agree we plan to work with stakeholders on new measure development.

Comment: Some commenters suggested that CMS carefully consider the selection of quality measures to ensure that they meaningfully assess quality of care for patients with diverse needs, particularly those patients with one or more chronic conditions.

Response: CMS is aware of the need for measures that address diverse needs and encourages the development of these types of measures.

Comment: One commenter believed that more patient safety measures should be included. The commenter recommended that a culture of patient safety be encouraged across healthcare organizations; that indicators of physical and emotional harms be used to measure workforce safety; that patient engagement be included as a measure of safety, beyond patient satisfaction; and that measures to track and monitor transparency, communication and resolution programs be added to the MIPS portion of the proposed rule.

Response: We thank the commenter and agree that patient safety should be encouraged across healthcare organizations. We note that we consider patient safety measures to be high-priority measures.

Comment: One commenter recommended quality measures be redefined. The commenter believed many are reporting burdens and are pedestrian from a quality standpoint and have little to do with physician work.

Response: Our quality measures define a reference point for care that is expected in the delivery of care. CQMs are tools that help measure and track the quality of health care services provided by MIPS eligible clinicians within our health care system. Measuring and reporting these measures helps to ensure that our health care system is delivering effective, safe, efficient, patient-centered, equitable, and timely care. MIPS eligible clinicians are accountable for the care they provide to our beneficiaries.

Comment: One commenter requested that when a MAV process is invoked, the number of measures which could have been reported is greater than the number of additional measures needed to satisfy the reporting requirement.

Response: We did not propose a MAV process for the MIPS Program, but we did propose, and will be finalizing, a data validation process. This process will apply for claims and registry submissions to validate whether MIPS eligible clinicians have submitted all applicable measures when MIPS eligible clinicians submit fewer than six measures or do not submit the required outcome measure or other high priority measure if an outcome measure is not available, or submit less than the full set of measures in the MIPS eligible clinicians' applicable specialty set.

Comment: One commenter suggested that CMS employ a more transparent approach to measure selection for the MIPS program, including a detailed rationale on why certain measures are not selected, providing feedback to MIPS eligible clinicians and provider organizations which have committed resources to improving measures.

Response: While we understand commenter's concern, we believe we have been substantially transparent with the considerations we have taken into account when developing the proposed measure list for MIPS and have provided detailed rationale explaining the choices we have made. In the appendix of this final rule with comment period, we have provided a list of measures proposed for removal along with the rationale. We would also

like to note that measures that appear on the MUC list are reviewed by the MAP and undergo detailed analyses, and we refer stakeholders to the MAP's report for feedback on those measures. We will continue working with stakeholders and measure developers to improve their measures.

Comment: In an effort to increase transparency in the process, the commenter suggested that prior to the publication of the recommendations, CMS contact the measure developer to make sure CMS's conclusions are accurate and to ensure the developer does not have data to suggest otherwise.

Response: We review measures annually with measure owners and stewards. Further, we provide feedback to measure developers on measure being submitted through the Call for Measures process. Stakeholders also have the opportunity to comment on new measures that are proposed in the annual notice and comment process.

Comment: A few commenters suggested that CMS develop a plan to transition from the use of process measures to outcomes measures to allow MIPS eligible clinicians to adopt the most updated evidence-based standards care and to ensure that MIPS eligible clinicians are truly achieving the goals of value-based health care. One commenter acknowledged that there is a large body of evidence showing that process measures do not improve outcomes.

Response: We aim to have the most current measure specifications updated annually. We also agree that outcome measures are more appropriate for assessing health outcomes and for accountability. We describe our measure development process in detail in our Quality Measure Development Plan (<https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>). We look forward to working with stakeholders to develop a wide range of outcome measures.

Comment: One commenter expressed concern that CMS' proposal is too focused on outcome measures while commenter believes the agency should also focus on establishing meaningful process measures tied to evidence-based outcomes. Another commenter noted that both outcome measures and high quality, evidence-based process measures that address gaps and variations in care have a role in improving care, and cautioned CMS against too much emphasis on outcomes without regard to evidence-based processes that underlie care.

Response: Although process measures will continue to play an important role in quality measurement, we believe that they should be tied to evidence based outcomes. As noted, we have a measure development strategy that seeks to develop a wide range of outcome measures but our plan will also provide for the development of both process and structural measures that may be needed to fill existing gaps in measurement. We encourage the submission of measures that address gaps in measurement, have significant variations in care, and also outcome measures, including patient reported outcome measures.

Comment: Several commenters agreed that focusing more on the outcome of a clinical intervention than the process of care is better for patients and requested we adopted more outcome measures. Further, outcome measures would yield the most meaningful data for consumers and are true indicators of healthcare services.

Response: We agree that outcome measures are important and will continue to emphasize the importance of outcomes measures in the future. We also agree that outcome measures are more appropriate for assessing health outcomes and for accountability. We describe our measure development process in detail in our Quality Measure Development Plan (<https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>). We look forward to working with stakeholders to develop a wide range of outcome measures.

Comment: One commenter requested the outcome measures represent clear care goals rather than intermediate process measures, thereby allowing clinicians' freedom to determine the best allocation of resources to improve clinical outcomes.

Response: We have made available numerous measures to include those with intermediate outcomes. Although there are far fewer measures that have intermediate outcomes we also agree that we should consider both intermediate and long-term outcome measures for assessing overall health outcomes and for accountability. We describe our measure development process in detail in our Quality Measure Development Plan (<https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>). We look forward to working with stakeholders to develop a wide range of outcome measures, including intermediate outcome measures.

Comment: Another commenter noted that, within the set of quality measures that can be self-selected, 58 of the measures focus on outcomes and 192 focus on process, and that only 9 focus on efficiency. The commenter encouraged CMS to conduct additional research around efficiency measures that could be added to the overall menu of measures and, where available and clinically relevant to practice areas, MIPS eligible clinicians should be required to report on an efficiency measure. Some commenters believed that the relative imbalance of process measures over outcome measures can undermine CMS's efforts to encourage eligible clinicians to demonstrate actual improvements in a patient's health status.

Response: We agree that there is a need for more outcome and efficiency measures and will strive to achieve a more balanced portfolio of measures in future years. As previously noted, we have a measure development strategy that seeks to develop a wide range of outcome measures but our plan will also provide for the development of both process and structural measures that may still be needed to fill existing gaps in measurement. CMS encourages the submission of measures that address gaps in measurement and have significant variations in care. Outcome measures are a recognized gap in measurement, including patient reported outcome measures, and we look forward to working with stakeholders to develop a wide range of such measures.

Comment: One commenter recommended that as CMS selects measures, it should include measures that capture variance across patient populations; should consider adopting more outcome measures; and should add measures related to coordination of care/exchange of information between specialists and PCPs in all specialty categories.

Response: We agree with the commenter on the importance of these measures and have proposed these types of measures for the program. We would encourage the commenter to submit additional measures for possible inclusion in MIPS through the Call for Measure process. We are particularly interested in developing outcome measures for chronic conditions (such as diabetes care and hypertension management) which present a measurement challenge to capture the many factors that impact the care and outcomes of patients with chronic conditions.

Comment: A few commenters agreed that outcome measures are very

important, but cautioned CMS against simply increasing the number of such measures each year. Commenters also opposed the proposal to increase the required number of patient experience measures in future years because the physician lacks control over such measures. One commenter supported the inclusion of risk adjustment and stratification in measures and suggested that CMS examine ASPE's future recommendations.

Response: We are aware of the need for measures that are adjusted for case-mix variation through risk adjustment and stratification techniques. As noted in this final rule with comment period, the Secretary is required to take into account the relevant studies conducted and recommendations made in reports under section 2(d) of the Improving Medicare Post-Acute Transformation (IMPACT) Act of 2014. Under the IMPACT Act, ASPE has been conducting studies on the issue of risk adjustment for sociodemographic factors on quality measures and cost, as well as other strategies for including SDS evaluation in CMS programs. We will review the report when issued by ASPE and will incorporate findings as appropriate and feasible through future rulemaking. With respect to patient experience measures, we believe that measures that assess issues that are important to patients are an integral feature of patient-centered care.

Comment: One commenter requested that CMS continue to use both process and outcome measures moving forward as a ramp-up tactic for MIPS eligible clinicians new to reporting on quality measures. Additionally, some commenters expressed particular support for measures which track appropriate use. The commenters strongly believe that especially in advanced illness, individuals should only receive treatment that is aligned with their values and wishes but that many times, because of a lack of advance care planning, there is overuse and overtreatment at this time. Other commenters encouraged CMS to focus efforts on the development of underuse measures that can serve as a consumer protection for ensuring that eligible clinicians are not limiting access to needed care in order to reduce costs.

Response: We agree with the importance of developing more measures of appropriate use and seek to have more of these measure types for a wider range of specialties, including geriatrics and palliative care.

Comment: A few commenters suggested that CMS should focus on identifying and emphasizing measures that drive more robust outcomes. The

commenters stated there are too many measures from which to choose.

Response: We appreciate the commenter's focus on the importance of patient outcome measurement.

However, we believe there remains a role for process measures that are linked to specific health outcomes. We would encourage the commenter to submit potential new measures for inclusion in MIPS through the Call for Measures process.

Comment: A few commenters suggested that CMS use the recommendations of the National Academy of Medicine's (NAM) 2015 Vital Signs report to identify the highest priority measures for development and implementation in the MIPS.

Response: We have reviewed the recommendations of the National Academy of Medicine report and it informed our Quality Measure Development Plan (<https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>) which emphasizes the need for outcome measures over process measures. We will continue to use the report as a resource to inform future measurement policy development.

Comment: Several commenters supported the development and strengthening of patient reported outcomes, PRO-based measures, and patient experience quality measures as a component of the MACRA proposed payment models. Further, commenters stated that patient-generated data assesses issues that are important to patients and are a key element of patient-centered care, enabling shared decision-making and care planning, and ensuring that patients are receiving high-quality health care services.

Response: We agree that PROs are important. Currently we have a number of PRO measures and intend to expand their portfolio. We also believe the other measure domains are important in measuring other aspects of care.

Comment: One commenter recommended that patient reported outcomes should have been given great weight, as well as continued solicitation of multi-stakeholder input on the available required measures through the NQF-convended MAP and updated patient sampling requirement over time. The commenter also recommended that all clinicians in groups of two or more should report a standard patient experience measure.

Response: We agree that patient-reported outcomes are important quality measures. We note also that patient experience measures, while not

required, are considered high-priority and are incentivized through the use of bonus points. However, patient-reported measurement generally requires a cost to clinician practices to conduct the survey and mandatory reporting of such measure may present a burden to many clinicians, especially those in small and solo practices. In future years, we will continue to seek methods of expanding reporting of these measures without unduly penalizing practices that cannot afford the measurement costs.

Comment: One commenter believed that it is necessary to specifically call out and prioritize patient-reported outcomes (PROs) and PRO-based measures (PROMs).

Response: We agree. We highlighted person and caregiver-centered experience and outcome measures in the proposed rule (81 FR 28194) and continue to believe that they appropriately emphasize the importance of collecting patient-reported data.

Comment: One commenter recommended that CMS should encourage EHR developers to incorporate PROMs, as well as development and use of PROMs.

Response: We agree that the inclusion of PROMs in health IT systems can help support quality improvement efforts at the provider level. As PROMs begin to be electronically specified and approved for IT development, testing and clinician use, we will work with ONC, health IT vendors, and stakeholders engaged in measure development to support the process of beginning to offer and support PROMs within certified health IT systems.

Comment: One commenter recommended expediting the adoption of patient-reported outcome measures (PROMs) for all public reporting programs as well as condition-specific outcome sets that focus on the longitudinal outcomes and quality-of-life measures that are most important to patients.

Response: We agree with the commenter that PROMs are an important aspect of assessing care quality, and we intend to continue working with stakeholders to encourage their use. We refer readers to section I.E.10. of this final rule with comment period for final policies regarding public reporting on Physician Compare.

Comment: One commenter stated the quality metrics have nothing to do with patient outcomes and measure process instead of results. The commenter requested the metrics be shifted to clinical outcome measures, including patient reported outcomes.

Response: We believe patient-reported outcomes are important as well, but we

respectfully disagree with commenter's characterization of our measures.

Comment: One commenter recommended that CMS consider measures that are validated and scientifically sound and to ensure measures address existing clinical relevance, given that the existing vehicles for measure inclusion has expanded to include qualified clinical data registries and specialty measure sets. The commenter also recommended that CMS consider working towards a set of core measures (similar to what was implemented through the Core Quality Measures Collaborative) that are most impactful to patient care. Further, they recommended that CMS consider the adoption of more outcome measures, specifically those using patient-reported outcomes.

Response: We thank the commenter for this feedback and agree. Our intent is to include more outcomes measures in the MIPS Program as more become available over time, and we are working with measure collaboratives to include more measures and align them with other health care payers. We believe the specialty measure sets ensure that we have adopted measures of clinical relevance for specialists. We did propose adoption of the majority of measures that were part of the CQMC core measure sets into the MIPS program.

Comment: One commenter recommended that CMS consider paring down from the list of over 250 quality measures from which a clinician may self-select for quality reporting, and instead focus on the creation of a smaller number of clinically relevant measures, particularly including additional patient outcome measures where available, and where there are separate and distinct outcomes measures. Additionally, as CMS embarks on future iterative changes to the Quality Payment Program, the commenter encouraged CMS to continue to rely on multi-stakeholder and consensus driven feedback loops, such as Core Quality Measures Collaborative, to inform additional core measure sets, where such measure sets are useful and promote the appropriate comparisons.

Response: We appreciate the commenters concerns and note that we intend to continue our work with the Core Quality Measures Collaborative. We did propose adoption of the majority of measures that were part of the CQMC core measure sets into the MIPS program. Further, to help clinicians successfully report, it is important that we provide as wide a range of measure options as possible that are germane to

the clinical practice of as many MIPS eligible clinicians as possible.

Comment: One commenter expressed concern related to the self-selection of quality measures. The commenter noted that they participated in the Core Quality Measures Collaborative (the “Collaborative”) to assist in the development of evidence-based measures and to help drive the health care system toward improved quality, decision making, and value-based payment and purchasing. The Collaborative recommended 58 MIPS quality measures. The commenter suggested that CMS consider making it mandatory for clinicians to report on those 58 measures when the measures are available within appropriate categories and when the measures are clinically relevant.

Response: We have taken an approach to allow MIPS eligible clinicians select their own measures for reporting based on beneficiaries seen in their practices and the measures that are most relevant to their clinical practice. However, we have included the CQMC measures in the MIPS measure sets, including the specialty-specific measure sets, to encourage their adoption into clinical practice.

Comment: A few commenters stated that CMS should ensure that ongoing quality measurement in the quality performance category encourages the appropriate use of imaging services that makes certain that Medicare patients receive accurate and timely diagnoses.

Response: We are adopting a number of appropriate use measures that track both over- and under-use of medical services. We encourage stakeholders to submit additional measures on this topic, and will take those submissions into account in the future.

Comment: One commenter expressed concern with the measures available to clinicians because many of the Core Quality Measures Collaborative measure sets were not included in the MIPS list and many of the MIPS measures are not NQF endorsed. Some commenters recommended that measures be approved by NQF before use in the program.

Response: We believe including 17 Core Quality Measures Collaborative measures for the transition year is an excellent starting point to promote measurement alignment with private sector quality measurement leaders. While we encourage NQF-endorsement for measures, we do not require that all measures be endorsed by the NQF before use in the program, as requiring NQF endorsement would limit measures that currently fill performance gaps. We continue to encourage measure

developers to submit their measures to NQF for endorsement.

Comment: A few commenters supported CMS encouragement in the proposed rule of eliminating special restrictions as to the type and make-up of the organization developing quality measures. Commenters further supported the ability to submit measures regardless of whether such measures were previously published in a proposed rule or endorsed by NQF.

Response: We would like to note that while we prefer NQF-endorsement of measures for MIPS, we do not require that new measures for inclusion in MIPS be NQF-endorsed; however, in order for a measure to be finalized for MIPS it must be published in the **Federal Register**.

Comment: A few commenters supported the proposed “Call for Quality Measures.” Further, one commenter suggested that CMS use this process to focus on specialty measures.

Response: We note that although we also conducted an annual Call for Measures under PQRS, section 1848(2)(D)(ii) of the Act requires us to conduct a Call for Quality Measure for MIPS annually.

Comment: One commenter supported allowing new quality measures to be submitted by specialty societies with supporting data from QCDRs.

Response: We encourage specialty societies to continue to submit new measures for potential inclusion in the MIPS program.

Comment: One commenter supported adoption of evidence-based measures through the “Call for Quality Measures” process. The commenter further suggested that CMS establish an interim process for adoption of subspecialty quality measure sets until quality measures can go through the “Call for Quality Measures” process so that CMS may be able to quickly assess the commenter’s members on clinically meaningful measures.

Response: We thank the commenter for the recommendation; however, we believe that the current process allows for careful review and scrutiny of the measures. We note that the Call for Quality Measures is open year-round, and that measures for inclusion in MIPS must go through notice-and-comment rulemaking.

Comment: One commenter sought clarification regarding whether new-process based measures will continue to be accepted.

Response: While we will consider new process based measures, we would request that they be closely tied to an outcome and that there be demonstrable variation in performance.

Comment: One commenter supported the flexibility CMS provided in the proposed rule for health care providers to select measures that make sense within their practice, as well as opening up the process for the annual submission of new measures, which will allow MIPS to evolve with the nation’s dynamic health care system.

Response: Thank you for the support.

After consideration of the comments we are finalizing our proposal to continue the annual “Call for Quality Measures” under MIPS. Specifically, eligible clinician organizations and other relevant stakeholders may submit potential quality measures regardless of whether such measures were previously published in a proposed rule or endorsed by an entity with a contract under section 1890(a) of the Act. We do encourage measure developers and stakeholders to submit measures for NQF-endorsement as this provides a scientifically rigorous review of measures by a multi-stakeholder group of experts. Furthermore, we are finalizing that stakeholders shall apply the following considerations when submitting quality measures for possible inclusion in MIPS:

- Measures that are not duplicative of an existing or proposed measure.
- Measures that are beyond the measure concept phase of development and have started testing, at a minimum.
- Measures that include a data submission method beyond claims-based data submission.
- Measures that are outcome-based rather than clinical process measures.
- Measures that address patient safety and adverse events.
- Measures that identify appropriate use of diagnosis and therapeutics.
- Measures that address the domain for care coordination.
- Measures that address the domain for patient and caregiver experience.
- Measures that address efficiency, cost and utilization of healthcare resources.
- Measures that address a performance gap.

(3) Requirements

Section 1848(q)(2)(D)(iii) of the Act provides that, in selecting quality measures for inclusion in the annual final list of quality measures, the Secretary must provide that, to the extent practicable, all quality domains (as defined in section 1848(s)(1)(B) of the Act) are addressed by such measures and must ensure that the measures are selected consistent with the process for selection of measures under section 1848(k), (m), and (p)(2) of the Act.

Section 1848(s)(1)(B) of the Act defines “quality domains” as at least the following domains: clinical care, safety, care coordination, patient and caregiver experience, and population health and prevention. We believe the five domains applicable to the quality measures under MIPS are included in the NQS’s six priorities as follows:

- *Patient Safety.* These are measures that reflect the safe delivery of clinical services in all health care settings. These measures may address a structure or process that is designed to reduce risk in the delivery of health care or measure the occurrence of an untoward outcome such as adverse events and complications of procedures or other interventions. We believe this NQS priority corresponds to the domain of safety.

- *Person and Caregiver-Centered Experience and Outcomes.* These are measures that reflect the potential to improve patient-centered care and the quality of care delivered to patients. They emphasize the importance of collecting patient-reported data and the ability to impact care at the individual patient level, as well as the population level. These are measures of organizational structures or processes that foster both the inclusion of persons and family members as active members of the health care team and collaborative partnerships with health care providers and provider organizations or can be measures of patient-reported experiences and outcomes that reflect greater involvement of patients and families in decision making, self-care, activation, and understanding of their health condition and its effective management. We believe this NQS priority corresponds to the domain of patient and caregiver experience.

- *Communication and Care Coordination.* These are measures that demonstrate appropriate and timely sharing of information and coordination of clinical and preventive services among health professionals in the care team and with patients, caregivers, and families to improve appropriate and timely patient and care team communication. They may also be measures that reflect outcomes of successful coordination of care. We believe this NQS priority corresponds to the domain of care coordination.

- *Effective Clinical Care.* These are measures that reflect clinical care processes closely linked to outcomes based on evidence and practice guidelines or measures of patient-centered outcomes of disease states. We believe this NQS priority corresponds to the domain of clinical care.

- *Community/Population Health.*

These are measures that reflect the use of clinical and preventive services and achieve improvements in the health of the population served. They may be measures of processes focused on primary prevention of disease or general screening for early detection of disease unrelated to a current or prior condition. We believe this NQS priority corresponds to the domain of population health and prevention.

- *Efficiency and Cost Reduction.*

These are measures that reflect efforts to lower costs and to significantly improve outcomes and reduce errors. These are measures of cost, utilization of healthcare resources and appropriate use of health care resources or inefficiencies in health care delivery.

Section 1848(q)(2)(D)(viii) of the Act provides that the pre-rulemaking process under section 1890A of the Act is not required to apply to the selection of MIPS quality measures. Although not required to go through the pre-rulemaking process, we have found the NQF convened Measure Application Partnership’s (MAP) input valuable. We proposed that we may consider the MAP’s recommendations as part of the comprehensive assessment of each measure considered for inclusion under MIPS. Elements we proposed to consider in addition to those listed in the “Call for Quality Measures” section of this final rule with comment period include a measure’s fit within MIPS, if a measure fills clinical gaps, changes or updates to performance guidelines, and other program needs. Further, we will continue to explore how global and population-based measures can be expanded and plan to add additional population-based measures through future rulemaking. We requested comment on these proposals.

The following is summary of the comments we received regarding our proposal on requirements for selecting quality measures.

Comment: A few commenters recommended that CMS continue to use the Measure Application Partnership (MAP) pre-rulemaking process in determining the final list of quality measures each year. One commenter supported elimination of the requirement for recommendation by the MAP for inclusion of MIPS quality measures and believed this could potentially speed the process for implementing measures into MIPS.

Response: Prior to proposing new quality measures for implementation into MIPS for the 2017 performance period, we did consult the MAP for feedback. To view the MAP’s recommendations on these measures,

please refer to the report entitled, “MAP 2016 Considerations for Implementing Measures in Federal Programs: Clinicians.” (http://www.qualityforum.org/Publications/2016/03/MAP_2016_Considerations_for_Implementing_Measures_in_Federal_Programs_Clinicians.aspx). We intend to continue to consult the MAP for feedback on proposed quality measures, but we retain the authority to propose measures that have not been supported by the MAP.

Comment: Some commenters believed quality measures in MIPS should go through a multi-stakeholder evaluation process and that CMS should encourage the use of quality measures endorsed by the NQF.

Response: Most measures are NQF endorsed or have gone through the pre-rulemaking process, but we retain the authority to adopt measures that are not so endorsed. All measures have gone through rulemaking and public comment process.

Comment: One commenter had concerns with the performance measures currently used in PQRS, and therefore, recommended that any measures CMS proposes to use outside of the core set identified by the Core Quality Measures Collaborative be endorsed by the Measure Application Partnership (MAP).

Response: We appreciate the comment to use measures identified by the CQMC, and while we intend to consult with MAP on measures for MIPS, we note that we have the authority to implement measures they have not reviewed.

Comment: A few commenters recommended that quality measures should prioritize patient-reported outcomes and promote goal-concordant care, specifically that quality should be evaluated using a harmonized set of patient-reported outcomes and other appropriate measures that clinicians can reliably use to understand what matters to patients and families, achieve more goal-concordant care, and improve the patient and family experience and satisfaction. Another commenter suggested that CMS’s proposed Quality Payment Program approach for considering value-based performance should expressly prioritize the patient and family voice and the constellation of what matters to them as key drivers of quality measures development and use.

Response: We note that person and caregiver centered experience measures are considered high priority under MIPS. For this reason and the reasons cited by commenters, we encourage the development and submission of patient-

reported outcomes to the Call for Measures for the reasons cited by the commenters.

Comment: One commenter recommended CMS include in the MIPS quality requirements measures outcomes that align with an individual's stated goals and values, commonly referred to as person-centered care, believing that performance measures that promote individuals articulating their goals and desired outcomes hold the system accountable for helping people achieve their goals and preferences. The commenter suggested that CMS reference the National Committee on Quality Assurance's work on long term services and supported measures and person centered outcomes using a standardized format to form a basis for building person centered metrics into MIPS and APMs.

Response: We will take this into consideration for use in the future.

Comment: A few commenters suggested making global and population-based measures optional. Reclassifying these measures as "population health measures" under the quality category does not fix the inherent problems with these measures. Commenters suggested that CMS not include the three population health measures in the quality category.

Response: We believe the population health measures are intended to incentivize quality improvement throughout the health care system, and we therefore believe that we have appropriately placed them under the Quality performance category. However, as discussed in section II.E.5.b. of this final rule with comment period, CMS will only finalize the all-cause readmission measure because the other population measures have not been fully tested with the new risk-adjusted methodology.

Comment: One commenter expressed support for measures that address all six of the NQS domains. For the Patient Safety domain, commenter especially supported measures designed to reduce risk in the delivery of health care (for example, adverse events and complications from medication use). For the Communication and Care Coordination category, the commenter pointed out that for pharmacists, ensuring interoperability and bidirectional communication in this area is extremely critical.

Response: We encourage MIPS eligible clinicians to select and report on measures that are applicable to their practices, regardless of their assigned domain, ultimately to improve the care of their beneficiaries.

Comment: One commenter supported CMS aligning the MIPS quality measure domain of patient and caregiver experience with the National Quality Strategy's domain person and caregiver-centered experience and outcomes among the six required domains, believing it will improve patient centered care.

Response: We appreciate the support. We support the measures in all domains, to include measures that embrace patient-centered care and involvement.

After consideration of the comments, we are finalizing the requirements for the selection of the Annual MIPS Quality Measures. Specifically, we will categorize measures into the six NQS domains and we intend to place future MIPS quality measures within the NQF convened Measure Application Partnership's (MAP), as appropriate. We intend to consider the MAP's recommendations as part of the comprehensive assessment of each measure considered for inclusion under MIPS.

(4) Peer Review

Section 1848(q)(2)(D)(iv) of the Act, requires the Secretary to submit new measures for publication in applicable specialty-appropriate, peer-reviewed journals before including such measures in the final annual list of quality measures. The submission must include the method for developing and selecting such measures, including clinical and other data supporting such measures. We believe this opportunity for peer review helps ensure that new measures published in the final rule with comment period are meaningful and comprehensive. We proposed to use the Call for Quality Measures process as an opportunity to gather the information necessary to draft the journal articles for submission from measure developers, measure owners and measure stewards since we do not always develop measures for the quality programs. Information from measure developers, measure owners and measure stewards will include but is not limited to: background, clinical evidence and data that supports the intent of the measure; recommendation for the measure that may come from a study or the United States Preventive Services Task Force (USPSTF) recommendations; and how this measure would align with the CMS Quality Strategy. The Call for Quality Measures is a yearlong process; however, to be aligned with the regulatory timelines, establishing the proposed measure set for the year generally begins in April and concludes in July. We will submit new measures

for publication in applicable specialty-appropriate, peer-reviewed journals before including such measures in the final annual list of quality measures. We requested comments on this proposal. Additionally, we solicited comment on mechanisms that could be used, such as the CMS Web site, to notify the public that the requirement to submit new measures for publication in applicable specialty-appropriate, peer-reviewed journals is met. Additionally, we solicited comment on the type of information that should be included in such notification.

The following is summary of the comments we received regarding the submission of MIPS quality measures to a peer reviewed journal.

Comment: One commenter supported the proposal that new measures must be submitted to peer reviewed journals.

Response: We thank the commenter for their support.

Comment: One commenter recommended that CMS use the Call for Quality Measures process as an opportunity to gather the information necessary to draft the journal articles required for quality measures implemented under MACRA. Commenter also recommended that any information required for journal article submission should align with the information required for the submission of the measure to CMS to reduce the workload of this new requirement on measure developers.

Response: We appreciate the support and recommendation and intend to utilize the Call for Quality Measures process to gather information necessary to draft the journal articles.

Comment: One commenter agreed that CMS should be responsible for submitting new measures for publication in applicable specialty-appropriate, peer-reviewed journals before including such measures in the final list of measures annually. The commenter agreed the public requirement will help ensure measures are both meaningful and comprehensive, but requested that CMS ensure a more collaborative approach to the submission of measures to peer-reviewed journals. A few commenters requested that CMS allow measure developers the right to first submit measure sets to specialty specific, peer-reviewed journals of their choice. One commenter was concerned that there are difficulties with the timing and sequencing of submitting new measures in that, with the requirement to submit new measures for publication in applicable specialty appropriate peer reviewed journals before including such measure, many journals will be very

reluctant to publish measures that are already in the public domain, and the July 1 measure deadline provides a narrow window for publication. Another commenter noted that most peer-reviewed medical journals only contained ground-breaking research. Therefore, they would not be a good source of information about quality measurement and improvement. The commenter was concerned that this criterion for approving new quality measures would be a significant barrier.

Response: We thank the commenters; however, we are required by statute to submit measures for publication in a peer-reviewed journal before including them in the final list of measures. Although we may collaborate with the measure owner to accurately capture the measure specifications, we cannot fulfill our statutory obligation by allowing the measure owner to submit the article. The statute requires the Secretary to submit new measures for publication in applicable specialty-appropriate, peer-reviewed journals before including such measures in the final annual list of quality measures. We would like to note, however, that this does not preclude a measure owner from independently submitting their measure for publication in a peer-reviewed journal.

Comment: One commenter recommended that CMS accept measures independently published in peer reviewed journals as well as measures submitted by CMS.

Response: We appreciate the suggestion; however, we are required by statute to submit measures for publication in a peer-reviewed journal before including them in the final list of measures for MIPS.

Comment: One commenter sought clarity on the process for submitting new measures for publication in specialty-appropriate, peer-reviewed journals prior to including measures in the final list, and suggested an abbreviated peer review process for publication to ensure there will not be slowdowns in the process of getting measures into the MIPS quality program.

Response: It is our intent to illustrate this process via subregulatory guidance that will be posted on our Web site. Further, we would like to note that we only have an obligation to submit the measure for publication. If the submission is not accepted for publication, we will still have met the statute requirement. If the submission is accepted, which is our preference, we are not obligated to delay our rulemaking process until the date the

journal chooses to publish the submission.

Comment: One commenter believed that the proposed process requiring that HHS submit measures for publication in applicable specialty-appropriate, peer-reviewed journals was highly duplicative of the work of measure developers; would infringe on measure ownership and copyright; and would ultimately limit the availability of and significantly delay the use of measures in MIPS. The commenter appreciated the exceptions to the rule for measures in QCDRs and those included in existing CMS programs, the commenter recommended this exclusion be extended to all measures published in a peer-review journal prior to their submission to CMS. The commenter believes that extending the exclusion would allow measure developers to maintain their ownership, copyright, prevent duplication, and ensure measures were not stagnated in the peer review and publication process.

Response: The statute requires the Secretary to submit new measures for publication in applicable specialty-appropriate, peer-reviewed journals before including such measures in the final annual list of quality measures. Further, we would like to note that we only have an obligation to submit the measure; we do not have to wait for the measures to be published. Even if the article is not published, we will have met the requirements under section 1848(q)(2)(D)(iv) of the Act. We believe that the summary of proposed new quality measures will help increase awareness of quality measurement in the clinician community especially for clinicians or professional organizations that are not aware of the ability to provide public comment on proposed quality measures through the rulemaking process. We will only submit new measures in accordance with applicable ownership or copyright restrictions and cite the measure developer's contribution in the submission.

Comment: One commenter recommended that new measures be posted to journals associated with the American Board of Medical Specialties (ABMS), related subspecialty journals or journals associated with the American College of that specialty and non-ABMS recognized clinical specialty journals that are trusted resources for specialists to ensure a wide range of readership and distribution.

Response: We will take these recommendations into consideration for the future.

Comment: Some commenters supported and appreciated the

clarification that CMS will be submitting new measures for publication in applicable specialty appropriate, peer-reviewed journals before including such measures in the final list of measures annually. Commenters requested that CMS ensure a more collaborative approach to the submission of measures to peer-reviewed journals, possibly through societies that routinely publish guidelines in their peer-reviewed journals.

Response: We appreciate the support. We will continue to seek input regarding our approach to the submission of measures from measure owners and specialty societies to improve the annual new measure submission process.

Comment: One commenter recommended that CMS collaborate with a national, multi-stakeholder organization that can provide expertise on measurement science, quality improvement, and expertise on data submission mechanisms, such as clinical registries, to develop alternative approaches to the peer review process. Commenter expressed support for a process whereby new measures are subject to external expert review and recommended that such review occur in an expedient manner, and that results be made available and maintained as measures are updated.

Response: Although we believe there is value in having external expert review of new measures, we note that we are required by statute to submit new measures to an applicable, specialty-appropriate peer-reviewed journal.

Comment: One commenter stated that until the USPSTF recommendation process is substantially reformed so that specialist physicians are consulted as part of its recommendation process, CMS should proceed with great caution before incorporating any future USPSTF recommendations into MIPS quality measures.

Response: We are committed to engaging all stakeholders in our measure development and selection process. We note that the annual call for measures and the annual measure update provides for the participation of patient, eligible clinician, and clinician stakeholders, including specialists, and allows for a transparent and robust review of our quality measure development and selection process.

Comment: One commenter recommended a quicker timeline for including quality measures after they had been published in a peer-reviewed journal; specifically, if a measure is already published in a peer-reviewed

journal, the commenter recommended that the timeline for approval for MIPS be 6–12 months.

Response: We appreciate the comments; however, new measures, even if they have been previously published, can only be included in MIPS through notice and comment rulemaking. Further, there is a statutory requirement that we publish the new measures not later than November 1 prior to the first day of the applicable performance period for a given year.

After consideration of the comments, we are finalizing our proposal to use the Call for Quality Measures process as a forum to gather the information necessary to draft the journal articles for submission from measure developers, measure owners and measure stewards since we do not always develop measures for the quality programs. Information from measure developers, measure owners and measure stewards shall include but is not limited to: Background, clinical evidence and data that supports the intent of the measure; recommendation for the measure that may come from a study or the United States Preventive Services Task Force (USPSTF) recommendations; and how this measure would align with the CMS Quality Strategy. The submission of this information will not preclude us from conducting our own research using Medicare claims data, Medicare survey results, and other data sources that we possess. We will submit new measures for publication in applicable specialty-appropriate, peer-reviewed journals before including such measures in the final annual list of quality measures.

(5) Measures for Inclusion

Under section 1848(q)(2)(D)(v) of the Act, the final annual list of quality measures must include, as applicable, measures from under section 1848(k), (m), and (p)(2) of the Act, including quality measures among: (1) Measures endorsed by a consensus-based entity; (2) measures developed under section 1848(s) of the Act; and (3) measures submitted in response to the “Call for Quality Measures” required under section 1848(q)(2)(D)(ii) of the Act. Any measure selected for inclusion that is not endorsed by a consensus-based entity must have an evidence-based focus. Further, under section 1848(q)(2)(D)(ix), the process under section 1890A of the Act is considered optional.

Section 1848(s)(1) of the Act, as added by section 102 of the MACRA, also requires the Secretary of Health and Human Services to develop a draft plan for the development of quality measures by January 1, 2016. We solicited

comments from the public on the “Draft CMS Measure Development Plan” through March 1, 2016. The final CMS Measure Development Plan was finalized and posted on the CMS Web site on May 2, 2016, available at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>.

(6) Exception for QCDR Measures

Section 1848(q)(2)(D)(vi) of the Act provides that quality measures used by a QCDR under section 1848(m)(3)(E) of the Act are not required to be established through notice-and-comment rulemaking or published in the **Federal Register**; be submitted for publication in applicable specialty-appropriate, peer-reviewed journals, or meet the criteria described in section 1848(q)(2)(D)(v) of the Act. The Secretary must publish the list of quality measures used by such QCDRs on the CMS Web site. We proposed to post the quality measures for use by qualified clinical data registries in the spring of 2017 for the initial performance period and no later than January 1 for future performance periods.

Quality measures that are owned or developed by the QCDR entity and proposed by the QCDR for inclusion in MIPS but are not a part of the MIPS quality measure set are considered non-MIPS measures. If a QCDR wants to use a non-MIPS measure for inclusion in the MIPS program for reporting, we propose that these measures go through a rigorous CMS approval process during the QCDR self-nomination period. Specific details on third party intermediaries’ requirements can be found in section II.E.9 of the proposed rule. The measure specifications will be reviewed and each measure will be analyzed for its scientific rigor, technical feasibility, duplication to current MIPS measures, clinical performance gaps, as evidenced by background, and literature review, and relevance to specialty practice quality improvement. Once the measures are analyzed, the QCDR will be notified of which measures are approved for implementation. Each non-MIPS measure will be assigned a unique ID that can only be used by the QCDR that proposed it. Although non-MIPS measures are not required to be NQF-endorsed, we encourage the use of NQF-endorsed measures and measures that have been in use prior to implementation in MIPS. Lastly, we note that MIPS eligible clinicians reporting via QCDR have the option of

reporting MIPS measures included in Table A in the Appendix in this final rule with comment period to the extent that such measures are appropriate for the specific QCDR and have been approved by CMS. We requested comment on these proposals.

The following is a summary of the comments we received regarding our proposals on QCDR measures.

Comment: One commenter supported CMS’s proposed exception for QCDR measures.

Response: We appreciate the support.

Comment: Some commenters agreed that non-MIPS measures implemented in QCDRs should be analyzed for scientific rigor, technical feasibility, duplication to current MIPS measures, clinical performance gaps, as evidenced by background and literature review, and relevance to specialty practice quality improvement.

Response: We appreciate the support.

Comment: One commenter stated that quality measures developed by QCDRs should not be subject to an additional CMS verification process before they are used for MIPS reporting and that an additional process is problematic for specialty areas such as oncology where there are deficiencies in the quality measure set for these types of practices. The commenter further believed the additional verification and approval processes appear as micro-managing the QCDR-developed measures process which could undermine the goals of QCDR reporting and creates additional burden given mature QCDRs such as the Quality Oncology Practice Initiative have already undergone an extremely robust and evidenced-based process to ensure clinical validity and reliability. The commenter further stated that additional uncertainty, restraints and regulatory burden should not be placed on these QCDRs. The commenter did support focusing on evaluating the QCDR measure development methodology during the self-nomination process instead.

Response: While we do not wish to add burden to QCDRs, we do need to maintain an appropriate standard for measures used in our program, especially since MIPS payment adjustments are based on the quality metrics.

Comment: One commenter recommended that CMS publish the specific criteria that they plan to use in evaluating QCDR measures moving forward. Some commenters requested that if CMS decides to deny the use of a measure in a QCDR, that CMS provide the measure developer/steward/owner with specific information on what criteria were not met that led to a

measure not being accepted for use and provide a process for immediate reconsideration when the issues have been addressed.

Response: Criteria were already adopted under PQRS and proposed under MIPS (see 81 FR 28284) for non-MIPS measures. In the future, we may publish supplemental guidance. In addition, measures should be fully developed prior to submission, and we intend to provide necessary feedback in a timely fashion.

Comment: A few commenters supported CMS's proposal for non-MIPS measures in QCDRs to go through a rigorous CMS approval process during the QCDR self-nomination period, and encouraged CMS to engage in a multi-stakeholder process as part of this approval process. One commenter recommended adopting an approval process for QCDR measures that would require them to be endorsed by the NQF.

Response: We intend to take the multi-stakeholder process's views into account when adopting policies on this topic in the future. We retain the authority to adopt measures that have not been endorsed by NQF, and we do not believe it appropriate to commit to requiring endorsement.

Comment: One commenter did not agree that CMS should support new measures developed by QCDRs.

Response: We respectfully disagree because we believe that QCDRs offer MIPS eligible clinicians the opportunity to report on measures associated with their beneficiaries that otherwise they may not be able to report.

Comment: A few commenters recommended that CMS encourage QCDRs to submit their measures for review by a consensus-based standards organization, like the NQF. One commenter suggested that CMS publish data for these measures to promote greater understanding of the use of QCDR measures and performance trends.

Response: The QCDRs develop new measures and propose them for consideration into our programs. We review all proposed measures and consider them for inclusion based on policy principles described in our Quality Measure Development Plan (<https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>). Although we do not require NQF endorsement for measure approval and acceptance, we expect all submitted measures to have had a rigorous evaluation including an assessment for feasibility, reliability, strong evidence

basis, and validity. All of our measures, regardless of NQF endorsement status, are thoroughly reviewed, undergo rigorous analysis, presented for public comment, and have a strong scientific and clinical basis for inclusion. QCDR measures must be approved by us before they can be made available for use by MIPS eligible clinicians.

Comment: One commenter approved of the use of QCDRs but is concerned that if QCDR measures are not part of the MIPS quality measure set and must undergo a thorough approval process by CMS, this will delay adoption of MIPS eligible measures and limit opportunities for transparency and stakeholder input to ensure measures are evidence-based and clinically rigorous. The commenter suggested that subjecting these measures to a formal endorsement process, such as National Quality Forum (NQF) endorsement, could help ensure that QCDR measures enjoy broad, consensus-based support through a process of thorough review and public vetting.

Response: We agree that ideally measures developed by QCDRs would be submitted to NQF for endorsement. However, we will not require NQF-endorsement and will continue to review measures submitted by QCDRs prior to their implementation in the MIPS program. We believe that QCDRs allow specialty societies and others to develop more relevant measures for specialists that can be implemented more rapidly and efficiently.

Comment: A few commenters expressed concern with CMS's "stringent" approach to QCDR measures as they believe it may be too burdensome. Commenters stated that QCDR measures should continue to be developed by a multi-stakeholder processes by the relevant specialty societies and reviewed by CMS in the QCDR approval process, but they should not be required to undergo MAP and NQF processes that are too time consuming to allow such developments to keep pace with constantly changing CMS requirements.

Response: We would like to note that QCDR measures are not required to undergo MAP and NQF processes.

Comment: One commenter supported flexibility with regard to the measures that are available for reporting by physicians and also supported the statutory provision that does not require that QCDR developed measures to be NQF-endorsed.

Response: We appreciate the comment and support.

Comment: One commenter expressed concern with the need for CMS to encourage reporting of NQF measures.

The commenter noted that obtaining NQF endorsement can be costly, time consuming and not the only way to ensure that measures are sound. The commenter expressed concern that the language will be interpreted as a requirement for NQF endorsement and encouraged CMS to reconsider the language. Another commenter opposed all measures being required to be endorsed by NQF for use in QCDRs because: requiring QCDR measures to go through NQF would go against CMS's goal of quickly iterating measures; the NQF process is cost and resource prohibitive for smaller specialties; such a revision would reduce the flexibility of QCDRs to offer specialty-specific reporting measures, which provide broader options that may be more meaningful to some practices than existing PQRS measures; and QCDRs provide a better picture of the overall quality of care provided, because QCDRs collect and report quality information on patients from all payers, not just Medicare patients.

Response: We would like to note that NQF endorsement is not a requirement for QCDR or MIPS measures. However, we do encourage application for NQF endorsement because it provides a rigorous scientific and consensus based measures evaluation.

Comment: One commenter expressed support for the use of quality measures that are used by QCDRs such as the Quality Oncology Practice Initiative (QOPI), which is designated as a QCDR and focuses specifically on measuring and assessing the quality of cancer care. However, the commenter expressed concern over the process for approval of QCDR measures, stating that CMS should not slow the continued use of existing, robust QCDR measures; decrease adoption of innovative, clinically relevant QCDR measures; or weaken the protections that exempt quality measures developed for use in a QCDR from many of the measure development process required for other MIPS measures.

Response: We understand the commenters concern and will continue to review QCDR measures in a timely fashion. Further, we would like to note that the approval criteria are not changing.

Comment: One commenter supported the CMS approach to non-MIPS measures used by QCDRs, including the caution about "check box" measures. Commenter expressed concern that the measurement of cancer care planning could become one such measure. Instead, the commenter suggested that care planning measures be developed as

patient engagement/experience measures.

Response: We thank the commenter for the recommendation and will take under consideration for future years. We note that, consistent with clinicians submitting quality data through other reporting mechanisms, those submitting quality data through QCDRs must meet our requirements for one outcome measure, or, if one is not applicable, one high-priority measure.

Comment: A few commenters recommended that CMS allow QCDRs to utilize measures from other QCDRs (with permission). One commenter further stated that CMS proposed that QCDR non-MIPS measures must go through a rigorous approval process and then be assigned a unique identifier that can only be used by the QCDR that proposed the measure. Commenters believe that prohibiting the sharing of non-MIPS quality measures between QCDRs would inhibit the efficient and cost-effective use and dissemination of such measures.

Response: We allow a QCDR to use a measure with permission from the measure owner, which may be a QCDR in some instances. Further, if the QCDR would like the measure to be shared among other clinicians, they can submit the measure to be included in the Program, where it would not be limited to that specific QCDR. Any measure needs only a single submission for the measure approval process.

Comment: One commenter recommended that CMS not require or restrict a QCDR from licensing its proprietary quality measures to other QCDRs after the QCDR-developed measures become available for MIPS reporting.

Response: We do not restrict but in fact encourage the sharing of QCDR-developed quality measures with clinicians and also other QCDRs.

Comment: One commenter requested that CMS clarify that the QCDR-developed measures available for 2016 PQRS reporting would automatically qualify for 2017 MIPS quality reporting.

Response: QCDR guidelines evolve over time as we continue to learn from implementation. We expect that measures in a QCDR 1 year would be expected to be retained for the next, however, we will review measures each year to ensure they are still relevant and meet scientific standards. Further, we would like to note that all QCDRs that were previously approved for PQRS will not be “grandfathered” as qualified under MIPS. Rather the QCDR must meet the requirements as described in section II.E.9.a. of this final rule with comment period.

Comment: One commenter indicated that requiring data collection in 2017 for measures not already included in a QCDR represents a myriad of technical challenges. QCDRs’ development and modifications require partnering with a number of developers that program code and develop software updates to facilitate reporting. Software developer often require 9–12 months to update data elements. In addition, time is required to train practice staff on how to enter new data and integrate measures into the practice workflow.

Response: We thank the commenter for the support of the QCDR program and understand the concern of the time involved in doing this work. We believe that QCDRs that implement and support non-MIPS measures are aware of the measure specifications in enough time to reliably work with developers to make system changes. Since these measures are owned by the QCDR or their partners, we believe they already know the changes needed prior to the submission of the measure for inclusion in the program.

Comment: One commenter asked CMS to modify the QCDR self-nomination process to allow measures that have been approved in prior years a period of stability by automatic measure approval for a period of at least 3 years, which would allow physicians and developers a period of assured measure inclusion.

Response: The QCDR measures are reviewed annually to ensure they are still appropriate for use in the program. We thank the commenter for the recommendation and will consider for future years.

Comment: One commenter suggested that CMS streamline the process for measure inclusion into MIPS beyond the accommodations that have been made for QCDRs and recommended that CMS consider the development of an “open source” QCDR that would allow small specialty organizations the opportunity to take advantage of the benefits of QCDRs for measure development, thereby shortening the process for inclusion in MIPS.

Response: It is not our intent to expand QCDR types at this time, but we will take this suggestion into consideration for future rulemaking.

Comment: One commenter supported the inclusion of outcome measures and other high priority measures for QCDRs, as well as the optional reporting of cross cutting measures by those clinicians who find those measures relevant to their practice. However, the commenter did not support mandating cross cutting measures requirements, especially for QCDRs since it contradicts the intent of

this submission mechanism, which is to give clinicians broad flexibility over determining which measures are most meaningful for their specialized practice.

Response: CMS believes that there are basic standards that each physician, regardless of their specialty, can and should perform. Additionally, the MIPS program offers payment incentives and MIPS payment adjustments based on the value of care patients receive. Having across-cutting set of measures will allow for direct comparisons among participants. We would like to note, however, that as discussed in section II.E.5.b. of this final rule with comment period, we are not finalizing the cross-cutting measure requirement.

Comment: One commenter requested that CMS compile the list of entities qualified to submit data as a QCDR, and that CMS accept the Indian Health Service (IHS) Resource and Patient Management System (RPMS) and other Tribal health information systems as a QCDR and work with IHS and Tribes to ensure health information systems are capable of meeting MIPS reporting requirements.

Response: CMS posts a list of approved QCDRs on its Web site annually. Entities are required to self-nominate to participate in MIPS as a QCDR. Entities that meet the definition of a “QCDR” at § 414.1305 and meet the participation requirements outlined in section II.E.9 of this final rule with comment period will be approved as a QCDR.

Comment: One commenter requested that CMS consider employing a MAV process for QCDRs or at minimum clarifying its intent for using such a process. The commenter stated that even in QCDRs certain clinicians do not have enough measures to report.

Response: QCDRs are required to go through a rigorous approval process that requires both their MIPS and non-MIPS measures be submitted at time of self-nomination. Since QCDRs have the ability to have up to 30 non-MIPS measures approved for availability to the MIPS eligible clinicians we anticipate that very few MIPS eligible clinicians who utilize the QCDR mechanism would not have measures applicable to them.

Comment: One commenter recommended that CMS not score non-MIPS QCDR measures in their first year as commenter does not believe they will have good benchmarking data.

Response: The non-MIPS measures approved for use within QCDRs are required to have benchmarks when possible and appropriate.

Comment: One commenter requested that CMS consider allowing QCDRs to determine the appropriate reporting sample (number or percentage) on a measure by measure basis.

Response: We will consider this recommendation in future rulemaking as we review the impact of such a change. However, we believe that the reporting sample must be of sufficient size to meet our reliability standards.

Comment: One commenter supported that the proposed rule established a quality measure review process for those measures that are not NQF-endorsed or included on the final MIPS measure list to assess if the quality measures have an evidence-based focus, and are reliable and valid.

Response: We appreciate the comment and support.

Comment: One commenter did not support CMS's proposal to support new measures developed by QCDRs because the commenter believed quality measures should go through a rigid evaluation and review process. The commenter believed CMS should focus on streamlining quality reporting by gradually eliminating excessive measures.

Response: We would like to note that all QCDR measures undergo a rigorous approval process before receiving approval.

Comment: One commenter indicated that allowing for the inclusion of non-MIPS quality measures via QCDRs will introduce more inconsistency and burden and result in data that cannot be compared across states/regions/providers, depending on their QCDR of origin.

Response: Acceptance of non-MIPS QCDR measures is to support specialty groups' ability to report on measures most relevant to their practice. QCDRs operate on a large scale, many at a national level, and offer valid and reliable measure data.

After consideration of the comments, we are finalizing at § 414.1330(a)(2) our proposal that for purposes of assessing performance of MIPS eligible clinicians on the quality performance category, CMS will use quality measures used by QCDRs. In the circumstances where a QCDR wants to use a non-MIPS measure for inclusion in the MIPS program for reporting, those measures will go through a CMS approval process during the QCDR self-nomination period. We also are finalizing our proposal to post the quality measures for use by qualified clinical data registries in the spring of 2017 for the initial performance period and no later than January 1 for future performance periods.

(7) Exception for Existing Quality Measures

Section 1848(q)(2)(D)(vii)(II) of the Act provides that any quality measure specified by the Secretary under section 1848(k) or (m) of the Act and any measure of quality of care established under section 1848(p)(2) of the Act for a performance or reporting period beginning before the first MIPS performance period (herein referred to collectively as "existing quality measures") must be included in the annual list of MIPS quality measures unless removed by the Secretary. As discussed in section II.E.4 of the proposed rule, we proposed that the performance period for the 2019 MIPS adjustment would be CY 2017, that is, January 1, 2017 through December 31, 2017. Therefore, existing quality measures would consist of those that have been specified or established by the Secretary as part of the PQRS measure set or VM measure set for a performance or reporting period beginning before CY 2017.

Section 1848(q)(2)(D)(vii)(I) of the Act provides that existing quality measures are not required to be established through notice-and-comment rulemaking or published in the **Federal Register** (although they remain subject to the applicable requirements for removing measures and including measures that have undergone substantive changes), nor are existing quality measures required to be submitted for publication in applicable specialty-appropriate, peer-reviewed journals.

The following is a summary of the comments we received regarding our proposal on the Exception for Existing Quality Measures.

Comment: Some commenters expressed preference for leveraging existing quality measures to ensure consistency of measurement.

Response: The vast of majority of measures that we are finalizing for the MIPS quality performance category are existing PQRS measures.

Comment: One commenter suggested that CMS conduct robust assessment of previously developed quality measures to ensure that the measures improve patient care and outcomes before introducing or maintaining those measures in the MIPS Program.

Response: We routinely review all of our existing measures through a maintenance and evaluation process that assess for the clinical impact on quality and any unintended consequences. We are committed to utilizing measures that improve patient care and outcomes.

After consideration of comments received from stakeholders on our proposals for exceptions to existing quality measures, we are finalizing our policies as proposed. While CMS has modified its performance period proposal as discussed in section II.E.4 of this final rule with comment period, this policy would not be affected since the minimum 90-day performance period would not begin any earlier than January 1, 2017.

(8) Consultation With Relevant Eligible Clinician Organizations and Other Relevant Stakeholders

Section 1890A of the Act, as added by section 3014(b) of the Affordable Care Act, requires that the Secretary establish a pre-rulemaking process under which certain steps occur for the selection of certain categories of quality and efficiency measures, one of which is that the entity with a contract with the Secretary under section 1890(a) of the Act (that is, the NQF) convenes multi-stakeholder groups to provide input to the Secretary on the selection of such measures. These categories are described in section 1890(b)(7)(B) of the Act and include the quality measures selected for the PQRS. In accordance with section 1890A(a)(1) of the Act, the NQF convened multi-stakeholder groups by creating the MAP. Section 1890A(a)(2) of the Act requires that the Secretary make publicly available by December 1 of each year a list of the quality and efficiency measures that the Secretary is considering under Medicare. The NQF must provide the Secretary with the MAP's input on the selection of measures by February 1 of each year. The lists of measures under consideration for selection are available at <http://www.qualityforum.org/map/>.

Section 1848(q)(2)(D)(viii) of the Act provides that relevant eligible clinician organizations and other relevant stakeholders, including state and national medical societies, must be consulted in carrying out the annual list of quality measures available for MIPS assessment. Section 1848(q)(2)(D)(ii)(II) of the Act defines an eligible clinician organization as a professional organization as defined by nationally recognized specialty boards of certification or equivalent certification boards. Section 1848(q)(2)(D)(viii) of the Act further provides that the pre-rulemaking process under section 1890A of the Act is not required to apply to the selection of MIPS quality measures.

Although MIPS quality measures are not required to go through the pre-rulemaking process under section 1890A of the Act, we have found the

MAP's input valuable. The MAP process enables us to consult with relevant EP organizations and other stakeholders, including state and national medical societies, patient and consumer groups and purchasers, in finalizing the annual list of quality measures. In addition to the MAP's input this year, we also received input from the Core Quality Measure Collaborative on core quality measure sets. The Core Quality Measure Collaborative was organized by AHIP in coordination with CMS in 2014. This multi-stakeholder workgroup has developed seven condition or setting-specific core measure sets to help align reporting requirements for private and public health insurance providers. Sixteen of the newly proposed measures under MIPS were recommended by the Core Quality Measure Collaborative and many of the remaining measures in the core sets were already in the PQRS program and have been proposed for MIPS for CY 2017.

The following is a summary of the comments we received regarding consultation with relevant eligible clinician organizations and other relevant stakeholders.

Comment: A few commenters applauded the work that went into establishing the measures that went into MIPS. The commenters suggested CMS continue to work with all stakeholders to align quality measures with those used in the private sector.

Response: We intend to continue to work with stakeholders to further align the MIPS quality measures with those used in the private sector.

Comment: Several commenters encouraged CMS to engage as broad an array of stakeholder organizations as possible in the measure review and selection process, noting that physicians and healthcare facility stakeholders, relevant task forces, provider groups, including nurses, physician assistants, nurse practitioners, patients, and caregivers should be included. Further, the commenters requested CMS implement new opportunities for stakeholders to participate in the measure development process.

Response: Part of the process for measure adoption is the public comment period, and we use the public comment period to enable all relevant stakeholders of all types, including the various stakeholders listed above, to provide feedback on measures that we have proposed for the Program.

Comment: One commenter encouraged CMS to keep measure developers, clinicians, and stakeholders engaged in the quality measure development and selection process to ensure the implementation of clinically

meaningful measures that are aligned across the MACRA Quality Payment Program performance pathways and other payer programs.

Response: We will continue to keep measure developers, clinicians, and stakeholders engaged in the quality measure development and selection process as evidenced by the multiple opportunities to provide input to the measure development and selection process.

Comment: A few commenters stated that CMS should work broadly with stakeholders, including patients and patient advocacy organizations to identify and address measures gaps. Further, these stakeholders could provide insight on patient experience and satisfaction measures, as well as measures of care planning and coordination. Increasingly, patient advocacy organizations are working to develop such measures based on their own registry data. Commenters encouraged CMS to commit to acting as a resource for those stakeholders that have less experience with the measures submission process, to encourage their participation in the process. Commenter also encouraged CMS to identify disease states for which commenters have articulated gaps in quality measures, and determine the feasibility of adopting measures based upon consensus-based clinical guidelines upon which CMS could solicit comments.

Response: We appreciate the recommendations and will engage with all stakeholders, including patient and consumer organizations. We provide a wide array of support and information about our measure development process. Our Measure Development Plan for stakeholders' provides clear guidance on this process (available at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>). We will take these suggestions into consideration in the future.

Comment: One commenter suggested that CMS look to and work with International Consortium for Health Outcomes Measurement (ICHOM) to develop additional and needed outcome measures and references MEDPACs June 2014 report.

Response: We will continue to collaborate with stakeholders that develop outcome measures for quality reporting.

Comment: One commenter recommended that CMS collaborate with specialty societies, frontline clinicians, and EHR vendors in the development, testing, and

implementation of measures with a focus on integrating the measurement of and reporting on performance with quality improvement and care delivery and on decreasing clinician burden.

Response: We agree it is important to continuously enhance the integration of health IT support for quality measurement and improvement with safe, effective care delivery workflows that minimize burdens on the clinician, patient, and clinical relationship. We will take the commenter's recommendation into consideration as we develop, test, and implement new measures.

Comment: One commenter recommended that CMS carefully review measure sets and defer to medical professional specialty society comments to ensure that measure sets are appropriately constructed. The commenter recommended that CMS obtain insight from clinicians who will be reporting these services to test the validity of the measure sets.

Response: We will continue to work with specialty groups to improve the specialty measure sets in the future.

Comment: Several commenters recommended that CMS use the core measure sets developed by the Core Quality Measures Collaborative because using these measure sets would ensure alignment, harmonization, and the avoidance of competing quality measures among payers.

Response: Measures that are a part of the CQMC core measure sets have been proposed for implementation and CMS intends to continue its collaboration with the CQMC to ensure alignment and harmonization in quality measure reporting.

Comment: One commenter recommended that CMS consider the recommendations made by the American College of Physicians (ACP) Performance Measurement Committee with regard to measure selection within MIPS.

Response: The ACP, like all other professional societies, has the opportunity to comment and provide feedback on our measure selection, including their recommendations, through the notice and comment process.

Comment: One commenter stated CMS has not adequately involved physicians in the measure development process.

Response: All Technical expert panels (TEPs) for measures developed by CMS or a CMS contractor include a clinical expert. Additionally, the majority of measures in the program are not developed by CMS but by medical specialty societies.

Comment: One commenter suggested that CMS account for the professional role of the Advanced Practice Registered Nurse (APRN) and all appropriate stakeholders who provide clinical services to beneficiaries when creating and evaluating quality measures. The commenter suggested that CMS ensure the committees and Technical Expert Panels tasked with developing quality measures include nurses.

Response: We value the expertise of APRNs in providing patient care and we will consider their participation in the future.

Comment: One commenter believed CMS should continue to work with stakeholders to make the process for selection of quality measures clear and well defined. The commenter encouraged CMS to focus on getting new, relevant measures into the program within a shorter timeframe. The commenter believed that a 2-year submission to implementation interval would hinder introduction of new measures into MIPS through the traditional approach. The commenter believed there will be growth in measures submitted to the program through QCDRs in the future.

Response: We do not develop most of the measures, but rather measure stewards/owners submit their measures to CMS for consideration and implementation. We will work with measure developers and other stakeholders to continue to try and shorten the timeframe for measure development and implementation and to make the process as efficient as possible.

Comment: One commenter requested that CMS promote and disseminate research on which process improvement measures have proven to be the most effective at improving clinical outcomes.

Response: We will take this under consideration and will continue working with clinicians to promote best practices and the highest quality healthcare for clinicians and Medicare beneficiaries.

Comment: One commenter believes we should consider how to work with measure developers to integrate patient preferences into measure design.

Response: We agree with the commenter and believe the patient experience and incorporation of patient preferences are important components of healthcare quality.

Comment: Commenters recommended that CMS consult with relevant eligible clinician organizations and other relevant stakeholders and reminded CMS that the MACRA statute does not require CMS to utilize the NQF MAP to

provide guidance into the pre-rulemaking process on the selection of MIPS quality measures, but requires the Secretary to consult with relevant eligible clinician organizations, including state and national medical societies. To strengthen the pre-rulemaking process, commenters recommended that CMS address issues with the MAP around: voting options on individual measures; discussion and treatment of existing measures undergoing maintenance review; timelines for commenting on MAP recommendations; the make-up of the MAP coordinating committee and workgroups; and the sometimes inadequate notice for public comment (for example, agendas are often not available until close to the day of a MAP meeting). In addition, the commenters reminded CMS that requiring measure developers to propose measures to the MAP for use in CMS programs introduces another time-consuming step in the measure development cycle, and that MACRA provides CMS the flexibility in terms of how it uses the MAP.

Response: We appreciate their feedback about the MAP, and the commenters correctly note that we retain the authority to adopt measures without MAP's recommendations. We will continue to work with the NQF on optimizing the MAP process and will take the commenters' recommendations into consideration in future rulemaking.

(9) Cross-Cutting Measures for 2017 and Beyond

Under PQRS we realized the value in requiring EPs to report a cross-cutting measure and have proposed to continue the use of cross-cutting measures under MIPS. The cross-cutting measures help focus our efforts on population health improvement and they also allow for meaningful comparisons between MIPS eligible clinicians. Under MIPS, we proposed fewer cross-cutting measures than those available under PQRS for 2016 reporting; however, we believe the list contains measures for which all patient-facing MIPS eligible clinicians should be able to report, as the measures proposed include commonplace health improvement activities such as checking blood pressure and medication management. We proposed to eliminate some measures for which the reporting MIPS eligible clinician may not actually be providing the care, but are just reporting another MIPS eligible clinician's performance result. An example of this would be a MIPS eligible clinician who never manages a diabetic patient's glucose, yet previously could have reported a

measure about hemoglobin A1c based on an encounter. This type of reporting will likely not help improve or confirm the quality of care the MIPS eligible clinician provides to his or her patients. Although there are fewer proposed cross-cutting measures under MIPS, in previous years some measures were too specialized and could not be reported on by all MIPS eligible clinicians. The proposed cross-cutting measures under MIPS are more broadly applicable and can be reported on by most specialties. Non-patient facing MIPS eligible clinicians do not have a cross-cutting measure requirement. The cross-cutting measures that were available under PQRS for 2016 reporting that are not being proposed as cross-cutting measures for 2017 reporting are:

- PQRS #001 (Diabetes: Hemoglobin A1c Poor Control).
- PQRS #046 (Medication Reconciliation Post Discharge).
- PQRS #110 (Preventive Care and Screening: Influenza Immunization).
- PQRS #111 (Pneumonia Vaccination Status for Older Adults).
- PQRS #112 (Breast Cancer Screening).
- PQRS #131 (Pain Assessment and Follow-Up).
- PQRS #134 (Preventive Care and Screening: Screening for Clinical Depression and Follow-Up Plan).
- PQRS #154 (Falls: Risk Assessment).
- PQRS #155 (Falls: Plan of Care).
- PQRS #182 (Functional Outcome Assessment).
- PQRS #240 (Childhood Immunization Status).
- PQRS #318 (Falls: Screening for Fall Risk).
- PQRS #400 (One-Time Screening for Hepatitis C Virus (HCV) for Patients at Risk).

While we proposed to remove the above listed measures from the cross-cutting measure set, these measures were proposed to be available as individual quality measures available for MIPS reporting, some of which have proposed substantive changes.

The following is a summary of the comments we received regarding our proposal on cross-cutting measures for 2017 and beyond.

Comment: Some commenters supported the proposal to require reporting at least one cross-cutting measure, and suggested that CMS support the development of additional cross-cutting measures.

Response: We appreciate the support; however, as discussed in section II.E.5.b. of this final rule with comment period, we are not finalizing the cross-cutting measure requirement in an effort

to reduce program complexity as part of the transition year of CY 2017.

Comment: Several commenters requested that CMS provide a broader selection of cross-cutting measures to choose from. Further stating that the list is not robust enough to allow all clinicians to meet this requirement.

Response: We appreciate the suggestion; however, as discussed in section II.E.5.b. of this final rule with comment period, we are not finalizing the cross-cutting measure requirement as part of the transition year of CY 2017.

Comment: One commenter requested that all eligible clinicians must receive clear and timely notification of all cross-cutting and outcome measures before the start of the reporting period so that they can select and plan for a full year of quality improvement activities.

Response: We appreciate the recommendation; however, as discussed in section II.E.5.b. of this final rule with comment period, we are not finalizing the cross-cutting measure requirement as part of the transition year of CY 2017.

Comment: Numerous commenters did not agree with requiring all patient facing clinicians to report one cross-cutting measure. The commenters did not believe there were measures that are important or informative for some procedural or technical sub-specialties and that they are difficult to understand and implement. Further, one commenter believes that the cross-cutting measures appear to be measures that will be applicable for multiple clinicians types rather than cross-sectional measures, or anything that would push for community collaboration.

Response: We appreciate the feedback and would like to note that, as discussed in section II.E.5.b. of this final rule with comment period, we are not finalizing the cross-cutting measure requirement as part of the transition year of CY 2017.

Comment: One commenter stated that Non-patient facing clinicians should be exempt from reporting a cross cutting measure.

Response: We would like to note that non-patient facing clinicians would have been exempt from reporting a cross-cutting measure. Further, as discussed in section II.E.5.b of this final rule with comment period, we are not finalizing the cross-cutting measure requirement as part of the transition year of CY 2017.

Comment: A few commenters recommended that CMS work with stakeholders to develop cross-cutting measures for non-patient facing MIPS eligible clinicians, as these MIPS eligible clinicians play an important role in ensuring safe, appropriate, high-

quality care. The commenters supported allowing non-patient facing MIPS eligible clinicians to report through a QCDR that can report non-MIPS measures.

Response: We appreciate the recommendation; however, as discussed in section II.E.5.b. of this final rule with comment period, we are not finalizing the cross-cutting measure requirement as part of the transition year of CY 2017.

Comment: A few commenters objected to the requirement that clinicians report one cross-cutting measure chosen from a list of general quality measures because it is counter to the statute's intent to allow eligible clinicians who report via QCDR the flexibility to select measure that are most relevant to their practice. The commenters urged CMS to remove the requirement that physicians reporting the quality performance category via QCDR must report on one cross-cutting measure.

Response: We appreciate the commenters' feedback; however, as discussed in section II.E.5.b. of this final rule with comment period, we are not finalizing the cross-cutting measure requirement as part of the transition year of CY 2017.

Comment: Several commenters disagreed with our proposal to remove various measures from the cross-cutting measure set. We also received support for some of the measures we proposed to include, as well as comments on measures that commenters did not support. Additionally, we received several recommendations of additional quality measures for potential inclusion in the cross-cutting measure set.

Response: We appreciate the commenters' feedback and would like to note that we are not finalizing the cross-cutting measure requirement as part of the transition year of CY 2017. We would also like to note that the measures that were proposed for the cross-cutting measure set are still listed as available measures under Table A of the appendix in this final rule with comment period.

As a result of the comments, and based on our other finalized policies, we are not finalizing the set of cross-cutting measures as proposed to reduce the complexity of the program. Rather we are incorporating these measures within the MIPS individual (Table A) and specialty measure sets (Table E) within the appendix of this final rule with comment period. We continue to value the reporting of cross-cutting measures to incentivize improvements in population health and in order to be better able to compare large numbers of physicians on core quality measures

that are important to patients and the health of populations. We understand that many clinicians believe that cross-cutting measures may not apply to them. We are seeking additional comments in this final rule with comment period from the public for future notice-and-comment rulemaking on approaches to implementation of cross-cutting measures in future years of the MIPS program that could achieve these program goals and be meaningful to MIPS eligible clinicians and the patients they serve.

d. Miscellaneous Comments

We received a number of comments for this section that are not related to specific measure proposals as well as comments spanning multiple measure proposals that contained common themes. We have summarized those comments below.

Comment: Numerous commenters made requests for new measures to be included in the annual list of quality measures. For example, we received several comments requesting additional measures be added that pertain to palliative care and behavioral-health.

Response: We appreciate the commenters' suggestions. We would encourage the commenters to submit potential new measures for inclusion in MIPS through the Call for Quality Measures process.

Comment: Numerous commenters made requests for changes to existing measure specifications. For example, some commenters requested encounter codes be added or removed from measure specifications or certain denominator criteria be expanded to include additional target groups for various measures.

Response: Although CMS has authority over all of its quality programs and measure changes within those programs, we also work with measure owners regarding the updates to measures. Measure changes are not automatically implemented within quality programs. We may adopt changes to measures in two ways: (1) For measures with substantive changes, the changes must be adopted through notice-and-comment rulemaking. Generally, measures with substantive changes are proposed through rulemaking and open for comment. (2) For measures with non-substantive or technical changes, we can consider implementing the changes through subregulatory means.

Comment: Numerous commenters made requests for additional specialty measure sets, as well as modifications to the proposed specialty measure sets.

Response: We appreciate the commenter's suggestions. We plan to work with the measure developers and specialty societies to continuously improve and expand the specialty-measure sets in the future. Further, several comments were not specific enough as to the measures that would be appropriate to the specialty measure set or where there were not enough measures within the current measure set to provide a sufficient number of measures for the specific specialty set. In instances where we received comments that were specific enough to develop or modify the specialty measure sets, and which we believed were appropriate, we have included those updates along with the rationale for those changes in the measure tables in the appendix.

Comment: We received several requests to update measure steward information in the measure tables located in the appendix.

Response: We appreciate the commenters' feedback and have made the necessary updates to the measures steward information in the measure tables.

Comment: Some commenters asked that physician led specialty organizations be able develop evidence-based quality guidelines of their own and proceed with a simple attestation procedure to document compliance.

Response: As discussed in section II.E.5.c. of this final rule with comment period, we have an annual call for measures where clinicians have the opportunity to submit additional measures covering the services that they provide. We have also made available a measure development plan for stakeholders' review, available at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>. While we recognize the simplicity of simple attestation, we believe it is important to receive actual performance information on how an MIPS eligible clinician or group reported, not just whether they did the measure.

Comment: A few commenters requested the adoption of appropriate use criteria (AUC) as quality measures to ensure the best care for patients. The commenters recommended that the specialty areas covered by the AUCs include: Radiology, cardiology, musculoskeletal (includes specialized therapy management, interventional pain, large joint surgery, spine surgery), radiation therapy, genetics and lab management, medical oncology, sleep medicine, specialty drug, and post-acute

care. In addition, the commenters recommended that AUC be derived from leading specialty societies, be incorporated from current peer-reviewed medical literature, have input from subject matter expert clinicians and community-based physicians, be available to any eligible clinicians free of charge on a Web site, and have a proven track record of effectiveness in a wide range of practice settings. The AUC should be subject to oversight and review by nationally recognized, independent accrediting bodies, and be reviewed annually.

Response: We are finalizing quality measures that are based on the AUC in this rule.

Comment: One commenter promoted the value of palliative care and encouraged CMS to monitor the effects of MACRA, specifically the quality and cost performance categories, on patient access to health care providers, particularly palliative care providers.

Response: We appreciate the suggestion. We intend to monitor the effects of the MIPS program on all aspects of care.

We have considered the comments received and will take them into consideration in future notice-and-comment rulemaking.

e. Cost Performance Category

(1) Background

(a) General Overview and Strategy

Measuring cost is an integral part of measuring value. We envision the measures in the MIPS cost performance category would provide MIPS eligible clinicians with the information they need to provide appropriate care to their patients and enhance health outcomes. In implementing the cost performance category, we proposed to start with existing condition and episode-based measures, and the total per capita costs for all attributed beneficiaries measure (total per capita cost measure). We also proposed that all cost measures would be adjusted for geographic payment rate adjustments and beneficiary risk factors. In addition, a specialty adjustment would be applied to the total per capita cost measure. We proposed that all of the measures attributed to a MIPS eligible clinician or group would be weighted equally within the cost performance category, and there would be no minimum number of measures required to receive a score under the cost performance category. Lastly, we indicated that we plan to draw on standards for measure reliability, patient attribution, risk adjustment, and payment standardization from the VM as well as the Physician Feedback

Program, as we believe many of the same measurement principles for cost measurement in the VM are applicable for measurement in the cost performance category in MIPS (81 FR 28196).

We proposed that all measures used under the cost performance category would be derived from Medicare administrative claims data and as a result, participation would not require use of a data submission mechanism.

In response to public comments, as detailed in section II.E.5.e.(2) of this final rule with comment period, we are lowering the weight of the cost performance category in the MIPS final score from 10 percent in the proposed rule to 0 percent for the transition year (MIPS payment year 2019). We are finalizing a weight of 10 percent for MIPS payment year 2020. For MIPS payment year 2021 and beyond, the cost performance category will have a weight of 30 percent of the final score as required by section 1848(q)(5)(E)(i) of the Act. Reducing the weight of the cost performance category provides MIPS eligible clinicians and groups the opportunity to better understand the cost measures in MIPS without an effect on their payments, especially the impact of adjustments to the attribution methodologies and their performance based on the MIPS decile scoring system. We are also limiting the cost measures finalized for the CY 2017 performance period to those that have been included in the VM or the 2014 sQRUR and that are reliable for both individual and group reporting. We plan to continue developing care episode groups, patient condition groups, and patient relationship categories (and codes for such groups and categories). We plan to incorporate new measures as they become available and will give the public the opportunity to comment on these provisions through future notice and comment rulemaking.

The following is a summary of the comments we received on the general provisions of cost measurement within the MIPS program.

Comment: Several commenters supported the inclusion of cost measures as part of the MIPS program, noting the important role of clinicians in ordering services and managing care so as to avoid unnecessary services.

Response: We thank the commenters for their support and believe that cost is an important element of the MIPS program, reflecting the key role of clinicians in guiding care decisions. However, we also consider it important to phase in cost measurement. Therefore, we are limiting the number of cost measures for the CY 2017

performance period and lowering the weight of the cost performance category to 0 percent in the final score for the transition year, 10 percent in the second MIPS payment year, and 30 percent in the third and following MIPS payment years.

Comment: Several commenters noted concern with the inclusion of cost measures in MIPS because it could cause unethical behavior and improper reductions in care, and clinicians control only a small part of healthcare costs. Some commenters noted that clinicians do not determine the costs of services such as hospital visits, durable medical equipment, or prescription drugs. Others asked that cost measures should only be used when there is a direct tie to quality measurement.

Response: We agree that cost should be considered in the context of quality. The statutory design of the final score incorporates both quality and cost such that they are linked in the clinician's overall assessment in MIPS. We recognize that clinicians do not personally provide, order, or determine the price of all of the individual services in the cost measures, but we do believe that clinicians do have an effect on the volume and type of services that are provided to a patient through better coordination of care and improved outcomes. We plan to continue to assess best methods for attributing cost to MIPS eligible clinicians.

Comment: Many commenters supported cost measures being calculated using claims data so as not to add additional reporting burden. Some commenters expressed concern with cost measures solely calculated based on claims and suggested that CMS consider other measures, such as appropriate use criteria or elements of Choosing Wisely.

Response: We agree that claims data can provide valuable information on cost and this method has the advantage of not requiring additional reporting from MIPS eligible clinicians. We appreciate that there are some potential measures related to cost that would not necessarily be calculated using claims. Some of these measures, such as appropriate use measures, are included, as appropriate, in the quality and improvement activity performance categories. We will take into consideration the commenter's suggestion related to elements of the Choosing Wisely measures in the future and determine whether they may be considered as cost measures.

Comment: Several commenters expressed concern that the proposed measures for the cost performance category did not adequately adjust costs

to account for the risks associated with different types of patients. They commented that the measures do not adjust for the socioeconomic status, patient compliance, or other non-health factors that might contribute to spending. Many of these commenters encouraged socioeconomic status to be included as a risk adjustment variable for individual measures or the entire program.

Response: We note that we are establishing, in this final rule with comment period, the cost performance category weight as 0 percent of the final score for the transition year (MIPS payment year 2019) to allow MIPS eligible clinicians to gain experience with these measures in MIPS. Although we believe the measures are valid and reliable, we will continue to evaluate the potential impact of risk factors, including socioeconomic status, on cost measure performance. Please see section II.E.5.b.(3) for a discussion of the integration of the findings of the ASPE report on socioeconomic factors into the overall MIPS program in the future.

Comment: Several commenters expressed concern that the risk adjustment methods used in the cost performance category would not adequately address the issues of their particular specialty or field of medicine. Many recommended that they only be compared to clinicians who had the same specialty.

Response: We will continue to explore methods to refine our risk adjustment methods to accommodate the different types of patients treated by clinicians in the Medicare system. We are applying a specialty adjustment to the total per capita cost measure because we found, when implementing this measure as part of the VM, that there were widely divergent costs among patients treated by various specialties that were not addressed by other risk adjustment methods. The other measures we are including in the cost performance category for the CY 2017 performance period accommodate clinical differences in other ways. The MSPB measure is adjusted on the basis of the index admission diagnosis-related groups (DRGs), which is likely to differ based on the specialty of the clinician attributed to the measure. The episode-based measures are triggered on the basis of the provision of a service that identifies a type of patient who is often seen by a certain specialty or limited number of specialties and this concurrent risk adjustment is an effective predictor of episode cost. We believe that the adjustments contained in these measures adequately differentiate patient populations by

different specialties and we will continue to investigate methods to ensure that the unique attributes of various medical specialties are appropriately accounted for within the program.

Comment: Some commenters expressed concern that cost measures would discourage the development of new therapies. One commenter suggested that CMS not include the costs of new technology within cost measures.

Response: We wish to ensure that cost measurement does not hinder the appropriate uptake of new technologies. One challenge of new technologies is that the costs are not represented in the historical benchmarks. However, we are finalizing a policy to create benchmarks for the cost measures based on the performance period, so the benchmarks will build in the costs associated with adoption of new technologies in that period. We also anticipate that new technologies may reduce the need for other services, which could further reduce the cost of care. We believe that excluding new technology from the cost measures is not appropriate when the technology is being paid for by the Medicare program and its beneficiaries, but we will continue to monitor this issue to determine whether adjustments should be made in the future.

(b) MACRA Requirements

Section 1848(q)(2)(A)(ii) of the Act establishes cost as a performance category under the MIPS. Section 1848(q)(2)(B)(ii) of the Act describes the measures of the cost performance category as the measurement of resource use for a MIPS performance period under section 1848(p)(3) of the Act, using the methodology under section 1848(r) of the Act as appropriate, and, as feasible and applicable, accounting for the cost of drugs under Part D.

As discussed in section II.E.5.e.(1)(c) of the proposed rule, we previously established in rulemaking the VM, as required by section 1848(p) of the Act, that provides for differential payment to a physician or a group of physicians (and EPs as the Secretary determines appropriate) under the PFS based on the quality of care furnished compared to cost. For the evaluation of costs of care, section 1848(p)(3) of the Act refers to appropriate measures of costs established by the Secretary that eliminate the effect of geographic adjustments in payment rates and take into account risk factors (such as socioeconomic and demographic characteristics, ethnicity, and health status of individuals, such as to recognize that less healthy individuals

may require more intensive interventions) and other factors determined appropriate by the Secretary.

Section 1848(r) of the Act specifies a series of steps and activities for the Secretary to undertake to involve the physician, practitioner, and other stakeholder communities in enhancing the infrastructure for cost measurement, including for purposes of MIPS and APMs. Section 1848(r)(2) of the Act requires the development of care episode and patient condition groups, and classification codes for such groups. That section provides for care episode and patient condition groups to account for a target of an estimated one-half of expenditures under Medicare Parts A and B (with this target increasing over time as appropriate). We are required to take into account several factors when establishing these groups. For care episode groups, we must consider the patient's clinical issues at the time items and services are furnished during an episode of care, such as clinical conditions or diagnoses, whether or not inpatient hospitalization occurs, the principal procedures or services furnished, and other factors determined appropriate by the Secretary. For patient condition groups, we must consider the patient's clinical history at the time of a medical visit, such as the patient's combination of chronic conditions, current health status, and recent significant history (such as hospitalization and major surgery during a previous period), and other factors determined appropriate. We are required to post on the CMS Web site a draft list of care episode and patient condition groups and codes for solicitation of input from stakeholders, and subsequently, post on the CMS Web site an operational list of such groups and codes. As required by section 1848(r)(2)(H) of the Act, no later than November 1 of each year (beginning with 2018), the Secretary shall, through rulemaking, revise the operational list as the Secretary determines may be appropriate.

To facilitate the attribution of patients and episodes to one or more clinicians, section 1848(r)(3) of the Act requires the development of patient relationship categories and codes that define and distinguish the relationship and responsibility of a physician or applicable practitioner with a patient at the time of furnishing an item or service. These categories shall include different relationships of the clinician to the patient and reflect various types of responsibility for and frequency of furnishing care. We are required to post on the CMS Web site a draft list of

patient relationship categories and codes for solicitation of input from stakeholders, and subsequently, post on the CMS Web site an operational list of such categories and codes. As required by section 1848(r)(3)(F) of the Act, not later than November 1 of each year (beginning with 2018), the Secretary shall, through rulemaking, revise the operational list as the Secretary determines may be appropriate.

Section 1848(r)(4) of the Act requires that claims submitted for items and services furnished by a physician or applicable practitioner on or after January 1, 2018, shall, as determined appropriate by the Secretary, include the applicable codes established for care episode groups, patient condition groups, and patient relationship categories under sections 1848(r)(2) and (3) of the Act, as well as the NPI of the ordering physician or applicable practitioner (if different from the billing physician or applicable practitioner).

Under section 1848(r)(5) of the Act, to evaluate the resources used to treat patients, the Secretary shall, as determined appropriate, use the codes reported on claims under section 1848(r)(4) of the Act to attribute patients to one or more physicians and applicable practitioners and as a basis to compare similar patients, and conduct an analysis of resource use. In measuring such resource use, the Secretary shall use per patient total allowed charges for all services under Medicare Parts A and B (and, if the Secretary determines appropriate, Medicare Part D) and may use other measures of allowed charges and measures of utilization of items and services. The Secretary shall seek comments through one or more mechanisms (other than notice and comment rulemaking) from stakeholders regarding the resource use methodology established under section 1848(r)(5) of the Act.

On October 15, 2015, as required by section 1848(r)(2)(B) of the Act, we posted on the CMS Web site for public comment a list of the episode groups developed under section 1848(n)(9)(A) of the Act with a summary of the background and context to solicit stakeholder input as required by section 1848(r)(2)(C) of the Act. That posting is available at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/MACRA-MIPS-and-APMs.html>. The public comment period closed on February 15, 2016.

(c) Relationship to the Value Modifier

Currently, the VM established under section 1848(p) of the Act utilizes six cost measures (see 42 CFR 414.1235): (1) A total per capita costs for all attributed beneficiaries measure (which we will refer to as the total per capita cost measure); (2) a total per capita costs for all attributed beneficiaries with chronic obstructive pulmonary disease (COPD) measure; (3) a total per capita costs for all attributed beneficiaries with congestive heart failure (CHF) measure; (4) a total per capita costs for all attributed beneficiaries with coronary artery disease (CAD) measure; (5) a total per capita costs for all attributed beneficiaries with diabetes mellitus (DM) measure; and (6) an MSPB measure.

Total per capita costs (measures 1–5) and the MSPB measure include payments under both Medicare Part A and Part B, but do not include Medicare payments under Part D for drug expenses. Cost measures for the VM are attributed at the physician group and solo practice level using the Medicare-enrolled billing TIN. They are risk adjusted and payment standardized, and the expected cost is adjusted for the TIN's specialty composition. We refer readers to our discussions of these total per capita cost measures (76 FR 73433 through 73434, 77 FR 69315 through 69316), MSPB measure (78 FR 74774 through 74780, 80 FR 71295 through 71296), payment standardization methodology (77 FR 69316 through 69317), risk adjustment methodology (77 FR 69317 through 69318), and specialty adjustment methodology (78 FR 74781 through 74784) in earlier rulemaking for the VM. More information about these measures may be found in documents under the links titled "Measure Information Form: Overall Total Per Capita Cost Measure," "Measure Information Form: Condition-Specific Total Per Capita Cost Measures," and "Measure Information Form: Medicare Spending Per Beneficiary Measure" available at <https://www.cms.gov/medicare/medicare-fee-for-service-payment/physicianfeedbackprogram/valuebasedpaymentmodifier.html>.

The total per capita cost measures use a two-step attribution methodology that is similar to, but not exactly the same, as the assignment methodology used for the Shared Savings Program. The attribution focuses on the delivery of primary care services (77 FR 69320) by both primary care clinicians and specialists. The MSPB measure has a different attribution methodology. It is attributed to the TIN that provides the

plurality of Medicare Part B claims (as measured by allowed charges) during the index inpatient hospitalization. We refer readers to the discussion of our attribution methodologies (77 FR 69318 through 69320, 79 FR 67960 through 67964) in prior rulemaking for the VM.

These total per capita cost measures include payments for a calendar year and have been reported to TINs for several years through the Quality and Resource Use Reports (QRURs), which are issued as part of the Physician Feedback Program under section 1848(n) of the Act. The total per capita cost measures have been used in the calculation of the VM payment adjustments beginning with the 2015 payment adjustment period and the MSPB measure has been used in the calculation of the VM payment adjustments beginning with the 2016 payment adjustment period. More information about the current attribution methodology for these measures is available in the “Fact Sheet for Attribution in the Value-Based Payment Modifier Program” document available at <https://www.cms.gov/medicare/medicare-fee-for-service-payment/physicianfeedbackprogram/valuebasedpaymentmodifier.html>.

In the MIPS and APMs RFI (80 FR 59102 through 59113), we solicited feedback on the cost performance category. A summary of those comments is located in the proposed rule (81 FR 28198).

(2) Weighting in the Final Score

As required by section 1848(q)(5)(E)(i)(II)(bb) of the Act, the cost performance category shall make up no more than 10 percent of the final score for the first MIPS payment year (CY 2019) and not more than 15 percent of the final score the second MIPS payment year (CY 2020). Therefore, we proposed at § 414.1350 that the cost performance category would make up 10 percent of the final score for the first MIPS payment year (CY 2019) and 15 percent of the final score for the second MIPS payment year (CY 2020) (81 FR 28384). As required by section 1848(q)(5)(E)(i)(II)(aa) of the Act and proposed at § 414.1350 (81 FR 28384), starting with the third MIPS payment year and for each MIPS payment year thereafter, the cost performance category would make up 30 percent of the final score.

