We would calculate region-specific weights and region-specific pooled historical average payments following the same steps as for hospital-specific weights and hospital-specific pooled average payments. Instead of grouping episodes by the attributed hospital as for hospital-specific calculations, region-specific calculations would group together SHFFT model episodes that were attributed to any IPPS hospital located within the region. The participant-specific and region-specific pooled historical average payments would be blended together as discussed in section III.D.4.b.(6) of the proposed rule. The specific order of steps, and how this step fits in with others, is discussed further in section III.D.4.c. of the proposed rule.

Afterwards, the blended pooled calculations would be “unpooled” by setting the episode benchmark price for episodes with price MS–DRG 482 to the resulting calculation, and by multiplying the resulting calculation by the severity factors to produce the episode benchmark prices for episodes with price MS–DRGs 480 and 481. Applying the discount factor as discussed in III.D.4.b.(10) and III.D.4.c. of the proposed rule would result in the SHFFT model quality-adjusted target prices for episodes with price MS–DRGs 480–482.

For episodes in the AMI model with price MS–DRGs in 280–282 or 246–251 and without readmissions for CABG MS–DRGs, we proposed to follow an analogous procedure to the SHFFT model with the following modifications. First we proposed to group episodes with price MS–DRGs 280–282 separately from episodes with price MS–DRGs 246–251 for the calculations. Second, we proposed to calculate severity factors for episodes with price MS–DRGs 280–282 as—

\[
MS - DRG\ 280\ severity\ factor = \frac{\text{Natl. avg. } MS - DRG\ 280\ episode\ spend}{\text{Natl. avg. } MS - DRG\ 282\ episode\ spend}
\]

\[
MS - DRG\ 281\ severity\ factor = \frac{\text{Natl. avg. } MS - DRG\ 281\ episode\ spend}{\text{Natl. avg. } MS - DRG\ 282\ episode\ spend}
\]

Third, we proposed to calculate hospital-specific weights and region-specific weights for episodes with price MS–DRGs 280–282 as—
Fourth, we proposed to calculate severity factors for episodes with price MS–DRG 246–251 as—

\[
\begin{align*}
MS – DRG 246 severity factor &= \frac{\text{Natl. avg. } MS – DRG 246 episode spend}{\text{Natl. avg. } MS – DRG 251 episode spend} \\
MS – DRG 247 severity factor &= \frac{\text{Natl. avg. } MS – DRG 247 episode spend}{\text{Natl. avg. } MS – DRG 251 episode spend} \\
MS – DRG 248 severity factor &= \frac{\text{Natl. avg. } MS – DRG 248 episode spend}{\text{Natl. avg. } MS – DRG 251 episode spend} \\
MS – DRG 249 severity factor &= \frac{\text{Natl. avg. } MS – DRG 249 episode spend}{\text{Natl. avg. } MS – DRG 251 episode spend} \\
MS – DRG 250 severity factor &= \frac{\text{Natl. avg. } MS – DRG 250 episode spend}{\text{Natl. avg. } MS – DRG 251 episode spend}
\end{align*}
\]

Fifth, we proposed to calculate hospital-specific weights and region-specific weights for episodes with price MS–DRG 246–251 as—

After blending historical and regional pooled episode payments for episodes with price MS–DRGs 280–282, the blended pooled calculations would be “unpooled” by setting the episode benchmark price for price MS–DRG 282 to the resulting calculation, and by multiplying the resulting calculation by the severity factors to produce the episode benchmark prices for price MS–DRGs 280 and 281.

After blending historical and regional pooled episode payments for episodes with price MS–DRGs 246–251, the blended pooled calculations would be “unpooled” by setting the episode benchmark price for price MS–DRG to the resulting calculation, and by multiplying the resulting calculation by the severity factors to produce the episode benchmark prices for price MS–DRGs 246–251.

Applying the discount factor as discussed in III.D.4.b.(10) and III.D.4.c of the proposed rule would result in the quality-adjusted target prices for price MS–DRGs 246–251.

For episodes in the CABG model with price MS–DRGs in 231–236, we proposed to calculate severity factors, hospital-specific weights, and region-specific weights separately for the anchor hospitalization portion of CABG model episodes and the post-anchor hospitalization portion of CABG model episodes.

For the anchor hospitalization portion of CABG model episodes, we proposed to follow an analogous procedure to the SHFFT model with the anchor hospitalization portion of CABG model episodes grouped by the price MS–DRG. Specifically, we proposed to calculate anchor hospitalization severity factors for price MS–DRGs 231–235 as—
We also proposed to calculate participant-specific weights and region-specific weights for the anchor hospitalization portion of CABG model episodes as—

\[
MS - DRG 231 \text{ anchor hosp. severity factor} = \frac{\text{Natl. avg. } MS - DRG 231 \text{ anchor hosp. spend}}{\text{Natl. avg. } MS - DRG 236 \text{ anchor hosp. spend}}
\]

\[
MS - DRG 232 \text{ anchor hosp. severity factor} = \frac{\text{Natl. avg. } MS - DRG 232 \text{ anchor hosp. spend}}{\text{Natl. avg. } MS - DRG 236 \text{ anchor hosp. spend}}
\]

\[
MS - DRG 233 \text{ anchor hosp. severity factor} = \frac{\text{Natl. avg. } MS - DRG 233 \text{ anchor hosp. spend}}{\text{Natl. avg. } MS - DRG 236 \text{ anchor hosp. spend}}
\]

\[
MS - DRG 234 \text{ anchor hosp. severity factor} = \frac{\text{Natl. avg. } MS - DRG 234 \text{ anchor hosp. spend}}{\text{Natl. avg. } MS - DRG 236 \text{ anchor hosp. spend}}
\]

\[
MS - DRG 235 \text{ anchor hosp. severity factor} = \frac{\text{Natl. avg. } MS - DRG 235 \text{ anchor hosp. spend}}{\text{Natl. avg. } MS - DRG 236 \text{ anchor hosp. spend}}
\]

For the post-anchor hospitalization portion of CABG model episodes, we proposed to follow an analogous procedure to the SHFFT model with the post-anchor hospitalization portion of CABG model episodes grouped in the following manner—

- With AMI diagnosis on the anchor inpatient claim and price MS–DRG with major complication or comorbidity (231, 233, or 235)
- With AMI diagnosis on the anchor inpatient claim and price MS–DRG without major complication or comorbidity (232, 234, or 236)

Specifically, we proposed to calculate the post-anchor hospitalization severity factors as—

\[
\text{Count of episodes with price } MS - DRG 231 - 236 = MS - DRG 231 \text{ episode count} \times MS - DRG 231 \text{ anchor hosp. severity factor} + MS - DRG 232 \text{ episode count} \times MS - DRG 232 \text{ anchor hosp. severity factor} + MS - DRG 233 \text{ episode count} \times MS - DRG 233 \text{ anchor hosp. severity factor} + MS - DRG 234 \text{ episode count} \times MS - DRG 234 \text{ anchor hosp. severity factor} + S - DRG 235 \text{ episode count} \times MS - DRG 235 \text{ anchor hosp. severity factor} + MS - DRG 236 \text{ episode count} \times 1
\]

After blending historical and regional pooled anchor hospitalization payments for the CABG model episodes, the blended pooled calculations would be “unpooled” by setting the price MS–DRG 236 anchor hospitalization benchmark price to the resulting calculation, and by multiplying the resulting calculation by the severity factors to produce the anchor hospitalization benchmark prices for price MS–DRGs 231–235.
We also proposed to calculate hospital-specific weights and region-specific weights for the post-anchor hospitalization portion of CABG model episodes as—

After blending historical and regional pooled post-anchor hospitalization payments for the CABG model episodes, the blended pooled calculations would be “unpooled” by setting the without AMI ICD–CM diagnosis code on the anchor inpatient claim and price MS–DRG without major complication or comorbidity (232, 234, or 236) post-anchor hospitalization benchmark price to the resulting calculation, and by multiplying the resulting calculation by the severity factors to produce the post-anchor hospitalization benchmark prices for:

- With AMI diagnosis on the anchor inpatient claim and price MS–DRG with major complication or comorbidity (231, 233, or 235)
- With AMI diagnosis on the anchor inpatient claim and price MS–DRG without major complication or comorbidity (232, 234, or 236)
- Without AMI diagnosis on the anchor inpatient claim and price MS–DRG with major complication or comorbidity (231, 233, or 235)

We proposed to calculate episode benchmark prices for CABG model episodes by summing combinations of CABG anchor hospitalization benchmark prices and CABG post-anchor hospitalization benchmark prices. Applying the discount factor as discussed in III.D.4.b.(10) and III.D.4.d of the proposed rule would result in the quality-adjusted target prices for CABG model episodes.

For episodes in the AMI model with CABG readmissions, we proposed to perform no additional blending of participant-specific and regional-specific episode payments. We proposed to calculate the AMI model episode benchmark and quality-adjusted target prices for such episodes as described in section III.D.4.e. of the proposed rule.

The proposals to combine episodes to set stable benchmark and quality-adjusted target prices for such episodes as described in section III.D.4.e. of the proposed rule.

We received no comments on our proposals for combining episodes.

We received no comments on our proposals for combining episodes.

Final Decision: We are finalizing the proposal, without modification, to combine prices for episodes. Our final policy for combining episodes is included in § 512.300(c)(13). We would note that since we did not finalize our proposal for price MS–DRGs, the term price MS–DRG is excluded and replaced with the term anchor MS–DRG.

(10) Effective Discount Factor

As discussed in section III.D.2.c. of the proposed rule, we proposed to make EPM participants partly or fully accountable for EPM-episode payments in relationship to the EPM quality-adjusted target price (81 FR 50844). As part of this, in setting an episode quality-adjusted target price for an EPM participant, we proposed to apply an effective discount factor to an EPM participant’s participant-specific and regional blended historical EPM-episode payments for a performance period. We expect EPM participants to have a significant opportunity to improve the quality and efficiency of care furnished during episodes in comparison with historical practice, because the EPMs would facilitate the alignment of financial incentives among providers caring for EPM beneficiaries. Our proposed effective discount factors were intended to serve as Medicare’s portion of reduced expenditures from an EPM episode with any EPM-episode expenditures below the quality-adjusted target price potentially available as reconciliation payments to the EPM participant where the anchor hospitalization occurred.
For the EPMs, we proposed to establish a 3 percent effective discount factor to calculate the quality-adjusted target prices for EPM participants in the below acceptable and acceptable quality categories, as discussed in section III.E.3.f. of the proposed rule (81 FR 50887 through 50893) and similar to the CJR model (80 FR 73355). The effective discount factor to calculate the quality-adjusted target price for EPM participants in the good and excellent quality categories would be 2 percent and 1.5 percent, respectively. As discussed in section III.D.2.c. of the proposed rule (81 FR 50844), because of the proposed phase-in of repayment responsibility with no responsibility in either performance year 1 or performance year 2 (NDR) and only partial repayment responsibility in performance year 2 (DR) and all of performance year 3, an EPM participant with actual EPM-episode payments that exceeded the quality-adjusted target prices multiplied by the EPM participant’s number of EPM episodes to which each quality-adjusted target price would apply in performance year 2 (DR) and performance year 3 would owe Medicare less than would otherwise result from this calculation.

Also, as discussed in section III.E.3.f of the proposed rule (81 FR 50801), we proposed to apply an “applicable discount factor” to repayment amounts in performance years 2 and 3 while this repayment responsibility was being phased-in. We refer to section III.E.1. and specifically Tables 20 through 28 in our proposed rule for further illustration of the discount percentages that would apply for reconciliation payment and Medicare repayment over the 5 EPM performance years (81 FR 50888 through 50892). We believe this methodology offers EPM participants an opportunity to create savings for themselves and Medicare, while also maintaining or improving quality of care for EPM model beneficiaries.

The proposal to establish discount factors that would apply to the quality categories was included in § 512.300(d). We sought comment on our proposal to establish discount factors that apply to the quality categories.

The following is a summary of the comments received and our responses.

Comment: Most commenters suggested that the ability to achieve savings under the proposed models (most notably for the cardiac models and the CABG model in particular) was more limited than for the CJR model, and that these limitations would become more significant as target prices decline further over time. For example, commenters opined that while about half of CJR episode spending is attributable to the initial hospitalization, CMS noted that about three-quarters of CABG episode spending is attributable to the initial hospitalization. As such, there are fewer opportunities to achieve efficiencies within the inpatient hospital payment amount because it is a predetermined per-discharge payment based primarily on the patient’s condition, not on services provided. Further, some portion of CABG and AMI costs outside the initial hospitalization is attributable to readmissions; however, these costs are already declining due to hospitals’ responses to the HRRP and any remaining readmissions are more likely to be clinically appropriate and necessary. As such, it would be difficult to achieve efficiencies within the remaining percentage of spending that occurs outside the initial hospitalization. Thus, commenters requested that CMS implement a smaller discount factor than what was proposed—typically a 1 percentage point reduction.

Response: We appreciate the comments and concerns raised with respect to our proposed discount factor. We recognize that, as compared to episodes under the CJR model, opportunities to achieve improved efficiencies under the proposed models would be different and potentially more challenging for participants under the proposed models. However, we do not believe the increased efficiencies needed to be successful as was proposed under the models are unattainable. Given our policy to phase-in full regional pricing over time, participants’ performance will increasingly be compared to that of peers within their region; thus, for the more efficient participants, target pricing would likely be higher than if we relied on participant-specific pricing alone. Further, as discussed in section III.D.4.b.(2), we plan to explore and implement additional adjustments for risk beginning in FY3, which should facilitate successful participants’ ability to achieve savings under the models.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, with modification, to establish discount factors that would apply to the quality categories. Specifically, for repayment amounts in performance year 2, our final applicable discount factor would apply only to participants that elected to include reconciliation payments in their performance year 2 breakup. For performance year 3, an EPM participant would apply only to participants that elected to include reconciliation payments in their performance year 3. Our final policy for the discount factor is included in § 512.300(d).

Response: We appreciate the suggested alternative the commenter offered, but would note that the proposed models are intended to test a bundled payment rather than a shared savings model, which is being tested through Innovation Center and Shared Savings Program ACO efforts.

Final Decision: After considering the public comments received, we are finalizing the proposal, with modification, to establish discount factors that would apply to the quality categories. Specifically, for repayment amounts in performance year 2, our final applicable discount factor would apply only to participants that elected to include reconciliation payments in their performance year 2. For performance year 3, an EPM participant would apply only to participants that elected to include reconciliation payments in their performance year 3. Our final policy for the discount factor is included in § 512.300(d).

Response: We appreciate the comments and concerns raised with respect to our proposed discount factor. We recognize that, as compared to episodes under the CJR model, opportunities to achieve improved efficiencies under the proposed models would be different and potentially more challenging for participants under the proposed models. However, we do not believe the increased efficiencies needed to be successful as was proposed under the models are unattainable. Given our policy to phase-in full regional pricing over time, participants’ performance will increasingly be compared to that of peers within their region; thus, for the more efficient participants, target pricing would likely be higher than if we relied on participant-specific pricing alone. Further, as discussed in section III.D.4.b.(2), we plan to explore and implement additional adjustments for risk beginning in FY3, which should facilitate successful participants’ ability to achieve savings under the models.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, with modification, to establish discount factors that would apply to the quality categories. Specifically, for repayment amounts in performance year 2, our final applicable discount factor would apply only to participants that elected to include reconciliation payments in their performance year 2. For performance year 3, an EPM participant would apply only to participants that elected to include reconciliation payments in their performance year 3. Our final policy for the discount factor is included in § 512.300(d).

c. Approach To Combine Pricing Features for All SHFFT Model Episodes and AMI Model Episodes Without CABG Readmissions

The following presents our proposed methodology for combining the pricing features presented in section III.D.4.b. of the proposed rule with respect to SHFFT model episodes and AMI model episodes without a CABG readmission.

Step 1—Calculate historical EPM-episode payments for episodes that were initiated during the 3-historical-years of each applicable EPM (that is, individually for each of the SHFFT and AMI models) (section III.D.4.b.(3) of the proposed rule) for all IPPS hospitals for all Medicare Part A and B services included in the EPM episodes. Limit the potential AMI model episodes to those episodes with price MS–DRGs in 280–282 or 246–251 and without readmissions for CABG MS–DRGs. We note that specific PBPM payments may be excluded from historical EPM-episode payment calculations as...
discussed in section III.D.6.d. of the proposed rule.

- Step 2—Remove the effects of special payment provisions (section III.D.3.b. of the proposed rule) and normalize for wage index differences (section III.D.4.b.(8) of the proposed rule) by standardizing Medicare FFS payments at the claim-level.
- Step 3—Prorate Medicare payments for included episode services that span a period of care that extends beyond the episode (section III.D.3.c. of the proposed rule).
- Step 4—Trend forward the 2 oldest recent historical years of data to the most recent year of historical data (section III.D.4.b.(4) of the proposed rule).

Separate national trend factors would be applied for each combination of price MS–DRGs.

- Step 5—Cap high episode payment episodes with a region- and price-MS–DRG-specific high payment ceiling (section III.D.3.d. of the proposed rule), using the episode output from the previous step.
- Step 6—Group episodes based on price MS–DRGs (SHFFTs MS–DRGs 480–482; AMI MS–DRGs 280–282; PCI MS–DRGs 246–251). Within each group of episodes, calculate severity factors and EPM participant-specific weights (section III.D.4.b.(9) of the proposed rule) using the episode output from the previous step to pool together episodes in each group of price MS–DRGs, resulting in EPM participant-specific pooled historical average episode payments for each group of price MS–DRGs. Similarly, calculate region-specific weights to calculate region-specific pooled historical average episode payments for each group of price MS–DRGs.
- Step 7—For each EPM participant-specific and region-specific weighted update factors (section III.D.4.b.(5) of the proposed rule) multiply each EPM participant-specific and region-specific pooled historical average episode payment by its corresponding EPM participant-specific and region-specific weighted update factors to calculate EPM participant-specific and region-specific updated, pooled, historical average episode payments.
- Step 8—Blend together each EPM-participant-specific updated, pooled, historical average episode payment with the corresponding region-specific updated, pooled, historical average episode payment according to the proportions for the EPM performance year (III.D.4.b.(6) of the proposed rule). EPM participants that do not have the minimum episode volume across the historical 3 years would use 0.0 percent and 100 percent as the proportions for hospital and region, respectively.
- Step 9—Multiply the outputs of step (8) by the wage normalization factor described in section III.D.4.b.(8) of this final rule to reintroduce geographic variation. For purposes of the proposed rule, we defined the three outputs of this step as the standard episode benchmark price for—
  - SHFFT model episodes with price MS–DRG 482
  - AMI model episodes with price MS–DRG 282 without readmission for CABG, and
  - AMI model episodes with price MS–DRG 251 without readmission for CABG.
- Step 10—Multiply the output of step (9) by the appropriate severity factors (step (6) of this calculation process and detailed in section III.D.4.b.(9) of the proposed rule) to calculate the standard episode benchmark prices for—
  - SHFFT model episodes with price MS–DRGs 480–481
  - AMI model episodes with price MS–DRGs 280–281 without readmission for CABG
  - AMI model episodes with price MS–DRGs 246–250 without readmission for CABG
- Step 11—Multiply the outputs of step (9) and (10) by 1 minus the applicable effective discount factor based on the EPM participant’s quality category as described in sections III.D.4.b.(10) and III.E.3.f. of the proposed rule. For purposes of the proposed rule, we defined the outputs of this step as the episode quality-adjusted target prices for:
  - SHFFT model episodes with price MS–DRGs 480–482
  - AMI model episodes with price MS–DRGs 280–282 without readmission for CABG, and
  - AMI model episodes with price MS–DRGs 246–251 without readmission for CABG.

We would note that because our final policy for inpatient-to-inpatient hospital transfers for AMI episodes does not include chained hospitalizations, the one change to our approach for combining pricing features for CABG model episodes is to replace the term price MS–DRG with the term anchor MS–DRG.

(2) Approach To Combine Pricing Features for Post-Anchor Hospitalization Portion of CABG Model Episodes

- Step 1—Calculate historical episode payments that occurred during the anchor hospitalization of CABG model episodes that were initiated during the 3 historical years (section III.D.4.b.(2) of the proposed rule) for all IPPS hospitals for all Medicare Part A and B services included in the episodes. We note that specific PBPM payments may be excluded from historical episode payment calculations as discussed in section III.D.6. of the proposed rule.
- Step 2—Apply steps III.D.4.c.(2) through (4) to the results of step (1) with trend factors calculated based on the anchor hospitalization portion of CABG model episodes with price MS–DRGs 231–236.
- Step 3—Repeat steps III.D.4.c.(2) through (4) to the results of step (1) with trend factors calculated for all IPPS hospitals for all Medicare Part A and B services included in the episodes. We note that specific PBPM payments may be excluded from historical episode payment calculations as discussed in section III.D.6. of the proposed rule.

We would note that because our final policy for inpatient-to-inpatient hospital transfers for AMI episodes does not include chained hospitalizations, the one change to our approach for combining pricing features for CABG model episodes is to replace the term price MS–DRG with the term anchor MS–DRG.
trend factors calculated based on the post-anchor hospitalization portion of CABG model episodes with price MS–DRGs 231–236, as described in section III.D.4.b.(4) of the proposed rule.

• Step 3—Group the post-anchor hospitalization portion of episodes based on—
  ++ With AMI diagnosis on the anchor inpatient claim and price MS–DRG with major complication or comorbidity (231, 233, or 235)
  ++ With AMI diagnosis on the anchor inpatient claim and price MS–DRG without major complication or comorbidity (232, 234, or 236)
  ++ Without AMI diagnosis on the anchor inpatient claim and price MS–DRG with major complication or comorbidity (231, 233, or 235)
  ++ Without AMI diagnosis on the anchor inpatient claim and price MS–DRG without major complication or comorbidity (232, 234, or 236).

Then apply steps III.D.4.c.(6)–(10) to the post-anchor hospitalization portion of the CABG model episodes with severity factors, hospital-specific weights, and region-specific weights calculated to apply based on the groups previously described in this step. For purposes of the proposed rule, we defined the output of this step as CABG post-anchor hospitalization benchmark prices for CABG model episodes corresponding to the groups described in this step.

We would note that because our final policy for inpatient-to-inpatient hospital transfers for AMI episodes does not include chained anchor hospitalizations, the one change to our approach for combining pricing features for the post-anchor hospitalization portion of CABG model episodes is to replace the term price MS–DRG with the term anchor MS–DRG.

(3) Combine CABG Anchor Hospitalization Benchmark Price and CABG Post-Anchor Hospitalization Benchmark Price

• Step 1—Sum the CABG anchor hospitalization benchmark price corresponding to each price CABG MS–DRG and the CABG post-anchor hospitalization price corresponding to each of the post-anchor hospitalization groupings described in III.D.4.d.(2) of the proposed rule. For purposes of the proposed rule, we defined the outputs of those calculations to be CABG model episode benchmark prices for—
  ++ CABG model episodes with price MS–DRG 231 and with AMI diagnosis;
  ++ CABG model episodes with price MS–DRG 232 and with AMI diagnosis;
  ++ CABG model episodes with price MS–DRG 233 and with AMI diagnosis;
  ++ CABG model episodes with price MS–DRG 234 and with AMI diagnosis;
  ++ CABG model episodes with price MS–DRG 235 and with AMI diagnosis;
  ++ CABG model episodes with price MS–DRG 236 and with AMI diagnosis.

The following presents our proposed methodology for combining the pricing features presented in section III.D.4.b of the proposed rule with respect to AMI model episodes with a CABG readmission (81 FR 50864). In general, the AMI model episode benchmark price for AMI model episodes with CABG readmission is the sum of the applicable standard AMI model episode benchmark price for an AMI episode without readmission corresponding to the AMI price MS–DRG and the applicable CABG anchor hospitalization benchmark price for a CABG model episode corresponding to the CABG readmission MS–DRG in the AMI model.

• Step 1—For each combination of AMI price MS–DRG and CABG readmission MS–DRG, sum the corresponding AMI model episode benchmark price and CABG anchor hospitalization benchmark price. This results in 54 possible CABG readmission AMI model episode benchmark prices, corresponding to—
  ++ Price MS–DRG 280; Readmission MS–DRG 231;
MS–DRG 236; ++ Price MS–DRG 249; Readmission MS–DRG 231; ++ Price MS–DRG 249; Readmission MS–DRG 232; ++ Price MS–DRG 249; Readmission MS–DRG 233; ++ Price MS–DRG 249; Readmission MS–DRG 234; ++ Price MS–DRG 249; Readmission MS–DRG 235; ++ Price MS–DRG 249; Readmission MS–DRG 236; ++ Price MS–DRG 250; Readmission MS–DRG 231; ++ Price MS–DRG 250; Readmission MS–DRG 232; ++ Price MS–DRG 250; Readmission MS–DRG 233; ++ Price MS–DRG 250; Readmission MS–DRG 234; ++ Price MS–DRG 250; Readmission MS–DRG 235; ++ Price MS–DRG 250; Readmission MS–DRG 236; ++ Price MS–DRG 250; Readmission MS–DRG 231; ++ Price MS–DRG 251; Readmission MS–DRG 232; ++ Price MS–DRG 251; Readmission MS–DRG 233; ++ Price MS–DRG 251; Readmission MS–DRG 234; ++ Price MS–DRG 251; Readmission MS–DRG 235; ++ Price MS–DRG 251; Readmission MS–DRG 236; ++ Price MS–DRG 251; Readmission MS–DRG 231; ++ Price MS–DRG 251; Readmission MS–DRG 232; ++ Price MS–DRG 251; Readmission MS–DRG 233; ++ Price MS–DRG 251; Readmission MS–DRG 234; ++ Price MS–DRG 251; Readmission MS–DRG 235; and ++ Price MS–DRG 251; Readmission MS–DRG 236.

We proposed to compare each EPM participant’s actual EPM episode payments to its quality-adjusted target price. We proposed, as discussed in section III.D.4. of the proposed rule, that an EPM participant would have multiple quality-adjusted target prices for EPM episodes ending in a given performance year, based on the anchor MS–DRG for the EPM episode, whether the EPM episode included a chained anchor hospitalization; whether the EPM episode included readmission for CABG MS–DRGs; whether the EPM episode included an AMI ICD–CM diagnosis code on the anchor inpatient claim; the performance year when the EPM episode was initiated; when the EPM episode was initiated within a given performance year (January 1 through September 30 of the performance year, October 1 through December 31 of the performance year, October 1 through December 31 of the prior performance year); and the potential effective discount factors. The difference between each EPM episode’s actual EPM episode payment and the relevant quality-adjusted target price under the EPM (calculated as quality-adjusted target price subtracted by actual EPM episode payment) would be aggregated for all EPM episodes in each EPM for an EPM participant within the performance year, representing the NPRA. For performance year 2, we would perform two separate aggregations in order to create two NPRA—–one reflecting episodes that ended during performance year 2 (NDR), and a second for episodes that ended during performance year 2 (DR).

We proposed to not include any reconciliation payments or repayments to Medicare under the EPMs for a given performance year when calculating actual episode spending and, therefore the NPRA for a subsequent performance year. We want to incentivize providers to provide high-quality and efficient care in all years of the EPMs. If reconciliation payments for a performance year were counted as Medicare expenditures in a subsequent performance year, an EPM participant would experience higher Medicare expenditures in the subsequent performance year as a consequence of

We proposed to not include any reconciliation payments or repayments to Medicare under the EPMs for a given performance year when calculating actual episode spending and, therefore the NPRA for a subsequent performance year. We want to incentivize providers to provide high-quality and efficient care in all years of the EPMs. If reconciliation payments for a performance year were counted as Medicare expenditures in a subsequent performance year, an EPM participant would experience higher Medicare expenditures in the subsequent performance year as a consequence of
providing high-quality and efficient care in the prior performance year, negating some of the incentive to perform well in the prior year. Therefore, we proposed to not have the NPRA for a given performance year be impacted by EPM repayments or reconciliation payments made in a prior performance year. For example, if an EPM participant receives a $10,000 reconciliation payment in the second quarter of 2018 for achieving episode spending below the quality-adjusted target price for performance year 1, that $10,000 reconciliation payment amount would not be included in the performance year 2 calculations of actual EPM-episode payments.

The NPRA would be subject to the stop-loss and stop-gain limits described in section III.D.7.b. and III.D.7.c.(1) of the proposed rule.

b. Payment Reconciliation

We proposed to retrospectively reconcile an EPM participant’s actual EPM-episode payments against the quality-adjusted target prices 2 months after the end of the performance year (81 FR 50865 through 50867). Specifically, we would capture claims submitted by March 1st following the end of the performance year and carry out the NPRA calculation as described previously to make an EPM reconciliation payment or hold participants responsible for repayment, as applicable, in quarter 2 of that calendar year.

We also proposed that during the following performance year’s reconciliation process, we would calculate the prior performance year’s actual EPM episode payments a second time to account for final claims run-out and any canceled EPM episodes, due to overlap with other models or other reasons as specified in section III.C.4.b of the proposed rule. This calculation, termed the subsequent reconciliation, would occur approximately 14 months after the end of the prior performance year. As discussed later in that section, the amount from this calculation, if different from zero, would be applied to the NPRA for the subsequent performance year, as well as the post-episode spending and ACO overlap calculation in order to determine the amount of the payment Medicare would make to the EPM participant or such participant’s repayment amount. We note that the subsequent reconciliation calculation would be combined with the previous calculation of NPRA for a performance year to ensure the stop-loss and stop-gain limits discussed in section III.D.7.b. and III.D.7.c.(1) of the proposed rule are not exceeded for a given performance year. For the performance year 1 reconciliation process, we would calculate an EPM participant’s NPRA as previously described, and if positive, such participant would receive the amount as a reconciliation payment from Medicare, subject to the stop-gain limit for performance year 1. If negative, the EPM participant would not be responsible for repayment to Medicare, consistent with our proposal to phase in financial responsibility beginning in the second quarter of performance year 2.

For the performance year 2 reconciliation process, we would calculate two separate NPRAs for an EPM participant—one for episodes that ended during performance year 2 (NDR) and a second for episodes that ended during performance year 2 (DR). While these NPRAs would be separately determined for each of these two periods, whether an EPM participant receives a Medicare reconciliation payment or makes a Medicare repayment in performance year 2 would be determined based on the sum of these two separately determined NPRAs. The NPRA for both performance year 2 (NDR) and performance year 2 (DR) would be subject to the same stop-gain limit of 5 percent, but because EPM participants would only have repayment responsibility for negative NPRA in performance year 2 (DR), the stop-loss limit of 5 percent would only apply to performance year 2 (DR). Thus, if an EPM participant’s NPRA for the first quarter of performance year 2 is positive, that amount would be counted toward a reconciliation payment from Medicare, subject to the stop-gain limit for performance year 2. If negative, the EPM participant would not be responsible for repayment to Medicare of the amount determined for performance year 2 (NDR). If an EPM participant’s NPRA is positive for episodes ending during performance year 2 (DR), that amount would be counted toward a reconciliation payment from Medicare, subject to the stop-gain limit for performance year 2. If negative, the EPM participant would be responsible for repayment to Medicare of the amount determined for episodes ending during performance year 2 (DR), subject to the stop loss limits for performance year 2 (DR). During the subsequent reconciliation process for performance year 2, we would also calculate the prior performance year’s actual EPM episode payments a second time separately for episodes that ended during performance year 2 (NDR) and for episodes that ended during performance year 2 (DR). Also, starting with the EPM reconciliation process for performance year 2, in order to determine the reconciliation or repayment amount, the amount from the subsequent reconciliation calculation would be combined with the NPRA for that subsequent year. The result of the post-episode spending calculation for performance year 1, as discussed in section III.D.7.e. of the proposed rule, and the dollar amount of the EPM discount percentage that was paid out as shared savings to an ACO during the prior year as specified in section III.D.6.b. of the proposed rule, would also be added to the NPRA and subsequent reconciliation calculation in order to create the reconciliation payment or repayment amount. If the amount is positive, and if the EPM participant is in the acceptable or better quality category for the EPM (discussed further in section III.E.3.f of the proposed rule), the EPM participant would receive the amount as a reconciliation payment from Medicare. If the amount is negative, Medicare would hold the EPM participant responsible for repaying the absolute value of the repayment amount following the rules and processes for all other Medicare debts. For example, when we conduct reconciliation for performance year 2 in early 2019, we would calculate the performance year 2 NPRA and the subsequent reconciliation calculation, post-episode spending, and ACO overlap calculation for performance year 1. These amounts would be added together to create the reconciliation payment or repayment amount.

Note that given our proposal to not hold EPM participants financially responsible for repayment for the first performance year, during the reconciliation process for performance year 2, the subsequent reconciliation calculation amount (for performance year 1) would be compared against the performance year 1 NPRA to ensure that the sum of the NPRAs calculated for performance year 1 and the subsequent reconciliation calculation for year 1 is not less than zero. Likewise given our proposal to not hold EPM participants financially responsible for repayment for episodes ending during performance year 2 (NDR), during the reconciliation process for performance year 3, the subsequent reconciliation calculation amount for performance year 2 (NDR) would be compared against the performance year 2 (NDR) NPRA to ensure that the sum of the NPRAs calculated for performance year 2 (NDR) and the subsequent episode spending calculation for performance year 2 (NDR) is not less than zero.
For performance year 2 (DR) and performance years 3 through 5, though, we proposed that Medicare would hold the participant responsible for repaying part or all of the absolute value of the repayment amount, as proposed in section III.D.2.c. of the proposed rule, following the rules and processes for all other Medicare debts. Table 17 illustrates a simplified example of how the subsequent reconciliation calculation may affect the following year’s reconciliation payment. Note that this example assumes the EPM participant is not responsible for post-episode spending or ACO overlap for performance year 1.

*Note the calculation of NPRA for performance year 2 represents the combined amounts of the NPRA for performance year 2 (NDR) and performance year 2 (DR).

The second column represents the NPRA calculated for performance year 1, meaning that EPM participant A’s aggregated episode payment was $50,000 below the sum of quality-adjusted target prices for all of Participant A’s EPM episodes. The third column represents the subsequent reconciliation calculation, indicating that when calculating actual EPM-episode payments during performance year 1 a second time, we determined that Participant A’s aggregated EPM-episode payment was $40,000 below the sum of quality-adjusted target prices for all of Hospital A’s EPM episodes, due to claims run out, accounting for model overlap, or other reasons. The fourth column represents the difference between the subsequent reconciliation calculation and the raw NPRA calculation for performance year 1. This difference is then combined with the amount in the fifth column to create the reconciliation payment amount for PY2, which is reflected in the sixth column. This reconciliation process would account for overlap between the EPMs and other CMS models and programs as discussed in section III.D.6.b of the proposed rule, and would also involve updating performance year EPM-episode claims data. We also noted that in cases where an EPM participant has appealed one or more of its EPM quality measure results through the HIQR Program appeal process (which is not part of the proposed EPM appeals process), where such HIQR Program appeal findings would result in a different effective discount factor for the EPM participant to calculate the quality-adjusted target prices from EPM-episode benchmark prices, the subsequent reconciliation calculation would account for these changes as well.

For example, for performance year 1 for these EPMs in 2017, we would capture claims submitted by March 1, 2018, and reconcile payments for EPM participants approximately 6 months after the end of the performance year 1 in quarter 2 of calendar year 2018. We would carry out the subsequent reconciliation calculation in the following year in quarter 2 of calendar 2019, simultaneously with the reconciliation process for the second performance year, 2018. Table 18 displays the reconciliation timeframes for the EPMs.

*Note that the reconciliation for Year 1 would not include repayment responsibility from EPM participants.

We proposed this approach in order to balance our goals of providing reconciliation payments in a reasonable timeframe, while being able to account for overlap and all Medicare claims attributable to EPM episodes. We believe that beginning to pull claims 2 months after the end of the performance year would provide sufficient claims run-out to conduct the reconciliation in a timely manner, given that our performance year includes EPM episodes ending, not beginning, by December 31st. We noted that in accordance with the regulations at §424.44 and the Medicare Claims Processing Manual (Pub. L. 100–04), Chapter 1, Section 70, Medicare claims can be submitted no later than 1 calendar year from the date-of-service. We also noted our recognition that by...
pulling claims 2 months after the end of the performance year to conduct reconciliation, we would not have complete claims run-out. However, we believed that the 2 months of claims run-out would be an accurate reflection of EPM-episode payments and consistent with the claims run-out timeframes used for reconciliation in other payment models, such as BPCI Models 2 and 3 and the CJR model. Otherwise, the alternative would be to wait to reconcile until we have full claims run out 12 months after the end of the performance year, but we were concerned that this approach would significantly delay earned reconciliation payments under the EPMs.

However, we proposed to conduct a subsequent reconciliation calculation 14 months after the end of a performance year to account for canceled episodes, post-episode spending, overlap with other CMS models and programs, and any remaining claims available at that time. The proposals for the annual reconciliation and subsequent reconciliation calculation were included in §512.305 and §512.307. We sought comment on these proposals for an annual reconciliation and subsequent calculation.

The following is a summary of the comments received and our responses.

**Comment:** A number of commenters supported the proposal for reconciliation payments, including the waiver of deductibles and copays with respect to reconciliation payments and Medicare repayments. While one commenter indicated that the proposed timeframes for reconciliation were reasonable, most of the commenters requested that CMS provide reconciliation payments or estimates of what reconciliation payments would be on a more frequent basis than annually. In most cases, these commenters recommended reconciliation payments on a quarterly basis (some noted this would be similar to BPCI and recommended the BPCI true-up process whereby we would make an initial reconciliation with three revisions (or “true-ups”) in order to include additional claims run outs and any other changes that might have occurred with the third (final) true-up occurring 9 months after the initial reconciliation rather than 12 months later than the subsequent reconciliation as is the case for the EPMs and CJR. Another commenter recommended quarterly reconciliation determination with the option of an annual reconciliation for those hospitals preferring such while another concurred with the opposite. Commenters favoring more frequent reconciliations suggested that doing so would provide hospitals with better cash flow that could be used to invest in the changes needed to be successful as well as more immediate feedback that would enable participants to better assess their performance and determine which of their approaches are effective as well as what changes might be needed to improve their performance. Further, if hospitals had more up front funding, they could in turn provide more frequent financial rewards to downstream collaborating providers, which would better maintain incentives on a more consistent basis to promote care coordination, with improved quality and efficiencies. One commenter suggested that the proposed annual reconciliation payment schedule could impede care redesign efforts and undermine gainsharing.

In addition to comments on the frequency of reconciliation, a commenter recommended that reconciliation occur at the beneficiary episode level rather than in aggregate across beneficiary episodes, as we proposed, because the former would better focus financial incentives on each episode as hospitals would recognize that they bear risk for every episode individually rather than in aggregate. In this commenter’s view, CMS’ proposal will more likely encourage gaming across episodes where a hospital tries to offset losses from one episode through savings on another.

**Response:** We appreciate the comments we received supporting our proposal for an annual reconciliation with subsequent calculation as well as the suggestions for more frequent reconciliations or estimated reconciliation amounts. We are not persuaded to make reconciliation payments or estimated payment amounts available more frequently than on an annual basis. We are concerned that, particularly for small hospitals, the number of cases included in quarterly data would limit the representativeness of the data, which could produce somewhat misleading results. For similar reasons, we do not believe that making more frequent reconciliation payments available than annually would advantage participants based on the expectation that additional resources would enhance their ability to develop infrastructure or gainsharing arrangements. Last, we are not persuaded to adopt the suggestion to determine reconciliations at the episode level. The commenter suggested that the proposed policy will result in hospitals “gaming” payments by offsetting losses for one episode with savings in another; however, we question this view. Rather, we believe the issue raised in this comment and our proposal for determining reconciliation payments under the models is similar and analogous to the basis under which Medicare makes payments under its FFS prospective systems in general. That is, for Medicare FFS prospective payments, an “average” payment is typically determined for a specific procedure or set of services where participants might “gain” or “lose” for a specific case but, on average and in aggregate across all cases, are paid that average amount. Given their recognition of this, we would not anticipate that Medicare providers and suppliers “game” their payments to offset losses on a case-by-case basis. Likewise, we would not expect that EPM participants would be any more or less encouraged to “game” episode payments depending on whether they received reconciliation payments at the episode level or in aggregate across all episodes.

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal, without modification, to make an annual reconciliation with subsequent calculation. Our final policies for an annual reconciliation and subsequent calculation are included in §512.305 and §512.307.

We would also note that since we have delayed the requirement to assume downside risk to performance year 3, except for participants that elect downside risk in performance year 2, we will not be performing two separate aggregations, as we had proposed, to separately create one NPRA for the period in performance year 2 without downside risk and another NPRA for the period where downside risk would apply.

Thus, in contrast to our proposal, unless the EPM participant elected downside risk in performance year 2, we would calculate an EPM participant’s NPRA for the performance year 1 and 2 reconciliation processes, and if positive, such participant would receive the amount as a reconciliation payment from Medicare, subject to the stop-gain limit for performance year 1 or performance year 2.

Also, starting with the EPM reconciliation process for performance year 2, in order to determine the reconciliation or repayment amount, the amount from the subsequent reconciliation calculation would be combined with the NPRA for that subsequent year. The result of the post-episode spending calculation for performance year 1, as discussed in section III.D.7.e. of the proposed rule, and the dollar amount of the EPM discount percentage that was paid out as
shared savings to an ACO during the prior year as specified in section III.D.6.b. of the proposed rule, would also be added to the NPRA and subsequent reconciliation calculation in order to create the reconciliation payment or repayment amount. If the amount is positive, and if the EPM participant is in the acceptable or better quality category for the EPM (discussed further in section III.E.3.f of the proposed rule), the EPM participant would receive the amount as a reconciliation payment from Medicare.

If the amount is negative, Medicare would hold the EPM participant responsible for repaying the absolute value of the repayment amount following the rules and processes for all other Medicare debts. Though the NPRA for performance year 2 will be subject to a stop-loss limit of 0 percent, except for EPM participants that elected downside risk in performance year 2, it is still possible that EPM participants not electing downside risk for performance year 2 could owe a repayment amount because of the subsequent reconciliation calculation, post-episode spending calculation, and ACO overlap calculation for performance year 1. For example, when we conduct reconciliation for performance year 3 in early 2020, we would calculate the performance year 3 NPRA and the subsequent reconciliation calculation, post-episode spending, and ACO overlap calculation for performance year 2. These amounts would be added together to create the reconciliation payment or repayment amount.

Note that given our proposal to not hold EPM participants financially responsible for repayment for the first performance year and the stop-loss limit of 0 percent for NPRA for the second performance year (except for EPM participants that otherwise elected downside risk), during the reconciliation process for performance year 3, the subsequent reconciliation calculation amount (for performance year 2) would be compared against the performance year 2 NPRA to ensure that the sum of the NPRA calculated for performance year 2 and the subsequent reconciliation calculation for year 2 is not less than zero.

For an EPM participant that elected downside risk in performance year 2 and all participants in performance years 3 through 5, Medicare would hold the participant responsible for repaying part or all of the absolute value of the repayment amount, as proposed in section III.D.2.c. of the proposed rule, following the rules and processes for all other Medicare debts.

Also, we would note that this final rule corrects proposed § 512.305(d)(iii) so that it refers to § 512.460(b) rather than § 512.460(b)(5).

c. Reconciliation Report

For EPM participants to receive timely and meaningful feedback on their performance under the models as well as better understand the basis of their reconciliation payment or Medicare repayment for a given performance year, if any, we proposed to annually issue to EPM participants a reconciliation report (§ 50867). Similar to the CJR Reconciliation Report, we make available to CJR participants (§ 73408). We proposed that these reports would contain the following information:

- Information on the EPM participant’s composite quality score described in section III.E.3.a. through III.E.3.e of this final rule.
- The total actual episode payments for the EPM participant.
- The NPRA.
- Whether the EPM participant is eligible for a reconciliation payment or must make a repayment to Medicare.
- The NPRA and subsequent reconciliation calculation amount for the previous performance year, as applicable.
- The post-episode spending amount and ACO overlap calculation for the previous performance year, as applicable.
- The reconciliation payment or repayment amount.

For performance year 2, we proposed that the reconciliation report would include information separately for the performance year 2 (NDR) and performance year 2 (DR) portions of that year.

As discussed in section III.D.8 of the proposed rule, EPM participants would review their reconciliation report and would be required to provide written notice of any error, in a calculation error form that must be submitted in a form and manner specified by CMS. Unless the EPM participant provides such notice, the reconciliation report would be deemed final within 45 calendar days after it is issued, and CMS would proceed with payment or repayment. The proposal to issue a reconciliation report was included in § 512.305(f). We sought comments on our proposal to issue a reconciliation report to EPM participants and what other information, if any, would be helpful to include in this report.

The following is a summary of the comments received and our responses.

Comment: As noted previously in section III.D.5.a. and b. of this final rule, some commenters requested that reconciliation payments or estimates of what reconciliation payments would be more frequently than on an annual basis. A commenter requested that, given the many adjustments to costs, including various value-based payments such as HRRP, CMS make publicly available and to the CJR model participant hospitals and EPM participants documentation of the various adjustments that would allow participants to verify or validate the adjustments and calculations. This commenter was concerned that providers who are taking on risk could otherwise be penalized multiple times for readmissions in the bundled payment program as well as other value-based payment programs.

Response: For the reasons previously articulated in this comment and response section, we are not persuaded to make reconciliation reports available for frequently than on an annual basis.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to annually issue a reconciliation report. Our final policy for issuing a reconciliation report is included in § 512.305(f).

6. Adjustments for Overlaps With Other Innovation Center Models and CMS Programs

a. Overview

Three issues may arise in overlap situations that must be addressed under EPM. First, we acknowledge that there may be circumstances where a hospital in a geographic area selected for the AMI, CABG or SHFFT model is also participating in BPCI for the same episode. We refer to this as “provider overlap.” Second, there may be situations where a Medicare beneficiary receives care that could potentially be counted under more than one episode or total cost of care payment model. We refer to this as “beneficiary overlap.” Finally, EPM reconciliation payments and Medicare repayments made under Parts A and B and attributable to a specific beneficiary’s episode may be at risk of not being accounted for by other models and programs when determining the beneficiary’s cost of care under Medicare. Therefore, a payment reconciliation policy is necessary in order to credit the entity that is closest to that care for the episode of care in terms of time, location, and care management responsibility.

We established our proposal for provider overlap at § 512.100(b) and § 512.230(g). We established our proposal for beneficiary overlap at
programs.

EPMs and other CMS models or programs.

The following is a summary of the comments received and our responses.

Comment: We received numerous comments related to overlap between EPMs and other CMS models or programs.

Response: For further discussion of comments related to model and program overlap, we refer readers to the specific sections later in this section of this final rule.

b. Provider Overlap

(1) BPCI Participant Hospitals in Geographic Areas Selected for EPMs

Provider overlap exists when a hospital in a geographic area selected for the AMI, CABG and SHFFT model is also an episode initiator in BPCI for an episode anchored by that EPM’s DRG. BPCI is an episode payment model testing AMI, CABG, SHFFT, and 45 other episodes in acute care, post-acute care, or both acute care and post-acute care settings.

Similar to CJR, we proposed for the EPMs that in the geographic areas where the AMI, CABG and SHFFT models will be implemented, an acute care hospital participating in BPCI Model 2 or 4 will participate in an EPM for episodes anchored by EPM MS–DRGs that are not covered under the hospital’s current BPCI agreement. If a BPCI hospital in an EPM-selected area withdraws from BPCI episodes anchored by EPM MS–DRGs, the BPCI hospital will participate in the EPMs from which it was previously excluded. As we stated in the proposed rule, we believe this proposal promotes accountable care by ensuring beneficiary coverage by BPCI or an EPM in selected areas.

We established the proposal for hospitals in geographic areas selected for EPMs that are also participating in BPCI episodes anchored by EPM DRGs at §512.100(b). We sought comment on this proposal. The following is a summary of the comments received and our responses.

Comment: Overall, we received considerable support from commenters for our proposal to continue to give precedence to existing BPCI models where the EPM participant was also participating in a BPCI model that overlapped with a SHFFT, AMI, or CABG EPM. Several commenters requested that existing precedence rules should continue for any similar voluntary models implemented after September 2018 when the current BPCI model is scheduled to end.

Response: We appreciate the many comments of support received for this aspect of the model. We wish to clarify that the current order of precedence for model overlaps pertains only to the currently existing models. CMS shall evaluate how to handle model overlaps for any future models at the time of implementation based on experience and knowledge gained through previous models.

We also recognize that this policy could indirectly impact clinicians with financial arrangements with an EPM participant, therefore, we refer to section III.A.2 for discussions of the ability for eligible clinicians to become qualifying APM participants (QP) as affiliated practitioners of EPMs that meet the Advanced APM criteria under the Quality Payment Program. Specifically, we are referring to the policy that eligible clinicians can meet program thresholds through participation in multiple Advanced APMs. We further discuss the considerations for a new alternative bundled payment model, and in particular the consideration for such a program to qualify as an Advanced APM, in section III.A.3.

Comment: Several commenters recommended that in order to minimize overlap with existing BPCI models, CMS exclude MSAs where there are existing BPCI models. A commenter recommended that BPCI participating hospitals be exempt from having to participate in multiple models even if there were no overlap in the episodes covered under each model. For example, a hospital participating in BPCI for SHFFT episodes would be exempt from having to participate in CABG or AMI EPMs.

Response: In identifying eligible MSAs where the EPMs could be implemented, we proposed to explicitly factor in the number of non-BPCI eligible cases when considering the relevant minimum volume of cases in an MSA. We refer readers to sections III.B.4., “Geographic Unit of Selection and Exclusion of Selected Hospitals” and III.B.5., “Overview and Options for Geographic Area Selection for AMI and CABG Episodes” of this final rule for a more detailed discussion of the factors considered in the selection of MSAs for EPMs. We do not believe it is appropriate to exempt hospitals from participating in EPMs solely because they are participating in a BPCI model for another non-overlapping episode. To do so would limit the potential volume of cases for evaluation purposes and could lead to patient steerage in areas where some hospitals in the same market may be participating in the EPM and others may not. Moreover, while we acknowledge the potential for some operational differences for those hospitals implementing multiple models, hospitals already participating in BPCI may, in fact, already have some of the infrastructure in place and be well positioned to succeed in implementing EPMs as well.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, for handling overlap situations between EPM and BPCI participating hospitals. That is, in the geographic areas where the AMI, CABG and SHFFT models will be implemented, an acute care hospital participating in BPCI Model 2 or 4 will participate in an EPM only for episodes anchored by EPM MS–DRGs that would not otherwise be a BPCI episode. BPCI episodes would take precedence over EPM episodes.

(2) BPCI Physician Group Practice (PGP) Episode Initiators in Hospitals Participating in EPMs

It is possible that a physician in a BPCI PGP may treat a Medicare beneficiary in a hospital participating in one or more EPMs. We proposed that if a beneficiary is admitted to an EPM participant for an episode anchored by EPM MS–DRGs that is also covered under the PGP’s BPCI agreement and the attending or operating physician on the admission’s inpatient claim is a member of the BPCI PGP, the BPCI episode will take precedence over the EPM episode for which the hospital would otherwise be the accountable entity. In other words, if, for any portion of the EPM episode, a beneficiary would also be in a BPCI PGP episode, we will cancel an episode that has already been initiated or never initiate the EPM episode in the first place. For example:

• A beneficiary is admitted for a CABG to an EPM participant in the CABG model. The attending or operating physician on the inpatient claim for the admission is in a BPCI Model 2 PGP participating in CABG. The episode is initiated under BPCI; an EPM episode does not initiate.

• A beneficiary is admitted for an AMI to an EPM participant in the AMI model. The beneficiary receives a PCI while hospitalized. The attending or operating physician on the inpatient claim for the admission is in a BPCI Model 2 PGP participating in PCI episodes but not medical AMI episodes. A PCI episode is initiated under BPCI; an EPM episode does not initiate.
A beneficiary is admitted for an AMI to an EPM participant in the AMI model. A PCI was not part of the beneficiary’s treatment. The attending or operating physician on the inpatient claim for the admission is in a BPCI Model 2 PGP participating in PCI episodes only. The episode is initiated under the AMI model. A PCI episode under BPCI Model 2 would not initiate unless a PCI were performed on the beneficiary, and

A beneficiary is admitted for an AMI to an EPM participant in the AMI model. A CABG was not part of the beneficiary’s treatment. The attending or operating physician on the inpatient claim is in a BPCI Model 2 PGP participating in CABG episodes only. The episode is initiated under the AMI model. A CABG episode under BPCI Model 2 would not be initiated unless a CABG was performed on the beneficiary while hospitalized.

We established the proposal for BPCI PGP episode initiators in hospitals participating at § 512.230(g). We sought comment on this proposal. The following is a summary of the comments received and our responses.

Comment: Many commenters supported our proposal to give precedence to situations where there was overlap between an episode attributed to a PGP voluntarily participating in BPCI and one that could otherwise have been attributed to an EPM participating hospital. However, we received several comments that expressed disagreement with this policy. These commenters believed that the hospital participant should have priority for having responsibility and financial accountability for the episode. A commenter expressed the specific concern that PGP episodes participating in BPCI could potentially select lower intensity cases and steer higher intensity and potentially more costly cases to non-BPCI, EPM participant hospitals. Concern was also expressed by some commenters that attributing episodes to BPCI in these situations would lower the volume of episodes available to the hospital and potentially made it less cost effective for the hospital to implement operational changes necessary to better manage episodes.

Response: We acknowledge the potential for overlap between PGP initiated BPCI episodes and hospital attributed EPM episodes in those MSAs selected for EPM participation where there are also PGP BPCI initiators. CMS will monitor admission and transfer patterns and trends to identify any inappropriate steerage that may be occurring. On balance, however, we believe it is important to maintain CMS’ commitment to existing models for which participants have volunteered and in which they are already actively involved. As these models end and CMS has the opportunity to evaluate their performance, including the impact of overlaps, we will incorporate the findings in the design of future models.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, for handling overlaps between BPCI PGP episodes and episodes initiated in hospitals participating in EPMs.

(c) Beneficiary Overlap

(1) Beneficiary Overlap With BPCI

As we stated in the proposed rule, we also need to account for instances where a different model’s episode could initiate during an ongoing EPM episode. We proposed that any BPCI Model 2, 3 or 4 episode, regardless of its anchor DRG exclusion status from an EPM episode definition, takes precedence over an AMI, CABG or SHFFT episode such that it would cancel or prevent the initiation of an AMI, CABG or SHFFT episode. For example—

• If a beneficiary is in an ongoing AMI model episode and is treated for SHFFT by a hospital, PGP physician, or post-acute care provider participating in a BPCI SHFFT episode, the initial AMI model episode will be canceled. The second entity will initiate a new episode under BPCI subject to the payment rules under that model, and

• If a beneficiary is in an ongoing BPCI AMI episode and is readmitted for SHFFT to an EPM participant in the SHFFT model, the BPCI episode would continue and the SHFFT model episode would not initiate.

Participants in BPCI have an expectation that eligible episodes will be part of the BPCI model test, whereas, based on our proposal, EPM participants would be aware that episodes may be canceled when there is overlap with BPCI episodes. As stated in the proposed rule, we aim to preserve the integrity of ongoing model tests without introducing major modifications that could make evaluation of existing models more challenging. Given the current scheduled end date for BPCI, we proposed to give precedence to episodes covered under BPCI Models 2, 3 and 4 initiated on or before September 30, 2018.

In the proposed rule, we acknowledged that this proposed BPCI–EPM overlap policy differs from the CJR beneficiary overlap policy, where a beneficiary may be in a CJR LEJR episode and a non-LEJR BPCI episode concurrently. However, in CJR this overlap is rare. Within the 90-day post-hospital discharge period, included readmissions occur for less than 1 percent of LEJR beneficiaries. In contrast, included readmissions occur for approximately 25 percent of AMI and CABG beneficiaries. The high incidence of included readmissions for AMI, CABG, and SHFFT episodes necessitates a different policy to avoid double-paying savings and double-counting losses, as well as not initiating new episodes when the readmission is a complication of care during the first episode that could have been managed.

As we stated in the proposed rule, we considered alternative options for dealing with situations in which a beneficiary in an EPM episode could also be in a BPCI episode, including allowing the first episode initiated to take precedence regardless of the model under which it occurred. This would encourage more accountable care, particularly with AMI, CABG, and SHFFT episodes that are more likely to involve readmissions for complications than generally occur with LEJR. However, preventing BPCI episodes from being initiated, particularly those initiated by post-acute care providers which, by definition, occur after an anchor hospitalization, could substantially reduce the number of such episodes and our ability to fully test BPCI. Moreover, operational challenges due to different timelines for payment reconciliation are of concern.

We established the proposal for beneficiary overlap with BPCI at § 512.230(h). We sought comment on this proposal. The following is a summary of the comments received and our responses.

Response: As with the previously described overlap situations, we received numerous comments in support of giving precedence to the BPCI initiated episode. However, many commenters did express concern over how EPM participant hospitals would be able to know whether a presenting patient is already covered by a BPCI episode or if an EPM episode is subsequently cancelled. Several commenters stated that it was unrealistic to expect hospitals or other providers to identify such patients in “real-time” and requested CMS clarify its administrative policies for identifying and informing EPM participants about beneficiaries whose episodes are initiated and then cancelled for any reason. A commenter requested at least quarterly notification. The commenters proposed that EPM participant awareness of episode cancellation is important for several...
reasons, including EPM participant calculation and monitoring of episode spending; beneficiary notification; provision of beneficiary engagement incentives; and determination of beneficiary eligibility for certain rule waivers. In addition, these commenters expressed concern about the potential for beneficiary confusion and dissatisfaction with multiple coordinators of care, as well as costly duplication of services when multiple entities believe they are accountable for the episode.

Response: We acknowledge the potential for confusion for providers participating in markets where there are BPCI participants or in situations where patients may travel out of area to receive services that result in cancelling EPM episodes. We also appreciate the interest of the commenters in conducting timely analyses of EPM episode spending, as well as ensuring that the requirements of the EPM are met in their treatment of Medicare beneficiaries. The potential for this to occur makes it important for EPM participants to become familiar with the range of models operating in their market and to maintain ongoing relationships with their patients after discharge, as well as to develop collaboration arrangements with physicians. Even with this, we acknowledge that EPM participants and their staff may not know when all overlaps occur. Given our plans for providing and updating episode claims data to EPM participants upon request as frequently as quarterly as discussed in section III.K.5. of this final rule, we will explore adding additional data elements to the beneficiary-identifiable claims data provided to EPM participants that would indicate potential for episode cancellation such as admission of a beneficiary to a hospital or post-acute care facility that initiates episodes under BPCI or receipt of inpatient services by a physician in a BPCI PCP. To the extent adding such indicators to the claims data is feasible, providing this information through the claims data shared with EPM participants would ensure that EPM participants are informed as frequently as quarterly about beneficiary circumstances that could result in EPM episode cancellation. This information would not be real-time, however, and while based on the best available information at the time, it would be subject to change due to the lag-time for the relevant claim to be submitted and processed and then reported back to the EPM participant. Note that at reconciliation, complete information would be provided to EPM participants about those episodes that were ultimately included in the participant’s reconciliation report as discussed in section III.D.5. of this final rule.

We note that we expect EPM participants to be actively managing all of their beneficiaries with conditions characterized by AMI, CABG, or SHFFT based on their care pathways, regardless of the model of program that may ultimately apply to the beneficiary under the uncommon circumstances of EPM episode cancellation. We also want to emphasize the importance of strong, ongoing communication among providers in a given geographic area caring for beneficiaries in similar models or programs where provider interests in delivering high quality, efficient health care should align.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, for handling situations in which a beneficiary eligible for coverage under an EPM is already covered by a BPCI episode or subsequently becomes eligible for coverage under a BPCI episode during the EPM episode period. Recognizing the limitation on available data, CMS will work to provide better, more timely informational resources to participants, where feasible, to assist them in identifying episodes that may be ineligible or cancelled due to overlaps.

(2) Beneficiary Overlap With the CJR Model and Other EPMs

As discussed in section III.C.4. of the proposed rule, if a beneficiary is in a SHFFT, AMI or CABG model or CJR episode and has a hospital readmission that is not excluded from the ongoing episode definition and would otherwise initiate an episode in a different EPM or the CJR model, that hospital readmission will not initiate another episode or cancel the ongoing episode. If a beneficiary is in a SHFFT, AMI or CABG model episode or CJR episode and has a hospital readmission that is excluded from the ongoing episode definition and could initiate an episode in a different EPM or the CJR model, the subsequent EPM or CJR episode will initiate, the ongoing episode would continue, and both episodes will occur concurrently. For example—

- The CJR model episode definition does not exclude the MS–DRGs that would initiate a SHFFT model episode. If a beneficiary is in the CJR model and receives SHFFT at an EPM participant in the SHFFT model during the ongoing CJR episode, the CJR episode will continue and the SHFFT model episode will not initiate;
- The SHFFT model episode definition does not exclude the MS–DRGs that would initiate a CJR LEJR episode. If a beneficiary is in the SHFFT model and receives an LEJR at a CJR hospital during the ongoing SHFFT episode, the SHFFT episode will continue and the CJR episode will not initiate;
- The AMI model episode definition does not exclude the MS–DRGs that would initiate a CABG model episode. If a beneficiary is in the AMI model and is readmitted for an AMI to an EPM participant in the AMI model during the ongoing SHFFT model episode, the SHFFT model episode will continue and the AMI model episode will not initiate;
- The SHFFT model episode definition does not exclude the MS–DRGs that would initiate an AMI model episode. If a beneficiary is in the SHFFT model and is readmitted for an AMI to an EPM participant in the AMI model during the ongoing AMI model episode, the AMI model episode will continue and the CABG model episode will not initiate.

As stated in the proposed rule, we believe that an overlap policy that gives precedence to the ongoing episode over subsequent episodes initiated during the post-hospital discharge period, except where the second admission is explicitly excluded, aligns with our stated goal of encouraging more accountable care. Moreover, this policy would establish an operationally straightforward policy for future EPMs.

We received no comments related to our proposed overlap policy that gave precedence to the ongoing episode when there was the potential for overlap between CJR and EPM episodes that were not otherwise excluded from the first episode’s definition.

Final Decision: Given that we received no public comments on the proposed policy for beneficiary overlap with the CJR model and the EPMs, we are finalizing the proposal, without modification, to give precedence to an ongoing EPM episode over subsequent episodes initiated during the post-hospital discharge period, except where the second admission is explicitly excluded from the initial episode.

(3) Beneficiary Overlap With Shared Savings Models and Programs

We explained in the proposed rule our expectation that many beneficiaries in an AMI, CABG or SHFFT model episode will also be assigned to a
Shared Savings Program ACO or a participant in an ACO model initiated by the CMS Innovation Center. For the purposes of this discussion, the term ACO will be used generically to refer to either Shared Savings Program or Innovation Center ACO models. Shared savings payments to ACOs and shared savings losses repaid by ACOs to CMS have the potential to overlap with EPM reconciliation payments. As with CJR, we proposed to attribute savings achieved during an EPM episode to the EPM participant, and to include EPM reconciliation payments for ACO-aligned beneficiaries as ACO expenditures. In order to address comments received during rulemaking for CJR, we proposed to test an alternative strategy to address ACO overlap. Specifically, we proposed to exclude beneficiaries from EPMs who are aligned to ACOs in the Next Generation ACO model and End Stage Renal Disease (ESRD) Seamless Care Organizations (ESCOs) in the Comprehensive ESRD Care model in tracks with downside risk for financial losses. We did not propose to exclude beneficiaries assigned to Shared Savings Program ACOs in Tracks 1, 2, or 3. However, we sought comment on excluding beneficiaries from EPMs that are prospectively assigned to Shared Savings Program Track 3 ACOs as well as to other financial risk tracks. The Shared Savings Program is a national program. We do not believe that testing a new approach to addressing overlap, which could potentially disrupt ACO investments, operations, and care redesign activities, would be appropriate for all Shared Savings Program ACOs at this time prior to a test with a smaller population. As we stated in the proposed rule, we plan to monitor and learn from the test of excluding beneficiaries prospectively assigned to an ACO from risk tracks and to consider these results and comments in future rule-making.

Several strong considerations drive us to otherwise follow CJR precedent for addressing ACO overlap. As we stated in the proposed rule, CMS continues to avoid double payment of savings and double recoupment of losses, which is an important principle of successful payment reform. Further, in implementing the EPMs, there would be no additional operational effort due to consistency in ACO overlap policies across models. In this respect, we anticipate little to no difficulty in replicating prior policy as new episode payment models are introduced. Third, this would have no negative financial impact on EPM participants, an important consideration for future EPMs. The payment reconciliation for EPM participants is described in section III.D.5. of the proposed rule.

Therefore, we proposed to follow the policy set forth in the CJR Final Rule for accounting for overlap between EPMs and the Shared Savings Program and ACO models other than the Next Generation ACO and CEC models listed previously.

Additionally, for programmatic consistency among ACO models and programs, given that our ACO models generally are tested for the purpose of informing future potential changes to the Shared Savings Program, we believe that the ACO model overlap adjustment policy should be aligned with the Shared Savings Program policy. Thus, we proposed that under EPMs, we would make an adjustment to the reconciliation amount to account for any of the applicable discount for an episode resulting in Medicare savings that is paid back through shared savings under the Shared Program or any other ACO model, but only when an EPM hospital also participates in the ACO and the beneficiary in the EPM episode is also assigned to that ACO. This adjustment would be necessary to ensure that the applicable discount under the EPM is not reduced because a portion of that discount is paid out in shared savings to the ACO and thus, indirectly, back to the hospital.

However, we proposed not to make an adjustment under EPMs when a beneficiary receives an AMI, SHFFT, or CABG at a hospital participating in the corresponding EPM and is assigned to an ACO in which the hospital is not participating. While this proposal would leave overlap unaccounted for in such situations, we do not believe it would be appropriate to hold responsible for repayment the hospital that managed the beneficiary during the episode through an EPM adjustment, given that the participant may have engaged in care redesign and reduced spending during the EPM episode. The participant may be unaware that the beneficiary is also assigned to an ACO. However, we recognize that as proposed this policy would allow an unrelated ACO full credit for the Medicare savings achieved during the episode. The evaluation of each of the EPMs, as discussed in section IV of the proposed rule, would examine overlap in such situations and the potential effect on Medicare savings.

We note that our proposed policy as outlined in the proposed rule would entail CMS rethinking the full amount of an EPM participant any discount percentage paid out as shared savings for the

Shared Savings Program or ACO models only when the hospital is an ACO participant and the beneficiary is assigned to that ACO, while other total cost of care models such as the Comprehensive Primary Care Plus initiative (CPC+) would adjust for the discount percentage in their calculations. We believe that other ACO models in testing that share operational principles with the Shared Savings Program should follow the same policies as the EPM Shared Savings Program adjustment for certain overlapping ACO beneficiaries. As the landscape of CMS models and programs changes, we may revisit this policy through future rulemaking.

However, there are circumstances when an alternative option may be appropriate to consider. Therefore, we are also considering an EPM–ACO overlap policy that would exclude from EPMs beneficiaries who are assigned to ACOs in the Next Generation ACO model and ESCOs in the Comprehensive ESRD Care model in tracks with downside risk for financial losses. Some ACOs have successfully managed acute care and post-acute care expenditures below regional or national mean costs, and expressed that the current CJR and BPCI ACO overlap policies deprives them of a key source of savings. We are aware of situations in certain markets that seem to reduce opportunities for ACOs to achieve savings given historic experience that indicates these particular ACOs are able to manage the care within episodes as successfully as EPM participants. Attributing savings to participants in episode payment models, such as CJR participants and EPM participants under the proposed rule, creates a problem when the ACO is accountable for coordinating a beneficiary’s care over a performance year but is not able to benefit from savings achieved from episodes completed during the performance year. Data shows that post-acute care spending is among the most significant sources of savings for ACOs currently, and where they focus significant investments.

weigh against exclusion of all ACO-assigned beneficiaries from participation in EPM episodes. Such a blanket exclusion would remove a large proportion of Medicare FFS beneficiaries from the EPMs, many of whom would inevitably receive care at EPM participants. This would dilute the power of the EPM test and generalizability of EPM findings. Additionally, differences between ACO beneficiary assignment algorithms do not support a blanket exclusion. It is more operationally feasible to identify and exclude beneficiaries who are prospectively assigned to ACOs. In retrospective assignment models, beneficiaries may be assigned to an ACO at the end of the performance year, before the performance year, or preliminarily assigned to one ACO before the performance year and subsequently assigned to a different ACO after all qualifying services are considered. In retrospective assignment, there will be significant numbers of beneficiaries assigned at final reconciliation to a given ACO who were not identified as preliminarily assigned to that ACO prior to the performance year. That is, they were identified either as unassigned to any ACO or assigned to a different ACO. In prospective assignment models and tracks, the list of assigned beneficiaries is available prior to the start of the performance year and a beneficiary’s assignment does not change on the basis of his or her utilization in the performance year (subject to various exclusions made on a quarterly basis, such as a beneficiary’s election into a Medicare Advantage plan).

Because ACOs in two-sided risk arrangements share in both savings and losses, they have stronger incentives than those in one-sided risk arrangements that share only in savings to reduce total cost of care. Given the possibility of paying CMS shared losses, we believe that ACOs in two-sided risk arrangements may be best positioned to assume the risk associated with EPM episodes, while ACOs in one-sided risk arrangements may be less well-positioned to do so. ACOs in one-sided risk arrangements, such as those in the Shared Savings Program Track 1, do not bear the risk of owing losses to CMS. In contrast, ACOs in two-sided risk arrangements, such as the Next Generation ACO model, are held to as much as 80 percent to 100 percent of first dollar losses. Thus, we explained our belief that pursuing a blanket exclusion of all ACOs would inappropriately disadvantage EPM participants that carry significant financial risk under EPMs.

This proposed ACO overlap policy would grant ACOs in models and tracks with the highest levels of downside risk for financial losses—the Next Generation ACO model and tracks of the Comprehensive ESRD Care model with downside risk for financial losses—paramount financial opportunity in exchange for accepting total cost of care responsibility for their beneficiaries. EPM participants may still realize opportunities to save by partnering with ACOs, but outside of the EPM arrangement. Specifically, we refer to section III.I. of the proposed rule which describes opportunities for gainsharing allowed under these models.

As we stated in the proposed rule, this policy tests the effects of such an ACO-assigned beneficiary exclusion policy within a broader test of the effectiveness of EPMs. We can learn its impact on EPM participants and ACOs that have beneficiaries excluded from EPMs, as well as ACOs that do not have beneficiaries excluded from EPMs. This will improve our understanding about the appropriate entity to hold accountable for the costs within the episode. For this reason we recommended this test be limited to the AMI, CABG, and SHFFT, and CJR models, and ACO models being conducted under CMS’ Innovation Center, and did not propose to implement the policy more broadly to other ACOs, such as those in the Shared Savings Program. In proposing the exclusion of beneficiaries in only a limited number of ACO initiatives we attempted to balance the desire to build a new payment reform initiative while mitigating the potential challenges to existing shared savings models and programs. We sought comment on this proposal as well as input on extending the proposal to CJR and other ACOs accepting two-sided risk, such as those ACOs in the Shared Savings Program Track 3.

We have investigated CMS data related to the services under consideration in the AMI, CABG and SHFFT models. A small fraction of total beneficiaries assigned to ACOs qualifying for this exclusion in fact have relevant anchor hospitalizations that would initiate an EPM in a given calendar year. For instance, from 2013 through 2015, about 2.4 percent of beneficiaries assigned to Pioneer ACO model participants had an anchor hospitalization that would have initiated an AMI, CABG or SHFFT model.

We considered several additional options to account for EPM–ACO beneficiary overlap prior to proposing the strategy outlined previously. We considered whether to split the risk, including at an equal sharing rate, at the time of financial reconciliation between EPM participants and ACOs when episodes included overlapping beneficiaries. This has the advantage of mitigating the supposed “carve out” of ACO expenditures, but requires CMS to arbitrarily declare a level of risk sharing. We are also concerned about the operational feasibility of such calculations, given that reconciliation would have to occur in tandem, resulting in long delays in payments or recoupments for both EPM participants and ACOs. We also considered whether to attribute to ACOs the more favorable of either the episode-specific target price or the actual expenditures incurred by the beneficiary during the episode time period. However, this policy would result in significant losses to the Medicare Trust Fund, as the double payment of savings/losses would be a certainty.

We established the proposal to exclude from the EPMs beneficiaries who are assigned to an ACO in the Next Generation ACO Model or Comprehensive ESRD Care Initiative at § 512.230(f). We established the proposal to attribute savings achieved during an EPM episode to the EPM participant, and include EPM reconciliation payments for other ACO-assigned beneficiaries as ACO expenditures at § 512.305 and § 512.307. We sought comment on our proposals to account for beneficiary overlap with shared savings models and programs.

The following is a summary of the comments received and our responses.

Comment: We received numerous comments in response to our proposed policies for handling overlap between ACOs and EPMs. A number of commenters expressed concern that ACOs should not be competing with bundled payment models and that CMS needs a sustainable overlap policy that would allow both models to thrive. Related to this, many commenters expressed concern over the difficulty of understanding the different model policies, and the need for a rigorous analysis of how different programs interact and impact participating providers as well as patients. A few commenters believed more information on the effect of overlapping value based models was necessary before moving forward with additional models.

A commenter wrote to support the current overlap policy and recommended that EPM participants be allowed to execute arrangements to
share or shift risk to an ACO but recommended against automatically excluding certain categories of beneficiaries assigned to ACOs. Only if the ACO and EPM fail to come to agreement on a distribution arrangement should the proposed rule be implemented. Another commenter wrote that giving priority to ACOs over EPMs could subordinate “provider led” models and sought further clarification on how this policy might function with future physician led EPMs. A commenter suggested that in the absence of an agreement, ACOs should be allowed to accept EPM assignment for ACO beneficiaries where an ACO participant served as the “attending physician” during the anchor stay. Under this policy a beneficiary would only be excluded from an EPM if they are actively being managed by an attending physician associated with the ACO and the provider episode care would take precedence over the EPM participant which was an institutional provider.

On the other hand, a significant number of commenters wrote to support the proposed exclusion of beneficiaries assigned to ACOs in either the Next Generation ACO or Comprehensive ESRD Care models. A substantial number of these commenters supported extending the exclusion to beneficiaries assigned to Shared Savings Program Track 3 ACOs. A number of these commenters recommended extending the exclusion even further to include more ACO related exclusions from EPMs and expressed concern that the current approach undermines ACOs. These commenters believed it was important to give preference to population based models versus those focused on more limited episodes. While bundling may give short term savings, it was noted, they do not focus on the total cost of care and have the potential to increase total utilization. In support of this perspective, several commenters recommended the exclusion be extended to include beneficiaries assigned to any ACO unless a collaboration agreement is in place. If there is no collaborative agreement in place between an EPM participant hospital and an ACO that it is not part of, then beneficiaries assigned to that ACO should be excluded from the EPM episodes. A commenter suggested that CMS should allow for “more flexible, market-based options where parties can mutually agree” to share the risk of an episode rather than the proposed exclusion. A commenter recommended that CMS allow for prospective alignment for all types of ACOs regardless of the risk sharing arrangement with CMS. The commenter disagreed with our statement that ACOs that didn’t share downside risk might be less able to manage risk and expressed the view that EPMs had an even lower risk threshold. Extending the option for prospective assignment to all ACOs with downside risk, they noted, could incentivize ACOs to assume more financial risk. Another suggested excluding beneficiaries based on preliminary prospective assignment with retrospective reconciliation if the EPM participant is not a member of the ACO or does not have a collaboration agreement with the ACO. Other commenters suggested that ACO participant hospitals be totally excluded from EPMs.

Response: We acknowledge the range of perspectives expressed by commenters and appreciate the many specific suggestions for handling these overlaps. We also acknowledge the operational challenge both ACOs and EPMs face and the financial impacts on both when there are overlaps. We believe the level and range of responses reflect the challenge in balancing multiple perspectives as was reflected in the discussion in the proposed rule. The predominance of commenters supported our proposal to exclude from EPMs those beneficiaries assigned to Next Generation ACOs and the downside risk track of Comprehensive ESRD Care models, and a significant number of commenters also supported extending this exclusion to Shared Savings Program Track 3 ACOs which also have beneficiaries prospectively assigned and share downside risk. We believe it is appropriate to test the impact of granting full-risk ACO models the opportunity to “hold the risk” associated with the care throughout the performance year, rather than defaulting to the EPM participant; ACOs have stated that they are the appropriate accountable entity for beneficiaries for whom they remain financially responsible, even in the event an assigned beneficiary experiences an episode at an EPM hospital. CMS believes there is significant value in testing an alternative approach which would also not significantly deplete the total number of EPMS. We are less convinced that all beneficiaries assigned to ACOs, regardless of model or track, should be excluded from EPMs and, among other issues, believe that would significantly deplete the volume of EPM episodes. We also remain concerned that excluding all ACO beneficiaries could ultimately exclude patients from EPMs that end up not being assigned to any model. We recognize the broader, more comprehensive perspective of ACOs and encourage the development of collaborative partnership agreements with EPMs. We do not, however, believe it is appropriate for CMS to mandate such agreements or the detailed terms of such agreements, or believe it is practical to tie exclusions to the presence of hospital and ACO specific agreements that may be in place for specific episodes.

In sum, we are convinced that there is merit in extending our proposed beneficiary exclusion from EPMs to include those beneficiaries assigned to Shared Savings Program Track 3 ACOs. We also note that CMS has recently announced that it will re-open applications for new participants in the Next Generation Accountable Care Organization (ACO) model for the 2018 performance year. Therefore we are finalizing our proposal with one modification: The exclusion of ACO beneficiaries assigned to Shared Savings Program Track 3 ACOs from the EPMs.

Comment: A few commenters stated that, while bundled payments may provide savings to Medicare in the short term, the EPMs do not sufficiently address volume or total cost of care. Commenters suggested that because ACOs focus on total cost of care and population health, while episode and bundled payments focus on specific disease states, issues such as the utilization or volume of services and selection or type of services such as preventative services could be better managed by ACOs. These commenters believed that the EPMs actually threaten the long term success of ACOs and that further, the EPMs could potentially increase overall Medicare costs.

Response: We appreciate these commenters’ concerns. The goals of the EPMs are to test methods to improve the quality of care furnished to beneficiaries and reduce spending during episodes in specific geographic areas. While we understand that overlaps between ACOs and EPMs exist, we believe the policies for handling overlap, which we are finalizing with slight modification in this final rule (that is Shared Savings Program Track 3 ACOs will be excluded from the EPMs), adequately and appropriately address and account for overlap with other Innovation Center Models.

With respect to commenters’ assertions that ACOs can better manage patient care and/or lower costs of health care, we believe we must also continue to assess the extent to which ACOs contribute to lowering costs and improving care, as research around this
issue continues to evolve.88 89 We will continue rigorous, independent evaluations that examine each particular payment model and how overlapping models affect Medicare beneficiaries so as to determine the need to require participation in these episode models to enhance learning around the best approaches to improving quality while containing costs. We will also continue to monitor the impact of testing alternative payment approaches and consider volume effects as part of that process.

We refer readers to section III.G. of this final rule for discussion of monitoring and beneficiary protections under this model which we believe will address the commenters’ concerns about potential increases to overall Medicare spending. We also refer readers to section IV of this final rule where we discuss the evaluation of the EPMs, including consideration of the impact of the EPMs on the total number of episodes, total cost of care and potential beneficiary risk selection.

Comment: Many commenters expressed concern about the challenge of having accurate and timely information on patient attribution with multiple models. They believed it was unrealistic to expect hospital staff and others to be able to accurately identify patients in excluded ACO models and questioned how EPM participants and their partners would be able verify a patient’s status. This was a particular concern with patients who may travel out of their home area to receive care, either regularly or one-time due to living out of the area for part of the year.

Response: We appreciate the operational challenges that EPM participants and their collaborating partners face in an environment where there are many, potentially overlapping, models in place. CMS is doing what we can to reduce operational barriers where we can practically and effectively do so. To this end we are in the process of developing a web portal where EPM participants can, at the point of care, look up and identify beneficiaries prospectively assigned to ACOs who will be excluded from EPMs. This system is currently in testing, and is expected to be operational when EPMs are implemented in July 2017. CMS will provide more specific information as it is rolled out.

Comment: A commenter stated that they are concerned with our inability to

fully model the estimated impact of the EPMs on beneficiaries who are also aligned or attributed to a Medicare Shared Savings Program participant or an ACO model initiated by the CMS Innovation Center. The commenter stated that CMS should delay implementation of EPMs until this issue can be evaluated. Further, they believe CMS should release the data necessary to study this issue.

Response: We understand the commenter’s desire to understand the full effect of EPMs in relation to other CMS initiatives. As discussed in the proposed rule (81 FR 50989 through 51002), the high uncertainty associated with concurrent EPM and ACO and/or Shared Savings Program attribution is a limitation in our modeling of the impacts of the interaction between these models and programs. We do not believe that delaying EPMs would enable prospective modeling of the potential interaction. We refer readers to section III.D.6.c. of this final rule for a discussion of our approach to accounting for beneficiaries who are simultaneously receiving care under the EPMs and other alternative payment models such as BPCI or CJR. We refer readers to section III.G. for a discussion of the Monitoring and Beneficiary Protections which will be implemented in the EPMs. We will monitor the impact of the EPMs on other CMS initiatives such as ACOs to ensure quality of care in these programs is not being adversely impacted by the EPMs. As discussed in section III.G. of this final rule, we plan to publish data as part of the EPM evaluations to promote transparency and an understanding of the EPM effects, including impacts on other models and programs such as ACOs.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, with modification, to exclude from eligibility for EPMs not only beneficiaries assigned to Next Generation ACOs and Comprehensive ESRD Care Initiative models, but also beneficiaries prospectively assigned to Shared Savings Program Track 3 ACOs. However, for reasons previously specified in this section, we do not believe it is appropriate to change the proposed policy, as implemented in the CJR model, for handling overlaps between EPMs and other ACOs (ACOs whose beneficiaries are not excluded from the EPMs) to attribute savings achieved during an EPM episode to the EPM participant, and to include EPM reconciliation payments for ACO-assigned beneficiaries as ACO expenditures. We also note that we will implement an on-line system for verification of attribution to support EPM participants in their ability to identify such exclusions.

d. Payment Reconciliation of Overlap With Non-ACO CMS Models and Programs

In general, Per-Beneficiary Per-Month (PBPM) payments are for new or enhanced provider or supplier services that share the goal of improving quality of care overall and reducing Medicare expenditures for services that could be avoided through improved care coordination. Some of these PBPM payments may be made for services furnished to a beneficiary that is in another Innovation Center model at the same time that the beneficiary is in an EPM, but the clinical relationship between the services paid for by the PBPM payments and the EPM will vary. For purposes of the proposed rule, we considered clinically related services paid for by PBPM payments that are for the purpose of care or duration of care management of any beneficiary diagnosis or hospital admission not excluded from an EPM’s episode definition, as discussed in section III.C. of the proposed rule. As with CJR, we proposed to include PBPM payments for new and enhanced services in EPM reconciliation calculations if we determine, on a model by model basis, that the services paid for by the PBPM payments are (1) not excluded from an EPM model’s episode definition; (2) rendered during the episode; and (3) paid for from the Medicare Part A or Part B Trust Funds. That is, we would include the clinically related services paid for by a PBPM payment if the services would not otherwise be excluded based on the principal diagnosis code on the claim, as discussed in section III.C. of the proposed rule. The PBPM payments for clinically related services would not be excluded from the EPMs’ historical episodes used to calculate target prices when the PBPM payments are made from the Part A or Part B Trust Fund, and they would not be excluded from calculation of actual episode expenditures during an EPM’s performance period. PBPM model payments that we determine are clinically unrelated would be excluded, regardless of the funding mechanism or diagnosis codes on claims for those payments. We note that in the case of PBPM model payments, principal diagnosis codes on a Part B claim (which are used to identify exclusions from EPMs, as discussed in section III.C. of the proposed rule) would not be the only mechanism for exclusion of a

service from an EPM. All such PBPM model payments that we determine are clinically unrelated would be excluded as discussed in the proposed rule. Finally, all services paid for by PBPM payments funded through the Innovation Center’s appropriation under section 1115A of the Act would be excluded from the EPMs, without a specific determination of their clinical relationship to an EPM. We believe including such PBPM payments funded under the Innovation Center’s appropriation and not included on claims would be operationally burdensome and could significantly delay any reconciliation payments and repayments for the EPMs. In addition, because these services are not paid for from the Medicare Parts A or B Trust Funds, we are not confident that they would be covered by Medicare under existing law. Therefore, we believe the services paid for by these PBPM payments are most appropriately excluded from the EPMs. Our proposal for the treatment of services paid for by PBPM payments in the EPMs would pertain to all existing models with PBPM payments, as well as future models and programs that incorporate PBPM payments. As we stated in the proposed rule, we believe that this is fully consistent with our goal of including all related Part A and Part B services in the EPMs, as discussed in section III.C. of the proposed rule.

As with CJR, we propose to exclude the PBPM payments for the OCM and Medicare Care Choices Model (MCCM) from the AMI, CABG, and SHFFT episode definitions. These PBPM payments (listed on the CMS Web page at https://innovation.cms.gov/Files/x/cjr-pbpmexclosures.xls) would be excluded from EPM reconciliation calculations. While the OCM will pay for new or enhanced services through PBPM payments funded by the Medicare Part B Trust Fund, we do not believe these services are clinically related to the EPMs. The OCM incorporates episode-based payment initiated by chemotherapy treatment, a service generally reported with ICD-9-CM and ICD-10-CM codes that will be excluded from the AMI, CABG, and SHFFT episode definition in section III.C. of the proposed rule. We believe the care coordination and management services paid for by OCM PBPM payments would be focused on chemotherapy services and their complications, so the services would be clinically unrelated to AMI, CABG and SHFFT model episodes. Therefore, we proposed that services paid for by PBPM payments under the OCM be excluded from the AMI, CABG, and SHFFT models. Similarly, we proposed to exclude services paid for by PBPM payments under the MCCM. The MCCM focuses on providing care coordination and palliative care services for beneficiaries with certain conditions certified as terminally ill with a life expectancy of 6 months or less that have not elected the Medicare hospice benefit. The MCCM seeks to test whether providing palliative care services, without beneficiaries having to forgo curative care, incentivizes beneficiaries to elect hospice sooner. This is aimed at addressing the large percentage of hospice beneficiaries who elect the hospice benefit too late to fully benefit from the range of services that hospice has to offer at end of life. Since the purpose of the MCCM is to test whether providing palliative care services to beneficiaries who are otherwise eligible to elect the Medicare hospice benefit without requiring the beneficiary to forgo curative care results in beneficiaries electing the hospice benefit sooner, we will not include such payments in the AMI, CABG and SHFFT models’ episode spending calculations. In addition, unlike the regular hospice benefits, which are furnished to beneficiaries in lieu of curative care and which therefore can be coordinated during an AMI, CABG or SHFFT model episode, the services furnished under the MCCM will be in addition to curative services. We note that we are including such curative services in the EPM episode, as they are consistent with our episode definition described in III.C. of the proposed rule, but not the services represented by the PBPM payment, which are provided in addition to curative services. Beneficiaries electing the hospice benefit could have lower episode spending because they have forgone curative care. However, beneficiaries included in the MCCM may have higher episode spending because they are receiving both curative care and the services represented by the PBPM. We do not want to create incentives that deter providers from enrolling beneficiaries in the MCCM.

We acknowledge there may be new models that could incorporate a PBPM payment for new or enhanced services. We plan to make our determination about whether services paid by a new model PBPM payment that is funded under the Medicare Trust Funds are clinically related to EPM episodes through the same sub regulatory approach that we have proposed to use to update the episode definitions (excluded MS–DRGs and ICD–CM diagnosis codes). We would assess each model’s PBPM payment to determine if it would be primarily used for care coordination or care management services for excluded clinical conditions in the EPMs based on the standards we proposed to use to update EPM episode definitions that are discussed in section III.C. of the proposed rule.

If we determine that a PBPM payment would primarily be used to pay for services to manage an excluded clinical condition, we would exclude the PBPM payment from the EPM on the basis that it pays for unrelated services. If we determine that the PBPM payment could primarily be used for services to manage an included clinical condition, we would include the PBPM payment in the EPM if the diagnosis code on the claim for the PBPM payment was not excluded from the episode, following our usual process for determining excluded claims for Part B services in accordance with the EPM episode definitions discussed in section III.C. of the proposed rule. To allow for public input on our planned application of these standards, we will post our proposed determination about whether the PBPM payment will be included in the episode on the CMS Web site. After our consideration of any public input received, we will make a final determination on the inclusion of the PBPM payment and will then post the final updated overlap list, reflecting any changes made to PBPM payment inclusions, to the CMS Web site.

With the publication of this final rule, we are initiating the sub-regulatory update process described in the preceding paragraphs to review potential additions to the PBPM exclusion lists for the EPMs. We did not consider the 2017 PBPM changes in the EPM proposed rule, because we limited our PBPM proposals to those models that were active when the proposed rule was published in the Federal Register on August 2, 2016. Since the proposed rule was published, other PBPM models have become active, such as the Million Hearts® Cardiovascular Disease (CVD) Risk Reduction Model and the Comprehensive Primary Care Plus (CPC+) model. These would be examples of PBPMs we will review for calendar year 2017 under the sub-regulatory update process we are establishing in this final rule. The potential modifications to the PBPM exclusion list for each EPM are posted on the CMS Web site at https://innovation.cms.gov/initiatives/epm. We request that public input on the potential modifications be sent to epm@cms.hhs.gov through 11:59 p.m. Eastern Standard Time on January 27, 2017.
After receiving and reviewing public input on potential revised exclusions, we will post the final revised PBPM exclusion lists by February 24, 2017, and will also specify via web post when the revisions will take effect and to which episodes they will apply.

The payment reconciliation process is described in section III.D.5. of the proposed rule. As with CJR, it is important that other models and programs in which providers are accountable for the total cost of care be able to account for the full Medicare payment, including EPM-related reconciliation payments and repayments as described in section III.D.5. of the proposed rule, for beneficiaries who are also in EPM episodes.

We established the proposal for accounting for non-ACO services and payments in the EPM reconciliation process at §512.210. We sought comment on this proposal.

The following is a summary of the comments received and our responses. We did not receive any specific comments relating to how we have proposed to handle PBPM payments from non-ACO models in the EPM reconciliation process.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to include PBPM payments for new and enhanced services in EPM reconciliation calculations if we determine, on a model by model basis, that the services paid for by the PBPM payments are (1) not excluded from an EPM model’s episode definition; (2) rendered during the episode; and (3) paid for from the Medicare Part A or Part B Trust Funds. We will post our list of PBPM payments which we propose to exclude from EPM episode spending calculations on the CMS Web site at https://innovation.cms.gov/initiatives/epm model exclusion and request that public input on the potential PBPM exclusions be sent to epm@cms.hhs.gov through 11:59 p.m. Eastern Standard Time on January 27th, 2017. After receiving and reviewing public input on potential PBPM exclusions, we will post the final PBPM exclusions by February 24th, 2017 including providing information about when the PBPM exclusions will take effect.

7. Limits or Adjustments to EPM Participants’ Financial Responsibility
   a. Overview

We recognized that hospitals that would be designated for participation in the proposed EPMs currently vary with respect to their readiness to function under an EPM with regard to their organizational and systems capacity and structure, as well as their beneficiary population served. That is, some EPM participants may be more quickly able to demonstrate high quality performance and savings than others, even though we proposed that the EPM-episode benchmark prices be based predominantly on the participant’s own historical EPM-episode utilization in the early years of the EPMs. We also noted that providers may be incentivized to excessively reduce or shift utilization outside of an EPM’s episode by the proposed payment policies of the EPMs. In order to mitigate any excessive repayment responsibility for EPM participants or reduction or shifting of care outside an EPM episode, especially beginning in performance year 2 of the EPMs when we proposed to begin to phase in responsibility for repaying Medicare for excess EPM-episode payments, we proposed several specific policies as follows (81 FR 50872).

b. Limit on Actual EPM-Episode Payment Contribution to Repayment Amounts and Reconciliation Payments
   (1) Limit on Actual EPM-Episode Payment Contribution to Repayment Amounts

As discussed in section III.D.3.d. of the proposed rule regarding our proposed pricing adjustment for high payment EPM episodes (81 FR 50846), EPM participants would not bear financial responsibility for actual EPM-episode payments greater than a ceiling set at 2 standard deviations above the mean regional EPM-episode payment. Nevertheless, EPM participants would begin to bear repayment responsibility beginning performance year 2 (DR) for EPM episodes where actual EPM-episode payments are greater than the EPM quality-adjusted target prices up to the level of the regional EPM-episode ceiling. When aggregated across all EPM episodes in a model, the total money owed to Medicare by an EPM participant for actual EPM-episode payments above the applicable EPM quality-adjusted target price could be substantial if a participant’s EPM episodes generally had high payments. As an extreme example, if a participants had all of its EPM episodes paid at 2 standard deviations above the mean regional EPM-episode payment, the EPM participant would need to repay Medicare a large amount of money, especially if the number of EPM episodes was large.

To limit a participant’s overall repayment responsibility for actual EPM-episode payments under the EPMs, (hereafter called a “stop-loss limit”), we proposed to establish the same stop-loss limits that were adopted for the CJR model (80 FR 73401); except, that they would apply beginning in the second rather than first quarter of performance year 2 (81 FR 50872 through 50873). Specifically, we proposed a 5 percent stop-loss limit in performance year 2 (DR), a 10 percent stop-loss limit in performance year 3, and a 20 percent stop-loss limit for performance years 4 and 5 for each EPM. That is, beginning in the second quarter of performance year 2, the EPM participant would owe Medicare under each proposed EPM no more than 5 percent of the sum of the EPM quality-adjusted target prices for all of the EPM participant’s EPM episodes during performance year 2 (DR). This responsibility would gradually phase up to 20 percent by performance year 4.

For performance year 2, the comparison against the stop loss limit would only apply for NPRA attributable to episodes ending in performance year 2 (DR). As described in section III.D.5. of the proposed rule, when calculating the NPRA for performance year 2, we would ensure the NPRA attributable to episodes ending during performance year 2 (NDR) was not less than zero and that NPRA attributable to episodes ending during performance year 2 (DR) did not exceed the stop-loss limit of 5 percent of the sum of quality-adjusted target prices for episodes that ended during performance year 2 (DR).

Similarly, when calculating the subsequent reconciliation calculation to reassess actual EPM-episode payments for performance year 2 (which would occur concurrently with the reconciliation for performance year 3), we would combine the performance year 2 (NDR) NPRA and the result of the subsequent reconciliation calculation for performance year 2 (NDR) to ensure the result was not less than zero. Also, we would combine the performance year 2 (DR) NPRA and the result of the subsequent reconciliation calculation for performance year 2 (DR) to ensure the stop-loss limit was not exceeded.

For performance years 3 through 5, it would not be necessary to split the performance years to ensure that the stop-loss limit was not exceeded as a single stop-loss limit would apply in each year. For example, as described in section III.D.5. of the proposed rule, when calculating the NPRA for performance year 3, we would ensure the NPRA did not exceed the stop-loss limit of 10 percent of the sum of quality-adjusted target prices. Similarly when conducting the subsequent...
reconciliation calculation to reassess actual EPM-episode payments for performance year 3 (which would occur concurrently with the reconciliation for performance year 4), we would combine the performance year 3 NPRA and the result of the subsequent reconciliation calculation for performance year 3 to ensure the stop-loss limit was not exceeded.

Note that, as described in sections III.D.5.b. and III.D.6.b.(2) of the proposed rule (81 FR 50865 through 50867 and 50869 through 50871), the result of the post-episode spending calculation and ACO overlap calculation that would occur concurrently with the subsequent reconciliation calculation for a given performance year would not be subject to the stop-loss limit. The result of these calculations would be added to the NPRA and subsequent reconciliation calculation to create the repayment amount or reconciliation payment. We believed that these limits would both offer EPM participants reasonable protections while maintaining incentives to improve care quality and efficiency. We noted that in addition to the CJR model, we apply a similar approach to hospitals participating in the model while maintaining incentives that will encourage improvements in care quality and efficiency.

The proposal to limit participants’ overall payment responsibility under the models was included in § 512.305(c)(2)(iii)(A). We sought comment on our proposal to limit hospitals’ overall payment responsibility.

The following is a summary of the comments received and our responses.

Comment: Commenters offered a variety of perspectives on the proposal to limit hospitals’ payment responsibility under the models. A number of commenters requested that CMS include additional protection to participants by delaying the phase-in period under which the limits would increase, or reducing the limits across-the-board or for certain hospital types, for example, participants treating a large percentage of complex cases or vulnerable populations. One commenter recommended that the limits remain at a statistically equivalent level of case complexity provided that the participants are improving with respect to their performance measures.

Another commenter recommended that in lieu of a blanket stop loss protection, CMS should instead make outlier payments for high-cost cases as they believed it would provide a better safety net to the small percentage of extremely high-cost episodes. One commenter recommended that hospitals with fewer than 20 episodes not be required to participate and if they did, their stop-loss threshold should be increased. Another commenter suggested that CMS include additional stop-loss protections for participants that provide services to complex patients and patients with comorbidities. The commenter also seemed to suggest that the additional stop-loss protections be offered where beneficiaries receive hospice services during an episode.

Response: We appreciate the comments we received either in support of our proposal or to modify the proposal. While we are not persuaded by comments to reduce the stop-loss limits or modify our proposed mechanism for offering participant protections against significant financial loss, we are delaying the phase-in period under which the stop-loss limits would increase to conform with our policy to delay when EPM participants would be required to accept downside risk under the EPMs as described in section III.D.2.c. of this final. Thus, under our final policy, except for those EPM participants with additional stop-loss protections as discussed in section III.D.7.c.(1) of this final rule, the limits on a EPM participant’s repayment responsibility as displayed in Table 19 are—

- For performance year 2, 5 percent for EPM participants that voluntarily elect downside risk for that year; and
- For performance years 3, 4 and 5, 10 percent, and 20 percent respectively.

We believe that this policy in conjunction with our policies to delay when hospitals must assume downside risk and cap high cost payments as well as our plans to implement further risk adjustment measures offer sufficient protections to hospitals participating in the model while maintaining incentives that will encourage improvements in care quality and efficiency.

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal, with modification, to establish limits on participants’ overall payment responsibility. Our final policy on participants’ overall payment responsibility is included in § 512.305(c)(2)(iii)(A).

(2) Limitation on Reconciliation Payments

We believe limits on reconciliation payments made under the proposed EPMs would also be appropriate for several reasons. Under our proposal, in performance year 1, EPM participants would have no repayment responsibility for excess EPM episode spending above the EPM quality-adjusted target price,
and CMS would bear full financial responsibility for Medicare actual EPM-episode payments for an EPM episode that exceeds the EPM quality-adjusted target price; however, we believe our responsibility should have judicious limits. In addition, our proposed rule noted that beginning in performance year 1, EPM participants would be eligible for reconciliation payments due to the NPRA if actual EPM-episode payments are less than the quality-adjusted target prices. This proposal for reconciliation payments due to the NPRA was intended to provide a financial incentive to EPM participants from the beginning of the model to manage and coordinate care throughout the EPM episode with a focus on ensuring that EPM beneficiaries receive the lowest intensity, medically appropriate care throughout the EPM episode that results in high quality outcomes. However, for purposes of responsible stewardship of CMS resources and concerns about potentially excessive reductions in utilization under the proposed EPMs that could lead to beneficiary harm, we also believed it would be reasonable and hence proposed to cap an EPM participant’s reconciliation payments resulting from actual EPM-episode payments for a given performance year as a percentage of EPM-episode payments.