The following is a summary of the comments we received regarding our proposals for the cost performance category weight in the final score for the first and second MIPS payment years.

Comment: Several commenters supported the weighting of the cost

performance category as 10 percent of the MIPS final score for 2019. However, we also had many commenters that encouraged us to reduce the weight of the cost performance category to as low as 0 percent for 2019 due to lack of familiarity with cost measures. Other commenters recommended a delay in the inclusion of the cost performance category within the final score because attribution methods did not properly identify the clinician who was responsible for the care and patients could be attributed to clinicians who had little influence on their overall care. Others recommended delay because risk adjustment methods based on administrative data could not properly capture the clinical risk differences among patients, placing clinicians who see more complex patients at a disadvantage. Others noted that more time was needed to perfect cost measures. Others recommended that cost measures be attributed to only those clinicians who volunteer to participate in a pilot in the transition year.

Response: Clinicians have received feedback on cost measures through the VM and the Physician Feedback Program reports for a number of years; however, we agree that clinicians may need time to become familiar with cost measures in MIPS. The VM calculation and the Physician Feedback Program are different in two significant ways from the proposed approach to cost measurement in the MIPS. The first major difference is that we proposed to attribute measures at the TIN/NPI level for those submitting as individuals rather than at the TIN level used for the VM. While this would not make a difference for those in solo practice, it would present a significant change for those that practice in groups and participate in MIPS as individuals. In MIPS, we have finalized a policy in section II.E.5.a.(2) of this rule that those that elect to participate in MIPS as groups, must be assessed for all performance categories as groups. Conversely, those that elect to participate in MIPS as individual clinicians will be measured on all four performance categories as an individual. With the exception of solo practitioners (defined for the VM as a single TIN with one EP identified by an NPI billing under the TIN), the VM evaluates performance at the aggregate group level. For example, a surgeon in a multi-specialty group who elects to participate in MIPS as an individual would receive feedback on the cost measures attributed to him or her individually as opposed to that of the entire group. Second, as

discussed in section II.E.5.e.(3)(c) of this final rule with comment period, to facilitate participation at the individual level, we will attribute cases at the TIN/NPI level, rather than at the TIN level, as is done currently under the VM. Even for groups that have received QRURs on cost measures under the VM, this global change to the attribution logic is likely to change the attributed cases, which in turn could affect their performance on cost measures.

In addition, as discussed in section II.E.6.a.(3) of this final rule with comment period, scoring for the cost performance category under MIPS is different from the VM because it is based on performance within a decile system as opposed to the quality-tiering scoring system used in the VM. A group or solo practitioner that scored in the average range under the VM quality-tiering methodology may be scored “above average” or “below average” in MIPS because of the difference in the scoring methods. We believe it is important for this transition year for MIPS eligible clinicians to have the opportunity to become familiar with the attribution changes and the scoring changes by receiving performance feedback showing what their performance on the cost measures will look like under the MIPS attribution and scoring rules before cost measures affects payment.

Section 1848(q)(5)(E)(i)(II)(bb) of the Act provides that for the first and second MIPS payment years, “not more than” 10 percent and 15 percent, respectively, of a MIPS eligible clinician’s final score shall be based on performance in the cost performance category. Accordingly, we believe that the statute affords discretion to adopt a weighting for the cost performance category lower than 10 percent and 15 percent for the first and second payment years, respectively. For these reasons described above, we believe that a transition period would be appropriate; we are lowering the weight of the cost performance category for the first and second MIPS payment years. We are not finalizing our proposal for a weighting of 10 percent for the transition year and 15 percent for the second MIPS payment year. Instead we are finalizing a weighting of 0 percent for the transition year and 10 percent for the second MIPS payment year.

We are not reducing the weight of the cost category due to concerns with attribution, risk adjustment, or the measure specifications. We intend to continue improving all aspects of the cost measures, but we believe our final methods are sound. However, due to the changes in scoring and attribution, we

agree that MIPS eligible clinicians should have more time to become familiar with these measures in the context of MIPS. Finally, we do not believe we should restrict the cost performance category to a pilot. MIPS eligible clinicians are not required to submit data and the cost performance category does not contribute to the final score for the transition year. Therefore, we will calculate a cost performance category score for all MIPS eligible clinicians for whom we can reliably calculate a score.

Comment: Many commenters encouraged CMS to defer assigning any weight to the cost performance category for MIPS until patient relationship codes have been in use.

Response: Section 1848(r)(3) of the Act requires us to develop patient relationship categories and codes that define and distinguish the relationship and responsibility of a physician or applicable practitioner with a patient. We are currently reviewing comments received on the draft list of patient relationship categories and will post an operational list of these categories and codes in April 2017. We disagree with commenters that we should wait until the patient relationship codes are in use before measuring cost. While we believe that these patient relationship codes can be an important contributor to better clarifying the particular role of a clinician in patient care, these codes will not be developed in time for the first MIPS performance period. Moreover, section 1848(r)(4) directs that such codes shall be included, as determined appropriate by the Secretary, on claims for items and services furnished on or after January 1, 2018. Following their inclusion on claims, we will need time to evaluate how best to incorporate those codes into cost measures. While this additional analysis of patient relationship codes takes place, the cost performance category will remain an important part of the MIPS. In their current form, we find the cost measures adopted in this final rule with comment period both reliable and valid.

After consideration of the comments, we believe that a transition period for measuring cost would be appropriate; therefore, we are not finalizing the weighting of the cost performance category in the MIPS final score as proposed. Instead, we are finalizing at § 414.1350(b) a weighting of 0 percent for the 2019 MIPS payment year and 10 percent for the 2020 MIPS payment year. Starting with the 2021 MIPS payment year, the cost performance category will be weighted at 30 percent, as required by section

1848(q)(5)(E)(i)(II)(aa) of the Act. We recognize that the individual attribution of cost measures for those MIPS eligible clinicians in group practices and the new MIPS scoring system is a change for clinicians and we would like to give them an opportunity to gain experience with the cost measures before increasing the weight of the performance category within the final score.

(3) Cost Criteria

As discussed in section II.E.5.a. of the proposed rule (81 FR 28181), performance in the cost performance category would be assessed using measures based on administrative Medicare claims data. We did not propose any additional data submissions for the cost performance category. As such, MIPS eligible clinicians and groups would be assessed based on cost for Medicare patients only and only for patients that are attributed to them. MIPS eligible clinicians or groups that do not have enough attributed cases to meet or exceed the case minimums proposed in sections II.E.5.e.(3)(a)(ii) and II.E.5.e.(3)(b)(ii) of the proposed rule would not be measured on cost. For more discussion of MIPS eligible clinicians and groups without a cost performance category score, please refer to II.E.6.a.(3)(d) and II.E.6.b.(2) of this final rule with comment period.

(a) Value Modifier Cost Measures Proposed for the MIPS Cost Performance Category

For purposes of assessing performance of MIPS eligible clinicians on the cost performance category, we proposed at § 414.1350(a) to specify cost measures for a performance period (81 FR 28384). For the CY 2017 MIPS performance period, we proposed to utilize the total per capita cost measure, the MSPB measure, and several episode-based measures discussed in section II.E.5.e.(3)(b) of the proposed rule (81 FR 28200) for the cost performance category. The total per capita costs measure and the MSPB measure are described in section II.E.5.e.(1)(c) of the proposed rule (81 FR 28197). We proposed including the total per capita cost measure as it is a global measure of all Medicare Part A and Part B resource use during the MIPS performance period and inclusive of the four condition-specific total per capita cost measures under the VM (chronic obstructive pulmonary disease, congestive heart failure, coronary artery disease, and diabetes mellitus) for which performance tends to be correlated and its inclusion was supported by commenters on the MIPS

and APMs RFI (80 FR 59102 through 59113). We also anticipate that MIPS eligible clinicians are familiar with the total per capita cost measure as the measure has been in the VM since 2015 and feedback has been reported through the annual QRUR to all groups starting in 2014.

We proposed to adopt the MSPB measure because by the beginning of the initial MIPS performance period in 2017, we believe most MIPS eligible clinicians will be familiar with the measure in the VM or its variant under the Hospital Value-Based Purchasing (VBP) Program. However, we proposed two technical changes to the MSPB measure calculations for purposes of its adoption in MIPS which were discussed in the proposed rule at 81 FR 28200.

We proposed to use the same methodologies for payment standardization, and risk adjustment for these measures for the cost performance category as are defined for the VM. For more details on the previously adopted payment standardization methodology, see 77 FR 69316 through 69317. For more details on the previously adopted risk adjustment methodology, see 77 FR 69317 through 69318.

We did not propose to include the four condition-specific total per capita cost measures (chronic obstructive pulmonary disease, congestive heart failure, coronary artery disease, and diabetes mellitus). Instead, we generally proposed to assess performance in part using the episode-based measures (81 FR 28200). This shift is in response to feedback received as part of the MIPS and APMs RFI (80 FR 59102 through 59113). In the MIPS and APMs RFI, commenters stated that they do not believe the existing condition-specific total per capita cost measures under the VM are relevant to their practice and expressed support for episode-based measures under MIPS.

The following is summary of the comments we received regarding our proposal to include the total per capita cost measure and MSPB measure as cost measures.

Comment: Several commenters supported the inclusion of the total per capita cost measure.

Response: We will include the total per capita cost measure in the CY 2017 performance period.

Comment: Several commenters opposed the inclusion of the total per capita cost measure because it was developed to measure hospitals.

Response: We believe that the commenters may have confused the total per capita cost measure with the MSPB measure, which was originally developed for use in the Hospital Value

Based Purchasing program and is triggered on the basis of an index admission. The total per capita cost measure was not developed for nor ever used to measure quality or cost by a hospital in a Medicare program. Many patients who are attributed under the total per capita cost measure are not admitted to a hospital in a calendar year. The total per capita cost measure has been a part of the VM program since inception.

Comment: A commenter opposed the inclusion of the total per capita cost measure because it focused on primary care.

Response: The MIPS program aims to measure the cost of all clinicians, both primary care and specialists. While the total per capita cost measure may be more likely to be attributed to clinicians that provide primary care and uses a primary care attribution method, other measures may be more likely to be attributed to specialists. Including a diversity of measures allows the program to measure all types of clinicians.

Comment: A commenter opposed the inclusion of the total per capita cost measure and instead urged CMS to speed development of episode-based measures.

Response: We plan to incorporate episode-based measures within the cost performance category of the MIPS program. We proposed to include 41 episode-based measures for the CY 2017 performance period (81 FR 28200) and plan to continue to develop more episode groups. However, we believe there is value to continue to include the total per capita cost measure as well. Not all patients will necessarily be attributed in episode-based measures and the total per capita cost measure is the best current measure of all patients.

Comment: A commenter supported the CMS decision not to propose for the cost performance category the four condition-specific total per capita cost measures that are used in the Value Modifier because they are duplicative of the total per capita cost measure covering all patients. Several commenters recommended that the four condition-specific total per capita cost measures be used in the cost performance category.

Response: We intend to use episode-based measures for specific disease focus areas in future years. We believe that the design of episode-based measures which incorporate clinical input and distinguish related from unrelated services will better allow clinicians to improve performance on a particular population of patients. We will not include the four condition-

specific total per capita cost measures in MIPS.

Comment: Several commenters opposed the inclusion of a specialty adjustment within the total per capita cost measure because this adjustment would reward specialties that provide more expensive treatments.

Response: The specialty adjustment for the total per capita cost measure has been used since the 2016 VM, which was based on 2014 data. We reviewed the different expected costs associated with various specialties as part of the CY 2014 PFS rulemaking and found substantial differences in average costs for attributed patients. For example, specialties such as medical oncology tend to treat relatively costly beneficiaries and bill for expensive Part B drugs but other specialties such as dermatology tend to treat low cost patients. Although cost data are adjusted to account for differences in patient characteristics, the effects of this adjustment do not fully account for the differences in costs associated with different specialties under this measure; therefore, we believe this adjustment is still warranted in MIPS. We are open to ways to improve the risk adjustment of this measure in the future to ensure that it appropriately evaluates all specialties of medicine.

Comment: Several commenters supported the inclusion of a specialty adjustment within the total per capita cost measure because patients who become sick often seek more care from specialists and their expected costs would not be reflected within the risk adjustment methodology.

Response: We believe the specialty adjustment is a necessary element of the total per capita cost measure. The MSPB and episode-based measures are designed with expected costs based in part on the clinical condition or procedure that triggers an episode. However, the total per capita cost measure is risk adjusted only on the basis of clinical conditions before the performance period. This risk adjustment cannot completely accommodate changes in source of care that are the result of new onset illness during the performance period. The specialty adjustment helps to accommodate for the differences in the types of patients seen by different specialists.

Comment: A commenter recommended that costs associated with a hospital visit should not be included in the total per capita cost measure because multiple physicians are often involved.

Response: We do not believe that excluding hospital services from the

total per capita cost measure would be consistent with an overall focus on care coordination that may extend to periods when a patient is hospitalized.

Comment: Several commenters supported the inclusion of the MSPB Measure.

Response: We believe that this measure is both familiar to clinicians from use in the VM and QRUR and reflects a period of care in which a clinician may be able to influence cost. We will finalize the MSPB measure.

Comment: Several commenters opposed the inclusion of the MSPB measure because it was developed to measure hospitals. Others suggested that it not be included in MIPS until it had been analyzed for use in a clinician program. Several comments opposed the inclusion of the MSPB measure because it focuses on primary care. Other commenters suggested the episode-based measures better measured specialists.

Response: While this measure was originally used as part of the Hospital Value-Based Purchasing program, the MSPB measure has also been used in the VM, a clinician program, since 2016 and we continue to believe that the clinician who provides a significant number of services during a hospital visit also has some responsibility for overall cost. We also see value in using common measures to create parallel incentives for hospitals and MIPS eligible clinicians to coordinate care and achieve efficiencies. We believe that the MSPB measure will be attributed to all clinicians who provide significant care in the hospital, including specialists and primary care clinicians to the extent which they admit patients to the hospital. If a clinician does not provide hospital services, that clinician will not be attributed any cases to be scored on the measure.

Comment: Several commenters expressed concern that cost measures could attribute patients for services before they are seen by the clinician to whom they are attributed. For example, a clinician could take over responsibility for primary care of a patient who had experienced health difficulties in the earlier part of the year that resulted in emergency room visits and hospital admissions that were partly due to the result of a lack of care coordination. This patient may not have had more than one visit with a particular clinician before this new clinician took over, resulting in all costs being attributed to the individual once he or she billed for two office visits for that patient.

Response: Our attribution methods aim to measure the influence of a

clinician on the cost of care of his or her patients. In some cases, certain elements within the cost measure may not be directly related to the performance of the attributed clinician. We aim to address this by requiring a minimum case volume and risk adjusting so that clinicians are compared on the basis of similar patient populations. We will continue to work with stakeholders to improve cost measures.

Comment: Several commenters noted that the same costs could be included in the total per capita cost measure, the MSPB measure, and the episode-based measures and suggested that costs should only be counted once for an individual physician.

Response: We believe that attempting to remove costs from one measure because they are reflected in another measure would make it much harder for clinicians to understand their overall performance on measures within the cost performance category. Measures are constructed to capture various components of care. In some cases, a clinician or group may provide primary care or episodic care for the same patient and we believe that costs should be considered in all relevant measures to make the measure performance comparable between MIPS eligible clinicians.

Comment: One commenter recommended that CMS use a total cost of care measure developed using a different methodology that is not limited to Medicare and instead captures data from all payer claims databases.

Response: We are unaware of a national data source that would allow us to accurately capture cost data for payers. Therefore, we are limited to using Medicare cost data for the total per capita cost measure. Following our consideration of the comments, we will finalize our proposal to include the total per capita cost measure and the MSPB measure within the MIPS cost performance category for the CY 2017 performance period. We believe these measures have the advantage of having been used within the VM and covering a broad population of patients.

(i) Attribution

In the VM, all cost measures are attributed to a TIN. In MIPS, however, we proposed to evaluate performance at the individual and group levels. Please refer to section II.E.5.e.(3)(c) of this rule for our discussion to address attribution differences for individuals and groups. For purposes of this section, we will use the general term MIPS eligible clinicians to indicate attribution for individuals or groups.

For the MSPB measure, we proposed to use attribution logic that is similar to what is used in the VM. MIPS eligible clinicians with the plurality of claims (as measured by allowed charges) for Medicare Part B services, rendered during an inpatient hospitalization that is an index admission for the MSPB measure during the applicable performance period would be assigned the episode. The only difference from the VM attribution methodology would be that the MSPB measure would be assigned differently for individuals than for groups. For the total per capita cost measure, we proposed to use a two-step attribution methodology that is similar to the methodology used in the 2017 and 2018 VM. We also proposed to have the same two-step attribution process for the claims-based population measures in the quality performance category (81 FR 28192), CMS Web Interface measures, and CAHPS for MIPS. However, we also proposed to make some modifications to the primary care services definition that is used in the attribution methodology to align with policies adopted under the Shared Savings Program.

The VM currently defines primary care services as the set of services identified by the following Healthcare Common Procedure Coding System (HCPCS)/CPT codes: 99201 through 99215, 99304 through 99340, 99341 through 99350, the welcome to Medicare visit (G0402), and the annual wellness visits (G0438 and G0439). We proposed to update this set to include new care coordination codes that have been implemented in the PFS: Transitional care management (TCM) codes (CPT codes 99495 and 99496) and the chronic care management (CCM) code (CPT code 99490). These services were added to the primary care service definition used by the Shared Saving Program in June 2015 (80 FR 32746 through 32748). We believe that these care coordination codes would also be appropriate for assigning services in the MIPS.

In the CY 2016 PFS final rule, the Shared Saving Program also finalized another modification to the primary care service definition: To exclude nursing visits that occur in a skilled nursing facility (SNF) (80 FR 71271 through 71272). Patients in SNFs (place of service (POS) 31) are generally shorter stay patients who are receiving continued acute medical care and rehabilitative services. While their care may be coordinated during their time in the SNF, they are then transitioned back to the community. Patients in a SNF (POS 31) require more frequent practitioner visits—often from 1 to 3

times a week. In contrast, patients in nursing facilities (NFs) (POS 32) are almost always permanent residents and generally receive their primary care services in the facility for the duration of their life. Patients in the NF (POS 32) are usually seen every 30 to 60 days unless medical necessity dictates otherwise. We believe that it would be appropriate to follow a similar policy in MIPS; therefore, we proposed to exclude services billed under CPT codes 99304 through 99318 when the claim includes the POS 31 modifier from the definition of primary care services.

We believe that making these two modifications would help align the primary care service definition between MIPS and Shared Savings Program and would improve the results from the two-step attribution process.

We note, however, that while we are aligning the definition for primary care services, the two-step attribution for MIPS would be different from the one used for the Shared Saving Program. We believe there are valid reasons to have differences between MIPS and the Shared Savings Program attribution. For example, as discussed in CY 2015 PFS final rule (79 FR 67960 through 67962), we eliminated the primary care service pre-step that is statutorily required for the Shared Savings Program from the VM. We noted that without the pre-step, the beneficiary attribution method would more appropriately reflect the multiple ways in which primary care services are provided, which are not limited to physician groups. As MIPS eligible clinicians include more than physicians, we continue to believe it is appropriate to exclude the pre-step.

In addition, in the 2015 Shared Savings Program final rule, we finalized a policy for the Shared Savings Program that we did not extend to the VM two-step attribution: To exclude select specialties (such as several surgical specialties) from the second attribution step (80 FR 32749 through 32754). We do not believe it is appropriate to restrict specialties from the second attribution step for MIPS. If such a policy were adopted under MIPS, then all specialists on the exclusion list, unless they were part of a multispecialty group, would automatically be excluded from measurement on the total per capita cost measure, as well as on claims-based population measures which rely on the same two-step attribution. While we do not believe that many MIPS eligible clinicians or groups with these specialties would be attributed enough cases to meet or exceed the case minimum, we believe that an automatic exclusion could remove some MIPS eligible clinicians

and groups that should be measured for cost.

We requested comments on these proposed changes.

The following is a summary of the comments we received regarding our proposal to use the attribution methods from the VM for the MSPB and total per capita cost measure with changes to the definition of primary care services.

Comment: Some commenters recommended that attribution be based in part on a patient attestation of their relationship with a clinician.

Response: We do not currently have a method for patients to attest to their relationship with a clinician so are unable to incorporate this mechanism into cost measures at this time. We will continue to work on improving attribution.

Comment: Several commenters opposed the attribution method used in the MSPB of assigning patients to all physicians who provided at least 30 percent of inpatient care, indicating that the attribution method had not been fully tested.

Response: The MSPB measure attributes patients to the clinician that provided the plurality of Medicare Part B charges during the index admission, not to all clinicians who provide at least 30 percent of inpatient care. We believe that this method is the best way to identify the single clinician who most influenced the care during a given hospital admission.

Comment: A commenter supported the exclusion of skilled nursing facility codes from the list of codes used to attribute the total per capita cost measure because patients in skilled nursing facilities require high intensity time-limited care.

Response: We are finalizing the exclusion of skilled nursing facility codes as proposed.

Comment: Several commenters expressed concern that incident-to billing practices, in which physicians bill for services provided by other clinicians such as nurse practitioners or physician assistants, obscure the actual clinician providing care and make attribution difficult. A commenter suggested that a new modifier be created to indicate when a service was provided under incident-to rules.

Response: “Incident to” billing is allowed, consistent with § 410.26 of our regulations, when auxiliary personnel provide services that are an integral, though incidental, part of the service of a clinician, and are commonly furnished without charge or included in the bill of a clinician. “Incident to” services are furnished under the supervision of the billing clinician, and with certain

narrow exceptions, under direct supervision. These services are billed and paid under the PFS as if the billing clinician personally furnished the service. We recognize that some services of certain MIPS eligible clinicians may be billed as incident to the services of others. However, given that the billing clinician provides the requisite supervision and bills for the service as if it was personally furnished, we do not believe “incident to” billing interferes with appropriate attribution of services. If this is a concern for certain MIPS eligible clinicians, we believe billing practices could be adjusted such that services are billed by the individual MIPS eligible clinician who provides the service.

Comment: A commenter expressed concern that attributing care to a single professional or group for costs could cause compartmentalization of care.

Response: The cost measures that are used in MIPS aim to measure how a particular clinician or group impacts a patient’s cost, both directly or indirectly. We have aimed to design a program that encourages more consideration of the costs of care associated with patients even after other clinicians become involved, so the measures require that clinicians who are most significantly responsible for their care, as measured by Medicare allowed amounts, assume accountability for it. We believe this system will encourage more coordination of care and consideration of cost.

Comment: A commenter opposed the inclusion of transition care management within the list of codes used to attribute the total per capita cost measure, noting that these codes are often used by specialists that may not have overall responsibility for care.

Response: We believe that those clinicians who are billing for transitional care management are providing significant services that reflect oversight for a patient. In some cases, the clinician providing transitional care management is different from the one providing primary care but in other cases it is the same individual. We believe that our attribution method of assigning patients to the clinician who provides the plurality of primary care services (which includes many services other than transitional care management) is the best method to attribute the total per capita cost measure. This change is consistent with the attribution methods that are used in the Shared Savings Program.

After considering comments, we are finalizing our proposal to use modified attribution methods from the VM for the

total per capita cost measure and the MSPB. Specifically, we are also finalizing the removal of skilled nursing facility codes (CPT codes 99304–99318) from and addition of transitional care management (CPT codes 99495–99496) and chronic care management codes (CPT code 99490) to the list of primary care services used to attribute the total per capita cost measure. We believe that the changes to the attribution methodology allow us to better identify the clinician or group and the extent of accountability for total per capita cost.

(ii) Reliability

We seek to ensure that MIPS eligible clinicians and groups are measured reliably; therefore, we intend to use the 0.4 reliability threshold currently applied to measures under the VM to evaluate their reliability. A 0.4 reliability threshold standard means that the majority of MIPS eligible clinicians and groups who meet the case minimum required for scoring under a measure have measure reliability scores that exceed 0.4. We generally consider reliability levels between 0.4 and 0.7 to indicate “moderate” reliability and levels above 0.7 to indicate “high” reliability. In cases where we have considered high participation in the applicable program to be an important programmatic objective, such as the Hospital VBP Program, we have selected this 0.4 moderate reliability standard. We believe this standard ensures moderate reliability, but does not substantially limit participation.

To ensure sufficient measure reliability for the cost performance category in MIPS, we also proposed at § 414.1380(b)(2)(ii) to use the minimum of 20 cases for the total per capita cost measure (81 FR 28386), the same case minimum that is being used for the VM. An analysis in the CY 2016 PFS final rule (80 FR 71282) confirms that this measure has high average reliability for solo practitioners (0.74) as well as for groups with more than 10 professionals (0.80).

In the CY 2016 PFS final rule, we finalized a policy that increases the minimum cases for the MSPB measure from 20 to 125 cases (80 FR 71295 through 71296) due to reliability concerns with the measure including the specialty adjustment. That said, we recognize that a case size increase of this nature also may limit the ability of MIPS eligible clinicians to be scored on the MSPB measure, and have been evaluating alternative measure calculation strategies for potential inclusion under MIPS that better balance participation, accuracy, and reliability. As a result of this, we

proposed two modifications to the MSPB measure.

The first technical change we proposed was to remove the specialty adjustment from the MSPB measure's calculation. As currently reported on the QRURs, the MSPB measure is risk adjusted to ensure that these comparisons account for case-mix differences between practitioners' patient populations and the national average. It is unclear that the current additional adjustment for physician specialty improves the accounting for case-mix differences for acute care patients, and thus, may not be needed, and as our analysis below indicated, reliability for the measure improves when then adjustment is removed.

The second technical change we proposed was to modify the cost ratio used within the MSPB equation to evaluate the difference between observed and expected episode cost at the episode level before comparing the two at the individual or group level. In other words, rather than summing all of the observed costs and dividing by the sum of all the expected costs, we would take the observed to expected cost ratio for each MSPB episode assigned to the MIPS eligible clinician or group and take the average of the assigned ratios. As we did previously, we would take the average ratio for the MIPS eligible clinician or group and multiply it by the average of observed costs across all episodes nationally, in order to convert a ratio to a dollar amount.

Our analysis, which is based on all Medicare Part A and B claims data for beneficiaries discharged from an acute inpatient hospital between January 1, 2013 and December 1, 2013, indicates that these two changes would improve the MSPB measure's ability to calculate costs and the accuracy with which it can be used to make clinician-level performance comparisons. We also believe that these changes would help ensure the MSPB measure can be applied to a greater number of MIPS eligible clinicians while still maintaining its status as a reliable measure. More specifically, our analysis indicated that after making these

changes to the MSPB measure's calculations, the MSPB measure meets the desired 0.4 reliability threshold used in the VM for over 88 percent of all TINs with a 20-case minimum, including solo practitioners. While this percentage is lower than our current policy for the VM (where virtually all TINs with 125 or more episodes have moderate reliability), setting the case minimum at 20 allows for an increase in participation in the MSPB measure. Therefore, we proposed to use a minimum of 20 cases for the MSPB measure (81 FR 28386). As noted previously, we consider expanded participation of MIPS eligible clinicians, particularly individual reporters, to be of great import for the purposes of transitioning to MIPS and believe that this justifies a slight decrease of the percentage of TINs meeting the reliability threshold.

We welcomed public comment on these proposals.

The following is summary of the comments we received regarding our proposals to use a 0.4 reliability threshold and a minimum of 20 cases for the total per capita cost measure.

Comment: Many commenters expressed concern with the proposed 0.4 reliability threshold for cost measures. Many commenters suggested that only measures with high reliability (over 0.7 or 0.8) be used within the program.

Response: We believe that measures with a reliability of 0.4 with a minimum attributed case size of 20 meet the standards for being included as cost measures within the MIPS program. We aim to measure cost for as many clinicians as possible and limiting measures to reliability of 0.7 or 0.8 would result in few individual clinicians with attributed cost measures. In addition, a 0.4 reliability threshold ensures moderate reliability for most MIPS eligible clinicians or group practices that are being measured on cost.

We will finalize our reliability threshold of 0.4 but will continue to work to develop measures and improve specifications to ensure the highest level of reliability feasible within the cost

measures in the MIPS program. We did not receive any specific comments on the our proposal to use a minimum of 20 cases for the total per capita cost measure. We are finalizing at § 414.1380(b)(2)(ii) that a MIPS eligible clinician must meet the minimum case volume specified by CMS to be scored on a cost measure. Therefore, a MIPS eligible clinician must have a minimum of 20 cases to be scored on the total per capita cost measure.

The following is a summary of the comments we received regarding our proposal to modify the case minimum for the MSPB, the proposal to remove the specialty adjustment from the MSPB measure's calculation, and the proposal to modify the cost ratio used within the MSPB equation.

Comment: Several comments opposed the 20 case minimum for MSPB, noting that CMS had previously increased the minimum to 125 within the VM program and that the 20 case minimum did not meet our standard of 0.4 reliability threshold.

Response: We understand the concerns of the commenters. We would like to reiterate that the proposed adjustments to the MSPB measure improve its reliability at 20 cases. As stated in the proposed rule, these changes result in the measure meeting 0.4 reliability for over 88 percent of TINs with at least 20 attributed cases, including solo practitioners. In MIPS, however, we must assess reliability at the individual clinician level as well as the TIN level because clinicians may choose to be assessed as individuals or part of a group in the MIPS program. Therefore, we reran the reliability analysis for the proposed MSPB using 2015 data to assess the impact at the TIN/NPI level. Table 6 summarizes the results for different case volumes. This analysis indicates only 77 percent of individual TIN/NPIs have 0.4 reliability at a 20 case volume. Therefore, we will increase the minimum case volume to 35 cases which has a 0.4 reliability threshold for 90 percent of individual TIN/NPIs and 97 percent of TINs that are attributed.

TABLE 6—PROPOSED MSPB RELIABILITY WITH TIN/NPI ATTRIBUTION

Reliability of revised MSPB measure using TIN/NPI attribution	Minimum 20 cases (%)	Minimum 30 cases (%)	Minimum 35 cases (%)
Percent of TIN/NPIs with 0.4 reliability at different minimum case volume requirements	77	86	90
Percent of TINs with 0.4 reliability at different minimum case volume requirements	90	95	97

Comment: Several comments supported the removal of specialty adjustment from the MSPB measure, noting that in some cases certain specialties may have higher spending that is not appropriate based on the condition of the patient. Several other commenters opposed the removal of the specialty adjustment from the MSPB measure because it would disadvantage those specialists who care for the sickest patients and not recognize the differences in the types of patients seen by different specialties. Some commenters opposed the change in the calculation of observed to expected ratio at the episode level rather than the clinician or group level.

Response: The MSPB measure includes not only risk adjustment to capture the clinical conditions of the patients in the period prior to the index admission, but also includes risk adjustment that reflects the clinical presentation based on the index MS-DRG. We believe that including the index MS-DRG helps to identify a pool of patients either receiving a procedure or admitted for a particular medical condition and the HCC risk adjustment helps to adjust for comorbidities which may suggest that a clinician is treating patients who are sicker than most within that pool. Since there is less variation in the specialties caring for a particular type of MS-DRG, adding specialty adjustment reduces reliability. We will continue to analyze all cost measures to ensure they include the proper risk adjustment and meet our reliability threshold.

We are finalizing at § 414.1380(b)(2)(ii) that a MIPS eligible clinician must meet the minimum case volume specified by CMS to be scored on a cost measure. Following our consideration of the comments, we are not finalizing our proposal of a minimum case volume of 20 for the MSPB measure. Instead, we are finalizing a minimum case volume of 35 for the MSPB. We are also adopting our proposals to not adjust the MSPB measure by specialty and to calculate observed to expected ratio at an episode level. We will continue to analyze the measure to ensure reliability.

(b) Episode-Based Measures Proposed for the MIPS Cost Performance Category

As noted in the previous section, we proposed to calculate several episode-based measures for inclusion in the cost performance category. Groups have received feedback on their performance on episode-based measures through the Supplemental Quality and Resource Use Report (sQRUR), which are issued as part of the Physician Feedback Program

under section 1848(n) of the Act; however, these measures have not been used for payment adjustments through the VM. Several stakeholders expressed in the MIPS and APMs RFI the desire to transition to episode-based measures and away from the general total per capita cost measures used in the VM. Therefore, in lieu of using the total per capita cost measures for populations with specific conditions that are used for the VM, we proposed episode-based measures for a variety of conditions and procedures that are high cost, have high variability in resource use, or are for high impact conditions. In addition, as these measures are payment standardized and risk adjusted, we believe they meet the statutory requirements for appropriate measures of cost as defined in section 1848(p)(3) of the Act because the methodology eliminates the effects of geographic adjustments in payment rates and takes into account risk factors.

We also reiterated that while we transition to using episode-based measures for payment adjustments, we will continue to engage stakeholders through the process specified in section 1848(r)(2) of the Act to refine and improve the episodes moving forward.

As noted earlier, we have provided performance information on episode-based measures to MIPS eligible clinicians through the sQRURs, which are released in the fall. The sQRURs provide groups and solo practitioners with information to evaluate their resource utilization on conditions and procedures that are costly and prevalent in the Medicare FFS population. To accomplish this goal, various episodes are defined and attributed to one or more groups or solo practitioners most responsible for the patient's care. The episode-based measures include Medicare Part A and Part B payments for services determined to be related to the triggering condition or procedure. The payments included are standardized to remove the effect of differences in geographic adjustments in payment rates and incentive payment programs and they are risk adjusted for the clinical condition of beneficiaries. Although the sQRURs provide detailed information on these care episodes, the calculations are not used to determine a TIN's VM payment adjustment and are only used to provide feedback.

We proposed to include in the cost performance category several clinical condition and treatment episode-based measures that have been reported in the sQRUR or were included in the list of the episode groups developed under section 1848(n)(9)(A) of the Act published on the CMS Web site: [https://](https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/MACRA-MIPS-and-APMs.html)

www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/MACRA-MIPS-and-APMs.html. The identified episode-based measures have been tested and previously published. Tables 4 (81 FR 28202–28206) and 5 (81 FR 28207) of the proposed rule listed the 41 clinical condition and treatment episode-based measures proposed for the CY 2017 performance period, as well as whether the episodes have previously been reported in a sQRUR.

While we proposed the measures listed in Tables 4 and 5 of the proposed rule for the cost performance category, we stated in the proposed rule that we were uncertain as to how many of these measures we would ultimately include in the final rule with comment period. As these measures have never been used for payment purposes, we indicated that we may choose to specify a subset of these measures in the final rule with comment period. We requested public comment on which of the measures listed in Tables 4 and 5 of the proposed rule to include in the final rule with comment period. In addition to considering public comments, we intended to consider the number of MIPS eligible clinicians able to be measured, the episode's impact on Medicare Part A and Part B spending, and whether the measure has been reported through sQRUR. In addition, while we do not believe specialty adjustment is necessary for the episode-based measures, we will continue to explore this further given the diversity of episodes. We solicited comment on whether we should specialty adjust the episode-based measures.

The following is summary of the comments we received regarding the episode-based measures proposed for the cost performance category for the CY 2017 performance period.

Comment: Several comments supported the inclusion of episode-based measures because they more closely tracked a clinician's influence on the care provided than total per-capita cost measures.

Response: Episode-based measures are an important component of the overall measurement of cost and we are finalizing a subset of episode-based measures.

Comment: Several commenters supported the eventual inclusion of episode-based measures in the cost performance category but opposed the inclusion of these measures in the transition year of MIPS because clinicians are not familiar with them yet and have not had the opportunity to receive feedback on them. Commenters

recommended a more transparent process in the development of episode groups. Others recommended that only those measures included in the sQRUR in previous years be included in the transition year of the MIPS program.

Response: We agree with the commenters. Even though we have reduced the weight of the cost performance category to 0 percent for the first MIPS payment year, we believe that clinicians would benefit from more exposure to these episode-based measures and how they might be scored before they are included in the MIPS final score. While 14 of the episode-based measures we proposed were included in the 2014 sQRUR, a number of them have never been included in the VM or a sQRUR. Therefore, as discussed below, we are finalizing a subset of the proposed episode-based measures, which have been included in the sQRUR for 2014 and meet our reliability threshold of 0.4. We note that we selected episodes from the 2014 sQRUR because these measures have been included in 2 years of sQRUR (2014 and 2015) which provides clinicians an opportunity for initial feedback before the MIPS performance period begins although the feedback does not contain any scoring information, nor does it contain the updated attribution changes.

In addition, we intend to provide performance feedback to clinicians on additional episode-based measures that we are not finalizing for inclusion in the MIPS cost performance category for the CY 2017 performance period but may want to consider proposing for inclusion in the MIPS cost performance category in the future. Section 1848(q)(12)(A)(i) of the Act requires that we provide timely confidential feedback to MIPS eligible clinicians on their performance under the cost performance category. While the feedback on these additional episode-based measures would be for informational purposes only, we believe it will aid in MIPS eligible clinicians' ability to understand the measures and the attribution rules and methods that we use to calculate performance on these measures, which may be helpful in the event that we decide to propose the measures for the MIPS cost performance category in future rulemaking.

Comment: Some commenters suggested that 41 episode-based measures was too many and that a smaller number should be used in the program. Another commenter suggested that CMS establish a maximum number of episode-based measures that may be attributed to a particular clinician or group.

Response: We believe that a large number of episode-based measures is needed to capture the diversity of clinicians in the MIPS program, as many clinicians may only have a small number of attributable episodes. While some large multispecialty groups may have a large number of episodes attributed, we believe this reflects the diversity of care that they are providing to patients. However, for the CY 2017 performance period, we are finalizing a reduced set of measures which are reliable at the group (TIN) and individual (TIN/NPI) level and where feedback has been previously presented to eligible clinicians or groups.

As discussed in the preceding response, we also intend to provide performance feedback to MIPS eligible clinicians under section 1848(q)(12)(A)(i) of the Act on additional episode-based measures for informational purposes only.

Comment: A commenter suggested that CMS provide technical assistance to specialty societies and other organizations in order to develop episode groups for specialty care.

Response: Episode development under section 1848(r) of the Act will continue. This process includes extensive communication with technical experts in the field and stakeholders but does not provide for technical assistance to organizations.

Comment: A commenter opposes the use of episode-based measures for upper respiratory infection (measure 33) and deep vein thrombosis of extremity (measure 34) because they are likely to occur in high risk patients.

Response: For the CY 2017 performance period, we are only finalizing episode-based measures which have been previously reported in the 2014 supplemental QRUR and meet our reliability thresholds. Upper respiratory infection and deep vein thrombosis of extremity were not included in the 2014 sQRUR, therefore we are not finalizing these measures for the MIPS CY 2017 performance period. We intend to develop episode-based measures that cover patients with various levels of risk. We believe that the advantage of episode-based measures is defining a certain patient population that will be similar even if everyone is high risk. In addition, episode-based measures are risk adjusted in the same fashion as the other cost measures that were proposed to be included within the program.

Comment: Several commenters suggested development of future episode-based measures because many clinicians do not have episode-based measures for patients they treat.

Response: We intend to continue to develop episode-based measures that cover more procedures and conditions and invite stakeholder feedback on additional conditions or procedures.

Comment: A commenter expressed concern that ICD-9-CM codes are insufficient to be used within episode-based measures because they do not contain enough clinical data to predict costs. Others suggested that the measures should be updated to use ICD-10-CM codes.

Response: ICD-9-CM was used for diagnosis coding for Medicare claims until October 1, 2015. Because ICD-9-CM codes were required for billing for all services, we believe they are the richest source of clinical data available to allow us to specify and risk adjust episode-based measures. The transition from ICD-9-CM to ICD-10-CM took place on October 1, 2015. There are many more diagnosis codes available in ICD-10-CM than in ICD-9-CM which reflect increased specificity in some clinical areas. In preparation for the transition to ICD-10-CM, a crosswalk of diagnosis codes from ICD-9-CM to ICD-10-CM was created and this was used for the transition of coverage policies and other documents that include diagnosis codes. We expect to use this crosswalk as a baseline for our transition work but understand that there may be changes that need to be made to accommodate the different use of diagnostic codes with ICD-10-CM.

Comment: Commenter suggests CMS consider episode-based measures for chronic conditions that do not have an inpatient trigger, so that costs for chronic conditions can be assessed under the cost performance category even if an inpatient stay does not occur.

Response: We will continue to work to develop episode-based measures and our work is not limited to those conditions that include an inpatient stay.

Comment: Commenter stated that there is difficulty in attributing an episode-based measure to a clinician providing a diagnostic service.

Response: One feature of episode-based measures is that they allow for the creation of a list of related services for a particular condition or procedure. This means that episode-based measures could be triggered on the basis of a diagnostic service if experts could develop a list of services that are typically related. Among our ten finalized episode-based measures is one triggered on the basis of colonoscopy, which is a diagnostic service.

Comment: A commenter indicated that future development of episode-based measures should not be limited to

Methods A and B as described in the rule.

Response: We generally believe that a consistent approach to cost measure development is easier to understand and fair to all clinicians. However, we recognize that cost measure development is ongoing and will continue to investigate methods to best capture the contributions of individual clinicians and groups to cost and will consider other methods if they are necessary.

Comment: Several commenters expressed concern with particular elements of the technical specifications of certain episode-based measures. One commenter requested that pneumatic compression devices be added as a relevant service to the VTE episode-based measure, that patient-activated event recorders be removed from the list of relevant services from the heart failure (chronic) episode-based measure, that AV node ablation be removed from the list of relevant services from Atrial Fibrillation/Flutter Chronic episode-based measure along with other recommendations.

Response: As we mentioned, we want to use episode-based measures that meet our reliability threshold and for which we have provided feedback through the 2014 sQRUR. We invite continued feedback on the episode-based measures as they are created and refined through the process outlined in section 1848(r) of the Act. However, we are not modifying the specifications for any of the episodes that we are finalizing in this rule.

Comment: A commenter recommended that the osteoporosis and rheumatoid arthritis episode-based measures should not be included in cost measurement in the transition year because the episode-based measures have not been thoroughly vetted.

Response: Although all episode-based measures were created with clinical

input, the measures identified by the commenters were not included in the 2014 sQRUR, so individual clinicians may be unfamiliar with them before the MIPS performance period. Therefore, we are not finalizing these episode-based measures for the CY 2017 performance period.

Comment: A commenter expressed concern with the use of HCC scores to risk adjust episode-based measures because HCC scores have been shown to under-predict costs for high cost patients or for patients in rural areas.

Response: We are unaware of other risk adjustment methodologies that are more appropriate than HCC for Medicare beneficiaries. We will continue to conduct analyses to ensure that risk adjustment is as precise as possible to ensure that clinicians are not inappropriately disadvantaged because of the use of this risk adjustment methodology.

Comment: A commenter supported the use of procedure codes to trigger the episode-based measure for cataract surgery as opposed to the licensure status of the physician. Another commenter expressed concern with the episode-based measure for cataract surgery because it did not reflect previous discussions with CMS regarding this episode-based measure.

Response: We will continue to work to improve the specifications of the episode-based measures. We are finalizing the episode-based measure for Lens and Cataract Procedures because it meets our reliability threshold and was included in the 2014 sQRUR. We offered stakeholders the opportunity to review measure specifications for all of the episode-based measures under development in a posting in February 2016 and invite continued feedback on the specifications going forward.

Comment: A commenter recommended that CMS provide more guidance on the implications of billing

for a trigger code for the lens and cataract episode-based measure and including a modifier for preoperative management only (modifier 56) or postoperative management only (modifier 55).

Response: Clinicians who bill for services with modifiers that indicate that they did not actually perform the index procedure will not be attributed for the costs associated with that episode.

We appreciate the enthusiasm expressed by many commenters for the development of episode-based measures and their more nuanced focus on particular types of care. We also understand the concerns expressed regarding lack of familiarity with the episode-based measures. For this reason, we are modifying our proposal and finalizing for the CY 2017 performance period only 10 episode-based measures from the proposed rule. All of these measures were included in the 2014 sQRUR and meet the reliability threshold of 0.4 for the majority of clinicians and groups at a case minimum of 20. Table 7 includes the episode-based measures that are finalized for the CY 2017 performance period and includes their reliability, which we calculated using data from the 2015 sQRUR when the measure is attributed at the TIN level, as in the VM, and when attributed at the TIN/NPI level, as we will do under the MIPS program. The measures listed in Table 7 will be used (along with the total per capita cost measure and the MSPB measure finalized in this rule) to determine the cost performance category score. As we noted earlier, the weight of the cost category is 0 percent for 2019 MIPS payment year, therefore the performance category score will provide information to MIPS eligible clinicians, but performance will not affect the final score for the 2019 MIPS payment year.

TABLE 7—EPISODE-BASED MEASURES FINALIZED FOR THE CY 2017 PERFORMANCE PERIOD

Method type/ measure number from Table 4 (Method A) and Table 5 (Method B) from proposed rule *	Episode name and description	Included in 2014 sQRUR	% TINs meeting 0.4 reliability threshold	% TIN/NPIs meeting 0.4 reliability threshold
A/1	Mastectomy (formerly titled “Mastectomy for Breast Cancer”)—Mastectomy is triggered by a patient’s claim with any of the interventions assigned as Mastectomy trigger codes. Mastectomy can triggered by either an ICD procedure code, or CPT codes in any setting (e.g. hospital, surgical center).	Yes	99.6	100.0
A/5	Aortic/Mitral Valve Surgery—Open heart valve surgery (Valve) episode is triggered by a patient claim with any of Valve trigger codes.	Yes	93.9	92.0

TABLE 7—EPISODE-BASED MEASURES FINALIZED FOR THE CY 2017 PERFORMANCE PERIOD—Continued

Method type/ measure number from Table 4 (Method A) and Table 5 (Method B) from proposed rule*	Episode name and description	Included in 2014 sQRUR	% TINs meeting 0.4 reliability threshold	% TIN/NPIs meeting 0.4 reliability threshold
A/8	Coronary Artery Bypass Graft (CABG)—Coronary Artery Bypass Grafting (CABG) episode is triggered by an inpatient hospital claim with any of CABG trigger codes for coronary bypass. CABG generally is limited to facilities with a Cardiac Care Unit (CCU); hence there are no episodes or comparisons in other settings.	Yes	96.9	94.8
A/24	Hip/Femur Fracture or Dislocation Treatment, Inpatient (IP)-Based—Fracture/dislocation of hip/femur (HipFxTx) episode is triggered by a patient claim with any of the interventions assigned as HipFxTx trigger codes. HipFxTx can be triggered by either an ICD procedure code or CPT codes in any setting.	Yes	88.9	76.1
B/1	Cholecystectomy and Common Duct Exploration—Episodes are triggered by the presence of a trigger CPT/HCPCS code on a claim when the code is the highest cost service for a patient on a given day. Medical condition episodes are triggered by IP stays with specified MS—DRGs.	Yes	89.6	81.8
B/2	Colonoscopy and Biopsy—Episodes are triggered by the presence of a trigger CPT/HCPCS code on a claim when the code is the highest cost service for a patient on a given day. Medical condition episodes are triggered by IP stays with specified MS—DRGs.	Yes	100.0	99.9
B/3	Transurethral Resection of the Prostate (TURP) for Benign Prostatic Hyperplasia—For procedural episodes, treatment services are defined as the services attributable to the MIPS eligible clinician or group managing the patient’s care for the episode’s health condition.	Yes	95.2	95.5
B/5	Lens and Cataract Procedures—Procedural episodes are triggered by the presence of a trigger CPT/HCPCS code on a claim when the code is the highest cost service for a patient on a given day.	Yes	99.7	99.5
B/6	Hip Replacement or Repair—Procedural episodes are triggered by the presence of a trigger CPT/HCPCS code on a claim when the code is the highest cost service for a patient on a given day.	Yes	97.8	97.7
B/7	Knee Arthroplasty (Replacement)—Procedural episodes are triggered by the presence of a trigger CPT/HCPCS code on a claim when the code is the highest cost service for a patient on a given day.	Yes	99.9	99.8

* Table 4 of the proposed rule is located on 81 FR 28202–28206; Table 5 of the proposed rule is located at 81 FR 28207.

In addition, for informational purposes, we intend to provide feedback to MIPS eligible clinicians under section 1848(q)(12)(A)(i) of the Act on the additional episode-based measures which may be introduced into MIPS in future years. We believe it will aid in MIPS eligible clinicians’ ability to understand the measures and the attribution rules and methods that we use to calculate performance on these measures, which may be helpful in the event that we decide to propose the measures for the MIPS cost performance category in future rulemaking.

(i) Attribution

For the episode-based measures listed in Tables 4 and 5 of the proposed rule (81 FR 28202), we proposed to use the attribution logic used in the 2014 sQRUR (full description available at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeedbackProgram/Downloads/Detailed-Methods-2014SupplementalQRURs.pdf>), with modifications to adjust for whether performance is being

assessed at an individual or group level. Please refer to 81 FR 28208 of the proposed rule for our proposals to address attribution differences for individuals and groups. For purposes of this section, we will use the general term MIPS eligible clinicians to indicate attribution for individuals or groups.

Acute condition episode-based measures would be attributed to all MIPS eligible clinicians that bill at least 30 percent of inpatient evaluation and management (IP E&M) visits during the initial treatment, or “trigger event,” that opened the episode. E&M visits during the episode’s trigger event represent services directly related to the management of the beneficiary’s acute condition episode. MIPS eligible clinicians that bill at least 30 percent of IP E&M visits are therefore likely to have been responsible for the oversight of care for the beneficiary during the episode. It is possible for more than one MIPS eligible clinician to be attributed a single episode using this rule. If an acute condition episode has no IP E&M claims during the episode, then that

episode is not attributed to any MIPS eligible clinician.

Procedural episodes would be attributed to all MIPS eligible clinicians that bill a Medicare Part B claim with a trigger code during the trigger event of the episode. For inpatient procedural episodes, the trigger event is defined as the IP stay that triggered the episode plus the day before the admission to the IP hospital. For outpatient procedural episodes constructed using Method A, the trigger event is defined as the day of the triggering claim plus the day before and 2 days after the trigger date. For outpatient procedural episodes constructed using Method B, the trigger event is defined as only the day of the triggering claim. Any Medicare Part B claim or line during the trigger event with the episode’s triggering procedure code is used for attribution. If more than one MIPS eligible clinician bills a triggering claim during the trigger event, the episode is attributed to each of the MIPS eligible clinicians. If co-surgeons bill the triggering claim, the episode is attributed to each MIPS eligible

clinician. If only an assistant surgeon bills the triggering claim, the episode is attributed to the assistant surgeon or group. If an episode does not have a concurrent Medicare Part B claim with a trigger code for the episode, then that episode is not attributed to any MIPS eligible clinician.

The following is a summary of the comments we received regarding our attribution methodology for the episode-based measures:

Comment: A commenter suggested that episodes be attributed to the clinician with the highest Part B charges.

Response: The episode-based measures each have different attribution methodologies. We believe that always attributing episodes to the clinician with the highest Part B charges is not necessarily appropriate in all cases, particularly in cases in which a procedure may trigger the beginning of an episode.

Comment: A commenter suggested that until the patient relationship codes are developed, clinicians should be allowed to select the cost measures that apply to them.

Response: We believe that the cost measures that are included in this final rule with comment period are constructed in such a way to ensure that clinicians or groups are measured for cost for the patients for which they provide care. For example, a clinician or group would be required to provide 20 coronary artery bypass grafts to be attributed an episode-based measure for that procedure. We believe that requiring a cardiothoracic surgeon or group to select this cost measure through some kind of administrative mechanism would not add value to the program and could potentially increase administrative burden for the clinician.

Comment: A commenter suggested that CMS employ Method B, which examines episodes independently, rather than Method A, in which cost is assigned to episodes on the basis of hierarchical rules, in developing episode-based measures for podiatrists.

Response: We continue to work on the development of episode groups and are evaluating the use of Method A and Method B within that context for a variety of medical conditions and procedures. Episode-based measures using both methods are included in this final rule with comment period.

Comment: A commenter expressed concern that certain specialties such as hospital-based physicians and palliative care physicians will have a large number of episode-based measures attributed to them.

Response: We believe that the episode-based measures represent a wide variety of procedural and medical episodes. For the transition year, we have limited the number of episode-based measures and reduced the weight of the cost performance category but recognize that some clinicians may have more attributed episode-based measures than others based on the nature of the patients that they treat. However, it is important to note that being attributed additional cost measures does not change the weight of the cost performance category in the final score, which is set at 0 percent for the 2019 MIPS payment year. In addition, having more attributed episode-based measures does not inherently disadvantage a clinician, particularly if the episodes are lower in cost compared to the cost for similar episodes with similarly complex patients. We intend to continue to develop episode-based measures to ensure that all specialties of medicine may be measured on cost in a similar fashion.

Following our consideration of the comments, we will finalize the attribution methodology for episode-based measures as proposed.

(ii) Reliability

To ensure moderate reliability, we proposed at § 414.1380(b)(2)(ii) to use the minimum of 20 cases for all episode-based measures listed in Tables 4 and 5 of the proposed rule (81 FR 28386). We proposed to not include any measures that do not have average moderate reliability (at least 0.4) at 20 episodes.

Comment: Several commenters opposed the inclusion of episode-based measures with a reliability of 0.4 at a 20 minimum case size and recommended that only measures with a 0.7 reliability at a 20 minimum case size be included.

Response: We believe that episode-based measures with a reliability of 0.4 with a minimum attributed case size of 20 meet the standards for being included as cost measures within the MIPS program. We aim to measure cost for as many clinicians as possible and limiting episode-based measures to reliability of 0.7 or 0.8 at a minimum case size of 20 would result in few individual clinicians being attributed enough patients under these measures, particularly since the episode-based measures represent only a subset of patients seen by an individual clinician or group.

Please see section II.E.5.e.(3)(b) for additional discussion of using 0.4 as the reliability threshold. All of the episode-based measures that we are finalizing are reliable at this threshold for 20 cases at both the individual and group level.

We are finalizing at § 414.1380(b)(2)(ii) that a MIPS eligible clinician must meet the minimum case volume specified by CMS to be scored on a cost measure. After considering the comments, we are finalizing our proposal that a MIPS eligible clinician must have a minimum of 20 cases to be scored on an episode-based measure.

(c) Attribution for Individual and Groups

In the VM and sQRUR, all cost measurement was attributed at the solo practitioner and group level, as identified by the TIN. In MIPS, however, we proposed to evaluate performance at the individual and group levels. For MIPS eligible clinicians whose performance is being assessed individually across the other MIPS performance categories, we proposed to attribute cost measures using the TIN/NPI rather than the TIN. Attribution at the TIN/NPI level allows individual MIPS eligible clinicians, as identified by their TIN/NPI, to be measured based on cases that are specific to their practices, rather than being measured on all the cases attributed to the group TIN. For MIPS eligible clinicians that choose to have their performance assessed as a group across the other MIPS performance categories, we proposed to attribute cost measures at the TIN level (the group TIN under which they report). The logic for attribution would be similar whether attributing to the TIN/NPI level or the TIN level. As an alternative proposal, we solicited comment on whether MIPS eligible clinicians that choose to have their performance assessed as a group should first be attributed at the individual TIN/NPI level and then have all cases assigned to the individual TIN/NPIs attributed to the group under which they bill. This alternative would apply one consistent methodology to both groups and individuals, compared to having a methodology that assigns cases using TIN/NPI for assessment at the individual level and another that assigns cases using only TIN for assessment at the group level. For example, the general attribution logic for the MSPB is to assign the MSPB measure based on the plurality of claims (as measured by allowed charges) for Medicare Part B services rendered during an inpatient hospitalization that is an index admission for the MSPB measure. Our proposed approach would determine “plurality of claims” separately for individuals and groups. For individuals, we would assign the MSPB measure using the “plurality of claims” by TIN/NPI, but for groups we would determine the “plurality of

claims” by TIN. The alternative proposal, in contrast, would determine the “plurality of claims” by TIN/NPI for both groups and individuals. However, for individuals, only the MSPB measure attributed to the TIN/NPI would be evaluated, while for groups the MSPB measure attributed to any TIN/NPI billing under the TIN would be evaluated.

We requested comment on this proposal and alternative considered.

Comment: A commenter supported the proposal to attribute cost measures at the TIN level for groups that select to be assessed on other MIPS performance categories as a group.

Response: We believe both attribution methodologies are valid, but as described below, we are finalizing the alternative proposal.

Comment: Several commenters supported the alternative proposal of attributing cost for all clinicians at the TIN/NPI level, regardless of whether they participate in MIPS as a group or as individual clinicians.

Response: We believe having a consistent attribution methodology for individual and group reporting would be beneficial and simpler for clinicians to understand. Therefore, we are finalizing the alternative proposal.

To reduce complexity in the MIPS program, we are finalizing the alternative proposal to attribute cost measures for all clinicians at the TIN/NPI level. For those groups that participate in group reporting in other MIPS performance categories, their cost performance category scores will be determined by aggregating the scores of the individual clinicians within the TIN. For example, if a TIN had one surgeon that billed for 11 codes and another surgeon in that TIN billed for 12 codes that would trigger the knee arthroplasty episode-based measure, neither surgeon would have enough cases to be measured individually. However, if the TIN elects group reporting, the TIN would be assessed on the 23 combined cases.

(d) Application of Measures to Non-Patient Facing MIPS Eligible Clinicians

Section 101(c) of the MACRA added section 1848(q)(2)(C)(iv) to the Act, which requires the Secretary to give consideration to the circumstances of professional types who typically furnish services without patient facing interaction (non-patient facing) when determining the application of measures and activities. In addition, this section allows the Secretary to apply alternative measures or activities to non-patient facing MIPS eligible clinicians that fulfill the goals of a performance

category. Section 101(c) of the MACRA also added section 1848(q)(5)(F) to the Act, which allows the Secretary to re-weight MIPS performance categories if there are not sufficient measures and activities applicable and available to each type of MIPS eligible clinician involved.

For the 2017 MIPS performance period, we did not propose any alternative measures for non-patient facing MIPS eligible clinicians or groups. This means that non-patient facing MIPS eligible clinicians or groups may not be attributed any cost measures that are generally attributed to clinicians who have patient facing encounters with patients. We therefore anticipate that, similar to MIPS eligible clinicians or groups that do not meet the required case minimum for any cost measures, many non-patient facing MIPS eligible clinicians may not have sufficient measures and activities available to report and would not be scored on the cost performance category under MIPS. We refer readers to section II.E.6.b.2. of this final rule with comment period where we discussed how we would address performance category weighting for MIPS eligible clinicians or groups who do not receive a performance category score for a given performance category. We also intend to work with non-patient facing MIPS eligible clinicians and specialty societies to propose alternative cost measures for non-patient facing MIPS eligible clinicians and groups under MIPS in future years. Lastly, we solicited comment on how best to incorporate appropriate alternative cost measures for all MIPS eligible clinician types, including non-patient facing MIPS eligible clinicians.

The following is summary of the comments we received.

Comment: Many commenters supported a policy to not attribute cost measures to those clinicians and groups that meet the requirements of non-patient facing MIPS eligible clinicians because these clinicians would have little influence on cost, particularly with regard to the measures that were proposed for the transition year of the program.

Response: We did not propose to preclude non-patient facing MIPS eligible clinicians from receiving a score for the cost performance category. Rather, based on the cost measures that we proposed for the CY 2017 performance period, we did not anticipate many non-patient facing MIPS eligible clinicians would have sufficient case volume as the measures are generally attributed to clinicians who have patient-facing encounters. If

non-patient facing MIPS eligible clinicians do in fact have sufficient case volume, however, they would be attributed measures in accordance with the attribution methodology and would receive a score for the cost performance category.

Comment: Many commenters recommended that CMS work to develop alternative cost measures that could be used for non-patient facing clinicians or groups in the future.

Response: We will continue to investigate all methods to measure cost, including methods for those clinicians who provide services that are not included in the existing cost measure attribution criteria.

We appreciate the comments received and will attribute cost measures to non-patient facing MIPS eligible clinicians who have sufficient case volume, in accordance with the attribution methodology.

(e) Additional System Measures

Section 1848(q)(2)(C)(ii) of the Act, as added by section 101(c) of MACRA provides that the Secretary may use measures used for a payment system other than for physicians, such as measures for inpatient hospitals, for purposes of the quality and cost performance categories of MIPS. The Secretary, however, may not use measures for hospital outpatient departments, except in the case of items and services furnished by emergency physicians, radiologists, and anesthesiologists.

We intend to align any facility-based MIPS measure decision across the quality and cost performance categories to ensure consistent policies for MIPS in future years. We refer readers back to section II.E.5.b.(5) of this rule which discusses our strategy and solicits comments related to this provision. Below is our response to comments related to measuring the cost of facility-based clinicians.

Comment: Some commenters supported the consideration of inpatient hospital cost measures for MIPS but requested that CMS create a methodology with an appropriate attribution methodology that could account for clinicians practicing in multiple facilities. Some commenters supported the inclusion of inpatient hospital cost measures as an option for certain clinicians and others opposed their inclusion in MIPS.

Response: We will take these comments into consideration if we propose system measures in future rulemaking.

Comment: Many commenters expressed concern that the total per

capita cost measure, MSPB, and episode-based measures would not capture cost associated with their particular specialty or field of medicine, such as anesthesiology. Commenters encouraged CMS to develop measures that would capture cost covering the unique contributions of all specialties.

Response: We will continue to develop more episode-based measures and other mechanisms of measuring cost that will cover a broader group of medical specialists in the coming years and will plan to work with stakeholders to identify gaps in cost measurement.

We appreciate the comments and will take all comments into consideration as we develop future cost measures.

(4) Future Modifications to Cost Performance Category

In the future, we intend to consider how best to incorporate Medicare Part D costs into the cost performance category, as described in section 1848(q)(2)(B)(ii) of the Act. We solicited public comments on how we should incorporate those costs under MIPS for future years. We also intend to continue developing and refining episode-based measures for purposes of cost performance category measure calculations.

The following is summary of the comments we received regarding the inclusion of Medicare Part D costs within cost measurement.

Comment: Several commenters expressed support the inclusion of Part D costs in future cost measures, some citing the contribution of prescribing behavior to overall health costs and that including costs from other categories without including oral prescription drugs presented an incomplete picture.

Response: To the extent possible, we will investigate ways to account for the cost of drugs under Medicare Part D in the cost measures in the future, as feasible and applicable, in accordance with section 1848(q)(2)(B)(ii) of the Act.

Comment: Several commenters opposed the inclusion of Part D drug costs in future cost measures, noting that certain physicians prescribe more expensive drugs than others and that there are technical challenges to price standardizing Part D data and others questioned the appropriateness of the data. Others commented that including Part D costs could create improper incentives to prescribe services based on the part of Medicare that covers the service.

Response: Drugs covered under Medicare Part D are a growing component of the overall costs for Medicare beneficiaries and one in which clinicians have a significant

influence. However, not all patients covered by Medicare A and B are covered under a Medicare Part D plan, which presents a technical challenge in assessing the cost of drugs for all patients. In addition, Medicare Part D is provided through private plans which independently negotiate payment rates for certain drugs or drugs within a particular class. We will continue to investigate methods to incorporate this important component of healthcare spending into our cost measures in the future.

Comment: Several commenters suggested removing the costs associated with drugs covered under Medicare Part B from cost in addition to those covered under Medicare Part D.

Response: We believe that clinicians play a key role in prescribing drugs for their patients and that the costs associated with drugs can be a significant contributor to the overall cost of caring for a patient. We do not believe it would be appropriate to remove the cost of Medicare Part B drugs from the cost measures.

We appreciate the comments and will take all comments into consideration as we develop future cost measures.

f. Improvement Activities Performance Category

(1) Background

(a) General Overview and Strategy

The improvement activities performance category focuses on one of our MIPS strategic goals, to use a patient-centered approach to program development that leads to better, smarter, and healthier care. We believe improving the health of all Americans can be accomplished by developing incentives and policies that drive improved patient health outcomes. Improvement activities emphasize activities that have a proven association with better health outcomes. The improvement activities performance category also focuses on another MIPS strategic goal which is to use design incentives that drive movement toward delivery system reform principles and participation in APMs. A further MIPS strategic goal we are striving to achieve is to establish policies that can be scaled in future years as the bar for improvement rises. Under the improvement activities performance category, we proposed baseline requirements that will continue to have more stringent requirements in future years, and lay the groundwork for expansion towards continuous improvement over time.

(b) The MACRA Requirements

Section 1848(q)(2)(C)(v)(III) of the Act defines an improvement activity as an activity that relevant eligible clinician organizations and other relevant stakeholders identify as improving clinical practice or care delivery, and that the Secretary determines, when effectively executed, is likely to result in improved outcomes. Section 1848(q)(2)(B)(iii) of the Act requires the Secretary to specify improvement activities under subcategories for the performance period, which must include at least the subcategories specified in section 1848(q)(2)(B)(iii)(I) through (VI) of the Act, and in doing so to give consideration to the circumstances of small practices, and practices located in rural areas and geographic health professional shortage areas (HPSAs).

Section 1848(q)(2)(C)(iv) of the Act generally requires the Secretary to give consideration to the circumstances of non-patient facing MIPS eligible clinicians or groups and allows the Secretary, to the extent feasible and appropriate, to apply alternative measures and activities to such MIPS eligible clinicians and groups.

Section 1848(q)(2)(C)(v) of the Act required the Secretary to use a request for information (RFI) to solicit recommendations from stakeholders to identify improvement activities and specify criteria for such improvement activities, and provides that the Secretary may contract with entities to assist in identifying activities, specifying criteria for the activities, and determining whether MIPS eligible clinicians or groups meet the criteria set. In the MIPS and APMs RFI, we requested recommendations to identify activities and specify criteria for activities. In addition, we requested details on how data should be submitted, the number of activities, how performance should be measured, and what considerations should be made for small or rural practices. There were two overarching themes from the comments that we received in the MIPS and APMs RFI. First, the majority of the comments indicated that all subcategories should be weighted equally and that MIPS eligible clinicians or groups should be allowed to select from whichever subcategories are most applicable to them during the performance period. Second, commenters supported inclusion of a diverse set of activities that are meaningful for individual MIPS eligible clinicians or groups. We have reviewed all of the comments that we received and took these recommendations into consideration

while developing the proposed improvement activities policies.

We are finalizing at § 414.1305 the definition of improvement activities, as proposed, to mean an activity that relevant MIPS eligible clinician, organizations and other relevant stakeholders identify as improving clinical practice or care delivery and that the Secretary determines, when effectively executed, is likely to result in improved outcomes.

(2) Contribution to Final Score

Section 1848(q)(5)(E)(i)(III) of the Act specifies that the improvement activities performance category will account for 15 percent of the final score, subject to the Secretary's authority to assign different scoring weights under section 1848(q)(5)(F) of the Act. Therefore, we proposed at § 414.1355, that the improvement activities performance category would account for 15 percent of the final score.

Section 1848(q)(5)(C)(i) of the Act specifies that a MIPS eligible clinician or group that is certified as a patient-centered medical home or comparable specialty practice, as determined by the Secretary, must be given the highest potential score for the improvement activities performance category for the performance period. For a further description of APMs that have a certified patient centered-medical home designation, we refer readers to the proposed rule (81 FR 28234).

A patient-centered medical home would be recognized if it is a nationally recognized accredited patient-centered medical home, a Medicaid Medical Home Model, or a Medical Home Model. The NCQA Patient-Centered Specialty Recognition would also be recognized, which qualifies as a comparable specialty practice. Nationally recognized accredited patient-centered medical homes are recognized if they are accredited by: (1) The Accreditation Association for Ambulatory Health Care; (2) the National Committee for Quality Assurance (NCQA) patient-centered medical home recognition; (3) The Joint Commission Designation; or (4) the Utilization Review Accreditation Commission (URAC).¹⁸ We refer readers to the proposed rule (81 FR 28330) for further description of the Medicaid Medical Home Model or Medical Home Model. The criteria for being an organization that accredits medical homes is that the organization must be

national in scope and must have evidence of being used by a large number of medical organizations as the model for their patient-centered medical home. We solicited comment on our proposal for determining which practices would qualify as patient-centered medical homes. We also note that practices may receive a patient-centered medical home designation at a practice level, and that individual TINs may be composed of both undesignated practices and practices that have received a designation as a patient-centered medical home (for example, only one practice site has received patient-centered medical home designation in a TIN that includes five practice sites). For MIPS eligible clinicians who choose to report at the group level, reporting is required at the TIN level. We solicited comment on how to provide credit for patient-centered medical home designations in the calculation of the improvement activities performance category score for groups when the designation only applies to a portion of the TIN (for example, to only one practice site in a TIN that is comprised of five practice sites).

Section 1848(q)(5)(C)(ii) of the Act provides that MIPS eligible clinicians or groups who are participating in an APM (as defined in section 1833(z)(3)(C) of the Act) for a performance period must earn at least one half of the highest potential score for the improvement activities performance category for the performance period. For further description of improvement activities and the APM scoring standard for MIPS, we refer readers to the proposed rule (81 FR 28234). For all other MIPS eligible clinicians or groups, we refer readers to the scoring requirements for MIPS eligible clinicians and groups in the proposed rule (81 FR 28247).

Section 1848(q)(5)(C)(iii) of the Act provides that a MIPS eligible clinician or group must not be required to perform activities in each improvement activities subcategory or participate in an APM to achieve the highest potential score for the improvement activities performance category.

Section 1848(q)(5)(B)(i) of the Act requires the Secretary to treat a MIPS eligible clinician or group that fails to report on an applicable measure or activity that is required to be reported, they will receive the lowest potential score applicable to the measure or activity.

The following is a summary of the comments we received regarding the improvement activities performance category contribution to the final score.

Comment: Several commenters expressed concern about the burden of complying with this performance category in addition to the other three performance categories and some recommended that the performance category not be included in the MIPS program, believing it would be difficult to report. Some commenters requested that we remove the improvement activities performance category completely.

Response: We recognize that there are challenges associated with understanding how to comply with a new program such as MIPS and the improvement activities performance category. However, the statute requires the improvement activities performance category be included in the Quality Payment Program. After consideration of the comments expressing concern about reporting burden, we are reducing the number of required activities we proposed from a maximum of six medium-weighted or three high-weighted or some combination thereof for full credit to a requirement of no more than four medium-weighted activities, two high-weighted activities, or a combination of medium and high-weighted activities where each selected high-weighted activity reduces the number of medium-weighted activities required. We believe this is still aligned with the statute in measuring performance in this performance category. We will continue to provide education and outreach to provide further clarity.

Comment: Some commenters expressed concern that improvement activities would not be successfully implemented because of the low percentage that this category was given in the final MIPS scoring methodology. The commenters suggested increasing the improvement activities performance categories percentage toward the final score. Another commenter recommended reducing the quality performance category's weighting from 50 percent to 35 percent and increasing the improvement activities performance category from 15 percent to 30 percent for 2017, indicating this would increase the likelihood that more MIPS eligible clinicians would fully participate.

Response: We believe we have appropriately weighted the improvement activities performance category within the final score, particularly given the statutory direction under section 1848(q)(5)(E)(i)(III) of the Act that the category account for 15 percent of the final score, subject to the Secretary's authority to assign different scoring weights under certain circumstances. However, we intend to

¹⁸Gans, D. (2014). *A Comparison of the National Patient-Centered Medical Home Accreditation and Recognition Programs*. Medical Group Management Association, www.mgma.com.

monitor the effects of category weighting under MIPS over time.

Comment: Several commenters requested that CMS develop a definition of a Medical Home or certified patient-centered medical home that includes practices that are designated by private health plans such as Blue Cross and Blue Shield of Michigan (BCBSM) patient-centered medical home program. Some commenters also requested including regional patient-centered medical home recognition programs that are free to practices. Other commenters requested that CMS consider MIPS eligible clinicians or groups that have completed a certification program that has a demonstrated track record of support by non-Medicare payers, state Medicaid programs, employers, or others in a region or state. Some commenters requested that CMS consider other significant rigorous certification programs or state-level certification. One example of a state-level certification program, provided by a commenter, was the Oregon patient-centered medical home certification. One commenter suggested recognizing certified patient-centered medical homes that may not have sought national certification. The same commenter also suggested providing a MIPS eligible clinician or group full credit as a certified patient-centered medical home if they were performing the advanced primary care functions reflected in the Joint Principles of the Patient-Centered Medical Home and the five key functions of the Comprehensive Primary Care Initiative. One commenter suggested that any MIPS eligible clinician or group that has received a certification from any entity that meets the necessary criteria as a patient-centered medical home accreditor should receive full credit. One commenter requested that “The Compliance Team”, a privately held, for-profit, healthcare accreditation organization that receives deeming authority from the CMS as an accreditation organization, be included as part of the accreditation organizations for patient-centered medical home. This commenter also stated that the exclusion of “The Compliance Team” from the final list of approved administering organizations would create artificial barriers to entry that will likely drive up the cost of accreditation because all the small practices and clinics that already went through accreditation with The Compliance Team would need to go through a second accreditation. One commenter requested that Behavioral Health Home Certification also be recognized for full

credit as a patient-centered medical home. Some commenters further stated that CMS should ensure that the activities and standards included in such accredited programs are meaningful, incorporate private sector best practices, and directly improve patient outcomes. Other commenters agreed with using the accreditation programs that were proposed in the rule to qualify patient-centered medical home models under the improvement activities performance category for full credit, including recommending that practices undergo regular re-accreditation by the proposed bodies to ensure they are continuing to provide care in a manner consistent with being a medical home. In addition, some commenters recommended the Quality Payment Program develop a way to reward practices that may not have reached patient-centered medical home recognition but are in the process of transformation.

Response: We were not previously aware of additional certifying bodies that are used by a large number of medical organizations that adhere to similar national guidelines for certifying a patient-centered medical home, meaning they are national in scope, as the ones cited in the proposal. Consistent with the credit provided for practices that have been certified as a patient-centered medical home or comparable specialty practice for certified bodies included in the proposal, we will also recognize practices that have received accreditation or certification from other certifying bodies that have certified a large number of medical organization and meet national guidelines. We further define large as certifying bodies that the certifying organizations must have certified 500 or more certified member practices. In addition to the 500 or more practice threshold for certifying bodies, the second criterion requires a practice to: (1) Have a personal clinician in a team-based practice; (2) have a whole-person orientation; (3) provide coordination or integrated care; (4) focus on quality and safety; and (5) provide enhanced access (Gans, 2014). The Oregon Patient-centered Primary Care Home Program described by comments and the Blue Cross Blue Shield of Michigan (BCBSM) are two examples of programs that would meet these two criteria in the proposed rule.

While we believe that some of the advanced primary care functions in the Joint Principles of the Patient-Centered Medical Home and key functions of the Comprehensive Primary Care Initiative might count as improvement activities there is a distinction maintained

between being an actual certified patient-centered medical home per the statute and performing some functions of one. Therefore, performing these functions alone would not qualify for full credit. Other certifications that are not for patient-centered medical homes or comparable specialty practices would also not qualify automatically for the highest score.

MIPS eligible clinicians and groups that receive certification from other accreditation organizations that certify for a patient-centered medical home or comparable specialty practice, including accredited organizations that receive deeming authority from CMS, such as The Compliance Team, would receive full credit as long as those accredited bodies meet the two criteria. These two criteria are: (1) The accredited body must have certified 500 or more member practices as a patient-centered medical home or comparable practice; and (2) they must meet national guidelines.

Comment: Some commenters agreed with CMS regarding not requiring that a MIPS eligible clinician select from any specific subcategories of activities. However, the commenters opposed CMS’ suggestion to eventually calculate performance in this performance category due to the technical complexity of doing so, but also because it would ignore the overall intent of the performance category, which is to recognize engagement in innovative activities that contribute to quality rather than actual performance. One commenter encouraged CMS to reconsider the improvement activities and scoring criteria in future years to incentivize physician improvement.

Response: We will take this suggestion into account as we continue implementation and refinement of the MIPS program in the future. While we recognize that it may be technically complex at this time to calculate performance within the improvement activities performance category, our expectation is that such a process would become simpler over time as MIPS eligible clinicians become accustomed to implementing improvement activities. For further discussion of improvement activities scoring as a component of the final score, we refer readers to section II.E.6.a.(4) in this final rule with comment period.

After consideration of the comments regarding the contribution to final score we are finalizing at § 414.1355, that the improvement activities performance category would account for 15 percent of the final score. We are not finalizing our policy on recognizing only practices that have received nationally recognized accredited or certified-patient centered

medical home certifications. Rather, we are finalizing at § 414.1380 an expanded definition of what is acceptable for recognition as a certified-patient centered medical home or comparable specialty practice. We are recognizing a MIPS eligible clinician or group as being a certified patient-centered medical home or comparable specialty practice if they have achieved certification or accreditation as such from a national program, or they have achieved certification or accreditation as such from a regional or state program, private payer or other body that certifies at least 500 or more practices for patient-centered medical home accreditation or comparable specialty practice certification. Examples of nationally recognized accredited patient-centered medical homes are: (1) The Accreditation Association for Ambulatory Health Care; (2) the National Committee for Quality Assurance (NCQA) Patient-Centered Medical Home (3) The Joint Commission Designation; or (4) the Utilization Review Accreditation Commission (URAC). We are finalizing that the criteria for being a nationally recognized accredited patient-centered medical home are that it must be national in scope and must have evidence of being used by a large number of medical organizations as the model for their patient-centered medical home. We will also provide full credit for the improvement activities performance category for a MIPS eligible clinician or group that has received certification or accreditation as a patient-centered medical home or comparable specialty practice from a national program or from a regional or state program, private payer or other body that administers patient-centered medical home accreditation and certifies 500 or more practices for patient-centered medical home accreditation or comparable specialty practice certification.

(3) Improvement Activities Data Submission Criteria

(a) Submission Mechanisms

For the purpose of submitting under the improvement activities performance category, we proposed in the proposed rule (81 FR 28181) to allow for submission of data for the improvement activities performance category using the qualified registry, EHR, QCDR, CMS Web Interface, and attestation data submission mechanisms. If technically feasible, we would use administrative claims data to supplement the improvement activities submission. Regardless of the data submission

method, all MIPS eligible clinicians or groups must select activities from the improvement activities inventory provided in Table H in in the Appendix to this final rule with comment period. We believe the proposed data submission methods would allow for greater access and ease in submitting data, as well as consistency throughout the MIPS program.

In addition, we proposed at § 414.1360, that for the transition year only, all MIPS eligible clinicians or groups, or third party intermediaries such as health IT intermediaries, QCDRs and qualified registries that submit on behalf of a MIPS eligible clinician or group, must designate a yes/no response for activities on the improvement activities inventory. In the case where a MIPS eligible clinician or group is using a health IT intermediary, QCDR, or qualified registry for their data submission, the MIPS eligible clinician or group will certify all improvement activities have been performed and the health IT intermediary, QCDR, or qualified registry will submit on their behalf. An agreement between a MIPS eligible clinician or group and a health IT vendor, QCDR, or qualified registry for data submission for improvement activities as well as other performance data submitted outside of the improvement activities performance category could be contained in a single agreement, minimizing the burden on the MIPS eligible clinician or group. See the proposed rule (81 FR 28281) for additional details.

We proposed to use the administrative claims method, if technically feasible, only to supplement improvement activities performance category submissions. For example, if technically feasible, MIPS eligible clinicians or groups, using the telehealth modifier GT, could get automatic credit for this activity. We requested comments on these proposals.

The following is a summary of the comments we received regarding the improvement activities performance category data submission criteria and mechanisms.

Comment: Some commenters noted that the definitions of some improvement activities (such as those that require patient-specific factors) are impossible for CEHRTs to determine from the data in the EHR. The commenters believed these will create usability problems and complicate clinical workflows.

Response: If an EHR vendor or developer cannot complete system changes to support usability and simplify clinical workflows for some improvement activities, a MIPS eligible

clinician or group may use another calculation method to support that attestation. For example, a MIPS eligible clinician or group may use their CEHRT to generate a list of patients for whom they have prescribed an antidiabetic agent (for example, insulin) and use an associated documented record with reference to an individual glycemic treatment goal that includes patient-specific factors to identify the competition rate through manual or other IT assisted calculation. We also encourage MIPS eligible clinicians to work with their CEHRT system developers to ensure that their systems consider the MIPS eligible clinician's workflow needs. In addition, we note that ONC recently relied an EHR Contract Guide, available at https://www.healthit.gov/sites/default/files/EHR_Contracts_Untangled.pdf, which is designed to help clinicians and developers work together to consider key issues related to product needs and product operation.

Comment: One commenter opposed separate processes for attesting improvement activities when those activities are related to advancing care information or quality measures performance categories.

Response: For the transition year of MIPS, we have concluded that we must require separate processes for attestation in separate performance categories, including cases where improvement activities are related to advancing care information or quality performance categories. Refer to section II.E.5.g. and Table H in in the Appendix to this final rule with comment period for more information on improvement activities that are designated activities which receive a 10 percent bonus in the advancing care information performance category. MIPS eligible clinicians should factor this 10 percent bonus into their selection of activities to meet the requirements of the improvement activities performance category as well. We intend to continue to streamline reporting requirements under MIPS in the future. For the advancing care information performance category, however, we have revised the policy for the transition year of MIPS, so that additional designated activities in Table H in in the Appendix to this final rule with comment period may also qualify for a bonus in the advancing care information performance category. We refer readers to section II.E.5.g.(5) of this final rule with comment period for more information on this bonus; MIPS eligible clinicians should factor this into their selection of activities to meet the requirements of the improvement activities performance category as well.

We intend to continue examining how to streamline reporting requirements under MIPS in the future.

Comment: Several commenters requested additional clarification on how MIPS eligible clinicians would report as a group for the improvement activities performance category. The commenters provided suggestions for how CMS should provide credit for those groups, including suggestions: (1) That CMS not require all MIPS eligible clinicians in a group to report all activities in the transition year; (2) that CMS specify how many clinicians in each group must participate in each activity to achieve points for the entire group; and (3) that CMS give credit to the entire group if at least part of a group is performing an activity.

Response: We would like to explain that all MIPS eligible clinicians, reporting as a group, will receive the same score for the improvement activities performance category. If at least one clinician within the group is performing the activity for a continuous 90 days in the performance period, the group may report on that activity.

Comment: A few commenters expressed concern with the improvement activities performance category noting that it will be necessary to have timely specifications on how to satisfy the qualifications for each activity to earn improvement activities credit.

Response: The improvement activities inventory in Table H in in the Appendix to this final rule with comment period includes a description of the specifications for how to satisfy the qualifications for each project (activity) in order to earn points.

Comment: Some commenters requested clarification on the submission mechanisms for the improvement activities performance category. The commenters believed that some activities require use of a third party vendor while others did not. The commenter stated it is unclear how MIPS eligible clinicians will report on activities within the improvement activities performance category.

Response: The submission mechanisms for the improvement activities performance category are listed in section II.E.5.f.(3) of this final rule with comment period. We agree there are some activities such as those that reference the use of a QCDR that may require a third party vendor. There are many others, however, that do not require third party vendor engagement or suggest that use of certified EHR technology is one way to support a given activity but not the only way to support an activity. We will provide

technical assistance through subregulatory guidance to further explain how MIPS eligible clinicians will report on activities within the improvement activities performance category. This subregulatory guidance will also include how MIPS eligible clinicians will be able to identify a specific activity through some type of numbering or other similar convention.

Comment: One commenter requested clarification that if an EHR vendor reports the improvement activities performance category for a MIPS eligible clinician or group, the vendor is simply reporting the MIPS eligible clinician's or group's attestation of success, not attesting to that success.

Response: The commenter is correct in that the vendor simply reports the MIPS eligible clinician's or group's attestation, on behalf of the clinician or group, that the improvement activities were performed. The vendor is not attesting on its own behalf that the improvement activities were performed.

Comment: Another commenter recommended allowing improvement activities to be reported via the CMS Web Interface for the transition year, rather than through a QCDR or EHR.

Response: The CMS Web Interface is one of the data submission mechanisms available for the improvement activities performance category reporting. We have included a number of possible submission mechanisms for MIPS and recognize the need to make the attestation process as simple as possible.

Comment: One commenter recommended that CMS provide additional clarity in the final rule with comment period on how MIPS eligible clinicians should attest if they meet part, but not all, of the entire improvement activity. In order to provide a more accurate and fair score, this commenter recommended providing more prescriptive criteria so that points may be assigned for sub-activities within each activity.

Response: A MIPS eligible clinician must meet all requirements of the activity to receive credit for that activity. Partial satisfaction of an activity is not sufficient for receiving credit for that activity. However, many activities offer multiple options for how clinicians may successfully complete them and additional criteria for activities are already included in the improvement activities inventory.

Comment: Some commenters supported CMS' proposed "yes/no" responses via reporting mechanisms of MIPS eligible clinicians' choice, and requested that we consider collecting more detailed responses in the future. Other commenters called on CMS to

ensure that improvement activities chosen by MIPS eligible clinicians are relevant and useful for improving care in their practices. One commenter expressed reservations about attestation and requested that CMS verify that MIPS eligible clinicians perform the activities. Still others, however, called on CMS to continue allowing flexibility for MIPS eligible clinicians, including attestation options.

Response: We will continue examining changes in the data collection process with the expectation that where applicable specification and data collection may be added on an activity by activity basis. We will also verify data through the data validation and audit process as necessary.

Comment: One commenter recommended that the certifying boards be included as reporting agents for improvement activities.

Response: We will take this suggestion into consideration for future rulemaking. To the extent possible, we will work with the patient-centered medical home and comparable specialty practice certifying bodies and other certification boards to verify practice status.

Comment: One commenter recommended that CMS align improvement activities across the country to facilitate shared learning and prevent against waste and inefficiency, and should create a "single source" option for clinicians for reporting, measurement benchmarking and feedback, that also counts toward the improvement activities performance category.

Response: We will take this suggestion into consideration for future rulemaking.

After consideration of the comments received regarding the improvement activities data submission criteria we are not finalizing the policies as proposed. Specifically, we are not finalizing the data submission method of administrative claims data to supplement the improvement activities as it is not technically feasible at this time.

We are finalizing at § 414.1360 to allow for submission of data for the improvement activities performance category using the qualified registry, EHR, QCDR, CMS Web Interface, and attestation data submission mechanisms. Regardless of the data submission method, with the exception of MIPS APMs, all MIPS eligible clinicians or groups must select activities from the improvement activities inventory provided in Table H in in the Appendix to this final rule with comment period.

In addition, we are finalizing at § 414.1360 that for the transition year of MIPS, all MIPS eligible clinicians or groups, or third party intermediaries such as health IT vendors, QCDRs and qualified registries that submit on behalf of a MIPS eligible clinician or group, must designate a yes response for activities on the improvement activities inventory. In the case where a MIPS eligible clinician or group is using a health IT vendor, QCDR, or qualified registry for their data submission, the MIPS eligible clinician or group will certify all improvement activities have been performed and the health IT vendor, QCDR, or qualified registry will submit on their behalf.

We are also including a designation column in the improvement activities inventory that will show which activities qualify for the advancing care information bonus finalized at § 414.1380 and refer readers to Table H in the Appendix to this final rule with comment period.

(b) Weighted Scoring

While we considered both equal and differentially weighted scoring in this performance category, the statute requires a differentially weighted scoring model by requiring 100 percent of the potential score in the improvement activities performance category for patient-centered medical home participants, and a minimum 50 percent score for APM participants. For additional activities in this category, we proposed at § 414.1380 a differentially weighted model for the improvement activities performance category with two categories: Medium and high. The justification for these two weights is to provide flexible scoring due to the undefined nature of activities (that is, improvement activities standards are not nationally recognized and there is no entity for improvement activities that serves the same function as the NQF does for quality measures).

Improvement activities are weighted as high based on alignment with our national public health priorities and programs such as the Quality Innovation Network-Quality Improvement Organization (QIN/QIO) or the Comprehensive Primary Care Initiative which recognizes specific activities related to expanded access and integrated behavioral health as important priorities. Programs that require performance of multiple activities such as participation in the Transforming Clinical Practice Initiative, seeing new and follow-up Medicaid patients in a timely manner in the clinician's state Medicaid Program, or an activity identified as a public

health priority (such as emphasis on anticoagulation management or utilization of prescription drug monitoring programs) were weighted as high.

The statute references certified patient-centered medical homes as achieving the highest score for the MIPS program. MIPS eligible clinicians or groups may use that to guide them in the criteria or factors that should be taken into consideration to determine whether to weight an activity medium or high. We requested comments on this proposal, including criteria or factors we should take into consideration to determine whether to weight an activity medium or high.

The following is a summary of the comments we received regarding weighted scoring for improvement activities.

Comment: One commenter recommended that we establish three weighting categories for the improvement activities performance category: (1) High—30 percent; (2) Medium—20 percent; and (3) Low—10 percent. The commenter stated that this weighting allocation would allow for the development of a third category for easier improvement activities.

Response: Generally, we received comments on the two weightings, high and medium. We believe there were no activities that merited a classification as a lower weighted activity during the MIPS transition year. However, in future years, through the annual call for activities and when more data are available on which activities are most frequently reported, we will reevaluate the applicability of these weights and potential reclassification of activities into lower weights.

Comment: Commenters noted an inconsistency regarding the weighting of activities related to the Prescription Drug Monitoring Program (PDMP). Section II.E.5.f.(3)(b) of the proposed rule (81 FR 28261) references this as a high priority activity; however, the PDMP related activity, "Annual registration in the Prescription Drug Monitoring Program" in Table H, in the Appendix of this final rule with comment period is listed as a medium-weighted activity (81 FR 28570).

Response: There are two PDMP activities, one with a medium weight-registering for the PDMP-and one with a high weight-utilizing the PDMP. We had added some additional language to the one PDMP activity with the high weight to differentiate it from the other medium-weighted PDMP activity. We refer readers to Table H in the Appendix to this final rule with

comment period for the additional language.

Comment: Several commenters supported the proposed list of activities but recommended that the number of required activities be reduced and that more activities be highly weighted to reduce the reporting burden for MIPS eligible clinicians.

Response: As discussed in section II.E.5.f.(2) of this final rule with comment period, we have reduced the number of activities that MIPS eligible clinicians are required to report to no more than four medium-weighted activities, two high-weighted activities, or any combination thereof, for a total of 40 points. We are reducing the number of activities for small practices, practices located in rural areas, and geographic HSPAs and non-patient facing MIPS eligible clinicians to no more than one high-weighted activity or two medium-weighted activities, where each activity counts for doubled weighting to also achieve a total of 40 points.

Comment: Several commenters suggested that CMS expand the number of high-weighted activities, noting that there were only 11 high-weighted activities out of 90, which may prevent MIPS eligible clinicians from reporting high-weighted improvement activities, and that the Emergency Response and Preparedness subcategory was the only subcategory without a high-weighted activity.

Response: We are changing one existing activity in the Emergency Response and Preparedness subcategory from "Participation in domestic or international humanitarian volunteer work. MIPS eligible clinicians and groups must be registered for a minimum of 6 months as a volunteer for domestic or international humanitarian volunteer work" to "Participation in domestic or international humanitarian volunteer work. Activities that simply involve registration are not sufficient. MIPS eligible clinicians attest to domestic or international humanitarian volunteer work for a period of a continuous 60 days or greater." We have changed this activity so that rather than requiring MIPS eligible clinicians to be registered for 6 months, we are requiring them to participate for 60 days. This change is in line with our overall new 90-day performance period policy. The 60-day participation would fall within that new 90-day window. We are also changing this existing activity from a medium to a high-weighted activity because such volunteer work is intensive, often involves travel, and working in challenging physical and clinical circumstances. Table H in the

Appendix to this final rule with comment period reflects this revised description of the existing activity and revised weighting. We note, however, that this is a change for this transition year for the 2017 performance period only. In addition, we are changing the weight from medium to high of the one activity related to “Participating in a Rural Health Clinic (RHC), Indian Health Service Medium Management (IHS), or Federally Qualified Health Center (FQHC) in ongoing engagement activities that contribute to more formal quality reporting” which we believe is consistent with section 1848(q)(2)(B)(iii) of the Act, which requires the Secretary to give consideration to the circumstances of practices located in rural areas and geographic HPSAs. Rural health clinics would be included in that definition for consideration of practices in rural areas. Table H in the Appendix to this final rule with comment period reflects this revised weighting.

Comment: Some commenters recommended assigning a higher weight to QCDR-related improvement activities and QCDR functions, and one commenter recommended that use of a QCDR count for several activities.

Response: Participating in a QCDR is not sufficient for demonstrating performance of multiple improvement activities, and we do not believe at this time that it warrants a higher weighting. In addition, QCDR participation was not proposed as a high-weighted activity because, while useful for data collection, it is neither critical for supporting certified patient-centered medical homes, which is what we considered in proposing whether an improvement activity would be high-weighted activity, nor does it require multiple actions. We also note that while QCDR participation may not automatically confer improvement activities credit, it may put MIPS eligible clinicians in a position to report multiple improvement activities, since there are several that specifically reference QCDR participation. We ask that each MIPS eligible clinician select from the broad list of activities provided in Table H in the Appendix to this final rule with comment period in order to achieve their total score.

Comment: Several commenters made suggestions for weighting within the improvement activities performance category. Some commenters recommended that CMS increase the number of high weight activities because they believed this would allow MIPS eligible clinicians to select activities that are more meaningful without sacrificing time and energy that

should be spent with patients. Other commenters offered suggestions for additional activities that should be allocated high weight under the performance category, or suggested consolidating activities under subcategories that could be afforded high weight.

Response: Additional reweighting, other than included in this final rule with comment period, will not occur until a revised improvement activities inventory list is finalized through the rulemaking process. We will take this recommendation into consideration for future rulemaking.

Comment: Some commenters made several suggestions for providing additional credit to MIPS eligible clinicians under the improvement activities performance category. For example, one commenter recommended giving automatic credit to surgeons for providing 24/7 access to MIPS eligible clinicians, groups, or care teams for advice about urgent or emergent care because surgeons provide on-call coverage and are available to medical facilities that provide after-hours access. Other commenters suggested that specialists that qualify for additional credit under the Blue Cross Blue Shield of Michigan Value-Base Reimbursement program should receive full credit for improvement activities performance category. Additional commenters suggested that we consider providing automatic credit for the improvement activities performance category to MIPS eligible clinicians participating in a QCDR rather than requiring attestation for each individual improvement activity. One commenter recommended that ED clinicians automatically earn at least a minimum score of one-half of the highest potential score for this performance category simply for providing this access on an ongoing basis, noting that emergency clinicians are one of the few clinician specialties that truly provide 24/7 care.

Response: We will consider these requests in future rulemaking for the MIPS program. As discussed in section II.E.f.(3)(c) of this final rule with comment period, we are revising our policy regarding the number of required activities for the transition year of MIPS. Specifically, we are asking MIPS eligible clinicians or groups that are not MIPS APMs, to select a reduced number of activities: Either four medium-weighted activities, or two medium-weighted and one high-weighted, or two high-weighted activities. For MIPS eligible clinicians or groups, in small practices, practices in rural areas or geographic HPSAs, or non-patient facing MIPS eligible clinicians, who are only

required to select one medium-weighted activity for one-half of the credit for this performance category or two medium-weighted or one high-weighted activity for full credit for this performance category.

Comment: Some commenters requested that the CAHPS for MIPS survey be included as a medium-weighted improvement activity.

Response: We disagree and believe assessing patients' experiences as they interact with the health care system is a valuable indication of merit. Please note, there are no reporting thresholds for improvement activities, this allows flexibility for MIPS eligible clinicians and groups to report surveys in a way that best reflects their efforts. Therefore, the CAHPS for MIPS survey is included as a high-weighted activity under the activity called “Participation in the Consumer Assessment of Healthcare Providers and Systems Survey (CAHPS) or other Supplemental Questionnaire Items.”

Comment: Some commenters supported patient-centered medical homes and supported these entities receiving full credit for improvement activities performance category. One commenter suggested that patient-centered medical homes stratify data by disparity variables and implement targeted interventions to address health disparities. Some commenters were concerned that groups of less than 50 would receive the highest potential score under the improvement activities performance category, while groups with greater than 50 would receive partial credit. One commenter stated that larger groups have the inherent capability of assuming greater risk. One commenter also requested that the 50 group number be stricken from the language allowing any group size that has acquired patient-centered medical home certification by a recognized entity to be given full credit for improvement activities to encourage all groups, regardless of size, to pursue patient-centered medical home certification as patient-centered medical home certification is fundamental to good practice. Additional commenters suggested including activities under the improvement activities performance category that are associated with actions conducted by a certified patient-centered medical home. One commenter recommended the following subcategories of activities for the improvement activities performance category that are aligned with elements of a patient centered medical home: Expanded practice access, population management, care coordination, beneficiary engagement, and patient

safety and practice assessment. This commenter believed that the presentation of the information in this way will allow clinicians to better understand the patient-centered medical home model and decide how to best deliver care under MIPS.

Response: We note that there is no limit on the size of a practice in a patient-centered medical home for eligibility for full improvement activities credit. We refer the commenter to section II.E.8. of this final rule with comment period on APMs to establishing thresholds of less than 50 as it relates to APM incentive payments. We encourage MIPS eligible clinicians and groups to working with appropriate certifying bodies to consider that in the future. We will also look for ways to reorganize the existing improvement activities inventory and working with clinicians and others in future years on the best way to present this list of activities.

Comment: A few commenters supported giving 50 percent credit in the improvement activities performance category to MIPS APMs.

Response: It is important to note that it was statutorily mandated that MIPS eligible clinicians participating in APMs receive at least one-half of the highest score in the improvement activities performance category.

Comment: Other commenters recommended that we establish three weighting categories for the improvement activities performance category: (1) High—30 percent; (2) medium—20 percent; and (3) low—10 percent. The commenter stated that this weighting allocation would allow for the development of a third category for easier improvement activities.

Response: We will consider other weighting options as appropriate for improvement activities in future rulemaking.

After consideration of the comments regarding weighted scoring we are finalizing at § 414.1380 a differentially weighted model for the improvement activities performance category with two categories: Medium and high. We refer readers to the following sections of this final rule with comment period in reference to the improvement activities performance category: Section VI.H for the modified list of high-weighted and medium-weighted activities, section II.E.5.f.(3)(c) for information on the number of activities required to achieve the highest score, section II.E.6.a.(4)(a) for information on how points will be assigned, section II.E.6.a.(4)(b) how the highest potential score can be achieved, section II.E.6.a.(4)(c) on how we will recognize a MIPS eligible clinician or

group for qualifying for the points for a certified patient-centered medical home or comparable specialty practices, and section II.E.6.a.(4)(d) for how the improvement performance activities will be calculated.

(c) Submission Criteria

We proposed at § 414.1380 to set the improvement activities submission criteria under MIPS, to achieve the highest potential score of 100 percent, at three high-weighted improvement activities (20 points each) or six medium-weighted improvement activities (10 points each), or some combination of high and medium-weighted improvement activities to achieve a total of 60 points for MIPS eligible clinicians participating as individuals or as groups (refer to Table H in in the Appendix to this final rule with comment period for improvement activities and weights). MIPS eligible clinicians or groups that select less than the designated number of improvement activities will receive partial credit based on the weighting of the improvement activity selected. To achieve a 50 percent score, one high-weighted and one medium-weighted improvement activity or three medium-weighted improvement activities are required for these MIPS eligible clinicians or groups.

Exceptions to the above apply for: Small practices, MIPS eligible clinicians and groups located in rural areas, MIPS eligible clinicians and groups that are located in geographic HPSAs, non-patient facing MIPS eligible clinicians or groups or MIPS eligible clinicians, or groups that participate in an APM or a patient-centered medical home submitting in MIPS.

For MIPS eligible clinicians and groups that are small practices, located in rural areas or geographic HPSAs, or non-patient facing MIPS eligible clinicians or groups, to achieve the highest score of 100 percent, two improvement activities are required (either medium or high). For MIPS eligible clinicians or groups that are small practices, located in rural areas, located in HPSAs, or non-patient facing MIPS eligible clinicians or groups, in order to achieve a 50 percent score, one improvement activity is required (either medium or high).

MIPS eligible clinicians or groups that participate in APMs are considered eligible to participate under the improvement activities performance category unless they are participating in an Advanced APM and they have met the Qualifying APM Participant (QP) thresholds or are Partial QPs that elect not to report information. A MIPS

eligible clinician or group that is participating in an APM and participating under the improvement activities performance category will receive one half of the total improvement activities score just through their APM participation. These are MIPS eligible clinicians or groups that we identify as participating in APMs for MIPS and may participate under the improvement activities performance category. To achieve the total improvement activities score, such MIPS eligible clinicians or groups will need to identify that they participate in an APM and this APM will submit the eligible clinicians' improvement activities score for that specific model type.

For further description of MIPS eligible clinicians or groups that are required to report to MIPS under the APM scoring standard and their improvement activities scoring requirements, we refer readers to the proposed rule (81 FR 28234). For all other MIPS eligible clinicians or groups participating in APMs that would report to MIPS, this section applies and we also refer readers to the scoring requirements for these MIPS eligible clinicians or groups in the proposed rule (81 FR 28237).

Since we cannot measure variable performance within a single improvement activity, we proposed at § 414.1380 to compare the improvement activities points associated with the reported activities against the highest number of points that are achievable under the improvement activities performance category which is 60 points. We proposed that the highest potential score of 100 percent can be achieved by selecting a number of activities that will add up to 60 points. MIPS eligible clinicians and groups, including those that are participating as an APM, and all those that select activities under the improvement activities performance category can achieve the highest potential score of 60 points by selecting activities that are equal to the 60-point maximum. We refer readers to the scoring section of the proposed rule (81 FR 28237) for additional rationale for using 60 points for the transition year of MIPS.

If a MIPS eligible clinician or group reports only one improvement activity, we would score that activity accordingly, as 10 points for a medium-level activity or 20 points for a high-level activity. If a MIPS eligible clinician or group reports no improvement activities, then the MIPS eligible clinician or group would receive a zero score for the improvement activities performance category. We

believe this proposal allows us to capture variation in the total improvement activities reported.

In addition, we believe these are reasonable criteria for MIPS eligible clinicians or groups to accomplish within the transition year for three reasons: (1) In response to several stakeholder MIPS and APMs RFI comments, we are not recommending a minimum number of hours for performance of an activity; (2) we are offering a broad list of activities from which MIPS eligible clinicians or groups may select; and (3) also in response to MIPS and APMs RFI comments, we proposed that an activity must be performed for at least 90 days during the performance period for improvement activities credit. We intend to reassess this requirement threshold in future years. We do not believe it is appropriate to require a determined number of activities within a specific subcategory at this time. This proposal aligns with the requirements in section 1848(q)(2)(C)(iii) of the Act that states MIPS eligible clinicians or groups are not required to perform activities in each subcategory.

Lastly, we recognize that working with a QCDR could allow a MIPS eligible clinician or group to meet the measure and activity criteria for multiple improvement activities. For the transition year of MIPS, there are several improvement activities in the inventory that incorporate QCDR participation. Each activity must be selected and achieved separately for the transition year of MIPS. A MIPS eligible clinician or group cannot receive credit for multiple activities just by selecting one activity that includes participation in a QCDR. As the improvement activities inventory expands over time we were interested in receiving comments on what restrictions, if any, should be placed around improvement activities that incorporate QCDR participation.

The following is a summary of the comments we received regarding submission criteria.

Comment: One commenter recommended that CMS base performance in the improvement activities performance category on participating in a number of improvement activities rather than a specific number of hours.

Response: We would like to explain that we proposed at § 414.1380 to require MIPS eligible clinicians to submit three high-weighted improvement activities or six medium-weighted improvement activities, or some combination of high and medium-weighted improvement activities to achieve the highest possible score in

this performance category (81 FR 28210). Credit awarded under the improvement activities performance category relies on the number of activities, not a specific number of hours. We refer readers to the section below entitled “Required Period of Time for Performing an Activity” below where we discuss the 90-day time period policy.

Comment: Other commenters did not support the improvement activities performance category because of some specialty concerns on the inability to report on two or more activities, such as one commenter that indicated that doctors of chiropractic practice in clinics, often with under 15 MIPS eligible clinicians, would have problems reporting on two improvement activities. This commenter noted that during the early adopter program for the NCQA Patient-Centered Connected Care recognition program, doctors of chiropractic did not experience favorable consideration because the TCPLs focused their funding on primary care clinicians.

Response: We believe there are a sufficient number of broad activities from which specialty practices, as well as primary care clinicians, can select. Furthermore, as discussed previously in this section, we are finalizing a policy reducing the required number of activities for MIPS eligible clinicians and groups.

After consideration of the comments received regarding the submission criteria, we are not finalizing the policies as proposed. Rather, we are reducing the maximum number of activities required to achieve the highest possible score in this performance category. Specifically, we are finalizing at § 414.1380 to set the improvement activities submission criteria under MIPS, to achieve the highest potential score, at two high-weighted improvement activities or 4 medium-weighted improvement activities, or some combination of high and medium-weighted improvement activities which will be less than four total number of activities for MIPS eligible clinicians participating as individuals or as groups (refer to Table H in in the Appendix to this final rule with comment period for improvement activities and weights).

Exceptions to the above apply for: Small practices, located in rural areas, practices located in geographic HPSAs, non-patient facing MIPS eligible clinicians or groups or MIPS eligible clinicians, or groups that participate in a MIPS APM or a patient-centered medical home submitting in MIPS. As discussed in sections II.E.5.h. and II.E.6. of this final rule with comment period,

we are reducing the maximum number of activities required for these MIPS eligible clinicians and groups to achieve the highest possible score in this performance category.

Specifically, for MIPS eligible clinicians and groups that are small practices, practices located in rural areas or geographic HPSAs, or non-patient facing MIPS eligible clinicians or groups, to achieve the highest score, one high-weighted or two medium-weighted improvement activities are required. For these MIPS eligible clinicians and groups, in order to achieve one-half of the highest score, one medium-weighted improvement activity is required.

We will also provide full credit for the improvement activities performance category for a MIPS eligible clinician or group that has received certification or accreditation as a patient-centered medical home or comparable specialty practice from a national program or from a regional or state program, private payer or other body that administers patient-centered medical home accreditation and certifies 500 or more practices for patient-centered medical home accreditation or comparable specialty practice certification.

We believe that this approach is appropriate for the transition year of MIPS since this is a new performance category of requirements for MIPS eligible clinicians and we want to ensure all MIPS eligible clinicians understand what is required of them, while not being overly burdensome.

All clinicians identified on the Participation List of an APM receive at least one-half of the highest score. To develop the improvement activities additional score assigned to all MIPS APMs, CMS will compare the requirements of the specific APM with the list of activities in the Improvement Activities Inventory in Table H in in the Appendix to this final rule with comment period and score those activities in the same manner that they are otherwise scored for MIPS eligible clinicians according to section II.E.6.a.(4) of this final rule with comment period. For further explanation of how MIPS APMs scores will be calculated, we refer readers to section II.E.5.h of this final rule with comment period. Should the MIPS APM not receive the maximum improvement activities performance category score then the APM entity can submit additional improvement activities. All other MIPS eligible clinicians or groups that we identify as participating in APMs will need to select additional improvement activities to achieve the improvement activities highest score.

(d) Required Period of Time for Performing an Activity

We proposed § 414.1360 that MIPS eligible clinicians or groups must perform improvement activities for at least 90 days during the performance period for improvement activities credit. We understand there are some activities that are ongoing whereas others may be episodic. We considered setting the threshold for the minimum time required for performing an activity to longer periods up to a full calendar year. However, after researching several organizations we believe a minimum of 90 days is a reasonable amount of time. One illustrative example of organizations that used 90 days as a window for reviewing clinical practice improvements are practice improvement activities undertaken by a large Veteran's Administration health care program that set a 90-day window for reviewing improvements in the management of opioid dispensing.¹⁹

Additional clarification for how some activities meet the 90-day rule or if additional time is required are reflected in the description of that activity in Table H in in the Appendix to this final rule with comment period. In addition, we proposed that activities, where applicable, may be continuing (that is, could have started prior to the performance period and are continuing) or be adopted in the performance period as long as an activity is being performed for at least 90 days during the performance period.

We anticipate in future years that extended improvement activities time periods will be needed for certain activities. We will monitor the time period requirement to assess if allowing for extended time requirements may enhance the value associated with generating more effective outcomes, or conversely, the extended time may reveal that more time has little or no value added for certain activities when associated with desired outcomes. We requested comments on this proposal.

The following is a summary of the comments we received regarding the required period of time for performing an activity.

Comment: Many commenters supported CMS's proposal to require improvement activities performance for at least 90 days during the performance period. Some commenters requested clarification about the applicable time period, noting that not all activities in

Table H in in the Appendix to this final rule with comment period lend themselves to a 90-day performance period. Other commenters suggested limiting reporting to 30 days or other time periods shorter than 90 days to enable MIPS eligible clinicians to test innovative strategies for improvement activities. One commenter suggested requiring improvement activities be performed throughout the entirety of the performance period.

Response: We note that we are requiring that each improvement activity be performed for a continuous 90-day period. Additionally, the continuous 90-day period must occur during the performance period.

We do not believe that reporting periods as short as 30 days are sufficient to ensure that the activities being performed are robust enough to result in actual practice improvements. However, we are also cognizant of the inherent challenges associated with implementing new improvement activities, which is why we are finalizing our requirement that these activities be performed during a continuous 90-day period during the performance period. We view that reporting period as an appropriate balance for the transition year of MIPS, and will re-examine reporting periods for improvement activities in the future.

Comment: Several commenters requested further clarification on our proposal regarding points for patient-centered medical home recognition in the improvement activities performance category. Specifically, the commenters requested clarification regarding what specific date, either as of December 31, 2017 or as of January 1, 2017, by which a practice needs to be recognized as a patient-centered medical home in order to claim optimal improvement activities performance category points.

Response: We would like to explain that a MIPS eligible clinician or group must qualify as a certified patient-centered medical home or comparable specialty practice for at least a continuous 90 days during the performance period. Therefore, any MIPS eligible clinician or group that does not qualify by October 1st of the performance year as a certified patient-centered medical home or comparable specialty practice cannot receive automatic credit as such for the improvement activities performance category.

Comment: Other commenters were very concerned that the required 90-day reporting period for improvement activities was simply inapplicable to many of the improvement activities listed by CMS in the improvement

activities inventory and in other cases that it is unclear what needs to be done for 90 days. The commenters believed the time period for improvement activities should be tailored to the particular activity being implemented. In some cases, positive change could occur in less than 90 days but even for activities with a longer time horizon, a practice should receive credit for the improvement activities as long as it is in place for a least one quarter. Another commenter recommended that CMS assign timeframes for each improvement activity for 2017, to gather empirical data regarding the time intervals, instead of assigning a 90-day timeframe to all activities.

Response: While not all of the activities in the improvement activities inventory lend themselves to performance for a full 90 consecutive days for all MIPS eligible clinicians, we believe that each activity can be performed for a full 90 consecutive days by some, if not all, MIPS eligible clinicians, and that there are a sufficient number of activities included that any eligible clinician may select and perform for a continuous 90 days that will allow them to successfully report under this performance category. Therefore, we are finalizing our proposal that for the transition year of MIPS, any selected activity must be performed for at least 90 consecutive days.

After consideration of the comments regarding the required period of time for performing an activity, we are finalizing at § 414.1360 that MIPS eligible clinicians or groups must perform improvement activities for at least 90 consecutive days during the performance period for improvement activities performance category credit. Activities, where applicable, may be continuing (that is, could have started prior to the performance period and are continuing) or be adopted in the performance period as long as an activity is being performed for at least 90 days during the performance period.

(4) Application of Improvement Activities to Non-Patient Facing MIPS Eligible Clinicians and Groups

We understand that non-patient facing MIPS eligible clinicians and groups may have a limited number of measures and activities to report. Therefore, we proposed at § 414.1360 allowing non-patient facing MIPS eligible clinicians and groups to report on a minimum of one activity to achieve partial credit or two activities to achieve full credit to meet the improvement activities submission criteria. These non-patient facing MIPS eligible

¹⁹ Westanmo A, Marshall P, Jones E, Burns K, Krebs EE. Opioid Dose Reduction in a VA Health Care System—Implementation of a Primary Care Population-Level Initiative. *Pain Med.* 2015;16(5):1019–26.

clinicians and groups receive partial or full credit for submitting one or two activities irrespective of any type of weighting, medium or high (for example, two medium activities will qualify for full credit). For scoring purposes, non-patient facing MIPS eligible clinicians or groups receive 30 points per activity, regardless of whether the activity is medium or high. For example, one high activity and one medium activity could be selected to receive 60 points. Similarly, two medium activities could also be selected to receive 60 points.

We anticipate the number of activities for non-patient facing MIPS eligible clinicians or groups will increase in future years as we gather more data on the feasibility of performing improvement activities. As part of the process for identifying activities, we consulted with several organizations that represent a cross-section of non-patient facing MIPS eligible clinicians and groups. An illustrative example of those consulted with include organizations that represent cardiologists involved in nuclear medicine, nephrologists who serve only in a consulting role to other clinicians, or pathologists who, while they typically function as a team, have different members that perform different roles within their specialty that are primarily non-patient facing.

In the course of those discussions these organizations identified improvement activities they believed would be applicable. The comments on activities appropriate for non-patient facing MIPS eligible clinicians or groups are reflected in the proposed improvement activities inventory across multiple subcategories. For example, several of these organizations suggested consideration for Appropriate Use Criteria (AUC). As a result, we have incorporated AUC into some of the activities. We encourage MIPS eligible clinicians or groups who are already required to use AUC (for example, for advanced imaging) to report an improvement activity other than one related to appropriate use. Another example, under Patient Safety and Practice Assessment, is the implementation of an antibiotic stewardship program that measures the appropriate use of antibiotics for several different conditions (Upper Respiratory Infection (URI) treatment in children, diagnosis of pharyngitis, and bronchitis treatment in adults) according to clinical guidelines for diagnostics and therapeutics. In addition, we requested comments on what activities would be appropriate for non-patient facing MIPS eligible clinicians or groups to add to

the improvement activities inventory in the future. We requested comments on this proposal.

The following is a summary of the comments we received regarding the application of improvement activities to non-patient facing MIPS eligible clinicians and groups.

Comment: Some commenters expressed their support for the general approach of reducing the improvement activities performance category requirements for non-patient facing MIPS eligible clinicians and groups, as well as MIPS eligible clinicians practicing in rural areas or health professional shortage areas. Other commenters disagreed with that approach, stating that non-patient facing MIPS eligible clinicians should be able to obtain a full score of 60 points without any special modifications to improvement activities scoring while another commenter did not support reducing the improvement activities performance category requirements for these MIPS eligible clinicians and recommended that we hold all clinicians to the same standard. Other commenters suggested increasing the number of MIPS eligible clinicians in a practice required to meet the definition of a small practice from 15 to 25 for purposes of the improvement activities performance category. The commenters were also concerned that there are several subcategories such as Beneficiary Engagement and Expanded Practice Access that may limit non-patient facing MIPS eligible clinicians from having access to a broader list of activities than other types of practices and suggested that CMS limit the number of activities in the transition year to two for non-patient facing MIPS eligible clinicians.

Response: We believe there are several subcategories such as Beneficiary Engagement and Expanded Practice Access that may limit a non-patient facing MIPS eligible clinician from having access to the broader list of activities than for other types of practices and believe it is reasonable to limit the number of activities in the transition year for non-patient facing MIPS eligible clinicians. We refer readers to § 414.1305 for the definition of small practice for the purposes of MIPS.

After consideration of the comments regarding the application of improvement activities to non-patient facing MIPS eligible clinicians and groups we are not finalizing the policies as proposed. Rather, based on commenters' feedback, we believe that it is appropriate to reduce the number of activities that a non-patient facing MIPS

eligible clinician must select to achieve credit to meet the improvement activities data submission criteria. Specifically, we are finalizing at § 414.1380 that for non-patient facing MIPS eligible clinicians or groups, to achieve the highest score one high-weighted or two medium-weighted improvement activities are required. For these MIPS eligible clinicians and groups, in order to achieve one-half of the highest score, one medium-weighted improvement activity is required.

(5) Special Consideration for Small, Rural, or Health Professional Shortage Areas Practices

Section 1848(q)(2)(B)(iii) of the Act requires the Secretary, in establishing improvement activities, to give consideration to small practices and practices located in rural areas as defined at § 414.1305 and in geographic based HPSAs as designated under section 332(a)(1)(A) of the Public Health Service Act. In the MIPS and APMs RFI, we requested comments on how improvement activities should be applied to MIPS eligible clinicians or groups in small practices, in rural areas, and geographic HPSAs: if a lower performance requirement threshold or different measures should be established that will better allow those MIPS eligible clinicians or groups to perform well in this performance category, what methods should be leveraged to appropriately identify these practices, and what best practices should be considered to develop flexible and adaptable improvement activities based on the needs of the community and its population.

We engaged high performing organizations, including several rural health clinics with 15 or fewer clinicians that are designated as geographic HPSAs, to provide feedback on relevant activities based on their specific circumstances. Some examples provided include participation in implementation of self-management programs such as for diabetes, and early use of telemedicine, as in the one case for a top performing multi-specialty rural practice that covers 20,000 people over a 25,000-mile radius in a rural area of North Dakota. Comments on activities appropriate for MIPS eligible clinicians or groups located in rural areas or practices that are designated as geographic HPSAs are reflected in the proposed improvement activities inventory across multiple subcategories.

After consideration of comments and listening sessions, we proposed at § 414.1360 to accommodate small practices and practices located in rural areas, or geographic HPSAs for the

improvement activities performance category by allowing MIPS eligible clinicians or groups to submit a minimum of one activity to achieve partial credit or two activities to achieve full credit. These MIPS eligible clinicians or groups receive partial or full credit for submitting two activities of any type of weighting (for example, two medium activities will qualify for full credit). We anticipate the requirement on the number of activities for small practices and practices located in rural areas, or practices in geographic HPSAs will increase in future years as we gather more data on the feasibility of small practices and practices located in rural areas, and practices located in geographic HPSAs to perform improvement activities. Therefore, we requested comments on what activities would be appropriate for these practices for the improvement activities inventory in future years.

The following is a summary of the comments we received regarding special consideration for MIPS small practices, or practices located in rural areas or geographic HPSAs.

Comment: Some commenters requested that to facilitate rapid learning in the area of improvement activities performance category, CMS should provide targeted, practical technical assistance to solo and small practices that is focused on the improvement activities tailored to their level of quality improvement activity.

Response: We intend to provide targeted, practical technical assistance to MIPS eligible clinicians. Specifically, we intend to have a MACRA technical assistant that will be available to solo and small practices. In addition, MIPS eligible clinicians may contact the Quality Payment Program Service Center with specific questions.

Comment: Some commenters proposed that CMS recognize improvement efforts for clinicians in small practices by awarding them “full credit” in the improvement activities for participation in a Practice Transformation Network.

Response: Please note that Transforming Clinical Practice Initiative (TCPI) credit which includes activities such as a Practice Transformation Network is provided as a high-weighted activity for the transition year of MIPS.

After consideration of the comments regarding special consideration for small practices, rural, or geographic HPSAs practices we are not finalizing the policies as proposed. Rather, based on stakeholders’ feedback, we believe that it is appropriate to reduce the required number of activities required to achieve full credit in this performance

category for small practices, rural, or health professional shortage areas practices. Specifically, we are finalizing at § 414.1380 that for MIPS eligible clinicians and groups that are small practices or located in rural areas, or geographic HPSAs, to achieve full credit, one high-weighted or two medium-weighted improvement activities are required. In addition, we are modifying our proposed definition of rural area and finalizing at § 414.1305 that a rural area means clinicians in zip codes designated as rural, using the most recent HRSA Area Health Resource File data set available. We proposed using HRSA’s 2014–2015 Area Resource File but decided a non-specific reference would be more broadly applicable. In addition, we are finalizing the following definitions, as proposed, at § 414.1305: (1) small practices means practices consisting of 15 or fewer clinicians and solo practitioners; and (2) Health Professional Shortage Areas (HPSA) means areas as designated under section 332(a)(1)(A) of the Public Health Service Act.

We refer readers to section I.E.6.a.(4) of this final rule with comment period for a more detailed explanation of the number of points and scoring for the improvement activities performance category.

(6) Improvement Activities Subcategories

Section 1848(q)(2)(B)(iii) of the Act provides that the improvement activities performance category must include at least the subcategories listed below. The statute also provides the Secretary discretion to specify additional subcategories for the improvement activities performance category, which have also been included below.

- Expanded practice access, such as same day appointments for urgent needs and after-hours access to clinician advice.
- Population management, such as monitoring health conditions of individuals to provide timely health care interventions or participation in a QCDR.
- Care coordination, such as timely communication of test results, timely exchange of clinical information to patients and other MIPS eligible clinicians or groups, and use of remote monitoring or telehealth.
- Beneficiary engagement, such as the establishment of care plans for individuals with complex care needs, beneficiary self-management assessment and training, and using shared decision-making mechanisms.
- Patient safety and practice assessment, such as through the use of

clinical or surgical checklists and practice assessments related to maintaining certification.

- Participation in an APM, as defined in section 1833(z)(3)(C) of the Act.

In the MIPS and APMs RFI, we requested recommendations on the inclusion of the following five potential new subcategories:

- Promoting Health Equity and Continuity, including (a) serving Medicaid beneficiaries, including individuals dually eligible for Medicaid and Medicare, (b) accepting new Medicaid beneficiaries, (c) participating in the network of plans in the Federally Facilitated Marketplace or state exchanges, and (d) maintaining adequate equipment and other accommodations (for example, wheelchair access, accessible exam tables, lifts, scales, etc.) to provide comprehensive care for patients with disabilities.

• Social and Community Involvement, such as measuring completed referrals to community and social services or evidence of partnerships and collaboration with the community and social services.

- Achieving Health Equity, such as for MIPS eligible clinicians or groups that achieve high quality for underserved populations, including persons with behavioral health conditions, racial and ethnic minorities, sexual and gender minorities, people with disabilities, people living in rural areas, and people in geographic HPSAs.

• Emergency preparedness and response, such as measuring MIPS eligible clinician or group participation in the Medical Reserve Corps, measuring registration in the Emergency System for Advance Registration of Volunteer Health Professionals, measuring relevant reserve and active duty uniformed services MIPS eligible clinician or group activities, and measuring MIPS eligible clinician or group volunteer participation in domestic or international humanitarian medical relief work.

- Integration of primary care and behavioral health, such as measuring or evaluating such practices as: Co-location of behavioral health and primary care services; shared/integrated behavioral health and primary care records; or cross-training of MIPS eligible clinicians or groups participating in integrated care. This subcategory also includes integrating behavioral health with primary care to address substance use disorders or other behavioral health conditions, as well as integrating mental health with primary care.

We recognize that quality improvement is a critical aspect of

improving the health of individuals and the health care delivery system overall. We also recognize that this will be the first time MIPS eligible clinicians or groups will be measured on the quality improvement work on a national scale. We have approached the improvement activities performance category with these principles in mind along with the overarching principle for the MIPS program that we are building a process that will have increasingly more stringent requirements over time.

Therefore, for the transition year of MIPS, we proposed at § 414.1365 that the improvement activities performance category include the subcategories of activities provided at section 1848(q)(2)(B)(iii) of the Act. In addition, we proposed at § 414.1365 adding the following subcategories: “Achieving Health Equity,” “Integrated Behavioral and Mental Health,” and “Emergency Preparedness and Response.” In response to multiple MIPS and APMs RFI comments requesting the inclusion of “Achieving Health Equity,” we proposed to include this subcategory because: (1) It is important and may require targeted effort to achieve and so should be recognized when accomplished; (2) it supports our national priorities and programs, such as Reducing Health Disparities; and (3) it encourages “use of plans, strategies, and practices that consider the social determinants that may contribute to poor health outcomes.” (CMS, Quality Innovation Network Quality Improvement Organization Scope of Work: Excellence in Operations and Quality Improvement, 2014).

Similarly, MIPS and APMs RFI comments supported the inclusion of the subcategory of “Integrated Behavioral and Mental Health,” citing that “statistics show 50 percent of all behavioral health disorders are being treated by primary care and behavioral health integration.” Additionally, according to MIPS and APMs RFI comments, behavioral health integration with primary care is already being implemented in numerous locations throughout the country. The third additional subcategory we proposed to include is “Emergency Preparedness and Response,” based on MIPS and APMs RFI comments that encouraged us to consider this subcategory to help ensure that practices remain open during disaster and emergency situations and support emergency response teams as needed. Additionally, commenters were able to provide a sufficient number of recommended activities (that is, more than one) that could be included in the improvement activities inventory in all of these

proposed subcategories and the subcategories included under section 1848(q)(2)(B)(iii) of the Act.

We also solicited public comments on two additional subcategories for future consideration:

- Promoting Health Equity and Continuity, including (a) serving Medicaid beneficiaries, including individuals dually eligible for Medicaid and Medicare, (b) accepting new Medicaid beneficiaries, (c) participating in the network of plans in the Federally Facilitated Marketplace or state exchanges, and (d) maintaining adequate equipment and other accommodations (for example, wheelchair access, accessible exam tables, lifts, scales, etc.) to provide comprehensive care for patients with disabilities; and

- Social and Community Involvement, such as measuring completed referrals to community and social services or evidence of partnerships and collaboration with community and social services.

For these two subcategories, we requested activities that can demonstrate some improvement over time and go beyond current practice expectations. For example, maintaining existing medical equipment would not qualify for an improvement activity, but implementing some improved clinical workflow processes that reduce wait times for patients with disabilities or improve coordination of care including activities that regularly provide additional assistance to find other care needed for patients with disabilities, would be some examples of activities that could show improvement in clinical practice over time.

We requested comments on these proposals.

The following is summary of the comments we received regarding improvement activities subcategories.

Comment: Some commenters recommended inclusion of activities under the two additional subcategories; Promoting Health Equity and Social and Community Involvement. One commenter suggested we include the ASCO/CNS Chemotherapy Safety Administration Standards, potentially under the achieving health equity subcategory, with the highest weight. Other commenters recommended we include the following activities in this subcategory: Adhering to the U.S. Access Board standards for medical diagnostic equipment; reduced wait time for patients with disabilities for whom long wait times are a barrier to care; replacing inaccessible equipment; remodeling or redesigning an office to meet accessibility standards in areas

other than medical diagnostic equipment, and training staff on best practices in serving people with disabilities, including appropriate appointment lengths, person-centered care, and disability etiquette. The commenters also suggested that CMS include people with disabilities in the subcategory of expanded practice access, stating that despite the Americans with Disabilities Act (ADA), many clinician offices remain inaccessible to people with disabilities.

One commenter recommended that for this subcategory, CMS require both MIPS eligible clinicians and community service clinicians to demonstrate improvement in their respective functions, processes, or outcomes and consider developing metrics to evaluate the quality of health and well-being services that community-based organizations provide. Another commenter recommended that activities in the Social and Community Involvement subcategory include employing community health workers (CHWs) or integrating CHWs employed by community-based organizations into care teams, establishing a community advisory council, and creating formal linkages with social services clinicians and community-based organizations.

Response: We will proceed with the current proposed list of subcategories included in Table H in the Appendix to this final rule with comment period, as well as the subcategory for participation in an APM, for the transition year of MIPS. We will consider these recommendations in future years as part of the annual call for measures and activities in future rulemaking.

Comment: A few commenters recommended that in order to encourage and allow MIPS eligible clinicians to proactively incorporate and test new technologies into their practice, while closely sharing the decision making process with patients, CMS should develop an additional improvement activities subcategory to encourage MIPS eligible clinicians and groups to engage patients to consider new technologies that may be an option for their care.

Response: These recommendations will be considered during the call for activities and addressed in future rulemaking as necessary.

Comment: Some commenters stated general support for the improvement activities performance category, including efforts to benefit long-term care, and the inclusion of the subcategories of Achieving Health Equity and Integration of Behavioral and Mental Health.

Response: We have included the Achieving Health Equity and Integration of Behavioral and Mental Health subcategories.

Comment: Other commenters recommended that CMS group similar activities together to reduce complexity and confusion, and provided an example to move all QCDR activities under the Population Health Management subcategory so MIPS eligible clinicians can easily determine which capabilities they already have or may adopt with use of a QCDR.

Response: We believe that we have appropriately placed activities within their subcategories as proposed. However, we would like to note that we are committed to ease of reporting and we allow MIPS eligible clinicians to report across all subcategories. We will provide technical assistance through the Quality Payment Program Service Center and other resources.

Comment: One commenter requested the ability to select an activity across any subcategory.

Response: We are finalizing our proposed policy that MIPS eligible clinicians may select any activity across any improvement activities subcategory, as our intention is to provide as much flexibility for MIPS eligible clinicians as possible. We believe that where possible, MIPS eligible clinicians should choose activities that are most important or most appropriate for their practice across any subcategory.

Comment: Many commenters supported CMS's flexibility in recognizing a broad range of improvement activities performance category for Care Coordination, Beneficiary Engagement, and Patient Safety and recommended that CMS include a fourth subcategory that allows practices to focus on office efficiency/operations in order to promote long term success. Some commenters also requested that CMS include two additional subcategories; Promoting Health Equity and Continuity and Social and Community Involvement.

Response: We will proceed with the current proposed list of subcategories for the transition year of MIPS, included in Table H in in the Appendix to this final rule with comment period, as well as the subcategory for participation in an APM. Further determinations of improvement activities and subcategories will be addressed in future rulemaking and as part of the annual call for the subcategory and activities process that will occur simultaneously with the annual call for measures.

After consideration of the comments regarding improvement activities

subcategories we are finalizing at § 414.1365 that the improvement activities performance category will include the subcategories of activities provided at section 1848(q)(2)(B)(iii) of the Act. In addition, we are finalizing at § 414.1365 the following additional subcategories: "Achieving Health Equity," "Integrated Behavioral and Mental Health," and "Emergency Preparedness and Response."

(7) Improvement Activities Inventory

To implement the MIPS program, we are required to create an inventory of improvement activities. Consistent with our MIPS strategic goals, we believe it is important to create a broad list of activities that can be used by multiple practice types to demonstrate improvement activities and activities that may lend themselves to being measured for improvement in future years.

We took several steps to ensure the initial improvement activities inventory is inclusive of activities in line with the statutory language. We had numerous interviews with highly performing organizations of all sizes, conducted an environmental scan to identify existing models, activities, or measures that met all or part of the improvement activities performance category, including the patient-centered medical homes, the Transforming Clinical Practice Initiative (TCPI), CAHPS surveys, and AHRQ's Patient Safety Organizations. In addition, we reviewed the CY 2016 PFS final rule with comment period (80 FR 70886) and the comments received in response to the MIPS and APMs RFI regarding the improvement activities performance category. The improvement activities inventory was compiled as a result of the stakeholder input, an environmental scan, MIPS and APMs RFI comments, and subsequent working sessions with AHRQ and ONC and additional communications with CDC, SAMHSA and HRSA.

Based on the above discussions we established guidelines for improvement activities inclusion based on one or more of the following criteria (in any order):

- Relevance to an existing improvement activities subcategory (or a proposed new subcategory);
- Importance of an activity toward achieving improved beneficiary health outcome;
- Importance of an activity that could lead to improvement in practice to reduce health care disparities;
- Aligned with patient-centered medical homes;
- Representative of activities that multiple MIPS eligible clinicians or

groups could perform (for example, primary care, specialty care);

- Feasible to implement, recognizing importance in minimizing burden, especially for small practices, practices in rural areas, or in areas designated as geographic HPSAs by HRSA;

- CMS is able to validate the activity;

or

- Evidence supports that an activity has a high probability of contributing to improved beneficiary health outcomes.

Activities that overlap with other performance categories were included if there was a strong policy rationale to include it in the improvement activities inventory. We proposed to use the improvement activities inventory for the transition year of MIPS, as provided in Table H in in the Appendix to this final rule with comment period. For further description of how MIPS eligible clinicians or groups would be designated to submit to MIPS for improvement activities, we refer readers to the proposed rule (81 FR 28177). For all other MIPS eligible clinicians or groups participating in APMs that would report to MIPS, this section applies and we also refer readers to the scoring requirements for these MIPS eligible clinicians or groups in the proposed rule (81 FR 28234).

We requested comments on the improvement activities inventory and suggestions for improvement activities for future years as well.

The following is a summary of the comments we received regarding the statutory requirements for improvement activities related to the activities that must be specified under the improvement activities performance category. We refer readers to Table H in in the Appendix to this final rule with comment period.

General Comments Related to Activities Across More Than One Subcategory

Comment: We received several comments supporting the broad descriptions provided for activities in the MIPS transition year to enable MIPS eligible clinicians to effectively and appropriately implement and report in a manner that best represents their performance. Other commenters requested more detail about the methodology used to assign weights to the activities, and questioned whether CMS intends to develop specifications for activities as it does for quality measures.

Response: We appreciate the requests to provide further details around the methodology and specifications for improvement activities. Under the statute, we may contract with various entities to assist in identifying activities

and specifying criteria for the activities. Accordingly, the methodology we used to assign weights to the activities was to engage multiple stakeholder groups, including the Centers for Disease Control, Health Resources and Services Administration, Office of the National Coordinator for Health Information Technology, SAMHSA, Agency for Healthcare Research and Quality, Food and Drug Administration, the Department of Veterans Affairs, and several clinical specialty groups, small and rural practices and non-patient facing clinicians to define the criteria and establish weighting for each activity. Activities were proposed to be weighted as high based on the extent to which they align with activities that support the patient-centered medical home, since that is the standard under section 1848(q)(5)(C)(i) of the Act for achieving the highest potential score for the improvement activities performance category, as well as with our priorities for transforming clinical practice. Activities that require performance of multiple actions, such as participation in the Transforming Clinical Practice Initiative, participation in a MIPS eligible clinician's state Medicaid program, or an activity identified as a public health priority (such as emphasis on anticoagulation management or utilization of prescription drug monitoring programs) were also proposed to be weighted as high. Future revisions and specifications to the activities may be provided through future rulemaking, consistent with the needs and maturation process of the MIPS program in future years.

Comment: Several commenters supported the proposed list of activities but recommended that the number of required activities be reduced and that more activities be highly weighted.

Response: As discussed in section II.E.5.f.(2) of this final rule with comment period, we have reduced the number of activities that MIPS eligible clinicians are required to report on to no more than four medium-weighted activities or two high-weighted activities, or any combination thereof which would be less than four activities. We are reducing the number of activities for small practices, practices located in rural and geographic HPSAs and non-patient facing clinicians to no more than one high-weighted activities or two medium-weighted activities to achieve the highest score.

Comment: Some comments recommended assigning a higher weight to QCDR-related improvement activities and QCDR functions, and one commenter recommended that use of a QCDR count for several activities.

Response: Participating in a QCDR is not sufficient for demonstrating performance of multiple improvement activities and we do not believe at this time it warrants a higher weighting. In addition, QCDR participation was not proposed as a high-weighted activity because, while useful for data collection, it is neither critical for supporting certified patient-centered medical homes nor requires multiple actions, which are criteria we considered for high-weighting. We also note that while QCDR participation may not automatically confer improvement activities performance category credit, it may put MIPS eligible clinicians in a position to report multiple improvement activities, since there are several that specifically reference QCDR participation. We ask that each MIPS eligible clinician or group select from the broad list of activities that is included in Table H in the Appendix to this final rule with comment period.

Comment: One commenter suggested that we list ID numbers for activities listed in the improvement activities inventory.

Response: We will include IDs in the on-line portal, as well as a short title.

Comment: Many commenters suggested that we adopt more specialty-specific activities, citing their belief that many improvement activities are focused on primary care. The commenters made many suggestions for specialty-specific activities, including care coordination, patient safety, and other activities.

Response: There are many future activities that we would like to develop and consider for inclusion in MIPS, including those specific to specialties. We intend to take these comments into account in future rulemaking and as part of the annual call for the subcategory and activities process that will occur simultaneously with the annual call for measures. We note that the current improvement activities inventory does offer activities that can benefit all practice types and we believe specialists will be able to successfully report under this performance category.

Comment: One commenter requested that CMS clarify and distinguish between activities under the direction and ability of a user, as opposed to activities under the clinical supervision and control of MIPS eligible clinicians or groups. Another commenter stated that activities under the improvement activities performance category needed to reward active participation in an activity rather than rewarding the MIPS eligible clinicians for being part of an entity that pays for the activity. For example, the commenter stated that a

teaching hospital might be the awardee in a BPCI contract, but the faculty practice clinicians are leading the effort to redesign care.

Response: To reward for active participation in an activity rather than rewarding for being part of an entity that pays for the activity, we believe that the requirement that the MIPS eligible clinician or group must actually perform the activity for a continuous 90-day period addresses that concern since the clinician would need to perform that activity for that period of time. In the example that the commenter provided, the practices reporting at the TIN/NPI level would receive the credit for the improvement activities.

Comment: Some commenters believe that the activities in this performance category would not lead to improvement.

Response: For the transition year of MIPS, we intend for MIPS eligible clinicians to focus on achievement of these activities; they do not need to show that the activity led to improvement. We believe these activities are important for all MIPS eligible clinicians because their purpose is to encourage movement toward clinical practice improvement.

Comment: Another commenter noted that the proposal that MIPS eligible clinicians are required to consult with clinical decision support (CDS) under this mandate "are encouraged" to select improvement activities other than those related to the use of CDS. The commenter suggested that CMS maintain this statement as a recommendation and not require that a MIPS eligible clinician or group report another improvement activity if they are participating under the mandate and report an improvement activity related to CDS.

Response: We would like to note that we encourage MIPS eligible clinicians or groups who are already required to use AUC (for example, for advanced imaging) to report an improvement activity other than one related to appropriate use. We do not mandate any activity that must be reported. Further, we do not require MIPS eligible clinicians to consult with CDS. We also do not require that an MIPS eligible clinician or group report another improvement activity if they are already participating and reporting on an existing activity related to CDS.

Comment: One commenter suggested that CMS consider the existing reporting burdens on hospital-based MIPS eligible clinicians, and encouraged CMS to work closely with third party recognition programs to ensure that information on recognized MIPS eligible clinicians can

be accurately reported directly to CMS and linked to MIPS eligible clinicians accordingly. Another commenter suggested that CMS ensure that specifications for improvement activities undergo proper stakeholder comment, including a public comment period prior to finalization. A few commenters also requested that CMS allow additional stakeholder comment on the improvement activities specifications.

Response: We intend to continue assessing hospital based MIPS eligible clinician's reporting burden under the MIPS program. While the current activity list is expansive, there remain opportunities to expand the list further in future years. The current list, however, does offer activities that can benefit all practice types and we believe hospital based specialists will be able to successfully report improvement activities. Additionally, we provided earlier opportunities for public input and comment on activities as part of both the 2015 MIPS and APM RFI and the 2016 proposed rule.

Comment: Another commenter recommended that CMS change language regarding the definition of medical homes to those that are "nationally recognized accredited or certified" as the commenter regularly uses certified and accredited interchangeably.

Response: We refer readers to section II.E.5.f. of this final rule with comment period for discussions on the definition of recognized certifying or accrediting bodies for patient-centered medical homes.

Comment: One commenter recommended a flexible approach to quality assessment that emphasizes outcomes of care and that favors continuous quality improvement methodologies rather than rigid, process-oriented patient-centered medical home certification models. The commenter believed that relying on patient-centered medical home certification as a means of quality assessment runs the risk of practices not actually realigning efforts to produce higher quality and more cost effective care.

Response: We refer readers to section II.E.6.a.(4)(c) of this final rule with comment period where we discuss patient-centered medical home certification models.

Activities Related to the Patient Safety and Practice Assessment Subcategory

Comment: We received more than 25 comments requesting changes or additions to activities under the Patient Safety and Practice Assessment

subcategory. Under this subcategory, several commenters suggested that CMS consider Maintenance of Certification (MOC) Part IV participation as an improvement activity in all improvement activities subcategories, not just the Patient Safety/Practice Assessment subcategory. Other commenters suggested that Participation in Maintenance of Certification Part IV should be re-designated as a high priority. A few commenters also pointed out inconsistencies with reference to PDMP as a high-weighted activity in this section compared to what is included in the improvement activities inventory and requested for the change to a high weight be made for this activity in the inventory list.

Response: We recognize that some activities may align with more than one subcategory but have assigned each activity to one and only one subcategory to minimize confusion and avoid an unwieldy list of too many or duplicative activities that may be difficult to select from for the transition year of MIPS. MIPS eligible clinicians may select any activity across any subcategories to meet the criteria for the improvement activities performance category. We look forward to working with stakeholders on activity alignments with subcategories in future years. We also believe that high weighting should be used for activities that directly address practice areas with the greatest impact on beneficiary care, safety, health, and well-being. We have focused high weighting under the subcategories on those activities. We do not believe there is an inconsistency as PDMP Consultation is listed as a high-weighted activity and annual registration in a PDMP is listed as a medium-weighted activity. We have made a revision in the Consultation of PDMP activity to further elaborate and explain the requirements.

Comment: Many commenters suggested that CMS recognize continuing medical education (CME) activities provided by national recognized accreditors, completion of other state/local licensing requirements and providing free care to those in need as improvement activities, particularly those CME activities that involve assessment and improvement of patient outcomes or care quality, best practice dissemination and aid in the application of the "three aims" (better care; healthier people and communities; smarter spending), the National Quality Standards and the CMS Quality Strategy. The commenters also recommended that inclusion of surveys or interviewing clinicians to determine if they have applied lessons learned to their practice for at least 90 days

following an activity should meet compliance requirements.

Response: We appreciate the suggestions that we grant improvement activities credit for activities already certified as CME activities, however, for the transition year of the MIPS program we do not have sufficient data to identify which CMEs could be included as activities. We will consider these recommendations for additional activities in future years as part of the nomination process.

Comment: One commenter recommended that the improvement activities performance category be used to evaluate what activities, in what quantity, contribute to increased value and improve quality, and that CMS avoid using overly prescriptive thresholds or quantities of activities requirements, such as those used in CPC, that show no correlation to outcomes, quality, or costs. The commenter suggested that CMS align its criteria for improvement activities with activities that are included as components of patient-centered home model. Another commenter advised significantly reducing process-oriented measures in the improvement activities performance category and building on activities that clinicians were already completing, because process-oriented measures could be perceived as busy work. This commenter also stated that when relevant improvement activities were not otherwise available, CMS could reduce the burden by allowing certified improvement activities as partial or complete satisfaction of improvement activities requirements.

Response: We believe that MIPS eligible clinicians are dedicated to the care of beneficiaries and will only attest to activities that they have undertaken in their practice that follow the specific guideline of each improvement activity. We note we have not proposed prescriptive thresholds for activities beyond an attestation that a certain percentage of patients were impacted by a given activity and that in establishing the improvement activities performance category we included activities that align with those patient-centered medical homes typically perform. We are not reducing process-oriented improvement activities in this performance category because these were activities that multiple practices recommended as contributing to practice improvements. We are also not allowing partial completion of an activity to count toward the improvement activities score. We refer readers to section II.E.5.f.(3)(c) of this final rule with comment period for discussions on how we have reduced

the number of activities required for the improvement activities performance category which we believe also addresses burden. In addition, we would like to explain that the activities in the improvement activities inventory were identified by different types of practices such as rural and small practices, as well as large practices, who indicated these are improvement activities that clinicians are already performing and believed they should be included in the improvement activities inventory.

Activities Related to the Population Management Subcategory

Comment: We received more than 10 comments related to the Population Management subcategory. One commenter expressed support for the 2014 AHA/ACC/HRS Guideline for the Management of Patients with Atrial Fibrillation, noting that comprehensive patient education, care coordination, and appropriate dosing decisions are important for managing patients on anticoagulants, including warfarin and novel oral anticoagulants. The commenter also indicated that the use of validated electronic decision support and clinical management tools, particularly those that support shared decision making, may benefit all patients treated with anticoagulants. The commenter recommended that improvement activities be inclusive of patients treated with all anticoagulants while recognizing differences in management requirements.

Response: We agree that comprehensive patient education, care coordination, and appropriate dosing decisions are important for managing patients on anticoagulants. We acknowledge that the use of validated electronic decision support and clinical management tools, particularly those that support shared decision making, may benefit all patients treated with anticoagulants. We refer the readers to section II.E.5.g. of this final rule with comment period for more information on electronic decision support. We also acknowledge that improvement activities should be inclusive of patients treated with all anticoagulants while recognizing differences in management requirements.

We note that because anticoagulants have been consistently identified as the most common causes of adverse drug events across health care settings, the Population Management activity starting with "Participation in a systematic anticoagulation program (coagulation clinic, patient self-reporting program, patient self-management program

highlights)" highlights the importance of close monitoring of Vitamin K antagonist therapy (warfarin) and the use of other coagulation cascade inhibitors.

Comment: One commenter suggested adding the NCQA Heart/Stroke Recognition Program as an activity for the Population Management subcategory. The commenter expressed their belief that attending an educational seminar on new treatments that covers medication management and side effects for cancer treatments such as neutropenia or immune reactions would improve safety and result in better care for beneficiaries.

Response: We appreciate this additional recommendation and will consider it in future years.

Activities Related to the Behavioral Health Subcategory

Comment: We received more than 20 comments related to activities under the Behavioral Health subcategory. One commenter agreed with our proposed activity: "Tobacco use: Regular engagement of MIPS eligible clinicians or groups in integrated prevention and treatment interventions, including tobacco use screening and cessation interventions (refer to NQF #0028) for patients with co-occurring conditions of behavioral or mental health and at risk factors for tobacco dependence," and in addition, requested that CMS consider adding features from a successful model such as the Million Hearts Multidisciplinary Approach to Increase Smoking Cessation Interventions that was demonstrated in New York City.

Response: We will consider the best way to incorporate additional smoking cessation efforts in MIPS and our other quality programs in the future.

Comment: Several commenters requested that CMS expand various descriptions in the improvement activities inventory list, such as for the activity "Participation in research that identifies interventions, tools or processes that can improve a targeted patient population," to include reference to engagement in federally funded clinical research.

Response: We will take this suggestion into consideration for future rulemaking.

Activities Under the Expand Practice Access Subcategory

Comment: We received only a few unique comments related to Expanding Practice Access, most related to telehealth. These commenters suggested that we consider additional activities under the improvement activities performance category, potentially

including telehealth services or other activities nominated by MIPS eligible clinicians or groups. The commenters made specific suggestions ranging from follow-up inpatient telehealth consultations furnished to beneficiaries in hospitals or SNFs, office or other outpatient visits to transitional care management services with high medical decision complexity, psychoanalysis, and family psychotherapy.

Response: In developing improvement activities, some of the developer's considerations should include whether the activity is evidenced based and applicable across service settings, and aligns with the National Quality Strategy and CMS Quality Strategy. We will take the commenters' suggestions into account for future rulemaking.

Activities Related to the Beneficiary Engagement Subcategory

Comment: Commenters suggested numerous nomenclature changes within the Activities Under Beneficiary Engagement subcategory. For example, one commenter suggested that we refer to "clinical registries" in general rather than QCDRs, since many MIPS eligible clinicians may participate in clinical registries without using them for MIPS participation. Other commenters suggested that we revise the wording of the proposed activity "Participation in CMMI models such as Million Hearts Campaign" to reflect that this is a model, not a "campaign," and suggested that we include the wording "standardized treatment protocols" in the proposed activity "Use decision support and protocols to manage workflow in the team to meet patient needs." Other commenters suggested changes to the activities labels in Table H in the Appendix to this final rule with comment period.

Response: We have revised the wording of the Million Hearts activity to read "Participation in CMMI models such as the Million Hearts Cardiovascular Risk Reduction Model." In addition, we have revised the decision support activity to read "Use decision support and standardized, evidence-based treatment protocols to enhance effective workflow in the team to meet patient needs."

Comment: Another commenter expressed concern that the proposed activity "Use tools to assist patients in assessing their need for support for self-management (for example, the Patient Activation Measure or How's My Health)" mentioned the Patient Activation Measure, which the commenter stated was proprietary and expensive if widely used. The commenter recommended that we

consider the variety of psychometric tools that can be used to measure not only patient motivation, but also confidence and intent to act. The commenter stated that for example, specifically calling out activation inhibits health behavior change innovation. The commenter stated that it is possible to measure the burden of patient symptoms by using instruments like impact index assessments. The commenter further stated that asking patients about how much they are bothered by their symptoms can help healthcare professionals assess the quality of life a patient is experiencing.

Response: We recognize that the Patient Activation Measure (PAM) survey is proprietary and does require an investment on the practices' part if they choose to utilize it. However, in the activity noted above related to PAM, we explain that this is an example of a tool that could be used. Other tools to assist patients in assessing their need for support for self-management would be acceptable for this activity.

Comment: Some commenters questioned whether a Million Hearts award received in prior years can count for improvement activities credit as prior awardees are not allowed to compete again. The commenters suggested that prior year awards should count for improvement activities credit and bonus points as well.

Response: We recognize the importance of the Million Hearts Cardiovascular Risk Reduction Model and have included that activity in the improvement activities inventory. All activities within the improvement activities inventory, however, must be performed for a continuous 90-day period that must occur within the performance period.

Activities Related to the Emergency Preparedness and Readiness Subcategory

Comment: Some commenters noted that the Emergency Response and Preparedness subcategory was the only subcategory with no high-weighted activities and several asked for more high-weighted activities.

Response: We are changing one existing activity in the Emergency Response and Preparedness Subcategory "Participation in domestic or international humanitarian volunteer work. MIPS eligible clinicians and groups must be registered for a minimum of 6 months as a volunteer for domestic or international humanitarian volunteer work" to a high-weighted activity that is "Participation in domestic or international humanitarian volunteer work. Activities that simply

involve registration are not sufficient. MIPS eligible clinicians must attest to domestic or international humanitarian volunteer work for a period of a continuous 60 days or greater." We have changed this activity from requiring being registered for 6 months to participating for 60 days to be in line with our overall new performance period policy which only requires a 90-day period. The 60-day participation would fall within that new 90-day window. We are also changing this to a high-weighted activity because such volunteer work is intensive, often involves travel and working under challenging physical and clinical circumstances. Table H in the Appendix to this final rule with comment period reflects this revised description of the existing activity and revised weighting.

Comment: One commenter recommended the exclusion of "Participation in domestic or international humanitarian volunteer work" activity, stating that it is unlikely to lead to improvements in the quality or experience of care for a MIPS eligible clinician's patients. Another commenter expressed concern that their patient satisfaction ratings will suffer because they are actively attempting to reduce prescription drug overdoses. The commenter suggested removing the patient satisfaction component.

Response: We disagree that this activity is unlikely to improve quality of care. Caring for injured and medically unwell patients during disasters is widely described by the generations of clinicians who have volunteered for these efforts as an excellent learning experience and that their volunteer work improved their clinical skills in their routine practice upon their patients. We believe that "Participation in domestic or international humanitarian volunteer work" will have a similar positive impact for MIPS eligible clinicians and their patients.

Comment: A few commenters believed that the Congress expressly defined remote monitoring and telehealth as a component of care coordination in improvement activities and understood the vital role of personal connected health in delivery of high quality clinical practice. The commenters suggested that CMS modify improvement activities in a manner that would reflect statutory language and provide incentive for the conduct of improvement activities using digital, interoperable communications.

Response: We have provided appropriate incentives through other performance categories aligned with the policy goals for interoperability of EHRs

and for achieving widespread exchange of health information. We also note the statutory example of "use of remote monitoring or telehealth" in several activities, which include under the Care Coordination subcategory, "Ensuring that there is bilateral exchange of necessary patient information to guide patient care that could include participating in a Health Information Exchange." This would require interoperable communications. Under the Population Management subcategory, we provide incentive for using remote monitoring or telehealth through the activity related to Oral Vitamin K antagonist therapy (warfarin) that includes, for rural or remote patients, that they can be managed using remote monitoring or telehealth options.

Comment: Other commenters supported the MIPS program in including improvement activities as a new performance category for clinician performance, particularly incentivizing the use of health IT, telehealth and connection of patients to community-based services. In addition, specifically for the improvement activities performance category activities regarding connections to community-based services and the use of health IT and telehealth, the commenters supported CMS increasing their weight by rating them as "high" in the final rule with comment period.

Response: We believe that high weighting should be used for activities that directly address areas with the greatest impact on beneficiary care, safety, health, and well-being. We have focused high weighting under the subcategory on those activities.

Comment: Another commenter recommended that we enhance the clarity of the improvement activities definitions in the final rule with comment period and with subregulatory guidance so that MIPS eligible clinicians know what they must do to qualify for a given improvement activity. For example, where a general and non-specific definition is intentional to permit clinicians flexibility, commenter requested that CMS define expectations on how MIPS eligible clinicians can meet and substantiate such an improvement activity requirement and specify the evidence that MIPS eligible clinicians would be expected to retain as documentation for a potential audit including documentation for non-percentage-based measures. The commenter stated their concern that, given short and ambiguous definitions in Table H in the Appendix to this final rule with comment period, clinicians may avoid a given

improvement activity based on varied understandings of what satisfying the activity entails.

Response: MIPS eligible clinicians may retain any documentation that is consistent with the actions they took to perform each activity. We also note that any MIPS eligible clinician may report on any activity; for example, a cardiologist may choose to select an improvement activity related to an emergency response and preparedness, if applicable. We will provide MIPS eligible clinicians more information about documentation expectations for the transition year of MIPS in subregulatory guidance.

Activities Related to the Health Equity Subcategory

Comment: We received over 10 comments related to activities under Health Equity. One commenter recommended that we add an activity that encourages referrals to a clinical trial for a minority population. Another commenter requested inclusion of an established health equity council. Another commenter supported a Promoting Health Equity and Continuity subcategory, and recommended including the Bravemann *et al.* definition of health equity and the Tool for Health and Resilience in Vulnerable Environments or THRIVE framework.

Response: We will consider these recommendations in future years as part of the nomination process.

Activities Related to the Care Coordination Subcategory

Comment: We received at least 10 comments related to Care Coordination activities. One commenter recommended that we expand the subset of activities listed for the Care Coordination subcategory in the improvement activities inventory list to include long-term services and supports. Another commenter supported our proposal to retain the activities related to care management and individualized plans of care in the proposed improvement activities inventory, and refine these activities over time by incorporating the concept of principles of person-centered care to coordinate care and identifying, tracking and updating individual goals as they relate to the care plan. One commenter recommended that participation in a Rural Health Innovation Collaborative (RHIC) count as an improvement activity since RHIC are recognized by Congress as organizations that can give technical support to small practices, rural practices, and areas experiencing a shortage of clinicians.

Response: We will work with stakeholders as part of the future nomination process to identify additional activities.

After consideration of the comments regarding the improvement activities inventory, we are finalizing the improvement activities and weighting provided in Table H in the Appendix to this final rule with comment period as proposed with the exception of the following: One change for one activity in the Emergency Response and Preparedness Subcategory from a medium to a high-weighted activity; one change for one activity in the Population Management Subcategory from a medium to a high-weighted activity; we have included the addition of an asterisk (*) in Table H in the Appendix to this final rule with comment period, next to activities that also qualify for the advancing care information bonus, and refer readers to section II.E.6.a.(5) of this final rule with comment period. We also included language, elaborating on the requirements for the Consultation PDMP activity. We are correcting the reference to Million Hearts Cardiovascular Risk Reduction Model instead of describing it as a “campaign;” and revising the wording of the proposed activity “Use decision support and protocols to manage workflow in the team to meet patient needs” to read “Use decision support and standardized treatment protocols to manage workflow in the team to meet patient needs;” and “removing the State Innovation Model participation activity.” Our reasoning for these changes is to alleviate confusion related to the activity based on comments, to correct a previous incorrect term such as the use of the word “campaign” or as a result of some other change in another section of the final rule with comment period, specifically inclusion of qualifying improvement activities for the advancing care information bonus. Our reasoning for changing the CAHPS for MIPS survey weighting to high is because the CAHPS for MIPS survey will be optional for large groups under the quality performance category and we want to encourage use of this survey. Another contributing element was the need to ensure options beyond the CAHPS for MIPS survey were available to provide credit for surveying and for CAHPS that did not meet thresholds/standards for reporting in measure category (largely because they did not have enough beneficiaries). Our reasoning for removing the State Innovation Model (SIM) activity is that SIM is a series of a different agreements

between CMS and states. Clinicians are not direct participants. In addition, we do not collect TIN/NPI combinations, so there is no way to validate participation based on attestation. Our reasoning for changing the weighting on the Emergency Response and Preparedness activity is that this improvement activity requires the clinician pay out of pocket to travel and do volunteer work (personal costs/risks), likely contributing some donated medical durables/expendables (practice material resources). In addition, the clinician also misses scheduled appointments with patients (foregoing practice financial revenue). Our reasoning for changing the weighting on the Population Management activity is that this improvement activity is consistent with section 1848(q)(2)(B)(iii) of the Act, which requires the Secretary to give consideration to the circumstances of practices located in rural areas and geographic HPSAs. Rural health clinics would be included in that definition for consideration of practices in rural areas. All of these changes are reflected in Table H in the Appendix to this final rule with comment period.

(a) CMS Study on Improvement Activities and Measurement

(1) Study Purpose

Previous experience with the PQRS, VM, and Medicare EHR Incentive programs have shown that many clinicians have errors within their data sets, as well as problems in understanding and choosing the data that corresponds to their selected quality measures. In CMS’ quest to create a culture of improvement using evidence based medicine on a consistent basis, fully understanding the strengths and limitations of the current processes is crucial to better understand the current processes, we proposed to conduct a study on clinical improvement activities and measurement to examine clinical quality workflows and data capture using a simpler approach to quality measures.

The lessons learned in this study on practice improvement and measurement may influence changes to future MIPS data submission requirements. The goals of the study are to see whether there will be improved outcomes, reduced burden in reporting, and enhancements in clinical care by selected MIPS eligible clinicians desiring:

- A more data driven approach to quality measurement.
- Measure selection unconstrained by a CEHRT program or system.

- Improving data quality submitted to CMS.
- Enabling CMS get data more frequently and provide feedback more often.

(2) Study Participation Credit and Requirements: Study Participation Eligibility

This present study will select 10 non-rural individual MIPS eligible clinicians or groups of less than three non-rural MIPS eligible clinicians, 10 rural individual MIPS eligible clinicians or groups of less than three rural MIPS eligible clinician's, 10 groups of three to eight MIPS eligible clinicians, five groups of nine to 20 MIPS eligible clinicians, three groups of 21 to 100 MIPS eligible clinicians, two groups of greater than 100 MIPS eligible clinicians, and two specialist groups of MIPS eligible clinicians. Participation would be open to a limited number of MIPS eligible clinicians in rural settings and non-rural settings. A rural area is defined at § 414.1305 and a non-rural area would be any MIPS eligible clinicians or groups not included as part of the rural definition. MIPS eligible clinicians and groups would need to sign up from January 1, 2017, to January 31, 2017. The sign up process will utilize a web-based interface. Participants would be approved on a first come first served basis and must meet all the required criteria. Selection criteria will also be based on different states and also within different clinician settings that falls in the participation eligibility criteria.

MIPS eligible clinicians and groups in the CMS study on practice improvement and measurement will receive full credit (40 points) for the improvement activities performance category of MIPS after successfully electing, participating and submitting data to the study coordinators at CMS for the full calendar year.

(3) Procedure

Based on feedback and surveys from MIPS eligible clinicians, study measurement data will be collected at baseline and at every three months (quarterly basis) afterwards for the duration of the calendar year. Study participants who can submit data on a more frequent basis will be encouraged to do so.

Participants will be required to attend a monthly focus group to share lessons learned along with providing survey feedback to monitor effectiveness. The focus group would also include providing visual displays of data, workflows, and best practices to be shared amongst the participants to

obtain feedback and make further improvements. The monthly focus groups would be used to learn from the practices on how to be more agile as we test new ways of measure recording and workflow.

For CY 2017, the participating MIPS eligible clinicians or groups would submit their data and workflows for a minimum of three MIPS CQMs that are relevant and prioritized by their practice. One of the measures must be an outcome measure, and one must be a patient experience measure. The participating MIPS eligible clinicians could elect to report on more measures as this would provide more options from which to select in subsequent years for purposes of measuring improvement.

If MIPS eligible clinicians or groups calculate the measures working with a QCDR, qualified registry, or CMS-approved third party intermediary, we would use the same data validation process described in the proposed rule (81 FR 28279). We would only collect the numerator and denominator for the measures selected for the overall population, all patients/all payers. This would enable the practices to build the measures based on what is important for their area of practice while increasing the quality of care.

The first round of the study will last for 1 year after which new participants will be recruited. Participants electing to continue in future years would be afforded the opportunity to opt-in or opt-out following the successful submission of data to us. The first opportunity to continue in the study would be at the end of the 2017 performance period. Eligible clinicians who elect to join the study but fail to participate in the study requirements and/or fail to successfully submit the data required will be removed from the study. Unsuccessful study participants will then be subject to the full requirements for the improvement activities performance category.

In future years, participating MIPS eligible clinicians or groups would select three of the measures for which they have baseline data from the 2017 performance period to compare against later performance years.

We requested comment on the study and welcome suggestions on future study topics.

The following is a summary of the comments we received regarding the CMS study on improvement activities and measurement.

Comment: Commenters recommended that CMS monitor performance of the activities by the various MIPS eligible clinicians and groups for trends and

consider whether activities result in better outcomes.

Response: We will consider these issues as we develop the study.

Comment: Some commenters supported CMS' proposal to conduct a study on improvement activities and measurement, in general, to examine clinical quality workflows and data capture using a simpler approach to quality measures. The commenters believed that CMS proposes an appropriate incentive by allowing a limited number of selected clinicians and groups to receive full credit (60 points) for the improvement activities performance category if they participate in the study. However, the commenters recommended that CMS expand this opportunity so that it is available to a broader and more diverse swath of practices, including emergency medicine practices. Other commenters supported our plans to conduct an annual call for activities to build the improvement activities inventory and our plans to study measurement, workflow, and current challenges for clinical practices. The commenters suggested that we ensure that we study a diverse range of participants when conducting that analysis.

Response: We plan to expand as we learn from the initial study, which is currently open to all types of practices. We acknowledge that there are many variables affecting measurement and will continue to make sure we look at this diversification as we study different methods of measurement.

Comment: One commenter was concerned about the study and wanted to know if CMS expects vendors to develop EHR workflows and reports for study measures and if vendors would be expected to support the study's requirements for more frequent data submission.

Response: We will work with these vendors and others as the study evolves. We note that for this study, we will use measures that already exist in programs, so that new development is required for technical workflows or documentation requirements for those products included on the ONC certified health IT product list (CHPL).

Comment: Another commenter agreed that improvement activities study participants should receive full credit for improvement activities and that those participants that do not adhere to the study guidelines should be removed and subject to typical improvement activities requirements. This commenter recommended that CMS provide a final date by which it plans to make these exclusion determinations and that after this date, CMS can work with the ex-

participant to help them complete the year. They also recommended that all participants who get excluded from the study not be allowed to participate in the study the following year.

Response: We will work with stakeholders to further define future participation requirements as this study evolves.

After consideration of the comments regarding the CMS study on improvement activities and measurement we are finalizing the policies with the exception that successful participation in the pilot would result in full credit for the improvement activities performance category of 40 points, not 60 points, in accordance with the revised finalized scoring. If participants do not meet the study guidelines they will be removed from the study and need to follow the current improvement activities guidelines.

(8) Improvement Activities Policies for Future Years of the MIPS Program

(a) Proposed Approach for Identifying New Subcategories

We proposed, for future years of MIPS, to consider the addition of a new subcategory to the improvement activities performance category only when the following criteria are met:

- The new subcategory represents an area that could highlight improved beneficiary health outcomes, patient engagement and safety based on evidence.

- The new subcategory has a designated number of activities that meet the criteria for an improvement activity and cannot be classified under the existing subcategories.

- Newly identified subcategories would contribute to improvement in patient care practices or improvement in performance on quality measures and cost performance categories.

In future years, MIPS eligible clinicians or groups would have an opportunity to nominate additional subcategories, along with activities associated with each of those subcategories that are based on criteria specified for these activities, as discussed in the proposed rule. We requested comments on this proposal.

We did not receive any comments regarding policies for identifying new improvement activities subcategories in future years of the MIPS program. We therefore are finalizing the addition of a new subcategory to the improvement activities performance category only when the following criteria are met:

- The new subcategory represents an area that could highlight improved

beneficiary health outcomes, patient engagement and safety based on evidence.

- The new subcategory has a designated number of activities that meet the criteria for an improvement activity and cannot be classified under the existing subcategories.

- Newly identified subcategories would contribute to improvement in patient care practices or improvement in performance on quality measures and cost performance categories.

(b) Request for Comments on Call for Measures and Activities Process for Adding New Activities

We plan to develop a call for activities process for future years of MIPS, where MIPS eligible clinicians or groups and other relevant stakeholders may recommend activities for potential inclusion in the improvement activities inventory. As part of the process, MIPS eligible clinicians or groups would be able to nominate additional activities that we could consider adding to the improvement activities inventory. The MIPS eligible clinician or group or relevant stakeholder would be able to provide an explanation of how the activity meets all the criteria we have identified. This nomination and acceptance process would, to the best extent possible, parallel the annual call for measures process already conducted by CMS for quality measures. The final improvement activities inventory for the performance year would be published in accordance with the overall MIPS rulemaking timeline. In addition, in future years we anticipate developing a process and establishing criteria to remove or add new activities to improvement activities performance category.

Additionally, prospective activities that are submitted through a QCDR could also be included as part of a beta-test process that may be instrumental for future years to determine whether that activity should be included in the improvement activities inventory based on specific criteria noted above. MIPS eligible clinicians or groups that use QCDRs to capture data associated with an activity, for example the frequency in administering depression screening and a follow-up plan, may be requested to voluntarily submit that same data in year 2 to begin identifying a baseline for improvement for subsequent year analysis. This is not intended to require any MIPS eligible clinician or group to submit improvement activities only via QCDR from 1 year to the next or to require the same activity from 1 year to the next. Participation in doing so, however, can help to identify how

activities can contribute to improve outcomes. This data submission process will be considered part of a beta-test to: (1) Determine if the activity is being regularly conducted and effectively executed and (2) if the activity warrants continued inclusion on the improvement activities inventory. The data would help capture baseline information to begin measuring improvement and inform the Secretary of the likelihood that the activity would result in improved outcomes. If an activity is submitted and reported by a QCDR, it would be reviewed by us for final inclusion in the improvement activities inventory the following year, even if these activities are not submitted through the future call for measures and activities process. We intend, in future performance years, to begin measuring improvement activities data points for all MIPS eligible clinicians and to award scores based on performance and improvement. We solicited comment on how best to collect such improvement activities data and factor it into future scoring under MIPS.

We requested comments on these approaches and on any other considerations we should take into account when developing these type of approaches for future rulemaking.

The following is summary of the comments we received regarding improvement activities policies for identifying new improvement activities in future years of the MIPS program.

Comment: Some commenters recommended that CMS limit participants from reporting on the same activity over several performance periods in future years.

Other commenters recommended that CMS allow MIPS eligible clinicians to maintain improvement activities over time and opposed CMS proposals to have more stringent requirements. These commenters were concerned that by imposing limits on frequency of reporting of the same activity over several years, CMS would be encouraging practices to implement temporary instead of permanent improvements and would risk creating short-lived activities that lack consistency across time, which is not beneficial to patients and is confusing and disruptive to MIPS eligible clinicians' workflow.

A few commenters recommended that CMS permit MIPS eligible clinicians to select from a wide range of improvement activities, allow MIPS eligible clinicians to perform them in a way that is effective and reasonable for both the MIPS eligible clinicians and their patient population, and refrain from imposing restrictive specifications

regarding how MIPS eligible clinicians document and report their activities. One commenter suggested that CMS keep the broad list of improvement activities and publish additional detail through non-binding clarification or guidance, rather than in regulatory text, which may limit innovation and flexibility.

Response: We recognize that some activities may be improved upon over time which would support reporting on the same activity across multiple performance periods. We also note that other activities, such as providing 24/7 access may provide limited opportunity to demonstrate improvement over time and would minimize the value of reporting this same activity over subsequent years. We will consider this for future rulemaking. It is our intention to continue to allow MIPS eligible clinicians to select from a wide range of improvement activities, allow MIPS eligible clinicians to perform them in a way that is effective and reasonable for both the MIPS eligible clinicians and their patient population, and refrain from imposing restrictive specifications regarding how MIPS eligible clinicians document and report their activities. In addition, we intend to keep the broad list of improvement activities and publish additional detail through non-binding clarification or guidance as we are able.

Comment: Other commenters suggested that in the future, CMS evaluate whether: (1) Improvement activities should be worth more than 15 percent of the final score; (2) individual activity weights should be increased; the number and type of MIPS eligible clinicians reporting on health equity improvement activities should be changed; (3) how performance on health equity improvement activities correlates with quality performance; (4) whether improvement activities result in better outcomes; and (5) what additional improvement activities should be included in MIPS. Some commenters suggested that some activities in the improvement activities performance category require considerable additional resources, and may warrant more points than 20—the proposed standard for “high.” Other commenters expressed concern about the proposed scoring for improvement activities, noting that the category is a new one that has not been implemented in previous programs and that activities may favor outpatient primary care.

Response: We intend to consider these comments in future rulemaking, and will monitor MIPS eligible clinicians’ performance in the improvement activities performance

category carefully to inform those policy decisions. We welcome commenters’ specific suggestions for additional activities or activities that may merit additional points beyond the “high” level we are adopting in the future. We refer readers to the section II.E.6. of this final rule with comment period for additional discussion of the public comments that we received on the MIPS program’s scoring methodology.

Comment: A few commenters agreed with the proposal that future scores for improvement activities should be based on outcomes and improvement. The commenters believed that MIPS eligible clinicians engaged in improvement activities should submit quality measures that reflect the focus of their improvement activities and demonstrate the quality improvement by engaging in those improvement activities. Other commenters suggested that we use improvement activities as a test bed for innovation to identify how activities could lead to improved outcomes and readiness for APM participation. The commenters encouraged collaboration with specialty physicians, medical societies, and other stakeholders to evaluate improvement activities continually.

Response: We will take the commenter’s suggestion that we should more closely link measures selected under the quality performance category with activities selected under the improvement activities performance category into consideration in the future. We note that for the transition year of MIPS, we believe we should provide MIPS eligible clinicians with flexibility in selecting measures and activities that are relevant to their practices.

We intend to monitor MIPS eligible clinicians’ participation in improvement activities carefully, and as the commenters suggested, we will continue examining potential relationships to quality measurement, advancing care information measures leveraging CEHRT, and APM participation readiness. We intend to continue collaborating with specialty clinicians, medical societies, and other stakeholders when conducting these evaluations.

Comment: Some commenters opposed adding additional measurement and reporting requirements for improvement activities in future years and stated that this would increase MIPS eligible clinician burden and is not in line with CMS’s objective to simplify MIPS. The commenters suggested that CMS view the improvement activities inventory as fluid and to formalize a standard process to add new activities each year.

Response: We will take these comments into account as we consider improvement activities policy for future program years. Our intent, however, is to minimize burden on MIPS eligible clinicians. We will consider whether or not we should adopt a standard process for adding activities in the future.

Comment: Some commenters recommended that CMS allow MIPS eligible clinicians or groups to nominate additional activities that CMS would consider adding to the improvement activities inventory. Specifically, they recommended that CMS draw upon working sessions with groups such as AHRQ, ONC, HRSA, and other federal agencies to create a patient-generated health data framework which would seek to identify best practices, gaps, and opportunities for progress in the collection and use of health data for research and care delivery.

Response: We intend to follow a similar process that is now employed in the annual Call for Measures for changes in the improvement activities inventory. It is important to keep in mind that in developing activities, some of the developer’s considerations should include whether the activity is evidenced based and applicable across service settings and aligns with the National Quality Strategy and CMS Quality Strategy.

Comment: Several commenters stated, as CMS implements new improvement activities in future years, the commenters were in support of a process similar to the current CMS Call for Quality Measures and recommended that CMS clearly communicate the timelines and requirements to the public early and often to allow for the preparation of submissions.

Response: Our intent is to proceed with this process for the transition year of MIPS.

Comment: A few commenters expressed concern about program requirements for MIPS eligible clinicians reporting as a group and future changes in the program. The commenters also requested more direction regarding documentation to maintain for these activities in the event of an audit.

Response: We will verify data through the data validation and audit process as necessary. MIPS eligible clinicians may retain any documentation that is consistent with the actions they took to perform each activity.

Comment: Other commenters proposed that CMS allow, for the improvement activities performance category, that individual activities may be pursued by an individual MIPS eligible clinician for up to 3 years, but

that following this period, MIPS eligible clinicians be required to select a different area of focus.

Response: We will consider this in the future.

Comment: One commenter supported CMS's proposal to study workflow and data capture to understand the limitations. This commenter encouraged CMS to include MIPS eligible clinicians from specialty behavioral health organizations as part of this study.

Response: We will work with key stakeholders on the workflow and data capture for better understanding of how to measure improvement of activities.

Comment: Some commenters expressed support for the approach for identifying new subcategories and activities in the future and one suggested that CMS develop a template designed to ensure that proposed improvement activities are clearly measurable and also that the "value" of the improvement activity can be related to an existing improvement activity.

Response: We will work with stakeholders to further refine this approach for future consideration.

Comment: Another commenter suggested rather than looking to restrictions on the use of QCDRs as improvement activities, in future years, we should include an assessment of how well an improvement activity was accomplished, including demonstration of resulting improvements in outcomes and/or patient experience from the improvement activity. This commenter believed that we should take this more positive approach to ensure improvement activities are being effective rather than trying to determine whether the clinician is using a QCDR to achieve "too many" improvement activities.

Response: We will work with the stakeholder community in future years for how this could be best addressed.

Comment: One commenter was concerned that MIPS did not recognize practices are likely to develop multi-year improvement strategies and that removal of an approved improvement activity in the annual update would undermine program stability. To address this concern, this commenter recommended that improvement activity topics identified for termination should be allowed to continue for the transition year beyond initial notification to allow for sufficient notice to participating practices.

Response: We will work with the stakeholder community in future years to best determine how to maintain the annual activity list.