In determining what would constitute an appropriate reconciliation payment limit due to actual episode spending (hereafter called a “stop-gain limit”), we believe it should provide significant opportunity for EPM participants to receive reconciliation payments for greater episode efficiency that includes achievement of quality care and actual EPM-episode payment reductions below the quality-adjusted target price, while avoiding the creation of significant incentives to sharply reduce utilization that could be harmful to EPM beneficiaries. We also believe that establishing parallel stop-gain and stop-loss limits is important to provide proportionately similar protections to CMS and EPM participants for their financial responsibilities under the EPMs as well as to protect the health of beneficiaries.

Accordingly, we proposed to establish symmetrical stop-gain limits (81 FR 50873). Specifically, we proposed a 5 percent stop-gain limit in performance years 1 and 2, a 10 percent stop-gain limit in performance year 3, and a 20 percent stop-gain limit for performance years 4 and 5 for each EPM. That is, in performance year 1 as we phased-in the stop-gain limits, the reconciliation payment that the EPM participant would be eligible to receive under each proposed EPM would be no more than 5 percent of the sum of the EPM quality-adjusted target prices for all of the EPM participant’s EPM episodes during the performance year. This limit would gradually phase up to 20 percent by performance year 4. As was also indicated in the CJR Final Rule, we wanted to ensure that any savings achieved by EPM participants in the early years of the EPM were not due to random variation, and that changes undertaken to improve efficiency included achievement in care quality and not sharp decreases in utilization that could be harmful to beneficiaries (80 FR 73402).

We clarified in our proposed rule that, as with the stop-loss limits, we proposed to determine whether an EPM participant had met the stop-gain limit by assessing the NPRA and subsequent reconciliation for a given performance year, if any. We noted that this approach aligned with our goal to place limits on the amount a participant may earn as a reconciliation payment due to reduced actual EPM-episode payments.

We also noted that we planned to monitor beneficiary access and utilization of services and the potential contribution of the stop-gain limit to any inappropriate reduction in EPM-episode services. We refer to section III.D.7.b.(1), in delaying when EPM participants would be required to accept reconciliation payments achieves an appropriate balance that both provides incentives for participants to improve care quality and efficiency without also encouraging excessive and inappropriate reductions in utilization.

Response: We appreciate the comments we received on our proposal, but disagree with recommendations to eliminate or raise the dollar amount at which payments would be capped. While the proposed models intend to establish financial incentives to better manage and coordinate care throughout the EPM episode in a way that improves both health care quality and efficiency, we believe it is also necessary to establish limits to discourage the changes for excessive reductions in utilization under the proposed EPMs that could lead to beneficiary harm. We believe our proposed cap on reconciliation payments achieves an appropriate balance that both provides incentives for participants to improve care quality and efficiency without also encouraging excessive and inappropriate reductions in utilization.

Also, as previously stated, we believe it is important that stop-gain and stop-loss limits under the models be established in a way that provides proportionately similar protections to CMS and EPM participants for their financial responsibilities under the EPMs as well as to protect the health of beneficiaries. As such, we proposed to establish stop-gain limits under the models that were symmetrical with our stop-loss limits.

As we previously noted in section III.D.7.b.(1), in delaying when EPM participants would be required to accept downside risk under the EPMs as described in section III.D.2.c. of this final rule, our final policy includes conforming adjustments to the limits on EPM participants’ overall payment responsibility. These conforming adjustments also necessitate adjustments to the stop-gains limits under the model for consistency with our policy for symmetrical stop-loss and stop-gain limits. Accordingly, the final stop-gain limits are 5 percent in performance years 1, 2, and 3; 10 percent in performance year 4; and 20 percent in performance year 5 for each EPM (see Table 20).

*Limits apply to hospitals other than those eligible for the separate stop-loss limits discussed in section III.D.7.c.(1) of this final rule.

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal, with modification, to establish a cap on an EPM participant’s reconciliation payment due to actual EPM-episode payments for a given performance year as a percentage of EPM-episode payment. Our final policy on the proposed cap, which includes conforming adjustments so that the stop-loss and stop-gain limits are symmetrical, is included in § 512.305(c)(2)(iii)(B).

c. Additional Protections for Certain EPM Participants

(1) Policies for Certain EPM Participants to Further Limit Repayment Responsibility

While the aforementioned proposals generally provide additional safeguards to ensure that EPM participants would have limited repayment responsibility, we proposed additional protections for certain groups of EPM participants that may have a lower risk tolerance and less infrastructure and support to achieve efficiencies for high-payment EPM episodes (81 FR 50873 through 50874). Specifically, we proposed additional protections for rural hospitals, SCHs, Medicare Dependent Hospitals, and Rural Referral Centers (RRCs). We note that these categories of hospitals often have special payment protections or additional payment benefits under Medicare because we recognize the importance of preserving Medicare beneficiaries’ access to care from these hospitals.

For the purpose of these models, we proposed to define a Rural Hospital as an IPPS hospital that is either located in a rural area in accordance with § 412.64(b) or in a rural census tract within an MSA defined at § 412.103(a)(1) or has reclassified to rural in accordance with § 412.103.

We proposed to define a Sole Community Hospital as it is defined in § 412.92. That is, hospitals paid under the IPPS can qualify for SCH status if they meet one of the following criteria:
- Located at least 35 miles from other like hospitals.
- Located in a rural area, located between 25 and 35 miles from other like hospitals, and no more than 25 percent of residents or Medicare beneficiaries who become hospital inpatients in the hospital’s service area are admitted to other like hospitals located within a 35-mile radius of the hospital or the hospital has fewer than 50 beds and would meet the 25 percent criterion if not for the fact that some beneficiaries or residents were forced to seek specialized care outside of the service area due to the unavailability of necessary specialty services at the hospital.
- Hospital is rural and located between 15 and 25 miles from other like hospitals but because of local topography or periods of prolonged severe weather conditions, the other like hospitals are inaccessible for at least 30 days in each of 2 out of 3 years.
- Hospital is rural and the travel time between the hospital and the nearest like hospital is at least 45 minutes.
- Hospital is rural and the travel time between the hospital and the nearest like hospital is at least 45 minutes.
- Hospital is rural and the travel time between the hospital and the nearest like hospital is at least 45 minutes.

We proposed to define a Medicare Dependent Hospital (MDH) as it is defined in § 412.108. That is, an MDH is a hospital that meets the following criteria:
- Located in a rural area.
- Has 100 beds or less.
- Is not a SCH.
- Sixty percent of the hospital’s inpatient days or discharges were attributable to individuals entitled to Medicare Part A benefits during specified time periods as provided in § 412.108.

We proposed to define a Rural Referral Center as it is defined in § 412.96. Specifically, RRCs are defined as IPPS hospitals with at least 275 beds that meet the following criteria:
- Fifty percent of the hospital’s Medicare patients are referred from other hospitals or from physicians who are not on the staff of the hospital.
- At least 60 percent of the hospital’s Medicare patients live more than 25 miles from the hospital.
- At least 60 percent of all services the hospital furnishes to Medicare patients are furnished to patients who live more than 25 miles from the hospital.

If a hospital does not meet these criteria, a hospital can also qualify for RRC status if a hospital meets the following criteria:
- For specified period of time, the hospital has a case-mix that equals at least the lower of the median case mix index (CMI) value for all urban hospitals nationally; or the median CMI value for urban hospitals located in its region, excluding those hospitals receiving indirect medical education payments.
- Its number of discharges is at least—
  ++ 5,000 (or 3,000 for an osteopathic hospital); or
  ++ The median number of discharges for urban hospitals in the census region in which it is located, set by the CMS through IPPS rulemaking.
- Additionally, a hospital must meet one of the following criteria:
  ++ More than 50 percent of its active medical staff are specialists who meet the conditions specified at § 412.96(c)(3).
recommended that CMS provide additional protection to these providers by waiving downside risk for them for the entire duration of the models as well as to retaining the proposed protections to MDHs in the event the MDH status expires during the period of the models. Some commenters requested that CMS extend to participants with a low volume of episodes or to hospitals that serve a large portion of vulnerable populations these same financial loss limits because they likely lacked the infrastructure and support to achieve greater efficiencies or served beneficiaries with more complex and diverse treatment needs. Some commenters provided data in support of their request suggesting that hospitals with fewer episodes had the widest range in gains and losses largest year-to-year variation in episode spending relative to target prices. One commenter suggested that CMS determine eligibility for these separate financial loss limits based on the same thresholds that would be applied for determining whether a participant’s EPM-episode benchmark prices would be based only on regional historical EPM-episode payments.

Response: We appreciate and agree with the comments supporting our proposal to establish separate financial loss limits for certain hospitals. We do not agree with the suggestion that we instead waive downside risk entirely for these hospitals. Given their lower tolerance of risk, more limited infrastructure and support to achieve efficiencies, and special status under Medicare to preserve Medicare beneficiaries’ access to care from these hospitals, we recognize that certain adjustments to the model are warranted for these hospitals. However, we believe our proposed financial loss limits offer sufficient protection to these hospitals while allowing us to maintain an appropriate balance of incentives to encourage care quality and efficiency improvements as would exist for the other hospitals that would be participating under the models. Under our proposal, the MDH program will continue through September 30, 2017, but will expire absent additional legislative authority. As we stated in the CJR Final Rule (80 FR 73406), we understand the concern that with the expiration of MDH status, hospitals will lose their MDH designation and additional Medicare FFS payments provided under the MDH designation. Additionally, under the expiration of MDH status, hospitals would no longer qualify for the protective stop-loss limit tied to that status under the EPM models. We believe it would be inconsistent to apply the additional benefit of protective stop-loss limits to former MDHs when by law, those hospitals are not permitted to retain the other Medicare payment benefits provided to MDHs. We would note, however, that should a participant’s MDH payment status expire, some MDHs may apply with their MACs to determine if they qualify as an RRC or SCH and would be able to maintain the protective stop-loss limits.

The requests commenters made to extend separate financial loss limits to hospitals with a low volume of episodes have persuaded us to extend these separate limits under the EPMs under certain specific circumstances. We conducted an analysis of cost variation for episodes under the EPMs and found greater variation in episode-level spending for episodes occurring among low-volume than high-volume hospitals. Under a range of low-volume thresholds, this analysis showed the standard deviation of historical AMI episode spending at low-volume hospitals in selected MSAs was 10 to 32 percent higher than low-volume hospitals in selected AMI model MSAs. Likewise, the standard deviation of historical SHFFT episode spending at low-volume hospitals was 14 to 18 percent above high-volume hospitals in selected AMI model MSAs, and the standard deviation of historical CABG episode spending was 6 to 19 percent higher above high volume hospitals in selected CABG model MSAs. Based on the results of our analysis, we share commenters’ concerns that when there is a low volume of episodes under a model, an EPM participant could potentially be held responsible for random variation in spending that occurs under that model. Thus, we have been persuaded to extend the separate financial loss limits that apply to rural hospitals, SCHs, MDHs, and RRCs to EPM participants determined to have a low volume of episodes under an EPM, which we will refer to as “EPM volume protection hospitals.” In contrast to rural hospitals, SCHs, MDHs, and RRCs, however, we will apply the separate loss limits to EPM volume protection hospitals at the model level as we will apply loss limits to most other hospitals under the EPMs rather than at the hospital level as is the case for these specific types of hospitals eligible for separate loss limits. Accordingly, this means we could
extend the separate loss limits to an EPM volume protection hospital for one or more EPMs but not necessarily all of the EPMs, depending on whether their historical EPM episode volume exceeded the threshold number for the specific model.

An EPM participant will qualify as an EPM volume protection hospital if their volume of historical EPM episodes that started in calendar years 2013 through 2015 is at or below the 10th percentile of the number of hospital-specific historical EPM episodes for hospitals located in the MSAs eligible for selection into that specific EPM. For purposes of determining the 10th percentile threshold, we will use historical episodes for the same historical periods used to determine an EPM participant’s benchmark and quality-adjusted target prices for performance year 1 based on hospitals with one or more historical episodes under that model in the applicable MSAs. This would include hospitals as rural hospitals, MDHs, SChs, and RRCs. While we considered both higher and lower thresholds, we believe the 10th percentile achieves the most appropriate balance with respect to focusing our policy on those hospitals that would uniquely have a low volume of episodes under an EPM. Though our analysis of episode volume from 2012–2014, suggests that around 10 percent of hospitals with any episodes would be subject to these additional protections, we expect that only around 1 percent or less of episode volume would be subject to the additional protections.

We also note that a participant could potentially be eligible for the separate loss limits based on their being either an EPM volume protection hospital or meeting the criteria for being one of the other eligible hospital types such as a rural hospital, MDH, SCH, or RRCs. We wish to clarify that in these cases we would extend the separate loss limits based on the criteria for the latter hospitals as their separate loss limits would apply at the hospital rather than the model level. Also, we would note that the stop-loss protections would not be additive whereby a participant benefited from the stop-loss protections under both eligibility criteria.

For each EPM, we will post the applicable historical EPM episode number threshold used to determine whether EPM participants are EPM volume protection hospitals and a list of the CCNs of EPM participants that are classified as EPM volume protection hospitals to the CMS Web site before the beginning of performance year 1. We will also indicate to each EPM participant whether it is classified as an EPM volume protection hospital at the same time that we prospectively communicate quality-adjusted target prices to EPM participants, as described in section III.D.4.a. of this final rule.

While the threshold for each EPM will be set for all five performance years so that EPM participants can know before the beginning of the first EPM performance year their hospital status for the five years of the EPM, we make technical revisions to the list of EPM volume protection hospitals to account for changes in business practices, like mergers, acquisitions, or the opening of new hospitals. For example if an EPM participant that was an EPM volume protection hospital merged with another EPM participant and the merged entity continued to use the CCN of the EPM volume protection hospital, we would consider the historical episode volume at both EPM participants to determine whether the merged entity would continue to be an EPM volume protection hospital.

We are not adopting the suggestion to determine an EPM participant’s eligibility for the separate protections using the same thresholds that are applied for determining whether their EPM-episode benchmark prices would be based only on regional historical EPM-episode payments. While these thresholds are appropriate for purposes of ensuring reliable estimates when establishing prices under the models, the measure would not be an effective metric for distinguishing hospitals with a low volume of episodes from other hospitals. Rather, it would result in too high a share of hospitals qualifying for the separate protections and thus would be too crude a metric for distinguishing hospitals with a low volume of episodes.

While we appreciate the comment suggesting that we extend the separate stop-loss limits to hospitals treating a large portion of vulnerable patients, we are not adopting this suggestion at this time. As discussed in the following section of this final rule, however, we requested comments on issues specific to hospitals serving a high percentage of potentially vulnerable populations and their opportunities to advance the goals of the EPMs. As we discuss in that section, while we will not be incorporating the suggestions we received in this rule, we will share the comments and suggestions we received with the Assistant Secretary for Planning and Evaluation for their consideration as well as consider their potential applicability, where appropriate, in future rulemaking.

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal, with modification, to establish separate financial loss protections for certain hospitals. Once again, we would note that in delaying when EPM participants would be required to accept downside risk under the EPMs as is described in section III.D.2.c. of this final rule, our final policy includes conforming adjustments to the separate financial loss limits on participants’ overall payment responsibility. We will extend the separate financial loss protections to EPM participants determined to have a low volume of episodes within a model. Thus, under our final policy, the separate financial loss limits for rural hospitals, SCHs, MDHs, RRCs, and EPM volume protection hospitals as displayed in Table 21 are—

- For performance year 2, 3 percent for EPM participants that voluntarily elect downside risk for that year; and
- For performance years 3, 4 and 5, 3 percent, 5 percent, and 5 percent respectively.

(2) Considerations for Hospitals Serving a High Percentage of Potentially Vulnerable Populations

In addition to the aforementioned hospitals, our proposed rule noted our recognition that other EPM participants, for which we did not propose additional protections, could also face factors affecting their ability to achieve savings under the proposed EPMs, and that these factors could be unrelated to their practice patterns but instead could reflect the EPM participants’ responsibilities for a relatively high percentage of potentially vulnerable populations with higher than average historical spending and/or less opportunities for efficiencies. For example, this could include hospitals that serve a relatively high percentage of beneficiaries that are dually eligible for both Medicare and Medicaid or whose total Medicare payments include a relatively high proportion of disproportionate share hospital payments under 1886(d)(5)(F) of the Act. Some of these hospitals are located in rural areas and would thus likely be classified as a type of hospital for which we proposed additional protections. However, most hospitals that serve a relatively high percentage of beneficiaries that are dually eligible for both Medicare and Medicaid or whose total Medicare payments include a relatively high proportion of disproportionate share hospital payments are located in urban areas, and very few are classified as a rural hospital, RRC, MDH, or SCH that would be subject to the additional protections we proposed. For the first 2 performance years of the EPMs, where pricing is either predominantly or totally based on regional data.

Our proposed rule also noted that the potential challenges posed by these kinds of factors is highlighted in Section 2(d) of the Improving Medicare Post-Acute Care Transformation “IMPACT” Act of 2014 (Pub. L. 113–183). Specifically, Section 2(d) requires the Secretary to conduct a study that examines the effect of individuals’ socioeconomic status, including their Medicaid eligibility, on quality measures and resource use and other measures for individuals under the Medicare program, in recognition that less healthy individuals may require more intensive interventions. The Secretary is required to submit a report on the results of this study within 2 years of enactment of the IMPACT Act. The IMPACT Act also requires the Secretary to conduct a second study that examines the impact of various risk factors, as well as race, health literacy, limited English proficiency (LEP), and Medicare beneficiary activation, on quality measures and resource use and other measures under the Medicare program in order to recognize that less healthy individuals may require more intensive interventions. The Secretary must submit a report on the results of this study within 5 years of enactment of the IMPACT Act.

If these studies find a relationship between the factors examined in the studies and quality measures and resource use and other measures, then the Secretary shall provide recommendations for, among other things, how CMS should account for such factors in quality measures, resource use measures, and other measures under Medicare; and in determining payment adjustments based on such measures in other applicable provisions related to the program. Likewise, taking into account these studies and recommendations as well as other relevant information, the Secretary is required to routinely, as determined appropriate and based on an individual’s health status and other factors, assess appropriate adjustments to quality measures, resource use measures, and other measures under the Medicare program; and assess and implement appropriate adjustments to Medicare payments based on these measures. The Assistant Secretary for Planning and Evaluation is responsible for these studies and a report on the results of the first one is forthcoming. Our proposed rule noted that upon issuance of these studies’ reports, we planned to consider their results as we implemented the proposed EPMs. We also planned to monitor the influence of beneficiary characteristics such as socioeconomic status on EPM participants’ performance during our implementation and evaluation of the EPMs. Given that the performance of EPM participants would be compared largely against their own historical episode cost performance data for the first 2 years of the models, however, we did not anticipate that the aforementioned factors should materially affect participants’ ability to achieve savings. However, as we increasingly began to rely more on regional cost performance data to determine episode benchmarks and quality-adjusted target prices in performance year 3, these factors could become more germane. Thus, in the event we identified the need for adjustments, we could consider proposing additional policies through subsequent rulemaking. Additionally, we planned to use information collected as part of our efforts to monitor beneficiary access to care and quality of care as discussed in sections III.G.4. and III.G.5. of the proposed rule (81 FR 50914 through 50915) to inform if potential adjustments would be needed in future years of the model.

Protections for EPM participants were discussed in section III.D.7.b.(1) and III.D.7.c.(1) of the proposed rule (81 FR 50872 through 50874). We sought comment about all issues specific to

### Table 21—Proposed and Final Separate Stop-Loss Limits by PY—Continued

| **Voluntary Downside Risk**—DR effective for episodes ending on or after 1/1/2018 (anchor discharges occurring on or after 10/4/2017) | 3% | 3% | 3% | 3% | 3% |
| n/a as no downside risk in PY1 | 3 | 5 | 5 | 5 | 5 |
hospitals serving a high percentage of potentially vulnerable populations and their opportunities to advance the goals of the EPMs (81 FR 50875). In particular, we sought comment, including data analysis, about approaches to identifying these hospitals; their opportunities to achieve high quality episode performance; specific considerations about their opportunities to achieve efficient care for the clinical conditions included in the AMI, CABG, and SHFFT models; potential approaches to risk adjustment; potential approaches to additional protections that could be considered for the future modeled after our proposals in section III.D.7.b.(1) of this final rule for certain other EPM participants or otherwise; and evaluation methodologies to ensure that we include appropriate comparison groups and monitor and evaluate the most relevant outcomes.

The following is a summary of the comments received and our responses.

Comment: Commenters urged CMS to provide greater financial protections for providers serving a high portion of vulnerable populations, and recommended that CMS apply lower caps on such providers’ losses. While these commenters suggested that further study was needed, they recommended that, at a minimum, CMS should extend the 5 percent cap to include all of performance year 3, and reduce the cap in PY4 and PY5 to 10 percent. These commenters also noted that CMS would establish a definition of vulnerable populations, which should account for Medicaid and uninsured populations, and should seek public comment on this definition. For example, one commenter suggested that in consideration section 1900 of the Social Security Act to identify hospitals serving a high number of vulnerable patients. Another commenter expressed their appreciation for CMS’ highlighting of this issue, recommended that adjustments for socio-demographic variables would be logical starting point, and providers that care for vulnerable patients and populations should be treated equally.

Response: We appreciate the comments we received on these issues and agree that further study is needed. While we will not be incorporating suggestions we received in this rule, we will share the comments and suggestions we received with the Assistant Secretary for Planning and Evaluation for their consideration as well as consider their potential applicability, where appropriate, in future rulemaking.

d. Application of Stop-Gain and Stop-Loss Limits

Because participants could be participating in the proposed AMI, CABG, and SHFFT models concurrently with the CJR model, our proposed rule noted that an additional consideration concerns the level at which the stop-loss and stop-gain thresholds would be applied, for example, at the participant’s level, as is currently the case for the CJR model, or at some other level, for example, at the model level. We indicated that our intention was to establish appropriate incentives and protections for participants under the proposed EPMs and the CJR model without creating unnecessary administrative complexity. Further, this issue would become especially relevant to the proposed EPMs and CJR model given that the CJR model and proposed EPMs would be operating at different points within their performance periods. That is, episodes under the proposed EPMs would always lag 1 performance year behind those in the CJR model. Thus, SHFFT model participants that would begin the first SHFFT model performance year in 2017 would already be participating in their second performance year under the CJR model. Consequently, in this example, a stop-loss limit could apply to the performance year 2 episodes under the CJR model but not to the performance year 1 SHFFT model episodes under the SHFFT model. SHFFT model participants would not have repayment responsibility in SHFFT model performance year 1 under our proposal. In contrast, for this example, the stop-gain limits would be the same for both the SHFFT and CJR model since the limit for both performance year 1 and 2 would be 5 percent.

Continuing with this example for a later performance year (performance year 4 for the CJR model and performance year 3 for the SHFFT model), any stop-loss limit that applied would be different. That is, the stop-loss limits for the CJR model episodes in performance year 4 would be 20 percent in contrast to the 10 percent stop-loss limit that would apply to the SHFFT model episodes in performance year 3. The proposed stop-gain limits would likewise diverge in this example as they are proposed to be symmetrical with the stop-loss limits.

Given these differences, we considered two options for setting stop-gain and stop-loss limits for hospitals participating in more than one of the AMI, CABG, SHFFT, and CJR models (81 FR 50875 through 50876). Under the first option, we would determine stop-loss and stop-gain limits, in total, at the participant level based on weighted thresholds. Specifically, CMS would calculate a single weighted stop-loss/gain threshold based on the total spending under each model. Thus, using the aforementioned example where CJR model episodes would be in performance year 4 of their model and SHFFT model episodes would be in performance year 3, assuming 50 percent of total spending under the CJR and SHFFT models is for CJR model episodes and the remaining 50 percent is for SHFFT model episodes, the weighted stop-loss limit for the two models at the participant level would be 15 percent: (0.50 × 0.10 for CJR model episodes) + (0.50 × 0.20 for SHFFT model episodes) = 0.15. Although this option would allow the application of a single stop-loss threshold to a participant’s total repayment under the models, we are concerned that computing a single limit such as this could either dilute or magnify the intended protections of the stop-loss limit under each model. As such, a participant that would have been protected from repayment exceeding 10 percent of its SHFFT model quality-adjusted target prices multiplied by the number of SHFFT model episodes for performance year 3 would only be protected for costs above the higher 15 percent level. Conversely, a participant that would have been protected only for repayment above 20 percent of its CJR model quality-adjusted target prices multiple by the number of CJR model episodes for performance year 3 would be protected against repayment above the lower 15 percent threshold.

Alternatively, we considered establishing stop-loss and stop-gain thresholds at the model level; that is, separately for each of the AMI, CABG, and SHFFT models, in addition to the limits that already exist for the CJR model. Under this option, we would separately apply the CJR-applicable stop-loss and stop-gain limits to CJR model episodes, the AMI-applicable limits to AMI model episodes, and so forth. Thus, considering the aforementioned example, the stop-loss limit for CJR model episodes in performance year 4 would be 20 percent for the hospital’s CJR model episodes, while the stop-loss limit for SHFFT model episodes for performance year 3 would be 10 percent. While we might choose to aggregate these amounts to conduct a single financial transaction with a hospital participating in more than one of the EPMs, we believe this option that would apply stop-loss and stop-gain limits at the model level for
hospitals participating in more than one model is superior to first option in that it better maintains appropriate incentives and protections under each of the models.

The proposal to establish stop-gain and stop-loss limits at the model level was included in § 512.305(c)(2)(iii)(D). We sought comment on our proposal to establish stop-gain and stop-loss limits at the model level.

The following is a summary of the comments received and our responses. Comment: Some commenters expressed concerns that a blanket stop-loss policy could offer insufficient protection to participants with a low volume of cases. Thus, one commenter recommended that the stop-loss provision be calculated on an episode-specific basis for each provider as the degree of outcome variability will differ significantly based on the provider’s volume and starting price position relative to the region. Another commenter recommended that CMS apply stop-loss at the episode level separately for low, medium, and high volume providers rather than at the model or program level so that the level of protection would vary by the number of episodes. In their view, this approach would offer hospitals, particularly those with lower volume, greater protection against exceptionally high costs.

Response: We appreciate the comment generally supporting our proposal as well as the suggestions to modify our proposal. As discussed elsewhere in this rule, in addition to protections we had proposed with respect to capping high-cost cases with respect to our financial calculations (see section III.D.3.d.), we are finalizing policies that would offer to hospitals with a low volume of episodes under a model the same stop-loss protections that would apply to certain other hospitals (see section III.D.7.c.) as well as further adjustments for risk that we anticipate making effective beginning in PY3 (see section III.D.4.a.2). We believe these protections are sufficient and are thus not adopting the recommended modifications to the application of stop-loss protections.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to establish stop-gain and stop-loss limits at the model level. Our final policy for establishing these limits is included in § 512.305(c)(2)(iii)(E).

e. EPM Participant Responsibility for Increased Post-Episode Payments

Our proposed rule noted that while episodes under the proposed EPMs would extend 90 days post-discharge from the anchor or chained anchor hospitalization, some EPM participants may have an incentive to withhold or delay medically-necessary care until after an EPM episode ends to reduce its actual EPM-episode payments. This inappropriate shifting could include both those services that are related to the episode (for which the hospital would bear financial responsibility as such services would be included in the actual EPM-episode payment calculation) and those that are unrelated (which would not be included in the actual EPM-episode payment calculation), because an EPM participant engaged in shifting of medically-necessary services outside the EPM episode for potential financial reward may be unlikely to clearly distinguish whether the services were related to the EPM episode or not in the hospital’s decisions.

We also stated our belief that this inappropriate shifting would not be typical, especially given the relatively long EPM episode duration. However, in order to identify and address inappropriate shifting of care, we proposed to calculate for each EPM performance year the total Medicare Parts A and B expenditures in the 30-day period following completion of each EPM episode for all services covered under Medicare Parts A and B, regardless of whether the services are included in the proposed EPM episode definition (sections III.C.3. and III.C.4 of the proposed rule, (81 FR 50829 through 50843). This proposal is consistent with our processes for BPCI Anchor Model 2 and the CJR model (80 FR 73407 through 73408). We proposed that the post-episode spending calculation for a performance year would occur at the same time we performed the subsequent reconciliation calculation for that same year (81 FR 50876 through 50877). We believe this timeframe would allow sufficient time for claims run out in order to set a reliable regional threshold for determining the post-episode spending.

For example, we would conduct the reconciliation for performance year 1 in the spring of 2018. The post-episode spending calculation for performance year 1 would occur during the next reconciliation process (spring 2019), when we conduct the subsequent reconciliation calculation for performance year 1 and account for overlap with other models and programs.

Our proposed calculation would include prorated payments for services that extend beyond the EPM-episode as discussed in section III.D.3.c. of the proposed rule (81 FR 50846).

Specifically, we would identify whether the average 30-day post-episode spending for an EPM participant in any given EPM performance year is greater than 3 standard deviations above the regional average 30-day post-episode spending, based on the 30-day post-episode spending for episodes attributed to all regional hospitals participating in the EPM in the same region as the EPM participant. We proposed that if the EPM participant’s average post-episode spending exceeds this threshold, the EPM participant would repay Medicare for the amount that exceeds such threshold. We noted that, consistent with CJR, an EPM participant’s responsibility for post-episode spending would not be subject to the stop-loss and stop-gain limits proposed in section III.D.7.b. and III.D.7.c.(1) of the proposed rule (81 FR 50872 through 50875). Also, although we believed that cases in which an EPM participant would be responsible for repayment of post-episode spending that exceeds the threshold would be rare, our intention was to identify and hold EPM participants responsible for situations in which those participants have significantly increased spending on services in the 30 days following the end of an EPM episode in order to appropriately shift services out of EPM episodes. This policy is consistent with our proposal for the CJR model in section V.D.1. of the proposed rule (81 FR 50951 through 50952).

We also noted that based on our experience with BPCI, we have not found that this proposal, including our proposal to include all Medicare Parts A and B expenditures to measure 30-day post-episode spending, would inappropriately penalize EPM participants. To that end, however, we believed that our proposed threshold of 3 standard deviations above the regional average is a high threshold, and we only proposed that an EPM participant would repay Medicare for the amount that exceeds such threshold. We further noted that those EPM participants that are eligible for reconciliation payments in an EPM performance year and also have average 30-day post-episode spending that is higher than 3 standard deviations above the regional average 30-day post-episode spending would have their reconciliation payments reduced by the amount by which spending exceeds 3 standard deviations.

The proposals to determine a participant’s post-episode spending 30 days after the end of an episode exceeds 3 standard deviations of average spending in their region for that period, and require those participants exceeding that threshold to repay Medicare for the
amounts in excess of 3 standard deviations were included in § 512.307(c). We sought comment on our proposals to determine if a participant exceeds this threshold and to repay amounts in excess of the threshold.

The following is a summary of the comments received and our responses.

Comment: One commenter expressed support for the proposal as it could help identify participants that withhold or delay medically necessary care until after an episode ends in order to reduce their actual episode spending. This commenter further suggested that CMS also implement a financial penalty for participants that are found to inappropriately delay beneficiaries’ care.

Response: We appreciate the comments in support of our proposal. As noted in section III.F.2. of this final rule, we have finalized various compliance tools for the EPMs that complement existing laws and regulations prohibiting care stinting, provision of substandard care, or denial of medically necessary care. As discussed in section III.F.2., when an EPM participant or its related EPM collaborator, collaboration agent, or downstream collaboration agent engages in these noncompliant behaviors, CMS may take remedial action, including reducing or eliminating the EPM participant’s reconciliation payment or reducing or eliminating the EPM participant’s CR incentive payment amount. In addition, under circumstances where CMS has required a corrective action plan, the EPM participant owes a repayment amount to CMS, and the EPM participant fails to timely comply with the corrective action plan or is noncompliant with the EPM’s requirements, CMS may add 25 percent to a repayment amount on an EPM participant’s reconciliation report. We believe these tools and structure for the financial penalty is consistent with the request of the commenter.

Comment: Some commenters viewed the proposal as unnecessary in light of other enforcement mechanisms to address hospitals that are willfully committing potential fraud and abuse or that the proposal effectively extends the episode duration from 90 to 120 days. One commenter stated that for cases where 30-day post-episode spending exceeded a certain threshold, these expenditures were likely necessary for treatment of a patient’s clinical needs rather than representing an intentional delay in providing care to Medicare beneficiaries to game the system for greater financial rewards.

Response: We disagree with the view that our proposal is unnecessary in light of other enforcement actions. We believe that our proposal in conjunction with our policies related to monitoring and enforcement actions is an appropriate means to discourage the occurrence of instances where access to high quality care might be impeded, and believe this deterrence is preferable to having to take enforcement actions subsequent to such an instance. We also do not agree with the comment that we are effectively extending episodes or that expenditures beyond our thresholds would typically be necessary for the care of a beneficiary. We also note that in the event that CMS identifies excessive post-episode spending at an EPM participant greater than 3 standard deviations above the regional average 30-day post-episode spending, the EPM participant will only be required to pay back the amount by which post-episode spending for episodes attributed to the EPM participant exceeds 3 standard deviations above the regional average 30-day post-episode spending. We note that this does not hold the EPM participant responsible for all post-episode spending as would be the case with 120 day episodes. Moreover, we believe that this threshold is sufficiently high to account for all clinically necessary care that would occur in the 30 days following an episode. As we noted in the CJR Final Rule (80 FR 73407), we believe that monitoring for 30 day post-episode spending is an appropriate tool to identify inappropriate shifts in car based on our experience with BPCI.

Comment: Some commenters raised concerns that care or services that are excluded from or unrelated to an episode would be included in the calculation of post-episode spending and recommended that we exclude these services from post-episode payment calculations. One commenter requested that CMS identify care situations that are “unrelated” to the EPM episode diagnosis with regard to calculating post-episode spending costs.

Response: As we stated in the CJR Final Rule (80 FR 73407), we disagree that we should exclude the same set of services that are excluded from the episode definition in the 30 day post-episode spending calculations because of concerns that the models could lead to shifting of both related and unrelated (those not included in the episode definition) services due to some providers encouraging delays of services for beneficiaries that are not immediately necessary, without discriminating between those services that are in and out of the episode definition. Additionally, our experience with BPCI that similarly includes all costs when monitoring for 30 day post-episode spending has helped to inform our policy for the CJR and the proposed EPMs. Based on our experience with BPCI, we have not found that by including all costs to measure 30 day post-episode spending, that we are inappropriately penalizing hospitals. While we understand commenters’ concerns that hospitals could be held responsible for high cost conditions that are not included in the episode definition, our policy aims to strike a balance to hold participating hospitals accountable for inappropriate shifts or delays in care and to provide hospitals with safeguards on financial risk for 30-day post-episode spending. Thus, we have set a high threshold where only hospitals that have a 30-day post-episode spending average that is 3 standard deviations above the regional average would be subject to repay that difference to Medicare, and in the case where the hospital’s average 30-day post-episode spending exceeds regional average 30-day post-episode spending, the participant would repay Medicare for the amount that exceeds such threshold.

Comment: Some commenters opposed the proposal to exclude post-episode spending from the stop-loss for the proposed EPM models in part because they viewed the provision overall as unnecessary and because of potential harm to those hospitals that might result.

Response: We have established the stop-loss policy to account for clinical variation or other high expenditures that are not accounted for by the target price methodology, which is not directly comparable to excessive spending that occurs during the 30 days after an episode. We believe that the post-episode spending policy sets a sufficiently high threshold to identify situations with clear increases in post-episode spending due to shifting of services to maximize financial gain under the EPMs, and thus that the stop-loss policy should not apply to any potential amount that an EPM participant owes CMS under the post-episode spending policy.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to determine if a participant’s post-episode spending 30 days after the end of an episode exceeds 3 standard deviations of average spending in their region for that period, and require those participants exceeding that threshold to repay Medicare for the amounts in excess of 3 standard
deviations. Our final policy for this is included at VII.

Collection of Information Requirements
8. Appeals Process
a. Overview

Consistent with the BPCI initiative and CJR model, we proposed to institute appeals processes for the EPMs that would allow EPM participants to appeal matters related to EPM payment, such as GR incentive payments, reconciliation amounts, repayment amounts, determinations associated with quality measures affecting payment (the use of quality measure results in determining the composite quality score, or the application of the composite quality score during reconciliation) as well as non-payment related issues, such as enforcement matters. These matters are discussed respectively throughout section III.D. and III.F. of this final rule.

We sought comment on the proposal to institute appeals processes for the EPMs.

The following is a summary of the comments received and our responses.

Comment: A commenter requested clarification on how CMS will handle an EPM participant’s appeal of a potential calculation error when the beneficiary has substance abuse and/or behavioral health claims which cannot be shared with the EPM participant. The commenter expressed concern regarding the balance between privacy restrictions around substance abuse and behavioral health claims and information that is provided to EPM participants in order to verify the calculations. The commenter stated that EPM participants will have to assume CMS has performed all calculations correctly, and as this is not a desirable situation, according to the commenter, the commenter recommended CMS exclude these claims from the episode calculation or provide the information to the EPM participants.

Response: While we appreciate the commenters’ position, we believe that the inclusion of these substance use disorder claims in the episode target and actual price calculations is necessary for accurately pricing the episodes.

Our proposal to exclude this information from the claims shared with model participants is consistent with our usual treatment of these data with other similar CMS programs and models where providers must take on risk in managing the care of their beneficiaries, such as the Shared Savings Program, BPCI, and the CJR model. We would note that, based on our experience to date, we are unaware of this policy being a significant impediment to the operations of these efforts. We do understand that by not receiving this data, EPM participants are unable to fully verify the accuracy of CMS’ calculations. However, as these claims typically represent less than 0.1 percent of episode spending (based on an analysis of 2015/2016 claims data used in current BPCI episodes) we do not believe their exclusion from the data that we provide to participants will produce material differences in the replication of target/actual prices.

Further, Section 1115A of the Act does not authorize the waiver of the requirements under 42 CFR part 2 which govern the release of substance use disorder claims. We note, though, that we may be able to share these claims with participants in the near future based on proposals outlined in the Confidentiality of Substance Use Disorder Patient Records proposed rule published to the Federal Register by SAMHSA on February 9, 2016 (81 FR 6987), which updates the 42 CFR part 2 regulations (referred to hereafter as the Part 2 Rule). These regulations govern the confidentiality of substance use disorder records. Significant changes have occurred within the U.S. health care system that were not envisioned by the current regulations, including new models of integrated care that are built on a foundation of information sharing to support coordination of patient care, the development of an electronic infrastructure for managing and exchanging patient information, and a new focus on performance measurement within the health care system. In the proposed rule, SAMHSA states that it strives to facilitate information exchange within new health care models while addressing the legitimate privacy concerns of patients seeking treatment for a substance use disorder.

In section 2.53 of the proposed rule, SAMHSA also proposes to permit the disclosure of Part 2 data necessary to a regulated ACO or similar CMS-regulated organization (including a CMS-regulated Qualified Entity (QE)) for a Medicare, Medicaid, Medicaid, Children’s Health Insurance Program (CHIP), or related audit or evaluation, under certain conditions. As such, should this SAMHSA proposal become final, EPM participants would be considered CMS-regulated Qualified Entities and would be able to receive this data pursuant to this audit and evaluation exception.

CMS will continue to consider the feasibility of making de-identified aggregate de-identified data available in a way that is both meaningful to EPM participants and in compliance with the Part 2 Rule. This issue is discussed in further detail in the data sharing section.

Comment: Commenters expressed concern regarding the data files and reconciliation reports received from the contractors administering our programs based on their experiences thus far with BPCI and CJR. Commenters stated the monthly data feeds from CMS regularly omit data elements that are used by the contractor to identify and reconcile episodes to target prices. Specifically, commenters stated that the master beneficiary files contained errors in the DOD and MSCD 1–12 fields. These fields either contained inaccurate or missing information. Commenters stated without these data elements, it is impossible to replicate the reconciliation results calculated by CMS. Participants are left to assume the contractor’s calculations are accurate. Commenters stated that the ability to replicate the reconciliation results helps maintain a transparent and open relationship among the EPM participants, CMS, and CMS’ contractor. Commenters also recommended CMS provide a mechanism for EPM participants to challenge and correct payment results that are not accurate. Commenters request the ability to provide evidence contradicting errors. Commenters stated currently there is no process or data system in place for this function. Commenters stated that the lack of a feedback loop will be an increasingly critical barrier to participation as the current system has been known to make errors.

Response: We thank commenters for their feedback. We understand commenters’ concern regarding missing data elements but we note that some of these elements are deliberately excluded in compliance with the constraints of 42 CFR part 2 and we are currently unable to provide such data. However, the comment response discussed previously outlines the potential changes that may be forthcoming regarding the data sharing constraints in 42 CFR part 2.

Regarding the master beneficiary files that contained errors in the DOD and MSCD 1–12 fields, CMS will work with their contractors to insure that the data provided is accurate. We appreciate the feedback regarding these operational concerns and we will work with the EPM payment contractor to establish a tracking and feedback process for participants to ask questions of CMS regarding payment calculations and potential incorrect amounts and be provided more detailed information regarding their reconciliation reports and calculation error reports for the EPM models.
Comment: A commenter recommended that CMS change the time period to recoup monies owed to CMS from EPM participants from 30 days to 60 days from the issuance of the Reconciliation Report.

Response: We thank the commenter for the comment. However, because the operational processes used in payment/recoupment actions are part of a standard system that operates across multiple models, including BPCI and CJR, as well as standard FFS operational timelines, we are unable to accommodate a system change and the recoupment time frame will be finalized at 30 days.

Final Decision: After consideration of the public comments received, we are finalizing the proposal without modification.

b. Notice of Calculation Error (First Level Appeal)

We proposed the following calculation error process for EPM participants to contest matters related to payment or reconciliation, of which the following is a non-exhaustive list: The calculation of the EPM participant’s reconciliation amount or repayment amount as reflected in the reconciliation report; the calculation of the EPM participant’s CR incentive payment as reflected in the CR incentive payment report; the calculation of NPRA; the use of quality measure results in determining the composite quality score, or the application of the composite quality score during reconciliation; and the successful reporting of the voluntary PRO THA/TKA data. EPM participants would review their reconciliation report and CR incentive payment report and be required to provide written notice of any error, in a calculation error form that must be submitted in a form and manner specified by CMS. Unless the EPM participant provides such notice, the reconciliation report and CR incentive report would be deemed final within 45 calendar days after it is issued, and CMS would proceed with payment or repayment. If CMS receives a timely notice of an error in the calculation, CMS would respond in writing within 30 calendar days to either confirm or refute the calculation error, although CMS would reserve the right to an extension upon written notice to the participant. We proposed that if an EPM participant does not submit timely notice of a calculation error, that is notice within 45 calendar days of the issuance of the reconciliation report and CR incentive payment report, the EPM participant would be precluded from later contesting any of the following matters contained in the reconciliation report or CR incentive payment report for that performance year; any matter involving the calculation of the EPM participant’s reconciliation amount or repayment amount as reflected in the reconciliation report; any matter involving the calculation of the EPM participant’s CR incentive payment as reflected in the CR incentive payment report; any matter involving the calculation of NPRA; the use of quality measure results in determining the composite quality score, or the application of the composite quality score during reconciliation; and the successful reporting of the voluntary PRO THA/TKA data. Given that EPM participants bear the financial risk in the EPM model, we proposed that only EPM participants might use the dispute resolution process described in this section.

In summary, we proposed the following requirements in § 512.310 (a) for notice of calculation error:

- Subject the dispositions on review in subpart D of this part, if an EPM participant wishes to dispute the calculation that involves a matter related to payment, a CR incentive payment, reconciliation amounts, repayment amounts, or determinations associated with quality measures affecting payment, the EPM participant is required to provide timely written notice of the calculation error, in a form and manner specified by CMS.

- Unless the EPM participant provides such notice, CMS deems final the reconciliation calculation 45 calendar days after the reconciliation report or CR incentive payment report is issued and proceeds with the payment or repayment processes as applicable.

- If CMS receives a notice of a calculation error within 45 calendar days of the issuance of the reconciliation report or CR incentive payment report, CMS responds in writing within 30 calendar days to either confirm that there was an error in the calculation or verify that the calculation is correct, although CMS reserves the right to an extension upon written notice to the EPM participant.

- Only EPM participants may use the notice of calculation error process described in this part.

We sought comment on the proposed notice of calculation error requirements. The following is a summary of the comments received and our responses. Comment: Commenters recommended development of a fair and transparent process for providers to appeal reconciliation report information.

Commenters stated EPM participants must be given adequate notice that their reconciliation reports are available, and must be provided with sufficient time to review their data. Commenters stated that, in many cases, the reconciliation reports may need to be reviewed by multiple providers at multiple locations, including both EPM participants and post-acute care providers. Commenters recommended that in order for EPM participants to access, review, and contest data in 45 days, they would be required to ignore the demands of patient care and competing priorities.

Response: We appreciate these comments and are sympathetic to the requests from commenters for more time to submit a notice of calculation error.
However, we are also conscious of the need to distribute funds to providers with positive NPRAs in a timely fashion and the payment/reconciliation disbursement/recoupment system is designed such that no funds can be released until notices of calculation errors are received by CMS. In balancing these needs, consistent with our rationale in the CJR model, we believe that 45 days is sufficient time for EPM participants to review reconciliation reports, and if they choose, to submit notices of calculation error. We believe that 45 days is the appropriate timeframe to allow for this process, as it allows for a reasonable time to review reconciliation reports and does not seriously delay payment of reconciliation payments. Specifically, CMS currently uses the following established operational procedures for appeals in both BPCI and CJR that we are finalizing in section III.D.8. of this final rule.

The procedures for processing and issuing reconciliation payments and repayments require that we submit the payment files for EPM participants to the payment systems in batches. CMS uses this batch processing method for several reasons. It is administratively more efficient to continue to use MACs to issue payments to all providers and suppliers that furnish services to beneficiaries during an EPM, so as not to disrupt the timing of FFS payments that providers and suppliers normally receive. For reconciliation payments and repayments, CMS has developed and implemented a process for handling these payments, which is already in use for other CMS models. This current process is the result of a substantial number of infrastructure changes to payment and recoupment procedures that were made over a period of several years. As a result, we believe it is appropriate to utilize those processes for the EPMs, given that the challenges associated with establishing these processes, as well as the fact that they were created for other CMS models.

The effect of these processes is that the batches are sent at specified intervals. The first batch is sent after the calculation error timeframe closes. The second batch is sent after CMS has responded to the notices of calculation error of EPM participants and those EPM participants choose to not proceed with the dispute resolution process detailed in section III.D.8.c. of this final rule. The final batch is sent after CMS has adjudicated all of the reconsideration reviews for those participants that selected to utilize the dispute resolution process.

Given these established operating processes, any extension in the timeframe allowed for submission of notices of calculation error delays payment not only to EPM participants that choose to utilize the calculation error and dispute resolution processes, but also those EPM participants that choose not to engage in these processes. Historically, 90 percent of BPCI awardees do not file a notice of calculation error form. As such, we believe the need for extending the deadline for submission of notices of calculation error should be balanced with CMS’ goal to issue reconciliation payments and repayments promptly, as an extension for these submissions would delay the processing of reconciliation payments for all participants for a significant period of time. EPM participants have stated these monies will be used for implementing both IT and care redesign. We believe that an extension beyond the 45 days proposed would cause undue burden on non-appealing EPM participants.

We also considered the commenters’ requests to extend the time frame for notice of participant-caused errors that are greater than 20 percent of the payment amount to 90 or 180 days, but we rejected these recommendations because we note that the calculation error form represents the first step in a two-step appeals process. Where an EPM participant submits a calculation form and is dissatisfied with CMS’ response, the dispute resolution option is available to the EPM participant via a reconsideration review request. Upon receipt of a reconsideration review request, the date of such a review would be scheduled by CMS approximately 115 days from the issue date of the reconciliation report. Thus, we believe that the option for reconsideration review, at a much later date, provides EPM participants with adequate additional time to analyze the data on reconciliation reports, that a 90 or 180 day submission deadline for the calculation error form is unnecessary. Finally, we believe the 45 days appropriately balances the goal of CMS to process reconciliation payments on a timely basis with the needs of EPM participants to have adequate time to review their reconciliation reports and submit notices of calculation error.

Final Decision: After consideration of the public comments received, we are finalizing the proposal to allow 45 days for participants to advise CMS of errors without modification.

c. Dispute Resolution Process (Second Level of Appeal)

We proposed the following dispute resolution process. First, we proposed that only an EPM participant may utilize the dispute resolution process. Second, in order to access the dispute resolution process a participant must have timely submitted a calculation error form, as previously discussed, for any matters related to payment. We proposed these matters would include any amount or calculation indicated on a reconciliation report or CR incentive payment report, including calculations not specifically reflected on a reconciliation report or CR incentive payment report but which generated figures or amounts reflected on a reconciliation report or CR incentive payment report. The following is a non-exhaustive list of the matters that we proposed would need to be first adjudicated by the calculation error process as previously detailed:

- Calculations of reconciliation or repayment amounts;
- Calculation of CR incentive payment amounts;
- Calculations of NPRA; and
- Any calculations or percentile distribution involving quality measures that we proposed that could affect reconciliation or repayment amounts.

If an EPM participant wants to engage in the dispute resolution process with regard to these matters, we proposed it would first need to submit a calculation error form. Where the EPM participant does not timely submit a calculation error form, we proposed the dispute resolution process would not be available to the EPM participant with regard to those matters for the reconciliation report or CR incentive payment report for that performance year.

If the EPM participant submitted a calculation error form and the EPM participant is dissatisfied with CMS’ response to the EPM participant’s notice of calculation error, the EPM participant would be permitted to request reconsideration review by a CMS reconsideration official. The reconsideration review request would be submitted in a form and manner and to an individual or office specified by CMS. The reconsideration review request would provide a detailed explanation of the basis for the dispute and include supporting documentation for the EPM participant’s assertion that CMS or its representatives did not accurately calculate the NPRA, the CR incentive payment amount, or post-episode spending amount in accordance with EPM rules. The following is a non-
exhaustive list of representative payment matters:

- Calculations of NPRA, calculations of the CR incentive payment, post-episode spending amount, target prices or any items listed on a reconciliation report or CR incentive payment report.
- The use of quality measure results in determining the composite quality score, the application of the composite quality score during reconciliation, or the successful reporting of the voluntary PRO THA/TKA data.
- Any contestation based on the grounds that CMS or its representative made an error in calculating or recording such amounts.

Where the matter is unrelated to payment, such as termination from the model, we proposed that the EPM participant need not submit a calculation error form. We proposed to require the EPM participant to timely submit a request for reconsideration review, in a form and manner to be determined by CMS. Where such a request is timely received, we proposed CMS would process the request as discussed later in this section.

We proposed that the reconsideration review would be an on-the-record review (a review of briefs and evidence only). The CMS reconsideration official would make reasonable efforts to notify the EPM participant in writing within 15 calendar days of receiving the EPM participant’s reconsideration review request of the date and time of the review, the issues in dispute, the review procedures, and the procedures (including format and deadlines) for submission of evidence (the “Scheduling Notice”). The CMS reconsideration official would make reasonable efforts to schedule the review to occur no later than 30 days after the date of the Scheduling Notice. The provisions at § 425.804(b), (c), and (e) (as in effect on the publication date of this final rule) would apply to reviews conducted pursuant to the reconsideration review process for EPM. The CMS reconsideration official would make reasonable efforts to issue a written determination within 30 days of the review. The determination would be final and binding.

We solicited comment on our proposals related to appeals rights under this model. The two-step appeal process for payment matters—(1) calculation error form, and (2) reconsideration review—is used broadly in other CMS models. We sought comment on whether we should develop an alternative appeal process. We are also interested in whether there should be appeal rights for reductions or eliminations of NPRA as a result of enforcement actions, as discussed in section III.F. of the proposed rule, and if so, whether the process for such appeals should differ from the processes proposed here.

In summary, we proposed the following requirements in § 512.310(b) for the reconsideration process:

- If the EPM participant is dissatisfied with CMS’ response to the issue date of CMS’ response to the EPM participant’s notice of calculation error, then CMS’ response to the calculation error is deemed final and applicable, as described in § 512.305. The CMS reconsideration official notifies the EPM participant in writing within 15 calendar days of receiving the EPM participant’s review request of the following:
  - The date, time, and location of the review.
  - The procedures (including format and deadlines) for submission of evidence.
  - The CMS reconsideration official takes all reasonable efforts to schedule the review to occur no later than 30 days after the date of receipt of notification.
  - The provisions at § 425.804(b), (c), and (e) of this chapter are applicable to reviews conducted in accordance with the reconsideration review process for the EPM.
  - The CMS reconsideration official issues a written determination within 30 days of the review. The determination is final and binding.
  - Only EPM participants may utilize the dispute resolution process described in this subpart. We sought comment on the proposed reconsideration process for the EPMs.
  - The following is a summary of the comments received and our responses.

Response: We appreciate these comments and are sympathetic to the requests from commenters for more time to resubmit a reconsideration request. However, we believe that a longer timeframe for submission of the reconsideration request is not appropriate for the EPMs. We note the EPM participant must make the request within this timeframe and provide an explanation of the basis of the dispute. CMS will make all reasonable efforts to schedule the review to occur no later than 30 days after the date of receipt of the notification. This rule does not prevent an EPM participant from supplying supplemental documentation after they submit the request to support their basis. As such we believe that 10 days to make the request is sufficient since this deadline requires only that the EPM participant submit the request and not an explanation of the basis for the dispute. Upon receipt of the request for dispute resolution, the rule allows the EPM participant to submit additional supporting documentation in the interim period prior to the final review by the CMS reconsideration official.

Final Decision: After consideration of the public comments received, we are finalizing the proposal without modification.

d. Exception to the Notice of Calculation Error Process and Notice of Termination

Similar to the CJR model and BPCI initiative, if the EPM participant...
In summary, we proposed the following requirements in § 512.310(c) for an exception to the notice of calculation error process:

- If the EPM participant contests a matter that does not involve an issue contained in, or a calculation which contributes to a reconciliation report or CR incentive payment report, a notice of calculation error is not required. In these instances, if CMS does not receive a request for reconsideration from the EPM participant within 10 calendar days of the notice of the initial determination, the initial determination is deemed final and CMS proceeds with the action indicated in the initial determination. This does not apply to the limitations on review in subparagraph (e).

In summary, we proposed the following requirements in § 512.310(d) for notice of termination:

- If an EPM participant receives notification that it has been terminated from the EPM and wishes to appeal such termination, it must provide a written notice to CMS requesting review of the termination within 10 calendar days of the notice. CMS has 30 days to respond to the EPM participant’s request for review. If the participant fails to notify CMS, the termination is deemed final.

We sought comment on the proposed exception to the notice of calculation error process and notice of termination. The following is a summary of the comments received and our responses.

**Final Decision:** CMS did not receive any comments on this section. Therefore, we are finalizing the proposal without modification.

E. EPM Quality Measures, Public Display, and Use of Quality Measures in the EPM Payment Methodology

1. Background

As discussed in the CJR model final rule, Medicare payment policy has moved away from FFS payments unlinked to quality and towards payments that are linked to quality of care (80 FR 73358). Through the Medicare Modernization Act and the Affordable Care Act, we have implemented specific IPPS programs like the HiQ Program (section 1886(b)(3)(B) of the Act), the HVBP Program (subsection (o) of section 1886), the Hospital Acquired Condition Reduction Program (HACRP) (subsection (q) of section 1886), and the Hospital Readmissions Reduction Program (HRRP) (subsection (p) of section 1886), where quality of care is linked to payment. We have also implemented the Shared Savings Program, an ACO program that links shared savings payment to quality performance. The CJR model similarly incorporates pay-for-performance through the potential for financial reward to participants based on the hospital’s level of quality performance, while also including an incentive for quality improvement if the hospital’s current level of quality is relatively low (80 FR 73374).

We proposed pay-for-performance methodologies similar to the CJR model for the proposed EPMs. Specifically, we proposed to financially reward higher quality in an EPM episode by reducing the effective discount factor used to calculate EPM quality-adjusted target prices at reconciliation. We would establish the effective discount factor based on the EPM participant’s overall quality performance and improvement on the EPM’s quality measures as reflected in the EPM participant’s EPM composite quality score. We would calculate the EPM participant’s composite quality score for each EPM performance year at the time of reconciliation. The EPM composite quality score would also determine whether an EPM participant is eligible for a reconciliation payment if savings are achieved beyond the EPM quality-adjusted target price by setting a minimum EPM composite quality score for reconciliation payment eligibility.

We note that we continue to believe that EPMs should include pay-for-performance methodologies for EPM participants to improve the quality of care based on timely reported patient experience, including communications with doctors and nurses, and responsiveness of hospital staff (80 FR 7065). Finally, we strive to align as many measures as possible in CMS’s proposed new EPMs with those in ongoing models and programs. Our goal is to focus provider improvement efforts and minimize burden on EPM participants in need of becoming familiar with and report new measures, while still allowing us to appropriately capture meaningful quality data and use it in the EPMs’ pay-for-performance methodologies.

More specifically, similar to our final decision for the CJR model, we did not propose to use any readmissions measures that could apply to clinical conditions in these EPMs but that are already in place or have been finalized for the HRRP, specifically the Hospital 30-day all-cause risk-standardized readmission rate (or HRRP) following AMI hospitalization (NQF #5050) and the Hospital 30-day all-cause, unplanned,
RSRR following CABG surgery (NQF #2515), due to the incentives, already in place by the HRRP, for hospitals to lower excess readmission rates (80 FR 73479). While we consider these readmissions measure rates to be important metrics for providing information about AMI and CABG hospital performance in the HRRP and HIQR Program for payment and public reporting, respectively, other proposed measures for the AMI and CABG models support the intent of these models to reduce actual payments in an EPM episode while ensuring that quality of care for AMI and CABG model beneficiaries is improved.

Furthermore, while we recognize the lack of complete alignment between EPM beneficiaries and the proposed cohorts for the EPM quality measures, we believe the proposed measures provide meaningful information about EPM participant quality performance and improvement that are relevant to EPM beneficiaries. For the AMI and CABG models in particular, beneficiaries included in the proposed episode-specific measures would significantly overlap with beneficiaries in AMI and CABG model episodes. We note that for purposes of the EPMs where we need to identify episodes that are included in the EPMs, we proposed to use the term anchor to identify hospitalizations that initiate EPM episodes for beneficiaries whose care is included in the EPMs. In describing the quality measures in detail in section III.E.4. of this final rule, we use the term index hospitalization to identify hospitalizations of beneficiaries whose outcomes are included in the measures. Thus, anchor hospitalizations and index hospitalizations would have varying degrees of overlap depending on the specific quality measure.

Moreover, we note that hospitals are the unit of analysis for the EPMs and that the proposed measures are hospital-centric measures, both because these are currently available measures that are aligned with those in other CMS programs and because one of the major goals of the EPMs is to encourage collaboration among different types of providers in order to achieve better care and reduced expenditures, while holding acute care hospitals financially responsible. For further discussion of our proposal that hospitals be accountable for EPM episodes, we refer to section III.B.3. of this final rule.

We recognized that there are also some gaps in the current proposed measures relative to other settings in which we care post-hospital discharge during EPM episodes, as well as around important complications of care for clinical conditions included in the three models. However, we believe that these hospital-level measures reasonably assess how well EPM participants provide care for EPM beneficiaries since the measures, depending on the EPM, assess—(1) important patient outcomes, including mortality as well as complications and days of acute care following discharge from the index hospitalization which can be costly; and (2) patients' perspectives on their hospital experience, which include patient feedback on communication with doctors, communication with nurses, responsiveness of hospital staff, communication about medicines, discharge information, cleanliness of the hospital environment, quietness of the hospital environment, and transition to post-hospital care. As we gain more experience with the EPMs, as well as the CJR model currently in testing, and future EPMs, we plan to work to create a more robust set of episode quality measures for these and future models. As we stated in the proposed rule, we will continue to assess the evolving inventory of measures and will continue to refine quality measures for potential future rulemaking based on public comments, changes to the EPMs' payment methodologies, recommendations from EPM participants and their collaborators, and new CMS episode measure development activities as we learn more about the impact of EPMs on quality improvement and episode efficiency. We refer to section III.E.4.e. of this final rule for a discussion of potential future EPM episode measures.

2. Selection of Quality Measures for the EPMs
a. Overview of Quality Measure Selection

The outcome and patient experience measures proposed for the EPMs were selected in order to: (1) Promote alignment with the financial and quality goals of the EPMs; (2) leverage hospitals' familiarity with the measures due to their use in other CMS hospital quality programs, including programs that tie payment to performance such as the HVBP Program; (3) streamline EPM measures for EPM participants testing more than one EPM; and (4) ensure consistency with CMS's priorities to reduce AMI and CABG mortality and complications while improving patient experience, as well as with CMS's priorities to reduce major LEJR surgery complications while improving the patient experience for SHFFT model beneficiaries, like those in the CJR model.

b. AMI Model Quality Measures

In order to encourage care collaboration among multiple providers of AMI model beneficiaries, we proposed three required measures and one measure that relies on voluntary data submission, in order to determine AMI model participant episode quality performance and improvement that would be linked to the AMI model payment methodology as discussed in section III.E.3.e.(2) of this final rule. We proposed the following measures for the AMI model:
- Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (NQF #230) (MORT–30–AMI).
- Excess Days in Acute Care after Hospitalization for AMI (AMI Excess Days).
- HCAHPS Survey (NQF #0166).
- Voluntary Hybrid Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) Hospitalization (NQF #2473) (Hybrid AMI Mortality) data submission.

I. We refer to sections III.E.4.a. and d. of this final rule for a detailed discussion of our proposals regarding these measures for the AMI model, including their importance as measures of the quality-of-care for beneficiaries treated for AMI. The proposals for the AMI model measures are included in §512.411, and the proposals for reporting the measures are included in §512.400. We sought comment on our proposals for AMI model quality measures.

The following is a summary of the comments received and our responses.

Comment: A few commenters supported the selection of these measures as good indicators of quality for AMI patients under the model.

Response: We appreciate the support expressed for the small, yet comprehensive, set of measures selected for this model. Our goal is to focus provider improvement efforts and minimize burden on EPM participants in needing to become familiar with and report new measures, while still allowing us to appropriately capture meaningful quality data and use it in the EPMs' pay for performance methodologies and we believe the small
set of measures we proposed will enable us to achieve this goal.  

**Comment:** Several commenters expressed concern that the 30-Day All cause Risk Standardized Mortality Rate (RSMR) following Acute Myocardial Infarction is not a good indicator of quality for the EPM episode 90 day episode of care. They stated that the quality metrics proposed for AMI are too hospital centric and will not assess quality across the full continuum of care. In contrast, a few other commenters recommended that CMS narrow the window for the AMI episode from 90 days to 30 days, stating that it is known from large randomized trials of therapies for AMI patients that the overwhelming majority of disease related complications and poor outcomes occur within the first 30 days. Additionally, some commenters expressed concern that reporting quality data could discourage the treatment of the most vulnerable and frail AMI patients. Other commentators stated that patients with AMI and serious disability, frailty and concurrent illnesses would not benefit from the model quality measures as these patients may have much higher mortality rates. Commenters also expressed concern that the proposed quality metrics do not offer useful ways to risk adjust for local patterns of care regarding end of life care in hospitals for these frail, high-risk patients. Several commenters expressed concern that the measures that were proposed are misaligned with the cohort for this model. Additionally, commenters were concerned that the quality metrics as proposed may not provide a meaningful measure of the quality of care for those targeted under the model. 

**Response:** We appreciate comments regarding the use of this measure in the model, and the duration of the episodes. While previous studies indicate that most complications occur during the 30-Day post discharge period, under this model we are evaluating the impact of a bundled payment on quality of care for a 90 day episode. For consistency sake across the model, we intend to evaluate the impact of such payment across a full 90 day period to ensure we capture longer term outcomes for patients. The models we proposed define hospitals as the episode initiators and financially accountable entities and while we acknowledge that the measures we proposed are hospital-centric, we believe they are appropriate for these hospital initiated models. We are appreciative of the concern regarding the quality of care for the beneficiaries including the frail, severely ill beneficiaries that may be included in the population on which this model is focused and that is why we proposed a comprehensive set of measures that rely on quality metrics that are readily available for use under the model. While we recognize the lack of complete alignment between EPM beneficiaries and the proposed cohorts for the EPM quality measures, we believe the proposed measures provide meaningful information about EPM participant quality performance and improvement that are relevant to EPM beneficiaries. We acknowledge that longer measures are needed and will begin investigating the development of measures to assess the quality of care across the full 90 day episode and if feasible, will incorporate such measures into model if deemed appropriate. 

**Comment:** We received a mix of comments for and against the proposed EDAC measure for the AMI model. A few commenters urged CMS to remove the EDAC measures from the AMI model measure set, noting that the proposed EDAC measure was adopted for the FY 2018 hospital IQR program, and is intended to capture “all-cause acute care utilization” in the 30 days after discharge for patients with a discharge diagnosis of AMI. Commenters further stated that in contrast to the existing AMI hospital readmission measure in IQR, the AMI EDAC measure includes both emergency department (ED) visits and observation stays, in addition to hospital readmissions. Commenters stated the purpose of the bundled payment is to create a financial incentive that aligns with the care goal of improving the patients’ health to the point where a return to the hospital is unnecessary. Measuring EDAC may be important when the financial incentives push toward greater numbers of hospital encounters, as they do in the fee for service system. However, in a bundled payment model, the commenters stated that this measure may not be as meaningful. Commenters urged CMS to alter how we think about what to measure in the bundle, stating that excess days in hospital care should not be the focus. Additionally, commenters were concerned that this measure inappropriately overlaps with the HRRP, thereby creating inconsistent incentives to reduce readmissions. Some stakeholders believe the use of this measure may lead to mixed performance signals between the existing HRRP and EPM model, potentially leading to hospitals doing well in one program and poorly in another. Some of these commenters expressed concern that the EDAC measure lacks NQF endorsement and has not yet been publicly reported on Hospital Compare. Commenters stated the hospital field has limited insight on whether the measure is accurate and reliable and also noted the lack of sociodemographic adjustment in the EDAC measure as a potential problem. 

Alternatively, commenters in support of patients’ rights endorsed the EDAC measure stating that it will capture all hospital contact including emergency room and observation stays. These commenters supported EDAC as it measures the full experience of a patient’s stay which should be a meaningful measure of hospital care quality. Another commenter offering support for the EDAC from a patients’ rights point of view stated that mortality and excess days in acute care are undoubtedly outcomes that matter to beneficiaries and their families and should absolutely be measured. 

**Response:** We appreciate stakeholder concerns regarding inclusion of the EDAC measure in the model. Although we received fewer comments supporting the inclusion of this measure in the model, we believe the points made in favor of patients’ rights and the need to measure the full hospital experience from the patient point of view are valid and relevant to this model that is designed to improve quality of care for the beneficiaries. We also note that the AMI EDAC measure has been recommended for endorsement without risk adjustment for sociodemographic status (SDS) and it will be publicly reported starting July 2017. 

Regarding concerns for measure overlap with HRRP, we conducted additional comparison analysis to determine the degree to which the EDAC and readmission measures provide distinct information about hospitals’ performance. In our analysis we compared hospitals’ outlier status using results from both sets of measures. The findings demonstrate that more hospitals are characterized as outliers by the EDAC measures compared with the readmission measures. Therefore, the two sets of measures provide different and directionally consistent information about hospitals performance. Very few hospitals are characterized in opposing directions by the two sets of measures, meaning that those few hospitals with poorer performance on the readmission measures tend to also perform poorly on the EDAC measures. 

We conclude that, with the inclusion of this measure in the AMI EPM, nearly all hospitals that are currently penalized in the HRRP will also be penalized on the EDAC measure. However, most poor performers on the
AMI EDAC measure will not be identified as poor performers on the AMI readmissions measure. The total overlap is minimal although there is a risk that some hospitals will be penalized in both the HRRP and AMI EPM programs.

While some commenters suggest that measuring EDAC may only be important when the financial incentives push toward greater numbers of hospital encounters, as they do in the FFS system, we believe tracking return visits to the hospital is a good indicator of the overall quality of care in an episode payment model as well.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modifications, to the AMI measure set as proposed.

c. CABG Model Quality Measures

In order to encourage care collaboration among multiple providers of CABG model beneficiaries, we proposed two required measures, in order to determine CABG model participant episode quality performance and improvement that would be linked to the CABG model payment methodology as discussed in section III.E.3.f.(3) of this final rule. We proposed the following measures for the CABG model:

- Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery (NQF# 2558) (MORT-30–CABG).
- IC-AHPS Survey (NQF #0166).

We refer to sections III.E.4.b and d. of this final rule for a detailed discussion of our proposals regarding these measures for the CABG model, including their importance as measures of the quality-of-care for beneficiaries treated with CABG.

II. The proposals for the CABG model measures are included in § 512.412., and the proposals for reporting the measures are included in § 512.400. We sought comment on our proposals for CABG model quality measures.

The following is a summary of the comments received and our responses.

Comment: A few commenters support our proposed CABG measures stating that the measures represent a brief, focused and relevant set of quality metrics. They expressed support for the use of the Thirty (30) day mortality measure, stating that this measure appropriately focuses on the key quality metrics that matter in the domain of cardiac care.

Response: We appreciate the support for the model and quality metrics proposed and we also believe that these measures reflect key quality metrics that matter for cardiac care.

Comment: A commenter suggested that CMS should also consider including a quality measure to evaluate blood transfusion rates during and after CABG procedures, stating that unnecessary blood transfusions during and after CABG procedures are costly to patients and to hospitals. Perioperative red blood cell transfusion is the single factor most reliably associated with increased perioperative morbidity events after CABG, such as serious infections, prolonged ventilation support and renal failure.

Response: We thank the commenter for their suggestion. CMS believes the 30 Day All Cause Risk Standardized Mortality rate will capture complications that lead to death related to the CABG procedures performed under the model.

Comment: A group of commenters recommended that the Society of Thoracic Surgeons (STS) consensus based outcomes be included for the CABG measure set. The STS has a robust, risk adjusted National Adult Cardiac Database that tracks measures for CABG Commenters stated that the vast majority of cardiothoracic programs and providers already report to and participate in the Database.

Response: We agree with commenters that the STS measure set is a comprehensive NQF-endorsed composite measure with strong potential to meaningfully improve quality. Although the STS measures were not proposed as a measure initially we intend to amend the measure set for CABG to include a voluntary data submission for various measures (there are 11 distinct measures) within the STS composite measure. Reporting of this measure data will be voluntary and will only help model participants. This measure will count for 10 percent of the score which will be worth 2 points. We have re-weighted the CABG and HC-AHPS scores out of a total point basis of 18. We will rank the overall scores out of 18 to set the performance ranges and then we offer 2 points on top of that if participants voluntarily submit data for this measure. The revised scoring and weighting methodology for the CABG model is discussed in detail in the linking quality payment section III.E.4.f of this final rule.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, with modification, to incorporate the STS composite measure data submission as a voluntary measure (would only help participants) weighted at 10 percent of the composite quality score as discussed in detail in section III.E.4.f of this final rule. CMS does not anticipate significant operational difficulties as we plan to work collaboratively with the STS Registry to receive the data files following each data collection period as prescribed by the STS Registry. EPM participants who are not members of the STS Proprietary Registry, but are a HQR participating facility would have access to Secure File Transfer (SFT). Data files can be securely sent via SFT in a transitional submission format available to systems using a spreadsheet-based approach.

d. SHFFT Model Quality Measures

In order to encourage care collaboration among multiple providers of SHFFT model beneficiaries, we proposed two required measures and one measure that relies on voluntary data submission, in order to determine SHFFT model participant episode quality performance and improvement that would be linked to the SHFFT model payment methodology as discussed in section III.E.3.f.(4) of this final rule. While we recognize that none of the proposed measures specifically target the care of SHFFT model beneficiaries, these measures are the same as those used for the CJR model because SHFFT model episodes will be tested along with the LEJR episodes in the CJR model (80 FR 73501 and 7307) at mostly the same hospitals. In addition, as discussed further in section III.E.3.e.(3) of this final rule, we propose to calculate a hospital-level composite quality score that would apply to episode payment for both the CJR and SHFFT models, consistent with our proposal of the same measures for the two models. We believe that due to the inclusion of beneficiaries with hip fracture in both the CJR and SHFFT models and our desire to streamline EPM participant measure reporting, as well as the focus of both models on major lower extremity orthopedic surgery, the same set of quality measures can be used for both models to incentivize quality improvement in lower extremity orthopedic surgery care and episode efficiency. We are also considering future measure development focused specifically on hip and femur fracture patients. We expect that many of the physicians and other providers collaborating with participant hospitals in the SHFFT and CJR models will be the same, such that certain care pathways and episode efficiencies may be coordinated for SHFFT and CJR model beneficiaries regardless of the model, potentially resulting in quality improvement for beneficiaries in both
models. We proposed the following measures for the SHFFT model:

- Hospital-level RSCR following elective primary THA and/or TKA (NQF #1550) (Hip/Knee Complications).
- HCAHPS Survey (NQF #0166).
- Total Hip Arthroplasty (THA)/Total Knee Arthroplasty (TKA) voluntary patient-reported outcome (PRO) and limited risk variable data submission (Patient-reported outcomes and limited risk variable data following elective primary THA/TKA).

We considered an alternative approach to the required quality measures for the SHFFT model given that the proposed measures do not specifically target the SHFFT model beneficiaries. This alternative approach would not account for any hip-specific measures (such as, Hospital-level RSCR following elective primary THA and/or TKA (NQF #1550) (Hip/Knee Complications)) and would instead only measure patient experience through the HCAHPS Survey (NQF #0166). Although there may be some rationale for excluding measures that do not specifically target SHFFT model beneficiaries, we did not propose this approach to SHFFT model quality measures because we believe that it is critical to include a measure of both clinical and patient experience outcomes in the setting of lower extremity orthopedic surgery episodes. Additionally, we believe that using quality measures for SHFFT model episodes that do not align with those in the CJR model could generate confusion at CJR model participant hospitals where we proposed that the SHFFT model be tested as discussed in section III.B.4. of the proposed rule (81 FR 50794).

We refer to sections III.E.4.c. and d. of this final rule for a detailed discussion of our proposals regarding these measures for the SHFFT model, including their importance as measures of the quality-of-care for beneficiaries undergoing major lower extremity joint replacement surgery.

The proposals for the SHFFT model measures are included in § 512.413, and the proposals for reporting the measures are included in § 512.400. We sought comment on our proposals for SHFFT model quality measures.

The following is a summary of the comments received and our responses.

Comment: Several commenters expressed concern that using the Hospital–level Risk Standardized Complication Rate (RSCR) measure of elective THA and/or TKA outcomes as an elective measure is an inappropriate proxy of SHFFT quality, as improving quality for the emergency procedures covered under SHFFT has no impact on RSCR. These commenters stated that the program effectively incentivizes only cutting costs without any beneficiary protection related to the quality of care. There is concern that use of this measure may distort incentives toward improving measures unrelated to care with no regard for the actual quality of an emergency SHFFT episode of care.

Response: We do not agree that the measure only incentivizes cost cutting. While we recognize that none of the proposed measures specifically target the care of SHFFT model beneficiaries, these measures are the same as those used for the CJR model because SHFFT model episodes will be tested along with the LEJR episodes in the CJR model (80 FR 73501 and 73507) at mostly the same hospitals. In addition, as discussed further in section III.E.3.e.(3) of this final rule, we proposed to calculate a hospital-level composite quality score that would apply to episode payment for both the CJR and SHFFT models, consistent with our proposal of the same measures for the two models. We continue to believe that due to the inclusion of beneficiaries with hip fracture in both the CJR and SHFFT models and our desire to streamline EPM participant measure reporting, as well as the focus of both models on major lower extremity orthopedic surgery, the same set of quality measures can be used for both models to incentivize quality improvement in lower extremity orthopedic surgery care and episode efficiency.

Response: We recognize that more robust measures better targeted to the SHFFT population are desirable and will considering future measure development focused specifically on hip and femur fracture patients.

Comment: Several commenters expressed support for the use of Patient Reported Outcome Measures (PROM) in SHFFT, and were supportive of plans to incentivize model participants who report PROMs.

Response: We appreciate the support for collection of PRO data in this model and believe that patient outcome data which will help develop quality PROMs can be helpful in measuring the quality of care rendered under this model.

Comment: A few commenters expressed concern that the model doesn’t include functional outcome measures and quality of life measures to assess the quality of life for the patient population. Commenters recommend that we consider performance-measures of function for the population such as the Six-Minute Walk Test including functional performance measures will give CMS better data on the functional outcome of this patient population.

Commenters expressed concern that while the measures proposed for use in this model mirror those in the CJR model, and considering the SHFFT model will be operating alongside the CJR episodes the SHFFT model composition of mostly non-elective cases precludes that the population between the two models have stark differences. Therefore, simply transferring the data from one EPM to another is not appropriate. Commenters urged CMS to develop measures that more accurately reflect the populations included in the model specifically.

Response: We appreciate the commenter thoughts regarding utilizing quality metrics to accurately measure and account for the patient population served under the SHFFT model specifically, in contrast to those in the concurrent CJR model. We believe that we have proposed a measure set of readily available measures to assess the quality of care across the SHFFT episodes. We will continue to investigate utilizing measures to more accurately reflect the patient population in this model.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to the quality measures proposed in the SHFFT model.

3. Use of Quality Measures in the EPM Payment Methodologies

a. Overview of EPM Composite Quality Score Methodology.

We believe that the proposed EPMs provide another mechanism for hospitals to improve quality of care, while also achieving cost efficiency. Incentivizing high-value care through episode payments for AMI, CABG, and hip fracture care is a primary objective of these proposed EPMs. Therefore, incorporating quality performance into the episode payment structure is an essential component of the proposed EPMs, just as it is for the CJR model (80 FR 73370). For the reasons stated previously, we believe it is important for the AMI, CABG, and SHFFT models to link the financial reward opportunity with performance and improvement in the quality of care for Medicare beneficiaries treated for AMI, CABG, and hip fracture.

As discussed in section III.D.4.a. of the proposed rule (81 FR 50794), which outlines the pricing methodologies for EPM episodes, for each EPM participant we proposed to set an EPM–episode benchmark price for each EPM episode. We would apply the EPM participant’s effective discount factor based on the
participant’s quality performance and improvement for the EPM performance year to the EPM-episode benchmark episode price to calculate the quality-adjusted target price for each EPM episode. We refer to section III.E.3.f. of this final rule for further discussion of the relationship between an EPM participant’s quality performance and improvement and the effective discount factor. As discussed in section III.C.4.a.(5) of this final rule, we are not finalizing our proposed AMI model inpatient-to-inpatient transfer episode initiation and attribution policy so we will not use the terms chained anchor hospitalization and price MS–DRG in the final AMI episode definition and quality discussion. Each EPM episode includes an anchor hospitalization for either AMI (AMI MS–DRG or PCI MS–DRG with AMI ICD–10–CM diagnosis code in the principal or secondary diagnosis code position), CABC (CABC MS–DRG), or SHFFT (SHFFT MS–DRG) and a 90-day period after discharge from the anchor hospitalization. An EPM quality-adjusted target price would represent expected spending on all related Part A and Part B items and services furnished during EPM episodes based on historical EPM episodes, and would incorporate the EPM participant’s effective discount factor for the EPM performance year. Participants that achieve actual EPM-episode payments below the quality-adjusted target price for a given performance year may be eligible for a reconciliation payment from CMS, subject to the proposed stop-gain limit policy as discussed in section III.D.7.b. of the proposed rule (81 FR 50794).

Participants that achieve actual EPM-episode payments that exceed the quality-adjusted target price for a given performance year may be required to repay Medicare a portion or all of the excess EPM-episode spending.

We proposed an EPM composite quality score methodology for linking quality and payment in the EPMs that is similar to that methodology finalized for the CJR model (80 FR 73363 to 73381). Similar to the CJR model, the EPM-specific composite quality score methodology would allow both performance and improvement on each EPM’s required quality measure to be meaningfully valued in the EPMs’ pay-for-performance methodology, incentivizing and rewarding cost savings in relation to the quality of episode care provided by the EPM participant (80 FR 73374 and 73370). Specifically, the EPM composite quality score is made up of the composite performance score (which includes both patient experience and outcome measures, including points for voluntarily reported measures) and an improvement score.

We believe the actual level of quality performance achieved should be most highly valued in the EPM composite quality score to reward those EPM participants furnishing high quality care to EPM beneficiaries, with a smaller contribution to the EPM composite quality score made by improvement points if measure result improvement is achieved. We acknowledge that substantial improvement on a quality measure result is not the sole indicator that an EPM episode-of-care is high quality; yet, the improvement spurred by the hospital’s participation in the EPM deserves to be valued as the EPM participant’s performance is moving in a direction that is good for the health of beneficiaries. Like the CJR model, the EPMs involve a wide range of participants that must participate if they are located in the selected MSAs, and the participants would be starting from many different current levels of quality performance. We note that the Shared Savings Program utilizes a similar scoring and weighting methodology, which is described in detail in the CY 2011 Shared Savings Program Final Rule (see § 425.502). The HVBP Program and the HACRP also utilize a similar scoring methodology, which applies weights to various measures and assigns an overall score to a hospital (79 FR 50049 and 50102). Despite the small number of quality measures proposed for the EPMs that represent both clinical outcomes and patient experience, and each carries substantial value in the EPM composite quality score.

Although performance and improvement on each measure would be valued in the EPM composite quality score methodology, it is the EPM participant’s overall quality performance under the EPM that would be considered in the pay-for-performance approach, rather than performance on each quality measure individually determining the financial opportunity under the EPM. The EPM composite score methodology also provides a framework for incorporating additional measures of meaningful outcomes for EPM episodes in the future. Finally, while we believe that high performance on all of the quality measures represents goals of clinical care that should be achievable by all EPM participants that heighten their focus on these measures, we appreciate that many participants have room for significant improvement in their current measure performance. The EPM composite score methodology would provide the potential for financial reward for more EPM participants that reach overall acceptable or better quality performance, thus incentivizing their continued efforts to improve the quality and efficiency of EPM episodes.

We sought comment on our proposal to use an EPM-specific composite quality score in the pay-for-performance methodologies of the AMI, CABC, and SHFFT models.

Final Decision: No comments were received on the EPM-specific composite quality score in the pay-for-performance methodologies of the AMI, CABC, and SHFFT models. Therefore, we are finalizing the proposal, without modification.

b. Determining Quality Measure Performance

Similar to our reasoning in the CJR model, we believe that relative measure performance for the EPM measures would be the most appropriate way to incorporate quality performance into the EPMs because we do not have sufficient information about participant performance to set and use an absolute performance result on each measure (80 FR 73371). Moreover, we believe that participants nationally are currently working to improve their performance on the quality measures proposed for the EPMs on an ongoing basis as these are included in other CMS programs such as the HIQR and HVBP Programs. Therefore, while we expect that EPM participants would have a heightened focus on performance on these measures as a result of the financial incentives resulting from the EPM payment methodology, we are not yet certain that performance outcomes can be achieved under best practices.

Thus, at the time of reconciliation for an EPM performance year, we proposed to assign each EPM participant’s measure point estimate from the most recent year as discussed in section III.E.5. of this final rule to a performance percentile based on the national distribution of measure results for subsection (d) hospitals that are eligible for payment under the IPPS reporting the measure that meet the minimum patient case or survey count. This proposal applies to the MORT–30–AMI (NQF #0230) and AMI Excess Days measure results for the AMI model; the MORT–30–CABG (NQF #2558) measure result for the CABG model; the Hip/Knee Complications (NQF #1550) measure result for the SHFFT model; and the HCAHPS Survey (NQF #0166) measure result for all of the EPMs.
The measure-specific parameters that would apply to developing the national distributions are displayed in Table 22.

**TABLE 22—REQUIREMENTS FOR USE OF SUBSECTION (d) HOSPITALS THAT ARE ELIGIBLE FOR PAYMENT UNDER THE IPPS MEASURE RESULTS IN DEVELOPING NATIONAL DISTRIBUTION OF REQUIRED MEASURES FOR EPMS**

<table>
<thead>
<tr>
<th>Measure</th>
<th>Requirements for use in national distribution</th>
</tr>
</thead>
<tbody>
<tr>
<td>MORT–30–AMI (NQF #0230)</td>
<td>At least 25 patient cases in the 3-year measure performance period.</td>
</tr>
<tr>
<td>AMI Excess Days</td>
<td>At least 25 patient cases in the 3-year measure performance period.</td>
</tr>
<tr>
<td>MORT–30–CABG (NQF #2558)</td>
<td>At least 25 patient cases in the 3-year measure performance period.</td>
</tr>
<tr>
<td>Hip/Knee Complications (NQF #1550)</td>
<td>At least 25 patient cases in the 3-year measure performance period.</td>
</tr>
<tr>
<td>HCAHPS Survey (#0166)</td>
<td>At least 100 completed surveys in the 4-quarter reporting period.</td>
</tr>
</tbody>
</table>

We would assign any low volume EPM participant without a reportable value for the measure, new hospitals that are identified as EPM participants, or EPM participants where we have suppressed the measure value due to an error in the data used to calculate the measure to the 50th performance percentile of the measure result, so as not to disadvantage an EPM participant based on its low volume or lack of applicable cases because that participant may in actuality provide high quality care. We believe that relative measures of quality performance are most appropriate for the EPMs as participants continue to make progress nationally on improving patient outcomes and experience. Proposed measure-specific assignment of points in the EPMs' composite quality scores based on relative quality measure performance are discussed in sections III.E.3.e.(1), (2), and (3) of the proposed rule (81 FR 50794).

We sought comment on our proposed overall approach to determining quality measure performance based on assigning the EPM participant's measure point estimate to a measure performance percentile based on the national distribution of measure results from subsection (d) hospitals eligible for payment under the IPPS.

No comments were received on this proposal so we are finalizing without modification.

c. Determining Quality Measure Improvement

Consistent with our reasoning for the CJR model, we believe it would be important in the EPMs to directly reward EPM participants for quality improvement, similar to the pay-for-performance policies under other programs such as the HVBP Program and the Shared Savings Program, in order to provide a significant incentive for quality improvement for EPM participants at all current levels of quality performance (80 FR 73379). For the CJR model, we adopted a refinement to the composite quality score methodology that would supplement the composite quality score's valuing of quality performance in the pay-for-performance methodology of the CJR model (80 FR 73379). As in the CJR model, we believe the heightened focus on EPM episode cost and quality performance by participants in the EPMs may lead to substantial year-over-year quality measure improvement over the EPM performance years. Nevertheless, we believe that the actual level of quality performance achieved in the EPMs should be most highly valued in the EPM composite quality score to reward those participants furnishing high-quality care to EPM beneficiaries, with a small contribution to the composite quality score made by improvement points if measure result improvement is achieved. Thus, we proposed adding into the EPM-specific composite quality score up to 10 percent of the maximum value for each EPM quality measure to which improvement could apply (excluding the voluntary data submission measures) for those EPM participants that demonstrate substantial improvement from the prior year's measure performance on that measure (80 FR 73379 through 73380). The maximum EPM composite quality score would be capped at 20 points under this proposal. Proposed measure-specific assignment of points for improvement in the EPMs' composite quality scores are discussed in sections III.E.3.e.(1), (2), and (3).

For the AMI and CABG models, we proposed to define measure improvement differently than in the CJR model, using an approach that is more similar to the methodologies of other CMS programs such as the HVBP Program. The CJR model defined measure improvement for model participants relative to a national performance distribution (80 FR 73380). In contrast, we proposed to define measure improvement as any improvement in an AMI or CABG model participant's own measure point estimate from the previous year, regardless of the participant's measure point estimate starting and ending values, if the AMI or CABG model participant falls into the top 10 percent of participants based on the national distribution of measure improvement over the 2 years for subsection (d) hospitals that are eligible for payment under the IPPS reporting the measure that meet the minimum patient case or survey count. We proposed this approach because it represents the greatest confidence that we are capturing meaningful improvement on a measure by an AMI or CABG model participant in comparison with performance changes of other hospitals yet, unlike the CJR and proposed SHFFT model methodologies, is founded on an AMI or CABG model participant's own measure performance change from year-to-year. We believe that moving toward incorporating a model participant's own measure performance improvement in the pay-for-performance methodologies for EPMs strengthens the incentives in the models for quality improvement, especially for EPM participants at the lower end of current measure performance.

For the SHFFT model, we proposed to modify the definition of improvement used in the CJR model in two ways (80 FR 73379 through 73380). First, we proposed to define measure improvement as improving 2 deciles or more in comparison to the national distribution of measure results from the prior year, based on a comparison of relative quality measure performance over the most recent 2 years of available quality measure result data. This is the same methodology as finalized for the CJR model, except that it reduces the threshold for improvement from 3 deciles to 2 deciles in order to reward a broader range of improvement.

Second, we proposed to award up to 10 percent of the maximum measure performance score on the outcome and patient experience measures described in III.E.3.e.(3) of the proposed rule (81
use the HBVP methodology that assigns either improvement or performance points to quality measures. We believe the actual level of quality performance achieved should be most highly valued in the EPM composite quality score to reward those EPM participants furnishing high quality care to EPM beneficiaries, with a smaller contribution to the EPM composite quality score made by improvement points if measure result improvement is achieved. We acknowledge that substantial improvement on a quality measure result is not the sole indicator that an EPM episode-of-care is high quality; yet, the improvement spurred by the hospital’s participation in the EPM deserves to be valued as the EPM participant’s performance is moving in a direction that is good for the health of beneficiaries. Thus, the EPM methodology, in comparison with HVBP, provides improvement points as a bonus on top of performance points. We believe improvement points should be awarded only when meaningful improvement is achieved and hospitals will be able to receive improvement points when they achieve meaningful improvement performance. For example, if the AMI or CABG model participant falls into the top 10 percent of participants based on the national distribution of measure improvement over the 2 years for subsection (d) hospitals that are eligible for payment under the IPPS reporting the measure that meet the minimum patient case or survey count. We propose this approach because it represents the greatest confidence that we are capturing meaningful improvement on a measure by an AMI or CABG model participant in comparison with performance changes of other hospitals yet, unlike the CJR and proposed SHFFT model methodologies, is founded on an AMI or CABG model participant’s own measure performance change from year-to-year.

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal, without modification to methodology to determine quality measure improvement for AMI, CABG, and SHFFT models.

d. Determining Successful Submission of Voluntary Data for AMI and SHFFT Models

(1) Hybrid AMI Mortality (NQF #2473) Voluntary Data

Similar to the CJR model, we proposed that AMI model participants that successfully submit the Hybrid AMI Mortality (NQF #2473) measure voluntary data would be eligible for points in the AMI model composite quality score (80 FR 73375, 73381).

**Encouraging collection and submission of the Hybrid AMI Mortality (NQF #2473) measure voluntary data through the AMI model would increase hospital familiarity with submitting hybrid quality measures based on claims data and data submitted from electronic health records; further develop an outcome measure that provides meaningful information on outcomes for AMI hospitalizations that are commonly experienced by Medicare beneficiaries; provide another quality measure that may be incorporated into the AMI model pay-for-performance methodology in future years, pending successful implementation testing of the measure; and inform the quality strategy of future payment models.**

The proposed requirements for determining successful submission of Hybrid AMI Mortality (NQF #2473) measure voluntary data are included in § 512.411(b)(2) and discussed in detail in section III.E.4.a.(3)(vii) of the proposed rule (81 FR 50794). We sought comment on our proposals for determining successful submission of voluntary data for each AMI model performance year.

**Final Decision:** No comments were received on this proposal. Therefore we are finalizing the proposal, without modification.

(2) Patient-Reported Outcomes and Limited Risk Variable Voluntary Data Following Elective Primary THA/TKA

Like the CJR model, we proposed that SHFFT model participants that successfully submit Patient-reported outcomes and limited risk variable voluntary data following elective primary THA/TKA be eligible for points in the SHFFT model composite quality score (80 FR 73375, 73381). We note that SHFFT model participants that are also participating in the CJR model would not need to submit data twice to satisfy the successful submission requirements of both models. If those hospitals successfully submit voluntary data for the CJR model they would be credited with successful submission under the SHFFT model.

The proposed requirements for determining successful submission of Patient-reported outcomes and limited risk variable voluntary data following elective primary THA/TKA are included in § 512.13(b)(2) and discussed in detail in section III.E.4.e.(2)(viii) of the proposed rule (81 FR 50794). We sought comment on our proposals for determining successful submission of voluntary data for each SHFFT model performance year.
Final Decision: No comments were received on this proposal. Therefore we are finalizing the proposal without modification.

- Calculation of the EPM-Specific Composite Quality Score

1. AMI Model Composite Quality Score

We proposed to assign each participant an AMI model composite quality score, calculated as the sum of the individual quality measure performance scores (including successful submission of Hybrid AMI Mortality [NQF #2473] measure voluntary data if applicable) and improvement scores. The quality measure performance scores would be set to reflect the intended weights for each of the quality measures and the successful submission of the Hybrid AMI Mortality [NQF #2473] voluntary data in the AMI model composite score.

<table>
<thead>
<tr>
<th>Quality measure</th>
<th>Weight in composite quality score (%)</th>
<th>Quality domain/weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>MORT–30–AMI (NQF #0230)</td>
<td>50</td>
<td>Outcome/80%</td>
</tr>
<tr>
<td>AMI Excess Days</td>
<td>20</td>
<td></td>
</tr>
<tr>
<td>Hybrid AMI Mortality (NQF #2473) Voluntary Data</td>
<td>10</td>
<td></td>
</tr>
<tr>
<td>HCAHPS Survey (NQF #0166)</td>
<td>20</td>
<td>Patient Experience/20%</td>
</tr>
</tbody>
</table>

We would assign the lowest weight of 10 percent to the submission of Hybrid AMI Mortality (NQF #2473) measure voluntary data because these data represent an AMI model participant’s meaningful participation in advancing the quality measurement of AMI outcomes in keeping with our goal to move toward the use of electronic health records (EHRs) for measures, and in response to stakeholder feedback to include clinical data in outcome measures. Given the importance of AMI mortality as an extremely serious AMI outcome, we proposed to assign the highest individual measure weight of 50 percent to the MORT–30–AMI (NQF #0230) measure. We proposed to assign another 20 percent of the weight to the AMI Excess Days measure that is also included in the outcome quality domain. The remaining 20 percent of the AMI model composite quality score weight would be assigned to the HCAHPS Survey (NQF #0166) measure because we believe that incorporating this quality measure, which reflects performance regarding patients’ perspectives on care, including communication, care transitions, and discharge information, is a meaningful patient experience measure of AMI model episode quality. This proposal of weights for the outcome and patient experience quality domains for the AMI model composite quality score is similar to the proposal of weights for the CABG model composite quality score described later in this section. We would assign the highest overall weight to the outcome quality domain (consisting of two measures and voluntary data submission) because the measures in this quality domain are specific to meaningful outcomes for AMI model beneficiaries, especially mortality which is not an outcome measure used in the CJR model composite quality score (80 FR 73375).

Under such an approach, we would first score individually each AMI model participant on the MORT–30–AMI (NQF #0230) measure; AMI Excess Days measure; and HCAHPS Survey (NQF #0166) measure based on the AMI model participant’s performance percentile as compared to the national distribution of subsection (d) hospitals that are eligible for payment under the IPPS measure performance, assigning scores according to the point values displayed in Table 24. These individual measure scores have been set to reflect the measure weights included in Table 23 so they can ultimately be summed without adjustment in calculating the AMI model composite quality score.

</tbody>
</table>
Given the current national distribution of subsection (d) hospitals eligible for payment under the IPPS performance on these measures, we believe that small point increments related to higher quality performance deciles would be the most appropriate way to assign more points to reflect meaningfully higher quality performance on the measures. The absolute differences for each decile among the three measures reflect the intended weight of the measure in the AMI model composite quality score. These three measures are well-established measures in use under CMS hospital programs, so we do not believe that scores below the 30th percentile reflect quality performance such that they should be assigned any individual quality measure score points under the AMI model.

Additionally, we would assign a quality score of 2 points for AMI model participants that successfully submit Hybrid AMI Mortality (NQF #2473) measure voluntary data and 0 points for participants that do not successfully submit these data. Because we would not use the actual Hybrid AMI Mortality (NQF #2473) measure result as an outcome measure in assessing AMI episode quality performance under the AMI model, we proposed this straightforward binary approach to scoring the submission of Hybrid AMI Mortality (NQF #2473) measure voluntary data for hybrid outcome measure testing.

CMS may, in future regulations, require hospitals to report additional data elements from EHRs and proposed additional hybrid measures in this and other models and programs, such as the HIQR Program. If, in future regulations, hospitals are required to report these same five data elements (age; heart rate; systolic blood pressure; troponin, creatinine) and six linking variables (CMS Certification Number (CCN), Medicare Health Insurance Claim (HIC) Number, date of birth, sex, admission date, and discharge date) that are included in the Hybrid AMI Mortality (NQF #2473) measure to support measurement through another CMS program, such as the HIQR Program, CMS may propose changes to the AMI model measures and the methodology for assigning the AMI model composite quality score.

Finally, we would award improvement scores on a measure-by-measure basis to those AMI model participants that demonstrate improvement on the measure; improvement points would be awarded for up to 10 percent of the maximum measure performance points available, with the total AMI model composite quality score capped at 20. Thus, improvement scores would be up to 1.0 points for the MORT–30–AMI (NQF #0230) measure; up to 0.4 points for the AMI Excess Days measure; and up to 0.4 points for the HCAHPS Survey (NQF #0166) measure. We would sum the performance and improvement scores on the three quality measures and the score on successful submission of Hybrid AMI Mortality (NQF #2473) measure voluntary data to calculate an AMI composite quality score for each AMI model participant.

The proposal for the methodology to calculate the AMI model composite quality score is included in §512.315(b)(1)–(4). We sought comment on our proposed methodology to calculate the AMI model composite quality score.

The following is a summary of the comments received and our responses.

**Comment:** A group of commenters believe the 30 Day Mortality measure is weighted too heavily under the proposed model. Several commenters expressed concern that this measure will not accurately measure quality of care across the proposed 90-day episode of care and therefore should not be weighted so heavily.

**Response:** We appreciate the comments regarding the heavy weighting that was proposed for the 30-Day Mortality measure. Mortality is a very serious outcome for AMI care and is one that model participants should manage to avoid. We have chosen to weight this measure so heavily because there at not many measures that will accurately measure quality for the EPM model. The mortality measure will assess a specific serious outcomes for these episodes, therefore we proposed high weights for this measure in the scoring methodology.

**Comment:** Several commenters expressed concern that HCAHPS are inappropriate and misaligned quality metric for this model. Several commenters have stated that this measure is hospital centric and will not address the patient experience of care for the entire episode therefore weighting this measure in the scoring methodology is an inappropriate approach to hold participants accountable for the overall beneficiary satisfaction during an episode. There is a general consensus that these measures are poorly aligned with the proposed cohorts.

**Response:** We appreciate the concern that the use of HCAHPS may not accurately assess patient satisfaction and quality related to the model specifically. However we have proposed the use of this instrument to access the patient satisfaction under the model as a readily available instrument to assess quality of care for patients. We will include the HCAHPS survey measure instrument until other alternative measures are available.

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal, without modification to the AMI composite quality scoring methodology.

(2) CABG Model Composite Quality Score

We proposed to assign each participant a CABG model composite quality score, calculated as the sum of the individual quality measure performance and improvement scores. The quality measure performance scores would be set to reflect the intended weights for each of the quality measures. Each quality measure performance would be assigned a weight in the CABG model composite quality score and possible scores for the measures would be set to reflect those weights. We would weight CABG model participant performance on each of the two required measures according to the measure weights displayed in Table 25.