We will take the comments regarding improvement activities policies for

identifying new improvement activities in future years of the MIPS program into consideration for future rulemaking.

(c) Request for Comments on Use of QCDRs for Identification and Tracking of Future Activities

In future years, we expect to learn more about improvement activities and how the inclusion of additional measures and activities captured by QCDRs could enhance the ability of MIPS eligible clinicians or groups to capture and report on more meaningful activities. This is especially true for specialty groups. In the future, we may propose use of QCDRs for identification and acceptance of additional measures and activities which is in alignment with section 1848(q)(1)(E) of the Act which encourages the use of QCDRs, as well as under section 1848(q)(2)(B)(iii)(II) of the Act related to the population management subcategory. We recognize, through the MIPS and APMs RFI comments and interviews with organizations that represent non-patient facing MIPS eligible clinicians or groups and specialty groups that QCDRs may provide for a more diverse set of measures and activities under improvement activities than are possible to list under the current improvement activities inventory. This diverse set of measures and activities, which we can validate, affords specialty practices additional opportunity to report on more meaningful activities in future years. QCDRs may also provide the opportunity for longer-term data collection processes which will be needed for future year submission on improvement, in addition to achievement. Use of QCDRs also supports ongoing performance feedback and allows for implementation of continuous process improvements. We believe that for future years, QCDRs would be allowed to define specific improvement activities for specialty and non-patient facing MIPS eligible clinicians or groups through the already-established QCDR approval process for measures and activities. We requested comments on this approach. We did not receive any comments regarding the use of QCDRs for identification and tracking of future activities.

(d) Request for Comments on Activities That Will Advance the Usage of Health IT

The use of health IT is an important aspect of care delivery processes described in many improvement activities. In this final rule with comment period we have finalized a

policy to allow MIPS eligible clinicians to achieve a bonus in the advancing care information performance category when they use functions included in CEHRT to complete eligible activities from the improvement activities inventory. Please refer to section II.E.5.g. of this final rule with comment period for details on how improvement activities using CEHRT relate to the objectives and measures of the advancing care information and improvement activities performance categories.

In addition to those functions included under the CEHRT definition, ONC certifies technology for additional emerging health IT capabilities which may also be important for enabling activities included in the improvement activities inventory, such as technology certified to capture social, psychological, and behavioral data according to the criterion at 80 FR 62631, and technology certified to generate and exchange an electronic care plan (as described at 80 FR 62648). In the future, we may consider including these emerging certified health IT capabilities as part of activities within the improvement activities inventory. By referencing these certified health IT capabilities in improvement activities, clinicians would be able to earn credit under the improvement activities performance category while gaining experience with certification criteria that may be reflected as part of the CEHRT definition at a later time. Moreover, health IT developers will be able to innovate around these relevant standards and certification criteria to better serve clinicians' needs.

We invite comments on this approach to encourage continued innovation in health IT to support improvement activities.

g. Advancing Care Information Performance Category

(1) Background and Relationship to Prior Programs

(a) Background

The American Recovery and Reinvestment Act of 2009 (ARRA), which included the Health Information Technology for Economic and Clinical Health Act (HITECH Act), amended Titles XVIII and XIX of the Act to authorize incentive payments and Medicare payment adjustments for EPs to promote the adoption and meaningful use of CEHRT. Section 1848(o) of the Act provides the statutory basis for the Medicare incentive payments made to meaningful EHR users. Section 1848(a)(7) of the Act also establishes downward payment adjustments, beginning with CY 2015, for EPs who

are not meaningful users of CEHRT for certain associated EHR reporting periods. (For a more detailed explanation of the statutory basis for the Medicare and Medicaid EHR Incentive Programs, see the July 28, 2010 Stage 1 final rule titled, “Medicare and Medicaid Programs; Electronic Health Record Incentive Program; Final Rule” (75 FR 44316 and 44317).)

A primary policy goal of the EHR Incentive Program is to encourage and promote the adoption and use of CEHRT among Medicare and Medicaid health care providers to help drive the industry as a whole toward the use of CEHRT. As described in the final rule titled “Medicare and Medicaid Programs; Electronic Health Record Incentive Program—Stage 3 and Modifications to Meaningful Use in 2015 Through 2017” (hereinafter referred to as the “2015 EHR Incentive Programs final rule”) (80 FR 62769), the HITECH Act outlined several foundational requirements for meaningful use and for EHR technology. CMS and ONC have subsequently outlined a number of key policy goals which are reflected in the current objectives and measures of the program and the related certification requirements (80 FR 62790). Current Medicare EP performance on these key goals is varied, with EPs demonstrating high performance on some objectives while others represent a greater challenge.

(b) MACRA Changes

Section 1848(q)(2)(A) of the Act, as added by section 101(c) of the MACRA, includes the meaningful use of CEHRT as a performance category under the MIPS, referred to in the proposed rule and in this final rule with comment period as the advancing care information performance category, which will be reported by MIPS eligible clinicians as part of the overall MIPS program. As required by sections 1848(q)(2) and (5) of the Act, the four performance categories shall be used in determining the MIPS final score for each MIPS eligible clinician. In general, MIPS eligible clinicians will be evaluated under all four of the MIPS performance categories, including the advancing care information performance category. This includes MIPS eligible clinicians who were not previously eligible for the EHR Incentive Program incentive payments under section 1848(o) of the Act or subject to the EHR Incentive Program payment adjustments under section 1848(a)(7) of the Act, such as physician assistants, nurse practitioners, clinical nurse specialists, certified registered nurse anesthetists, and hospital-based EPs (as defined in

section 1848(o)(1)(C)(ii) of the Act). Understanding that these MIPS eligible clinicians may not have prior experience with CEHRT and the objectives and measures under the EHR Incentive Program, we proposed a scoring methodology within the advancing care information performance category that provides flexibility for MIPS eligible clinicians from early adoption of CEHRT through advanced use of health IT. In the proposed rule (81 FR 28230 through 28233), we also proposed to reweight the advancing care information performance category to zero in the MIPS final score for certain hospital-based and other MIPS eligible clinicians where the measures proposed for this performance category may not be available or applicable to these types of MIPS eligible clinicians.

(c) Considerations in Defining Advancing Care Information Performance Category

In implementing MIPS, we intend to develop the requirements for the advancing care information performance category to continue supporting the foundational objectives of the HITECH Act, and to encourage continued progress on key uses such as health information exchange and patient engagement. These more challenging objectives are essential to leveraging CEHRT to improve care coordination and they represent the greatest potential for improvement and for significant impact on delivery system reform in the context of MIPS quality reporting.

In developing the requirements and structure for the advancing care information performance category, we considered several approaches for establishing a framework that would naturally integrate with the other MIPS performance categories. We considered historical performance on the EHR Incentive Program objectives and measures, feedback received through public comment, and the long term goals for delivery system reform and quality improvement strategies.

One approach we considered would be to maintain the current structure of the Medicare EHR Incentive Program and award full points for the advancing care information performance category for meeting all of the objectives and measures finalized in the 2015 EHR Incentive Programs final rule, and award zero points for failing to meet all of these requirements. This method would be consistent with the current EHR Incentive Program and is based on objectives and measures already established in rulemaking. However, we considered and dismissed this approach as it would not allow flexibility for

MIPS eligible clinicians and would not allow us to effectively measure performance for MIPS eligible clinicians in the advancing care information performance category who have taken incremental steps toward the use of CEHRT, or to recognize exceptional performance for MIPS eligible clinicians who have excelled in any one area. This is particularly important as many MIPS eligible clinicians may not have had past experience relevant to the advancing care information performance category and use of EHR technology because they were not previously eligible to participate in the Medicare EHR Incentive Program. This approach also does not allow for differentiation among the objectives and measures that have high adoption and those where there is potential for continued advancement and growth.

We subsequently considered several methods which would allow for more flexibility and provide CMS the opportunity to recognize partial or exceptional performance among MIPS eligible clinicians for the measures under the advancing care information performance category. We decided to design a framework that would allow for flexibility and multiple paths to achievement under this category while recognizing MIPS eligible clinicians' efforts at all levels. Part of this framework requires moving away from the concept of requiring a single threshold for a measure, and instead incentivizes continuous improvement, and recognizes onboarding efforts among late adopters and MIPS eligible clinicians facing continued challenges in full implementation of CEHRT in their practice.

Below is a summary of the comments received on our overall approach to the advancing care information performance category under MIPS:

Comment: A commenter did not support the name change, expressing concern that it is attempting to draw a distinction without a difference and is going to cause confusion. The commenter urged CMS to return to the term “meaningful use”.

Response: We believe that the name “advancing care information” is appropriate to distinguish the MIPS performance category from meaningful use under the EHR Incentive Programs. We note that the term “meaningful use,” still applies for purposes of the Medicare and Medicaid EHR Incentive Programs. The reporting requirements and scoring to demonstrate meaningful use were established in regulation under the EHR Incentive Programs and vary substantially from the requirements and scoring finalized for the advancing care

information performance category in the MIPS program.

(2) Advancing Care Information Performance Category Within MIPS

In defining the advancing care information performance category for the MIPS, we considered stakeholder feedback and lessons learned from our experience with the Medicare EHR Incentive Program. Specifically, we considered feedback from the Stage 1 (75 FR 44313) and Stage 2 (77 FR 53967) EHR Incentive Program rules, and the 2015 EHR Incentive Programs final rule (80 FR 62769), as well as comments received from the MIPS and APMs RFI (80 FR 59102). We have learned from this feedback that clinicians desire flexibility to focus on health IT implementation that is right for their practice. We have also learned that updating software, training staff and changing practice workflows to accommodate new technology can take time, and that clinicians need time and flexibility to focus on the health IT activities that are most relevant to their patient population. Clinicians also desire consistent timelines and reporting requirements to simplify and streamline the reporting process. Recognizing this, we have worked to align the advancing care information performance category with the other MIPS performance categories, which would streamline reporting requirements, timelines and measures in an effort to reduce burden on MIPS eligible clinicians.

The implementation of the advancing care information performance category is an important opportunity to increase clinician and patient engagement, improve the use of health IT to achieve better patient outcomes, and continue to meet the vision of enhancing the use of CEHRT as defined under the HITECH Act. In the proposed rule (81 FR 28220), we proposed substantial flexibility in how we would assess MIPS eligible clinician performance for the new advancing care information performance category. We proposed to emphasize performance in the objectives and measures that are the most critical and would lead to the most improvement in the use of health IT to advance health care quality. We intend to promote innovation so that technology can be interconnected easily and securely, and data can be accessed and directed where and when it is needed to support patient care. These objectives include Patient Electronic Access, Coordination of Care Through Patient Engagement and Health Information Exchange, which are essential to leveraging CEHRT to improve care. At the same time, we

proposed to eliminate reporting on objectives and measures in which the vast majority of clinicians already achieve high performance—which would reduce burden, encourage greater participation and direct MIPS eligible clinicians' attention to higher-impact measures. Our proposal balances program participation with rewarding performance on high-impact objectives and measures, which we believe would make the overall program stronger and further the goals of the HITECH Act.

(a) Advancing the Goals of the HITECH Act in MIPS

Section 1848(o)(2)(A) of the Act requires that the Secretary seek to improve the use of EHRs and health care quality over time by requiring more stringent measures of meaningful use. In implementing MIPS and the advancing care information performance category, we sought to improve and encourage the use of CEHRT over time by adopting a new, more flexible scoring methodology, as discussed in the proposed rule (81 FR 28220) that would more effectively allow MIPS eligible clinicians to reach the goals of the HITECH Act, and would allow MIPS eligible clinicians to use EHR technology in a manner more relevant to their practice. This new, more flexible scoring methodology puts a greater focus on Patient Electronic Access, Coordination of Care Through Patient Engagement, and Health Information Exchange—objectives we believe are essential to leveraging CEHRT to improve care by engaging patients and furthering interoperability. This methodology would also de-emphasize objectives in which clinicians have historically achieved high performance with median performance rates of over 90 percent for the last 2 years. We believe shifting focus away from these objectives would reduce burden, encourage greater participation, and direct attention to other objectives and measures which have significant room for continued improvement. Through this flexibility, MIPS eligible clinicians would be incentivized to focus on those aspects of CEHRT that are most relevant to their practice, which we believe would lead to improvements in health care quality.

We also sought to increase the adoption and use of CEHRT by incorporating such technology into the other MIPS performance categories. For example, in section II.E.6.a.(2)(f) of the proposed rule (81 FR 28247), we proposed to incentivize electronic reporting by awarding a bonus point for submitting quality measure data using CEHRT. Additionally, in section II.E.5.f.

of the proposed rule (81 FR 28209), we aligned some of the activities under the improvement activities performance category such as Care Coordination, Beneficiary Engagement and Achieving Health Equity with a focus on enhancing the use of CEHRT. We believe this approach would strengthen the adoption and use of certified EHR systems and program participation consistent with the provisions of section 1848(o)(2)(A) of the Act.

Below is a summary of the comments received regarding our overall approach to requirements under the advancing care information performance category:

Comment: Many commenters noted that what we proposed is even more complicated than Stage 3 of meaningful use. Most commenters appreciated the increased flexibility. One commenter appreciated the proposal but did not believe that it went far enough. They noted that there should be widespread health data interoperability throughout the clinical data ecosystem and not just between meaningful users. Many commenters did not support the retention of the all-or-nothing approach to scoring for the advancing care information performance category. Many wanted a less prescriptive approach to allow clinicians to be creative in applying technology to their own unique workflows. Some noted that clinicians should not be penalized for actions that they cannot control such as patient actions in certain measures. One recommended that CMS focus its efforts on increasing functional interoperability between and among EHR vendors. Another commenter explained that the CMS efforts to date do not go far enough toward the attainment of widespread health data interoperability. Further CMS should provide advancing care information performance category credit for activities that demonstrate a MIPS eligible clinician's use of digital clinical data to inform patient care. Many noted that this category is too similar to the existing meaningful use framework and should be further modified.

Response: We have carefully considered and will address these comments in more detail in the following sections of this final rule with comment period as we further describe the final policies for the advancing care information performance category. We note that within the proposed requirements for the performance category, we sought to balance the new requirements under MACRA with our goal to allow greater flexibility and providing consistency for clinicians with prior experience in the Medicare and Medicaid EHR Incentive Programs. This consistency includes maintaining

the definition of CEHRT (as adapted from the EHR Incentive Program) and specifications for the applicable measures. We believe this consistency will ease the transition to MIPS and allow MIPS eligible clinicians to adapt to the new program requirements quickly and with ease. We also believe this will aid EHR vendors in their development efforts for MIPS as many of the requirements are consistent with prior policy finalized for the EHR Incentive Program in previous years.

We hope to continue to work with our stakeholders over the coming years so that we can continue to improve the framework and implementation of this performance category in order to improve health outcomes for patients across the country.

(b) Future Considerations

The restructuring of program requirements described in this final rule with comment period are geared toward increasing participation and EHR adoption. We believe this is the most effective way to encourage the adoption of CEHRT, and introduce new MIPS eligible clinicians to the use of certified EHR technology and health IT overall.

We will continue to review and evaluate MIPS eligible clinician performance in the advancing care information performance category, and will consider evolutions in health IT over time as it relates to this performance category. Based on our ongoing evaluation, we expect to adopt changes to the scoring methodology for the advancing care information performance category to ensure the efficacy of the program and to ensure increased value for MIPS eligible clinicians and the Medicare Program, as well as to adopt more stringent measures of meaningful use as required by section 1848(o)(2)(A) of the Act.

Potential changes may include establishing benchmarks for MIPS eligible clinician performance on the advancing care information performance category measures, and using these benchmarks as a baseline and threshold for future reporting. This may include scoring for performance improvement over time and the potential to reevaluate the efficacy of measures based on these analyses. For example, in future years we may use a MIPS eligible clinician's prior performance on the advancing care information performance category measures as comparison for the subsequent year's performance category score, or compare a MIPS eligible clinician's performance category score to peer groups to measure their improvement and determine a performance category score based on

improvement over those benchmarks or peer group comparisons. This type of approach would drive continuous improvement over time through the adoption of more stringent performance standards for the advancing care information performance category measures.

We are committed to continual review, improvement and increased stringency of the advancing care information performance category measures as directed under section 1848(o)(2)(A) of the Act both for the purposes of ensuring program efficacy, as well as ensuring value for the MIPS eligible clinicians reporting the advancing care information performance category measures. We solicited comment on further methods to increase the stringency of the advancing care information performance category measures in the future.

We additionally solicited comment on the concept of a holistic approach to health IT—one that we believe is similar to the concept of outcome measures in the quality performance category in the sense that MIPS eligible clinicians could potentially be measured more directly on how the use of health IT contributes to the overall health of their patients. Under this concept, MIPS eligible clinicians would be able to track certain use cases or patient outcomes to tie patient health outcomes with the use of health IT.

We believe this approach would allow us to directly link health IT adoption and use to patient outcomes, moving MIPS beyond the measurement of EHR adoption and process measurement and into a more patient-focused health IT program. From comments and feedback we have received from the health care provider community, we understand that this type of approach would be a welcome enhancement to the measurement of health IT. At this time, we recognize that technology and measurement for this type of program is currently unavailable. We solicited comment on what this type of measurement would look like under MIPS, including the type of measures that would be needed within the advancing care information performance category and the other performance categories to measure this type of outcome, what functionalities with CEHRT would be needed, and how such an approach could be implemented.

The following is a summary of the comments we received:

Comment: Several commenters expressed an interest in advancing the use of certified health IT in a clinical setting. Some commenters suggested combining advancing care information

performance category measures and improvement activities in the improvement activities performance category, though cautioned that improvement activities should not require the use of CEHRT, more so that CEHRT should be optional for improvement activities and should allow MIPS eligible clinicians to earn credit in the advancing care information performance category. Some commenters recommended that CMS award credit in both the advancing care information performance category and improvement activities performance category for overlapping activities.

Response: We agree that tying applicable improvement activities under the improvement activities performance category to the objectives and measures under the advancing care information performance category would reduce reporting burden for MIPS eligible clinicians. Our first step toward that goal of reducing reporting burden, and toward a more holistic approach to EHR measurement is to award a bonus score in the advancing care information performance category if a MIPS eligible clinician attests to completing certain improvement activities using CEHRT functionality. We believe tying these performance categories encourages MIPS eligible clinicians to use their CEHRT products not only for documenting patient care, but also for improving their clinical practices by using their CEHRT in a meaningful manner that supports clinical practice improvement. The objectives and measures of the advancing care information performance category measure specific functions of CEHRT which are the building blocks for advanced use of health IT. In the improvement activities performance category, these same functions may be tied to improvement activities which focus on a specific improvement goal or outcome for continuous improvement in patient care.

In Table 8, we identify a set of improvement activities from the improvement activities performance category that can be tied to the objectives, measures, and CEHRT functions of the advancing care information performance category and would thus qualify for the bonus in the advancing care information performance category. For further explanation of these improvement activities, we refer readers to the discussion in section II.E.5.f. of this final rule with comment period. While we note that these activities can be greatly enhanced through the use of CEHRT, we are not suggesting that these activities require the use of CEHRT for the purposes of

reporting in the improvement activities performance category. More so, we are suggesting that the use of CEHRT in carrying out these activities can further the outcomes of clinical practice improvement, and thus, we are awarding a bonus score in the advancing care information performance category if a MIPS eligible clinician can attest to using the associated CEHRT functions when carrying out the activity. A MIPS eligible clinician attesting to using CEHRT for improvement activities would use the same certification criteria in completing the improvement activity as they would

for the measures under advancing care information as listed in Table 8; for the 2017 performance period, this may include 2014 or 2015 Edition CEHRT. For example, for the first improvement activity in Table 8, in which a MIPS eligible clinician would provide 24/7 access for advice about urgent and emergent care, a MIPS eligible clinician may accomplish this through expanded practice hours, use of alternatives to increase access to the care team such as e-visits and phone visits, and/or provision of same-day or next-day access. The Secure Messaging measure under the advancing care information

performance category requires that a secure message was sent using the electronic messaging function of CEHRT to the patient (or the patient-authorized representative), or in response to a secure message sent by the patient (or the patient-authorized representative). If secure messaging functionality is used to provide 24/7 access for advice about urgent and emergent care (for example, sending or responding to secure messages outside business hours), this would meet the requirement of using CEHRT to complete the improvement activity and would qualify for the advancing care information bonus score.

TABLE 8: Improvement Activities Eligible for the Advancing Care Information Performance Category Bonus

Improvement Activity Performance Category Subcategory	Activity Name	Activity	Improvement Activity Performance Category Weight	Related Advancing Care Information Measure(s)*
Expanded Practice Access	Provide 24/7 access to eligible clinicians or groups who have real-time access to patient's medical record	<p>Provide 24/7 access to MIPS eligible clinicians, groups, or care teams for advice about urgent and emergent care (for example, eligible clinician and care team access to medical record, cross-coverage with access to medical record, or protocol-driven nurse line with access to medical record) that could include one or more of the following:</p> <p>Expanded hours in evenings and weekends with access to the patient medical record (for example, coordinate with small practices to provide alternate hour office visits and urgent care);</p> <p>Use of alternatives to increase access to care team by MIPS eligible clinicians and groups, such as e-visits, phone visits, group visits, home visits and alternate locations (for example, senior centers and assisted living centers); and/or</p> <p>Provision of same-day or next-day access to a consistent MIPS eligible clinician, group or care team when needed for urgent care or transition management.</p>	High	<p>Provide Patient Access</p> <p>Secure Messaging</p> <p>Send A Summary of Care</p> <p>Request/Accept Summary of Care</p>

Improvement Activity Performance Category Subcategory	Activity Name	Activity	Improvement Activity Performance Category Weight	Related Advancing Care Information Measure(s)*
Population Management	Anticoagulant management improvements	<p>MIPS eligible clinicians and groups who prescribe oral Vitamin K antagonist therapy (warfarin) must attest that, in the first performance period, 60 percent or more of their ambulatory care patients receiving warfarin are being managed by one or more of these improvement activities:</p> <p>Patients are being managed by an anticoagulant management service, that involves systematic and coordinated care*, incorporating comprehensive patient education, systematic INR testing, tracking, follow-up, and patient communication of results and dosing decisions;</p> <p>Patients are being managed according to validated electronic decision support and clinical management tools that involve systematic and coordinated care, incorporating comprehensive patient education, systematic INR testing, tracking, follow-up, and patient communication of results and dosing decisions;</p> <p>For rural or remote patients, patients are managed using remote monitoring or telehealth options that involve systematic and coordinated care, incorporating comprehensive patient education, systematic INR testing, tracking, follow-up, and patient communication of results and dosing decisions; and/or</p> <p>For patients who demonstrate motivation, competency, and adherence, patients are managed using either a patient self-testing (PST) or patient-self-management (PSM) program.</p> <p>The performance threshold will increase to 75 percent for the second performance period and onward.</p> <p>Clinicians would attest that, 60 percent for first year, or 75 percent for the second year, of their ambulatory care patients receiving warfarin participated in an anticoagulation management program for at least 90 days during the performance period.</p>	High	<p>Provide Patient Access</p> <p>Patient-Specific Education</p> <p>View, Download, Transmit</p> <p>Secure Messaging</p> <p>Patient Generated Health Data or Data from Non-Clinical Setting</p> <p>Send a Summary of Care</p> <p>Request/Accept Summary of Care</p> <p>Clinical Information Reconciliation Exchange</p> <p>Clinical Decision Support (CEHRT Function Only)</p>

Improvement Activity Performance Category Subcategory	Activity Name	Activity	Improvement Activity Performance Category Weight	Related Advancing Care Information Measure(s)*
Population Management	Glycemic management services	<p>For outpatient Medicare beneficiaries with diabetes and who are prescribed antidiabetic agents (for example, insulin, sulfonylureas), MIPS eligible clinicians and groups must attest to having:</p> <p>For the first performance period, at least 60 percent of medical records with documentation of an individualized glycemic treatment goal that:</p> <p>a) Takes into account patient-specific factors, including, at least 1) age, 2) comorbidities, and 3) risk for hypoglycemia, and</p> <p>b) Is reassessed at least annually.</p> <p>The performance threshold will increase to 75 percent for the second performance period and onward. Clinicians would attest that, 60 percent for first year, or 75 percent for the second year, of their medical records that document individualized glycemic treatment represent patients who are being treated for at least 90 days during the performance period.</p>	High	<p>Patient Generated Health Data</p> <p>Clinical Information Reconciliation</p> <p>Clinical Decision Support, CCDS, Family Health History (CEHRT functions only)</p>
Population Management	Chronic care and preventative care management for empanelled patients	<p>Proactively manage chronic and preventive care for empaneled patients that could include one or more of the following:</p> <p>Provide patients annually with an opportunity for development and/or adjustment of an individualized plan of care as appropriate to age and health status, including health risk appraisal; gender, age and condition-specific preventive care services; plan of care for chronic conditions; and advance care planning;</p> <p>Use condition-specific pathways for care of chronic conditions (for example, hypertension, diabetes, depression, asthma and heart failure) with evidence-based protocols to guide treatment to target;</p> <p>Use pre-visit planning to optimize preventive care and team management of patients with chronic conditions;</p> <p>Use panel support tools (registry functionality) to identify services due;</p> <p>Use reminders and outreach (for example, phone calls, emails, postcards, patient portals and community health workers where available) to alert and educate patients about services due; and/or</p> <p>Routine medication reconciliation.</p>	Medium	<p>Provide Patient Access</p> <p>Patient-Specific Education</p> <p>View, Download, Transmit</p> <p>Secure Messaging</p> <p>Patient Generated Health Data or Data from Non-Clinical Setting</p> <p>Send A Summary of Care</p> <p>Request/Accept Summary of Care</p> <p>Clinical Information Reconciliation</p> <p>Clinical Decision Support, Family Health History (CEHRT functions only)</p>

Improvement Activity Performance Category Subcategory	Activity Name	Activity	Improvement Activity Performance Category Weight	Related Advancing Care Information Measure(s)*
Population Management	Implementation of methodologies for improvements in longitudinal care management for high risk patients	<p>Provide longitudinal care management to patients at high risk for adverse health outcome or harm that could include one or more of the following:</p> <p>Use a consistent method to assign and adjust global risk status for all empaneled patients to allow risk stratification into actionable risk cohorts. Monitor the risk-stratification method and refine as necessary to improve accuracy of risk status identification;</p> <p>Use a personalized plan of care for patients at high risk for adverse health outcome or harm, integrating patient goals, values and priorities; and/or</p> <p>Use on-site practice-based or shared care managers to proactively monitor and coordinate care for the highest risk cohort of patients.</p>	Medium	<p>Provide Patient Access</p> <p>Patient-Specific Education</p> <p>Patient Generated Health Data or Data from Non-clinical Settings</p> <p>Send A Summary of Care</p> <p>Request/Accept Summary of Care</p> <p>Clinical information reconciliation</p> <p>Clinical Decision Support, CCDS, Family Health History, Patient List (CEHRT functions only)</p>
Population Management	Implementation of episodic care management practice improvements	<p>Provide episodic care management, including management across transitions and referrals that could include one or more of the following:</p> <p>Routine and timely follow-up to hospitalizations, ED visits and stays in other institutional settings, including symptom and disease management, and medication reconciliation and management; and/or</p> <p>Managing care intensively through new diagnoses, injuries and exacerbations of illness.</p>	Medium	<p>Send A Summary of Care</p> <p>Request/Accept Summary of Care</p> <p>Clinical Information Reconciliation</p>
Population Management	Implementation of medication management practice improvements	<p>Manage medications to maximize efficiency, effectiveness and safety that could include one or more of the following:</p> <p>Reconcile and coordinate medications and provide medication management across transitions of care settings and eligible clinicians or groups;</p> <p>Integrate a pharmacist into the care team; and/or</p> <p>Conduct periodic, structured medication reviews.</p>	Medium	<p>Clinical Information Reconciliation</p> <p>Clinical Decision Support, Computerized Physician Order Entry Electronic Prescribing (CEHRT functions only)</p>

Improvement Activity Performance Category Subcategory	Activity Name	Activity	Improvement Activity Performance Category Weight	Related Advancing Care Information Measure(s)*
Care Coordination	Implementation of use of specialist reports back to referring clinician or group to	Performance of regular practices that include providing specialist reports back to the referring MIPS eligible clinician or group to close the referral loop or where the referring MIPS eligible clinician or group initiates regular inquiries to specialist for specialist reports which could be documented or noted in the CEHRT.	Medium	Send A Summary of Care Request/Accept Summary of Care Clinical Information Reconciliation
Care Coordination	Implementation of documentation improvements for practice/process	Implementation of practices/processes that document care coordination activities (for example, a documented care coordination encounter that tracks all clinical staff involved and communications from date patient is scheduled for outpatient procedure through day of procedure).	Medium	Secure Messaging Send A Summary of Care Request/Accept Summary of Care Clinical Information Reconciliation
Care Coordination	Implementation of practices/processes for developing regular individual care plans	Implementation of practices/processes to develop regularly updated individual care plans for at-risk patients that are shared with the beneficiary or caregiver(s).	Medium	Provide Patient Access (formerly Patient Access) View, Download, Transmit Secure Messaging Patient Generated Health Data or Data from Non-Clinical Setting
Care Coordination	Practice improvements for bilateral exchange of patient information	Ensure that there is bilateral exchange of necessary patient information to guide patient care that could include one or more of the following: Participate in a Health Information Exchange if available; and/or Use structured referral notes.	Medium	Send A Summary of Care Request/Accept Summary of Care Clinical Information Reconciliation

Improvement Activity Performance Category Subcategory	Activity Name	Activity	Improvement Activity Performance Category Weight	Related Advancing Care Information Measure(s)*
Beneficiary Engagement	Use of certified EHR to capture patient reported outcomes	In support of improving patient access, performing additional activities that enable capture of patient reported outcomes (for example, home blood pressure, blood glucose logs, food diaries, at-risk health factors such as tobacco or alcohol use, etc.) or patient activation measures through use of CEHRT, containing this data in a separate queue for clinician recognition and review.	Medium	Provide Patient Access Patient-Specific Education Care Coordination through Patient Engagement
Beneficiary Engagement	Engagement of patients through implementation of improvements	Access to an enhanced patient portal that provides up to date information related to relevant chronic disease health or blood pressure control, and includes interactive features allowing patients to enter health information and/or enables bidirectional communication about medication changes and adherence.	Medium	Provide Patient Access Patient-Specific Education
Beneficiary Engagement	Engagement of patients, family and caregivers in developing a plan of care	Engage patients, family and caregivers in developing a plan of care and prioritizing their goals for action, documented in the CEHRT.	Medium	Provide Patient Access Patient-specific Education View, Download, Transmit (Patient Action) Secure Messaging
Safety and Practice Assessment	support and standardized	Use decision support and protocols to manage workflow in the team to meet patient needs.	Medium	Clinical Decision Support (CEHRT function only)
Achieving Health Equity	Leveraging a QCDR to standardize processes for screening	Participation in a QCDR, demonstrating performance of activities for use of standardized processes for screening for social determinants of health such as food security, employment and housing. Use of supporting tools that can be incorporated into the CEHRT is also suggested.	Medium	Patient Generated Health Data or Data from a Non-Clinical Setting Public Health and Clinical Data Registry Reporting

Improvement Activity Performance Category Subcategory	Activity Name	Activity	Improvement Activity Performance Category Weight	Related Advancing Care Information Measure(s)*
Integrated Behavioral and Mental Health	Implementation of integrated PCBH model	<p>Offer integrated behavioral health services to support patients with behavioral health needs, dementia, and poorly controlled chronic conditions that could include one or more of the following:</p> <ul style="list-style-type: none"> Use evidence-based treatment protocols and treatment to goal where appropriate; Use evidence-based screening and case finding strategies to identify individuals at risk and in need of services; Ensure regular communication and coordinated workflows between eligible clinicians in primary care and behavioral health; Conduct regular case reviews for at-risk or unstable patients and those who are not responding to treatment; Use of a registry or certified health information technology functionality to support active care management and outreach to patients in treatment; and/or Integrate behavioral health and medical care plans and facilitate integration through co-location of services when feasible. 	High	<p>Provide Patient Access</p> <p>Patient-Specific Education</p> <p>View, Download, Transmit</p> <p>Secure Messaging</p> <p>Patient Generated Health Data or Data from Non-Clinical Setting</p> <p>Care coordination through Patient Engagement</p> <p>Send A Summary of Care</p> <p>Request/Accept Summary of Care</p>
Integrated Behavioral and Mental Health	Electronic Health Record Enhancements for BH data capture	<p>Enhancements to an electronic health record to capture additional data on behavioral health (BH) populations and use that data for additional decision-making purposes (for example, capture of additional BH data results in additional depression screening for at-risk patient not previously identified).</p>	Medium	<p>Patient Generated Health Data or Data from Non-Clinical Setting</p> <p>Send A Summary of Care</p> <p>Request/Accept Summary of Care</p> <p>Clinical Information Reconciliation</p>

* Several measure names have changed since the proposed rule. This table reflects those changes. We refer readers to section II.E.5.g.(7) of this final rule with comment period for further discussion of measure name changes.

BILLING CODE 4120-01-C

After consideration of the comments, we will award a 10 percent bonus in the advancing care information performance category if a MIPS eligible clinician attests to completing at least one of the improvement activities specified in Table 8 using CEHRT. We note that 10 percent is the maximum bonus a MIPS eligible clinician will receive whether

they attest to using CEHRT for one or more of the activities listed in the table. This bonus is intended to support progression toward holistic health IT use and measurement; attesting to even one improvement activity demonstrates that the MIPS eligible clinician is working toward this holistic approach to the use of their CEHRT. We additionally note that the weight of the

improvement activity has no bearing on the bonus awarded in the advancing care information performance category.

We are seeking comment on this integration of the improvement activities with the advancing care information performance category, and other ways to further the advancement of health IT measurement.

(3) Clinical Quality Measurement

Section 1848(o)(2)(A)(iii) of the Act requires the reporting of CQMs using CEHRT. Section 1848(q)(5)(B)(ii)(II) of the Act provides that under the methodology for assessing the total performance of each MIPS eligible clinician, the Secretary shall, for a performance period for a year, for which a MIPS eligible clinician reports applicable measures under the quality performance category through the use of CEHRT, treat the MIPS eligible clinician as satisfying the CQM reporting requirement under section 1848(o)(2)(A)(iii) of the Act for such year. We note that in the context and overall structure of MIPS, the quality performance category allows for a greater focus on patient-centered measurement, and multiple pathways for MIPS eligible clinicians to report their quality measure data. Therefore, we did not propose separate requirements for CQM reporting within the advancing care information performance category and instead would require submission of quality data for measures specified for the quality performance category, in which we encourage reporting of CQMs with data captured in CEHRT. We refer readers to section II.E.5.a. of the proposed rule (81 FR 28184–28196) for discussion of reporting of CQMs with data captured in CEHRT under the quality performance category.

Below is a summary of the comments received regarding CQM reporting for the advancing care information category:

Comment: Many commenters supported our proposal not to include the submission of CQMs in this category. Several noted that this elimination will reduce burden for MIPS eligible clinicians, streamline reporting and reduce overlap. Others supported the elimination of duplicative reporting that existed under PQRS and the EHR Incentive Programs.

Response: We appreciate commenters' support and note that the submission of CQMs is a requirement for the Medicare EHR Incentive Program. For the advancing care information performance category, we will require submission of quality data for measures specified for the quality performance category, in which we encourage reporting of CQMs with data captured in CEHRT. This approach helps to avoid unnecessary overlap and duplicative reporting. Therefore, we have not included separate requirements for clinical quality measurement in the advancing care information performance category, and direct readers to the quality

performance category discussed in section II.E.5.b. of this final rule with comment period for information on clinical quality measurement.

(4) Performance Period Definition for Advancing Care Information Performance Category

In the Medicare and Medicaid Programs; Electronic Health Record Incentive Program—Stage 3 proposed rule, we proposed to eliminate the 90-day EHR reporting period beginning in 2017 for EPs who had not previously demonstrated meaningful use, with a limited exception for the Medicaid EHR Incentive Program (80 FR 16739–16740, 16774–16775). We received many comments from respondents stating their preference for maintaining the 90-day EHR reporting period to allow first time participants to avoid payment adjustments. In addition, commenters indicated that the 90-day time period reduced administrative burden and allowed for needed time to adapt their EHRs to ensure they could achieve program objectives. As a result, we did not finalize our proposal and established a 90-day EHR reporting period for all EPs in 2015 and for new participants in 2016, as well as a 90-day EHR reporting period for new participants in 2015, 2016, and 2017 with regard to the payment adjustments (80 FR 62777–62779; 62904–62906). In addition we have proposed a 90-day EHR reporting period in 2016 for the EHR Incentive Programs in a recent proposed rule, the Calendar Year (CY) 2017 Changes to the Hospital Outpatient Prospective Payment System (OPPS) and Ambulatory Surgical Center (ASC) (81 FR 45753).

Moving forward, the implementation of MIPS creates a critical opportunity to align performance periods to ensure that quality, improvement activities, cost, and the advancing care information performance categories are all measured and scored based on the same period of time. We believe this would lower reporting burden, focus clinician quality improvement efforts and align administrative actions so that MIPS eligible clinicians can use common systems and reporting pathways.

Under MIPS, we proposed to align the performance period for the advancing care information performance category to the proposed MIPS performance period of one full calendar year and the intent of the proposal was to reduce reporting burden and streamline requirements so that MIPS eligible clinicians and third party intermediaries, such as registries and QCDRs, would have a common timeline for data submission to all performance

categories (81 FR 28179–28181). Therefore, we noted there would not be a separate 90-day performance period for the advancing care information performance category and MIPS eligible clinicians would need to submit data based on performance period starting January 1, 2017, and ending December 31, 2017 for the first year of MIPS. We also stated that MIPS eligible clinicians that only have data for a portion of the year can still submit data, be assessed and be scored for the advancing care information performance category (81 FR 28179–28181). Under that proposal, MIPS eligible clinicians would need to possess CEHRT and report on the objectives and measures (without meeting any thresholds) during the calendar year performance period to achieve the advancing care information performance category base score. Finally, we stated that MIPS eligible clinicians would be required to submit all of the data they have available for the performance period, even if the time period they have data for is less than one full calendar year.

The following is a summary of the comments we received regarding our advancing care information performance period proposal.

Comment: The majority of commenters did not support our proposal for a performance period of one full calendar year. Instead they overwhelmingly recommended a 90-day performance period in 2017. Commenters noted the need for time and resources to understand and adjust to the new MIPS program. Others suggested that 90 days would give MIPS eligible clinicians flexibility to acquire and implement health IT products. A commenter noted that a shorter performance period would enable MIPS eligible clinicians to adopt innovative uses of technology as it would permit them to test new health IT solutions. Additionally with the final rule with comment period not expected until late in 2016, commenters noted there is not sufficient time to review and understand the rule and begin data collection on January 1, 2017.

Other commenters noted that MIPS eligible clinicians must perform improvement activities for the improvement activities performance category for at least a 90-day performance period, and suggested adopting the same for the advancing care information performance category as it would create alignment. Some commenters requested a performance period of 90-days for the first several years of the program. A few recommended a 90-day performance period every time a new edition of

CEHRT is required. Others suggested partial year reporting or reporting for a quarter. One recommended that solo practitioners report for 60 days. We note that only a few commenters supported our proposal.

Response: We understand the challenges of a full year performance period. As discussed in the proposed rule (81 FR 28179 through 28181), MIPS eligible clinicians that only have data for a portion of the year can still submit data, be assessed and be scored for the advancing care information performance category, and thus, would not need to report for one full year, rather, they could report whatever data they had available even if that data represented less than a full-year period.

Additionally, we understand the commenters' concerns and rationale for requesting a 90-day performance period. As discussed in section II.E.4. of this final rule with comment period, for the first performance period of CY 2017, we will accept a minimum of 90 days of data within CY 2017, although we greatly encourage MIPS eligible clinicians to submit data for the full year performance period. Also in recognition of the switch from CEHRT certified to the 2014 Edition to CEHRT certified to the 2015 Edition, for the 2018 performance period we will also accept a minimum of 90 days of data within CY 2018. We refer readers to section II.E.4. of this final rule with comment period for further discussion about the MIPS performance period and the 90-day minimum.

Comment: One commenter encouraged CMS to extend the transition timeframe to performance periods under MIPS in 2017 and 2018. They indicated that their vendors struggle to provide budgetary estimates needed to plan staff and financial resources due to the lack of clarity on what would be required for the MIPS program.

Response: We recognize that vendors will require varying levels of effort to transition their technology to the MIPS reporting requirements. We note that our proposal to adopt substantively the same definition of CEHRT for the 2015 Edition under MIPS that was adopted in the 2015 EHR Incentive Programs final rule was intended to provide consistency for MIPS eligible clinicians, as well as to allow EHR vendors to begin development based on the specifications finalized in October of 2015 and released by ONC for testing beginning in 2016 unimpeded by the timeline related to any rulemaking for the MIPS program. This would allow vendors to work toward certification on a longer timeline and allow MIPS eligible

clinicians to adopt an implement the technology in preparation for the performance period in 2018. The MIPS performance period in 2017 will serve as a transition year for MIPS eligible clinicians, vendors and others parties supporting MIPS eligible clinicians. Further, in section II.E.5.a. of this final rule with comment period, we have established multiple reporting mechanisms to allow MIPS eligible clinicians to report their advancing care information data in the event that their vendor is unable to support new submission requirements. We are adopting for MIPS the 2017 Advancing Care Information Transition objectives and measures (referred to in the proposed rule as Modified Stage 2 objectives and measures) and Advancing Care Information objectives and measures (referred to in the proposed rule as adapted from the Stage 3 objectives and measures) and allowing MIPS eligible clinicians and groups to use technology certified to either the 2014 Edition or the 2015 Edition or a combination of the two editions to support their selection of objectives and measures for 2017. We intend this consistency with prior programs to help ease the transition and reduce the development work needed to transition to MIPS. Finally, we will accept a minimum of any consecutive 90 days in the 2018 performance period for the advancing care information performance category to support eligible clinicians and groups as they transition to technology certified to the 2015 Edition for use in 2018. For these reasons, we believe a 1 year transition during the 2017 MIPS performance period is sufficient.

After consideration of the public comments received, we are finalizing our proposal to align the performance period for the advancing care information performance category with the MIPS performance period of one full calendar year. For the first performance period of MIPS (CY 2017), we will accept a minimum of 90 consecutive days of data in CY 2017, however, we encourage MIPS eligible clinicians to report data for the full year performance period. For the second performance period of MIPS (CY 2018), we will accept a minimum of 90 consecutive days of data in 2018, however, we encourage MIPS eligible clinicians to report data for the full year performance period. We refer readers to section II.E.4. of this final rule with comment period for further discussion of the MIPS performance period.

(5) Advancing Care Information Performance Category Data Submission and Collection

(a) Definition of Meaningful EHR User and Certification Requirements

In the 2015 EHR Incentive Programs final rule (80 FR 62873), we outlined the requirements for EPs using CEHRT in 2017 for the Medicare and Medicaid EHR Incentive Programs as it relates to the objectives and measures they select to report. In the proposed rule, we proposed to adopt a definition of CEHRT at § 414.1305 for MIPS eligible clinicians that is based on the definition that applies in the EHR Incentive Programs under § 495.4.

We proposed for 2017, the first MIPS performance period, MIPS eligible clinicians would be able to use EHR technology certified to either the 2014 or 2015 Edition certification criteria as follows:

- A MIPS eligible clinician who only has technology certified to the 2015 Edition may choose to report: (1) On the objectives and measures specified for the advancing care information performance category in section II.E.5.g.(7) of the proposed rule (81 FR 28221 through 28223), which correlate to Stage 3 requirements; or (2) on the alternate objectives and measures specified for the advancing care information performance category in section II.E.5.g.(7) of the proposed rule (81 FR 28223 and 28224), which correlate to modified Stage 2 requirements.

- A MIPS eligible clinician who has technology certified to a combination of 2015 Edition and 2014 Edition may choose to report: (1) On the objectives and measures specified for the advancing care information performance category in section II.E.5.g.(7) of the proposed rule (81 FR 28221 through 28223), which correlate to Stage 3; or (2) on the alternate objectives and measures specified for the advancing care information performance category as described in section II.E.5.g.(7) of the proposed rule (81 FR 28223 and 28224), which correlate to modified Stage 2, if they have the appropriate mix of technologies to support each measure selected.

- A MIPS eligible clinician who only has technology certified to the 2014 Edition would not be able to report on any of the measures specified for the advancing care information performance category described in section II.E.5.g.(7) of the proposed rule (81 FR 28221 through 28223) that correlate to a Stage 3 measure that requires the support of technology certified to the 2015 Edition. These MIPS eligible clinicians would be

required to report on the alternate objectives and measures specified for the advancing care information performance category as described in section II.E.5.g.(7) of the proposed rule (81 FR 28223 and 28224), which correlate to modified Stage 2 objectives and measures.

We proposed beginning with the performance period in 2018, MIPS eligible clinicians:

- Must only use technology certified to the 2015 Edition to meet the objectives and measures specified for the advancing care information performance category in section II.E.5.g.(7) of the proposed rule (81 FR 28222 and 28223), which correlate to Stage 3.

We welcomed comments on the proposals, which were intended to maintain consistency across MIPS, the Medicare EHR Incentive Program and the Medicaid EHR Incentive Program.

Finally, we proposed to define at § 414.1305 a meaningful EHR user under MIPS as a MIPS eligible clinician who possesses CEHRT, uses the functionality of CEHRT, and reports on applicable objectives and measures specified for the advancing care information performance category for a performance period in the form and manner specified by CMS.

The following is a summary of the comments we received regarding our proposal for EHR certification requirements.

Comment: Most commenters supported the proposal to allow MIPS eligible clinicians to use either technology certified to 2014 or 2015 Edition for the performance period in 2017. Many commenters urged CMS to allow MIPS eligible clinicians to continue to use either EHR technology certified to the 2014 or 2015 Edition in the performance period 2018 and beyond, citing concerns over the time required for health IT development and certification and MIPS eligible clinician readiness concerns that the 2015 Edition technology may not be available in time for the performance period or reporting timeframe. A few commenters suggested that flexibility in the form of a hardship exception to reporting to MIPS be offered to accommodate MIPS eligible clinicians who are unable to implement EHR technology certified to the 2015 Edition in time for the 2018 performance period. Other commenters found the requirement to use EHR technology certified to the 2015 Edition in 2018 unacceptable. Commenters noted that as of the comment due date there are zero products certified to the 2015 Edition and recommended that we allow the use of products certified to the

2014 Edition through 2020. Some commenters were also concerned that the small amount of products certified to the 2015 Edition would require MIPS eligible clinicians to find alternatives to meeting the advancing care information requirements and possibly limit those in APMs from utilizing the benefits of the new technology.

Response: We appreciate the comments and feedback we received, and the support of the proposal for performance periods in 2017 to allow the use of technology certified to the 2014 or 2015 Edition or a combination of the two. We believe this will allow MIPS eligible clinicians the flexibility to transition to EHR technology certified to the 2015 Edition for use for performance periods in 2018 in a manner that works best for their systems, workflows, and clinical needs. We additionally understand the concerns raised by commenters regarding the timeline to implement the 2015 Edition in time for use for performance periods in 2018. We note the requirements for technology certified to the 2015 Edition were established in October 2015 in ONC's final rule titled 2015 Edition Health Information Technology (Health IT) Certification Criteria, 2015 Edition Base Electronic Health Record (EHR) Definition, and ONC Health IT Certification Program Modifications (80 FR 62602–62759). The EHR Incentive Programs final rule adopted the requirement that EPs, eligible hospitals, and CAHs use technology certified to the 2015 Edition beginning in 2018. We intend to maintain continuity for MIPS eligible clinicians and health IT vendors who may already have CEHRT or who have begun planning for a transition to technology certified to the 2015 Edition based on the definition of CEHRT finalized for the EHR Incentive Programs in the 2015 EHR Incentive Programs final rule (80 FR 62871 through 62889). Therefore, there are no new certification requirements in the definition we are finalizing for MIPS eligible clinicians participating in the advancing care information performance category of MIPS at § 414.1305 in order to maintain consistency with the EHR Incentive Programs CEHRT definition at 42 CFR 495.4. Our proposal to adopt a substantively similar definition of CEHRT that was finalized in the 2015 EHR Incentive Programs final rule was intended to provide consistency for MIPS eligible clinicians and also to allow EHR vendors to begin development based on the specifications finalized in October of 2015 and released by ONC for testing beginning in 2016 unimpeded by the timeline related

to any rulemaking for the MIPS program. This allows vendors to work toward certification on a longer timeline and allows MIPS eligible clinicians to adopt an implement the technology in preparation for the performance period in 2018. In addition, in order to allow eligible clinicians and groups adequate time to transition to EHR technology certified to the 2015 Edition for use in CY 2018, we will accept a minimum of 90 consecutive days of data within the CY 2018 performance period for the advancing care information performance category. In partnership with ONC, we are monitoring the development and certification process for health IT products certified to the 2015 Edition and will continue to gauge MIPS eligible clinician readiness for the 2018 performance period. At this time, we believe it is appropriate to require the use of EHR technology certified to the 2015 Edition for the performance period in 2018 and encourage MIPS eligible clinicians to work with their EHR vendors in the coming months to prepare for the transition to 2015 Edition in for the performance period in CY 2018.

Comment: One commenter suggested that the CEHRT definition be expanded to include requirements beyond those finalized for meeting the advancing care information performance category and commenters noted that vendors other than EHR vendors could support the criteria listed in the proposed rule, to include Health Information Exchanges (HIE) or Health Information Service Providers (HISPs).

Response: The definition of CEHRT does contain elements that are not included in the advancing care information performance category. As noted in the proposed rule (81 FR 28218–28219), and consistent with prior EHR Incentive Program policy, removing a measure from the reporting requirements does not remove the functions supporting that measure from the definition of CEHRT unless we make corresponding changes to that definition. Therefore, a MIPS eligible clinician must implement that function in their practice in order to have their system meet the technological specifications required for participation in the program. For example, in the 2015 EHR Incentive Programs final rule (80 FR 62786), we noted that the Stage 1 "Record Demographics" measure was designated as topped out and no longer required for reporting, but CEHRT must still capture and record demographics as structured data using the appropriate standards. For MIPS, we did not propose to include the CPOE and CDS objectives and measures in the

advancing care information performance category although the technology functions supporting these measures were included in our proposed definition of CEHRT for MIPS.

Comment: Some commenters were encouraged by the CMS' commitment to collaborate with ONC on the 2015 Edition CEHRT requirements for MIPS to align with the evolving standards to support health IT capabilities.

Response: We appreciate these comments and will continue to collaborate with ONC on the alignment of MIPS requirements and CEHRT in future rulemaking.

Comment: A few commenters requested that the definitions of CEHRT incorporate the roles of non-physician practitioners, including Nurse Practitioners (NPs), Physician Assistants (PAs), Certified Registered Nurse Anesthetists (CRNAs) and Clinical Nurse Specialists (CNSs). They noted that current EHR vendor software usually does not allow non-physician practitioners to make entries or be identified. The commenters suggested that CEHRT vendors should be required include provisions so that non-physician practitioners can also utilize the CEHRT so that they can meet MIPS requirements.

Response: The requirements for the use of CEHRT do not specify the type of provider or clinician that can enter data, nor do ONC's certification criteria in any way limit the entry of data by non-physician practitioners. In some states, the MIPS eligible clinicians mentioned by the commenter may already be participating in the Medicaid EHR Incentive Programs as an EP and using CEHRT to support their clinical practice. In addition, many practices across a wide range of settings where EPs have participated in the Medicare EHR Incentive Programs have developed different workflows to meet their practice needs including the various staff beyond the eligible clinician that enter data. We encourage MIPS eligible clinicians and groups to work with their vendor, and with their own practice and clinical workflows to identify and establish best practices for data capture and data mapping to support their unique practice needs.

Comment: Some commenters recommended that CMS consider ways to measure possible clinical workflow disruptions caused by health IT (EHRs). The commenters suggested that CMS use Medicare beneficiary surveys, focus groups, patient reported outcome measures, and the CAHPS for MIPS survey; and to incorporate those results when designing health IT specifications

and regulations to be used across settings.

Response: We appreciate the feedback and will take this suggestion into consideration in the future. We encourage MIPS eligible clinicians to work with their EHR vendor to improve the clinical workflow in a way that best suits their individual practice needs.

Comment: Other commenters noted that while patient access to data is important, MIPS eligible clinicians also need interoperable data from a variety of sources to integrate seamlessly into their work flow. The commenters believe that third party applications will play a major role in satisfying this need to ensure data "quality" so that physicians get the most relevant data in a useable format, when and where they need it.

Response: CMS and ONC agree with the comments that interoperability and the seamless integration of data and systems into clinical workflows is essential to improving health care quality. For this reason, the 2015 Edition certification criteria include testing and certification for API functionality as a certified health IT module (80 FR 62601–62759), as well as criteria related to ensuring the ability to receive and consume electronic summary of care records from external sources into the provider's EHR and to developing a path for bi-directional exchange of immunization data with public health registries.

After consideration of the comments we received, we are finalizing our proposal regarding EHR certification requirements at § 414.1305 as proposed and encourage MIPS eligible clinicians to prepare for the migration to the 2015 Edition of CEHRT in 2018. In 2017, MIPS eligible clinicians may use EHR technology certified to the 2014 Edition or the 2015 Edition or a combination of the two. We note that a MIPS eligible clinician who only has technology certified to the 2014 Edition would not be able to report certain measures specified for the advancing care information performance category that correlate to a Stage 3 measure for which there was no Stage 2 equivalent. These MIPS eligible clinicians may instead report the objectives and measures specified for the advancing care information performance category which correlate to Modified Stage 2 objectives and measures. In 2018, MIPS eligible clinicians must use EHR technology certified to the 2015 Edition.

The following is a summary of the comments we received regarding our proposal for defining a meaningful EHR user under MIPS.

Comment: Many commenters expressed an overall desire to maintain

a moderate to high level standard and category weight for the distinction of meaningful EHR user. These commenters noted that the definition of meaningful EHR user will have an important impact on health IT adoption and that reducing the stringency or lowering the advancing care information performance category weight in the MIPS final score could hinder progress toward robust, person-centered use of health IT across the health care industry.

Response: We agree that defining a meaningful EHR user is critical for all of the reasons that the commenter raises; it is an important piece of health IT adoption and promoting interoperability. We seek to balance this critical aspect of EHR reporting with our desire to increase widespread adoption of health IT and clinical standards among MIPS eligible clinicians. We believe our final policies will encourage more widespread adoption and use of health IT in a practice setting. We are also dedicated to increasing the stringency of the measures specified for the advancing care information performance category in future years of the MIPS program to further the advancement of health IT use.

After consideration of the public comments we received, we are finalizing our proposal to define a meaningful EHR user for MIPS under § 414.1305 as a MIPS eligible clinician who possesses CEHRT, uses the functionality of CEHRT, and reports on applicable objectives and measures specified for the advancing care information performance category for a performance period in the form and manner specified by CMS.

(b) Method of Data Submission

Under the Medicare EHR Incentive Program, EPs attest to the numerators and denominators for certain objectives and measures, through a CMS Web site. For the purpose of reporting advancing care information performance category objectives and measures under the MIPS, we proposed at § 414.1325 to allow for MIPS eligible clinicians to submit advancing care information performance category data through qualified registry, EHR, QCDR, attestation and CMS Web Interface submission methods. Regardless of data submission method, all MIPS eligible clinicians must follow the reporting requirements for the objectives and measures to meet the requirements of the advancing care information performance category.

We note that under this proposal, 2017 would be the first year that EHRs (through the QRDA submission

method), QCDRs and qualified registries would be able to submit EHR Incentive Program objectives and measures (as adopted for the advancing care information performance category) to us, and the first time this data would be reported through the CMS Web Interface. We recognize that some Health IT vendors, QCDRs and qualified registries may not be able to conduct this type of data submission for the 2017 performance period given the development efforts associated with this data submission capability. However, we are including these data submission mechanisms in 2017 to support early adopters and to signal our longer-term commitment to working with organizations that are agile, effective and can create less burdensome data submission mechanisms for MIPS eligible clinicians. We believe the proposed data submission methods could reduce reporting burden by synchronizing reporting requirements and data submission, and systems, allow for greater access and ease in submitting data throughout the MIPS program. We note that specific details about the form and manner for data submission will be addressed by CMS in the future.

The following is a summary of the comments we received regarding our proposal to allow for multiple methods for data submission for the advancing care information performance category.

Comment: The majority of commenters supported the proposed data submission approach to allow for MIPS eligible clinicians to submit data for the advancing care information performance category through multiple submission methods, which includes, for example, via attestation, qualified registries, QCDRs, EHRs and CMS Web Interface. Many agreed that the proposal alleviates the need for individual MIPS eligible clinicians and groups to use a separate reporting mechanism to report data for different performance categories.

Response: We appreciate the supportive comments and reiterate that our goals include reducing the reporting burden, aligning reporting requirements across MIPS performance categories, and supporting efficient data submission mechanisms.

Comment: Some commenters expressed concern that many third party data submission entities do not have the necessary data submission functionality and will not have enough time to develop, distribute and adopt the needed functionality for a performance period in 2017. One commenter requested that CMS provide detailed guidance to vendors and QCDRs as they

implement data submission functionality. Another commenter expressed concern about the potential for vendors and developers of QCDRs and registries to fail to fulfill the technical requirements for data submission and advised CMS to finalize a policy indicating that MIPS eligible clinicians would not be penalized for failure of data submission due to vendor issues. One commenter suggested offering bonus points for the use of QCDRs or registry adoption to recognize the investment needed to participate.

Response: We appreciate the concerns raised by commenters and note that we intend to provide detailed guidance for EHR vendors, as well as third party data intermediaries who submit data on behalf of MIPS eligible clinicians to help them be successful in data submission. However, we acknowledge that some EHRs, QCDRs and registry vendors may not be able to support data submission for the advancing care information performance category for 2017 due to the time needed to develop the technology and functionality to collect and submit these data. For this reason, as discussed in section I.E.5.a. of this final rule with comment period, we offer MIPS eligible clinicians several reporting mechanisms from which to choose. While we believe that in the long term, it is more convenient for MIPS eligible clinicians to submit data one time for all performance categories, we acknowledge that this may not be possible in the transition year for the aforementioned reasons. Therefore, we offer the option of attestation for those MIPS eligible clinicians who's CEHRT, QCDR or registry are not prepared to support advancing care information performance category data submission in 2017. For further discussion of MIPS submission methods, we refer readers to section I.E.5.a. of this final rule with comment period.

Comment: One commenter requested that CMS provide greater flexibility in the submission standards set forth for health IT vendors, particularly in the transition year of MIPS, including the ability to submit data via QCDR XML. The commenter stated that QCDR vendors often experience issues submitting data using the uniform standards in QRDA implementation guides and that many QRDA variables that are clinical in nature do not easily map to the variables in CEHRT.

Response: We note that our proposal does allow for submission of the advancing care information performance category data via QCDR, as well as registry, CEHRT, CMS Web Interface and attestation. We believe this flexibility allows MIPS eligible

clinicians the ability to submit through their chosen submission mechanism that is most appropriate for their practice.

Comment: One commenter believed the attestation process is cumbersome and expensive for large groups and suggested that CMS develop a process that will allow larger groups to attest as a group.

Response: Because the EPs reporting under EHR Incentive Program reported using their individual NPIs, attestation and data submission was completed at the NPI level which was not conducive to groups combining their data and attesting for all of their NPIs together. We agree that this same approach under the MIPS would be cumbersome for group submission. Under the MIPS, groups will have the ability to attest or submit their advancing care information data through a qualified registry, QCDR, EHR, attestation, or CMS Web Interface as a group, meaning the data would be aggregated to the group level and submitted once on behalf of all MIPS eligible clinicians within the group. MIPS eligible clinicians will also have the ability to submit as individuals, if their group is not submitting using the group method. In these cases, the attestation or data submission would be done at the individual (TIN/NPI) level.

Comment: One commenter recommended the mandatory publication of EHR source code in order to reduce bias and errors.

Response: We appreciate the suggestion, however, we note that this is outside our authority under section 1848(q) of the Act and outside the scope of this rule.

We note that there were several other comments related to data submission for MIPS, and we direct readers to section I.E.5.a. of this final rule with comment period for discussion of those comments. After consideration of the comments we received, we are finalizing our policy as proposed.

(c) Group Reporting

Under the Medicare EHR Incentive Program, we adopted a reporting mechanism for EPs that are part of a group, to attest using one common form, or a batch reporting process. To determine whether those EPs meaningfully used CEHRT, under that batch reporting process, we assessed the individual performance of the EPs that made up the group, not the group as a whole.

The structure of the MIPS and our desire to achieve alignment across the MIPS performance categories appropriately necessitates the ability to assess the performance of MIPS eligible

clinicians at the group level for all MIPS performance categories. We believe MIPS eligible clinicians should be able to submit data as a group, and be assessed at the group level, for all of the MIPS performance categories, including the advancing care information performance category. For this reason, we proposed a group reporting mechanism for individual MIPS eligible clinicians to have their performance assessed as a group for all performance categories in section II.E.1.e. of the proposed rule (81 FR 28178 and 28179), consistent with section 1848(q)(1)(D)(i)(I) & (II) of the Act.

Under this option, we proposed that performance on advancing care information performance category objectives and measures would be assessed and reported at the group level, as opposed to the individual MIPS eligible clinician level. We note that the data submission criteria would be the same when submitted at the group-level as if submitted at the individual-level, but the data submitted would be aggregated for all MIPS eligible clinicians within the group practice. We believe this approach to data submission better reflects the team dynamics of the group, and would reduce the overall reporting burden for MIPS eligible clinicians that practice in groups, incentivize practice-wide approaches to data submission, and provide enterprise-level continuous improvements strategies for submitting data to the advancing care information performance category. Please see section II.E.1.e. of the proposed rule (81 FR 28178 and 28179) for more discussion of how to participate as a group under MIPS.

The following is a summary of the comments we received regarding our proposal to allow for group reporting starting in 2017.

Comment: The majority of commenters strongly support the allowance of group reporting in the advancing care information performance category. Reasons for support include the reduction in reporting burden, as well as alignment with other MIPS performance categories.

Response: We appreciate the supportive comments.

Comment: Many commenters expressed concern about allowing group reporting for the advancing care information performance category in 2017 given the short timeframe between the publication for this final rule with comment period and the start of the 2017 performance period. Commenters believe that this would offer too little time to implement group reporting capabilities in CEHRT, stating that

report logic will require clear specifications and time for development and distribution of report updates.

Response: We recognize that the implementation of group reporting may require varying levels of effort for different practices and therefore may not be the best choice for all MIPS eligible clinicians for the 2017 performance period. However, we believe that making group reporting available for performance periods in CY 2017 offers a significant reduction in reporting burden for many group practices that have a large number of MIPS eligible clinicians, all of whom would otherwise have to report the MIPS requirements individually. We additionally note that groups and MIPS eligible clinicians have the ability to report through multiple reporting mechanisms providing flexibility should their CEHRT be unable to support group reporting in 2017.

Comment: Some commenters requested clarification on how group reporting of the base and performance scores will be calculated if one or more individual MIPS eligible clinicians within a group practice does not report on an objective or can claim an exclusion from reporting on an objective. In addition, a few commenters asked how to avoid counting more than once the unique patients seen by multiple MIPS eligible clinicians within the group practice. They also asked for detailed instructions for calculating the numerators and denominators of the measures reported.

Response: We understand that additional explanation is needed in order for groups to determine whether the group reporting option is best for their practice.

As with group reporting for the other MIPS performance categories, to report as a group, the group will need to aggregate data for all the individual MIPS eligible clinicians within the group for whom they have data in CEHRT. For those who choose to report as a group, performance on the advancing care information performance category objectives and measures would be reported and evaluated at the group level, as opposed to the individual MIPS eligible clinician level. For example, the group calculation of the numerators and denominators for each measure must reflect all of the data from all individual MIPS eligible clinicians that have been captured in CEHRT for the given advancing care information measure. If the group practice has CEHRT that is capable of supporting group reporting, they would submit the aggregated data produced by the CEHRT. If the group practice does not have CEHRT that is

capable of or updated to support group reporting, the group would aggregate the data by adding together the numerators and denominators for each MIPS eligible clinician within the group for whom the group has data captured in their CEHRT. If an individual MIPS eligible clinician meets the criteria to exclude a measure, their data can be excluded from the calculation of that particular measure only.

We understand and agree that it can be difficult to identify unique patients across a group for the purposes of aggregating performance on the advancing care information measures, particularly when that group is using multiple CEHRT systems. We further recognize that for 2017, groups may be using systems which are certified to different CEHRT editions further adding to this challenge. We consider “unique patients” to be individual patients treated by the group who would typically be counted as one patient in the denominator of an advancing care information measure. This patient may see multiple MIPS eligible clinicians within the group, or may see MIPS eligible clinicians at multiple group locations. When aggregating performance on advancing care information measures for group reporting, we do not require that the group determine that a patient seen by one MIPS eligible clinician (or at one location in the case of groups working with multiple CEHRT systems) is not also seen by another MIPS eligible clinician in the group or captured in a different CEHRT system. While this could result in the same patient appearing more than once in the denominator, we believe that the burden to the group of identifying these patients is greater than any gain in measurement accuracy. Accordingly, this final policy will allow groups some flexibility as to the method for counting unique patients in the denominators to accommodate these scenarios where aggregation may be hindered by systems capabilities across multiple CEHRT platforms. We note that this is consistent with our data aggregation policy for providers practicing in multiple locations under the EHR Incentive Program (77 FR 53982).

Comment: A few commenters voiced concerns that group reporting and many EHR systems, particularly hospital EHRs, mask who actually performs the service and may not recognize the ability of MIPS eligible clinicians who are not physicians to provide and document care. For example, non-physicians who are not considered MIPS eligible clinicians, such as nurse-midwives, physical or occupational

therapists and psychologists often perform services and complete their actions using CEHRT. However, the commenter notes that CEHRT functionality usually does not offer the ability to distinguish which clinician actually performed the action, thus making it difficult to calculate an accurate numerator and denominator for measures in the advancing care information performance category. One commenter requested that CMS require that CEHRT be able to identify which clinician is using the CEHRT, ensuring that clinicians other than physicians are able to make entries and actions are attributed to MIPS eligible clinicians.

Response: We appreciate the feedback and agree that there are issues related to group reporting that we will continue to monitor as the program develops. We note that the vast majority of commenters supported the group reporting option as it represents a reduction in reporting burden for MIPS eligible clinicians who choose to report as groups rather than as individuals. As we move forward with the advancing care information performance category we will be working with ONC to refine capabilities in CEHRT that could further support group reporting.

Comment: One commenter urged CMS to avoid issuing guidance that assigns nurses the role of scribe or data entry for physicians because this would adversely affect the quality of care delivered to patient.

Response: We do not intend to issue guidance that define or redefine the role of non-physician practitioners, such as nurse practitioners or nurse specialists.

After consideration of the comments, we are finalizing our proposal to allow group reporting for the advancing care information performance category with the additional explanation of data aggregation requirements for group reporting provided in our response above, particularly as it relates to aggregating unique patients seen by the group.

For our final policy, we considered and rejected imposing a threshold for group reporting. For example, in future years we may require that groups can only submit their advancing care information performance category data as a group if 50 percent or more of their eligible patient encounters are captured in CEHRT. While we considered this as an option for 2017, the transition year of MIPS, we chose not to institute such a policy at this time and will instead consider it for future years. We are seeking comment in this final rule with comment period on what would be an appropriate threshold for group reporting in future years.

We note that group reporting policies for the MIPS program, including the other performance categories, are discussed in section II.E.5.a. of this final rule with comment period, and we refer readers to that section for additional discussion of group reporting.

(6) Reporting Requirements & Scoring Methodology

(a) Scoring Method

Section 1848(q)(5)(E)(i)(IV) of the Act, as added by section 101(c) of the MACRA, states that 25 percent of the MIPS final score shall be based on performance for the advancing care information performance category. Therefore, we proposed at § 414.1375 that performance in the advancing care information performance category will comprise 25 percent of a MIPS eligible clinician's MIPS final score for payment year 2019 and each year thereafter. We received many comments in the MIPS and APMs RFI from stakeholders regarding the importance of flexible scoring for the advancing care information performance category and provisions for multiple performance pathways. We agree that this is the best approach moving forward with the adoption and use of CEHRT as it becomes part of a single coordinated program under the MIPS. For the reasons described here and previously in this preamble, we are proposing a methodology which balances the goals of incentivizing participation and reporting while recognizing exceptional performance by awarding points through a performance score. In this methodology, we proposed at § 414.1380(b)(4) that the score for the advancing care information performance category would be comprised of a score for participation and reporting, hereinafter referred to as the "base score," and a score for performance at varying levels above the base score requirements, hereinafter referred to as the "performance score".

The following is a summary of the comments we received regarding overall scoring for the advancing care information performance category.

Comment: Overall, most commenters found the scoring to be cumbersome, complex, and complicated and recommended that it be simplified. Suggestions included removing distinction between the base score and performance score. Others suggested removing objectives and measures or moving them to other MIPS performance categories, such as moving Public Health and Clinical Data Registry Reporting to the improvement activities performance category. One commenter

suggested simplifying the assignment of points for each measure. For example, they suggested that 10 percent per measure be awarded for the following: 1. Patient Access; 2. Electronic Prescribing; 3. Computerized Provider Order Entry (CPOE); 4. Patient-Specific Education; 5. View, Download, Transmit; 6. Secure Messaging; 7. Patient-Generated Health Data; 8. Patient Care Record Exchange; 9. Request/Accept Patient Care Record; 10. Clinical Information Reconciliation.

Response: We appreciate the constructive feedback from commenters. Our priority is to finalize reporting requirements for the advancing care information performance category that incentivizes performance and reporting with minimal complexity and reporting burden. We have addressed many of these comments and concerns in our final scoring methodology outlined in section II.E.5.g.(6)(a) of this final rule with comment period.

Comment: Some commenters appreciated the split between base and performance scores in the advancing care information performance category, citing the flexibility offered compared to the EHR Incentive programs. Many commenters also praised the elimination of the requirement to meet measure thresholds.

Response: We appreciate commenters' support for our proposal. Our priority is to finalize a scoring methodology for the advancing care information performance category that promotes the use of CEHRT reporting requirements in an efficient, effective and flexible manner.

Comment: Some commenters did not support the elimination of measure thresholds. They believed that incorporating measure thresholds enables MIPS eligible clinicians to earn higher score for the advancing care information performance score and would encourage a higher level of success using CEHRT. Another commenter suggested replacing the base score requirement of at least one in the numerator with a requirement to meet a 5 percent threshold for each measure reported beginning for the performance period of CY 2019.

Response: We believe the scoring approach, as proposed and then as finalized in this final rule with comment period, promotes performance on the advancing care information performance category measures by rewarding high performance rather than requiring MIPS eligible clinicians to meet one threshold across the board. We agree that in future years of the program, we may consider higher minimum thresholds for reporting, however, we also seek to allow flexibility for MIPS

eligible clinicians to report on the measures that are most meaningful to their practice.

Comment: Most commenters supported the proposal to move away from the overall all-or-nothing scoring approach previously used in the EHR Incentive Programs. However, many commenters do not support the all-or-nothing approach proposed to earn the base score and subsequent points in the performance score, for the advancing care information performance category. More than one commenter recommended offering partial credit for each objective in the base score rather than an all-or-nothing approach. Other comments include removing the base score and only awarding points toward a performance score, as well as adding more measure exclusions. Some suggested awarding points toward the performance score even if the MIPS eligible clinician fails to meet a base score.

Response: In order to provide more flexibility for MIPS eligible clinicians, we have moved away from the all-or-nothing approach in our final policy. We note that certain measures under our final policy remain required measures in the base score. For example, section 1848(o)(2)(A) of the Act includes certain requirements that we have chosen to implement through measures such as e-Prescribing, Send Summary of Care (formerly Patient Care Record Exchange) and Request/Accept Patient Care Record, and thus, certain measures under our final policy remain required measures for the base score in the advancing care information performance category. In addition to those measures listed above, there are other measures such as Security Risk Analysis that are essential to protecting patient privacy, which we believe should be mandatory for reporting. We have addressed these comments further with our final scoring methodology outlined in section II.E.5.g.(6)(a) of this final rule with comment period. We have reduced the total number of required measures from 11 in the base score as proposed to only five in the final policy, which addresses some of the concerns raised by commenters while meeting our statutory requirements, as well as our commitment to patient privacy and access.

Comment: Many commenters requested that the distribution of points for the base score and performance score of the advancing care information performance category be reweighted. More than one commenter suggested reducing the weight of the base score and increasing the weight of the performance score over time. For

example, some commenters requested that the base be worth 40 percent and the performance be 60 percent of the points. Another commenter believed the base score should initially be more heavily weighted, with the base score at 60 points, Protect Patient Health Information score at 10 points, and performance score at 80 points.

Response: Based on the overwhelming comments received, and our goal to simplify the scoring methodology wherever possible, we agree with commenters that the base and performance scores should be reconsidered for the final policy. We have outlined the final scoring methodology in section II.E.5.g.(6)(a) of this final rule with comment period, in which the performance score is reweighted and the total possible score for the advancing care information performance category is increased to 155 percent which would be capped at 100 percent when applied to the 25 possible points for the advancing care information performance category in the MIPS final score.

Comment: Many commenters disliked that no credit is awarded if the numerator for any measure is not at least one or the response is not “yes” for yes/no measures. Some commenters propose changing the policy to allow MIPS eligible clinicians to earn a performance score and bonus score even if they fail the base score. Others suggest reducing the number of objectives to report to earn the base score. For example, one commenter suggested requiring only the measures within the following objectives to achieve the base score: Protect Patient Health Information, Patient Electronic Access and Health Information Exchange.

Response: We appreciate the suggestions raised by commenters and have taken these comments into account for our final policy discussed in section II.E.5.g.(6)(a). We note that for required measures in the base score, we would still require a one in the numerator or a “yes” response to yes/no measures. Section 1848(o)(2)(A) of the Act includes certain requirements that we have chosen to implement through three of the measures in the base score (e-Prescribing, Send a Summary of Care (formerly Patient Care Record Exchange) and Request/Accept Summary of Care (formerly Patient Care Record), and thus, we believe these measures should be required in order for a MIPS eligible clinician to earn any score in the advancing care information performance category. The other two required measures, Security Risk Analysis and Provide Patient Access (formerly Patient Access) are of paramount importance to

CMS, and thus, we have maintained them as required measures in the base score.

Comment: Many commenters support the emphasis on health information exchange and patient engagement in both the base score and performance score. Some commenters recommended an even more weight given to these areas in the performance score.

Response: We appreciate this feedback. We agree that health information exchange and coordination of care through patient engagement are essential to improving the quality of care.

(b) Base Score

To earn points toward the base score, a MIPS eligible clinician must report the numerator and denominator of certain measures specified for the advancing care information performance category (see measure specifications in section II.E.5.g.(7) (81 FR 28226 through 28228)), which are based on the measures adopted by the EHR Incentive Programs for Stage 3 in the 2015 EHR Incentive Programs final rule, to account for 50 percent (out of a total 100 percent) of the advancing care information performance category score. For measures that include a percentage-based threshold for Stage 3 of the EHR Incentive Program, we would not require those thresholds to be met for purposes of the advancing care information performance category under MIPS, but would instead require MIPS eligible clinicians to report the numerator (of at least one) and denominator (or a yes/no statement for applicable measures, which would be submitted together with data for the other measures) for each measure being reported. We note that for any measure requiring a yes/no statement, only a yes statement would qualify for credit under the base score. Under the proposal, the base score of the advancing care information performance category would incorporate the objective and measures adopted by the EHR Incentive Programs with an emphasis on privacy and security. We proposed two variations of a scoring methodology for the base score, a primary and an alternate proposal, which are outlined below. Both proposals would require the MIPS eligible clinician to meet the requirement to protect patient health information created or maintained by CEHRT to earn any score within the advancing care information performance category; failure to do so would result in a base score of zero, a performance score of zero (discussed in section II.E.5.g of the proposed rule (81 FR 28221), and an advancing care

information performance category score of zero.

The primary proposal at section II.E.5.g.(6)(b)(ii) of the proposed rule (81 FR 28221) would require a MIPS eligible clinician to report the numerator (of at least one) and denominator or yes/no statement (only a yes statement would qualify for credit under the base score) for a subset of measures adopted by the EHR Incentive Program for EPs in the 2015 EHR Incentive Programs final rule. In an effort to streamline and simplify the reporting requirements under the MIPS, and reduce reporting burden on MIPS eligible clinicians, we proposed that two objectives (Clinical Decision Support and Computerized Provider Order Entry) and their associated measures would not be required for reporting the advancing care information performance category. Given the consistently high performance on these two objectives in the EHR Incentive Program with EPs accomplishing a median score of over 90 percent for the last 3 years, we stated our belief that these objectives and measures are no longer an effective measure of EHR performance and use. In addition, we do not believe these objectives and associated measures contribute to the goals of patient engagement and interoperability, and thus, we believe these objectives can be removed in an effort to reduce reporting burden without negatively impacting the goals of the advancing care information performance category. We note that the removed objectives and associated measures would still be required as part of ONC's functionality standards for CEHRT, however, MIPS eligible clinicians would not be required to report the numerator and denominator or yes/no statement for those measures. In the 2015 EHR Incentive Programs final rule we also established that, for measures that were removed, the technology requirements would still be a part of the definition of CEHRT. For example, in that final rule, the Stage 1 Objective to Record Demographics was removed, but the technology and standard for this function in the EHR were still required (80 FR 62784). This means that the MIPS eligible clinician would still be required to have these functions as a part of their CEHRT.

The alternate proposal at section II.E.5.g.(6)(b)(iii) of the proposed rule (81 FR 28222) would require a MIPS eligible clinician to report the numerator (of at least one) and denominator or yes/no statement (only a yes statement would qualify for credit under the base score) for all objectives and measures adopted for Stage 3 in the

2015 EHR Incentive Programs final rule to earn the base score portion of the advancing care information performance category, which would include reporting a yes/no statement for CDS and a numerator and denominator for CPOE objectives. We included these objectives in the alternate proposal as MIPS eligible clinicians may believe the continued measurement of these objectives is valuable to the continued use of CEHRT as this would maintain the previously established objectives under the EHR Incentive Program.

We stated our belief that both proposed approaches to the base score are consistent with the statutory requirements under HITECH and previously established CEHRT requirements as we transition to MIPS. We also believe both approaches, in conjunction with the advancing care information performance score, recognize the need for greater flexibility in scoring CEHRT use across different clinician types and practice settings by allowing MIPS eligible clinicians to focus on the objectives and measures most applicable to their practice.

Comment: Several commenters were disappointed that our proposals for the base score are so similar to the current meaningful use requirements. They requested a more streamlined approach as they believe the statute intended. Another commenter believed that advancing care information performance category should reflect a MIPS eligible clinician's use of digital clinical data to inform patient care and encourage bi-directional data interoperability.

Response: While we did draw on the meaningful use foundation in drafting the requirements for the advancing care information performance category, our proposals have lessened those requirements and provided additional flexibility as compared with all stages of the EHR Incentive Programs. We note that we have made significant revisions to the scoring methodology and reporting requirements in our final policy discussed in section II.E.5.g.(6)(a) in response to these comments. We would also welcome concrete proposals for new measures as we move forward with EHR reporting requirements under the MIPS. We are eager to improve interoperability and would welcome suggestions for improvement.

Comment: We received many comments on the allocation of points in the base score. Some commenters asked CMS to simplify the base score calculation and weight the base score higher. Alternatively commenters recommended that CMS reweight the base score to 75 percent of the total advancing care information performance

category. Other commenters recommended that increasing the weight of the base score only occur if CMS also moves away from the pass-fail approach to scoring this section. Others suggested removing the base component of the scoring methodology, and instead just have a set amount of points that it is possible to achieve for each measure.

In regard to the base score calculation, most commenters requested that we remove the all-or-nothing scoring of the base score. Some asked that CMS give clinicians the option to report on a subset of measures to satisfy the base score. Many requested partial credit. Some commenters expressed concern that not reporting at least a numerator of one for the base measures will result in a score of zero for the entire category. A commenter proposed reporting a zero numerator or denominator on a measure would satisfy successfully submitting data, and thus, the clinician should achieve full points for the base score. Another recommended CMS grant credit for each reported measure under the base score and make clear that a physician will not fail the entire advancing care category if they fail to report all base score measures.

Commenters also suggested giving full credit in the advancing care information performance category if a MIPS eligible clinician attests to using technology certified to the 2014 or 2015 Edition for MIPS year 1, and 75 percent credit toward advancing care information performance category for subsequent years. Another asked that 50 percent in the base score be awarded to clinicians that implemented CEHRT for at least 90 days of the performance period to ease newer users into EHR. While most requested less stringent requirements, some thought that it is too easy to achieve the 50 percent base score. Others believed the "one patient threshold" for advancing care information performance category reporting for all measures in the base score is far too low.

Response: We have taken commenters' feedback into consideration as we have constructed our final policy as outlined in section II.E.5.g.(6)(a) of this final rule with comment period. While we appreciate commenters concerns about low thresholds, we believe that the reporting requirements we set (a one in the numerator for numerator/denominator measures, and a "yes" for yes/no measures) are appropriate as we transition to the MIPS. We note the definition of MIPS eligible clinician includes many practitioners that were not eligible under the EHR Incentive Programs and thus have little to no

experience with the objectives and measures. While the reporting requirements are lower than the thresholds established for Modified Stage 2 and Stage 3 of the EHR Incentive Programs, we believe they are appropriate for the first performance period of MIPS. Further we have tried to limit the composition of the base score so that MIPS eligible clinicians can distinguish themselves through reporting on the performance score measures. We are finalizing additional flexibilities to address the concern about an all-or-nothing approach and reduced the number of required measures from 11 in the proposed base score to five in our final policy. We note that certain measures which implement statutory requirements or that we consider high priority to protect patient privacy and access are required for reporting. MIPS eligible clinicians are required to report on all five of the required measures in the base score in order to earn any points in the advancing care information performance category. Considering this significant reduction in the number of required measures for the base score, we do not believe it is appropriate to increase the weight of the base score as some commenters suggested and will keep it at 50 percent in our final scoring methodology.

We are finalizing our policy that a MIPS eligible clinician must report either a one in the numerator for numerator/denominator measures, or a "yes" response for yes/no measures in order to earn points in the base score, and a MIPS eligible clinician must report all required measures in the base score in order to earn a score in the advancing care information performance category. We note that the remainder of a MIPS eligible clinician's score will be based on performance and/or meeting the requirements to earn a bonus score for Public Health and Clinical Data Registry Reporting or improvement activities as described in section II.E.5.g.(7)(b) and II.E.5.g.(2)(b) of this final rule with comment period.

(i) Privacy and Security; Protect Patient Health Information

In the 2015 EHR Incentive Programs final rule (80 FR 62832), we finalized the Protect Patient Health Information objective and its associated measure for Stage 3, which requires EPs to protect electronic protected health information (ePHI, as defined in 45 CFR 160.103) created or maintained by the CEHRT through the implementation of appropriate technical, administrative, and physical safeguards. As privacy and security is of paramount importance and applicable across all objectives, the

Protect Patient Health Information objective and measure would be an overarching requirement for the base score under both the primary proposal and alternate proposal, and therefore would be an overarching requirement for the advancing care information performance category. We proposed that a MIPS eligible clinician must meet this objective and measure to earn any score within the advancing care information performance category. Failure to do so would result in a base score of zero under either the primary proposal or alternate outlined proposal, as well as a performance score of zero (discussed in section II.E.5.g. of the proposed rule (81 FR 28215) and an advancing care information performance category score of zero.

The following is a summary of the comments we received regarding our proposal to require that a MIPS eligible clinician must meet the Protect Patient Health Information objective and measure to earn any score within the advancing care information performance category.

Comment: Many commenters supported the proposal requiring the Protect Patient Health Information objective and measure in order to receive the full base score and any performance score in the advancing care information performance category.

Response: We agree as we continue to believe that there are many benefits of safeguarding ePHI. Unintended and/or unlawful disclosures of ePHI puts EHRs, interoperability and health information exchange at risk. It is paramount that ePHI is properly protected and secured and we believe that requiring this objective and measure remains fundamental to this goal.

Comment: A few commenters expressed uncertainty about the effectiveness of the Protect Patient Health Information objective and measure in ensuring the security and privacy of patient health information, as well as maintaining doctor-patient confidentiality.

Response: We understand that in some cases this measure may not be enough to protect data as data breaches become more sophisticated. However we continue to believe that widespread performance of security risk analyses on a regular basis remains an important component of protecting ePHI. The measure is a foundation of protection and we expect that individuals and entities subject to HIPAA will also be meeting the requirements of HIPAA.

Comment: Some commenters believed that reporting the Protect Patient Health Information objective and measure is redundant and burdensome, as the

security risk analysis and other privacy and security areas are already included under HIPAA requirements.

Response: Yes, we agree that a security risk analysis is included in the HIPAA rules. However, it is our experience that some EPs are not fulfilling this requirement under the EHR Incentive Programs. To reinforce its importance, we are including it as a requirement for MIPS eligible clinicians.

Comment: Some commenters expressed concern that meeting the Protect Patient Health Information objective and measure requirements presents a burden to small group practices, practices in rural settings, new adopters of CEHRT and some MIPS eligible clinicians who experience varying hardships.

Response: We disagree. The HIPAA Privacy and Security Rules, which are more comprehensive than the Advancing Care Information measure and with which certain entities must also comply, have been effective for over 10 years. In addition, the Department of Health and Human Services has produced a security risk assessment tool designed for use by small and medium sized providers and clinicians available at <https://www.healthit.gov/providers-professionals/security-risk-assessment> and also <http://www.hhs.gov/hipaa/for-professionals/security/index.html>. This tool should help providers and clinicians with compliance and additional resources are also available at <http://www.hhs.gov/hipaa/for-professionals/security/guidance/index.html>. We understand that there are many sources of education available in the commercial market regarding HIPAA compliance.

Comment: Many commenters stated that EHR use could jeopardize patient confidentiality because personal information can be stolen. Some stated that EHRs are a violation of privacy. Others do not want their medical information accessible to the government or third party vendors. Several stated that the proposed rule is contrary to the HIPAA regulations.

Response: We agree that it is important to address the unique risks and challenges that EHRs may present. We maintain that a focus on the protection of ePHI is necessary for all clinicians. We also note that a security risk analysis is required under the HIPAA regulations (45 CFR 164.308(a)(1)).

Comment: A few commenters offered suggestions to modify the Protect Patient Health objective and measure, such as aligning the architecture of CEHRT with the Hippocratic Oath or

working with Office for Civil Rights (OCR) or the Office of the Inspector General (OIG) to develop additional guidance to physicians regarding privacy practices.

Response: We appreciate this feedback. We will continue to work with the OCR and ONC to develop and refine guidance.

We are finalizing the requirement that a MIPS eligible clinician must meet the Protect Patient Health Information objective and measure in order to earn any score within the advancing care information performance category.