<table>
<thead>
<tr>

<td>25</td>
<td>Patient Experience/25%</td>
</tr>
</tbody>
</table>

**Table 25—Measures and Associated Performance Weights in CABG Model Composite Quality Score**
We proposed to assign 75 percent of the weight in the CABG model composite quality score to the outcome quality domain, assigning all weight to the MORT–30–CABG (NQF #2558) measure, and the remaining 25 percent of the CABG model composite quality score weight to the HCAHPS Survey (NQF #0166) measure representing the patient experience quality domain. This proposal of weights for the outcome and patient experience quality domains for the CABG model composite quality score is similar to the proposal of weights for the AMI model composite quality score described previously in this section. CABG mortality is an extremely serious outcome and, like our proposal for the Mort–30–AMI (NQF #230) measure in the AMI model composite quality score, we proposed that the MORT–30–CABG (NQF #2558) measure would have the highest individual measure weight in the CABG model composite quality score. We would assign 25 percent of the weight to the HCAHPS survey measure (NQF #0166) because we believe that incorporating this quality measure, which reflects performance regarding patients’ perspectives on care, including communication, care transitions, and discharge information, is a meaningful patient experience measure of CABG model episode quality. We would assign the highest overall weight to the outcome quality domain (consisting of one measure) because it is specific to meaningful outcomes for CABG surgery for CABG model beneficiaries. We did not propose to assign the HCAHPS survey (NQF #0166) measure the highest weight of the quality and patient experience quality domains, as the measure is not specific to CABG model episodes, but rather to all clinical conditions treated by CABG model participants. Unlike the CJR model where the measure weights in the CJR model composite quality score relatively evenly balance the outcome and patient experience quality domains, CABG mortality representing the outcome quality domain is a serious outcome specific to CABG model beneficiaries such that we believe it deserves a high weight in the proposed CABG model composite quality score (80 FR 73375).

Under such an approach, we would first score individually each CABG model participant on the MORT–30–CABG (NQF #2558) measure; and HCAHPS Survey (NQF #0166) measure based on the participant’s performance percentile as compared to the national distribution of subsection (d) hospitals that are eligible for payment under the IPPS measure performance, assigning scores according to the point values displayed in Table 26. These individual measure scores have been set to reflect the measure weights included in Table 25 so they can ultimately be summed without adjustment in calculating the CABG model composite quality score.

</tbody>
</table>

Given the current national distribution of subsection (d) hospitals that are eligible for payment under the IPPS performance on these measures, we believe that small point increments related to higher measure performance deciles would be the most appropriate way to assign more points to reflect meaningfully higher quality performance on the measures. The absolute differences for each decile among the two measures reflect the intended weight of the measure in the CABG model composite quality score. These two measures are well-established measures in use under CMS hospital programs, so we do not believe that scores below the 30th percentile reflect quality performance such that they should be assigned any individual quality measure score points under the CABG model.

Finally, we would award improvement points on a measure-by-measure basis to those CABG model participants that demonstrate improvement on the measure; improvement points would be awarded for up to 10 percent of the maximum measure performance points available, with the total CABG model composite quality score capped at 20. Thus, improvement scores would be up to 1.5 points for the MORT–30–CABG (NQF #2558) measure; and up to 0.5 points for the HCAHPS Survey (NQF #0166) measure.

We would sum the performance and improvement scores on the two quality measures to calculate a CABG model composite quality score for each CABG model participant. The proposal for the methodology to calculate the CABG model composite quality score is included in §512.315(c)(1) through (4). We sought comment on our proposed methodology to calculate the CABG model composite quality score.

The following is a summary of the comments received and our responses. Comment: A group of commenters believe the 30 Day Mortality measure is weighted too heavily under the proposed model. Several commenters expressed concern that this measure will not accurately measure quality of care across the proposed 90-day episode of care and therefore should not be weighted so heavily. Several commenters expressed concern about the proposed weighting of the MORT–30–CABG at 50 percent of the composite quality score because the high weight assigned to the (RSMR) 30 day-mortality rate could encourage inappropriate treatment such as total revascularization even when not clinically indicated at the time of the acute event.

Response: We appreciate the comments regarding the heavy weighting that was proposed for the 30-Day Mortality measure. Mortality is a very serious outcome for CABG care and is one that model participants should manage to avoid. We have chosen to weight this measure so heavily because there at not many measures that will accurately measure quality for the EPM model. The mortality measure will assess a specific serious outcomes for these episodes, therefore we proposed...
high weights for this measure in the scoring methodology. We do not believe the use of this measure will lead to inappropriate treatment and intend to monitor for such activities under the model. However, we note that we will be making a slight downward adjustment in the weight this measure carries, from 75 percent to 70 percent in response to comments asking us to incorporate the STS composite CABG measure in our CABG model.

Comment: Several commenters expressed that the use of HCAHPS is inappropriate in the model and recommended removal of these measures. These is concern that the HCAHPS scores reflect an entire patient population and not just those included in the EPM episodes specifically. There is also concern that HCAHPS fail to address several important aspects of the EPM episode, and instead focus on aspects of care that are germane to the episode like “quietness” of a hospital for example. Commenters believe the use of these measures and weighting of the measures for this model is inappropriate and a misaligned approach to linking quality of care to payment under the model.

Response: We appreciate the concerns regarding HCAHPS and as mentioned in the proposed rule recognizes the misalignment of measures that exists for the patient population and cohort under the model. However, there are limited instruments available to measure patient experience available at this time. We have chosen to rely on these metrics to assess patient satisfaction under the model. The HCAHPS are a reliable set of metrics widely accepted to adequately measure patient experience. However, we note that we will be making a slight downward adjustment in the weight this measure carries, from 25 percent to 20 percent in response to comments asking us to incorporate the STS composite CABG measure in our CABG model.

Comment: A group of commenters recommended that the STS measure set be included in the CABG measure set as a comprehensive set of measures currently utilized by several providers to access the quality of care for patients.

Response: We appreciate the feedback regarding the inclusion of the STS measures into the CABG model to offer a more comprehensive measure set. As a result the CABG quality composite score will be revised to include these measures be reported as a voluntary measure. Following our standing policy for CJR and for the other models in this final rule voluntary measures are set to a composite score weight of 10 percent. Since we had previously allocated 100 percent of the composite weight over the two proposed measures, to be responsive to these comments we also need to adjust the proposed weighting for the mortality and HCAHPS measures. The revised weighting for the CABG measures is shown in the following revised tables 27 and 28:

**TABLE 27—MEASURES AND ASSOCIATED PERFORMANCE WEIGHTS IN CABG MODEL COMPOSITE QUALITY SCORE**

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal, with modification, to include the STS measures as voluntary measures with the revised weights displayed in Tables 27 and 28.

(3) SHFFT Model Composite Quality Score

We proposed to adopt the same calculation of the SHFFT model composite quality score as the CJR model, including the proposed changes to the CJR model composite quality score methodology described in section V.E. of the proposed rule (81 FR 50794). For those participants in both SHFFT and CJR models, the SHFFT model composite quality score calculated each year would be the same as the CJR model composite quality score (80 FR 73370 through 73381). We proposed to assign each SHFFT model participant a SHFFT model composite quality score, capped at 20 points and calculated as the sum of the individual quality measure and improvement scores as well as successful submission of THA/TKA voluntary PRO and limited risk variable data if applicable. The quality measure performance scores would be set to reflect the intended weights for each of the quality measures. Each quality measure performance score would be assigned a weight in the SHFFT model composite quality score and possible scores for the measures would be set to reflect those weights. We would weight SHFFT model participant performance on each of the two required measures and successful submission of THA/TKA voluntary PRO and limited risk variable data according to the measure weights displayed in Table 41.
TABLE 29—MEASURES AND ASSOCIATED PERFORMANCE WEIGHTS IN SHFFT MODEL COMPOSITE QUALITY SCORE

<table>
<thead>
<tr>
<th>Quality measure</th>
<th>Weight in composite quality score (%)</th>
<th>Quality domain/weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hip/Knee Complications (NQF #1550)</td>
<td>50</td>
<td>Outcome/50%</td>
</tr>
<tr>
<td>THA/TKA voluntary PRO and limited risk variable submission</td>
<td>10</td>
<td>Patient Experience/50%</td>
</tr>
<tr>
<td>HCAHPS Survey (NQF #0166)</td>
<td>40</td>
<td></td>
</tr>
</tbody>
</table>

Consistent with the CJR model, we proposed to assign 50 percent of the weight in the SHFFT model composite quality score to the outcome quality domain, assigning 50 percent of the weight to the Hip/Knee Complications (NQF #1550) measure. We proposed to assign 50 percent of the weight to the patient experience quality domain, specifically 10 percent of the weight in that quality domain to the THA/TKA voluntary PRO and limited risk variable submission. We would assign 40 percent of the weight to the HCAHPS survey measure (NQF #0166) representing the patient experience (80 FR 73375). We would assign 40 percent to the HCAHPS survey measure (NQF #0166) because we believe that incorporating this quality measure, which reflects performance regarding patients’ perspectives on care, including communication, care transitions, and discharge information, is a highly meaningful outcome measure of SHFFT episode quality under the SHFFT model, and because doing so ensures that there is a consistent methodology for linking quality performance and improvement to payment for SHFFT model participants that are also participating in the CJR model. As in the CJR model, we believe this weighting appropriately balances patient experience with meaningful health outcomes for beneficiaries (80 FR 73375).

Under such an approach, we would first score individually each SHFFT model participant on the Hip/Knee Complications (NQF #1550) measure; and HCAHPS Survey (NQF #0166) measure based on the participant’s performance percentile as compared to the national distribution of subsection (d) hospitals that are eligible for payment under the IPPS measure performance, assigning scores according to the point values displayed in Table 30. These individual measure scores have been set to reflect the measure weights included in Table 29 so they can ultimately be summed without adjustment in calculating the SHFFT model composite quality score. We note that the point score for each decile for the two measures for the SHFFT model is the same as that used for other CJR model.

<td>0.00</td>
</tr>
</tbody>
</table>

Given the current national distribution of subsection (d) hospitals that are eligible for payment under the IPPS performance on these measures, we believe that small point increments related to higher measure performance deciles would be the most appropriate way to assign more points to reflect meaningfully higher quality performance on the measures. The absolute differences for each decile among the three measures reflect the intended weight of the measure in the SHFFT model composite quality score. These two measures are well-established measures in use under CMS hospital programs, so we do not believe that scores below the 30th percentile reflect quality performance such that they should be assigned any individual quality measure score points under the SHFFT model.

As in the CJR model, we proposed to assign a measure quality score of 2 points for SHFFT model participants that successfully submit THA/TKA voluntary PRO and limited risk variable data and 0 points for participants that do not successfully submit these data (80 FR 73376).

Finally, we would award improvement scores on a measure-by-measure basis to those SHFFT model participants that demonstrate improvement on the measure (defined as year-over-year improvement of 2 or more deciles in the performance distribution); improvement points would be awarded for up to 10 percent of the maximum measure performance points available, with the total SHFFT model composite quality score capped at 20. Thus, improvement scores would be up to 1.0 points for the Hip/Knee Complications (NQF #1550) measure; and up to 0.8 points for the HCAHPS Survey (NQF #0166) measure.

We would sum the performance and improvement scores on the two required quality measures and the score on successful submission of THA/TKA voluntary PRO and limited risk variable data to calculate a SHFFT model composite quality score for each SHFFT model participant. For those CJR model participants (the majority of SHFFT model participants), the SHFFT model composite quality score would be the same as the participant’s score for the CJR model.

The proposal for the methodology to calculate the SHFFT model composite...
quality score is included in §512.315(d)(1) through (4). We sought comment on our proposed methodology to calculate the SHFFT model composite quality score.

The following is a summary of the comments received and our responses.

Comment: Several commenters expressed that the use of HCAHPS is inappropriate in the model and recommended removal of these measures. These are concern that the HCAHPS scores reflect an entire patient population and not just those included in the EPM episodes specifically. There is also concern that HCAHPS fail to address several important aspects of the EPM episode, and instead focus on aspects of care that are not germane to the episode like “quietness” of a hospital for example. Commenters believe the use of these measures and weighting of the measures for this model is inappropriate and a misaligned approach to linking quality of care to payment under the model.

Response: We appreciate the concerns regarding HCAHPS and as mentioned in the proposed rule recognizes the misalignment of measures that exists for the patient population and cohort under the model. However, there are limited instruments available to measure patient experience at this time. We have chosen to rely on these metrics to assess patient satisfaction under the model. The HCAHPS are a reliable set of metrics widely accepted to adequately measure patient experience.

Comment: Several commenters urged CMS to use the CJR composite scoring methodology.

Response: We appreciate the support for utilizing the CJR composite scoring methodology in the SHFFT model as proposed. We believe the SHFFT model composite scoring methodology accurately reflects the quality measures that will be assessed under the model.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification.

f. EPM Pay-for-Performance Methodologies to Link Quality and Payment

(1) Overview of Pay-for-Performance Proposals Applicable to the EPMs

As in the CJR model, we proposed that the maximum effective discount factor for all EPM participants that could be incorporated in quality-adjusted target prices would be 3.0 percent (80 FR 733760). We refer to section III.D.4.b.(10) of this final rule for further discussion of the application of the effective discount factor to EPM-

episode benchmark prices in calculating quality-adjusted target prices. EPM participants that provide high-quality episode care would have the opportunity to reduce the effective discount factor used to calculate their quality-adjusted prices at reconciliation. The effective discount factors are displayed in tables in the following EPM-specific sections, based on the EPM-specific composite quality score that would place each EPM participant into one of four quality categories, specifically “Below Acceptable,” “Acceptable,” “Good,” and “Excellent,” for each EPM performance year. Three tables are required to display the proposed effective discount factor and applicable discount factor (the discount factor that represents the phase-in of repayment responsibility in performance years 2 (DR) and 3) for each quality category due to the phase-in of EPM participant repayment responsibility from no responsibility in performance year 1 and performance year 2 (NDR), to partial responsibility in performance years 2 (DR) and 3, and finally full responsibility in performance years 4 and 5 as discussed in section III.D.2.c. Note that the applicable discount factor only applies to EPM performance years 2 (DR) and 3.

The following is a summary of the comments received and our responses.

Comment: A commenter suggests that CMS heavily skew the point distributions for the models so that the majority of the hospitals fall into the “good” category of performance. There is concern that the disparity between excellent and good would be great across the model using the proposed methodology. Commenters believe the bar for achieving “excellent” care is set too high and strongly recommended that threshold be lowered to allow for more hospitals to be placed into the “excellent” category under the three models. Lowering the “excellent” threshold would correctly recognize additional institutions that are achieving high levels of quality of care for their patients.

Response: We disagree with the commenters that the bar for achieving excellent care is set too high. In modeling the score ranges for the different improvement categories, we are assuming that the majority of model participants will score within the “good” category. We have proposed to award up to 10 percent of the maximum measure points available and believe that the standard for providing excellent quality of care should be high.

Comment: CMS’s stated belief that the EPM models should use the pay for performance methodologies that simultaneously reward improvement in patient outcomes and lower health care spending. The commenter supports the proposal to pay on a quality first principle: Only sharing saving with hospitals that achieve quality scores above the 30th percentile and weighting the discount percentage based on quality performance.

Response: We acknowledge and appreciate your support for the payment methodology and quality driven focus of this model. CMS is committed to linking payments to the quality of care delivered across this model.

Comment: A commenter urged CMS to explore a reward for higher quality, and consider paying bonuses to hospitals which improve quality while keeping costs stable. Under the proposed model there is no reward for a hospital that achieves better outcomes for its patients at the same cost. Under the proposed model, quality measurement only comes into play as a punitive measure. If spending is the same but quality is higher, there is no bonus.

Response: The basic design of the EPMs requires savings to Medicare first, before any payment would be made to EPM participants for future savings. Thus, the payments to EPM participants are not “bonus” Payments to participants may vary based on episode quality. Quality is not used as a “punitive” measure but, rather, improved quality allows EPM participants to receive a higher amount of their savings achieved. No payment is made to any EPM participant under the design where there are no measurable savings to the Medicare program.

Rounding hospitals who achieve higher quality at the same cost is not within the scope of this model or the intent.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification.

(2) AMI and CABG Model Pay-for-Performance Methodologies

(a) AMI Model Pay-for-Performance Methodology

We proposed to incorporate the AMI model composite quality score in the AMI model payment methodology by (1) requiring a minimum AMI model composite quality score for reconciliation payment eligibility if the AMI model participant’s actual episode payments are less than the quality-adjusted target price and (2) determining the effective discount factor included in the quality-adjusted target price experienced by the AMI model.
Under this approach, the maximum AMI model effective discount factor included in the quality-adjusted target price would be 3.0 percent, consistent with the CJR model (80 FR 73365). We believe that a maximum effective discount factor of 3.0 percent is reasonable as it is within the range of estimated Medicare payment for historical AMI episodes beginning in CYs 2012 to 2014 was $24,200.$\text{91}

Under this methodology, we proposed to require AMI model participants to achieve a minimum AMI model cost-effectiveness ratio of 80 percent, as proposed in this rule that began in CYs 2012–2014.
composite quality score of >=3.6 to be eligible for a reconciliation payment if actual episode payments were less than the quality-adjusted target price based on the 3.0 percent maximum effective discount factor. Participants with below acceptable quality performance reflected in an AMI model composite quality score <3.6 would not be eligible for a reconciliation payment if actual AMI model episode payments were less than the quality-adjusted target price. A level of quality performance that is below acceptable would not affect AMI model participants’ repayment responsibility if actual AMI model episode payments exceeded the quality-adjusted target price. We believe that excessive reductions in utilization that lead to low actual AMI model episode payments and that could result from the financial incentives of an EPM would be limited by a requirement that this minimum level of AMI model episode quality be achieved for reconciliation payments to be made. This policy would encourage AMI model participants to focus on appropriate reductions or changes in utilization to achieve high quality care in a more efficient manner. Therefore, these participants would be ineligible to receive a reconciliation payment if actual AMI model episode payments were less than the quality-adjusted target price.

We proposed that AMI model participants with an acceptable AMI model composite quality score of >=3.6 and <6.9 would be eligible for a reconciliation payment if actual AMI model episode payments were less than the quality-adjusted target price based on a 3.0 percent effective discount factor because their quality performance was at the acceptable level established for the AMI model. Therefore, these AMI model participants would be eligible to receive a reconciliation payment if actual AMI model episode payments were less than the quality-adjusted target price. We proposed that AMI model participants with a good AMI model composite quality score of >=6.9 and <=14.8 would be eligible for a reconciliation payment if actual AMI model episode payments were less than the quality-adjusted target price based on a 2.0 percent effective discount factor that reflects their good quality performance. Thus, participants achieving this level of quality for AMI episodes under the AMI model would either have less repayment responsibility (that is, the reduced effective discount factor would offset a portion of their repayment responsibility) or receive a higher reconciliation payment (that is, the reduced effective discount factor would increase the reconciliation payment). We proposed that AMI model participants with an excellent AMI model composite quality score of >14.8 would be eligible to receive a reconciliation payment if actual AMI model episode payments were less than the quality-adjusted target price based on a 1.5 percent effective discount factor that reflects their excellent performance. Thus, participants achieving this level of quality for AMI episodes under the AMI model would either have less repayment responsibility (that is, the reduced effective discount factor would offset a portion of their repayment responsibility) or receive a higher reconciliation payment (that is, the reduced effective discount factor would increase the reconciliation payment).

Under this methodology, the proposed stop-loss and stop-gain limits discussed in section III.D.7.b. of this final rule will not change. We believe this approach to quality incentive payments based on the AMI model composite quality score could have the effect of increasing the alignment of the financial and quality performance incentives under the AMI model to the potential benefit of AMI model participants and their collaborators as well as CMS, and would be consistent with the CJR model methodology linking quality and payment.

The proposal to link quality to payment in the AMI model pay-for-performance methodology is included in §512.315(b)(5). We sought comment on our proposal to link quality to payment in the AMI model pay-for-performance methodology.

We did not receive comments which uniquely addressed the proposed AMI model pay-for-performance methodology.

Final Decision: Although we did not receive comments on the proposed AMI model pay-for-performance methodology, adjustments to our proposal are necessary due to the final selection of actual EPM MSAs and our policy for participants who elect early downside risk as discussed in section III.D.2.c. of this final rule. Specifically, in our proposed rule we created composite quality score ranges for the AMI measure based on historical performance of a representative group of hospitals within 98 potentially EPM-eligible MSAs. However, for the final rule we have randomly selected 98 MSAs in which to officially conduct the EPM models. Therefore, the composite quality score ranges associated with each quality performance category we are finalizing in this rule are based on a model of historical performance in the actual 98 MSAs selected for this model. Final AMI model composite quality score ranges, associated quality performance categories and discounts are reflected in tables 31, 32, and 33. After consideration of the public comments received, we are finalizing the proposal, with modification to final composite quality score ranges to reflect selection of MSAs, as discussed here.

(b) CABG Model Pay-for-Performance Methodology

We proposed to incorporate the CABG model composite quality score in the CABG model payment methodology by—(1) requiring a minimum CABG model composite quality score for reconciliation payment eligibility if the CABG model participant’s actual episode payments are less than the quality-adjusted target price; and (2) determining the effective discount factor included in the quality-adjusted target price experienced by the CABG model participant in the reconciliation process. The payment policies we would apply are displayed in Tables 34, D24, and D25 for the performance years of the CABG model. Under the CABG model as proposed, there is no CABG model participant repayment responsibility in performance year 1 and performance year 2 (NDR) and this responsibility begins to be phased-in in performance year 2 (DR), with full implementation in performance year 4. Because repayment responsibility is phased-in, in performance years 2 (DR) and 3, repayment responsibility only applies to a portion of the amount of excess CABG model episode spending that results from the quality-adjusted target prices that include the CABG model participant’s effective discount factor. We, therefore, refer in the repayment column to the applicable discount factor for repayment amount in performance years 2 (DR) and 3. The effective discount factor applies to both the reconciliation payment and the repayment amount in performance years 4 and 5. We note that the average Medicare payment for historical CABG

Under this approach, the maximum CABG model effective discount factor included in the quality-adjusted target price would be 3.0 percent, consistent with the CJR model (80 FR 73365). We believe that a maximum effective discount factor of 3.0 percent is reasonable as it is within the range of discount percentages included in the Medicare Acute Care Episode (ACE) demonstration and it is the Model 2 BPCI discount factor for 30 and 60 day episodes, where BPCI participants are testing CABG episodes subject to the 3.0 percent discount factor. CABG model participants that provide high quality episode care would have the opportunity for a lower effective discount factor to be included in their quality-adjusted target prices at reconciliation as displayed in Tables 34, 35, and 36.

Under this methodology, we proposed that we would require CABG model participants to achieve a minimum CABG model composite quality score of >=2.8 to be eligible for a reconciliation payment if actual episode payments were less than the quality-adjusted target price based on the 3.0 percent maximum effective discount factor. We proposed that participants with below acceptable quality performance reflected in an CABG model composite quality score <2.8 would not be eligible for a reconciliation payment if actual CABG model episode payments were less than the quality-adjusted target price. A level of quality performance that is below acceptable would not affect participants’ repayment responsibility if actual CABG model episode payments exceed the quality-adjusted target price. We believe that excessive reductions in utilization that lead to low actual CABG model episode payments and that could result from the financial incentives of an EPM would be limited by a requirement that this minimum level of CABG model episode quality be achieved for reconciliation payments to be made.

---

92 Episodes for CABG beneficiaries initiated by all U.S. IPPS hospitals and constructed using standardized Medicare FFS Parts A and B claims, as proposed in this rule that began in CYs 2012–2014.
This policy would encourage CABG model participants to focus on appropriate reductions or changes in utilization to achieve high quality care in a more efficient manner. Therefore, these participants would be ineligible to receive a reconciliation payment if actual CABG model episode payments were less than the quality-adjusted target price.

We proposed that CABG model participants with an acceptable CABG model composite quality score of >=2.8 and <=4.8 would be eligible for a reconciliation payment if actual CABG model episode payments were less than the quality-adjusted target price based on a 3.0 percent effective discount factor because their quality performance was at the acceptable level established for the CABG model. Therefore, these CABG model participants would be eligible to receive a reconciliation payment if actual CABG model episode payments were less than the quality-adjusted target price.

We proposed that CABG model participants with a good CABG model composite quality score >=4.8 and <=17.5 would be eligible for a reconciliation payment if actual CABG model episode payments were less than the quality-adjusted target price based on a 2.0 percent effective discount factor that reflects their good quality performance. Thus, participants achieving this level of quality for CABG episodes under the CABG model would either have less repayment responsibility (that is, the reduced effective discount factor would offset a portion of their repayment responsibility) or receive a higher reconciliation payment (that is, the reduced effective discount factor would increase the reconciliation payment) at reconciliation than they would have otherwise based on a comparison of actual CABG model episode payments to quality-adjusted target prices that include the maximum 3.0 percent effective discount factor.

Under this methodology, the proposed stop-loss and stop-gain limits discussed in section III.D.7.b. of this final rule will not change. We believe this approach to quality incentive payments based on the CABG model composite quality score could have the effect of increasing the alignment of the financial and quality performance incentives under the CABG model to the potential benefit of CABG model participants and their collaborators as well as CMS, and would be consistent with the CJR model methodology linking quality and payment.

The proposal to link quality to payment in the CABG model pay-for-performance methodology is included in § 512.315(c)(5). We sought comment on our proposal to link quality to payment in the CABG model pay-for-performance methodology.

We did not receive comments which uniquely addressed our proposed CABG model pay-for-performance methodology.

Final Decision: Although we did not receive comments on the proposed CABG model pay-for-performance methodology, adjustments to our proposal are necessary due to selection of the EPM MSAs and our policy for participants who elect early downside risk (that is, to create a more similar model of historical performance of inpatient care). Therefore, the composite quality score ranges for the CABG measure based on historical performance of a representative group of hospitals within 98 potentially EPM-eligible MSAs. However, for the final rule we have randomly selected 98 MSAs in which to officially conduct the EPM models. Therefore, the composite quality score ranges associated with each quality performance category we are finalizing in this rule are based on a model of historical performance of the actual 98 MSAs selected for this model. Final CABG model composite quality score ranges, associated quality performance categories and discounts are reflected in tables 34, 35, and 36. After consideration of the public comments received, we are finalizing the proposal, with modifications to final composite quality score ranges to reflect selection of MSAs, as discussed here.

**(c) Alignment Between the AMI and CABG Model Methodologies**

The AMI and CABG models are closely related, given that they both are based on a significant event or procedure for a beneficiary with CAD. As discussed in sections III.D.2.b. and III.D.2.c. of the proposed rule (81 FR 50794), we proposed the use of a 30-day mortality measure in both models, specifically MORT–30–AMI (NQF #2030) with a weight of 50 percent in the AMI model composite quality score and MORT–30–CABG (NQF #2558) with a weight of 75 percent in the CABG model quality score. The beneficiaries included in the measure have some overlap, because some beneficiaries with AMI will have a CABG during their hospitalization that begins an episode. Analysis of both the MORT–30–AMI (NQF #2030) and MORT–30–CABG (NQF #2558) measure national distributions suggests that improving from the 25th percentile to 75th percentile represents roughly a 1 percentage point decrease in mortality rates for both measures.

In addition, we note that for historical 2012 to 2014, the average Medicare spending for an AMI episode that extends 90 days post-hospital discharge was approximately $24,200 and for a CABG episode was approximately $47,000. However, because we proposed the same 1.5 percent to 3.0 percent effective discount factor range based on quality performance and improvement for the AMI and CABG models (and, to a lesser degree, because of the modestly lower weight assigned to the mortality measure under the AMI model), the absolute dollar amounts tied to changes in AMI or CABG mortality rates are different in the two models. A larger absolute financial incentive is associated with improvement in CABG mortality than AMI mortality under our proposal. We recognize that mortality is a serious outcome for beneficiaries with CAD who have a significant event or procedure, and we considered setting a wider effective discount factor range based on quality in the AMI model than the CABG model to align the absolute financial incentives to improve mortality under both models. For example, to create a more similar absolute financial incentive between the lowest and highest effective discount percentages in the AMI and CABG models, we could set the effective discount factor range based on quality in the AMI model than the CABG model.
discount factor range for the AMI model at 0.75 percent to 3.75 percent and the CABG model range at 1.5 percent to 3 percent. Alternatively, we could set the AMI model effective discount factor range at 1.5 percent to 3 percent and compress the CABG effective discount factor range. While we did not propose different effective discount factor ranges for the AMI and CABG models in order to retain consistency with the CJR model and the BPCI initiative, we sought comments about the potential benefits and drawbacks of establishing the same absolute dollar incentive for similar improvements in quality across different models that have similar measures but vary in average episode cost. This feedback will be useful as we consider future episode payment models and candidate quality measures for potential new and existing models, as well as consider future refinements to the pay-for-performance methodologies under the models. Our goal in all of our episode payment models is to create strong financial incentives for quality improvement and performance for participants at all levels of current quality performance and to rationalize the strength of the financial incentives in the context of the specificity and importance of the quality measures used under the models.

Final Decision: No comments were received on the proposed pay for performance methodology. Therefore, we are finalizing the proposal, without modification.

(3) SHFFT Model Pay-for-Performance Methodology

We proposed to incorporate the SHFFT model composite quality score in the SHFFT model payment methodology by (1) requiring a minimum SHFFT model composite quality score for reconciliation payment eligibility if the SHFFT model participant’s actual episode payments are less than the quality-adjusted target price and (2) determining the effective discount factor included in the quality-adjusted target price experienced by the SHFFT model participant in the reconciliation process. The payment policies we would apply are displayed in Tables 37, 38, and 28 for the performance years of the SHFFT model. Under the SHFFT model as proposed, there is no SHFFT model participant repayment responsibility in performance year 1 and performance year 2 (NDR) and this responsibility begins to be phased-in in performance year 2 (DR), with full implementation in performance year 4. Because repayment responsibility is phased-in, in performance years 2 (DR) and 3, repayment responsibility only applies to a portion of the amount of excess SHFFT model episode spending that results from the quality-adjusted target prices that include the SHFFT model participant’s effective discount factor. We, therefore, refer in the repayment column to the applicable discount factor for repayment amount in performance years 4 and 5. We note that the average Medicare payment for historical SHFFT episodes beginning in CYs 2012 to 2014 was $43,000.

We refer to section V.E. of this final rule for discussion of the correction to the composite quality score ranges for the four quality categories from what was presented in the CJR final rule (80 FR 73378). The SHFFT model composite quality score ranges displayed in Tables 37 through 39 are the corrected ranges that also apply to the CJR model.

---

Episodes for SHFFT beneficiaries initiated by all U.S. IPPS hospitals and constructed using standardized Medicare FFS Parts A and B claims, as proposed in this rule that began in CYs 2012–2014.
Under this methodology, we proposed that we would require SHFFT model participants to achieve a minimum SHFFT model composite quality score of >5.0 to be eligible for a reconciliation payment if actual episode payments were less than the quality-adjusted target price based on the 3.0 percent maximum effective discount factor. We proposed that participants with below acceptable quality performance reflected in a SHFFT model composite quality score <5.0 would not be eligible for a reconciliation payment if actual SHFFT model episode payments were less than the quality-adjusted target price. We believe that excessive reductions in utilization that lead to low actual SHFFT model episode payments and that could result from the financial incentives of an EPM would be limited by a requirement that this minimum level of SHFFT model episode quality be achieved for reconciliation payments to be made. This policy would encourage SHFFT model participants to focus on appropriate reductions or changes in utilization to achieve high quality care in a more efficient manner. Therefore, these participants would be ineligible to receive a reconciliation payment if actual SHFFT model episode payments were less than the quality-adjusted target price.

We proposed that SHFFT model participants with an acceptable SHFFT model composite quality score of >=5.0 and <6.9 would be eligible for a reconciliation payment if actual SHFFT model episode payments were less than the quality-adjusted target price based on a 3.0 percent effective discount factor because their quality performance was at the acceptable level established for the SHFFT model. Therefore, these SHFFT model participants would be eligible to receive a reconciliation payment if actual SHFFT model episode payments were less than the quality-adjusted target price.

We proposed that SHFFT model participants with a good SHFFT model composite quality score of >=6.9 and <=15.0 would be eligible for a reconciliation payment if actual SHFFT model episode payments were less than the quality-adjusted target price based on a 2.0 percent effective discount factor that reflects their good quality performance. Thus, participants achieving this level of quality for SHFFT model episodes under the SHFFT model would either have less repayment responsibility (that is, the reduced effective discount factor would offset a portion of their repayment responsibility) or receive a higher reconciliation payment (that is, the reduced effective discount factor would increase the reconciliation payment) at reconciliation than they would have otherwise based on a comparison of actual SHFFT model episode payments to quality-adjusted target prices that include the maximum 3.0 percent effective discount factor.

Finally, we proposed that SHFFT model participants with an excellent SHFFT model composite score quality score of >15.0 would be eligible to receive a reconciliation payment if actual SHFFT model episode spending was less than the quality-adjusted target price based on a 1.5 percent effective discount factor that reflects their excellent performance. Thus, participants achieving this level of quality for SHFFT model episodes would either have less repayment responsibility (that is, the reduced effective discount factor would offset a portion of their repayment responsibility) or receive a higher reconciliation payment (that is, the reduced effective discount factor would increase the reconciliation payment) at reconciliation than they would have otherwise based on a comparison of actual SHFFT model episode payments to quality-adjusted target prices that include the maximum 3.0 percent effective discount factor.

Under this methodology, the proposed stop-loss and stop-gain limits discussed in section III.D.7.b. of this final rule will not change. We believe this approach to quality incentive payments based on the SHFFT model composite quality score could have the effect of increasing the alignment of the financial and quality performance incentives under the SHFFT model to the potential benefit of SHFFT model participants and their collaborators as well as CMS, and would be consistent with the CJR model methodology linking quality and payment.

The proposal to link quality to payment in the SHFFT model pay-for-performance methodology is included in §512.315(d)(5). We sought comment on our proposal to link quality to payment in the SHFFT model pay-for-performance methodology.

We did not receive comments on the proposed SHFFT model pay-for-performance methodology.

Final Decision: We are finalizing without modification our proposal for SHFFT model pay-for-performance methodology.

4. Details on Quality Measures for the EPMs

a. AMI Model-Specific Measures

(1) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) Hospitalization (NQF #0230)(MORT30-AMI)

(a) Background

AMI is one of the most common principal hospital discharge diagnoses among older adults and is associated with high mortality. AMI was the tenth most common principal discharge diagnosis among patients with Medicare in 2012.\footnote{Agency for Healthcare Research and Quality (AHRQ). Healthcare Cost and Utilization Project (HCUP) http://hcupnet.ahrq.gov/} Each year, over 600,000 Americans will experience an AMI. Despite improvements in treatments, 30-day mortality rates following AMI exceed 7 percent. CMS pays...
approximately $11.7 billion annually for in-hospital costs for Medicare beneficiaries with coronary heart disease, of which AMI is a major contributor. The high prevalence and considerable morbidity and mortality associated with AMI create an economic burden on the health care system.96

Hospital mortality is an outcome that is likely attributable to care processes and is an important outcome for patients. Complex and critical aspects of care, such as communication between providers, prevention of and response to complications, patient safety, and coordinated transitions to the outpatient environment, all contribute to patient outcomes. Many current hospital interventions are known to decrease the risk of death within 30 days of hospital admission.97,98 We believe it is important to assess the quality of care provided to Medicare beneficiaries who are hospitalized for AMI.

The measure developed by CMS, and currently implemented in the HIQR and HVBP Programs, assesses a hospital’s risk-standardized mortality rate, which is the rate of death after admission to a hospital with a principal diagnosis of AMI. The measure outcome is the rate of mortality occurring after admission with a principal diagnosis of AMI for patients 65 and older during a 30-day period that begins with the date of the index admission for the specific hospital. An index admission is the hospitalization which is included in the measure cohort because it meets all inclusion criteria and does not meet any exclusion criteria. The index admission is the hospitalization to which the mortality outcome is attributed. The median hospital-level risk-standardized mortality rate for 2016 public reporting on Hospital Compare was 14.2 percent, with an interquartile range from 13.7 percent to 14.6 percent in hospitals. The variation in mortality rates suggests that important differences in the quality of care delivered across hospitals exist, and there is room for quality improvement.

We developed the measure of hospital-level risk-standardized mortality rate (RSMR) following AMI hospitalization, which is endorsed by the NQF (NQF #0230). The measure has been publicly reported on Hospital Compare since FY 2007, and was incorporated into what is now the HIQR Program since FY 2008 (FY 2008 IPPS/LTCH final rule 71 FR 67960), and the HVBP Program since FY 2014 (FY 2011 IPPS/LTCH final rule 76 FR 26510).

(b) Data Sources

We proposed to use Medicare Part A and Part B FFS claims submitted by the AMI model participant as the data source for calculation of the MORT–30–AMI (NQF #0230) measure. Index admission diagnoses and in-hospital comorbidities are assessed using Medicare Part A claims. Additional comorbidities prior to the index admission are assessed as Part A inpatient, outpatient, and Part B office visit Medicare claims in the 12 months prior to the index admission. Enrollment and post-discharge mortality status are obtained from Medicare’s enrollment database which contains beneficiary demographics, benefits/coverage, and vital status information.

(c) Cohort

The MORT–30–AMI (NQF #0230) measure includes Medicare FFS beneficiaries, aged 65 years or older, discharged from non-federal acute care hospitals with a principal discharge diagnosis of AMI and with a complete claims history for the 12 months prior to admission. Eligible hospitalizations are defined using the following ICD–10-CM codes: I2109, I2119, I2111, I2119, I2129, I214, and I213.

We proposed that the measure will include index admissions to all non-federal acute care hospitals, which includes all AMI model participants. Hospital performance will only be publically reported for hospitals with 25 or more index admissions in the 3-year measurement period. The AMI model cohort would differ from the hospital cohort that is currently captured in the measure through the HIQR Program. Although performance on the measure will not be publically reported for hospitals with fewer than 25 cases, they will receive information about their performance. We refer readers to section III.B.5. of this final rule for participant selection for the AMI model. For eligible hospitalizations defined using ICD–9-CM codes, we refer readers to the CMS Web site at: http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInitiatives-Measure-Methodology.html.

(d) Inclusion and Exclusion Criteria

We proposed that an index admission is the hospitalization to which the mortality outcome is attributed. We note that for purposes of the EPMs where we need to identify episodes that are included in the EPMs, we use the term anchor hospitalization to identify hospitalizations that initiate EPM episodes for beneficiaries whose care is included in the EPMs. In describing the quality measures themselves in detail in section III.E.4. of the proposed rule (81 FR 50794), we use the term index hospitalization to identify hospitalizations of beneficiaries whose outcomes are included in the measures. Thus, anchor hospitalizations and index hospitalizations would have varying degrees of overlap depending on the specific quality measure. The measure includes the following index admissions for patients:

• Having a principal discharge diagnosis of AML.
• Enrolled in Medicare FFS.
• Aged 65 or over.
• Not transferred from another acute care facility.
• Enrolled in Medicare Part A and Part B for the 12 months prior to the date of index admission, and enrolled in Part A during the index admission.

This measure excludes the following index admissions for patients:

• Discharged alive on the day of admission or the following day who were not transferred to another acute care facility.
• With inconsistent or unknown vital status or other unreliable demographic (age and gender) data.
• Enrolled in the Medicare hospice program any time in the 12 months prior to the index admission, including the first day of the index admission;
• Discharged against medical advice American Medical Association (AMA);
• Without at least 30 days of post-discharge enrollment in FFS Medicare as the 30-day mortality outcome cannot be assessed for these patients.

Finally, for the purpose of this measure, admissions within 30 days of discharge from an index admission are not eligible to also be index admissions. Thus, only one index admission for AMI per beneficiary is randomly selected for inclusion in the cohort.

(e) Risk-Adjustment

We note that this measure is aligned with the risk-adjustment methodologies adopted for the MORT–30–AMI (NQF #0230) measure under the HIQR Program in accordance with section 1886(b)(3)(B)(viii)(VIII) of the Act, as

A 3-year rolling period for calculating measure results would be consistent with the time frame used for the HIQR Program (FY 2008 IPPS/LTCH final rule 71 FR 67960). We also note that the measure risk adjustment takes into account patient age, sex, and comorbidities to allow a fair assessment of hospital performance. The measure defines the patient risk factors for mortality using diagnosis codes collected from all patient claims 1 year prior to patient index hospitalization for AMI. As previously noted in the MORT–30–AMI measure (NQF #0230), ICD–10–CM codes on Medicare Parts A and B administrative claims are used to inform the risk prediction for each patient; diagnostic codes from post-acute care settings are included in the measure, but this information is only used to identify a hospital’s patient case mix in order to adequately adjust for differences in case mix across hospitals. Use of Parts A and B data does not mean the measure is applicable to post-acute care settings, only that it uses comprehensive data to predict the risk of the outcome and adjust for hospital patient case mix. We note that the patient diagnosis codes are grouped using Hierarchical Condition Categories (HCCs), which are clinically relevant diagnostic groups of codes. The CCs used in the risk-adjustment model for this measure are provided on the CMS QualityNet Web site at: https://www.qualitynet.org/dcs/ContentServer?c=Page&pageName=QnetPublic%2FPage%2FQnetTier4&cid=1219069856694.

In summary, age, sex, and comorbidities present at the time of admission are adjusted for differences in hospital case mix (patient risk factors). The measure uses the hierarchical logistic regression model (HLM) statistical methodology for risk adjustment.

(f) Calculating the Risk-Standardized Mortality Ratio (RSMR) and Performance Period

We proposed to calculate hospital 30-day, all-cause, risk-standardized mortality rates consistent with the methodology used to risk standardize all readmission and mortality measures used in CMS hospital quality programs. Using HLM, we calculate the hospital-level risk-standardized mortality rate following AMI hospitalization by producing a ratio of the number of “predicted” deaths (that is, the adjusted number of deaths at a specific hospital) to the number of “expected” deaths (that is, the number of deaths if an average quality hospital treated the same mix as) for each hospital and then multiplying the ratio by the national raw mortality rate.

The proposal to include Hospital-level 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) following AMI hospitalization (NQF #0230) measure in the AMI model is included in § 512.3 (f) (I). We sought comment on this proposal to include Hospital-level 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) following AMI hospitalization (NQF #0230) measure in the AMI model to assess quality performance.

The following is a summary of the comments received and our responses.

Comment: One commenter supported the proposal to use mortality rates as the principal outcome measure for the cardiac EPMs. The commenter agreed that mortality is an extremely serious outcome for these episodes, and it has the added benefit of not requiring adjustment for SES, demographic, or environmental risk factors.

Response: We thank the commenter for their support.

Comment: Several commenters expressed concern about the proposed weighting of the 30-day risk-standardized mortality rate (RSMR) at 50 percent of the composite quality score because the high weight assigned to the risk-standardized 30-day mortality rate could encourage inappropriate treatment such as total revascularization even when not clinically indicated at the time of the acute event. One commenter was also concerned that with this weighting proposal, hospitals with fewer AMI cases would be further disadvantaged since there will be less data used to calculate the hospital’s quality score.

Response: To ensure hospitals have enough cases to produce a valid quality score, the AMI mortality measure uses 3 years of claims data to calculate the measure. Hospitals must have at least 25 qualifying index admissions within the 3-year measurement period to calculate and publically report a measure result. We do not believe these measures disadvantage smaller volume hospitals. We have found hospitals with fewer cases tend to have measure results that are close to the national average, hospital rate and are therefore rarely identified as poor performing outliers.

Comment: One commenter recommended excluding cardiogenic shock and sepsis patients because patients with these conditions and AMI have a higher mortality rate than those who do not.

Response: In order to account for differences in patient mix among hospitals, the measures adjust for variables (for example, age, comorbid diseases, and indicators of patient frailty) that are clinically relevant and have relationships with the outcome. In the case of the AMI measure, we risk adjust for cardio-respiratory failure or shock. However the measure’s risk model does not include a risk variable for sepsis.

Comment: Several commenters requested clarification or expressed concern about attribution of the measure outcome to hospitals when patients are transferred among acute-care hospitals. One commenter suggested that hospitalizations that include transfers among institutions be excluded or that the AMI mortality measure not be used in cases where there was a transfer. Another commenter suggested that the current method within the AMI mortality measure of attributing the outcome to the transferring hospital, rather than the receiving hospital should be changed.

Response: In the AMI mortality measures, for patients transferred from one short-term acute care hospital to another, only the first admission in the transfer chain is eligible for inclusion in the cohort. The subsequent admissions are not included. The measures assign a death that occurs within 30 days to the hospital that initially admitted the patient as an index admission. For example, if a patient is admitted to Hospital A for AMI and then transfers to Hospital B,
only the Hospital A admission (the index admission) would be included in the cohort, and death within 30 days of the Hospital A admission would be captured in Hospital A's AMI mortality outcome. The rationale for this approach is that the initial admitting hospital makes diagnostic and treatment decisions which exert great influence on a patient's risk of mortality in AMI cases even when patient transfers are warranted, for example, for interventions that cannot be provided at the initial admitting institution, such as cardiac catheterization.

Comment: One commenter expressed concern that having 50 percent of an EPM participant's quality score for AMI and 75 percent of a participant's quality score for CABG based upon 30-day hospital mortality places a heavy reliance on only a few quality measures. Furthermore, the commenter believed that the heavy emphasis on 30-day mortality could disadvantage smaller hospitals with relatively low AMI/CABG admissions, such that a few adverse outcomes could disproportionately impact the hospital’s quality score.

Response: To ensure hospitals have enough cases to produce a valid quality score, the AMI mortality measure uses 3 years of claims data to calculate the measure. Hospitals must have at least 25 qualifying index admissions within the 3-year measurement period to calculate and publically report a measure result. We do not believe these measures disadvantage smaller volume hospitals. We have found hospitals with few cases tend to have measure results that are close to the average hospital rate and are therefore rarely identified as poor performing outliers.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to include Hospital-level 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) following AMI hospitalization (NQF #0230) measure in the AMI model to assess quality performance.

(2) Excess Days in Acute Care After Hospitalization for Acute Myocardial Infarction (AMI Excess Days)

(a) Background

The Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction (AMI Excess Days) is a risk-standardized outcome measure that compares the number of days that patients are predicted to spend in acute care across the full spectrum of possible acute care events (hospital readmissions, observation stays, and ED visits) after discharge from a hospital for AMI, to the days patients are expected to spend in acute care based on their degree of illness.

Some of the costs for AMI can be attributed to high acute care utilization for post-discharge AMI patients in the form of readmissions, observation stays, and emergency department (ED) visits. We note that patients admitted for AMI have disproportionately high readmission rates, and that readmission rates following discharge for AMI are highly variable across hospitals in the United States.

For the previously adopted HIQR Program measure, Hospital 30-Day, All-Cause Risk-Standardized Readmission Rate (RSRR) following Acute Myocardial Infarction (AMI) Hospitalization (NQF #0505) (CY 2009 OPPS/ASC final rule with comment period; 73 FR 68780 through 68781), publicly reported 30-day risk-standardized readmission rates for AMI ranged from 17.5 percent to 30.3 percent for the time period between July 2011 and June 2012. However, in addition to an increased risk of requiring readmission in the post-discharge period, patients are also at risk of returning to the hospital for both observation stays and ED visits which also characterize potentially preventable acute care. ED visits represent a significant proportion of post-discharge acute care utilization for all conditions, including patients with AMI. Two recent studies conducted in patients of all ages showed that 9.5 percent of patients return to the ED within 30 days of hospital discharge; additionally, about 12 percent of these patients are initially discharged from the ED and are not captured by the previously adopted HIQR Program readmission measures. The rising use of observation stays among Medicare beneficiaries between 2001 and 2008 sparked concern among providers, and policymakers that the AMI 30-day Readmission (NQF #0505) measure does not capture the full range of unplanned acute care events that occur in the post-discharge period. In order to address the rising use of observation stays amongst Medicare beneficiaries CMS proposed the Excess Days in Acute Care after Hospitalization for AMI (AMI Excess Days) measure for use in the AMI model. The AMI Excess Days measure comprehensively captures all post-discharge, unplanned acute care events as a count of the excess days a hospital’s patients spent as inpatients, in observation, or in the ED over a 3-year measurement period.

In 2014, we developed the proposed measure of excess days in acute care following AMI hospitalization, supported for use in the Hospital Quality Reporting Program by the MAP and submitted to the NQF for endorsement. We note that this measure was submitted for endorsement to the NQF All-Cause Admissions and Readmissions Committee in January 2016 with appropriate consideration for sociodemographic status. The measure was finalized for the HIQR Program FY 2018 payment determination (FY 2016 IPPS/LTCH final rule 80 FR 49690).

(b) Data Sources

We proposed to use Medicare Part A and Part B FFS claims submitted by the AMI model participant as the data source for calculation of the AMI Excess Days measure as harmonized with the MORT–30–AMI[NQF #0230] and READM–30–AMI[NQF #0505] measures. Index admission diagnoses and in-hospital comorbidities are assessed using Medicare Part A claims. Additional comorbidities prior to the index admission are assessed as Part A inpatient, outpatient, and Part B office visit Medicare claims in the 12 months prior to the index (initial) admission. Enrollment and post-discharge mortality status are obtained from Medicare's enrollment database which contains beneficiary demographic, benefits/coverage, and vital status information.

(c) Cohort

The AMI Excess Days measure includes Medicare FFS beneficiaries, aged 65 years or older, discharged from non-federal acute care hospitals with a principal discharge diagnosis of AMI and with a complete claims history for the 12 months prior to index admission. Eligible hospitalizations are defined using the following ICD–10–CM codes: I2109, I2111, I2119, I2129, I214, and I213.

We proposed that the measure will include index admissions to all non-federal acute care hospitals, which includes all participants in the AMI model. Hospital performance will only be publically reported for hospitals with 25 or more index admissions in the 3-year measurement period. The AMI model cohort would differ from the hospital cohort that is currently captured in the measure through the HIQR Program. Although performance on the measure will not be publically reported for hospitals with fewer than 25 cases, such hospitals will receive information about their performance on the measure. We refer readers to section III.B.5. of this final rule for a discussion of AMI model participant selection.

(d) Inclusion and Exclusion Criteria

We proposed that an index admission is the hospitalization to which the excess days in acute care outcome is attributed. We note that for purposes of the EPMs where we need to identify episodes that are included in the EPMs, we use the term anchor hospitalization to identify hospitalizations that initiate EPM episodes for beneficiaries whose care is included in the EPMs. In describing the quality measures themselves in detail in section III.E.4. of the proposed rule (81 FR 50794), we use the term index hospitalization to identify hospitalizations of beneficiaries whose outcomes are included in the measures. Thus, anchor hospitalizations and index hospitalizations would have varying degrees of overlap depending on the specific quality measure. The measure includes the following index admissions for patients:

- Having a principal discharge diagnosis of AMI.
- Enrolled in Medicare FFS.
- Aged 65 or over.
- Not transferred from another acute care facility.
- Enrolled in Medicare Part A and Part B for the 12 months prior to the date of index admission, and enrolled in Part A during the index admission.

The measure excludes the following index admissions for patients:

- Discharged alive on the day of index admission or the following day who were not transferred to another acute care facility.
- With inconsistent or unknown vital status or other unreliable demographic (age & gender) data.
- Enrolled in the Medicare hospice program any time in the 12 months prior to the index admission, including the first day of the index admission.
- Discharged AMA.
- Without at least 30 days of post-discharge enrollment in FFS Medicare as the 30-day excess days outcome cannot be assessed for these patients.

Finally, for the purpose of this measure, hospitalizations that occur within 30 days of discharge from an index admission are not eligible to also be index admission. Thus, only one index admission for AMI per beneficiary is randomly selected for inclusion in the cohort.

(e) Risk-Adjustment

We proposed for the AMI model to align this measure with the risk-adjustment methodologies adopted for the AMI Excess Days measure under the HIQR Program in accordance with section 1886(b)(3)(B)(viii)(VIII) of the Act, as finalized in the FY 2016 IPPS/LTCH final rule (80 FR 49682). We also note that the measure risk adjustment takes into account patient age, sex, and comorbidities to allow a fair assessment of hospital performance. The measure defines the patient risk factors for excess days using diagnosis codes collected from all patient claims 1 year prior to a patient’s index hospitalization for AMI. Accordingly, only comorbidities that convey information about the patient at the time of index admission or in the 12 months prior, and not complications that arise during the course of the index hospitalization, are included in the risk-adjustment model. The measure does not adjust for patients’ index admission source or their discharge disposition (for example, SNF) because these factors are associated with the structure of the health care system, not solely patients’ clinical comorbidities. Regional differences in the availability of post-acute care providers and practice patterns might also exert undue influence on measure results. In addition, data fields that capture discharge disposition, for example to post-acute care settings, on inpatient claims are not audited and are not as reliable as diagnosis codes.

As previously noted in the AMI Excess Days measure, ICD–10–CM diagnosis codes present on Parts A and B administrative claims are used to inform the risk prediction for each patient. Diagnostic codes from post-acute care settings are utilized in the measure calculation, but this information is only used to identify a hospital’s patient case mix in order to adequately adjust for differences in case mix across hospitals. We note that the patient diagnosis codes are grouped using HCCs, which are clinically relevant diagnostic groups of codes. The CCs used in the risk-adjustment model for this measure are provided on the CMS QualityNet Web site: https://www.qualitynet.org/dcs/ContentServer?c=Page&pageName=QnetPublic%2FPage%2FQnetTier4&cid=121906956694.

In summary, age, sex, and comorbidities present at the time of index admission are adjusted for differences in hospital case mix (patient risk factors). The measure uses the HLM statistical methodology for risk adjustment.

(f) Calculating the Rate and Performance Period

We proposed to calculate hospital 30-day excess days in acute care with the methodology used to risk standardize all excess days measures used in CMS hospital quality programs. The outcome of the measure is a count of the number of days the patient spends in acute care within 30 days of discharge. We define days in acute care as days spent in an ED, admitted to an observation unit, or admitted as an unplanned readmission for any cause within 30 days from the date of discharge from the index AMI hospitalization. Each ED treat-and-release visit is counted as 1 half-day (0.5 days). Observation stays are recorded in terms of hours and are rounded up to the nearest half-day. Each readmission day is counted as 1 full day (1 day). We count all eligible outcomes occurring in the 30-day period, even if they are repeat occurrences. The measure incorporates “exposure time” (the number of days each patient survives after discharge, up to 30). This exposure time is included to account for differential risk for excess days in acute care after discharge among those patients who do not survive the full post-discharge period. If a readmission or observation stay extends beyond the 30-day window, only those days within the 30-day window are counted.

Using a two-part random effects model, or “hurdle” model, we account for the structure of the data (patients clustered within hospitals) and the observed distribution of the outcome. Specifically, we model the number of acute care days for each patient as: (a) The probability that the patient will have a non-zero number of days in post-discharge acute care; and (b) the number
of days the patient is predicted to spend given that this number is non-zero. The first part is specified as a logit model, and the second part is specified as a Poisson model, with both parts having the same risk-adjustment variables and each part having a random effect. This model is used to calculate the predicted (including random effects) and expected (assuming random effects are zero) number of days in post-discharge acute care for each patient. The average difference between patients’ predicted and expected estimates for each hospital is used to construct the risk-standardized excess days outcome. The excess days outcome is reported at the hospital-level per 100 discharges.

We define the time period for the measure as within 30 days of the date of discharge of the index AMI hospitalization. The 30-day post-discharge window for assessing the outcome is consistent with the claims-based MORT—30—AMI (NQF #0230) and Hybrid AMI Mortality (NQF #2473) measures as noted in this final rule. A 3-year rolling performance period would be consistent with that used for the HIQR Program (FY 2016 IPPS/LTC final rule 80 FR 49681). Section III.E.5., Form, Manner, and Timing of Quality Measure Data Submission, of this final rule summarizes the proposed measure performance periods for AMI model performance years 1 through 5. We note that improvement on the AMI Excess Days measure would be determined from the immediate 3-year rolling performance period available for the year preceding the AMI model performance year as explained in Table 41.

The proposal to include the Excess Days in Acute Care after Hospitalization for AMI measure in the AMI model is included in § 512.411(a)(2). We sought comment on this proposal to include the Excess Days in Acute Care after Hospitalization for AMI measure in the AMI model to assess quality performance.

The following is a summary of the comments received and our responses. Comment: Several commenters stated that certain characteristics of the patient population, such as patient expectations, health literacy, inadequate transportation, lack of caregiver support, and socioeconomic status, contribute to the rate of post-discharge hospitalizations and disadvantage hospitals serving poorer populations. Response: We appreciate the commenters’ concerns that socioeconomic factors influence patients’ risk of post-discharge returns to the hospital for acute care. The AMI EDAC measure currently does not include socioeconomic factors in the risk-adjustment model. We routinely monitor the impact of SDS on providers’ differential performance on our outcome and payment measure.

The NQF is currently conducting a 2-year trial, in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF is expected to issue recommendations on future permanent inclusion of sociodemographic factors. During the trial, measure developers are encouraged to submit information such as analyses and interpretations as well as performance scores with and without sociodemographic factors in the risk-adjustment model. Several measures developed by CMS have been brought to NQF since the beginning of the trial, including the AMI EDAC measure, which was submitted to NQF in January 2016 and is a part of the trial. Under the guidance of NQF, we are making every effort to be proactive in examining SDS factors in quality measures by testing SDS factors in the measures’ risk models and making recommendations about whether or not to include these factors in the endorsed measure. We are still awaiting final recommendations from the NQF and intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for SDS factors in our outcome measures. For more detailed information about measures in the NQF SDS trial period, we refer commenters to: http://www.qualityforum.org/SSES_Trial_Period.aspx. Furthermore, we are awaiting the findings of an ASPE report on SDS factors in risk-adjustment. Therefore, we are not currently changing our risk-adjustment methodology with respect to SDS factors at this time. We will continue to consider such factors in our ongoing measure development and maintenance activities.

Comment: Two commenters opposed the AMI EDAC measure because it measures quality based partly on care provided in settings and facilities other than those of the initial discharging hospital. Response: We believe these measures reflect the actions of hospitals and the care their patients receive post-discharge. Hospitals providing quality inpatient care, conducting appropriate discharge planning, and working with providers and suppliers on appropriate follow-up care will likely perform well, because the Medicare beneficiaries they serve will have a reduced need for excessive post-discharge services. The risk-adjustment methodology used for these measures acknowledge the differences in a given hospital’s patient case mix, so that their performance can be compared to a national average. We recognize that the structure of health care markets and practice patterns vary geographically, beyond the variation in patient case mix. However, as previously mentioned, we believe that the aforementioned opportunities for hospitals to exert control over post-discharge services exist, regardless of the degree of integration of a health system. In cases where systems are not well-integrated, there may be an even greater opportunity for redesign of care processes to achieve high performance on these measures. We are collaborating with our postacute care quality programs and we will take the commenters’ suggestions that similar measures should be incorporated into those programs under consideration. However, we do not believe that it would be appropriate to delay adoption of this measure and the public reporting of this valuable and actionable payment information until such time as any similar, postacute care measures are implemented.

Comment: Several commenters expressed concern with the outcome of the AMI EDAC measures, questioning whether excess days in acute care provides a signal of quality. One commenter opposed the AMI EDAC measure because high readmission rates could stem from the need to care for chronically ill patients. The commenter stated that hospitals should not be punished for high readmission rates when they are associated with lower mortality rates and good access to inpatient hospital care. Response: We disagree that excess days in acute care does not provide a signal of quality. Our discussions with patients and the TEP, as well as published literature indicate that acute care utilization after discharge (that is, return to the ED, observation stay, and readmission), for any reason, is disruptive to patients and caregivers, costly to the health care system, and puts patients at additional risk of hospital-acquired infections and complications. These measures are meant to provide patients with a more complete picture of potential post-discharge acute care use as they make choices for their care. We are confident that for most patients, remaining home or remaining in a non-acute setting rather than returning to the hospital...
indicates a better outcome. Although some hospital returns are unavoidable, others may result from poor quality of care, overutilization of care or inadequate transitional care. Transitional care includes effective discharge planning, transfer of information at the time of discharge, patient assessment and education, and coordination-of-care and monitoring in the post-discharge period. When appropriate care transition processes are in place (for example, a patient is discharged to a suitable location, communication occurs between clinicians, medications are correctly reconciled, timely follow-up is arranged), fewer patients return to an acute care setting, either for an ED visit, observation stay, or hospital readmission during the 30 days post-discharge. Numerous studies have found an association between quality of inpatient or transitional care and early (typically 30-day) readmission rates and ED visits or a wide range of conditions including AMI. With respect to the commenter’s concern that some hospitals care for a greater number of chronically ill patients, although the measures cannot capture all reasons for variability among hospitals, the EDAC measures incorporate risk adjustment using claims data to account for patient factors that could account for the observed variability. The measures use claims based risk adjusters that are clinically relevant and have strong relationships with the outcome as has been done in other claims-based outcome measures in the Hospital IQR Program. This approach was supported by the TEP. We understand that hospitals have complex patients with varying comorbidities.

Although the cohort may contain patients with different disease severity, and therefore, different levels of risk, the measure accounts for this range of severity and risk because it is risk-adjusted for 65 factors that are clinically relevant and have strong relationships with the outcome of acute care utilization.

With respect to the comment that hospitals not be punished for readmission if they reduce patient mortality, the goal of these measures is not to punish hospitals for appropriate readmissions; it is to help patients and providers understand variation among hospitals in the days that are spent by patients in acute care settings following a discharge for AMI. The measures provide a broader perspective on post-discharge events than the current readmission measures and are intended to incentivize improvements in care transitions from the hospital so that patients are less likely to return to the acute setting.

Comment: One commenter recommended the AMI EDAC measure be removed from the model to create a better balance of provider risk and reward. One commenter noted that costs of a hospital emergency department or observation visit following an index admission is already captured and will impact a hospital’s reimbursement in this EPM. The commenter stated that hospitals should not be further penalized by including this measure in the quality component. The commenter also opposed the AMI EDAC measure because it was not included in the list of recommended quality measures in the HCP LAN “Accelerating and Aligning Clinical Episode Payment Models: Coronary Artery Disease” draft whitepaper released in May, 2016.

Response: We interpreted this commenter’s concern to be that because visits to the emergency department and observation stays are less costly than readmissions, by combining all of these types of visits into a single outcome, providers are not incentivized to use the lower cost settings to deliver care whenever appropriate. We agree that all acute care utilization is not equal in its disruption, cost, or risk to patients. In the AMI EDAC measure, the weight of events (such as observation or ED care) is determined by the intensity of care delivered to patients. Prolonged acute care is more costly and worse from a patient perspective than a brief ED visit. That is why we elected to report the AMI EDAC measure as a count of days: Events lasting longer with more cost and disruptive admissions, therefore, naturally weigh more than brief events (such as ED visits) in the overall day count. This approach is based on the belief that, from a patient perspective, it is the count of total days spent in acute care settings that is most meaningful and representative of the disruption, which is why we combine day counts for each type of event and do not separately report rates of each type of event. This day count is also valuable for hospitals, because a hospital with a high number of ED visits may still be able to achieve a low number of total days in acute care by actively coordinating care from the ED and avoiding re-hospitalizations. Because the EDAC measure had not previously been publically reported at the time of the HCP LAN report in May 2016, they did not consider it for inclusion on the list of potential measures to be used in cardiovascular episode of payment models. However, the AMI and CABG readmission measures were recommended suggesting that the HCP LAN did consider the prevention or reduction of post-discharge acute care use as an important quality metric to include in cardiovascular episode payment models.

Comment: One commenter supported inclusion of the AMI EDAC measure in the AMI EPM bundle and recommended CMS include a measure of excess days in acute care for the CABG and surgical hip and femur fracture treatment EPM bundles.

Response: We thank the commenters for their support and will consider additional measure development as was suggested.

Comment: One commenter stated that the AMI EDAC measure will not be helpful to beneficiaries in navigating their care or will not make the measure more actionable for hospitals given that physicians dictate the discharge date.

Response: We disagree that the AMI EDAC measure will not be helpful to beneficiaries. We have developed the AMI EDAC measure to try to provide important patient-centered information to providers. The measure supports existing hospital incentives to further invest in interventions and tools to improve hospital care, better respond to individual patient preferences, better assess patient readiness for discharge, and facilitate transitions to outpatient status. Such interventions and tools will reduce the likelihood of patients having any return to the hospital and make it more likely that patients who do return have less severe illnesses which may require fewer days of care. We disagree that providers do not have the ability to take meaningful actions that would have an impact on patient outcomes as a result of adopting the AMI EDAC.
measure. The measure spotlights the excess number of days patients spend in acute care (hospital readmissions, observation stays, and ED visits) per 100 discharges during the first 30 days after discharge from the hospital, relative to the number spent by the same patients discharged from an average hospital. We believe the information provided to hospitals through this measure will help inpatient and outpatient providers better understand the trajectory of care for patients that have been discharged from their facility. Specifically, hospitals will be able to assess whether patients discharged from their facility have readmissions, observation stays, and/or ED visits during the first 30 days after discharge from the hospital.

Because the measure provides more granular information regarding patient discharge outcomes, this will assist hospitals in developing targeted quality improvement activities aimed at improving transitions of care. We believe that the measure will reduce readmissions, observation stays, and/or ED visits by encouraging hospitals to further invest in interventions to improve hospital care by better assessing the readiness of patients for discharge and facilitating quality transitions to outpatient status.

Comment: One commenter requested that CMS not include outpatient care that is beneficial to patients as part of the AMI EDAC measure.

Response: We do not dismiss the importance of hospital-level care in outpatient settings, such as the Emergency Department, and support hospitals using the level of care most appropriate for each particular patient’s condition. We agree with the commenter that some returns to the acute care setting are necessary and beneficial to patients. The goal is not to avoid all post-discharge acute care service utilization, but to identify excess use of acute care post-discharge. Acute care utilization after discharge (that is, return to the ED, observation stay, and readmission), for any reason, is disruptive to patients and caregivers, costly to the health care system, and puts patients at additional risk of hospital-acquired infections and complications. Although some factors are outside hospitals’ control, when appropriate care transition processes are in place (for example, a patient is discharged to a suitable location, communication occurs between clinicians, medications are correctly reconciled, timely follow-up is arranged), fewer patients return to an acute setting whether for an ED visit, observation stay, or hospital readmission during the 30 days post-discharge period. Numerous studies have found an association between quality of inpatient or transitional care and early (typically 30-day) readmission rates and ED visits for a wide range of conditions including AMI.

Comment: Several commenters opposed the inclusion of the AMI EDAC measure because it is not NQF endorsed and wasn’t reviewed by the MAP for inclusion in this EPM.

Response: Section 1886(b)(3)(B)(IX)(bb) of the Act provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. While we considered other existing measures related to care transitions and post-discharge acute care utilization that have been endorsed by NQF or other consensus organizations, we were unable to identify any NQF-endorsed (or other consensus organization endorsed) measures that assess the full range of post-discharge acute care use that patients may experience.

Existing process measures capture many important domains of care transitions such as education, medication reconciliation, and follow-up, but all require chart review and manual abstraction. Existing outcome measures are focused entirely on readmissions or complications and do not include observation stays or ED visits. We are not aware of any other measures that assess the quality of transitional care by measuring 30-day risk-standardized days in acute care (hospital readmissions, observation stays, and ED visits) following hospitalization for AMI that have been endorsed or adopted by a consensus organization, and we have not found any other feasible and practical measures on this topic. However, we note that this measure has been submitted to NQF for endorsement proceedings and received a recommendation for endorsement from the Admissions and Readmissions Standing Committee as part of the All-Cause Admissions and Readmissions project in January 2016.

Furthermore, the AMI EDAC measure was reviewed by clinical experts and a TEP and was subject to separate public input prior to being proposed for the Hospital IQR Program. This measure was also included on a publicly available document entitled “List of Measures under Consideration for December 1, 2014” (available at: http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367) and has been reviewed by the NQF MAP Hospital Workgroup. The measure was conditionally supported pending the examination of SDS factors and NQF review and endorsement of the measure update, as referenced in the MAP 2015 Final Recommendations Spreadsheet (available at: http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367).

We will continue to work collaboratively with stakeholders in soliciting input on ways to refine this measure in the future.

Comment: Several commenters opposed the inclusion of the AMI EDAC measure because it is not publicly reported.

Response: CMS understands the commenters concern that the measure has not been publicly reported as of yet. We held a dry run to educate hospitals on the AMI and HF EDAC measures in September 2015 and we reported updated results to hospitals in the IQR Preview Period in April 2016. Hospitals results on the measures will be updated with more recent data and reported to hospitals in Spring 2017 as part of the IQR Preview Period for the public reporting release of the measures in July 2017.

Comment: One commenter opposed inclusion of the AMI EDAC measure because it overlaps with the AMI readmission measure.

Response: In response to the commenter’s concern about overlap of the AMI EDAC and the current readmission measure, we interpret the commenter to be referring to the 30-day AMI readmission measure. That measure and the AMI EDAC measure assess different outcomes. Although both measures count readmission, the 30-day AMI readmission measure only informs a hospital if a patient had a readmission, and does not include all postdischarge outcomes that matter to patients, such as having to return to the ED or spending time in the hospital under observation, like the AMI EDAC measure does. The AMI EDAC measure provides patients a more comprehensive and patient-centered perspective on the 30-day postdischarge experience because it includes not only readmissions, but also ED visits and observation stays and captures the numbers of days in these settings.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to include the Excess Days
in Acute Care after Hospitalization for AMI measure in the AMI model.

(3) Hybrid Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) Hospitalization (NQF #2473) (Hybrid AMI Mortality)

(a) Background

In keeping with our goal to move toward the use of EHRs, and in response to stakeholder feedback to include clinical data in outcome measures, we have developed the hospital 30-day risk-standardized acute myocardial infarction (AMI) mortality eMeasure (NQF #2473) (herein after referred to as Hybrid AMI Mortality measure). This measure will incorporate a combination of claims data and EHR data submitted by hospitals, and because of these combined data sources, it is referred to as a hybrid measure. The Hybrid AMI Mortality (NQF #2473) measure cohort and outcome are identical to those in the hospital 30-day, all-cause, risk-standardized mortality rate (RSMR) following acute myocardial infarction (AMI) (NQF #0230), measure which is also being proposed in the AMI model.

In contrast to the claims-only MORT–30–AMI (NQF #0230) measure, the proposed Hybrid AMI Mortality (NQF #2473) measure utilizes five core clinical data elements (age; heart rate; systolic blood pressure; troponin; creatinine) in the risk-adjustment methodology that are obtainable through EHR data. These five core clinical data elements are intended to reflect patients’ clinical status when they first present to an acute care hospital for treatment of AMI. The clinical data elements include age at the time of admission, first-captured vital signs (heart rate, systolic blood pressure) collected within 2 hours of the patient first presenting to the hospital, and the first captured laboratory values (troponin, creatinine) collected within 24 hours of the patient first presenting to the hospital to which they are subsequently admitted. We note that these five data elements are routinely collected on hospitalized adults with AMI upon presentation to the hospital, consistently captured in medical records under current clinical practice, and can be feasibly electronically extracted from hospital EHRs.

In order to prepare for future reporting of the Hybrid AMI Mortality (NQF #2473) measure, we proposed to seek and reward voluntary data submission of the five core clinical data elements in order to feed the risk model for the Hybrid AMI mortality (NQF #2473) measure. We also proposed to require submission of six additional linking variables (CCN, HIC Number, date of birth, sex, admission date, and discharge date) to ensure that the datasets containing administrative claims data are correctly linked with EHR datasets containing the core clinical data elements for proper risk adjustment. The voluntary data submission initiative will allow AMI model participants to build processes to extract and report the EHR data elements, as well as support CMS testing of systems required for Hybrid AMI Mortality measure (NQF #2473) production including data receiving and auditing, the merging EHR and claims data, calculation and production of measure results.

Finally, we are considering using the Hybrid AMI Mortality (NQF #2473) measure as a replacement for the current publicly reported MORT–30–AMI (NQF #0230) measure in CMS models or programs when appropriate. In future years CMS may implement the Hybrid AMI Mortality (NQF #2473) measure in models and/or programs, such as in the AMI model or HIQR Program. In that event, we would propose to adopt the measure through notice and comment rulemaking. We refer readers to more detailed information on the measure specifications in this final rule and to the CMS Web site at: http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.

(b) Data Sources

We proposed to use two sources of data submitted by AMI model participants to calculate the Hybrid AMI Mortality (NQF #2473) measure: Medicare Part A and Part B (FFS claims to identify index admission diagnoses; and EHR-captured clinical information collected at presentation for risk-adjustment of patients’ severity of illness. Deaths are identified using the Medicare Enrollment Database which contains beneficiary demographic, benefits/coverage, and vital status information.

For the voluntary data submission initiative, EHR data submission will align with existing Electronic Clinical Quality Measure (eCQM) standards and data reporting procedures for hospitals. In alignment with these standards, we are posting the electronic specifications for the Hybrid AMI Mortality (NQF #2473) measure, which include the Measure Authoring Tool (MAT) output and value sets for all included data elements, on the CMS Web site: http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.

The Office of the National Coordinator for Health Information Technology (ONC) adopted quality reporting document architecture (QRDA) as the standard to support both QRDA Category I (individual patient) and QRDA Category III (aggregate) data submission approaches for Meaningful Use Stage 2 in the Health Information Technology: Standards, Implementation Specifications, and Certification Criteria for Electronic Health Record Technology, 2014 Edition: Revisions to the Permanent Certification Program for Health Information Technology rule (77 FR 54163 through 54292). We intend to provide AMI model participants with information about how many qualifying admissions are submitted successfully. We refer readers to the definition of “successful data submission” in section III. E.4.a.(3)(vii) of this final rule.

We sought comment on our proposal to use the following reporting mechanisms in performance year 1: QRDA, a simpler mechanism such as a spreadsheet, or both. We proposed using QRDA in AMI model performance years 2 through 5. The purpose of the use of a simpler reporting format in the first performance year reporting format in the first performance year would be to allow hospitals to perfect data extraction with the 2017 data and postpone mastery of reporting in the QRDA format to the following year.

The following is a summary of the comments received and our responses.

Comment: Several commenters had concerns or provided suggestions about the reporting standard for voluntary reporting of EHR data elements. One commenter recommended that CMS require QRDA file format for every year of data submission, as it is already required for the Inpatient Quality Reporting and Meaningful Use programs. Another commenter recommended that CMS not allow data to be submitted for performance year (PY) 1 in a different file format than the other years to avoid confusion. Several commenters agreed with CMS in being flexible in the voluntary reporting of the clinical data elements by allowing multiple reporting formats. One commenter specifically appreciated the flexible approach, as it created a better balance of provider risk and reward. Another commenter suggested that CMS allow both QRDA and Excel reporting in performance years 2 and 3.

Response: We thank commenters for their suggestion to align standards across our programs, noting that it is important to align these data collection requirements to reduce burden on
hospitals and improve interoperability. We will take this feedback into consideration as we shape future proposals for hybrid measures. One of the main tenets of the 2015 Edition Health IT Certification Criteria final rule (80 FR 62601) is to facilitate greater interoperability for several clinical health information purposes and enable health information exchange through new and enhanced certification criteria, standards, and implementation specifications. We note that we have worked closely with ONC to enhance testing and validation of certified technology’s ability to capture, exchange, and report electronic patient data, such as improved testing and certification through the Cypress CQM testing and certification tool. As another example, we note that ONC proposed a 2015 Edition “CQM—report” certification criterion in the FY 2016 IPPS/LTCH PPS proposed rule (80 FR 24613 through 24614). After consideration of stakeholder input on the standards for representing and reporting CQM data in certified health IT to improve the reliability and consistency of such data reporting, we finalized that hospitals can report using either the 2014 or 2015 edition of CEHRT (80 FR 49708). Furthermore, the 2015 Edition certification criteria related to eCQMs offer increased data portability and user access using the established QRDA standards. Because of the support for testing and certification offered by ONC and their certification tools and programs, the widespread deployment of the QRDA standard and CMS’ own recent experience that QRDA can provide superior clinical data for assessing quality and performance, we will finalize our selection of QRDA–I as the primary reporting standard for the EPM Model Rule for program years 1–3. If QRDA–I cannot be available to all participants for year 1, we will make a transitional submission format available to systems using a spreadsheet-based approach that will allow these sites additional time to meet the QRDA-based reporting requirements. We thank commenters for their continued support of improving the electronic reporting process and plan to continue to make improvements as standards evolve.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to use the following reporting mechanisms in performance year 1: QRDA, a simpler mechanism such as a spreadsheet, or both. We proposed using QRDA in AMI model performance years 2 through 5.

(c) Cohort
The Hybrid AMI Mortality (NQF #2473) measure includes Medicare FFS beneficiaries, aged 65 years or older, discharged from non-federal acute care hospitals with a principal discharge diagnosis of AMI. Eligible hospitalizations are defined using the following ICD–10–CM codes: I210, I211, I2119, I2129, I214, and I213.
Hospital performance for the Hybrid AMI Mortality (NQF #2473) measure will not be publicly reported. However, AMI model participants will receive hospital-specific reports for each performance year with information about the success of their voluntary submission of EHR data.

(d) Inclusion and Exclusion Criteria
We proposed that an index admission is the hospitalization to which the mortality outcome is attributed. The Hybrid AMI mortality (NQF #2473) measure includes the following index admissions for patients:
• Having a principal discharge diagnosis of AMI.
• Enrolled in Medicare FFS.
• Aged 65 or over.
• Not transferred from another acute care facility.
• Enrolled in Medicare Part A and Part B for the 12 months prior to the date of index admission, and enrolled in Part A during the index admission.

This measure excludes the following index admissions for patients:
• Discharged alive on the day of admission or the following day who were not transferred to another acute care facility.
• With inconsistent or unknown vital status or other unreliable demographic (age & gender) data.
• Enrolled in the Medicare hospice program any time in the 12 months prior to the index admission, including the first day of the index admission.
• Discharged AMA.
• Without at least 30 days of post-discharge enrollment in FFS Medicare as the 30-day mortality outcome cannot be assessed for these patients.

Finally, for the purpose of this measure, only one index admission per patient for AMI is randomly selected for inclusion in the cohort.

(e) Risk-Adjustment
We note that this measure is aligned with the methodology approach adopted for the MORT–30–AMI (NQF #0230) measure under the HiQ Program in accordance with section 1888.113[B][viii] of the Act, as finalized in FY 2008 IPPS/LTCH final rule (2008 IPPS/LTCH final rule 71 FR 67960). The Hybrid AMI Mortality (NQF #2473) measure uses EHR data and not administrative claims data to adjust for differences across hospitals in how at-risk their patients are for death, relative to patients cared for by other hospitals. The risk model was developed with input from the literature, clinical and EHR experts, and health IT vendors. In order to be included as risk variables, clinical data elements had to be—(1) consistently obtained in the target population (Medicare FFS AMI patients) based on current clinical practice; (2) captured with a standard definition and recorded in a standard format within the EHR; and (3) entered in structured fields that are feasibly retrieved from current EHR systems. The final measure includes five variables that meet these feasibility criteria, are present for most patients at the time of clinical presentation to the hospital, are clinically relevant to patients with AMI, and demonstrate a strong statistical association with 30-day mortality. Hospitals will submit the first-captured data values of each of the five core clinical data elements upon patient presentation to the hospital. They are:
Age; the first-captured heart rate and systolic blood pressure measured within 2 hours of a patient presenting to the hospital; and the first captured troponin and creatinine values within 24 hours of a patient presenting to the hospital. Although EHRs likely will ultimately link across clinical episodes of care and contain historical patient data, given the EHR environment at the time of measure development and inability to reliably obtain data from the outpatient setting prior to admission, we only considered for inclusion those measure variables that would be available and consistently collected at first presentation to the hospital.

The overall performance of the model was comparable with or better than that of current publicly reported outcome measures.\textsuperscript{106} We tested measure score validity by correlating the RSMR with that of the previously validated, publicly reported, administrative claims-based MORT–30–AMI (NQF #0230) measure. For more detailed information on the model performance, we refer readers to the CMS Web site at: http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInitiatives/Measure-Methodology.html.

(f) Calculating the Risk-Standardized Mortality Ratio (RSMR) and Performance Period

We calculate hospital 30-day, all-cause, risk-standardized mortality rates consistent with the methodology used to risk standardize all readmission and mortality measures used in CMS hospital quality programs. Using an HLM statistical methodology for risk adjustment, we calculate the hospital-level risk-standardized mortality rate following AMI hospitalizations by producing a ratio of the number of “predicted” deaths (that is, the adjusted number of deaths at a specific hospital) to the number of “expected” deaths (that is, the number of deaths if an average quality hospital treated the same patients) for each hospital and then multiplying the ratio by the national observed mortality rate.

We proposed defining AMI model performance years as outlined in section III.E.5. of the proposed rule (81 FR 50794). A performance period for the voluntary data submission are those timeframes in which a hospital discharge occurs for an eligible AMI index hospitalization. For performance year 1 of the AMI model, participants voluntarily submitting data will only be requested to submit data for a 2-month period. The 2-month period for AMI voluntary data reporting was identified due to data processing and coordination with other proposed timelines for this model. Data submitted for the first year would be for cases that fulfill the inclusion criteria of AMI index hospitalizations with discharges occurring between July 1, 2017 and August 31, 2017.

For performance year 2 of the AMI model, AMI voluntary data reporting would be 10 months of data for discharges from eligible AMI hospitalizations occurring between September 1, 2017 and June 30, 2018. For subsequent years of the model, the performance periods for submission of voluntary data will consist of discharges within calendar-year 12-month time periods from July 1 through June 30. The proposed performance periods would enable AMI model participants to receive points toward the AMI model composite quality score for data submission starting in performance year 1. We sought comment on our proposal for defining the data reporting period for performance year 1 episodes for an AMI model participant as eligible AMI index hospitalizations with discharges occurring between July 1, 2017 and August 31, 2017, and for performance year 2 as eligible AMI hospitalizations with discharges occurring between September 1, 2017 and June 30, 2018, with subsequent performance year data reporting periods each being calendar-year 12 month periods and starting every July 1st. Refer to Table 41 for summary of performance periods.

The following is a summary of the comments received and our responses. Comment: Several commenters were supportive of including a voluntary hybrid AMI mortality measure in the AMI episode payment model, but were concerned about the timeline to report clinical data. Commenters remarked that hospitals need to redesign their EHRs to collect and validate this data, and recommended delaying the implementation of this measure until 2018. One commenter recommended that CMS delay the start date of the hybrid AMI mortality measure to PY 2 because the proposed rule indicates that data collection will start on July 1, 2017, likely 6 months after release of the final rule, which is too long a time for vendors to consume the final rule and specifications, as well as develop, package, and release the required updates to clients.

Response: We are aware of the burden to hospitals associated with extraction, validation, and submission of EHR data. However, data submission for EHR data elements used in the Hybrid AMI Mortality Measure is voluntary, with an incentive for hospitals that chose to submit clinical data. Hospitals that are unable to consume the specifications, develop, package, and submit the EHR data elements will not be penalized under this payment program. Hospitals that do not submit data in program year one, will have the opportunity to submit data and receive the incentive in program years two through five. Comment: One commenter noted that, according to CMS’s Conditions of Participation (CoPs), hospitals must thirty days following discharge to complete the medical records with final diagnosis. Since CMS is proposing a submission period for the AMI EHR data 60 days following the end of the measurement period, this would only allow thirty days following final diagnosis to compile, validate, and submit data. The commenter recommended that CMS allow a 120 day submission period after the end of the measurement period.

Response: We will use a 30-day claims maturity period to identify the index admissions for the voluntary reporting of EHR data for the AMI EPM in program year 1. This will allow hospitals 30 days to extract data on the appropriate patients and submit the data to CMS. In program years 2 through 5 CMS will use the customary 90-day claims maturity period to identify the index admissions for the voluntary reporting of EHR data for the AMI EPM. This is the same 90-day claims maturity period currently used in the claims-based AMI 30-day mortality measure. Hospitals will have 60 days to complete EHR data extraction and submission to CMS.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification to define the data reporting period for performance year 1 episodes for an AMI model participant as eligible AMI index hospitalizations with discharges occurring between July 1, 2017 and August 31, 2017, and for performance year 2 as eligible AMI hospitalizations with discharges occurring between September 1, 2017 and June 30, 2018, with subsequent performance year data reporting periods each being calendar-year 12 month periods and starting every July 1st.

(g) Requirements for Successful Submission of AMI Voluntary Data

In order for CMS to assess if AMI model participants that submit the AMI voluntary data are eligible for points toward the hospital’s AMI model composite quality score, we proposed to use the following criteria to determine if a participant has successfully submitted AMI voluntary data:

Submission of the first-captured data values for the five core clinical data elements (age; first-captured heart rate and systolic blood pressure measured within 2 hours of a patient presenting to the hospital; and first-captured troponin and creatinine values measured within 24 hours of a patient presenting to the hospital), and six linking variables required to merge with the CMS claims data CCN, HIC Number, date of birth, sex, admission date, and discharge date).

All of these data elements must be submitted for each qualifying AMI hospitalization as described in section III.E.5. of the proposed rule (81 FR 50794). If troponin was not measured in the patient within 24 hours of presentation to the hospital, the hospital will still receive credit for successful data submission if all other clinical data elements (age, heart rate, systolic blood pressure, and creatinine) as well as the six linking variables are all reported in the submission. We recognize that some patients may have clinical signs or symptoms that require emergent treatment; and that in such cases treatment might proceed without first obtaining a troponin level. However
hospitals are required to report troponin values on all patients in whom a troponin test was performed within the first 24 hours of presenting to the hospital and to indicate in their data submission each instance in which a troponin value was not measured and therefore not available for a patient. AMI voluntary data submission must occur within 60 days of the end of the most recent data collection period as described in the listing of reporting periods for all 5 model performance years in section III.E.5. of the proposed rule (81 FR 50794).

To fulfill AMI voluntary data collection criteria for model performance year 1, hospitals must submit valid data on 50 percent of qualifying AMI hospitalizations (identified by the denominator in the measure authorizing tool (MAT) output). To successfully submit AMI voluntary data for performance years 2 through 5, hospitals must submit valid data for all five core clinical data elements of AMI patients (with the exception for troponin values described in this section). Further details on scoring of the voluntary data submission are discussed in section III.E.3.e.(1) of the proposed rule (81 FR 50794).

Each year, AMI model participants voluntarily submitting data for this measure will receive hospital-specific reports that detail submission results from the most recent performance period. The reports will include the match rate between the hospital’s submitted EHR data and corresponding claims data, as well as the proportion of patient data submitted relative to all qualifying AMI admissions with all five core clinical data elements. As the initiative sought to test and reward hospitals’ ability to submit data, hospitals will not be penalized for missing troponin values for patients in whom these values were not measured at the time of admission; hospitals are required to report troponin values on all patients in whom a troponin test was performed. If hospitals successfully submit the remaining four clinical data elements and all of the linking variables, a missing troponin value which is due to troponin having not been measured in that patient will not result in an unsuccessful submission as long as hospitals indicate that the troponin value was not measured and therefore not available for that patient. Hospitals will still be rewarded for successfully submitting data in these cases.

We previously described a qualifying AMI patient in section III.E.4.a.(3)(ii) of the proposed rule (81 FR 50794). This description, as those patients are those for whom we seek submission of voluntary data from AMI model participants. We selected the requirement of submitting 90 percent of qualifying AMI patients’ data for performance years 2 through 5 because this volume of cases will result in a high probability that we will have a national sample of AMI patient data representative of each hospital’s patient case mix. Having 90 percent of the data for qualifying AMI patients in performance years 2 through 5 will enable an accurate and reliable assessment of the potential implementation of a Hybrid AMI mortality (NQF# 2473) measure that utilizes EHR data. In addition, the testing we have performed in hospitals’ EHR data indicates that these data elements are captured in over 90 percent of Medicare FFS patients who are 65 years or older and admitted to acute care hospitals for treatment of AMI.

We sought public comment on the proposed requirements to determine successful voluntary submission of AMI data, including the proposal to give hospitals credit for data submission if they submit all troponin values that were actually measured, each of the other four data elements, and all of the linking variables; to not penalize hospitals for failure to submit a troponin value if it was not measured during the admission; and the proposal on the specific minimum percentage requirements for data on the qualifying AMI patients.

The following is a summary of the comments received and our responses.

Comment: Several commenters agreed with the potential value of hybrid measures, but expressed concern about the ability of hospitals to submit accurate and reliable data. Several commenters urged CMS not to finalize any data submission requirements beyond the first reporting period until hospitals and the agency have gained experience with measure submission. Two commenters specifically recommended the percent of data submitted be gradually increased over time, instead of 50 percent in performance year 1, to 90 percent in performance year 2. One commenter expressed concern that hospitals that did not participate in the Meaningful Use Program that utilized QRDA technology would be disadvantaged by being required to submit clinical data in this format. One commenter noted that while CMS continues to conduct testing of the electronic specifications in a few hospitals, the QRDA format has not demonstrated competency, and should therefore not be included in the AMI episode payment model.

Response: We thank the commenter for their support. We sought to develop a model that included key variables that are clinically relevant, demonstrate a strong statistical association with 30-day mortality, and are feasible for use in a hybrid model. We developed the following criteria to assess feasibility of candidate variables: 1. Data that are consistently obtained in the target population based on current clinical practice; 2. Data that are captured with a standard definition and recorded in a standard format; 3. Data that are entered in structured fields that are feasibly retrieved from current EHR systems. During measure development the members of the expert working group reviewed the entire list of variables in the National Cardiovascular Data Registry ACTION Registry—Get With The Guidelines database and selected variables that met these criteria. We then tested all candidate variables in multivariate regression models with 30-day mortality as the outcome. CMS did
evaluate white blood cell count as one of the candidate variables. However it was not consistently predictive of mortality in the risk model and therefore was not included in the final measure. Albumin was not considered.

We have developed two other hybrid outcome measures which use additional clinical data including the Hybrid Hospital-Wide Readmission Measure with Claims and Electronic Health Record Data (NQF #2879), and the Hybrid Hospital 30-day, All-cause, Risk-standardized Mortality Rate (RSMR) Following Acute Ischemic Stroke with Risk Adjustment for Stroke Severity (NQF #2877). For descriptions of these measures we refer readers to the FY 2016 IPPS/LTCH final rule 80 49698, and the FY 2017 IPPS/LTCH final rule 81 57161, respectively.

**Comment:** Several commenters referred to the hybrid AMI mortality measure as a “hybrid eCQM”.

**Response:** We wanted to clarify the hybrid AMI mortality measure is a claims-based, and not an electronically quality measure (eCQM). The cohort and outcome for the hybrid AMI mortality measure is derived from claims and not the EHR.

**Comment:** One commenter recommended that CMS release the final specifications for the hybrid AMI mortality measure as soon as possible following the release of the final EPM rule. The commenter further recommended that CMS align the specifications of the hybrid AMI mortality measure as closely as possible with other electronically submitted CQMs available through the IQR program.

**Response:** The measure specifications have been published along with this final rule. We refer readers to “Core Clinical Data Elements and Hybrid Measures” folder on our Web site at: [https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment- Instruments/HospitalQualityInitiats/Measure-Methodology.html](https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInitiats/Measure-Methodology.html).

We closely aligned our development process for the hybrid AMI mortality measure electronic specifications with the electronic clinical quality measures (eCQM) development process, according to the MMS Blueprint. This process included a stakeholder public comment on the measure specifications, input from experts in the field, Bonnie testing, Mitre review, and VSAC review of the value sets. Additionally, we tested the electronic specifications in several different health systems, which utilized different EHRs. We aligned the electronic specifications with eCQMs in use by IQR and MU programs. Where appropriate, we harmonized the use of the value sets and logic that are currently used in these program measures to ease the implementation of the CCDE. We plan to continue these harmonization efforts with each annual update cycle.

**Comment:** One commenter requested clarification how the hybrid AMI mortality measure would be validated using EHR and claims data.

**Response:** The hybrid AMI mortality measures has been fully tested and validated in merged Medicare claims and registry data from the National Cardiovascular Data Registry (NCDR) ACTION Registry-Get With The Guidelines. The measure was endorsed by the NQF in 2014. However, we plan to perform additional testing as a part of measure reevaluation. We have not yet determined when this testing will take place.

**Comment:** One commenter believed that CMS did not account for a small but important population of patients that arrive at a participating hospital in an unstable, critical condition by not excluding cardiogenic shock. The commenter noted that this population is at a higher risk of mortality, and thus should have separate quality measures that take into account the severity and complexity of their medical conditions.

**Response:** In order to account for differences in patient mix among hospitals, the measures adjust for variables (for example, age, comorbid diseases, and indicators of patient frailty) that are clinically relevant and have relationships with the outcome. In the case of the AMI measure, we risk adjust for cardio-respiratory failure or shock. However, the measure’s risk model does not include a risk variable for sepsis. A diagnosis of sepsis that occurred during the index AMI admission would not be used as a risk variable because we cannot know whether sepsis was present at the time a patient first presented for care or was a consequence of poor care received during the hospitalization. During measure development we did consider including sepsis as a risk variable only if it occurred in the 12 months prior to the index admission. This variable was not consistently found to predict mortality in the measure cohort and, therefore, was not included in the final risk model.

**Comment:** One commenter was supportive of using clinical data and claims data to create a hybrid measure, but noted combining these data is a laudable endeavor. They noted that determining the measure population using administrative data would increase the reporting burden on hospitals.

**Response:** We acknowledge that the need to identify patients with a principal discharge diagnosis of AMI will be required to successfully map, extract, and report data for the hybrid AMI mortality measure. However, we believe that the added benefit of including clinical data in the measure’s risk model outweighs the additional burden of EHR data extraction and reporting. Many commenters in this and previous public comment periods have expressed support for this approach. Additionally, we note that reporting of the EHR data elements is voluntary and that hospitals will not be penalized if they cannot or choose not to submit these data.

**Comment:** One commenter requested CMS explore the use of sociodemographic factors in improving the risk adjustment for the hybrid AMI mortality measure.

**Response:** We appreciate the commenters’ concerns that socioeconomic factors influence admission risk and hospitalization outcomes and costs. We routinely monitor the impact of SDS on providers’ differential performance on our outcome and payment measure. The NQF is currently conducting a 2-year trial, in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF is expected to issue recommendations on future permanent inclusion of sociodemographic factors. During the trial, measure developers are encouraged to submit information such as analyses and interpretations as well as performance scores with and without sociodemographic factors in the risk adjustment model. Several measures developed by CMS have been brought to NQF since the beginning of the trial, including the AMI EDAC measure which was submitted to NQF in January 2016. Under the guidance of NQF, we are making every effort to be proactive in examining SDS factors in quality measures by testing SDS factors in the measures’ risk models and making recommendations about whether or not to include these factors in the endorsed measure. We are still awaiting final recommendations from the NQF and intend to continue engaging in the NQF process as we consider the
appropriateness of adjusting for SDS factors in our outcome measures. For more detailed information about measures in the NQF SDS trial period, we refer commenters to: http://www.qualityforum.org/SES_TrialPeriod.aspx. Furthermore, we are awaiting the findings of an ASPE report on SDS factors in risk-adjustment. Therefore, we are not currently changing our risk-adjustment methodology with respect to SDS factors. We will continue to consider such factors in our ongoing measure development and maintenance activities.

Comment: One commenter requested CMS clarify when they would replace the current publicly reported AMI mortality measure (NQF #0230) with the hybrid AMI mortality measure (NQF #2473).

Response: We have not yet determined and timeline for replacing the claims-only AMI mortality measure (NQF #0230) with the hybrid AMI mortality measure (NQF #2473). However, we will make any changes to the measures used in payment programs through the notice of proposed rulemaking. We point out that the hybrid AMI mortality measure, similar to other CMS condition-specific outcome measures, requires a 3-year measurement period in order for a sufficient number of hospitals to meet the threshold of having discharged at least 25 patients with a principal diagnosis of AMI to be included in the measure cohort. Therefore, reporting measure results would require a minimum of 3 years of EHR data collection.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to give hospitals credit for data submission if they submit all troponin values that were actually measured, each of the other four data elements, and all of the linking variables; to not penalize hospitals for failure to submit a troponin value if it was not measured during the admission; and the proposal on the specific minimum percentage requirements for data on the qualifying AMI patients.

b. CABG Model-Specific Measure
(1) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery (NQF# 2558)(MORT–30–CABG)

(a) Background
CABG is a common procedure associated with considerable morbidity, mortality, and health care spending. In 2010, the National Hospital Discharge Survey (NHDS) estimated that 219,000 patients underwent a total of 397,000 CABG procedures. Among Medicare FFS beneficiaries, there were 139,133 hospitalizations for isolated CABG surgery between July 2012 and June 2015. CABG surgeries are costly procedures that account for the majority of major cardiac surgeries performed nationally. In FY 2009, isolated CABG surgeries accounted for almost half (47.6 percent) of all cardiac surgery hospital admissions in Massachusetts. This provides an example of the frequency in which a CABG is performed for a patient admitted for cardiac surgery. In 2008, the average Medicare IPPS payment was $30,546 for CABG without valve replacement and $47,669 for CABG with valve replacement surgeries.

The proposed Hospital-level 30-Day Risk-Standardized Mortality Rate (RSMR) following Coronary Artery Bypass Graft (CABG) Surgery (MORT–30–CABG) (NQF# 2558) measure was endorsed by the HIQR program, assesses hospitals’ 30-day, all-cause risk-standardized rate of mortality, which is rate of death after admission for a CABG procedure for patients 65 and older during a 30-day period that begins with the date of the index admission for the specific hospital; an index admission is the hospitalization to which the mortality outcome is attributed. The data indicate that the median hospital-level risk-standardized mortality rate for 2016 public reporting was 3.2 percent, with a range of 1.4 percent to 8.3 percent among hospitals. The variation in these rates suggests that important differences in the quality of care delivered across hospitals exist, and that there is room for improvement.

More details about the measure can be found in the 2016 Annual Updates and Specifications Report for CABG Mortality posted on the CMS Web site at: https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Mortality-Measure-Methodology.html.

The proposed MORT–30–CABG (NQF# 2558) measure was endorsed by the NQF in November 2014. This measure has been publicly reported on Hospital Compare since FY 2015 and was incorporated into the HIQR Program for FY 2017 (FY 2015 IPPS/LTC final rule 79 FR 50227). The proposed MORT–30–CABG (NQF# 2558) measure includes Medicare FFS beneficiaries, aged 65 years and older, discharged from a non-federal short-term acute care hospitals, Indian Health Services hospitals, and critical access hospitals, who received a qualifying CABG procedure, and with a complete claims history for the 12 months prior to admission and through 30 days post-procedure.

We propose that the measure will include index admissions to all non-federal acute care hospitals, which includes all hospitals in the CABG model. Hospital performance will only be publicly reported for hospitals with 25 or more index admissions in the 3-year measurement period. The CABG model cohort would differ from the hospital cohort that is currently captured in the measure through the HIQR Program. Although performance on the measure will not be publicly reported for hospitals with fewer than 25 cases, such hospitals will receive information about their performance. We refer readers to section III.B.5. of this final rule for a discussion of CABG model participant selection. For eligible hospitalizations defined using ICD–9–CM codes, we refer readers to the CMS Web site at: http://cmsgov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Mortality-Measure-Metho...
the measure cohort considers only patients undergoing isolated CABG as eligible for inclusion in the measure. We defined isolated CABG patients as those undergoing CABG procedures without concomitant valve or other major cardiac, vascular, or thoracic procedures. In addition, our clinical experts, consultants, and Technical Expert Panel (TEP) members agreed that an isolated CABG cohort is a clinically coherent cohort for quality measurement. For detailed information on the cohort definition, we refer readers to the 2016 Annual Updates and Specifications Report for CABG Mortality on the CMS Web site at: https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInitiatives/Measure-METHODOLOGY.html.

(d) Inclusion and Exclusion Criteria

We proposed that an index admission is the hospitalization to which the mortality outcome is attributed. The measure includes the following index admissions for patients:

- Having a qualifying isolated CABG surgery during the index admission;
- Enrolled in Medicare FFS Part A and Part B for the 12 months prior to the date of the index admission, and enrolled in Part A during the index admission; and,
- Aged 65 or over.

Isolated CABG surgeries are defined as those CABG procedures performed without the following concomitant valve or other major cardiac, vascular, or thoracic procedures:

- Valve procedures.
- Atrial and/or ventricular septal defects.
- Congenital anomalies.
- Other open cardiac procedures.
- Heart transplants.
- Aorta or other non-cardiac arterial bypass procedures.
- Head, neck, intracranial vascular procedures.
- Other chest and thoracic procedures.

This measure excludes the following index admissions for patients:

- With inconsistent or unknown vital status or other unreliable demographic (age and gender) data.
- Discharged AMA.
- For patients with more than one qualifying CABG surgery admission in the measurement period, the first CABG admission is selected for inclusion in the measure and the subsequent CABG admission(s) are excluded from the cohort.

(e) Risk-Adjustment

We note that this measure is aligned with the risk-adjustment methodologies adopted for the other mortality measures developed by CMS and implemented under the HIQR Program in accordance with section 1886(b)(3)(B)(viii)(VIII) of the Act, as finalized in FY 2008 IPPS/LTCH final rule (2008 IPPS/LTCH final rule 71 FR 67960). We also note that the measure risk adjustment takes into account patient age, sex, and comorbidities to allow a fair assessment of hospital performance. The measure defines the patient risk factors for mortality using diagnosis codes collected from all patient claims 1 year prior to patient index hospitalization for CABG surgery. ICD–10–CM diagnosis codes on Parts A and B administrative claims are used to inform the risk prediction for each patient; diagnostic codes from post-acute care settings are included in the measure, but this information is only used to identify a hospital’s patient case mix in order to adequately adjust for differences in case mix across hospitals. Use of Parts A and B data does not mean the measure is applicable to post-acute care settings, only that it uses comprehensive data to predict the risk of the outcome and adjust for hospital patient case mix. We note that the patient diagnosis codes are grouped using HCCs. The CCs used in the risk-adjustment model for this measure are provided on the CMS QualityNet Web site: https://www.qualitynet.org/dcsc/contentserver?c=Page&pagemenu=QnetPublic%2FPage%2FQnetTier4&cid=1219069856694.

In summary, age, sex, and comorbidities present at the time of admission are adjusted for differences in hospital case mix (patient risk factors). The measure uses the HLM statistical methodology for risk adjustment.

(f) Calculating the Risk-Standardized Mortality Ratio (RSMR) and Performance Period

We proposed to calculate hospital 30-day, all-cause, risk-standardized mortality rate (RSMR) following CABG Surgery (NQF #2558) measure in the CABG model to assess quality performance.

The EPM episodes are structured as 90-day periods with the hospital as the primary accountable entity, because we believe 90 days is a period over which hospitals have substantial ability to influence the quality and efficiency of the care that patients receive. We believe that there could be significant benefits for the quality of patient care from using quality measures that examine patient outcomes over a period that extends at least as long as the EPM episode (that is, 90 days after discharge). In particular, we believe that this approach could help ensure that hospitals are held fully accountable for the quality of the care they deliver during the period covered by the bundle.

However, as discussed in section III.E. of the proposed rule (81 FR 50794), several of the outcome measures we proposed for these EPMs (MORT–30–AMI (NQF #0230), AMI excess days, and MORT–30–CABG (NQF #2558) assess outcomes over a 30-day period following discharge. We proposed the use of these existing 30-day measures, at least initially, because they are in wide use and have gained acceptance among hospitals and because the mortality measures have been reviewed and endorsed by the National Quality Forum. Nevertheless, we believe that it is appropriate to seek to adapt these measures or to develop new related
measures to assess outcomes over a longer timeframe, including timeframes at least as long as the EPM episodes. In developing measures that use a longer timeframe, CMS would perform empirical analyses to ensure that such measures are scientifically robust and to identify appropriate risk-adjustment approaches. Once such measures were available, CMS would consider when and how to incorporate these measures into the EPM quality payment methodology. We invite public comment on refining the existing 30-day measures to extend the period of outcome assessment following admission for AMI or CABG surgery, including the length of the period that should be examined by an extended measure, any important considerations in developing the refined measures, and any factors CMS should consider in incorporating these measures into the EPM quality payment methodologies.

The following is a summary of the comments received and our responses. Several commenters suggested that the CABG mortality measure not be used in the EPM until it had been reviewed by the NQF in the context of the ongoing SDS trial period. The commenter supported the use of the CABG mortality measure if CMS includes SDS factors in the risk-adjustment because mortality is tied to community factors that are typically outside of the direct control of health care providers.

Response: We appreciate the commenters’ concerns that socioeconomic factors influence patient’s risk of post-discharge returns to the hospital for acute care. The CABG mortality measure currently does not include socioeconomic factors in the risk-adjustment model. We routinely monitor the impact of SDS on providers’ differential performance on our outcome and payment measure.

The NQF is currently conducting a 2-year trial, in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF is expected to issue recommendations on future permanent inclusion of sociodemographic factors. During the trial, measure developers are encouraged to submit information such as analyses and interpretations as well as performance scores with and without sociodemographic factors in the risk adjustment model. Although the CABG mortality measure was not included in the SDS trial period, several measures developed by CMS have been brought to NQF since the beginning of the trial, including several mortality. Under the guidance of NQF, we are making every effort to be proactive in examining SDS factors in quality measures by testing SDS factors in the measures’ risk models and making recommendations about whether or not to include these factors in the endorsed measure. We are still awaiting final recommendations from the NQF and intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for SDS factors in our outcome measures. For more detailed information about measures in the NQF SDS trial period, we refer commenters to: http://www.qualityforum.org/SES_Trial_Period.aspx. Furthermore, we are awaiting the findings of an ASPE report on SDS factors in risk-adjustment. Therefore, we are not currently changing our risk-adjustment methodology with respect to SDS factors. We will continue to consider such factors in our ongoing measure development and maintenance activities.

Comment: Once commenter expressed agreement with the decision not to include the CABG readmission measure in this EPM stating that incentives are already in place for hospitals to lower excess readmission rates and it would be duplicative to hold hospitals accountable to these measures.

Response: We thank the commenter for their support.

Comment: Several commenters suggested alternative measures be used in the CABG EPM. One commenter suggested that CMS use the CABG Composite Score suggesting that it is more comprehensive because it is based on several outcomes, not solely mortality and is used by most cardiothoracic surgery programs. They also note that there is more variation among hospitals in the Composite Score compared with a mortality measure. Another commenter suggested that CMS use measures developed by the Society of Thoracic Surgeon (STS) for benchmarking instead of the CMS measure.

Response: We agree with commenters that this is a comprehensive NQF-endorsed composite measure with strong potential to meaningfully improve quality. The STS CABG Composite Score measures surgical performance based on a combination of 11 NQF-endorsed process and outcomes measures grouped into four domains. We are incorporating the use of the CABG Composite Score performance measure (NQF #0696) as a voluntary option weighted at 10 percent. By including this measure in the CABG EPM, we are reducing proposed HCAHPS and mortality weights by 5 percent each for those hospitals choosing to voluntarily submit this data. We intend to address the weighting and the use of the actual measure score in the next EPM rulemaking cycle. For more information about the STS Composite Score, we refer readers here: http://www.sts.org/pts-public-reporting-online/cabg-composite-score. Comment: One commenter expressed concern 75 percent of a hospital’s quality score for CABG based upon 30-day hospital mortality places a heavy reliance on only this quality measure. This commenter was also concerned that with this weighing propose, hospitals with few CABG cases would be further disadvantaged since there will be less data used to calculate the hospital’s quality score.

Response: To ensure hospitals have enough cases to produce a valid quality score, the CABG mortality measure uses 3 years of claims data to calculate the measure. Hospitals must have at least 25 qualifying index admissions within the 3-year measurement period to calculate and publically report a measure result. We do not believe these measures disadvantage smaller volume hospitals. We have found that hospitals with few cases tend to have measure results that are close to the national average hospital rate and are therefore rarely identified as poor performing outliers.

Comment: One commenter disagreed with the proposal to use the CABG mortality measure in the CABG EPM because this measure is used in the Hospital Inpatient Quality Reporting program (“HIQR”). The commenter suggested that the CABG mortality measure would do little to characterize the quality performance beyond what is already reported through existing CMS programs. The commenter suggested that CMS develop a new measure of complications following CABG surgery.

Response: We disagree with the suggestion that including the CABG mortality measure would do little to characterize the quality performance beyond what is already reported through the existing CMS programs. Mortality is a very serious outcome for AMI and CABG care and is one that EPM model participants should manage to avoid under the AMI and CABG models.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, with minor modification, to incorporate the STS CABG Composite Score measure (NQF
percent, respectively.\(^{113}\) Reported rates for pulmonary embolism following TKA range from 0.5 percent to 0.9 percent.\(^{112}\) \(^{113}\) \(^{114}\) Reported rates for sepsis/septicaemia range from 0.1 percent, during the index admission \(^{115}\) to 0.3 percent, 90-days following discharge for primary TKA.\(^{116}\) Rates for bleeding and hematoma following TKA have been reported at 0.94 percent \(^{117}\) to 1.7 percent.\(^{118}\) Combined, TKA and THA procedures account for the largest payments for procedures under Medicare.\(^{119}\) Both hip and knee arthroplasty procedures improve the function and quality of life of patients with disabling arthritis, and the volume and cost associated with these procedures are very high. We believe it is important to assess the quality of care provided to Medicare beneficiaries who undergo one or both of these procedures.

The proposed measure developed by CMS, and currently implemented in the HIQR and HVBP Programs and the CJR model, assesses a hospital’s risk-standardized complication rate, which is the rate of complications occurring after elective primary THA and TKA surgery. The measure outcome is the rate of complications occurring after THA and TKA during a 90-day period that begins with the date of the index admission for a specific hospital; an index admission is the hospitalization to which the complications outcome is attributed. The following outcomes (either one or more) are considered complications in this measure: Acute myocardial infarction, pneumonia, or sepsis/septicemia within 7 days of admission; surgical site bleeding, pulmonary embolism or death within 30 days of admission; or mechanical complications, peri-prosthetic joint infection or wound infection within 90 days of admission. The data indicated that the median hospital-level risk-standardized complication rate for 2008 was 4.2 percent, with a range from 2.2 percent to 8.9 percent in hospitals. The variation in complication rates suggests that there are important differences in the quality of care delivered across hospitals, and that there is room for quality improvement.

In 2010, we developed the proposed measure of hospital-level risk-standardized complication rate (RSCR) following elective primary THA and TKA surgery, which was later endorsed by the NQF (NQF #1550). In its Pre-Rulemaking Report for 2012,\(^{120}\) the Measure Application Partnership (MAP) also recommended the inclusion of this measure in the HIQR Program; we have not submitted this measure for use in post-acute care settings as the measure was developed for the acute care hospital setting. This measure has been publicly reported on Hospital Compare since FY 2014 and in the HIQR Program since FY 2015 (FY 2015 IPPS/LTC final rule 79 FR 50062). Finally, we note a comparison of the median hospital-level risk-standardized complication rates for hospitals between April 1, 2011 and March 31, 2014 illustrates a performance gap (median RSCR of 3.1 percent with a range from 1.4 percent to 6.9 percent) indicating there is still room for quality improvement.\(^{121}\)

\(^{(b)}\) Data Sources

Measure results are calculated using Medicare Part A and Part B FFS claims.
submitted by all non-federal acute care hospitals. Index admission diagnoses and in-hospital comorbidities are assessed using Medicare Part A claims. Additional comorbidities prior to the index admission are assessed using Part A inpatient, outpatient, and Part B office visit Medicare claims in the 1 to 2 months prior to the index (initial) admission. Enrollment and post-discharge mortality status are obtained from Medicare’s enrollment database which contains beneficiary demographic, benefits/coverage, and vital status information.

(c) Cohort

The Hip/Knee Complications (NQF #1550) measure includes Medicare FFS beneficiaries, aged 65 years or older, admitted to non-federal acute care hospitals for elective primary THA or TKA. THA and TKA procedures eligible for inclusion are defined using ICD–9–CM codes 81.51 and 81.54, respectively. The following 24 codes in ICD–10 correspond to these two ICD–9–CM codes.

- ICD–9 code 81.51 (Total Hip Replacement) = ICD–10 codes 0SR90J9, 0SR90JZ, 0SR90J0Z, 0SRR0J9, 0SRR0JZ, 0SRR0J0Z.
- ICD–9 code 81.54 (Total Knee Replacement) = ICD–10 codes 0SRC0J9, 0SRC0JZ, 0SRC0J0Z, 0SRD0J9, 0SRD0JZ, 0SRD0J0Z, 0SRD07Z, 0SRD079Z, 0SRD07KZ, 0SRD07QZ, 0SRD07RZ, 0SRD07SZ, 0SRD087Z, 0SRD089Z, 0SRD08KZ, 0SRD08QZ, 0SRD08RZ, 0SRD08SZ, 0SRD08TZ, 0SRD08VZ, 0SRD08WZ, 0SRD08XZ, 0SRD08YZ, 0SRD08ZKZ.

We proposed that the measure will include index admissions to all non-federal acute care hospitals, which includes all hospitals included in the SHFFT model. Hospital performance will only be publicly reported for hospitals with 25 or more index admissions in the 3-year measurement period. The SHFFT model participant hospital cohort would differ from the hospital cohort that is currently captured in the measure through the HIQR Program. Although performance on the measure will not be publicly reported for hospitals with fewer than 25 cases, such hospital will receive information about their performance. We refer readers to section III.B.5. of this final rule for discussion of the selection of participants for the SHFFT model.

(d) Inclusion and Exclusion Criteria

An index admission is the hospitalization to which the complication outcome is attributed. We note that for purposes of the EPMs where we need to identify episodes that are included in the EPMs, we use the term anchor hospitalization to identify hospitalizations that initiate EPM episodes for beneficiaries whose care is included in the EPMs. In describing the quality measures themselves in detail in section III.E.4. of the proposed rule (81 FR 50794), we use the term index hospitalization to identify hospitalizations of beneficiaries whose outcomes are included in the measures. Thus, anchor hospitalizations and index hospitalizations would have varying degrees of overlap depending on the specific quality measure. The MS–DRGs for the anchor or chained hospitalizations included in the SHFFT model will identify beneficiaries that do not overlap with the index hospitalizations used in the SHFFT model measures, since the SHFFT model measures use the elective THA/TKA cases as proxies for hip or femur fracture cases. The measure includes the following index admissions for patients:

- Enrolled in Medicare FFS.
- Aged 65 or over.
- Enrolled in Part A and Part B Medicare for the 12 months prior to the date of index admission and during the index admission.
- Have a qualifying elective primary THA/TKA procedure; elective primary THA/TKA procedures are defined as those procedures without any of the following:
  ++ Femur, hip, or pelvic fractures coded in principal or secondary discharge diagnosis fields of the index admission.
  ++ Partial hip arthroplasty (PHA) procedures with a concurrent THA/TKA.
  ++ Revision procedures with a concurrent THA/TKA.
  ++ Resurfacing procedures with a concurrent THA/TKA.
  ++ Mechanical complication coded in the principal discharge diagnosis field.
  ++ Malignant neoplasm of the pelvis, sacrum, coccyx, lower limbs, or bone/bone marrow or a disseminated malignant neoplasm coded in the principal discharge diagnosis field.
  ++ Removal of implanted devices/prostheses.
  ++ Transfer from another acute care facility for the THA/TKA.

The following admissions would be excluded from the measure:

- Admissions for patients discharged AMA.
- Admissions for patients with more than two THA/TKA procedure codes during the index hospitalization.
- Consistent with the FY 2016 IPPS/LTCH proposed rule, admissions for patients without at least 90 days post-discharge enrollment in FFS Medicare; this exclusion is an update to the measure signaled in the HIQR Program section of the FY2016 IPPS/LTCH proposed rule (80 FR 24572 through 24574) to ensure that disproportionate Medicare FFS disenrollment does not bias the measure results.

After applying these exclusion criteria, we randomly select one index admission for patients with multiple index admissions in a calendar year. Therefore, we exclude the other eligible index admissions in that year. Identification and use of a single index admission in a calendar year is done because this measure includes mortality as an outcome and the probability of death increases with each subsequent admission, preventing each admission from being mutually independent. Therefore only one index admission is selected to maintain measure integrity.

We note that the Hip/Knee Complications (NQF #1550) measure does not capture patients undergoing partial hip arthroplasty procedures. We excluded partial hip arthroplasty procedures primarily because partial hip arthroplasty procedures are done for hip fractures. Therefore, they are not elective procedures. Also, partial hip arthroplasty procedures are typically performed on patients who are older, frailer, and have more comorbid conditions. Although this exclusion is not fully harmonized with MS–DRGs 469 and 470, which includes partial hip arthroplasty procedures, use of this measure will still provide strong incentives for improving and maintaining care quality across joint replacement patients as hospitals typically develop protocols for lower extremity joint arthroplasty that will address peri-operative and post-operative care for both total and partial hip arthroplasty procedures. Fiscal year 2014 claims data indicate that among inpatient claims with MS–DRGs 469 or 470, partial hip arthroplasty (ICD–9–CM procedure code: 81152) accounted for 12 percent, while Total Hip Replacement (ICD–9 code: 81.51) and total knee replacement (ICD–9 code: 81.54) accounted for 87 percent (80 FR 73300 and 73474). We also note that the same surgeons and care teams frequently perform both procedures. Therefore, quality improvement efforts initiated in response to the Hip/Knee Complications (NQF #1550) measure are likely to benefit patients undergoing similar elective procedures, such as partial hip arthroplasty and revision THA/TKA procedures, and possibly even non-elective lower extremity hip fracture surgery as described in section III.E.2.d. of the proposed rule (81 FR 50794).
We note that this measure is aligned with the risk-adjustment methodologies adopted for the HIQR Program and HRRP in accordance with section 1886(b)(3)(B)(viii)(VIII) of the Act (FY 2013 IPPS/LTC final rule 77 FR 53516 through 53518 and FY 2015 IPPS/LTC final rule; 79 FR 50024, 50031, and 50020). We note that the risk-adjustment takes into account the patient case-mix to assess hospital performance. The patient risk factors are defined using the HCCs. We note that the risk-adjustment model for this measure are provided on the CMS QualityNet Web site: ([https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=122877272693](https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=122877272693)). We note that the measure uses ICD–9–CM diagnosis codes on Parts A and B administrative claims for the year prior to and including the index admission. The ICD–9–CM codes are utilized to inform the risk prediction for each patient. Diagnostic codes from post-acute care settings are utilized for the measure calculation, but this information is only used to identify a hospital’s patient case mix in order to adequately adjust for differences in case mix across hospitals. Use of the administrative claims data does not mean the measures are applicable to post-acute care settings, only that they use comprehensive data to predict the risk of the outcome and adjust for hospital patient case mix. The measure methodology defines “complications” as acute myocardial infarction (AMI); pneumonia; sepsis/septicemia; pulmonary embolism; surgical site bleeding; death; wound infection; periprosthetic joint infection; and mechanical complication within 0 to 90-days post the index date of admission, depending on the complication. The decision on the appropriate follow-up period of 0 to 90 days was based on our analysis of 90-day trends in complication rates using the 2008 Medicare FFS Part A Inpatient Data. We found that rates for mechanical complications are elevated until 90 days post the date of index admission. We found that the rates for four other complications—death, surgical site bleeding, wound infection, and pulmonary embolism—are elevated for 30 days, and that rates for AMI, pneumonia, and sepsis/septicemia level off 7 days after the date of index admission.

We considered an alternative approach to the required quality measures for the HIQR model given.
that the proposed measures do not specifically target the SHFFT model beneficiaries. This alternative approach would not account for any hip-specific measures (such as, Hospital-level RSCR following elective primary THA and/or TKA (NQF #1550) (Hip/Knee Complications)) and would instead only measure patient experience through the HCAHPS Survey (NQF #0166). Although there may be some rationale for excluding measures that do not specifically target SHFFT model beneficiaries, we do not propose this approach to SHFFT model quality measures because we believe that it is critical to include a measure of both clinical and patient experience outcomes in the setting of lower extremity orthopedic surgery episodes. Additionally, we believe that using quality measures for SHFFT model episodes that do not align with those in the CJR model could generate confusion at CJR model participant hospitals where we propose that the SHFFT model be tested as discussed in III.B.4. of this final rule.

Response: One commenter expressed support for our proposed approach of using the same measures in the CJR and SHFFT models given the lack of measures specific to the hip fracture population.

Response: We thank the commenter for their support.

Comment: Several commenters suggested that we develop measures that are specific to the SHFFT model population.

Response: We thank the commenter for this suggestion and are considering future measure development focused specifically on hip and femur fracture patients.

Comment: One commenter suggested that the measures proposed do not assess what matters most to patients, such as whether patient’s or providers’ goals were met by the surgery performed.

Response: We have incorporated the THA/TKA patient-reported outcome-based data submission (henceforth referred to as “THA/TKA voluntary data”) into the SHFFT model. The THA/TKA voluntary data would provide participating hospitals with valuable information on functional outcomes that would assist them in assessing an important patient-centered outcome, engaging other providers and suppliers in care redesign for joint replacement episodes, as well as provide them with the potential for greater financial benefit from improved episode efficiencies.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to assess quality performance for SHFFT model participants through implementation of the Hospital-level risk-standardized complication rate (RSCR) following elective primary total hip arthroplasty (THA) and/or total knee arthroplasty (TKA) (NQF #1550) measure. (2) Hospital-Level Performance Measure(s) of Patient-Reported Outcomes Following Elective Primary Total Hip and/or Total Knee Arthroplasty

III. (a) Background

As part of our goal to move towards outcome measures that assess patient-reported outcomes, we have begun development on a measure to assess improvement in patient-reported outcomes following THA/TKA procedures. The Hospital-Level Performance Measure(s) of Patient-Reported Outcomes Following Elective Primary Total Hip and/or Total Knee Arthroplasty (hereinafter referred to as “THA/TKA patient-reported outcome-based measure”) is currently under development. We specifically chose to focus on THA/TKA procedures since THA/TKAs are important, effective procedures performed on a broad population, and the patient outcomes for these procedures (for example, pain, mobility, and quality of life) can be measured in a scientifically sound way and are also influenced by a range of improvements in care. We also note that THA/TKA procedures are specifically intended to improve patient-reported outcomes the most meaningful outcome metric to assess for these common, costly procedures. Patient-reported outcomes would be assessed separately for THA and TKA procedures, though these results may be combined into a single composite measure for reporting. Therefore, we will refer to a single measure, but acknowledge the possibility of two measures, one for THA patients and one for TKA patients.

During measure development, we discovered that in order to complete measure development, we would need access to a nationally representative sample of THA and TKA inpatient surgical procedure patient-reported outcome data set that is also consistently collected at the hospital-level and contains risk variables identified by orthopedists. The rationale for requesting access to a national THA and TKA inpatient surgical procedures patient-reported data source are twofold — (1) a national data source would provide us with hospital-level data representative of the total number of THA and TKA procedures performed in hospitals, as well as representative data on hospital-level case-mix; and (2) access to a national THA and TKA inpatient surgical procedures patient-reported data source would allow us to assess and identify a set of parsimonious data elements that will minimize the data collection burden by patients, physicians and hospitals. We believe access to such data would allow for completion and testing of the current measure under development that can be appropriately used for nationwide hospital performance evaluation. We implemented the initial data collection for this measure initially in the CJR model in order to test and resolve these measurement development issues through the collection of THA and TKA patient-reported outcome data. We proposed to test SHFFT model episodes in mainly the same hospitals as the CJR model as discussed in section III.B.4. of the proposed rule (81 FR 50794). We note that approximately 50 hospitals currently excluded from CJR model participation because they are testing BPCI LEJR episodes would be included in the SHFFT model. Access to this data through the SHFFT and CJR models would address the following:

• Current data sources are not consistently collected nor collected in a uniform process and in a standardized format (that is, data elements are not consistently defined across different data sources). We note that currently available data sources tend to be limited to single hospitals or regional registries which are associated with complex data access sharing requirements.

• Current lack of uniform hospital-level data that can be used in measure development.

• Lack of incentive for physicians and hospitals to collect patient-reported outcome data such as a component of the model’s financial incentives associated with voluntary data submission.

• Current lack of a technically simple and feasible mechanism for hospitals to submit patient-reported data to CMS. This model would help create and optimize such a mechanism, potentially enabling future measure implementation.

In summary, the voluntary data collection that is already underway in most SHFFT model participants who are also participants in the CJR model would provide data from the patient’s perspective that is necessary to finalize and test the measure specifications, including the risk model. Access to this nationally representative voluntarily submitted data would enable us to do the following:

• Determine a parsimonious set of risk factors that are statistically adequate for risk adjustment for patient-reported outcome.
• Examine the differences in hospital performance related to different components in the patient-reported outcome (such as functional status, pain, etc.) to finalize the statistical modeling methodology for risk adjustment.
• Evaluate the reliability of the patient-reported outcome measure.
• Examine validity of the patient-reported outcome measure upon finalization of the risk adjustment model via potential testing methods such as face validity testing with national experts, comparing the measure results to similar results based on other data sources if feasible, etc.

In order to encourage participation with voluntary data submission of patient-reported outcome data, we are proposed to seek and reward voluntary participation in submission of THA/TKA patient-reported outcome-based measure data as outlined in section III.E.4c.(2)(viii) of the proposed rule (81 FR 50794). We note that we would not publicly report the THA/TKA voluntary data.

Finally, we intend to use a fully tested and completed THA/TKA patient-reported outcome-based measure in CMS models or programs when appropriate. If there is a decision to implement the fully developed THA/TKA patient-reported outcome-based measure, we would propose to adopt the measure through notice and comment rulemaking. We refer reviewers to draft measure specifications in the downloads section of the Measure Methodology Web page at http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.

(b) Data Sources

As previously discussed, this measure is under development, and we proposed to reward SHFFT model participants that volunteer to submit provider- and patient-level data elements. We note that there is currently little uniformity across hospitals regarding collection of specific provider- and patient-level data elements that are used to assess patient outcomes after THA and TKA inpatient procedures. In the voluntary data submission for the THA/TKA patient-reported outcome-based measure, we are trying to identify a uniform set of provider- and patient-level data elements that are accurate, valid, and reliable pieces of information that can be used in the determination of improvement in various patient characteristics like those previously listed (that is, pain, mobility, and quality of life). Furthermore, in order to minimize provider and hospital burden associated with data collection and submission of provider- and hospital-level data elements, we proposed using a variety of data sources for measure development. We anticipate using the following data sources are:

• Patient-reported data.
• Administrative claims-based data.
• One or both physician-reported and electronic health record data.

Through this voluntary data submission proposal, we hope to identify a uniform set of provider- and patient-level data elements while also identifying data sources that are the least burdensome for the patients, providers, and hospitals. We proposed to request that SHFFT model participants provide administrative claims-based data whenever possible, in order to minimize burden on patients, providers, and hospitals. Additionally, we proposed to request that SHFFT model participants submit either hospital documentation, chart abstraction, or abstraction from the electronic health records. We proposed to request submission of the following data elements as finalized in the CJR model final rule (80 FR 73494 through 73495):

• Pre-operative Assessments (to be collected between 270 and 365 days after the THA/TKA procedure).
  • Date of admission to hospitalization.
  • Eligible THA/TKA procedure.
  • Medicare Health Insurance Claim Number (Unique Identifier).
  • Generic PROM Instrument for THA and TKA Procedures.
  • Knee-Specific PROM Instrument for TKA Procedures.

Either either (A) the HOOS Jr. (6 item total) [collected pre-operatively (90 to 0 days prior to the THA procedure)] or (B) the original HOOS Pain Subscale (10 items), AND the original HOOS Function, Daily Living Subscale (17 items, for a total of 27 items) [collected pre-operatively (90 to 0 days prior to the THA procedure).]

• Hip-specific PROM Instrument for TKA procedures.

Either either (A) the HOOS Jr. (6 item total) [collected both pre-operatively (90 to 0 days prior to the THA procedure) and post-operatively (270 to 365 days after the THA procedure)] and/or (B) the original HOOS Pain Subscale (10 items), AND the original HOOS Function, Daily Living Subscale (17 items, for a total of 27 items) [collected both pre-operatively (90 to 0 days prior to the THA procedure) and post-operatively (270 to 365 days after the THA procedure).]

• Body Mass Index (or height in cm and weight in kg).
• Pre-operative use of narcotics.
• Patient-Reported Pain in Non-operative Lower Extremity Joint.
• Patient-Reported Back Pain (Oswestry Index question).
• Patient-Reported Health Literacy.
• Post-operative Assessments (To be collected between 270 and 365 days following THA/TKA procedure):
  • Date of admission to hospitalization.
  • Eligible THA/TKA procedure.

Either either (A) the KOOS Jr. (7 items total) [collected post-operatively (270 to 365 days after the TKA procedure)] OR (B) the original KOOS Jr. (17 items total) OR (C) the original KOOS Function, Daily Living Subscale (17 items, for a total of 28 items) [collected post-operatively (270 to 365 days after the TKA procedure)].
days prior to the THA procedure), and either (A) the HOOS Jr. (6 items total) [collected post-operatively (270 to 365 days after the THA procedure) or (B) the original HOOS Pain Subscale (10 items), AND the original HOOS Function, Daily Living Subscale (17 items, for a total of 27 items) [collected post-operatively (270 to 365 days after the THA procedure)].

Finally, we note that as the measure continues to undergo development that the list of data elements may be simplified. As stated earlier in this section, we intend to identify a uniform set of provider- and patient-level data elements that are accurate, valid and reliable pieces of information that can be used in the determination of improvement in various patient-reported outcomes like those previously listed (that is, pain, mobility, and quality of life).

In accordance with, and to the extent permitted by, the HIPAA Privacy Rule and other applicable law, we proposed to request that participants submit the data specified in the request, which we would limit to the minimum data necessary for us to conduct quality assessment and improvement activities. Regarding the process for data collection, we proposed the THA/TKA voluntary data will be submitted to and collected by a CMS contractor in a manner and format similar to existing CMS data submission processes. For example, CMS would supply applicable hospitals with a file template and instructions for populating the file template with data and submitting the data; the hospitals will populate the template, log in to a secure portal, and transmit the file to the appropriate CMS contractor; the CMS contractor would also match the submitted data to Medicare administrative claims-based data and calculate successful submission determination for use in assigning the SHFFT composite quality score as described in section III.E.3.e.(3). of this final rule (or validated subscales or abbreviated versions of these instruments). We believe that voluntary participation in the submission of THA/TKA patient-reported outcome-based measure data will provide the minimum information we would need that would inform us on how to continuously improve the currently specified measure in development.

We note that some of these data elements are closely aligned with data elements in e-clinical measures. The measure cohort inclusion criteria are all patients undergoing elective primary THA/TKA procedures. Exclusion criteria will consist of patients undergoing non-elective procedures (that is, patients with fractures resulting in THA/TKA), as it is infeasible to routinely capture pre-operative patient-reported assessments in these patients; patients with mechanical complications of prior hip and knee joint procedures and those undergoing revision THA/TKA will also be excluded, as their patient-reported outcomes may be influenced by prior care experiences and therefore may not adequately represent care quality of the hospital performing the revision procedure.

(f) Risk-Adjustment (if applicable)

We note that the measure’s risk model has yet to be developed. In order to develop the risk model, final risk variable selection for the risk model will involve empirical testing of candidate risk variables as well as consideration of the feasibility and reliability of each variable. The risk model will account for the hospital level response rate as well as measureable patient-level factors relevant to patient-reported outcomes following elective THA/TKA procedures. To the extent feasible, the risk model methodology will adhere to established statistical recommendations.

(g) Calculating the Risk-Standardized Rate

We note that the approach to reporting this measure(s) has yet to be developed. The measure will use one or more of the following patient-reported outcome instruments (or validated subscales or abbreviated versions of these instruments) to calculate the measure score: The Patient Reported Outcomes Measurement Information Systems (PROMIS)-Global or the Veterans Rand 12 Item Health Survey (VR-12), and the Hip dysfunction and Osteoarthritis Outcome Score/Knee injury and Osteoarthritis Outcome Score (HOOS/KOOS) instruments to measure pre- and postoperative improvement or both. These candidate instruments were selected by a TEP based upon their meaningfulness to patients and clinicians, performance characteristics such as reliability, responsiveness and validity, and their perceived burden to both patients and providers. The pre-operative data collection timeframe will be 90 to 0 days before surgery, and the post-operative data collection timeframe will be 270 to 365 days following surgery. The approach to calculating the improvement or worsening of patient outcomes represented by the pre- and postoperative patient-reported survey results has not yet been determined, but will use one or more surveys to define the improvement or worsening of patient-reported outcomes to reliably identify differences between hospitals of varying performance.

The measure will assess change in patient-reported outcomes between the pre-operative (90 to 0 days prior to the elective primary THA/TKA procedure) and post-operative (270–365 days following the elective primary THA/TKA procedure) periods.

(h) Performance Period for Successful Submission of THA/TKA Patient-Reported-Outcome-Based Voluntary Data

We proposed defining data reporting performance periods for each performance year of the SHFFT model as outlined in Table 40. Performance periods for voluntary reporting of THA/TKA patient-reported outcome-based measure data are those timeframes in which a hospital admission occurs for an eligible THA/TKA voluntary data submission procedure. Data submitted for the first SHFFT model performance year would be for cases that fulfill the measure specifications described in section III.E.4.c.(2)(i) of the proposed rule (81 FR 50794), and would be restricted to the pre-operative data elements on cases performed between September 1, 2016 and June 30, 2017. We note that SHFFT model participants generally would have the opportunity for voluntary data submission on cases performed in this timeframe through the hospitals’ participation in the CJR model, which uses the same timeframe for voluntary submission of pre-operative data elements on cases. The proposed timing allows matching of the patient-reported data with relevant administrative claims-based data in order to accurately calculate the percent of eligible elective primary THA/TKA patients for which THA/TKA voluntary data was successfully submitted. For SHFFT model performance year 2, THA/TKA voluntary data reporting would be 10 months of post-operative data for cases performed between September 1, 2016 and June 30, 2017, and 12 months of pre-operative data for cases performed between July 1, 2017 and June 30, 2018. For SHFFT model performance year 3 and subsequent years of the model, the performance periods for submission of voluntary data will consist of 12-month time periods.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The proposed performance periods would enable SHFFT model participants to receive points toward the SHFFT model composite quality score starting in performance year 1, even though complete pre-operative and post-operative data collection requires a minimum 9- through 12-month time period. This 9- through 12-month time period, between the procedure and post-operative data collection, was defined through clinician and stakeholder input and provides for both sufficient elapsed time for maximum clinical benefit of THA/TKA procedures on patient-reported outcomes and accommodates common clinical care patterns in which THA/TKA patients return to their surgeon 1 year after surgery. We emphasize that SHFFT model participants that are also participating...
in the CJR model do not need to submit data twice to satisfy the successful submission requirements of both models. If those hospitals successfully submit voluntary data for the CJR model they will be credited with successful submission under the SHFFT model.

We sought comment on our proposed measure reporting periods for the performance years of the SHFFT model.

The following is a summary of the comments received and our responses.

**Comment:** One commenter expressed support for our proposal to assess patient-reported functional status before surgery and again one year after surgery as a mechanism to provide insight into the effectiveness of these procedures.

**Response:** We thank the commenter for their support.

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal, without modification, to meet the reporting periods for the performance years of the SHFFT model. The performance periods will enable model participants to receive points toward the SHFFT model composite quality score starting in performance year 1, even though complete pre-operative and post-operative data collection requires a minimum 9- through 12-month time period. This 9- through 12-month time period, between the procedure and post-operative data collection, was defined through clinician and stakeholder input and provides for both sufficient elapsed time for maximum clinical benefit of THA/TKA procedures on patient-reported outcomes and accommodates common clinical care patterns in which THA/TKA patients return to their surgeon 1 year after surgery.

(i) Requirements for Successful Submission of THA/TKA Patient-Reported-Outcome-Based Voluntary Data

In order for CMS to assign points in the SHFFT model composite quality score for successful participant submission of THA/TKA voluntary data, requirements to determine if the submitted data for each measure development have been identified.

We believe that the following criteria should be used to determine if a participant has successfully submitted THA/TKA voluntary data. We note that successful THA/TKA voluntary data submission requires completion of all of the following:

- Submission of the data elements listed in section III.E.4.c.(2)(i) of the proposed rule (81 FR 50794).
- Data elements listed in section III.E.4.c.(2)(ii) of this final rule must be submitted on at least 80 percent of their eligible elective primary THA/TKA patients.
- THA/TKA voluntary data submission must occur within 60 days of the end of the most recent data collection period.

To successfully submit THA/TKA voluntary data for performance years 1 through 5, SHFFT model hospitals must submit both pre-operative and post-operative patient reported outcome data on an increasing proportion of eligible elective primary THA/TKA patients over the performance years as described in Table 29 of the proposed rule (81 FR 50794). Performance periods for which we proposed to have THA/TKA voluntary data submitted are displayed in Table 29 of the proposed rule (81 FR 50794). Table 29 also summarizes the performance periods for pre-operative and post-operative THA/TKA voluntary data. Finally, SHFFT model hospitals volunteering to submit THA/TKA data would be required to submit pre-operative data on all eligible patients and post-operative data elements only on those patients at least 366 days out from surgery. Therefore, hospitals are not expected to collect and submit post-operative THA/TKA voluntary data on patients who are fewer than 366 days from the date of surgery.

We previously described a THA/TKA eligible patient in section III.E.4.c.(2)(i) of the proposed rule (81 FR 50794). This description is important as these patients are those in which we sought submission of voluntary data. We also selected the requirement of submitting an increasing percent of eligible elective primary THA/TKA patients’ data starting at 60 percent in performance year 1 and reaching 80 percent by performance years 4 and 5 because this volume of cases would result in a high probability that we will have a national sample of THA/TKA patient data representative of each hospital’s patient case mix. Having at least 80 percent of the eligible elective primary THA/TKA patients would enable an accurate and reliable assessment of patient-reported outcomes for use in measure development. We note that data used for outcome measure development must adequately represent the population that is anticipated to be measured and in this case that population would be those experiencing elective primary THA/TKA inpatient surgical procedures. Furthermore, we considered setting the requirement at 100 percent of the eligible elective primary THA/TKA patients, but concluded that a requirement of 100 percent data may not be feasible for all hospitals or may be excessively burdensome to achieve.

Therefore we set the requirement in SHFFT model performance year 4 and beyond at 80 percent of the eligible elective primary THA/TKA patients. We believe acquisition of 80 percent of the eligible elective primary THA/TKA patients will provide representative data for measure development while decreasing patient, provider and hospital burden.

The proposal for voluntary submission of THA/TKA data is included in §591.413(b). We sought public comment of these requirements to determine successful voluntary submission of THA/TKA data. We also sought comment specifically on the requirement for data collection on an increasing percentage of eligible patients starting with at least 60 percent in SHFFT model performance year 1 and increasing to 80 percent of the eligible elective primary THA/TKA patients by SHFFT model performance year 4.

The following is a summary of the comments received and our responses.

**Comment:** One commenter expressed support of our proposal to incentivize SHFFT model participants who submit PRO data.

**Response:** We thank the commenter for their support.

**Comment:** Several commenters expressed concern that the instruments used for the proposed Total Hip Arthroplasty (THA)/Total Knee Arthroplasty (TKA) voluntary patient-reported outcome (PRO) measure had not been validated in hip fracture patients, specifically the Hip disability and Osteoarthritis Outcome Score (HOOS), JR.

**Response:** The purpose of the voluntary PRO data collection is to collect the data required to develop a future PRO-based performance measure that will assess hospital quality of care for patients undergoing elective primary THA/TKA procedures. Because only patients with elective primary THA/TKA procedures will complete these survey instruments, there is no need to assess their validity in hip fracture patients. Although we plan to develop a PRO-based measure that excludes patients with fracture-related THA/TKA, we believe quality improvement efforts initiated in response to the future measure are likely to benefit patients undergoing similar elective procedures, such as partial hip arthroplasty and revision THA/TKA procedures, and possibly even non-elective THA/TKA procedures, such as fracture-related THA.

**Comment:** Several commenters suggested that hospitals will not be able collect PRO data on hip fracture patients...
prior to the procedure because hip fractures are acute and unanticipated events.

Response: The PRO data will be collected only for patients undergoing elective THA/TKA procedures within hospitals participating in the SHFFT model and not for hip fracture patients.

Comment: One commenter expressed concern that the proposal that hospitals seeking credit for voluntary submission of PRO data need only submit data on 80 percent of eligible elective primary THA/TKA patients could cause hospitals to report data only on those patients who had positive outcomes. The commenter requested that CMS raise the threshold.

Response: We appreciate the commenter’s suggestion to increase the successful criterion based upon the concern that lowering the successful criterion (that is, the patient-reported outcome instrument response and risk variable submission rates required for successful participation) may produce biased data that are not generalizable to all patients undergoing elective primary THA/TKA procedures at a given hospital. We refer the commenter to our response to this concern in the CJR model final rule (80 FR 73499–73500).

Comment: One commenter suggested that we consider removing the Oswestry Index from the list of required variables to be submitted with pre-operative PRO data. The commenter suggested that the Oswestry Index is lengthy and burdensome to complete and is not relevant for hip and knee surgery.

Response: We note that a joint statement from multiple surgical specialty societies received during the public comment of the CJR Model Proposed Rule included back pain as a prioritized risk variable for the voluntary PRO and risk variable data collection [cite final rule (80 FR 73496) and Ayers]. The commenter noted that the Oswestry Index requires responses to a lengthy set of questions. To minimize data collection burden, we have included a single question from the Oswestry Index to capture patient-reported back pain: My BACK PAIN at the moment is (none, very mild, moderate, fairly severe, very severe, worst imaginable).  

Comment: One commenter suggested that we reduce the number of responses required to satisfy the HOOS and KOOS completion rate.

Response: In response to the commenter’s concern regarding the burden of PRO data collection, we have limited the number of PRO survey data elements to a minimum of 16 or 17 questions, depending upon whether the patient is undergoing a THA or TKA procedure, plus the additional risk variable questions, which CMS believes is a reasonable burden for elective procedures intended solely for improving pain and function. In addition, comments received during the public comment of the CJR Model Proposed Rule indicate that high patient-reported outcome data collection rates are feasible. For example, a commenter shared that its institution reported a reliable 85 percent response rate for its PRO data collection (80 FR 73500).

Comment: Several commenters expressed concerns about hospitals’ ability to collect post-operative PRO data one year after surgery. One concern was about the difficulty of locating patients due to the possibility of a beneficiary’s death, incapacity, a move, or an unwillingness to participate in a survey. One commenter suggested CMS shorten the timeframe for assessing the PRO data to 6 months and that CMS provide a file of CJR/SHFFT patients who are deceased at the start of the post-operative data collection period in order to avoid mailing reminders or surveys to the families of deceased beneficiaries. One commenter suggested extending the timeframe for PRO assessment beyond 365 days in case patients do not return to their provider within a year of surgery.

Response: The PRO data will be collected only for patients undergoing elective THA/TKA procedures within hospitals participating in the SHFFT model and not for hip fracture patients. The collection time window of 270 to 365 days for post-operative PRO data was specified in conjunction with our TEP and based on recovery trajectories for primary elective THA/TKA patients. Because experts and stakeholders have identified this window as ideal for capturing PROs, we encourage hospitals to develop strategies to collect data within the time window, such as mailing surveys to patients well before they return for their one-year follow up visit.

Comment: One commenter suggested that PRO performance measures should be used to assess quality of post-acute care services as well as acute care hospitals.

Response: We thank the commenter for their suggestion. We will consider this feedback during ongoing measure evaluation.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, for voluntary submission of THA/TKA data as included in §512.413(b). We are also finalizing these requirements for data collection on an increasing percentage of eligible patients starting with at least 60 percent in SHFFT model performance year 1 and increasing to 80 percent of the eligible elective primary THA/TKA patients by SHFFT model performance year 4.

d. Measure Used for All EPMs

(1) Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey (NQF #0166)

(a) Background

The HCAHPS Survey (NQF #0166) is a CMS survey and a national, standardized, publicly reported survey of patients’ experience of hospital care. The HCAHPS Survey is endorsed by the NQF (#0166); CMS is the measure steward. The HCAHPS Survey, also known as CAHPS® Hospital Survey, is a survey instrument and data collection methodology for measuring patients’ perceptions of their hospital experience. The HCAHPS Survey asks recently discharged patients 32 questions about aspects of their hospital experience that they are uniquely suited to address. The core of the survey contains 21 items that ask “how often” or whether patients experienced a critical aspect of hospital care. The survey also includes four items to direct patients to relevant questions, five items to adjust for the mix of patients across hospitals, and two items that support congressionally mandated reports (77 FR 53513 through 53515). Eleven HCAHPS measures (seven composite measures, two individual items, and two global items) are currently publicly reported on the Hospital Compare Web site for each hospital participating in the HIQR Program (79 FR 50259). Each of the seven currently reported composite measures is constructed from two or three survey questions. The seven composites summarize the following:

• How well doctors communicate with patients.
• How well nurses communicate with patients.
• How responsive hospital staff are to patients’ needs.
• How well hospital staff helps patients manage pain.
• How well the staff communicates with patients about medicines.
• Whether key information is provided at discharge.
• How well the patient was prepared for the transition to post-hospital care.

Lastly, the two individual items address the cleanliness and quietness of patients’ rooms, while the two global

items report patients’ overall rating of the hospital, and whether they would recommend the hospital to family and friends. We proposed to adopt a measure in the EPMs that uses HCAHPS survey data to assess quality performance and capture patient experience of care.

(b) Data Sources

The HCAHPS Survey is administered to a random sample of adult inpatients between 48 hours and 6 weeks after discharge. The HCAHPS survey data is collected on inpatient experience, is not limited to Medicare beneficiaries, and does not distinguish between types of Medicare beneficiaries. Patients admitted in the medical, surgical, and maternity care service lines are eligible for the survey; the survey is not restricted to Medicare beneficiaries. Hospitals may use an approved survey vendor or collect their own HCAHPS data (if approved by CMS to do so) for a detailed discussion see 79 FR 50259.

To accommodate hospitals, the HCAHPS Survey can be implemented using one of the following four different survey modes:

- Mail.
- Telephone.
- Mail with telephone follow-up.
- Active Interactive Voice Recognition (IVR).

Regardless of the mode used, hospitals are required to make multiple attempts to contact patients. Hospitals may use the HCAHPS Survey alone, or include additional questions after the 21 core items discussed previously. Hospitals must survey patients throughout each month of the year, and hospitals participating in the HIQR Program must target at least 300 hospitals participating in the HIQR Program as reasonable for use in the EPMs since this is a survey that many hospitals and patients are familiar with. In determining HCAHPS performance, we proposed to utilize the HCAHPS Linear Mean Roll-up (HLMR) score. The HLMR summarizes performance across 10 of the 11 publicly reported HCAHPS measures for IPPS hospitals with 100 or more completed HCAHPS surveys in a 4-quarter period. All of the publicly reported measures are included except for how well hospital staff helps patients manage pain since revisions are under consideration for that measure. The HLMR is calculated by taking the average of the linear mean scores (LMS) for each of the 10 publicly reported HCAHPS measures. We note that the HLMR is not current publicly reported but may be calculated using the LMS, which are publicly reported in the Patient Survey Results in the Hospital Compare downloadable database found on Data.Medicare.gov at https://data.medicare.gov/data/hospital-compare?sort=relevance&tag=patient%20survey%20results. The LMS, which was created for the calculation of HCAHPS Star Ratings, summarizes all survey responses for each HCAHPS measure; a detailed description of LMS can be found in HCAHPS Star Rating

(e) Case-Mix Adjustment

To ensure that HCAHPS scores allow fair and accurate comparisons among hospitals, CMS adjusts for factors that are not directly related to hospital performance but which affect how patients answer survey items. This includes the mode of survey administration and characteristics of patients that are out of a hospital’s control. Patient-mix adjustments (also known as case-mix adjustment) control for patient characteristics that affect ratings and that are differentially distributed across hospitals. Most of the patient-mix items are included in the “About You” section of the survey, while others are taken from hospital administrative records. Based on the HCAHPS mode experiment, and consistent with previous studies of patient-mix adjustment in HCAHPS and in previous hospital patient surveys, we employ the following variables in the patient-mix adjustment model:

- Self-reported general health status (specified as a linear variable).
- Education (specified as a linear variable).
- Type of service (medical, surgical, or maternity care).
- Age (specified as a categorical variable).
- Admission through emergency room (discontinued in 2010).
- Lag time between discharge and survey.
- Age by service line interaction.
- Language other than English spoken at home.

Once the data are adjusted for patient mix, there is a fixed adjustment for Mode of survey administration (mail, telephone, mail with telephone follow-up, and active Interactive Voice Response). Information on patient-mix adjustment (risk adjustment) and survey mode adjustment of HCAHPS scores can be found at http://www.hcahpsonline.org/modeadjustment.aspx.

(f) HCAHPS Scoring

Regarding the HCAHPS Survey (NQF #0166) measure, we identified the methodology used to assess hospitals in the HIQR Program as reasonable for use in the EPMs since this is a survey that many hospitals and patients are familiar with. In determining HCAHPS performance, we proposed to utilize the HCAHPS Linear Mean Roll-up (HLMR) score. The HLMR summarizes performance across 10 of the 11 publicly reported HCAHPS measures for IPPS hospitals with 100 or more completed HCAHPS surveys in a 4-quarter period. All of the publicly reported measures are included except for how well hospital staff helps patients manage pain since revisions are under consideration for that measure. The HLMR is calculated by taking the average of the linear mean scores (LMS) for each of the 10 publicly reported HCAHPS measures. We note that the HLMR is not current publicly reported but may be calculated using the LMS, which are publicly reported in the Patient Survey Results in the Hospital Compare downloadable database found on Data.Medicare.gov at https://data.medicare.gov/data/hospital-compare?sort=relevance&tag=patient%20survey%20results. The LMS, which was created for the calculation of HCAHPS Star Ratings, summarizes all survey responses for each HCAHPS measure; a detailed description of LMS can be found in HCAHPS Star Rating
We proposed that EPM participants must have at least 100 completed HCAHPS surveys over a given 4-quarter period to be evaluated on HCAHPS for the EPMs. The responses to the survey items used in each of the 10 HCAHPS measures described previously are combined and converted to a 0 to 100 linear-scaled score as follows:

- “Never” = 0; “Sometimes” = 33 1/3; “Usually” = 66 2/3; and “Always” = 100 (For HCAHPS Survey items 1-9, 11, and 16-17).
- “No” = 0; “Yes” = 100 (For items 19 and 20).

Overall Rating “0” = 0; Overall Rating “1” = 10; Overall Rating “2” = 20; . . .; Overall Rating “10” = 100 item 21).
- “Definitely No” = 0; “Probably No” = 33 1/3; “Probably Yes” = 66 2/3; and “Definitely Yes” = 100 (For item 22).
- “Strongly Disagree” = 0; “Disagree” = 33 1/3; “Agree” = 66 2/3; and “Strongly Agree” = 100 (For items 23, 24, and 25).

The linear-scaled scores are then adjusted for patient mix, survey mode, and quarterly weighting to create the LMS, see http://www.hcahpsonline.org/files/HCAHPS_Stars_Tech_Notes_Apr2015.pdf.

The HLMR summarizes performance across the 10 HCAHPS measures by taking an average of each of the LMS of the 10 HCAHPS measures, using a weight of 1.0 for each of the 6 HCAHPS composite measures, and a weight of 0.5 for each of the single item measures (Cleanliness, Quietness, Overall Hospital Rating and Recommend the Hospital). The HLMR is calculated at the second decimal place. Once the HLMR score is determined for an EPM participant, the hospital’s percentile of performance can be determined by applying the aforementioned methods to the linear mean scores for all IPPS hospitals with 100 or more completed surveys in a 4-quarter period. As previously noted, linear mean scores are publicly reported, but HLMRs are not. An EPM model participant can estimate the national distribution of HLMRs and the performance percentiles by using the Patient Survey Results in the Hospital Compare downloadable database found on Data.Medicare.gov, https://data.medicare.gov/data/hospital-compare?sort=relevance&tag=patient%20survey%20results, to calculate the HLMRs for all IPPS hospitals with 100 or more completed surveys in a 4-quarter period.

(g) Calculating the Rate and Performance Period

We proposed to be consistent with the HIQPR Program, which uses 4 quarters of data for HCAHPS (79 FR 50259). For the EPMs, we proposed to use the most recently available HCAHPS 4-quarter roll-up to calculate the HLMR score for the initial year of the EPMs. The proposed measure performance period is discussed in section III.E.5. of the proposed rule (81 FR 50794), and summarizes measure performance periods for performance years 1 through 5 of the EPM performance years.

We note that improvement on the HCAHPS Survey (#0166) measure would be determined from the measure performance period available for the year immediately preceding the EPM model performance year. We sought comment on this proposal to include the HCAHPS Survey (NQF 0166) measure in the EPMs to assess quality performance and capture patient experience of care.

The following is a summary of the comments received and our responses.

Comment: Several commenters did not support or were skeptical of the inclusion of HCAHPS because it is an overall measure of all patients receiving hospital services that is not specific to heart attacks, bypass surgery, or joint replacements. Therefore, HCAHPS does not reflect quality for targeted episodes of care. In addition, the measure is too narrow because it only encompasses patient experience during the inpatient hospital stay and does not capture information about patients’ experience later in the episode of care. For these reasons, commenters did not believe that the measure captures the correct information, and it will be of limited value to clinicians for quality improvement.

Response: We appreciate the concerns from the commenters about the breadth and population covered by this measure. Although the HCAHPS Survey encompasses a broader range of patients than the model episode definitions, we are not aware of evidence that such patients’ experience of care differs markedly from those of the larger group of eligible patients after patient-mix adjustment for service line (surgery) and age have been applied. Having all patients responding to the survey helps to inform hospitals on areas for improvement. From a survey implementation standpoint, it is not feasible to target only Medicare beneficiaries who had a specific surgery, or to calculate the HCAHPS Linear Mean Roll-up score on the basis of particular surgical patients. In addition to complicating the administration of the survey, the number of completed surveys from such a narrow set of patients would be, for many hospitals, too small to support reliable measurement or comparison. The inclusion of the HCAHPS Survey measure (NQF #0166) as currently implemented and the HLMR derived from it in these models will present participating hospitals with a further incentive to improve experience of care for all patients. HCAHPS, which was launched in 2006 and has been continuously administrated ever since, is familiar to over 4,000 hospitals. Modifications to the standardized implementation protocols would be disruptive to the other programs that employ HCAHPS data, such as the HIQR Program and Hospital Value-Based Purchasing program. We believe through the HCAHPS Survey measure (NQF #0166), CMS programs continue to highlight the importance of assessing patient experience of care.

Comment: Several commenters recognized patient satisfaction as an important component of quality and supported the use of HCAHPS as a way to measure patient feedback. One commenter appreciated CMS not creating a bar that is too high for the quality measures included in the EPMs.

Response: We thank the commenters for their support.

Comment: Several commenters were concerned about compounding penalties for the CJR participants that are also selected for participation in the SHFFT model. Commenters further noted that the HCAHPS survey is already a significant part of quality measurement through its inclusion in the Hospital Value Based Purchasing Program.

Response: We appreciate the commenters’ concerns regarding the inclusion of HCAHPS in multiple CMS programs. However, this measure aligns with our priorities to reduce AMI and CABG mortality and complications while improving patient experience, as well as our priorities to reduce major LEJR surgery complications while improving patient experience for SHFFT model beneficiaries, like those in the CJR model. Through HCAHPS, CMS programs continue to highlight the importance of assessing patient experience of care. Furthermore, this approach allows hospitals to align with other CMS hospital quality programs, including programs that tie payment to performance such as the HVBP Program, and streamlines EPM measures for EPM participants testing more than one EPM.

Comment: Several commenters recommended that CMS reduce the
weight percentage assigned to HCAHPS. One commenter suggested that HCAHPS should only be 15 percent of the overall quality score, whereas another commenter recommended a reduced, phased-in weighting at least for years 1 and 2.

Response: We believe that the proposed weight percentage assigned to HCAHPS is appropriate and a phased-in weighting is not necessary. Hospitals participating in these models have had several years of experience with the HCAHPS survey. Since July 2007, hospitals subject to the IPPS annual payment update provisions have been required to collect and submit HCAHPS data in order to receive their full annual payment update (71 FR 48037). Non-IPPS hospitals, such as CAHs, may voluntarily participate in HCAHPS. The incentive for IPPS hospitals to improve patient experience was further strengthened by the Patient Protection and Affordable Care Act of 2010 (Pub. L. 111–148), which specifically included HCAHPS’s performance in the calculation of the value-based incentive payment in the Hospital Value-Based Purchasing program beginning with October 2012 discharges. With respect to the HCAHPS Linear Mean Roll-up score measure that we proposed for the model, hospitals began receiving HCAHPS Summary Star Rating in their December 2014 Hospital Compare Preview Report. The HLMR is the basis for the HCAHPS Summary Star Rating; see HCAHPS Star Rating Technical Notes at http://www.hcahpsonline.org/StarRating.aspx. While the HLMR is a relatively new calculation from the existing measures, hospitals have been using the HCAHPS survey for many years and have had time to become familiar with it, with their results, and with their standing relative to other hospitals through information presented on the HCAHPS On-Line Web site such as the HCAHPS Percentiles tables (http://www.hcahpsonline.org/SummaryAnalyses.aspx). IPPS hospitals have available their HCAHPS scores’ relative rank compared to other hospitals participating in the HVBP program. As such, we believe that hospitals are familiar with their individual and relative performance on the HCAHPS Survey measure (NQF #0166).

Comment: One commenter expressed concern that inclusion of HCAHPS in the EPMS could negatively affect essential hospitals if used as part of the quality composite score used to determine hospital eligibility to receive reconciliation payments. The commenter stated that patients admitted through the ED report lower HCAHPS scores, thus essential hospitals with higher ED volumes might score lower despite the fact that their quality could be the same or better than other hospitals.

Response: We have examined the performance of “safety net” hospitals, sometimes referred to as “essential” hospitals, on the HCAHPS component of the HVBP program. Although we do not have an official definition or designation of “safety net” hospital, we understand that a safety net status typically entails one or more of three criteria: High Medicaid share; high proportion of uncompensated patients; and high county-associated poverty rate. In general, after all HCAHPS adjustments are applied (patient mix and survey mode), we believe that so-called safety net hospitals, as we understand the term, perform similarly to other hospitals. The current adjustment approach that CMS employs is both well-validated and necessary to ensure fair comparisons of HCAHPS scores across hospitals. When these adjustments are applied according to the rules currently in place, the performance of safety net hospitals for the HCAHPS portion of HVBP is typical of hospitals in general.

With respect to HCAHPS scores of patients admitted through hospital emergency departments, CMS is investigating whether participating hospitals could submit a valid and standardized administrative record regarding ED admission. When HCAHPS was developed, such an indicator was available and was employed in HCAHPS patient-mix adjustment, where it had a small, negative effect on HCAHPS scores. However, collection of this measure ceased several years ago due to misgivings about its validity.

Comment: One commenter requested that the Pain Management scores be included in the HCAHPS measure for CJR Performance Year 1. The commenter believed that removing the Pain Management scores diminish the importance of the role pain management plays in the recovery and sustained well-being of patients.

Response: We remain dedicated to improving the quality of care provided to patients, including the appropriate management of pain and communication between patients and their providers regarding pain. We continue to believe that pain control is an appropriate part of routine patient care that hospitals should manage and is an important concern for patients, their families, and their caregivers. Furthermore, we are unaware of any empirical evidence demonstrating that failing to prescribe opioids lowers a hospital’s HCAHPS Survey scores. However, we believe the potential confusion about the appropriate use of the Pain Management dimension questions, coupled with the public health concern about the opioid epidemic, warrants removing these questions from Hospital VBP Program scoring calculations until alternative pain management questions are available. In response to possible confusion about the Pain Management measure, we have finalized our proposal to remove this dimension from the Hospital Value-Based Purchasing payment formula beginning in FY 2018. However, CMS will continue publicly report the Pain Management measure on the Hospital Compare Web site because we continue to believe that pain control is an appropriate part of routine patient care that hospitals should manage and is an important concern for patients, their families, and their caregivers.

Comment: One commenter was concerned about the use of HCAHPS for PAC/LTC based practices as there are no current requirements to use skilled nursing facility patient satisfaction surveys. The commenter believed that the measure is not appropriate for PAC-based clinicians because in many situations the information source is not reliable due to the cognitive status of the patients being surveyed.

Response: Patients discharged to nursing homes and SNFs are excluded from HCAHPS survey administration because of the difficulty contacting such patients and consistently surveying them in a timely manner. We are not aware of evidence that patients discharged to a nursing home or SNF have different experience of care than other inpatients in the hospital. Only acute-care hospitals participate in the HCAHPS Survey, not long term care hospitals.

Comment: One commenter recommended that CMS make the HCAHPS Linear Mean Roll-up (HLMR) score publicly available in order to allow hospitals to not only know their HLMR score, but that of other hospitals in order to understand their percentile levels. The commenter further recommended that this data be released automatically and at least quarterly to facilitate hospitals’ ability to improve performance and assess financial risk.

Response: We appreciate the concerns from the commenters about the broad patient population covered by this measure. Although the HCAHPS Survey encompasses a broader range of patients than the model episodes, we are not aware of evidence that such patients’ experience of care differs...
markedly from those of the larger group of eligible patients after patient-mix adjustment for service line (surgery) and age have been applied. Having all patients responding to the survey helps to inform hospitals on areas for improvement. From a survey implementation standpoint, it is not feasible to target only Medicare beneficiaries who had a specific surgery, or to calculate the HCAHPS Linear Mean Roll-up score on the basis of particular surgical patients. In addition to complicating the administration of the survey, the number of completed surveys from such a narrow set of patients would be, for many hospitals, too small to support reliable measurement or comparison. The inclusion of the HCAHPS Survey measure (NQF #0166) as currently implemented and the HLMR derived from it in these models will present participating hospitals with a further incentive to improve experience of care for all patients. HCAHPS, which was launched in 2006 and has been continuously administered ever since, is familiar to over 4,000 hospitals.

Modifications to the standardized implementation protocols would be disruptive to the other programs that employ HCAHPS data, such as the HIQR Program and Hospital Value-Based Purchasing program. We believe through the HCAHPS Survey measure (NQF #0166), CMS programs continue to highlight the importance of assessing patient experience of care.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to include the HCAHPS Survey (NQF #0166) measure in the EPMs to assess quality performance and capture patient experience of care.

e. Potential Future Measures

CMS recognizes that there remain gaps in quality measures targeting AMI, CABG, and hip fracture care. Specifically with regard to hip fracture care, examples of potential measures suitable for consideration for inclusion in the SHFFT model in future performance years include: (1) Claims-based or hybrid risk-standardized hospital-level mortality, complication, and/or readmission measures intended for assessing hospital or provider performance for patients with hip fracture; and (2) patient-reported outcome data-based measures of functional status, symptom burden, number of days at home and/or return to home and/or independent living suitable for patients with hip fractures and/or patients undergoing total hip or knee arthroplasty as referred to in 79 FR 50259. Additionally, we would consider including measures of all—cause harm across the models in future years and appropriateness of procedures. CMS also recognizes that care for patients with AMI, CABG, and hip fractures extends across care settings and providers, and includes care provided by a multitude of clinicians and possible post-acute care facilities (for example, inpatient rehabilitation facilities, intermediate care facilities, and/or home health services). CMS welcomed comments on measure concepts for future measures that potentially could be included in the AMI, CABG, and SHFFT models, including measures that are attributable to acute care and post-acute care facilities and clinicians. CMS also welcomed information about existing patient-centered outcomes measures that address quality gaps relevant to the AMI, CABG, and SHFFT models. Any changes to the measures included in the AMI, CABG, and SHFFT models would be subject to future rulemaking.

The following is a summary of the comments received and our responses.

Comment: Several commenters recommended implementing quality measures across the care continuum, including post-acute care (PAC) and measures that address providers beyond the hospital that provides the surgery, such as Independence at Home, FQHCs, PCMHs, and ACOs.

Response: We appreciate the commenters for the suggestion to implement quality measures across the care continuum. We recognize that there are some gaps in the current proposed measures relative to other settings in which patients receive care post-hospital discharge during EPM episodes. We will take these recommendations into consideration in our measure development and testing efforts, as well as in our ongoing efforts to identify and propose appropriate measures for the payment models in the future.

Comment: Several commenters recommended the use of registries to report data for new measures. Commenters suggested measures from the Core Quality Measure Collaborative (CQMC) Cardiovascular and Orthopedic core quality measures set, National Cardiovascular Data Registry (NCDR) measures, and the STS CABG Composite Score.

Response: We thank the commenters for their recommendations. We believe that registries may facilitate valuable quality improvement feedback to hospitals. We note that many registry measures are proprietary. With that said, we agree with commenters that the STS CABG Composite Score is a comprehensive NQF-endorsed measure with strong potential to meaningfully improve quality. The STS CABG Composite Score measures surgical performance based on a combination of 11 NQF-endorsed process and outcomes measures. We also note that 7 of the 11 NQF-endorsed process and outcomes measures are used for the Physician Quality Reporting Program (PQRS) which promotes alignment of measurement across programs. We are incorporating the STS CABG composite measure (NQF #0069) data submission as a voluntary option weighted at 10 percent. By including this composite measure in the CABG EPM, we are reducing proposed HCAHPS and mortality weights by 5 percent each for those hospitals that voluntarily report the STS measure. We intend to address the weighting and the use of the actual measure score in the next EPM rulemaking cycle. For more information about the STS Composite Score, we refer readers here: http://www.sts.org/pts-public-reporting-online/cabg-composite-score.

Comment: Several commenters recommended that CMS explore the opportunity to develop and implement quality of life and patient reported outcome measures (PROMs). Commenters identified PROMIS Global, VR12, SAQ–7, PHQ–2, Rose Dyspnea Score, and International Consortium for Health Outcomes Measurement (ICHOM) recommended measures as candidates for future inclusion in the EPMs. Furthermore, two commenters supported the inclusion of PROMs in the SHFFT model and encouraged CMS to mandate the PROMs for the SHFFT model as soon as possible.

Response: We thank the commenters for their recommendations. We will take these into consideration as candidates for future inclusion in the EPMs and in our measure development and testing efforts.

Comment: One commenter encouraged CMS to include other CAHPS measures, such as GG–CAHPS and S–CAHPS.

Response: We thank the commenter for their recommendations.

Comment: One commenter supported holding hospitals financially responsible for quality and encouraged CMS to maintain the proposed measures.

Response: We thank the commenter for their support.

Comment: Several commenters recommended including functional status measures, such as functional status improvement from admission to discharge, Functional status change for
patients with Hip impairments (NQF 
#0423), and other NQF-endorsed functional outcome measures in the EPM models.

Response: We thank the commenters for their recommendations. We will take these into consideration as candidates for future inclusion in the EPMs and in our measure development and testing efforts.

Comment: Several commenters recommended that CMS consider 90-day measures and measures for high-impact areas including medication errors, hospital-acquired infections, and hospital-related injuries, such as surgical site infection (SSI) following hip fracture, complications rate following hip fracture, 90-day reoperations rate following hip fracture, percent of patients returning to pre-fracture ambulatory status at 90 days, length of stay following hip fracture, arrival to surgical procedure, and 30-day readmissions following hip fracture.

Response: We appreciate these comments, including the suggestions for priority areas for further measure development. CMS acknowledges that outcomes measures addressing a longer timeframe, such as 90 days, should be pursued. In developing measures that use a longer timeframe, CMS will conduct empirical analyses to ensure that such measures are scientifically robust and to identify appropriate risk-adjustment approaches. CMS will begin initial exploration of the suggested priority areas as well as review condition specific and procedure specific measure concepts. The timeline for this to occur is dependent upon several factors including expert panel review and comment periods, reliability, and validity testing, thus is varied and subject to change. This timeline ranges between 24–36 months, pending no major setbacks or delays outside of CMS control. Once such measures are fully developed, submitted for NQF endorsement and available, CMS will consider the most appropriate time frame to incorporate these measures into the EPM quality payment methodology through future notice and comment rulemaking.

Comment: One commenter supported the use of shared decision-making measures. The commenter believed that patients and their family caregivers should have the opportunity to receive all relevant information, review all options, weigh the benefits and potential drawbacks, to make the best decision. We will take this measure concept into consideration in our ongoing measure development and testing efforts.

5. Form, Manner, and Timing of Quality Measure Data Submission

We believe it is important to be transparent and to outline the form, manner and timing of quality measure data submission. We believe that measure results are provided to hospitals, and that timely and accurate calculation of measure results are consistently produced to determine annual reconciliation payment. We proposed that data submission for Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) Hospitalization (NQF #0230)(MORT–30–AMI); Excess Days in Acute Care after Hospitalization for an Acute Myocardial Infarction (AMI Excess Days); Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery (NQF # 2558)(MORT–30–CABG); and Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) (NQF #1550)(Hip/Knee Complications) be accomplished through the existing HIQR Program processes. Since these measures are claims-based measures, hospitals will not need to submit data.

We proposed that the same mechanisms used in the HIQR Program to collect HCAHPS Survey (NQF #0166) measure data also be used in the AMI, CABG, and SHFFT models (79 FR 50259). For the hospitals that voluntarily submit data for the Hybrid AMI mortality measure, we anticipate, if it is technically feasible, for data submission processes to be broadly similar to those summarized for the HIQR Program for electronic clinical quality measures. We proposed to allow hospitals to submit the data elements using either QRDA–I or to submit to data elements using a simpler spreadsheet in performance year 1. We proposed to require hospitals to submit data elements using only QRDA–I in performance years 2 through 5. We would create a template for data reporting, provide a secure portal for data submission, and provide education and outreach on how to use these mechanisms for data collection and where to submit the Hybrid AMI voluntary measure data. The NPRM proposes to use a simple spreadsheet in year 1 and QRDA–I files in subsequent years, whereas participants submitting AMI voluntary data will receive hospital-specific reports that detail submission results from the most recent performance period. The commenter believes this scenario requires extra work and puts burden on providers for different implementation solutions. The commenter requests additional information on how standardized the spreadsheets will be, as well as who will specify the format.

Response: We thank commenters for their suggestion to align standards across our programs. We agree that it is important to align these data collection requirements to reduce burden on hospitals and improve interoperability. We will take this feedback into consideration as we shape future proposals for hybrid measures.

One of the main tenets of the 2015 Edition Health IT Certification Criteria final rule (80 FR 62601) is to facilitate greater interoperability for several clinical health information purposes and enable health information exchange through new and enhanced certification criteria, standards, and implementation specifications. We note that we have worked closely with ONC to enhance testing and validation of certified technology’s ability to capture, exchange, and report electronic patient data, such as through improved testing and certification through the Cypress CQM testing and certification tool. As another example, we note that ONC proposed a 2015 Edition “CQM—report” certification criterion in the FY 2016 IPPS/LTCH PPS proposed rule that sought stakeholder input on the standards for representing and reporting CQM data in certified health IT to improve the reliability and consistency of such data reporting (80 FR 24614). Furthermore, the 2015 Edition criteria related to eCQMs offer increased data portability and user
access using the established QRDA standards. Because of the support for testing and certification offered by ONC and their certification tools and programs, the widespread deployment of the QRDA standard and CMS’ own recent experience that QRDA can provide superior clinical data for assessing quality and performance, we will finalize our selection of QRDA–I as the primary reporting standard for the EPM Model Rule for program years 1–3. If QRDA–I cannot be available to all participants for year 1, we will make a transitional submission format available to systems using a spreadsheet-based approach that will allow these sites additional time to meet the QRDA-based reporting requirements. We thank commenters for their continued support of improving the electronic reporting process and plan to continue to make improvements as standards evolve.

Comment: One commenter requested that CMS conduct an analysis of any performance differences resulting from the transition to ICD–10 for the measures used in the EMPs, and for CMS to make these analyses publicly available.

Response: The AMI EDAC, AMI and CABG 30-day mortality measures all have 3-year measurement periods. Because ICD–10 implementation began in October 2015, measure results calculated for program years 1 through 5 of the EMPs will be based on a combination of ICD–9 and ICD–10 coded claims. Therefore, CMS cannot provide hospitals with any meaningful comparative results with ICD–9 claims alone or ICD–10 claims alone. CMS continues to test ICD–10-based measure specifications to ensure ongoing validity of the measures. CMS provides analysis of claims data for each new performance year added to the 3-year period in the measures’ Annual Updates and Specifications Reports posted on QualityNet each April during the IPPS notice of proposed rulemaking. Comment: Several commenters expressed concern regarding the administrative burden imposed by the proposed data submission. One commenter stated that the current submission process is highly manual, as data must be entered for each patient separately into the CMS spreadsheet. The commenter suggested a portal in which data can be uploaded and validated monthly with greater efficiency than the spreadsheet. Another commenter encouraged the use of measurement instruments which can be administered electronically to reduce burden.

Response: We appreciate the commenters’ concern, however, as stated in 81 FR 50910, for the Hybrid AMI mortality measure, we proposed to allow to submit the data elements using either QRDA–I or to submit data elements using a simpler spreadsheet in performance year 1. We proposed requiring the hospitals to submit data elements using only QRDA–I in performance years 2 through 5. We disagree that increased burden is placed on providers in that there are options to use either QRDA–I or simpler spreadsheet in performance year 1. The purpose of the option to use a simpler reporting format (spreadsheet) is to allow hospitals to perfect data extraction with the 2017 data and postpone mastery of reporting in the QRDA format to the following year. CMS would create a template for data reporting, provide a secure portal for data submission, and provide education and outreach on how to use these mechanisms for data collection and where to submit the hybrid AMI voluntary data. We proposed the same mechanisms used in the HIQR Program to collect HCAHPS Survey measure data also be used in the AMI, CABG, and SHFFT models (79 FR 50259).

Comment: One commenter expressed concern about collecting quality data that may not yield meaningful results. The commenter recommended a delay in collecting and reporting quality data for the EMPs until CJR data can be examined to ascertain its utility and determine whether it provides robust quality information.

Response: We note that we currently have broad experience with pay-for-performance in Medicare programs, including the HRRP, HVBP Program, HAC Reduction Program, and the Shared Savings Program. These pay-for-performance programs have improved the quality of care for Medicare beneficiaries. For example, since the implementation of HRRP in 2012, readmission and complications rates for various medical conditions such as elective THA/TKA have been significantly reduced, thereby resulting in improvements in the quality of care for Medicare beneficiaries undergoing joint replacement procedures. Furthermore, pay-for-performance is a feature of a number of Innovation Center models currently in testing. We refer readers to section III.D.5. of the CJR Final Rule (80 FR 73473) for further discussion of public reporting of pay-for-performance data during performance year 1 of the model. We have developed and adopted a variety of new quality measures in programs through bundling since 2011, as well as gained experience with pay-for-reporting and pay-for-performance in a variety of models and programs involving a wide range of health care providers and clinical conditions. Given our extensive experience over the past several years with pay-for-performance approaches, the availability of existing measures that reflect the quality of care for AMI, CABG, and SHFFT episodes, and the breadth of the EMPs, which reaches substantially all IPPS hospitals in the selected MSAs, including those hospitals who otherwise would not participate in a voluntary payment model, we believe that a pay-for-performance approach is necessary and appropriate beginning in the model’s first performance year. IPPS hospitals have substantial experience over multiple years with CMS programs that include pay-for-performance and we believe, given the proposed quality measures for the EMPs, that AMI, CABG, and SHFFT pay-for-performance in episode payment models is a natural extension to bundled payment of pay-for-performance measures used in current CMS programs. While we acknowledge that pay-for-performance is not the only way for a model to heighten a focus on maintaining or improving the quality of care, we believe that the EMPs, like other Innovation Center models should target both improved quality and reduced costs. Based on our experience in other programs and models, we believe that pay-for-performance under the EMPs shows great promise in moving participant hospitals toward greater efficiency and higher quality care. In view of successful implementation of pay-for-performance in other CMS hospital programs using similar quality measures that has resulted in significant improvements in the quality of care, we believe IPPS hospitals have sufficient experience to be ready for pay-for-performance under the AMI, CABG, and SHFFT models.

We expect that other features of the model design, including our plans for data sharing, will help participant hospitals committed to care redesign toward these goals achieve success on both quality and cost performance for episodes. We note that the quality measures finalized for the model as discussed in section III.E.2 of this final rule rely upon data that hospitals are already submitting and which are already analyzed by CMS for other programs, so we see no reason to adopt a period of pay-for-reporting for the first performance year of the model or longer. In the proposed rule, we considered a similar policy that would not penalize hospitals with regard to their eligibility for reconciliation...
payments for failure to meet the proposed quality measure thresholds in performance year 1. However, we continue to believe that adopting pay-for-reporting and not pay-for-performance in performance year 1 or longer would be inappropriate given that two of the proposed quality measures are administrative claims based measures and impose no additional reporting burden on hospitals, the proposed measures are all established measures in existing CMS quality programs, and a central goal of the EMPs is improving care for Medicare beneficiaries. In this regard, the EPMs are different from some other CMS value-based initiatives where the data for some measures were newly submitted by providers or newly analyzed by CMS early in the initiative. Furthermore, we do not believe that participant hospitals need a year of pay-for-reporting to develop systems for analyzing episode claims under the model, as we expect hospitals to already be focused on improving their performance on these measures. The measures finalized for the EPMs are aligned with the goals of the models, are familiar to hospitals based on their use in other CMS hospital programs, and are aligned with CMS priorities to reduce mortality and complications while improving the patient experience. Because the measures reflect these goals and accurately measure hospitals’ level of achievement and improvement on quality outcomes that are important to beneficiaries, we are finalizing our proposal to implement a pay-for-performance approach in the AMI, CABG, and SHFFT models in the first performance year by using quality performance in the episode payment methodology.

Comment: One commenter recommended clarification on the PROM, specifically the Veterans RAND 12 Item Health Survey (VR–12) data submission requirement to accommodate for the handling of missing data elements consistent with proven methods in the scientific literature as it determines if a hospital has successfully met its reporting threshold.

Response: We thank the commenter for their suggestion. One of the generic health-related quality of life assessment survey that hospitals can use is the Veterans RAND 12 Item Health Survey (VR–12). Hospitals who elect to use this survey instrument must report patient responses to all of the questions; that is, all 14 questions from this survey. Twelve questions or items (i.e., question groups 1–7) in the survey are used to calculate two scores, a “Physical Health Summary Measure (PCS-physical component score)” and a “Mental Health Summary Measure (MCS-mental component score).” Two additional questions are included as anchor questions that CMS will use to gauge the clinical significance of a (physical and/or mental health) change following an intervention. Likewise, hospitals who elect to use the other generic health-related quality of life assessment, the PROMIS-Global, must also report patient responses to all of the questions to be considered for the successful voluntary reporting of the PRO and risk variable data component of the SHFFT model.

Comment: Several commenters believed that measures should be collected at intervals more immediately post-surgery and more routinely afterward throughout the 6 month post-discharge duration. One commenter further noted that a participant hospital’s quality performance must be considered in parallel with its financial performance and these components be compared, in tandem, to a pre-EPM baseline.

Response: The measures proposed for the AMI, CABG, and SHFFT models use a 3-year reporting period and are updated annually. The 3-year reporting period ensures that hospitals have a sufficient number of cases for a reliable and valid estimate of their risk-adjusted outcome rate. The measures are not designed for more frequent reporting of results. CMS does assess trends in hospitals’ performance on the proposed measures to identify potential unintended consequences in the HIQR program.

Comment: Several commenters were supportive of the proposed approach to reporting and data collection. Commenters stated that it demonstrates CMS’ effort to minimize administrative burden on providers when implementing new care models. One commenter appreciated that many of the proposed quality measures are currently being reported for the Inpatient Quality Reporting Program (IQR), thereby reducing additional reporting burden for hospital staff. Another commenter commended CMS for treating and separately bundling services for patients who fall under the SHFFT model rather than including them in CJR.

Response: We thank the commenters for their support.

Comment: Several commenters raised concerns about the proposed timeline for voluntary data submission in the SHFFT model. Specifically commenters were concerned that the data submission timeline did not align with the model performance years. The commenters suggested that the data submission deadline closely align with the start date of the model so CMS can receive relevant data and have time to analyze initial CJR changes to make necessary changes before implementation of SHFFT data collection.

Response: The intent of the proposed timeline for voluntary data submission for the SHFFT model is to reduce confusion by proposing to use the same 3-year rolling time periods for calculating readmissions and complications performance that are used in the hospital IQR program and to align the data collection timeline with the CJR model timeline starting in program year 1. CMS will assess data submitted for the CJR model and will consider any necessary changes in future rulemaking cycles for the CJR and SHFFT models.

Response: For the Hybrid AMI Mortality measure, CMS is seeking to risk adjust individual patients, thus we have specified QRDA–I, which describes patient level data, as the appropriate standard. The QRDA–III standard, which describes aggregate data, would not be appropriate for this purpose. One of the main tenets of the 2015 Edition Health IT Certification Criteria final rule (80 FR 62601) is to facilitate greater interoperability for several clinical health information purposes and enable health information exchange through new and enhanced certification criteria, standards, and implementation specifications. We note that we have worked closely with ONC to enhance testing and validation of certified technology’s ability to capture, exchange, and report electronic patient data, such as through improved testing and certification through the Cypress CQM testing and certification tool. As another example, we note that ONC proposed a 2015 Edition “CQM—report” certification criterion in the FY 2016 IPPS/LTCH PPS proposed rule that sought stakeholder input on the standards for representing and reporting CQM data in certified health IT to improve the reliability and consistency of such data reporting (80 FR 24613 through 24614). Furthermore, the 2015 Edition criteria related to eCQMs offer increased data portability and user access using the existing QRDA standards. Because of the support for testing and certification offered by ONC...
and their certification tools and programs, the widespread deployment of the QRDA standard and CMS’ own recent experience that QRDA can provide superior clinical data for assessing quality and performance, we will finalize our selection of QRDA–I as the primary reporting standard for the EPM Model Rule for program years 1–3. If QRDA–I cannot be available to all participants for year 1, we will make a transitional submission format available to systems using a spreadsheet-based approach that will allow these sites additional time to meet the QRDA-based reporting requirements.

Comment: Several commenters raised concerns about the proposed timeline for voluntary data submission in the SHFFT model. Specifically commenters were concerned that the data submission timeline did not align with the model performance years. The commenters suggested that the data submission deadline closely align with the start date of the model so CMS can receive relevant data and have time to analyze initial CJR changes to make necessary changes before implementation of SHFFT data collection.

Response: The intent of the proposed timeline for voluntary data submission for the SHFFT model is to reduce confusion by proposing to use the same 3-year rolling time periods for calculating readmissions and complications performance that are used in the hospital IQR program and to align the data collection timeline with the CJR model timeline starting in program year 1. CMS will assess data submitted for the CJR model and will consider any necessary changes in future rulemaking cycles for the CJR and SHFFT models.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to collect EHR data through either QRDA–I or through a simple spreadsheet in performance year 1 and to collect EHR data through only QRDA–I in performance years 2 through 5.

The proposed quality measure performance periods for required and voluntary reporting measures by the performance year of the AMI, CABG, and SHFFT models are displayed in Tables 41, 42, 43, 44, and 45.

6. Display of Quality Measures and Availability of Information for the Public

From the AMI, CABG, and SHFFT Models

We believe that the display of measure results is an important way to educate the public on hospital performance and increase the transparency of the model. We proposed to display quality measure results on the Hospital Compare Web site (http://www.hospitalcompare.hhs.gov). We believe that the public and hospitals are familiar with this Web site and how the information is displayed. The proposed measures have been displayed on Hospital Compare over the past few years. Finally, we believe that the public and hospitals' familiarity with the Hospital Compare Web site will make it simpler to access data. We sought comment on this proposal.

The following is a summary of the comments received and our responses.

Comment: Several commenters supported the proposal to publicly report hospitals' EPM quality performance data on Hospital Compare.

Response: We thank the commenters for their support.

Comment: Several commenters expressed concern that the description of data publicly displayed on Hospital Compare should accurately reflect performance. Rather than placing hospitals with insufficient volume on a quality measure at the 50th percentile in the "Good" category, it should be placed in a separate category noting that there was insufficient volume to determine a performance score. One commenter further suggested that hospitals be provided an opportunity to preview and offer corrections to data provided by CMS before reporting on Hospital Compare.

Response: While we understand the concerns of the commenter that we have no actual outcome measure results for certain hospitals, we continue to believe it would be unfair to disadvantage a participant hospital in the pay-for-performance methodology of this model based on insufficient number or no applicable cases alone and, therefore, we will assign these hospitals to the 50th performance percentile, which is the middle of the national measure performance distribution, and assign quality performance points to the participant hospital accordingly based on the performance percentile scale identified in Table 41.

We note that the Hospital Compare Web site is the vehicle that provides public reporting and within this Web site we indicate that this Web site fulfills section 1886(b)(3)(B)(viii)(VII) of the Act, as amended by section 3001(a)(2) of the Affordable Care Act, which requires the Secretary to establish procedures for making information regarding measures submitted available to the public after ensuring that a hospital has the opportunity to review its data before they are made public. Prior to the release of data on Hospital Compare, hospitals are given the opportunity to review data during a 30-day preview period via the QualityNet Secure Portal (http://www.qualityreportingcenter.com/wpcontent/uploads/2015/07/IQR_FY-2017_Hospital-IQR-Program-ReferenceChecklist_Tool_7.21.2015_FINAL508.pdf). With respect to the HCAHPS Survey measure (NQF #0166), CMS similarly provides hospitals with their confidential preview reports on a quarterly basis, before the results are publicly reported on Hospital Compare Web site (http://www.hospitalcompare.hhs.gov/) (78 FR 50778).

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to display quality measure results on the Hospital Compare Web site (http://www.hospitalcompare.hhs.gov).

Regarding the voluntary PRO data collection, because we are collecting the data required to develop a future PRO-based performance measure that will assess hospital quality of care for patients undergoing elective primary THA/TKA procedures, we do not plan to publicly report on Hospital Compare.

For the STS CABG Composite measure, which is voluntary for year one, we intend to publicly report if operationally feasible. We plan to utilize notice and comment rulemaking if CMS decides to require this measure in the future and will thus discuss plans for public reporting.

F. Compliance Enforcement and Termination of an Episode Payment Model

1. Overview and Background

The following discussion details the enforcement mechanisms we proposed to make available to CMS for the EPM when an EPM participant or certain other individuals or entities fails to comply with the requirements of the model.

Section 510.410 established that CMS will enforce the CJR model requirements against CJR participant hospitals, and will hold each participant hospital responsible for its own and its CJR collaborators' compliance with CJR model requirements. Given that CJR participant hospitals may receive reconciliation payments, and may choose to distribute or share those
payments with their CJR collaborators, CMS believes that enhanced scrutiny and monitoring of CJR participant hospitals was necessary and appropriate. We also noted in the CJR Final Rule (80 FR 73464) that by making the CJR participant hospitals responsible for compliance with the model, CMS indirectly will be accounting for CJR collaborators’ compliance, in addition to any direct monitoring of such CJR collaborators that HHS (including CMS and OIG) conducts. Furthermore, § 510.410 established that upon discovering an instance of CJR collaborator noncompliance with the CJR model, CMS, HHS, or a respective designee may take remedial action against the CJR participant hospital, including requiring the participant hospital to terminate a sharing arrangement with a CJR collaborator and to prohibit further engagement in the CJR model by that collaborator, and CMS may also increase a participant hospital’s repayment. Section 510.410 as well as section 1115A of the Social Security Act authorizes CMS to reduce or eliminate a participant hospital’s reconciliation payment as well as increase a participant hospital’s repayment amount. We proposed an enforcement structure for the EPM that will be consistent with the CJR model, as we believe the CJR model and the EPM share many of the same policy characteristics.

2. Compliance Enforcement for the EPMs

We proposed that CMS have authority to take remedial action against any EPM participant where the EPM participant or its EPM collaborator, collaboration agent, or downstream collaboration agent is not compliant with the applicable requirements as set forth in § 512.460(b)(1). These compliance tools will support CMS’ objectives for the EPM to maintain or improve quality of care, reduce program expenditures, safeguard program integrity, protect against fraud and abuse, and deter noncompliance with EPM requirements. Furthermore, preventing EPM participants from engaging in avoiding high-cost and high-severity patients or from targeting low-cost and low-severity patients will further CMS’ goals under the CR incentive payment model to reduce cardiovascular mortality, improve health-related quality of life, and reduce the risk of hospital admission.

Additionally, these compliance tools will support CMS’ aim under the EPM that beneficiaries receive complete and accurate information, including notices which promote increasing consumer engagement and freedom of choice. Given that EPM participants may choose to enter into sharing arrangements with EPM collaborators, those EPM collaborators may have distribution arrangements with collaboration agents, and those collaboration agents may have downstream distribution arrangements with downstream collaboration agents, we believe that enhanced scrutiny and monitoring of EPM participants and their EPM collaborators, collaboration agents, and downstream collaboration agents is necessary and appropriate in order to mitigate program integrity risks.

Similar to the CJR model, we proposed to hold the EPM participant responsible for its own and its EPM collaborators’ compliance with the EPM requirements. Additionally, in the EPM proposed rule we proposed to add EPM participant responsibility for the other individuals and entities with financial arrangements under the EPM. This was based in part on the proposed addition of ACOs and hospitals, including CAHs, as EPM collaborators. Specifically, because we proposed to allow additional entities and individuals to be EPM collaborators, collaboration agents, or downstream collaboration agents, we must have tools to address noncompliance with the requirements of the EPM by these entities and individuals as well. Overall, we concluded in the proposed rule that EPM participants should ensure that any entity or individual with a financial arrangement under the EPM complies with model requirements in order to safeguard program integrity.

We proposed that CMS have authority to take remedial action against an EPM participant if its related EPM collaborator, collaboration agent, or downstream collaboration agent fails to comply with the requirements of the EPM; has signed a sharing arrangement, distribution arrangement, or downstream distribution arrangement that is noncompliant with the requirements of the EPM; takes any action that threatens the health or safety of patients; avoids at-risk beneficiaries; avoids patients on the basis of payer status; is subject to sanctions or final actions of an accrediting organization or federal, state, or local government that could lead to the inability to comply with the requirements of the EPM; takes any action that CMS determines for program integrity reasons should have been taken to further the best interests of the EPM; is subject to action to redress an allegation of fraud or significant misconduct; or is subject to action involving violations of certain laws, rules, or regulations that are relevant to the EPM. Moreover, we proposed that for purposes of this provision, “failure to comply with the requirements of the EPM” would specifically include, but not be limited to, avoiding potentially high-cost or high-severity patients; targeting potentially low-cost or low-severity patients; failing to provide medically appropriate services or systematically engaging in the over- or under-delivery of appropriate care; failing to provide beneficiaries with complete and accurate information, including required notices; failing to allow beneficiary choice of medically necessary options, including non-surgical options; or failing to follow the requirements related to sharing arrangements.

Proposed remedial actions included issuing a warning letter to the EPM participant; requiring the EPM participant to develop a corrective action plan; reducing or eliminating the EPM participant’s reconciliation payment; requiring the EPM participant’s CR incentive payment; requiring the EPM participant to terminate a sharing arrangement with an EPM collaborator and prohibit further engagement by the EPM participant sharing arrangements with the EPM collaborator; and terminating the EPM participant’s participation in the EPM. Where a participant is terminated from the EPM, we proposed that the EPM participant would remain liable to CMS for all negative NPRA generated from episodes of care that occurred prior to termination. In addition, we noted that any information collected by CMS in relation to termination of a participant from the EPM would be shared with our program integrity colleagues at HHS, the Department of Justice, and their respective designees. We noted further that should an EPM participant, or one of its related EPM collaborators, collaboration agents, or downstream collaboration agents, be noncompliant with the requirements of the EPM or engage in unlawful behavior related to participation in the EPM, such information could be used in proceedings unrelated to the administrative enforcement mechanisms in this section. We believe these remedial actions are necessary tools to safeguard program integrity, including protecting against fraud and abuse and deterring noncompliance with EPM requirements.
In summary, we set forth in proposed § 512.460 that EPM participants must comply with all requirements outlined in part 512. We specified that, except as specifically noted in this part, the regulations under this part must not be construed to affect the applicable payment, coverage, program integrity, or other requirements under this chapter (such as those in parts 412 and 482).

Further, we proposed in § 512.460 that CMS may take remedial actions if an EPM participant or its related EPM collaborators, collaboration agents, or downstream collaboration agents:

• Fails to comply with any applicable requirements of this part or is identified as noncompliant through monitoring by HHS (including CMS and OIG) of the EPM, including but not limited to—
  ++ Avoiding potentially high-cost or high-severity patients;
  ++ Targeting potentially low-cost or low-severity patients;
  ++ Failing to provide medically appropriate services or systematically engaging in the over- or under-delivery of appropriate care;
  ++ Failing to provide beneficiaries with complete and accurate information, including required notices;
  ++ Failing to allow beneficiary choice of medically-necessary options, including non-surgical options; or
  ++ Failing to follow the requirements related to sharing arrangements.
• Has signed a sharing arrangement, distribution arrangement, or downstream distribution arrangement that is noncompliant with the requirements of this part;
• Takes any action that threatens the health or safety of patients;
• Avoids at risk Medicare beneficiaries, as this term is defined in § 425.20 of this part;
• Avoids patients on the basis of payer status;
• Is subject to sanctions or final actions of an accrediting organization or federal, state, or local government agency that could lead to the inability to comply with the requirements of this part;
• Takes any action that CMS determines for program integrity reasons is not in the best interests of the EPM, or fails to take any action that CMS determines for program integrity reasons should have been taken to further the best interests of the EPM;
• Is subject to action by HHS (including OIG and CMS) or the Department of Justice to redress an allegation of fraud or significant misconduct, including intervening in a False Claims Act qui tam matter, issuing a pre demand or demand letter under a civil sanction authority, or similar actions; or
  • Is subject to action involving violations of the physician self-referral law, civil monetary penalties law, Federal anti-kickback statute, antitrust laws, or any other applicable Medicare laws, rules, or regulations that are relevant to the EPM.

We proposed the remedial actions to include the following:

• Issuing a warning letter to the EPM participant.
• Requiring the EPM participant to develop a corrective action plan, commonly referred to as a CAP.
• Reducing or eliminating the EPM participant’s reconciliation payment.
• Reducing or eliminating the EPM participant’s CR incentive payment.
• Requiring the EPM participant to terminate a sharing arrangement with an EPM collaborator and prohibit further engagement by the EPM participant in sharing arrangements with the EPM collaborator.
• Terminating the EPM participant’s participation in the EPM. Where a participant is terminated from an EPM, the EPM participant will remain liable for all negative NPRA generated from EPM episodes that occurred prior to termination.

Furthermore, we proposed that CMS may add 25 percent to a repayment amount on the EPM participant’s reconciliation report if all of the following conditions are met:

• CMS has required a corrective action plan or is noncompliant with the EPM’s requirements.
• The EPM participant owes a repayment amount to CMS.
• The EPM participant fails to timely comply with the corrective action plan or is noncompliant with the EPM’s requirements.

The proposals for compliance enforcement were included in proposed § 512.460. We sought comment on our proposals.

The following is a summary of the comments received and our responses.

**Comment:** Several commenters acknowledged the need for remedial actions proposed by CMS under the EPM to address EPM participant noncompliance with EPM requirements. However, some commenters expressed concern about CMS’ proposal that EPM participants would be held responsible for the compliance of their related EPM collaborators, collaboration agents, and downstream collaboration agents. The commenters claimed that such an expansive accountability for the conduct of others would create a large regulatory and legal burden for the EPM participant, especially regarding collaboration agents and downstream collaboration agents with which EPM participants do not have direct contractual relationships. One commenter stated their belief that while EPM participants can and should validate that each EPM collaborator, collaboration agent, and downstream collaboration agent has a compliance program, EPM participants should not be responsible for the compliance of these individuals and entities with the requirements of the EPM. The commenter asserted that the compliance of these parties is essentially out of the EPM participant’s control when the individual or entity with a financial arrangement under the EPM is not owned or operated by the EPM participant. The commenter urged CMS to instead hold each EPM collaborator, collaboration agent, and downstream collaboration agent accountable for its own compliance with the requirements of the EPM or, at a minimum, to identify specific elements for which the EPM participant would be responsible for the compliance of its related EPM collaborators, collaboration agents, and downstream collaboration agents.

**Response:** We appreciate the concerns of some of the commenters regarding the potential burdens on EPM participants associated with accountability for the conduct of other individuals and entities, especially for those individuals and entities that do not have direct contractual relationships with the EPM participant. With regard to the commenter’s belief that EPM participants can and should validate that each EPM collaborator, collaboration agent, and downstream collaboration agent has a compliance program, we want to clarify that our proposal for financial arrangements would only require that an EPM collaborator have a compliance program that includes oversight of the sharing arrangement as proposed in § 512.500(b)(4). We did not propose to require that collaboration agents or downstream collaboration agents have a compliance program.

We note that under the EPM, the EPM participant is the sole entity that is financially accountable to CMS. It is only through an EPM participant that the opportunity exists for EPM collaborators, collaboration agents, and downstream collaboration agents to have financial arrangements under the EPM. In addition, because only EPM participants can generate internal cost savings and receive reconciliation payments and then choose to distribute those funds through gainsharing payments to EPM collaborators, we believe a focus on EPM participants is necessary and appropriate. Therefore,
the enforcement authority over the EPM participant is key to successfully implementing these models and ensuring program integrity.

We note that the Shared Savings Program regulations in § 425.210(b) and § 425.218 similarly permit CMS to hold ACOs accountable for not only the noncompliance of their ACO participants and ACO providers/suppliers but also for the noncompliance of any other individuals or entities performing functions or services related to ACO activities. Furthermore, CMS may terminate the participation agreement with an ACO when an ACO, ACO participants, ACO providers/suppliers, or other individuals or entities performing functions or services related to ACO activities fail to comply with any of the requirements of the Shared Savings Program under the regulations. The scope of the compliance enforcement authority in the Shared Savings Program is similar to our proposal to hold the EPM participant accountable for the noncompliance of its related EPM collaborators, collaboration agents, and downstream distribution agents.

In the EPM proposed rule and in this final rule, we provide our rationale for the EPM requirements that we proposed and are finalizing, which we believe are necessary to advance the goals of the EPM, protect beneficiaries from potential adverse consequences of the EPM, and provide program integrity safeguards for the Medicare program. We believe it is important that EPM participants, EPM collaborators, collaboration agents, and downstream collaboration agents consider these requirements holistically and determine how to best to achieve compliance. Thus, we will not identify only a subset of EPM requirements or the other proposed provisions to identify noncompliance specified in § 512.460(b)(1)(i) through (ix) for which we will hold the EPM participant responsible with respect to its related EPM collaborators, collaboration agents, or downstream collaboration agents.

Finally, we emphasize that entering into sharing arrangements is a choice that EPM participants may make, and EPM participants also have the choice as to whom to select as an EPM collaborator based on selection criteria developed by the EPM participant as specified in § 512.500(a)(3) and finalized in this final rule. In addition, EPM participants have the authority through their contracts with their EPM collaborators to address the conduct of collaboration agents and downstream collaboration agents.

Comment: One commenter asserted that the compliance enforcement provisions that CMS proposed will not protect EPM beneficiaries in a timely manner. The commenter observed that CMS specifically proposed to allow for termination of an EPM participant’s participation in the EPM or termination of a sharing arrangement when an EPM participant or its related EPM collaborator, collaboration agents, or downstream collaboration agent discriminates against at-risk Medicare beneficiaries by avoiding caring for them or takes an action that threatens patients’ health or safety. However, the commenter expressed concern that CMS did not appear to allow the termination of an EPM participant or termination of a sharing arrangement for an EPM participant or EPM collaborator, respectively, found to have purposefully steered a patient to a particular provider which it knew, or should have known, would fail to provide needed care. The commenter claimed that CMS’ proposal also did not address the termination of providers found to have deliberately administered substandard care. The commenter stated that termination or exclusion of poorly performing providers from the EPM is important because participants cannot ultimately control patient choice and where beneficiaries choose to go post-discharge. The commenter urged CMS to expressly allow for remedial action in the case of an EPM participant or an EPM collaborator who repeatedly withholds care as referenced in other parts of the proposed rule, or steers patients to particular providers which it knew, or should have known, would fail to provide needed care.