(ii) Advancing Care Information Performance Category Base Score Primary Proposal

In the 2015 EHR Incentive Programs final rule (80 FR 62829–62871), we finalized certain objectives and measures EPs would report to demonstrate meaningful use of CEHRT for Stage 3. Under our proposal for the base score of the advancing care information performance category, MIPS eligible clinicians would be required to submit the numerator (of at least one) and denominator, or yes/no statement as appropriate (only a yes statement would qualify for credit under the base score), for each measure within a subset of objectives (Electronic Prescribing, Patient Electronic Access to Health Information, Care of Coordination Through Patient Engagement, Health Information Exchange, and Public Health and Clinical Data Registry Reporting) adopted in the 2015 EHR Incentive Programs final rule for Stage 3 to account for the base score of 50 percent of the advancing care information performance category score. Successfully submitting a numerator and denominator or yes/no statement for each measure of each objective would earn a base score of 50 percent for the advancing care information performance category. As proposed in the proposed rule, failure to meet the submission criteria (numerator/denominator or yes/no statement as applicable) and measure specifications (81 FR 28226 through 28230) for any measure in any of the objectives would result in a score of zero for the advancing care information performance category base score, a performance score of zero (discussed in section II.E.5.g. of the proposed rule 81 FR 28215) and an advancing care information performance category score of zero.

For the Public Health and Clinical Data Registry Reporting objective there is no numerator and denominator to measure; rather, the measure is a “yes/no” statement of whether the MIPS eligible clinician has completed the

measure, noting that only a yes statement would qualify for credit under the base score. Therefore we proposed that MIPS eligible clinicians would include a yes/no statement in lieu of the numerator/denominator statement within their submission for the advancing care information performance category for the Public Health and Clinical Data Registry Reporting objective. We further proposed that, to earn points in the base score, a MIPS eligible clinician would only need to complete submission on the Immunization Registry Reporting measure of this objective. Completing any additional measures under this objective would earn one additional bonus point in the advancing care information performance category score. For further information on this proposed objective, we direct readers to 81 FR 28230.

(iii) Advancing Care Information Performance Category Base Score Alternate Proposal

Under our alternate proposal for the base score of the advancing care information performance category, a MIPS eligible clinician would be required to submit the numerator (of at least one) and denominator, or yes/no statement as appropriate, for each measure, for all objectives and measures for Stage 3 in the 2015 EHR Incentives Program final rule (80 FR 62829–62871) as outlined in Table 7 of the proposed rule (81 FR 28223). Successfully submitting a numerator and denominator for each measure of each objective would earn a base score of 50 percent for the advancing care information performance category. Failure to meet the submission requirements, or measure specifications for any measure in any of the objectives would result in a score of zero for the advancing care information performance category base score, a performance score of 0 (discussed in section II.E.5.g. of the proposed rule), and an advancing care information performance category score of 0.

We proposed the same approach in the alternate proposal for the Public Health and Clinical Data Registry Reporting objective as for the primary outlined proposal. We direct readers to 81 FR 28226 through 28230 for further details on the individual objectives and measures.

The following is a summary of the comments we received regarding our base score primary and alternate proposals which differ based on whether reporting the CDS and CPOE objectives would be required.

Comment: Most commenters support the adoption of the base score primary proposal, which eliminates the objectives and associated measures for CPOE and CDS and agreed that most MIPS eligible clinicians already use CPOE and CDS and do very well on those measures. Several noted that measures require additional data entry and the pop-up alerts interfere with clinical workflow, and thus, removal of these measures could improve clinical workflow in the EHR.

Response: We agree and appreciate the support of these commenters. As we have done previously under the EHR Incentive Programs we will continue to monitor performance on objectives and measures and plan to propose to refine measures and add new measures in future years.

Comment: Since CPOE and CDS continue to be valuable to practices, many commenters support the alternate proposal to require the CPOE and CDS objectives in the base score for the advancing care information performance category. One commenter stated that maintaining these two objectives offers an opportunity for the development of important measures for specialists, including anesthesia-focused measures. Another commenter suggested including the CPOE objective in for the performance score of the advancing care information performance category to give more flexibility and offer an opportunity to MIPS eligible clinicians to earn more points, especially for those MIPS eligible clinicians who will be using an EHR technology certified to the 2014 Edition in 2017.

Response: While we agree that CPOE and CDS are valuable, we continue to believe that it is important to streamline and simplify the reporting requirements under MIPS. We note that the functionality supporting these objectives will continue to be required as part of CEHRT requirements.

Comment: One commenter urged CMS to clarify that even if the reporting of CPOE and CDS measures is eliminated under the primary proposal base score of the advancing care information performance category, MIPS eligible clinicians who utilize CPOE are still expected to utilize appropriately credentialed clinical staff to enter the orders and those who utilize CDS must have the required functionality turned on to receive credit in the advancing care information performance category base score.

Response: As for the functionality, even if the CPOE and CDS objectives and measures are not included for reporting under the advancing care information performance category, it is

still expected that MIPS eligible clinicians will continue to have the functionality enabled as a part of CEHRT.

Comment: Some commenters recommended retaining the CPOE and CDS objectives and associated measures, noting that while the two functionalities are widely adopted by those who were already participating in the Medicare and Medicaid EHR Incentive Programs, MIPS eligible clinicians include practitioners who were not eligible for those programs, many of whom have not yet adopted the functionalities and activities required for those objectives. Some commenters asked that, if retaining the CPOE objective and associated measures, that CMS include the low volume threshold exclusions.

Response: While we appreciate these concerns, we continue to believe that it is important to streamline and simplify the reporting requirements under MIPS. Practitioners who are not eligible to participate in the EHR Incentive Programs but are MIPS eligible clinicians will be subject to many new requirements and will have a considerable amount of learning to do in their initial years of the program, thus we do not believe it is necessary to add more to that list of requirements and also increase the reporting burden for clinicians with more experience using EHR who have historically had high performance on these measures in the past under the EHR Incentive Program. We note that the functionality supporting these objectives will continue to be required as part of certification requirements and available to new adopters of EHR technology.

Comment: One commenter expressed skepticism about the applicability of the objectives with special emphasis in the base score to specialists. For example, the commenter expressed concern that many anesthesiologists may have difficulty attesting to the Patient Electronic Access, Coordination of Care Through Patient Engagement and Health Information Exchange objectives. They suggested developing equally valuable substitute measures and objectives that focus on the use of CEHRT by specialists and MIPS eligible clinicians who work in settings that vary from traditional office-based practices.

Response: We understand that the practice settings of MIPS eligible clinicians vary and that meeting the proposed objectives and measures may require different levels of effort. We will consider the development of objectives and measures for specialists and other clinicians who do not work in office settings in future rulemaking.

Comment: We received many suggested changes to the measures included in our primary proposal. Some requested that we allow MIPS eligible clinicians to choose which measures are most relevant to their practice. Others recommended that the base score be streamlined and focus on three critical objectives of meaningful use: Protection of personal health information, patient electronic access to his/her health information, and health information exchange. Some commenters recommended including the smallest set of objectives in the base score required by statute and including any additional objectives in the performance score category.

Response: We appreciate the many suggested changes to measures and measure reporting requirements and will take them into consideration in this and future rules. We are also conscious of the need to balance complexity or reporting requirements with reporting goals. In our final policy, we have restructured our base score to reduce reporting burden, and limited the required measures keeping only those measures that implement certain requirements under section 1848(o)(2)(A) of the Act, which include e-Prescribing and two of the measures under the Health Information Exchange objective; as well as Security Risk Analysis, which we have previously stated is of paramount importance to protecting patient privacy; and Provide Patient Access which is critical to increasing patient engagement and allowing patients access to their personal health data. We note that this reduction of measures is responsive to the comments we received requesting that we move away from the all-or-nothing scoring methodology in the proposed base score. While we believe all measures under the advancing care information performance category are of upmost importance, we acknowledge that we must balance the need for these data with data collection and reporting burden. We refer readers to section II.E.5.g.(6)(a) for more discussion of our final scoring policy.

After consideration of the comments, we are modifying our primary proposal with modifications described in section II.E.5.g.(6)(a) for the base score. This proposal does not require the reporting of the objectives and measures for CDS and CPOE. We note that the functionalities required for these objectives and associated measures are still required as part of ONC's certification criteria for CEHRT.

The following is a summary of the comments we received related to the

bonus for Public Health and Clinical Data Registry Reporting.

Comment: The majority of commenters recommended that more bonus credit should be awarded to MIPS eligible clinicians for reporting to additional registries by either increasing the bonus to 5 or 10 percent or by offering a bonus for each additional registry to which the MIPS eligible clinician reports. One commenter specifically expressed concern that only awarding 1 percent downplays the importance and benefit of submitting data to multiple registries. Many commenters supported the proposal that Immunization Registry Reporting should be the only registry required for the base score, but encouraged CMS to provide more than 1 percent as a bonus for additional registry reporting. Another suggested that for CY 2017, CMS require two public health reporting measures in the Public Health and Clinical Data Registry Reporting objective for the base score, including mandatory reporting to immunization registries and any of the optional public health measures.

Response: The Public Health and Clinical Data Registry reporting objective focuses on the importance of the ongoing lines of communication that should exist between MIPS eligible clinicians and public health agencies and clinical data registries thus, we agree that a larger bonus should be awarded for reporting to additional registries under the Public Health and Clinical Data Registry Reporting objective. These registries play an important part in monitoring the health status of patients across the country and some, for example syndromic surveillance registries, help in the early detection of outbreaks which is critical to public health overall.

After consideration of the comments we received, and for the reasons mentioned above, we are increasing the bonus score to 5 percent in the advancing care information performance category score for reporting to one or more public health or clinical data registries beyond the Immunization Registry Reporting measure. We note that in our effort to reduce the number of required measures in the base score and simplify reporting requirements, the Immunization Registry Reporting measure is no longer required as part of the base score, however MIPS eligible clinicians can earn 10 percent in the performance score for reporting this measure. Additionally, if the MIPS eligible clinician reports to one or more additional registries under the Public Health and Clinical Data Registry Reporting objective, they will earn the 5

percent bonus score. We note that the bonus is only available to MIPS eligible clinicians who earn a base score.

(iv) 2017 Advancing Care Information Transition Objectives and Measures (Referred to in the Proposed Rule as Modified Stage 2)

In the 2015 EHR Incentive Programs final rule (80 FR 62772), we streamlined reporting for EPs by adopting a single set of objectives and measures for EPs regardless of their prior stage of participation. This was the first step in synchronizing the objectives and eliminating the separate stages of meaningful use in the EHR Incentive Program. In doing so, we also sought to provide some flexibility and to allow adequate time for EPs to move toward the more advanced use of EHR technology. This flexibility included alternate exclusions and specifications for EPs scheduled to demonstrate Stage 1 in 2015 and 2016 (80 FR 62788) and allowed clinicians to select either the Modified Stage 2 Objectives or the Stage 3 Objectives in 2017 (80 FR 62772) with all EPs moving to the Stage 3 Objectives in 2018. We note that in section II.E.5.g (81 FR 28218 and 28219) of the proposed rule, we proposed the requirements for MIPS eligible clinicians using various editions of CEHRT in 2017 as it relates to the objectives and measures they select to report.

In connection with that proposal, and in an effort not to unfairly burden MIPS eligible clinicians who are still utilizing EHR technology certified to the 2014 Edition certification criteria in 2017, we proposed at § 414.1380(b)(4) modified primary and alternate proposals for the base score for those MIPS eligible clinicians utilizing EHR technology certified to the 2014 Edition. We note that these modified proposals are the same as the primary and alternate outlined proposals in regard to scoring and data submission, but vary in the number of measures required under the Coordination of Care Through Patient Engagement and Health Information Exchange objectives as demonstrated in Table 8 of the proposed rule (81 FR 28224).

This approach allows MIPS eligible clinicians to continue moving toward advanced use of CEHRT in 2018, but allows for flexibility in the implementation of upgraded technology and in the selection of measures for reporting in 2017.

The following is a summary of the comments we received regarding the proposals for reporting on the Modified Stage 2 objectives and measures for the advancing care information performance

category in 2017. We note that in this final rule with comment period we will refer to these measures as the 2017 Advancing Care Information Transition objectives and measures instead of Modified Stage 2, which is a term specific to the EHR Incentive Program.

Comment: Many commenters supported the proposal to allow MIPS eligible clinicians to report on the 2017 Advancing Care Information Transition objectives and measures in the 2017 performance period to meet the requirements of the advancing care information performance category. They stated that this approach offers flexibility to MIPS eligible clinicians who do not yet use a 2015 Edition CEHRT.

Response: We agree. We are aware that in 2017 many MIPS eligible clinicians might not yet have access to EHR technology certified to the 2015 Edition. Therefore, to accommodate these MIPS eligible clinicians we will allow the option for them to report for the 2017 performance period using EHR technology certified to the 2014 Edition or a combination of both 2014 and 2015 Editions.

Comment: A majority of commenters suggested retaining 2017 Advancing Care Information Transition objectives and measures beyond performance periods in 2017, citing vendor, as well as clinician readiness with implementing and using EHR technology certified to the 2015 Edition in time for the 2018 performance period. Additionally, some commenters believed that the 2017 Advancing Care Information Transition reporting requirements are less stringent, and therefore, more feasible for MIPS eligible clinicians to achieve, resulting in more MIPS eligible clinician success in the advancing care information performance category. One commenter suggested continuing to allow the reporting of 2017 Advancing Care Information Transition objectives and not requiring the reporting of Advancing Care Information objectives until a performance period in 2019.

Response: For the majority of measures in the EHR Incentive Programs, the difference between the Modified Stage 2 measures and the Stage 3 measures is the threshold required to successfully demonstrate meaningful use. For the advancing care information performance category, there are no thresholds and MIPS eligible clinicians are allowed to select the objectives and measures most applicable to their practice for reporting purposes. For this reason, we disagree that either set of measures for the advancing care information performance category is

more stringent than the other. While we understand the commenters' concerns about readiness for subsequent years as it relates to adopting new technologies, we continue to believe that it is important to move forward with a single set objectives and measures focused on the top priorities of clinical effectiveness, patient engagement and health information exchange. We further maintain our belief that it reduces complexity and burden to have all MIPS eligible clinicians reporting on the same set of objectives and measures and the same specifications for those measures. We note that we will accept a minimum of 90 consecutive days of data within the CY 2018 performance period for the advancing care information performance category in order to support MIPS eligible clinicians and groups transitioning to technology certified to the 2015 Edition for use in 2018. At this time, we believe it is appropriate to require the use of EHR technology certified to the 2015 Edition for the CY 2018 performance period and encourage MIPS eligible clinicians to work with their EHR vendors in the coming months to prepare for the transition to 2015 Edition CEHRT.

Comment: A few commenters requested clarification of the objectives and measures to use for performance periods in CY 2017 if the MIPS eligible clinician uses a combination of technologies certified to the 2014 and 2015 Editions during the performance period. The commenters anticipate that many practices could begin the performance period using 2014 Edition and upgrade during the performance period to begin use of 2015 Edition. Others expect that MIPS eligible clinicians may use a combination of 2014 and 2015 Editions during the performance period. Commenters also requested clarification on how MIPS eligible clinicians will be scored if the objectives and measures to which they report only apply to part of the performance period and not the full calendar year.

Response: In 2017, a MIPS eligible clinician who has technology certified to a combination of 2015 Edition and 2014 Edition may choose to report on either the Advancing Care Information objectives and measures specified for the advancing care information performance category in section II.E.5.g.(7) of this final rule or the 2017 Advancing Care Information Transition objectives and measures specified for the advancing care information performance category as described in section II.E.5.g.(7) of this final rule if they have the appropriate mix of technologies to support each measure

selected. If a MIPS eligible clinician switches from 2014 Edition to 2015 Edition CEHRT during the performance period, the data collected for the base and performance score measures should be combined from both the 2014 and 2015 Edition of CEHRT.

After consideration of the comments we received, we are finalizing our proposal as proposed. We note that because we will accept a minimum of 90 consecutive days of data from the CY 2017 performance period, MIPS eligible clinicians who have EHR technology certified to the 2014 Edition and then transition to EHR technology certified to the 2015 Edition in 2017 have flexibility and may select which measures they want to report on for the 2017 performance period.

(c) Performance Score

In addition to the base score, which includes submitting each of the objectives and measures to achieve 50 percent of the possible points within the advancing care information performance category, we proposed to allow multiple paths to achieve a score greater than the 50 percentage base score. The performance score is based on the priority goals established by us to focus on leveraging CEHRT to support the coordination of care. A MIPS eligible clinician would earn additional points above the base score for performance in the objectives and measures for Patient Electronic Access, Coordination of Care through Patient Engagement, and Health Information Exchange. These measures have a focus on patient engagement, electronic access and information exchange, which promote healthy behaviors by patients and lay the ground work for interoperability. These measures also have significant opportunity for improvement among MIPS eligible clinicians and the industry as a whole based on adoption and performance data. We believe this approach for achievement above a base score in the advancing care information performance category would provide MIPS eligible clinicians a flexible and realistic incentive towards the adoption and use of CEHRT.

We proposed at § 414.1380(b)(4) that, for the performance score, the eight associated measures under these three objectives would each be assigned a total of 10 possible points. For each measure, a MIPS eligible clinician may earn up to 10 percent of their performance score based on their performance rate for the given measure. For example, a performance rate of 95 percent on a given measure would earn 9.5 percentage points of the performance score for the advancing

care information performance category. This scoring approach is consistent with the performance score approach outlined for other MIPS categories in the proposed rule. Table 9 of the proposed rule (81 FR 28225), provided an example of the proposed performance score methodology.

We noted that in this methodology, a MIPS eligible clinician has the potential to earn a performance score of up to 80 percent, which, in combination with the base score would be greater than the total possible 100 percent for the advancing care information performance category. We stated that this methodology would allow flexibility for MIPS eligible clinicians to focus on measures which are most relevant to their practice to achieve the maximum performance category score, while deemphasizing concentration in other measures which are not relevant to their practice.

This proposed methodology recognizes the importance of promoting health IT adoption and standards and the use of CEHRT to support quality improvement, interoperability, and patient engagement. We invited comments on our proposal.

The following is a summary of the comments we received regarding our proposal.

Comment: A few commenters suggested removing the base score and instead scoring MIPS eligible clinicians solely on performance for the following measures: (1) Patient Electronic Access; (2) Electronic Prescribing; (3) Computer Provider-Order Entry; (4) Patient-Specific Education; (5) View, Download, Transmit; (6) Secure Messaging; (7) Patient-Generated Health Data; (8) Patient Care Record Exchange; (9) Request/Accept Patient Care Record; and (10) Clinical Information Reconciliation. Others requested that the patient engagement measures, View, Download or Transmit, Secure Messaging, and Patient-Generated Health Data be voluntary in order to provide flexibility.

Response: We appreciate the feedback and have significantly reduced the number of required measures in the base score which adds both flexibility and simplicity to the scoring methodology while addressing statutory requirements. We refer readers to section II.E.5.g.(6)(b) of this final rule with comment period for further discussion of our final policy.

Comment: A commenter suggested that the performance score measures should reflect the patient population because many MIPS eligible clinicians treat patients that are poor, elderly, or have limited English proficiency, and

suggested that these factors strongly disadvantage MIPS eligible clinicians on measures as compared to MIPS eligible clinicians whose patient populations are better educated and better off financially. Another suggested the advancing care information performance category be renamed Health IT-related activities score and reflect the improvement activities performance category such that MIPS eligible clinicians select activities from a long list.

Response: While we understand that the demographics and education-level of patient populations of MIPS eligible clinicians may vary, we disagree that measures in the advancing care information performance category should be adjusted to accommodate for different patient populations. We believe MIPS eligible clinicians who have CEHRT have the ability to adequately use CEHRT to perform the actions required for the measures, regardless of their patient population. We also believe we have offered enough flexibility for MIPS eligible clinicians who are concerned about patient action requirements by not establishing measure thresholds and instead requiring a minimum of one in the numerator for numerator/denominator measures. We direct readers to the discussion of the advancing care information performance category scoring in section II.E.5.g.(6)(a) of this final rule with comment period. We look forward to continuing to refine the advancing care information performance category over time.

(d) Overall Advancing Care Information Performance Category Score

To determine the MIPS eligible clinician's overall advancing care information performance category score, we proposed to use the sum of the base score, performance score, and the potential Public Health and Clinical Data Registry Reporting bonus point. We note that if the sum of the MIPS eligible profession's base score (50 percent) and performance score (out of a possible 80 percent) with the Public Health and Clinical Data Registry Reporting bonus point are greater than 100 percent, we would apply an advancing care information performance category score of 100 percent. For example, if the MIPS eligible clinician earned the base score of 50 percent, a performance score of 60 percent and the bonus point for Public Health and Clinical Data Registry Reporting for a total of 111 percent, the MIPS eligible clinician's overall advancing care information performance category score would be 100 percent. The total percentage score (out of 100)

for the advancing care information performance category would then be multiplied by the weight (25 percent) of the advancing care information performance category and incorporated into the MIPS final score, as described at 81 FR 28220 through 28271 of the proposed rule. Table 10 of the proposed rule (81 FR 28226) provides an example of the calculation of the advancing care information performance category score based on these proposals. For our final policy, we revised the proposed scoring approach by reducing the number of required measures in the base score and adding measures to the performance score in an effort to address commenters' concerns (as described above) and add flexibility wherever possible. The base score and performance score are added together, along with any additional bonus score if applicable, to determine the overall advancing care information performance category score.

Under the final policy, a MIPS eligible clinician must report all required measures of the base score to earn any base score, and thus to earn any score in the advancing care information performance category. We understand that many commenters preferred that we do away entirely with the all-or-nothing approach to the base score and we have made adjustments to the base score to be responsive to those commenters' concerns. We note that section 1848(o)(2)(A) of the Act includes certain requirements that we have chosen to implement through certain measures such as e-Prescribing, Send a Summary of Care and Request/Accept Summary, and thus, we continue to require these measures in the advancing care information performance category base score. In addition, we have maintained the Security Risk Analysis measure as a required measure as we believe it is essential to protecting patient privacy as discussed in the proposed rule (81 FR 28221), and thus, we believe should be mandatory for reporting. We have also maintained Provide Patient Access as the fifth required measure under the base score because we believe it is essential for patients to have access to their health care information in order to improve health, provide transparency and drive patient engagement. To address commenters' concerns, we have reduced the total number of required measures in the base score to only these five, and moved other measures to the performance score where MIPS eligible clinicians can choose which measures to report based on their individual

practice. While we believe all measures under the advancing care information performance category are of upmost importance, we acknowledge that we must balance the need for these data with data collection and reporting burden. Given the considerable reduction in required measures, we do not believe it is appropriate to increase the weight of the base score, and thus, it remains at 50 percent of the advancing care information performance category score.

The performance score builds upon the base score and is based on a MIPS eligible clinician's performance rate for each measure reported for the performance score (calculated using the numerator/denominator). A performance rate of 1–10 percent would earn 1 percentage point, a performance rate of 11–20 percent would earn 2 percentage points and so on. For example, if the clinician reports a numerator/denominator of 85/100 for the Patient-Specific Education measure, their performance rate would be 85 percent and they would earn 9 percentage points toward their performance score for the advancing care information performance category. With nine measures included in the performance score, a MIPS eligible clinician has the ability to earn up to 90 percentage points if they report all measures in the performance score.

We note that the measures under the Public Health and Clinical Data Registry Reporting objective are yes/no measures and do not have a numerator/denominator to calculate the performance rate. For the Immunization Registry Reporting measure, we will award 0 or 10 percentage points for the performance score (0 percent for a "no" response, 10 percent for a "yes" response). Active engagement with a public health or clinical data registry to meet any other measure associated with the Public Health and Clinical Data Registry Reporting objective will earn the MIPS eligible clinician a bonus of 5 percentage points as outlined in section II.E.5.g.(6)(b)f this final rule with comment period. MIPS eligible clinicians are not required to report the Immunization Registry Reporting measure in order to earn the bonus 5 percent for reporting to one or more additional registries.

Two of the measures in the base score are not included in the performance score. The Security Risk Analysis and e-Prescribing measures are required under the base score, but a MIPS eligible clinician will not earn additional points

under the performance score for reporting these measures. Due to the critical nature of the Security Risk Analysis measure, and as we stated in the proposed rule, we believe this measure is of paramount importance and applicable across all objectives. Therefore, the Protect Patient Health Information objective and Security Risk Analysis measure are foundational requirements for the advancing care information performance category (81 FR 28221). For this reason, we are including it as a required measure in the base score, but are not awarding any additional score for performance. The e-Prescribing measure is one of the measures that fulfills a statutory requirement under section 1848(o)(2)(A) of the Act, and thus, we are requiring it as part of the base score. Given the historically high performance on this measure under the EHR Incentive Program with EPs achieving an average of 87 percent of all permissible prescriptions written and transmitted electronically using CEHRT in 2015, we are not including it in the performance score for the advancing care information performance category.

Under our final policy, MIPS eligible clinicians have the ability to earn an overall score for the advancing care information performance category of up to 155 percentage points, which will be capped at 100 percent when the base score, performance score and bonus score are all added together. We believe this addresses commenters' requests for additional opportunities to earn credit in all aspects of the advancing care information performance category including the base score, performance score and bonus score. In addition, we believe this scoring approach adds flexibility for MIPS eligible clinicians to choose measures that are most applicable to their practice and best represent their performance. While certain measures are still required for reporting, we have reduced this number from 11 required measures in the proposed base score to only five in this final policy. We have also increased the number of measures for which a MIPS eligible clinician has the ability to earn performance score credit from eight measures in the proposed performance score to nine in this final policy. We note that MIPS eligible clinicians can choose which of these measures to focus on for their performance score allowing clinicians to customize their reporting and score.

TABLE 9—ADVANCING CARE INFORMATION PERFORMANCE CATEGORY SCORING METHODOLOGY ADVANCING CARE INFORMATION OBJECTIVES AND MEASURES

Advancing care information objective	Advancing care information measure *	Required/ not required for base score (50%)	Performance score (up to 90%)	Reporting requirement
Protect Patient Health Information	Security Risk Analysis	Required	0	Yes/No Statement.
	Electronic Prescribing	Required	0	Numerator/Denominator.
	Patient Electronic Access	Required	Up to 10	Numerator/Denominator.
Coordination of Care Through Patient Engagement.	Patient-Specific Education	Not Required ...	Up to 10	Numerator/Denominator.
	View, Download, or Transmit (VDT) ...	Not Required ...	Up to 10	Numerator/Denominator.
Health Information Exchange	Secure Messaging	Not Required ...	Up to 10	Numerator/Denominator.
	Patient-Generated Health Data	Not Required ...	Up to 10	Numerator/Denominator.
	Send a Summary of Care	Required	Up to 10	Numerator/Denominator.
	Request/Accept Summary of Care	Required	Up to 10	Numerator/Denominator.
Public Health and Clinical Data Registry Reporting.	Clinical Information Reconciliation	Not Required ...	Up to 10	Numerator/Denominator.
	Immunization Registry Reporting	Not Required ...	0 or 10	Yes/No Statement.
	Syndromic Surveillance Reporting	Not Required ...	Bonus	Yes/No Statement.
	Electronic Case Reporting	Not Required ...	Bonus	Yes/No Statement.
	Public Health Registry Reporting	Not Required ...	Bonus	Yes/No Statement.
	Clinical Data Registry Reporting	Not Required ...	Bonus	Yes/No Statement.
Bonus (up to 15)				
Report to one or more additional public health and clinical data registries beyond the Immunization Registry Reporting measure.			5 bonus	Yes/No Statement.
Report improvement activities using CEHRT			10 bonus	Yes/No Statement.

*Several measure names have been changed since the proposed rule. This table reflects those changes. We refer readers to section II.E.5.g.(7)(a) of this final rule with comment period for further discussion of measure name changes.

Comment: In addition to the scoring comments we summarized in the above sections, many commenters expressed concerns related to the difference in scoring for the 2017 Advancing Care Information Transition objectives and measures (referred to in the proposed rule as the Modified Stage 2 Objectives and Measures). Commenters highlighted that for the proposed policy, there are eight available measures in the Advancing Care Information Objectives and Measures while there are only six available measures in the 2017 Advancing Care Information Transition objectives and measures for which MIPS eligible clinicians can earn credit in the performance score of the advancing care

information performance category. Commenters believed this would pose a disadvantage to those MIPS eligible clinicians with EHR technology certified to the 2014 Edition who would only be able to report on 2017 Advancing Care Information Transition objectives and measures, and consequently have a lesser opportunity to earn credit in the performance score.
Response: We appreciate the comments and have outlined our final scoring methodology for the 2017 Advancing Care Information Transition objectives and measures in Table 10 to demonstrate that those MIPS eligible clinicians reporting the 2017 Advancing Care Information Transition objectives and measures will not be disadvantaged.

MIPS eligible clinicians will have the ability to earn up to 155 percentage points for the advancing care information performance category, which will be capped at 100 percent, regardless of which set of measures they report. We note that in order to make up the difference in the number of measures included in the performance score for the two measure sets, we have increased the number of percentage points available for the performance weight of the Provide Patient Access and Health Information Exchange measures (up to 20 percent for each measure), as these measures are critical to our goals of patient engagement and interoperability.

TABLE 10—ADVANCING CARE INFORMATION PERFORMANCE CATEGORY SCORING METHODOLOGY FOR 2017 ADVANCING CARE INFORMATION TRANSITION—OBJECTIVES AND MEASURES

2017 Advancing care information transition objective (2017 only)	2017 Advancing care information transition measure * (2017 only)	Required/ not required for base score (50%)	Performance score (up to 90%)	Reporting requirement
Protect Patient Health Information	Security Risk Analysis	Required	0	Yes/No Statement.
Electronic Prescribing	E-Prescribing	Required	0	Numerator/Denominator.
Patient Electronic Access	Provide Patient Access	Required	Up to 20	Numerator/Denominator.
	View, Download, or Transmit (VDT)	Not Required ...	Up to 10	Numerator/Denominator.
Patient-Specific Education	Patient-Specific Education	Not Required ...	Up to 10	Numerator/Denominator.
Secure Messaging	Secure Messaging	Not Required ...	Up to 10	Numerator/Denominator.
Health Information Exchange	Health Information Exchange	Required	Up to 20	Numerator/Denominator.
Medication Reconciliation	Medication Reconciliation	Not Required ...	Up to 10	Numerator/Denominator.

TABLE 10—ADVANCING CARE INFORMATION PERFORMANCE CATEGORY SCORING METHODOLOGY FOR 2017 ADVANCING CARE INFORMATION TRANSITION—OBJECTIVES AND MEASURES—Continued

2017 Advancing care information transition objective (2017 only)	2017 Advancing care information transition measure* (2017 only)	Required/not required for base score (50%)	Performance score (up to 90%)	Reporting requirement
Public Health Reporting	Immunization Registry Reporting	Not Required	0 or 10	Yes/No Statement.
	Syndromic Surveillance Reporting	Not Required	Bonus	Yes/No Statement.
	Specialized Registry Reporting	Not Required	Bonus	Yes/No Statement.
Bonus up to 15%				
Report to one or more additional public health and clinical data registries beyond the Immunization Registry Reporting measure.			5% bonus	Yes/No Statement.
Report improvement activities using CEHRT			10% bonus ...	Yes/No Statement.

* Several measure names have been changed since the proposed rule. This table reflects those changes. We refer readers to section II.E.5.g.(7)(a) of this final rule with comment period for further discussion of measure name changes.

We are seeking comment on our final scoring methodology policies, and future enhancements to the methodology.

(e) Scoring Considerations

Section 1848(q)(5)(E)(ii) of the Act, as added by section 101(c) of the MACRA, provides that in any year in which the Secretary estimates that the proportion of EPs (as defined in section 1848(o)(5) of the Act) who are meaningful EHR users (as determined under section 1848(o)(2) of the Act) is 75 percent or greater, the Secretary may reduce the applicable percentage weight of the advancing care information performance category in the MIPS final score, but not below 15 percent, and increase the weightings of the other performance categories such that the total percentage points of the increase equals the total percentage points of the reduction. We note section 1848(o)(5) of the Act defines an EP as a physician, as defined in section 1861(r) of the Act. For purposes of applying section 1848(q)(5)(E)(ii) of the Act, we proposed to estimate the proportion of physicians as defined in section 1861(r) who are meaningful EHR users as those physician MIPS eligible clinicians who earn an advancing care information performance category score of at least 75 percent under our proposed scoring methodology for the advancing care information performance category for a performance period. This would require the MIPS eligible clinician to earn the advancing care information performance category base score of 50 percent, and an advancing care information performance score of at least 25 percent (or 24 percent plus the Public Health and Clinical Data Registry Reporting bonus point) for an overall performance category score of 75 percent for the advancing care information performance

category. We are alternatively proposing to estimate the proportion of physicians as defined in section 1861(r) who are meaningful EHR users as those physician MIPS eligible clinicians who earn an advancing care information performance category score of 50 percent (which would only require the MIPS eligible clinician to earn the advancing care information performance category base score) under our proposed scoring methodology for the advancing care information performance category for a performance period, and we solicited comments on both of these proposed thresholds.

We proposed to base this estimation on data from the relevant performance period, if we have sufficient data available from that period. For example, if feasible, we would consider whether to reduce the applicable percentage weight of the advancing care information performance category in the MIPS final score for the 2019 MIPS payment year based on an estimation using the data from the 2017 performance period. We noted that in section II.E.5.g.(8) of the proposed rule (81 FR 28231–28232) we proposed to reweight the advancing care information performance category to zero for certain hospital-based physicians and other physicians. These physicians meet the definition of MIPS eligible clinicians, but would not be included in the estimation because the advancing care information performance category would be weighted at zero for them. We note that any adjustments of the performance category weights specified in section 1848(q)(5)(E) of the Act based on this policy would be established in future notice and comment rulemaking.

The following is a summary of the comments we received regarding our proposed definition of meaningful EHR user.

Comment: Commenters overwhelmingly supported the proposal to define meaningful EHR users as those MIPS eligible clinicians who earn a score of 75 percent in the advancing care information performance category. They believed that a lower score, such as 50 percent, would not be stringent enough and that the majority of MIPS eligible clinicians would achieve the meaningful EHR user status by simply reporting and attesting to just one patient encounter for each measure. Additionally, many commenters pointed out that this would result in a reduction of the applicable weight of the advancing care information performance category in the MIPS final score and would reduce the focus and emphasis on increased patient engagement and health information exchange.

Response: We appreciate this feedback and agree that 50 percent would be a very low threshold to be considered a meaningful EHR user in the advancing care information performance category.

Comment: A few commenters supported the alternate proposal to define meaningful EHR users as those MIPS eligible clinicians who earn a score of 50 percent in the advancing care information performance category. This approach would only require MIPS eligible clinicians to achieve the base score of 50 percent to achieve the meaningful EHR user status. They cited the overall complexity of the reporting requirements, as well as level of difficulty for small practices to score well in the performance category.

Response: We understand the commenters' concerns regarding the complexity of reporting requirements, and note that we have addressed this through our final scoring policy outlined in section II.E.5.g.(6)(d) of this final rule with comment period. We

believe the adjustments made in the scoring methodology address commenters' concerns by reducing the requirements to earn the base score, and thus, there is no need to lower the threshold for being considered a meaningful EHR user.

Comment: One commenter requested that the definition of a meaningful EHR user and the requirements to achieve this status in the MIPS be further clarified in this rule stating that it is important to clearly define expectations and set a higher standard in order to achieve interoperability and EHR-aided improved health outcomes for Medicare beneficiaries.

Response: We appreciate this feedback and reiterate that a meaningful EHR user under this policy is a physician, as defined in section 1861(r) of the Act who earns an advancing care information performance category overall score of 75 percent per our primary proposal outlined above. To earn a score of 75 percent in the advancing care information performance category, a physician would need to accomplish the base score, plus additional performance and/or bonus score for a total of 75 percent or 18.75 performance category points as they are applied to the MIPS final score.

After consideration of the comments we received, in combination with our final scoring methodology and its impact on this policy, we are finalizing as proposed our primary proposal for purposes of applying section 1848(q)(5)(E)(ii) of the Act, to estimate the proportion of physicians as defined in section 1861(r) of the Act who are meaningful EHR users as those physician MIPS eligible clinicians who earn an advancing care information performance category score of at least 75 percent for a performance period. We will base this estimation on data from the relevant performance period, if we have sufficient data available from that period. We will not include in this estimation physicians for whom the advancing care information performance category is weighted at zero percent under section 1848(q)(5)(F) of the Act.

(7) Advancing Care Information Performance Category Objectives and Measures Specifications

(a) Advancing Care Information Objectives and Measures Specifications (Referred to in the Proposed Rule as MIPS Objectives and Measures)

We proposed the objectives and measures for the advancing care information performance category of MIPS as outlined in the proposed rule. We noted that these objectives and

measures have been adapted from the Stage 3 objectives and measures as finalized in the 2015 EHR Incentive Programs final rule (80 FR 62829 through 62871), however, we did not propose to maintain the previously established thresholds for MIPS. Any additional changes to the objectives and measures were outlined in the proposed rule. For a more detailed discussion of the Stage 3 objectives and measures, including explanatory material and defined terms, we refer readers to the 2015 EHR Incentive Programs final rule (80 FR 62829 through 62871).

Objective: Protect Patient Health Information.

Objective: Protect electronic protected health information (ePHI) created or maintained by the CEHRT through the implementation of appropriate technical, administrative, and physical safeguards.

Security Risk Analysis Measure: Conduct or review a security risk analysis in accordance with the requirements in 45 CFR 164.308(a)(1), including addressing the security (to include encryption) of ePHI data created or maintained by CEHRT in accordance with requirements in 45 CFR 164.312(a)(2)(iv) and 45 CFR 164.306(d)(3), implement security updates as necessary, and correct identified security deficiencies as part of the MIPS eligible clinician's risk management process.

Objective: Electronic Prescribing.

Objective: Generate and transmit permissible prescriptions electronically.

e-Prescribing Measure: At least one permissible prescription written by the MIPS eligible clinician is queried for a drug formulary and transmitted electronically using CEHRT.

- *Denominator:* Number of prescriptions written for drugs requiring a prescription in order to be dispensed other than controlled substances during the performance period; or number of prescriptions written for drugs requiring a prescription in order to be dispensed during the performance period.

- *Numerator:* The number of prescriptions in the denominator generated, queried for a drug formulary, and transmitted electronically using CEHRT.

For this objective, we note that the 2015 EHR Incentive Program final rule included a discussion of controlled substances in the context of the Stage 3 objective and measure (80 FR 62834), which we understand from stakeholders has caused confusion. We therefore proposed for both MIPS and for the EHR Incentive Programs that health care providers would continue to have the option to include or not include

controlled substances that can be electronically prescribed in the denominator. This means that MIPS eligible clinicians may choose to include controlled substances in the definition of "permissible prescriptions" at their discretion where feasible and allowable by law in the jurisdiction where they provide care. The MIPS eligible clinician may also choose not to include controlled substances in the definition of "permissible prescriptions" even if such electronic prescriptions are feasible and allowable by law in the jurisdiction where they provide care.

Objective: Clinical Decision Support (Alternate Proposal Only).

Objective: Implement clinical decision support (CDS) interventions focused on improving performance on high-priority health conditions.

Clinical Decision Support (CDS) Interventions Measure: Implement three clinical decision support interventions related to three CQMs at a relevant point in patient care for the entire performance period. Absent three CQMs related to a MIPS eligible clinician's scope of practice or patient population, the clinical decision support interventions must be related to high-priority health conditions.

Drug Interaction and Drug-Allergy Checks Measure: The MIPS eligible clinician has enabled and implemented the functionality for drug-drug and drug-allergy interaction checks for the entire performance period.

Objective: Computerized Provider Order Entry (Alternate Proposal Only).

Objective: Use computerized provider order entry (CPOE) for medication, laboratory, and diagnostic imaging orders directly entered by any licensed healthcare professional, credentialed medical assistant, or a medical staff member credentialed to and performing the equivalent duties of a credentialed medical assistant, who can enter orders into the medical record per state, local, and professional guidelines.

Medication Orders Measure: At least one medication order created by the MIPS eligible clinician during the performance period is recorded using CPOE.

- *Denominator:* Number of medication orders created by the MIPS eligible clinician during the performance period.

- *Numerator:* The number of orders in the denominator recorded using CPOE.

Laboratory Orders Measure: At least one laboratory order created by the MIPS eligible clinician during the performance period is recorded using CPOE.

- *Denominator*: Number of laboratory orders created by the MIPS eligible clinician during the performance period.

- *Numerator*: The number of orders in the denominator recorded using CPOE.

Diagnostic Imaging Orders Measure: At least one diagnostic imaging order created by the MIPS eligible clinician during the performance period is recorded using CPOE.

- *Denominator*: Number of diagnostic imaging orders created by the MIPS eligible clinician during the performance period.

- *Numerator*: The number of orders in the denominator recorded using CPOE.

Objective: Patient Electronic Access.

Objective: The MIPS eligible clinician provides patients (or patient-authorized representative) with timely electronic access to their health information and patient-specific education.

Patient Access Measure: For at least one unique patient seen by the MIPS eligible clinician: (1) The patient (or the patient-authorized representative) is provided timely access to view online, download, and transmit his or her health information; and (2) The MIPS eligible clinician ensures the patient's health information is available for the patient (or patient-authorized representative) to access using any application of their choice that is configured to meet the technical specifications of the Application Programming Interface (API) in the MIPS eligible clinician's CEHRT.

- *Denominator*: The number of unique patients seen by the MIPS eligible clinician during the performance period.

- *Numerator*: The number of patients in the denominator (or patient authorized representative) who are provided timely access to health information to view online, download, and transmit to a third party and to access using an application of their choice that is configured meet the technical specifications of the API in the MIPS eligible clinician's CEHRT.

Patient-Specific Education Measure: The MIPS eligible clinician must use clinically relevant information from CEHRT to identify patient-specific educational resources and provide electronic access to those materials to at least one unique patient seen by the MIPS eligible clinician.

- *Denominator*: The number of unique patients seen by the MIPS eligible clinician during the performance period.

- *Numerator*: The number of patients in the denominator who were provided

electronic access to patient-specific educational resources using clinically relevant information identified from CEHRT during the performance period.

Objective: Coordination of Care Through Patient Engagement.

Objective: Use CEHRT to engage with patients or their authorized representatives about the patient's care.

View, Download, Transmit (VDT) Measure: During the performance period, at least one unique patient (or patient-authorized representatives) seen by the MIPS eligible clinician actively engages with the EHR made accessible by the MIPS eligible clinician. A MIPS eligible clinician may meet the measure by either—(1) view, download or transmit to a third party their health information; or (2) access their health information through the use of an API that can be used by applications chosen by the patient and configured to the API in the MIPS eligible clinician's CEHRT; or (3) a combination of (1) and (2).

- *Denominator*: Number of unique patients seen by the MIPS eligible clinician during the performance period.

- *Numerator*: The number of unique patients (or their authorized representatives) in the denominator who have viewed online, downloaded, or transmitted to a third party the patient's health information during the performance period and the number of unique patients (or their authorized representatives) in the denominator who have accessed their health information through the use of an API during the performance period.

Secure Messaging Measure: For at least one unique patient seen by the MIPS eligible clinician during the performance period, a secure message was sent using the electronic messaging function of CEHRT to the patient (or the patient-authorized representative), or in response to a secure message sent by the patient (or the patient-authorized representative).

- *Denominator*: Number of unique patients seen by the MIPS eligible clinician during the performance period.

- *Numerator*: The number of patients in the denominator for whom a secure electronic message is sent to the patient (or patient-authorized representative) or in response to a secure message sent by the patient (or patient-authorized representative), during the performance period.

Patient-Generated Health Data Measure: Patient-generated health data or data from a non-clinical setting is incorporated into the CEHRT for at least one unique patient seen by the MIPS

eligible clinician during the performance period.

- *Denominator*: Number of unique patients seen by the MIPS eligible clinician during the performance period.

- *Numerator*: The number of patients in the denominator for whom data from non-clinical settings, which may include patient-generated health data, is captured through the CEHRT into the patient record during the performance period.

Objective: Health Information Exchange.

Objective: The MIPS eligible clinician provides a summary of care record when transitioning or referring their patient to another setting of care, receives or retrieves a summary of care record upon the receipt of a transition or referral or upon the first patient encounter with a new patient, and incorporates summary of care information from other health care clinician into their EHR using the functions of CEHRT.

Send a Summary of Care (formerly Patient Care Record Exchange) Measure: For at least one transition of care or referral, the MIPS eligible clinician that transitions or refers their patient to another setting of care or health care clinician—(1) creates a summary of care record using CEHRT; and (2) electronically exchanges the summary of care record.

- *Denominator*: Number of transitions of care and referrals during the performance period for which the MIPS eligible clinician was the transferring or referring clinician.

- *Numerator*: The number of transitions of care and referrals in the denominator where a summary of care record was created using CEHRT and exchanged electronically.

Request/Accept Summary of Care (formerly Patient Care Record) Measure: For at least one transition of care or referral received or patient encounter in which the MIPS eligible clinician has never before encountered the patient, the MIPS eligible clinician receives or retrieves and incorporates into the patient's record an electronic summary of care document.

- *Denominator*: Number of patient encounters during the performance period for which a MIPS eligible clinician was the receiving party of a transition or referral or has never before encountered the patient and for which an electronic summary of care record is available.

- *Numerator*: Number of patient encounters in the denominator where an electronic summary of care record

received is incorporated by the clinician into the CEHRT.

Clinical Information Reconciliation Measure: For at least one transition of care or referral received or patient encounter in which the MIPS eligible clinician has never before encountered the patient, the MIPS eligible clinician performs clinical information reconciliation. The MIPS eligible clinician must implement clinical information reconciliation for the following three clinical information sets: (1) Medication. Review of the patient's medication, including the name, dosage, frequency, and route of each medication. (2) Medication allergy. Review of the patient's known medication allergies. (3) Current Problem list. Review of the patient's current and active diagnoses.

- **Denominator:** Number of transitions of care or referrals during the performance period for which the MIPS eligible clinician was the recipient of the transition or referral or has never before encountered the patient.

- **Numerator:** The number of transitions of care or referrals in the denominator where the following three clinical information reconciliations were performed: Medication list, medication allergy list, and current problem list.

Objective: Public Health and Clinical Data Registry Reporting.

Objective: The MIPS eligible clinician is in active engagement with a public health agency or clinical data registry to submit electronic public health data in a meaningful way using CEHRT, except where prohibited, and in accordance with applicable law and practice.

Immunization Registry Reporting Measure: The MIPS eligible clinician is in active engagement with a public health agency to submit immunization data and receive immunization forecasts and histories from the public health immunization registry/immunization information system (IIS).

Syndromic Surveillance Reporting Measure: The MIPS eligible clinician is in active engagement with a public health agency to submit syndromic surveillance data from a non-urgent care ambulatory setting where the jurisdiction accepts syndromic data from such settings and the standards are clearly defined.

Electronic Case Reporting Measure: The MIPS eligible clinician is in active engagement with a public health agency to electronically submit case reporting of reportable conditions.

Public Health Registry Reporting Measure: The MIPS eligible clinician is in active engagement with a public

health agency to submit data to public health registries.

Clinical Data Registry Reporting Measure: The MIPS eligible clinician is in active engagement to submit data to a clinical data registry.

(b) 2017 Advancing Care Information Transition Objectives and Measures Specifications (Referred to in the Proposed Rule as Modified Stage 2)

We proposed the 2017 Advancing Care Information Transition objectives and measures for the advancing care information performance category of MIPS as outlined in this section of the proposed rule. We note that these objectives and measures have been adapted from the Modified Stage 2 objectives and measures as finalized in the 2015 EHR Incentive Programs final rule (80 FR 62793–62825), however, we have not proposed to maintain the previously established thresholds for MIPS. Any additional changes to the objectives and measures are outlined in this section of the proposed rule. For a more detailed discussion of the Modified Stage 2 objectives and measures, including explanatory material and defined terms, we refer readers to the 2015 EHR Incentive Programs final rule (80 FR 62793–62825).

Objective: Protect Patient Health Information.

Objective: Protect electronic protected health information (ePHI) created or maintained by the CEHRT through the implementation of appropriate technical, administrative, and physical safeguards.

Security Risk Analysis Measure: Conduct or review a security risk analysis in accordance with the requirements in 45 CFR 164.308(a)(1), including addressing the security (to include encryption) of ePHI data created or maintained by CEHRT in accordance with requirements in 45 CFR 164.312(a)(2)(iv) and 45 CFR 164.306(d)(3), and implement security updates as necessary and correct identified security deficiencies as part of the MIPS eligible clinician's risk management process.

Objective: Electronic Prescribing.

Objective: MIPS eligible clinicians must generate and transmit permissible prescriptions electronically.

E-Prescribing Measure: At least one permissible prescription written by the MIPS eligible clinician is queried for a drug formulary and transmitted electronically using CEHRT.

- **Denominator:** Number of prescriptions written for drugs requiring a prescription in order to be dispensed other than controlled substances during

the performance period; or number of prescriptions written for drugs requiring a prescription in order to be dispensed during the performance period.

- **Numerator:** The number of prescriptions in the denominator generated, queried for a drug formulary, and transmitted electronically using CEHRT.

Objective: Clinical Decision Support (alternate proposal only).

Objective: Implement clinical decision support (CDS) interventions focused on improving performance on high-priority health conditions.

Clinical Decision Support (CDS) Interventions Measure: Implement three clinical decision support interventions related to three CQMs at a relevant point in patient care for the entire performance period. Absent three CQMs related to a MIPS eligible clinician's scope of practice or patient population, the clinical decision support interventions must be related to high-priority health conditions.

Drug Interaction and Drug-Allergy Checks Measure: The MIPS eligible clinician has enabled and implemented the functionality for drug-drug and drug-allergy interaction checks for the entire performance period.

Objective: Computerized Provider Order Entry (alternate proposal only).

Objective: Use computerized provider order entry (CPOE) for medication, laboratory, and diagnostic imaging orders directly entered by any licensed healthcare professional, credentialed medical assistant, or a medical staff member credentialed to and performing the equivalent duties of a credentialed medical assistant, who can enter orders into the medical record per state, local, and professional guidelines.

Medication Orders Measure: At least one medication order created by the MIPS eligible clinician during the performance period is recorded using CPOE.

- **Denominator:** Number of medication orders created by the MIPS eligible clinician during the performance period.

- **Numerator:** The number of orders in the denominator recorded using CPOE.

Laboratory Orders Measure: At least one laboratory order created by the MIPS eligible clinician during the performance period is recorded using CPOE.

- **Denominator:** Number of laboratory orders created by the MIPS eligible clinician during the performance period.

- **Numerator:** The number of orders in the denominator recorded using CPOE.

Diagnostic Imaging Orders Measure: At least one diagnostic imaging order created by the MIPS eligible clinician during the performance period is recorded using CPOE.

- *Denominator:* Number of diagnostic imaging orders created by the MIPS eligible clinician during the performance period.

- *Numerator:* The number of orders in the denominator recorded using CPOE.

Objective: Patient Electronic Access.

Objective: The MIPS eligible clinician provides patients (or patient-authorized representative) with timely electronic access to their health information and patient-specific education.

Patient Access Measure: At least one patient seen by the MIPS eligible clinician during the performance period is provided timely access to view online, download, and transmit to a third party their health information subject to the MIPS eligible clinician's discretion to withhold certain information.

- *Denominator:* The number of unique patients seen by the MIPS eligible clinician during the performance period.

- *Numerator:* The number of patients in the denominator (or patient authorized representative) who are provided timely access to health information to view online, download, and transmit to a third party.

View, Download, Transmit (VDT) Measure: At least one patient seen by the MIPS eligible clinician during the performance period (or patient-authorized representative) views, downloads or transmits their health information to a third party during the performance period.

- *Denominator:* Number of unique patients seen by the MIPS eligible clinician during the performance period.

- *Numerator:* The number of unique patients (or their authorized representatives) in the denominator who have viewed online, downloaded, or transmitted to a third party the patient's health information during the performance period.

Objective: Patient-Specific Education.

Objective: The MIPS eligible clinician provides patients (or patient authorized representative) with timely electronic access to their health information and patient-specific education.

Patient-Specific Education Measure: The MIPS eligible clinician must use clinically relevant information from CEHRT to identify patient-specific educational resources and provide access to those materials to at least one

unique patient seen by the MIPS eligible clinician.

- *Denominator:* The number of unique patients seen by the MIPS eligible clinician during the performance period.

- *Numerator:* The number of patients in the denominator who were provided access to patient-specific educational resources using clinically relevant information identified from CEHRT during the performance period.

Objective: Secure Messaging.

Objective: Use CEHRT to engage with patients or their authorized representatives about the patient's care.

Secure Messaging Measure: For at least one patient seen by the MIPS eligible clinician during the performance period, a secure message was sent using the electronic messaging function of CEHRT to the patient (or the patient-authorized representative), or in response to a secure message sent by the patient (or the patient authorized representative) during the performance period.

- *Denominator:* Number of unique patients seen by the MIPS eligible clinician during the performance period.

- *Numerator:* The number of patients in the denominator for whom a secure electronic message is sent to the patient (or patient-authorized representative) or in response to a secure message sent by the patient (or patient-authorized representative), during the performance period.

Objective: Health Information Exchange.

Objective: The MIPS eligible clinician provides a summary of care record when transitioning or referring their patient to another setting of care, receives or retrieves a summary of care record upon the receipt of a transition or referral or upon the first patient encounter with a new patient, and incorporates summary of care information from other health care clinicians into their EHR using the functions of CEHRT.

Health Information Exchange Measure: The MIPS eligible clinician that transitions or refers their patient to another setting of care or health care clinician (1) uses CEHRT to create a summary of care record; and (2) electronically transmits such summary to a receiving health care clinician for at least one transition of care or referral.

- *Denominator:* Number of transitions of care and referrals during the performance period for which the EP was the transferring or referring health care clinician.

- *Numerator:* The number of transitions of care and referrals in the

denominator where a summary of care record was created using CEHRT and exchanged electronically.

Objective: Medication Reconciliation.

Medication Reconciliation Measure: The MIPS eligible clinician performs medication reconciliation for at least one transition of care in which the patient is transitioned into the care of the MIPS eligible clinician.

- *Denominator:* Number of transitions of care or referrals during the performance period for which the MIPS eligible clinician was the recipient of the transition or referral or has never before encountered the patient.

- *Numerator:* The number of transitions of care or referrals in the denominator where the following three clinical information reconciliations were performed: Medication list, medication allergy list, and current problem list.

Objective: Public Health Reporting.

Objective: The MIPS eligible clinician is in active engagement with a public health agency or clinical data registry to submit electronic public health data in a meaningful way using CEHRT, except where prohibited, and in accordance with applicable law and practice.

Immunization Registry Reporting Measure: The MIPS eligible clinician is in active engagement with a public health agency to submit immunization data.

Syndromic Surveillance Reporting Measure: The MIPS eligible clinician is in active engagement with a public health agency to submit syndromic surveillance data.

Specialized Registry Reporting Measure: The MIPS eligible clinician is in active engagement to submit data to a specialized registry.

We note that the 2017 Advancing Care Information Transition objectives and measures specifications that we proposed are for those MIPS eligible clinicians that are using 2014 Edition CEHRT. We are referring to this as the "2017 Advancing Care Information Transition objectives and measures" in this final rule with comment period, although it was referred to in the proposed rule as the "Modified Stage 2 objectives and measures" set. In addition, in this final rule with comment period, we refer to the measures specified for the advancing care information performance category described in section II.E.5.g.(7) of the proposed rule (81 FR 28221 through 28223) that correlate to a Stage 3 as the "Advancing Care Information objectives and measures" although it was referred to in the proposed rule as "MIPS objectives and measures" set. We note that these terms more are more specific

to MIPS, and to the advancing care information performance category than the terms used in the proposed rule. We have also decided to re-name several of the proposed measures to use titles that we believe are more illustrative of the substance of the measures. We note that we are not changing the names of the objectives associated with these measures. The measures being renamed are as follows:

Proposed title	Revised title
Patient Access	Provide Patient Access.
Patient Care Record Exchange.	Send a Summary of Care.
Request/Accept Patient Care Record.	Request/Accept Summary of Care.

We will be referring to these measures by their revised titles throughout the remainder of this final rule with comment period.

The following is a summary of the comments we received regarding the proposal to adopt the objectives and measures detailed at 81 FR 28226–28230 for the advancing care information performance category.

Comment: One commenter suggested the e-Prescribing measure be included in both the base score as well as the performance score of the advancing care information performance category to give more flexibility and offer an opportunity for MIPS eligible clinicians to earn more points, especially for those MIPS eligible clinicians who will be using a 2014 Edition CEHRT in 2017.

Response: As several commenters have stated, MIPS eligible clinicians should not be disadvantaged due to having to report on the 2017 Advancing Care Information Transition objectives and measures in 2017 and we agree. While we have not added the e-Prescribing measure to the performance score, we have added many other measures to give MIPS eligible clinicians the opportunity to increase their performance score under the advancing care information performance category. We refer readers to section II.E.5.g.(6)(a) of this final rule with comment period for further discussion of the scoring policy to see how we have equalized the opportunities for MIPS eligible clinicians reporting using technology certified to the 2014 Edition and those using technology certified to the 2015 Edition for the advancing care information performance category for 2017.

Comment: Many commenters supported the inclusion of the e-Prescribing measure in the base score of the advancing care information performance category. Some recommended modifications to the

measure such as changing the threshold to yes/no. A commenter supported adoption of the e-Prescribing measure on the condition that it have no minimum threshold and no performance measurement.

Response: We disagree that the threshold should be yes/no as we continue to believe that reporting a numerator and denominator is more appropriate because it will provide us with the data necessary to monitor performance on this measure. Performance on the measure, under the EHR Incentive Programs, has been consistently much higher than the thresholds set. We believe that through e-Prescribing, errors from paper prescriptions are reduced, and therefore, inclusion in the base score is justified. We also disagree with commenters who recommended adding e-Prescribing to the performance score. Since historical performance on this measure under the EHR Incentive Program has been high, we do not believe that this measure will help MIPS eligible clinicians distinguish themselves from others in regard to performance, and thus we have not included it in the performance score.

Comment: A commenter urged CMS to take into account that measurement of e-Prescribing is often not a measurement of the physician's diligence or capability, but rather a measurement of factors completely outside the physician's control, such as the ability of nearby pharmacies to accept electronic prescriptions. Another commenter recommended an exception to e-Prescribing for MIPS eligible clinicians in rural areas where most pharmacies do not have capability to accept electronic prescriptions.

Response: While we understand these concerns, section 1848(o)(2)(A)(i) of the Act requires electronic prescribing as part of using CEHRT in a meaningful manner. We note that we proposed an exclusion for MIPS eligible clinicians who write fewer than 100 permissible prescriptions. Further, we believe the inclusion of the Electronic Prescribing objective in the base score is appropriate because, as noted in the Medicare and Medicaid Programs; Electronic Health Record Incentive Program; Final Rule (75 FR 44338), it is the most widely adopted form of electronic exchange occurring and has been proven to reduce medication errors.

Comment: For the e-Prescribing measure, a commenter requested clarification that MIPS eligible clinicians are permitted to optionally exclude from the denominator any "standing" or "protocol" orders for medications that are predetermined for

a given procedure or a given set of patient characteristics.

Response: We disagree that the denominator should exclude "standing" prescriptions and continue to believe that the denominator should be the number of prescriptions written for drugs requiring a prescription in order to be dispensed other than controlled substances during the performance period; or number of prescriptions written for drugs requiring a prescription in order to be dispensed during the performance period.

Comment: One commenter stated that the e-Prescribing measure will be topped out by the time that MIPS is implemented and should be removed.

Response: While performance on the e-Prescribing measure may be high for EPs participating in the EHR Incentive Programs, the MIPS program includes many other clinicians who may have limited experience with this measure. Furthermore, as we have previously stated, section 1848(o)(2)(A)(i) of the Act requires electronic prescribing as part of using CEHRT in a meaningful manner, and thus, we have chosen to make it a required measure under the advancing care information performance category.

Comment: A commenter asked how e-Prescribing for the prescription of controlled substances should be measured for MIPS eligible clinicians who have not yet adopted the upgraded technology associated with the 2015 Edition.

Response: We proposed (81 FR 28227) that MIPS eligible clinicians would continue to have the option to include or not include controlled substances that can be electronically prescribed in the denominator of the e-Prescribing measure. This means that MIPS eligible clinicians may choose to include controlled substances in the definition of "permissible prescriptions" at their discretion where feasible and allowable by law in the jurisdiction where they provide care. The MIPS eligible clinician may also choose not to include controlled substances in the definition of "permissible prescriptions" even if such electronic prescriptions are feasible and allowable by law in the jurisdiction where they provide care. This policy is the same for MIPS eligible clinicians using EHR technology certified to the 2014 and the 2015 Editions.

Comment: Many commenters supported the inclusion of the Patient Electronic Access objective. Many commenters appreciated the emphasis on patient electronic access throughout the advancing care information performance category and agreed with

providing flexibility for MIPS eligible clinicians to provide information to patients.

Response: We appreciate the support and will require the Provide Patient Access measure of the Patient Electronic Access objective in the base score of the advancing care information performance category. We continue to believe that through providing access to information and increased patient engagement, health care outcomes can be improved.

Comment: Many commenters claimed that MIPS eligible clinicians will continue to struggle meeting the Patient Electronic Access objective. Some commenters believe the Patient Electronic Access objective holds MIPS eligible clinicians responsible for the actions of patients and other physicians outside of their control. A few noted that internet access issues will suppress small and rural MIPS eligible clinicians' performance scores in the advancing care information performance category, particularly in achieving success with Patient Electronic Access. Another commenter expressed concern regarding the Patient Electronic Access objective due to a lack of computers and electronic access among minority and non-English speaking patients. One commenter recommended that MIPS eligible clinicians be given 4 business days to provide this information, rather than 48 hours because MIPS eligible clinicians need time to review, correct and verify the accuracy of the information.

Response: While we understand these concerns, we believe providing patients' access to their health information is a critical step in improving patient care, increasing transparency and engaging patients. Under the Patient Electronic Access Objective, the Provide Patient Access measure only requires that patients are provided timely access to view online, download, and transmit his or her health information; and that the information is available to access using any application of their choice that is configured to meet the technical specifications of the Application Programming Interface (API) in the MIPS eligible clinician's CEHRT. This measure is required for the base score. The base score requirement is for MIPS eligible clinicians to report a numerator (of at least one) and a denominator, which we believe is reasonable and achievable by most MIPS eligible clinicians regardless of their practice circumstances or the characteristics of their patient population. This measure does not require that the patient take any action. (Note the View, Download or Transmit measure under the Coordination of Care Through Patient

Engagement Objective depends on the actions of the patient but the measure is part of the performance score and is not required.) The other measure under the Patient Electronic Access Objective is the Patient-Specific Access measure which is part of the performance score and is not required.

We additionally note that we have increased flexibility of our scoring methodology allowing MIPS eligible clinicians to focus on measures that best represent their practice in the performance score, and thus this measure is optional for reporting as part of the performance score.

Comment: A few commenters suggested that both measures in the Patient Electronic Access objective be retired. They believe that CMS data shows most clinicians score very well on Patient-Specific Education and Provide Patient Access measures, and thus, should not have to report on them. One commenter suggests that the Patient-Specific education measure be considered "topped out" due to historically high performance and stated concern that the manner in which the Patient-Specific education measure is currently specified is overly constrained and limiting to providers who may prefer workflows to provide patient education beyond what is permitted by CMS and certification.

Response: We disagree. As we have indicated previously, we believe these measures are a critical step to improving patient health, increasing transparency and engaging patients in their care. We additionally note there are certain types of clinicians that were not eligible to participate under the EHR Incentive Programs but are considered MIPS eligible clinicians, and we believe that it is appropriate to include the Patient Electronic Access objective and its associated measures. We note that under the Stage 2 of the EHR Incentive Programs, EPs achieved an average of 91 percent on the Provide Patient Access measure. While under the EHR Incentive Programs EPs performed well, we will be gathering data on MIPS eligible clinicians to determine whether the Patient-Specific Education and Patient Electronic Access measures should be included in future MIPS performance periods. We welcome specific examples suggestions for changes to the existing measures and potential new measures to replace the existing ones.

Comment: A commenter sought clarification on the Patient Electronic Access objective around the API availability and the use of 2014 Edition CEHRT. Another commenter asked what is meant by the phrase "subject to the

MIPS eligible clinician's discretion to withhold certain information" and asked why it was included.

Response: The specifications of the 2017 Advancing Care Information Transition Provide Patient Access measure do not require use of an API, and thus MIPS eligible clinicians who use EHR technology certified to the 2014 Edition and report this measure would not need to use an API for this measure. We refer readers to section II.E.5.g.(7) of this final rule with comment period for a description of the measure specifications. The Advancing Care Information Provide Patient Access measure is identical to the Patient Electronic Access measure that was finalized in the 2015 EHR Incentive Programs final rule for Stage 3. We maintain that MIPS eligible clinicians who provide electronic access to patient health information should have the ability to withhold any information from disclosure if the disclosure of the information is prohibited by federal, state or local laws or such information, if provided, may result in significant patient harm. We refer readers to the 2015 EHR Incentive Programs final rule (80 FR 62841–FR 62852) for a discussion of the Stage 3 Patient Electronic Access measure.

Comment: A commenter suggested that the View, Download and Transmit and Secure Messaging measures be made optional and noted the previous reductions in thresholds as an indication that there are significant challenges to meeting these measures.

Response: While we understand that there are challenges with these measures we continue to believe that the measures in the Coordination of Care Through Patient Engagement objective is an essential component of improving health care. We note that under our revised scoring methodology, these measures will not be required in the base score of the advancing care information category.

Comment: One commenter believed that although it is a reasonable policy for CMS to require MIPS eligible clinicians to make information electronically available to their patients within a reasonable time frame, they are very concerned about numerator requirements of the View, Download, or Transmit measure that only takes into account the actions of patients. Some stated that MIPS eligible clinicians who are diligent in making information securely available to their patients should not be penalized simply because the patient is not interested in accessing the information.

Response: The View, Download, or Transmit measure is not required in the

base score of the advancing care information performance category under our final scoring policy. It is available for MIPS eligible clinicians who choose to report on the measure to increase their performance score.

Comment: A few commenters recommended removing the Send a Summary of Care measure (formerly named the Patient Care Record Exchange measure) under the Health Information Exchange objective from the base score because some specialists may not have any transitions of care. One suggested that a minimum exclusion be provided for MIPS eligible clinicians that do not transition care or refer patients during the performance period.

Response: We disagree with the recommendation to remove this measure from the base score. One of the primary focuses of the advancing care information performance category is to encourage the exchange of health information using CEHRT. The Send a Summary of Care measure encourages the incorporation of summary of care information from other health care providers and clinicians into the MIPS eligible clinician's EHR to support better patient outcomes. We believe that MIPS eligible clinicians, particularly specialists, have the opportunity to send or receive a summary of care record from another care setting or clinician at least once during a MIPS performance period. In addition, since meeting the requirements of this measure to earn the base score involves reporting a numerator and denominator of at least one rather than meeting a percentage threshold, we believe this offers enough flexibility for MIPS eligible clinicians who are concerned that they rarely exchange patient health information with other providers.

Comment: A commenter requested that the Patient-Specific Education measure under the Patient Electronic Access objective not be limited to educational materials identified by CEHRT as they believe many medical specialty societies have developed patient-facing Web sites and educational materials.

Response: We appreciate this suggestion and will consider in future years of MIPS. However, as finalized for the 2017 performance period, the Patient-Specific Education measure is limited to educational materials identified by CEHRT. We note that we have refined our proposal and in 2017, this measure is not required in the base score of the advancing care information category. MIPS eligible clinicians may choose whether to report this measure as part of the performance score.

Comment: One commenter asked for clarification about when the patient-specific education was to be provided. The 2017 Advancing Care Information Transition measure in the proposed rule (based on Modified Stage 2 measure of the EHR Incentive Program) requires that patient-specific education be provided during the performance period while the 2015 EHR Incentive Programs final rule allows patient education to be provided any time between the start of the EHR reporting period and the date of attestation to count toward the numerator.

Response: While the commenter is correct about the policy established for the EHR Incentive Programs, under the MIPS, the patient-specific education must be provided within the performance period. We additionally note for the commenter that we included a proposal for the EHR Incentive Programs related to measure calculations for actions outside the EHR reporting period in the recent hospital Outpatient Prospective Payment System Proposed Rule (81 FR 45745 through 45746) for reporting in CY 2017 for the EHR Incentive Program.

Comment: A commenter requested that we stay consistent with the Stage 3 measure exclusion for the Patient-Specific Education measure and allow MIPS eligible clinicians with no office visits during the performance period be permitted to report a "null value" and achieve full base and performance score credit.

Response: In our final scoring methodology for the advancing care information category, the Patient-Specific Education measure is not a required measure for reporting in the base score, and thus we do not believe it is necessary to provide an exclusion for this measure. Instead MIPS eligible clinicians may choose to report the measure to earn credit in the advancing care information performance score. We believe it is appropriate to require the reporting of a numerator and denominator to add to the performance score. We refer readers to section II.E.5.g.(6)(a) for more discussion of our final scoring policy. We additionally note that there are exclusions for MIPS eligible clinicians who are considered non-patient facing, and direct readers to section II.E.3. of this final rule with comment period for further discussion of this policy.

Comment: A commenter questioned whether the MIPS eligible clinician or the patient is responsible for the View, Download, and Transmit measure under the Coordination of Care Through Patient Engagement objective as the description states that the MIPS eligible

clinician may meet the measure and does not reflect that the necessity of a patient viewing, downloading, and transmitting.

Response: We appreciate that the commenter brought this error to our attention. Our intention was that a MIPS eligible clinician may meet the measure if at least one unique patient viewed, downloaded, or transmitted to a third party their health information. We are revising the Advancing Care Information measure under the Coordination of Care Through Patient Engagement objective to reflect our intended policy.

Comment: Some commenters supported the inclusion of the Secure Messaging measure. A few recommended that it be converted into a yes/no measure. A commenter supported adoption of the proposed Secure Messaging measure, provided that the finalized measure have no minimum threshold and no performance measurement. A few commenters requested the removal of the requirement for secure messaging between patient and MIPS eligible clinician for nursing home residents and to patients who receive their primary care at home, since patients will not sign-up. A commenter recommended changing the numerator of the Secure Messaging measure to "responses to secure messages sent by patients," and the denominator to "all secure messages sent by patients," to address the misalignment between the numerator and denominator in the proposed measure.

Response: We appreciate the comments and the support for the Secure Messaging measure. In our revised scoring policy, we are finalizing our scoring methodology such that the Secure Messaging measure is not one of the required measures of the advancing care information performance category. MIPS eligible clinicians may still choose to report the measure to earn credit in the performance score, and thus have the option to determine whether this measure represents their practice. We refer readers to section II.E.5.g.(6)(a) of this final rule with comment period for further discussion of our final scoring policy.

We disagree with the suggestion to change Secure Messaging to a yes/no measure, or to change the numerator and denominator as this measure is meant to promote the sending of secure messages by the MIPS eligible clinician and not by patients. We believe that it is more appropriate for the numerator to consist of the number of patients found in the denominator to whom a secure electronic message is sent or in response

to a secure message sent by the patient (or patient-authorized representative), during the performance period.

Comment: Some commenters opposed the inclusion of the Health Information Exchange objective and the associated measures: Send a Summary of Care, Request/Accept Summary of Care, and Clinical Information Reconciliation. They noted that it holds MIPS eligible clinicians responsible for information over which they have no control and recommended the objective be removed. The commenters believed that the Health Information Exchange objective holds MIPS eligible clinicians responsible for the actions of patients and other physicians outside of their control. Other commenters opposed the measures included in the Health Information Exchange objective because those measures overestimate the interoperability of EHR technology. Commenters also expressed concern that this measure would emphasize quantity of information, rather than the sharing of relevant information. A few commenters indicated that past experience with the Health Information Exchange objective in the EHR Incentive Programs has been challenging for EPs. Challenges include costs, lack of contacts at hospital systems to effectively communicate where an electronic transition of care document should be sent, and inadequate training and understanding of how to use EHR functionality even if fully enabled.

Response: While we appreciate these concerns, we believe the benefits health information exchange outweigh the challenges. As we stated in the 2015 EHR Incentive Programs final rule (80 FR 62804), we believe that the electronic exchange of health information between providers and clinicians would encourage the sharing of the patient care summary from one provider or clinician to another and important information that the patient may not have been able to provide. This can significantly improve the quality and safety of referral care and reduce unnecessary and redundant testing. EHRs and the electronic exchange of health information, either directly or through health information exchanges, can reduce the burden of such communication. Therefore, we believe it is appropriate to include the Health Information Exchange objective and include the Send the Summary of Care and the Request/Accept Summary of Care measures as required in the base score of the advancing care information performance category.

Comment: A commenter was concerned about MIPS eligible clinicians who do not have access to a

health information exchange and in these cases, recommended a hardship exception option for this objective.

Response: We note that there is no requirement to have access to a health information exchange for the Health Information Exchange objective. Rather for the Request/Accept Summary of Care measure (formerly Patient Care Record measure), the summary of care record must be electronically exchanged. We note that the intent for flexibility around exchange via any electronic means is to promote and facilitate a wide range of options. We refer readers to the discussion of the Health Information Exchange objective at 80 FR 62852 through 62862 as it provides a thorough discussion of transport mechanisms for the summary of care record.

Comment: Some commenters believe that internet access issues will stifle performance in the advancing care information performance category for MIPS eligible clinicians in small and rural settings, especially those with high staff turnover, in trying to satisfy the Health Information Exchange objective.

Response: We understand this concern and recognize that nationwide access to broadband is still a challenge for some MIPS eligible clinicians. If a MIPS eligible clinician does not have sufficient internet access, they may qualify for reweighting of the advancing care information performance category score. We refer readers to the discussion of MIPS eligible clinicians facing a significant hardship in section II.E.5.g.(8)(a)(ii) of this final rule with comment period.

Comment: A commenter stated that the Health Information Exchange objective does not adequately reflect EHR interoperability. They believe the metric is too focused on the quantity of information moved and not the relevance of these exchanges. They urged CMS to re-focus the advancing care information performance category on interoperability by developing specialty-specific interoperability use cases rather than the measuring the quantity of data exchanged.

Response: We are very interested in adopting measures that reflect interoperability. We urge interested parties to participate in our solicitation call for new measures that will be available in the next few months.

Comment: A commenter urged CMS to clarify whether the denominator of the Request/Accept Summary of Care measure under the Health Information Exchange objective includes the number of transitions of care sent to the MIPS eligible clinicians with CEHRT, and whether MIPS eligible clinicians are

able to exclude referrals from this measure if the receiving clinician does not have CEHRT fully implemented.

Response: The calculation of the denominator for the 2017 Advancing Care Information Transition measure, Health Information Exchange, is different from that of the Advancing Care Information measure, Request/Accept Summary of Care. As we noted in the 2015 EHR Incentive Programs final rule (80 FR 62804–62806) we did not adopt a requirement for the Modified Stage 2 Health Information Exchange measure (which correlates to the 2017 Advancing Care Information Transition measure) that the recipient to whom the EP sends a summary of care document possess CEHRT or even an EHR in order to be the recipient of an electronic summary of care document. However, measure 2 of the Stage 3 Health Information Exchange objective (which correlates to the Advancing Care Information measure, Request/Accept Summary of Care) was finalized such that the EP, as a recipient of a transition or referral, incorporates an electronic summary of care document into CEHRT. Therefore, as we proposed for MIPS, we are finalizing our policy such that transitions and referrals from recipients who do not possess CEHRT could be excluded from the denominator of the 2017 Advancing Care Information Transition measure, Health Information Exchange, but should be included for the denominator of the MIPS measure, Request/Accept Summary of Care.

We disagree that the Advancing Care Information measure should be limited to only include recipients who possess CEHRT for the Request/Accept Summary of Care measure, as that would limit support for MIPS eligible clinicians exchanging health information with providers and clinicians across a wide range of settings. We further note that, consistent with the policy set forth in the 2015 EHR Incentive Programs final rule (80 FR 62852–62862), MIPS eligible clinicians and groups may send the electronic summary of care document via any electronic means so long as the MIPS eligible clinician sending the summary of care record is using the standards established for the creation of the electronic summary of care document.

Comment: Many commenters strongly supported the inclusion of the Health Information Exchange objective and associated measures. They noted benefits such as the incorporation and use of both non-clinical and patient-generated health data as well as supplementing medication reconciliation for transitions of care

with medication allergies and problems as part of the Health Information Exchange objective. They supported the prioritization of measures that promote the policy objectives of interoperability, care coordination, and patient engagement. They supported measures that incorporate the use of online access to health information and secure email, and the collection and integration of data from non-clinical sources.

Response: We agree and will continue to require the Health Information Exchange objective in the advancing care information performance category. In addition section 1848(o)(2)(A)(ii) of the Act requires the electronic exchange of health information.

Comment: A commenter noted that the definition of patient-generated health data inappropriately focuses on the device generating the data rather than the patient and recommended expanding the definition to include other more relevant data sources such as filling out forms and surveys, and by self-report. One commenter believed there should be a distinction between patient-generated and device-generated data and that MIPS eligible clinicians should have the ability to review data sources as part of the record similar to a track change function.

Response: For the Patient-Generated Health Data measure, the calculation of the numerator incorporates both health data from non-clinical settings, as well as health data generated by the patient. We will consider the suggestion for expanding the types of health data to include for this measure, such as some patient-reported information, in future rulemaking.

Comment: For the Clinical Information Reconciliation measure, specifically the medication reconciliation portion, the commenter believed the updated measure for Stage 3 adds further definition to the data that must be reviewed.

Response: We note that the Clinical Information Reconciliation measure under the Health Information Exchange objective, we are adopting for the advancing care information performance category is the same as the Stage 3 measure under the EHR Incentive Program with the threshold and exclusion removed.

Comment: For the Medication Reconciliation measure, the proposed 2017 Advancing Care Information Transition measure adds the medication allergy list and current problems list to the items that must be reconciled. One commenter indicated that this significantly expands the current Modified Stage 2 measure such that a change in workflow is required. In

addition, functionality to reconcile medication allergies and problems are not included in the 2014 Edition of CEHRT.

Response: The 2017 Advancing Care Information Transition Medication Reconciliation measure is still limited to medication reconciliation as it was for the Modified Stage 2 measure. For the Advancing Care Information measure, we proposed to include medication list, medication allergy list and current problem list under the Clinical Information Reconciliation measure which aligns with the third measure under the Health Information Exchange objective for Stage 3 of the EHR Incentive Programs and requires technology certified to the 2015 Edition.

Comment: A few commenters requested, in addition to eliminating the requirement to report the CPOE and CDS objectives and associated measures that MIPS eligible clinicians only be required to report on the remaining objectives and measures that are relevant to their practice.

Response: In developing our final scoring methodology for the advancing care information performance category for a performance period in 2017, we have significantly reduced the number of required measures from 11 to five. We have moved more measures to the performance score so the MIPS eligible clinicians are able to tailor their participation by relevance to their practices. We refer readers to section II.E.5.g.(6)(a) for more discussion of our final scoring policy.

Comment: The majority of commenters supported the proposal to include the Public Health and Clinical Data Registry Reporting objective in the advancing care information performance category. Many commenters particularly praised the reduction in requirements of the objective by only requiring the reporting of the Immunization Registry Reporting measure while including the remaining measures as optional to earn a bonus point. However, some commenters expressed concern that by only requiring one measure to report, the importance of public health registry reporting is downplayed. Many commenters suggested MIPS eligible clinicians be encouraged and incentivized to report to registries beyond Immunization Registry Reporting.

Several commenters indicated that the Public Health Registry reporting objective would be better suited as an activity in the improvement activities performance category and public health registry reporting should be counted for points in that performance category

rather than the advancing care information performance category.

Response: We appreciate the support of our proposal to reduce the reporting burden for the Public Health and Clinical Data Registry Reporting objective. We agree that given the importance and benefit to MIPS eligible clinicians of submitting data to multiple registries, that more points should be awarded for reporting to additional registries under the objective. As we have amended our proposal and the Immunization Registry Reporting measure is no longer a required measure in the base score, MIPS eligible clinicians may still choose to report the measure to increase their performance score. In addition, we are increasing the bonus to 5 percent for reporting one or more public health or clinical data registries.

We disagree that the Public Health and Clinical Data Registry reporting objective should be in the improvement activities performance category. The proposed measures in the Public Health and Clinical Data Registry Reporting objective focus on active, ongoing engagement with registries, as well as electronic submission of data, which we believe are within the scope of effectively using CEHRT to achieve the goals of the advancing care information performance category.

Comment: A commenter supported the proposal to include the Public Health and Clinical Data Registry reporting but encouraged CMS to require reporting to cancer registries, because accurate and detailed cancer information enables better public policy development.

Response: We have not created a separate cancer registry reporting measure for MIPS because we believe that such reporting is captured under existing public health registry reporting measures. If a MIPS eligible clinician is reporting under the 2017 Advancing Care Information Transition objectives and measures, they may report cancer registry data under the specialized registry measure. However, if the eligible clinician or group chooses to do so, they must use the 2014 Edition certification criteria specific to cancer case reporting in order to meet the measure. This measure is an exception to the flexible CEHRT requirements for the 2017 Advancing Care Information Transition objectives and measures Specialized Registry Reporting measure and for this reason we previously finalized a policy that if a participant has the CEHRT available and chooses to report to meet the measure they may do so but they are not required to consider a cancer registry in their specialized

registry selection (80 FR 62823). If the MIPS eligible clinician is reporting under the MIPS advancing care information performance category measures, active engagement with a cancer registry would meet the Public Health Registry Reporting measure and would require the use of technology certified to the cancer case reporting criteria of the 2014 or 2015 Edition.

If a MIPS eligible clinician is reporting under the 2017 Advancing Care Information Transition objectives and measures, they may report cancer registry data under the Specialized Registry measure. If they are reporting under the Advancing Care Information objectives and measures, they would report under the Public Health Registry Reporting measure.

Comment: One commenter expressed concern that many of the measures under the Public Health and Clinical Registry Reporting objective do not apply to all practices, and for those to whom it does apply, the measures should not burden MIPS eligible clinicians by requiring them to join a registry in order to report.

Response: We appreciate the concern that different registries have different requirements for participation and they may not apply to a MIPS eligible clinician's practice. We note that we have amended our proposal and the Immunization Registry Reporting measure is no longer a required measure, but MIPS eligible clinicians may report the measure to earn credit in the performance score. In addition, we are only awarding a bonus score for reporting to additional public health or clinical data registries. We believe this offers enough flexibility for MIPS eligible clinician who may experience challenges engaging with a public health or clinical registry.

Comment: A commenter recommended that for performance period 2017, MIPS eligible clinicians be required to be in active engagement with two public health registries and to report on two public health registry reporting measures, for example, Immunization Registry Reporting and one optional public health registry reporting measure. Several commenters recommended that for performance periods in 2018 and beyond, MIPS eligible clinicians be required to be in active engagement with three public health registries and to report on three public health registry reporting measures, for example, Immunization Registry Reporting, Electronic Public Health Registry Reporting, and one specialized public health registry.

Response: While we appreciate these comments, we are not requiring Public

Health and Clinical Data Registry Reporting in the base score of the advancing care information performance category. MIPS eligible clinicians can increase their performance score if they choose to report on the Immunization Registry Reporting measure in 2017. We are also finalizing as part of our scoring policy that MIPS eligible clinicians can earn a bonus score for reporting to additional public health registries.

Comment: A commenter stated that our proposal to only require Immunization Registry Reporting measure will likely result in a decrease in public health reporting. They urged CMS to retain the public health reporting requirements from the EHR Incentive Programs. While another noted that after putting significant effort into meeting EHR Incentive Program Stage 2 requirements of submitting to two public health registries, they were disappointed that the proposed MACRA rule would only require data submission to an immunization registry.

Response: While we understand these concerns, and we believe that the Public Health and Clinical Registry Reporting measures should not be included in the base score of the advancing care information performance category and have amended our proposal to specify that the Immunization Registry Reporting measure is no longer a required measure in the base score. We agree with the commenter that many EPs have successfully achieved active engagement with more than one clinical data registry over the past few years. However, we also know that many MIPS eligible clinicians are still working diligently toward meeting the requirements of this objective. We believe that an opportunity for growth and improvement continues to exist, especially among a large proportion of MIPS eligible clinicians who did not previously participate in the Medicare and Medicaid EHR incentive programs. Therefore, MIPS eligible clinicians may still choose to report the Immunization Registry Reporting measure to increase their performance score. In addition, MIPS eligible clinicians who choose to report on additional public health and clinical data registry reporting measures may increase their bonus score toward their advancing care information performance category score.

Comment: Some commenters supported the inclusion of the Immunization Registry Reporting measure. They noted that immunization registries are the most widely available and applicable public health registries and previously included for EPs in meaningful use. The continuation of the exclusions for MIPS eligible clinicians

who do not administer immunizations, or whose local registries do not accept data according to the standards adopted in certification, ensures that MIPS eligible clinicians are not penalized for factors beyond their control.

Response: While we appreciate these comments, we are not requiring public health reporting in the base score of the advancing care information performance category. However, MIPS eligible clinicians may still choose to report the Immunization Registry Reporting measure to increase their advancing care information performance score.

Comment: A commenter recommended that there be a resource or listing of all available public health and clinical registries that MIPS eligible clinicians could engage with to meet the measures of the Public Health and Clinical Data Registry Reporting objective.

Response: We are planning a to develop a centralized public health registry repository to assist MIPS eligible clinicians in finding public health registries available and clinically relevant to their practice that are accepting electronic submissions.

Comment: A commenter questioned why we had modified the Stage 3 measure for syndromic surveillance from an "urgent care setting" to a "non-urgent" care setting under MIPS.

Response: This was an oversight on our part. As we noted in the 2015 final rule (80 FR 62866) few jurisdictions accept syndromic surveillance from non-urgent care EPs. We are modifying the measure for MIPS so that it aligns with the Stage 3 measure that we finalized for the EHR Incentive Program and limit the surveillance data to be submitted to data from an urgent care setting.

After consideration of the comments, we are finalizing our proposal for the Advancing Care Information objectives and measures and the 2017 Advancing Care Information Transition objectives and measures as proposed with modifications to correct language in certain measures as noted as follows:

For the 2017 Advancing Care Information Transition Medication Reconciliation measure: We are maintaining the Modified Stage 2 numerator as follows: "Numerator: The number of transitions of care in the denominator where medication reconciliation was performed."

For the Advancing Care Information View, Download, Transmit (VDT) measure: During the performance period, at least one unique patient (or patient-authorized representatives) seen by the MIPS eligible clinician actively engages with the EHR made accessible

by the MIPS eligible clinician. An MIPS eligible clinician may meet the measure by a patient either—(1) viewing, downloading, or transmitting to a third party their health information; or (2) accessing their health information through the use of an API that can be used by applications chosen by the patient and configured to the API in the MIPS eligible clinician's CEHRT; or (3) a combination of (1) and (2).

For the Advancing Care Information Syndromic Surveillance Reporting measure: The MIPS eligible clinician is in active engagement with a public health agency to submit surveillance data from an urgent care ambulatory setting where the jurisdiction accepts syndromic data from such settings and the standards are clearly defined.