Response: We appreciate the commenter’s concern about protecting beneficiaries under the EPM from the potentially harmful consequences of withholding care, providing substandard care, or steering beneficiaries to particular providers who fail to provide needed care. These are serious concerns, and we believe that our proposal for compliance enforcement under the EPM allows CMS to take remedial action if any of these circumstances are discovered. We proposed in § 512.460(b)(1)(iii) that CMS may take remedial action against any EPM participant when the EPM participant or its related EPM collaborator, collaboration agent, or downstream collaboration agent takes any action that threatens the health or safety of patients. If an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent is found to have taken any action that threatens the health or safety of patients, including but not limited to, withholding care, providing substandard care, or steering beneficiaries to certain providers or suppliers who will fail to provide needed care, the regulations adopted in this final rule allow CMS to take remedial action. Moreover, CMS may take remedial action in response to actions that threaten health and safety that include the types of actions the commenter requested, including issuing a warning letter to the EPM participant; requiring the EPM participant to develop a corrective action plan; reducing or eliminating the EPM participant’s reconciliation payment; increasing the EPM participant’s repayment amount; reducing or eliminating the EPM participant’s CR incentive payment; requiring the EPM participant to terminate a sharing arrangement with an EPM collaborator and prohibit further engagement by the EPM participating in sharing arrangements with the EPM collaborator; or terminating the EPM participant’s participation in the EPM.

Comment: One commenter requested that CMS address how a patient’s clinical outcome may be considered when determining noncompliance with the requirements of the EPM. The commenter stated there could be scenarios where health care that may not be in the best interest of an EPM participant’s cost performance under the EPM may be clinically in the best interest of the patient.

Response: We appreciate the commenter’s concern that compliance enforcement take into account what is clinically in the best interest of the patient. We note that the types of noncompliance we identified in our proposal in § 512.460(b)(1)(i) included failing to provide medically appropriate services or systematically engaging in the over- or under-delivery of appropriate care or failing to allow beneficiary choice of medically necessary options, including non-surgical options. Each case of noncompliance determined based on the provisions in § 512.460(b)(1) will be considered on a case-by-case basis, and CMS will weigh both the financial interests of the Medicare program and the clinical needs of beneficiaries when determining the appropriate remedial action.

Comment: One commenter encouraged CMS to clarify the proposal in § 512.460(b)(1)(vii) that CMS may take remedial action if an EPM participant or its related EPM collaborator, collaboration agent, or downstream collaboration agent “takes
any action that CMS determines for program integrity reasons is not in the best interests of the applicable episode payment model, or fails to take any action that CMS determines for reasons of program integrity should have been taken to further the best interests of the EPM.’’ The commenter requested that in the final rule, CMS provide examples of actions that are not clear violations of existing fraud and abuse statutes that would fall into this category of noncompliance.

Response: The proposed provision in § 512.460(b)(1)(vi) where the commenter requested that CMS provide examples would allow CMS the flexibility to take remedial action where the EPM participant or its related EPM collaborator, collaboration agent, or downstream collaboration agent takes any action that CMS determines is not in the best interests of the EPM, or fails to take any action that CMS determines for program integrity reasons should have been taken to further the best interests of the EPM. This provision is purposefully structured to include noncompliance that is not a clear violation of existing fraud and abuse statutes. For example, an EPM participant could fail to respond to a request from CMS for records to enable the investigation into concerns about the potential selection of EPM collaborators based on the volume and value of referrals. In this scenario, CMS could determine that the EPM participant was noncompliant based on this proposed provision because the EPM participant failed to provide access to records so that the potential program integrity concerns could be assessed. Thus, CMS could take remedial action in this example by issuing a warning letter to the EPM participant regarding the need to supply the requested records. In another example, if an audit of claims for physicians’ services furnished to EPM beneficiaries by a collaboration agent found a high error rate in payment due to incorrect coding, CMS could determine for program integrity reasons that the coding errors of the agent are not in the best interests of the EPM. CMS could then take remedial action by requiring the EPM participant to develop a corrective action plan to address the coding errors.

Comment: One commenter expressed concern about the proposal in § 512.460(b)(1)(ix) that CMS may take remedial action involving the physician self-referral law, civil monetary penalties law, Federal anti-kickback statute, antitrust laws, or any other applicable Medicare laws, rules, or regulations that are relevant to the EPM. The commenter stated specifically that violations “of any other applicable Medicare laws, rules, or regulations that are relevant to EPM” is overly broad so that CMS should apply a reasonable knowledge standard to the EPM participant’s awareness of a collaborator’s involvement in such matters.

Response: We appreciate the commenter’s interest in the standard that CMS will apply for purposes of the proposed provision in § 512.460(b)(1)(ix) in identifying circumstances when an EPM participant or its related EPM collaborator, collaboration agent, or downstream collaboration agent is subject to action for violations of the specified laws, or any other applicable Medicare laws, rules, or regulations that are relevant to the EPM. However, we disagree with the commenter’s suggestion that CMS apply a reasonable knowledge standard to the EPM participant’s awareness of a collaborator’s involvement in such matters. We believe the information regarding whether an individual or entity is “subject to action” should be readily available to the EPM participant. EPM participants can also include provisions in their contracts to require that they be notified when such circumstances exist. Accordingly, we believe it is reasonable to expect that the EPM participant will be aware of all such circumstances when its related EPM collaborator, collaboration agent, or downstream collaboration agent is specifically subject to action involving violations of the physician self-referral law, civil monetary penalties law, Federal anti-kickback statute, antitrust laws, or any other applicable Medicare laws, rules, or regulations that are relevant to the EPM. Therefore, we believe that use of a bright-line standard is more appropriate to determine compliance with this provision, regardless of what specific individual or entity is subject to action for a violation.

Comment: One commenter recommended that CMS strengthen the accountability for EPM participants that are found to withhold or delay care by imposing a separate financial penalty that is independent of repayment responsibility. The commenter reasoned that an EPM participant that has already had to repay CMS the maximum percentage permitted under the EPM, that is, the stop-loss limit, will have little incentive to refrain from other potentially harmful cost-cutting strategies unless the EPM participant could be subject to a separate financial penalty that is not subject to the EPM stop-loss limit.

Response: Given the proposed compliance tools for the EPM, as well as the existing laws and regulations that prohibit care stunting, provision of substandard care, or denial of medically necessary care, we believe that it is unnecessary to implement a process for a separate financial penalty outside of the compliance tools that we proposed. When an EPM participant or its related EPM collaborator, collaboration agent, or downstream collaboration agent engages in these noncompliant behaviors, CMS may take remedial action, including reducing or eliminating the EPM participant’s reconciliation payment or reducing or eliminating the EPM participant’s CR incentive payment amount. In addition, under circumstances where CMS has required a corrective action plan, the EPM participant owes a repayment amount to CMS, and the EPM participant fails to timely comply with the corrective action plan or is noncompliant with the EPM’s requirements, we proposed that CMS may add 25 percent to a repayment amount on an EPM participant’s reconciliation report. We are clarifying in regulation in this final rule that the 25 percent is a penalty.

Moreover, we note that in accordance with the provisions finalized in § 512.305(d) for determination of the reconciliation payment or repayment amount, we first calculate the NPRA for a performance year that is adjusted, if applicable, for the stop-loss or stop-gain percentage that applies. Next, we add in the results from the post-episode spending and ACO overlap calculations, if applicable, for the prior performance year. Finally, we adjust the reconciliation or repayment amount as described in §§ 512.460(b) and (c). Thus, the potential financial penalty of up to 25 percent of the repayment amount on an EPM participant’s reconciliation report if certain conditions are met is not subject to the EPM stop-loss limitation. Therefore, the EPM participant has a continuing financial incentive to refrain from other potentially harmful cost-cutting strategies that could lead CMS to apply this financial penalty even if that EPM participant already has to repay CMS the maximum percentage permitted under the stop-loss limitation under the EPM. We believe this structure for the financial penalty is consistent with the request of the commenter.

Final Decision: After consideration of the public comments received, we are finalizing the proposals in § 512.460 for
compliance enforcement, with modification to clarify that the 25 percent that CMS may add to the repayment amount under certain conditions is a penalty. The compliance enforcement provisions for the EPM are:

- EPM participants must comply with all of the requirements outlined in this part. Except as specifically noted in this part, the regulations under this part must not be construed to affect the applicable payment, coverage, program integrity, or other requirements under this chapter (such as those in parts 412 and 482 of this chapter).
- CMS may take one or more of the remedial actions set forth in this section if an EPM participant or its related EPM collaborator, collaboration agent, or downstream collaboration agent does any of the following:
  ++ Fails to comply with any requirements of this part or is identified as noncompliant through monitoring by HHS (including CMS and OIG) of the EPM, including but not limited to any of the following:
    - Avoiding potentially high-cost or high-severity patients.
    - Targeting potentially low-cost or low-severity patients.
    - Failing to provide medically appropriate services or systematically engaging in the over- or under-delivery of appropriate care.
    - Failing to provide beneficiaries with complete and accurate information, including required notices.
    - Failing to allow beneficiary choice of medically necessary options, including non-surgical options.
    - Failing to follow the requirements related to sharing arrangements.
  ++ Has signed a sharing arrangement, distribution arrangement, or downstream distribution arrangement that is noncompliant with the requirements of this part.
  ++ Takes any action that threatens the health or safety of patients.
  ++ Avoids at-risk Medicare beneficiaries, as this term is defined in §425.20 of this chapter.
  ++ Avoids patients on the basis of payer status.
  ++ Is subject to sanctions or final actions of an accrediting organization or Federal, state, or local government agency that could lead to the inability to comply with the requirements and provisions of this part.
  ++ Takes any action that CMS determines for program integrity reasons is not in the best interests of the EPM, or fails to take any action that CMS determines for program integrity reasons should have been taken to further the best interests of the EPM.
  ++ Is subject to action by HHS (including OIG and CMS) or the Department of Justice to redress an allegation of fraud or significant misconduct, including intervening in a False Claims Act qui tam matter, issuing a pre-demand or demand letter under a civil sanction authority, or similar actions.
  ++ Is subject to action involving violations of the physician self-referral law, civil monetary penalties law, Federal anti-kickback statute, antitrust laws, or any other applicable Medicare laws, rules, or regulations that are relevant to the EPM.
  • Remedial actions include the following:
    ++ Issuing a warning letter to the EPM participant.
    ++ Requiring the EPM participant to develop a corrective action plan, commonly referred to as a CAP.
    ++ Reducing or eliminating the EPM participant’s reconciliation amount. Reducing or eliminating the EPM participant’s CR incentive payment.
    ++ Requiring the EPM participant to terminate a sharing arrangement with an EPM collaborator and prohibit further engagement by the EPM participant in sharing arrangements with the EPM collaborator.
    ++ Terminating the EPM participant’s participation in the EPM. Where a participant is terminated from an EPM, the EPM participant will remain liable for all negative NPRA generated from EPM episodes that ended prior to termination.
    • CMS may add a 25 percent penalty to a repayment amount on the EPM participant’s reconciliation report if all of the following conditions are met:
      ++ CMS has required a corrective action plan from the EPM participant.
      ++ The EPM participant owes a repayment amount to CMS.
      ++ The EPM participant fails to timely comply with the corrective action plan or is noncompliant with the EPM’s requirements.

3. Termination of an Episode Payment Model

We set forth in proposed §512.900 that CMS may terminate any EPM for reasons including, but not limited to, the following:

- CMS no longer has the funds to support the applicable model.
- CMS terminates the applicable model in accordance with section 1115A(b)(3)(B) of the Act. As provided by section 1115A(d)(2) of the Act, termination of the model is not subject to administrative or judicial review.

We did not receive any comments on these proposals.
a particular geographic area. For example, the state of Maryland has a unique payment system under Medicare, but that payment system does not create an alternative care delivery system, nor does it in any way impact beneficiary decisions. Moreover, we do not believe that an ability to opt out of a payment system is a factor in upholding beneficiary choice or is otherwise advantageous to beneficiaries or even germane to beneficiary decisions, given that the proposed EPMs will not increase beneficiary cost-sharing. However, we also believe that full notification and disclosure of the EPMs and their possible implications is critical for beneficiary understanding and protection. Further, it is important to create safeguards for beneficiaries to ensure that care recommendations are based on clinical needs and not inappropriate cost savings. This is particularly important when one entity is held accountable for payments across multiple provider settings as in the design of the proposed EPMs. It also is important for beneficiaries to know that they can raise any concerns with their physicians, with the 1-800–MEDICARE helpline, or with their local Quality Improvement Organizations (QIOs).

As with the CJR model and other episode-based payment models, the proposed EPMs will not limit a beneficiary’s ability to choose among Medicare providers or the range of services that will be available to them. Beneficiaries will continue to choose any Medicare participating provider, or any provider that has opted out of Medicare, with the same costs, copayments and responsibilities as they have for other Medicare services that are not included in an EPM episode. Although the proposed EPMs will allow EPM participants to enter into sharing arrangements with certain providers, suppliers, and ACOs and allow EPM participants to recommend to beneficiaries preferred providers and suppliers, within the constraints of applicable laws and regulations, EPM participants may not restrict beneficiaries to a list of preferred or recommended providers or suppliers that surpass any restrictions that already exist under current statutes and regulations. Moreover, an EPM participant may not charge any EPM collaborator a fee to be included on a list of preferred providers or suppliers, nor may the EPM participant accept such payments, which would be considered to be outside the realm of sharing arrangements. Although the emergent nature of some of the clinical conditions that are the focus of the proposed EPMs may limit beneficiaries’ abilities to plan the hospital where they will be treated for these conditions, such constraint should be no different than it will be in the absence of the EPMs. Thus, the proposed EPMs will not create any new restriction of beneficiary freedom to choose providers, including surgeons, hospitals, post-acute care providers, or any other providers or suppliers.

To specifically safeguard beneficiary freedom of choice in decision-making about care following hospital discharge, we proposed to require that, similar to CJR participant hospitals, EPM participants must, as part of discharge planning, account for potential financial bias by providing each patient with a complete list of all available post-acute care options in the applicable service area consistent with medical need, including beneficiary cost-sharing and quality information (where available and as applicable). We stated our expectation that the treating physician, as well as all other treating practitioners, would continue to identify and discuss all medically appropriate options with the beneficiary, and that the EPM participant will discuss the various facilities and providers available to meet the clinically identified needs. These proposed requirements for EPM participants would supplement the discharge planning requirements under existing CoPs. We also specifically note that neither the CoPs nor this proposed transparency requirement preclude EPM participants from recommending preferred providers and suppliers within the constraints created by current laws and regulations, as coordination of care and optimization of care are important factors for successful participation in the EPMs.

We invited comment on these proposals, including additional opportunities to ensure high quality care.

The following is a summary of the comments received and our responses.

Comment: Several commenters requested that beneficiaries be permitted to opt out of the EPMs. One commenter was concerned that a beneficiary may try to “opt out” by driving to another hospital that is not an EPM participant, thus restricting the beneficiary’s freedom of choice.

Response: In proposing that beneficiaries are not able to opt out of the EPMs, we meant that beneficiaries are not able to opt out of having their care, when furnished in an EPM episode, from which the EPM methodology. Once a beneficiary initiates an episode through admission to an EPM participant for a clinical condition that results in discharge from an MS–DRG that begins an EPM episode, their care is automatically included in the EPM and they are unable to opt out of having their care included in an EPM episode. In the geographic region of that EPM participant, the EPM is how Medicare pays for care for the clinical condition that is the focus of that EPM episode. Beneficiaries do have the choice to avoid their care being paid for under the EPM by choosing to be admitted to a hospital that is not an EPM participant, which would require that the hospital be in a different MSA that has not been selected for EPM participation. In some cases, such as elective CABG, a beneficiary may choose to travel to a hospital that is not a CABG model participant for surgery that is planned in advance if the beneficiary does not want his or her care to be paid for under the CABG model. However, in most cases under the proposed EPMs this choice is infeasible because beneficiaries with AMI or hip fracture are often transported to hospitals by emergency medical services that use transport protocols to determine the hospital that will receive the beneficiary. In other cases of AMI, even though beneficiaries may travel themselves to an emergency department, it is likely that the severity of AMI symptoms will lead them to go to the nearest hospital emergency department. Once the treatment plan for the hip fracture or AMI is established in the emergency department, to the extent that plan may include immediate admission for surgery or medical management, it is infeasible and unsafe for the beneficiary to choose to travel to another hospital at that point to avoid their care being included in an EPM.

By not allowing beneficiaries to opt out of having their care paid for under the EPM, this does not mean that their right to choose or decline otherwise covered Medicare items and services is limited. EPM beneficiaries retain their right to choose or decline items and services that are covered by Medicare. The EPMs are testing changes to how Medicare pays for care but, like Medicare payment systems, they neither define nor limit coverage, nor limit beneficiary choices to any specific covered services. In both the EPMs and other Medicare payment methodologies, providers are expected to not treat Medicare beneficiaries differently from other patients based on differences in Medicare payment. Moreover, the beneficiary safeguards adopted in this final rule ensure that the EPM payment structure does not disadvantage...
Medicare beneficiaries. We note that within traditional FFS Medicare we do not allow beneficiaries to opt out of any Medicare payment systems as payment systems exist to ensure appropriate payment for similar services across beneficiaries and across providers. Furthermore, because beneficiary cost-sharing is unchanged under the EPMs, it does not have a direct financial effect on beneficiaries and, therefore, minimizes any impacts on beneficiary freedom of choice.

We discuss in the next section our requirement for beneficiary notification under the EPMs that must contain an explanation of the model and how it may or may not impact their care; notification that the beneficiary retains freedom of choice to choose providers and services for the EPM episode (where those choices are especially relevant during the 90 days following hospital discharge); explanation of how patients can access care records and claims data through an available patient portal, and how they can share access to their Blue Button® electronic health information with caregivers; a statement that all existing Medicare beneficiary protections continue to be available to the beneficiary, including the ability to report concerns of substandard care to the QIOs and the 1-800-MEDICARE helpline; and a list of the providers and suppliers with whom the EPM participant has a sharing arrangement. We also require that individuals and entities with financial arrangements under the EPMs furnishing care to EPM beneficiaries provide notice to the beneficiary of the EPM’s structure and the existence of the financial arrangement. Even if the clinical condition of a beneficiary makes it unrealistic for the beneficiary to make an active choice about whether or not his or her care is included in an EPM episode, we believe the notification policies provide important safeguards to protect beneficiary freedom of choice and access to care throughout EPM episodes which continue for 90 days following discharge from the anchor hospitalization allows beneficiaries to understand the potential impact of the EPMs on their care and gives them the opportunity to understand the interests of all parties when they are presented with care recommendations that may lead to less costly care under the EPMs.

**Comment:** Many commenters commended CMS for providing beneficiaries with the ability to choose among Medicare providers and the range of services that would be available to them under the EPM. Some commenters were pleased that EPM participants may not limit beneficiaries upon hospital discharge to receiving services only from preferred or recommended providers. Other commenters believe that changes to beneficiary care patterns under the EPMs may result in beneficiaries not being given true choice to continue to receive care within their home community and advocated for stronger protections to ensure that this choice is available.

Several commenters provided suggestions about strategies CMS could employ to ensure that beneficiary freedom of choice is not being compromised under the EPMs. They encouraged CMS to monitor EPM episode claims data and publish these findings as part of the EPM evaluation to promote transparency and an understanding of the EPM’s effects. The commenters supported CMS’ proposal to review and audit hospitals if CMS has reason to believe an EPM participant is compromising beneficiary access to care. The commenters also recommended that CMS explore both the retrospective monitoring reviews discussed in the proposal rule, as well as the potential for real-time monitoring to provide more immediate information about EPM beneficiary care.

**Response:** We appreciate the support of the commenters for our proposal that beneficiaries retain their freedom to choose providers and suppliers, as well services, under the EPMs, in the context of the EPMs that encourage increased care coordination and clinical pathways that may improve the quality and efficiency of EPM episodes. We understand and share the interest of the commenters in ensuring that this freedom of choice is realized in practice in the experience of EPM beneficiaries, when the financial incentives under the EPMs may lead EPM participants and treating providers and suppliers to make specific treatment recommendations to advance the EPM goal of improving the quality and efficiency of care. We believe that our final policies for beneficiary notification, including our requirements for the provision of a list of post-acute care providers as part of discharge planning and for monitoring throughout the EPMs as discussed in sections III.G.3. through 6. of this final rule, provide important safeguards for EFM beneficiary freedom of choice.

Monitoring will help us to confirm that EPM beneficiary freedom of choice is not being restricted and to address timely issues of noncompliance by EPM participants or their related EPM collaborators, collaboration agents, or downstream collaboration agents that arise.

**Comment:** Many commenters provided a variety of perspectives on CMS’ proposal to require, as part of discharge planning and referral, EPM participants to inform beneficiaries of all Medicare participating post-acute care providers in an area and identify those post-acute care providers with whom the EPM participant has sharing arrangements, as well as the proposal that EPM participants may recommend preferred provider and suppliers, consistent with applicable statutes and regulations.

The commenters in favor of CMS’ proposal reasoned that it was most consistent with maintaining beneficiary choice under the EPMs, in the context of the financial incentives of the EPMs to reduce episode spending. However, even under CMS’ proposal, multiple commenters were apprehensive about the potential for patient “soft steering” between EPM participants and post-acute care providers to occur due to the incentives for EPM participants to reduce expenditures, which could result in shifting care or directing beneficiaries to low-cost providers that may provide substandard care. Several commenters were concerned that if an EPM participant reduced the number of preferred providers the EPM participant recommends in response to the financial incentives under the EPMs, patients may be required to travel further for care or be cared for by a provider that is not the best fit for their medical needs. A number of commenters recommended that CMS could mitigate the potential for soft steering by adding additional requirements for the information provided to EPM beneficiaries about post-acute care providers. One commenter urged CMS to institute such additional requirements for those preferred providers that are recommended by an EPM participant, including requiring that any preferred provider furnished enhanced services and/or higher quality services. Another commenter urged CMS to minimize steering by requiring hospitals to inform patients and their families of the post-acute care options in their geographic area, as well as the pros and cons of selecting a particular post-acute care provider, including the provider’s capabilities and limitations.

Other commenters disagreed with elements of CMS’ proposed requirements for the information that EPM participants must provide to beneficiaries as part of the discharge planning process. Some commenters objected to CMS’ proposal that the EPM participant provide each patient with a “complete list of all available post-acute care options in the applicable service
area,” arguing that a complete list may be difficult to keep current because post-acute care providers change often. Other commenters claimed that providing a complete list of post-acute care providers is not useful and will confuse and overwhelm beneficiaries when they receive this list, as well as a list of preferred providers and suppliers. The commenters pointed out that the complete list does not identify the quality of the post-acute care providers. As such, commenters suggested that EPM participants be permitted to provide a preferred list of post-acute care providers only, as long as that list is compiled based upon objective quality metrics which are explained to the beneficiary. Several commenters requested that CMS allow EPM participants to provide a list of post-acute care options based on the patient need.

The commenters who urged CMS to allow EPM participants to provide a preferred list also requested that all Medicare discharge planning requirements be waived since EPM participants are being held financially accountable for costs throughout the episode. The commenters contended that by receiving a targeted list of post-acute care providers to choose from, EPM beneficiaries would be more likely to engage in their follow up care. Alternatively, the commenters recommended that if CMS does not allow EPM participants to provide only a preferred list that EPM participants should be allowed to exclude certain post-acute care providers with poor quality performance from the complete list. They rationalized these suggestions by stating that continuity of care efforts may be hampered between EPM participants and preferred providers if beneficiaries choose to receive post-acute care services from providers on the complete list as opposed to the preferred list, particularly if those post-acute care providers have poor quality performance, yet the EPM participant is still responsible for the cost and quality performance of the EPM episode. The commenters further asserted that in order to align with the goals of the EPM to reduce cost and improve quality of care and care coordination through care redesign efforts, EPM participants should be permitted to collaborate with post-acute care providers by selectively targeting those post-acute care providers best able to meet the need for consistency of care and ongoing collaboration and communication with EPM participants regarding the care of EPM beneficiaries.

Other commenters in favor of providing only a preferred list believe this approach would make it easier for physicians to know which beneficiaries are in the EPMs and for which they are accountable. Several commenters urged CMS to allow hospitals, physicians, and post-acute care facilities to organize into provider teams that can better coordinate care for patients and improve adherence to treatment plans throughout the episode. The commenters were concerned about EPM participants that would be held accountable for EPM episode quality and spending if the patient chooses a sub-optimal post-discharge facility and believe that EPM participants should be able to recommend post-acute care providers that they have evaluated and work with to provide higher quality, lower cost care.

Response: Given the wide range of the commenters’ views, we believe that our proposed policy on the information about post-acute care providers that must be shared with beneficiaries as part of discharge planning and referral represents a middle position that appropriately balances transparency and beneficiaries’ need to be informed of their full range of post-acute care provider options to maintain freedom of choice, with EPM participants’ desire to inform beneficiaries of those post-acute care providers that are most efficient and provide the highest quality care.

We believe that requiring the provision of a complete list is most consistent with the CoP on discharge planning in § 482.43 and ensures that beneficiaries have full information about post-acute care providers in the area. To allow EPM participants to provide only a preferred list, even if that list were compiled based on objective criteria, could restrict beneficiary freedom of choice of providers and suppliers under the EPM and would be inconsistent with the discharge planning CoP on that basis. It could also increase the risk of patient “soft steering” between EPM participants and post-acute care providers due to the incentives for EPM participants to reduce expenditures, which could result in stunting on care or directing beneficiaries to low-cost providers that may provide substandard care. We did not propose to waive any aspect of the discharge planning CoP and continue to believe the CoP provides important protections for Medicare beneficiaries, including those in an EPM episode, regarding discharge planning, while the proposed EPM requirements are designed to supplement existing discharge planning requirements in the context of the episode. We also disagree with the commenters that providing a complete list of post-acute care providers in the area would reduce the likelihood of meaningful beneficiary engagement in follow up care as compared to their engagement if we were to permit EPM participants to provide only a list of preferred providers and suppliers.

Therefore, as we proposed we are requiring EPM participants to provide a complete list of post-acute care providers to EPM beneficiaries as part of discharge planning and referral, and we will not waive Medicare’s discharge planning CoP. EPM participants need to make sure the complete list provided to EPM beneficiaries is based on the most current, available information. There are publicly available sources that can be used to maintain and update complete lists of post-acute care providers in the area. Because such complete lists are required to be presented to patients for whom home health care or post-hospital extended care services are indicated and appropriate as determined by the discharge planning evaluation under the discharge planning CoP in the discharge planning and referral, we do not believe Medicare’s discharge planning CoP will not waive Medicare’s discharge planning evaluation under § 482.43. We believe that EPM participants already prepare such lists for many beneficiaries. Therefore, applying this requirement to all EPM beneficiaries with a medical need for a specific level of post-acute care services does not result in any significant additional administrative burden on EPM participants.

While we proposed to require that EPM participants provide each patient with a complete list of all available post-acute care options in the applicable service area consistent with medical need, we did not propose the parameters related to medical need in regulation. We agree with the commenters that the complete list of post-acute care providers presented to EPM beneficiaries should be based on medical need. For example, we do not believe it would be appropriate for an EPM participant to provide a complete list of SNFs to an EPM beneficiary as part of discharge planning and referral if SNF care would not be medically necessary for the beneficiary following hospital discharge. Therefore, we are clarifying in § 512.450(a)(1) that as part of discharge planning and referral, EPM participants must provide a complete list of HHAs, SNFs, IRFs, or LTCHs that are participating in the Medicare program in an area, and that this list must be presented to EPM beneficiaries for whom home health care, SNF, IRF, or LTCH services are medically necessary.
We further note that, while this list must include all post-acute care providers that meet the regulatory requirements and, therefore, may not exclude those post-acute care providers with poor quality performance based on the provisions of the EPM, we also proposed to require that the complete list include beneficiary cost-sharing and quality information (where available and as applicable), although we did not incorporate this in our proposed regulations. We do not believe it would be appropriate for the complete list to require that beneficiary cost-sharing and quality information be included due to the potential burden on EPM participants to prepare this additional information. However, we are confirming that EPM participants may provide beneficiary cost-sharing and quality information about post-acute care providers on the complete list, as long the EPM participant includes cost-sharing and quality information that is comparable for all the post-acute care providers on the complete list. Providing this information on only a subset of post-acute care providers on the complete list could be used to steer beneficiaries to certain post-acute care providers and that would be contrary to the purposes of transparency and beneficiary freedom of choice that are the underlying reasons for providing the complete list.

In response to the commenters who expressed concern that beneficiaries would be confused by the complete list of post-acute care providers, especially if also provided with a preferred list of providers, we believe that discharge planning involves discussions with beneficiaries and caregivers and that those professionals engaged in discharge planning, including the treating physician as well as all other treating practitioners, will continue to identify and discuss all medically appropriate options with the beneficiary to meet the beneficiary’s clinically identified needs. In addition, we expect that the EPM participant will discuss the various facilities and providers available to meet the clinically identified needs, taking into account patient and family preferences when they are expressed. We are confident that through these important discussions related to post-discharge planning EPM participants will be available to satisfactorily address any confusion on the part of beneficiaries and caregivers about the list(s) of post-acute care providers that the EPM beneficiary receives.

We proposed that EPM participants could also identify preferred providers and suppliers as part of the discharge planning and referral process, consistent with applicable statutes and regulations. This would allow EPM participants to provide information to EPM beneficiaries about high-quality, efficient providers that an EPM participant would prefer patients choose, on the basis of internal assessments of quality and cost. Because we recognize that there may be many high quality and efficient post-acute care providers and suppliers who do not enter into sharing arrangements with EPM participants, we do not believe that the EPM participant’s list of preferred providers and suppliers must include only EPM collaborators, nor do we believe that all EPM collaborators must be considered to be preferred providers and suppliers.

While we understand that some commenters would like us to additionally require that the preferred providers and suppliers recommended by the EPM participant be determined based on specific criteria such as the provision of enhanced services or higher quality care in order to further safeguard against steering in discharge planning, we believe that establishing such requirements would be overly prescriptive and is unnecessary. Because EPM participants are responsible for EPM episode cost and quality performance, and the EPM episode includes the period of time during which an EPM beneficiary would be receiving post-acute care services following discharge from the anchor hospitalization, EPM participants have a vested interest in recommending only those post-acute care providers on a preferred list that the EPM participant has reason to believe will provide care that will advance the EPM goals. Therefore, we do not believe it is necessary for us to set additional requirements for the list of preferred providers and suppliers beyond those already applicable under existing statutes and regulations because to do so would limit the flexibility of EPM participants to identify such preferred providers and suppliers. We recommend that EPM participants be transparent and that providers and suppliers are generally selected, and note that policies that define the relationships between the EPM participant and the physicians and post-acute care providers and suppliers in its region must be consistent with applicable laws and regulations, but we do not believe that the details of hospitals’ internal business processes must be disclosed.

Allowing EPM participants to recommend post-acute care providers on the preferred list to EPM beneficiaries, in addition to providing the complete list, meets the need of EPM participants for care redesign that improves the quality and reduces the cost of EPM episodes through collaboration with post-acute care providers that are best able to provide consistent care and ongoing collaboration and communication with EPM participants regarding the care of EPM beneficiaries, while not restricting beneficiary freedom of choice. We disagree that considerations of ease of physician identification and tracking of EPM beneficiaries should be a consideration in determining the lists of post-acute care providers that are provided to EPM beneficiaries as part of the discharge planning and referral process. EPM participants are accountable for EPM episodes and, therefore, have the primary responsibility for EPM beneficiaries.

We agree with those commenters who believe that hospitals, physicians, and post-acute care facilities that organize into provider teams may better coordinate care for patients and improve adherence to treatment plans throughout the EPM episodes. Our provisions for financial arrangements under the EPMs that are discussed in section III.I. of this final rule facilitate the financial alignment of providers, suppliers, and ACOs in care redesign that advances the goals of the EPMs. By allowing EPM participants to recommend to EPM beneficiaries post-acute care providers on a preferred list, while requiring transparency about the existence of sharing arrangements with post-acute care providers on the list and prohibiting EPM participants from charging fees or accepting payments from any EPM collaborator to be on the list, we expect that EPM participants will be able to capitalize on the care redesign work of such teams, without restricting beneficiary freedom of choice. EPM participants are able to recommend post-acute care providers on a preferred list that is developed in a way that is consistent with applicable statutes and regulations and who they have evaluated and work with to provide higher quality, lower cost care, as long as the financial relationships among the parties are disclosed.

Finally, since there is no requirement that the beneficiary receive post-acute care services from a provider on a preferred list, we do not believe the size of the preferred list will influence the distance an EPM beneficiary needs to travel for post-acute care services. The beneficiary may select any provider of post-acute care services for care, and the EPM participant must also provide a complete list of post-acute care...
providers in the area so that the beneficiary has complete information to make his or her choice.

Comment: Several commenters requested clarification of “in the area” in the context of the requirement that EPM participants must inform beneficiaries of all Medicare participating post-acute care providers in the area as part of discharge planning and referral because the proposed regulation did not define this phrase. The commenters observed that “in the area” could have different meanings for different EPM participants and beneficiaries. One commenter noted that for EPM participants that provide tertiary care, it would be unreasonable to require them to provide a complete list of post-acute care providers in the patient’s home service area when it is not the same service area as the EPM participant.

Response: As discussed in the proposed rule (81 FR 50915), the proposed requirement for EPM participants to inform beneficiaries of all participating post-acute care providers in an area as part of discharge planning and referral would supplement the discharge planning requirements under the existing CoP. The intention of this EPM requirement is to ensure that beneficiaries are given information about potential post-acute care options in a geographic area that is convenient to the beneficiary after discharge from the hospital. Therefore, for consistency with the complete lists of HHAs or SNFs already required for some patients in the discharge planning, we are requiring that EPM participants provide a list of HHAs, SNFs, IRFs, or LTCHs that are available to the EPM beneficiary, that are participating in the Medicare program, and that serve the geographic area (as defined by the HHA) in which the patient resides, or in the case of a SNF, IRF, or LTCH, in the geographic area requested by the patient. As discussed previously, this list must be presented to EPM beneficiaries for whom home health, SNF, IRF, or LTCH services are medically necessary. We have added to § 512.2 the definition of area that is the same definition used in the CoP for discharge planning. Area means “as defined in § 400.200 of this chapter, the geographical area within the boundaries of a State, or a State or other jurisdiction, designated as constituting an area with respect to which a Professional Standards Review Organization or a Utilization and Quality Control Peer Review Organization has been, or may be designated.” We note that we expect the SNF list provided to an EPM beneficiary would also include all rural hospital providers of SNF-level care in swing beds in the geographic area requested by the patient.

In response to the commenter who was concerned that it would be unreasonable to require EPM participants to provide a complete list of post-acute care providers in the patient’s home service area when it is not the same service area as the EPM participant, we note that this requirement already exists under the CoP for discharge planning for those Medicare beneficiaries who need a discharge plan and for whom home health care is indicated and appropriate as determined by the discharge planning evaluation. The EPMs simply extend this requirement to all EPM beneficiaries so we believe the provision of such lists is feasible for EPM participants. We emphasize that the EPMs do not restrict Medicare beneficiaries’ ability to choose to receive post-acute care services from any Medicare-enrolled provider, regardless of the geographic location of that provider.

Comment: Several commenters encouraged CMS to allow EPM participants to educate beneficiaries on where electronic listings of post-acute care providers can be found, rather than providing EPM participants with hard copy lists. The commenters suggested that beneficiaries could be provided with a notification advising where the complete, electronic list could be located, and that beneficiaries may receive a hard copy upon request.

Other commenters requested that CMS, rather than the EPM participant, provide a list of all Medicare-participating post-acute care providers through the CMS and/or MAC Web sites, as CMS already has this information. The commenters asserted that compiling, updating and providing this information is an administrative burden on EPM participants that could be better handled by CMS.

Response: We appreciate commenters’ feedback regarding the form and preparation of the complete list of post-acute care providers that EPM participants must provide to EPM beneficiaries based on medical necessity as part of discharge planning and referral. We believe it is imperative to provide the complete list, as well as a preferred list if applicable, in a written manner as part of discharge planning and referral. Beneficiaries may not have online access at the time of discharge planning, and we believe that the provision of respective lists is key to facilitating productive discharge planning discussions with beneficiaries and caregivers. EPM participants are welcome to post these lists on their Web site to supplement any hard copy list provided as a part of discharge planning and referral.

Finally, we believe that the EPM participant, rather than CMS, is in the best position to provide the complete list of post-acute care providers that is medically necessary for an EPM beneficiary. Because such complete lists are required to be presented to patients for whom home health care or post-hospital extended care services are indicated and appropriate as determined by the discharge planning evaluation under the discharge planning CoP in the discharge plan for patients who are likely to suffer adverse health consequences upon discharge if there is no adequate discharge planning under § 482.43, we believe that EPM participants already prepare such lists for many beneficiaries. In addition, we expect that the EPM participant will discuss with the EPM beneficiary the various facilities and providers available to meet the clinically identified needs, taking into account patient and family preferences when they are expressed and, therefore, the EPM participant is best-positioned to prepare the complete list and provide it to the EPM beneficiary.

Comment: Several commenters stated their belief that the best approach to avoiding patient steering and promoting patient choice is by educating the beneficiary about the EPMs and the effects on the care they may receive. Some commenters further requested that CMS mandate shared decision-making tools be used during the discharge planning process, such as a patient-decision aid to provide balanced, evidence-based sources of information about treatment options. Several commenters encouraged CMS to adopt more detailed requirements for an all-inclusive discharge planning process that engages a broad team of health professionals in the discharge decision-making process, considers the beneficiary’s personal health care goals and preferences in order to provide for better access to care, and does not lose sight of what best meets the needs of the individual patient, while still being cost-effective. One commenter urged CMS to specifically require that discharge planning involve an interdisciplinary team that incorporates expertise in all post-acute care capabilities.

One commenter who believes that discharge planning has historically been focused on getting the patient out of the hospital rather than any extended planning relative to post-hospital care
urged CMS to consider the wider and time-extended responsibility for post-hospital care planning that occurs under an EPM. The commenter requested that CMS require the EPM participant to offer advance care planning discussions as part of care planning that represents the evolution of hospital discharge planning to fit the needs of EPMs.

Other commenters requested that CMS provide a discharge planning notice template to ensure that discharge planning under the EPMs leads to successful transitions. One commenter further recommended that CMS soften the language in the CoP for discharge planning to enable more fruitful conversations between patients and their care teams, and ultimately more effective and efficient transitions of care.

Response: We appreciate the interest of the commenters in successful discharge planning for EPM beneficiaries that results in improved quality and reduced costs for EPM episodes. As discussed previously, we did not propose to waive any aspect of the discharge planning CoP and continue to believe the CoP provides important protections for Medicare beneficiaries, including those included in an EPM episode of care, regarding discharge planning, while the proposed EPM requirements are designed to supplement existing discharge planning requirements in the context of the EPMs. We believe that adopting additional requirements under the EPMs for discharge planning or care planning beyond those that currently exist under all applicable statues and regulations would be overly restrictive for EPM participants without providing additional, necessary beneficiary safeguards and is, therefore, unnecessary. Therefore, we will not require EPM participants to engage in specific additional activities such as advance care planning, use specific strategies such as shared decision-making tools, or involve specified teams of health professionals, beyond any existing requirements under applicable statutes and regulations. For these same reasons, we also decline to adopt the commenters’ suggestion that CMS provide a discharge planning template to EPM participants, as we believe such a template would be overly restrictive.

We expect that the accountability of EPM participants for the cost and quality of EPM episodes will lead them to work toward successful discharge planning that results in post-discharge services and beneficiary experiences that advance the EPM goals. As part of care redesign, we expect that EPM participants may make changes to their current discharge planning processes to improve care coordination and informed beneficiary decision-making to the extent these factors are expected to improve the quality and efficiency of EPM episode care and the revised approaches are consistent with all applicable statutes and regulations.

Final Decision: After consideration of the public comments received, we are finalizing the proposals in § 512.450(a) for beneficiary choice under the EPMs, with modification to clarify the complete list of post-acute care providers to be provided to the EPM beneficiary as part of discharge planning and referral. Additionally, we are finalizing the proposal that beneficiaries cannot opt out of having their care included in an EPM episode, without modification. The EPM beneficiary choice policies are the following:

- The EPMs do not restrict Medicare beneficiaries’ ability to choose any Medicare enrolled provider or supplier, or any physician or practitioner who has opted out of Medicare.
- As part of discharge planning and referral, EPM participants must provide a complete list of HHAs, SNFs, IRFs, or LTCHs that are participating in the Medicare program, and that serve the geographic area (as defined by the HHA) in which the patient resides, or in the case of a SNF, IRF, or LTCH, in the geographic area requested by the patient.

- This list must be presented to EPM beneficiaries for whom home health care, SNF, IRF, or LTCH services are medically necessary.
- EPM participants must specify on the list those post-acute care providers on the list with whom they have a sharing arrangement.
- EPM participants may recommend preferred providers and suppliers, consistent with applicable statutes and regulations.
- EPM participants may not limit beneficiary choice to any list of providers or suppliers in any manner other than that permitted under applicable statutes and regulations.
- EPM participants must take into account patient and family preferences when they are expressed.
- EPM participants may not charge any EPM collaborator a fee to be included on any list of preferred providers or suppliers, nor may the EPM participant accept such payments.

3. Beneficiary Notification

As we stated in the EPM proposed rule, we believe that beneficiary notification and engagement is essential because under the proposed EPMs, there will be a change in the way EPM participants are paid, which could affect the type of care or treatments beneficiaries receive. While we believe that existing Medicare provisions are effective in protecting beneficiary freedom of choice and access to appropriate care, we also believe that the additional safeguards implemented with the CJR model will also be appropriate under the proposed EPMs. We believe that appropriate beneficiary notification should—(1) explain the model; (2) advise beneficiaries and their families or caregivers of the beneficiaries’ clinical needs and care-delivery choices; and (3) clearly specify that any non-hospital provider holding a risk-sharing arrangement with the EPM participant should be identified to the beneficiary as a financial partner of such EPM participant for the purposes of services covered under the proposed EPMs’ episodes. Through these policies, we sought to enhance beneficiaries’ understanding of their care, improve their abilities to share in the decision-making, and give them the opportunity to consider competing benefits even as they are presented with cost-saving recommendations. We believe that appropriate beneficiary notification should do all of the following:

- Explain the model and how it may or may not impact their care.
- Inform patients that they retain freedom of choice to choose providers and services.
- Explain how patients can access care records and claims data through an available patient portal and through sharing access to care-givers to their Blue Button® electronic health information.
- Advise patients that all standard Medicare beneficiary protections remain in place, including the ability to report concerns of substandard care to Quality Improvement Organizations (QIO) and the 1–800–MEDICARE helpline.

However, we acknowledged that because of the emergent nature of admissions related to the clinical conditions that are the focus of the proposed EPMs, in particular the AMI and SHFFT models, many patients initially admitted for such episodes may not, at the time of admission, be capable of receiving appropriate notification. In addition, there may be situations in which it is not determined until after an admission that the patient’s care will be included in an EPM episode. In such situations, because the decision to admit may not be made in advance, it would be appropriate that the notifying entity be the EPM participant. Nonetheless,
consistent with CJR policy, we proposed that EPM participants must: (1) Require all providers and suppliers that execute EPM sharing arrangements with such EPM participants to share with beneficiaries or beneficiary representatives certain notification materials, to be developed or approved by CMS, that detail the applicable EPM; and (2) where feasible, provide such information in advance of admission for services included in EPM episodes. When, due to the emergent nature of the admission, it is not feasible to provide such notification in advance of admissions, we proposed that the EPM participant would be responsible for providing such notifications as soon as reasonably practicable but no later than discharge from the hospital accountable for the episode. Under our proposal, EPM participants would be required to provide such notifications as a condition of any EPM sharing arrangements. Where an EPM participant does not have such sharing arrangements with providers or suppliers that furnish services to beneficiaries during EPM episodes, or where admissions for covered episodes of care are ordered by physicians who do not have such EPM sharing arrangements, we proposed that the EPM participant must provide such beneficiary notification materials at the earliest time that is reasonably practicable but no later than discharge from the hospital accountable for the episode.

Further, we proposed that each participant of an ACO that has entered into a sharing arrangement with the EPM participant provide to each EPM beneficiary a written notice of the EPM’s structure and the existence of the ACO’s sharing arrangement with the EPM participant. Under this proposal, the ACO must require any ACO participant with which such ACO has relevant distribution arrangements, to provide the written notification. We proposed the ACO must provide such beneficiary notification no later than the time that the beneficiary first receives services from such ACO participant and/or an ACO PGP member collaboration agent during the EPM episode. We understand that various providers and suppliers, including hospitals, may be ACO participants; therefore, if, due to the emergent nature of a particular admission, it is not feasible to provide such notification in advance of such admission, the ACO participant would be responsible for providing such notification as soon as reasonably practicable but no later than discharge from the hospital accountable for the episode. The purpose of this proposed policy was to ensure that all beneficiaries who initiate EPM episodes and/or their designated representatives receive the beneficiary notification materials as early as possible. We believe that this proposal targeted beneficiaries for whom information is relevant, and increased the likelihood that patients would become engaged and seek to understand the EPMs and their potential impact on their care.

We also proposed that an EPM participant must provide the beneficiary with a written notice of any potential financial liability associated with non-covered services recommended or presented as an option as part of discharge planning, no later than the time that the beneficiary discusses a particular post-acute care option or at the time the beneficiary is discharged, whichever occurs earlier. We proposed that if the hospital knows or should have known that the beneficiary is considering or has decided to receive a non-covered post-acute care service or other non-covered service or supply, the hospital must notify the beneficiary that the service would not be covered by Medicare. Moreover, if the hospital is discharging a beneficiary to a SNF prior to the occurrence of a 3-day hospital stay, and the beneficiary is being transferred to or is considering a SNF that would not qualify under the SNF 3-day waiver discussed in section III.J.6.a. of the proposed rule (81 FR 50939 through 50941), the hospital must notify the beneficiary that he or she will be responsible for costs associated with that stay, except those which would be covered by Medicare part B during a non-covered inpatient SNF stay.

We proposed that all providers and suppliers that are required to provide notice to beneficiaries of the EPM model (participant and collaborator hospitals, PGCs, physicians, nonphysician practitioners, post-acute care providers and suppliers, and ACOs) must be able to, upon request by CMS, indicate compliance with the beneficiary notification requirements outlined in this section. The participant or collaborator should be able to generate a list of beneficiaries that received such notification and when the notification was received and provide it to CMS upon request. We noted that the method employed to document beneficiary notification may vary; for example, some hospitals and collaborators may retain a list of all beneficiaries that received the notification; document in the medical record that the beneficiary received the benefit notification; require the beneficiary to sign a notification form, add a barcode to the notification form to be scanned into the medical record; or employ another method of recordkeeping. Regardless of the method used for recordkeeping, the entity must be able to provide CMS with a list of all beneficiaries that received the notification materials in a specified time period. This requirement will aid CMS in monitoring EPM participant and collaborator compliance with the EPM notification requirements.

We noted that Medicare beneficiaries are accustomed to receiving similar notices of rights and obligations from health care providers prior to the start of inpatient care, or, as appropriate, under emergency conditions. In following the same guidelines established for the CJR model, we aimed to limit confusion and to provide consistent direction to hospitals which may be participating in both the CJR model and the EPMs. We invited comment on ways in which the timing and source of beneficiary notification might be modified to best serve the needs of beneficiaries without creating unnecessary administrative work for providers.

The following is a summary of the comments received and our responses.

**Comment:** A number of commenters stressed that education and counseling for patients and caregivers is crucial to patient outcomes. From the perspective of the commenters, when patients and caregivers receive real-time information from providers in language they can understand, patients and caregivers can then take on more active roles and participate more fully in the care patients receive and make more informed decisions. The commenters commended CMS for recognizing the importance of communication between providers, patients, and caregivers in favorably influencing health outcomes. In addition, the commenters agreed that beneficiaries should be adequately educated about applicable Medicare provisions for their care so that they can make informed choices about what care is appropriate for them. Most commenters were pleased that CMS proposed detailed beneficiary notification requirements that would require EPM participants and CJR hospital participants to advise patients and caregivers of care choices and explain how the EPMs or CJR model might impact the care they receive. One commenter suggested that detailed beneficiary notification should only be provided upon beneficiary request.

Other commenters stated that the proposed notification requirements imposed on EPM participants and CJR hospital participants would represent a significant unnecessary burden with no notable impact on beneficiary care. One
commenter stated that EPM beneficiary notification is unnecessary because providers and suppliers do not provide such notices under the IPPS when a beneficiary is admitted to the hospital. Another commenter stressed that the complexities of patient identification, attribution, and precedence rules make providing the correct notification at the correct time an operational barrier to successful beneficiary notification under the EPM. While several commenters agreed with the idea of promoting transparency for beneficiaries, from their perspective this ideal was outweighed by the administrative burden of beneficiary notification. The commenters stated that the beneficiary notification requirement will require investment in significant health IT resources to build the necessary tools and reminders in the Electronic Health Record in order to comply with the detailed notification requirement. Several commenters also objected to the proposed requirement that EPM participants furnish to CMS upon request the list of patients who received beneficiary notification and the date the notification was provided on the grounds that it is unduly burdensome. One commenter on the proposal for the CJR model requested that CMS delay the proposed requirement that CJR hospital participants be able to report beneficiaries who received notification until July 1, 2017, noting that it will take time for participants to develop and build information technology programs to retrieve the names of beneficiaries who have beneficiary notification, including the date received, for any period of time that CMS may request.

Other commenters urged CMS to be responsible for providing the detailed beneficiary notification to alleviate the administrative burden on EPM participants. Furthermore, because participation in the EPMs is required in the selected geographic regions, some commenters suggested that CMS be responsible for providing the beneficiary notification for this reason as well. The commenters speculated that CMS could provide the beneficiary notifications via the annual “Medicare & You” handbook that is mailed to all Medicare beneficiaries by adding an insert with the mailing clearly notifying the beneficiary of the Innovation Center models being tested in their MSA and describing how those models may impact beneficiaries who are admitted to a hospital with certain conditions or have certain procedures.

Response: We believe that providing full notification and disclosure of the EPMs or CJR model and the possible implications for beneficiaries’ access to care is essential to ensuring that beneficiaries understand the EPMs or CJR model, are protected from potential harm under the EPMs or CJR model, and maintain freedom of choice of providers and suppliers, as well as services, throughout EPM or CJR episodes. We previously finalized detailed beneficiary notification requirements for the CJR model in the CJR Final Rule (80 FR 73516 through 73521). We believe it is essential that this notification be specific to beneficiaries whose care is actually included in the EPMs or CJR model and provided in close proximity (or during) the EPM or CJR episode so it is meaningful to the beneficiary while he or she is receiving recommendations for care during the EPM or CJR episode. In addition, we believe that all beneficiaries whose care is included in an EPM or CJR episode should be provided with detailed information about the model, not just those beneficiaries who request such information. It is not possible for CMS to target notification to the specific Medicare beneficiaries who initiate an EPM or CJR episode; instead, the entity with the best, most timely information on a beneficiary’s status is the EPM participant or CJR hospital participant because the beneficiary’s EPM or CJR episode initiates at the EPM participant or CJR hospital participant.

Like the CJR model, the EPMs incorporate financial incentives for reducing the cost of care for all related items and services furnished to EPM beneficiaries during the anchor hospitalization and the 90 days post-hospital discharge. This payment methodology creates the potential for the unintended consequences of reduced access to care or care stinting that are not present under the IPPS, which provides a single payment to the hospital for a hospitalization, without regard to payments for Part B services during the inpatient hospitalization or payment for any Part A or Part B items or services furnished after hospital discharge. Thus, while such notification is not required under the IPPS, we believe the EPM detailed beneficiary notification requirement encourages care recommendations that are based on the clinical needs of beneficiaries and not on inappropriate cost savings. Moreover, we note that all existing Medicare beneficiary protections continue to be available to the EPM beneficiary. These include the ability to report concerns of substantiated care to the 1–800–MEDICARE helpline and the QIOs, where staff will be trained to assist EPM beneficiaries with any concerns they may have about their care under the EPMs.

While we understand that this detailed notification requirement places some additional burden on EPM participants and CJR hospital participants, we believe the value of the notification in protecting beneficiaries from harm and maintaining beneficiary freedom of choice outweighs this burden, given the potential for beneficiary steering and care stinting that may result from the financial incentives under the EPM or CJR model. Based on their early implementation experience with the CJR model, CJR hospital participants already have significant experience with similar detailed notification requirements to those we proposed for the EPMs and CJR model. We further note that EPM participants have experience with required notification of beneficiary rights and obligations upon hospital admission, and we expect EPM participants will draw upon this experience in operationalizing the beneficiary notification requirement for the EPMs. We encourage EPM participants to notify all beneficiaries under circumstances where it is likely that the beneficiary’s care will be included in the EPM, even if the EPM participant may be unable to be certain, in view of the rules around model attribution and precedence or the rapid pace of clinical care, in a timeframe that would otherwise allow timely beneficiary notification that meets the EPM requirements.

In response to those commenters who specifically objected to the proposed requirement that EPM participants provide to CMS upon request the list of beneficiaries who received notification and the date of that notification, this record access and retention requirement is the same as the requirement for other records under the EPMs where those records must be maintained and the Government provided access to enable audit, evaluation, inspection, or investigation as discussed in section III.H. of this final rule. Given the importance of beneficiary notification as a beneficiary safeguard under the EPMs, we must be able to monitor the sufficiency of such notifications. Additionally, regarding the request of one commenter that we delay implementing the proposed requirement that CJR hospital participants be able to provide information on beneficiaries notified upon request by CMS, as discussed in section V.H. of this final rule, the effective date of the full amended beneficiary notification regulations in §10.405 for the CJR
model is July 1, 2017, which is consistent with the commenter’s request for the delayed timing of the effective date of this requirement.

Comment: Several commenters provided their perspectives on CMS’ proposal for the contents and timing of the detailed beneficiary notification. The commenters urged CMS to adopt the proposed detailed notification elements, including a detailed explanation of the EPM and how it might be expected to affect the beneficiary’s care; notification that the beneficiary retains freedom of choice to choose providers and services; explanation of how patients can access care records and claims data; a statement about all existing Medicare beneficiary protections that continue to be available to the beneficiary; and a list of the providers and suppliers with whom the beneficiary has a sharing arrangement. One commenter suggested that the notification should highlight that participation in an EPM is intended to improve quality and reduce waste, rather than focus on notifying beneficiaries of sharing arrangements. Several commenters stated that while patients should be informed that they are receiving care from a hospital that is required to participate in the EPM, beneficiaries should not be given reason to be unnecessarily worried about the quality of care they will receive.

Some commenters suggested that the beneficiary notification be provided prior to admission for an anchor hospitalization. One commenter stated that notification at the point of admission for LEJR under the CJR model was too late because it would not occur at a time when beneficiaries could process and act on the information. Several commenters on the CJR model proposal for the detailed beneficiary notification recommended that the delivery of the notification to a beneficiary occur before admission to an anchor hospitalization, stating that notification could be provided by the admitting physician regardless of his or her participation in the CJR model as a collaborator or, alternatively, the CJR participant hospital could convey the notification prior to admission once the surgery is scheduled. Another commenter requested that CMS allow the beneficiary notification to be given at any time during a CJR episode, arguing that requiring providers to furnish beneficiary notifications prior to admission for surgery under the CJR model leads to additional administrative burden on providers.

Other commenters were concerned that given the emergent nature of some EPM episodes, notice may not always be able to be provided upon admission since MS–DRGs are not assigned to beneficiaries until the claim is coded and submitted for payment following the beneficiary’s discharge from the hospital. One commenter urged CMS to work with the provider community to identify exceptions where delivering a notification is not possible prior to discharge and create an exception to the detailed beneficiary notification requirement in these cases. The commenter provided the example of instances where patients are admitted and then subsequently transferred to another facility for a higher level of care, claiming that in this scenario there may not be time to provide the notification. As a result, the commenter believes that EPM participants may be penalized due to a clinical situation that is beyond their control.

Response: We appreciate the commenters’ support for the proposed elements of the detailed beneficiary notification. We do not believe that providing detailed notification to a beneficiary that his or her care is included in an EPM in a format that presents the proposed elements should lead to undue beneficiary concerns about the quality of their care, especially given the beneficiary safeguards that are being adopted for the EPMs. Given the importance of transparency of financial arrangements under the EPMs that have the potential to influence care recommendations for EPM beneficiaries, we disagree with the commenter that providing information on sharing arrangements that the EPM participant’s detailed notification to the beneficiary is unnecessary.

We have further considered the timing of the required detailed beneficiary notification in view of the public comments. For the EPMs, we proposed that the EPM participant must provide notification upon admission to the hospital or immediately following the decision to schedule a procedure or provide a service which would result in a patient being discharged under a covered episode. The proposed EPM regulation text specified that where, due to the patient’s condition, it may not be feasible to provide notification at such times, the notification must be provided to the beneficiary or his or her representative as soon as is reasonably practicable but no later than discharge from the hospital accountable for the episode. We believe this timing is generally appropriate and provides EPM participants and, similarly, CJR hospital participants with necessary flexibility regarding the timing of the detailed notification for beneficiaries with the clinical conditions that are the focus of EPM or CJR episodes. We disagree with the commenter who suggested that beneficiary notification could be provided any time during a CJR episode because it is important that beneficiaries be advised as early as possible in an episode (if not before the episode begins) that their care is included in an EPM or CJR episode, in order to safeguard beneficiary freedom of choice of providers and services and ensure the beneficiary’s understanding of how the model might be expected to affect the beneficiary’s care.

We believe that the earliest point in time that the detailed beneficiary notification could be provided by the EPM participant or CJR hospital participant is when the admission is scheduled in advance with the EPM participant or CJR hospital participant, consistent with the request of some commenters that the notification be provided prior to hospital admission for the anchor hospitalization. However, under the EPMs many admissions will be unscheduled due to the clinical conditions that are the focus of the EPM models and in those circumstances, beneficiary notification must be provided upon admission or as soon as is reasonably practicable but no later than discharge from the EPM participant accountable for the EPM episode. Similarly, while we believe that the detailed beneficiary notification under the CJR model should be provided by the CJR hospital participant that CMS holds financially responsible for the CJR episode rather than the admitting physician, the earliest point in time that this notification could be provided is when the admission is scheduled in advance with the CJR hospital participant, consistent with the alternative suggested by one commenter as an alternative to admitting physician notification of the model. This timing will allow beneficiaries with scheduled admissions to process and act on the beneficiary notification prior to the beneficiary’s admission to the hospital, although this notification timing is not possible for those admissions that are not scheduled in advance with the CJR hospital participant.

We note that in view of our final AMI transfer policy as discussed in section III.C.4.a.(5) of this final rule which cancels the AMI episode initiated at the initial treating hospital when the beneficiary is transferred to another hospital for care, the timing of notification issues raised by the commenter who urged CMS to allow for exceptions should no longer pose a concern. All beneficiaries in the AMI model will be discharged from the acute care hospital responsible for the AMI
episode so we do not believe exceptions to the detailed notification requirement are necessary. We expect that EPM participants will generally be able to identify EPM beneficiaries upon admission given the clinical conditions that are the focus of the EPMs. Moreover, in the case of any uncertainly about the MS–DRG that will ultimately be assigned to the beneficiary’s claim, we encourage EPM participants to provide notification to those beneficiaries whose care may be included in the EPM so that the notification requirement is met in the event the beneficiary’s care is ultimately included in the EPM.

Given that the EPM participant is required to provide the detailed notification, in our final regulations we are clarifying the requirements for the timing of the notification to be more specific based on whether or not the admission is scheduled in advance with the EPM participant. We note that scheduled admissions are especially relevant to CABG episodes and unscheduled admissions are relevant to AMI, CABG, and SHFFT episodes. If the admission is scheduled in advance, then the EPM participant must provide notice as soon as the admission is scheduled. The notification must be provided upon admission to the EPM participant if the admission that initiates the EPM episode is not scheduled with the EPM participant in advance. We believe this timing is appropriate because hospitals provide other information concerning patient rights and responsibilities upon admission to the hospital. In either case, in circumstances where, due to the patient’s condition, it is not feasible to provide notification at such times, the notification must be provided to the beneficiary or his or her representative as soon as is reasonably practicable but no later than discharge from the EPM participant accountable for the EPM episode.

We are also clarifying in §512.450(b)(1)(iv) that the disclosure of the EPM participant’s sharing arrangements as part of the detailed beneficiary notification may be satisfied if the EPM participant provides a web address where beneficiaries may access the list of providers, suppliers, and ACOs with whom the EPM participant has a sharing arrangement. Section 512.500(d)(1)(iii)(A), as we are finalizing it in this final rule, requires the EPM participant to publicly post (and update on at least a quarterly basis) on a Web page on the EPM participant’s Web site accurate current and historical lists of all EPM collaborators. We expect that allowing the detailed beneficiary notification to reference the Web site for the list of providers, suppliers, and ACOs with sharing arrangements will reduce the burden on EPM participants to prepare and keep current this element of the notification.

We are finalizing the elements of the detailed beneficiary notification in §512.450(b)(1), specifically a detailed explanation of the EPM and how it might be expected to affect the beneficiary’s care; notification that the beneficiary retains freedom of choice to choose providers and services; explanation of how patients can access care records and claims data through an available patient portal, and how they can share access to their Blue Button® electronic health information with caregivers; a statement that all existing Medicare beneficiary protections continue to be available to the beneficiary, including the ability to report concerns of substandard care to Quality Improvement Organizations or the 1–800–MEDICARE helpline; and a list of the providers, suppliers, and ACOs with whom the EPM participant has a sharing arrangement, which may be fulfilled by the EPM participant including in the detailed notification a web address where beneficiaries may access the list.

Comment: A few commenters expressed support for the proposed requirement that EPM participants and EPM collaborators disclose their financial relationships and interests to patients in the context of the structure of the EPM. Other commenters stated that CMS’ proposal would create an overload for EPM and CJR beneficiaries, result in administrative burden on providers, and be infeasible in some cases unless the EPM participant or CJR hospital administrator administers the notice on behalf of physicians. They also questioned the rationale for the differences in the proposed timing for such notices by different collaborators that resulted in a lack of uniformity, ranging from the time the decision to undergo a procedure or service covered under an EPM is made and no later than discharge from the hospital accountable for the episode to when the beneficiary first receives services from a provider or supplier associated with the party with the sharing arrangement. One commenter pointed out that CMS’ proposal that a physician who is an EPM collaborator notify the beneficiary of his or her sharing arrangement at the time that the decision to undergo a procedure or service covered under an EPM is made and no later than discharge from the hospital accountable for the episode makes providing timely notice impossible for an EPM collaborator who is a physician who does not furnish a service to the beneficiary until after hospital discharge. The commenter requested clarification about whether such a physician would need to provide notice to the beneficiary of the sharing arrangement and, if so, the timing of such notice. Another commenter asserted that it would be unlikely that certain providers with a sharing arrangement under the CJR model would practically be able to collect administrative documentation from the beneficiary about the notice in the course of clinical care, such as in the case of an independent hospitalist who only sees patients while they are admitted to the CJR participant hospital or an anesthesiologist who is working on improving operating room efficiency.

Several commenters recommended that beneficiary notices should only be provided once by the EPM participant or CJR hospital participant and should provide information on all individuals and entities with sharing arrangements under the EPM or CJR model. The commenters asserted that this approach to notices would make the beneficiary aware of all the individuals and entities with a sharing arrangement with the EPM participant or CJR hospital participant, without overwhelming the patient every time he or she sees a clinician or goes to a facility for care.

One commenter who opposed the collaborator notice requirement requested that CMS provide specific examples of when various EPM collaborators would need to provide notice if the policy is adopted. The commenter described the example of an ACO that has a sharing arrangement with a CABG model participant, and both an independent group of cardiothoracic surgeons and an independent group of primary care physicians are ACO participants who also have sharing arrangements with the same CABG model participant. If the notification requirement is finalized, the commenter requested that CMS clarify the notice requirements for the ACO and both physician groups with respect to a CABG beneficiary who receives included services from physicians in both groups during the CABG episode.

Response: We appreciate the support of the commenters for disclosure to EPM beneficiaries of EPM financial relationships between the EPM participant and other providers, suppliers, and ACOs. We agree that a single notice by the EPM participant to the beneficiary of all individuals and entities with sharing arrangements
under the EPM is important to provide disclosure of these financial arrangements that could potentially influence the recommendations of the EPM beneficiary’s treating providers and suppliers and, therefore, we are finalizing this requirement as part of the detailed beneficiary notification discussed previously. However, we believe it is necessary also to provide the EPM beneficiary with such information again at the time and in the context where the beneficiary can best use that information to evaluate the advice he or she is receiving from health care providers and suppliers based on the beneficiary’s specific knowledge of any financial interests of those providers and suppliers that could influence their recommendations. By providing additional notice of sharing arrangements specific to the care the beneficiary is receiving from the EPM collaborator and providing this notice in close proximity to when that care is being furnished during the EPM episode, the beneficiary will be better able to assess the recommendations from that individual or entity.

We have further considered the issues raised by the commenters about the potential for multiple notices to beneficiaries and the inconsistency of the proposed notice provisions for different types of EPM or CJR collaborators that would have had different timing during the EPM or CJR episode and might, therefore, have been difficult for EPM or CJR collaborators to comply with or been confusing to providers and suppliers treating EPM or CJR beneficiaries. We proposed different timelines for some of the required EPM notices, ranging from the time the decision to undergo a procedure or service covered under an EPM is made to the time when the beneficiary first receives a service from the entity or its related providers and suppliers that treat beneficiaries. We acknowledge that our timing proposal for collaborating physician, nonphysician practitioner, PGP, and hospital notice of sharing arrangements was a practical impossibility for these types of EPM collaborators if the individual or entity did not furnish a service to the EPM beneficiary prior to discharge from the hospital accountable for the EPM episode. Moreover, while our EPM proposal for ACO notices was intended to refer broadly to ACOs, the specific proposed regulation text regarding the timing appeared to narrow the notice scope to only those ACO providers/suppliers that are PGP with distribution arrangements, resulting in lack of uniformity for ACO notices. Additionally, while we proposed that physicians, nonphysician practitioners, PGP, post-acute care providers and suppliers, hospitals, and ACOs with sharing arrangements would be required to provide written notice to EPM beneficiaries of the structure of the EPM and the existence of the individual’s or entity’s sharing arrangement with the EPM participant, we did not address collaborator notice by providers or suppliers of outpatient therapy services or CAHs that we also proposed be eligible to be EPM collaborators.

We continue to believe that it is an important beneficiary safeguard to provide EPM and CJR beneficiaries with separate, specific notice of each sharing arrangement that has the potential to influence a provider’s or supplier’s care recommendations, even if that results in the beneficiary receiving multiple notices during an EPM or CJR episode. This rationale is applicable to all EPM and CJR collaborators. We also continue to believe that it is not feasible or necessary to require those individuals and entities with distribution arrangements and downstream distribution arrangements under the EPM or CJR model to provide notice to EPM or CJR beneficiaries. These other arrangements are not entered into directly with the EPM participant or CJR hospital participant and, therefore, they may not have the same potential for affecting clinical decisions.

Furthermore, to require an additional notice from each of these parties could greatly increase the number of separate notices to beneficiaries, potentially resulting in information overload and confusion that do not contribute to improved EPM or CJR beneficiary understanding and greater safeguards.

However, in response to concerns raised by the commenters about the uniformity and feasibility of the EPM collaborator notice requirements we proposed, we also are streamlining the EPM collaborator notice requirements. Specifically, we are adopting a provision of notice that are more equitable and consistent across all the individuals and entities with sharing arrangements under the EPM, as those individuals and entities are finalized in section III.I of this final rule, with a notice timeframe that is appropriate and practical for EPM collaborators. We believe our revisions clarify which parties are responsible for providing beneficiary notice of sharing arrangements and when such notice must be provided, and will minimize any confusion among providers and suppliers treating EPM beneficiaries. In our final beneficiary notice requirements discussed later in this section, we distinguish among EPM collaborators that are individual providers or suppliers that furnish items and services directly to EPM beneficiaries, and those EPM collaborators that do not directly furnish items and services to EPM beneficiaries, namely PGP, nonphysician practitioner group practices (NPPGPs), therapy group practices (TGP’s), and ACOs.

First, an EPM participant must require every EPM collaborator that furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the individual’s or entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from the EPM collaborator during an EPM episode. In circumstances where, due to the participant’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The EPM collaborator must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS upon request. We believe this notice requirement is feasible for all EPM collaborators that furnish items and services to EPM beneficiaries (that is, EPM collaborators other than ACOs, PGP’s, NPPGPs, or TGP’s) at any point in the EPM episode, including the circumstances raised by the commenter of an independent hospitalist with a sharing arrangement that only sees patients while they are admitted to the model participant or an anesthesiologist who has a sharing arrangement related to improving operating room efficiency. In the case of both of these physicians, the EPM participant must require the physician to provide written notice to the beneficiary of the structure of the EPM and the existence of the physician’s sharing arrangement when the beneficiary first receives an item or service from the physician during an EPM episode. If the physician with a sharing arrangement does not provide an item or service to the physician during an EPM episode, no notice is required. However, we point out that ultimately to be eligible to receive a gainsharing payment for an EPM performance year, the physician who is an EPM collaborator must have directly furnished a billable service to an EPM beneficiary during an EPM episode that occurred during the performance
year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment according to the requirement in §512.500(c)(2)(ii).

Second, an EPM participant must require every EPM collaborator that is a PGP, NPPGP, or TGP where a member of the PGP, member of the NPPGP, or member of the TGP furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any member of the PGP, member of the NPPGP, or member of the TGP and the required notice may be provided by that member. The PGP, NPPGP, or TGP must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS upon request. The required notice for a PGP, NPPGP, or TGP with a sharing arrangement need only be provided once to a beneficiary during an EPM episode. Different members of the same group who furnish items or services to the same beneficiary later in the EPM episode do not need to also provide notice.

Third, an EPM participant must require an EPM collaborator that is an ACO where an ACO participant or ACO provider/supplier furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any ACO participant or ACO provider/supplier and the required notice may be provided by that ACO participant or ACO provider/supplier. The ACO must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS upon request. The required notice for an ACO with a sharing arrangement need only be provided once to a beneficiary during an EPM episode. Different ACO participants or ACO providers/suppliers that furnish items or services to the same beneficiary later in the EPM episode do not need to also provide notice. We note that in the case of an ACO participant that is a group practice that bills for but does not itself directly furnish the first item or service to an EPM beneficiary from any ACO participant or ACO provider/supplier during an EPM episode, “the time at which the beneficiary first receives an item or service from any ACO participant” means the time when the beneficiary first receives an item or service that is billed by the ACO participant and furnished by a group practice member. In these circumstances, the required ACO notice may be provided by that group practice member.

These final notice provisions set forth a consistent framework for beneficiary notice of sharing arrangements that can be applied to all EPM collaborators, with additional details about the notice for those entities that can be EPM collaborators but that do not themselves directly furnish items and services to EPM beneficiaries. While a beneficiary may receive multiple notices of sharing arrangements during one EPM episode, we only require that each individual or entity that is an EPM collaborator provide notice once during the episode, including those circumstances where an EPM beneficiary receives items or services during an EPM episode from more than one member of the PGP, member of the NPPGP, or member of the TGP with a sharing arrangement or more than one ACO participant or ACO provider/supplier in an ACO with a sharing arrangement.

We believe this comprehensive framework clarifies the notice requirements for all EPM collaborators, and that it is feasible for EPM participants to require their EPM collaborators to provide notices that meet the requirements. However, we also appreciate that developing and coordinating the notice processes to fit within the course of clinical care, especially for those collaborators that never themselves directly furnish items and service to EPM beneficiaries, will require effort that is related to the number and complexity of the EPM participant’s sharing arrangements, the technological capacity of its collaborators to document and retain notices, the care patterns for EPM beneficiaries for which a particular EPM participant is responsible, and other issues. Nevertheless, as discussed previously, we believe that individual notice of sharing arrangements by each EPM collaborator to EPM beneficiaries is necessary, and we expect that the streamlined structure we are finalizing for these notices minimizes, to the extent possible, any additional burden on EPM participants and their related collaborators.

For purposes of illustration, we will stop through the application of these provisions to the commenter’s example of an ACO that has a sharing arrangement with a CABG model participant and both an independent group of cardiothoracic surgeons and an independent group of primary care physicians who are ACO participants who also have sharing arrangements with the same participating hospital. We note that this example results in a complex notice pattern that is highly unlikely to occur in practice, because we expect that in general the ACO would contract with the CABG model participant and then enter into distribution arrangements with its ACO participants, in this case the group of cardiothoracic surgeons and the group of primary care physicians, rather than all three entities contracting individually with the CABG model participant. In the example, both physician groups furnish included services to a CABG beneficiary during a CABG episode. We further assume that a member of the cardiothoracic surgery group furnishes a service to a CABG beneficiary during a CABG episode before a member of the primary care physician group. In this scenario, when the cardiothoracic surgeon furnishes the first service to the CABG beneficiary that is billed by the cardiothoracic surgery group, that surgeon is required to provide notice to the CABG beneficiary about the sharing arrangement of the group of cardiothoracic surgeons and the sharing arrangement of the ACO with the CABG model participant. When the primary care physician later in the CABG episode furnishes the first service to the CABG beneficiary that is billed by the primary care physician, the primary care physician is required to provide notice to the CABG beneficiary about the sharing arrangement of the group of primary care physicians with the CABG model participant. The beneficiary has already been notified about the ACO’s sharing arrangement.

Comment: Several commenters urged CMS to allow the required beneficiary notifications and notices by any individual or entity to be permitted on an electronic basis, with proof of receipt by the EPM beneficiary, rather than through a paper process that requires a beneficiary’s signature.

Response: We did not propose a written signature requirement in regulation. We agree that electronic health records may be used to maintain documentary evidence of written communications, and we have not specified a specific mechanism by which proof of beneficiary notification must be maintained.

Comment: Several commenters expressed support for CMS’ proposal that notification materials be developed...
or approved by CMS, because the commenters believe that allowing hospitals and other providers that stand to profit from the EPM to describe the EPM and how it might affect the beneficiary’s care is unlikely to result in objective information for consumers. The commenters requested that CMS provide samples of beneficiary notifications to be provided by EPM participants and samples of notices to be provided by post-acute care providers that are EPM collaborators. One commenter pointed out that there are cases where the determination of a procedure, either LEJR or a hip pinning for fracture, is not made until after the surgery is in process, so the commenter urged CMS to consider a combined CJR/SHFFT notice that will incorporate all needed elements and reduce confusion for patients.

Other commenters requested that CMS make available generic sample notices that could apply to all models in order to reduce confusion for beneficiaries, hospitals, physicians, and the general public. The commenters claimed that a single streamlined beneficiary notification for all models would relieve EPM participants of a large operational burden and ensure that beneficiaries receive appropriate notice related to the care they are receiving, without causing unnecessary confusion. Several commenters stressed that a sample notice will achieve a level of accuracy and consistency that would not occur with individual notice formats and contents devised by each EPM participant.

Response: We appreciate the interest of the commenters in streamlining the beneficiary notification materials that are used for the EPMs, as well as other models, in order to provide greater clarity for beneficiaries, providers and suppliers, and the general public. However, we do not agree that a single general notification could apply to all models, given the elements we are finalizing for the EPM detailed beneficiary notification as discussed previously in this section, which include an explanation of the EPM and how it might be expected to affect the beneficiary’s care. While we agree that certain beneficiary notification elements, such as notification that the beneficiary retains freedom of choice to choose providers and services, may be common across many models, other elements differ. Therefore, we cannot provide a single generic beneficiary notification document that applies across all models. Beneficiaries, providers and suppliers, and the general public with an interest in model notifications need to know about the specific model features and how the model might be expected to affect a beneficiary’s care.

We also appreciate the commenters’ interest in having CMS develop or approve the detailed beneficiary notification about the EPMs in the interest of transparency and accuracy of the information for beneficiaries, for whose benefit the notification is provided. We prepared a detailed beneficiary notification template for the CJR model which is currently used by CJR participant hospitals, and we similarly plan to prepare and make available prior to EPM implementation a detailed beneficiary notification template that EPM participants can use. While we appreciate that a combined notification template for the CJR and SHFFT models could be desirable in some circumstances, for expedience we recommend that if there is uncertainty about the hip fracture surgery that will be performed, the CJR/SHFFT model participant should provide both detailed model notifications to the beneficiary upon unscheduled admission to the hospital that initiates the episode.

We will also consider the possibility of preparing notice templates that may be used for individuals and entities with sharing arrangements under the EPMs that are required to provide notice to EPM beneficiaries. While we are not certain that a single notice is appropriate for all individuals and entities with these arrangements, or even for a single type of provider or supplier (such as a physician or SNF) with a sharing arrangement, we will continue to explore the option of making notice templates available to EPM participants for their related EPM collaborators to use.

Comment: A number of commenters provided recommendations about how CMS should monitor compliance with the beneficiary detailed notification and notice requirements. Some commenters suggested that monitoring could be carried out by a CMS contractor, such as a state survey agency or a QIO. Alternatively, the commenters asserted that a hospital private accrediting body could conduct the monitoring. The commenters recommended that monitoring should include submission of any model notice format and content to the monitoring entity in advance of its use, certification of assurances of compliance by EPM participants and individuals with EPM sharing arrangements, auditing of compliance within the first 30 to 60 days of EPM implementation or implementation of the revised notice requirements in the CJR model, and annual auditing of compliance thereafter. Additionally, several commenters expressed concern regarding the implications for the EPM participant should an EPM collaborator fail to provide their required notice to a beneficiary.

Response: We agree with the commenters on the importance of monitoring for the sufficiency of beneficiary detailed notifications and notices under the EPMs and CJR model. We appreciate the specific suggestions and will take them into consideration in developing the specific monitoring strategies for these notifications and notices as we refine the plans with the monitoring contractor that is currently engaged with us in monitoring the CJR model and the monitoring contractor that we expect to assist us with monitoring the EPMs.

Beneficiary notifications and notices as finalized in § 512.450(b) are requirements of the EPM and, as such, CMS may take remedial action if an EPM participant or one of its related EPM collaborators, collaboration agents, or downstream collaboration agents is noncompliant with the requirements of the EPM, including on the basis of failure to provide required beneficiary notices. As discussed in section III.F. of this final rule, we require the EPM participant to assume responsibility for compliance of all of these parties to ensure that its activities and those of its related EPM collaborators, collaboration agents, and downstream collaboration agents comply with EPM requirements, and our compliance tools for instances of noncompliance apply to EPM participants. We emphasize that entering into sharing arrangements is a choice that EPM participants may make, and EPM participants also have the choice as to whom to select as an EPM collaborator based on selection criteria developed by the EPM participant.

Final Decision: After consideration of the public comments received, we are finalizing the proposals in § 512.450(b) for required beneficiary notifications under the EPMs, with modification to streamline both the detailed beneficiary notification and EPM collaborator notice requirements, as well as to apply the EPM collaborator notice requirements to all individuals and entities with sharing arrangements under the EPMs. We emphasize that all information provided to beneficiaries must be in a form and manner which is accessible to the beneficiary, including those beneficiaries with disabilities and beneficiaries with limited English proficiency, consistent with applicable law and CMS policy. Required beneficiary notifications must:

• Each EPM participant must provide written notification to any Medicare...
beneficiary that meets the criteria in § 512.240 of his or her inclusion in the EPM. The notification must be provided upon admission to the EPM participant if the admission that initiates the EPM episode is unscheduled. If the admission is scheduled, then the EPM participant must provide notice when the decision to schedule admission is made. In circumstances where, due to the patient’s condition, it is not feasible to provide notification at such times, the notification must be provided to the beneficiary or his or her representative as soon as is reasonably practicable but no later than discharge from the EPM participant accountable for the EPM episode. The EPM participant must be able to generate a list of all beneficiaries receiving such notification including the date on which the notification was provided to the beneficiary to CMS upon request. The beneficiary notification must contain all of the following:

++ A detailed explanation of the EPM and how it might be expected to affect the beneficiary's care;

++ Notification that the beneficiary retains freedom of choice to choose providers and services;

++ Explanation of how patients can access care records and claims data through an available patient portal, and how they can share access to their Blue Button® electronic health information with caregivers;

++ A statement that all existing Medicare beneficiary protections continue to be available to the beneficiary. These include the ability to report concerns of substandard care to Quality Improvement Organizations or the 1–800–MEDICARE helpline;

++ A list of the providers, suppliers, and ACOs with whom the EPM participant has a sharing arrangement. This requirement may be fulfilled by the EPM participant including in the detailed notification a web address where beneficiaries may access the list.

• An EPM participant must provide every EPM collaborator to provide written notice to applicable EPM beneficiaries of the structure of the EPM and the existence of its sharing arrangement with the EPM participant.

++ Require every EPM collaborator that furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the individual’s or entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from the EPM collaborator during an EPM episode. In circumstances where, due to the

patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The EPM collaborator must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS upon request.

++ Require every EPM collaborator that is a PGP, NPPGP, or TGP where a member of the PGP, member of the NPPGP, or member of the TGP furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the entity’s sharing arrangement under the EPM. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any member of the PGP, member of the NPPGP, or member of the TGP, and the required notice may be provided by that member. In circumstances where, due to the patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The PGP, NPPGP, or TGP must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS upon request.

++ Require every EPM collaborator that is an ACO where an ACO participant bills for or ACO provider/supplier furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the entity’s sharing arrangement under the EPM. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any ACO participant or ACO provider/supplier and the required notice may be provided by that ACO participant or ACO provider/supplier. In circumstances where, due to the patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The ACO must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS upon request.

• An EPM participant must provide the beneficiary with a written notice of any potential financial liability associated with non-covered services recommended or presented as an option as part of discharge planning, no later than the time that the beneficiary discusses a particular post-acute care option or at the time the beneficiary is discharged, whichever occurs earlier.

++ Of any potential financial liability, associated with non-covered services recommended or presented as an option as part of discharge planning, no later than the time that the beneficiary discusses a particular post-acute care option or at the time the beneficiary is discharged, whichever occurs earlier.

• If the EPM participant knows or should have known that the beneficiary is considering or has decided to receive a non-covered post-acute care service or other non-covered associated service or supply, the EPM participant must notify the beneficiary that the service would not be covered by Medicare.

• If the EPM participant is discharging a beneficiary to a SNF prior to the occurrence of a 3-day hospital stay, and the beneficiary is being transferred to or is considering a SNF that would not qualify under the SNF 3-day waiver in § 512.610, the EPM participant must notify the beneficiary in accordance with paragraph (b)(3)(i) of this section that the beneficiary will be responsible for payment for the services furnished by the SNF during that stay, except those services that would be covered by Medicare Part B during a non-covered inpatient SNF stay.

• Lists of beneficiaries that receive notifications or notices must be retained and access provided to CMS in accordance with § 512.110.

4. Monitoring for Access to Care

Given that an EPM participant could receive a reconciliation payment when the EPM participant reduces average actual EPM-episode spending below the quality-adjusted target price and achieves an acceptable or better level of quality of care, the EPM participant could have an incentive to avoid complex, high-cost cases by not admitting patients at all or by transferring patients to nearby facilities or specialty referral centers that are not EPM participants. We intend to monitor the EPM participants’ episode claims data—for example, to compare each EPM participant’s case mix relative to a pre-model historical baseline—to determine whether complex patients are being systematically excluded from the EPM participant’s EPM episodes. We proposed to publish these data as part of each EPM’s evaluation to promote transparency and an understanding of the EPM’s effects. We propose to continue to review and audit EPM participants if we have reason to believe
that they are compromising beneficiary access to care. For example, we would review claims data to determine whether there is an unusual pattern of referral to regional hospitals located outside of the EPM participant’s catchment area or a clinically unexplained increase or decrease in CABG or rates of other related surgical procedures that do not initiate EPM episodes.

The following is a summary of the comments received and our responses. Comment: Many commenters emphasized that a beneficiary’s access to the full range of treatment options appropriate for a given medical condition is critical for positive health care outcomes to be achieved under the proposed EPMs. The commenters expressed support for CMS’ goals for the EPMs to encourage EPM participants and providers and suppliers caring for EPM beneficiaries to improve access to care, manage patients to better outcomes, and achieve improvements in the efficiency of care.

Several commenters expressed concern that the financial incentives under the EPMs will affect both patient selection and access to the most appropriate care for the individual beneficiary, especially because the EPM pricing methodology does not risk adjust EPM episode quality-adjusted target prices for patient demographic and disease characteristics. The commenters claimed that frail, elderly, disabled, sicker, and complex beneficiaries with multiple comorbidities who would be more likely to initiate EPM episodes due to the generally emergent nature of the clinical conditions that are the focus of the EPMs may experience unintended consequences such as problems with access to care, substandard quality of care, and care stinting because these patients commonly require more therapeutic interventions, thereby incurring higher costs, to achieve the best health outcomes. Specifically, the commenters speculated that EPM participants may avoid caring for beneficiaries likely to be complex, high-cost cases by delaying treatment, not admitting patients at all, or transferring patients to nearby facilities or referral centers that are outside of the EPM participant’s MSA that was selected for participation in the EPM. A few commenters expressed particular concern that small and rural hospitals that are EPM participants would avoid admitting frail patients in their home communities. Another commenter noted that cherry-picking for EPM beneficiaries requires prompt attention and early, accurate identification of beneficiaries. The commenter believes that in view of the multiple clinical scenarios and critical nature of the physical condition of most beneficiaries in the proposed EPMs, in many instances the process of identifying patients as being an EPM beneficiary will be a secondary concern to the importance of getting the beneficiary to the proper level of care regardless of inclusion or exclusion in an EPM, which may make patient selection less likely than in episodes in other models.

Many commenters believe the EPMs do not include sufficient safeguards to substantially improve the care experience for the many and growing numbers of Medicare beneficiaries. Some commenters urged CMS to delay testing the models, particularly the CABG model, until the benefits of such models can be proven.

Several commenters encouraged CMS to closely monitor EPM participants’ claims data for changes in referral and care patterns to ensure that complex patients are not excluded from the EPMs and for other changes that may indicate EPM participants are stinting on necessary and appropriate care. Some commenters stressed the particular importance of monitoring for beneficiary access to care because beneficiaries cannot opt out of the EPMs. One commenter recommended that CMS conduct audits, both internally and by an outside party, of a sample of patient medical records to determine whether the services actually received by beneficiaries in the proposed EPMs correspond to existing standards of care—and whether they also include innovative treatments and procedures appropriate for a beneficiary’s medical condition.

One commenter provided a detailed crosswalk of potential monitoring measures in the measure domains of beneficiary freedom of choice; access, quality, and cost of care; SHFFT participants’ coding for hip and femur fractures and “upcoding”; patient shifting; and EPM participants’ use of waivers and compliance with other rules. The commenter matched potential monitoring measures in these domains, such as beneficiary complaints in the freedom of choice domain, to the source of information for the measure, which in this example would be complaints registered to the 1–800–MEDICARE helpline and state QIOs. The commenter’s list of recommended sources of information for the monitoring measures was extensive and specific, including beneficiary surveys; claims data from EPM participants and EPM collaborators; claims data from EPM participants and EPM collaborators linked to provider of service and Medicare data on provider practice and specialty (MD–PPAS) files; agreements for financial arrangements; site visits, beneficiary engagement incentives documentation; financial records of reconciled payments and repayments; and claims data linked to post-acute care provider data sets.

Another commenter requested clarification about how CMS intends to monitor EPM participants and EPM collaborators for compliance other than through claims review for changes in utilization patterns. The commenter asserted that meaningful claims data required for oversight of the EPMs will not be available for years after the models have been implemented. In addition, the commenter stated that utilization patterns measure only one aspect of compliance.

The commenters urged CMS to strengthen the protections against EPM participants engaging in cherry-picking healthier patients and avoiding sick patients in order to give the appearance of improved EPM cost and quality performance. Several commenters also recommended that beneficiaries in the models should be informed of the hotlines available to convey grievances on care at each level of service during the episode. Some commenters supported CMS’ proposal to monitor compliance and to integrate the QIOs into the process as an entity available to handle beneficiary complaints.

Other commenters believe that any discoveries of problems with access to care should be publicly reported, and that EPM participants found to be participating in these practices should not be able to receive reconciliation payments. Another commenter urged CMS to strengthen the accountability of EPM participants by implementing a separate financial penalty for hospitals found to have deliberately withheld medically necessary care or steered a patient toward a health care provider known to be delivering substandard care. The commenter suggested that such a penalty should be sizable enough to act as a disincentive for hospitals and other providers that might consider stinting as potentially profitable. Response: We appreciate the commenters’ support for the goals of the EPM and agree that a beneficiary’s access to the full range of treatment options appropriate for a given medical condition should be maintained. We believe that the final design of the EPMs provides sufficient beneficiary protections that there is no need to
delay the EPMs and proceeding with testing beginning on July 1, 2017 as we proposed, coupled with close monitoring and the patient safeguards adopted in this final rule, is the most appropriate way to move quickly to gather new insights into the most effective strategies to improve the quality and reduce the cost of care through episode payment.

We also acknowledge that patient selection and underutilization are both potential issues related to access to care due to the financial incentives of the EPMs. With respect to underutilization, we agree that it is important to monitor changes in utilization patterns and case mix, and to generally monitor whether barriers to patient access develop in MSAs where hospitals are required to participate in the EPMs. We appreciate the extensive potential monitoring measures recommended by one commenter, many of which appear promising and where information will be available to operationalize these measures. We note that the sources of information for monitoring measures extend well beyond claims data to include information on beneficiary experience and outcomes that cannot be obtained through claims data. While there is necessarily some lag in the availability of claims data due to the timing of claims submission and processing, we disagree with the commenter who suggested it would be years after EPM implementation before meaningful claims data for oversight were available. For example, we will be analyzing claims data on an ongoing basis and will be performing the first reconciliation process 9 months after model implementation, for which we expect to have reliable claims data for EPM episodes during the first performance year. We will take the suggestions of monitoring measures provided by the commenters into consideration in developing the specific metrics for monitoring for access to care as we refine the plans with our monitoring and evaluation contractors. We note that further details about these plans are available.

We believe that it is appropriate to use our existing oversight authority to monitor the risks of the EPM regarding access to care, just as we monitor the various risks inherent in all payment models and systems, but we do not believe that new controls are necessary in regulation, other than those which we proposed and are finalizing for the EPMs after consideration of the public comments. We do not believe that specific requirements for medical necessity or review against specific standards of care are necessary, beyond those broad requirements which are set by the CoPs. We believe that the existing influences of reputation, care guidelines, QIO review, Joint Commission review, quality metrics, and our EPM monitoring and evaluation activities are sufficient to ensure that beneficiary access to care is not impeded under the EPMs. We further note that the existing antitrust laws help to prevent anti-competitive practices in the maintenance of hospital networks, thereby allowing competition between network providers to promote high quality outcomes.

In response to concerns raised by the commenters about our EPM pricing methodology that the commenters believe heightens the risk of patient selection or hospital financial harm for those hospitals disproportionately caring for complex patients, we are exploring incorporating risk adjustment into the EPM payment methodologies by performance year 3 of the EPMs, as discussed in section III.D.4.b.(2) of this final rule. Risk adjustment could potentially reduce variation in payment stemming from differences in case mix rather than the value of care provided, as well as help minimize the incentive EPM participants may have to avoid complex cases under the EPM. We agree with the commenter that the risk of patient selection under the EPM may be reduced due to the generally emergent nature of the clinical conditions that are the focus of the EPMs, rather than elective surgery such as in the CJR model. However, the potential for patient selection based on our final payment policy for transfers of beneficiaries with AMI from the outpatient or inpatient setting of an initial treating hospital to a transfer hospital as discussed in section III.C.4.a.(5) of this final rule may be increased in comparison with our proposal so we will be monitoring the treatment patterns of beneficiaries with AMI closely throughout the model performance years.

In section III.F. of this final rule, we describe the reasons that an EPM participant or its related EPM collaborator, collaboration agent, or downstream collaboration may be noncompliant under the EPM, which include avoiding potentially high-cost patients or high-severity patients; targeting potentially low-cost or low-severity patients; failing to provide medically necessary services or systematically engaging in the over- or under-delivery of appropriate care; failing to allow beneficiary choice of medically necessary options, including non-surgical options; taking any action that threatens the health or safety of patients; or avoiding at-risk Medicare beneficiaries. We will make a determination of EPM participant noncompliance based on all information available to us, including the information from our monitoring activities regarding access to care, quality of care, and delayed care as discussed in this final rule.

We have several compliance tools available to us for circumstances of noncompliance, including issuing a warning letter to the EPM participant; requiring the EPM participant to develop a corrective action plan; reducing or eliminating the EPM participant’s reconciliation payment; requiring the EPM participant to terminate a sharing arrangement with an EPM collaborator and prohibit further engagement by the EPM participant in sharing arrangements with the EPM collaborator; terminating the EPM participant’s participation in the EPM; and, when certain circumstances are met, adding a 25 percent penalty to a repayment amount on the EPM participant’s reconciliation report. We also note that we have the authority to revoke provider enrollment in the Medicare program for cause, such as providing substandard care that places beneficiaries at risk by under-delivering care. This broad range of tools provides us with the flexibility to address noncompliant EPM participant behaviors of varying levels of severity, and provides strong safeguards for beneficiaries and the Medicare program. We note that the compliance tools do not include public reporting of problems with access to care found for specific EPM participants because we do not believe this would be appropriate for EPM enforcement actions. Instead, we may notify our federal program integrity colleagues and, where appropriate, law enforcement, of such behavior, particularly in instances in which HHS (including CMS and OIG) discovered knowing violations or patterns of violations of requirements that directly impacted the safety and health of patients.

Given the enforcement tools delineated in this final rule, as well as the prevalence of existing laws, rules, and regulations prohibiting care stunting, provision of substandard care, or denial of medically necessary care, we believe that it is unnecessary to implement processes for a separate financial penalty specifically for the EPM as requested by one commenter, outside of the compliance tools finalized in section III.F. of this final rule. Where an EPM participant engages
in these behaviors, CMS could consider reducing or eliminating that EPM participant’s reconciliation payment or applying a penalty to the repayment amount, as well as notifying our federal program integrity colleagues and, where appropriate, law enforcement, of such behavior.

Finally, as discussed in section III.G.3. of this final rule, we require that detailed beneficiary notification under the EPMs includes advising EPM beneficiaries that all standard Medicare beneficiary protections remain in place. The EPM beneficiary may voice concerns or grievances regarding care, such as to the QIOs or through the 1–800–MEDICARE helpline.

Final Decision: After consideration of the public comments received, we are finalizing the proposals for monitoring beneficiary access to care, without modification.

5. Monitoring for Quality of Care

As we noted previously, in any payment system that promotes efficiencies of care delivery, there may be opportunities to direct patients away from higher cost services at the expense of better outcomes and higher quality. However, we believe that professionalism, the quality measures proposed for the EPMs, and clinical standards can be effective in preventing stunting on medically necessary care in both the inpatient and post-acute care settings during the 90 days in the EPM episode following discharge from the anchor hospitalization. Accordingly, we believe that the potential for the denial of medically necessary care within the EPMs is not be greater than that which currently exists under the IPPS. However, we also believe that we have the authority and responsibility to audit EPM participants’ and their EPM collaborators’ medical records and claims to verify that beneficiaries receive medically necessary services, and we proposed to perform such auditing activities as we deem appropriate. We also proposed to monitor financial arrangements between EPM participants and their EPM collaborators to ensure that such arrangements do not result in the denial of medically necessary care or other programmatic or patient abuses. Our proposals were consistent with the policies that have been established for the CJR model.

In the proposed rule, we stated our belief that the 90-day post-hospital discharge episode duration is sufficiently long so as to create financial accountability for the EPM participant and to encourage the provision of high quality care that minimizes the risk of complications and readmissions that typically could occur within such a time period. Clinical standards of care also constrain physician patterns of practice, and we believe that the risk associated with deviations from those standards provides further deterrence to compromising care.

We invited comment on the proposal, including additional opportunities to ensure high quality care.

The following is a summary of the comments received and our responses. Comment: Several commenters expressed concern that the EPMs could negatively affect a beneficiary’s access to and quality of care based on the financial incentives under the EPMs. Some commenters claimed that these incentives may discourage guideline-based care and best practices identified through clinical research. Other commenters speculated that AMI model participants may treat an AMI episode with outpatient observation rather than admit the beneficiary for medical management so as to avoid the episode from being initiated. Similarly, some commenters claimed that beneficiaries with AMI who need a PCI would receive the procedure as an outpatient, also to avoid the initiation of an AMI episode. The commenters were concerned with the potential for such site-of-service shifting to result in lower quality of care for AMI beneficiaries treated medically or with a PCI, especially for those complex beneficiaries that could result in high-cost AMI episodes if admitted for inpatient treatment.

Several commenters identified a potential risk to quality of care that could result from changes in the timing of planned secondary PCIs after AMI due to the financial incentives in the AMI model, where AMI episodes include planned, related care such as readmissions for PCI and outpatient PCI without a payment adjustment, except in the case of a CABG readmission. The commenters speculated that AMI model participants will either perform this secondary PCI during the initial hospital stay, potentially causing harm to patients, or intentionally delaying the procedure until after the episode ends. The commenters recommended that CMS monitor and evaluate whether these shifts in the timing of PCI occur and whether they affect patient outcomes.

One commenter claimed that the performance of SHFFFT procedures may not be sustainable in rural hospitals that are SHFFFT model participants. The commenter reasoned that rural hospitals in regions that have a high percentage of SHFFTT model participation that have, in the past, provided to their community the service of local joint replacement and hip fracture treatment may no longer be able to sustain this practice given the financial implications of the proposed SHFFFT model. Other commenters discussed the unintended consequences of limited access to care throughout the 5-year duration of the EPMs. One commenter presented findings from interviews of SNF staff members at SNFs that experienced shorter lengths-of-stay in markets with heavy Medicare Managed Care penetration who reported having to discharge patients early when the staff members believed those patients were unsafe for release.

One commenter outlined in detail their quality concerns about the transitions at the beginning and end of the EPM episode. The commenter asserted that the required bundling in the EPMs in the selected geographic areas would create a new transition in care, at the end of the 90 days following hospital discharge, for persons for whom care transitions are already problematic. The commenter claimed that the transition into the hospitalization for serious conditions like hip fracture, AMI, and CABG that are the focus of the EPMs is a disruptive event. They recommended that the requirements for the EPMs should attend to this initial transition at least with respect to the quality of care planning and the documentation of the decision to operate. The commenter specifically urged CMS to specify that the merits of the decision to hospitalize and to monitor or operate must be documented, both for fracture patients and for AMI, and that documentation should show that the risks and expected benefits had been discussed thoroughly. In addition, the commenter believes that at the end of the episode, the patient would likely lose whatever care coordination and supplemental benefits that the hospital and its partners were providing under the EPM. They pointed out that this creates another transition, with the associated risks of inadequate information transfer, fear and anxiety in creating and learning another set of care arrangements, and cessation of important services. The commenter reasoned that persons with underlying, serious chronic conditions will be unlikely to be stable and doing well at 90 days following hospital discharge; they will be more likely to be in fragile health and may be continuing to decline. Therefore, the commenter suggested that the EPMs should require attention to these issues by generating quality metrics that reflect performance in this transition. The commenter identified this last transition
as an opportunity for CMS to tally utilization and mortality shortly after the EPM episode ends and also to generate and use metrics that directly monitor transition quality.

Response: We agree that the commenters have accurately described possible risks of unintended consequences on care quality as a result of the financial incentives under the EPMs; however, we note that similar risks are inherent in all bundled payment models and systems. We agree that monitoring is necessary in order to further reduce these potential risks. We believe that professionalism, the quality measures proposed for the EPMs, and clinical standards can be effective in preventing denials of medically necessary care in both the inpatient and post-acute care settings during the 90 days post-hospital discharge. Additionally, we have consistently found that the traditional authorities available to the Secretary, including antitrust laws, anti-kickback provisions and other existing laws and regulations under the Medicare program, are adequate to provide a counterbalance to the economic incentives that could drive under-delivery of care. Therefore, we believe that we can use our existing oversight authority to monitor the risks of the EPMs, just as we monitor the various risks inherent in all payment models and systems, but we do not believe that new controls are necessary in regulation, other than those which we proposed and are finalizing for the EPMs after consideration of the public comments.

We have a number of established mechanisms by which we will monitor for evidence of the under-delivery of care, and by which we can react to and mitigate any identified problems. We will be monitoring data in the process of calculating quality metrics, and we have several reporting mechanisms, such as the 1–800–MEDICARE helpline. We monitor the quality of hospitals and surgical procedures through the QIOs, we routinely review medical records in our claims audits, and we specifically investigate outcomes as part of our evaluations of new payment and service delivery models. All of these processes create opportunities to identify potentially noncompliant providers or suppliers. Providers or suppliers who are investigated and found to be inappropriately denying care, diverting patients, providing unsafe care, or furnishing care in a setting that does not comply with Medicare rules may be sanctioned using our authorities under the Medicare program as well as those adopted for the EPMs, with penalties that may include

EPM participant ineligibility for reconciliation payments, revocation from the Medicare program if patients are placed at risk by substandard care, or other applicable administrative actions.

We agree that there are opportunities to employ additional quality metrics in the EPMs, including those around care transitions at the beginning of the EPM episode and the end of the episode. However, we note that obstacles exist not only in defining new measures, but in implementing mechanisms to report and assess those metrics without creating undue administrative burden or technological challenges for providers. Therefore, we are not adopting any additional requirements for these care transitions under the EPMs.

We believe that there are opportunities for rural SHFFT model participants to improve the quality and efficient of care under the SHFFT model that are similar to those for hospitals that are not located in rural areas. Rural SHFFT model participants have the same opportunity as other SHFFT model participants to benefit financially from improvements in the cost and quality performance of SHFFT episodes. In addition, as discussed in section III.D.7.c.(1) of this final rule, we are finalizing more protective limitations on loss for rural hospitals, SCHs, MDHs, and RRCs in recognition of the importance of preserving Medicare beneficiaries’ access to care from these hospitals. Therefore, we disagree with the commenter that the financial implications of the SHFFT model are likely to make the provision of surgical hip fracture treatment in rural hospitals unsustainable.

We agree with the commenters that monitoring is essential to protect against practices that may reduce the quality of post-acute care services. We believe that monitoring for this quality is best accomplished at the population level through monitoring for access to the appropriate level and quantity of post-acute care services. We also believe that beneficiary knowledge and engagement; the reliance on the medical direction of the physician; the monitoring of quality metrics; the complaint and oversight opportunities through the 1–800–MEDICARE helpline and the QIOs; and the use of care coordination all cooperate to ensure the quality of individual services delivered to individual beneficiaries, including post-acute care services, is maintained or improved under the EPMs.

We note that we will analyze the care patterns and we will also with AMI who present to AMI model participants for treatment, regardless of whether or not they are admitted to the hospital for treatment, treated as an outpatient, transferred to another hospital for the initial hospitalization, or transferred from an inpatient stay at the AMI model participant to another hospital for an inpatient hospitalization. Because best AMI care practices for hospitals with different cardiac care capacity are not well-defined, we expect that our analyses performed as part of monitoring will help to identify the effects on care quality and costs of different patterns in relation to patient complexity. Not all the beneficiaries we examine through our monitoring analyses will actually be included the AMI model (for example, if the beneficiary is treated for AMI only as an outpatient), but we plan to examine the experiences of all beneficiaries with AMI who present to an AMI model participant for treatment so we can develop the full picture of all care patterns for this emergent, common clinical condition. We will also analyze patterns of planned cardiac care for AMI beneficiaries for consistency with clinical guidelines and to examine the effects of such patterns on beneficiary outcomes.

Comment: Several commenters expressed support for CMS’ proposal to continuously monitor financial arrangements between EPM participants and EPM collaborators, as well as auditing of patients’ medical records and claims to allow early detection and intervention in the case of quality concerns. However, the commenters requested that the monitoring be conducted through the analysis of already submitted documentation, and not through an additional reporting requirement.

Response: We appreciate the commenters’ support for monitoring financial arrangements and patient medical records to allow for early detection of quality concerns, as well as their concerns over the increased administrative burden on EPM participants that could result from these monitoring activities. We note that we do not require routine submission of most information under the EPMs, including documentation on sharing arrangements or EPM beneficiary medical records. However, we proposed in §512.110 that EPM participants must allow the Government access to all books, contracts, records, documents, and other evidence sufficient to enable the audit, evaluation, inspection, or investigation of several areas, including the entity’s compliance with EPM requirements and the quality of services furnished to an EPM beneficiary during EPM episodes. We expect that the
proposed monitoring activities will require records being made available to CMS consistent with the access to records and retention requirements as discussed in section III.H. of this final rule. We further note that CMS may also designate contractors to which these records will be required to be made available. We understand the need to balance our monitoring of financial arrangements and auditing of EPM beneficiaries’ medical records and claims as a safeguard for beneficiary quality of care with the administrative burden on EPM participants to make those records available to us, although EPM participants are required retain those records and provide access to them upon request. Therefore, we will be judicious in our request that records be submitted to us to allow for monitoring, keeping in mind the burden on EPM participants of record submission in relation to the value of those records to provide program integrity checks and allow early detection of any quality concerns.

Comment: A few commenters recommended that CMS develop a plan to identify where and when inappropriate reductions in care might occur. While the commenters commended CMS for articulating the potential for such problems to occur under the EPMs, they urged CMS to create a clear and specific monitoring and enforcement plan to ensure beneficiary choice is protected and to ensure that consumers receive the most appropriate care, in the most appropriate setting, at the right time.

The commenters suggested that CMS develop training for 1–800–MEDICARE call center employees to identify and flag potential care reductions or inappropriate steering under the EPMs. They also encouraged CMS to ensure that the State Health Insurance Assistance Programs (SHIPs) are appropriately trained and engaged by the time the final EPMs are implemented. Other commenters suggested the CMS adopt an appeals mechanism for beneficiaries who receive poor quality care under the EPMs.

The commenters further recommended that CMS consider establishing an independent Ombudsman program for the purposes of monitoring and assisting beneficiaries in all model tests underway at the Innovation Center, including the proposed EPMs. The commenters reported that Ombudsman programs are being successfully used in the Financial Alignment Initiative for Medicare-Medicaid Enrollees, as well as to monitor the Durable Medical Equipment Prosthetics, Orthotics and Supplies (DMEPOS) Competitive Bidding program authorized by the Medicare Prescription Drug, Improvement, and Modernization Act of 2003. The commenters stated these independent entities are responsible for monitoring beneficiary access to care, in addition to limiting beneficiary confusion and promoting enhanced understanding. With an increasing number of delivery and payment system models ongoing at the Innovation Center, the commenters believe a dedicated Ombudsman is warranted.

The commenters recommended that beneficiaries be provided information and data about improved outcomes and satisfaction seen to date under payment models. The commenters further believe that general beneficiary education programs regarding medical necessity and beneficiary choice would be advantageous to supporting providers and suppliers furnishing services to EPM beneficiaries. Specifically, one commenter stated that some post-acute care providers are not educated or are continuing to operate with protocols that encourage overuse of certain types of care and result in lower quality health care for Medicare beneficiaries.

An example provided by the commenter included service patterns where all patients are treated by the provider for the maximum number of benefit days, regardless of clinical or social need. The commenter explained that in other circumstances than under the EPMs, events that create quality concerns may be a financial benefit to the post-acute care provider, such as when a patient who resides in a SNF falls and fractures his or her hip. The commenter claimed that upon readmission to the SNF, it is likely that the SNF will keep the patient at an acute level of care for 90 days or even longer, regardless of the original functional status of the patient.

Finally, one commenter stated that patients report that some post-acute care providers are engaging in marketing efforts that may not accurately portray beneficiary choice. The commenter asserted that in their direct experience, some post-acute care providers establish mandatory minimum stay requirements that do not align with physician discharge orders and show reluctance to coordinate with the beneficiary’s care team during the post-acute stay. In this scenario, the commenter concluded that there would be little an EPM participant could do to influence the pattern of care furnished by such post-acute care providers if an EPM beneficiary is treated by a provider that uses such practices. The commenter requested that CMS support EPM participants in improving the quality and efficiency of EPM episodes by adopting revised payment policies for institutional post-acute care services that are better aligned with medical necessity, including payment for short stays that include more appropriate types of therapy that support improved outcomes and increased quality. The commenter further recommended that CMS engage in monitoring marketing activities in order to support EPM goals.

Response: We thank commenters for their feedback regarding additional mechanisms to monitor the quality of care received by beneficiaries. We will be developing the specific metrics for monitoring for the quality of care as we refine the plans with our monitoring and evaluation contractors so further details are currently unavailable. We appreciate the recommendations of the commenters on metrics for monitoring quality of care as a counter to the financial incentives under the EPMs and will take them into consideration as we finalize our plans for monitoring the effects of the EPMs.

We do not believe that special beneficiary appeal rights are necessary under the EPMs. First, there are numerous processes in place under the EPMs and the Medicare program to protect beneficiary choice. The beneficiary retains all rights to choose the provider or supplier for medically necessary covered services. The beneficiary retains the benefits of the doctor-patient relationship, with additional notification of any sharing arrangement that could create a potential conflict of interest. In addition, the beneficiary must be provided with a notice of non-coverage for continuing services, such as a continued stay in an EPM participant or a SNF, and the beneficiary has access to the existing expedited review process in these cases. The beneficiary may also voice concerns or grievances, such as to the QIO or through the 1–800–MEDICARE helpline. We agree that it would be beneficial to distribute educational materials to ensure that beneficiaries can take advantage of the support available at the 1–800–MEDICARE helpline. We appreciate the recommendations of commenters on additional mechanisms to monitor marketing activities in order to support EPM goals.
We further note that we intend to establish an Alternative Payment Models Beneficiary Ombudsman within CMS who will complement the Medicare Beneficiary Ombudsman in responding to beneficiary inquiries and concerns arising from care under the models addressed in this final rule, as well as other Innovation Center models, under the existing Medicare processes. These existing Medicare beneficiary inquiry processes include the Quality Improvement Organizations (QIO) and the 1–800–MEDICARE helpline that works with the Medicare Beneficiary Ombudsman and CMS caseworker staff to resolve beneficiary issues. We will ensure that the QIOs, 1–800–MEDICARE helpline, CMS casework staff and the Alternative Payment Models Beneficiary Ombudsman have the information necessary, as well as access to program experts, to the extent consistent with applicable privacy and security laws, to respond to beneficiary issues prior to the implementation of the EPMs on July 1, 2017. The 1–800–MEDICARE helpline staff, QIOs and the Medicare Beneficiary Ombudsman already have information and program expert access for the CJR model, but we will ensure that those same materials are also made available to the Alternative Payment Models Beneficiary Ombudsman and CMS casework staff, to the extent consistent with applicable privacy and security laws.

While we will not revise our payment policies under the Medicare program for EPM participants or other providers or suppliers beyond those discussed in this final rule, we agree with commenters regarding the need to continually improve stakeholder education for models to succeed and we intend to do as much as we can to work to design and deploy a helpful learning and diffusion program. We currently facilitate learning within models by disseminating the lessons learned across models so that participants can benefit from the experiences of other models, and are always looking for better ways to educate and assist participants and their partners in care redesign in knowledge sharing. We continue to believe that these efforts contribute to reducing the administrative burden on the health care delivery system and are responsive to commenters’ requests that we address the educational needs of providers and suppliers caring for EPM beneficiaries.

We also note that the usual tools employed by CMS to monitor and prevent overutilization all apply to the services, including post-acute care services, furnished during EPM episodes. These tools include data analysis, the process of tracking patterns of utilization and trends in the delivery of care, and medical review, a clinical audit process by which we verify that services paid by Medicare were reasonable and necessary in accordance with section 1862(a)(1)(A) of the Act. We believe that these tools as employed by the MACs and by the QIOs are sufficient to check for the medical necessity of EPM services, including post-acute care services.

Final Decision: After consideration of the public comments received, we are finalizing the proposals for monitoring quality of care, without modification.

6. Monitoring for Delayed Care

We proposed the EPMs in part to incentivize EPM participants to create efficiencies in the delivery of care during a 90-day post-hospital discharge episode duration following an acute clinical event. Theoretically, the EPMs also could create incentives for EPM participants and their collaborators to delay services until after the 90-day post-discharge period has ended. Consistent with the CJR model, we believe that existing Medicare safeguards and other proposals under the EPMs are sufficient to protect EPM beneficiaries from harm due to delayed care.

First, our experience with other episode-based payment models such as the BPCI initiative has shown that providers focus first on appropriate care and then on efficiencies only as obtainable in the setting of appropriate care. We believe that a 90-day post-discharge episode duration is sufficient to minimize the risk that EPM participants and their collaborators would compromise services furnished in relation to a beneficiary’s care. While we recognize that ongoing care for underlying conditions or continued recovery may be required after the EPM episode ends, we believe that EPM participants would be unlikely to postpone key services beyond a 90-day post-discharge period because the consequences of delaying care beyond the episode duration would be contrary to usual standards of care.

However, we also proposed that additional monitoring for delayed care would occur as a function of the proposed EPMs. As with the CJR model, we proposed as part of the EPM payment policies (81 FR 50876 through 50877) that certain post-episode payments occurring in the 30-day window subsequent to the end of the EPM episode would be counted as an adjustment against savings achieved by the EPM participant. We believe that including such a payment adjustment would create an additional deterrent to delaying care beyond the episode duration. In addition, the data collection and calculations used to determine the adjustment would provide a mechanism to check whether providers are inappropriately delaying care. Finally, we noted in the proposed rule that the proposed quality measures would create additional safeguards against delays in medically necessary care under the EPMs, as such measures are used to monitor and influence clinical care at the institutional level, including for other CMS hospital programs.

In the proposed rule, we invited public comment on our proposed methods for monitoring EPM participants’ actions and compliance, as well as on other methods to safeguard delivery of high quality, clinically appropriate care.

The following is a summary of the comments received and our responses.

Comment: Several commenters acknowledged that the use of alternative payment models such as the proposed EPMs is to reduce unnecessary services and their associated costs, resulting in inherent incentives in such models to potentially delay or reduce medically necessary care. The commenters recommended that all alternative payment models should be designed to closely monitor health care received and protect beneficiaries against potential stunting of clinical treatment, delays in care, and case mix shifts. They recommended that CMS continue to offer regular and structured opportunities for stakeholder feedback to ensure that as the number of models increases, CMS continues to protect beneficiary access to care and all clinically appropriate treatment options.

Several commenters expressed concern that AMI model participants would delay costly, medically necessary cardiac care until after the AMI episode ends, a practice that would be inconsistent with clinical guidelines. The commenters identified planned follow-up inpatient or outpatient PCI of lesions identified at the time of the AMI but not responsible for the AMI and readmissions for cardiac surgery, such as cardiac valve replacement or implantable cardioverter defibrillator implantation, as potential instances where cardiac care could be delayed until after the end of an AMI episode. One commenter requested further details regarding how CMS intends to protect beneficiaries from delayed care.

Response: We appreciate the interest of the commenters in ensuring that the EPMs and other alternative payment models are designed to closely monitor care in order to detect and address any
delays in care or other potentially harmful care patterns that could be incentivized by the financial incentives under the models. We agree with the commenters that because the EPM episodes for which an EPM participant is responsible extend 90 days post-discharge from the anchor hospitalization, there is some risk that care could be delayed until after the end of the episode. However, we believe that EPM participants and other providers and suppliers furnishing services to EPM beneficiaries will focus first on clinically appropriate, timely care consistent with evidence-based clinical guidelines. We further note that delaying medically necessary care for more than 90 days following hospital discharge could both be contrary to usual clinical standards of care and potentially lead to complications that could result in utilization of health care services that increases actual EPM-episode spending and endangers the EPM participant’s episode cost and quality performance under the EPM. The potential for costly complications serves to counter the theoretical financial benefit that an EPM participant could experience when care is intentionally delayed until after the episode ends.

Moreover, as discussed in section III.E.3 of this final rule, we use quality measures of patient outcomes and patient experience in the pay-for-performance methodologies of the EPMs where the financial opportunity for EPM participants to receive savings for any given level of actual EPM-episode spending increases with higher quality of care. Thus, we believe the use of quality measures in the pay-for-performance methodologies of the EPMs also serves to deter potentially harmful delays in care. Finally, as discussed in section III.D.7.e. of this final rule, EPM participants with post-episode spending in the 30 days following the end of EPM episodes that exceeds a threshold set at 3 standard deviations above average spending in their region for that period of time need to repay Medicare for the amount over the threshold. This repayment is not subject to the stop-loss limitations under the EPMs, resulting in full risk for EPM participants. Therefore, we believe this policy also discourages delays in medically necessary care until after an EPM episode ends.

We will be developing the specific metrics for monitoring for delayed care as we refine the plans with our monitoring and evaluation contractors so further details are currently unavailable. We note that EPM participants found to engage in delaying medically necessary care would be noncompliant with the EPM under the provisions finalized in §512.460(b)(1) due to actions that threaten the health or safety of patients. In these circumstances, CMS could utilize one of the compliance tools finalized in §§512.460(b)(2) and (b)(3), which include requiring the EPM participant to develop a corrective action plan; reducing or eliminating the EPM participant’s reconciliation payment; adding a 25 percent penalty to the repayment amount on the EPM participant’s reconciliation report under certain conditions, or terminating the EPM participant’s participation in the EPM. We believe that these compliance tools allow us to take timely remedial action for instances of noncompliance by an EPM participant and that the finalization of these tools provides a significant beneficiary safeguard against delayed care.

Final Decision: After consideration of the public comments received, we are finalizing the proposals for monitoring for delayed care, without modification.

H. Access to EPM Records and Record Retention

Consistent with the Shared Savings Program, the BPCI initiative, the CJR model, and other Innovation Center models, we proposed specific access to EPM records and record retention requirements for individuals and entities involved with the EPM. For the CJR model, the record access and retention requirements were originally located in Subpart F (Financial Arrangements and Beneficiary Incentives). However, we proposed to include them in Subpart B (Episode Payment Model Participants) for the EPM and to move them to Subpart B for the CJR model as discussed in section V.L. of this final rule, so that these requirements can be applied to categories of information that are broader than those solely related to financial arrangements and beneficiary incentives, as discussed later in this section.

We proposed that EPM participants, EPM collaborators, collaboration agents, downstream collaboration agents, and any other individuals or entities performing EPM activities must allow both scheduled and unscheduled access to all books, contracts, records, documents, and other evidence (including data related to utilization and payments, quality of care criteria, billings, lists of EPM collaborators, sharing arrangements, distribution arrangements, downstream distribution arrangements, and the documentation required under §§512.500(d) and 512.525(d)) sufficient to enable the audit, evaluation, inspection, or investigation of six categories of information. We further proposed that all such books, contracts, records, documents, and other evidence be maintained for a period of 10 years from the last day of the EPM participant’s participation in the EPM or from the date of completion of any audit, evaluation, inspection, or investigation, whichever is later, unless CMS determines a particular record or group of records should be retained for a longer period and notifies the EPM participant at least 30 calendar days before the disposition date; or there has been a dispute or allegation of fraud or similar fault against the EPM participant, EPM collaborator, collaboration agent, downstream collaboration agents, or any other individual or entity performing EPM activities in which case the records must be maintained for 6 years from the date of any resulting final resolution of the dispute or allegation of fraud or similar fault.

In the CJR model, we applied these record access and retention obligations only to participant hospitals and CJR collaborators (80 FR 73432 through 73433). However, because we proposed additional types of EPM collaborators and types of financial arrangements in section III.L. of this final rule for the EPM, as well as defined EPM activities as those related to promoting accountability for the quality, cost, and overall care for EPM beneficiaries, we proposed to apply the record access and retention obligations to EPM participants and all individuals and entities with EPM financial arrangements where payments are substantially based on quality of care and the provision of EPM activities, as well as to other individuals and entities providing EPM activities. While this proposal is an expansion of the current record access and retention obligations under the CJR model to additional categories of individuals and entities, we believe the expansion is necessary and appropriate for the six categories of information to which we proposed that the access and retention requirements would apply. Access to this information from those individuals and entities providing EPM activities that are the basis of care redesign in the EPM provides an important program safeguard by allowing monitoring for compliance with EPM requirements. The alternative of limiting the requirements solely to EPM participants and EPM collaborators as we finalized for the CJR model would result in no record access and retention obligation.
for certain individuals and entities that have financial arrangements under the EPM and engage in EPM activities, thereby limiting the Government’s ability to audit, evaluate, inspect, or investigate compliance with EPM requirements. We similarly proposed changes to the individuals and entities subject to record access and retention obligations under the CJR model as discussed in section V.L. of this final rule.

We have identified six categories of information related to key EPM parameters for which we proposed that the record access and retention requirements would apply. Like the CJR model, we proposed that one category of information consists of those documents related to the individual’s or entity’s compliance with EPM requirements. Given the individuals and entities who must comply with the requirements of the EPM either directly or through their arrangements, including EPM participants, EPM collaborators, collaboration agents, and downstream collaboration agents, an important program safeguard is record access and retention that allow compliance with the EPM requirements to be monitored and assessed.

Additionally, similar to the CJR model, we proposed that a second category of information consists of documents related to the calculation, distribution, receipt, or recoupment of gainsharing payments, alignment payments, distribution payments, and downstream distribution payments. This list includes all types of payments proposed under EPM financial arrangements as discussed in section III.I of this final rule and is different from the current CJR model requirement to the extent that we proposed additional types of EPM financial arrangements in view of our proposal that ACOs can be EPM collaborators. Because of the proposed EPM requirements for these types of payments that are designed to ensure that all financial arrangements are for the sole purpose of aligning the financial incentives of individuals and entities with the goals of the EPM participant to improve the quality and efficiency of EPM episode care, we believe that these records of all the individuals and entities who enter such arrangements should be accessible and retained to allow compliance with the EPM requirements for the payments to be monitored and assessed. We proposed similar changes to this category of information under the CJR model as discussed in section V.L. of this final rule.

The third category of information for which we proposed to require record access and retention is related to an EPM participant’s obligation to repay to CMS any reconciliation payment or CR incentive payments owed. The CR incentive payment has been added to this provision which otherwise applied to the CJR model because we proposed and finalize a CR incentive payment in section VI of this final rule for AMI and CABG model participants in selected MSAs, while the CJR model does not include this payment. Requiring record access and retention about repayment obligations under the EPM provides an important program integrity safeguard for repayments to CMS.

We proposed to require record access and retention on the quality of the services furnished to an EPM beneficiary during an EPM episode as the fourth category of information. While the CJR model specified the quality of services furnished without further limitation in the record access and retention requirements, given our EPM proposals that require gainsharing, distribution, and downstream distribution payments to be substantially based on quality of care and EPM activities, we believe that it is appropriate to specify that the record access and retention requirements apply specifically to the services furnished to an EPM beneficiary during an EPM episode. The quality of services furnished without further limitation could result in an overly broad record access and retention requirement for services that are delivered outside of EPM episodes, where these services are not subject to EPM requirements. Services furnished to EPM beneficiaries during EPM episodes are the services for which we will also be monitoring for access to care, delayed care, and quality of care, important activities to safeguard the program and Medicare beneficiaries, so access to documents to support this monitoring is necessary. We proposed similar changes to this category of information under the CJR model and discuss further in section V.L. of this final rule.

Given the beneficiary notification requirements that we proposed for the EPM in section III.G. of this final rule, we proposed to require access to records and record retention about the sufficiency of EPM beneficiary notifications. The beneficiary notification requirement is an important beneficiary protection under the EPM, and the access to records and record retention requirements provide a program integrity safeguard to monitor for compliance with this requirement. We proposed to add this same category of information for the CJR model and discuss this further in section V.L. of this final rule.

Finally, we proposed to establish CEHRT use attestation for EPM participants so that an EPM participant could be in a Track 1 EPM that meets the requirements in the Quality Payment Program final rule with comment period (81 FR 77708) to be an Advanced APM as discussed in section III.A.2 of this final rule. Thus, we proposed to require access to records and record retention about the accuracy of each Track 1 EPM participant’s submissions under CEHRT use requirements. Specifically, attestation to CEHRT use and submission of clinician financial arrangements lists are key requirements for Track 1 EPMs that are Advanced APMs, and the ability to access and record retention requirements provide a program integrity safeguard by allowing us to assess the completeness and accuracy of the EPM participant’s compliance with the requirements for those submissions. We proposed to add this same category of information for the CJR model and discuss this further in section V.L. of this final rule.

As we stated in the proposed rule, we believe the proposed requirements regarding access to EPM records and record retention are necessary to safeguard program integrity and protect against abuse, in view of the EPM design and requirements as discussed throughout this final rule that would lead to achieving the EPM goals of improved EPM episode quality and efficiency. We also believe that by providing access to EPM records, we promote transparency of activities under the EPM. Furthermore, as stated in the proposed rule, we believe the proposed access to records and record retention requirements would promote the compliance of EPM participants, EPM collaborators, collaboration agents, downstream collaboration agents, and any other individuals or entities providing EPM activities with EPM requirements by ensuring that compliance with these requirements can be monitored and assessed. Finally, these records may be necessary in the event that an EPM participant appeals any matter that is subject to dispute resolution through CMS. As such, CMS would have the resources necessary to prepare and respond to any such appeal.

The proposals for access to records and record retention are included in § 512.110. We sought comment on our proposals, including whether it is necessary, reasonable, or appropriate to impose these access and retention obligations on all of the proposed
I. Financial Arrangements Under the EPM

1. Background

In November 2015 we finalized regulations for financial arrangements for the CJR model (80 FR 73550 through 73553), an episode payment model that is similar to the three new proposed EPMs. In this rulemaking, we proposed three new episode payments models that fall under the overarching term EPM, specifically the AMI model, CABG model, and SHFFT model. Both the CJR model and the three proposed EPMs would place financial responsibility for the episode on the hospital where the episode begins with a hospitalization and would require participation of hospitals in the selected MSAs for the models. Like LEJR episodes under the CJR model, the AMI, CABG, and SHFFT episodes in the proposed EPMs were broadly defined to include most Part A and Part B services and extend 90 days following discharge from the hospitalizations that initiate the EPM episode. During the design of the EPMs, we considered proposing the same CJR financial arrangements that were finalized through notice and comment rulemaking because the proposed EPMs have a similar design to the CJR model with the same goals of improving the quality and efficiency of model episodes. We expected that the types of financial arrangements needed to align the financial incentives of CJR participant hospitals and EPM participants with other providers and suppliers caring for CJR beneficiaries or EPM beneficiaries that initiate episodes to improve episode quality and efficiency would be similar. We also believed that program integrity safeguards that would provide protections against abuse under the financial relationships permitted for the EPMs should be comparable to those for the CJR model. However, we believed that it was possible to improve on the current regulatory structure for financial relationships that we established for the CJR model in our proposals for the EPM. Our proposals reflected changes from the current CJR model regulations that generally fell into the following four categories:

- Removing duplication of requirements in similar provisions.
- Streamlining and reorganizing the provisions for clarity and consistency.
- Providing additional flexibility in response to feedback from CJR participant hospitals and other stakeholders.
- Expanding the scope of financial arrangements under the EPM.

We note that in section V.I of the proposed rule (81 FR 50958 through 50968), we proposed changes to the CJR model financial arrangements regulations in Part 510 to parallel those we proposed for the EPM. These proposals would result in the same provisions and requirements for CJR model and EPM financial arrangements when the first performance year of the proposed EPM would begin on July 1, 2017.

2. Overview of EPM Financial Arrangements

For purposes of this section, the term “EPM” refers to one model specifically among the proposed AMI model, CABG model, or SHFFT model and should be read throughout Subpart F—Financial Arrangements and Beneficiary Incentives (§§ 512.500 through 512.525) of the proposed regulations as a single one of these three proposed EPMs. For example, when reading the proposed regulations for the CABG model, §512.500(b)(6), the provision would read as, “The board or other governing body of the [CABG model] participant must have responsibility for overseeing the [CABG model] participant’s participation in the [CABG model], its arrangements with [CABG model] collaborators, its payment of gainsharing payments, its receipt of alignment payments, and its use of beneficiary incentives in the [CABG model].” We used this approach because we meant for the proposed requirements to apply to every participant in the EPM regardless of whether the EPM was the AMI, CABG, or SHFFT model.

As discussed in section III.D.2.b. of the proposed rule (81 FR 50844), we proposed that each EPM would be a retrospective episode payment model, under which Medicare payments for items and services included in an EPM episode would continue to be made to all providers and suppliers under the existing FFS payment systems, and episode payment would be based on later reconciliation of actual spending for an EPM episode under the FFS payment systems to the EPM episode’s quality-adjusted target price. If the actual episode spending was less than the quality-adjusted target price, the EPM participant financially responsible for the EPM episode would receive a reconciliation payment, assuming the EPM composite quality score for the EPM participant was in the “acceptable,” “good,” or “excellent” quality category. If an EPM episode’s actual spending exceeded the quality-adjusted target price, then, beginning in performance year 2, the EPM participant would begin to repay the difference to Medicare up to the stop-loss threshold.
Similar to our approach in the CJR model (80 FR 73412), in the proposed rule for the EPM we discussed our belief that EPM participants might wish to enter into financial arrangements with providers and suppliers caring for EPM beneficiaries to share financial risks and rewards under the EPM, in order to align the financial incentives of those providers and suppliers with the EPM goals of improving the quality and efficiency of EPM episodes. We further believed that EPM participants might wish to enter into financial arrangements with ACOs that participate in EPM care redesign and EPM beneficiary care management and whose ACO participants and ACO providers/suppliers care for EPM beneficiaries. We expected that EPM participants would identify key providers and suppliers caring for EPM beneficiaries, as well as ACOs to which EPM beneficiaries were aligned, in their communities and referral regions. The EPM participants then could establish close partnerships with these individuals and entities to promote accountability for the quality, cost, and overall care for EPM beneficiaries, including managing and coordinating care; encouraging investment in infrastructure, enabling technologies, and redesigned care processes for high quality and efficient service delivery; the provision of items and services during an EPM episode in a manner that reduces costs and improves quality; and carrying out other obligations or duties under the EPM. These providers, suppliers, and ACOs might invest substantial time and other resources in these activities, yet they would neither be the direct recipients of any reconciliation payments from Medicare, nor directly responsible for repaying Medicare for excess episode spending. Therefore, we believed it would be possible that an EPM participant that might receive a reconciliation payment from Medicare or might need to repay Medicare might want to enter into financial arrangements with other providers, suppliers, or ACOs to share risks and rewards under the EPM. We expected that all financial relationships established between EPM participants and providers, suppliers, or ACOs for purposes of the EPM would be those permitted only under applicable law and regulations, including the applicable fraud and abuse laws and all applicable payment and coverage requirements. In addition to providers, suppliers, and ACOs with which the EPM participant might want to enter into financial arrangements to share risks and rewards under the proposed EPM, in the proposed rule we discussed our expectation that EPM participants might choose to engage with organizations that were neither providers nor suppliers to assist with matters such as episode data analysis; local provider and supplier engagement; care redesign planning and implementation; beneficiary outreach; beneficiary care coordination and management; monitoring EPM participants’ compliance with the EPM’s terms and conditions; or other EPM-related activities. Such organizations might play important roles in an EPM participant’s plans to implement an EPM based on the experience these organizations might bring, such as prior experience with bundled payment initiatives; care coordination expertise; familiarity with a particular local community; or knowledge of Medicare claims data. We expected that all relationships established between EPM participants and these organizations for purposes of the EPM would be those permitted only under existing law and regulation, including any relationships that would include the EPM participant’s sharing of EPM risks and rewards with such organizations. We also expected that all of these relationships would be based solely on the level of engagement of the organization’s resources to directly support the participants’ EPM implementation.

Finally, because the proposed broadly defined EPM episodes would extend 90 days post-discharge from their respective anchor or chained anchor hospitalizations, similar to the CJR model (80 FR 73433), in the proposed rule we discussed our belief that EPM participants caring for EPM beneficiaries might want to offer beneficiary engagement incentives to encourage adherence to recommended treatment and active patient engagement in recovery. Such incentives should be closely related to the provision of high quality EPM care and advance a clinical goal for an EPM beneficiary, and should not serve as inducements for beneficiaries to seek care from the EPM participants or other specific suppliers and providers. The incentives might help an EPM participant reach their quality and efficiency goals for EPM episodes, while also benefitting beneficiaries’ health and the Medicare Trust Fund. If the EPM participant improved the quality and efficiency of episodes through care redesign that resulted in EPM beneficiary reductions in hospital readmissions, complications, days in acute care, and mortality, while recovery continued uninterrupted or accelerated.

Comment: Many commenters stressed the need for waivers of existing fraud and abuse laws, given CMS’ proposal to allow financial arrangements between EPM participants and other individuals and entities that comply with the requirements of the proposed rule. They stated that such waivers are necessary for aligning the financial incentives of providers and other entities redesigning care and coordinating episode care for EPM beneficiaries to improve episode quality and efficiency. The commenters urged CMS and OIG to use the full scope of their combined authority to waive certain fraud and abuse laws that the commenters believed may inhibit care coordination in order to enable EPM participants to form the financial relationships necessary for success in the models. They claimed that waivers must be issued no later than concurrently with publication of the final rule to allow EPM participants sufficient time to prepare for EPM implementation. One commenter emphasized that the requirement for hospitals to participate in the EPM should not take effect unless and until hospitals have the needed, explicit protections in place and adequate time to form the necessary financial arrangements.

Response: We understand the commenters’ interest in the timely publication of fraud and abuse waivers for the EPM and revised waivers for the CJR model. As we stated in the proposed rule (81 FR 50931), any waivers of the fraud and abuse laws for the EPM or revisions to the existing CJR waivers would be issued separately by OIG (as to sections 1128A and 1128B of the Act) and CMS (as to section 1877 of the Act). No waivers of any fraud and abuse authorities are being issued in this final rule.

The substance and timing of any such waivers is outside the scope of this rulemaking. However, the Department is mindful of the significant interest of participants in knowing waiver parameters sufficiently in advance of entering into financial arrangements. The Department’s goal is that any waivers meet the legal standard under section 1115A, align closely and appropriately with the final rules, are clear, and limit burden on participants and others to the extent feasible while also protecting the program and patients from fraud and abuse. The Department is considering carefully concerns expressed by commenters about the existing fraud and abuse waivers for the CJR model and will keep those concerns in mind when considering fraud and
abuse waivers for the EPM, as well as any adjustments to the existing CJR waivers. As was done for the CJR model, waivers for the EPM will be promulgated by notice rather than rulemaking, which will expedite issuance. Any fraud and abuse waivers issued in connection with the EPM or revisions to the existing CJR waivers of fraud and abuse laws will be posted on the OIG Web site and at https://www.cms.gov/Medicare/Fraud-and-Abuse/PhysicianSelfReferral/Fraud-and-Abuse-Waivers.html.

Comment: Several commenters asserted that the fraud and abuse laws should be revised to accommodate APMs and other aspects of the modern health care environment. In addition, many commenters offered suggestions regarding how any fraud and abuse waivers should be drafted for the EPM and episode payment models generally. Other commenters advocated for the creation of a new Stark exception that would protect certain financial arrangements in risk-bearing models. One commenter requested that CMS provide a mechanism for EPM participants and CJR participant hospitals to ask questions about fraud and abuse law waivers.

Response: These comments are outside the scope of this rulemaking, but we have forwarded them to appropriate staff within the Department for consideration. We note that the public may contact CMS with questions related to compliance with the EPM and CJR regulations by emailing epm@cms.hhs.gov and cjr@cms.hhs.gov, respectively.

3. EPM Collaborators

As we explained in the proposed rule, given the financial incentives of episode payment under the EPM, an EPM participant might want to engage in financial arrangements with individuals and entities making contributions to the EPM participant’s episode performance on spending or quality. Such arrangements would allow the EPM participant to share all or some of the reconciliation payments they might be eligible to receive from CMS, or the EPM participant’s internal cost savings that resulted from care for beneficiaries during EPM episodes. Likewise, such arrangements would allow the EPM participant to share the responsibility for the funds needed to repay Medicare with individuals and entities engaged in providing care to EPM beneficiaries, if those individuals and entities had a role in the EPM participant’s episode spending or quality performance. We proposed to use the term “EPM collaborator” to refer to these individuals and entities.

Since each proposed EPM’s episode duration would be 90 days following discharge from the anchor or chained anchor hospitalization and such episodes would be broadly defined as discussed in section III.C.3.b. of the proposed rule (81 FR 50832 through 50834), many providers and suppliers other than the EPM participant would furnish related services to beneficiaries during EPM episodes. Those providers and suppliers might include SNFs, HHAs, LTCHs, IRFs, physicians, nonphysician practitioners, providers or suppliers of outpatient therapy services, PGP’s, hospitals, and critical access hospitals (CAHs). In addition, ACOs might be actively involved in coordinating the care of beneficiaries during EPM episodes. The proposed definition of EPM collaborator included each of these categories of individuals and entities as eligible to be an EPM collaborator. The proposed list of types of EPM collaborators was the same list as CJR collaborator, but with the addition of hospitals, CAHs, and ACOs. We expected that hospitals and CAHs that were not EPM participants might frequently play roles in care delivered to EPM beneficiaries during a chained anchor hospitalization as discussed in section III.C.4.a.(5) of the proposed rule (81 FR 50836 through 50840) or following discharge from an anchor or chained anchor hospitalization that initiated an EPM episode. For example, an AMI model participant without cardiac surgery or interventional cardiology capacity might need to transfer certain AMI model beneficiaries after initial admission to transfer hospitals or transfer CAHs for revascularization through PCI or through CABG. A transfer hospital might, itself, be participating in the AMI and CABG models (a CAH cannot be an AMI or CABG model participant), but the AMI model episode would be the responsibility of the AMI model participant that first admitted the beneficiary. Additional, hospital or CAH readmission during the proposed EPM episodes would be common for beneficiaries post-anchor or post-chained anchor hospitalization discharge for AMI, CABG, and SHFFT model beneficiaries, and, because care for these clinical conditions might sometimes be provided at transfer hospitals that initiated EPM episodes as EPM participants, we expected that readmissions during such episodes might sometimes be to other hospitals or CAHs that were not EPM participants near beneficiaries’ home communities. Thus, we believed it would be important to allow EPM participants to enter into financial arrangements with other hospitals and CAHs that cared for EPM beneficiaries, in order to align the financial incentives of such other hospitals and CAHs with the EPM goals of improving the quality and efficiency of EPM episodes.

Many accountable care organizations and other stakeholders had expressed strong interest in being collaborators in episode payment models generally, including sharing potential financial risks and rewards with model participants. Multiple commenters on the CJR Final Rule stated that robust accountable care organizations have proven track records of providing Medicare providers and suppliers with care redesign and case management assistance for Medicare beneficiaries, as well as managing the overall care of accountable care organization-aligned beneficiaries to improve the quality and efficiency of care (80 FR 73417). They reasoned that accountable care organizations might be able to provide CJR participant hospitals with care coordination assistance at reduced cost due to economies of scale and existing accountable care organization resources, as well as potentially assume a percentage of downside risk, in order to mitigate that risk to CJR participant hospitals. In the CJR Final Rule (80 FR 73417), we did not adopt accountable care organizations as CJR collaborators, responding that we decided to limit the testing of gainsharing relationships to solely those between hospitals and providers and suppliers enrolled in Medicare because we expected enrolled providers and suppliers to be most directly and specifically engaged with the CJR participant hospitals in care redesign and episode care for CJR beneficiaries who had surgeries at those hospitals. We also noted that a number of scenarios discussed by commenters to support their request to allow accountable care organizations to be CJR collaborators could be achieved outside of the context of gainsharing relationships between the CJR participant hospitals and those organizations.

With the steady growth in the number of accountable care organizations and accountable care organization-aligned beneficiaries, in the proposed rule we noted that we had further considered the potential for accountable care organizations to be EPM collaborators. The proposed EPMs would include beneficiaries with cardiovascular disease as well as beneficiaries with hip fracture who commonly would be older with multiple comorbidities, and accountable care organizations have...
expertise in care coordination and accountability for the quality and expenditures for health care for accountable care organization-aligned beneficiaries over an annual period.

While we proposed to exclude certain accountable care organization-aligned beneficiaries from EPM episodes, we noted that the challenges of attributing savings and changes in the quality of care for beneficiaries simultaneously in EPM and total cost-of-care models or programs, such as accountable care organizations, remained under consideration without full resolution, as discussed further in section III.D.6. of the proposed rule (81 FR 50869 through 50871). Local relationships between providers, suppliers, and accountable care organizations vary in the care of beneficiaries, and it would be difficult for CMS at this time to provide standard program or model rules that would fairly distribute savings among different models and programs for overlapping periods of beneficiary care, when variable local arrangements would determine which entity provides the resources for coordinating and managing a particular beneficiary’s care over time. Finally, we noted that accountable care organizations are groups of physicians, hospitals, and other health care providers and suppliers that come together to furnish coordinated, high quality care to their aligned Medicare beneficiaries to ensure that these beneficiaries, especially the chronically ill, get the right care at the right time, while avoiding unnecessary duplicative services and preventing medical errors. Accountable care organizations’ goals of delivering high quality care and spending health care dollars more wisely are the same as those of hospitals that would participate in the EPM. Therefore, we believed it would be especially important to further encourage collaborative partnerships between accountable care organizations and EPM participants that maximize their organizational efficiency and effectiveness, given their shared goals. In considering the accountable care organizations that could be EPM collaborators engaged in collaborative relationships with EPM participants, we limited our consideration to accountable care organizations under Medicare because the proposed EPM would be an episode payment model for Medicare FFS beneficiaries. We note that in section III.D.6. of the proposed rule (81 FR 50869 through 50871), we proposed to exclude from the proposed EPM episodes beneficiaries who are aligned to the Next Generation ACO model or tracks of the Comprehensive ESRD Care Model incorporating downside risk for financial losses. Downside risk for financial losses and prospective alignment of beneficiaries were important criteria in selection of these models and tracks of models for this proposed exclusion. We also sought comment in that section on extending this exclusion proposal to Track 3 of the Shared Savings Program. Because we proposed to allow financial arrangements under the EPM only with those entities that were involved in the delivery of care to EPM beneficiaries with goals of improving the quality and efficiency of EPM episodes, we did not believe it would be appropriate to permit Next Generation ACOs to be EPM collaborators because their aligned beneficiaries would be excluded from the EPM. Similarly, because we proposed that beneficiaries eligible for Medicare on the basis of ESRD be excluded from the EPM as discussed in section III.C.5.a. of the proposed rule (81 FR 50834), we did not believe that participants in the Comprehensive ESRD Care initiative which predominantly include beneficiaries eligible for Medicare on the basis of ESRD should be permitted to be EPM collaborators. Finally, we noted that the Pioneer ACO model ends in CY 2016, so that model would not overlap with the EPM which was proposed to begin on July 1, 2017.

Thus, we proposed that “ACOs,” meaning those ACOs as defined at § 425.20 of regulations that are participating in the Shared Savings Program, be permitted to be EPM collaborators. This proposal would allow locally variable financial arrangements that could account for the way care in EPM episodes was coordinated and managed in communities, and ensure that entities with appropriate skills and experience were permitted to share the proposed EPM’s risks and rewards with EPM participants. Medicare has a close relationship with such ACOs, which are regulated by CMS, so we could verify that these ACOs met current Shared Savings Program requirements that could make them suitable for a role as EPM collaborators. Finally, in this way, ACO participants and ACO providers/suppliers might be engaged in EPM care redesign directly through their ACO, instead of bypassing the ACO to become involved directly in the EPM through the EPM participant. We limited our proposal of entities that were not providers or suppliers but that were permitted to be EPM collaborators to ACOs alone. We proposed to allow financial arrangements under the EPM only with those entities that were involved in the delivery of care to EPM beneficiaries.

We set forth in proposed § 512.2 that ACOs and the following types of providers and suppliers may be EPM collaborators:

- SNF.
- HHA.
- LTCH.
- IRF.
- Physician.
- Nonphysician practitioner.
- Provider or supplier of outpatient therapy services.
- PGP.
- Hospital.
- CAH.
- ACO.

We sought comment on the proposed definition of EPM collaborators. In addition to general comment, we were specifically interested in comment on the proposal to include hospitals, CAHs, and ACOs in the definition of EPM collaborators. Furthermore, we sought comment specifically on the accountable care organizations that we proposed to include in the definition of ACO and which accountable care organizations should be included and excluded from the definition of ACOs that might be EPM collaborators to best advance the goals of the EPM and program generally. Finally, we also sought comment on the regulatory and practical implications of establishing that ACOs may be EPM collaborators under the EPM, including without limitation how the requirements under the EPM would relate to how financial arrangements within ACOs are currently regulated under the Medicare Shared Savings Program.

The following is a summary of the comments received and our responses.

Comment: Several commenters requested clarification about whether certain groups of health care professionals that do not include physicians could be EPM collaborators. The commenters requested that, in addition to PGP’s, groups of certified registered nurse anesthetists (CRNAs), advanced practice registered nurses (APRNs), outpatient speech-language pathologists, physical therapists, and other qualified licensed healthcare professionals who are not physicians, be permitted to be EPM collaborators. One commenter explained that these groups are identified by a TIN.

A number of commenters pointed out that while the proposed rule specifically listed PGP as eligible to be EPM collaborators, CMS’ proposal did not separately list groups of physical therapists or other therapists as eligible to be EPM collaborators. One commenter asserted that allowing only
individual therapists to be EPM collaborators and excluding therapy practice groups from entering into sharing arrangements with EPM participants is shortsighted because rehabilitation therapy practices and independent therapists are likely to be significant contributors to SHFFT episodes. The commenters requested that CMS clarify the regulations to explicitly permit groups of therapists to enter into sharing arrangements with EPM participants. One commenter further proposed that once a therapy practice group contracts with a hospital as a collaborator, it should be up to the practice group to ensure that financial exchanges with the participant hospital were attributed to the physical therapists who directly furnished services to EPM beneficiaries.

Response: We appreciate the interest of the commenters in ensuring groups of nonphysician practitioners and groups of therapists have the same opportunities to be EPM collaborators that we proposed for PGP, as well as their interest in allowing financial exchanges with their members who furnished services to EPM beneficiaries. Under our proposal, individual nonphysician practitioners are permitted to be EPM collaborators. We also proposed that individual therapists would be permitted to be collaborators to the extent that they fell within the collaborator category for provider or supplier of outpatient therapy services. As collaborators, these individuals would be eligible to receive gainsharing payments from EPM participants. Moreover, our proposal defined a PGP member to include a nonphysician practitioner or therapist who is an owner or employee of a PGP who has reassigned his or her right to receive Medicare payment to the PGP. Accordingly, as PGP members, these nonphysician practitioners and therapists would be eligible for distribution payments and downstream distribution payments from a PGP. We agree with the commenters that because our proposals addressed the role of PGP as EPM collaborators and collaboration agents without reference to other types of groups, we left some uncertainty about whether groups without a physician owner or employee would be eligible to be EPM collaborators and whether such groups would be permitted to enter into distribution arrangements or downstream distribution arrangements with their members. We also agree with the commenters that our proposal to allow suppliers of outpatient therapy services to be EPM collaborators is potentially unclear, because this term did not separately identify therapists in private practice or groups of therapists in private practice on the list of EPM collaborators, as did our proposal regarding physicians and PGP. We also appreciate the commenters’ uncertainty associated with the fact that we did not address whether a collaborator that was a therapy group practice would be permitted to enter into distribution arrangements or downstream distribution arrangements with their members, as we proposed for PGP.

We do not believe it would be appropriate to allow a group of licensed health care professionals to be EPM collaborators if that group consists solely of individuals who are not among the categories of individuals we proposed to be EPM collaborators. However, we believe that if a category of individuals is eligible to be EPM collaborators, then Medicare-enrolled groups that include such individuals should also be permitted to be collaborators and that such groups should be permitted to enter into distribution arrangements or downstream distribution arrangements with their members. We clarify these policies through this final rule.

Groups of nonphysician practitioners that do not include a physician are not included in the category of PGP that we proposed to include on the list of EPM collaborators. However, we believe these groups of nonphysician practitioners should be permitted to be EPM collaborators, just as we proposed to allow both individual physicians and nonphysician practitioners to be EPM collaborators. We also believe these groups of nonphysician practitioners should be treated similarly to PGP with regard to their ability to engage in distribution arrangements and downstream distribution arrangements with their members, consistent with our treatment of nonphysician practitioners who are PGP members. Therefore, we are adding to the list of entities that are eligible to be EPM collaborators a nonphysician practitioner group practice (NPPGP), defined as “an entity that is enrolled in Medicare as a group practice, includes at least one owner or employee who is a nonphysician practitioner, does not include a physician owner or employee, and has a valid and active TIN.” The requirements for sharing arrangements, distribution arrangements, and downstream distribution arrangements for NPPGP and NPPGP members are discussed in the sections of this final rule that address our policies for these arrangements.

We further believe that our proposal to include a provider or supplier of outpatient therapy services on the list of types of providers and suppliers that can be EPM collaborators should be modified to provide greater clarity about the providers and suppliers of outpatient therapy services that can be EPM collaborators. The Medicare Claims Processing Manual, Chapter 5, Part B Outpatient Rehabilitation and COR/OPT Services, Section 10 lists the following Medicare-enrolled providers and suppliers that can submit claims for outpatient therapy services: SNF, outpatient hospital; CAH; HHA; outpatient physical therapy provider (OPT), otherwise known as rehabilitation agency; comprehensive outpatient rehabilitation facility (CORF); physician; nonphysician practitioner; and physical or occupational therapist or speech-language pathologist in private practice. We note that the list of EPM collaborators already includes hospitals, SNFs, CAHs, HHAs, physicians, and nonphysician practitioners so their inclusion as collaborators under the proposed definition of provider or supplier of outpatient therapy services is duplicative. Therefore, rather than finalizing our proposed definition of provider of outpatient therapy services which would have included all providers and suppliers of outpatient therapy services, we believe it is clearer to specify individually on the list of EPM collaborators all the types of Medicare-enrolled providers and suppliers that can bill Medicare for outpatient therapy services. Thus, we are defining a new term in private practice as “a therapist that either: complies with the special provisions for services furnished by physical therapists in private practice in § 410.60(c) of this chapter; or complies with the special provisions for services furnished by occupational therapists in private practice in § 410.59(c) of this chapter; or complies with the special provisions for services furnished by speech-language pathologists in private practice in § 410.62(c) of this chapter.” We are adding therapist in private practice to the list of EPM collaborators, which ensures that all individual suppliers of outpatient therapy services are on the EPM collaborator list. In addition, we are revising our definition of provider of outpatient therapy services to mean “an entity that is enrolled in Medicare as a provider of therapy services and furnishes one or

more of the following: outpatient physical therapy services as defined in § 410.60 of this chapter; outpatient occupational therapy services as defined in § 410.59 of this chapter; outpatient speech-language pathology services as defined in § 410.62 of this chapter.”

Under this revised definition, provider of outpatient therapy services now includes only those entities that enroll in Medicare specifically as a provider of outpatient physical therapy/occupational therapy/speech-language pathology services, and we are revising the list of EPM collaborators to use this defined term in place of “provider or supplier of outpatient therapy services.” Finally, we are adding CORFs to the list of EPM collaborators because it is the only other type of provider that can furnish outpatient therapy services that are not included on the EPM collaborator list under our new and revised terms. Thus, with the addition of therapy group practices as discussed specifically later in this section, in total, these changes to the definitions and supplements to the list of EPM collaborators clarify which individuals and entities may be EPM collaborators by separately specifying each type of supplier and provider of outpatient therapy services that is eligible to be an EPM collaborator.

With respect to the specific interest of commenters in therapy practice groups being eligible to be EPM collaborators that can share payments under EPM financial arrangements with their members, we agree with the commenters that such groups should be permitted to be EPM collaborators and to enter into distribution arrangements and downstream distribution arrangements with their members, consistent with our treatment of PGP and NPPCPs. Thus, we are defining therapy group practice (TGP) as “an entity that is enrolled in Medicare as a therapy group in private practice, includes at least one owner or employee that is a therapist in private practice, does not include an owner or employee who is a physician or nonphysician practitioner, and has a valid and active TIN” and adding TGP to the list of EPM collaborators. The requirements for sharing arrangements, distribution arrangements, and downstream distribution arrangements for TGP and TGP members are discussed in the sections of this final rule that address our policies for these arrangements. We are finalizing, with the modifications discussed, the definition of EPM collaborator in § 512.2 to mean an ACO or one of the following Medicare-
that can be EPM collaborators, including Medicare beneficiaries in order to create the greatest potential for sustained improvements in quality and reductions in cost under the EPM.

We appreciate the commenter’s suggestion that Next Generation ACOs be included in the definition of ACOs that are on the list of EPM collaborators, so the Next Generation ACO may act on behalf of its ACO participant and ACO providers/suppliers to establish sharing arrangements with EPM participants for beneficiaries not assigned to the ACO. While we understand that the Next Generation ACO would like to enter into an EPM sharing arrangement as an EPM collaborator on behalf of its providers and suppliers, to be eligible to receive a gainsharing payment or be required to make an alignment payment under the sharing arrangement the Next Generation ACO itself must have contributed to EPM activities and been clinically involved in the care of EPM beneficiaries through activities such as providing care coordination services to EPM beneficiaries during and/or after inpatient admission or engaging with an EPM participant in care redesign strategies, and actually performing a role in implementing such strategies, that are designed to improve the quality of care and reduce spending for EPM episodes; or in coordination with providers and suppliers (such as ACO participants, ACO providers/suppliers, the EPM participant, and post-acute care providers) implementing strategies designed to address and manage the comorbidities of EPM beneficiaries. We are unclear of the role the Next Generation ACO itself would play in the care of EPM beneficiaries that are not assigned to the ACO, beyond serving as a contracting agent for its ACO participants and ACO providers/suppliers. We further believe that such an arrangement would require distinguishing activities on behalf of beneficiaries assigned to the ACO who are excluded from EPM episodes and beneficiaries not assigned to the ACO who are included in EPM episodes, and such distinctions could create confusion for beneficiaries, and suppliers, as well as administrative complexity for the Next Generation ACO. Therefore, we do not believe it would be appropriate to include Next Generation ACOs in the definition of ACOs that may be EPM collaborators. Finally, we note that as discussed in section III.D.6.c.(3) of this final rule, we are additionally finalizing the exclusion of beneficiaries from EPM episodes who are prospectively assigned to a Shared Savings Program ACO in Track 3. Therefore, for consistency with our policy for Next Generation ACOs whose assigned beneficiaries are also excluded from EPM episodes, we are excluding Shared Savings Program ACOs in Track 3 from the definition of ACOs that may be EPM collaborators. Thus, we are modifying our definition of ACO to read “ACO means an accountable care organization, as defined at § 425.20 of this chapter, that participates in the Shared Savings Program and is not in Track 3.” We emphasize that no EPM policy precludes providers or suppliers who are ACO participants or ACO providers/suppliers in a Next Generation ACO from entering into a sharing arrangement with an EPM participant on their own, provided they are on the list of EPM collaborators.

In summary, at this time we will not adopt a final policy that includes additional entities or individuals that are not providers or suppliers beyond those we proposed to be EPM collaborators. We selected acute care hospitals as the financially responsible entity for the EPM because we are interested in evaluating the impact of bundled payment and care redesign across a broad spectrum of hospitals with varying levels of infrastructure and experience in entering into risk-based payment arrangements. We believe that it is most appropriate to identify a single type of provider to bear financial responsibility for making repayment to CMS under the EPM. Given that hospitals perform a central role in coordinating episode-related care and ensuring smooth transitions for beneficiaries, this role factored in our decision to select IPPS hospitals as the financially responsible entity for this model. Under this structure, we believe that limiting the testing of gainsharing relationships to solely those between EPM participants, certain Shared Savings Program ACOs, and providers and suppliers enrolled in Medicare is most appropriate because we expect enrolled providers and suppliers to be most directly and specifically engaged with the EPM participants in care redesign and EPM episode care for beneficiaries. While we recognize that Shared Savings Program ACOs are not providers or suppliers, Medicare has a close relationship with such ACOs, which are regulated by CMS, so we can verify that these ACOs meet current Shared Savings Program requirements that make them suitable for a role as EPM collaborators. Further, by including such ACOs on the list of EPM collaborators, we are permitting locally variable financial arrangements that could account for the way care in EPM episodes is coordinated and managed in communities, and ensure that entities...
with appropriate skills and experience are permitted to share the EPM’s risks and rewards with EPM participants.

We are finalizing in § 512.2 the definition of ACO, with modification to mean an accountable care organization, as defined at § 425.20 of this chapter, that participates in the Shared Savings Program and is not in Track 3.

Comment: One commenter requested clarification about whether outpatient speech-language pathologists are considered providers of outpatient therapy services and, therefore, eligible to be EPM collaborators.

Response: We appreciate the opportunity to clarify that speech-language pathologists are eligible to be EPM collaborators if they are furnishing outpatient services as Medicare-enrolled speech-language pathologists in private practice. As discussed previously in this section, speech-language pathologists in private practice are included under the new definition of therapist in private practice when they are therapists that comply with the special provisions for services furnished by speech-language pathologists in private practice in § 410.62(c). In addition, a group of speech-language pathologists in private practice is included under the new definition of TGP when the group is an entity that is enrolled in Medicare as a therapy group in private practice, includes at least one owner or employee that is a physician or nonphysician practitioner, and has a valid and active TIN. Both therapists in private practice and TGPs are included on the final list of types of providers and suppliers that may be EPM collaborators so individual speech-language pathologists in private practice, as well as speech-language pathology groups in private practice, are eligible to be EPM collaborators.

Final Decision: After consideration of the public comments received, we are finalizing the proposals in § 512.2 for the definition of EPM collaborator and other terms used in that definition, with modification to revise the definitions of provider of outpatient therapy services; and ACO; create new definitions for CORF, therapist in private practice, NPPGP, and TGP; and include additional individuals and entities on the list of EPM collaborators. EPM collaborator means an ACO or one of the following Medicare-enrolled individuals or entities that enters into a sharing arrangement:

(1) SNF.
(2) HHA.
(3) LTPP.
(4) IRF.

(5) Physician.
(6) Nonphysician practitioner.
(7) Therapist in private practice.
(8) CORF.
(9) Provider of outpatient therapy services.
(10) PGP.
(11) Hospital.
(12) CAH.
(13) NPPGP.
(14) TGP.

4. Sharing Arrangements Under the EPM

a. General

Similar to the CJR model (80 FR 73430), we proposed that certain financial arrangements between an EPM participant and an EPM collaborator be termed “sharing arrangements.” A sharing arrangement would be a financial arrangement to share only—(1) EPM reconciliation payments; (2) the EPM participant’s internal cost savings; and (3) the EPM participant’s repayment amount. Where a payment from an EPM participant to an EPM collaborator was made pursuant to a sharing arrangement, we proposed to define that payment as a “gainsharing payment.” A gainsharing payment may be composed only of—(1) EPM reconciliation payments; (2) the EPM participant’s internal cost savings; or (3) both. A “reconciliation payment” was proposed to be defined as a payment made by CMS to an EPM participant as determined in accordance with proposed § 512.305(d) and as discussed in section III.D.5. of the proposed rule (81 FR 50864 through 50867). “Internal cost savings” would be the measurable, actual, and verifiable cost savings realized by the EPM participant resulting from care redesign undertaken by such participant in connection with providing items and services to beneficiaries within specific EPM episodes. Internal cost savings would not include savings realized by any individual or entity that was not the EPM participant. Where a payment from an EPM collaborator to an EPM participant was made pursuant to an EPM sharing arrangement, we proposed to define that payment as an “alignment payment.” An alignment payment could consist only of a portion of the “repayment amount,” which would be the amount owed by an EPM participant to CMS, as reflected on a reconciliation report. An EPM participant would not be permitted to make a gainsharing payment or receive an alignment payment except in accordance with a sharing arrangement. We proposed that a sharing arrangement must comply with the provisions of proposed § 512.500 and all other applicable laws and regulations, including the applicable fraud and abuse laws and all applicable payment and coverage requirements.

We proposed that the EPM participant must develop, maintain, and use a set of written policies for selecting individuals and entities to be EPM collaborators, and that the selection criteria must include the quality of care delivered by the potential EPM collaborator. The selection criteria could not be based directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent. With the exception of adding “past or anticipated” to the selection criteria for EPM collaborators, these proposed criteria were similar to the existing requirements of the CJR model (80 FR 73430). By adding this language, all previous and future referrals between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent were encompassed. We did not believe it would be appropriate for sharing arrangements to be based on criteria that include the volume or value of past or anticipated referrals because the sole purpose of sharing arrangements would be to create financial alignment between EPM participants and EPM collaborators toward the EPM goals of improving the quality and efficiency of episode care. Thus, we proposed to require EPM participants to select EPM collaborators based on criteria that include the quality of care furnished by the potential EPM collaborator to ensure that the selection of EPM collaborators took into consideration the likelihood of their future performance in improving the quality of episode care. In addition, requiring that selection criteria include quality of care furnished by the potential EPM collaborator would provide a safeguard against abuse.

Finally, we proposed that if an EPM participant entered into a sharing arrangement, its compliance program must include oversight of sharing arrangements and compliance with the applicable requirements of the EPM. Requiring oversight of sharing arrangements to be include in the
compliance program would provide a program integrity safeguard.

The proposals for the general provisions for sharing arrangements under the EPM were included in proposed § 512.500(a). We sought comment about all of the provisions set out in the preceding discussion, including whether additional or different safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the EPM were met.

The following is a summary of the comments received and our responses.

**Comment:** While many commenters expressed appreciation for CMS' proposal that would allow EPM participant choice regarding the formation of specific financial relationships with other individual and entities as determined by the EPM participant, several commenters expressed concern that engaging in sharing arrangements by EPM participants is voluntary for hospitals. One commenter stated that CMS' proposal to leave the choice of sharing reconciliation payments from episode savings achieved under the EPM to the responsible hospitals would have the unintended consequences of further consolidating control of care at the hospital level rather than with the community providers at the forefront of providing patient-centered care and could restrict beneficiary choice.

Another commenter stated that because EPM participants are not required to distribute their episode savings as gainsharing payments, the proposed model design and financial arrangements would exclude post-acute care providers from having a significant role in the EPM. One commenter who expressed appreciation for CMS' proposal to allow ACOs to be EPM collaborators nevertheless asserted that under the current and proposed policies for EPM financial arrangements, model participants often have little or no incentive to collaborate with ACOs, a situation which threatens the continuity of care for patients. The commenter believes that participants in bundled payment models have a significant incentive to take advantage of an ACO's ongoing efforts to coordinate care over the course of the full year (which includes the EPM episode), which could lead to episode savings achieved by the ACO's efforts, rather than hospitals' efforts under the EPM. The commenter urged CMS to require sharing arrangements between EPM participants and unrelated ACOs in the same market or otherwise that all ACO-assigned beneficiaries would be excluded from EPM episodes. Finally, another commenter encouraged CMS, at a minimum, to add stronger language to encourage EPM participants to enter into sharing arrangements if CMS chooses to maintain the proposed policy which is permissive rather than directive.

**Response:** We appreciate the perspectives of the commenters regarding our proposal for financial arrangements under the EPM that would not require EPM participants to enter into sharing arrangement with collaborators under the model. As we finalize in section III.B.3. of this final rule for the EPM and as we finalized for the CJR model in the CJR Final Rule (80 FR 73288), we have selected acute care hospitals as the financially responsible entity for the EPM because we are interested in evaluating the impact of bundled payments and care redesign across a broad spectrum of hospitals with varying levels of infrastructure and experience in entering into risk-based financial arrangements. Our expectation that hospitals would perform a central role in coordinating episode-related care and ensuring smooth transitions for beneficiaries hospitalized for clinical conditions that are the focus of the EPM factored into our identification of hospitals as the financially responsible entity for the model.

While we proposed that hospitals would be the financially responsible entity for episodes under the EPM as they are under the CJR model, we agree with the commenters that effective care redesign for EPM episodes likely requires meaningful collaboration among acute care hospitals, CAHs, post-acute care providers, ACOs, physicians, and other providers and suppliers within communities to achieve the highest value care for Medicare beneficiaries. We believe it may be essential for key providers and suppliers to be aligned and engaged, financially and otherwise, with participant hospitals, and that they have the potential to share financial responsibility with those hospitals. We believe that coordination and engagement of certain providers, suppliers, and ACOs with EPM participants may be especially important, given the clinical complexity of many beneficiaries in EPM episodes who are likely to have underlying chronic condition and risk factors, such as advanced age that led to the acute event of AMI or hip fracture or progressively worsening cardiac status resulting in CABG that are the focus of EPM episodes. Depending on a hospital's current degree of clinical integration, new and different contractual relationships among hospitals and other health care providers and suppliers may be important, although not necessarily required, for EPM success in a community. We do not believe, however, that it would be appropriate to require that EPM participants engage in sharing arrangements, including with any specific individuals or entities such as ACOs, since, under the EPM, the participant hospitals are solely responsible to CMS for financial risk under the models. While we are providing EPM participants with required parameters for any financial arrangements with collaborators that assist them in engaging other individuals and entities in care redesign toward the goals of improving EPM episode quality and reducing cost, we believe that model participants providing care in their own communities are best positioned to determine whether sharing arrangements would advance these goals. We refer to section III.D.6.c.(3) of this final rule for further discussion of required policies regarding overlap of EPM beneficiaries with shared savings models and programs.

We emphasize that, although we allow sharing arrangements under the EPM, beneficiaries in EPM episodes retain their full rights to choose their providers and suppliers. EPM participants, providers, and suppliers are reminded that patient steering is not permissible and such entities and individuals must continue to comply with all applicable law and regulations. EPM participants and their collaborators that engage in sharing arrangements may not impede the rights of the beneficiary. Furthermore, we reiterate that sharing arrangements must not induce the EPM participant, EPM collaborator, or any employees, contractors, or subcontractors of the EPM participant or EPM collaborator to reduce or limit medically necessary services to any Medicare beneficiary; or restrict the ability of an EPM collaborator to make decisions in the best interests of its patients, including the selection of devices, supplies, and treatments.

**Comment:** A number of commenters commended CMS for not requiring EPM participants to collaborate with certain groups of providers or suppliers, thereby allowing market forces to feed the creative innovation of model participants and their community partners to determine the financial partnerships that would be most beneficial to achieving the overarching goals of the models. One commenter stated that EPM participants should not be required to offer risk-sharing...
arrangements to all post-acute care providers in their markets. Several commenters expressed support for CMS’ proposal to require EPM participants to utilize quality criteria in the selection of collaborators, which is consistent with the goal of the EPM to improve the quality of episode care while reducing its cost.

Many commenters also agreed with CMS’ intent that the selection requirements should prevent EPM participants from developing methodologies for selecting collaborators that take into account the volume or value of past or anticipated referrals between the parties. However, one commenter advocated that CMS permit EPM participants to consider a potential EPM collaborator’s relevant experience in collaborator selection. The commenter seemed to be recommending that CMS permit collaborator selection criteria to consider factors such as the amount of procedures a physician has performed that would be subject to payment under an EPM episode or the amount of other services a potential collaborator has performed that would be considered EPM activities. The commenter urged CMS not to prohibit experience from being a qualifying factor in the selection of collaborators on the grounds that such a policy would compromise the model’s stated goal of increasing quality while reducing cost. The commenter believed it was only appropriate to prohibit selection criteria that consider the historical amount of procedures (or other services that would constitute EPM activities) that the potential collaborator performed for beneficiaries treated at the EPM participant.

Several commenters expressed concern that allowing EPM participants discretion over the selection of collaborators for sharing arrangements could limit collaborators to a small group of preferred providers and lead to narrow referral networks to control costs, strategies that are not necessarily in the best interest of beneficiaries. The commenters encouraged CMS to modify the proposal for allowing EPM participants broad discretion to determine how they identify and choose EPM collaborators. The commenters further urged CMS to adopt stronger safeguards and to closely monitor referral patterns to ensure that the EPM is not diminishing patient choice or disrupting existing provider-patient relationships that are necessary for ensuring patient-centered continuity of care. A few commenters believed that EPM participant discretion in choosing collaborators should be limited and that EPM participants should be required to make gainsharing payments to all providers who care for EPM beneficiaries. One commenter requested that CMS require EPM participants to allow any interested provider who meets basic, minimum quality standards and sees a minimum number of EPM beneficiaries to be included on the list of collaborators with sharing arrangements. Another commenter requested that EPM participants’ written policies for the selection of collaborators be made public to promote transparency. One commenter emphasized that without transparent contracting and financial data requirements, many independent PGPs are hesitant to participate in sharing arrangements for episode payment models like the EPM managed by hospitals.

A few commenters requested that CMS make available certain information to EPM participants or potential collaborators such as physician groups and post-acute care providers. With respect to information for EPM participants, the commenters recommended that CMS create a tool with a standardized methodology to compare costs so model participants could select the most cost-effective partner in the care that is included in the models for which they are financially responsible. Other commenters urged CMS to provide information to potential EPM collaborators about hospital accountability for episodes under the EPM, CJR model, and other CMS bundled payment models, explaining that it is currently challenging for physicians and post-acute care providers to determine what hospital owns which episodes in order to seek partnerships, especially when the hospitals may be located in other geographic areas. One commenter further recommended that CMS provide a path to identify the responsible entity for episodes in order to alleviate the administrative burden on post-acute care providers that are tracking financial risk and clinical responsibility for episodes in bundled payment models. Response: We appreciate the commenters’ support for our proposed requirements for EPM participants’ policies for the selection of their collaborators. We proposed to allow financial arrangements in the EPM to incentivize higher quality care and reductions in episode spending through improved financial alignment between providers and suppliers furnishing services to beneficiaries during EPM episodes while protecting against undue risk from beneficiary steering, care stunting, and inappropriate reductions in access to care that could otherwise result from the financial incentives in an episode payment model. The proposed requirements for the selection criteria for collaborators provide important safeguards for these financial arrangements.

We are mindful of the commenter’s concern that the goals of EPM may be more difficult to achieve if EPM participants are prohibited from selecting collaborators based on their relative experience in providing services that would constitute EPM activities. We proposed that the written policies for selecting EPM collaborators must contain criteria related to, and inclusive of, the quality of care delivered by the potential EPM collaborator. We also proposed that the selection criteria cannot be based directly or indirectly on the volume or value of past or anticipated referrals or other business. Because sharing arrangements should be for the sole purpose of aligning the parties’ financial incentives toward the EPM goal of improving the quality and efficiency of care, we do not believe that collaborators should be selected in a manner that is based on referrals or the generation of other business. We believe that imposing experience qualifications that are tied to referrals, rather than quality, presents a significant program integrity risk. Specifically, such criteria could be a proxy for rewarding past referrals or for encouraging the initiation of an excessive number of EPM episodes. Nevertheless, depending on the circumstances, the consideration of a potential collaborator’s experience in performing services that would constitute EPM activities may further the quality and efficiency goals of the EPM. For example, an ACO’s experience in providing care coordination services or implementing care redesign strategies may be relevant in evaluating the likelihood that a potential ACO collaborator will have the requisite expertise to contribute to the EPM participant’s success in the model. Similarly, we recognize that, in an effort to ensure quality of care and successful outcomes for certain procedures, many hospitals require physicians to perform a reasonable minimum number of procedures as a condition of maintaining medical staff privileges to perform those procedures. Therefore, we are modifying the selection criteria provision in § 512.500(a)(3) to provide that a selection criterion requiring a potential EPM collaborator to have performed a reasonable minimum number of services that would qualify as EPM activities will be deemed not to violate the volume or value standard if
the purpose of the criterion is to ensure the quality of care furnished to EPM beneficiaries. We believe this standard appropriately balances the commenter’s concerns and the relevant program integrity risks.

We do not agree with the commenters recommending that EPM participants be required to engage as collaborators all providers and suppliers caring for EPM beneficiaries or any interested provider meeting minimum standards for quality and model beneficiary volume. As discussed previously, there is no requirement that EPM participants enter into sharing arrangements under the EPM, in order to allow EPM participants who are financially responsible for EPM episodes the flexibility to determine whether sharing arrangements would advance the model goals. Should they choose to enter into financial arrangements with collaborators, we believe EPM participants are in the best position to select the collaborators, subject to the requirements we proposed, who are most willing to engage in the model participant’s care redesign strategies and provide high quality care. However, we continue to believe it is appropriate to require EPM participants to create a written set of policies for selecting providers, suppliers, and ACOs for sharing risks and gains as EPM collaborators. We are adopting numerous safeguards to address patient steering and protect beneficiary freedom of choice, including the requirement that EPM beneficiaries be informed that they retain freedom of choice to choose providers and services; the requirement that EPM participants not restrict beneficiaries’ ability to choose any Medicare-enrolled provider or supplier, or any physician or practitioner who has opted out of Medicare; the caps on gainsharing payments to physicians, nonphysician practitioners, PGP’s, and NPPGP’s; the requirement that the opportunity to make or receive gainsharing payments (or the opportunity to make or receive alignment payments) may not be conditioned on the volume or value of past or anticipated referrals; the requirement that gainsharing payments be distributed to EPM collaborators substantially based on the quality of care and the provision of EPM activities; and the requirement that opportunity to make or receive distribution payments or downstream distribution payments not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent. In light of these safeguards, we believe that EPM participants should be allowed to enter into different sharing arrangements with various EPM collaborators. While we appreciate the reasons why some commenters recommended that we require EPM participants to enter into financial relationships with certain entities and individuals, we do not agree that such a requirement is necessary given these protections. Furthermore, we believe these safeguards are sufficient to protect beneficiary choice and ensure that the EPM does not disrupt existing provider-patient relationships.

We understand and agree with the commenters who believe that transparency in contracting under the EPM is important, so that providers, suppliers, and ACOs in communities that provide episode care for EPM beneficiaries are knowledgeable about any collaborators working with the EPM participant toward achieving the model goals and understand how the model participant selected those collaborators. This transparency is all the more significant in light of our decision not to require that EPM participants engage with any specific providers, suppliers, or ACOs. To the extent the commenter who mentioned PGP concerns about the transparency of contracting and financial data requirements for sharing arrangements was referring to the internal requirements of the EPM participant, we do not believe that sharing arrangements under the EPM are different in this regard from any other scenario in which a PGP contracts with a hospital. To address the transparency of the EPM participant’s selection criteria for EPM collaborators that are required in § 512.500(a)(5), we are requiring EPM participants to make publicly available on the EPM participant’s Web site their policies for selecting individuals and entities to be EPM collaborators and to update this information at least quarterly. The public availability of the collaborator selection policies complements the requirement for EPM participants to publicly post on their Web site accurate current and historical lists of all EPM collaborators, including EPM collaborator names and addresses, and to update such lists on at least a quarterly basis. The policy for the lists of EPM collaborators is discussed in section III.B.4.d of this final rule for the EPM.

With regard to providing standard information to EPM participants that would allow them to select the most cost-effective providers and suppliers as collaborators, as discussed in section III.K.2 of this final rule for EPM participants, upon EPM participant request we are making available beneficiary-identifiable claims data no less frequently than on a quarterly basis for EPM episodes, as applicable to the participant. These data allow the EPM participant to examine episodes where model beneficiaries receive care by specific providers or suppliers in order to identify patterns in quality and cost that may help them identify providers and suppliers that meet the EPM participant’s selection criteria for collaborators. However, we will not provide EPM participants with a tool that uses a standard methodology to analyze episode costs of care to allow for specific comparisons among potential collaborators. Instead, EPM participants will need to develop their own methodology to analyze the features of historical episodes that are relevant to their collaborator selection criteria.

We appreciate the interest of potential EPM collaborators in being able to identify the bundled payment model episodes and responsible hospitals for beneficiaries for whom they provide care in order to seek partnerships that may contribute to improvements in the quality of episode care and reductions in cost. We will continue to make available on the CMS Web site information about bundled payment models, model participants, and the episodes that each model participant is testing. We encourage potential EPM collaborators to review this information and to discuss the potential for collaboration with model participants both in their communities and where they have historically provided post-discharge care following hospitalization for the clinical conditions that are the focus of the EPM. Given the complexities of the provider and beneficiary overlap policies among different models and programs as discussed in section III.D.6 of this final rule, we are not able to provide any other specific information about the financially responsible entity for beneficiaries who are hospitalized and then receive related post-discharge care during their recovery.

We are finalizing the selection criteria for EPM collaborators in § 512.500(a)(3) as modified. We are finalizing in § 512.500(d)(1)(iii)(A) the requirement for EPM collaborators to publicly post on their Web site accurate current and historical lists of all EPM collaborators, including EPM collaborator names and addresses, and to update such lists on at least a quarterly basis. The policy for the lists of EPM collaborators is discussed in section III.B.4.d of this final rule for the EPM.
We are adding the requirement in § 512.500(d)(1)(ii)(B) that the EPM participant publicly post on the EPM participant’s Web site the written policies for selecting individuals and entities to be EPM collaborators required by § 512.500(a)(3). We are eliminating as redundant the separate verbiage in proposed § 512.500(d)(1)(ii) to obligate the EPM participant to maintain accurate current and historical lists of all EPM collaborators because this obligation is encompassed in the obligations to publicly post and update such lists as required in § 512.500(d)(1)(ii) as finalized.

Comment: Several commenters expressed concern about the various “volume or value” standards that CMS proposed to use in the regulations for EPM and CJR financial arrangements. The commenters pointed out that CMS’ proposal made clear that the criteria for the selection of collaborators and the determination of who shall be eligible to make or receive alignment or gainsharing payments cannot be based directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated between the parties, their various agents, and any individuals or entities affiliated with them or their agents. However, the commenters observed that the proposal did allow for the “amount of EPM activities” to be taken into account in the methodology for calculating gainsharing payments. With respect to the calculation of alignment payments, the commenters observed that CMS proposed that EPM participants may not “directly” take into account the volume or value of past or anticipated referrals, proposing this different “volume or value” standard for these payments. One commenter believes that the varying standards are confusing and will have little effect on the integrity of the models, while EPM participants and CJR participant hospitals will need to seek substantial legal consultation to avoid placing themselves at risk of whistleblower lawsuits. The commenter requested that CMS revisit the reasoning behind the “volume or value” standard in the proposed EPM and CJR model which they believed was imported from the Stark law, while also taking into account the significant safeguards built into the models and the goal of provider-supplier alignment with EPM and CJR participants through financial arrangements. At minimum, the commenter urged CMS to streamline and clarify the provisions that include the “volume and value” standard.

Another commenter was concerned that EPM participants and CJR participant hospitals participants will avoid entering into financial arrangements due to the fear of liability under the Stark law and requested that CMS clarify specifically what does and does not constitute a violation of the “volume or value” standard for sharing and distribution arrangements. The commenter urged CMS to provide EPM participants and CJR participant hospitals with assurance that compliance with the CMS standard would not result in liability under the fraud and abuse laws. The commenters asserted that this would give model participants the confidence to enter into arrangements that will enable them to achieve the goals of the model.

Response: We appreciate the commenters’ interest in streamlining and clarifying the proposed standards for various requirements of the EPM and CJR financial arrangements that utilize a specific standard related to “volume or value.” We proposed volume or value standards for three things: (1) The selection criteria for EPM collaborators; (2) the opportunity to make or receive a payment (gainsharing, alignment, distribution, or downstream distribution payment); and (3) the alignment payment methodology. Our proposal was designed to ensure that the sole purpose of any financial relationships in the CJR model and the EPM is to align the financial incentives of the participants, collaborators, collaboration agents, and downstream collaboration agents so that the models can achieve the goals of improved episode care quality and efficiency. For reasons provided later in this section, we believe that the proposed volume or value standard is appropriate in all three instances.

First, we proposed in § 512.500(a)(3) that the selection criteria for EPM collaborators cannot be based directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent (“affiliated individuals or entities”). We do not believe it would be appropriate to permit EPM collaborators to be selected based on the volume or value of their referrals to any of the enumerated parties. Without this prohibition, such arrangements could be used to reward collaborators for their referrals, including referrals for business outside the EPM.

Second, we proposed that the opportunity to make or receive a gainsharing payment, alignment payment, distribution payment, or downstream distribution payment could not be conditioned on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any affiliated individual or entity. As with the collaborator selection criteria, we do not believe that a payment opportunity should be used to reward referrals. We note that in proposed § 512.500(c)(7) (regarding an opportunity to make or receive a gainsharing payment or an alignment payment), we did not explicitly state that the payment opportunity could not be conditioned “directly or indirectly” on the volume or value of referrals or other business. We are revising the regulation text at § 512.500(c)(7) to include the words “directly or indirectly” before the volume or value standard. While we do not believe this revision effects a substantive change, we are mindful of the commenters’ requests to clarify and streamline all the “volume or value” provisions. This change simply clarifies that the volume or value standard is the same in all payment opportunity provisions.

Finally, we proposed in § 512.500(c)(14) that the methodology for determining alignment payments must not “directly” account for the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any affiliated individual or entity. We deliberately avoided proposing that alignment payments must not “directly or indirectly” account for the volume or value of referrals or other business. Alignment payments represent a portion of the EPM participant’s repayment liability to CMS, which is determined in part by summing actual EPM episode payments that could include payments for some items or services referred by the EPM collaborator. This proposal simply recognizes that alignment payments might indirectly account for the volume or value of an EPM collaborator’s referrals. The commenters did not specifically object to the volume or value standard in § 512.500(c)(14), and we are finalizing the provision as proposed.

We did not propose a “volume or value” standard for the methodologies used to determine the amount of any gainsharing payment, distribution payment, or downstream distribution payment. As we discussed in the
proposed rule (81 FR 50923, 50926, and 50027), we proposed that these payments must be determined in accordance with a methodology that is substantially based on quality of care and the provision of EPM activities. We further proposed that the methodology may take into account the amount of EPM activities provided by one EPM collaborator, collaboration agent, or downstream collaboration agent relative to other EPM collaborators, collaboration agents, or downstream collaboration agents, as applicable to the type of payment. We proposed this standard because we recognized that a "volume or value" standard could be interpreted to prohibit a payment methodology that would result in higher compensation to individuals and entities that performed more EPM activities (which may result in referrals) compared to others. In response to the commenters who questioned the need for different standards for gainsharing payments and alignment payments, if the methodology for determining alignment payments was allowed to take into the account the amount of EPM activities provided by an EPM collaborator relative to other EPM collaborators, there would be a significant risk that the financial arrangement could directly account for the volume or value of past or anticipated referrals or business generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any affiliated individual or entity.

Table 46 summarizes the applicability of "volume or value" standards being finalized in this rule for EPM financial arrangements.

Comment: Many commenters raised concerns about the burdens of writing EPM sharing arrangements and the overall complexity of the requirements for financial arrangements. Several commenters claimed that financial arrangements are underutilized in the BPCI initiative due to the complexity of CMS' requirements, the administrative burden associated with understanding and ensuring compliance with those requirements, and the lack of clearly articulated safe harbors from the fraud and abuse laws implicated by the arrangements. The commenters further asserted that few potential collaborators have sufficient volume of cases in episodes for the financial benefits of gainsharing to outweigh the administrative burdens to develop and maintain these arrangements.

Another commenter stated that it is infeasible for EPM participants to write sharing arrangements with each party where the EPM participant will transfer beneficiaries with AML. The commenter recommended that CMS institute a default sharing arrangement which would come into force when there is no specific sharing arrangement between an EPM participant and another hospital in order to protect receiving hospitals from the effects of adverse patient selection that would inflate the transfer hospital’s costs.

One commenter stated that the structure of CJR fraud and abuse waivers have hindered gainsharing arrangements because of CJR participant hospitals' concerns that they may lose waiver protection if they miss any one of the program requirements, including those that the commenter believes pose no fraud and abuse risk to any federal health care program. The commenter asserted that the program requirements for sharing arrangements do not appropriately balance CMS’ program integrity interest with need for meaningful change.

Response: We appreciate the feedback of the commenters, as well as the information provided regarding the potential challenges associated with constructing and executing sharing arrangements, both in the EPM and CJR model and other CMS efforts such as the BPCI initiative. We understand that parties may want to consider a number of factors when assessing whether to enter into a sharing arrangement, including the number of episodes in which the collaborator will be engaged,
the quality measures used to measure performance, as well as purely contractual matters governing payment, appeals, and termination.

With respect to the overall complexity of the requirements for financial arrangements in the EPM, we note, as we discussed in the proposed rule (80 FR 50917), that in response to feedback from participant hospitals in the CJR model, other stakeholders, and the general public we have made an effort to simplify the requirements in comparison to what was adopted for the CJR model by removing duplication of requirements in similar provisions; streamlining and reorganizing many of the provisions for clarity and consistency; and providing additional flexibility. We believe that these efforts have resulted in a set of requirements that are more accessible to EPM participants and involved parties. Nevertheless, we note that an EPM participant’s decision to enter into sharing arrangements remains voluntary—as it is for EPM collaborators, collaboration agents, and downstream collaboration agents—and as stated in the proposed rule, we expect that all parties will carefully consider the impact of entering into sharing arrangements in order to align the financial incentives of providers and suppliers with the EPM goals of improving the quality and efficiency of EPM episodes.

We note that we have proposed to exclude the term “collaborator agreement” from the EPM (and to amend the CJR model to remove this term). We believe that dispensing with this term and the associated mandates for the collaborator agreements removes an unnecessary level of regulatory complexity and offers useful flexibilities to parties developing their sharing arrangements and drafting the written agreements to memorialize those sharing arrangements.

A desire to allow for flexibility is the same reason we decline to develop a default template for written agreements to memorialize sharing arrangements, as requested by one commenter. Given the variation and potential complexity of financial arrangements between EPM participants and collaborators, we believe that a sharing arrangement template is more likely to be constrictive than helpful. We would expect that any template developed by the agency would include provisions to account the diversity of sharing arrangements that could be pursued and therefore include a number of provisions that would be inapplicable or unnecessary for the written

agreements in many sharing arrangements.

Regarding the specific concern of the commenter about the feasibility of EPM participants writing sharing arrangements with each party where a hospital will transfer beneficiaries with AMI, as discussed in section III.C.4.a.(5) of this final rule, we are finalizing a modification to our proposed policy and will cancel all AMI episodes when a beneficiary initiates an AMI episode at the initial treating hospital and then is transferred to another hospital for inpatient hospital care. We believe this revision to the proposed AMI model episode initiation and transfer attribution policy addresses the concerns of the commenter by eliminating the circumstances that would lead an initial treating hospital to enter into sharing arrangements with hospitals solely because such hospitals are receiving beneficiaries in transfer during AMI care because the initial treating hospital will no longer be responsible for an AMI episode when the beneficiary is transferred.

We emphasize that all the requirements in §§512.500, 512.505, and 512.510 for sharing arrangements, distribution arrangements, and downstream distribution arrangements, respectively, are EPM programmatic requirements. As noted previously, fraud and abuse waivers for the EPM are outside the scope of this rulemaking.

Comment: One commenter urged CMS to carefully consider the impact state law, particularly in California, would have on providers’ ability to participate in the proposed EPM and allow time for agreements to be structured so hospitals are not put at risk for violating state law and can maintain their relationships with physicians. The commenter asserted that California’s corporate practice of medicine prohibition makes financial alignment between EPM participants and certain collaborators particularly complicated because the prohibition mandates a strict separation of hospitals and physicians. They concluded that in developing sharing arrangements, EPM participants would need to undertake careful analysis of their compliance with both federal and state law, including the interaction of federal and state law requirements.

Response: We appreciate the information provided by the commenter about the challenges that may arise for EPM participants developing sharing arrangements that comply with the requirements of the EPM and applicable state laws. For much of the time that EPM participants may need to prepare and put into place the sharing arrangements that they believe are necessary to align their financial incentives with those of their collaborators toward the goal of the EPM to improve the quality of care while reducing its cost. Given the first performance year of the EPM begins on July 1, 2017, EPM participants will have knowledge of the federal requirements for EPM financial arrangements several months prior to their implementation in the EPM, which we believe is sufficient for the early planning about these arrangements.

Final Decision: After consideration of the public comments received, we are finalizing the proposals in § 512.500(a) for the general requirements for EPM sharing arrangements, with modification to clarify that an EPM collaborator selection criterion that considers whether a potential collaborator has performed a reasonable minimum number of services that would qualify as EPM activities will be deemed not to violate the volume or value standard if the purpose of the criterion is to ensure the quality of care furnished to EPM beneficiaries. EPM sharing arrangements must comply with the following general provisions:

• An EPM participant may enter into a sharing arrangement with an EPM collaborator to make a gainsharing payment, or to receive an alignment payment, or both. An EPM participant must not make a gainsharing payment or receive an alignment payment except in accordance with a sharing arrangement.

• A sharing arrangement must comply with the provisions of this section and all other applicable laws and regulations, including the applicable fraud and abuse laws and all applicable payment and coverage requirements.

• The EPM participant must develop, maintain, and use a set of written policies for selecting individuals and entities to be EPM collaborators. These policies must contain criteria related to, and inclusive of, the quality of care delivered by the potential EPM collaborator. The selection criteria cannot be based directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent. A selection criterion that considers whether a potential EPM collaborator has performed a reasonable minimum number of services that would qualify as
EPM activities will be deemed not to violate the volume or value standard if the purpose of the criterion is to ensure the quality of care furnished to EPM beneficiaries.

- If an EPM participant enters into a sharing arrangement, its compliance program must include oversight of sharing arrangements and compliance with the applicable requirements of the EPM.

b. Requirements

We proposed a number of specific requirements for sharing arrangements to help ensure that their sole purpose was to create financial alignment between EPM participants and EPM collaborators toward the goals of the EPM while providing program integrity safeguards. We proposed that the sharing arrangement must be in writing, signed by the parties, and entered into before care was furnished to EPM beneficiaries under the sharing arrangement. In addition, participation in a sharing arrangement must be voluntary and without penalty for nonparticipation. It would be important that providers, suppliers, and ACOs with ACO participants and ACO providers/suppliers rendering items and services to EPM beneficiaries during EPM episodes have the freedom to provide medically necessary items and services to EPM beneficiaries without any requirement that they participate in a sharing arrangement, in order to safeguard beneficiary freedom of choice, access to care, and quality of care.

Similarly, we believed that if a provider, supplier, or ACO entered into a sharing arrangement with an EPM participant, that sharing arrangement must precede the provision of care to the EPM beneficiary under the sharing arrangement. We expected the sharing arrangement to set out the mutually agreeable terms for the financial arrangement between the parties to guide and reward EPM care redesign for future EPM episodes, rather than reflect the quality and financial results of EPM episodes that had already occurred and where the financial outcome of the sharing arrangement terms would be known before signing.

We proposed that the sharing arrangement must require the EPM collaborator and its employees, contractors, and subcontractors to comply with certain requirements that would be important for program integrity under the arrangement. We noted that the terms contractors and subcontractors, respectively, included collaboration agents as defined later in this section. The sharing arrangement must require all of these individuals and entities to comply with the applicable provisions of proposed Part 512, including requirements regarding beneficiary notifications, access to records, record retention, and participation in any evaluation, monitoring, compliance, and enforcement activities performed by CMS or its designees, because these individuals and entities all would play a role in EPM care redesign and be part of financial arrangements under the EPM.

The sharing arrangement must also require all of these individuals and entities to comply with the applicable Medicare provider enrollment requirement at § 424.500, including having a valid and active TNIN or NPI, during the term of the sharing arrangement. This would be to ensure that the individuals and entities have the required enrollment relationship with CMS under the Medicare program, although we noted that they would not be responsible for complying with requirements that did not apply to them. Finally, the sharing arrangement must require individuals and entities to comply with all other applicable laws and regulations.

We proposed that the sharing arrangement must not pose a risk to beneficiary access, beneficiary freedom of choice, or quality of care so that financial relationships between EPM participants and EPM collaborators did not negatively impact beneficiary protections under the EPM. The sharing arrangement must require the EPM collaborator to have a compliance program that included oversight of the sharing arrangement and compliance with the requirements of the EPM, just as we would require EPM participants to have a compliance program for this purpose as a program integrity safeguard. In the proposed rule, we noted our understanding that some stakeholders might have interpreted the substantially similar requirement in the CJR model as obligating CJR collaborators to adopt specific compliance programs components (for example, an externally staffed hotline to receive complaints) and the perceived cost of adopting those components might be a disincentive for certain individuals and entities to be CJR collaborators in the CJR model.

However, we noted that the CJR compliance program requirement did not mandate that a CJR collaborator’s compliance program take a particular form or include particular components. OIG has repeatedly and consistently emphasized that there is no “one size fits all” compliance program (for example, refer to OIG compliance program guidance for Individual and Small Group Physician Practices, 65 FR 59434, 59434–52 (October 5, 2000)). Like OIG, we noted our understanding of the variances and complexities within the industry and appreciated differences in the size and resources of different providers and suppliers, particularly the financial constraints on individual physicians and nonphysician practitioners and small PGPs. Accordingly, we did not believe that the compliance program requirement for CJR collaborators as properly understood should be a disincentive for individuals or small PGPs to become CJR collaborators. Thus, we proposed to adopt a substantially similar requirement for the EPM. We sought comment on the anticipated effect of the proposed compliance program requirement for EPM collaborators, particularly with regard to individual physicians and nonphysician practitioners and small PGPs, and whether alternative compliance program requirements for all or a subset of EPM collaborators should be adopted to mitigate any effect of the proposal that could make participation as an EPM collaborator infeasible for any provider, supplier, or other entity on the proposed list of types of EPM collaborators.

We observed it would be necessary that EPM participants have adequate oversight over sharing arrangements to ensure that all arrangements meet the proposed requirements of this section and provide program integrity protections. Therefore, we proposed that the board or other governing body of the EPM participant have responsibility for overseeing the EPM participant’s participation in the EPM, its arrangements with EPM collaborators, its payment of gainsharing payments, its receipt of alignment payments, and its use of beneficiary incentives in the EPM.

For purposes of financial arrangements under the EPM, we proposed to define activities related to promoting accountability for the quality, cost, and overall care for EPM beneficiaries, including managing and coordinating care; encouraging investment in infrastructure and redesigned care processes for high quality and efficient service delivery; the provision of items and services during an EPM episode in a manner that reduces costs and improves quality; or carrying out any other obligation or duty under the EPM as “EPM activities.” In addition to the quality of care provided during episodes, we noted the activities that would fall under this proposed definition would encompass...
the totality of activities upon which it would be appropriate for certain financial arrangements under the EPM to be based in order to value the contributions of providers, suppliers, and other entities toward meeting the EPM goals of improving the quality and efficiency of episodes. We sought comment on the proposed definition of EPM activities as an inclusive and comprehensive framework for capturing direct care and care redesign for EPM episodes that contributed to improving the quality and efficiency of these episodes. We proposed to use the term EPM activities in identifying certain obligations of parties in a sharing arrangement that were described as “changes in care coordination or delivery” in the CJR regulations governing the contents of the written agreement memorializing the sharing arrangement. We noted that as discussed in section V.J. of the proposed rule (81 FR 50958), we proposed to define and use the term CJR activities in the CJR regulations just as we proposed to define and use the term EPM activities in the EPM regulations.

We proposed that the written agreement memorializing a sharing arrangement must specify a number of parameters of the arrangement, including the following:

- The purpose and scope of the sharing arrangement.
- The identities and obligations of the parties, including specified EPM activities and other services to be performed by the parties under the sharing arrangement.
- The date of the sharing arrangement.
- Management and staffing information, including type of personnel or contractors that will be primarily responsible for carrying out EPM activities.
- The financial or economic terms for payment, including the following:
  + Eligibility criteria for a gainsharing payment.
  + Eligibility criteria for an alignment payment.
  + Frequency of gainsharing or alignment payment.
  + Methodology and accounting formula for determining the amount of a gainsharing payment that is substantially based on quality of care and the provision of EPM activities.
  + Methodology and accounting formula for determining the amount of an alignment payment.

Finally, we proposed to require that the terms of the sharing arrangement must not prohibit EPM participant, EPM collaborator, or any employees, contractors, or subcontractors of the EPM participant or EPM collaborator to reduce or limit medically necessary services to any Medicare beneficiary or restrict the ability of an EPM collaborator to make decisions in the best interests of its patients, including the selection of devices, supplies, and treatments. These proposed requirements were to ensure that the quality of care for EPM beneficiaries would not be negatively affected by sharing arrangements under the EPM.

The proposals for the requirements for sharing arrangements under the EPM were included in proposed § 512.500(b). We sought comment about all of the proposed requirements set out in the preceding discussion, including whether additional or different safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the EPM were met.

The following is a summary of the comments received and our responses. Comment: Some commenters requested that CMS simplify the requirements for sharing arrangements and allow gainsharing to the fullest extent possible consistent with the goals of preventing fraud and abuse and unfair business practices.

One commenter asserted that the regulations lack a clear section laying out each and every requirement to be included in the written agreement memorializing the sharing arrangement. The commenter urged CMS to set forth in the final EPM and CJR regulations a comprehensive list of the requirements for the written sharing arrangement requirements.

Some commenters urged CMS to eliminate proposed requirements for financial arrangements that they believe are overly inclusive or technical. They singled out as unnecessary the requirement that the written agreement memorializing the sharing arrangement include management and staffing information. The commenters stated that it should be sufficient to spell out each party’s obligations and allow greater latitude to determine how the management and staffing aspects of those obligations will be met. The commenters also identified as overly technical and confusing the requirement that all gainsharing payments and any alignment payments must be administered by the EPM participant in accordance with generally accepted accounting principles. The commenters asserted this requirement does not lessen the fraud and abuse risk posed by any sharing arrangement.

Response: We appreciate commenters’ feedback on the requirements for sharing arrangements. With the specific exceptions noted later in this section, we continue to believe that the requirements with respect to financial arrangements in the EPM set forth in the proposed rule are necessary for program integrity purposes and to prevent the distribution and receipt of payments for reasons outside the goals of the EPM and we finalize those requirements here.

We direct the commenters suggesting that the regulations lack a clear section laying out each and every requirement to be included in the written agreement memorializing the sharing arrangement to § 512.500(b) of the regulation text, with particular emphasis on § 512.500(b)(7). This subsection sets forth the requirements for the written agreement memorializing the sharing arrangement. In addition to providing a list of specifications for the written agreement memorializing a sharing arrangement, § 512.500(b) is intended to offer flexibility to the parties to draft written agreements in a format most useful for them. We note that while EPM participants may conclude that additional provisions in their written agreements are the most appropriate tool to hold their EPM collaborators accountable for compliance with other programmatic requirements, we are not mandating that EPM participants adopt that approach.

As noted previously, we have endeavored to streamline the requirements for financial arrangements under the EPM in areas where we believe the program integrity risk is low. As also noted previously, the removal of the collaborator agreement requirement—a term present in the CJR Final Rule, not included in this final rule—represents a result of that effort. In addition, we agree with the commenters who recommended that we eliminate the requirement that the written agreement memorializing the sharing arrangement include management and staffing information, including the type of personnel or contractors that will be primarily responsible for carrying out EPM activities. Upon further consideration, we believe that the requirement for the written agreement is unnecessary as a program safeguard.

While we generally expect that EPM participants entering into sharing arrangements will have an EPM care redesign plan that includes management and staffing information, including the types of personnel or contractors that will be primarily responsible for carrying out EPM activities, we understand that maintaining up-to-date management and staffing information as part of the written agreement for the sharing arrangement could be administratively burdensome to EPM participants. We therefore finalize that requirement.
participants and EPM collaborators and reduce their flexibility to accommodate changes in personnel or in their plans for care redesign in response to their cost and quality performance under the EPM. Therefore, we are removing the proposed requirement in §512.500(b)(7)(iv) that the written agreement include management and staffing information. However, we decline to remove provisions from the set of requirements for financial arrangements where we believe such changes would increase the risk for fraud and abuse or would be inconsistent with the goals of the model. We disagree with the commenters who suggested that we should remove the requirement that gainsharing payments and alignment payments be administered by the EPM participant in accordance with generally accepted accounting principles (GAAP). For purposes of program integrity, compliance, and monitoring, there is a benefit to all participants across the EPM applying a standard set of accounting principles to these types of payments. Thus, we decline to accept the commenters’ suggestion to remove this requirement.