We note that we will consider new measures for future years of the program, and invite comment on what types of EHR measures and measurement should be considered for inclusion in the program. In addition we invite comments on how to make the measures that we are adopting in this final rule more stringent in the future, especially in light of the statutory requirements.

(c) Exclusions

In the 2015 EHR Incentive Programs final rule (80 FR 62829 through 62871) we outlined certain exclusions from the objectives and measures of meaningful use for EPs who perform low numbers of a particular action or activity for a given measure (for example, an EP who writes fewer than 100 permissible prescriptions during the EHR reporting period would be granted an exclusion for the Electronic Prescribing measure) or for EPs who had no office visits during the EHR reporting period. Moving forward, we believe that the proposed MIPS exclusion criteria as proposed at (81 FR 28173–28176) and as further discussed in section II.E.1. of this final rule with comment period, and advancing care information performance category scoring methodology together accomplish the same end as the previously established exclusions for the majority of the advancing care information performance category measures. By excluding from MIPS those clinicians who do not exceed the low-volume threshold (proposed in section II.E.3.c. of the proposed rule, as MIPS eligible clinicians who, during the performance period, have Medicare billing charges less than or equal to \$10,000 and provide care for 100 or fewer Part B-enrolled Medicare beneficiaries), we believe exclusions for most of the individual advancing care information

performance category measures are no longer necessary. The additional flexibility afforded by the proposed advancing care information performance category scoring methodology eliminates required thresholds for measures and allows MIPS eligible clinicians to focus on, and therefore report higher numbers for, measures that are more relevant to their practice.

We noted that EPs who write less than 100 permissible prescriptions during the EHR reporting period are allowed an exclusion for the e-Prescribing measure under the EHR Incentive Program (80 FR 62834), which we did not propose for MIPS. We note that the Electronic Prescribing objective would not be part of the performance score under our proposals, and thus, MIPS eligible clinicians who write very low numbers of permissible prescriptions would not be at a disadvantage in relation to other MIPS eligible clinicians when seeking to achieve a maximum advancing care information performance category score. For the purposes of the base score, we proposed that those MIPS eligible clinicians who write fewer than 100 permissible prescriptions in a performance period may elect to report their numerator and denominator (if they have at least one permissible prescription for the numerator), or they may report a null value. This is consistent with prior policy which allowed flexibility for clinicians in similar circumstances to choose an alternate exclusion (80 FR 62789).

In addition, in the 2015 EHR Incentive Programs final rule, we adopted a set of exclusions for the Immunization Registry Reporting measure under the Public Health and Clinical Data Registry Reporting objective (80 FR 62870). We recognize that some types of clinicians do not administer immunizations, and therefore proposed to maintain the previously established exclusions for the Immunization Registry Reporting measure. We therefore proposed that these MIPS eligible clinicians may elect to report their yes/no statement if applicable, or they may report a null value (if the previously established exclusions apply) for purposes of reporting the base score.

We note that we did not propose to maintain any of the other exclusions established under the EHR Incentive Program, however, we solicited comment on whether other exclusions should be considered under the advancing care information performance category under the MIPS.

The following is a summary of the comments we received regarding our exclusion proposal.

Comment: Many commenters supported our proposal to provide an exclusion for the e-Prescribing measure to those MIPS eligible clinicians who write less than 100 permissible prescriptions during the performance period, and many commenters requested additional exclusions. Commenters disagreed with the removal of exclusions for other objectives, such as the transitions of care measure under the Health Information Exchange objective that existed under the EHR Incentive Programs. Many suggested continuing all EHR Incentive Programs Modified Stage 2 and Stage 3 exclusions under MIPS. Others suggested that exclusions be added to the Health Information Exchange measure under 2014 Edition CEHRT and the MIPS Clinical Information Reconciliation measure. Some suggested an exclusion for the Health Information Exchange Objective be added if a MIPS eligible clinician has fewer than 100 external referrals. Commenters also requested exclusions for clinicians who do not refer patients and those with insufficient broadband availability. Commenters recommended low-volume exclusions for various measures including e-Prescribing, Provide Patient Access, and the measures under the Coordination of Care Through Patient Engagement, and Health Information Exchange objectives. Commenters also urged the addition of an exclusion for MIPS eligible clinicians practicing in multiple locations because they may encounter specific hardships due to CEHRT availability. Some requested that any meaningful use exclusions for Public Health and Clinical Data Registry Reporting remain in effect for those using the 2014 CEHRT. Some requested an exclusion should exist for the Syndromic Surveillance Reporting measure for those physicians who do not directly or rarely diagnose or treat conditions related to syndromic surveillance. Another commenter requested that we maintain the meaningful use Stage 3 exclusion for the Patient-Specific Education and that MIPS eligible clinicians with no office visits during the performance period be permitted to report a “null value” and achieve full base and performance score credit.

Response: We note that we are finalizing fewer required measures for the base score of the advancing care information performance category than we had proposed. As there are now fewer required measures, we do not believe that it is necessary to create additional exclusions for measures which are now optional for reporting. In

addition, as we have moved the Immunization Registry Reporting measure from “required” in the base score to “not required” in the base score, we are not finalizing our proposal to provide an exclusion for those MIPS eligible clinicians who do not administer immunizations during the performance period. The exclusion is no longer necessary because MIPS eligible clinicians now have the option of whether or not to report on Immunization Registry Reporting to receive credit for this measure under the performance score of the advancing care information performance category.

Comment: A few commenters supported the elimination of exclusions and noted that the elimination of thresholds enable MIPS eligible clinicians to focus more on quality patient care and less on meeting thresholds.

Response: We appreciate the support of these commenters and agree that the fewer required measures and elimination of thresholds have enabled the removal of many of the exclusions that existed under the EHR Incentive Programs.

After consideration of the comments, we are finalizing our exclusion policy as proposed with the following modification. We are not finalizing the exclusions for the Immunization Registry Reporting measure under the Public Health and Clinical Data Registry Reporting objective for those MIPS eligible clinicians who do not administer immunizations as part of their practice.

(8) Additional Considerations

(a) Reweighting of the Advancing Care Information Performance Category for MIPS Eligible Clinicians Without Sufficient Measures Applicable and Available

As discussed in the proposed rule, section 101(b)(1)(A) of the MACRA amended section 1848(a)(7)(A) of the Act to sunset the meaningful use payment adjustment at the end of CY 2018. Section 1848(a)(7) of the Act includes certain statutory exceptions to the meaningful use payment adjustment under section 1848(a)(7)(A) of the Act. Specifically, section 1848(a)(7)(D) of the Act exempts hospital-based EPs from the application of the payment adjustment under section 1848(a)(7)(A) of the Act. In addition, section 1848(a)(7)(B) of the Act provides that the Secretary may exempt an EP who is not a meaningful EHR user for the EHR reporting period for the year from the application of the payment adjustment under section 1848(a)(7)(A) of the Act if

the Secretary determines that compliance with the requirements for being a meaningful EHR user would result in a significant hardship, such as in the case of an EP who practices in a rural area without sufficient internet access. The MACRA did not maintain these statutory exceptions for the advancing care information performance category of the MIPS. Thus, the exceptions under sections 1848(a)(7)(B) and (D) of the Act are limited to the meaningful use payment adjustment under section 1848(a)(7)(A) of the Act and do not apply in the context of the MIPS.

Section 1848(q)(5)(F) of the Act provides, if there are not sufficient measures and activities applicable and available to each type of MIPS eligible clinician, the Secretary shall assign different scoring weights (including a weight of zero) for each performance category based on the extent to which the category is applicable to each type of MIPS eligible clinician, and for each measure and activity specified for each such category based on the extent to which the measure or activity is applicable and available to the type of MIPS eligible clinician.

We believe that under our proposals for the advancing care information performance category of the MIPS, there may not be sufficient measures that are applicable and available to certain types of MIPS eligible clinicians as outlined in the proposed rule, some of whom may have qualified for a statutory exception to the meaningful use payment adjustment under section 1848(a)(7)(A) of the Act. For the reasons stated in the proposed rule, we proposed to assign a weight of zero to the advancing care information performance category for purposes of calculating a MIPS final score for these MIPS eligible clinicians. We refer readers to section I.E.6. of the proposed rule for more information regarding how the quality, cost and improvement activities performance categories would be reweighted.

(i) Hospital-Based MIPS Eligible Clinicians

Section 1848(a)(7)(D) of the Act exempts hospital-based EPs from the application of the meaningful use payment adjustment under section 1848(a)(7)(A) of the Act. We defined a hospital-based EP for the EHR Incentive Program under § 495.4 as an EP who furnishes 90 percent or more of his or her covered professional services in sites of service identified by the codes used in the HIPAA standard transaction as an inpatient hospital or emergency room setting in the year preceding the

payment year, or in the case of a payment adjustment year, in either of the 2 years before the year preceding such payment adjustment year. Under this definition, EPs that have 90 percent or more of payments for covered professional services associated with claims with Place of Service Codes 21 (inpatient hospital) or 23 (emergency department) are considered hospital-based (75 FR 44442).

We believe there may not be sufficient measures applicable and available to hospital-based MIPS eligible clinicians under our proposals for the advancing care information performance category of MIPS.

Hospital-based MIPS eligible clinicians may not have control over the decisions that the hospital makes regarding the use of health IT and CEHRT. These MIPS eligible clinicians therefore may have no control over the type of CEHRT available, the way that the technology is implemented and used, or whether the hospital continually invests in the technology to ensure it is compliant with ONC certification criteria. In addition, some of the specific advancing care information performance category measures, such as the Provide Patient Access measure under the Patient Electronic Access objective requires that patients have access to view, download and transmit their health information from the EHR which is made available by the health care clinician, in this case the hospital. Thus the measure is more attributable and applicable to the hospital and not to the MIPS eligible clinician, as the hospital controls the availability of the EHR technology. Further, the requirement under the Protect Patient Health Information objective to conduct a security risk analysis, would rely on the actions of the hospital, rather than the actions of the MIPS eligible clinician, as the hospital controls the access and availability and secure implementation of the EHR technology. In this case, the measure is again more attributable and applicable to the hospital than to the MIPS eligible clinician. Further, certain specialists (such as pathologists, radiologists and anesthesiologists) who often practice in a hospital setting and may be hospital-based MIPS eligible clinicians often lack face-to-face interaction with patients, and thus, may not have sufficient measures applicable and available to them under our proposals. For example, hospital-based MIPS eligible clinicians who lack face-to-face patient interaction may not have patients for which they could transfer or create an electronic summary of care record.

In addition, we noted that eligible hospitals and CAHs are subject to meaningful use requirements under sections 1886(b)(3)(B) and (n) and 1814(l) of the Act, respectively, which were not affected by the enactment of the MACRA. Eligible hospitals and CAHs are required to report on objectives and measures of meaningful use under the EHR Incentive Program, as outlined in the 2015 EHR Incentive Programs final rule. We noted the objectives and measures of the EHR Incentive Programs for eligible hospitals and CAHs are specific to these facilities, and are more applicable and better represent the EHR technology available in these settings.

For these reasons, we proposed to rely on section 1848(q)(5)(F) of the Act to assign a weight of zero to the advancing care information performance category for hospital-based MIPS eligible clinicians. We proposed to define a “hospital-based MIPS eligible clinician” at § 414.1305 as a MIPS eligible clinician who furnishes 90 percent or more of his or her covered professional services in sites of service identified by the codes used in the HIPAA standard transaction as an inpatient hospital or emergency room setting in the year preceding the performance period, otherwise stated as the year 3 years preceding the MIPS payment year. For example, under this proposal, hospital-based determinations would be made for the 2019 MIPS payment year based on covered professional services furnished in 2016. We also proposed, consistent with the EHR Incentive Program, that we would determine which MIPS eligible clinicians qualify as “hospital-based” for a MIPS payment year. We invited comments on these proposals.

In addition, we sought comment on how the advancing care information performance category could be applied to hospital-based MIPS eligible clinicians in future years of MIPS, and the types of measures that would be applicable and available to these types of MIPS eligible clinicians.

We also sought comment on whether the previously established 90 percent threshold of payments for covered professional services associated with claims with Place of Service (POS) Codes 21 (inpatient hospital) or 23 (emergency department) is appropriate, or whether we should consider lowering this threshold to account for hospital-based MIPS eligible clinicians who bill more than 10 percent of claims with a POS other than 21 or 23. Although we proposed a threshold of 90 percent, we are considering whether a lower threshold would be more appropriate

for hospital-based MIPS eligible clinicians. In particular, we are interested in what factors should be applied to determine the threshold for hospital-based MIPS eligible clinicians. We will continue to evaluate the data to determine whether there are certain thresholds which naturally define a hospital-based MIPS eligible clinician.

The following is a summary of the comments we received regarding our proposal for defining hospital-based MIPS eligible clinicians.

Comment: Many commenters supported our proposed definition of a hospital-based MIPS eligible clinician as those who furnish 90 percent or more of his or her covered professional services in either Place of Service 21 or 23. Many also supported the proposal to assign a weight of zero to the advancing care information performance category for hospital-based MIPS eligible clinicians, citing that health IT decisions for these MIPS eligible clinicians are often made at the hospital level and are out of their control.

Response: We thank commenters for their support of our proposal. For the reasons stated in the proposed rule, and based on the measures we are finalizing in this final rule with comment period, we agree that there may not be sufficient measures applicable and available to hospital-based MIPS eligible clinicians to report for the advancing care information performance category.

Comment: A few commenters disagreed with our proposal and provided alternate hospital-based thresholds. They recommended that the threshold be lowered to a majority (or more than 50 percent). Several commenters recommended a 75 percent threshold, while another suggested reducing the threshold to 60 percent. One commenter recommended that CMS adopt a flexible approach that accommodates eligible clinicians who work in multiple settings.

Response: Although commenters suggested alternate thresholds, they did not provide specific rationale to support the lowered thresholds or the factors that should be applied to determine the threshold for hospital-based MIPS eligible clinicians. With commenter feedback in mind, we have reevaluated the data and found that historical claims data support a lower threshold as suggested in these comments. With consideration of the comments and data we have reviewed, we are reducing the percentage of covered professional services furnished in certain sites of service to determine hospital-based MIPS eligible clinicians from 90 percent to 75 percent. The data analyzed supports the comments we received

while still allowing MIPS eligible clinicians with 25 percent or more of their services in a settings outside of inpatient hospital, on-campus outpatient hospital (as referenced below) or emergency room settings to participate and earn points in the advancing care information performance category.

Comment: Many commenters proposed that CMS broaden the definition of “hospital-based clinician” to include those MIPS eligible clinicians who are employed by a hospital, but still bill outpatient services, as those MIPS eligible clinicians will not have input into the selection of the EHR, pointing out that facility-based clinicians in both inpatient and outpatient settings experience the similar difficulties in meeting the proposed objectives and measures in the advancing care information performance category. Another commenter believed that CMS should include other clinician settings, such as ambulatory surgery centers, with hospital inpatient and ED settings as clinicians in other settings may also lack control over EHR technology. Another urged CMS to revise the criteria to include care provided in hospital outpatient departments and ASCs, excluding evaluation and management services. One commenter supported our proposal for hospital-based MIPS eligible clinicians and recommended that CMS also include POS 22 (on-campus outpatient hospital) because many hospitalists provide care in both the inpatient setting, as well as on-campus outpatient hospital departments. Another commenter suggested that the definition of hospital-based MIPS eligible clinicians include observation services.

Response: We agree with commenters that there are MIPS eligible clinicians who bill using place of service codes other than POS 21 and POS 23 but who predominantly furnish covered professional services in a hospital setting and have no control over EHR technology. We believe these clinicians should be considered hospital-based for purposes of MIPS, and therefore, we are expanding our hospital-based definition to include POS 22, on-campus outpatient hospital.

Comment: One commenter recommended using the newly-introduced Medicare specialty billing code for hospitalists in the definition of “hospital-based.”

Response: The official use of the Medicare specialty billing code for hospitals does not begin until after the start of the MIPS program, and therefore we have no historical data to support its

inclusion in the definition of hospital-based at this time. We will consider this recommendation for future rulemaking.

Comment: One commenter recommended that CMS describe this group of MIPS eligible clinicians as facility-based rather than hospital-based.

Response: We appreciate the comment although we continue to believe that hospital-based is the more appropriate term. We believe facility-based is too broad a term and could be misleading.

Comment: A commenter requested that CMS be transparent about the time period used for determining whether an MIPS eligible clinician is hospital-based.

Response: We proposed to use data from the year preceding the performance period, otherwise stated as the year that is 3 years preceding the MIPS payment year. We are adopting a modified final policy and will instead use claims with dates of service between September 1 of the calendar year 2 years preceding the performance period through August 31 of the calendar year preceding the performance period. For example, for the 2017 performance period (2019 MIPS payment year) we will use the data available at the end of October 2016 for Medicare claims with dates of service between September 1, 2015, through August 31, 2016, to determine whether a MIPS eligible clinician is considered hospital-based by our definition. In the event that it is not operationally feasible to use claims from this exact time period, we will use a 12-month period as close as practicable to September 1 of the calendar year 2 years preceding the performance period and August 31 of the calendar year preceding the performance period. We have adopted this change in policy in an effort to provide transparency to MIPS eligible clinicians; this change in timeline will allow us to notify MIPS eligible clinicians of their hospital-based status prior to the start of the performance period. By adopting this policy and notifying MIPS eligible clinicians of their hospital-based determination prior to the performance period, we enable MIPS eligible clinicians to better plan and prepare for reporting.

Comment: One commenter noted that specialists who meet the criteria for being considered a hospital-based MIPS eligible clinician may still have access and the ability to effectively use CEHRT, and may sufficiently meet the requirements of the advancing care information performance category, while those MIPS eligible clinicians who do not meet the hospital-based

criteria as proposed would not be able to meet those requirements. The commenter suggested taking this into consideration and proposed allowing some MIPS eligible clinicians who are not hospital-based, but who still face the same hardships, to reweight and redistribute their advancing care information performance category score.

Response: We realize that some MIPS eligible clinicians face similar challenges around the inability to control their access to CEHRT even if they are not determined to be hospital-based. We refer readers to section II.E.5.g.(8)(a)(ii) of this final rule with comment period for further discussion of reweighting applications for those MIPS eligible clinicians who face a significant hardship.

Comment: Commenters recommended offering MIPS eligible clinicians or groups the option to petition for a change in their hospital-based status when there is a change in their organizational affiliation.

Response: We agree that circumstances change from year to year and MIPS eligible clinicians' hospital-based determination should be reevaluated for each MIPS payment year. We note that we are finalizing a policy to determine hospital-based status for each MIPS payment year by looking at a MIPS eligible clinician's covered professional services based on claims with dates of service between September 1 of the calendar year 2 years preceding the performance period through August 31 of the calendar year preceding the performance period. We appreciate the suggestion that MIPS eligible clinicians should have the ability to petition their hospital-based status. However, we believe this annual reevaluation in combination with our policy that hospital-based MIPS eligible clinicians may choose to report to the advancing care information performance category should they determine that there are applicable and available measures for them to submit allow sufficient flexibility for hospital-based MIPS eligible clinicians without the need to petition their hospital-based status.

After consideration of the public comments and the data we have available, we are finalizing our proposal for MIPS under § 414.1305 with the following modifications. Under the MIPS, a hospital-based MIPS eligible clinician who furnishes 75 percent or more of his or her covered professional services in sites of service identified by the Place of Service (POS) codes used in the HIPAA standard transaction as an inpatient hospital (POS 21), on campus

outpatient hospital (POS 22), or emergency room (POS 23) setting, based on claims for a period prior to the performance period as specified by CMS. We intend to use claims with dates of service between September 1 of the calendar year 2 years preceding the performance period through August 31 of the calendar year preceding the performance period, but in the event it is not operationally feasible to use claims from this time period, we will use a 12-month period as close as practicable to this time period.

We note that this expanded definition of hospital-based MIPS eligible clinician will include a greater number of MIPS eligible clinicians than the previously proposed definition. We have expanded this definition because we believe it better represents hospital-based eligible clinicians and acknowledges the challenges they face with regard to EHR reporting as stated above. For the reasons stated in the proposed rule, our assumption remains that MIPS eligible clinicians who are determined hospital-based do not have sufficient advancing care information measures applicable to them, and thus we will reweight the advancing care information performance category to zero percent of the MIPS final score for the MIPS payment year in accordance with section 1848(q)(5)(F) of the Act. If a MIPS eligible clinician disagrees with our assumption and believes there are sufficient advancing care information measures applicable to them, they have the option to report the advancing care information measures for the performance period for the MIPS payment year for which they are determined hospital-based. However, if a MIPS eligible clinician who is determined hospital-based chooses to report on the advancing care information measures, they will be scored on the advancing care information performance category like all other MIPS eligible clinicians, and the performance category will be given the weighting prescribed by section 1848(q)(5)(E) of the Act regardless of their advancing care information performance category score.

(ii) MIPS Eligible Clinicians Facing a Significant Hardship

Section 1848(a)(7)(B) of the Act provides that the Secretary may exempt an EP who is not a meaningful EHR user for the EHR reporting period for the year from the application of the payment adjustment under section 1848(a)(7)(A) of the Act if the Secretary determines that compliance with the requirements for being a meaningful EHR user would result in a significant hardship. In the Stage 2 final rule (77 FR 54097–54100),

we defined certain categories of significant hardships that may prevent an EP from meeting the requirements of being a meaningful EHR user. These categories include:

- Insufficient Internet Connectivity (as specified in 42 CFR 495.102(d)(4)(i)).
- Extreme and Uncontrollable Circumstances (as specified in 42 CFR 495.102(d)(4)(iii)).
- Lack of Control over the Availability of CEHRT (as specified in 42 CFR 495.102(d)(4)(iv)(A)).
- Lack of Face-to-Face Patient Interaction (as specified in 42 CFR 495.102(d)(4)(iv)(B)).

We believe that under our proposals for the advancing care information performance category, there may not be sufficient measures applicable and available to MIPS eligible clinicians within the categories above. For these MIPS eligible clinicians, we proposed to rely on section 1848(q)(5)(F) of the Act to re-weight the advancing care information performance category to zero.

Sufficient internet access is fundamental to many of the measures proposed for the advancing care information performance category. For example, the e-Prescribing measure requires sufficient access to the Internet to transmit prescriptions electronically, and the Secure Messaging measure requires sufficient Internet access to receive and respond to patient messages. These measures may not be applicable to MIPS eligible clinicians who practice in areas with insufficient internet access. We proposed to require MIPS eligible clinicians to demonstrate insufficient internet access through an application process in order to be considered for a reweighting of the advancing care information performance category. The application would have to demonstrate that the MIPS eligible clinicians lacked sufficient internet access, during the performance period, and that there were insurmountable barriers to obtaining such infrastructure, such as a high cost of extending the internet infrastructure to their facility.

Extreme and uncontrollable circumstances, such as a natural disaster in which an EHR or practice building are destroyed, can happen at any time and are outside a MIPS eligible clinician's control. If a MIPS eligible clinician's CEHRT is unavailable as a result of such circumstances, the measures specified for the advancing care information performance category may not be available for the MIPS eligible clinician to report. We proposed that these MIPS eligible clinicians submit an application to include the circumstances by which the EHR

technology was unavailable, and for what period of time it was unavailable, to be considered for reweighting of their advancing care information performance category.

In the Stage 2 final rule (77 FR 54100) we discussed EPs who practice at multiple locations, and may not have the ability to impact their practices' health IT decisions. We noted the case of surgeons using ambulatory surgery centers or a physician treating patients in a nursing home who does not have any other vested interest in the facility, and may have no influence or control over the health IT decisions of that facility. If MIPS eligible clinicians lack control over the CEHRT in their practice locations, then the measures specified for the advancing care information performance category may not be available to them for reporting. To be considered for a reweighting of the advancing care information performance category, we proposed that these MIPS eligible clinicians would need to submit an application demonstrating that a majority (50 percent or more) of their outpatient encounters occur in locations where they have no control over the health IT decisions of the facility, and request their advancing care information performance category score be reweighted to zero. We noted that in such cases, the MIPS eligible clinician must have no control over the availability of CEHRT. Control does not imply final decision-making authority. For example, we would generally view MIPS eligible clinicians practicing in a large, group as having control over the availability of CEHRT, because they can influence the group's purchase of CEHRT, they may reassign their claims to the group, they may have a partnership/ownership stake in the group, or any payment adjustment would affect the group's earnings and the entire impact of the adjustment would not be borne by the individual MIPS eligible clinician. These MIPS eligible clinicians can influence the availability of CEHRT and the group's earnings are directly affected by the payment adjustment. Thus, such MIPS eligible clinicians would not, as a general rule, be viewed as lacking control over the availability of CEHRT and would not be eligible for their advancing care information performance category to be reweighted based on their membership in a group practice that has not adopted CEHRT.

In the Stage 2 final rule (77 FR 54099), we noted the challenges faced by EPs who lack face-to-face interaction with patients (EPs that are non-patient facing), or lack the need to provide follow-up care with patients. Many of

the measures proposed under the advancing care information performance category require face-to-face interaction with patients, including all eight of the measures that make up the three performance score objectives (Patient Electronic Access, Coordination of Care Through Patient Engagement and Health Information Exchange). Because these proposed measures rely so heavily on face-to-face patient interactions, we do not believe there would be sufficient measures applicable to non-patient facing MIPS eligible clinicians under the advancing care information performance category. We proposed to automatically reweight the advancing care information performance category to zero for a MIPS eligible clinician who is classified as a non-patient facing MIPS eligible clinician (based on the number of patient-facing encounters billed during a performance period) without requiring an application to be submitted by the MIPS eligible clinician. We refer readers to section I.E.1.b. of the proposed rule for further discussion of non-patient facing MIPS eligible clinicians. We also sought comment on how the advancing care information performance category could be applied to non-patient facing MIPS eligible clinicians in future years of MIPS, and the types of measures that would be applicable and available to these types of MIPS eligible clinicians.

We proposed that all applications for reweighting the advancing care information performance category be submitted by the MIPS eligible clinician or designated group representative in the form and manner specified by CMS. We proposed that all applications may be submitted on a rolling basis, but must be received by us no later than the close of the submission period for the relevant performance period, or a later date specified by us. For example, for the 2017 performance period, applications must be submitted no later than March 31, 2018 (or later date as specified by us) to be considered for reweighting the advancing care information performance category for the 2019 MIPS payment year. An application would need to be submitted annually to be considered for reweighting each year.

The following is a summary of comments received.

Comment: Most commenters supported the inclusion of something similar to a hardship exception under the EHR Incentive Program for the advancing care information performance category and the reweighting of the advancing care information score to zero. Other commenters expressed appreciation that CMS has moved away

from the 5 year limitation to hardship exceptions.

Response: We appreciate the support of our proposal, and note that we did not propose exceptions from reporting on the advancing care information performance category or from application of the MIPS payment adjustment factor based on hardship. Rather, we are recognizing that there may not be sufficient measures applicable and available under the advancing care information performance category to MIPS eligible clinicians who lack sufficient internet connectivity, face extreme and uncontrollable circumstances, lack control over the availability of CEHRT, or do not have face-to-face interactions with patients. For those MIPS eligible clinicians, we proposed to reweight the advancing care information performance category to zero percent in the MIPS final score.

Comment: We received many comments suggesting various additions to our proposal. One commenter suggested hardship exceptions under the advancing care information performance category for both 2017 and 2018 for practices that are experiencing transitional, infrastructural changes. One commenter suggested expanding the exceptions for unforeseen circumstances to a minimum of 5 years. Another requested that one of the hardship categories for the 2017 performance period include the lateness of the publication of the final rule with comment period, which will create a short timeline for adjustment to new requirements. A commenter strongly recommended that hospitalist be added to the list because they do the majority of their work in a hospital.

Response: We note that, in some cases, transitional infrastructure changes might be considered under the extreme and uncontrollable circumstances category, depending upon the particular circumstances of the clinician practice. We believe that it is necessary for MIPS eligible clinicians to submit an application to reweight their advancing care information performance category score to zero for each applicable year. We do not believe it is appropriate to automatically reweight to zero the advancing care information performance category score for a span of multiple years as circumstances change year to year. We believe that our policy to allow a minimum of 90-days data for the transition year of MIPS helps to address any issues related to the timing of the release of this final rule with comment period. We refer readers to section II.E.4. of this final rule with comment period for further discussion of the MIPS performance period. Finally

we note that hospital medicine is not a clinician specialty that is identified through the Medicare enrollment process. Those MIPS eligible clinicians that are considered hospital-based by our definition would have their advancing care information performance category weighted at zero percent of the MIPS final score as was previously discussed in this final rule with comment period.

Comment: Many commenters suggested additional categories related to CEHRT. One commenter asked CMS to create hardship exceptions to ensure that clinicians are not unfairly punished for the failures of their CEHRT, citing concerns of past failures with technologies in meeting standards imposed by CMS and ONC. Yet another commenter recommended that we consider expanding the criteria for 2017 and 2018 to include specific clinician types that can prove that they would incur major administrative and financial burdens by adopting EHR technology for the first and second performance period. Another commenter suggested that exceptions be developed to avoid negative payment adjustments in 2019 for EHR migration difficulties. Other commenters suggested exception for switching CEHRT and providing hardships when CEHRT is decertified.

Response: We appreciate this input and understand that there may be many issues related to CEHRT that may result in a MIPS eligible clinician being unable to report on measures under the advancing care information performance category due to circumstances outside of their control. As we do not want to limit potential unforeseen circumstances we will consider issues with vendors and CEHRT under the “extreme and uncontrollable circumstances” category, but we note that not all issues may qualify as extreme and outside of control of the clinician.

Comment: One commenter supported continued hardship exceptions for clinicians who practice in settings such as skilled nursing facilities where they do not have control over availability of CEHRT, however they also believe this proposal does not go far enough. The commenter explained that without a hardship exception granted, these facilities will be encouraged to limit the number of patients seen by their clinicians so that they can avoid being eligible to participate in MIPS, which would adversely affect the access to care provided to this vulnerable population. They requested that skilled nursing facility visits (POS 31) and nursing facility visits (POS 32) (CPT codes 99304–99318) simply be exempt from meaningful use, and by extension the

advancing care information performance category.

Response: While we acknowledge this issue, we believe that it is adequately addressed by the “lack of control over CEHRT” category and does not warrant the exemption of certain evaluation and management codes. As we have noted previously, this final rule with comment period only addresses policies related to MIPS eligible clinicians and not Medicaid EPs, eligible hospitals or CAHs under the Medicare and Medicaid EHR Incentive Programs.

Comment: Other commenters believed that CMS should continue a hardship exception for medical centers because the medical centers will have to monitor more programs requiring some but less of the same data. The commenters stated that the processes are confusing and time-consuming.

Response: We currently do not allow a hardship exception specific to medical centers under the EHR Incentive Program. Medical centers are not subject to the application of the MIPS payment adjustment factors and are not addressed in this rulemaking.

Comment: A few commenters requested that, as was included in the Medicare and Medicaid EHR Incentive Programs, an automatic hardship exception be granted to the following PECOS specialties: diagnostic radiology (30), nuclear medicine (36), interventional radiology (94), anesthesiology (05) and pathology (22).

Response: We disagree that we should reweight to zero the advancing care information performance category score based on specialty code, and note that our proposal and final policy for reweighting the advancing care information performance category is based on the number of patient-facing encounters billed during a performance period, not based on specialty type. In the EHR Incentive Programs, we offered an exception to the Medicare payment adjustments to certain specialties as designated in PECOS because we recognized that EPs within the specialties that lack face-to-face interactions and lack follow up with patients with sufficient frequency (77 FR 54099–54100). Under the MIPS, we proposed to automatically reweight the advancing care information performance category to zero for any hospital-based MIPS eligible clinicians and/or non-patient facing MIPS eligible clinicians who may not have sufficient measures applicable and available to them. Some of the MIPS eligible clinicians in specialties referenced by the commenter may have sufficient patient encounters to report the measures under the advancing care information performance

category, and thus, the advancing care information performance category measures would be applicable to these MIPS eligible clinicians.

Comment: A commenter suggested that CMS publish an explanation of what constitutes “limited” internet access and list limited access areas per the Federal Communications Commission (FCC).

Response: We have stated that MIPS eligible clinicians located in an area without sufficient Internet access to comply with objectives requiring Internet connectivity, and faced insurmountable barriers to obtaining such Internet connectivity could be apply for significant hardship. The FCC’s National Broadband Map allows MIPS eligible clinicians to search, analyze, and map broadband availability in their area: <http://www.broadbandmap.gov/>.

Comment: One commenter recommended a new option to allow applications to reweight advancing care information performance category to zero for MIPS eligible clinicians who did not previously intend to participate in meaningful use in CY 2017, and instead planned to obtain a significant hardship to avoid the Electronic Health Record Incentive Program 2019 payment adjustment.

Response: We note that under section 101(b)(1) of the MACRA, the payment adjustments under the Medicare EHR incentive program will end after the 2018 payment adjustment year, which is based on the EHR reporting period in 2016. Therefore, MIPS eligible clinicians are not required to participate in the Medicare EHR incentive programs in the 2017 EHR reporting period to avoid a 2019 payment adjustment. MIPS eligible clinicians may qualify for reweighting of their advancing care information performance category score if they meet the criteria outlined in our policy for reweighting under MIPS.

Comment: A commenter recommended that CMS explicitly clarify that the “lack of influence over the availability of CEHRT” option for reweighting advancing care information performance category to zero is not limited to multi-location/practice MIPS eligible clinicians.

Response: The “lack of control over the availability of CEHRT” is not limited to MIPS eligible clinicians who practice at multiple locations, instead, it is available to any MIPS eligible clinicians who may not have the ability to impact their practices’ health IT decisions. We noted that in such cases, the MIPS eligible clinician must have no control over the availability of CEHRT. We further specified that a majority (50

percent or more) of their outpatient encounters must occur in locations where they have no control over the health IT decisions of the facility. Control does not imply final decision-making authority as demonstrated in the example given in our proposal.

Comment: A commenter recommended granting MIPS eligible clinicians that are eligible for Social Security benefits a hardship exception because of the considerable expenditures of both human and financial capital that would require several years to see a return on investment.

Response: While we understand this suggestion, we do not believe that it is appropriate to reweight this category solely on the basis of a MIPS eligible clinicians’ age or Social Security status. We have analyzed EHR Incentive Program data, as well as provider feedback, and believe that while other factors such as the lack of access to CEHRT or unforeseen environmental circumstances may constitute a significant hardship, the age of a MIPS eligible clinician alone or the preference to not obtain CEHRT does not.

Comment: Commenters requested that application for reweighting not be burdensome for MIPS eligible clinicians to submit. One commenter requested that CMS clarify whether MIPS eligible clinicians will need to submit an annual application to be excluded from the advancing care information performance category or if this will occur automatically and the commenter preferred the latter.

Response: We noted that CMS would specify the form and manner that reweighting applications are submitted outside the rulemaking process. Additional information on the submission process will be available after the rule is published. We do note that if an application is required, it must be submitted annually.

Comment: Some commenters stated that MIPS eligible clinicians, who did not qualify for meaningful use, will need more time to familiarize themselves with EHR and could receive a low MIPS final score and negative payment adjustment due to lack of CEHRT. They believed that these MIPS eligible clinicians most likely serve high-disparity populations and that the most vulnerable patient populations could be negatively impacted.

Response: We acknowledge that under MIPS more clinicians will be subject to the requirements of EHR reporting than were previously eligible under the EHR Incentive Program and may not have advancing care information measures that are

applicable or available for them to submit. For this reason, we have proposed to reweight the advancing care information performance category to zero for hospital-based MIPS eligible clinicians, NPs, PAs, CRNAs and CNSs. We have also allowed for MIPS eligible clinicians to apply for a reweighting of their advancing care information performance category score should the MIPS eligible clinician not have measures that are applicable or available to them for various reasons as discussed in section II.E.5.g. of this final rule with comment period. We do not agree that MIPS eligible clinicians who were not eligible for the EHR Incentive Programs are concentrated in high disparity populations, nor do we believe that serving such a population would limit a MIPS eligible clinician’s ability to report on the advancing care information objectives and measures.

After consideration the comments, we are finalizing our policy to re-weight the advancing care information performance category to zero percent of the MIPS final score for MIPS eligible clinicians facing a significant hardships as proposed. For the reasons discussed in the proposed rule, we continue to assume that these clinicians may not have sufficient measures applicable and available to them for the advancing care information performance category. Should a MIPS eligible clinician apply for their advancing care information performance category to be reweighted under this policy but subsequently determine that their situation has changed such that they believe there are sufficient measures applicable and available to them for the advancing care information performance category, they may report on the measures. If they choose to report, they will be scored on the advancing care information performance category like any other MIPS eligible clinician, and the category will be given the weighting prescribed by section 1848(q)(5)(E) of the Act regardless of the MIPS eligible clinician’s advancing care information performance category score.

(iii) Nurse Practitioners, Physician Assistants, Clinical Nurse Specialists, and Certified Registered Nurse Anesthetists

The definition of a MIPS eligible clinician under section 1848(q)(1)(C) of the Act includes certain non-physician practitioners, including Nurse Practitioners (NPs), Physicians Assistants (PAs), Certified Registered Nurse Anesthetists (CRNAs) and Clinical Nurse Specialists (CNSs)). CRNAs and CNSs are not eligible for the incentive payments under Medicare or

Medicaid for the adoption and meaningful use of CEHRT (sections 1848(o) and 1903(t) of the Act, respectively) or subject to the meaningful use payment adjustment under Medicare (section 1848(a)(7)(A) of the Act), and thus, they may have little to no experience with the adoption or use of CEHRT. Similarly, NPs and PAs may also lack experience with the adoption or use of CEHRT, as they are not subject to the payment adjustment under section 1848(a)(7)(A) of the Act. We further noted that only 19,281 NPs and only 1,379 PAs have attested to the Medicaid EHR Incentive Program. Nurse practitioners are eligible for the Medicaid incentive payments under section 1903(t) of the Act, as are PAs practicing in a FQHC or a RHC that is led by a PA, if they meet patient volume requirements and other eligibility criteria.

Because many of these non-physician clinicians are not eligible to participate in the Medicare and/or Medicaid EHR Incentive Program, we have little evidence as to whether there are sufficient measures applicable and available to these types of MIPS eligible clinicians under our proposals for the advancing care information performance category. The low numbers of NPs and PAs who have attested for the Medicaid incentive payments may indicate that EHR Incentive Program measures required to earn the incentive are not applicable or available, and thus, would not be applicable or available under the advancing care information performance category. For these reasons, we proposed to rely on section 1848(q)(5)(F) of the Act to assign a weight of zero to the advancing care information performance category if there are not sufficient measures applicable and available to NPs, PAs, CRNAs, and CNSs. We would assign a weight of zero only in the event that an NP, PA, CRNA, or CNS does not submit any data for any of the measures specified for the advancing care information performance category. We encourage all NPs, PAs, CRNAs, and CNSs to report on these measures to the extent they are applicable and available, however, we understand that some NPs, PAs, CRNAs, and CNSs may choose to accept a weight of zero for this performance category if they are unable to fully report the advancing care information measures. We believe this approach is appropriate for the first MIPS performance period based on the payment consequences associated with reporting, the fact that many of these types of MIPS eligible clinicians may lack experience with EHR use, and our

current uncertainty as to whether we have proposed sufficient measures that are applicable and available to these types of MIPS eligible clinicians. We noted that we would use the first MIPS performance period to further evaluate the participation of these MIPS eligible clinicians in the advancing care information performance category and would consider for subsequent years whether the measures specified for this category are applicable and available to these MIPS eligible clinicians.

We invited comments on our proposal. We additionally sought comment on how the advancing care information performance category could be applied to NPs, PAs, CRNAs, and CNSs in future years of MIPS, and the types of measures that would be applicable and available to these types of MIPS eligible clinicians.

The following is a summary of the comments we received regarding our proposal.

Comment: Commenters generally supported our proposal to reweight the advancing care information performance category for those MIPS eligible clinicians without sufficient measures. Most commenters supported CMS' proposal that submission under the advancing care information performance category for NPs, PAs, CNSs, and CRNAs, would be optional in 2017 given these non-physicians' lack of past participation in meaningful use.

Response: We appreciate commenters for their support of this proposal and we agree for the reasons stated in the proposed rule that it is appropriate to assign a weight of zero only if the aforementioned practitioners do not submit data for any of the advancing care information performance category measures.

Comment: One commenter urged CMS to revise the proposed rule so that NPs and advanced practice nurses (APNs) can obtain EHR Incentive Program incentives.

Response: This final rule with comment period implements the MIPS as authorized under section 1848(q) of the Act. Eligibility for incentive payments under the EHR Incentive Program is determined under a separate section of the statute. Any change to the eligibility or extension of incentive payments under the EHR Incentive Program would require a change to the law and is not in the scope of this final rule with comment period.

Comment: One commenter requested CMS make advancing care information performance category participation optional for clinicians who primarily provide services in post-acute care settings, which have not been part of the

EHR Incentive Program in the past. Several commenters supported excluding clinicians not eligible to participate in the Medicare/Medicaid EHR Incentive Programs.

Response: While we understand the concerns of the commenters, we disagree with their suggestions. Section 1848(q)(1)(C)(i) of the Act defines a MIPS eligible clinician to include specific types of clinicians and provides discretion to include other types of clinicians in later years. In the future, we expect additional clinician types will be added to the definition of MIPS eligible clinician.

Comment: A commenter noted that by allowing additional non-physician practitioners (NPs, PAs, and in the future, dietitians, etc.) to be eligible to participate in the advancing care information performance category, the number of eligible clinicians under MIPS will greatly increase from the number of eligible clinicians in the EHR Incentive Program. The increased number of eligible clinicians will cause an unnecessary burden for organizational support staff to track and report their data. Commenters recommend advancing care information performance category data reporting be rolled up to the clinicians that they bill under so that clinician reporting includes data representing their MIPS eligible clinicians.

Response: As we noted above, the definition of MIPS eligible clinician is broader than the definition of an EP in the EHR Incentive Program, and we intend to add additional clinician types to the definition of MIPS eligible clinician in future years. Under this program, we have added a group reporting option in which MIPS eligible clinicians who have reassigned their billing rights to a TIN may report at the group or TIN level instead of the individual level. We believe this addresses the administrative concerns raised by this comment and allows MIPS eligible clinicians to aggregate their data for reporting, therefore reducing reporting burden.

After consideration of the comments, we are finalizing our NPs, PAs, CRNAs, and CNSs policy as proposed. These MIPS eligible clinicians may choose to submit advancing care information measures should they determine that these measures are applicable and available to them; however, we note that if they choose to report, they will be scored on the advancing care information performance category like all other MIPS eligible clinicians and the performance category will be given the weighting prescribed by section 1848(q)(5)(E) of the Act regardless of

their advancing care information performance category score.

(iv) Medicaid

In the 2015 EHR Incentive Programs final rule we adopted an alternate method for demonstrating meaningful use for certain Medicaid EPs that would be available beginning in 2016, for EPs attesting for an EHR reporting period in 2015 (80 FR 62900). Certain Medicaid EPs who previously received an incentive payment under the Medicaid EHR Incentive Program, but failed to meet the eligibility requirements for the program in subsequent years, are permitted to attest using the CMS Registration and Attestation system for the purpose of avoiding the Medicare payment adjustment (80 FR 62900). However, as discussed in the proposed rule, section 101(b)(1)(A) of the MACRA amended section 1848(a)(7)(A) of the Act to sunset the meaningful use payment adjustment for Medicare EHR Incentive Program EPs at the end of CY 2018. This means that after the CY 2018 payment adjustment year, there will no longer be a separate Medicare EHR Incentive Program for EPs, and therefore Medicaid EPs who may have used this alternate method for demonstrating meaningful use cannot potentially be subject to a payment adjustment under the Medicare EHR Incentive Program at that time. Accordingly, there will no longer be a need for this alternate method of demonstrating meaningful use after the CY 2018 payment adjustment year.

Similarly, beginning in 2014, states were required to collect, upload and submit attestation data for Medicaid EPs for the purposes of demonstrating meaningful use to avoid the Medicare payment adjustment (80 FR 62915). This form of reporting will also no longer need to continue with the sunset of the meaningful use payment adjustment for Medicare EHR Incentive Program EPs at the end of CY 2018. Accordingly, we proposed to amend the reporting requirement described at 42 CFR 495.316(g) by adding an ending date such that after the CY 2018 payment adjustment year states would no longer be required to report on meaningful EHR users.

We noted that the Medicaid EHR Incentive Program for EPs was not impacted by the MACRA and the requirement under section 1848(q) of the Act to establish the MIPS program. We did not propose any changes to the objectives and measures previously established in rulemaking for the Medicaid EHR Incentive Program, and thus, EPs participating in that program must continue to report on the

objectives and measures under the guidelines and regulations of that program.

Accordingly, reporting on the measures specified for the advancing care information performance category under MIPS cannot be used as a demonstration of meaningful use for the Medicaid EHR Incentive Programs. Similarly, a demonstration of meaningful use in the Medicaid EHR Incentive Programs cannot be used for purposes of reporting under MIPS.

Therefore, MIPS eligible clinicians who are also participating in the Medicaid EHR Incentive Programs must report their data for the advancing care information performance category through the submission methods established for MIPS in order to earn a score for the advancing care information performance category under MIPS and must separately demonstrate meaningful use in their state's Medicaid EHR Incentive Program in order to earn a Medicaid incentive payment. The Medicaid EHR Incentive Program continues through payment year 2021, with 2016 being the final year an EP can begin receiving incentive payments (§ 495.310(a)(1)(iii)). We solicited comments on alternative reporting or proxies for EPs who provide services to both Medicaid and Medicare patients and are eligible for both MIPS and the Medicaid EHR Incentive Payment.

The following is a summary of the comments we received regarding our proposal to separate the reporting requirements of MIPS and the Medicaid EHR Incentive Programs:

Comment: Many commenters stated the reporting burden imposed on MIPS eligible clinicians who also participate in the Medicaid EHR Incentive Programs, would have to report separately to achieve points in the advancing care information performance category, and to receive an incentive payment in the Medicaid EHR Incentive Programs. Some commenters urged CMS to align reporting requirements and submission methods across both programs to eliminate duplication in reporting effort. Some commenters requested that CMS eliminate the need to report duplicative quality measures by modifying its proposal to require that if quality is reported in a manner acceptable under MIPS or an APM, then it would not need to be reported under the Medicaid EHR Incentive Program. Other commenters expressed concern that varying reporting requirements for MIPS eligible clinicians, for hospitals and Medicaid EPs who participate in the EHR Incentive Programs will bring hardship to clinician staff, as well as EHR vendors.

Response: We understand that reporting burden is a concern to MIPS eligible clinicians and CMS remains committed to exploring opportunities for alignment when possible. However, MIPS and the Medicare and Medicaid EHR Incentive Program are two separate programs with distinct requirements. The reporting requirements and scoring methods of the Medicaid EHR Incentive Program and those finalized for the advancing care information performance category in the MIPS program differ significantly. For example, in the Medicaid EHR Incentive Programs, EPs must report on all objectives and meet measure thresholds finalized in the 2015 EHR Incentive Programs final rule. In the advancing care information performance category, MIPS eligible clinicians must report on objectives and measures, but are not required to meet measure thresholds to be considered a meaningful EHR user.

We remind commenters that while MIPS eligible clinicians would be required to meet the requirements of the advancing care information performance category to earn points toward their MIPS final score, there is no longer a requirement that EPs demonstrate meaningful use under the Medicaid EHR incentive program as a way to avoid the Medicare EHR payment adjustments. However, MIPS eligible clinicians who meet the Medicaid EHR Incentive Program eligibility requirements are encouraged to additionally participate in the Medicaid EHR Incentive Program to be eligible for Medicaid incentive payments through program year 2021.

Comment: A few commenters proposed that MIPS eligible clinicians who are participating in the Medicaid EHR Incentive Program be exempted from reporting to MIPS until after the completion of their final EHR performance period. Others proposed allowing clinicians to choose either to report in the Medicaid EHR Incentive Program or the advancing care information performance category of MIPS. One commenter suggested awarding MIPS eligible clinicians 30 points toward the advancing care information performance category score if they successfully attest to meaningful use in the Medicaid EHR Incentive Program.

Response: As previously mentioned, objective and measure requirements of the Medicaid EHR Incentive Program and those finalized for the advancing care information performance category in the MIPS program vary too greatly to enable one to serve as proxy for another.

We are finalizing our Medicaid policy as proposed.

h. APM Scoring Standard for MIPS Eligible Clinicians Participating in MIPS APMs

Under section 1848(q)(1)(C)(ii) of the Act, as added by section 101(c)(1) of MACRA and as discussed in section II.F.5. of this final rule with comment period, Qualifying APM Participants (QPs) are not MIPS eligible clinicians and are thus excluded from MIPS payment adjustments. Partial Qualifying APM Participants (Partial QPs) are also not MIPS eligible clinicians unless they opt to report and be scored under MIPS. All other eligible clinicians participating in APMs who are MIPS eligible clinicians are subject to MIPS requirements, including reporting requirements and payment adjustments. However, most current APMs already assess their participants on cost and quality of care and require engagement in certain care improvement activities.

We proposed at § 414.1370 to establish a scoring standard for MIPS eligible clinicians participating in certain types of APMs (“APM scoring standard”) to reduce participant reporting burden by eliminating the need for such APM eligible clinicians to submit data for both MIPS and their respective APMs. In accordance with section 1848(q)(1)(D)(i) of the Act, we proposed to assess the performance of a group of MIPS eligible clinicians in an APM Entity that participates in certain types of APMs based on their collective performance as an APM Entity group, as defined at § 414.1305.

In addition to reducing reporting burden, we sought to ensure that eligible clinicians in APM Entity groups are not assessed in multiple ways on the same performance activities. For instance, performance on the generally applicable cost measures under MIPS could contribute to upward or downward adjustments to payments under MIPS in a way that is not aligned with the strategy in an ACO initiative for reducing total Medicare costs for a specified population of beneficiaries attributed through the unique ACO initiative’s attribution methodology. Depending on the terms of the particular APM, we believe similar misalignments could be common between the MIPS quality and cost performance categories and the evaluation of quality and cost in APMs. We believe requiring eligible clinicians in APM Entity groups to submit data, be scored on measures, and be subject to payment adjustments that are not aligned between MIPS and an APM could potentially undermine the validity of testing or performance evaluation under the APM. We also believe imposition of these

requirements would result in reporting activity that provides little or no added value to the assessment of eligible clinicians, and could confuse eligible clinicians as to which CMS incentives should take priority over others in designing and implementing care activities.

We proposed to apply the APM scoring standard to MIPS eligible clinicians in APM Entity groups participating in certain APMs (“MIPS APMs”) that meet the criteria listed below (and would be identified as “MIPS APMs” on the CMS Web site). In the proposed rule, we defined the proposed criteria for MIPS APMs, the MIPS performance period for APM Entity groups, the proposed MIPS scoring methodology for APM Entity groups, and other information related to the APM scoring standard (81 FR 28234–28247).

(1) Criteria for MIPS APMs

We proposed at § 414.1370 to specify that the APM scoring standard under MIPS would only be applicable to eligible clinicians participating in MIPS APMs, which we proposed to define as APMs (as defined in section II.F.4. of the proposed rule) that meet the following criteria: (1) APM Entities participate in the APM under an agreement with CMS; (2) the APM requires that APM Entities include at least one MIPS eligible clinician on a Participation List; and (3) the APM bases payment incentives on performance (either at the APM Entity or eligible clinician level) on cost/ utilization and quality measures. We understood that under some APMs the APM Entity may enter into agreements with clinicians or entities that have supporting or ancillary roles to the APM Entity’s performance under the APM, but are not participating under the APM Entity and therefore are not on a Participation List. We proposed not to consider eligible clinicians under such arrangements to be participants for purposes of the APM Entity group to which the APM scoring standard would apply. We also proposed that the APM scoring standard would not apply for certain APMs in which the APM Entities participate under statute or our regulations rather than under an agreement with us. We solicited comments on how the APM scoring standard should apply to those APMs as well.

The criteria for the identification of MIPS APMs are independent of the criteria for Advanced APM determinations discussed in section II.F.4. of this final rule with comment period, so a MIPS APM may or may not

also be an Advanced APM. As such, it would be possible that an APM meets all three proposed criteria to be a MIPS APM, but does not meet the Advanced APM criteria described in section II.F.4. of this final rule with comment period. Conversely, it would be possible that an Advanced APM does not meet the criteria listed above because it does not include MIPS eligible clinicians as participants.

The APM scoring standard would not apply to MIPS eligible clinicians involved in APMs that include only facilities as participants. APMs that do not base payment on cost/utilization and quality measures also would not meet the proposed criteria for the APM scoring standard. Instead, MIPS eligible clinicians participating in these APMs would need to meet the generally applicable MIPS data submission requirements for the MIPS performance period, and their performance would be assessed using the generally applicable MIPS standards, either as individual eligible clinicians or as a group under MIPS.

As we explained in the proposed rule, we believe the proposed APM scoring standard would help alleviate certain duplicative, unnecessary, or competing data submission requirements for MIPS eligible clinicians participating in MIPS APMs. However, we were interested in public comments on alternative methods that could reduce MIPS data submission requirements to enable MIPS eligible clinicians participating in Advanced APMs to maximize their focus on the care delivery redesign necessary to succeed within the Advanced APM while maintaining the statutory framework that excludes only certain eligible clinicians from MIPS and reducing reporting burden on Advanced APM participants.

We proposed that the APM scoring standard would not apply to MIPS eligible clinicians participating in APMs that are not MIPS APMs. Rather, such MIPS eligible clinicians would submit data to MIPS and have their performance assessed either as an individual MIPS eligible clinician or group as described in section II.E.2 of this final rule with comment period. Some APMs may involve certain types of MIPS eligible clinicians that are affiliated with an APM Entity but not included in the APM Entity group because they are not participants of the APM Entity. We proposed that even if the APM meets the criteria to be a MIPS APM, MIPS eligible clinicians who are not included in the MIPS APM Participation List would not be considered part of the participating APM Entity group for purposes of the

APM scoring standard. For instance, MIPS eligible clinicians in the Next Generation ACO Model might be involved in the APM through a business arrangement with the APM Entity as “preferred providers” but are not directly tied to beneficiary attribution or quality measurement under the APM.

The following is a summary of the comments we received regarding our proposals for the criteria for an APM to be a MIPS APM, and for the APM scoring standard to apply only to MIPS eligible clinicians who are included in the APM Entity group on a MIPS APM Participation List.

Comment: A commenter sought clarity on the term “MIPS APM”.

Response: The term “MIPS APM” is used to describe an APM that meets the three criteria for purposes of the APM scoring standard: (1) APM Entities participate in the APM under an agreement with CMS; (2) the APM requires that APM Entities include at least one MIPS eligible clinician on a Participation List; and (3) the APM bases payment incentives on performance (either at the APM Entity or eligible clinician level) on cost/ utilization and quality measures. Individuals and groups that do not participate in MIPS APMs will be scored under the generally applicable MIPS scoring standards. We note that the APM scoring standard has no bearing on the QP determination for eligible clinicians in Advanced APMs.

Comment: Some commenters stated that the definition of MIPS APMs is too limiting and prevents eligible clinicians in APMs that are not considered MIPS APMs from reporting as APM Entities. Other commenters indicated that basing payment on quality measures should not be a MIPS APM criterion.

Response: We continue to believe the criteria we proposed for a MIPS APM will appropriately identify APMs in which the eligible clinicians would be subject to potentially duplicative and conflicting incentives and reporting requirements if they were required to report and be scored under the generally applicable MIPS standard. The eligible clinicians in a MIPS APM that is not also an Advanced APM are considered MIPS eligible clinicians and are subject to MIPS reporting requirements and payment adjustments (unless they are otherwise excluded). The eligible clinicians in a MIPS APM that is an Advanced APM are also considered MIPS eligible clinicians unless they meet the threshold to be a QP for a year. In any MIPS APM, whether or not it is also an Advanced APM, eligible clinicians may already be required to report on the quality, cost and other

measures on which their performance is assessed as part of their participation in the APM, leading to potentially duplicative or conflicting reporting under MIPS. Additionally, eligible clinicians in these MIPS APMs already have payment incentives tied to performance on quality and cost/ utilization measures, creating the potential for conflicting assessments based on the same or similar data. Although other APMs may have similar reporting requirements to the MIPS APMs such that there is some level of duplicative reporting, unless an APM includes performance metrics tied to payment incentives in the APM, we do not believe there is the same potential for duplication and conflict. We continue to believe that eligible clinicians in APMs that meet all three of the criteria to be MIPS APMs would face a substantial level of duplication and/or conflict between reporting and assessment under the APM and the generally applicable MIPS standard. In addition, the participants in other APMs may not be subject to MIPS at all because the participants are not MIPS eligible clinicians. To the extent that eligible clinicians do participate in APMs that are not MIPS APMs, we believe they would often be in a position to consider group reporting options under MIPS.

Comment: A few commenters suggested CMS simplify MIPS reporting and scoring by requiring no additional reporting requirements for any MIPS eligible clinicians in MIPS APMs to receive a MIPS final score. One commenter stated the APM Scoring Standard does not go far enough to reduce reporting burden because APM participants will still be required to report improvement activities and advancing care information.

Response: We believe the proposed policy included meaningful reductions in reporting burden for MIPS APM participants. The additional policies we are finalizing in this rule (such as assigning a MIPS APM improvement activities score) will reduce this burden further. However, we do not believe it would be feasible to fully eliminate reporting requirements for MIPS APM participants while adhering to the core goals and structure of MIPS.

Comment: A few commenters stated it is untenable to require physician groups to simultaneously pursue quality metrics, reduce costs, and build the infrastructure required to participate in APMs and MIPS. A few commenters indicated that the APM scoring standard may undermine the intent of the statute to have eligible clinicians join APMs by not providing sufficient reductions in

burden under MIPS. Another commenter recommended that the third MIPS APM criterion be changed to “the APM bases payment incentives on performance on cost/utilization and/or quality measures” instead of requiring that the APM base payment incentives on both cost/utilization and quality measures. Several commenters recommended that CMS make QP determinations early enough so that eligible clinicians participating in Advanced APMs would know in advance of the MIPS submission period whether they are QPs for the year and, as such would not have to report to MIPS at all. One commenter did not support implementation of the APM scoring standard because the commenter stated that the proposal was confusing and may incentivize physicians to remain in the FFS program rather than progress towards APMs.

Response: We recognize that MIPS APM participants are diligently working to provide high quality, cost-effective care to their patients. We also recognize the burden of reporting to more than one CMS program. We proposed to adopt the APM scoring standard with the intent of reducing the reporting burden for eligible clinicians and alleviating duplicative and/or conflicting payment methodologies that could potentially distract eligible clinicians from the goals and objectives they agreed to as an APM participant, or provide incentives that conflict with those under the APM. We also acknowledge that some stakeholders may find the APM scoring standard requirements confusing, and we will continue to consider ways to further simplify the APM scoring standard in future rulemaking. We believe much of this confusion will be resolved through continued discussions with all of our stakeholders, participants, and patients, through CMS’s planned technical assistance and education and outreach activities for the Quality Payment Program, and through experience with this new program in the first performance year. We also note that the finalized QP Performance Period, described in section II.F.5. of this final rule with comment period, modifies the proposed QP determination timeframe so that eligible clinicians who are QPs for a year will not need to report MIPS data. However, an eligible clinician that is in an Advanced APM but does not meet the QP threshold will still be subject to MIPS. Furthermore, eligible clinicians who are participants in a MIPS APM that is not an Advanced APM cannot be QPs and thus will be

subject to MIPS under the APM scoring standard.

Comment: A commenter recommended that CMS not reward low-value care. The commenter indicated that by reducing the cost performance category to zero and reducing the weight for the quality performance category to zero for MIPS APMs other than the Shared Savings Program and Next Generation ACO Model, CMS may allow such MIPS APMs to perform poorly on measures of efficiency and quality at the expense of other clinicians who are truly delivering high-value care. The commenter suggested that CMS either measure all MIPS eligible clinicians in the same way, or allow MIPS APM participants to elect a neutral score for the quality and cost MIPS performance categories.

Response: We do not believe the APM scoring standard rewards low-value care, but rather that it provides MIPS eligible clinicians in MIPS APMs a way to meet the requirements of the MIPS while focusing on the goals of the APM to improve quality and lower the cost of care. The terms and conditions of MIPS APMs themselves hold participants accountable for the cost and quality of care. In accordance with the statute, only Partial QPs have the option whether to report and be subject to a MIPS payment adjustment for a year, as described in section II.F.5. of this final rule with comment period. All MIPS eligible clinicians, including those subject to the APM scoring standard, will continue to receive final scores and MIPS payment adjustments.

Comment: A commenter indicated the creation of the APM scoring standard provides a large advantage to MIPS APM participants, disadvantaging other MIPS eligible clinicians.

Response: We acknowledge that eligible clinicians in MIPS APMs may achieve high scores in some MIPS performance categories. In some categories such as improvement activities, the statute encourages and credits participation in an APM. In others, MIPS eligible clinicians may perform well because of the requirements they meet by virtue of participating in MIPS APMs. However, we believe all MIPS eligible clinicians have the opportunity to score highly, and as such we do not believe the APM scoring standard will necessarily disadvantage other MIPS eligible clinicians. We believe MIPS eligible clinicians under the APM scoring standard have the potential to receive high MIPS payment adjustments because they successfully perform the requisite activities, not simply because they participate in an APM.

Comment: One commenter recommended CMS ensure that the APM scoring standard actually reduces administrative burden in order to allow MIPS APM participants to focus on APM efforts.

Response: We believe this final rule with comment period addresses many of the concerns expressed by commenters about the MIPS reporting burden for MIPS APM participants and we will continue to work to identify ways to ensure APMs and their participants can focus their efforts to achieve the care transformation goals of the APM.

Comment: Several commenters expressed support for the APM scoring standard as proposed and applauded CMS for its efforts to reduce reporting burden and allow MIPS APM participants to focus on the aims of those APMs without misaligning incentives or having redundant or conflicting requirements across programs. One commenter stated they supported the proposed APM scoring standard, but thought CMS should offer sufficient education and outreach to clinicians so they understand it, as it adds complexity to the program. Two commenters requested that CMS develop a flexible scoring methodology for MIPS APMs that would recognize the significant investments to transform healthcare made by APM participants. One commenter requested that the APM scoring standard incorporate all MIPS eligible clinicians in large multispecialty groups that may have some but not all MIPS eligible clinicians participating in MIPS APMs. Another commenter recommended that the APM scoring standard be retained in the future, allowing APM decisions to be made with clarity, while another commenter supported the APM scoring standard generally but thought it should be optional.

Response: We appreciate the general support for the proposed APM scoring standard. We will continue to consider future refinements to the APM scoring standard to ensure we are supporting eligible clinicians in their efforts to transform health care and participate in new payment and care delivery models. Although we understand that some organizations may have some members of their practices in APMs and others not in APMs, we do not believe that the APM scoring standards should apply more broadly than the identified group of actual participants in MIPS APMs, that is, the eligible clinicians included on an APM Entity's Participation List.

Comment: A few commenters disagreed with our statements in the proposed rule suggesting that APMs focused on hospitals do not have any

MIPS eligible clinicians as participants, stating that surgeons will be involved in hip and knee replacements under CJR and CJR quality performance measures should count for them for purposes of MIPS. Another commenter stated that the MIPS APM criteria should be broader to include the BPCI Initiative, CJR, and other episode payment models. A few commenters stated that such APMs have been successful at reducing costs and improving quality and that not including them as MIPS APMs discourages clinicians from participation. A few commenters suggested that CMS should amend facility-based APMs to require Participation Lists. One commenter suggested that the APM scoring standard requirement that a MIPS APM must require APM Entities to include at least one eligible clinician on a Participation List should be delayed until more MIPS APMs are available. A few commenters suggested the criteria for a MIPS APM be expanded to include other APMs such as those APMs that have an agreement with another payer outside the Medicare program or those that have a CMS agreement to participate in an APM through another entity such as a convener. One commenter expressed concern that by not including all APMs as MIPS APMs some APM participants will be forced to report twice on quality.

Response: An APM that is hospital-based may be a MIPS APM if it meets all of the MIPS APM criteria, including the criterion that the APM must require APM Entities to include at least one MIPS eligible clinician on a Participation List. If this criterion is not met, the APM is not a MIPS APM and the APM scoring standard does not apply.

Particularly relevant to facility- or hospital-based APMs (because some do not require APM Entities to maintain Participation Lists), any MIPS eligible clinicians that do not qualify as QPs or Partial QPs, and are not included on a Participation List of an APM Entity that participates in the MIPS APM, would report to MIPS and be scored according to the generally applicable MIPS requirements for an individual or group. The APM scoring standard is intended to ensure that the MIPS eligible clinicians that are directly and collectively accountable for beneficiary attribution and quality and cost/ utilization performance under the MIPS APM are able to focus their efforts on the care transformation objectives of the APM rather than on potentially duplicative reporting of measures. We note that the MIPS eligible clinicians that are subject to the APM scoring

standard are not necessarily the same as the eligible clinicians who could become QPs via participation in Advanced APMs, as described in section II.F.5. of this final rule with comment period. For instance, in certain circumstances, Affiliated Practitioners could become QPs, but because the Advanced APM does not base payment incentives for these eligible clinicians (either at the APM Entity or the eligible clinician level) on their performance on cost/utilization and quality measures we do not consider the APM requirements to be sufficiently related to MIPS reporting requirements such that the APM scoring standard should be applied. In other words, the QP determination for the APM incentive and the MIPS performance categories measure different aspects of performance that align differently with the roles of affiliated practitioners. The QP determination depends on the level of payments or patients furnished services through an Advanced APM. In contrast, MIPS payment adjustments depend on an assessment of performance on cost and quality in four categories. Whereas affiliated practitioners may furnish services through an Advanced APM, contributing to collective achievement under the APM, the QP threshold, in and of itself, does not assess or directly incentivize their performance based on cost and quality. Therefore, we do not believe there is the same potential for overlapping requirements under MIPS and APMs for such MIPS eligible clinicians. Under certain Advanced APMs such as CJR, Affiliated Practitioners may be the primary eligible clinicians receiving payment through the Advanced APM, but cost and quality measurement and reporting under the Advanced APM are the responsibility of participating hospitals rather than eligible clinicians. As such, there is minimal potential for overlap between requirements under MIPS and the APM for these MIPS eligible clinicians.

We agree with commenters that we should continue to consider whether there are opportunities for additional APMs, including existing episode payment models, to become MIPS APMs. As we work toward that goal we believe we should move forward with the policy to avoid potentially duplicative or conflicting reporting or incentives for MIPS eligible clinicians participating in APMs that currently meet the MIPS APM criteria. In the future, we may consider amending existing APMs to meet MIPS APM criteria. However, as stated in the

previous response, we do not believe that application of the APM scoring standard should be expanded to include MIPS eligible clinicians such as Affiliated Practitioners whose roles are not directly linked to quality and cost/utilization measures under the APM, or that the MIPS APM criteria should be expanded to include APMs that do not tie payment incentives to performance on quality and cost/utilization measures or APMs (such as CJR) that do not require APM Entities to have at least one eligible clinician on a Participation List. In these instances, we do not believe the requirements of the APM are sufficiently connected to MIPS reporting requirements and scoring such that there is significant potential for duplicative reporting or conflicting incentives between the APM and MIPS, the avoidance of which is the underlying purpose of the APM scoring standard.

Comment: Two commenters requested that CMS clarify that the MIPS APM payment adjustments resulting from the MIPS APM scoring standard will not be included in the Shared Savings Program and Next Generation ACO Model expenditures for benchmark calculations.

Response: MIPS payment adjustments resulting from the APM scoring standard are the same as MIPS adjustments for all other MIPS eligible clinicians. There are no unique “MIPS APM payment adjustments.” Rather, the APM scoring standard is only a particular scoring methodology for deriving a final score that results in a MIPS payment adjustment for an eligible clinician. Each APM has its own benchmarking methodology—benchmarking is not necessarily standard across APMs. Making a single determination with respect to the use of MIPS payment adjustments in APM benchmarking is outside the scope of this final rule with comment period.

Comment: One commenter suggested that CMS create an “Other Payer MIPS APM” category.

Response: We appreciate the idea of allowing MIPS scoring to be affected by participation in certain payment arrangements with other payers and we may consider the feasibility of doing so in the future in concert with the introduction of the All-Payer Combination Option.

After considering these comments, we are finalizing the criteria for an APM to be a MIPS APM as proposed with one modification to the first criterion in order to encompass APMs with terms defined through law or regulation. MIPS APMs are APMs that meet the following criteria: (1) APM Entities participate in

the APM under an agreement with CMS or by law or regulation; (2) the APM requires that APM Entities include at least one MIPS eligible clinician on a Participation List; and (3) the APM bases payment incentives on performance (either at the APM Entity or eligible clinician level) on cost/utilization and quality measures.

Below we describe in detail how MIPS APM participants will be identified from an APM Participation List to be included in the APM Entity group under the APM scoring standard.

We are also finalizing the proposal that the APM scoring standard does not apply to MIPS eligible clinicians who are not on a Participation List for an APM Entity group in a MIPS APM. MIPS eligible clinicians who are not part of the APM Entity group to which the APM scoring standard applies may choose to report to MIPS as individuals or groups according to the generally applicable MIPS rules.

(2) APM Scoring Standard Performance Period

We proposed that the performance period for MIPS eligible clinicians participating in MIPS APMs would match the generally applicable performance period for MIPS proposed in section II.E.4. of the proposed rule. We proposed this policy would apply to all MIPS eligible clinicians participating in MIPS APMs (those that meet the criteria specified in section II.E.5.h.1. of the proposed rule) except in the case of a new MIPS APM for which the first APM performance period begins after the start of the corresponding MIPS performance period. In this instance, the participating MIPS eligible clinicians in the new MIPS APM would submit data to MIPS in the first MIPS performance period for the APM either as individual MIPS eligible clinicians or as a group using one of the MIPS data submission mechanisms for all four performance categories, and report to us using the APM scoring standard for subsequent MIPS performance period(s).

Additionally, we anticipate that there might be MIPS APMs that would not be able to use the APM scoring standard (even though they met the criteria for the APM scoring standard and were treated as a MIPS APMs in the prior MIPS performance period) in their last year of operation because of technical or resource issues. For example, a MIPS APM in its final year may end earlier than the end of the MIPS performance period (proposed to be December 31). We might not have continuing resources dedicated or available to continue to support the MIPS APM activities under the APM scoring standard if the MIPS

APM ends during the MIPS performance period. Therefore, if we determine it is not feasible for the MIPS eligible clinicians participating in the APM Entity to report to MIPS using this APM scoring standard in an APM's last year of operation, the MIPS eligible clinicians in the MIPS APM would need to submit data to MIPS either as individual MIPS eligible clinicians or as a group using one of the MIPS data submission mechanisms for the applicable performance period. We proposed that the eligible clinicians in the MIPS APM would be made aware of this decision in advance of the relevant MIPS performance period.

The following is a summary of the comments we received regarding our proposal that the APM scoring standard performance period will be same as the MIPS performance period.

Comment: A few commenters recommended CMS maintain consistency between the reporting period for MIPS and MIPS APMs to reduce administrative burden, and a commenter supported the same 12-month performance period for use by MIPS and APMs. One commenter requested a 90-day reporting period for 2017.

Response: We agree with the commenters that aligning the performance periods reduces administrative burden. We will maintain the 12-month performance period for the APM scoring standard, but data submitted for the advancing care information and, if necessary, improvement activities performance categories will follow the generally applicable MIPS data submission requirements regarding the number of measures and activities required to be reported during the performance period in order to receive a score for these performance categories. The quality performance category data for MIPS APMs will be submitted in accordance with the specific reporting requirements of the APM, which for most MIPS APMs covers the same 12-month performance period that will be used for the APM scoring standard.

Comment: Two commenters requested CMS provide guidance for eligible clinicians in a MIPS APM that closes before the end of the performance period.

Response: We will post the list of MIPS APMs prior to the first day of the MIPS performance period for each year. If the APM would have qualified as a MIPS APM but the APM is ending before the end of the performance period, then the APM will not appear on this list. We will notify participants in any such APMs in advance of the start

of the performance period if they will need to report to MIPS using the MIPS individual or group reporting option.

We are finalizing the APM scoring standard performance period to align with the MIPS performance period.

(3) How the APM Scoring Standard Differs From the Assessment of Groups and Individual MIPS Eligible Clinicians Under MIPS

We believe that establishing an APM scoring standard under MIPS will allow APM Entities and their participating eligible clinicians to focus on the goals and objectives of the MIPS APM to improve quality and lower costs of care while avoiding potentially conflicting incentives and duplicative reporting that could occur as a result of having to submit separate or additional data to MIPS. The APM scoring standard we proposed is similar to group assessment under MIPS as described in section II.E.3.d. of the proposed rule, but would differ in one or more of the following ways: (1) Depending on the terms and conditions of the MIPS APM, an APM Entity could be comprised of a sole MIPS eligible clinician (for example, a physician practice with only one eligible clinician could be considered an APM Entity); (2) the APM Entity could include more than one unique TIN, as long as the MIPS eligible clinicians are identified as participants in the APM by their unique APM participant identifiers; (3) the composition of the APM Entity group could include APM participant identifiers with TIN/NPI combinations such that some MIPS eligible clinicians in a TIN are APM participants and other MIPS eligible clinicians in that same TIN are not APM participants. In contrast, assessment as a group under MIPS requires a group to be comprised of at least two MIPS eligible clinicians who have assigned their billing rights to a TIN. It also requires that all MIPS eligible clinicians in the group use the same TIN.

In addition to the APM Entity group composition being potentially different than that of a group as generally defined under MIPS, we proposed for the APM scoring standard that we would generate a MIPS final score by aggregating all scores for MIPS eligible clinicians in the APM Entity that is participating in the MIPS APM to the level of the APM Entity. As we explained in the proposed rule, we believe that aggregating the MIPS performance category scores at the level of the APM Entity is more meaningful to, and appropriate for, these MIPS eligible clinicians because they have elected to participate in a MIPS APM and collectively focus on

care transformation activities to improve the quality of care.

Further, depending on the type of MIPS APM, we proposed that the weights assigned to the MIPS performance categories under the APM scoring standard for MIPS eligible clinicians who are participating in a MIPS APM may be different from the performance category weights for MIPS eligible clinicians not participating in a MIPS APM for the same performance period. For example, we proposed that under the APM scoring standard, the weight for the cost performance category will be zero and that for certain MIPS APMs, the weight for the quality performance category will be zero for the 2019 payment year. Where the weight for the performance category is zero, neither the APM Entity nor the MIPS eligible clinicians in the MIPS APM would need to report data in these categories, and we would redistribute the weights for the quality and cost performance categories to the improvement activities and advancing care information performance categories to maintain a total weight of 100 percent.

To implement certain elements of the APM scoring standard, we need to use the Shared Savings Program (section 1899 of the Act) and CMS Innovation Center (section 1115A of the Act) authorities to waive specific statutory provisions related to MIPS reporting and scoring. Section 1899(f) of the Act authorizes waivers of title XVIII requirements as may be necessary to carry out the Shared Savings Program, and section 1115A(d)(1) of Act authorizes waivers of title XVIII requirements as may be necessary solely for purposes of testing models under section 1115A of the Act. For each section in which we proposed scoring methodologies and waivers to enable the proposed approaches, we described how the use of waivers is necessary under the respective waiver authority standards. The underlying purpose of APMs is for CMS to pay for care in ways that are unique from FFS payment and to test new ways of measuring and assessing performance. If the data submission requirements and associated adjustments under MIPS are not aligned with APM-specific goals and incentives, the participants receive conflicting messages from us on priorities, which could create uncertainty and severely degrade our ability to evaluate the impact of any particular APM on the overall cost and quality of care. Therefore, we explained our belief that, for the reasons stated in section II.E.5.h. of the proposed rule certain waivers are necessary for testing and operating

APMs and for maintaining the integrity of our evaluation of those APMs.

In the proposed rule we noted that for at least the first performance year, we do not anticipate that any APMs other than those under sections 1115A or 1899 of the Act would meet the criteria to be MIPS APMs. In the event that we do anticipate other types of APMs (demonstrations under section 1866C of the Act or required by federal law) will become MIPS APMs for a future year, we will address MIPS scoring for eligible clinicians in those APMs in future rulemaking.

The following is a summary of the comments we received regarding our proposals to use the Shared Savings Program (section 1899 of the Act) and CMS Innovation Center (section 1115A of the Act) authorities to waive specific statutory provisions related to MIPS reporting and scoring to implement the APM Scoring Standard for MIPS APMs and to apply the MIPS final score at the APM Entity level.

Comment: A few commenters expressed support for CMS' use of waiver authorities to establish the APM scoring standard. Several commenters also supported the proposal to calculate the final score at the APM Entity level. One commenter supported averaging scores for all clinicians in a MIPS APM Entity for purposes of the MIPS payment adjustment. A few commenters had concerns about aggregating all data for the clinicians linked to an APM Entity, and one commenter recommended that the APM scoring standard be optional.

Response: We continue to believe the final score derived at the APM Entity level should be the score used for purposes of determining the MIPS payment adjustment for each MIPS eligible clinician in that APM Entity group. As part of their participation in any MIPS APM, eligible clinicians should be working collaboratively and advancing shared care goals for aligned patients. We believe this collaboration toward shared goals under the MIPS APM differentiates these MIPS eligible clinicians from those in a MIPS group defined by a billing TIN, and supports our proposal to score these clinicians as a group.

The APM Entity final score is derived by aggregating the scores for each of the performance categories as applicable. For example, if the CPC+ model is determined to be a MIPS APM, participating MIPS eligible clinicians in CPC+ will not be evaluated in the cost and quality performance categories, which will have a zero weight for the first performance year. In this example, the final score will be calculated for

MIPS eligible clinicians at the APM Entity level by adding the weighted advancing care information score and the assigned improvement activities score for the MIPS APM (see below for the final policies on the scoring for these performance categories). This same final score calculated at the APM Entity level will be applied to each MIPS eligible clinician TIN/NPI combination in the APM Entity as identified on the APM Entity's Participation List.

Comment: A commenter requested clarification on how reporting will be accomplished with groups where MIPS eligible clinicians participate in multiple APMs, especially multiple Advanced APMs.

Response: As finalized in section II.E.6. of this final rule with comment period, if a single TIN/NPI combination for a MIPS eligible clinician is in two or more MIPS APMs, we will use the highest final score to determine the MIPS payment adjustment for that MIPS eligible clinician. MIPS adjustments apply to the TIN/NPI combination, so to the extent that a MIPS eligible clinician (NPI) participates in multiple MIPS APMs with different TINs, each of those TIN/NPI combinations would be assessed separately under each respective APM Entity.

We are finalizing the proposal to use the Shared Savings Program and CMS Innovation Center authorities under sections 1899 and 1115A of the Act, respectively, to waive specific statutory requirements related to MIPS reporting and scoring in order to implement the APM scoring standard. We note that although we proposed to use our authority under section 1899(f) of the Act to waive these statutory requirements in order to implement the APM scoring standard for MIPS eligible clinicians participating in Shared Savings Program ACOs, we believe we could also use our authority under section 1899(b)(3)(D) of the Act to accomplish this result. Section 1899(b)(3)(D) of the Act allows us to incorporate reporting requirements under section 1848 of the Act into the reporting requirements for the Shared Savings Program, as we determine appropriate, and to use alternative criteria than would otherwise apply. Thus, we believe that section 1899(b)(3)(D) of the Act also provides authority to apply the APM scoring standard for MIPS eligible clinicians participating in a Shared Savings Program ACO rather than requiring these MIPS eligible clinicians to report individually or as a group using one of the MIPS data submission mechanisms.

We are also finalizing our proposal to score MIPS eligible clinicians in the MIPS APM at the APM Entity level. The final score calculated at the APM Entity level will be applied to each MIPS eligible clinician in the APM Entity group.

(4) APM Participant Identifier and Participant Database

To ensure we have accurately captured performance data for all of the MIPS eligible clinicians that are participating in an APM, we proposed to establish and maintain an APM participant database that would include all of the MIPS eligible clinicians who are part of the APM Entity. We would establish this database to track participation in all APMs, in addition to specifically tracking participation in MIPS APMs and Advanced APMs. We proposed that each APM Entity be identified in the MIPS program by a unique APM Entity identifier, and we also proposed that the unique APM participant identifier for a MIPS eligible clinician would be a combination of four identifiers including: (1) APM identifier established by CMS (for example, AA); (2) APM Entity identifier established by CMS (for example, A1234); (3) the eligible clinician's billing TIN (for example, 123456789); and (4) NPI (for example, 111111111). The use of the APM participant identifier will allow us to identify all MIPS eligible clinicians participating in an APM Entity, including instances in which the MIPS eligible clinicians use a billing TIN that is shared with MIPS eligible clinicians who are not participating in the APM Entity. In the proposed rule, we stated that we would plan to communicate to each APM Entity the MIPS eligible clinicians who are included in the APM Entity group in advance of the applicable MIPS data submission deadline for the MIPS performance period.

Under the Shared Savings Program, each ACO is formed by a collection of Medicare-enrolled TINs (ACO participants). Under our regulation at 42 CFR 425.118, all Medicare enrolled individuals and entities that have reassigned their rights to receive Medicare payment to the TIN of the ACO participant must agree to participate in the ACO and comply with the requirements of the Shared Savings Program. Because all providers and suppliers that bill through the TIN of an ACO participant are required to agree to participate in the ACO, all MIPS eligible clinicians that bill through the TIN of an ACO participant are considered to be participating in the ACO. For purposes of the APM scoring standard, the ACO

would be the APM Entity. The Shared Savings Program has established criteria for determining the list of eligible clinicians participating under the ACO, and we would use the same criteria for determining the list of MIPS eligible clinicians included in the APM Entity group for purposes of the APM scoring standard.

We recognize that there may be scenarios in which MIPS eligible clinicians may change TINs, use more than one TIN for billing Medicare, change their APM participation status, and/or change other practice affiliations during a performance period. Therefore, we proposed that only those MIPS eligible clinicians who are on the Participation List for the APM Entity in a MIPS APM on December 31 (the last day of the performance period) would be considered part of the APM Entity group for purposes of the APM scoring standard. Consequently, MIPS eligible clinicians who are not listed as participants of an APM Entity in a MIPS APM at the end of the performance period would need to submit data to MIPS through one of the MIPS data submission mechanisms and would have their performance assessed either as individual MIPS eligible clinicians or as a group for all four MIPS performance categories. For example, under the proposal, a MIPS eligible clinician who participates in the APM Entity on January 1, 2017, and leaves the APM Entity on June 15, 2017, would need to submit data to MIPS using one of the MIPS data submission mechanisms and would have their performance assessed either as an individual MIPS eligible clinician or as part of a group. This approach for defining the applicable group of MIPS eligible clinicians was consistent with our proposal for identifying eligible clinician groups for purposes of QP determinations outlined in section II.F.5.b. of the proposed rule; the group of eligible clinicians we use for purposes of a QP determination would be the same as that used for the APM scoring standard. This would be an annual process for each MIPS performance period.

The following is a summary of the comments we received regarding our proposals to establish an APM participant identifier, a CMS database to identify and track the APM participants, and the dates that we will use to determine if an MIPS APM eligible clinician will be included in the MIPS APM for purposes of MIPS reporting under the APM scoring standard.

Comment: A commenter suggested CMS use the current CMS enrollment infrastructure such as PECOS to identify and track APM participants to provide

an incentive for eligible clinicians to update their Medicare enrollment information, which in turn would provide CMS with more accurate data on the MIPS eligible clinicians that are in a MIPS APM.

Response: We will be using existing systems to the extent feasible to ensure we have accurate data on MIPS eligible clinicians and APM participants. Depending on the results of our assessment of available data and systems, we may or may not include any particular system, such as PECOS.

Comment: A number of commenters supported the use of an APM participant identifier that includes the TIN and NPI for the MIPS APM eligible clinicians and urged collaboration with vendors to build a useful infrastructure. One commenter thought CMS should simplify this APM participant identifier. Two commenters encouraged CMS to make the APM participant identifiers available to stakeholders in real time via an Application Program Interface (API). One commenter indicated the APM participant identifier would add administrative complexity. Another commenter encouraged CMS to make sure there is a consistent approach to identifying both APM and MIPS participants.

Response: We believe the use of the APM participant identifier will ensure we use accurate information regarding MIPS eligible clinicians and their participation in APMs, and we believe that this will reduce administrative complexity by reducing ambiguity. We appreciate the suggestion to make the APM participant identifier available via an API, and we are exploring a variety of methods to communicate this information.

Comment: A few commenters were opposed to the December 31 date for determining if the APM Entity participant would be included in the MIPS APM for purposes of the APM scoring standard. A commenter did not support this proposal because MIPS eligible clinicians could be excluded if they were participating throughout the year but not on December 31st. One commenter suggested that the eligible clinician should be included in the group if they were in the MIPS APM for more than half of the performance period and another commenter suggested they be considered as participating in the group if they were in the MIPS APM for 90 days. Yet another commenter stated that CMS's proposed policy for determining who participates in a given APM does not sufficiently respond to the often complex billing relationships clinicians maintain across TINs, and that these

complex billing relationships are especially true for academic medical center clinicians who often relocate due to changes in employment based on the academic year. The commenter suggested having a more flexible list of dates for updating the list of MIPS eligible clinicians participating in a MIPS APM (and therefore subject to the APM scoring standard) or looking at claims rather than Participation Lists.

Response: We agree with the commenters that only using the December 31 date to determine whether an eligible clinician is a MIPS APM participant could potentially impact a clinician's decision on whether or when to leave a MIPS APM and their ability to report to MIPS if they leave the MIPS APM prior to the end of the performance period. We also recognize that an eligible clinician who participates in a MIPS APM in the first 6 months of the performance period and then leaves the MIPS APM may have difficulty reporting to MIPS independent of the APM Entity. If the MIPS eligible clinician leaves the MIPS APM and joins a group or another APM that is not a MIPS APM, the individual would likely be included in the new group's MIPS reporting. But if the MIPS eligible clinician does not join another group, then they would need to report to MIPS as an individual. In such a case, the MIPS eligible clinician may not be able to meet one or more of the MIPS performance category reporting requirements. For example, a MIPS eligible clinician who used CEHRT in an APM Entity through July of a performance period may not have the CEHRT available to report the advancing care information performance category as an individual MIPS eligible clinician during the MIPS submission period. We are revising the points in time at which we will assess whether a MIPS eligible clinician is on a Participation List for purposes of the APM scoring standard. We will review the Participation Lists for MIPS APMs on March 31, June 30, and August 31. A MIPS eligible clinician on the Participation List for an APM Entity in a MIPS APM on at least one of these three dates will be included in the APM Entity group for the purpose of the APM scoring standard. For example, if the Oncology Care Model (OCM) is determined to be a MIPS APM, a MIPS eligible clinician who is identified on the Participation List of an APM Entity participating in OCM from January 1 through April 25 of the performance year would be included in the APM Entity group for purposes of the APM

scoring standard for that performance year.

Comment: A commenter requested clarification on whether a MIPS eligible clinician who participates in a MIPS APM for part of the year but leaves prior to the end of the performance period is allowed to submit a partial year of MIPS data for the time they were not in the MIPS APM.