Comment: One commenter expressed concern about CMS’ proposal to no longer use the term “collaborator agreement” in the CJR model and to not use this term in the EPM, although the commenter supported CMS’ proposed definition of a sharing arrangement and the related requirements. They claimed that not all collaborator agreements would be sharing arrangements. For example, the commenter explained that hospitals that are EPM participants could have agreements with their employed physicians that cascade the programmatic requirements of the EPM, but do not necessarily alter the physicians’ underlying compensation or the potential for gainsharing payments. They urged CMS to retain the term collaborator agreement, rather than adopt the proposed change to sharing arrangement, as the term collaborator agreement would include both the agreements that cascade programmatic requirements as well as those that also create explicit financial arrangements. The commenter added that this distinction is important because CMS proposed to make a financial arrangement a prerequisite to being placed on the list of Affiliated Practitioners for the determination of Eligible Clinicians who could be considered QPs based on services furnished under the EPM and CJR model. However, MACRA states that the “entity” must bear more than nominal risk to qualify for an APM incentive payment, not the clinician. By altering the terms used in the EPM and CJR model to eliminate the term collaborator agreement, the commenter concluded that CMS was suggesting that a shift of risk is required for a clinician to be on the list of Affiliated Practitioners and thus qualify for a bonus, which they believe is inconsistent with the statute. The commenter recommended that CMS retain the term collaborator agreement and clarify that the agreements do not need to include financial arrangements for the clinicians to be placed on the Affiliated Practitioners list for the determination of Eligible Clinicians for QP determinations.

Response: We appreciate the information provided by the commenter on the agreements that hospitals may develop with their employed physicians and their support for the proposed requirements for sharing arrangements. However, the commenter appears to misunderstand the existing CJR provisions regarding collaborator agreements. As finalized in the CJR Final Rule (80 FR 73541), a collaborator agreement means a written, signed agreement between a CJR collaborator and a participant hospital that meets the requirements of §510.500(c). Among other requirements, §510.500(c) mandates that each collaborator agreement “must contain a description of the sharing arrangement between the participant hospital and the CJR collaborator regarding gainsharing payments and alignment payments.” (81 FR 73553). Therefore, an agreement between a CJR participant hospital and its employed physicians to require physicians to meet the programmatic requirements of the CJR model that does not also include the potential for gainsharing payments or alignment payments is not a collaborator agreement. Thus, the commenter’s assumption that maintaining the CJR requirements for collaborator agreements and adopting those requirements for the EPM as a mechanism to include clinicians without sharing arrangements on the Affiliated Practitioners lists for these models is incorrect. As noted previously, in developing the proposed rule, we concluded that we could streamline the CJR requirements and adopted less burdensome requirements for the EPM by eliminating the concept of collaborator agreement and the separate requirements associated with these agreements. The example provided by the commenter does not meet the definition of a CJR collaborator agreement. We continue to believe that it is appropriate under the EPM and CJR model to focus on the requirements for a sharing arrangement, without imposing additional regulatory burdens associated with a collaborator agreement.

For discussion of the identity of the clinicians that are reported on the Affiliated Practitioner List for the EPM and CJR model and the opportunity for clinicians without financial arrangements under the EPM and CJR model to be included on those lists, we refer to sections III.A.2.c. and V.O.3. of this final rule, respectively.

Comment: A number of commenters commended CMS for its proposal that EPM sharing arrangements remain voluntary and without penalty for nonparticipation. One commenter added that this is especially important for those professionals that are non-patient facing providers who do not select their patients and whose contact, relationship, and services furnished to a beneficiary may occur during a short part of the episode.

Response: We agree with the commenters who supported the voluntary nature of sharing arrangements, and we continue to believe that it is essential that sharing arrangements be voluntary and without penalty for nonparticipation. We are not requiring EPM participants to offer sharing arrangements to all providers and suppliers caring for EPM beneficiaries. Likewise, EPM participants are prohibited from coercing or requiring individuals or entities to enter into a sharing arrangement. EPM participants may not penalize or discriminate against physicians, nonphysician practitioners, and other providers, suppliers, or ACOs on the grounds that they are not EPM collaborators. For example, EPM participants may not condition the ability of individuals or entities to receive future referrals from the EPM participant on the basis of EPM collaborator status or on criteria that are outside of the goals of the EPM.

We are finalizing in §512.500(b)(2) that participation in sharing arrangements be voluntary and without penalty for nonparticipation.

Comment: Several commenters expressed concerns about the level of control given to EPM participants over the amount of gainsharing payments and their allocation, urging CMS to modify its proposal to require greater input from collaborators on the methodology for sharing payments and to provide additional safeguards to prevent coercing or requiring individuals or entities to enter into a sharing arrangement. Specifically, they recommended that...
providers who furnished services to EPM beneficiaries should be part of decision-making regarding the amount and allocation of gainsharing payments. The commenters suggested that providers furnishing a minimum percentage of EPM services should be required to be part of the EPM participant governance structure that develops written policies for collaborators and the sharing arrangement methodologies. The commenters urged CMS to establish a maximum amount of reconciliation payments that hospitals may keep and a minimum amount of gainsharing payments that must be paid to each collaborator. They concluded that these modifications would strengthen collaborator. They concluded that these modifications would strengthen collaborator’s ability to choose any Medicare-enrolled provider or supplier, or any physician or practitioner who has opted out of Medicare; the cap on gainsharing payments to physicians, nonphysician practitioners, PGPs, and NPPGPs; the requirement that EPM collaborator selection must be based on written policies that contain criteria related to, and inclusive of, the quality of care delivered by the potential EPM collaborator and cannot be based directly or indirectly on the volume or value of past or anticipated referrals; the requirements that the opportunity to make or receive gainsharing payments, alignment payments, distribution payments, and downstream distribution payments may not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent; and the requirements that the amount of any gainsharing payments and, with limited exceptions, any distribution payments and downstream distribution payments be determined in accordance with a methodology that is substantially based on the quality of care and the provision of EPM activities. We believe these safeguards are sufficient to protect beneficiary choice and ensure that providers, suppliers, and ACOs that are EPM collaborators, collaboration agents, or downstream collaboration agents receive payments that are based on quality of care and activities specifically related to promoting accountability for the quality, cost, and overall care for EPM beneficiaries, including managing and coordinating care; encouraging investment in infrastructure; enabling technologies, and redesigned care processes for high quality and efficient service delivery; the provision of items and services during an EPM episode in a manner that reduces costs and improves quality; or carrying out any other obligation or duty under the EPM.

Comment: One commenter recommended that CMS enable individuals and entities, such as small PGPs, to participate in the EPM as collaborators without requiring major investments in infrastructure and electronic health records. The commenter urged CMS to provide appropriate resources and support to enable small practices to participate. They further requested that CMS monitor activities involving distribution of payment to guard against unfair business practices and to promote a fair and equitable distribution of gainsharing payments to all providers who are involved as collaborators. Finally, the commenter urged CMS to mandate distribution of gainsharing payments to EPM collaborators in a timely fashion.

Response: It is our intent that the models offer opportunities for providers and suppliers of all sizes to be EPM collaborators, provided they meet the criteria in this final rule. We note that the EPM does not include requirements for certain infrastructure or use of electronic health records. While we currently do not plan to provide specific resources targeted to providers, suppliers, and ACOs engaged in sharing arrangements with EPM participants, we will broadly disseminate to the public information that may be useful to model collaborators throughout implementation of the EPM.

In response to the commenters’ desire to ensure that gainsharing payments are distributed fairly and equitably to EPM collaborators, as noted previously, we believe that the provisions of this final rule adequately address this point. We appreciate the commenter’s concern about the potential for unfair business practices, but the regulation of such practices is outside the scope of our authority. Accordingly, we will not add a prohibition against unfair business practices. However, we believe that many of the program integrity provisions for sharing arrangements will also serve to deter unfair business practices, and we will be monitoring compliance with these requirements.

Regarding the timely distribution of gainsharing payments, we require that gainsharing payments be distributed on an annual basis. As discussed previously, we are not requiring EPM participants to enter into sharing arrangements with all providers and suppliers caring for EPM beneficiaries, but where an EPM participant does enter into one or more sharing arrangements, the model participant must not distribute any gainsharing payments more than once per year. We believe that this requirement ensures that gainsharing payments are timed to sufficiently maintain an EPM collaborator’s commitment to lowering costs and improving quality of care. To the extent the commenter was requesting that CMS prohibit late payment of amounts owed to EPM collaborators, we believe that the consequences for breach of contract offer sufficient protection.

Comment: Many commenters expressed strong support for CMS’ proposal to adopt the terms of
activities and CJR activities to describe activities in support of the goals of the models, as well as CMS’ proposed approach of utilizing these definitions as the comprehensive framework for capturing both direct patient care and care redesign for EPM and CJR episodes. Several commenters also supported CMS’ proposal that the methodology for determining gainsharing payments may take into account the amount of EPM or CJR activities provided by an EPM or CJR collaborator relative to other EPM or CJR collaborators, and the application of this same standard to distribution payments and downstream distribution payments. One commenter commended CMS for recognizing that risk-sharing between EPM participants and CJR participant hospital and their collaborators should involve more elasticity by accounting for the effects of the collaborator’s overall participation and involvement. Another commenter claimed that this approach would provide EPM participants and CJR participant hospitals greater flexibility to incentivize care redesign by allowing more actively involved physicians who participate in care redesign to receive higher gainsharing payments as compared to physicians that may only care for a few model beneficiaries and may not be actively involved in care redesign. One commenter recommended that CMS should add to the definitions of EPM activities and CJR activities a consideration of the long-term patient experience and outcomes to ensure that these definitions do not undermine consideration of decisions that potentially impact long-term value beyond the episode.

Response: We appreciate the commenters’ support for our proposal to adopt the terms EPM activities and CJR activities and to use these as a framework for capturing items and services furnished directly to beneficiaries in the EPM and CJR model and care redesign efforts for EPM episodes and CJR episodes. We also appreciate the commenters’ support for our proposal that the methodology for determining gainsharing payments may take into account the amount of EPM activities or CJR activities provided by an EPM collaborator or CJR collaborator relative to other EPM collaborators or CJR collaborators, and the use of this same standard for distribution payments and downstream distribution payments. We agree with the commenters that this standard provides important flexibility for EPM participants and CJR participants to more effectively align the financial incentives of providers, suppliers, and ACO with the goals of the EPM and CJR model to improve the quality of care and reduce the cost of episode care by allowing financial arrangements to account for the level of the collaborator, collaboration agent, or downstream collaboration agent’s overall participation and involvement in beneficiary care and care redesign.

We appreciate the interest of the commenter who sought to ensure that care redesign under the EPM and CJR model does not lead to care pathways that may negatively impact long-term patient experience and outcomes. We do not believe it would be appropriate to add consideration of long-term patient experience and outcomes to the definition of EPM activities and CJR activities. The goals of the EPM and CJR model are focused on the quality and efficiency of episode care and, therefore, we believe that the definition of EPM activities and CJR activities that are part of the basis for payments under financial arrangements in the EPM and CJR model should include only those activities related to the immediate goals of the EPM and CJR model. However, as discussed in section IV. of this final rule, the evaluation of the EPM, like the evaluation of the CJR model (80 FR 73528 through 73530), will examine the impact of the EPM on outcomes and quality, including during the period following the end of episodes and on measures of relevant long-term quality.

We are finalizing in § 512.2 the definition of EPM activities and use that term throughout the regulations for EPM financial arrangements.

Comment: A commenter requested that CMS provide additional guidance on the compliance program required for EPM collaborators. The commenter expressed appreciation for the discussion in the proposed rule that a collaborator’s compliance program need not take any one particular form and further, that there is no “one size fits all” compliance program. However, the commenter stated that the requirement that an EPM collaborator include oversight of not only the sharing arrangement, but compliance with the requirements of the entire EPM, is a large undertaking for any one collaborator, let alone a collaborator who is a solo practitioner. The commenter urged CMS to consider the practical implications of this compliance program requirement in the event an EPM participant contracts with a physician individually, and that physician is also a member of a PGP that is not an EPM collaborator.

Response: We appreciate the interest of the commenter in the implication of the proposed requirement for an EPM collaborator to have a compliance program, particularly for collaborators who are individuals. In our proposed requirements for sharing arrangements, we proposed in § 512.500(b)(4) that the sharing arrangement must require the EPM collaborator to have a compliance program that includes oversight of the sharing arrangement and compliance with the requirements of the EPM. Any individual or entity that wants the benefits of becoming a collaborator must also accept the responsibility to ensure that its collaboration complies with the requirements of the EPM. The proposal requires that each collaborator implement mechanisms to promote compliance, while giving each collaborator the discretion to determine which mechanisms are appropriate for that individual or entity. Our intent is to require the EPM collaborator’s compliance program to monitor its own conduct and relationships only, in contrast with policing independent, third parties with whom it does not have any direct relationship. The goal is for the EPM collaborator’s compliance efforts to look not just at its financial relationship with the EPM participant but at the collaborator’s overall compliance with the requirements of the model (for example, collaborator performance of clinical care under the model; the propriety of any distribution arrangements). Moreover, we believe that the requirement for a collaborator to have a compliance program should not be understood as requiring each collaborator to independently maintain a separate compliance program, but rather that every collaborator must be covered by a compliance program that includes the required oversight. For example, it may not be practical for each member of a PGP to separately maintain his or her own compliance program. However, the EPM requirement could still be met if the PGP has a compliance program that covers the PGP member and that includes oversight of the PGP member’s sharing arrangement and the PGP member’s compliance with the requirements of the model.

Therefore, while we continue to believe that it is appropriate to require all EPM collaborators, including individual practitioners, to be covered by a compliance program that includes oversight of the sharing arrangement, we are clarifying that the collaborator’s obligations may be met if the collaborator either has or is covered by a compliance program that includes the appropriate oversight of the collaborator, and that the requirements of the EPM that are relevant for the EPM
collaborator’s compliance program are those requirements of the EPM that apply to its role as an EPM collaborator, including any distribution arrangements, rather than all requirements of the entire model.

We are finalizing in § 512.500(b)(4) that the EPM collaborator must have or be covered by a compliance program that includes oversight of the sharing arrangement and compliance with the requirements of the EPM that apply to its role as an EPM collaborator, including any distribution arrangements.

Comment: Several commenters requested clarification about the timing for entering into sharing arrangements, distribution arrangements, or downstream distribution arrangements with respect to EPM episodes in view of CMS’ proposals that the three types of arrangements must be in writing and signed by the parties, and entered into before care is furnished to EPM beneficiaries under the applicable arrangement. One commenter further inquired about whether a sharing arrangement needs to be signed prior to an episode beginning in order for an EPM collaborator to receive a gainsharing payment for savings associated with the episode or whether it is also possible for a collaborator to receive a gainsharing payment for savings associated with the episode if the sharing arrangement is signed prior to an episode ending.

Response: We appreciate the need to understand when “care is furnished to EPM beneficiaries under the applicable arrangement” in order to ensure that execution of the written agreements is timely. A sharing arrangement, distribution arrangement, or downstream distribution arrangement requires that the amount of a gainsharing payment, distribution payment, or downstream distribution payment to an EPM collaborator, collaboration agent, or downstream collaboration agent, respectively be determined in accordance with a methodology that is substantially based on the quality of care and the provision of EPM activities, which by definition must be for EPM beneficiaries during EPM episodes. EPM activities include, but are not limited to, billable items and services furnished to EPM beneficiaries during EPM episodes. Therefore, “care is furnished to EPM beneficiaries under the applicable arrangement” when the individual or entity in the financial arrangement (designee to the extent permitted by regulation) first provides EPM activities may be considered in the methodology for determining the amount of the applicable payment.

Accordingly, the written agreement memorializing the sharing arrangement, distribution arrangement, or downstream distribution arrangement must have been signed by the parties and entered into before the date the first EPM activities that may be considered in the methodology for determining the applicable payment amount are provided.

We note that once a sharing arrangement is signed by an EPM collaborator in a performance year, there is no restriction for that performance year on the timing of the specific episodes that result in savings that can be paid to the EPM collaborator as a gainsharing payment. According to our requirements in § 512.500(b)(2), to be eligible to receive a gainsharing payment, an EPM collaborator must meet quality of care criteria for the performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment, as well as meet the other criteria specific to the type of collaborator, namely directly furnished an item or service to an EPM beneficiary during an EPM episode; billed for an item or service that was rendered by one or more PGP member, NPPGP member, or TGP member respectively to an EPM beneficiary during an EPM episode, contributed to EPM activities, and been clinically involved in the care of EPM beneficiaries; or had an ACO provider/supplier that directly furnished, or an ACO participant that billed for, an item or service to an EPM beneficiary during an EPM episode, contributed to EPM activities, and been clinically involved in the care of EPM beneficiaries during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment.

Final Decision: After consideration of the public comments received, we are finalizing the proposals in § 512.500(b) for the requirements for EPM sharing arrangements, with modification to specify that the EPM collaborator must have or be covered by a compliance program which must include oversight of the sharing arrangement and compliance with the requirements of the EPM that apply to its role as an EPM collaborator, including any distribution arrangements. We are also modifying our proposal as discussed previously and removing the requirement that the written agreement memorializing a sharing arrangement includes management and staffing information, a change which results in renumbering proposed § 512.500(b)(7)(iv) (requiring the financial or economic terms for payment be specified in the written agreement about the sharing arrangement) to § 512.500(b)(7)(iv). EPM sharing arrangements must meet the following general requirements:

A. A sharing arrangement must be in writing and signed by the parties, and entered into before care is furnished to EPM beneficiaries under the sharing arrangement.

B. Participation in a sharing arrangement must be voluntary and without penalty for nonparticipation.

C. The sharing arrangement must require the EPM collaborator and its employees, contractors (including collaboration agents), and subcontractors (including downstream collaboration agents) to comply with the following:

1. The applicable provisions of this part (including requirements regarding beneficiary notifications, access to records, record retention, and participation in any evaluation, monitoring, compliance, and enforcement activities performed by CMS or its designees);

2. All applicable Medicare provider enrollment requirements at § 424.500 of this chapter, including having a valid TIN or NPI, during the term of the sharing arrangement; and

3. All other applicable laws and regulations.

D. The sharing arrangement must require the EPM collaborator to have or be covered by a compliance program that includes oversight of the sharing arrangement and compliance with the requirements of the EPM that apply to its role as an EPM collaborator, including any distribution arrangements.

E. The sharing arrangement must not pose a risk to beneficiary access, beneficiary freedom of choice, or quality of care.

F. The board or other governing body of the EPM participant must have responsibility for overseeing the EPM participant’s participation in the EPM, its arrangements with EPM collaborators, its payment of gainsharing payments, its receipt of alignment payments, and its use of beneficiary incentives in the EPM.

G. The written agreement memorializing a sharing arrangement must specify the following:

1. The purpose and scope of the sharing arrangement.

2. The identities and obligations of the parties, including specified EPM activities and other services to be performed by the parties under the sharing arrangement;
++ The date of the sharing arrangement.
++ The financial or economic terms for payment, including the following:
—Eligibility criteria for a gainsharing payment.
—Eligibility criteria for an alignment payment.
—Frequency of gainsharing or alignment payment.
—Methodology and accounting formula for determining the amount of a gainsharing payment that is substantially based on quality of care and the provision of EPM activities.
—Methodology and accounting formula for determining the amount of an alignment payment.
• The sharing arrangement must not:
  ++ Induce the EPM participant, EPM collaborator, or any employees, contractors, or subcontractors of the EPM participant or EPM collaborator to reduce or limit medically necessary services to any Medicare beneficiary; or
  ++ Restrict the ability of an EPM collaborator to make decisions in the best interests of its patients, including the selection of devices, supplies, and treatments.

We proposed a number of conditions and limitations for gainsharing payments, alignment payments, and internal cost savings as program integrity protections for the payments to and from EPM collaborators. We proposed to require that gainsharing payments be derived solely from reconciliation payments, internal costs savings, or both; that they be distributed on an annual basis, not more than once per calendar year; that they not be a loan, advance payment, or payment for referrals or other business; and that they be clearly identified as a gainsharing payment at the time they are paid.

In the proposed rule, we discussed our belief that gainsharing payment eligibility for EPM collaborators should be conditioned on two requirements—(1) meeting quality of care criteria; and (2) rendering items and services to EPM beneficiaries during EPM episodes—as safeguards to ensure that eligibility for gainsharing payments would be solely based on aligning financial incentives for EPM collaborators with the EPM goals of improving EPM episode quality and efficiency. With respect to the first requirement, we proposed that to be eligible to receive a gainsharing payment, an EPM collaborator must meet quality of care criteria for the performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprised the gainsharing payment. The quality of care criteria that would be established by the EPM participant must be directly related to EPM episodes. With regard to the second requirement, which is also applicable to being required to make an alignment payment, we proposed different criteria depending on the type of collaborator involved. We proposed that to be eligible to receive a gainsharing payment, an EPM collaborator other than a PGP or an ACO must have directly furnished a billable item or service to an EPM beneficiary during an EPM episode that occurred in the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment or was assessed a repayment amount. For purposes of this requirement, we considered a collaborator that is a hospital, CAH, or post-acute care provider to have “directly furnished” a billable service if one of these entities billed for an item or service for an EPM beneficiary during an EPM episode that occurred in the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment or was assessed a repayment amount. For example, a PGP or ACO provider/supplier that directly furnished, or an ACO participant that billed for, an item or service that was rendered to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment or was assessed a repayment amount. With respect to ACOS, we proposed that an “ACO participant” and “ACO provider/supplier” have the meaning set forth in § 425.20 of regulations. Thus, these proposed variations on the requirements for other collaborator types also required a linkage between the EPM collaborator that is the PGP or ACO and the provision of items and services to EPM beneficiaries during EPM episodes by PGP members or ACO participants or ACO providers/suppliers, respectively.

Moreover, we further proposed that because PGP s and ACOS do not directly furnish items and services to beneficiaries, in order to be eligible to receive a gainsharing payment or be required to make an alignment payment, the PGP or ACO must have contributed to EPM activities and been clinically involved in the care of EPM beneficiaries during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprised the gainsharing payment or was assessed a repayment amount. For example, a PGP or ACO might have been clinically involved in the care of EPM beneficiaries by providing care coordination services to EPM beneficiaries during and/or after inpatient admission; engaging with an EPM participant in care redesign strategies, and actually performing a role in implementing such strategies that were designed to improve the quality of care for EPM episodes and reduce EPM episode spending; or in coordination with providers and suppliers (such as members of the PGP, ACO participants, ACO providers/suppliers, the EPM participant, and post-acute care providers),
implementing strategies designed to address and manage the comorbidities of EPM beneficiaries.

Because internal cost savings might be shared through gainsharing payments with EPM collaborators, we proposed certain requirements for their calculation as a program integrity safeguard. First, the methodology for accruing, calculating and verifying internal cost savings must be transparent, measurable, and verifiable in accordance with generally accepted accounting principles (GAAP) and Government Auditing Standards (The Yellow Book). Second, because we believed it would be necessary that the internal cost savings reflect care redesign under the EPM in order to be eligible to be shared through gainsharing payments, the methodology used to calculate internal cost savings must reflect the actual, internal cost savings achieved by the EPM participant through the documented implementation of EPM activities identified by the EPM participant and must exclude any savings realized by any individual or entity that was not the EPM participant and “paper” savings from accounting conventions or past investment in fixed costs. In the proposed rule, we noted that, unlike the current CJR model policy where we require that sharing arrangements document the methodology for accruing, calculating, and verifying the internal cost savings generated by the participant hospital based on the care redesign elements specifically associated with the particular collaborator (80 FR 73431), we did not propose to require in the EPM that the calculation of internal cost savings be tied to the activities of any specific EPM collaborator. Rather, we believed it would be appropriate for EPM participants to calculate internal cost savings based on the implementation of EPM activities and then provide gainsharing payments to EPM collaborators that might include internal cost savings, reconciliation payments, or both based on a methodology that met the requirements described in this section. We proposed this same change to the internal cost savings calculation requirements for the CJR model in section V.J. of the proposed rule (81 FR 50961).

We proposed to limit the total amount of gainsharing payments for a performance year to EPM collaborators that were physicians, nonphysician practitioners, or PGPs. For EPM collaborators that were physicians or nonphysician practitioners, that proposed limit was 50 percent of the Medicare-approved amounts under the PFS for items and services furnished by that physician or nonphysician practitioner to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprised the gainsharing payment being made. For EPM collaborators that were PGPs, the proposed limit was 50 percent of the Medicare-approved amounts under the PFS for items and services billed by the PGP and furnished to the EPM participant’s EPM beneficiaries by members of the PGP during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprised the gainsharing payment being made. These proposed limits were consistent with those in the CJR model (80 FR 73430).

We proposed that the amount of any gainsharing payments must be determined in accordance with a methodology that was substantially based on quality of care and the provision of EPM activities. The methodology could take into account the amount of such EPM activities provided by an EPM collaborator relative to other EPM collaborators. While we emphasized in the proposed rule that financial arrangements may not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent so that their sole purpose was to align the financial incentives of the EPM participations and EPM collaborators toward the EPM goals of improved EPM episode care quality and efficiency, we believed that accounting for the relative amount of EPM activities by EPM collaborators in the determination of gainsharing payments did not undermine this objective. Rather, the proposed requirement would allow flexibility in the determination of gainsharing payments where the amount of an EPM collaborator’s provision of EPM activities (including direct care) to EPM beneficiaries during EPM episodes might contribute to both the internal cost savings and EPM participant’s reconciliation payment that might be available for making a gainsharing payment. Greater contributions of EPM activities by one EPM collaborator versus another EPM collaborator that resulted in greater differences in the funds available for gainsharing payments could be appropriately valued in the methodology used to make gainsharing payments to those EPM collaborators in order to reflect these differences in EPM activities among EPM collaborators. For example, a physician who was an EPM collaborator who treated 100 EPM beneficiaries during EPM episodes that resulted in high quality, less costly care could receive a larger gainsharing payment than a physician who was an EPM collaborator who treated 10 EPM beneficiaries during episodes that similarly resulted in high quality, less costly care.

However, we did not believe it would be appropriate to allow the selection of EPM collaborators or the opportunity to make or receive a gainsharing payment or an alignment payment to take into the account the amount of EPM activities provided by a potential or actual EPM collaborator relative to other potential or actual EPM collaborators because these financial relationships were not to be based directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent. Specifically, with respect to the selection of EPM collaborators or the opportunity to make or receive a gainsharing payment or an alignment payment, we did not believe that the amount of EPM activities provided by a potential or actual EPM collaborator relative to other potential or actual EPM collaborators could be taken into account by the EPM participant without a significant risk that the financial arrangement in those instances could be based directly or indirectly on the volume or value of past or anticipated referrals or business generated by, between or among the parties. Similarly, if the methodology for determining alignment payments was allowed to take into the account the amount of EPM activities provided by an EPM collaborator relative to other EPM collaborators there would be a significant risk that the financial arrangement could directly account for the volume or value of past or anticipated referrals or business generated by, between or among the
parties and, therefore, we proposed that the methodology for determining alignment payments could not directly take into account the volume or value of past or anticipated referrals or business generated by, between or among the parties.

We proposed a change to this same standard for gainsharing payments under the CJR model as discussed in section V.J. of the proposed rule (81 FR 50961 through 50962). We sought comment on this proposal for gainsharing payments, where the methodology may take into account the amount of EPM activities provided by an EPM collaborator relative to other EPM collaborators. We were particularly interested in comments about whether this standard would provide sufficient additional flexibility in the gainsharing payment methodology to allow the financial reward of EPM collaborators commensurate with their level of effort that achieved improvements in EPM episode quality and efficiency. In addition, we were interested in comments on whether additional safeguards or a different standard was needed to allow for greater flexibility to provide certain performance-based payments consistent with the goals of program integrity, protecting against abuse and ensuring the goals of the EPM were met.

We proposed that for a performance year, the aggregate amount of all gainsharing payments that were derived from a reconciliation payment must not exceed the amount of the reconciliation payment the participant received from CMS. In accordance with the prior discussion, no entity or individual, whether a party to a sharing arrangement or not, may condition the opportunity to make or receive gainsharing payments or to make or receive alignment payments on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent. We proposed that an EPM participant must not make a gainsharing payment to an EPM collaborator that was subject to any action for noncompliance with this part or the fraud and abuse laws, or for the provision of substandard care in EPM episodes or other integrity problems. Finally, we proposed that the sharing arrangement must require the EPM participant to recoup any gainsharing payment that contained funds derived from a CMS overpayment on a reconciliation report or was based on the submission of false or fraudulent data. These requirements would provide program integrity safeguards for gainsharing under sharing arrangements.

With respect to alignment payments, we proposed that alignment payments from an EPM collaborator to an EPM participant may be made at any interval that was agreed upon by both parties. They must not be issued, distributed, or paid prior to the calculation by CMS of a repayment amount reflected in a reconciliation report; loans, advance payments, or payments for referrals or other business; or assessed by an EPM participant if it did not owe a repayment amount. The EPM participant must not receive any amounts under a sharing arrangement from an EPM collaborator that were not alignment payments.

We also proposed certain limitations on alignment payments that were consistent with the CJR model (80 FR 73430). For a performance year, we proposed that the aggregate amount of all alignment payments received by the EPM participant must not exceed 50 percent of the EPM participant’s repayment amount. Given that the EPM participant would be responsible for developing and coordinating care redesign strategies in response to its EPM participation, we believed it was important that the participant retain a significant portion of its responsibility for repayment to CMS. For example, upon receipt of a reconciliation report indicating that the EPM participant owed $100 to CMS, the EPM participant would be permitted to receive no more than $50 in an alignment payment from the ACO. In the second scenario where an ACO was an EPM collaborator, upon receipt of that same reconciliation report, the EPM participant would be permitted to receive no more than $50 in an alignment payment from the ACO. Finally, in accordance with the prior discussion, the methodology for determining alignment payments must not directly account for the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent.

We proposed that all gainsharing payments and any alignment payments must be administered by the EPM participant in accordance with GAAP and Government Auditing Standards (The Yellow Book). Additionally, we proposed that all gainsharing payments and alignment payments must be made by check, electronic funds transfer, or another traceable cash transaction. We noted that while the CJR model required gainsharing payments and alignment payments to be made by electronic funds transfer (EFT) (80 FR 73431), we proposed a different requirement for the EPM to provide additional flexibility for entities making gainsharing payments and alignment payments. We made this proposal to mitigate the administrative burden that the EFT requirement would place on the financial arrangements between certain EPM participants and EPM collaborators, especially individual physicians and nonphysician practitioners of small and very small EPMs, which could discourage participation of those suppliers as EPM collaborators.
proposed a change to adopt this same standard under the CJR model as discussed in section V.J. of the proposed rule (81 FR 50962). We sought comment on the effect of this proposal on reducing the administrative barriers to individual physician and nonphysician practitioner and small PGP participation in the EPM as EPM collaborators.

The proposals for the conditions and restrictions on gainsharing payments, alignment payments, and internal cost savings under the EPM were included in proposed § 512.506(c). We sought comment about all of the conditions and restrictions set out in the preceding discussion, including the feasibility of implementing the proposed safeguards in the context of the current regulatory framework applicable to ACOs and whether additional or different safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the EPM were met.

The following is a summary of the comments received and our responses.

Comment: Some commenters opposed CMS’ proposal that gainsharing payments be distributed on annual basis, but not more than once per year. The commenters believe this periodicity is too restrictive and creates an unintended advantage for BPCI participants who distribute gainsharing payments monthly and quarterly. While one commenter acknowledged that CMS responded to this same concern in the CJR Final Rule based primarily on operational considerations regarding the frequency of the reconciliation process, the commenter does not believe that such challenges should be resolved at the expense of an effective gainsharing program for EPM participants and CJR participant hospitals. The commenter pointed out that current CJR participant hospitals choosing to make gainsharing payments containing NPRA are prohibited from making any gainsharing payment until after the annual reconciliation process, which may take up to 18 months from the start of the performance year. They claimed that this lengthy process is stifling meaningful change and ultimately reducing quality and cost savings because the potential rewards for CJR collaborators are so far removed from the care for beneficiaries during CJR episodes. The commenter requested that quarterly gainsharing payments be permitted under the EPM and CJR model. As an alternative, the commenter recommended that CMS consider adopting a modified gainsharing payment quarterly gainsharing payments to no more than once per performance year for the initial performance year and then thereafter allow for quarterly gainsharing payments. They believe this alternative could alleviate some of the operational concerns, while allowing EPM participants and CJR participant hospitals the flexibility to create a more impactful, long-term gainsharing strategy.

Response: We appreciate that some commenters are interested in aligning the periodicity for gainsharing payments under the EPM and CJR model with the periodicity of similar payments permitted in the BPCI models. However, we believe the differences in periodicity are warranted in light of the substantive difference between BPCI and the EPM and CJR model. Under the BPCI initiative, the frequency of gainsharing of internal cost savings is not specified, while quarterly gainsharing of reconciliation payments is permitted in association with the BPCI quarterly reconciliation process. BPCI participants are also required to submit their reconciliation payments to CMS for review and acceptance by CMS prior to their use. In contrast, as finalized for the CJR model (80 FR 73386) and as discussed and finalized for the EPM in section III.D.5. of this final rule, the reconciliation process for the EPM and CJR model will be conducted annually, and specific gainsharing methodologies are not required to be submitted to CMS, although the EPM and CJR gainsharing methodologies must meet all the requirements finalized in this final rule.

We note again that gainsharing payments may only consist of reconciliation payments and internal cost savings, although, as discussed in more detail later in this section, we expect a majority of gainsharing payments to not include internal cost savings, and thus would contain only dollars from reconciliation payments. Given that gainsharing of reconciliation payments cannot be carried out until after the reconciliation process is performed and the funds available are known to the model participant, we cannot change the permissible frequency of gainsharing payments derived from reconciliation payments to allow a closer temporal linkage between the gainsharing payment and the performance period for which the EPM participant or CJR participant hospital earned the reconciliation payment without carrying out the reconciliation process more frequently. Under our annual reconciliation process, there is a delay of 6 to 18 months between the time EPM episode care occurs and savings are represented in a reconciliation payment from which gainsharing payments can be made. We do not believe the commenters are requesting that quarterly reconciliation payments be permissible after the reconciliation payment is made under an annual reconciliation process, which would only lead to an even longer delay between the EPM episode care that occurred and the gainsharing payment that ultimately was made. Thus, the only way to allow more frequent gainsharing payments than annually, and to shorten the time lag between EPM episode care and gainsharing payments derived from reconciliation payments, would be to carry out the reconciliation process on a more frequent basis, such as quarterly. However, for the reasons discussed in section III.D.5. of this final rule, we will not conduct the reconciliation process more frequently than annually for any performance years of the EPM, including for any performance year after the first year of the EPM.

While an EPM participant’s calculation of internal cost savings could occur more frequently than annually, because internal cost savings do not rely on determinations by CMS, to allow more frequent gainsharing of internal cost savings would increase the documentation burden on EPM participants. Based on the comments received, we believe the commenters’ primary interest is in being able to make more frequent gainsharing payments derived from reconciliation payments, rather than those derived from internal cost savings. Additionally, based on the implementation plans submitted by BPCI Awardees and anecdotal information from CJR participant hospitals, we expect that few EPM participants will choose to distribute gainsharing payments derived from internal cost savings. Therefore, while we will consider whether a change may be warranted in the future to allow more frequent gainsharing of internal cost savings under the EPM and CJR model as we gain implementation experience with the models, we are not making a change now to allow gainsharing payments to be made more frequently than annually because we do not expect the increased complexity of such a policy would be useful to EPM participants and CJR participant hospitals.

Given that the BPCI initiative is scheduled to end late in CY 2018 and no longer is adding participants, we do not believe the different EPM and CJR gainsharing payment periodicity policies in comparison with those of the BPCI initiative provide any meaningful advantage to BPCI Awardees for those EPM participants and CJR participant hospitals.
hospitals seeking to enter into sharing arrangements with EPM collaborators and CJR collaborators. While we appreciate the potential financial reward for EPM collaborators and CJR collaborators may be initially 6 to 18 months removed from their contributions of EPM activities and CJR activities to beneficiaries in the EPM and CJR model, we expect that many collaborators will have sustained engagement in the EPM and CJR model and will understand that assessing the cost and quality outcomes of care redesign for episodes requires a substantial period of time for relevant, reliable performance information to become available. For EPM collaborators and CJR collaborators that do have sustained engagement in the model(s), gainsharing payments to those collaborators could potentially be distributed as early as two quarters following the end of the performance year. We also expect that some EPM participants and CJR participants hospitals who request beneficiary-identifiable data as discussed in section III.D.2. of this final rule will be monitoring episode spending performance throughout the EPM and CJR performance years. Thus, model participants may be able to provide their collaborators with interim information regarding their estimates of episode spending performance and the implications for gainsharing payments that may ultimately be available to help sustain collaborator engagement throughout the performance years. We are finalizing in §512.500(c)(1)(ii) the annual distribution of gainsharing payments (not more than once per calendar year).

Comment: A number of commenters urged CMS to allow EPM participants to financially reward collaborators through gainsharing payments on the basis of the individual collaborator’s performance as CMS proposed. One commenter in favor of this approach interpreted CMS’ proposal as requiring payment of gainsharing payments to post-acute care providers based on the pool of post-acute care providers with which the EPM participant had a sharing arrangement rather than based on individual collaborator performance. Another commenter requested that CMS advise EPM participants to treat advanced practice nurses and physicians equally in their gainsharing methodologies. In general, many commenters urged CMS to ensure reconciliation payments are distributed in a fair and equitable manner to collaborators. 

MedPAC expressed support for the proposed gainsharing safeguards in the EPM. In addition, they recommended that gainsharing payments to individual physicians and nonphysician practitioners who are part of the same sharing arrangement should not be allowed to vary based on whether these practitioners were involved in high- or low-cost episodes. MedPAC claimed this requirement would reduce practitioners’ incentive to treat primarily low-cost patients and steer high-cost patients to other physicians or nonphysician practitioners at the EPM participant. To operationalize this policy, MedPAC suggested that if a gainsharing arrangement results in hospital internal cost savings or savings on episode spending, the total gainsharing payment under that sharing arrangement should be divided evenly among all the episodes that are part to the arrangement. In other words, the episode gainsharing payment amount should be equal for all practitioners in the arrangement, although practitioners who are responsible for more episodes could receive higher total payments, yet they would receive the same per-episode gainsharing payment as all physicians and nonphysician practitioners who are part of the same sharing arrangement.

MedPAC further urged CMS to adopt safeguards similar to those they recommended for gainsharing between EPM participants and physicians for sharing arrangements between hospitals and post-acute care providers. They recommended that EPM participants not be required to offer risk-sharing arrangements to all post-acute care providers in their markets and that model participants should be able to discontinue their risk-sharing arrangements with post-acute care providers that do not contribute to lowering episode spending. MedPAC further suggested that the risk or reward should be calculated for all post-acute care providers in the arrangement, not on a patient-specific or post-acute care provider-specific basis. They stated that pooling the savings on episode spending and quality performance of the post-acute care providers would create incentives for them to cooperate to jointly lower EPM episode spending. Under this approach, the risk-sharing arrangement between an EPM participant and its post-acute care provider collaborators would be based on the change in per-episode spending in the performance period, resulting in the same per-episode gainsharing payment for all post-acute care providers in the arrangement.

Response: We acknowledge the interest of the commenters in ensuring that reconciliation payments are distributed in a fair and equitable manner to collaborators, including different types of individual providers and post-acute care providers. We further appreciate the support of the commenters for our proposal to allow EPM participants to use a methodology for determining a gainsharing payment that is substantially based on quality of care and the provision of EPM activities for each collaborator, without requiring standardization of the methodologies across any groups of collaborators. Thus, our proposal would allow each sharing arrangement to be based on the contributions of the specific collaborator. With regard to the commenter who interpreted our proposal as requiring gainsharing payment based on a pool of post-acute care providers with which the EPM participant enters into sharing arrangements, rather than based on individual collaborator performance, we note that we did not propose any pooling of funds for making gainsharing payment to groups of collaborators under the EPM.

While we understand the potential benefits of a policy standardizing sharing arrangements to protect against selection of low-cost patients and the resulting patient steering, as well as to provide an incentive for providers of the same type to cooperate to jointly improve quality and reduce episode spending, we believe that EPM participants may have legitimate reasons to enter into a sharing arrangement with a particular provider, supplier, or ACO that differs from the EPM participant’s arrangements with other similar providers, suppliers, or ACO. For example, it is possible there may be instances in which a particular SNF has greater capacity to monitor the cardiac status of beneficiaries or has resources that an EPM participant believes will especially benefit beneficiaries with cognitive impairments who are recovering from hip fracture surgery. In these instances, it may be prudent for an EPM participant to enter into a different sharing arrangement with that SNF, as opposed to other SNFs. Furthermore, EPM participants may have legitimate reasons to enter into different sharing arrangements with EPM collaborators that agree to take on a portion of the EPM participant’s downside risk, such as one particular ACO, compared to sharing arrangements with other EPM participants, including other ACOs that do not take on such downside risk. The EPM policies that hold EPM participants responsible for episode quality and cost performance will
encourage EPM participants to seek EPM collaborators that are especially supportive of these goals. As discussed earlier in our response to comments on EPM participant policies for selecting collaborators, we have included robust safeguards in this final rule to address concerns about patient steering and protect beneficiary freedom of choice. We believe the MedPAC recommendation to require the same per-episode payments for collaborators of the same type (physicians and post-acute care providers) would likely limit physician and post-acute care provider commitment to the goals of the EPM, resulting in less chance of model success. Our experience in other models that incorporate gainsharing has indicated that the financially responsible entity may have legitimate reasons to construct different sharing arrangements with different physicians, depending on factors such as the involvement of the physician in the entity’s care redesign efforts, adoption of leadership roles requiring direction and instruction of other physicians, and the number and magnitude of disruptions in the physician’s existing practice patterns. Similarly, the responsible entity may have legitimate reasons to construct different sharing arrangements with different post-acute care providers, such as the higher care capacity of a SNF that allows the SNF to accept an EPM beneficiary earlier than typical post-surgery or greater capacity of one HHA versus other to closely coordinate care for frail beneficiaries discharged directly to home following a hospitalization.

We stress that there is no requirement that EPM participants enter into sharing arrangements with any providers, suppliers, or ACOs. Accordingly, EPM participants are not required to enter into sharing arrangements with all post-acute care providers in their markets. There also are no requirements for EPM participants to continue any specific sharing arrangements, so EPM participants would be able to discontinue sharing arrangements if they believe those arrangements are not contributing to meeting the EPM goals, subject to any contract termination provisions in their contracts with EPM collaborators.

We are finalizing in §512.500(c)(5) that the amount of any gainsharing payments must be determined in accordance with a methodology that is substantially based on the quality of care and the provision of EPM activities. The methodology may take into account the amount of such EPM activities provided by an EPM collaborator relative to other EPM collaborators. A number of commenters recommended changes to the proposed methodology for setting the cap on physician, nonphysician practitioner, and PGP gainsharing payments. One commenter asserted that due to the importance of primary care management in preventing readmissions, it is likely that the potential value of care management services provided during the post-discharge period is significantly greater than the total PFS payments a physician will receive for these services. The commenter urged CMS to increase the proposed 50 percent cap to reflect the value provided by these primary care physicians’ services. Several other commenters requested that if the cap was not

Comment: One commenter urged CMS to amend the proposed regulation in §512.500(c)(6) which states, “For a performance year, the aggregate amount of all gainsharing payments that are derived from a reconciliation payment must not exceed the amount of the reconciliation payment the EPM participant receives from CMS.” The commenter asserted that this text is unclear regarding whether the gainsharing amount can also include internal cost savings. The commenter believes the proposed text is confusing because it either suggests that the total dollars available for gainsharing are limited to the total reconciliation payment amount, which is inconsistent with the definition of gainsharing, or it suggests that the proportion of the gainsharing that is from the reconciliation payment cannot be more than that payment, which by definition is true.

Response: We appreciate the commenter’s suggestion that we clarify whether a gainsharing payment may include internal cost savings. However, we believe that the commenter’s suggested change to the proposed provision in §512.500(c)(6) is inadvisable. The purpose of this requirement is to ensure that the total amount of all gainsharing payments made to collaborators and derived from the reconciliation payment the EPM participant receives from CMS does not exceed the amount of that reconciliation payment. The commenter is correct that as specified in §512.500(c)(1)(i), gainsharing payments derived from the reconciliation payments, or internal cost savings, or both. We believe it would be confusing to revise §512.500(c)(6) as the commenter suggested to add that the gainsharing amount can include internal cost savings, as that is specified elsewhere in regulation and is not necessary for this requirement specific to gainsharing payments derived from a reconciliation payment. However, we believe that reordering of the terms in the provision eliminates any confusion about the requirement. Therefore, we are modifying §512.500(c)(6) to state, “For a performance year, the aggregate amount of all gainsharing payments that are derived from a reconciliation payment the EPM participant receives from CMS must not exceed the amount of that reconciliation payment.”

We are finalizing in §512.500(c)(6) the limit on the aggregate amount of all gainsharing payments that are derived from a reconciliation payment with the modifications discussed. A number of commenters, including MedPAC, supported CMS’ proposal to cap the amount of gainsharing payments to physicians, nonphysician practitioners, and PGP’s, most commenters either recommended that CMS eliminate the caps for PGP’s; eliminate the caps altogether for PGP’s, physicians, and nonphysician practitioners; or apply the caps on a different basis than CMS’ proposal of 50 percent of the Medicare-approved amounts under the PFS for items and services furnished by the physician or nonphysician practitioner to the EPM participant’s EPM beneficiaries during the EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

One commenter who objected to the proposed caps on physicians stated that physicians are singled out for different treatment than other provider and supplier types because the commenter believed physicians were the only type of EPM collaborator with a cap, and contended that the cap dampens the ability of gainsharing to support physician behavior change by relocating payments to a nominal amount. Another commenter claimed that the proposed EPM financial arrangements may not be sufficiently flexible for the breadth of agreements EPM participants may wish to set up with PGP’s, noting that the proposed gainsharing cap of 50 percent was based on services furnished by individual physicians in the PGP to EPM beneficiaries as opposed to the BPCI initiative where the commenter believes the cap is set at 50 percent for the entire physician group. They claimed that under CMS’ proposal, there is no way for a PGP to stabilize risk among higher- and lower-performing physicians and, therefore, the group risk-sharing potential will be less than 50 percent in total.
dropped altogether, the cap should be set at 50 percent of episode savings rather than Part B billings, reasoning that limiting the cap based on the Medicare-approved amounts paid under the PFS negatively impacts EPM participants’ flexibility in determining the amount of savings to share, as well as targets physicians individually. The commenters reasoned that physicians are the key to driving improved quality and efficiency due to their direct relationships with patients, access to the patient’s current health status, and ability to recommend the appropriate level of post-acute care services, and that the proposed cap would eliminate meaningful financial incentives for physicians to fully engage in the EPM. Several commenters further added that because CMS has entrusted hospitals with the responsibility to oversee and implement EPM care redesign, CMS should grant hospitals greater flexibility in designing their respective gainsharing programs and determining the amount of episode savings to share with their EPM collaborators.

Other commenters interpreted CMS’ proposal as allowing EPM participants to share up to 50 percent of savings achieved via Part B services with physicians and recommended that the cap be revised to include savings from both Part A and Part B services in gainsharing payments. The commenters asserted that accounting for unplanned care necessitating Part B services is critical, and that to improve patient outcomes, unplanned clinically appropriate care must be accounted for which potentially results in more physician involvement than originally anticipated. They concluded that significant reductions in Part A spending may be achieved through reducing the lengths-of-stay and unnecessary readmissions during EPM episodes, but those savings are unlikely to be accomplished without active physician participation and, therefore, physicians should be eligible to share in those Part A savings.

Response: We acknowledge the many different perspectives of the commenters on the proposed cap on gainsharing payments to physicians, nonphysician practitioners, and PGPs in the EPM. We reiterate that we proposed to limit the total amount of gainsharing payments for a performance year to EPM collaborators, collaboration agents, or downstream collaboration agents that are physicians, nonphysician practitioners, or PGPs. For physicians and nonphysician practitioners the proposed limit was 50 percent of the Medicare-approved amounts under the PFS for items and services furnished by the physician or nonphysician practitioner to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that is included in the payment being made to the physician or nonphysician practitioner. For PGPs, the proposed limit on gainsharing payments was 50 percent of the Medicare-approved amounts under the PFS for items and services billed by the PGP and furnished to the EPM participant’s EPM beneficiaries by members of the PGP during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that is included in the payment being made to the PGP. We note that the proposed EPM gainsharing caps for PGP members operate in the same way as the caps on PGP member gainsharing in the BPCI initiative. In both instances, the cap is set at 50 percent of the total Medicare-approved amounts under the PFS for services furnished by the physician or nonphysician practitioner PGP member to model beneficiaries during the applicable time period. Accordingly, it is not correct that the proposal for gainsharing caps under the EPM provides less flexibility than under the BPCI initiative.

We do not agree with commenters that the proposed caps on payments under EPM financial arrangements to physicians, nonphysician practitioners, and PGPs should be eliminated because we proposed these caps for a specific purpose. The purpose of the cap is to serve as a safeguard against the potential risks of stinting, steering, and denial of medically necessary care due to financial arrangements specifically allowed under the EPM by providing an upper limit on the potential additional funds a physician, nonphysician practitioner, or PGP can receive for their engagement with EPM participants in caring for EPM beneficiaries beyond the FFS payments that those suppliers are also paid and that are included in the actual episode spending calculation for the episodes. We do not believe it would be appropriate to identify certain types of physicians, such as those providing primary care management services, for higher caps under the EPM because we believe EPM participants should have the flexibility to enter into sharing arrangements with those EPM collaborators that help them execute their care redesign plans, which we expect to vary from EPM participant to EPM participant. We further note that the proposed caps were based on the Medicare-approved amounts under the PFS paid to physicians and nonphysician practitioners for care furnished to EPM beneficiaries, and not based on Part B episode savings as some commenters interpreted the proposal. Therefore, we do not agree with concerns of some commenters that Part B spending could increase even if total episode spending decreased and, therefore, could affect the potential for physician gainsharing payments because we do not specify where the episode savings included in a reconciliation payment must come from (Part A or Part B) in order for part of the reconciliation payment to be paid to a physician, nonphysician practitioner, or PGP as a gainsharing payment. While we appreciate the information provided by the commenters regarding the valuable role physicians may play in reducing Part A spending, we do not believe it would be appropriate to cap physician, nonphysician practitioner, and PGP gainsharing payments at 50 percent of total episode savings beyond the quality-adjusted target price.

Historical EPM episodes include average episode spending ranging from approximately $23,000 to $47,000, with Part B spending (predominantly FFS) accounting for 7 percent to 14 percent of the total. Thus, depending on actual episode savings experienced by the EPM participant, we believe the proposed cap at 50 percent of Part B billings would generally allow a physician, nonphysician practitioner, or PGP to receive a gainsharing payment that is comprised of a reconciliation payment that includes Part A savings. Further, setting the gainsharing cap based on Part B billings for physicians, nonphysician practitioners, and PGPs helps to maintain a connection between their gainsharing payments and their payments under the PFS for items and services furnished to EPM beneficiaries so as not to create a disproportionate opportunity and associated program integrity risk for physicians, nonphysician practitioners, and PGPs to dramatically increase their payments on behalf of Medicare beneficiaries based on their participation in EPM financial arrangements.

We emphasize that we have applied the 50 percent cap on gainsharing payments to physicians, nonphysician practitioners, or PGPs to limit the total amount of gainsharing payments to EPM participants to 50 percent of the Medicare-approved amounts under the PFS for items and services furnished by physicians or nonphysician practitioners to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that is included in the payment being made to the physician or nonphysician practitioner.
practitioners, and PGPs in the CJR model as well as the BPCI initiative, and participants have not voiced significant complaints that this financial limitation has hampered their ability to engage physicians, nonphysician practitioners, and PGPs in care redesign to improve episode quality and reduce costs. We acknowledge the important role physicians play in providing quality, efficient health care to beneficiaries, but we believe that allowing a physician, nonphysician practitioner, and PGP to be paid up to 50 percent more for engagement with the episode care of EPM beneficiaries than the payments they are paid for furnishing direct services to those beneficiaries under the PFS provides EPM participants with substantial flexibility to develop and implement meaningful financial arrangements that align the financial interests of physicians, nonphysician practitioners, and PGPs with the quality and cost goals of the EPM participant under the EPM.

We note that as discussed previously in this section, we are adding NPPGPs to the list of EPM collaborators. Consistent with our cap on gainsharing payments to PGPs, as well as our cap on gainsharing payments to physicians and nonphysician practitioners, we are adding NPPGPs to § 512.500(4)(ii) where we specify the cap on gainsharing payments to PGPs so that those caps are also applied to gainsharing payments to NPPGPs.

We are finalizing in §§ 512.500(4)(i) and § 512.500(4)(ii) the caps on the total amount of alignment payments for a performance year paid to physicians, nonphysician practitioners, PGPs, and NPPGs.

We note that our proposals were not clear or consistent regarding whether caps applied to individual therapists or TGPs. We did not propose to cap gainsharing payments to EPM collaborators that are providers or suppliers of outpatient therapy services, which include individual therapists and therapy group practices, and we did not propose to cap the distribution payments to therapists who are members of a PGP under proposed § 512.505(8)(i). However, we proposed that therapists who are members of a PGP and receive downstream collaboration payments would have their payments capped under proposed § 512.510(b)(7) as members of the PGP. As discussed in section III.I.3 of this final rule, we have created new terms and revised certain proposed terms for this final rule to separately define therapists in private practice and TGP as eligible to be collaborators. While capping gainsharing payments to therapists and TGPs would be most consistent with our treatment of gainsharing payments to other individual clinicians and their practice groups and it would be possible to apply such caps in view of the new definitions of therapist in private practice and TGP adopted in this final rule, we do not believe it would be appropriate to adopt gainsharing caps for therapists in private practice or TGPs because we did not solicit comment on caps for any providers or suppliers of outpatient therapy services, including therapists in private practice and TGPs. Therefore, while we are not adopting gainsharing caps for any providers or suppliers of outpatient therapy services, including therapists in private practice and TGPs, we propose to cap the distribution payments to therapists and TGPs.

Comment: Some commenters urged CMS to eliminate the proposed caps on alignment payments at the entity level, specifically mentioning ACOs, PGPs, and post-acute care providers in their discussion. One commenter was concerned that under CMS’ proposal a single EPM collaborator other than an ACO could possibly be accountable for up to 50 percent of an EPM participant’s repayment amount, highlighting that such an amount could post serious financial jeopardy to the EPM collaborator’s existence. To mitigate this risk, the commenter recommended that all the EPM collaborators other than ACOs in aggregate would pay no more than 25 percent of the EPM participant’s repayment amount or, alternatively, would pay proportionally based upon the Medicare-approved amounts the EPM collaborator was paid for items and services furnished to EPM beneficiaries. Response: We appreciate the commenters’ recommendation to eliminate caps on alignment payments by entities that are EPM collaborators. We note that we proposed for a performance year, the aggregate amount of all alignment payments received by the EPM participant must not exceed 50 percent of the EPM participant’s repayment amount. In regards to the 50 percent cap on the aggregate amount of alignment payments, the commenters did not provide specific justification for eliminating this cap on alignment payments provided to EPM participants. As such, given that the EPM participant is responsible for developing and coordinating care redesign strategies in response to its EPM participation, we believe it is important that the EPM participant retain a significant portion of its responsibility for repayment to CMS. Therefore, we are maintaining the cap on the aggregate amount of all alignment payments at 50 percent of the EPM participant’s repayment amount, ensuring that EPM participants retain a minimum of 50 percent of the repayment amount as their responsibility.

In addition, we proposed that the aggregate amount of all alignment payments from an EPM collaborator other than an ACO to the EPM participant may not be greater 25 percent of the EPM participant’s repayment amount. In response to the commenter’s concern about the potential for an EPM collaborator that is not an ACO to experience serious financial jeopardy due to this amount, we emphasize that there is no requirement that any provider, supplier, or ACO enter into a sharing arrangement as an EPM collaborator, including a sharing arrangement that requires them to make an alignment payment. We also emphasize that the 25 percent cap on alignment payments represents the upper threshold for risk sharing that a single EPM collaborator may assume, and that the parties may agree to lower amounts. Furthermore, participation in sharing arrangements must be voluntary and without penalty for nonparticipation. Thus, we cap the aggregate amount of all alignment payments from an EPM collaborator
other than an ACO at 25 percent of the EPM participant’s repayment amount as a broad safeguard for EPM collaborators and EPM participants from excessive financial risk or undue influence from the EPM participant’s contractual relationship with a single EPM collaborator. However, this cap is not a substitute for the deliberation of both the EPM participant and EPM collaborator before entering into a sharing arrangement that would require the EPM collaborator to make an alignment payment to the EPM participant if the EPM participant has a repayment amount debt to Medicare. We believe that the EPM collaborator is best-positioned to make financial decisions on its own behalf and to bear the consequence of those decisions, and that flexibility in sharing arrangements between different parties is important. Therefore, we see no need to provide a more protective cap on the accountability for a single EPM collaborator by aggregating the accountability of all EPM collaborators or requiring that the EPM collaborator only assume accountability for paying a portion of the EPM participant’s repayment amount that is proportionate to the EPM episode spending on items and services furnished by that EPM collaborator. Therefore, we are maintaining the cap on the aggregate amount of all alignment payments from an EPM collaborator other than an ACO to the EPM participant at 25 percent of the EPM participant’s repayment amount.

We are finalizing in §§ 512.500(c)(12) and 512.500(c)(13) the cap on the aggregate amount of all alignment payments received by the EPM participant and the cap on alignment payments that may be made by EPM collaborators to the EPM participant. Comment: One commenter opposed CMS’ proposal to cap the aggregate amount of all alignment payments from an EPM collaborator that is an ACO to an EPM participant at 50 percent of the EPM participant’s repayment amount, arguing that setting such a limit interferes the negotiations between an EPM participant and its collaborators. The commenter asserted that ACOs should be able to use their substantial expertise and resources to contribute to the EPM’s dual goals of limiting spending and increasing quality. They urged CMS to permit an EPM participant and its collaborators to jointly agree on the terms and conditions of a sharing arrangement, including specifics around gainsharing or repayment percentages, because it is unnecessary to place limits on repayment amounts as long as they do not collectively exceed the amount the EPM participant would have to repay. Another commenter pointed out that the risk threshold for an EPM consisting of beneficiaries discharged from several MS–DRGs is substantially less than that of two-sided risk ACO models, approximately $500,000 versus $2,000,000 for a small ACO, respectively. They suggested that CMS consider the risk alignment of ACOs and the EPM as an opportunity for ACOs to phase-in downside risk incrementally and at a substantially lower entry point of dollars than current two-sided ACO options. The commenter believes that adopting such an approach would encourage ACOs to take on more downside risk. Response: We appreciate the commenter’s recommendation to eliminate the proposed cap on alignment payments made by an EPM collaborator that is an ACO to an EPM participant. We agree with the commenter about the expertise that ACOs may offer EPM participants with regard to managing the cost and quality of care Medicare beneficiaries receive. We proposed that the aggregate amount of all alignment payments from an EPM collaborator to the EPM participant may not be greater than 25 percent of the EPM participant’s repayment amount for an EPM collaborator that is not an ACO and 50 percent of the EPM participant’s repayment amount for an EPM collaborator that is an ACO. We proposed to allow a higher percentage of the EPM participant’s repayment amount to be paid by an ACO than by EPM collaborators that are not ACOs in recognition that some ACOs are sizable organizations with significant financial and other resources that can benefit EPM episode spending and quality performance.

We have constructed a framework for EPM financial arrangements that we believe leaves EPM participants and EPM collaborators relatively unconstrained to develop sharing arrangements in a manner they see fit based on the contributions of different parties to the goals of the EPM, provided that all the requirements for financial arrangements included in this final rule are met. We did not propose that EPM participants would need to use a particular methodology for determining alignment payments that are made by either an EPM collaborator that is an ACO or an EPM collaborator that is not an ACO. However, as discussed in the response to the previous comment, given that the EPM participant is responsible for developing and coordinating care redesign strategies in response to its EPM participation, we believe it is important that the EPM participant retain a significant portion of its responsibility for repayment to CMS. The EPM was not designed to test the phase-in of ACO downside risk or specifically encourage ACOs to take on more downside risk, but rather to test the EPM where acute care hospitals are the financially accountable entity to CMS for episode quality and cost performance, with sufficient flexibility to share their upside and downside risk with EPM collaborators based on the financial alignment needs arising from EPM episode care redesign.

Therefore, we are maintaining the cap on the aggregate amount of all alignment payments at 50 percent of the EPM participant’s repayment amount, while allowing an ACO to assume responsibility for the remaining 50 percent of the repayment amount through an alignment payment to be made to the EPM participant. While we appreciate the commenter’s view that we should let the market determine the best arrangements for the parties without constrain, in the early performance years of the first required episode payment models and in our first experience with ACOs as model collaborators, we believe the alignment payment limit allows sufficient flexibility for the development of market-based arrangements between EPM participants and ACOs, while providing assurance of the EPM participant’s active involvement in developing and implementing EPM care redesign strategies.

Comment: One commenter urged CMS to apply a cap on gainsharing payments to all EPM collaborators, arguing that because CMS proposed caps only on gainsharing payments to physicians, nonphysician practitioners, and PPGs that EPM participants may conclude that sharing arrangements with other types of providers, such as post-acute care providers, is not encouraged by CMS. The commenter further contended that CMS’ proposal to cap gainsharing payments for physician, nonphysician practitioners, and PPGs at a certain percentage of the amount billed to Medicare is ill-advised given that the goal of the EPM is to reduce costs to Medicare by better managing services and reducing unnecessary services. They recommended that CMS adopt a gainsharing cap policy that specifies that no one type of collaborator (for example, physicians) nor individual provider or organization can receive more than 50 percent of the available gainsharing amount. We also encourage all EPM collaborators may be eligible for a gainsharing payment.
should they meet the requirements of their sharing arrangement.

Response: We do not agree with the commenter that the lack of a proposed cap on gainsharing payments to providers, suppliers, and ACOs other than physicians, nonphysician practitioners, and PGP s in our proposal implies that these other individuals and entities are not worthy of consideration by EPM participants as potential EPM collaborators. We note that we proposed to add ACOs, hospitals, and CAHs, none of whom have gainsharing caps, to the list of types of providers and suppliers that may be EPM collaborators, thereby expanding the list initially adopted for the CJR model.

The purpose of the final cap on gainsharing payments for physicians, nonphysician practitioners, PGP s, and NPPGPs (as adopted in this final rule) is to serve as a safeguard against the potential risks of stinting, steering, and denial of medically necessary care due to financial arrangements specifically allowed under the EPM by providing an upper limit on the potential additional funds a physician, nonphysician practitioner, PGP, or NPPGP can receive for their engagement with EPM participants in caring for beneficiaries in the EPM beyond the FFS payments that those suppliers are also paid and that are included in the actual episode spending calculation for the episodes. With the exception of physicians, nonphysician practitioners, PGP s, and NPPGPs, we do not limit the amount of gainsharing payments to other eligible EPM collaborators; as discussed earlier in this section, as the financially responsible entities for EPM episodes, we believe that EPM participants should have as much flexibility as possible, subject to adequate program integrity safeguards, in decisions about financial arrangements, including whether or not to enter into them; the selection of collaborators; and the methodologies for determining the amounts of gainsharing payments and alignment payments. Therefore, we do not believe it would be appropriate to limit the gainsharing payment of an EPM participant to any EPM collaborator other than a PGP or an ACO that offered them no benefit or services to EPM beneficiaries as a method of promoting accountability for the overall quality, cost, and overall care for EPM beneficiaries.

Comment: One commenter claimed that CMS’ proposal applies some unnecessary limits to when an EPM collaborator can receive a gainsharing payment. The commenter reasoned that if the goal of the EPM is to redesign care, then the possibility should be considered that an EPM collaborator may furnish a service that is not “billable” under Medicare FFS today and yet could play an integral role in changing the outcomes and cost under an EPM episode. They recommended that CMS not limit the eligibility for receiving gainsharing payments to just services that are billable but instead allow the EPM collaborator to receive some payment after the fact for a service or item that contributed positively to the EPM episode. To accomplish this change, the commenter specifically suggested that CMS delete “billable” in proposed § 512.500(c)(2)(ii) where CMS proposed to require that to be eligible to receive a gainsharing payment or to be required to make an alignment payment, an EPM collaborator other than a PGP or an ACO must have directly furnished a billable item or service to an EPM beneficiary during an EPM episode that occurred in the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount. They believe it is unlikely that this change would be abused as it is not in the EPM participant’s best interest to issue a gainsharing payment to an EPM collaborator that offered them no benefit in the EPM.

Response: We appreciate the commenter’s detailed suggestions about changes to the proposed gainsharing eligibility criteria for ACOs, specifically that their involvement in an EPM beneficiary’s care was either: 1) related to the provision of care coordination services and/or 2) related to engaging in care redesign strategies and helping to implement those strategies, be added to the gainsharing eligibility requirement for other EPM collaborators that are not ACOs or PGP s in § 512.500(c)(2)(ii). They believe that providers and suppliers should also be eligible for gainsharing if they engage in those tasks. The commenter concluded that making both of their recommended changes to § 512.500(c)(2)(ii) would contribute to comparable gainsharing opportunities being available for EPM collaborators carrying out the same activities to advance the goals of the EPM.

Response: We do not agree with the commenter that their proposal applies some unnecessary limits to when an EPM collaborator can receive a gainsharing payment. The commenter reasoned that if the goal of the EPM is to redesign care, then the possibility should be considered that an EPM collaborator during an EPM episode that occurred in the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment to be eligible to receive a gainsharing payment, there is no requirement that the gainsharing payment methodology rely only upon billable items and services. As proposed in § 512.500(c)(5), the amount of any gainsharing payments must be determined in accordance with a methodology that is substantially based on the quality of care and the provision of EPM activities. We proposed that EPM activities means activities related to promoting accountability for the overall quality, cost, and overall care for EPM beneficiaries.

For those EPM collaborators who can directly furnish items and services to Medicare beneficiaries, which are all EPM collaborators that are not ACOs, PGP s, NPPGPs, or TGP s, we believe a connection to the actual care of EPM beneficiaries is essential so that the financial incentives of providers furnishing billable items and services to EPM beneficiaries are aligned with those of EPM participants to improve the quality of care and reduce the costs of episode. It is difficult to contemplate how model success can be achieved without significant care redesign that involves billable items and services furnished by the providers and suppliers actually caring for EPM beneficiaries. The requirement that EPM collaborators other than ACOs, PGP s, NPPGPs, and TGP s directly furnish billable items or services to EPM beneficiaries to be eligible for gainsharing payments ensures a nexus between the financial incentives and actual care to EPM beneficiaries. This requirement also provides a program integrity safeguard against the free flow of gainsharing payments to an EPM collaborator who does not furnish items or services to EPM beneficiaries as a
means of impacting the referral patterns of the EPM collaborator to particular hospitals. Thus, we do not believe that adopting the recommendation of the commenter that we use the criteria for ACOs, that do not directly furnish items or services to beneficiaries, to define the clinical involvement of EPM collaborators that are not ACOs, PGPs, NPPGs, or TGP in the care of EPM beneficiaries that is required for gainsharing eligibility is necessary or appropriate. It is only in the case of ACOs, PGPs, NPPGs, and TGP that do not directly furnish items or services to EPM beneficiaries that we needed to develop another definition for the clinical involvement that is a requirement for gainsharing payment eligibility. We expect that EPM collaborators that are not ACOs, PGPs, NPPGs, or TGP will commonly provide care coordination services to EPM beneficiaries, engage in care redesign strategies, and perform a role in implementing such strategies, just as we expect similar activities for ACOs, PGPs, NPPGs, and TGP that are EPM collaborators. We further note that an EPM participant can factor these types of activities into the methodology that determines the amount of the gainsharing payment for EPM collaborators. However, for the reasons described previously, we will not allow EPM collaborators that are not ACOs, PGPs, NPPGs, or TGP to be eligible for gainsharing payments if they have not directly furnished a billable item or service to an EPM beneficiary during an EPM episode during the applicable time period. We are of the opinion that the gainsharing payment eligibility policies provide the potential for comparable gainsharing opportunities for all types of EPM collaborators, while taking into consideration the reality that individuals and entities with different potential for providing billable services to EPM beneficiaries may be EPM collaborators.

We are finalizing in § 512.500(c)(2)(ii) that to be eligible to receive a gainsharing payment, an EPM collaborator that is not an ACO, PGP, NPPGP, or TGP must have directly furnished a billable item or service to an EPM beneficiary during an EPM episode.

Comment: Several commenters expressed concern about the proposed restrictions on paper savings in the methodology used to calculate the EPM participant’s internal cost savings from which the participant may make gainsharing payments to EPM collaborators. The commenters claimed that very few hospital accounting systems can clearly separate “paper” savings from “real” savings. They claimed that introducing systems to account for savings will require time and resources that may restrict ability of many EPM participants to meet the proposed requirements, yet “paper” savings may yield real benefits for patients. As an example, one commenter pointed out that “paper” savings due to reductions in nursing time may permit that time to be dedicated to other patients improving coverage and benefiting the quality of care.

Response: We appreciate the information provided by the commenters on the types of internal cost savings that EPM participants might achieve based on care redesign under the EPM. We note that we proposed in § 512.500(c)(3)(ii) that the methodology used to calculate internal cost savings must reflect the actual, internal cost savings achieved by the EPM participant through the documented implementation of EPM activities identified by the EPM participant, and in § 512.500(c)(3)(ii)(B) proposed that the methodology must exclude “paper” savings from accounting conventions or past investment in fixed costs.

In considering the EPM participant’s methodology for calculating internal cost savings achieved based on their implementation of EPM activities, EPM participants should consider all of these requirements and others we proposed for internal cost savings in their totality. We believe that any methodology that meets the proposed requirements for the methodology to calculate internal cost savings would require some system to account for savings. Moreover, we do not believe it would be appropriate to allow gainsharing payments derived from an EPM participant’s internal cost savings that cannot be specifically accounted for due to the program integrity risk that such payments may pose. We appreciate that accounting for the savings resulting from the implementation of EPM activities by the EPM participant could require accounting systems of different complexities based on the specific types of internal cost savings that the EPM participant wants to capture for purposes of making gainsharing payments. For example, internal cost savings due to physician collaboration to achieve device standardization in EPM episodes that results in the EPM participant being able to purchase the device at a lower price reflecting volume discounts may be relatively easily accounted for by comparing device purchase invoices during the EPM performance year to those during the immediately prior period. On the other hand, reductions in nursing time for EPM beneficiaries due to a shorter hospital stay that results from streamlined discharge planning may require more complex systems to track and compare nursing time and its associated hospital cost for EPM beneficiaries during the EPM performance period to those during the immediately prior period. Thus, while we recognize the challenges identified by the commenters in tracking real savings associated with EPM care redesign, given that we proposed to allow EPM participants to select their own methodologies for calculating internal cost savings (provided that such methodologies meet the requirements in this final rule to be included in gainsharing payments to EPM collaborators), we believe that we have provided sufficient flexibility to allow each EPM participant the ability to develop a methodology for calculating internal cost savings that aligns with its technical capacity to track those savings. We note that the purpose of this prohibition on paper savings is to bar the distribution of gainsharing payments comprised of funds that did not derive from real savings, as well as bar payments made for purposes other than the provision of EPM activities by EPM collaborators that results in reduced episode spending or increased quality. As such, we believe the proposed requirements prohibiting EPM participants from sharing internal cost savings that results merely from paper savings—rather than real savings arising from the successful implementation of EPM activities by the EPM participant—are necessary as a program integrity safeguard, and so we are declining to accept the commenters’ suggestion.

We are finalizing in § 512.500(c)(3)(ii)(B) that the methodology used to calculate internal cost savings must exclude paper savings from accounting conventions or past investment in fixed costs.

Comment: One commenter requested clarification regarding CMS’ proposal that an EPM participant must not make a gainsharing payment to an EPM collaborator that is subject to any action for noncompliance with the EPM requirements or fraud and abuse laws, or for the provision of substandard care in EPM episodes or other integrity problems. The commenter expressed concerns regarding the absence of a bright line standard EPM participants could use to ensure compliance with this standard. The commenter expressed particular concern about how a participant could determine if a collaborator was subject to an action for
the “provision of substandard care in EPM episodes or other integrity problems.” The commenter further recommended that CMS should apply a reasonable knowledge standard to compliance with this provision.

Response: We appreciate the commenter’s interest in additional clarification regarding how a participant can ensure it complies with this payment restriction. We believe that we can provide additional clarity to the standard for not making a gainsharing payment by establishing that this provision only restricts an EPM participant’s ability to make a gainsharing payment if CMS notifies the EPM participant of the action that would trigger the payment restriction. Specifically, we are modifying the provision to state, “An EPM participant must not make a gainsharing payment to an EPM collaborator if CMS has notified the EPM participant that such collaborator is subject to any action for noncompliance with this part or the fraud and abuse laws, or for the provision of substandard care in EPM episodes or other integrity problems.” This change should eliminate any uncertainty by the EPM participant about circumstances in which an EPM collaborator must not be paid a gainsharing payment, while also providing a sufficient safeguard against gainsharing with individuals and entities that present risk of patient harm or program abuse. Therefore, we are revising §512.500(c)(8) accordingly.

We believe that adopting the alternative approach recommended by the commenter and using a reasonable knowledge standard would make enforcing this prohibition of distributing gainsharing payments to EPM collaborators under certain circumstances highly challenging, if not impossible. We believe the notification approach discussed previously allows for the “bright line” that the commenter was seeking, while maintaining the agency’s ability to prevent gainsharing payments to an EPM collaborator that has program integrity concerns.

We are finalizing in §512.500(c)(8) that an EPM participant must not make a gainsharing payment to an EPM collaborator if CMS has notified the EPM participant that such collaborator is subject to any action for noncompliance with this part or the fraud and abuse laws, or for the provision of substandard care in EPM episodes or other integrity problems.

Comment: Several commenters requested that CMS extend financial arrangements permitted under the EPM and CJR model to scenarios that extend beyond EPM episodes. The commenters believe that these requests would require fraud and abuse law waivers. One commenter encouraged CMS to allow for gainsharing on commercial and Medicaid episode payment arrangements that are similar to the CJR model or proposed under the EPM to increase the volume of cases on which hospitals can share gains with collaborators. Another commenter urged CMS to allow EPM participants and CJR participant hospitals to provide care management tools and services to beneficiaries and providers prior to the start of the episode, consistent with activities contemplated by the Medicare Shared Savings Program, ACO participation waiver. While acknowledging that CMS is not inclined to start the episode prior to the date of the admission for the anchor hospitalization, the commenter explained that pre-episode services have been proven to not only improve patient outcomes and satisfaction but also to result in the delivery of more efficient and higher quality care. The commenter provided examples of pre-episode services they requested be allowed under the EPM and CJR model: comprehensive patient evaluation to assess a beneficiary’s overall condition and chronic comorbid conditions; patient education videos and materials; discharge planning review and counseling; home safety reviews; and patient and caregiver education. Finally, another commenter requested that EPM participants and CJR participant hospitals be able to provide other providers, including post-acute care providers and PGPs in their communities with whom they collaborate, necessary telehealth equipment, health IT support, and items and services necessary to achieve the type of care integration necessary for the EPM and CJR model without fear of liability under anti-kickback, physician self-referral, and beneficiary inducement prohibitions.

Response: We appreciate the descriptions provided by the commenters of additional care redesign strategies beyond care for EPM and CJR beneficiaries that could ultimately contribute to improvements in the quality of care and reductions in the cost of EPM and CJR episodes. While we understand that being able to share cost savings based on a larger volume of cases that includes patients in similar episode payment arrangements under Medicaid and commercial insurers could provide beneficiary participants and CJR participant hospitals more funds for aligning the financial incentives of their collaborators with the goals of the episode payment arrangements, we will not regulate arrangements for beneficiaries outside of those in EPM and CJR episodes in this rulemaking because it would be inappropriate to do so.

We are finalizing the initiation of EPM episodes with admission for the anchor hospitalization as discussed in sections III.4.a.(2) through (4) of this final rule, just as we finalized that same policy for the CJR model (80 FR 73318). We note that all AMI and SHP beneficiaries, as well as a significant percentage of CABG and CJR beneficiaries, would be admitted emergently to the EPM participant or CJR participant hospital, making pre-episode services not possible for these beneficiaries even if we were to permit them under the models. We did not propose to allow sharing arrangements for pre-episode services under the EPM and CJR model because we believe there are significant program integrity risks of patient steering and adverse patient selection for admissions for elective surgery, such as some CABG surgery and LEJR, that would be difficult to overcome if EPM participants and CJR participant hospitals were permitted to furnish pre-episode services beyond those allowed under current laws and regulations, including the fraud and abuse laws.

Similarly, we did not propose parameters for the provision of equipment and other items and services by EPM participants and CJR participant hospitals to their collaborators to aid in care integration beyond those that are permissible under current laws and regulations, including the fraud and abuse laws. We believe that it would be very challenging to establish sufficient safeguards to protect beneficiary freedom of choice and guard against patient steering in such EPM and CJR model scenarios where EPM participants and CJR participant hospitals provided resources to collaborators that were not specifically based on the quality of care and the provision of EPM activities or CJR activities for beneficiaries in EPM episodes or CJR episodes by that collaborator.

Comment: One commenter recommended that disclosure of sharing arrangements be required by the EPM participant to receive a reconciliation payment, so that CMS can confirm that hospitals have contracts in place with all the involved clinicians and post-acute care providers. The commenter further urged CMS to also require full disclosure of the total amount of all gainsharing payments and how much is
being distributed to each provider or supplier who furnished care to an EPM beneficiary, in order to ensure that payments for care delivery are as transparent as possible. Another commenter requested that CMS collect documents related to the calculation, distribution, receipt, or recoupment of gainsharing payments, alignment payments, distribution payments, and downstream distribution payments and other savings-related payments and the distribution to collaborating physicians and other healthcare professionals. The commenter believes that CMS could utilize these data for future efforts and to ensure program integrity, as well as to help examine the extent to which savings are equitably being shared by EPM participants with collaborating physicians and other healthcare professionals.

Response: As discussed previously in this section, we do not require EPM participants to enter into sharing arrangements, and we do not require that those sharing arrangements include any specific groups of providers, suppliers, or ACOs. Thus, we do not need to confirm the sharing arrangements that are in place with specific EPM collaborators prior to making a reconciliation payment to an EPM participant. However, we do require that EPM participants report the historical and current lists of collaborators on a Web page on the EPM participant’s Web site of EPM collaborators as discussed in section III.I.4.d. of this final rule, which provides transparency regarding the identities of collaborators with EPM participants. In addition, CMS has the ability to request this information from EPM participants under the provisions regarding access to records and retention for the EPM.

We appreciate the requests that CMS consider routinely collecting specific information on the calculation, distribution, receipt, or recoupment of gainsharing payments, alignment payments, distribution payments, and downstream distribution payments and other savings-related payments and the distribution to collaborators. While EPM participants are required to provide this information to CMS upon request under the access to records and retention provisions for the EPM and CMS will exercise this authority where appropriate, we believe the routine submission of this information would create a substantial and unnecessary administrative burden on EPM participants given the large number of potential EPM collaborators and the expected varied nature of their respective arrangements with EPM participants. We also are mindful of the challenges associated with creating a universal collection tool that would account for all the various iterations of financial arrangements into which EPM participants and their collaborators may enter into.

We agree with the commenters that transparency is important to ensure program integrity and to assist with evaluation of the model. We have tried, where possible, to ensure transparency regarding sharing, distribution, and downstream distribution arrangements without imposing undue administrative burden on the individuals and entities that enter into such arrangements. Because documenting financial arrangements is consistent with general business practices, we believe that our documentation requirements impose minimal additional administrative burden on EPM participants, their collaborators, collaboration agents, and downstream collaboration agents. The regulations require contemporaneous documentation of all arrangements and the written agreements must be in writing and signed by the parties, contain the date of the agreement, and be entered into before care is furnished to EPM beneficiaries under the arrangement. The written agreement for sharing arrangements also must specify the purpose and scope of the sharing arrangement, the identities and obligations of the parties, management and staffing information, and the financial or economic terms for payment. We believe that the goals of transparency and program integrity can be achieved by requiring EPM participants, EPM collaborators, collaboration agents, downstream collaboration agents, and any other individual and entities performing EPM activities maintain documentation for at least 10 years following the last day of the EPM participant’s participation in the EPM and allowing CMS, OIG, HHS, and the Comptroller General or their designees access to such records. The evaluation for the EPM intends to examine factors associated with variations in the EPM and the likelihood of experiencing unintended consequences. Factors of interest include variations in how gainsharing, distribution, and downstream distribution payments are implemented between the parties. At this time, it is intended that such information on payments will be collected through mechanisms such as provider surveys, interviews and in case studies.

Final Decision: After consideration of the public comments received, we are finalizing the proposals in § 512.500(c) for EPM gainsharing payment, alignment payment, and internal cost savings conditions and restrictions, with modifications. In addition to the modifications previously discussed in this section, we are specifying that like PGP’s, to be eligible to receive a gainsharing payment or to be required to make an alignment payment, a NPPGP or TGP must have billed for an item or service that was rendered by one or more NPPGP member or TGP member respectively to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount. In addition, like PGP’s, the NPPGP or TGP must have contributed to EPM activities and been clinically involved in the care of EPM beneficiaries during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount. Gainsharing payments, alignment payments, and internal cost savings must meet the following conditions and restrictions:

- Gainsharing payments, if any, must—
  ++ Be derived solely from reconciliation payments, or internal cost savings, or both;
  ++ Be distributed on an annual basis (not more than once per calendar year);
  ++ Not be a loan, advance payment, or payment for referrals or other business; and
  ++ Be clearly identified as a gainsharing payment at the time it is paid.

- To be eligible to receive a gainsharing payment, an EPM collaborator must meet quality of care criteria for the performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment. The quality of care criteria must be established by the EPM participant and directly related to EPM episodes.

- To be eligible to receive a gainsharing payment, or to be required to make an alignment payment, an EPM collaborator other than an ACO, PGP, NPPGP, or TGP must have directly furnished a billable item or service to an EPM beneficiary during an EPM episode that occurred in the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that...
comprises the gainsharing payment or was assessed a repayment amount.
++ To be eligible to receive a
gainsharing payment, or to be required
to make an alignment payment, an EPM
collaborator that is a PGP, NPPGP, or
TPG must meet the following criteria:
—The PGP, NPPGP, or TGP must have
billed for an item or service that was
rendered by one or more PGP
member, NPPGP member, or TGP
member respectively to an EPM
beneficiary during an EPM episode
that occurred during the same
performance year for which the EPM
participant accrued the internal cost
savings or earned the reconciliation
payment that comprises the
gainsharing payment or was assessed
a repayment amount; and
—The PGP, NPPGP, or TGP must have
contributed to EPM activities and
been clinically involved in the care of
EPM beneficiaries during the same
performance year for which the EPM
participant accrued the internal cost
savings or earned the reconciliation
payment that comprises the
gainsharing payment or was assessed
a repayment amount. For example, a
ACO might be have been clinically
involved in the care of EPM
beneficiaries by—
++ Providing care coordination
services to EPM beneficiaries during
and/or after inpatient admission;
++ Engaging with an EPM participant
in care redesign strategies, and actually
performing a role in implementing such
strategies, that are designed to improve
the quality of care and reduce spending
for EPM episodes; or
++ In coordination with providers
and suppliers (such as ACO
participants, ACO providers/suppliers,
the EPM participant, and post-acute care
providers), implementing strategies
designed to address and manage the
comorbidities of EPM beneficiaries.
++ The methodology for accruing,
calculating and verifying internal cost
savings must be transparent,
measurable, and verifiable in
accordance with generally accepted
accounting principles (GAAP) and
Government Auditing Standards (The
Yellow Book).
++ The methodology used to
calculate internal cost savings must
reflect the actual, internal cost savings
achieved by the EPM participant
through the documented
implementation of EPM activities
identifiable by the EPM participant and
must exclude:
—Any savings realized by any
individual or entity that is not the
EPM participant; and
++ “Paper” savings from accounting
conventions or past investment in fixed
costs.
• The total amount of a gainsharing
payment for a performance year paid to
certain individuals and entities that are
EPM collaborators must not exceed the
following:
++ In the case of an EPM collaborator
who is a physician or nonphysician
practitioner, 50 percent of the Medicare-
approved amounts under the PFS for
items and services furnished by that
physician or nonphysician practitioner
to the EPM participant’s EPM
beneficiaries during EPM episodes that
occurred during the same performance
year for which the EPM participant
accrued the internal cost savings or
earned the reconciliation payment that
comprises the gainsharing payment
being made.
++ In the case of an EPM collaborator
that is a PGP or NPPGP, 50 percent of
the Medicare-approved amounts under
the PFS for items and services billed by
that PGP or NPPGP and furnished to
the EPM participant’s EPM beneficiaries
by the PGP members or NPPGP members
respectively during EPM episodes that
occurred during the same performance
year for which the EPM participant
accrued the internal cost savings or
earned the reconciliation payment that
comprises the gainsharing payment
being made.
++ The amount of any gainsharing
payments must be determined in
accordance with a methodology that is
substantially based on quality of care
and the provision of EPM activities. The
methodology may take into account
the amount of such EPM activities provided
by an EPM collaborator relative to other
EPM collaborators.
• For a performance year, the
aggregate amount of all gainsharing
payments that are derived from a
reconciliation payment the EPM
participant receives from CMS must not
exceed the amount of that reconciliation
payment.
• No entity or individual, whether a
party to a sharing arrangement or not,
may condition the opportunity to make or
receive gainsharing payments or to make or receive alignment payments
directly or indirectly on the volume or
value of past or anticipated referrals or
business otherwise generated by,
between or among the EPM participant,
any EPM collaborator, any collaboration
agent, any downstream collaboration
agent, or any individual or entity
affiliated with an EPM participant, EPM
collaborator, collaboration agent, or
downstream collaboration agent.
• An EPM participant must not make a
gainsharing payment to an EPM
collaborator if CMS has notified the
EPM participant that such collaborator
is subject to any action for
noncompliance with this part or the
fraud and abuse laws, or for the
provision of substandard care to EPM
beneficiaries or other integrity
problems.
• The sharing arrangement must
require the EPM participant to recoup
any gainsharing payment that contained
funds derived from a CMS overpayment
on a reconciliation report or was based
on the submission of false or fraudulent
data.
• Alignment payments from an EPM
collaborator to an EPM participant may
be made at any interval that is agreed
upon by both parties, and must not be—
++ Issued, distributed, or paid prior
to the calculation by CMS of a
repayment amount reflected in a reconciliation report:
   ++ Loans, advance payments, or payments for referrals or other business; or
   ++ Assessed by an EPM participant if it does not owe a repayment amount.
• The EPM participant must not receive any amounts under a sharing arrangement from an EPM collaborator that are not alignment payments.

For a performance year, the aggregate amount of all alignment payments received by the EPM participant must not exceed 50 percent of the EPM participant’s repayment amount.
• The aggregate amount of all alignment payments from an EPM collaborator to the EPM participant may not be greater than—
   ++ With respect to an EPM collaborator other than an ACO, 25 percent of the EPM participant’s repayment amount; or
   ++ With respect to an EPM collaborator that is an ACO, 50 percent of the EPM participant’s repayment amount.
• The amount of any alignment payments must be determined in accordance with a methodology that does not directly account for the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent.
• All gainsharing payments and any alignment payments must be administered by the EPM participant in accordance with generally accepted accounting principles (GAAP) and Government Auditing Standards (The Yellow Book).
• All gainsharing payments and alignment payments must be made by check, electronic funds transfer, or another traceable cash transaction.

d. Documentation Requirements

To ensure the integrity of the sharing arrangements, we proposed that EPM participants must meet a variety of documentation requirements for these arrangements. Specifically, we proposed that the EPM participant must—
• Document the sharing arrangement contemporaneously with the establishment of the arrangement;
• Maintain accurate current and historical lists of all EPM collaborators, including EPM collaborator names and addresses; update such lists on at least a quarterly basis; and publicly report the current and historical lists of EPM collaborators on a Web page on the EPM participant’s Web site; and
• Maintain and require each EPM collaborator to maintain contemporaneous documentation with respect to the payment or receipt of any gainsharing payment or alignment payment that includes at a minimum the—
   ++ Nature of the payment (gainsharing payment or alignment payment);
   ++ Identity of the parties making and receiving the payment;
   ++ Date of the payment;
   ++ Amount of the payment;
   ++ Amount and date of any recoupment of all or a portion of an EPM collaborator’s gainsharing payment; and
   ++ Explanation for each recoupment, such as whether the EPM collaborator received a gainsharing payment that contained funds derived from a CMS overpayment on a reconciliation report, or was based on the submission of false or fraudulent data.

In addition, we proposed that the EPM participant must keep records for all of the following:
• Its process for determining and verifying its potential and current EPM collaborators’ eligibility to participate in Medicare.
• Its plan to track internal cost savings.
• Information on the accounting systems used to track internal cost savings;
• A description of current health information technology, including systems to track reconciliation payments and internal cost savings; and
• Its plan to track gainsharing payments and alignment payments.

Finally, we proposed that the EPM participant must retain and provide access to, and must require each EPM collaborator to retain and provide access to, the required documentation in accordance with proposed §512.110. The proposals for the requirements for documentation of sharing arrangements under the EPM were included in proposed §512.500(d). We sought comment about all of the requirements set out in the preceding discussion, including whether additional or different safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the EPM were met.

We received no specific comments on the proposed documentation requirements for EPM sharing arrangements other than the comment discussed previously requesting further documentation related to the criteria for selection of EPM collaborators.

Final Decision: We are finalizing the proposals in §512.500(d) for EPM documentation requirements, with the modification previously discussed to require the EPM participant to publicly post the written policies for selecting EPM collaborators on a Web page on the EPM participant’s Web site and the reorganization to consolidate and streamline the documentation requirements related to public posting. EPM sharing arrangements must meet the following documentation requirements:
• The EPM participant must do all of the following:
  ++ Document the sharing arrangement contemporaneously with the establishment of the arrangement.
  ++ Publicly post (and update on at least a quarterly basis) on a Web page on the EPM participant’s Web site:
    ++ Accurate current and historical lists of all EPM collaborators, including EPM collaborator names and addresses.
    ++ Written policies for selecting individuals and entities to be EPM collaborators, required by §512.500(a)(3).
  ++ Maintain and require each EPM collaborator to maintain contemporaneous documentation with respect to the payment or receipt of any gainsharing payment or alignment payment that includes at a minimum all of the following:
    —Nature of the payment (gainsharing payment or alignment payment).
    —Identity of the parties making and receiving the payment.
    —Date of the payment.
    —Amount of the payment.
    —Date and amount of any recoupment of all or a portion of an EPM collaborator’s gainsharing payment.
    —Explanation for each recoupment, such as whether the EPM collaborator received a gainsharing payment that contained funds derived from a CMS overpayment on a reconciliation report, or was based on the submission of false or fraudulent data.
• The EPM participant must keep records of the following:
  ++ Its process for determining and verifying its potential and current EPM collaborators’ eligibility to participate in Medicare.
  ++ Its plan to track internal cost savings.
  ++ Information on the accounting systems used to track internal cost savings.
  ++ A description of current health information technology, including systems to track reconciliation payments and internal cost savings.
  ++ Its plan to track gainsharing payments and alignment payments.
• The EPM participant must retain and provide access to, and must require each EPM collaborator to retain and provide access to, the required documentation in accordance with § 512.110.

5. Distribution Arrangements Under the EPM

a. General

Similar to the CJR model, we proposed that certain financial arrangements between EPM collaborators and other individuals or entities called “collaboration agents” be termed “distribution arrangements.” A distribution arrangement would be a financial arrangement between an EPM collaborator that was an ACO or PGP and a collaboration agent for the sole purpose of sharing a gainsharing payment received by the ACO or PGP.

We proposed that a collaboration agent would be an individual or entity that was not an EPM collaborator and that was either a PGP member that had entered into a distribution arrangement with the same PGP in which he or she was an owner or employee or an ACO participant or ACO provider/supplier that had entered into a distribution arrangement with the same ACO in which it was participating. Where a payment from an EPM collaborator to a collaboration agent was made pursuant to an EPM distribution arrangement, we proposed to define that payment as a “distribution payment.” A collaboration agent could only make a distribution payment in accordance with a distribution arrangement which complied with the provisions of proposed § 512.505 and all other applicable laws and regulations, including the fraud and abuse laws.

The proposals for the general provisions for distribution arrangements under the EPM were included in proposed § 512.505(a). We sought comment about all of the provisions set out in the preceding discussion, including whether additional or different safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the EPM were met.

We received no specific comments on the proposed general provisions for distribution arrangements under the EPM.

Final Decision: We are finalizing the proposals in § 512.505(a) for the general requirements for EPM distribution arrangements, with modification to allow NPPGPs or TGP members to enter into distribution arrangements with NPPGP members or TGP members respectively. Similar to PGP when they are EPM collaborators, we believe it is appropriate to allow NPPGPs or TGP members to enter into distribution arrangements with NPPGP members or TGP members respectively for the sole purpose of sharing a gainsharing payment received by the NPPGP or TGP. Distribution arrangements under the EPM must comply with the following general provisions:

- An ACO, PGP, NPPGP, or TGP that has entered into a sharing arrangement with an EPM participant may distribute all or a portion of any gainsharing payment it receives from the EPM participant only in accordance with a distribution arrangement.

- All distribution arrangements must comply with the provisions of this section and all other applicable laws and regulations, including the fraud and abuse laws.

b. Requirements

We proposed a number of specific requirements for distribution arrangements as a program integrity safeguard to help ensure that their sole purpose was to create financial alignment between EPM collaborators and collaboration agents toward the goals of the EPM to improve the quality and efficiency of EPM episodes. These requirements largely paralleled those proposed in § 512.500(b) and (c) for sharing arrangements and gainsharing payments based on similar reasoning for these two types of arrangements and payments. We proposed that all distribution arrangements must be in writing and signed by the parties, contain the date of the agreement, and be entered into before care was furnished to EPM beneficiaries under the distribution arrangement. Furthermore, we proposed that participation must be voluntary and without penalty for nonparticipation, and the distribution arrangement must require the collaboration agent to comply with all applicable laws and regulations.

Like our proposal for gainsharing payments, we proposed that the opportunity to make or receive a distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent. We proposed more flexible standards for the determination of the amount of distribution payments from ACOs and PGP members for the same reasons we proposed this standard for the determination of gainsharing payments. Specifically, for ACOs we proposed that the amount of any distribution payments must be determined in accordance with a methodology that was substantially based on quality of care and the provision of EPM activities and that may take into account the amount of such EPM activities provided by a collaboration agent relative to other collaboration agents. In the proposed rule, we discussed our belief that the amount of a collaboration agent’s provision of EPM activities (including direct care) to EPM beneficiaries during EPM episodes might contribute to the EPM participant’s internal cost savings and reconciliation payment that might be available for making a gainsharing payment to the EPM collaborator with which the collaboration agent had a distribution arrangement. Greater contributions of EPM activities by one collaboration agent versus another collaboration agent that resulted in different contributions to the gainsharing payment made to the EPM collaborator with which those collaboration agents both had a distribution arrangement might be appropriately valued in the methodology used to make distribution payments to those collaboration agents. Accordingly, we believed this would be the appropriate standard for determining the amount of distribution payments from an ACO to its collaboration agents.

We noted that for distribution payments made by a PGP to PGP members, the requirement that the amount of any distribution payments must be determined in accordance with a methodology that was substantially based on quality of care and the provision of EPM activities might be more limiting in how a PGP paid its members than was allowed under existing law. Therefore, to retain existing flexibility for distribution payments by a PGP to PGP members, we proposed that the amount of the distribution payment from a PGP to PGP members must be determined either using the methodology previously described for distribution payments from an ACO or in a manner that complied with § 411.352(g). We noted that the proposed option to allow the amount of the distribution payment from a PGP to a PGP member to be determined in a manner that complied with § 411.352(g) was not currently permitted under the CJR model, although we proposed this change for...
the CJR model in section V.J. of the proposed rule (81 FR 50965). This proposal would allow a PGP the choice either to comply with the general standard that the amount of a distribution payment must be substantially based on quality of care and the provision of EPM activities or to provide its members a financial benefit through the EPM without consideration of the PGP member’s individual quality of care. In the latter case, PGP members who were not collaboration agents (including those who furnished no services to EPM beneficiaries) would be able receive a share of the profits from their PGP that included the monies contained in a gainsharing payment. We believed this would be an appropriate exception to the general standard for determining the amount of distribution payment under the EPM from a PGP to a PGP member because CMS has determined under the physician self-referral law that payments from a group practice as defined under §411.352 to its members that comply with §411.352(g) are appropriate.

We sought comment on this proposal and specifically whether there were additional safeguards or a different standard was needed to allow for greater flexibility in calculating the amount of distribution payments that would avoid program integrity risks and whether additional or different safeguards were reasonable, necessary, or appropriate for the amount of distribution payments from a PGP to its members. Similar to our proposed requirements for sharing arrangements for those EPM collaborators that furnished or billed for items and services, except for a distribution payment from a PGP to a PGP member that complied with §411.352(g), we proposed that a collaboration agent would be eligible to receive a distribution payment only if the collaboration agent furnished or billed for an item or service rendered to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprised the gainsharing payment being distributed. In the proposed rule, we discussed our belief that, absent the alternative safeguards afforded by a PGP’s distribution payments in compliance with §411.352(g), these proposed limitations on distribution payments, which were the same as those for proposed for gainsharing payments to physicians, nonphysician practitioners, and PGPs as we proposed for gainsharing payments. In the case of a collaboration agent that was a physician or nonphysician practitioner, we proposed to limit the total amount of distribution payments paid for a performance year to the collaboration agent to 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the collaboration agent to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprised the gainsharing payment being distributed. In the case of a collaboration agent that was a PGP, we proposed that the limit would be 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by members of the PGP to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprised the gainsharing payment being distributed. In the proposed rule, we discussed our belief that, absent the alternative safeguards afforded by a PGP’s distribution payments in compliance with §411.352(g), these proposed limitations on distribution payments, which were the same as those for proposed for gainsharing payments to physicians, nonphysician practitioners, and PGPs, were necessary to eliminate any financial incentives for these individuals or entities to engage in a financial arrangement as an EPM collaborator versus as a collaboration agent. Furthermore, we believed that PGPs should be able to choose whether to engage in financial arrangements that were unrelated to direct care for EPM beneficiaries during EPM episodes when the amount of the distribution payment was not determined in a manner that complies with §411.352(g).

Except for a distribution payment from a PGP to a PGP member that complied with §411.352(g), we proposed the same limitations on the total amount of distribution payments to physicians, nonphysician practitioners, and PGPs as we proposed for gainsharing payments. In the case of a collaboration agent that was a physician or nonphysician practitioner, we proposed to limit the total amount of distribution payments paid for a performance year to the collaboration agent to 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the collaboration agent to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprised the gainsharing payment being distributed. In the case of a collaboration agent that was a PGP, we proposed that the limitation would be 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the collaboration agent to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprised the gainsharing payment being distributed. In the proposed rule, we discussed our belief that, absent the alternative safeguards afforded by a PGP’s distribution payments in compliance with §411.352(g), these proposed limitations on distribution payments, which were the same as those for proposed for gainsharing payments to physicians, nonphysician practitioners, and PGPs, were necessary to eliminate any financial incentives for these individuals or entities to engage in a financial arrangement as an EPM collaborator versus as a collaboration agent. Furthermore, we believed that PGPs should be able to choose whether to engage in financial arrangements that were unrelated to direct care for EPM beneficiaries during EPM episodes when the amount of the distribution payment was not determined in a manner that complies with §411.352(g).