Response: As discussed in section II.F.5. of this final rule with comment period, we are adopting a modified version of the proposed policy for defining the APM Entity group, which will be applicable to both QP determinations and the APM scoring standard. Under the final policy, if a MIPS eligible clinician is on the APM Participation List on at least one of the APM participation assessment (Participation List “snapshot”) dates, the MIPS eligible clinician will be included in the APM Entity group for purposes of the APM scoring standard for the applicable performance year. If the MIPS eligible clinician is not on the APM Entity’s Participation List on at least one of the snapshots dates (March 31, June 30, or August 31), then the MIPS eligible clinician will need to submit data to MIPS using the MIPS individual or group reporting option and adhere to all generally applicable MIPS data submission requirements to avoid a negative payment adjustment. Therefore, if the applicable data submission requirements include full-year reporting, the MIPS individual or group would need to report for the full year.

Comment: A commenter recommended that CMS: (1) Allow ACOs to report quality data and other information for MIPS on behalf of participating clinicians who join an ACO mid-performance year but are not included on the ACO Participation List until the following year, and (2) hold harmless from negative MIPS payment adjustments those clinicians who join the ACO mid-performance year but are not included on the ACO Participation List until the following year. Another commenter requested that MIPS APM participants who leave prior to the end of the performance period be exempt from MIPS reporting because this may hinder employment mobility. Some commenters suggested CMS indemnify clinicians who joined an ACO mid-year from any negative MIPS payment adjustments because the commenters believe these clinicians should not be penalized for the hard work they put into the APM during the year solely because they joined the APM Entity after the start of the performance year.

Response: Each APM has specific rules as to when participants can be added or removed from Participation Lists. If the MIPS eligible clinician is on the MIPS APM Participation List on at least one of the three snapshot dates (March 31, June 30, or August 31), then the MIPS eligible clinician will be included in the APM Entity group and scored according to the APM scoring standard for purposes of MIPS for that performance year. Once an eligible clinician is determined to be part of the APM Entity group in a MIPS APM at one of the snapshot dates, the eligible clinician will be part of the group for purposes of MIPS and the APM scoring standard for that performance period even if they leave the APM Entity at a later date.

Comment: A commenter requested clarification about whether the APM Entities will submit new Participation Lists for the purpose of MIPS or if CMS will use Participation Lists submitted for the MIPS APM. One commenter indicated it may be easier if the APM Entity provides CMS with the list of MIPS APM participants. Another commenter suggested that instead of using a Participation List CMS should design other approaches to discern which eligible clinicians are in an APM Entity.

Response: We will use the Participation Lists that the APM Entity provides to us in accordance with the particular MIPS APM’s rules. Each APM has particular rules for how the Participation Lists may be updated during a performance year to reflect the APM Entities and their participating eligible clinicians, as identified by their TIN/NPI combinations. We will maintain these Participation Lists for each APM in a dedicated database, and we will use the same Participation Lists for operational purposes within the APM, for QP determinations, and to determine which MIPS eligible clinicians are in the APM Entity group for purposes of the APM scoring standard. Therefore, APM Entities such as ACOs would not be required to submit any additional Participant Lists for purposes of the Quality Payment Program.

Comment: A commenter requested CMS provide clear guidance as to how each eligible clinician would be scored if they are a QP in a MIPS APM so they can make informed decisions regarding APM participation.

Response: An eligible clinician who becomes a QP is exempt from MIPS reporting requirements and the payment adjustment for the applicable payment year. For example, if the eligible clinician is determined to be a QP for

the 2019 payment year based on 2017 performance, then the clinician is exempt from a MIPS payment adjustment in 2019 and does not need to report data to MIPS data for the 2017 performance period.

We are finalizing the use of the proposed APM participant identifier to define the APM Entity group that is participating in a MIPS APM. The APM Participation List information will be stored in a database so that, among other uses, we can identify and include the appropriate MIPS eligible clinicians in an APM Entity group to which the APM scoring standard applies. We are revising our proposal to use December 31 as the date on which an eligible clinician must appear on the Participation List to be included in the APM Entity group for a MIPS APM. Instead of identifying MIPS eligible clinicians participating in a MIPS APM at a single point in time on December 31 of the performance year, we will review the MIPS APM Participation Lists on March 31, June 30 and August 31. All eligible clinicians who appear on an APM Entity’s list for a MIPS APM on at least one of those three dates will be included in the APM Entity group for purposes of the APM scoring standard for the year. We describe the determination of the APM Entity group in full detail in section II.F.5. of this final rule with comment period.

(5) APM Entity Group Scoring for the MIPS Performance Categories

As mentioned previously, section 1848(q)(3)(A) of the Act requires the Secretary to establish performance standards for the measures and activities under the following performance categories: (1) Quality; (2) cost; (3) improvement activities; and (4) advancing care information. We proposed at § 414.1370 to calculate one final score that is applied to the billing TIN/NPI combination of each MIPS eligible clinician in the APM Entity group. Therefore, each APM Entity group (for example, the MIPS eligible clinicians in a Shared Savings Program ACO or an Oncology Care Model practice) would receive a score for each of the four performance categories according to the proposals described in the proposed rule, and we would calculate one final score for the APM Entity group. The APM Entity group score would be applied to each MIPS eligible clinician in the group, and subsequently used to develop the MIPS payment adjustment that is applicable to each MIPS eligible clinician in the group. Thus, the final score for the APM Entity group and the participating MIPS eligible clinician score are the same. For

example, in the Shared Savings Program, the MIPS eligible clinicians in each ACO would be an APM Entity group. That group would receive a single final score that would be applied to each of its participating MIPS eligible clinicians. Similarly, in the OCM, the MIPS eligible clinicians identified on an APM Entity's Participation List would comprise an APM Entity group. That group would receive a single final score that would be applied to each of the MIPS eligible clinicians in the group. We note that this APM Entity group final score is not used to evaluate eligible clinicians or the APM Entity for purposes of incentives within the APM, shared savings payments, or other potential payments under the APM, and we currently do not foresee APMs using the final score for purposes of evaluation within the APM. Rather, the APM Entity group final score would be used only for the purposes of the APM scoring standard under MIPS. It should be noted that although we proposed that the APM scoring standard would only apply to participants in MIPS APMs, MIPS eligible clinicians that participate in an APM (including but not limited to a MIPS APM) and submit either individual or group level data to MIPS earn a minimum score of 50 percent of the highest potential improvement activities performance category score as long as such MIPS eligible clinicians are on a list of participants for an APM and are identifiable by the APM participant identifier.

We explained in the proposed rule that we want to avoid situations in which different MIPS eligible clinicians in the same APM Entity group receive different MIPS scores. APM Entities have a goal of collective success under the terms of the APM, so having a variety of differing MIPS adjustments for eligible clinicians within that collective unit would undermine the intent behind the APM to test a departure from a purely FFS system based on independent clinician activity.

We proposed, for the first MIPS performance period, a specific scoring and reporting approach for the MIPS eligible clinicians participating in MIPS APMs, which would include the Shared Savings Program, the Next Generation ACO Model, and other APMs that meet the proposed criteria for a MIPS APM. In the proposed rule, we described the APM Entity data submission requirements and proposed a scoring approach for each of the MIPS performance categories for specific MIPS APMs (the Shared Savings Program, Next Generation ACO Model, and all other MIPS APMs).

The following is a summary of the comments we received regarding our proposal to calculate one final score per APM Entity group in a MIPS APM, and to apply that final score to each MIPS eligible clinician (identified by the billing TIN/NPI combination) in the APM Entity group and our proposal to give one-half of the maximum improvement activities score to any MIPS eligible clinicians who are on a list of participants and identified by the APM participant identifier, regardless of whether they participate in an Advanced APM, MIPS APM, or other APM.

Comment: A number of commenters supported our proposal. Another commenter was concerned that in a group, poor performance by some eligible clinicians may affect the final score for other eligible clinicians who perform better. A commenter suggested that CMS allow APM participants to receive the MIPS score that is the higher of the APM Entity group score and the group TIN score.

Response: As previously discussed, we are finalizing MIPS APM scoring at the APM Entity level, and the final score will be applied to each TIN/NPI combination in the APM Entity group. In any group reporting structure, the resulting final score reflects the collective performance of the group. Unless all APM Entity group members score exactly equally, some will receive higher or lower final scores than they would have achieved individually. We believe that, although some group members' lower final scores may offset the final score for higher performers in the APM Entity, the APM Entity level score appropriately reflects the aggregate performance of the eligible clinicians in the APM Entity. APMs are premised on a group of MIPS eligible clinicians working together to collectively achieve the goals of the APM, and providing different MIPS payment adjustments within an APM Entity is not consistent with those goals.

Under specific circumstances, described below, in which a Shared Savings Program ACO fails to report quality under the Shared Savings Program requirements, participant TINs of such ACOs would be considered the APM Entity groups for purposes of the APM scoring standard. Even under this exception, those TIN groups would still be scored as a cohesive unit, with no individual final score variation within the TIN.

Comment: A commenter supported allowing participants in other APMs, such as the Accountable Health Communities Model, to receive improvement activities credit. A few

commenters requested that CMS clarify how eligible clinicians and groups participating in APMs that are not MIPS APMs would receive credit for APM participation in the improvement activities category.

Response: MIPS eligible clinicians that participate in an APM that is not a MIPS APM will need to be identified by their APM participant identifier on a CMS-maintained list during the MIPS performance year in order to receive one-half of the maximum improvement activities score for APM participation. This list may be a Participation List, an Affiliated Practitioner List, or another CMS-maintained list, as applicable. Such CMS-maintained lists define APM participation; therefore, MIPS eligible clinicians are not considered to be participating in an APM unless included on a CMS-maintained list. We will notify APM Entities in advance of the first day of the performance period if the APM utilizes such a list. If the specific APM does utilize such a list, then the MIPS eligible clinicians will be eligible for the improvement activities credit.

Comment: A commenter requested that CMS clarify in the final rule with comment period that a rheumatologist participating in other APMs not listed as an Advanced or MIPS APM in this rule would receive one-half of the maximum improvement activities score for such participation.

Response: As stated above, an eligible clinician that participates in an APM, even one that is not an Advanced APM or MIPS APM, would still receive one-half the maximum score for improvement activities through APM participation. CMS defines participation in APMs by presence on a CMS-maintained list associated with an APM. Therefore, we will use those lists to validate the APM participation improvement activities credit.

Comment: A number of commenters supported scoring MIPS eligible clinicians at the APM Entity level, and other commenters supported scoring MIPS eligible clinicians at the TIN level. A commenter stated that evaluating APM Entities, such as ACOs, at the APM Entity level reinforces the APM Entity purpose and avoids fractures within the APM Entity. Another commenter recommended CMS have all ACOs scored at the APM Entity level for the advancing care information performance category to recognize that the health information technology work in most APMs is best measured as a whole. A few commenters requested that the APM participants have a choice as to being scored at the APM Entity level or participant TIN level. A

commenter further suggested that scoring at the APM Entity level instead of the participant TIN level overstates the relationship between these clinicians. One commenter stated that the policies in which the primary TIN for an ACO reports the primary-care focused CMS Web Interface measures result in a double standard whereby specialists in ACOs are not held to the same individual level of accountability as those in small group or solo practices where reporting is done at the individual clinician level.

Response: We believe that APM Entities should be scored at the APM Entity level because the APM Entity is a group of eligible clinicians focused on achieving the collective goals of the APM, which include shared responsibility for cost and quality. That stated, we specifically recognize that there may be rare instances in which an ACO in the Shared Savings Program may fail to report quality as required by the Shared Savings Program, which would adversely impact the MIPS final score of all MIPS eligible clinicians billing under ACO participant TINs. Accordingly, in the event that a Shared Savings Program ACO does not report quality measures as required by the Shared Savings Program, scoring under the APM scoring standard would be calculated at the ACO participant TIN level for MIPS eligible clinicians in that ACO, and each of the ACO participant TINs would receive its own TIN-level final score instead of an APM Entity-level final score. We note, however, that our final policy would not cancel or mitigate any of the negative consequences associated with non-reporting on quality as required under the Shared Savings Program, including ineligibility for shared savings payments and/or potential termination of the ACO from the program.

We are finalizing our proposal to calculate one final score at the APM Entity level that will be applied to the billing TIN/NPI combination of each MIPS eligible clinician in the APM Entity group. We are also finalizing our policy to give one-half of the maximum improvement activities score to eligible clinicians who are APM participants, with the clarification that we would extend such improvement activities scoring credit to any MIPS eligible clinicians identified by an APM participant identifier on a Participation List, an Affiliated Practitioners List, or other CMS-maintained list of participants at any time during the MIPS performance period.

In the event that a Shared Savings Program ACO does not report quality measures as required under the Shared

Savings Program regulations, then scoring on all MIPS performance categories will be at the ACO participant TIN level, and the resulting TIN-level final score will be applied to each of its constituent TIN/NPI combinations. For purposes of both the Shared Savings Program quality performance requirement and the APM scoring standard, any “partial” reporting of quality measures through the CMS Web Interface that does not satisfy the quality reporting requirements under the Shared Savings Program will be considered a failure to report. We note that in this scenario, each ACO participant TIN would need to report quality data to MIPS according to MIPS group reporting requirements in order to avoid a score of zero for the quality performance category.

We believe that this exception for the Shared Savings Program recognizes the recommendations of several commenters that the APM scoring standard should apply at the TIN level and concerns that in some cases ACOs are not representative of the potentially widely-varying MIPS performance across ACO participant TINs. Although we maintain that the APM Entity-level scoring is generally appropriate to reflect the collective goals and responsibilities of the group, we believe that ACOs that fail to report quality as required under the Shared Savings Program do not necessarily represent the quality performance of their constituent TINs. Therefore, we believe it is appropriate in such cases to allow ACO participant TINs to avoid a score of zero in the quality performance category and to take responsibility for their own MIPS reporting and scoring independent of the ACO and other TINs in the ACO. Further, this policy is generally consistent with similar policies that have been proposed for ACO participant TINs under PQRS and the Value Modifier program at (81 FR 46408–46409, 46426–46427).

Additionally, we recognize that there may be instances when an APM Entity's participation in the APM is terminated during the MIPS performance period. As we state in section II.F.5. of this final rule with comment period, we will not make the first assessment to determine whether a MIPS eligible clinician is on an APM Entity's Participation List until March 31 of the performance period. Therefore if an APM Entity group terminates its participation in the APM prior to March 31, the MIPS eligible clinicians would not be considered part of an APM Entity group for purposes of the APM scoring standard.

If an APM Entity's participation in the APM is terminated on or after March 31

of a performance period, the MIPS eligible clinicians in the APM Entity group would still be considered an APM Entity group in a MIPS APM for the year, and would report and be scored under the APM scoring standard.

(6) Shared Savings Program—Quality Performance Category Scoring Under the APM Scoring Standard

We proposed that beginning with the first MIPS performance period Shared Savings Program ACOs would only need to submit their quality measures to CMS once using the CMS Web Interface through the same process that they use to report to the Shared Savings Program to report quality measures to MIPS. These data would be submitted once but used for both the Shared Savings Program and for MIPS. Shared Savings Program ACOs have used the CMS Web Interface for submitting their quality measures since the program's inception, making this a familiar data submission process. The Shared Savings Program quality measure data reported to the CMS Web Interface would be used by CMS to calculate the MIPS quality performance category score at the APM Entity group level. The Shared Savings Program quality performance data that is not submitted to the CMS Web Interface, for example the CAHPS survey and claims-based measures, would not be included in the MIPS APM quality performance category score. The MIPS quality performance category requirements and performance benchmarks for quality measures submitted via the CMS Web Interface would be used to determine the MIPS quality performance category score at the ACO level for the APM Entity group. We stated that we believe this would reduce the reporting burden for Shared Savings Program MIPS eligible clinicians by requiring quality measure data to be submitted only once and used for both programs.

In the proposed rule, we explained that we believe that no waivers are necessary to adopt this approach because the quality measures submitted via the CMS Web Interface under the Shared Savings Program are also MIPS quality measures and would be scored under MIPS performance standards. In the event that Shared Savings Program quality measures depart from MIPS measures in the future, we would address such changes including whether further waivers are necessary at such a time in future rulemaking.

The following is a summary of the comments we received regarding our proposal to have Shared Savings Program ACOs report quality measures to MIPS using the CMS Web Interface as

they normally would under Shared Savings Program rules and our proposal to calculate the MIPS quality performance category score at the APM Entity group level based on the data reported by the ACO to the CMS Web Interface and using MIPS performance benchmarks.

Comment: A commenter wanted to know which set of APM scoring standard rules would apply to CPC+ practices that participate in both CPC+ and the Shared Savings Program. The commenter noted that if the reporting and scoring under the APM scoring standard for other MIPS APMs applies to the CPC+ practice, the quality performance category would be reweighted to zero. The commenter recommended that MIPS eligible clinicians who participate in both the CPC+ and the Shared Savings Program use the Shared Savings Program rules for reporting and scoring under the APM scoring standard.

Response: In May 2016, CMS announced that practices may participate in both a CPC+ model and in an ACO participating in the Shared Savings Program. More information about dual participation may be found in the CPC+ FAQs or RFA at <https://innovation.cms.gov/Files/x/cpcplus-practiceapplicationfaq.pdf> or <https://innovation.cms.gov/Files/x/cpcplus-rfa.pdf>. For purposes of the APM scoring standard, MIPS eligible clinicians in CPC+ practices that are also participating in a Shared Savings Program ACO will be considered part of a Shared Savings Program ACO. CPC+ practices that are part of a Shared Savings Program ACO will report quality to CPC+ as required by the CPC+ model but will not receive the CPC+ performance-based incentive payment. As part of a Shared Savings Program ACO, CPC+ practices, along with the other ACO participants, will be subject to the payment incentives for cost and quality under the Shared Savings Program. Because CPC+ practices that participate in both the CPC+ model and the Shared Savings Program are not eligible to receive the performance-based incentive payment under the CPC+ model, responsibility for cost and quality is assessed more comprehensively under the Shared Savings Program. Therefore, we believe that the Shared Savings Program participation of these “dual participants” should determine the manner in which we assess them under the APM scoring standard.

Comment: A commenter agreed with the proposed approach of not including CAHPS or other non-CMS Web Interface quality data measures in the MIPS APM

quality performance category score for ACOs in the Shared Savings Program. Alternately, a commenter recommended that CAHPS measures be included in Shared Savings Program ACO quality performance category scores.

Response: Because CAHPS survey responses are not submitted to the CMS Web Interface and may not be available in time for inclusion in the MIPS quality performance category scoring, we are not including these measures in the MIPS quality performance category score for the ACOs in the Shared Savings Program and the Next Generation ACO Model.

Comment: One commenter requested clarification as to which quality measures, specifically whether MIPS population health measures, would be included in the APM scoring standard for Shared Savings Program ACOs.

Response: The MIPS population health measures will not be included in the quality performance category score for eligible clinicians participating in the Shared Savings Program, the Next Generation ACO Model or other MIPS APMs under the APM scoring standard.

Comment: A commenter requested that CMS ensure that all the MIPS eligible clinicians billing under the TIN of an ACO participant in a Shared Savings Program ACO receive the APM Entity group final score even though most ACO quality measures are for primary care physicians.

Response: All eligible clinicians that bill through the TIN of a Shared Savings Program ACO participant and are included on the Participant List on at least one of the three Participation List snapshot dates will receive the APM Entity group final score.

Comment: A commenter requested that all ACOs be exempt from the MIPS quality performance category because they are already being assessed for quality under the APM and also requested that Shared Savings Program Track 1 participants have the option to be exempt from MIPS.

Response: All MIPS eligible clinicians participating in the Shared Savings Program are subject to MIPS unless they are determined to be a QP or a Partial QP whose APM Entity elects not to report under MIPS. This includes MIPS eligible clinicians who are not participating in Advanced APMs. Under the APM scoring standard, MIPS eligible clinicians participating in Shared Savings Program ACOs do not have to do any additional reporting to satisfy MIPS quality performance category reporting requirements.

We are finalizing our proposal that a Shared Savings Program ACO's quality data reported to the CMS Web Interface

as required by Shared Savings Program rules will also be used for purposes of scoring the MIPS quality performance category using MIPS performance benchmarks. We note that for purposes of the Shared Savings Program quality reporting requirement and the APM scoring standard, any “partial” reporting of quality measures through the CMS Web Interface that does not satisfy the requirements under the Shared Savings Program will be considered a failure to report, triggering the exception finalized above in which we will separately assess each ACO participant TIN under the APM scoring standard.

(7) Shared Savings Program—Cost Performance Category Scoring Under the APM Scoring Standard

We proposed that for the first MIPS performance period, we would not assess MIPS eligible clinicians participating in the Shared Savings Program (the MIPS APM) under the cost performance category. We proposed this approach because: (1) Eligible clinicians participating in the Shared Savings Program are already subject to cost and utilization performance assessments under the APM; (2) the Shared Savings Program measures cost in terms of an objective, absolute total cost of care expenditure benchmark for a population of attributed beneficiaries, and participating ACOs may share savings and/or losses based on that standard, whereas the MIPS cost measures are relative measures such that clinicians are graded relative to their peers, and therefore different than assessing total cost of care for a population of attributed beneficiaries; and (3) the beneficiary attribution methodologies for measuring cost under the Shared Savings Program and MIPS differ, leading to an unpredictable degree of overlap (for eligible clinicians and for us) between the sets of beneficiaries for which eligible clinicians would be responsible that would vary based on unique APM Entity characteristics such as which and how many TINs comprise an ACO. We believe that with an APM Entity's finite resources for engaging in efforts to improve quality and lower costs for a specified beneficiary population, the population identified through an APM must take priority to ensure that the goals and program evaluation associated with the APM are as clear and free of confounding factors as possible. The potential for different, conflicting results across Shared Savings Program and MIPS assessments—due to the differences in attribution, the inclusion in MIPS of episode-based measures that do not

reflect the total cost of care, and the objective versus relative assessment factors listed above—creates uncertainty for MIPS eligible clinicians who are attempting to strategically transform their respective practices and succeed under the terms of the Shared Savings Program.

For example, Shared Savings Program ACOs are held accountable for expenditure benchmarks that reflect the total Medicare Parts A and B spending for their assigned beneficiaries, whereas many of the proposed MIPS cost measures focus on spending for particular episodes of care or clinical conditions. We consider it a programmatic necessity that the Shared Savings Program has the ability to structure its own measurement and payment for performance on total cost of care independent from other incentive programs such as the cost performance category under MIPS. Thus, we proposed to reduce the MIPS cost performance category weight to zero for all MIPS eligible clinicians in APM Entities participating in the Shared Savings Program.

Accordingly, under section 1899(f) of the Act, we proposed to waive—for MIPS eligible clinicians participating in the Shared Savings Program—the requirement under section 1848(q)(5)(E)(i)(II) of the Act that specifies the scoring weight for the cost performance category. With the proposed reduction of the cost performance category weight to zero, we believed it would be unnecessary to specify and use cost measures in determining the MIPS final score for these MIPS eligible clinicians. Therefore, under section 1899(f) of the Act, we proposed to waive—for MIPS eligible clinicians participating in the Shared Savings Program—the requirements under sections 1848(q)(2)(B)(ii) and 1848(q)(2)(A)(ii) of the Act to specify and use, respectively, cost measures in calculating the MIPS final score for such MIPS eligible clinicians.

Given the proposal to waive requirements under section 1848(q)(5)(E)(i)(II) of the Act in order to reduce the weight of the cost performance category to zero, we also needed to specify how that weight would be redistributed among the remaining performance categories in order to maintain a total weight of 100 percent. We proposed to redistribute the cost performance category weight to both the improvement activities and advancing care information performance categories as specified in Table 11 of this final rule with comment period. The MIPS cost performance category is

proposed to have a weight of 10 percent for the first performance period. Because the MIPS quality performance category bears a relatively higher weight than the other three MIPS performance categories, and in accordance with section 1848(q)(5)(E)(i)(I) and (II) of the Act, the weight for this category will be reduced from 50 to 30 percent as of the 2021 MIPS payment period, we proposed to evenly redistribute the 10 percent cost performance category weight to the improvement activities and advancing care information performance categories so that the distribution does not change the relative weight of the quality performance category. Because the MIPS quality performance category weight is required under the statute to be reduced to 30 percent after the first 2 years of MIPS, we believe that increasing the quality performance category weight would be incongruous in light of the eventual balance of the weights set forth in the statute. The redistributed cost performance category weight of 10 percent would result in a 5 percentage point increase (from 15 to 20 percent) for the improvement activities performance category and a 5 percentage point increase (from 25 to 30 percent) for the advancing care information performance category. We invited comments on the proposed weights and specifically whether we should increase the MIPS quality performance category weight.

In the proposed rule we explained that as the MIPS cost performance category evolves over time, there might be greater potential for alignment and less potential duplication or conflict with MIPS cost measurement for MIPS eligible clinicians participating in APMs such as the Shared Savings Program. We will continue to monitor and consider how we might incorporate an assessment in the MIPS cost performance category into the APM scoring standard for MIPS eligible clinicians participating in the Shared Savings Program. We also understand that reducing the cost performance category weight to zero and redistributing the weight to the improvement activities and advancing care information performance categories could, to the extent that improvement activities and advancing care information scores are higher than the scores these MIPS eligible clinicians would have received under the cost performance category, would result in higher final scores on average for MIPS eligible clinicians participating in the Shared Savings Program. We solicited comment on the possibility of assigning

a neutral score to the Shared Savings Program APM Entity groups for the cost performance category to moderate MIPS final scores for APM Entities participating in the Shared Savings Program. We also generally solicited comment on our proposed policy, and on whether and how we should incorporate the cost performance category into the APM scoring standard under MIPS for eligible clinicians participating in the Shared Savings Program for future years.

The following is a summary of the comments we received regarding our proposal to reduce the MIPS cost performance category weight to zero for APM Entity groups participating in the Shared Savings Program.

Comment: Several commenters supported our proposal not to assess cost for MIPS APMs and our efforts to reduce duplicative measurement. One commenter suggested we give a full score for the cost performance category instead of redistributing the 10 percent weight to other MIPS performance categories. A few commenters recommended the 10 percent weight for the cost performance category be redistributed entirely to the improvement activities performance category.

One commenter recommended that MIPS eligible clinicians in Shared Savings Program ACOs receive extra credit in the cost performance category if their ACO achieved expenditures below its benchmark. The commenter suggested that CMS consider having a sliding scale of cost category points awarded to MIPS eligible clinicians that participate in Shared Savings Program ACOs with benchmarks of less than \$10,000 per beneficiary per year. One commenter proposed that CMS reward Shared Savings Program ACOs that score at or above the average on cost measures, and hold harmless Shared Savings Program ACOs scoring below average. One commenter was opposed to reducing the cost performance category weight to zero.

Response: We appreciate commenters' widespread support for this proposal to reduce the weight of the MIPS cost performance category to zero under the APM scoring standard for eligible clinicians participating in the Shared Savings Program. While we will continue to monitor and consider how we might in future years incorporate the MIPS cost performance category into the APM scoring standard for eligible clinicians participating in the Shared Savings Program, we believe that assessment in this category would conflict with the assessment of the financial performance of ACOs

participating in the Shared Savings Program at this time. Because ACOs in the Shared Savings Program are assessed through particular attribution and benchmarking methodologies for purposes of earning shared savings payments, we believe that adding additional and separate MIPS incentives around cost would be redundant, potentially confusing, and could undermine the incentives built into the Shared Savings Program.

We are finalizing our proposal to reduce the cost performance category to zero percent for APM Entity groups in the Shared Savings Program and to evenly redistribute the 10 percent cost performance category weight to the improvement activities and advancing care information performance categories. We note that this policy may seem unnecessary given that the MIPS policy for the initial performance year reduces the cost performance category weight to zero for all MIPS eligible clinicians. However, the zero weight for the cost performance category for APM Entity groups in the Shared Savings Program will remain in place for subsequent years unless we modify it through future notice and comment rulemaking, whereas the zero weight given to the cost performance category under the generally applicable MIPS scoring standard is limited to the first performance period, will increase to 10 percent in the second performance period, and will increase to 30 percent in the third performance period. We believe that setting this foundation from the outset of the Quality Payment Program will contribute to consistency and minimize uncertainty for MIPS APM participants at least until such a time as we might identify a means to consider performance in the MIPS cost performance category that is congruent with cost evaluation under the Shared Savings Program.

We further note that although we proposed to use our authority under section 1899(f) of the Act to waive the requirement under section 1848(q)(5)(E)(i)(II) of the Act to specify the scoring weight for the cost performance category because it was necessary to waive this requirement in order to ensure that the Shared Savings Program retains the ability to structure its own measurement and payment for performance on total cost of care independent of other incentive programs, we believe we could also use our authority under section 1899(b)(3)(D) of the Act to accomplish this result. Section 1899(b)(3)(D) of the Act allows us to incorporate reporting requirements under section 1848 into the reporting requirements for the

Shared Savings Program, as we determine appropriate, and to use alternative criteria than would otherwise apply. Thus, we believe that section 1899(b)(3)(D) of the Act also provides authority to reduce the weight of the cost performance category to zero percent for eligible clinicians participating in Shared Savings Program ACOs and to redistribute the 10 percent weight to the improvement categories and advancing care information categories.

(8) Shared Savings Program—
Improvement Activities and Advancing
Care Information Performance Category
Scoring Under the APM Scoring
Standard

We proposed that MIPS eligible clinicians participating in the Shared Savings Program would submit data for the MIPS improvement activities and advancing care information performance categories through their respective ACO participant billing TINs independent of the Shared Savings Program ACO. Under section 1848(q)(5)(C)(ii) of the Act, all ACO participant group billing TINs would receive a minimum of one half of the highest possible score for the improvement activities performance category. Additionally, under section 1848(q)(5)(C)(i) of the Act, any ACO participant TIN that is determined to be a patient-centered medical home or comparable specialty practice will receive the highest potential score for the improvement activities performance category. The improvement activities and advancing care information scores from all the ACO participant billing TINs would be averaged to a weighted mean MIPS APM Entity group level score. We proposed to use a weighted mean in computing the overall improvement activities and advancing care information quality performance category score to account for difference in the size of each TIN and to allow each TIN to contribute to the overall score based on its size. Then all MIPS eligible clinicians in the APM Entity group, as identified by their APM participant identifiers, would receive that APM Entity score. The weights used for each ACO participant billing TIN would be the number of MIPS eligible clinicians in that TIN. Because all providers and suppliers that bill through the TIN of an ACO participant are required to agree to participate in the ACO, all MIPS eligible clinicians that bill through the TIN of an ACO participant are considered to be participating in the ACO. Any Shared Savings Program ACO participant billing TIN that does not submit data for the MIPS improvement activities and/or advancing care information performance

categories would contribute a score of zero for each performance category for which it does not report; and that score would be incorporated into the resulting weighted average score for the Shared Savings Program ACO. All MIPS eligible clinicians in the ACO (the APM Entity group) would receive the same score that is calculated at the ACO level (the APM Entity level).

In the proposed rule, we recognized that the Shared Savings Program eligible clinicians participate as a complete TIN because all of the eligible clinicians that have reassigned their Medicare billing rights to the TIN of an ACO participant must agree to participate in the Shared Savings Program. This is different from other APMs, which may include APM Entity groups with eligible clinicians who share a billing TIN with other eligible clinicians who do not participate in the APM Entity. We solicited comment on a possible alternative approach in which improvement activities and advancing care information performance category scores would be applied to all MIPS eligible clinicians at the individual billing TIN level, as opposed to aggregated to the ACO level, for Shared Savings Program participants. We also indicated that if MIPS APM scores were applied to each TIN in an ACO at the TIN level, we would also likely need to permit those TINs to make the Partial QP election, as discussed elsewhere in this final rule with comment, at the TIN level. We proposed that under the APM scoring standard, the ACO-level APM Entity group score would be applied to each participating MIPS eligible clinician to determine the MIPS payment adjustment. We explained that we believe calculating the score at the APM Entity level mirrors the way APM participants are assessed for their shared savings and other incentive payments in the APM, but we understand there may be reasons why a group TIN, particularly one that believes it would achieve a higher score than the weighted average APM Entity level score, would prefer to be scored in the improvement activities and advancing care information performance categories at the level of the group billing TIN rather than the ACO (APM Entity level).

We solicited comment as to whether Shared Savings Program ACO eligible clinicians should be scored at the ACO level or the group billing TIN level for the improvement activities and advancing care information performance categories.

The following is a summary of the comments we received regarding our proposals for how to score and weight the improvement activities and

advancing care information performance categories for the Shared Savings Program under the APM scoring standard and on whether to score these two MIPS performance categories at the APM Entity or the ACO participant TIN level.

Comment: Several commenters suggested that all APM Entities should receive full credit for improvement activities because they are already performing these activities as a result of being a participant in an APM. A few commenters stated that all APM participants should get at least 80 percent of the maximum score for improvement activities. Some commenters suggested that ACOs are involved in many of the improvement activities on a daily basis in order to meet the stringent requirements of the Shared Savings Program and the Next Generation ACO Model and requested that CMS provide a simple and straightforward way for ACOs to attest that their eligible clinicians have been involved in improvement activities for at least 90 days in the performance year by being a part of an ACO initiative.

Response: We agree with the comments that eligible clinicians participating in the Shared Savings Program and other MIPS APMs are actively engaged in improvement activities by virtue of participating in an APM. In an effort to further reduce reporting burden for eligible clinicians in MIPS APMs and to better recognize improvement activities work performed through participation in MIPS APMs, we are modifying our proposal with respect to scoring for the improvement activities performance category under the APM scoring standard. Specifically, for APM Entity groups in the Shared Savings Program, Next Generation ACO Model and other MIPS APMs, we will assign a baseline score for the improvement activities performance category based on the improvement activity requirements under the terms of the particular MIPS APM. CMS will review the MIPS APM requirements as they relate to activities specified under the generally applicable MIPS improvement activities performance category and assign an improvement activities score for each MIPS APM that is applicable to all APM Entity groups participating in the MIPS APM. To develop the improvement activities score assigned to a MIPS APM and applicable to all APM Entity groups in the APM, CMS will compare the requirements of the MIPS APM with the list of improvement activities measures in section II.E.5.f. of this final rule with comment period and score those measures in the same manner that they

are otherwise scored for MIPS eligible clinicians according to section II.E.5.f. of this final rule with comment period. Thus, points assigned to an APM Entity group in a MIPS APM under the improvement activities performance category will relate to documented requirements under the terms and conditions of the MIPS APM, such as in a participation agreement or regulation. We will apply this improvement activities score for the MIPS APM to each APM Entity group within the MIPS APM. For example, points assigned in the improvement activities performance category for participation in the Next Generation ACO Model will relate to documented requirements under the terms of the model, as set forth in the model's participation agreement. In the event that a MIPS APM incorporates sufficient improvement activities to receive the maximum score, APM Entity groups or their constituent MIPS eligible clinicians (or TINs) participating in the MIPS APM will not need to submit data for the improvement activities performance category in order to receive that maximum improvement activities score. In the event that a MIPS APM does not incorporate sufficient improvement activities to receive the maximum potential score, APM Entities will have the opportunity to report and add points to the baseline MIPS APM-level score on behalf of all MIPS eligible clinicians in the APM Entity group for additional improvement activities that would apply to the APM Entity level improvement activities performance category score. The improvement activities performance category score we assign to the MIPS APM based on improvement activity requirements under the terms of the APM will be published in advance of the MIPS performance period on the CMS Web site.

Comment: A commenter generally agreed with the proposed reweighting of performance categories for MIPS APMs under the APM scoring standard but recommended the 10 percent for the cost performance category be reallocated to improvement activities instead of both improvement activities and advancing care information. Another commenter also agreed with the scoring and supported the weight for the improvement activities performance category. One commenter recommended that MIPS APM participants have the option of having the APM Entity report improvement activities in order to achieve group scores higher than the initial 50 percent. A few commenters requested that the MIPS APMs only be

scored on the quality and improvement activities performance categories.

Response: After considering comments, we believe the reweighting of the improvement activities and the advancing care information performance categories should be finalized as proposed. We believe the proposed weights represent an appropriate balance between improvement activities and advancing care information, both of which are important goals of the MIPS program. Moreover, because the quality performance category weight will be reduced over time we believe that increasing the quality performance category weight in the first performance period would be incongruent the balance of the weights set forth in the statute.

For the Shared Savings Program we are finalizing the weights assigned to each of the MIPS performance categories as proposed for Shared Savings Program ACOs: Quality 50 percent; cost 0 percent; improvement activities 20 percent; and advancing care information 30 percent for purposes of the APM scoring standard. We are finalizing the proposal that for the advancing care information performance category, ACO participant TINs will report the category to MIPS, and the TIN scores will be aggregated and weighted in order to calculate one APM Entity score for the category. In the event a Shared Savings Program ACO fails to satisfy quality reporting requirements for measures reported through the CMS Web Interface, advancing care information group TIN scores will not be aggregated to the APM Entity level. Instead, each ACO participant TIN will be scored separately based on its TIN-level group reporting for the advancing care information performance category.

We are revising our proposal with respect to the scoring of the improvement activities performance category for the Shared Savings Program. We will assign an improvement activities score for the Shared Savings Program based on the improvement activities required under the Shared Savings Program. We consider all Shared Savings Program tracks together for purposes of assigning an improvement activities performance category score because the tracks all require the same activities of their participants. All APM Entity groups in the Shared Savings Program will receive that baseline improvement activities score. To develop the improvement activities score for the Shared Savings Program, we will compare the requirements of the Shared Savings Program with the list of improvement activities measures in section II.E.5.f. of

this final rule with comment period and score those measures in the same manner that they would otherwise be scored for MIPS eligible clinicians according to section II.E.5.f. of this final rule with comment period. We will assign points for improvement activities toward the score for the Shared Savings Program based on documented requirements for improvement activities

under the terms of the Shared Savings Program. We will publish the assigned scores for Shared Savings Program on the CMS Web site before the beginning of the MIPS performance period. In the event that the assigned score represents the maximum improvement activities score, APM Entity groups will not need to report additional improvement activities. In the event that the assigned

score does not represent the maximum improvement activities score, APM Entities will have the opportunity to report additional improvement activities that would apply to the APM Entity group score. Table 11 summarizes the finalized APM scoring standard rules for the Shared Savings Program.

TABLE 11—APM SCORING STANDARD FOR THE SHARED SAVINGS PROGRAM—2017 PERFORMANCE PERIOD FOR THE 2019 PAYMENT ADJUSTMENT

MIPS performance category	APM entity submission requirement	Performance score	Performance category weight %
Quality	Shared Savings Program ACOs submit quality measures to the CMS Web Interface on behalf of their participating MIPS eligible clinicians.	The MIPS quality performance category requirements and benchmarks will be used to determine the MIPS quality performance category score at the ACO level.	50
Cost Improvement Activities.	MIPS eligible clinicians will not be assessed on cost ACOs only need to report if the CMS-assigned improvement activities scores is below the maximum improvement activities score.	N/A CMS will assign the same improvement activities score to each APM Entity group based on the activities required of participants in the Shared Savings Program. The minimum score is one half of the total possible points. If the assigned score does not represent the maximum improvement activities score, ACOs will have the opportunity to report additional improvement activities to add points to the APM Entity group score.	0 20
Advancing Care Information.	All ACO participant TINs in the ACO submit under this category according to the MIPS group reporting requirements.	All of the ACO participant TIN scores will be aggregated as a weighted average based on the number of MIPS eligible clinicians in each TIN to yield one APM Entity group score.	30

(9) Next Generation ACO Model—Quality Performance Category Scoring Under the APM Scoring Standard

We proposed that beginning with the first MIPS performance period, Next Generation ACOs would only need to submit their quality measures to CMS once using the CMS Web Interface through the same process that they use to report to the Next Generation ACO Model. These data would be submitted once but used for purposes of both the Next Generation ACO Model and MIPS. Next Generation ACO Model ACOs have used the CMS Web Interface for submitting their quality measures since the model's inception and would most likely continue to use the CMS Web Interface as the submission method in future years. The Next Generation ACO Model quality measure data reported to the CMS Web Interface would be used by CMS to calculate the MIPS APM quality performance score. The MIPS quality performance category requirements and performance benchmarks for reporting quality measures via the CMS Web Interface would be used to determine the MIPS quality performance category score at the ACO level for the APM Entity group.

The Next Generation ACO Model quality performance data that are not submitted to the CMS Web Interface, for example the CAHPS survey and claims-based measures, would not be included in the APM Entity group quality performance score. The APM Entity group quality performance category score would be calculated using only quality measure data submitted through the CMS Web Interface and scored using the MIPS benchmarks, whereas the quality reporting requirements and performance benchmarks calculated for the Next Generation ACO Model would continue to be used to assess the ACO under the APM-specific requirements. We stated in the proposed rule that we believe this approach would reduce the reporting burden for Next Generation ACO Model participants by requiring quality measure data to be submitted only once and used for both MIPS and the Next Generation ACO Model.

In the proposed rule, we indicated that we believe that no waivers are necessary here because the quality measures submitted via the CMS Web Interface under the Next Generation ACO Model are MIPS quality measures and would be scored under MIPS performance standards. In the event that

Next Generation ACO Model quality measures depart from MIPS measures in the future, we stated that we would address such changes, including whether further waivers are necessary, at such a time in future rulemaking.

The following is a summary of the comments we received regarding our proposal to have Next Generation ACOs report quality measures to MIPS using the CMS Web Interface as they normally would under Next Generation ACO Model rules and our proposal for CMS to calculate the MIPS quality performance category score at the APM Entity group level based on the data reported to the CMS Web Interface and using the MIPS performance standards.

Comment: A commenter requested clarification regarding whether the population-based quality measures and CAHPS would be included in the Next Generation ACO quality performance category score.

Response: The population-based quality measures and CAHPS will not be included in the quality scoring under the APM scoring standard. This final rule with comment period does not affect APM-specific measurement and incentives.

We are finalizing the scoring policy for the quality performance category for the Next Generation ACO Model as proposed. We will use Next Generation ACO Model quality measures submitted by the ACO to the CMS Web Interface and MIPS benchmarks to score quality for MIPS eligible clinicians in a Next Generation ACO at the APM Entity level. An ACO's failure to report quality as required by the Next Generation ACO Model will result in a quality score of zero for the APM Entity group.

(10) Next Generation ACO Model—Cost Performance Category Scoring Under the APM Scoring Standard

We proposed that for the first MIPS performance period, we would not assess MIPS eligible clinicians in the Next Generation ACO Model participating in the MIPS APM under the cost performance category. We proposed this approach because: (1) MIPS eligible clinicians participating in the Next Generation ACO Model are already subject to cost and utilization performance assessments under the APM; (2) the Next Generation ACO Model measures cost in terms of an objective, absolute total cost of care expenditure benchmark for a population of attributed beneficiaries, and participating ACOs may share savings and/or losses based on that standard, whereas the MIPS cost measures are relative measures such that clinicians are graded relative to their peers and therefore different than assessing total cost of care for a population of attributed beneficiaries; and (3) the beneficiary attribution methodologies for measuring cost under the Next Generation ACO Model and MIPS differ, leading to an unpredictable degree of overlap (for eligible clinicians and for us) between the sets of beneficiaries for which eligible clinicians would be responsible that would vary based on unique APM Entity characteristics such as which and how many eligible clinicians comprise an ACO. We believe that with an APM Entity's finite resources for engaging in efforts to improve quality and lower costs for a specified beneficiary population, the population identified through the Next Generation ACO Model must take priority to ensure that the goals and model evaluation associated with the APM are as clear and free of confounding factors as possible. The potential for different, conflicting results across the Next Generation ACO Model and MIPS assessments—due to the differences in attribution, the inclusion in MIPS of episode-based measures that do not reflect the total cost of care, and the objective versus

relative assessment factors listed above—creates uncertainty for eligible clinicians who are attempting to strategically transform their respective practices and succeed under the terms of the Next Generation ACO Model. For example, Next Generation ACOs are held accountable for expenditure benchmarks that reflect the total Medicare Parts A and B spending for their attributed beneficiaries, whereas many of the proposed MIPS cost measures focus on spending for particular episodes of care or clinical conditions. Therefore, we proposed to reduce the MIPS cost performance category weight to zero for all MIPS eligible clinicians participating in the Next Generation ACO Model. Accordingly, under section 1115A(d)(1) of the Act, we proposed to waive—for MIPS eligible clinicians participating in the Next Generation ACO Model—the requirement under section 1848(q)(5)(E)(i)(II) of the Act that specifies the scoring weight for the cost performance category. With the proposed reduction of the cost performance category weight to zero, we believe it would be unnecessary to specify and use cost measures in determining the MIPS final score for these MIPS eligible clinicians. Therefore, under section 1115A(d)(1) of the Act, we proposed to waive—for MIPS eligible clinicians participating in the Next Generation ACO Model—the requirements under sections 1848(q)(2)(B)(ii) and 1848(q)(2)(A)(ii) of the Act to specify and use, respectively, cost measures in calculating the MIPS final score for such eligible clinicians.

Given the proposal to waive requirements under section 1848(q)(5)(E) of the Act to reduce the weight of the cost performance category to zero, we must subsequently specify how that weight would be redistributed among the remaining performance categories to maintain a total weight of 100 percent. We proposed to redistribute the cost performance category weight to both the improvement activities and advancing care information performance categories as specified in Table 13 of the proposed rule. The MIPS cost performance category is proposed to have a weight of 10 percent. Because the MIPS quality performance category bears a relatively higher weight than the other three MIPS performance categories and the weight for this category will be reduced from 50 to 30 percent as of the 2021 payment year, we proposed to evenly redistribute the 10 percent cost weight to the improvement activities and advancing care information performance categories

so that the distribution does not change the relative weight of the quality performance category in the opposite of the direction it will change in the future. Because the quality performance category weight is required under the statute to be reduced to 30 percent after the first 2 years of MIPS we believe that increasing the quality performance category weight is incongruous with the eventual balance of the weights set forth in the statute. The redistributed cost performance category weight of 10 percent would result in a 5 percentage point increase (from 15 to 20 percent) for the improvement activities performance category and a 5 percentage point increase (from 25 to 30 percent) for the advancing care information performance category. We invited comments on the proposed redistributed weights and specifically on whether we should also increase the MIPS quality performance category weight.

In the proposed rule, we explained that we understand that as the MIPS cost performance category evolves over time, there might be greater potential for alignment and less potential duplication or conflict with MIPS cost measurement for MIPS eligible clinicians participating in MIPS APMs such as the Next Generation ACO Model. We stated that we would continue to monitor and consider how we might incorporate an assessment in the MIPS cost performance category into the APM scoring standard for the Next Generation ACO Model. We also understand that reducing the cost weight to zero and redistributing the weight to the improvement activities and advancing care information performance categories could, to the extent that improvement activities and advancing care information performance category scores are higher than the scores MIPS eligible clinicians would have received under the cost performance category, result in higher final scores on average for MIPS eligible clinicians in APM Entity groups participating in the Next Generation ACO Model. We solicited comment on the possible alternative of assigning a neutral score to APM Entity groups participating in the Next Generation ACO model for the cost performance category in order to moderate APM Entity scores. We also generally sought comment on our proposed policy, and on whether and how we should incorporate the cost performance category into the APM scoring standard for MIPS eligible clinicians in APM Entity groups participating in the Next Generation ACO model for future years.

The following is a summary of the comments we received regarding our proposal to reduce the MIPS cost performance category weight to zero for APM Entity groups in the Next Generation ACO Model.

Comment: Many commenters supported our proposal to not assess cost for MIPS APMs, including the Next Generation ACO Model.

Response: We appreciate commenters' widespread support for this proposal. While we will continue to monitor and consider how we might in future years incorporate the MIPS cost performance category into the APM scoring standard for participants in the Next Generation ACO Model, we believe that assessment in this category would conflict with Next Generation ACO Model assessment at this time. Participants in the Next Generation ACO Model are assessed through particular attribution and benchmarking methodologies for purposes of earning shared savings payments; adding additional and separate MIPS incentives around cost would be redundant, potentially confusing, and could undermine the incentives built into the Next Generation ACO Model.

We are finalizing our proposal to reduce the cost performance category weight to zero for MIPS eligible clinicians in APM Entity groups participating in the Next Generation ACO Model and to evenly redistribute the 10 percent cost weight to the improvement activities and advancing care information performance categories without changes.

(11) Next Generation ACO Model—Improvement Activities and Advancing Care Information Performance Category Scoring Under the APM Scoring Standard

We proposed that all MIPS eligible clinicians participating in the Next Generation ACO Model would submit data for the improvement activities and advancing care information performance categories. MIPS eligible clinicians participating in the Next Generation ACO Model may bill through a TIN that includes other MIPS eligible clinicians not participating in the APM. Therefore for both the improvement activities and advancing care information performance categories, we proposed that MIPS eligible clinicians participating in the Next Generation ACO Model would submit individual level data to MIPS and not group level data.

For both the improvement activities and advancing care information performance categories, the scores from all of the individual MIPS eligible clinicians in the APM Entity group

would be aggregated to the APM Entity level and averaged for a mean score. Any individual MIPS eligible clinicians that do not report for purposes of the improvement activities performance category or the advancing care information performance category would contribute a score of zero for that performance category in the calculation of the APM Entity score. All MIPS eligible clinicians in the APM Entity group would receive the same APM Entity score.

Because the MIPS quality performance category bears a relatively higher weight than the other three MIPS performance categories, we proposed to evenly redistribute the 10 percent cost performance category weight to the improvement activities and advancing care information performance categories. Section 1848(q)(5)(C)(i) of the Act requires that MIPS eligible clinicians who are in a practice that is certified as a patient-centered medical home or comparable specialty practice, as determined by the Secretary, for a performance period shall be given the highest potential score for the improvement activities performance category. Accordingly, a MIPS eligible clinician participating in an APM Entity that meets the definition of a patient-centered medical home or comparable specialty practice will receive the highest potential improvement activities score. Additionally, section 1848(q)(5)(C)(ii) of the Act requires that MIPS eligible clinicians participating in APMs that are not patient-centered medical homes for a performance period shall earn a minimum score of one-half of the highest potential score for improvement activities.

For the APM scoring standard for the first MIPS performance period, we proposed to weight the improvement activities and advancing care information performance categories for the Next Generation ACO Model in the same way that we proposed to weight those categories for the Shared Savings Program: 20 percent and 30 percent for improvement activities and advancing care information, respectively. We solicited comment on our proposals for reporting and scoring the improvement activities and advancing care information performance categories under the APM scoring standard. In particular, we solicited comment on the appropriate weight distributions in the first performance year.

The following is a summary of the comments we received regarding our proposals to score and weight the improvement activities and advancing care information performance categories for APM Entity groups in the Next

Generation ACO under the APM scoring standard.

Comment: Several commenters suggested that all APM Entities including ACOs in the Next Generation ACO Model should receive full credit for improvement activities because they are already performing these activities as a result of being a participant in an APM. Some commenters also indicated that improvement activities should be reported at the APM Entity level rather than at the individual level then averaged. A few commenters believed that CMS should allow reporting at the APM Entity level for all performance categories. Some commenters also believed that the advancing care information performance category should not be part of the APM scoring standard but rather incorporated into APM design through CEHRT requirements. One commenter indicated that the activities that lead to success in the Next Generation ACO Model directly overlap with the proposed improvement activities.

Response: We agree that we can streamline reporting and scoring for the improvement activities and advancing care information performance categories while recognizing the work Next Generation ACO Model participants do in pursuit of the APM goals. Therefore, as described below, for purposes of the APM scoring standard we will assign an improvement activities score to the Next Generation ACO Model based on the improvement activities required under the Model.

Regarding the advancing care information performance category, we do not believe that there is a compelling reason to exclude assessment in this performance category from the APM scoring standard in the same way that we are reducing the weight of the cost performance category. We do not see advancing care information measurement as duplicative or in conflict with Next Generation ACO Model goals and requirements. Participation in the Next Generation ACO Model is aligned with many MIPS improvement activities measures. This is why we are finalizing a policy that further reduces MIPS reporting burdens for Next Generation ACO Model participants and recognizes the similarities between MIPS improvement activities and the requirements of participating in the Next Generation ACO Model.

Comment: A commenter requested clarification of our proposal that MIPS eligible clinicians participating in the Next Generation ACO would submit data for the improvement activities

performance category to MIPS individually, and not as a group.

Response: The proposed policy involved individual reporting of improvement activities, which would be averaged across the ACO for one APM Entity group score. The finalized policy, described below, no longer requires individual reporting for purposes of the improvement activities performance category.

Comment: A commenter noted that Next Generation ACO participants who are determined to be Partial QPs for a year may be disadvantaged given the reweighting of MIPS categories under the APM scoring standard.

Response: We do not believe there is a disadvantage for Partial QPs who achieve that status through participation in any Advanced APM, including the Next Generation ACO Model to the extent it is determined to be an Advanced APM. As discussed in section II.F.5., the eligible clinicians who are Partial QPs can decide at the APM Entity group level to be subject to the MIPS reporting requirements and payment adjustment, in which case the eligible clinicians in the group would be scored under the APM scoring standard, or to be excluded from MIPS for the year.

In response to comments, we are revising our proposal with respect to the scoring of the improvement activities performance category for the Next Generation ACO Model. CMS will assign all APM Entity groups in the Next Generation ACO Model the same improvement activities score based on the improvement activities required by the Next Generation ACO Model. To develop the improvement activities score assigned to all APM Entity groups in the Next Generation ACO Model, CMS will compare the requirements under the Next Generation ACO Model with the list of improvement activities measures in section II.E.5.f. of this final rule with comment period and score those measures in the same manner that they are otherwise scored for MIPS eligible clinicians according to section II.E.5.f. of this final rule with comment period. Thus, points assigned for participation in the Next Generation ACO Model will relate to documented requirements under the terms of the Next Generation ACO Model. We will publish the assigned improvement activities performance category score for

the Next Generation ACO Model, based on the APM's improvement activity requirements, prior to the start of the performance period. In the event that the assigned score does not represent the maximum improvement activities score, APM Entities will have the opportunity to report additional improvement activities that would be applied to the baseline APM Entity group score. In the event that the baseline assigned score represents the maximum improvement activities score, APM Entities will not need to report additional improvement activities.

In order to further reduce reporting burden and align with the generally applicable MIPS group reporting option, we are revising the advancing care information scoring policy for the Next Generation ACO Model. A MIPS eligible clinician may receive a score for the advancing care information performance category either through individual reporting or through group reporting based on a TIN according to the generally applicable MIPS reporting and scoring rules for the advancing care information performance category, described in section II.E.5.g of this final rule with comment period. We will attribute one advancing care information score to each MIPS eligible clinician in an APM Entity by looking at both individual and group data submitted for a MIPS eligible clinician and using the highest reported score. Thus, instead of only using individual scores to derive an APM Entity-level advancing care information score as proposed, we will use the highest score attributable to each MIPS eligible clinician in an APM Entity group in order to determine the APM Entity group score based on the average of the highest scores for all MIPS eligible clinicians in the APM Entity group.

Like the proposed policy, each MIPS eligible clinician in the APM Entity group will receive one score, weighted equally with that of the other clinicians in the group, and CMS will calculate a single APM Entity-level advancing care information performance category score. Also like the proposed policy, for a MIPS eligible clinician who has no advancing care information performance category score—if the individual's TIN did not report as a group and the individual did not report—that MIPS eligible clinician will contribute a score

of zero to the aggregate APM Entity group score.

In summary, we will attribute one advancing care information performance category score to each MIPS eligible clinician in an APM Entity group, which will be averaged with the scores of all other MIPS eligible clinicians in the APM Entity group to derive a single APM Entity score. In attributing a score to an individual, we will use the highest score attributable to the TIN/NPI combination of a MIPS eligible clinician. Finally, if there is no group or individual score, we will attribute a zero to the MIPS eligible clinician, which will be included in the aggregate APM Entity score.

We have revised this policy for the advancing care information performance category for Next Generation ACOs under the APM scoring standard because we recognize that individual reporting in the advancing care information performance category for all MIPS eligible clinicians in an APM Entity group may be more burdensome than allowing some degree of group reporting where applicable, and we believe that requiring individual reporting on advancing care information in the Next Generation ACO Model context will not supply a meaningfully greater amount of information regarding the use of EHR technology as prescribed by the advancing care information performance category. We believe that this revised policy maintains the alignment with the generally applicable MIPS reporting and scoring requirements under the advancing care information performance category while responding to commenters' desires for reduced reporting requirements for MIPS APM participants. Therefore, we believe that the revised policy, relative to the proposed policy, has the potential to substantially reduce reporting burden with little to no reduction in our ability to accurately evaluate the adoption and use of EHR technology. We also believe this final policy balances the simplicity of TIN-level group reporting, which can reduce burden, with the flexibility needed to address partial TIN scenarios common among Next Generation ACOs in which a TIN may have some MIPS eligible clinicians participating in the ACO and some MIPS eligible clinicians not in the ACO. Table 12 summarizes the final APM scoring standard rules for the Next Generation ACO Model.

TABLE 12—APM SCORING STANDARD FOR THE NEXT GENERATION ACO MODEL—2017 PERFORMANCE PERIOD FOR THE 2019 PAYMENT ADJUSTMENT

MIPS Performance category	APM Entity submission requirement	Performance score	Performance category weight %
Quality	ACOs submit quality measures to the CMS Web Interface on behalf of their participating MIPS eligible clinicians.	The MIPS quality performance category requirements and benchmarks will be used to determine the MIPS quality performance category score at the ACO level.	50
Cost	MIPS eligible clinicians will not assessed on cost.	N/A	0
Improvement Activities.	ACOs only need to report improvement activities data if the CMS-assigned improvement activities scores is below the maximum improvement activities score.	CMS will assign the same improvement activities score to each APM Entity group based on the activities required of participants in the Next Generation ACO Model. This minimum score is one half of the total possible points. If the assigned score does not represent the maximum improvement activities score, ACOs will have the opportunity to report additional improvement activities to add points to the APM Entity group score.	20
Advancing Care Information.	Each MIPS eligible clinician in the APM Entity group reports advancing care information to MIPS through either group reporting at the TIN level or individual reporting.	CMS will attribute one score to each MIPS eligible clinician in the APM Entity group. This score will be the highest score attributable to the TIN/NPI combination of each MIPS eligible clinician, which may be derived from either group or individual reporting. The scores attributed to each MIPS eligible clinicians will be averaged to yield a single APM Entity group score.	30

(12) MIPS APMs Other Than the Shared Savings Program and the Next Generation ACO Model—Quality Performance Category Scoring Under the APM Scoring Standard

For MIPS APMs other than the Shared Savings Program and the Next Generation ACO Model, we proposed that eligible clinicians or APM Entities would submit APM quality measures under their respective MIPS APM as usual, and those eligible clinicians or APM Entities would not also be required to submit quality information under MIPS for the first performance period. Current MIPS APMs have requirements regarding the number of quality measures, measure specifications, as well as the measure reporting method(s) and frequency of reporting, and have an established mechanism for submission of these measures to us. We believe there are operational considerations and constraints that would prevent us from being able to use the quality measure data from some MIPS APMs for the purpose of satisfying the MIPS data submission requirements for the quality performance category in the first performance period. For example, some current APMs use a quality measure data collection system or vehicle that is separate and distinct from the MIPS systems. We do not believe there is sufficient time to adequately implement changes to the current APM quality measure data collection timelines and infrastructure to conduct a smooth hand-off to the MIPS system that would

enable use of APM quality measure data to satisfy the MIPS quality performance category requirements in the first MIPS performance period. As we have noted, we are concerned about subjecting MIPS eligible clinicians who participate in MIPS APMs to multiple performance assessments—under MIPS and under the APMs—that are not necessarily aligned and that could potentially undermine the validity of testing or performance evaluation under the APM. As stated in the proposed rule, our goal is to reduce MIPS eligible clinician reporting burden by not requiring APM participants to report quality data twice to us, and to avoid misaligned performance incentives. Therefore, we proposed that, for the first MIPS performance period only, for MIPS eligible clinicians participating in APM Entity groups in MIPS APMs (other than the Shared Savings Program or the Next Generation ACO Model), we would reduce the weight for the quality performance category to zero. As we explained in the proposed rule, we believe it is necessary to do this because we require additional time to make adjustments in systems and processes related to the submission and collection of APM quality measures to align APM quality measures with MIPS and ensure APM quality measure data can be submitted in a time and manner sufficient for use in assessing quality performance under MIPS and under the APM. Additionally, due to the implementation of a new program that does not account for non-MIPS

measures sets, the operational complexity of connecting APM performance to valid MIPS quality performance category scores in the necessary timeframe, as well as the uncertainty of the validity and equity of scoring results could unintentionally undermine the quality performance assessments in MIPS APMs. Finally, for purposes of performing valid evaluations of MIPS APMs, we must reduce the number of confounding factors to the extent feasible, which, in this case, would include reporting and assessment on non-APM quality measures. Thus, we proposed to waive certain requirements of section 1848(q) of the Act for the first MIPS performance year to avoid risking adverse operational or program evaluation consequences for MIPS APMs while we work toward incorporating MIPS APM quality measures into MIPS scoring for future MIPS performance periods.

Accordingly, under section 1115A(d)(1) of the Act, we proposed to waive—for MIPS eligible clinicians participating in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model—the requirement under section 1848(q)(5)(E)(i)(I) of the Act that specifies the scoring weight for the quality performance category. With the proposed reduction of the quality performance category weight to zero, we believe it would be unnecessary to establish an annual final list of quality measures as required under section 1848(q)(2)(D) of the Act, or to specify

and use quality measures in determining the MIPS final score for these MIPS eligible clinicians. Therefore, under section 1115A(d)(1) of the Act, we proposed to waive—for MIPS eligible clinicians participating in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model—the requirements under sections 1848(q)(2)(D), 1848(q)(2)(B)(i) and 1848(q)(2)(A)(i) of the Act to establish a final list of quality measures (using certain criteria and processes); and to specify and use, respectively, quality measures in calculating the MIPS final score, for these MIPS eligible clinicians.

We anticipated that beginning in the second MIPS performance period, the APM quality measure data submitted to us during the MIPS performance period would be used to derive a MIPS quality performance score for APM Entities in all APMs that meet criteria for application of the APM scoring standard. We also anticipated that it may be necessary to propose policies and waivers of different requirements of the statute—such as one for section 1848(q)(2)(D) of the Act, to enable the use of non-MIPS quality measures in the quality performance category score—through future rulemaking. We indicated that we expect that by the second MIPS performance period we will have had sufficient time to resolve operational constraints related to use of separate quality measure systems and to adjust quality measure data submission timelines. Therefore, beginning with the second MIPS performance period, we anticipated that through use of the waiver authority under section 1115A(d)(1) of the Act, the quality measure data for APM Entities for which the APM scoring standard applies would be used for calculation of a MIPS quality performance score in a manner specified in future rulemaking. We solicited comment on this transitional approach to use of APM quality measures for the MIPS quality performance category for purposes of the APM scoring standard under MIPS in future years.

The following is a summary of the comments we received regarding our proposal to, for the first MIPS performance period, reweight the quality performance category to zero for APM Entity groups in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model.

Comment: A commenter supported exempting MIPS APMs that are not using the CMS Web Interface to report quality from reporting for purposes of the MIPS quality performance category in the first performance year. One

commenter was concerned that these MIPS APMs will not receive a quality score for the first performance year and another commenter recommended revising the performance category weights so that quality is included.

Response: We agree that it would be ideal to include performance on quality for all MIPS APMs in the first MIPS performance year. As noted, we are only reweighting the quality performance category to zero for the first performance year due to operational limitations. APM Entities in MIPS APMs are, under the policies adopted in this final rule with comment period, required to base payment incentives on cost/utilization and quality measure performance. As such they will continue to report quality as required under the APM, and are not truly exempt from quality assessment for the year. We are finalizing the inclusion of a MIPS quality performance category score under the APM scoring standard for the 2018 performance year at § 414.1370(f), and will develop additional scoring policies for that year through future notice-and-comment rulemaking.

We are finalizing as proposed the policy to reweight the MIPS quality performance category to zero percent for APM Entity groups in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model for the first performance year.

(13) MIPS APMs Other Than the Shared Savings Program and Next Generation ACO—Cost Performance Category Scoring Under the APM Scoring Standard

For the first MIPS performance period, we proposed that, for MIPS eligible clinicians participating in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model, to reduce the weight of the cost performance category to zero. We proposed this approach because: (1) APM Entity groups are already subject to cost and utilization performance assessments under MIPS APMs; (2) MIPS APMs usually measure cost in terms of total cost of care, which is a broader accountability standard that inherently encompasses the purpose of the claims-based measures that have relatively narrow clinical scopes, and MIPS APMs that do not measure cost in terms of total cost of care may depart entirely from MIPS measures; and (3) the beneficiary attribution methodologies differ for measuring cost under APMs and MIPS, leading to an unpredictable degree of overlap (for eligible clinicians and for CMS) between the sets of beneficiaries for which eligible clinicians would be responsible

that would vary based on unique APM Entity characteristics such as which and how many eligible clinicians comprise an APM Entity. We believe that with an APM Entity's finite resources for engaging in efforts to improve quality and lower costs for a specified beneficiary population, the population identified through an APM must take priority to ensure that the goals and model evaluation associated with the APM are as clear and free of confounding factors as possible. The potential for different, conflicting results across APM and MIPS assessments creates uncertainty for MIPS eligible clinicians who are attempting to strategically transform their respective practices and succeed under the terms of an APM.

Accordingly, under section 1115A(d)(1) of the Act, we proposed to waive—for MIPS eligible clinicians participating in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model—the requirement under section 1848(q)(5)(E)(i)(II) of the Act that specifies the scoring weight for the cost performance category.

With the proposed reduction of the cost performance category weight to zero, we believed it would be unnecessary to specify and use cost measures in determining the MIPS final score for these MIPS eligible clinicians. Therefore, under section 1115A(d)(1) of the Act, we proposed to waive—for MIPS eligible clinicians participating in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model—the requirements under section under sections 1848(q)(2)(B)(ii) and 1848(q)(2)(A)(ii) of the Act to specify and use, respectively, cost measures in calculating the MIPS final score for such eligible clinicians.

Given the proposal to waive requirements of section 1848(q) of the Act to reduce the weight of the quality and cost performance categories to zero, we also needed to specify how those weights would be redistributed among the remaining improvement activities and advancing care information categories in order to maintain a total weight of 100 percent. We proposed to redistribute the quality and the cost performance category weights as specified in Table 14 of the proposed rule.

We understand that as the cost performance category evolves, the rationale we discussed in the proposed rule for establishing a weight of zero for this performance category might not be applicable in future years. We solicited comment on whether and how we should incorporate the cost performance category into the APM scoring standard

under MIPS. We also understand that reducing the quality and cost performance category weight to zero and redistributing the weight to the improvement activities and advancing care information performance categories could, to the extent that improvement activities and advancing care information scores are higher than the scores MIPS eligible clinicians would have received under the cost performance category, would result in higher final scores on average for MIPS eligible clinicians in APM Entity groups participating in MIPS APMs. We solicited comment on the possible alternative of assigning a neutral score to MIPS eligible clinicians in APM Entity groups participating in MIPS APMs for the quality and cost performance categories in order to moderate APM Entity scores.

The following is a summary of the comments we received regarding our proposal to establish a MIPS cost performance category weight of zero for all MIPS eligible clinicians in APM Entities participating in the MIPS APMs other than the Shared Savings Program and the Next Generation ACO model.

Comment: The majority of commenters supported not assessing cost for MIPS APMs by reducing the weight for the cost performance category to zero.

Response: We appreciate commenters' widespread support for this proposal. While we will continue to monitor and consider how we might in future years incorporate the MIPS cost performance category into the APM scoring standard for all MIPS APMs, we believe that inclusion of this category would conflict with the assessment of cost made within MIPS APMs at this time. Participants in MIPS APMs are assessed through particular attribution and benchmarking methodologies for purposes of incentives and penalties; adding additional and separate MIPS incentives around cost would be redundant, potentially confusing, and could undermine the incentives built into these MIPS APMs.

We are finalizing the proposal to reduce the cost performance category weight to zero percent for APM Entity groups in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model.

(14) MIPS APMs Other Than the Shared Savings Program and Next Generation ACO Model—Improvement Activities and Advancing Care Information Performance Category Scoring Under the APM Scoring Standard

We proposed that all MIPS eligible clinicians participating in a MIPS APM

other than the Shared Savings Program or the Next Generation ACO Model would submit data for the improvement activities and advancing care information performance categories as individual MIPS eligible clinicians. MIPS eligible clinicians in these other APMs may bill through a TIN that includes MIPS eligible clinicians that do not participate in the APM. Therefore for both the improvement activities and the advancing care information performance categories, we proposed that these MIPS eligible clinicians submit individual level data to MIPS and not group level data. For both the improvement activities and advancing care information performance categories, the scores from all of the individual MIPS eligible clinicians in the APM Entity group would be aggregated to the APM Entity level and averaged for a mean score. Any individual MIPS eligible clinicians that do not submit data for the improvement activities performance category or the advancing care information performance category would contribute a score of zero for that performance category in the calculation of the APM Entity score. All MIPS eligible clinicians in the APM Entity group would receive the same APM Entity group score.

Section 1848(q)(5)(C)(i) of the Act requires that MIPS eligible clinicians who are in a practice that is certified as a patient-centered medical home or comparable specialty practice, as determined by the Secretary, for a performance period shall be given the highest potential score for the improvement activities performance category. Accordingly, a MIPS eligible clinician in an APM Entity group that meets the definition of a patient-centered medical home or comparable specialty practice will receive the highest potential score. Additionally, section 1848(q)(5)(C)(ii) of the Act requires that MIPS eligible clinicians participating in APMs that are not patient-centered medical homes for a performance period shall earn a minimum score of one-half of the highest potential score for improvement activities. We acknowledged that using this increased weight for improvement activities may make it easier in the first performance period for eligible clinicians in a MIPS APM to attain a higher MIPS score. We do not have historical data to assess the range of scores under improvement activities because this is the first time such activities are being assessed in such a manner.

For the advancing care information performance category, we explained our belief that MIPS eligible clinicians

participating in MIPS APMs would be using certified health IT and other health information technology to coordinate care and deliver better care to their patients. Most MIPS APMs encourage participants to use health IT to perform population management, monitor their own quality improvement activities and, better coordinate care for their patients in a way that aligns with the goals of the advancing care information performance category. In the proposed rule, we indicated that we want to ensure that where we proposed reductions in weights for other MIPS performance categories, such weights are appropriately redistributed to the advancing care information performance category.

Therefore, for the first MIPS performance period, we proposed that the weights for the improvement activities and advancing care information performance categories would be 25 percent and 75 percent, respectively. We solicited comment on our proposals for reporting and scoring the improvement activities and advancing care information performance categories under the APM scoring standard. In particular, we solicited comment on the appropriate weight distributions in the first performance year and subsequent years when we anticipate incorporating assessment in the quality performance category for all MIPS eligible clinicians participating in MIPS APMs.

The following is a summary of the comments we received regarding our proposals to score and weight the improvement activities and advancing care information performance categories for MIPS eligible clinicians participating in APM Entity groups in MIPS APMs other than the Shared Savings Program and the Next Generation ACO Model under the APM scoring standard.

Comment: Some commenters were concerned that if eligible clinicians in MIPS APMs would be scored only on the advancing care information and improvement activities performance categories, clinicians in those MIPS APMs could disproportionately receive upward MIPS payment adjustments because they would not be assessed in the quality or cost performance categories. Commenters believed that it may be easier for clinicians to perform well in the improvement activities and advancing care information performance categories than in the quality and cost performance categories. Although a few commenters supported the proposed performance category weights, other commenters suggested alternatives. Two commenters were concerned about the performance category scoring weights

for MIPS APMs under the APM scoring standard and suggested that the weights for the advancing care information and improvement activities performance categories should be similar to the ones proposed for the Shared Savings Program and Next Generation ACO Model. Two other commenters suggested assigning greater weight to the improvement activities performance category instead of redistributing so much of the weight to the advancing care information performance category. A few commenters suggested redistributing the weights from the quality and cost performance categories to the improvement activities and advancing care information performance categories differently—for example, 50 percent for improvement activities and 50 percent for advancing care information. One commenter indicated they understood the need to reweight the improvement activities and advancing care information for MIPS APMs other than the Shared Savings Program and the Next Generation ACO Model but requested that, in making reweighting decisions, CMS give consideration to ensuring a “level playing field.” A few commenters expressed concern that the proposed APM scoring standard for MIPS APMs increases the advancing care information category weight to 75 percent, and a commenter stated that performance in this category could be challenging for many clinicians, particularly those with little control over the IT choices and decisions made by their employers. A commenter recommended basing performance in this category on the adoption and use of EHR technology tailored to a specialty-appropriate assessment of meaningful use and urged CMS to work closely with physician societies.

Response: We understand that an APM Entity group’s final score under the proposed weights for the APM scoring standard could differ from the final score such APM Entity groups could receive if they were subject to both the quality and cost performance categories. However, for reasons discussed above, reweighting the quality performance category to zero percent is necessary for operational and programmatic reasons only for the first performance year, and we anticipate being able to incorporate performance under MIPS APM quality measures beginning in the second year of the Quality Payment Program, subject to future rulemaking. Also, in light of the MIPS scoring policies we are finalizing for the first performance year, we do not believe that this will cause a material

adverse impact on MIPS scoring because the impact on MIPS payment adjustments for an eligible clinician will be affected more by meeting the minimum reporting requirements than by the weighting of performance categories. In subsequent years, we intend to incorporate assessments in the quality performance category into the APM scoring standard for all MIPS APMs, and the performance category weights will no longer so heavily emphasize advancing care information. For the first performance year, we believe that the proposed balance between improvement activities and advancing care information is appropriate, especially given the possibility that MIPS APM participants may be assigned the maximum improvement activities score under our final policy, as described below.

Comment: A commenter stated that improvement activities reporting should be done by the APM Entity and that advancing care information should not be part of the APM scoring standard. Several commenters suggested that all APM Entities should receive full credit for improvement activities because they are already performing these activities as a result of being a participant in an APM. Other commenters suggested that both advancing care information and improvement activities be reported and scored at the individual level instead of being aggregated to the APM Entity level. A few commenters believed that CMS should allow reporting at the APM Entity level for all performance categories.

Response: In contrast to the cost performance category, we do not find a compelling reason to reduce the weight of the advancing care information performance category because we do not believe it would potentially conflict with or duplicate assessments that are made within the MIPS APM.

We agree with commenters that reporting in the improvement activities performance category could be more efficient if done by an APM Entity on behalf of the APM Entity group. In order to further reduce reporting burden on all parties and to better recognize improvement activities work performed through participation in MIPS APMs, we are modifying our proposal with respect to scoring for the improvement activities performance category under the MIPS APM scoring standard. As described above, we will assign an improvement activities performance category score at the MIPS APM level based on the requirements of participating in the particular MIPS APM. The baseline score will be applied to each APM Entity group in the MIPS

APM. In the event that the assigned score is less than the maximum score, we would allow the APM Entity to report additional activities to add points to the APM Entity group score. With regards to the comment suggesting scoring improvement activities at the individual level, we believe that reporting and scoring improvement activities at the APM Entity level support the goals of APM participation, which focus on collective responsibility for the cost and quality of care for beneficiaries. Similarly, we agree with the comments pointing out that eligible clinicians participating in MIPS APMs are actively engaged in improvement activities by virtue of participating in the APM.

Comment: A commenter sought clarification regarding how a subgroup of MIPS eligible clinicians that is not participating in a MIPS APM will be treated when other MIPS eligible clinicians in the same large multispecialty practice participate in a MIPS APM.

Response: We maintain lists of participants that are in the MIPS APM using the APM participant identifier, and those MIPS eligible clinicians will be scored as an APM Entity group under the APM scoring standard. The non-APM participants in the practice will report to MIPS under the generally applicable MIPS requirements for reporting as an individual or group. If the practice decides to report to MIPS as a group under its TIN, then its reporting may include some data from the MIPS APM participants, even though those TIN/NPI combinations will receive their MIPS final score based on the APM Entity group according to the scoring hierarchy in section II.E.6. of this final rule with comment period.

We are revising the proposed improvement activities scoring policy for MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model. CMS will assign a score for the improvement activities performance category to each MIPS APM, and that score will be applied to each APM Entity group in the MIPS APM. To develop the improvement activities score for a MIPS APM, CMS will compare the requirements of the MIPS APM with the list of improvement activities measures in section II.E.5.f. of this final rule with comment period and score those measures in the same manner that they are otherwise scored for MIPS eligible clinicians according to section II.E.5.f. of this final rule with comment period. Thus, points assigned to an APM Entity group in a MIPS APM under the improvement activities performance category will relate to

documented requirements under the terms and conditions of the MIPS APM. We will publish the assigned improvement activities scores for each MIPS APM on the CMS Web site prior to the beginning of the MIPS performance period. In the event that the assigned score does not represent the maximum improvement activities score, APM Entities will have the opportunity to report additional improvement activities that would apply to the APM Entity group score. In the event that the assigned score represents the maximum improvement activities score, APM Entity groups will not need to report additional improvement activities.

In order to further reduce reporting burden and align with the generally applicable MIPS group reporting option, we are also revising the proposed advancing care information scoring policy for MIPS APMs other than the Shared Savings Program and the Next Generation ACO Model.

A MIPS eligible clinician may receive a score for the advancing care information performance category either through individual reporting or through group reporting based on a TIN according to the generally applicable MIPS reporting and scoring rules for the advancing care information performance category, described in section II.E.5.g. of this final rule with comment period. We will attribute one score to each MIPS eligible clinician in an APM Entity group by looking for both individual and group data submitted for a MIPS eligible clinician and using the highest score. Thus, instead of only using individual scores to derive an APM

Entity-level advancing care information score as proposed, we will use the highest score attributable to each MIPS eligible clinician in an APM Entity group in order to create the APM Entity group score based on the average of the highest scores for all MIPS eligible clinicians in the APM Entity group.

Like the proposed policy, each MIPS eligible clinician in the APM Entity group will receive one score, weighted equally with that of the other clinicians in the group, and we will calculate a single APM Entity-level advancing care information score. Also like the proposed policy, for a MIPS eligible clinician who has no advancing care information score attributable to the individual—the individual’s TIN did not report as a group and the individual did not report—that MIPS eligible clinician will contribute a score of zero to the aggregate APM Entity group score.

In summary, we will attribute one advancing care information score to each MIPS eligible clinician in an APM Entity group, which will be averaged with the scores of all other MIPS eligible clinicians in the APM Entity group to derive a single APM Entity score. In attributing a score to an individual, we will use the highest score attributable to the TIN/NPI combination of a MIPS eligible clinician. Finally, if there is no group or individual score, we will attribute a zero to the MIPS eligible clinician, which will be included in the aggregate APM Entity score.

We have revised the proposed policy for the advancing care information performance category for MIPS APM participants under the APM scoring standard because we recognize that

individual reporting in the advancing care information performance category for all MIPS eligible clinicians in an APM Entity group may be more burdensome than allowing some degree of group reporting where applicable, and we believe that requiring individual reporting on advancing care information in the MIPS APM context will not supply a meaningfully greater amount of information regarding the use of EHR technology as prescribed by the advancing care information performance category. We believe that this revised policy maintains the alignment with the generally applicable MIPS reporting and scoring requirements under the advancing care information performance category while responding to commenters’ desires for reduced reporting requirements for MIPS APM participants. Therefore, we believe that the revised policy, relative to the proposed policy, has the potential to substantially reduce reporting burden with little to no reduction in our ability to accurately evaluate the adoption and use of EHR technology. We also believe this final policy balances the simplicity of TIN-level group reporting, which can reduce burden, with the flexibility needed to address partial TIN scenarios common among APM Entities in MIPS APMs in which a TIN may have some MIPS eligible clinicians participating in the APM Entity and some MIPS eligible clinicians not in the APM Entity. Table 13 summarizes the finalized APM scoring standard rules for MIPS APMs other than the Shared Savings Program and Next Generation ACO Model.

TABLE 13—APMS SCORING STANDARD FOR MIPS APMS OTHER THAN THE SHARED SAVINGS PROGRAM AND NEXT GENERATION ACO MODEL—2017 PERFORMANCE PERIOD FOR THE 2019 PAYMENT ADJUSTMENT

MIPS Performance category	APM Entity submission requirement	Performance score	Performance category weight %
Quality	The APM Entity group will not be assessed on quality under MIPS in the first performance period. The APM Entity will submit quality measures to CMS as required by the APM.	N/A	0
Cost	MIPS eligible clinicians will not be assessed on cost	N/A	0
Improvement Activities.	APM Entities only need to report improvement activities data if the CMS-assigned improvement activities scores is below the maximum improvement activities score.	CMS will assign the same improvement activities score to each APM Entity group based on the activities required of participants in the MIPS APM. The minimum score is one half of the total possible points. If the assigned score does not represent the maximum improvement activities score, APM Entities will have the opportunity to report additional improvement activities to add points to the APM Entity group score.	25

TABLE 13—APMS SCORING STANDARD FOR MIPS APMS OTHER THAN THE SHARED SAVINGS PROGRAM AND NEXT GENERATION ACO MODEL—2017 PERFORMANCE PERIOD FOR THE 2019 PAYMENT ADJUSTMENT—Continued

MIPS Performance category	APM Entity submission requirement	Performance score	Performance category weight %
Advancing Care Information.	Each MIPS eligible clinician in the APM Entity group reports advancing care information to MIPS through either group reporting at the TIN level or individual reporting.	CMS will attribute one score to each MIPS eligible clinician in the APM Entity group. This score will be the highest score attributable to the TIN/NPI combination of each MIPS eligible clinician, which may be derived from either group or individual reporting. The scores attributed to each MIPS eligible clinician will be averaged to yield a single APM Entity group score.	75

(15) APM Entity Data Submission Method

Presently, we require APM Entities in MIPS APMS to either use the CMS Web Interface or another data submission mechanism for submitting data on the quality measures for purposes of the APM. We are not currently proposing to change the method used by APM Entities to submit their quality measure data to CMS. Therefore, we expect that APM Entities like the Shared Savings Program ACOs will continue to submit their data on quality measures using the CMS Web Interface data submission mechanism. Similarly, in the event that the Comprehensive ESRD Care (CEC) Initiative is determined to be a MIPS APM, APM Entities in the CEC would continue to submit their quality measures to CMS using the Quality Measures Assessment Tool (QMAT) for purposes of the CEC quality performance assessment under the APM. We proposed that all MIPS eligible clinicians in APM Entities participating in MIPS APMS would be required to use one of the proposed MIPS data submission mechanisms to submit data for the advancing care information performance category.

The following is a summary of the comments we received regarding the method used by APM Entities to submit quality data for purposes of MIPS.

Comment: One commenter requested that all APM Entities be required to use the QRDA III data submission method because many EHRs now support this

standard. Another commenter supported retaining the CMS Web Interface as the submission method for quality data for APM Entities participating in the Shared Savings Program. One commenter suggested that the improvement activities information could be collected via the CMS Web Interface. Another commenter suggested that all MIPS performance categories be submitted via web-based reporting. Some commenters communicated that MIPS eligible clinicians participating in APMS should not have to report quality data separately to both APMS and MIPS and another commenter suggested that MIPS APM participants only be required to submit data for the quality and improvement activities performance categories.

Response: We appreciate the commenter's support and suggestions. We believe the policies that we are adopting in this final rule regarding data submission minimize reporting burden and disruption to APM participants and we will continue to consider new reporting methods in the future.

Comment: A commenter recommended that the data collection processes be standardized and data submission be minimized to the extent that data can be used for various purposes within the Medicare program because rural practices often have human and IT infrastructure resource limitations.

Response: We thank the commenters for their input and believe that the

finalized policies for the APM scoring standard represent further reductions in reporting burden and reflect our commitment to streamline submissions wherever possible. We will continue to look for ways to reduce reporting burdens without compromising the robustness of our assessments.

We are finalizing without changes our proposal regarding APM Entity data submission for the quality performance category in all MIPS APMS and the advancing care information performance category in the Shared Savings Program. APM Entity groups will not submit data for the improvement activities performance category unless the improvement activities performance category score we assign at the MIPS APM level is less than the maximum score. In this instance, the APM Entities in the MIPS APM would use one of the MIPS data submission mechanisms if they opt to report additional improvement activities in order to increase their score for the improvement activities performance category. MIPS eligible clinicians in APM Entity groups participating in MIPS APMS other than the Shared Savings Program may report advancing care information performance category to MIPS using a MIPS data submission mechanism for either group reporting at the TIN level or individual reporting. Table 14 describes data submission methods for the MIPS performance categories under the APM scoring standard.

TABLE 14—APM ENTITY SUBMISSION METHOD FOR EACH MIPS PERFORMANCE CATEGORY

MIPS performance category	APM Entity eligible clinician submission method
Quality	The APM Entity group submits quality measure data to CMS as required under the APM.
Cost	No data submitted by APM Entity group to MIPS.
Improvement Activities	No data submitted by APM Entity group to MIPS unless the assigned score at the MIPS APM level does not represent the maximum improvement activities score, in which case the APM Entity may report additional improvement activities using a MIPS data submission mechanism.
Advancing Care Information	Shared Savings Program ACO participant TINs submit data using a MIPS data submission mechanism. Next Generation ACO Model and other MIPS APM eligible clinicians submit data at either the individual level or at the TIN level using a MIPS data submission mechanism.

(16) MIPS APM Performance Feedback

For the first MIPS performance feedback specified under section 1848(q)(12) of the Act to be published by July 1, 2017, we proposed that all MIPS eligible clinicians participating in MIPS APMs would receive the same historical information prepared for all MIPS eligible clinicians except the report would indicate that the historical information provided to such MIPS eligible clinicians is for informational purposes only. MIPS eligible clinicians participating in APMs have been evaluated for performance only under the APM. Thus, historical information may not be representative of the scores that these MIPS eligible clinicians would receive under MIPS.

For MIPS eligible clinicians participating in MIPS APMs, we proposed that the MIPS performance feedback would consist only of the scores applicable to the APM Entity group for the specific MIPS performance period. For example, the MIPS eligible clinicians participating in the Shared Savings Program and Next Generation ACO Model would receive performance feedback for the quality, improvement activities, and advancing care information performance categories for the 2017 performance period. Because these MIPS eligible clinicians would not be assessed for the cost performance category, information on MIPS performance scores for the cost performance category would not be applicable to these MIPS eligible clinicians.

We also proposed that, for the Shared Savings Program, the performance feedback would be available to the eligible clinicians participating in the Shared Savings Program at the group billing TIN level. For the Next Generation ACO Model we proposed that the performance feedback would be available to all MIPS eligible clinicians participating in the MIPS APM Entity.

We proposed that in the first MIPS performance period, the MIPS eligible clinicians participating in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model would receive performance feedback for the improvement activities and advancing care information performance categories only, as they would not be assessed under the quality or cost performance categories. The information such as MIPS measure score comparisons for the quality and cost performance categories would not be applicable to these MIPS eligible clinicians because no such comparative data would exist. We proposed the performance feedback for MIPS eligible

clinicians participating in these other APMs would be available for each MIPS eligible clinician that submitted MIPS data for these performance categories under their respective APM Entities. We invited comment on these proposals.

The following is a summary of the comments we received regarding our proposals to provide the same historical information as those participating in MIPS, provide feedback on scores for applicable performance categories to the APM Entity group for the specific MIPS performance period, and provide feedback for those participating in the Shared Savings Program at the group TIN level and feedback for those participating in the Next Generation ACO Model and all other MIPS APMs at the individual level.

Comment: One commenter recommended that CMS deliver feedback to clinicians or organizations by no later than October 1 of the reporting year to allow the organization to make appropriate changes in care improvement. One commenter stated that eligible clinicians participating in APMs need timely feedback to provide a clear understanding of patient attribution and performance measurement, and several commenters requested that CMS give feedback more frequently than annually during the first few years of the program.

Response: We appreciate that MIPS eligible clinicians participating in MIPS APMs would prefer to receive feedback as early and often as possible in order to succeed in the Quality Payment Program and continue to improve, and we will continue to explore opportunities to provide more frequent feedback in the future.

We are revising the proposed policy in order to maintain alignment with the generally applicable MIPS performance feedback policies. As noted in section II.E.8.a. of this final rule with comment period, the September 2016 QRUR will be used to satisfy the requirement under section 1848(q)(12)(A)(i) of the Act to provide MIPS eligible clinicians performance feedback on the quality and cost performance categories beginning July 1, 2017. We are finalizing a policy that all MIPS eligible clinicians scored under the APM scoring standard will also receive this performance feedback to the extent applicable, unless they did not have data included in the September 2016 QRUR. MIPS eligible clinicians without data included in the September 2016 QRUR will not receive performance feedback until CMS is able to use data acquired through the Quality Payment Program for performance feedback.

6. MIPS Final Score Methodology

By incentivizing quality and value for all MIPS eligible clinicians, MIPS creates a new mechanism for calculating MIPS eligible clinician payments. To implement this vision, we proposed a scoring methodology that allows for accountability and alignment across the performance categories and minimizes burden on MIPS eligible clinicians. Further, we proposed a scoring methodology that is meaningful, understandable and flexible for all MIPS eligible clinicians. Our proposed methodology would allow for multiple pathways to success with flexibility for the variety of practice types and reporting options. First, we proposed multiple ways that MIPS eligible clinicians may submit data to MIPS for the quality performance category. Second, we provided greater flexibility in the reporting requirements and scoring for MIPS. Third, we proposed that bonus points would be available for reporting high priority measures and electronic reporting of quality data. Recognizing that MIPS is a new program, we also outlined proposals which we believed are operationally feasible for us to implement in the transition year, while maintaining our longer-term vision.

Section 1848(q) of the Act requires the Secretary to: (1) Develop a methodology for assessing the total performance of each MIPS eligible clinician according to performance standards for a performance period for a year; (2) using the methodology, provide a final score for each MIPS eligible clinician for each performance period; and (3) use the final score of the MIPS eligible clinician for a performance period to determine and apply a MIPS payment adjustment factor (and, as applicable, an additional MIPS payment adjustment factor) to the MIPS eligible clinician for the MIPS payment year. In section II.E.5 of the proposed rule (81 FR 28181), we proposed the measures and activities for each of the four MIPS performance categories: Quality, cost, improvement activities, and advancing care information. This section of the final rule with comment period discusses our proposals of the performance standards for the measures and activities for each of the four performance categories under section 1848(q)(3) of the Act, the methodology for determining a score for each of the four performance categories (referred to as a "performance category score"), and the methodology for determining a final score under section 1848(q)(5) of the Act based on the scores determined for each of the four performance categories. We proposed to

define the performance category score in section II.E.6 of the proposed rule (81 FR 28247) as the assessment of each MIPS eligible clinician's performance on the applicable measures and activities for a performance category for a performance period based on the performance standards for those measures and activities. In section II.E.7 of the proposed rule (81 FR 28271), we included proposals for determining the MIPS adjustments factors based on the final score.

As noted in section II.E.2 of the proposed rule (81 FR 28176), we proposed to use multiple identifiers to allow MIPS eligible clinicians to be measured as individuals, or collectively as part of a group or an APM Entity group (an APM Entity participating in a MIPS APM). Further, in section II.E.5.a.(2) of the proposed rule (81 FR 28182), we proposed that data for all four MIPS performance categories would be submitted using the same identifier (either individual or group) and that the final score would be calculated using the same identifier. Section II.E.5.h of the final rule with comment period describes our policies in the event that an APM Entity scored through the APM scoring standard fails reporting. The scoring proposals in section II.E.6 of the proposed rule (81 FR 28247), would be applied in the same manner for either individual submissions, proposed as TIN/NPI, or for the group submissions using the TIN identifier. Unless otherwise noted, for purposes of this section on scoring, the term "MIPS eligible clinician" will refer to clinicians that are reporting and are scored at either the individual or group level, but will not refer to clinicians participating in an APM Entity scored through the APM scoring standard.

Comments related to APM Entity group reporting and scoring for MIPS eligible clinicians participating in MIPS APMs are summarized in section II.E.5.h of this final rule with comment period. All eligible clinicians that participate in APMs are considered MIPS eligible clinicians unless and until they are determined to be either QPs or Partial QPs who elect not to report under MIPS, and are excluded from MIPS, or unless another MIPS exclusion applies. We finalize at § 414.1380(d) that MIPS eligible clinicians in APM Entities that are subject to the APM scoring standard are scored using the methodology under § 414.1370, as described in II.E.5.h of this final rule with comment period.

MIPS eligible clinicians who participate in APMs that are not MIPS APMs as defined in section II.E.5.h of the proposed rule (81 FR 28234) would

report to MIPS as an individual MIPS eligible clinician or group. Unless otherwise specified, the proposals in section II.E.6.a of the proposed rule (81 FR 28247) that relate to reporting and scoring of measures and activities do not affect the APM scoring standard.

Our rationale for our scoring methodology is grounded in the understanding that the MIPS scoring system has many components and numerous moving parts. Thus, we believe it is necessary to set up key parameters around scoring, including requiring MIPS eligible clinicians to report at the individual or group level across all performance categories and generally, to submit information for a performance category using a single submission mechanism. Too many different permutations would create additional complexities that could create confusion amongst MIPS eligible clinicians as to what is or is not allowed.

We have heard from stakeholders about our MIPS proposals. There are some major concerns, particularly for the transition year (MIPS payment year 2019), about program complexity, not having sufficient time to understand the program before being measured, and potentially receiving negative adjustments. Based on stakeholder feedback discussed in this section, we are adjusting multiple parts of our proposed scoring approach to enhance the likelihood MIPS eligible clinicians who may have not had time to prepare can succeed under the program. We believe that these adjustments will enable more robust and thorough engagement with the program over time. Specifically, we have modified performance standards for the performance categories used to evaluate the measures and activities as well as the methodology to create a final score, and we lowered the performance threshold. Thus, we have created a transition year scoring methodology that does the following:

- Provides a negative 4 percent payment adjustment to MIPS eligible clinicians who do not submit any data to MIPS;
- Ensures that MIPS eligible clinicians who submit data and meet program requirements under any of the three performance categories for which data must be submitted (quality, improvement activities, and advancing care information) for at least a 90-day period,²⁰ and have low overall

²⁰ We note there are special circumstances in which MIPS eligible clinicians may submit data for a period of less than 90 days and avoid a negative MIPS payment adjustment. For example, in some

performance in the performance category or categories on which they choose to report may receive a final score at or slightly above the performance threshold and thus a neutral to small positive adjustment, and

- Ensures that MIPS eligible clinicians who submit data and meet program requirements under each of the three performance categories for which data must be submitted (quality, improvement activities, and advancing care information) for at least a 90-day period, and have average to high overall performance across the three categories may receive a final score above the performance threshold and thus a higher positive adjustment, and, for those MIPS eligible clinicians who receive a final score at or above the additional performance threshold, an additional positive adjustment.

a. Converting Measures and Activities Into Performance Category Scores

(1) Policies That Apply Across Multiple Performance Categories

The detailed policies for scoring the four performance categories are described in section II.E.6.a of the proposed rule (81 FR 28248). However, as the four performance categories collectively create a single MIPS final score, there are some cross-cutting policies that we proposed to apply to multiple performance categories.

(a) Performance Standards

Section 1848(q)(3)(A) of the Act requires the Secretary to establish performance standards for the measures and activities in the four MIPS performance categories. Section 1848(q)(3)(B) of the Act requires the Secretary, in establishing performance standards for measures and activities for the four MIPS performance categories, to consider historical performance standards, improvement, and the opportunity for continued improvement. We proposed to define the term, performance standards, at § 414.1305 as the level of performance and methodology that the MIPS eligible clinician is assessed on for a MIPS performance period at the measures and activities level for all MIPS performance categories. We defined the term, MIPS payment year, at § 414.1305 as the calendar year in which MIPS payment adjustments are applied. Performance

circumstances, MIPS eligible clinicians may meet data completeness criteria for certain quality measures in less than the 90-day period. Also, in instances where MIPS eligible clinicians do not meet the data completeness criteria for quality measures submitted, we will provide partial credit for submission of these measures.

standards for each performance category were proposed in more detail in section II.E.6 of the proposed rule (81 FR 28247). MIPS eligible clinicians would know the actual performance standards in advance of the performance period, when possible. Further, each performance category is unified under the principle that MIPS eligible clinicians would know, in advance of the performance period, the methodology for determining the performance standards and the methodology that would be used to score their performance. Table 16 of the proposed rule (81 FR 28249), summarizes the proposed performance standards.

The following is a summary of the comments we received regarding our performance standard proposals.

Comment: Multiple commenters were concerned that the performance standards may not be available in advance of the performance period, or that the performance standards methodologies would only be available "when possible". Commenters requested that CMS publish the performance standards with as much advance notice as possible so that MIPS eligible clinicians will be able to plan and know the standards against which they will be measured.

Response: The performance standard methodology will be known in advance so that MIPS eligible clinicians can understand how they will be measured. For improvement activities and advancing care information, the performance standards are known prior to the performance period and are delineated in this final rule with comment period. For the quality performance category, benchmarks are known prior to the performance period when benchmarks are based on the baseline period. For new measures in the quality performance category, for quality measures where there is no historical baseline data to build the benchmarks, and for measures in the cost performance category, the benchmarks will be based on performance period data and therefore, will not be known prior to the performance period.

When performance standards for certain quality measures are not known prior to the performance period, we are implementing protections for MIPS eligible clinicians who ultimately perform poorly on these measures. For example, as discussed in section II.E.6.a.(2)(b) of this final rule with comment period, we have added quality performance floors for the transition year to protect MIPS eligible clinicians against unexpectedly low performance

scores. For cost measures, the benchmarks will be based on performance period data and cannot be published in advance. However, we do plan to provide feedback on performance so that MIPS eligible clinicians can understand their performance and improve in subsequent years. We will provide feedback before the performance period based on prior period data, illustrating how MIPS eligible clinicians might perform on these measures and we will provide feedback after the performance period based on performance period data, illustrating how MIPS eligible clinicians actually performed on these measures.

In addition, as discussed in section II.E.5.e.(2) of this final rule with comment period, we are also lowering the weight of the cost performance category to 0 percent of the final score for the transition year.

Finally, as discussed in section II.E.7.c of this final rule with comment period, we are lowering the performance threshold for this transition year.

Comment: One commenter stated that the government should not decide on definitions of quality and financial rewards or penalties for meeting such standards.

Response: Section 1848(q)(3)(A) of the Act requires the Secretary to establish performance standards for the measures and activities in the four MIPS performance categories, including quality, and section 1848(q)(1)(A) of the Act generally requires us to develop a scoring methodology for assessing the total performance of each MIPS eligible clinician according to those standards and to use such scores to determine and apply MIPS payment adjustment factors and, as applicable, additional MIPS adjustments. We believe our proposals are consistent with these statutory requirements.

After consideration of the comments, we are finalizing the term, performance standards, at § 414.1305 as the level of performance and methodology that the MIPS eligible clinician is assessed on for a MIPS performance period at the measures and activities level for all MIPS performance categories. We are finalizing at § 414.1380(a) that MIPS eligible clinicians are scored under MIPS based on their performance on measures and activities in four performance categories. MIPS eligible clinicians are scored against performance standards for each performance category and receive a final score, composed of their scores on individual measures and activities, and calculated according to the final score methodology. We are also finalizing at § 414.1380(a)(1) that measures and

activities in the four performance categories are scored against performance standards.

MIPS eligible clinicians will know, in advance of the performance period, the methodology for determining the performance standards and the methodology that will be used to score their performance. MIPS eligible clinicians will know the numerical performance standards in the quality performance category in advance of the performance period, when possible. A summary of the performance standards per performance category is provided in Table 15. As discussed in section II.E.6.a.(2) of this final rule with comment period, we are finalizing at § 414.1380(a)(1)(i) that for the quality performance category, measures are scored between zero and 10 points. Performance is measured against benchmarks. Bonus points are available for both submitting specific types of measures and submitting measures using end-to-end electronic reporting. As discussed in section II.E.6.a.(3) of this final rule with comment period, we are finalizing at § 414.1380(a)(1)(ii) that for the cost performance category, that measures are scored between one and 10 points. Performance is also measured against benchmarks. As discussed in section II.E.6.a.(4), we are also finalizing at § 414.1380(a)(1)(iii) that for the improvement activities performance category each improvement activity is worth a certain number of points. The points for each reported activity are summed and scored against a total potential performance category score of 40 points as discussed in section. As discussed in section II.E.6.a.(5) of this final rule with comment period, we are finalizing at § 414.1380(a)(1)(iv), that for the advancing care information performance category, the performance category score is the sum of a base score, performance score, and bonus score.

As discussed in section II.E.6.a.(2) of this final rule with comment period, we are making changes to the quality performance category in response to comments received and are providing a minimum floor for all submitted measures to provide additional safeguards in the transition year. As discussed in section II.E.6.a.(4) of this final rule with comment period, we are making a minor modification to the improvement activities standard to provide additional clarification on improvement activities scoring and to align with comments received. Further, as discussed in section II.E.5.f of this final rule with comment period, we are making additional changes to the advancing care information performance category to align with comments

received. We are also finalizing our definition of performance category score as defined in § 414.1305 as the assessment of each MIPS eligible clinician's performance on the applicable measures and activities for a performance category for a performance

period based on the performance standards for those measures and activities. Additionally, we are finalizing the definition of the term, MIPS payment year with a modification for further consistency with the statute. Specifically, MIPS payment year is

defined at § 414.1305 as a calendar year in which the MIPS payment adjustment factor, and if applicable the additional MIPS payment adjustment factor, are applied to Medicare Part B payments.

TABLE 15—PERFORMANCE CATEGORY PERFORMANCE STANDARDS FOR THE 2017 PERFORMANCE PERIOD

Performance category	Proposed performance standard	Final performance standard
Quality	Measure benchmarks to assign points, plus bonus points	Measure benchmarks to assign points, plus bonus points with a minimum floor for all measures.
Cost	Measure benchmarks to assign points	Measure benchmarks to assign points.
Improvement Activities ..	Based on participation in activities that align with the patient-centered medical home. Number of points from reported activities compared against a highest potential score of 60 points. Based on participation in the CMS study on improvement activities and measurement; Number of points from reported activities or credit from participation in an APM compared against a highest potential score of 40 points.	Based on participation in activities listed in Table H of the Appendix final rule with comment period. Based on participation as a patient-centered medical home or comparable specialty practice. Based on participation as an APM.
Advancing Care Information.	Based on participation (base score) and performance (performance score). Base score: Achieved by meeting the Protect Patient Health Information objective and reporting the numerator (of at least one) and denominator or yes/no statement as applicable (only a yes statement would qualify for credit under the base score) for each required measure. Performance score: Decile scale for additional achievement on measures above the base score requirements, plus 1 bonus point.	Based on participation (base score) and performance (performance score). Base score: Achieved by meeting the Protect Patient Health Information objective and reporting the numerator (of at least one) and denominator or yes/no statement as applicable (only a yes statement would qualify for credit under the base score) for each required measure. Performance score: Between zero and 10 or 20 percent per measure (as designated by CMS) based upon measure reporting rate, plus up to 15 percent bonus score.

(b) Unified Scoring System

Section 1848(q)(5)(A) of the Act requires the Secretary to develop a methodology for assessing the total performance of each MIPS eligible clinician according to performance standards for applicable measures and activities in each performance category applicable to the MIPS eligible clinician for a performance period. While MIPS has four different performance categories, we proposed a unified scoring system that enables MIPS eligible clinicians, beneficiaries, and stakeholders to understand what is required for a strong performance in MIPS while being consistent with statutory requirements. We sought to keep the scoring as simple as possible, while providing flexibility for the variety of practice types and reporting options. We proposed to incorporate the following characteristics into the scoring methodologies for each of the four MIPS performance categories:

- For the quality and cost performance categories, all measures would be converted to a 10-point scoring system which provides a framework to universally compare different types of measures across different types of MIPS eligible

clinicians. We noted that a similar point framework has been successfully implemented in several other CMS quality programs including the Hospital VBP Program.

- The measure and activity performance standards would be published, where feasible, before the performance period begins, so that MIPS eligible clinicians can track their performance during the performance period. This transparency would make the information more actionable to MIPS eligible clinicians.

• Unlike the PQRS or the EHR Incentive Program, we proposed that we generally would not include “all-or-nothing” reporting requirements for MIPS. The methodology would score measures and activities that meet certain standards defined in section II.E.5 of the proposed rule (81 FR 28181 through 28247) and this section of the final rule with comment period. However, section 1848(q)(5)(B)(i) of the Act provides that under the MIPS scoring methodology, MIPS eligible clinicians who fail to report on an applicable measure or activity that is required to be reported shall be treated as receiving the lowest possible score for the measure or activity. Therefore, MIPS eligible clinicians that fail to

report specific measures or activities would receive zero points for each required measure or activity that they do not submit to MIPS.

- The scoring system would ensure sufficient reliability and validity by only scoring the measures that meet certain standards (such as the required case minimum). The standards are described later in this section.
- The scoring proposals provide incentives for MIPS eligible clinicians to invest and focus on certain measures and activities that meet high priority policy goals such as improving beneficiary health, improving care coordination through health information exchange, or encouraging APM Entity participation.
- Performance at any level would receive points towards the performance category scores.

We noted that we anticipated scoring in future years would continue to align and simplify. We requested comment on the characteristics of the proposed unified scoring system.

We also proposed at § 414.1325 that MIPS eligible clinicians and groups may elect to submit information via multiple mechanisms; however, they must use the same identifier for all performance categories and they may only use one

submission mechanism per performance category. For example, a MIPS eligible clinician could use one submission mechanism for sending quality measures and another for sending improvement activities data, but a MIPS eligible clinician could not use two submission mechanisms for a single performance category, such as submitting three quality measures via claims and three quality measures via registry. We did intend to allow flexibility, for example, in rare situations where a MIPS eligible clinician submits data for a performance category via multiple submission mechanisms (for example, submits data for the quality performance category through a registry and QCDR), we would score all the options (such as scoring the quality performance category with data from a registry, and also scoring the quality performance category with data from a QCDR) and use the highest performance category score for the MIPS eligible clinician final score. We would not however, combine the submission mechanisms to calculate an aggregated performance category score.

In carrying out MIPS, section 1848(q)(1)(E) of the Act requires the Secretary to encourage the use of QCDRs under section 1848(m)(3)(E) of the Act. In addition, section 1848(q)(5)(B)(ii) of the Act provides that under the methodology for assessing the total performance of each MIPS eligible clinician, the Secretary shall encourage MIPS eligible clinicians to report on applicable measures under the quality performance category through the use of CEHRT and QCDRs. To encourage the use of QCDRs, we proposed opportunities for QCDRs to report new and innovative quality measures. In addition, several improvement activities emphasize QCDR participation. Finally, we proposed under section II.E.5.a of the proposed rule (81 FR 28181) for QCDRs to be able to submit data on all MIPS performance categories. We believe these flexible options would allow MIPS eligible clinicians to meet the submission criteria for MIPS in a low burden manner, which in turn may positively affect their final score. We further believe these flexibilities encourage use of end-to-end electronic data extraction and submission where feasible today, and foster further development of methods that avoid manual data collection where automation is a valid, reliable option and that promote the goal of capturing data once and re-using it for multiple appropriate purposes.

In addition, section 1848(q)(5)(D) of the Act lays out the requirements for incorporating performance

improvement into the MIPS scoring methodology beginning with the second MIPS performance period, if data sufficient to measure improvement is available. Section 1848(q)(5)(D)(ii) of the Act also provides that achievement may be weighted higher than improvement. Stated generally, we consider achievement to mean how a MIPS eligible clinician performs relative to performance standards, and improvement to mean how a MIPS eligible clinician performs compared to the MIPS eligible clinician's own previous performance on measures and activities in a performance category. Improvement would not be scored for the transition year of MIPS, but we solicited comment on how best to incorporate improvement scoring for all performance categories.

The following is a summary of the comments we received regarding our proposal for a unified scoring system.

Comment: Some commenters expressed support for the unified scoring system and agreed with having a unified and simplified scoring system, but some believed the proposed scoring methodology for MIPS is confusing and requires more alignment across performance categories. Commenters noted that physicians will not be able to understand how CMS calculated their score and would not know if appeals to CMS would be needed in order to correct information or plan for the future. Several commenters requested one single score, or fewer than four separate performance category scores, rather than aggregating individual scores for the four performance categories. Others noted the need for feedback prior to scoring. Others recommended simplifying the scoring system by aligning it across performance categories, and one commenter expressed concern about the total number of measures and activities across the four performance categories adding complexity to the scoring.

Response: Despite our efforts to create a transparent and standardized scoring system, we understand that some stakeholders may be concerned about the scoring complexity and may want more alignment across categories. We also understand stakeholders' requests for feedback prior to scoring. Several of our core objectives for MIPS are to promote program understanding and participation through customized communication, education, outreach and support, and to improve data and information sharing to provide accurate, timely, and actionable feedback to MIPS eligible clinicians. Prior to receiving a payment adjustment, MIPS eligible clinicians will receive timely

confidential feedback on their program performance as discussed in section II.E.8.a of this final rule with comment period.

We have simplified the overall scoring approach for MIPS eligible clinicians in the transition year. Under this scoring approach, MIPS eligible clinicians who report measures/activities with minimal levels of performance will not be subject to negative payment adjustments if their final score is at or above the performance threshold. We believe having scores for individual performance categories aligns with the statute; however, we have provided numerous examples within section II.E.6.a.(2)(g) of this final rule with comment period to provide transparency as to how we will calculate MIPS eligible clinicians' scores and help MIPS eligible clinicians to understand how to succeed in the program. Further, we will continue to provide additional materials to create a transparent and standardized scoring system.

Comment: Commenters expressed concern that the unified scoring system may not allow consumers and payers to make meaningful comparisons across MIPS eligible clinicians. The commenters' reasons for concern include the varied reporting options and different score denominators.

Response: We have taken a patient-centered approach toward implementing our unified scoring system, which does allow for special circumstances for certain types of practices such as non-patient facing professionals, as well as small practices, rural practices and those in HPSA geographic areas. We believe our approach balances the interests of patients and payers while also providing flexibility for the variety of MIPS eligible clinician practices and encourages more collaboration across practice types.

Comment: Multiple commenters requested clarification on evaluating group performance within each of the four performance categories; specifically, whether it is CMS's intent to evaluate each individual within a group and somehow aggregate that performance into a composite group score or to evaluate the group as a single entity.

Response: Evaluation of group practices and individual practices is discussed under each performance category in sections II.E.5.b., II.E.5.e., II.E.5.f., and II.E.5.g. of this final rule with comment period.

Comment: One commenter requested that CMS explain the benefit of

reporting via QCDR and why this method is emphasized in the proposed rule.

Response: QCDRs have more flexibility to collect data from different data sources and to rapidly develop innovative measures that can be incorporated into MIPS. Therefore, we believe that QCDRs provide an opportunity for innovative measurement that is both relevant to MIPS eligible clinicians and beneficial to Medicare beneficiaries. In addition, section 1848(q)(1)(E) of the Act requires us to encourage the use of QCDRs.

Comment: Some commenters supported the removal of “all-or-nothing” scoring. One commenter encouraged CMS to create more partial-scoring opportunities.

Response: We appreciate the comment on the removal of “all-or-nothing” scoring. We will take these comments into consideration when considering additional recommendations for partial credit in future rulemaking.

Comment: One commenter expressed concern that CMS cannot measure physician “performance” accurately. The commenter cited multiple sources that supported this statement.

Response: We recognize the challenges in measuring clinician performance and continue to work with stakeholders to address concerns.

After consideration of these comments, we are finalizing all of our policies related to unified scoring as proposed, except we are modifying our proposed policy on scoring quality measures.

We list below all policies we are finalizing related to our proposed unified scoring system.

- For the quality and cost performance categories, all measures will be converted to a 10-point scoring system which provides a framework to universally compare different types of measures across different types of MIPS eligible clinicians.

- The measure and activity performance standards will be published, where feasible, before the performance period begins, so that MIPS eligible clinicians can track their performance during the performance period.

- MIPS eligible clinicians who fail to report specific measures or activities would receive zero points for each required measure or activity that they do not submit to MIPS.

- The scoring policies provide incentives for MIPS eligible clinicians to invest and focus on certain measures and activities that meet high priority policy goals such as improving

beneficiary health, improving care coordination through health information exchange, or encouraging APM Entity participation.

- Performance at any level would receive points towards the performance category scores.

We also are finalizing at § 414.1325 that MIPS eligible clinicians and groups may elect to submit information via multiple mechanisms; however, they must use the same identifier for all performance categories and they may only use one submission mechanism per performance category. For example, a MIPS eligible clinician could use one submission mechanism for sending quality measures and another for sending improvement activities data, but a MIPS eligible clinician could not use two submission mechanisms for a single performance category, such as submitting three quality measures via claims and three quality measures via registry. We did intend to allow flexibility, for example, in rare situations where a MIPS eligible clinician submits data for a performance category via multiple submission mechanisms (for example, submits data for the quality performance category through a registry and QCDR), we will score all the options (such as scoring the quality performance category with data from a registry, and also scoring the quality performance category with data from a QCDR) and use the highest performance category score for the MIPS eligible clinician final score. We will not however, combine the submission mechanisms to calculate an aggregated performance category score. The one exception to this policy is CAHPS for MIPS, which is submitted using a CMS-approved survey vendor. CAHPS for MIPS can be scored in conjunction with other submission mechanisms.

With regard to the above policy, we note that some submission mechanisms allow for multiple measure types, such as a QCDR could submit data on behalf of an eligible clinician for a mixture of MIPS eQMs and non-MIPS measures. However, we recognize that the scoring of only one submission mechanism in the transition year may influence which measures a MIPS eligible clinician selects to submit for the performance period. For example, a MIPS eligible clinician or group may only be able to report a limited number of measures relevant to their practice through a given submission mechanism, and therefore they may elect to choose a different submission mechanism through which a more robust set of measures relevant to their practice is available. We are seeking comment on whether we should modify this policy

to allow combined scoring on all measures submitted across multiple submission mechanisms within a performance category. Specifically, we are seeking comment on the following questions:

- Would offering a combined performance category score across submissions mechanisms encourage electronic reporting and the development of more measures that effectively use highly reliable, accurate clinical data routinely captured by CEHRT in the normal course of delivering safe and effective care? If so, are there particular approaches to the performance category score combination that would provide more encouragement than others?

- What approach should be used to combine the scores for quality measures from multiple submission mechanisms into a single aggregate score for the quality performance category? For example, should CMS offer a weighted average score on quality measures submitted through two or more different mechanisms? Or take the highest scores for any submitted measure regardless of how the measure is submitted?

- What steps should CMS and ONC consider taking to increase clinician and consumer confidence in the reliability of the technology used to extract, aggregate, and submit electronic quality measurement data to CMS?

- What enhancements to submission mechanisms or scoring methodologies for future years might reinforce incentives to encourage electronic reporting and improve reliability and comparability of CQMs reported by different electronic mechanisms?

We are modifying our proposed policy on scoring quality measures. Specifically, as discussed in section II.E.6.a.(2)(b) of this final rule with comment period, for the transition year, we are providing a global minimum floor of 3 points for all quality measures submitted. As discussed in section II.E.6.a.(2)(c) of the final rule with comment period, we are also modifying our proposed policy in which we would only score the measures that meet certain standards (such as required case minimum). For the transition year, we are automatically providing 3 points for quality measures that are submitted, regardless of whether they lack a benchmark or do not meet the case minimum or data completeness requirements. Finally, as discussed in section II.E.6.h of this final rule with comment period, we intend to propose options for scoring based on improvement through future rulemaking.

Various policies related to scoring the four performance categories are finalized at § 414.1380(b) and described in more detail in sections II.E.6.a.(2), II.E.6.a.(3), II.E.6.a.(4), and II.E.5.g.(6) of this final rule with comment period.

(c) Baseline Period

In other Medicare quality programs, such as the Hospital VBP Program, we have adopted a baseline period that occurs prior to the performance period for a program year to measure improvement and to establish performance standards. We view the MIPS Program as necessitating a similar baseline period for the quality performance category. We intend to establish a baseline period for each performance period for a MIPS payment year to measure improvement for the quality performance category and to enable us to calculate performance standards that we can establish and announce prior to the performance period. As with the Hospital VBP Program, we intend to adopt one baseline period for each MIPS payment year that is as close as possible in duration to the performance period specified for a MIPS payment year. In addition, evaluating performance compared to a baseline period may enable other payers to incorporate MIPS benchmarks into their programs. For each MIPS payment year, we proposed at section II.E.6.a.(1)(c) of the proposed rule (81 FR 28250) that the baseline period would be the 12-month calendar year that is 2 years prior to the performance period for the MIPS payment year. Therefore, for the first MIPS payment year (CY 2019 payment adjustments), for the quality performance category, we proposed that the baseline period would be CY 2015 which is 2 years prior to the proposed CY 2017 performance period. As discussed in section II.E.6.a.(2)(a) of the proposed rule (81 FR 28251), we proposed to use performance in the baseline period to set benchmarks for the quality performance category, with the exception of new measures for which we would set the benchmarks using performance in the performance period and an exception for CMS Web Interface reporters, which will use the benchmarks associated with Shared Savings Program. For the cost performance category, we proposed to set the benchmarks using performance in the performance period and not the baseline period, as discussed in section II.E.6.a.(3) of the proposed rule (81 FR 28259). For the cost performance category, we also made an alternative proposal to set the benchmarks using performance in the baseline period. We

proposed to define the term “measure benchmark” for the quality and cost performance categories (81 FR 28250) as the level of performance that the MIPS eligible clinician will be assessed on for a performance period at the measures and activities level.

The following is a summary of the comments we received regarding our proposal to define the baseline period.

Comment: One commenter expressed concern that baseline scoring may be misaligned when using benchmarks from 1 year for the cost performance category and a different year for measures in the quality performance category. Multiple commenters believe all categories should use the same year to determine benchmarks. Some commenters requested that CMS measure MIPS eligible clinicians as close as possible to the performance period, ideally, less than 2 years from the performance period. Others noted concern about the ability of a clinician to correct actions with 2-year old data.

Response: Ideally, we would like to have data sources for our benchmarks aligned across the quality and cost performance categories. However, we have purposefully chosen different periods for the quality and cost performance categories. We proposed to use the baseline period for benchmarks for the quality performance category so that MIPS eligible clinicians can know quality performance category benchmarks in advance; however, we believe there are disadvantages to benchmarking cost measures to a previous year. For example, development of a new technology or a change in payment policy could result in a significant change in typical cost from year to year. Therefore, for more accurate data, it is better to build cost benchmarks from performance period data than the baseline period. We believe there is more value in the advance notice for quality performance measures so that MIPS eligible clinicians can benchmark themselves for quality measures when historical data is available. In contrast, for the cost performance category, we believe it is more beneficial to base benchmarks on the performance period. After considering comments, we are finalizing that the baseline period will be the 12-month calendar year that is 2 years prior to the performance period for the MIPS payment year. We believe that 2 years is the most recent data we can use to develop benchmarks prior to the performance period.

We will use performance in the baseline period to set benchmarks for the quality performance category, with the exception of new quality measures,

or quality measures that lack historical data, for which we would set the benchmarks using performance in the performance period, and an exception for CMS Web Interface reporters which we will use the benchmarks associated with the Shared Savings Program. For the cost performance category, we will set the benchmarks using performance in the performance period and not the baseline period. We are defining the term “measure benchmark” for the quality and cost performance categories at § 414.1305 as the level of performance that the MIPS eligible clinician is assessed on for a specific performance period at the measures and activities level.

(2) Scoring the Quality Performance Category

In section II.E.5.b.(3) of the proposed rule, we proposed multiple ways that MIPS eligible clinicians may submit data for the quality performance category to MIPS; however, we proposed that the scoring methodology would be consistent regardless of how the data is submitted. In summary, we proposed at § 414.1380(b)(1) to assign 1–10 points to each measure based on how a MIPS eligible clinician’s performance compares to benchmarks. Measures must have the required case minimum to be scored. We proposed that if a MIPS eligible clinician fails to submit a measure required under the quality performance category criteria, then the MIPS eligible clinician would receive zero points for that measure. We proposed that MIPS eligible clinicians would not receive zero points if the required measure is submitted (meeting the data completeness criteria as defined in section II.E.5.b.(3)(b) of the proposed rule (81 FR 28188) but is unable to be scored for any of the reasons listed in section II.E.6.a.(2) of the proposed rule (81 FR 28250), such as not meeting the required case minimum or a measure lacks a benchmark. We described in section II.E.6.a.(2)(d) of the proposed rule (81 FR 28254), examples of how points would be allocated and how to compute the overall quality performance category score under these scenarios. Bonus points would be available for reporting high priority measures, defined as outcome, appropriate use, efficiency, care coordination, patient safety, and patient experience measures.

As discussed in section II.E.6.a.(2)(g) of the proposed rule (81 FR 28256), the quality performance category score would be the sum of all the points assigned for the scored measures required for the quality performance category plus the bonus points (subject

to the cap) divided by the sum of total possible points. Examples of the calculations were provided in the proposed rule (81 FR 28256).

In section II.E.6.b of the proposed rule (81 FR 28269), we discussed how we would score MIPS eligible clinicians who do not have any scored measures in the quality performance category. The details of the proposed scoring methodology for the quality performance category are described below.

(a) Quality Measure Benchmarks

For the quality performance category, we proposed at section II.E.6.a.(2)(a) of the proposed rule (81 FR 28251) that the performance standard is measure-specific benchmarks. Benchmarks would be determined based on performance on measures in the baseline period. For quality performance category measures for which there are baseline period data, we proposed to calculate an array of measure benchmarks based on performance during the baseline period, breaking baseline period measure performance into deciles. Then, a MIPS eligible clinician's actual measure performance during the performance period would be evaluated to determine the number of points that should be assigned based on where the actual measure performance falls within these baseline period benchmarks. If a measure does not have baseline period information (for example, new measures), or if the measure specifications for the baseline period differ substantially from the performance period (for example, when the measure requirements change due to updated clinical guidelines), then we proposed to determine the array of benchmarks based on performance on the measure in the performance period, breaking the actual performance on the measure into deciles. In addition, we proposed to create separate benchmarks for submission mechanisms that do not have comparable measure specifications. For example, several eCQMs have specifications that are different than the corresponding measure from registries. We proposed to develop separate benchmarks for EHR submission mechanisms, claims submission mechanisms, and QCDRs and qualified registry submission mechanisms.

For CMS Web Interface reporting, we proposed to use the benchmarks from the Shared Savings Program as described at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/sharedsavingsprogram/Quality-Measures-Standards.html>,

which were finalized in previous rulemaking.²¹ We proposed to adopt the Shared Savings Program performance year benchmarks for measures that are reported through the CMS Web Interface for the MIPS performance period, but proposed to apply the MIPS method of assigning 1 to 10 points to each measure as an alternative to calculating separate MIPS benchmarks. Because the Shared Savings Program does not publicly post or use benchmarks below the 30th percentile, we proposed to assign all scores below the 30th percentile a value of 2 points, which is consistent with the mid-cluster approach we proposed for topped out measures. We believed using the same benchmarks for MIPS and the Shared Savings Program for the CMS Web Interface measures would be appropriate because, as is discussed in the proposed rule (81 FR 28237 through 28243), we proposed to use the MIPS benchmarks to score MIPS eligible clinicians in the Shared Savings Program and the Next Generation ACO Model on the quality performance category and believe it is important to not have conflicting benchmarks. We would post the MIPS CMS Web Interface benchmarks with the other MIPS benchmarks.

As an alternative approach, we considered creating CMS Web Interface specific benchmarks for MIPS instead of using the Shared Savings Program benchmarks. This alternative approach for MIPS benchmarks would be restricted to CMS Web Interface reporters and would not include other MIPS data submission methods or other data sources which are currently used to create the Shared Saving Program benchmarks. This alternative would also apply the topped out cluster approach if any measures are topped out. While we see benefit in having CMS Web Interface methodology match the other MIPS benchmarks, we are also concerned about the Shared Saving Program and the Next Generation ACO Model participants having conflicting benchmark data. We requested

²¹ Shared Saving Program quality performance benchmarks and scoring methodology regulations: Medicare Program; Medicare Shared Savings Program; Accountable Care Organizations; Final Rule, 76 FR 67802 (Nov. 2, 2011). Medicare Program; Revisions to Payment Policies under the Physician Fee Schedule, Clinical Laboratory Fee Schedule & Other Revisions to Part B for CY 2014; Final Rule, 78 FR 74230 (Dec. 10, 2013). Medicare Program; Revisions to Payment Policies under the Physician Fee Schedule, Clinical Laboratory Fee Schedule & Other Revisions to Part B for CY 2015; Final Rule, 79 FR 67907 (Nov. 13, 2014). Medicare Program; Revisions to Payment Policies under the Physician Fee Schedule, Clinical Laboratory Fee Schedule & Other Revisions to Part B for CY 2016; Final Rule, 80 FR 71263 (Nov. 16, 2015).

comments on building CMS Web Interface specific benchmarks.

We proposed that all MIPS eligible clinicians, regardless of whether they report as an individual or group, and regardless of specialty, that submit data using the same submission mechanism would be included in the same benchmark. We proposed to unify the calculation of the benchmark by using the same approach as the VM of weighting the performance rate of each MIPS eligible clinician and group submitting data on the quality measure by the number of beneficiaries used to calculate the performance rate so that group performance is weighted appropriately (77 FR 69321 through 69322). We would also include data from APM Entity submissions in the benchmark but would not score APM Entities using the MIPS scoring methodology. For APM scoring, we refer to section II.E.5.h. of the proposed rule (81 FR 28234).

To ensure that we have robust benchmarks, we proposed that each benchmark must have a minimum of 20 MIPS eligible clinicians who reported the measure meeting the data completeness requirement defined in section II.E.5.b.(3) of the proposed rule (81 FR 28185), as well as meeting the required case minimum criteria for scoring that is defined later in this section. We proposed a minimum of 20 because, as discussed below, our benchmarking methodology relies on assigning points based on decile distributions with decimals. A decile distribution requires at least 10 observations. We doubled the requirement to 20 so that we would be able to assign decimal point values and minimize cliffs between deciles. We did not want to increase the benchmark sample size requirement due to concerns that an increase could limit the number of measures with benchmarks.

We also proposed that MIPS eligible clinicians who report measures with a performance rate of 0 percent would not be included in the benchmarks. In our initial analysis, we identified some measures that had a large cluster of eligible clinicians with a 0 percent performance rate. We were concerned that the 0 percent performance rate represents clinicians who are not actively engaging in that measurement activity. We did not want to inappropriately skew the distribution. We solicited comment on whether or not to include 0 percent performance in the benchmark.

We proposed at § 414.1380(b)(1)(i) to base the benchmarks on performance in the baseline period when possible. We

proposed to publish the numerical benchmarks when possible, prior to the start of the performance period. In those cases, where we do not have comparable data from the baseline period, we proposed to use information from the performance period to establish benchmarks. While the benchmark methodology would be established in a final rule in advance of the performance period, we proposed that the actual numerical benchmarks would not be published until after the performance period for quality measures that do not have comparable data from the baseline period. The methodology for creating the benchmarks was discussed in the proposed rule (81 FR 28251).

We considered not scoring measures that either are new to the MIPS program or do not have a historical benchmark based on performance in the baseline period. This policy would be consistent with the VM policy in which we do not score measures that have no benchmark (77 FR 69322). However, in the proposed rule (81 FR 28252), we expressed concern that such a policy could stifle reporting on innovative new measures because it would take several years for the measure to be incorporated into the performance category score. We also believed that any issues related to reporting a new measure would not disproportionately affect the relative performance between MIPS eligible clinicians.

We also considered a variation on the scoring methodology that would provide a floor for a new MIPS measure. Under this variation, if a MIPS eligible clinician reports a new measure under the quality performance category, the MIPS eligible clinician would not score lower than 3 points for that measure. This would encourage reporting on new measures, but also prevent MIPS eligible clinicians from receiving the lowest scores for a new measure, while still measuring variable performance. Finally, we also considered lowering the weight of a new measure, so that new measures would contribute relatively less to the score compared to other measures. In the end, we did not propose the alternatives we considered, because we wanted to encourage adoption and measured performance of new measures, however, we did request comment on these alternatives, including comments on what the lowest score should be for MIPS eligible clinicians who report a new measure under the quality performance category and protections against potential gaming related to reporting of new measures only. We also sought comments on alternative methodologies for scoring new measures under the quality

performance category, which would assure equity in scoring between the methodology for measures for which there is baseline period data and for new measures which do not have baseline period data available.

Finally, we clarified that some PQRS reporting mechanisms have limited experience with all-payer data. For example, under PQRS, all-payer data was permitted only when reporting via registries for measure groups; reporting via registries for individual measures was restricted to Medicare only. Under MIPS, however, we proposed to have more robust data submissions, as described in section II.E.5.b.(3) of the proposed rule (81 FR 28188). We recognized that comparing all-payer performance to a benchmark that is built, in part, on Medicare data is a limitation and noted we would monitor the benchmarks to see if we need to develop separate benchmarks. We also noted that this data issue would resolve in a year or two, as new MIPS data becomes the historical benchmark data in future years.

The following is a summary of the comments we received regarding our proposals for quality measure benchmarks.

Comment: Commenters generally supported our proposed approach: some commenters supported the establishment of separate benchmarks for submission mechanisms that do not have comparable measure specifications, and another supported using national benchmarks and linear-based scoring in the MIPS performance scoring methodology.

Response: We agree with commenters and are finalizing at § 414.1380(b)(1)(iii) the establishment of separate benchmarks for the following submission mechanisms: EHR submission options; QCDR and qualified registry submission options; claims submission options; CMS Web Interface submission options; CMS-approved survey vendor for CAHPS for MIPS submission options; and administrative claims submission options. We note that the administrative claims benchmarks are for measures derived from claims data, such as the readmission measure. As discussed below, the CMS Web Interface submission benchmarks will be the same as the Shared Savings Program benchmarks for the corresponding Shared Savings Program performance period. We note that assigning separate benchmarks in this manner creates opportunities for clinicians to achieve higher quality scores by selectively choosing submission mechanisms; as discussed in section II.E.5.a.(2) in this

final rule with comment period, we intend to monitor for such activity and to report back on any findings from our monitoring in future rulemaking.

Comment: Commenters requested that CMS provide each measure's benchmarks in advance, with one recommending that CMS do so in the final rule and in future proposed rules so that MIPS eligible clinicians know their target goals or, alternatively, that CMS hold a listening session for input on benchmarks for each measure. The commenters stated that they did not want to be held accountable for performance if benchmarks cannot be provided in advance. One commenter noted that it would be difficult to gauge performance and areas for improvement since benchmarks would not be released in time and real time feedback is needed.

Response: We agree with commenters that quality benchmarks should be made public and should be known in advance when possible so that MIPS eligible clinicians can understand how they will be measured. We are finalizing that measure benchmarks are based on historical performance for the measures based on a baseline period. Those benchmarks will be known in advance of the performance period. We finalize this approach with one exception. The CMS Web Interface will use benchmarks from the corresponding performance year of the Shared Savings Program and not the baseline year. Those benchmarks are also known in advance of the performance period.

When no comparable data exists from the baseline period, then we finalize that we will use information from the performance period (CY 2017 for the transition year, during which MIPS eligible clinicians may report for a minimum of any continuous 90-day period, as discussed in section II.E.4 of this final rule with comment period) to assess measure benchmarks. In this case, while the benchmark methodology is being finalized in this final rule with comment period, the numerical benchmarks will not be known in advance of the performance period. However, as discussed throughout this final rule with comment period, we have added protections to protect MIPS eligible clinicians from poor performance, particularly in the transition year.

Comment: Some commenters did not support the use of 2015 data or other historical data to set the 2017 benchmarks, with one commenter stating that CMS would be using data from periods during which MIPS did not exist and requesting that CMS establish an adequate foundation for

benchmarks based on MIPS data. One commenter recommended that CMS not set benchmarks or hold clinicians accountable for performance until it has established an adequate foundation based on MIPS data. Another emphasized using reliable and valid patient sample sizes or adequate foundation of data to determine benchmarks even if only for limited number of measures.

Response: In establishing the performance standards, we had to choose between two feasible alternatives: Either develop benchmarks based on historical data and provide the numerical benchmarks in advance of the performance period; or use more current data for benchmarks and not provide the numerical benchmarks in advance of the performance period. We believe there is more value in providing advance notice for quality performance category measures so that MIPS eligible clinicians can set a clear performance goal for these measures, provided that historical data is available. In many cases, MIPS quality measures are the same as those available under PQRS, so we believe that using PQRS data is appropriate for a MIPS benchmark. In contrast, we do not believe there is more value in providing advance notice for cost performance category measures since the claims data for the cost performance category can vary due to payment policies, payment rate adjustment and other factors. Therefore, we believe having the cost performance category measures based on performance period data will be more beneficial to MIPS eligible clinicians given that it is based on more current data. For the cost performance category, we believe it is more beneficial to base performance on the performance period.

Comment: A few commenters opposed our benchmarking approach, with some opposing our proposal to separate benchmarks solely by submission mechanism given that medical groups vary by size, location, specialty and other factors which should be built into developing the benchmarks. Commenters recommended specialty-specific benchmarks, benchmarking by region, and benchmarks based on group size (for example, groups with 10–50 clinicians, 51–100 clinicians, 101–500 clinicians, 501–1,000 clinicians, and >1,000 clinicians). In other words, commenters did not believe in one overall benchmark but rather that groups should be compared only to other similar groups (for example, APM entities to APM entities, individuals to individuals, clinicians by specialty and

groups to groups, small practices to small practices, or region by region).

Response: We want the benchmarks to be as broad and inclusive as possible and to establish a single performance standard whenever the measure specifications are comparable. We finalized separate benchmarks by submission mechanism only when the differences in specifications make comparisons less valid. We do not believe differences in specialty, group size, and region create an inherent need for separate benchmarks as the specifications are comparable across each of these categories. Furthermore, we do not expect differences in location, practice size, and other characteristics to impact the quality of care provided. We also want to keep robust sample sizes in each benchmark, and stratifying a benchmark by different characteristics would risk fragmenting the sample size in such a manner that we do not have a valid benchmark for some measures.

We estimated quality performance scores by practice size based on historical data and did not see a systematic difference in performance by practice among MIPS eligible clinicians that submitted complete and reliable data to require a need for separate benchmarks. However, as we monitor the MIPS program, we will continue to evaluate whether we need to further refine and stratify the benchmarks.

Comment: One commenter recommended that CMS should analyze the quality performance data by looking at Medicare and non-Medicare populations separately, and should also examine whether stratifying the performance data by specialty code, site-of-service code, or both will result in more accurate measurement and fair adjustments for physicians who treat the sickest patients.

Response: We want accurate and fair measurement in the MIPS program. We have incorporated measures that have gone through public review. In many cases, we believe the measure developers have considered scenarios where risk adjustment is required to consider mix of patient population and site-of-service and do not believe we need a separate universal policy to further stratify performance by patient mix, specialty, or site of service for all measures. As we move through the transition year, however, we will continue to evaluate the need for additional adjustments or stratification for informational purposes and would make any proposed adjustments through future rulemaking.

Comment: One commenter expressed their belief that integrating data from MIPS eligible clinicians participating in

MIPS APMs with data from MIPS eligible clinicians who do not participate in APMs will skew the universe of reported data toward better performance, as MIPS APM participants tend to be more advanced and well resourced, putting MIPS eligible clinicians who do not participate in APMs at a disadvantage in scoring. The commenter recommended segregating such data for purposes of setting MIPS benchmarks for 2019 payment adjustments.

Response: As discussed above, we believe in having inclusive and robust datasets as possible for benchmarks. We note that we are building benchmarks by comparable submission mechanism and not all submission mechanisms will have APM data; however, we believe it is important to include APM participants when comparable information is available because the benchmark represents the true distribution of performance. We do not want to establish separate, potentially lower, standards of care for clinicians who are not in APMs. In addition, as more MIPS eligible clinicians transition to APMs, we may not have sufficient volume to create benchmark based on MIPS eligible clinicians alone.

Comment: A few commenters believed CMS should not allow a “new” physician’s quality measure performance to count against the practice under Quality Payment Program if they have not been with that practice greater than 6 months. Another commenter recommended that CMS allow physicians who practice less than 12 months to self-identify so that their scoring can take into account the physician’s limited data.

Response: We appreciate the commenter’s feedback and will restrict the data for the benchmarks to MIPS eligible clinicians and, as discussed above, the benchmarks will include comparable APM data, including data from QPs and Partial QPs. We believe these steps will help ensure that the validity and completeness of the benchmark data.

Comment: Some commenters expressed concern regarding the comparability of measures from different EHR vendor systems. One commenter noted that data submitted from different EHR vendor systems may use different methodologies, as well as inconsistent numerators and denominators, and will therefore not be comparable across systems and clinicians. This commenter recommended that CMS work with ONC to standardize data submitted to Medicare across a number of vendor systems. Another commenter requested

that CMS incorporate work by medical societies to implement guides to ensure eCQM calculations and benchmarks are accurate and that different EHRs are accurately capturing eCQMs. Another commenter cautioned that in the case of EHRs, eCQMs are also not uniformly calculated across EHRs, as several different administrative code sets are used. This commenter recommended that CMS create standards and mapping tools to facilitate working across these different codes, ensure consistency when EHR data is exchanged, and ensure eCQM calculations and benchmarks are accurate. The commenter also noted that different EHRs are more accurate at capturing eCQMs.

Response: To date, there have been issues with EHR data accuracy and consistency. We have worked with ONC to address these issues through public feedback mechanisms, the availability of tools to support eCQM testing and value set uploads, and by encouraging vendors to consume the health quality measure format (HQMF) measure specifications directly. As these improvements penetrate to all systems in use by providers, we expect to see improvements in eCQM consistency. We will continue to work with ONC to continue considering the elimination of transitional code systems to further improve alignment of the eCQM data elements, and we will continue to engage with sites and stakeholder organizations to identify methods to further ensure consistency across sites and systems.

Comment: Commenters generally supported our proposal to use the Shared Savings benchmarks for CMS Web Interface. One commenter supported our alternative approach of building our own benchmarks for CMS Web Interface measures.

Response: We appreciate the commenters support and are finalizing our proposal to use the Shared Savings benchmarks for the CMS Web Interface. However, as we discuss in more detail below, we are adding a floor of 3 points for each measure for the transition year. Therefore, any values that are below the 30th percentile will receive a score of 3 points.

Comment: Some commenters agreed that 0 percent performance rates should be excluded from benchmark calculations. One commenter suggested including 0 percent performance rates in benchmark calculations but distinguishing the data that was intentionally submitted from data that was unintentionally submitted from EHR reporting. Another commenter suggested rewarding clinicians that

reported on a measure if more than 50 percent of MIPS eligible clinicians reported zero on that measure and removing zeroes would artificially increase the benchmark for any given measure.

Response: We appreciate that in some circumstances a 0 performance rate may be a valid score; however, we are also concerned about skewing the distribution with potentially inaccurate scores. We are finalizing the policy to exclude 0 percent scores from the benchmarks for the transition year. We will continue to evaluate the impact of 0 percent scores on benchmarks. However, as described below, we are adding a floor for the transition year of MIPS, which will limit the effect of this adjustment on MIPS eligible clinicians' scores.

Comment: One commenter did not agree with our proposal to use the Value Modifier approach to weight the performance of individuals and groups by the number of beneficiaries to create a single set of benchmarks. The commenter was concerned about combining both individuals and groups into one set of benchmarks. The commenter recommended simplifying the performance standards and incorporating aspects of the Shared Savings Program and VM into this MIPS category.

Response: As discussed above, we believe that both individuals and groups reporting through the same submission mechanism are comparable, as the measure specifications are similar. In the proposed rule, we proposed to combine the group and individual data into a single benchmark by using the VM approach of patient weighting. However, after further analysis, we do not believe this approach is appropriate for the MIPS program.

The VM defines relative performance as statistical difference from the mean for a measure, and weights each clinician's performance rate by the number of beneficiaries to identify the average score for a measure, a single unit. However, unlike the VM, in MIPS, we are not defining relative performance by using a single point, but rather a percentile distribution of the reliable clinician summary performance scores. We have taken steps to ensure that each clinician or group score meets certain standards to promote reliability at the group or individual clinician level. For example, the group or individual reporter must meet certain case volume and data completeness standards to be included in the MIPS benchmark. In MIPS, weighting individual or group values by the number of patients is similar to cloning or replicating that

individual or group score in the percentile distribution. In a distribution benchmark, weighting will not have an impact in the following cases: When the distribution of scores is highly compressed (low variance); the distribution of cases is highly compressed (such as, all practices have fairly similar numbers of cases); or when the number of practices is large relative to the typical number of eligible cases for any practice for the measure. However, the difference between unweighted and weighted benchmarks is more likely to have an impact is when the number of eligible cases and corresponding performance scores vary widely across practices. The difference will be exacerbated if there are relatively few practices and/or if practices with especially high or low scores also have a disproportionately large number of cases. For example, assume a given benchmark has one large group and several smaller groups and individual reporters. The large group cares for 20 percent of the beneficiaries represented in the benchmark. If we weight the benchmark by patient weight, then another MIPS eligible clinician with a score just above or just below that performance rate will have a score that is different by a point or two, not because of differences in performance but because of differences in the number of beneficiaries cared for by the group or individual MIPS eligible clinician.

Therefore, we are not finalizing our proposal to patient weight the benchmarks. Instead, we will count each submission, either by individual or group, as a single data point for the benchmark. We believe this data is reliable and the revision simplifies the combination of group and individual performance.

Comment: Some commenters did not agree with our proposal to use performance period data to set benchmarks in instances where the measure is a new measure or there is a change to an existing measure. Instead, the commenter recommended just giving credit for reporting the measure. Another commenter recommended that new measures receive a score equal to the 90th percentile if the reporting rates are met. Another commenter supported not scoring new quality measures until 2 years after introduction. Another commenter recommended that MIPS eligible clinicians reporting new measures be held harmless from negative scoring.

Response: To encourage meaningful measurement, we want to score all available measures for performance, including new measures. However,

because new measures would not have a benchmark available prior to the start of the performance period; we are creating a 3-point new measure floor specifically for new measures and measures without a benchmark based on baseline period data. This floor would be available annually to any measure without a published benchmark. Generally, we would expect new measures to have the 3-point floor for the first 2 years until we get baseline data for that measure. This approach helps to ensure that the MIPS eligible clinicians are protected from a poor performance score that they would not be able to anticipate. As we discussed in section II.E.6.a.(2)(b) below, we are also setting a global 3-point floor for all submitted measures during the transition year. We would like to note that the global 3-point floor for all measures is a policy for the transition year of MIPS. In contrast, the new measure 3-point floor for measures without a previously published benchmark, such as new measures, would be available in future years of MIPS and not just the transition year. We also note that the new measure 3-point floor for measures without a previously published benchmark, is different than class 2 measures, as defined later in section II.E.6.a.(2)(c) of this rule and summarized in Table 17, that lack a benchmark because we do not have a minimum of 20 MIPS eligible clinicians who reported the measure meeting the case minimum and data completeness requirements. The new measure 3-point floor allows MIPS eligible clinicians to be scored on performance in which the lowest score possible for a measure will be 3 points, and the highest possible score is 10 points assuming the new measure has a

benchmark and the MIPS eligible clinician has met the case minimum and data completeness criteria. However, the class 2 measures, as defined in Table 17, is not a floor but rather an automatic score of 3 points, in which MIPS eligible clinicians are not scored on performance and would only receive 3 points for that measure.

We considered giving a set number of points for submitting a new measure, rather than measuring performance. We do not think it is equitable to give the maximum performance score (a score equal to the 90th percentile or the top decile) when other eligible clinicians may receive fewer points based on performance.

Comment: Many commenters expressed support for our alternative approach that if a MIPS eligible clinician reports a new measure under the quality performance category, the MIPS eligible clinician will not score lower than 3 points for that measure. One commenter agreed with the assessment that this would encourage clinicians to report new measures, prevent clinicians from gaming the system by reporting only on new measures to avoid being compared to a benchmark, and still incentivize better performance on the new measure. This commenter also expressed support for the alternative to weight new measures less than measures with existing benchmark data, stating that this will also accomplish the above goals. Two commenters recommended that CMS apply this minimum floor proposal both to the transition year in which the measure is available in MIPS and to the first time the eligible clinician reports on the measure. One commenter noted that this will encourage reporting on new measures and help mitigate potential unintended consequences.

Response: We are finalizing the alternative approach for the scoring of new measures, or measures without a comparable historical benchmark, to have a floor of 3 points until baseline data can be utilized. We note that the floor only applies when the new measure does not have a benchmark based on baseline data and not the first time the eligible clinician reports on the measure in subsequent years.

In addition, for the transition year (first year) only, we are also implementing a global floor of 3 points for all submitted quality measures, not only new measures. This floor, along with changes in the performance threshold, affords MIPS eligible clinicians the ability to learn about MIPS and be protected from a negative adjustment in the transition year for any level of performance.

Comment: One commenter noted that, while ensuring that an eligible clinician reporting a new measure would not receive a score lower than three points may incentivize reporting of new measures, the commenter was concerned that doing so may artificially inflate the measure's benchmark, and adversely affect clinicians reporting the measure in year 2, during which time scoring would no longer be based on an inflated benchmark. This commenter recommended that CMS establish measure benchmarks based only on true measure performance instead of potentially inflated, incentivized performance.

Response: We would like to note that the benchmarks are based on the performance rates for the measures, not on the assigned points. Therefore, the floor for new measures should not affect future benchmarks. Table 16 has an example of how the floor would work.

TABLE 16—EXAMPLE OF USING BENCHMARKS FOR A SINGLE MEASURE TO ASSIGN POINTS WITH A FLOOR OF 3 POINTS

Benchmark decile	Sample quality measure benchmarks (%)	Possible points with 3-point floor	Possible points without 3-point floor
Benchmark Decile 1	0.0–9.5	3.0	1.0–1.9
Benchmark Decile 2	9.6–15.7	3.0	2.0–2.9
Benchmark Decile 3	15.8–22.9	3.0–3.9	3.0–3.9
Benchmark Decile 4	23.0–35.9	4.0–4.9	4.0–4.9
Benchmark Decile 5	36.0–40.9	5.0–5.9	5.0–5.9
Benchmark Decile 6	41.0–61.9	6.0–6.9	6.0–6.9
Benchmark Decile 7	62.0–68.9	7.0–7.9	7.0–7.9
Benchmark Decile 8	69.0–78.9	8.0–8.9	8.0–8.9
Benchmark Decile 9	79.0–84.9	9.0–9.9	9.0–9.9
Benchmark Decile 10	85.0–100	10	10

In this example, we still create an array of percentile distributions for benchmarks and decile breaks.

However, where we would normally assign between 1.0–2.9 points for MIPS eligible clinicians with performance in

the first or second deciles (in this example, performance between 0 and 15.7 percent), we will now assign 3.0

points. In future years, however, as baseline data becomes available for new measures, we would remove the floor and assign points less than 3, as illustrated above. For example, a performance rate of 9.6 percent (start of the 2nd decile), would receive 3.0 points with the floor and only 2.0 points without the floor. This methodology will not affect the scoring for MIPS eligible clinicians with performance in the third decile or higher. In addition, this methodology will not affect the calculation of future benchmarks. We do note, however, that if a MIPS eligible clinician consistently has poor performance, then by the time the baseline data can be used, the MIPS eligible clinician may receive fewer points because the floor has been removed.

After consideration of the comments on quality measure benchmarks, we are finalizing many policies as proposed. Specifically:

- For quality measures for which baseline period data is available, we are establishing at § 414.1380(b)(1)(i) measure benchmarks are based on historical performance for the measure based on a baseline period. Each benchmark must have a minimum of 20 individual clinicians or groups who reported the measure meeting the data completeness requirement and minimum case size criteria and performance greater than zero. We will restrict the benchmarks to data from MIPS eligible clinicians, and, as discussed above, comparable APM data, including data from QPs and Partial QPs.

We will publish the numerical baseline period benchmarks prior to the start of the performance period (or as soon as possible thereafter).

- For quality measures for which there is no comparable data from the baseline period, we are establishing at § 414.1380(b)(1)(ii) that CMS will use information from the performance period to create measure benchmarks. We will publish the numerical performance period benchmarks after the end of the performance period. In section II.E.4 of this final rule with comment period, we are finalizing that for the transition year, the performance period will be a minimum of any continuous 90-day period within CY 2017. Therefore, for MIPS payment year 2019, we will use data submitted for performance in CY 2017, during which MIPS eligible clinicians may report for a minimum of any continuous 90-day period.

- We are establishing at § 414.1380(b)(1)(iii) separate benchmarks are used for the following

submission mechanisms: EHR submission options; QCDR and qualified registry submission options; claims submission options; CMS Web Interface submission options; CMS-approved survey vendor for CAHPS for MIPS submission options, and administrative claims submission options. As discussed above, we are not stratifying benchmarks by other practice characteristics, such as practice size. For the reasons discussed above, we do not believe that there is a compelling rationale for such an approach, and we believe that stratifying could have unintended negative consequences for the stability of the benchmarks, equity across practices, and quality of care for beneficiaries. However, we continue to receive feedback that small practices should have a different benchmark, so we seek comment on any rationales for or against stratifying by practice size we may not have considered.

- We are establishing at § 414.1380(b)(1)(ii)(A) that the CMS Web Interface submission will use benchmarks from the corresponding reporting year of the Shared Savings Program. We will post the MIPS CMS Web Interface benchmarks in the same manner as the other MIPS benchmarks. We are not building CMS Web Interface-specific benchmarks for the MIPS. We will apply the MIPS scoring methodology to each measure. Measures below the 30th percentile will be assigned a value of 3 points during the transition year to be consistent with the global floor established in this rule for other measures. We will revisit this global floor for future years.

We are modifying our proposed policy with regards to patient weighting. Based on public comments, we are not finalizing our proposal to weight the performance rate of each MIPS eligible clinician and group submitting data on the quality measure by the number of beneficiaries used to calculate the performance rate. Instead, we will count each submission, either by an individual or group, as a single data point for the benchmark. We believe the original proposal could create potential unintended distortions in the benchmark. Therefore we believe it is more appropriate to use a distribution of each individual or group submission that meets our criteria to ensure reliable and valid data.

We are also modifying our proposed policy for scoring new measures. Based on public comments, for the transition year and subsequent years of MIPS, we are adding protection against being unfairly penalized for poor performance on measures without benchmarks by finalizing a 3-point floor for new

measures and measures without a benchmark. As discussed in more detail in the next section, for the transition year of MIPS we are also finalizing a 3-point floor for all submitted measures. We will revisit this policy in future years.

(b) Assigning Points Based on Achievement

We proposed in § 414.1380(b)(1)(x) of the proposed rule (81 FR 28251) to establish benchmarks using a percentile distribution, separated into deciles, because it translates measure-specific score distributions into a uniform distribution of MIPS eligible clinicians based on actual performance values. For each set of benchmarks, we proposed to calculate the decile breaks for measure performance and assign points for a measure based on the benchmark decile range in which the MIPS eligible clinician's performance rate on the measure falls. For example, MIPS eligible clinicians in the top decile would receive 10 points for the measure, and MIPS eligible clinicians in the next lower decile would receive points ranging from 9 to 9.9. We proposed to assign partial points to prevent performance cliffs for MIPS eligible clinicians near the decile breaks. The partial points would be assigned based on the percentile distribution.

Table 17 of the proposed rule (81 FR 28252) illustrated an example of using decile points along with partial points to assign achievement points for a sample quality measure. We noted in the proposed rule (81 FR 28252) that any MIPS eligible clinician who reports some level of performance would receive a minimum of one point for reporting if the measure has the required case minimum, assuming the measure has a benchmark.

We did not propose to base scoring on decile distributions for the same measure ranges as described in Table 17 of the proposed rule when performance is clustered at the high end (that is, "topped out" measures), as true variance cannot be assessed. MIPS eligible clinicians report on different measures and may elect to submit measures on which they expect to perform well. For MIPS eligible clinicians electing to report on measures where they expect to perform well, we anticipated many measures would have performance distributions clustered near the top. We proposed to identify "topped out" measures by using a definition similar to the definition used in the Hospital VBP Program: Truncated

Coefficient of Variation²² is less than 0.10 and the 75th and 90th percentiles are within 2 standard errors;²³ or median value for a process measure that is 95 percent or greater (80 FR 49550).²⁴

Using 2014 PQRS quality reported data measures, we modeled the proposed benchmark methodology and identified that approximately half of the measures proposed under the quality performance category are topped out. Several measures have a median score of 100 percent, which makes it difficult to assess relative performance needed for the quality performance category score.

However, we did not believe it would be appropriate to remove topped out measures at this time. As not all MIPS eligible clinicians would be required to report these measures under our proposals for the quality performance category in section II.E.5.b. of the proposed rule (81 FR 28184), it would be difficult to determine whether a measure is truly topped out or if only excellent performers are choosing to report the measure. We also believed removing such a large volume of measures would make it difficult for some specialties to have enough applicable measures to report. At the same time, we did not believe that the highest values on topped out measures convey the same meaning of relative quality performance as the highest values for measures that are not topped out. In other words, we did not believe that eligible clinicians electing to report topped out process measures should be able to receive the same maximum score as eligible clinicians electing to report preferred measures, such as outcome measures.

Therefore, we proposed to modify the benchmark methodology for topped out measures. Rather than assigning up to 10 points per measure, we proposed to limit the maximum number of points a topped out measure can achieve based on how clustered the scores are. We proposed to identify clusters within topped out measures and would assign all MIPS eligible clinicians within the cluster the same value, which would be the number of points available at the midpoint of the cluster. That is, we proposed to take the midpoint of the highest and lowest scores that would pertain if the measure was not topped out and the values were not clustered.

²² The 5 percent of MIPS eligible clinicians with the highest scores, and the 5 percent with lowest scores are removed before calculating the Coefficient of Variation.

²³ This is a test of whether the range of scores in the upper quartile is statistically meaningful.

²⁴ This last criterion is in addition to the HVBP definition.

We proposed to only apply this methodology for benchmarks based on the baseline period. When we develop the benchmarks, we would identify the clusters and state the points that would be assigned when the measure performance rate is in a cluster. We proposed to notify MIPS eligible clinicians when those benchmarks are published with regard to which measures are topped out.

We proposed this approach because we wanted to encourage MIPS eligible clinicians not to report topped out measures, but to instead choose other measures that are more meaningful. We also sought feedback on alternative ways and an alternative scoring methodology to address topped out measures so that topped out measures do not disproportionately affect a MIPS eligible clinician's quality performance category score. Other alternatives could include placing a limit on the number of topped out measures MIPS eligible clinicians may submit or reducing the weight of topped out measures. We also considered whether we should apply a flat percentage in building the benchmarks, similar to the Shared Savings Program, where MIPS eligible clinicians are scored on their percentage of their performance rate and not on a decile distribution and requested comment on how to apply such a methodology without providing an incentive to report topped out measures. Under the Shared Savings Program, 42 CFR 425.502, there are circumstances when benchmarks are set using flat percentages. For some measures, benchmarks are set using flat percentages when the 60th percentile was equal to or greater than 80.00 percent, effective beginning with the 2014 reporting year (78 FR 74759–74763). For other measures benchmarks are set using flat percentages when the 90th percentile was equal to or greater than 95.00 percent, effective beginning in 2015 (79 FR 67925). Flat percentages allow those with high scores to earn maximum or near maximum quality points while allowing room for improvement and rewarding that improvement in subsequent years. Use of flat percentages also helps ensure those with high performance on a measure are not penalized as low performers. We also noted that we anticipate removing topped out measures over time, as we work to develop new quality measures that will eventually replace these topped out measures. We requested feedback on these proposals.

The following is a summary of the comments we received regarding our

proposal to assign points based on achievement.

Comment: Many commenters supported the use of the decile scoring method for non-topped-out measures, including the partial point allocation, but some cautioned that without stronger clarification, the scoring complexity would create considerable confusion among MIPS eligible clinicians. One commenter wanted to know how CMS would capture partial credit in the quality performance category. The commenter also wanted to know if there is a standardized grading scale used to determine where a clinician/practice might fall between 0–10 points.

Response: We appreciate the support for the decile scoring. We are finalizing the decile scoring method for assigning points, but for the transition year, we are also adding a 3-point floor for all submitted measures, as well as for the readmission measure (if the readmission measure is applicable). This means that MIPS eligible clinicians will receive between 3 and 10 points per reported measure. We note that this scoring method allows partial credit because the MIPS eligible clinician can still achieve points even if the MIPS eligible clinician does not submit all the required measures. For example, if the MIPS eligible clinician has six applicable measures yet only submits two measures, then we will score the two submitted measures. However, the MIPS eligible clinician will receive a 0 for every required measure that is not submitted.

Comment: A few commenters requested that CMS not use quality-tiering in MIPS given that regardless of the investment in quality, most MIPS eligible clinicians will receive an average score.

Response: We are not using the quality-tiering methodology in MIPS. We are shifting to the decile scoring system, and, unlike quality tiering, we expect performance to be along a continuum.

Comment: Other commenters were concerned about the scoring criteria, which they believed would not offer guaranteed success just for reporting. Commenters stated that benchmarks and performance standards remain undefined and return on investment is uncertain and requested that CMS revise the quality scoring so that half of the quality score is granted to any practice that just attempts to report.

Response: We would like to note that MACRA requires us to measure performance, not reporting. During this transition year, though, we believe it is important for MIPS eligible clinicians to

learn to participate in MIPS, be rewarded for good performance, and be protected from being unfairly subjected to negative payment adjustments.

Therefore, in addition to scoring measures on performance, we will give at least 3 points for each quality measure that is submitted under MIPS, as well as for the readmission measure (if the readmission measure is applicable). With the lowered performance threshold described in section II.E.7.c. of this final rule with comment period, this will ensure that MIPS eligible clinicians that submit quality data will receive at least a neutral payment adjustment or a small positive payment adjustment.

Comment: A few commenters did not support the decile approach. One commenter proposed that CMS model quality scoring on the advancing care information performance category scoring with a target point total and the ability to exceed that total, and another commenter recommended using flat percentages. One commenter opposed using percentiles, deciles or any other rank-based statistics for performance ranking used for payment adjustments because it does not generate information on statistically significant performance at either end of the performance spectrum and hides real differences that could lead to effective quality improvement. The commenter also believed the proposed approach will always penalize a certain proportion of clinicians. This commenter recommended a methodology which uses some basis of statistical significance or classification based on the underlying spread of the distribution.

Response: All scoring systems have limitations, but we believe the proposed scoring system is appropriate for MIPS. For measures for which there is baseline data, our scoring system bases the benchmarks on this data. This structure aligns with the HVBP and creates benchmarks that are achievable. In addition, we were striving for simplicity, and we believe that comparison to these benchmarks is well aligned. This approach brings attention to measure performance and focuses on quality improvement. We did not propose the flat percentage option as not all measures are structured as a percentage. Finally, we elected not to base the benchmark distribution on statistical significance because those methods can be more difficult to explain, monitor and track. We note also that relative performance is embedded in the MIPS payment adjustment, which is applied to the final score on a linear scale. We are finalizing at

§ 414.1380(b)(1)(ix) to score performance using a percentile distribution, separated by decile categories.

Comment: One commenter encouraged CMS to incorporate health equity into a clinician's quality achievement score in future years.

Response: We will consider this feedback in future rulemaking.

Comment: One commenter requested clarification on how the CAHPS for MIPS survey would be scored. The commenter asked if CMS intended to create a single CAHPS for MIPS overall mean score roll-up or if CMS would score each summary survey measure (SSM) individually to create a CAHPS for MIPS average score.

Response: Each SSM will have an individual benchmark. We will score each SSM individually and compare it against the benchmark to establish the number of points. The CAHPS score will be the average number of points across SSMs.

Comment: Many commenters supported retaining topped out measures and allowing topped out measures to be awarded the maximum number of points. Commenters emphasized that topped out measures allow more specialties to report and that the proposed lower point assignment to topped out measures put clinicians that have limited ability to report and track performance over time at a distinct disadvantage. For this reason, commenters recommended awarding equal points for topped out and non-topped out measures by maintaining the 10-point maximum value, at least in the transition year. Commenters also cited a lack of transparency in how topped out measures are identified, the existing complexity in the quality scoring approach, the fact that measures that are recognized as topped out nationally might not be topped out regionally or locally, and a belief that topped out measures are only reported by a small percentage of eligible physicians for any particular measure. Commenters recommend not removing topped out measures for at least 3 years since it takes that timeframe for new measures to be developed to replace topped out measures and because some topped out measures are critical to clinical care; however, other commenters recommended removing topped out measures since such measures will not appropriately reward high performance. Another commenter requested a year's notice prior to removal.

Response: We agree that MIPS eligible clinicians should understand which measures are topped out. Therefore, we are not going to modify scoring for

topped out measures until the second year the measure has been identified as topped out. The first year that any measure can be identified as topped out is the transition year, that is, the CY 2017 performance period. Thus, we will not modify the benchmark methodology for any topped out measures for the CY 2017 performance period. We will modify the benchmark methodology for topped out measures beginning with the CY 2018 performance period, provided that it is the second year the measure has been identified as topped out. We seek comment on whether, for the second year a measure is topped out, to use a mid-cluster scoring approach, flat rate percentage approach or to remove topped out measures at this time.

Comment: Some commenters recommended that if topped out measures are to be scored differently, we should use the Shared Savings Program approach, not the Hospital VBP approach. One commenter suggested that CMS review these measures after the first performance period to re-evaluate topped out designations. One commenter noted that the methodology for distinguishing topped out measures is flawed since a narrow performance gap only means that performance is high for the cohort of reporting providers and does not reflect the performance of the rest of the population to whom the measure may be applicable. This commenter stated that many of the measures CMS that had deemed topped out were not implemented in PQRS long enough for robust data to have been collected to confirm that designation and thus requested that CMS remove the topped out designation.

Response: As noted above, we are not creating a separate scoring system for topped out measures until the second year that the measure has been identified as topped out based on the baseline quality scores (for example, 2015 performance for the 2017 performance year). Our methodology for selecting topped out measures uses all information available to us. Because we offer the flexibility for most MIPS eligible clinicians to select the measures most relevant to their practice, we generally cannot assess the performance of clinicians on measures that the clinicians do not elect to submit. However, we can assess the performance of clinicians for the readmission measure which is not submitted but which is calculated from administrative claims data. We note that we are not removing topped out measures and that the designation can change if data collection practices and results change. We recognize that the MIPS scoring algorithm may not work as

well for topped out measures; however, for the transition year, we have added protections in place to ensure that MIPS eligible clinicians who report at least one quality measure are protected from being unfairly subjected to a negative adjustment. We also intend to reduce the number of topped out measures in MIPS in future years.

Comment: Commenters requested more transparency in how topped out measures were identified and stressed the importance of identifying topped out measures and the benchmarks for each of before finalizing a separate scoring system for such measures. Some commenters recommended listing them in the final rule with comment period, defining the rationale for maintaining them, and that if advance notice is not possible, topped out measure points should not be reduced. One commenter recommended that we allow the public to provide feedback before designating a measure as topped out to explain why it might appear as such. Another commenter noted that insufficient data is available to determine whether a measure is truly topped out or whether only high performers might have chosen to report a given measure.

Response: We agree that MIPS eligible clinicians should understand which measures are topped out. We will take these comments into consideration for future rulemaking. As discussed above, we are not going to modify scoring for topped out measures until the second year the measure has been identified as topped out.

We plan to identify topped out measures for benchmarks based on the baseline period when we post the detailed measures specifications and the measure benchmarks prior to the start of the performance period. This will count as the first year a measure is identified as topped out. The second year the same measure is topped out, we will apply a topped out measure scoring standard beginning in performance periods occurring in 2018. We note as reflected above we are seeking comment on the topped out measure scoring standard. We also plan to identify topped out measures for benchmarks based on the performance period.

Comment: Most commenters recommended not limiting the number of topped out measures clinicians can submit, with one commenter asking for clarification on whether reporting additional topped out measures would allow a clinician to reach the maximum quality performance category score. Another commenter supported limiting MIPS eligible clinicians to reporting no more than two topped out measures to avoid potential “gaming”.

Response: For the transition year of MIPS, we are not going to limit the number of topped out measures a clinician can submit. Thus, reporting topped out measures could potentially allow a clinician to reach the maximum quality performance category score since the MIPS eligible clinician could receive 10 points for each topped out measure submitted. We will continue to monitor and evaluate the impact of topped out measures and should we deem it necessary, we would propose a limitation of how many topped out measures could be reported through future rulemaking.

Comment: One commenter recommended that CMS reweight topped out measures so as not to impose an unavoidable penalty on specialists. Another commenter suggested CMS re-evaluate and consider expanding its criteria for topped out measures to ensure clinicians' relative quality performance is fairly and accurately tied to payment, while still ensuring that specialists have a sufficient number of measures to select from under MIPS.

Response: We share the concerns that topped out measures may disproportionately affect different specialties. We plan to publicly post which measures are topped out so that commenters will be able to plan accordingly. In addition, for the transition year of MIPS, we are not modifying the scoring for topped out measures. Instead, scoring for topped out measures will be the same as scoring for all other measures. We will continue to monitor and evaluate the impact of topped out measures by various MIPS eligible clinician practice characteristics. We will propose any additional policy changes through future rulemaking. Further, we encourage stakeholders to create new measures that can be used in the MIPS program to replace any topped out measures.

Comment: One commenter recommended removing topped out measures from the CMS Web Interface measures.

Response: We are not proposing to remove topped out measures for MIPS in the transition year, and we do not believe it would be appropriate to remove topped out measures from the CMS Web Interface. The CMS Web Interface measures are used in MIPS and in APMs such as the Shared Savings Program. We have aligned policies where possible, including using the Shared Savings Program benchmarks for the CMS Web Interface measures. We believe any modifications to the CMS Web Interface measures should be

coordinated with Shared Savings Program and go through rulemaking.

Comment: One commenter was concerned about our comment in the proposed rule that approximately half of the MIPS quality measures are topped out and that several have a median score of 100 percent.

Response: We share the commenter's concerns that so many measures are topped out and show little variation in performance. It is unclear if this result is truly due to lack of variation in performance or clinicians are only submitting measures for which they have a good performance. We believe that MIPS eligible clinicians generally should have the flexibility to select measures most relevant to their practice, but one trade-off is not all MIPS eligible clinicians are reporting the same measure. Because removing such a large volume of measures would make it difficult for some specialties to have enough applicable measures to submit, we are not removing these measures from MIPS. As discussed above, we will identify these measures for year 1, but we will not modify the scoring of topped out measures until the second year they have been identified.

Comment: One commenter recommended that CMS identify topped out measures as measures with a median performance rate over 95 percent because the definition is easier to understand. Another commenter requested further clarification on the definition of topped out measures.

Response: We agree that, for process measures that are scored between 0 and 100 percent, using a median greater than 95 percent is a simple way to identify topped out measures. For process measures, we are modifying our proposal to identify topped out measures as those with a median performance rate of 95 percent or higher. For other measures, we are finalizing our proposal to identify topped out measures by using a definition similar to the definition used in the Hospital VBP Program: Truncated Coefficient of Variation is less than 0.10 and the 75th and 90th percentiles are within 2 standard errors.

Comment: One commenter recommended that CMS use historical data to analyze whether allowing clinicians to choose an unrestricted combination of six quality measures out of hundreds of measures would lead to a topped out effect among final scores, and to devise an alternative MIPS measure selection methodology should it find that average final scores are universally inflated. Commenter also recommended that CMS remove topped out measures from the list of quality

measures that MIPS eligible clinicians have to choose from, as measures that generate universally high performance scores fail to appropriately reward performance with higher payment.

Response: We plan to continue evaluating the impact of topped out measures in the MIPS program. Because removing such a large volume of measures would make it difficult for some specialties to have enough applicable measures to report, we are not removing these measures from MIPS in year 1. As discussed above, we will identify these measures for year 1, but we will not modify the scoring of topped out measures until the second year they have been identified.

After consideration of the comments, we are not finalizing all of our policies as proposed.

We are establishing that the performance standard with respect to the quality performance category is measure-specific benchmarks. Specifically, we are finalizing at § 414.1380(b)(1) that, for the 2017 performance period, MIPS eligible clinicians receive three to ten achievement points for each scored quality measure in the quality performance category based on the MIPS eligible clinician's performance compared to measure benchmarks. A MIPS quality measure must have a measure benchmark to be scored based on performance. MIPS quality measures that do not have a benchmark will not be scored based on performance. Instead, these measures will receive 3 points for the 2017 performance period.

We are finalizing at § 414.1380(b)(1)(ix), that measures submitted by MIPS eligible clinicians are scored using a percentile distribution, separated by decile categories. As discussed below, for MIPS payment year 2019, topped out quality measures are not scored differently than quality measures that are not considered topped out. At § 414.1380(b)(1)(x), we finalize that for each set of benchmarks, CMS calculates the decile breaks for measure performance and assigns points based on which benchmark decile range the MIPS eligible clinician's measure rate is between. At § 414.1380(b)(1)(xi) we assign partial points based on the percentile distribution. In § 414.1380(b)(1)(xii) MIPS eligible clinicians are required to submit measures consistent with § 414.1335.

Based on public comments, we are finalizing a modification to our proposal for the benchmark methodology for topped out measures. Specifically, we will not modify the benchmark methodology for topped out measures

for the first year that the measure has been identified as topped out. Rather, for the first year the measure has been identified as topped out we will score topped out measures in the same manner as other measures until the second year the measure has been identified as topped out. The first year that any measure can be identified as topped out is the transition year, that is, the CY 2017 performance period. Thus, we will not modify the benchmark methodology for any topped out measures for the CY 2017 performance period. We will modify the benchmark methodology for topped out measures beginning with the CY 2018 performance period, provided that it is the second year the measure has been identified as topped out. We seek comment on how topped out measures would be scored provided that it is the second year the measure has been identified as topped out. One option would be to score the measures using a mid-cluster approach. Under this approach, beginning with the CY 2018 performance period, we would limit the maximum number of points a topped out measure can achieve based on how clustered the scores are. We would identify clusters within topped out measures and assign all MIPS eligible clinicians within the cluster the same value, which will be the number of points available at the midpoint of the cluster. That is, we would take the midpoint of the highest and lowest scores that would pertain if the measure were not topped out and the values were not clustered. We would only apply this methodology for measures with benchmarks based on the baseline period. When we develop the benchmarks, we would identify the clusters and state the points that would be assigned when the measure performance rate is in a cluster. We would notify MIPS eligible clinicians when those benchmarks are published with regard to which measures are topped out. Another approach would be to remove topped out measures in the CY 2018 performance period, provided that it is the second year the measure has been identified as topped out. In this instance, we would not score these measures. Finally, a third approach would be to apply a flat percentage in building the benchmarks for topped out measures, similar to the Shared Savings Program, where MIPS eligible clinicians are scored on the performance rate rather than their place in the performance rate distribution. We request comment on how to apply such a methodology without providing an incentive to report topped out measures.

Under the Shared Savings Program, 42 CFR 425.502, there are circumstances when benchmarks are set using flat percentages. For some measures, benchmarks are set using flat percentages when the 60th percentile was equal to or greater than 80.00 percent, effective beginning with the 2014 reporting year (78 FR 74759–74763). For other measures benchmarks are set using flat percentages when the 90th percentile was equal to or greater than 95.00 percent, effective beginning in 2015 (79 FR 67925). Flat percentages allow those with high scores to earn maximum or near maximum quality points while allowing room for improvement and rewarding that improvement in subsequent years. Use of flat percentages also helps ensure those with high performance on a measure are not penalized as low performers. We seek comment on each of these three options. Finally, we also note that we anticipate removing topped out measures over time, as we work to develop new quality measures that will eventually replace these topped out measures. We seek comment on at what point in time should measures that are topped out be removed from the MIPS.

We are modifying our proposed approach to identify topped out measures. We had proposed to identify all topped out measures by using a definition similar to the definition used in the Hospital VBP Program: Truncated Coefficient of Variation²⁵ is less than 0.10 and the 75th and 90th percentiles are within 2 standard errors;²⁶ or median value for a process measure that is 95 percent or greater (80 FR 49550).²⁷ However, for process measures, we are defining at § 414.1305 topped out process measures as those with a median performance rate of 95 percent or higher. For other measures, we are defining at § 414.1305 topped out non-process measures using a definition similar to the definition used in the Hospital VBP Program: Truncated Coefficient of Variation is less than 0.10 and the 75th and 90th percentiles are within 2 standard errors.

In addition, as discussed in section II.E.6.a.(2)(a) of this final rule with comment period, we will add a global 3-point floor for all submitted measures for the transition year by assigning the decile breaks for measure performance between 3 and 10 points. We will revisit

²⁵ The 5 percent of MIPS eligible clinicians with the highest scores, and the 5 percent with lowest scores are removed before calculating the Coefficient of Variation.

²⁶ This is a test of whether the range of scores in the upper quartile is statistically meaningful.

²⁷ This last criterion is in addition to the HVBP definition.

this policy in future years. Adding this floor responds to public comments for protections against being unfairly penalized for low performance. Table 16 in section II.E.6.a.(2)(a) illustrates an example of using decile points along with the addition of the 3-point floor to assign achievement points for a sample quality measure. The methodology in this example could apply to measures where the benchmark is based on the baseline period or for new measures where the benchmark is based on the performance period, assuming the measures meet the case minimum requirements and have a benchmark. We will continue to apply the new measure 3-point floor for measures without baseline period benchmarks for performance years after the first transition year. As discussed in section II.E.6.a.(2)(g)(ii) of this final rule with comment period, CMS Web Interface measures below the 30th percentile will be assigned a value of 3 points during the transition year to be consistent with other submission mechanisms. For the transition year, the 3-point floor will apply for all submitted measures regardless of whether they meet the case minimum requirements or have a benchmark, with the exception of measures submitted through the CMS Web Interface, which must still meet the case minimum requirements and have a benchmark in order to be scored. All submitted measures, regardless of submission mechanism, must meet the case minimum requirements, data completeness requirements, and have a benchmark in order to be awarded more than 3 points. We will revisit this policy in future years.