We further proposed that with respect to the distribution of any gainsharing payment received by a PGP or ACO, the total amount of all distribution payments must not exceed the amount of the gainsharing payment received by the EPM collaborator from the EPM participant. Like gainsharing and alignment payments, we proposed that all distribution payments must be made by check, electronic funds transfer, or another traceable cash transaction. The collaboration agent must retain the ability to make decisions in the best interests of the patient, including the selection of devices, supplies, and treatments. Finally, we proposed that the distribution arrangement must not induce the collaboration agent to reduce or limit medically necessary items and services to any Medicare beneficiary or reward the provision of items and services that were medically unnecessary.

We proposed that the EPM collaborator must maintain contemporaneous documentation regarding distribution arrangements in accordance with proposed §512.110, including:
- The relevant written agreements;
- The date and amount of any distribution payment(s);
- The identity of each collaboration agent that received a distribution payment; and
- A description of the methodology and accounting formula for determining the amount of any distribution payment.

We proposed that the EPM collaborator may not enter into a distribution arrangement with any individual or entity that has a sharing arrangement with the same EPM participant. This proposal would ensure that the proposed separate limitations on the total amount of gainsharing payment and distribution payment to PGPs, physicians, and nonphysician practitioners that were substantially based on quality of care and the provision of EPM activities were not exceeded in absolute dollars by a PGP, physician, or nonphysician practitioner’s participation in both a sharing arrangement and distribution arrangement for the care of the same EPM beneficiaries during EPM episodes. Allowing both types of arrangements for the same individual or entity for care of the same EPM beneficiaries during EPM episodes could also allow for duplicate counting of the individual or entity’s
same quality of care and provision of EPM activities in the methodologies for both gainsharing and distribution payments, leading to financial gain that was disproportionate to the quality of care and provision of EPM activities by that individual or entity. Finally, we proposed that the EPM collaborator must retain and provide access to, and must require collaboration agents to retain and provide access to, the required documentation in accordance with proposed § 512.110.

The proposals for requirements for distribution arrangements under the EPM were included in proposed § 512.505(b). We sought comment about all of the requirements set out in the preceding discussion, including whether additional or different safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the EPM were met. In addition, we sought comment on how the regulation of the financial arrangements under this proposal might interact with how these or similar financial arrangements are regulated under the Medicare Shared Savings Program.

The following is a summary of the comments received and our responses. **Comment:** One commenter who expressed support for the proposed cap on distribution and downstream distribution payments by PGPs to individual clinicians at 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the clinician to the EPM participant’s EPM beneficiaries during EPM episodes in the applicable time period opposed CMS’ proposal to eliminate the requirements to link quality to these payments and for the clinicians to provide services to EPM beneficiaries in EPM episodes for PGPs payments to clinicians under a methodology that complies with § 411.352(g). The commenter observed that under CMS’ proposal, distribution arrangements would be subject to many of the same requirements as sharing arrangements. They claimed that while some PGPs may want to cascade funds in the same way as other funds that are paid in accordance with § 411.352(g), a provision that prohibits physicians in a group practice from being directly or indirectly compensated based on the volume or value of his or her referrals, the commenter believes that the provision of all payments under EPM financial arrangements, including gainsharing payments, distribution payments, and downstream distribution payments, should have a direct association with high-quality, cost-effective care furnished to EPM beneficiaries. **Response:** We appreciate the commenter’s concerns about our proposal to allow distribution payments and downstream distribution payments to be made by a PGP to PGP members either based on a methodology that complies with § 411.352(g) or in accordance with a methodology that is substantially based on quality of care and the provision of EPM activities. Under the latter methodology, we proposed that the PGP member who is a collaboration agent or a downstream collaboration agent would be eligible to receive a payment if he or she furnished or billed for an item or service rendered to an EPM beneficiary during an EPM episode during the applicable time period and the total amount of payment for a performance year would be subject to a cap. These requirements would not apply to distribution or downstream distribution payments by a PGP to PGP members based on a methodology that complies with § 411.352(g).

We remain concerned that without the § 411.352(g) exception that we proposed, the distribution and downstream distribution methodologies would be more limiting in how a PGP pays its members than is allowed under existing law. Our proposal would allow a PGP the choice either to comply with the standard under the EPM that the amount of a distribution payment or downstream distribution payment must be substantially based on quality of care and the provision of EPM activities or to provide its members a financial benefit under the general standard at § 411.352(g) without consideration of the PGP member’s individual quality of care. In the latter case, PGP members who are not collaboration agents or downstream collaboration agents (including those who furnished no services to EPM beneficiaries) would be able receive a share of the profits from their PGP that includes the monies contained in a gainsharing or distribution payment. We continue to believe this is an appropriate exception to the standard created under the EPM for determining the amount of distribution payment under the EPM from a PGP to a PGP member because CMS has determined under the physician self-referral law that payments from a group practice as defined under § 411.352 to its members that comply with § 411.352(g) are appropriate. We note that even in such cases, our proposal includes some requirements to ensure a nexus between the financial arrangement and the care provided by PGP members to beneficiaries in EPM episodes. In addition to the requirement in § 512.500(c)(2)(i) that for any EPM collaborator to be eligible receive a gainsharing payment, the EPM collaborator must meet quality of care criteria for the performance year, under § 512.500(c)(2)(iii) we further specify that for PGPs to be eligible to receive a gainsharing payment the PGP also must have billed for an item or service that was rendered by one or more members of the PGP to an EPM beneficiary during an EPM episode during the applicable time period and that the PGP must have contributed substantially to EPM activities and been clinically involved in the care of EPM beneficiaries during that same time period. We believe these requirements for gainsharing eligibility establish a clear link between the quality of care furnished to EPM beneficiaries by PGP members and EPM activities by the PGP and the subsequent financial arrangements between the PGP and its members. In addition, we require in § 512.505(b)(5) that the amount of any distribution payments from an ACO (including those to a PGP) must be determined in accordance with a methodology that is substantially based on quality of care and the provision of EPM activities. Therefore, we believe there is a sufficiently close link between distribution payments and downstream distribution payments that comply with § 411.352(g) and the quality of care furnished to EPM beneficiaries by PGP members and EPM activities by the PGP that allowing payments by the PGP to its members that comply with § 411.352(g) does not substantially threaten the important relationship between payments under the EPM financial arrangements and the quality of care furnished to EPM beneficiaries in EPM episodes.

We are finalizing in §§ 512.505(6) and 512.510(6) that the amount of any distribution payments or downstream distribution payments from a PGP to a PGP member must be determined either in a manner that complies with § 411.352(g) of this chapter or in accordance with a methodology that is substantially based on quality of care and the provision EPM activities.

**Comment:** One commenter requested clarification about whether a provider of outpatient therapy services can receive distribution payments or downstream distribution payments as either a member of a PGP who is an EPM collaborator or as a member of a PGP that is an ACO participant in an ACO that has a distribution arrangement with an EPM collaborator.

Other commenters sought to clarify whether groups of nonphysician...
practitioners could enter into financial arrangements under the EPM.  

Response: The definition of a member of a PGP or PGP member means “a physician, nonphysician practitioner, or therapist who is an owner or employer of a PGP and who has reassigned to the PGP his or her right to receive Medicare payment.” Thus, therapists who are PGP members may be eligible to receive distribution payments or downstream distribution payments when those PGPs enter into financial arrangements under the EPM in accordance with all the requirements in this final rule. We are finalizing in § 512.2 the definition of member of the PGP or PGP member to include therapists.

Moreover, as we discussed previously, in response to commenters’ confusion regarding the permissibility of financial arrangements for therapists both as individuals and as part of groups we adopt multiple clarifications in this final rule to affirm the permissibility of such arrangements and to clarify the applicable requirements.

In addition to the adoption of new definitions that clarify the sharing arrangements available to therapists in private practice or TGPs as discussed previously, this final rule adopts parameters for TGPs and therapists in private practice to receive distribution payments from an ACO that is an EPM collaborator, for TGPs to make distribution payments and downstream distribution payments to their members, and for therapists to receive distribution payments and downstream distribution payments as part of members of NPPGPs or members of TGPs.

Similarly, in response to commenters seeking clarity on whether groups of nonphysician practitioners are eligible to enter into financial arrangements under the EPM that mirror those expressly permitted for PGPs, in this final rule, we affirm the permissibility of and parameters for such arrangements for NPPGPs. In addition to the provisions discussed previously and as discussed further later in this section, the final rule establishes parameters for distribution payments to NPPGPs that directly parallel the parameters we proposed and now finalize for such payments to PGPs. Similarly, as is also discussed further later in this section, the parameters for distribution payments and downstream distribution payments by an NPPGP to its members directly parallel the parameters for distribution payments and downstream distribution payments by a PGP to its members as proposed and adopted in this final rule for, due to the inapplicability of the physician self-referral law and its exceptions, NPPGPs do not have the options afforded to PGPs to make distributions to their members in a manner that complies with § 411.352(g) of this chapter.

Final Decision: After consideration of the public comments received, we are finalizing the proposals in § 512.505(b) for the requirements for EPM distribution arrangements, with modification to include policies for NPPGPs or TGPs that enter into distribution arrangements with NPPGP members or TGP members respectively. Like a PGP, an NPPGP that is an ACO participant in an ACO that is an EPM collaborator may enter into distribution arrangement with the ACO. The distribution payments to the NPPGP are subject to the same requirements as the distribution payments to PGPs that are collaboration agents. The NPPGP is eligible to receive a distribution payment only if the collaboration agent billed for an item or service rendered to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed. The distribution payment to the NPPGP is capped at 50 percent of the total Medicare-approved amounts under the PFS for items and services billed by the NPPGP for items and services furnished by NPPGP members to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed. If a TGP is an EPM collaborator, it may enter into a distribution arrangement with a NPPGP member, who is a nonphysician practitioner or therapist who is an owner or employee of a NPPGP and who has reassigned to the NPPGP his or her right to receive Medicare payment. The requirements for NPPGP distribution payments under those distribution arrangements are the same as those for PGPs, except that we allow the amount of any distribution payments from a PGP to a PGP member to be determined in a manner that complies with § 411.352(g). While CMS has determined that under the physician self-referral law payments from a group practice as defined under § 411.352 to its members that comply with § 411.352(g) are appropriate, NPPGPs do not fall under this definition of group practice. Therefore, the amount of any distribution payments from a NPPGP to a NPPGP member must always be determined in accordance with a methodology that is substantially based on quality of care and the provision of EPM activities, the same standard that applies to PGP distribution payments that are not determined in a manner that complies with § 411.352(g). Like the requirement for PGP members when a distribution payment does not comply with § 411.352(g), a NPPGP member is eligible to receive a distribution payment only if the collaboration agent furnished an item or service to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed. Finally, the total amount of distribution payments paid for a performance year to the NPPGP member may not exceed 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the NPPGP member to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed. In addition, with respect to the distribution of any gainsharing payment received by a NPPGP, the total amount of all distribution payments must not exceed the amount of the gainsharing payment received by the EPM collaborator from the EPM participant.

Like a PGP and NPPGP, a TGP that is an ACO participant in an ACO that is an EPM collaborator may enter into distribution arrangement with the ACO. The distribution payments to the TGP are not subject to the cap that applies to PGPs and NPPGPs. While we cap distribution payments to physicians and nonphysician practitioners, we will not cap distribution payments to TGPs. Like PGPs and NPPGPs, the TGP is eligible to receive a distribution payment only if the collaboration agent billed for an item or service rendered to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed. If a TGP is an EPM collaborator, it may enter into a distribution arrangement with a TGP member, who is a therapist who is an owner or
employee of a TGP and who has reassigned to the TGP his or her right to receive Medicare payment. Like distribution payments from a NPPGP to a NPPGP member, the amount of any distribution payments from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision EPM activities, the same standard that applies to PGP distribution payments that are not determined in a manner that complies with § 411.352(g). Like the requirement for PGP members when a distribution payment does not comply with § 411.352(g) and for NPPG members, a TGP member is eligible to receive a distribution payment only if the collaboration agent furnished an item or service to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed. We will not cap the total amount of distribution payments paid for a performance year to a TGP member for the reasons discussed previously for not applying caps on gainsharing payments to therapists in private practice. Finally, with respect to the distribution of any gainsharing payment received by a TGP, the total amount of all distribution payments must not exceed the amount of the gainsharing payment received by the EPM collaborator from the EPM participant.

Distribution arrangements under the EPM must comply with the following requirements:

• All distribution arrangements must be in writing and signed by the parties, contain the date of the agreement, and be entered into before care is furnished to EPM beneficiaries under the distribution arrangement.

• Participation in a distribution arrangement must be voluntary and without penalty for nonparticipation.

• The distribution arrangement must require the collaboration agent to comply with all applicable laws and regulations.

• The opportunity to make or receive a distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, any EPM collaborator, collaboration agent, or downstream collaboration agent.

• The amount of any distribution payments from an ACO, from a NPPGP to a NPPGP member, or from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision EPM activities and that may take into account the amount of such EPM activities provided by a collaboration agent relative to other collaboration agents.

• The amount of any distribution payments from a PGP must be determined either in a manner that complies with § 411.352(g) of this chapter or in accordance with a methodology that is substantially based on quality of care and the provision EPM activities and that may take into account the amount of such EPM activities provided by a collaboration agent relative to other collaboration agents.

• Except for a distribution payment from a PGP to a PGP member that complies with § 411.352(g) of this chapter, a collaboration agent is eligible to receive a distribution payment only if the collaboration agent furnished or billed for an item or service rendered to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

• Except for a distribution payment from a PGP to a PGP member that complies with § 411.352(g) of this chapter, the total amount of distribution payments for a performance year paid to a collaboration agent must not exceed the following:

++ In the case of a collaboration agent that is a physician or nonphysician practitioner, 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the collaboration agent to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

++ In the case of a collaboration agent that is a PGP or NPPGP, 50 percent of the total Medicare-approved amounts under the PFS for items and services billed by that PGP or NPPGP for items and services furnished by PGP members or NPPGP members to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

6. Downstream Distribution Arrangements Under the EPM

a. General

We proposed that the EPM allow for certain financial arrangements within an ACO between a PGP and its members. Specifically, we proposed that certain financial arrangements between a collaboration agent that was both a PGP and an ACO participant and other individuals termed “downstream collaboration agents” be termed a “downstream distribution arrangement.” A downstream distribution arrangement would be a...
financial arrangement between a collaboration agent that was both a PGP and an ACO participant and a downstream collaboration agent for the sole purpose of sharing a distribution payment received by the PGP. We proposed that a downstream collaboration agent would be an individual who was not an EPM collaborator or a collaboration agent and who was a PGP member that had entered into a downstream distribution arrangement with the same PGP in which he or she was an owner or employee, and where the PGP was a collaboration agent. Where a payment from a collaboration agent to a downstream collaboration agent was made pursuant to a downstream distribution arrangement, we proposed to define that payment as a "downstream distribution payment." A collaboration agent may only make a downstream distribution payment in accordance with a downstream distribution arrangement which complied with the requirements of this section and all other applicable laws and regulations, including the fraud and abuse laws.

The proposals for the general provisions for downstream distribution arrangements under the EPM were included in proposed § 512.510(a). We sought comment about all of the provisions set out in the preceding discussion, including whether additional or different safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the EPM were met.

We received no specific comments on the proposed general provisions for downstream distribution arrangements under the EPM; however, the comments described previously regarding commenters’ confusion regarding the permissibility of financial arrangements for individuals and groups of therapists and nonphysician practitioners under our proposal are relevant to these provisions.

Final Decision: We are finalizing the proposals in § 512.510(a) for the general requirements for EPM downstream distribution arrangements, with modification to allow NPPCPs or TGP to enter into downstream distribution arrangements with NPPGP members or TGP members respectively. Downstream distribution arrangements under the EPM must comply with the following general provisions:

- An ACO participant that is a PGP, NPPGP, or TGP and that has entered into a distribution arrangement with an EPM collaborator that is an ACO may distribute all or a portion of any distribution payment it receives from the EPM collaborator only in accordance with a downstream distribution arrangement.
- All downstream distribution arrangements must comply with the provisions of this section and all applicable laws and regulations, including the fraud and abuse laws.

b. Requirements

We proposed a number of specific requirements for downstream distribution arrangements. One program integrity safeguard to help ensure that their sole purpose was to create financial alignment between collaboration agents that were PGP which were also ACO participants and downstream collaboration agents toward the goals of the EPM to improve the quality and efficiency of EPM episodes. These proposed requirements largely paralleled those proposed in proposed § 512.500(b) and (c) and § 512.505(b) for sharing and distribution arrangements and gainsharing and distribution payments based on similar reasoning for these three types of arrangements and payments. We proposed that all downstream distribution arrangements must be in writing and signed by the parties, contain the date of the agreement, and entered into before care was furnished to EPM beneficiaries under the downstream distribution arrangement. Furthermore, we proposed that participation must be voluntary and without penalty for nonparticipation, and the downstream distribution arrangement must require the downstream collaboration agent to comply with all applicable laws and regulations.

Like our proposals for gainsharing and distribution payments, we proposed that the opportunity to make or receive a downstream distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent. We proposed the more flexible standard for the determination of the amount of downstream distribution payments for the same reasons we proposed this standard for the determination of distribution payments by a PGP to PGP members. Specifically, the amount of any downstream distribution payments must be determined either in a manner that complies with § 411.352(g) or in accordance with a methodology that was substantially based on quality of care and the provision of EPM activities and that may take into account the amount of such EPM activities provided by a downstream collaboration agent relative to other downstream collaboration agents. In the proposed rule, we discussed our belief that the amount of a downstream collaboration agent’s provision of EPM activities (including direct care) to EPM beneficiaries during EPM episodes might contribute to the EPM participant’s internal cost savings and reconciliation payment that might be available for making a gainsharing payment to the EPM collaborator that was then shared through a distribution payment to the collaboration agent with which the downstream collaboration agent had a downstream distribution arrangement. Greater contributions of EPM activities by one downstream collaboration agent versus another downstream collaboration agent that resulted in different contributions to the distribution payment made to the collaboration agent with which the downstream collaboration agents both had a downstream distribution arrangement might be appropriately valued in the methodology used to make downstream distribution payments to those downstream collaboration agents. Just as we proposed an alternative to a methodology that was substantially based on quality of care and the provision of EPM activities for determining the amount of a distribution payment from a PGP to a PGP member, we similarly proposed an alternative that the amount of a downstream distribution payment from a PGP to a PGP member may be determined in a manner that complied with § 411.352(g).

Similar to our proposed requirements for distribution arrangements for those EPM collaborators that were PGP, we proposed that, except for a downstream distribution arrangement that complied with § 411.352(g), a downstream collaboration agent would be eligible to receive a downstream distribution payment only if the PGP billed for an item or service furnished by the downstream collaboration agent to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprised the gainsharing payment from which the ACO made the distribution payment to the PGP that was an ACO participant. This proposal would ensure that, absent the alternative safeguards afforded by a
PGP’s downstream distribution payments in compliance with § 411.352(g), there would be the same required relationship between direct care for EPM beneficiaries during EPM episodes and downstream distribution payment eligibility that we proposed to require for gainsharing and distribution payment eligibility. We believed this requirement would provide a safeguard against payments to downstream collaboration agents that were unrelated to direct care for EPM beneficiaries during EPM episodes when the amount of the downstream distribution payment was not determined in a manner that complied with § 411.352(g).

We proposed the same limitations on downstream distribution payments to downstream collaboration agents as we proposed for distribution payments by EPM collaborators that were PGP. We proposed that, absent the alternative safeguards afforded by compliance with § 411.352(g), the total amount of downstream distribution payments paid for a performance year to the downstream collaboration agent would be limited to 50 percent of the total Medicare-approved amounts under the PFS for services billed by the PGP and furnished by the downstream collaboration agent to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprised the gainsharing payment from which the ACO made the distribution payment to the PGP. We believed that, absent the alternative safeguards afforded by a PGP’s downstream distribution payments in compliance with § 411.352(g), this proposed limitation on downstream distribution payments that was the same as those for distribution payments to physicians and nonphysician practitioners was necessary to eliminate any financial incentives for a PGP member to engage in a specific financial arrangement as a collaboration agent versus a downstream collaboration agent.

We further proposed that the total amount of all downstream distribution payments made to downstream collaboration agents must not exceed the amount of the distribution payment received by the collaboration agent (that is, the PGP that was an ACO participant) from the ACO that was an EPM collaborator. Like gainsharing, alignment, and distribution payments, we proposed that all downstream distribution payments must be made by check, electronic funds transfer, or another traceable cash transaction. The downstream collaboration agent must retain the ability to make decisions in the best interests of the patient, including the selection of devices, supplies, and treatments. The distribution arrangement must not induce a downstream collaboration agent to reduce or limit medically necessary items and services to any Medicare beneficiary or reward the provision of items and services that were medically unnecessary.

We proposed that the PGP must maintain contemporaneous documentation regarding downstream distribution arrangements in accordance with proposed § 512.110, including all of the following:

• The relevant written agreements.
• The date and amount of any downstream distribution payment(s).
• The identity of each downstream collaboration agent that received a downstream distribution payment.
• A description of the methodology and accounting formula for determining the amount of any downstream distribution payment.

We proposed that the PGP may not enter into a downstream distribution arrangement with any PGP member who had a sharing arrangement with an EPM participant or distribution arrangement with the ACO the PGP was a participant in. This proposal would ensure that the proposed separate limitations on the total amount of gainsharing payment, distribution payment, and downstream distribution payment to PGP members that were substantially based on quality of care and the provision of EPM activities were not exceeded in absolute dollars by a PGP member’s participation in more than one type of arrangement for the care of the same EPM beneficiaries during EPM episodes. Allowing more than one arrangement for the same PGP member for the care of the same EPM beneficiaries during EPM episodes could also allow for duplicate counting of the PGP member’s same quality of care and provision of EPM activities in the methodologies for the different payments. Finally, we proposed that the PGP must retain and provide access to, and must require downstream collaboration agents to retain and provide access to, the required documentation in accordance with proposed § 512.110.

The proposals for requirements for downstream distribution arrangements under the EPM were included in proposed § 512.510(b). We sought comment about all of the requirements set out in the preceding discussion, including whether additional or different safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the EPM were met.

We received no specific comments on the proposed requirements for downstream distribution arrangements under the EPM; however, the comments described previously regarding commenters’ confusion regarding the permissibility of financial arrangements for individuals and groups of therapists and nonphysician practitioners under our proposal and regarding the request to simplify and reduce the burdens associated with the programmatic requirements are relevant to these provisions.

Final Decision: We are finalizing the proposals in § 512.510(b) for the requirements for EPM downstream distribution arrangements, with modification to include policies for NPPGP or TGP that enters into downstream distribution arrangements with NPPGP members or TGP members respectively. Consistent with commenters’ overall request that we streamline the regulations, we are also modifying proposed § 512.510(b)(6), which is final § 512.510(b)(7), to eliminate one of the two proposed requirements for eligibility of a downstream collaboration agent to receive a downstream distribution payment, specifically the requirement that the PGP bill for the item or service furnished by the downstream collaboration agent. Instead, we base downstream collaboration agent eligibility only on whether the downstream collaboration agent furnished an item or service to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment from which the ACO made the distribution payment to the PGP, NPPGP, or TGP that is an ACO participant. This approach is parallel to § 512.505(b)(7), which applies to distribution payments from ACOs to ACO participants or ACO providers/suppliers and certain distribution payments from PGP to PGP members, and ensures that the member of the PGP, NPPGP, or TGP receiving the downstream distribution payment furnished items and services to an EPM beneficiary during an EPM episode, without explicitly requiring that the PGP, NPPGP, or TGP to which the member of the PGP, NPPGP, or TGP would have reassigned his or her benefits also billed for the item or service. This latter approach would add complexity that is unnecessary when our objective of the
requirement is only to ensure that the recipient of the downstream distribution payment furnished an item or service to an EPM beneficiary during an EPM episode in order to link the payment to actual care. Finally, as discussed previously, in order to achieve consistency in the parameters for gainsharing payments and distribution payments to therapists and to streamline programmatic requirements, we are revising proposed § 512.510(b)(7), which is final in § 512.510(b)(8), by removing the cap on downstream distribution payments to PGP members as applied to therapists who are PGP members.

A NPPGP that is an ACO participant that has entered into a distribution arrangement with an EPM collaborator that is an ACO may enter into a downstream distribution arrangement with a NPPGP member, who is a nonphysician practitioner or therapist who is an owner or employee of a NPPGP and who has reassigned to the NPPGP his or her right to receive Medicare payment. The requirements for NPPGP downstream distribution payments under those downstream distribution arrangements are the same as those for PGP, except that we allow the amount of any downstream distribution payments from a PGP to be determined in a manner that complies with § 411.352(g). The amount of any downstream distribution payments from a NPPGP to a NPPGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision EPM activities, the same standard that applies to PGP distribution payments that are not determined in a manner that complies with § 411.352(g). The opportunity to make or receive any individual or entity affiliated with a downstream distribution arrangement must require the downstream collaboration agent relative to other downstream collaboration agents.

The amount of any downstream distribution payments from a NPPGP to a NPPGP member or from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision EPM activities and that may take into account the amount of such EPM activities provided by a downstream collaboration agent relative to other downstream collaboration agents. The amount of any downstream distribution payments from a PGP must be determined either in a manner that complies with § 411.352(g) of this chapter or in accordance with a methodology that is substantially based on quality of care and the provision EPM activities and that may take into account the amount of such EPM activities provided by a downstream collaboration agent relative to other downstream collaboration agents.

Like PGPs, NPPGPs and TGPs must

items and services furnished by the NPPGP member to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment from which the ACO made the distribution payment to the NPPGP that is an ACO participant. In addition, the total amount of all downstream distribution payments made to downstream collaboration agents must not exceed the amount of the distribution payment received by the NPPGP from the ACO.

A TGP that is an ACO participant that has entered into a distribution arrangement with an EPM collaborator that is an ACO may enter into a downstream distribution arrangement with a TGP member, who is a therapist who is an owner or employee of a NPPGP and who has reassigned to the TGP his or her right to receive Medicare payment. Like downstream distribution payments from a NPPGP to a NPPGP member, the amount of any downstream distribution payments from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision EPM activities, the same standard that applies to PGP distribution payments that are not determined in a manner that complies with § 411.352(g). The requirement for PGP members when a distribution payment does not comply with § 411.352(g), a NPPGP member is eligible to receive a downstream distribution payment only if the downstream collaboration agent furnished an item or service to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment from which the ACO made the distribution payment to the NPPGP that is an ACO participant. We will not cap the total amount of downstream distribution payments paid for a performance year to a TGP member. Finally, the total amount of all downstream distribution payments made to downstream collaboration agents must not exceed the amount of the distribution payment received by the TGP from the ACO.

Like PGPs, NPPGPs and TGPs must maintain contemporaneous documentation regarding downstream distribution arrangements. Similarly, the NPPGP or TGP may not enter into a downstream distribution arrangement with any NPPGP member or TGP member respectively who has a sharing arrangement with an EPM participant or a distribution arrangement with the ACO the NPPGP or TGP is a participant in.

Downstream distribution arrangements under the EPM must comply with the following requirements:

• All downstream distribution arrangements must be in writing and signed by the parties, contain the date of the agreement, and be entered into before care is furnished to EPM beneficiaries under the downstream distribution arrangement.

• Participation in a downstream distribution arrangement must be voluntary and without penalty for nonparticipation.

• The downstream distribution arrangement must require the downstream collaboration agent to comply with all applicable laws and regulations.

• The opportunity to make or receive a downstream distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent.

The amount of any downstream distribution payments from a NPPGP to a NPPGP member or from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision EPM activities and that may take into account the amount of such EPM activities provided by a downstream collaboration agent relative to other downstream collaboration agents.

The amount of any downstream distribution payments from a PGP must be determined either in a manner that complies with § 411.352(g) of this chapter or in accordance with a methodology that is substantially based on quality of care and the provision EPM activities and that may take into account the amount of such EPM activities provided by a downstream collaboration agent relative to other downstream collaboration agents.

Except for a downstream distribution payment from a PGP to a PGP member that complies with § 411.352(g) of this chapter, a downstream collaboration agent is eligible to receive a downstream distribution arrangement.
distribution payment only if the downstream collaboration agent furnished an item or service to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprise the gainsharing payment from which the ACO made the distribution payment to the PGP, NPPGP, or TGP that is an ACO participant.

- Except for a downstream distribution payment from a PGP to a PGP member that complies with §411.352(g) of this chapter, the total amount of downstream distribution payments for a performance year paid to a downstream collaboration agent who is a physician or nonphysician practitioner and is either a PGP member or NPPGP member must not exceed 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the downstream collaboration agent to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the distribution payment being distributed.

- The total amount of all downstream distribution payments made to downstream collaboration agents must not exceed the amount of the distribution payment received by the PGP, NPPGP, or TGP from the ACO.

- All downstream distribution payments must be made by check, electronic funds transfer, or another traceable cash transaction.

- The downstream collaboration agent must retain his or her ability to make decisions in the best interests of the patient, including the selection of devices, supplies, and treatments.

- The downstream distribution arrangement must not—
  ++ Induce the downstream collaboration agent to reduce or limit medically necessary services to any Medicare beneficiary; or
  ++ Reward the provision of items and services that are medically unnecessary.

- The PGP, NPPG, or TGP must maintain contemporaneous documentation regarding downstream distribution arrangements in accordance with §512.110, including the following:
  ++ The relevant written agreements.
  ++ The date and amount of any downstream distribution payment.

- The identity of each downstream collaboration agent that received a downstream distribution payment.

- A description of the methodology and accounting formula for determining the amount of any downstream distribution payment.

- The PGP, NPPGP, or TGP may not enter into a downstream distribution arrangement with any PGP member, NPPGP member, or TGP member who has—
  ++ A sharing arrangement with an EPM participant; or
  ++ A distribution arrangement with the ACO that the PGP, NPPGP, or TGP is a participant in.

- The PGP, NPPGP, or TGP must retain and provide access to, and must require downstream collaboration agents to retain and provide access to, the required documentation in accordance with §512.110.

7. Summary of Policies for Sharing, Distribution, and Downstream Distribution Arrangements Under the EPM

Figure 2 summarizes the proposals for the defined terms and financial arrangements discussed in sections III.I.4. through 6. of the proposed rule (81 FR 50920 through 50929).
Our final policies for financial arrangements reflect a number of changes to the proposals for EPM financial arrangements in response to comments on the proposed rule. Accordingly, Figure 2 summarizes the final policies for the defined terms and financial arrangements discussed in sections III.I.4. through 6. of this final rule.
8. Enforcement Authority

As discussed in the proposed rule, OIG authority is not limited or restricted by the provisions of the EPM, including the authority to audit, evaluate, investigate, or inspect the EPM participant, EPM collaborators, collaboration agents, or any other person or entity or their records, data, or information, without limitations. Additionally, no EPM provisions would limit or restrict the authority of any other Government Agency to do the same.

The proposals for enforcement authority under the EPM were included in proposed §512.520. We sought comment about all of the requirements set out in the preceding discussion, including whether additional or different safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the EPM were met.

We received no comments on the proposals for enforcement authority under the EPM.

Final Decision: We are finalizing the proposals in §512.520 for the enforcement authority for the EPM, without modification. The final provisions include—

- OIG authority is not limited or restricted by the provisions of the EPM, including the authority to audit, evaluate, investigate, or inspect the EPM participant, EPM collaborators, or any other person or entity or their records, data, or information, without limitation; and
- None of the provisions of the EPM limits or restricts the authority of any other government agency permitted by law to audit, evaluate, investigate, or inspect the EPM participant, EPM collaborators, or any other person or entity or their records, data, or information, without limitation.

9. Beneficiary Engagement Incentives under the EPM

a. General

Similar to our reasoning for the CJR model (80 FR 73433 through 73437), in the proposed rule, we discussed our belief that the EPM would incentivize EPM participants to furnish directly and otherwise coordinate items and services throughout the EPM episodes that lead to higher quality care for EPM beneficiaries and lower EPM episode spending. We believed that one mechanism that might be useful to EPM participants in achieving these goals would be the provision of certain items and services as in-kind patient engagement incentives to the EPM beneficiary during the EPM episode. Under such an approach, the costs of the patient engagement incentives
would be borne by the EPM participant. However, we believed that certain conditions on these incentives were necessary to ensure that their provision was solely for the purpose of achieving the EPM goals of improving episode quality and efficiency.

We proposed that the incentive must be provided directly by the EPM participant or by an agent of the EPM participant under the EPM participant’s direction and control to the EPM beneficiary during an EPM episode. We considered whether this policy on beneficiary incentives should extend to providers and suppliers other than the EPM participant that furnish services during the EPM episode, or to other entities altogether, such as ACOs that were EPM collaborators. However, as discussed in section III.B.3. of the proposed rule (81 FR 50813 through 50814), given our belief that the EPM participant was best positioned to coordinate the care of beneficiaries in the EPM, we believed that EPM participants would also be better suited than other individuals and entities to provide beneficiary incentives.

We proposed that the item or service provided as an incentive must be reasonably connected to medical care provided to an EPM beneficiary during an EPM episode. For example, EPM participants could provide incentives such as post-surgical or cardiac monitoring equipment to track patient weight and vital signs for post-surgical or post-AMI patients discharged directly to home, but could not provide theater tickets, which would bear no reasonable connection to the patient’s medical care.

Similarly, EPM participants might provide cardiac or post-surgical monitoring equipment, but not broadly used technology that was more valuable to the beneficiary than equipment that was reasonably necessary for the patient’s post-hospital discharge care, such as a smartphone. In such circumstances, a reasonable inference would arise that the technology would not be reasonably connected to the medical care of the patient. Among other things, this safeguard precluded incentives that might serve to inappropriately induce beneficiaries to receive other medical care that was not included in the episode. We also proposed that the incentive must be a preventive care item or service or an item or service that advanced a clinical goal, as described later in this section, for a beneficiary in an EPM episode by engaging the beneficiary in better managing his or her own health. We also proposed that the item or service provided as an incentive must not be tied to the receipt of items or services outside the EPM episode and that the item or service must not be tied to the receipt of items or services from a particular provider or supplier. These provisions would provide safeguards against the provision of in-kind patient engagement incentives to steer beneficiaries toward certain providers or suppliers for care.

We proposed that the availability of the items or services provided as incentives must not be advertised or promoted except that a beneficiary may be made aware of the availability of the items or services at the time the beneficiary could reasonably benefit from them. This condition would provide a safeguard against the advertisement of in-kind patient engagement incentives to certain beneficiaries that could increase an EPM participant’s number of EPM episodes and shift the patient severity for an EPM participant compared to historical EPM episodes by encouraging more beneficiaries with less severe clinical conditions in the EPM to seek care at the EPM participant. Such changes could produce financial gain for the EPM participant that would not be related to improvements in EPM quality and efficiency by resulting in the EPM participant’s quality-adjusted target prices for EPM episodes being higher than would be appropriate based on the lower average patient severity during the EPM performance years. We did not intend for any of the financial arrangements proposed for the EPM, including beneficiary incentives, to alter the EPM participant’s market share of care for a clinical condition in the EPM, nor did we intend for these arrangements to shift the patient severity for an EPM participant or cause access problems for Medicare beneficiaries. Finally, we proposed that the cost of the items or services must not be shifted to another federal health care program, as defined at section 1128B(f) of the Act.

Our proposals for the general provisions for beneficiary incentives were included in proposed § 512.525(a). We sought comment on our proposed general provisions for beneficiary incentives and welcomed comment on additional or alternative program integrity safeguards. We summarize the comments and provide our responses in section III.I.9.d. of this final rule.

h. Technology Provided to an EPM Beneficiary

In some cases, items or services involving technology might be useful as beneficiary engagement incentives that could advance a clinical goal of the EPM by engaging a beneficiary in managing his or health during the 90 days following discharge from the anchor or chained anchor hospitalization. However, in the proposed rule we discussed our belief that specific enhanced safeguards were necessary for these items and services to prevent abuse, and our proposals were consistent with the CJR model policies (80 FR 73437). Specifically, we proposed that items or services involving technology provided to a beneficiary may not exceed $1,000 in retail value for any one beneficiary in any one EPM episode, and that items or services involving technology provided to a beneficiary must be the minimum necessary to advance a clinical goal as discussed in this section for a beneficiary in an EPM episode.

We proposed additional enhanced requirements for items of technology exceeding $100 in retail value as an additional safeguard against misuse of these items as beneficiary engagement incentives. Specifically, we proposed that these items of technology remain in the possession of the EPM participant and be retrieved from the beneficiary at the end of the EPM episode. The EPM participant must document all retrieval attempts, including the ultimate date of retrieval. However, because we understood that EPM participants may not always be able to retrieve these items after the EPM episode ends, such as when a beneficiary died or moved to another geographic area, documented, diligent, good faith attempts to retrieve items of technology would be deemed to meet the retrieval requirement.

Our proposals for enhanced requirements for technology provided to EPM beneficiaries as beneficiary engagement incentives under the EPM were included in proposed § 512.525(b). We sought comment on our proposed requirements for beneficiary engagement incentives that involve technology and welcomed comment on additional or alternative program integrity safeguards for this type of beneficiary engagement incentive, including whether the financial thresholds proposed for participation were reasonable, necessary, and appropriate. We summarize the comments and provide our responses in section III.I.9.d. of this final rule.

c. Clinical Goals of the EPM

As discussed in section III.C.3. of the proposed rule (81 FR 50829 through 50834), the proposed EPMs were broadly defined to include most Part A and Part B items and services furnished during EPM episodes that would extend 90 days following discharge from the anchor or chained anchor.
hospitalization that began the episode, excluding only those Part A and Part B services that were unrelated to the EPM episode based on hospital readmissions or diagnoses for which care was unrelated to the EPM episode diagnosis and procedures based on clinical rationale. Therefore, in the proposed rule we discussed our belief that in-kind patient engagement incentives might appropriately be provided for managing acute conditions arising from EPM episodes, as well as chronic conditions if the condition was likely to have been affected by care during the EPM episode or when substantial services were likely to be provided for the chronic condition during the EPM episode.

We proposed that the following were the clinical goals of the EPM, which might be advanced through beneficiary incentives:

- Beneficiary adherence to drug regimens.
- Beneficiary adherence to a care plan.
- Reduction of readmissions and complications resulting from treatment for the EPM clinical condition.
- Management of chronic diseases and conditions that may be affected by treatment for the EPM clinical condition.

Our proposals for the clinical goals of the EPM that a beneficiary engagement incentive that was not a preventive care item or service must be intended to advance were included in proposed §512.525(c). We sought comment on our proposed documentation requirements, including whether additional or different documentation requirements might provide better program integrity safeguards. The following is a summary of the comments received and our responses on all proposals for beneficiary engagement incentives under the EPM.

Comment: Some commenters opposed the proposed requirements that EPM participant must maintain documentation of items and services furnished as beneficiary engagement incentives that exceed $25 in retail value. The commenters recommended that CMS increase the documentation threshold, for example to $50, in order to reduce record keeping for inexpensive beneficiary engagement incentives and to minimize unnecessary administrative requirements. One commenter also recommended that CMS allow beneficiary engagement incentives greater than $25.

Response: We appreciate the perspectives of the commenter on our proposed requirements for documentation of all items and services provided as beneficiary engagement incentives that exceed $25, including the date and the identity of the beneficiary to whom the item or service was provided. We proposed a $25 retail value threshold for documentation because we recognized that a beneficiary could receive many incentives that are each of low dollar value but in the aggregate constitute an excessively high value to the beneficiary. While we considered setting a cumulative threshold on the retail value of beneficiary engagement incentives received by an EPM beneficiary during an EPM episode above which documentation would be required, we believe such an approach would be even more burdensome than our proposal to require documentation beginning at $25 in retail value for each incentive that exceeds that value. A documentation requirement based on a cumulative threshold would require documentation of every expense for beneficiary engagement incentives (including those below $25) to ensure compliance with required documentation of the cumulative retail value of incentives that exceed the threshold. Therefore, we believe it is prudent to maintain a per-item/per-service documentation threshold and to not increase the documentation threshold, thereby keeping the threshold at a modest level for all beneficiary incentives in order to monitor compliance with the requirements for providing these items and services. We continue to believe that the $25 threshold represents an appropriate balance between the benefits of beneficiary incentives and burden of the documentation requirement.

For clarification, we did not propose that EPM participant may only provide in-kind beneficiary engagement incentives less than $25. With the exception of beneficiary engagement incentives involving technology which we proposed may not exceed $1,000 in retail value for any one beneficiary in any one EPM episode, there is no limit on the retail value of a single item or service provided as an in-kind patient engagement incentive to a beneficiary in an EPM episode, or to the aggregate of such incentives provided to the beneficiary in the episode.

We are finalizing in §512.515(d)(1) the requirement that an EPM participant must maintain documentation of items and services furnished as beneficiary engagement incentives that exceed $25 in retail value. Under §512.515(d)(4), we set forth the requirement that the EPM participant must retain and provide access to the required documentation in accordance with §512.110.

Comment: In regards to beneficiary engagement incentives involving technology, one commenter requested that the items or services involving technology provided to an EPM beneficiary not be capped at $1,000 given that CMS’ proposal would require the EPM participant to pick up the technology from the EPM beneficiary if its retail value is greater than $100. The same commenter recommended that CMS increase the proposed cap of $100 to $500 for items of technology that must remain the property of the EPM participant and be retrieved from the beneficiary at the end of the EPM episode because under the proposed threshold, the commenters believes it
would cost the EPM participant more to pick up the item of technology from the EPM beneficiary than the item of technology is worth.

Several commenters suggested that CMS eliminate altogether the proposed requirement that items of technology provided as beneficiary engagement incentives be retrieved from the beneficiary at the end of the EPM episode. One commenter claimed that there may be situations where the patient may continue to benefit from the use of items of technology that were originally provided as EPM beneficiary engagement incentives beyond the 90-day post-discharge episode duration. They speculated that continued use of the technology could reduce the future need for urgent or emergent care and impact the overall future cost to Medicare to care for the beneficiary. The commenter urged CMS to establish a process or criteria to evaluate whether a beneficiary should be able to keep the technology and continue using it after the EPM episode ends, ensuring that any new policies take into the account the need for flexibility at the local level to provide benefits to patients, the community, and the health system as a whole. Finally, the commenter requested that if CMS decides not to establish a process to allowed continued use of the technology after the EPM episode ends, then CMS should require that documentation of beneficiary engagement incentives include written acknowledgement by the beneficiary or their representative that the technology remains the property of the EPM participant and must be returned upon completion of the episode.

Another commenter pointed out remote patient monitoring equipment that could be provided as a beneficiary engagement incentive under the EPM must be linked to particular a particular provider to be effective and sought clarification about how devices provided in conjunction with remote patient monitoring could avoid being tied to a particularly provider. They further explained the Medicare program does not provide any payment for remote patient monitoring or other items and services provided to patients for improved self-management and believes that EPM participants are likely to engage in these activities only if they believe that improved episode quality or cost savings will result. The commenter asserted that so long as the provision of technology to beneficiaries is reasonably related to the clinical goals of the EPM, EPM would be encouraged to explore the use of remote patient monitoring through efforts that are not constrained by limitations CMS proposed.

Response: We appreciate the requests by the commenters for additional flexibility with respect to items and services involving technology provided as EPM beneficiary engagement incentives. We proposed that items or services involving technology provided to as a beneficiary engagement incentive may not exceed $1,000 in retail value for any one beneficiary in any one EPM episode. While one commenter requested that we raise this limit because any technology exceeding $100 in retail value would remain the property of the EPM participant, no commenters provided information about items and services involving technology that would exceed this amount and that EPM participants would specifically wish to provide to advance the goals of the EPM to improve the quality and reduce the cost of care. Therefore, we are maintaining the limit of $1,000 in retail value for items or service involving technology provided to any one beneficiary during any one EPM episode even though the beneficiary’s use of the technology costing more than $100 in retail value would be limited to the EPM episode. We believe that providing beneficiaries with more expensive technology could pose a program integrity risk of patient steering and that a higher limit is not necessary under the EPM.

We understand the administrative burden on EPM participants that tracking and retrieval requires, but believe that a higher retrieval threshold, such as $500, is not warranted. Similarly, we do not believe it would be appropriate to eliminate the retrieval threshold altogether, even for items of technology that may provide additional health benefits to beneficiaries after the EPM episode ends and/or lead to reduced expenditures on health care. It would be inappropriate for EPM participants to furnish items of technology with a retail value of over $100 for beneficiaries’ permanent use because the high value of these items could unduly influence the beneficiary to receive services from the EPM participant, particularly services outside of the EPM episode. We do not believe the potential longer-term benefits of continued use or the administrative burden of retrieving items involving technology with a retail value in excess of $100 outweigh the program integrity benefits of retrieval.

We propose documentation requirements for beneficiary engagement incentives that exceed $25 in retail value as a safeguard against abuse, including the date the incentive is provided, the identity of the beneficiary to whom the item or service is provided, and contemporaneous documentation of attempts to retrieve items of technology exceeding $100 in retail value. However, we believe that any additional documentation requirements such as the commenter’s suggestion of written acknowledgement by the beneficiary or their representative that the technology remains the property of the EPM participant and must be returned upon completion of the episode would be unnecessarily prescriptive and burdensome for EPM participants. For items of technology with a retail value exceeding $100 that remain the property of the EPM participant, it is up to the EPM participant to determine how they can best ensure that EPM beneficiaries understand the ownership of the technology while minimizing the burden on the EPM participant needed for successful retrieval or the documentation of retrieval attempts.

Finally, with respect to the clarification requested by the commenter about how items of technology for remote monitoring could meet the requirement for EPM beneficiary engagement incentives that the item or service must not be tied to the receipt of items or service from a particular provider or supplier, we note that the intent of this latter requirement is as a safeguard from the use of beneficiary engagement incentives as a way to steer beneficiaries toward a certain provider or type of services. We understand that remote monitoring information that is collected from EPM beneficiaries must be sent to a treating provider for review and interpretation in order for the remote-monitoring to guide clinical care. However, in this case the remote monitoring technology would be linked to a provider that is treating the beneficiary, rather than being provided to steer the beneficiary to a particular treating provider, so we believe that remote monitoring equipment may be provided as a beneficiary engagement incentive without violating the requirement that the item or service not be tied to the receipt of items or services from a particular provider or supplier.

Comment: Some commenters requested that CMS allow other beneficiary engagement incentives in the EPM to be provided by EPM participants, such as forgiving primary care or all beneficiary copayments for items and services included in the episode and making available supportive services that otherwise in short supply or of inadequate quality, rather than just those closely tied to the...
medical issues. The commenters provided examples of in-kind assistance they believe could be helpful to improve the quality and reduce the cost of EPM episode care, such as meal delivery or other food assistance for beneficiaries and the family caregiver; enhanced homemaker and personal care aide services; and housing assistance for homeless patients. One commenter noted that while this would be a more expansive view of beneficiary engagement incentives for the EPM than CMS proposed, such an approach would allow targeted services to address key social determinants of health that could improve the quality and reduce the cost of EPM episodes by improving beneficiary outcomes and reducing readmissions. Another commenter urged CMS to provide guidance on specific circumstances where these or other social support services would be permissible, including applicable patient screening protocols and expenditure caps. The commenters encouraged CMS to allow EPM participants, who would be required to take on financial risk for cardiac and orthopedic episodes of care under the EPM, to use a full suite of tools to provide economically challenged patients the social supports necessary to minimize the risk of readmissions.

Other commenters requested clarification about whether examples of beneficiary engagement incentives more directly related to medical issues would meet CMS’ proposed requirements, such paying for a beneficiary’s medications for management of coronary artery disease (either copayment or entire prescription in the instance of a patient who lacks Part D) or paying for a beneficiary’s medications for management of an exacerbating chronic disease (for example, diabetes) (either copayment or entire prescription in the instance of a patient who lacks Part D).

Response: We appreciate the commenters’ recommendations for additional beneficiary engagement incentives under the EPM, as well as their requests for clarification about certain items and services that EPM participants may wish to provide as beneficiary engagement incentives. Regarding requests for CMS to waive copayments for items and services included in EPM episodes, most beneficiaries in traditional Medicare have supplemental coverage, specifically employer-sponsored, Medicaid, and Medigap in descending order of prevalence.130 In 2011, 81 percent of beneficiaries in traditional Medicare had supplemental coverage. While we recognize that without supplemental coverage the copayments associated with an EPM episode could be significant, most beneficiaries would not experience significant out-of-pocket costs for the items and services themselves because their supplemental coverage would help to cover those costs. For the subset of beneficiaries without supplemental coverage, we note that, under current law, hospitals and other providers and suppliers are permitted to waive copayments under certain limited conditions and that copayment waivers that comply with existing law continue to be permitted under the EPM. In light of these factors, we will not waive copayments for items and services covered by Medicare under the EPM.

No commenters suggested that our specific proposal for the purpose of the items and services provided as beneficiary engagement incentives, specifically that they must be preventive care items or services or items and services that advance a clinical goal for a beneficiary in an EPM episode by engaging the beneficiary in better managing his or her own health, were not appropriate for the EPM. Several commenters who urged us to allow them the flexibility to provide support services as beneficiary engagement incentives presented specific arguments about how those items and services would reduce readmissions or enhance beneficiary adherence to the treatment plan, which are on the proposed list of clinical goals of the EPM. On the other hand, some commenters expressed concern that social support services that have the potential to advance EPM goals might not meet the proposed requirements because they are not closely tied to medical issues and, therefore, would not meet the requirement that the item or service must be reasonably connected to medical care or serve to provide an EPM beneficiary during and EPM episode. While we appreciate that social issues have a significant influence on beneficiary health, we are testing the EPM as an innovative payment approach for Medicare beneficiaries, which focuses on improving care coordination following inpatient hospitalization for treatment of a clinical condition included in the EPM to improve the quality and reduce the cost of health care. The EPM is an APM that is being tested as an alternative to FFS Medicare. Therefore, we continue to believe that it is important to maintain the requirements of a reasonable connection between the item or service provided as a beneficiary engagement incentive and a beneficiary’s medical care and that the item or service advance a meaningful clinical goal for the EPM beneficiary. These requirements both protect against EPM participants’ incentives to influence the beneficiary’s choice of providers and types of care in the EPM and ensure that the EPM as implemented with a standardized episode payment design in a large number and wide variety of EPM participants can be appropriately evaluated in comparison with FFS Medicare.

We will not provide additional interpretation of the requirements for beneficiary engagement incentives that we are finalizing in this final rule, nor provide other guidance at this time. Instead, we encourage EPM participants considering offering items or services as beneficiary engagements incentives to EPM beneficiaries to closely consider those potential items and services and ensure that their provision would meet all the requirements of § 512.525 before deciding to provide those items or services as beneficiary engagement incentives under the EPM.

Comment: One commenter requested that CMS address a specific scenario where an EPM participant already has a program in place prior to implementation of the EPM to encourage beneficiaries to follow through on their plan of care after hospital discharge. The commenter requested that CMS clarify whether the incentives under the existing program become beneficiary engagement incentives under the EPM and, therefore, subject to the requirements of the EPM, or whether the existing incentives would only be considered beneficiary engagement incentives under the EPM if they are specifically being offered to encourage improvement of clinical goals based on the EPM care redesign for the EPM episode.

Response: We appreciate the request for clarification about the relationship of a hospital’s existing incentives provided to Medicare beneficiaries following hospital discharge to encourage adherence to the beneficiary’s care plan to EPM beneficiary engagement incentives provided by an EPM participant that must meet the specific requirements proposed in § 512.515 and all other applicable laws and regulations, including the applicable fraud and abuse laws. If an EPM participant has a program already in place to provide incentives to beneficiaries following hospital discharge, we expect that all such

incentives offered would comply with all current laws and regulations, including the fraud and abuse laws. Therefore, if an EPM participant provides beneficiary engagement incentives to EPM beneficiaries during EPM episodes, those incentives must either comply with all current laws and regulations, including the fraud and abuse laws, or with the requirements for EPM beneficiary engagement incentives in § 512.515 and all other applicable laws and regulations, including the applicable fraud and abuse laws. We note that any waivers of fraud and abuse laws for the EPM or revisions to the existing CJR waivers are outside the scope of this rulemaking.

Final Decision: After consideration of the public comments received, we are finalizing the proposals in §§ 512.525(a) through (d) for the EPM general provisions, technology provided to an EPM beneficiary, clinical goals of the EPM, and documentation of beneficiary incentives, without modification. Beneficiary engagement incentives under the EPM must meet the following conditions and requirements:

EPM participants may choose to provide in-kind patient engagement incentives to beneficiaries in an EPM episode, subject to the following conditions:
• The incentive must be provided directly by the EPM participant or by an agent of the EPM participant under the EPM participant’s direction and control to the EPM beneficiary during an EPM episode.
• The item or service provided must be reasonably connected to medical care provided to an EPM beneficiary during an EPM episode.
• The item or service must be a preventive care item or service or an item or service that advances a clinical goal, as listed in paragraph (c) of this section, for a beneficiary in an EPM episode by engaging the beneficiary in better managing his or her own health.
• The item or service must not be tied to the receipt of items or services outside the EPM episode.
• The item or service must not be tied to the receipt of items or services from a particular provider or supplier.
• The availability of the items or services must not be advertised or promoted except that a beneficiary may be made aware of the availability of the items or services at the time the beneficiary could reasonably benefit from them.
• The cost of the items or services must not be shifted to another federal health care program, as defined at section 1128B(f) of the Act.

Beneficiary engagement incentives involving technology are subject to the following additional conditions:
• Items or services involving technology provided to a beneficiary may not exceed $1,000 in retail value for any one beneficiary in any one EPM episode.
• Items or services involving technology provided to a beneficiary must be the minimum necessary to advance a clinical goal, as listed in paragraph (c) of this section, for a beneficiary in an EPM episode.
• Items of technology exceeding $100 in retail value must—
  ++ Remain the property of the EPM participant; and
  ++ Be retrieved from the beneficiary at the end of the EPM episode. The EPM participant must document all retrieval attempts, including the ultimate date of retrieval. Documented, diligent, good faith attempts to retrieve items of technology will be deemed to meet the retrieval requirement.
• The following are the clinical goals of the EPM, which may be advanced through beneficiary incentives:
  • Beneficiary adherence to drug regimens.
  • Beneficiary adherence to a care plan.
  • Reduction of re-admissions and complications resulting from treatment for the EPM clinical condition.
  • Management of chronic diseases and conditions that may be affected by treatment for the EPM clinical condition.

Documentation of beneficiary engagement incentives:
• EPM participants must maintain documentation of items and services furnished as beneficiary engagement incentives that exceed $25 in retail value.
• The documentation established contemporaneously with the provision of the items and services must include at least the following:
  ++ The date the incentive is provided.
  ++ The identity of the beneficiary to whom the item or service was provided.
• The documentation regarding items of technology exceeding $100 in retail must also include contemporaneous documentation of any attempt to retrieve technology at the end of an EPM episode as described previously in this section.
• The EPM participant must retain and provide access to the required documentation in accordance with § 512.110.

10. Compliance With Fraud and Abuse Laws

Certain arrangements between and among EPM participants and third parties or beneficiaries may implicate civil monetary penalty (CMP) law (subsections 1128A(a)(5), (b)(1), and (b)(2) of the Act), the Federal Anti-kickback statute (subsections 1128B(b)(1) and (2) of the Act), or the physician self-referral law (section 1877 of the Act). In many cases, arrangements that implicate these laws can be structured to comply with them by using existing safe harbors and exceptions. Section 1115A(d)(1) of the Act authorizes the Secretary to waive certain specified fraud and abuse laws as may be necessary solely for purposes of testing of payment models under section 1115A(b) of the Act. A waiver is not needed for an arrangement that does not implicate the fraud and abuse laws or that implicates the fraud and abuse laws but either fits within an existing exception or safe harbor, as applicable, or does not otherwise violate the law. Accordingly, pursuant to section 1115A(d)(1) of the Act, the Secretary will consider whether waivers of certain fraud and abuse laws are necessary to test the EPM as such models develop. Such waivers, if any, will be designated separately from this final regulation by OIG (as to sections 1128A and 1128B of the Act) and CMS (as to section 1877 of the Act), to which the respective authorities have been delegated.

As discussed in the proposed rule, requirements for the EPM will bear on the need for and scope of any fraud and abuse waivers that might be granted for the EPM. Because of the close nexus between the regulations governing the structure and operations of the EPM and the development of any fraud and abuse waivers necessary to carry out the provisions of the EPM, CMS and OIG may, when considering the need for or scope of any waivers, consider comments submitted in response to the proposed rule and provisions of this final rule.

J. Waivers of Medicare Program Requirements

1. Overview

Under the CJR model, we stated that it may be necessary and appropriate to provide additional flexibilities to hospitals participating in the CJR model, as well as other providers that furnish services to beneficiaries in CJR episodes. The purpose of such flexibilities is to increase CJR-episode quality and decrease episode spending or internal costs or both of providers and suppliers...
that results in better, more coordinated care for beneficiaries and improved financial efficiencies for Medicare, providers, and beneficiaries. These additional flexibilities were implemented through our waiver authority under section 1115A of the Act, which affords broad authority for the Secretary to waive statutory Medicare program requirements as necessary to carry out the provisions of section 1115A.

As discussed in the proposed rule, in testing EPMs, we believe that certain program waivers, similar to those adopted under the CJR model, will offer providers and suppliers more flexibility so that they may increase coordination of care and management of beneficiaries in EPM episodes. However, we stated in the proposed rule that before adopting the same waivers as we adopted in the CJR model for EPMs, we stated that further examination is necessary to determine if doing so increases financial vulnerability for the Medicare program or creates inappropriate clinical incentives that may reduce the quality of beneficiary care.

Based on our analysis of data available from current models being tested and other available clinical data, specific program requirements for which we proposed waivers under the AMI, CABG, and SHFFT models and for which we invited comments are included in the sections that follow. In addition, for providers or suppliers of cardiac rehabilitation and intensive cardiac rehabilitation services furnished to EPM beneficiaries during an AMI and CABG episode, we proposed to waive the physician definition to allow a qualified nonphysician practitioner to perform specific physician functions.

We proposed that these waivers of program requirements would apply to the care of beneficiaries who are in the proposed AMI, CABG, or SHFFT episodes at the time when such waivers would be used to bill for services furnished to the beneficiary, even if the episode is later cancelled as described in section III.C.4.b. of the proposed rule. Thus, it may have been appropriate for the hospital to have used a waiver if there was a reasonable expectation that the beneficiary was in the model at the time the waiver was used. However, if a service is found to have been billed and paid by Medicare under circumstances allowed only by a program requirement waiver for a beneficiary not in the proposed AMI, CABG, or SHFFT models at the time the service was furnished, CMS would recoup payment for that service from the provider or supplier who was paid, and require that provider or supplier to repay the beneficiary for any coinsurance previously collected. We did not receive any comments on this policy therefore, we are adopting this policy in this final rule.

We also generally sought comment on any additional Medicare program requirements that may be necessary to waive using our authority under section 1115A of the Act in order to effectively test the proposed EPMs that we could consider in the context of our early model implementation experience to inform any future proposals we may make. While we cannot finalize program requirement waivers that we have not specifically proposed, we will continually monitor the use of program waivers in each EPM to ensure that the appropriate outcomes in provider/supplier financial incentives and patient care are achieved.

The following is a summary of the comments received and our responses. Comment: Many commenters recommended that CMS include other program waivers in addition to the proposed EPM waivers. In general, these suggestions were similar to the suggestions received during the CJR rulemaking process. Specifically, one commenter recommended that CMS expand more innovation to the post-acute care provider community in models such as CJR, EPM, and BPCI by allowing them to participate more robustly in these models through waiving some of the provider-specific rules, such as the IRF 60-percent rule and 3-hour therapy guideline. Another commenter recommended that CMS include a waiver to allow advance practice registered nurses to certify hospitalized patients for home health care services for the CJR model and the EPMs. Some commenters urged CMS to waive discharge planning requirements that prohibit hospitals from specifying or otherwise limiting information about post-acute care services, waive the regulatory constraints on how therapy services are delivered to EPM-eligible beneficiaries, and promote parity across Medicare programs by ensuring similar flexibilities are available to Medicare Advantage Organizations so that all Medicare beneficiaries can benefit from these services or removal of barriers. Another commenter urged CMS to waive audits of post-acute care and other collaborators participating in an EPM or CJR episode since the episode-managing entity is financially accountable for the provision of those services. Some commenters recommended that because certain ambulance services and a “sharing arrangement” as outlined in the EPM proposed rule, CMS should waive fraud and abuse, beneficiary inducement, and physician self-referral liability for EPM entities.

Response: In the CJR Final Rule (80 FR 73439), we responded to numerous comments to include additional waivers under the CJR model. The final regulations issued for the CJR model reflect our responses to those comments. We stated in the CJR Final Rule that while we were not making any changes to the proposed waivers, we would continually monitor the data from early testing of the CJR model. The CJR model was implemented on April 1, 2016 thus data is currently not available to evaluate if changes to the program waivers are warranted. We stated that if the early CJR model testing data supports changes to the program waivers then we would do so in future rulemaking.

Our goal for implementing program waivers for EPMs was to replicate the general aspects of the waivers that were issued in the CJR final regulations. However, we stated in the EPM proposed rule that adopting the CJR waivers for the proposed EPMs required further examination to determine if such adoption would increase financial vulnerability to the Medicare program or would create inappropriate incentives to reduce the quality of beneficiary care. Thus, for the EPMs we proposed the following waivers that are similar to the adopted CJR waivers:

• Adopt waivers of the telehealth originating site and geographic site requirement and to allow in-home telehealth visits for all three proposed EPMs, as well as the general waiver to allow post-discharge home visits and;

• Provide waivers on the number of post-discharge home visits and for the SNF 3-day stay, made on an EPM episode basis.

We anticipate that if the CJR model testing data supports additions or changes to the CJR program waivers, then we would consider extending those revisions to CJR waivers in future rulemaking to the EPMs if those waivers would be clinically appropriate for the clinical conditions that are the focus of the EPM. Hence, our responses to the EPM waiver comments in this section reflect this common relationship with the final CJR model waivers.

Final Decision: We address the specific Medicare program waivers we proposed in the EPM proposed rule in the following sections. We decline at this time to waive any additional Medicare program requirements. We will review the information provided by the commenters and our early CJR model and EPM experience and may
consider waiving additional requirements during the course of the CJR model and EPM test.

2. Summary of Waivers Adopted Under the CJR Model

As part of the CJR model implemented in 2016, we issued regulatory waivers of the following Medicare program requirements:

- Section 510.600 of the regulations waives the direct supervision requirement to allow clinical staff to furnish certain post-discharge home visits under the general, rather than direct, supervision of a physician or nonphysician practitioners. This waiver allows a CJR beneficiary who does not qualify for home health benefits to receive up to 9 post-discharge visits in his or her home or place of residence at any time during the episode. All other Medicare rules for coverage and payment of services incident to a physician’s service continue to apply.
- Section 510.615 waives current Medicare billing rules to allow the separate billing of these post-discharge home visits for CJR beneficiaries during a 90-day post-operative global surgical period. All other Medicare rules for global surgery billing during the 90-day post-operative period continue to apply.
- Section 510.650 of the regulations waives a Medicare-approved telehealth service to be furnished to a CJR beneficiary regardless of the beneficiary’s geographic location, and in his or her home or place of residence. CMS also waives certain telehealth payment provisions. Specifically, Medicare will not pay the originating site facility fee if the service originates in the beneficiary’s home or place of residence, and the telehealth home visits will be paid using unique HCPCS codes with payment based on comparable office visits, less the practice expense portion of the payment paid for these comparable visits when furnished in-person. All other requirements for Medicare coverage and payment of telehealth services continue to apply.
- Section 510.610 of the regulations waives the 3-day hospital stay requirement before a beneficiary may be discharged from a hospital to a qualified SNF, which CMS define as SNFs that are rated an overall of 3 stars or better for 7 of the last 12 months on the Nursing Home Compare Web site. This waiver applies to episodes being tested under the CJR model for specific performance years. For example, under CJR, the waiver applies beginning in performance year 2 (as hospitals are not bearing risk in their first year). All other Medicare rules for coverage and payment of Part A-covered SNF services continue to apply.
- Section 510.620 of the regulations waives the deductible and coinsurance statutory requirements to the extent necessary to make reconciliation payments or receive repayments based on the episodic payment methodology under the final payment model for CJR participant hospitals. The reconciliation or repayments do not affect the beneficiary’s cost sharing amounts for services furnished under the CJR model.

3. Analysis of Current Model Data

As discussed in the proposed rule, we believe that before we adopt the same regulatory waivers offered under the CJR model, we must determine if doing so would: (1) Be clinically-appropriate; (2) not introduce financial vulnerabilities to the Medicare program; and, more importantly, (3) not decrease desired outcomes of patient care. To make this determination, we analyzed waiver usage data and post-acute care usage from Medicare claims data current being tested in other EPMs. In addition, we analyzed the latest arithmetic and geometric means for the MS-DRGs associated with the proposed AMI, CABG, and SHFFT models published as Table 5 in the IPPS FY 2016 Correction Notice to the Final Rule (CMS–1632–CN; 80 FR 60055). The following summarizes the available data.

a. Analysis of Waiver Usage

As stated in the proposed rule, waiver usage data is currently not available from the CJR model, thus we reviewed waiver usage data from the BPCI model. Waivers were offered for all 48 episodes under the BPCI model. However, we note that such waivers were significantly different from those adopted under the CJR model. For example, many BPCI model awardees were concerned about the difficulties in accurately identifying beneficiaries in BPCI episodes, which we believe might have been a disincentive to using the waiver of the SNF 3-day hospital stay. For the CJR model, we attempted to address this by codifying that the SNF stay would be covered if the beneficiary was in the episode at the time that the SNF waiver was utilized. With respect to the home visit, the BPCI model only allows 3 visits in a 90-day period (less if the episode is shorter), and awardees might not consider it worth the effort to incorporate this limited number of visits into their care design for episode beneficiaries. For the CJR model, we increased this allowance to 9 post-discharge visits in a 90-day period to allow for one visit a week for the two thirds of the 90-days post-discharge when the beneficiary was not receiving post-acute care. Finally, in the BPCI model we waived the geographic restrictions for telehealth visits, whereas for the CJR model we allow telehealth visits originating in the home, regardless of geographic location.

Given that the waivers offered under the BPCI model differ from the waivers in the CJR model, and presumably for the waivers that we are implementing in this final rule, the BPCI model data shows—

- The use of the home visit and telehealth waiver is minimal; and
- The waiver of the SNF 3-day rule may be getting the most use.

b. Analysis of Discharge Destination—Post-Acute Care Usage

As discussed in the proposed rule, the following Table 47 shows the discharge destination and post-acute care usage for the cardiac related episodes (CABG, PCI, and AMI) in the BPCI model.

Analysis of the data in Table 47 shows—
- Patients with CABG have high post-acute care usage; and
- Patients with PCI have very little post-acute care usage; and
- Patients with AMI have average post-acute care usage compared to patients with PCI and CABG.

As discussed in the proposed rule, Table 48 shows the geometric and arithmetic mean length of stay (LOS) for MS–DRGs associated with the proposed CABG, AMI (including PCI) and SHFFT models.

the available data, we believe some proposed rule, based on our analysis of the sections that follow.

As discussed in the proposed rule, based on our analysis of the available data, we believe that minimal program and patient outcome vulnerabilities may exist with adopting the same CJR regulatory waivers for the following program requirements for some EPMs:

- The direct supervision requirement for certain post-discharge home visits and the Medicare billing requirement that will allow the separate billing of these post-discharge home visits for EPM beneficiaries during a 90-day post-operative global surgical period.
- The telehealth geographic site requirement and the requirement that will allow in-home telehealth visits.
- The deductible and coinsurance statutory requirements to the extent necessary to make reconciliation payments or receive repayments based on the episodic payment methodology under the final payment model for EPM participants.
- The financial incentives in the EPMs will encourage hospitals to closely examine the most appropriate post-acute care settings for beneficiaries so that the clinically-appropriate setting of the lowest acuity is recommended following discharge from the anchor hospitalization. We expect that all these considerations will lead to greater interest on the part of hospitals and other providers and suppliers caring for EPM beneficiaries in furnishing services to beneficiaries in their homes or places of residence. Such services could include visits by licensed clinical staff other than physicians and nonphysician practitioners.

In order for Medicare to pay for home health services, a beneficiary must be determined to be “homebound.” Specifically, sections 1835(a) and 1814(a) of the Act require that a physician certify (and recertify) that in the case of home health services under the Medicare home health benefit, such services are or were required because the individual is or was “confined to the home” and needs or needed skilled nursing care on an intermittent basis, or physical or speech therapy or has or had a continuing need for occupational therapy. A beneficiary is considered to be confined to the home if the beneficiary has a condition, due to an illness or injury, that restricts his or her ability to leave home except with the assistance of another individual or the aid of a supportive device (that is, crutches, a cane, a wheelchair or a walker) or if the beneficiary has a condition such that leaving his or her home is medically contraindicated. While a beneficiary does not have to be bedridden to be considered confined to the home, the condition of the beneficiary must be such that there exists a normal inability to leave home and leaving home requires a considerable and taxing effort by the beneficiary.

Analysis of data in Table 48 shows—

- Patients under all CABG MS–DRGs have a mean LOS of 6 days up to 11–13 days;
- Patients under all PCI MS–DRGs have a mean LOS of about 2 days up to about 6 days;
- Patients under all AMI MS–DRGs have a mean LOS of about 2 days up to about 6 days; and
- Patients under all SHFFT MS–DRGs have a mean LOS of about 4 days up to about 8 days.

Analysis of the CJR model data shows the mean LOS for MS–DRGs associated with the CJR model of about 3 days up to about 7 days.

As discussed in the proposed rule, based on our analysis of the available data, we believe that minimal program and patient outcome vulnerabilities exist with adopting the same CJR regulatory waivers for the following program requirements for EPMs:

- The number of post-discharge home visits allowed during the model episode.
- Therefore, in conjunction with the comments received, we are adopting, as proposed, model-specific limits to the number of post-discharge home visits to EPM beneficiaries during a 90-day post-discharge period following discharge from the hospital or post-acute care setting will also be important to high-quality episode care. Scientific evidence exists to support the use of home nursing visits among Medicare beneficiaries in improving care coordination following hospital discharge.131 In addition, we believe the financial incentives in the EPMs will

**TABLE 48—GEOGRAPHIC AND ARITHMETIC MEAN LENGTH OF STAY FOR BPCI CARDIAC DIAGNOSES AND SHFFT**

[Source: FY 2016 IPPS correction notice; Table 5] *
Absent this condition, it would be expected that the beneficiary typically could get the same services in an outpatient or other setting. Thus, the homebound requirement provides a way to help differentiate between patients that require medical care at home versus patients who could more appropriately receive care in less-costly outpatient settings. Additional information regarding the homebound requirement is available in the Medicare Benefit Manual (Pub 100–02); Chapter 7, “Home Health Services,” section 30.1.1, “Patient Confined to the Home.”

We considered whether a waiver of the homebound requirement would be appropriate under the AMI, CABG and SHFFT models, particularly beginning in performance year 2, where hospitals begin to bear repayment responsibility for excess episode spending. Waiving the homebound requirement would allow additional beneficiaries to receive home health care services in their home or place of residence. As previously discussed, physician certification that a beneficiary meets the homebound requirement is a prerequisite for Medicare coverage of home health services, and waiving the homebound requirement could result in lower episode spending in some instances. For example, if a beneficiary is allowed to have home health care visits, even if the beneficiary is not considered homebound, the beneficiary may avoid a hospital readmission. All other requirements for the Medicare home health benefit would remain unchanged. Thus, under such a waiver, only beneficiaries who otherwise meet all program requirements to receive home health services would be eligible for coverage of home health services without being homebound.

However, we did not propose to waive the homebound requirement under the proposed EPMs for several reasons. Based on the typical clinical course of beneficiaries after procedures in the proposed EPMs, we believe that many beneficiaries would meet the homebound requirement for home health services immediately following discharge from the anchor hospitalizations or following discharge to a SNF that furnished post-acute care services immediately following the hospital discharge, so they could receive medically-necessary home health services under existing program rules. Home health episodes are 60 days in duration, and payment adjustments are made for beneficiaries who require only a few visits during the episode or who are discharged during the episode. For those EPM beneficiaries who could benefit from home visits by licensed clinical staff for purposes of assessment and monitoring of their clinical conditions, care coordination, and improving adherence with treatment but who are not homebound, we do not believe that paying for these visits as home health services under Medicare is necessary or appropriate, especially given that Medicare payments for home health services are set based on the clinical care furnished to beneficiaries who are truly homebound. Finally, in other CMS episode payment models, such as the BPCI initiative and the CJR model, we have not waived the homebound requirement for home health services.

The following is a summary of the comments received and our responses. 
Response: While we appreciate the commenters’ requests that we waive the homebound requirement for home health services, we disagree that waiving the homebound requirement is necessary for testing the model. As we discussed in the EPM proposed rule, we believe many EPM beneficiaries should qualify for home health services under the existing program rules, especially immediately after discharge from the hospital or discharge from an institutional setting such as a SNF to their residence. Furthermore, as a retrospective payment model, all providers and suppliers are paid for services furnished to model beneficiaries at their usual rates, and program payments for home health services are set based on the needs of Medicare beneficiaries who are truly homebound. The resources required to care for homebound beneficiaries in the home are likely greater than those required for EPM beneficiaries who are not homebound. Therefore, waiving the homebound requirement would lead to inappropriate payment for post-discharge home visits to EPM beneficiaries and could result in increased EPM actual spending, which is counter to the goals of the EPM.

Final Decision: After consideration of the public comments we received, we are finalizing our proposal, without modification, to maintain the existing Medicare requirements for home health services, including the requirement that the beneficiary be homebound, when home health services are furnished to EPM beneficiaries.

For the EPMs, we proposed to adopt program requirement waivers similar to the post-discharge home visit waivers implemented for the CJR model. We proposed to waive the “incident to” rule set forth in § 410.26(b)(5) to allow an EPM beneficiary who does not qualify for home health services to receive post-discharge visits in his or her home or place of residence any time during the episode. The waiver would not apply to services furnished to beneficiaries who would qualify for home health services under the Medicare program, as set forth under § 409.42. Therefore, these visits would not be billed for such beneficiaries. Under the proposed waiver, we would allow services furnished under the waiver to be billed under the PFS by the physician or nonphysician practitioner who is supervising the licensed clinical staff or by the hospital to which the supervising physician has reassigned his or her benefits if all other requirements are met. In the latter scenario, we note that the post-discharge home visit services will not be “hospital services,” even when furnished by licensed clinical staff of the hospital.
Under the CJR model, we allow up to 9 post-discharge home visits to be billed and paid during each 90-day post-anchor hospitalization CJR episode. This limit on the number of visits is based on the average post-acute care LOS of approximately 30 to 45 days for CJR episodes and the incentives under CJR to improve efficiency, which may shorten post-acute care stays. Thus, 9 visits represent a home visit on average of once per week for two-thirds of the 90-day episode duration, the period of time when the typical beneficiary may have concluded post-acute care in an efficient episode.

Since current model data shows that the average post-acute care LOS may vary or in some case post-acute care may not be used at all, for EPMs, we proposed to use model-specific limits on post-discharge home visits as follows:

a. AMI Model

Current model data show that most beneficiaries with AMI diagnoses, regardless of AMI medical treatment or PCI treatment for AMI, are not discharged to post-acute care. Based on no post-acute care usage, we proposed that a beneficiary in the AMI model could receive up to 13 home visits, which represents a home visit on average of once per week for the entire 90-day AMI episode.

b. CABG Model

Current model data show that most beneficiaries with CABG diagnoses are discharged to SNPs or to home health. Assuming an average post-acute care LOS of 30 days, we proposed that a beneficiary in the CABG model could receive up to 9 home visits, which represents a home visit on average of once per week for 60 days, or two-thirds of a 90-day CABG episode.

c. SHFFT Model

Current model data show that most beneficiaries with SHFFT diagnoses are discharged to SNPs with an average post-acute care LOS of 30 days. Thus, we proposed that a beneficiary in the SHFFT model could receive up to 9 home visits, which represents a home visit on average of once per week for 60 days, or two-thirds of a 90-day SHFFT episode.

The following is a summary of the comments received and our responses.

Comment: Most commenters supported the “incident to” waiver to allow general supervision rather than direct supervision. A few commenters recommended that the post-discharge home visits be available to all EPM beneficiaries, including those who qualify for home health services. Some commenters requested that CMS issue a clarification that specifically permits a hospital or community physician or nonphysician practitioner to contract with an HHA for home nursing visits under the “incident to” waiver and that this clarification should also provide that the Medicare home health agency Conditions of Participation do not apply to such visits.

Response: In the CJR Final Rule, we responded to similar comments regarding the “incident to” direct supervision waiver (80 FR 73442 through 73444). While we appreciate the commenters’ suggestions that we provide greater flexibility to participate in hospitals to deliver the configuration of services the hospital believes to be most appropriate to manage a beneficiary’s care, under the EPMs we continue to believe that home visits furnished under the “incident to” direct physician supervision waiver should be limited to model beneficiaries who otherwise would not qualify for home health services. We note that while home health episodes are 60 days in duration, payment adjustments are made for beneficiaries who require only a few visits during the episode or who are discharged during the home health episode. Therefore, EPM beneficiaries who qualify for home health services could receive home health services that would be appropriately paid even if they qualified for such services for less than 60 days. Those beneficiaries who qualify for home health services for any duration of time during the EPM episode would not need to receive post-discharge home visits under the “incident to” direct physician supervision waiver. Furthermore, we expect that homebound EPM beneficiaries may typically need other types of services provided under the home health benefit than just post-discharge home visits by clinical staff, including skilled nursing services, therapy services, medical supplies, and medical social services. We would not expect that post-discharge home visits provided under the “incident to” direct physician supervision waiver would adequately substitute for home health services under the more comprehensive Medicare home health benefit. For those beneficiaries receiving home health care, paying additionally for post-discharge home visits under the “incident to” direct physician supervision waiver would be duplicative of services that should be furnished during the home health episode and could lead to ineffective care coordination and management due to the involvement of multiple clinical staff working for different organizations or physician practices.

Although we proposed to waive the direct physician supervision requirement in § 410.26(b)(5) as previously discussed, licensed clinical staff providing post-discharge home visits as “incident to” services would still need to be considered “auxiliary personnel” (employed, contracted, or leased employee of the physician or same employing organization as physician) as required by § 410.26(a)(1) and § 410.26(b)(6). Therefore, it would not be permissible for HHAs, community-based organizations, hospitals, or others to provide post-discharge home visits under the proposed “incident to” direct physician supervision waiver as entities would not meet the definition of “auxiliary personnel” as outlined in regulation. At this time, we are declining to waive any additional requirements of the “incident to” rules that would be necessary for these other entities to furnish EPM post-discharge home visits because we continue to believe that the post-discharge home visits should always be “incident to” a physician’s professional services, including that they are an integral, although incidental, part of the physician’s professional services in the course of the diagnosis or treatment of an illness of injury, and that they are furnished by auxiliary personnel (if not by the physician or practitioner with an “incident to” benefit), who by definition are linked to the physician (or employing organization of the physician) by employment, contract, or lease. We believe the “incident to” relationship of post-discharge home visits to a physician’s professional services is critical due to the importance of robust care coordination and close care management to episode cost and quality performance, given the lengthy, broadly defined EPM episodes. We note that in the case where a post-discharge home visit is furnished by licensed clinical staff employed by the hospital, the hospital could bill under the PFS if the supervising physician who is an employee or a contractor of the hospital has reassigned his or her benefits to the hospital. As a result, we are not providing additional waivers for post-discharge home visits to EPM beneficiaries who otherwise do not qualify for Medicare home health services.

Comment: Most commenters supported the additional allowance of visits for AMI model patients, but were not clear what the clinically appropriate number should be for any particular...
patient. Some commenters suggested that CMS not place any limits on the number of visits since in some cases this may result in readmissions during the episode that may be avoided with additional home monitoring. Other commenters were concerned that differential rules about the number of visits permitted for specific EPM episodes may be confusing for model participants. Some commenters supported CMS’ proposal for differential post-discharge visit limits at this time, but urge the agency to monitor care patterns and consider refinements in the future with an eye toward consistency through future rulemaking.

Response: In the CJR Final Rule, we responded to similar comments regarding the limit on the number of post-discharge home visits (80 FR 73444). While we understand that some commenters would prefer no limit or a higher limit on the number of post-discharge home visits, as discussed previously these visits are restricted to model beneficiaries who do not qualify for home health services. As discussed in the CJR Final Rule, we continue to believe it is appropriate to limit the number of post-discharge home visits that can be paid under an episode-based payment model to mitigate the risk of overutilization, especially in the early years of the model where EPM participants have no, or limited, repayment responsibility for excess actual episode spending above the quality-adjusted target price. As with the CJR post-discharge home visits, we believe in the number of visits is appropriate for the EPMs. In addition, we believe that the average post-acute care length of stay data supports differences in post-acute care usage for each of the EPMs as discussed in the proposed rule. Thus, we continue to believe that it is clinically appropriate to account for these differences on an episode-specific basis when setting the limits on the number of visits covered under the waiver.

As with the post-discharge home visit waiver for the CJR model, we are not prescribing the periodicity, pattern, or number of these visits for model beneficiaries. We will monitor utilization of these visits and may revisit the maximum number of visits over the course of the EPMs based on the implementation experience of EPM participants.

Comment: Some commenters urged CMS to require more specific identification of all the clinicians who provide services that are billed incident to another practitioner.

Response: While we believe this “incident to” waiver can be a significant tool to support a participant’s success with the EPM, we believe that the administrative complexity of changing the billing requirements in order to collect this additional information outweighs the potential usefulness of this information in evaluating this aspect of the EPMs.

Final Decision: After consideration of the public comments we received, we are finalizing the proposal, without modification, to waive the “incident to” direct physician supervision requirement set forth at § 410.26(b)(5), to allow an EPM beneficiary who does not qualify for home health services to receive post-discharge visits in his or her home or place of residence any time during the EPM episode following discharge from an anchor hospitalization, limited to 13 visits for the AMI model, 9 visits for the CABG model, and 9 visits for the SHFFT model. We will allow practitioners to bill for services provided by licensed clinical staff, such as nurses, who are considered “auxiliary personnel” as defined in § 410.26(b)(1), when provided under the general, rather than direct, supervision of a physician or nonphysician practitioner. In some situations the clinical staff providing these services may be employees of the participant hospital and, as long as these clinical staff are supervised by the billing physician or nonphysician practitioner and the appropriate relationship exists between the physician and the clinical staff, payment under the PFS can be made. We plan to monitor utilization patterns of post-discharge home visits under the EPMs to monitor for overutilization and significant reductions in medical home health services.

Similar to the CJR model, we proposed that the service be reported with HCPCS code GXXXX (EPM–AMI, CABG, or SHFFT model home visit for patient assessment performed by clinical staff for an individual not considered homebound, including, but not necessarily limited to patient assessment of clinical status, safety/fall prevention, functional status/ambulation, medication reconciliation/management, compliance with orders/plan of care, performance of activities of daily living, and ensuring beneficiary connections to community and other services; for use only in the Medicare-approved EPM–AMI, CABG, or SHFFT model; may not be billed for a 30-day period covered by a transitional care management code and estimated that it would be paid at approximately $50 under the PFS. The standard PFS rate setting methodologies establish relative value units (RVUs) based on the resources required to furnish the typical service. We proposed that final RVUs under the CY 2017 PFS for the proposed new HCPCS code for AMI, CABG, and SHFFT home visits will be included in this final rule. In addition, we proposed to update the values each year to correspond to final values established under the PFS.

The waiver would not apply with respect to an AMI, CABG, or SHFFT beneficiary who has qualified, or would qualify, for home health services when the visit was furnished. We expect that the visits by licensed clinical staff could include patient assessment, monitoring, assessment of functional status and fall risk, review of medications, assessment of adherence with treatment recommendations, patient education, communication and coordination with other treating clinicians, care management to improve beneficiary connections to community and other services, etc. These post-discharge home visits would remove barriers to follow-up care outside of the home with practitioners and allow the beneficiary to be treated in his or her home environment or place of residence, where potential safety concerns, such as tripping hazards, could quickly be identified and remediated. Given these occasions for further patient assessment and intervention, we believe that where such post-discharge home visits are furnished, there are opportunities to increase patient-centered care coordination and decrease episode spending, potentially resulting in higher-quality care for beneficiaries and increased episode efficiency which may benefit the beneficiaries, the Medicare Trust Fund, and EPM participants.

We also proposed to waive current Medicare billing rules in order to allow the separate reporting of these post-discharge home visits during surgical global periods. The PFS payment for the surgical procedure includes 90 days of post-operative care furnished by the surgeon. Post-operative follow-up care is not separately billable by the surgeon or, when there is a transfer of care, by the practitioner to whom care is transferred. The current construction of the global packages included in PFS payments reflects a narrow view of surgical follow-up care that does not encompass broader, more comprehensive models of post-operative care, such as an episode payment model like the proposed AMI, CABG, and SHFFT models. As we have noted in the past, it is also difficult to determine the appropriate valuation of the various components of the current global packages (2015 Physician Fee Schedule
We do not believe that the AMI, CABG, and SHFFT post-discharge home visits, which can include nursing assessments for chronic conditions for which care may be affected by the surgery, would replace or substantially duplicate the kind of post-operative visits involved in furnishing post-operative follow-up care for the global surgery procedure under the PFS.

Instead, we anticipate that the work of these post-discharge visits will be similar to the work furnished by the physician coordinating the patient’s overall episode care. Therefore, we proposed to waive the global surgery billing rules to allow the surgeon or other practitioners to furnish and bill for the post-discharge home visits during surgical global periods.

Comment: Several commenters supported the proposal to waive current Medicare billing rules for global surgeries to allow the separate billing of these post-discharge home visits by the physician or nonphysician practitioner who performed the EPM procedure.

One commenter supported the proposal, but urged CMS to clarify how this policy will interact with the PFS proposal for CY 2017 to require billing HCPCS G-codes during the global period to collect information on post-surgical visits.

Response: We appreciate the support on these issues. In response to the request for clarification, we note that since the post-discharge home visits furnished to EPM beneficiaries are being paid for, they do not need to be separately reported under the global surgery data collection requirements under the PFS. (See the CY 2017 PFS Final Rule, 81 FR 80170, for the finalized policies related to the global surgery data collection requirements under the PFS.)

Final Decision: Services furnished under the waiver will be billed under the PFS by the physician or nonphysician practitioner or by the entity, including a hospital, to which the supervising physician or nonphysician practitioner has reassigned his or her benefits. We are also waiving current Medicare billing rules in order to allow the separate reporting by the physician who performed a procedure during the anchor hospitalization of the EPM episode of these post-discharge home visits during surgical global periods when he or she is providing the general supervision of the post-discharge home visit.

The post-discharge home visit will be billed with the new HCPCS code G9863, displayed in Table 49. This code will be payable for EPM model beneficiaries beginning July 1, 2017, the start date of the first EPM performance year as discussed in section III.D.2., of this final rule. Rather than finalizing the specific RVUs for this new HCPCS code in this final rule, we are finalizing them through reference to the RVUs for another HCPCS G-code paid under the PFS. Specifically, the RVUs for this new code will be based upon the same inputs used to determine the payment rate for HCPCS code G9187 (BPCI initiative home visit for patient assessment performed by a qualified health care professional for individuals not considered homebound including, but not limited to, assessment of safety, falls, clinical status, fluid status, medication reconciliation/management, patient compliance with orders/plan of care, performance of activities of daily living, appropriateness of care setting; (for use only in the Medicare-approved BPCI initiative); may not be billed for a 30-day period covered by a transitional care management code), the specific HCPCS G-code currently used to report post-discharge home visits under BPCI. We are crosswalking the RVUs for this specific HCPCS code G9863 to the RVUs for the existing post-discharge home visit HCPCS G-code for the BPCI model because, given our view of the similarities between these two services in the two different models and the similar HCPCS G-code descriptors, we expect the resources required to be the same so the two codes are assigned the same inputs under the standard PFS ratesetting methodologies. In summary, we are finalizing the policy in this EPM final rule that the new HCPCS code G9863 for EPM post-discharge home visits will have the same RVUs as HCPCS code G9187 for BPCI model post-discharge home visits.

The CY 2017 RVUs, geographic practice cost indices and conversion factor that determine the PFS payment for HCPCS code G9187 are included in the CY 2017 PFS Final Rule. We will annually update the RVUs for HCPCS code G9863 for post-discharge home visits for EPM beneficiaries by crosswalking the RVUs for HCPCS code G9863 to HCPCS code G9187 as part of the annual PFS update, and information on the update will be included in the PFS Final Rule each year.

The waiver of direct supervision requirements for certain post-discharge home visits is set forth at §512.600. The waiver of certain post-operative billing restrictions under the PFS global surgery rules is set forth at §512.615.

5. Billing and Payment for Telehealth Services

As discussed in the previous section, we expect that the EPMs’ design features will lead to greater interest on
the part of hospitals and other providers and suppliers caring for EPM beneficiaries in furnishing services to beneficiaries in their homes or places of residence, including physicians’ professional services. While physicians may furnish and be paid by Medicare for home visits under the PFS, few visits actually are furnished to Medicare beneficiaries because of the significant physician resources required for such visits and the general structure of most office-based physician practices. For example, in 2014, only 2.6 million physician or nonphysician practitioner home visits were furnished to Medicare beneficiaries, in contrast to almost 250 million office or other outpatient evaluation and management visits furnished by physicians or nonphysician practitioners.

EPM would create new incentives for comprehensive episode care management for beneficiaries, including early identification and intervention regarding changes in health status following discharge from the anchor hospitalization. We understand that EPM participants may want to engage physicians in furnishing timely visits to homebound or non-homebound EPM beneficiaries in their homes or places of residence to address concerning symptoms or observations raised by beneficiaries themselves, clinicians furnishing home health services, or licensed clinical staff furnishing post-discharge home visits, while physicians committed to the proposed AMI, CABC, and SHFFT care redesign may not be able to revise their practice patterns to meet this home visit need for EPM beneficiaries.

Under section 1834(m) of the Act, Medicare pays for telehealth services furnished by a physician or practitioner under certain conditions even though the physician or practitioner is not in the same location as the beneficiary. The telehealth services must be furnished to a beneficiary located in one of the eight types of originating sites specified in section 1834(m)(4)(C)(ii) of the Act and the site must satisfy at least one of the requirements of sections 1834(m)(4)(C)(i)(I) through (III) of the Act. Generally, for Medicare payment to be made for telehealth services under the PFS several conditions must be met, as set forth under § 410.78(b).

Specifically, for a service to be eligible for payment, the individual receiving the services must be in an eligible originating site, and the service must

- On the Medicare list of telehealth services;
- Furnished via an interactive telecommunications system; and
- Furnished to a telehealth-eligible individual.

When all of these conditions are met, Medicare pays a facility fee to the originating site and provides separate payment to the distant-site practitioner for the service. Section 1834(m)(4)(F)(i) of the Act defines Medicare telehealth services to include professional consultations, office visits, office psychiatry services, and any additional service specified by the Secretary, when furnished via a telecommunications system.

Under section 1834(m)(4)(F)(ii) of the Act, CMS has an annual process to consider additions to and deletions from the list of telehealth services. We do not include any services as telehealth services when Medicare does not otherwise make a separate payment for them.

Some literature suggests that technologies that enable health care providers to deliver care to patients in locations remote from providers are being increasingly used to complement face-to-face patient-provider encounters in both urban and rural areas. In these cases, the use of remote access technologies may improve the accessibility and timeliness of needed care, increase communication between providers and patients, enhance care coordination, and improve the efficiency of care. We note that certain professional services that are commonly furnished remotely using telecommunications technology are paid under the same conditions as in-person physicians’ services, and thus do not require a waiver to be considered as telehealth services.

Such services that do not require the patient to be present in person with the practitioner when they are furnished are covered and paid in the same way as services delivered without the use of telecommunications technology when the practitioner is in person at the medical facility furnishing care to the patient.

In other CMS episode-based payment models, such as BPCI Models 2 and 3 and the CJR model, we determined it was necessary to waive the geographic-

132 For the list of approved Medicare telehealth services, see the CMS Web site at http://www.cms.gov/Medicare/Medicare-General-Information/Telehealth.

located at the time the service is furnished via a telecommunications system. Specifically, we proposed to waive the requirement only when telehealth services are being furnished in the EPM beneficiary’s home or place of residence during the episode. Any service on the list of Medicare approved telehealth services and reported on a claim with an ICD–10–CM principal diagnosis code that is not excluded from the applicable EPM’s episode definition (see section III.C. of this final rule) could be furnished to an EPM beneficiary in his or her home or place of residence, unless the service’s HCPCS code descriptor precludes delivering the service in the home or place of residence. For example, subsequent hospital care services could not be furnished to beneficiaries in their home since those beneficiaries would not be inpatients of the hospital.

The existing set of codes used to report evaluation and management (E/M) visits are extensively categorized and defined by the setting of the service, and the codes describe the services furnished when both the patient and the practitioner are located in that setting. Section 1834(m) of the Act provides for particular conditions under which Medicare can make payment for office visits when a patient is located in a health care setting (the originating sites authorized by statute) and the eligible practitioner is located elsewhere. However, we do not believe that the kinds of E/M services furnished to patients outside of health care settings via real-time, interactive communication technology are accurately described by any existing E/M codes. This would include circumstances when the patient is located in his or her home and the location of the practitioner is unspecified. Therefore, in order to create a mechanism to report E/M services accurately under the EPMs, we proposed to create a specific set of HCPCS G-codes to describe the E/M services furnished to EPM beneficiaries in their homes via telehealth. Among the existing E/M visit services, we envision these services would be most similar to those described by the office and other outpatient E/M codes.

Therefore, we proposed to structure the new codes similarly to the office/outpatient E/M codes but adjusted to reflect the location as the beneficiary’s residence and the virtual presence of the practitioner. Specifically, we proposed to create a parallel structure and set of descriptors currently used to report office or other outpatient E/M services, (CPT codes 99201–99205 for new patient visits and CPT codes 99212–99215 for established patient visits). For example, the proposed G-code for a level 3 E/M visit for an established patient would be a remote in-home visit for the evaluation and management of an established patient, which requires at least two of the following three key components:

• An expanded problem focused history.
• An expanded problem focused examination.
• Medical decision making of low complexity, furnished in real time using interactive audio and video technology. Counseling and coordination of care with other physicians, other qualified health care professionals or agencies are provided consistent with the nature of the problem(s) and the needs of the patient or the family or both. Usually, the presenting problem(s) are of low to moderate severity. Typically, 15 minutes are spent with the patient or family or both, audio and video intercommunications technology.

We note that we did not propose a G-code to parallel the level 1 office/outpatient visit for an established patient, since that service does not require the presence of the physician or other qualified health professional. We also believe this would duplicate the home visits for non-homebound beneficiaries previously proposed in this section.

We proposed to develop payment rates for these new telehealth G-codes for E/M services in the patient’s home that are similar to the payment rates for the office/outpatient E/M services, since the codes will describe the work involved in furnishing similar services. Therefore, we proposed to include the resource costs typically incurred when services are furnished via telehealth. In terms of the relative resource costs involved in furnishing these services, we believe that the efficiencies of virtual presentation generally limit resource costs other than those related to the professional time, intensity, and malpractice risk to marginal levels. Therefore, we proposed to adopt work and malpractice (MP) RVUs associated with the corresponding level of office/outpatient codes as the typical service because the practitioner’s time and intensity and malpractice liabilities when conducting a visit via telehealth are comparable to the office visit.

We proposed to include final RVUs under the CY 2016 PFS when we finalize the rules for EPMs. Additionally, we proposed to update these values to correspond to final values established under the PFS. We considered whether each level of visit typically would warrant support by auxiliary licensed clinical staff within the context of the proposed EPMs. The cost of such staff and any associated supplies, for example, would be incorporated in the practice expense (PE) RVUs under the PFS. For the lower-level visits (levels 1–3 for new visits and levels 2 and 3 for established visits), we stated that we do not believe that visits necessarily would require auxiliary medical staff to be available in patients’ homes. We anticipate these lower-level visits would be the most-commonly furnished and would serve as mechanisms for patients to consult quickly with practitioners for concerns that patients can easily describe and explain. We did not propose to include PE RVUs for these services, since we do not believe that virtual visits envisioned for EPMs typically incur the kinds of costs included in the PE RVUs under the PFS. For higher-level visits, we typically would anticipate some amount of support from auxiliary clinical staff. For example, wound examination and minor wound debridement would be considered included in an E/M visit and would require licensed clinical staff to be present in the beneficiary’s home during the telehealth visit for the complete service to be furnished. We believe it would be rare for a practitioner to conduct as complex and detailed a service as a level 4 or 5 E/M home visit via telehealth for beneficiaries in the proposed EPMs’ episodes without licensed clinical staff support in the home.

However, we also note that the proposed EPMs already include several avenues for licensed clinical staff to be in the patient’s home, either through a separately paid home visit as proposed for the model or through home health services as discussed earlier in this section of this final rule. Therefore, although we consider support by auxiliary clinical staff to be typical for levels 4 or 5 E/M visits furnished to EPM beneficiaries in the home via telehealth, we did not propose to incorporate these costs through PE RVUs. Given the anticipated complexity of these visits, we would expect to observe levels 4 and 5 E/M visits to be reported on the same claim with the same date of service as a home visit or during a period of authorized home health care. If neither of these occurs, we proposed to require the physician to document in the medical record that auxiliary licensed clinical staff were available on site in the patient’s home during the visit and if they were not, to document the reason that such a high-
level visit would not require such personnel.

We note that because these home telehealth services are E/M services, all other coverage and payment rules regarding E/M services would continue to apply.

Under the proposed EPMs, we believe that this proposal to waive the originating site requirements and create new home visit telehealth HCPCS codes would support the greatest efficiency and timely communication between providers and beneficiaries by allowing beneficiaries to receive telehealth services at their places of residence.

With respect to home health services paid under the home health prospective payment system (HH PPS), we emphasize that telehealth visits under this model cannot substitute for in-person home health visits. Under section 1895(e)(1)(A) of the Act. Furthermore, telehealth services by social workers cannot be furnished for EPM beneficiaries who are in a home health episode of care because medical social services are included as home health services per section 1861(m) of the Act and paid for under the Medicare HH PPS. However, telehealth services permitted under section 1834(m) of the Act and furnished by physicians or other practitioners, specifically physician assistants, nurse practitioners, clinical nurse specialists, certified nurse midwives, nurse anesthetists, psychologists, and dieticians, can be furnished for EPM beneficiaries who are in a home health episode of care. Finally, sections 1835(a) and 1814(a) of the Act require that the patient has a face-to-face encounter with the certifying physician or an allowed nonphysician practitioner working in collaboration with or under the supervision of the certifying physician before the certifying physician certifies that the patient is eligible for home health services. Under §424.22(a)(1)(y), the face-to-face encounter can be performed up to 90 days prior to the start of home health care or within 30 days after the start of home health care. Section 424.22(a)(1)(v)(A) also allows a physician, with privileges, who cared for the patient in an acute or post-acute care setting (from which the patient was directly admitted to home health) or an allowed nonphysician practitioner working in collaboration with or under the supervision of the acute or post-acute care physician to conduct the face-to-face encounter.

Although sections 1835(a) and 1814(a) of the Act allow the face-to-face encounter to be performed via telehealth, we did not propose that the waiver of the telehealth geographic site requirement for telehealth services and the originating site requirement for telehealth services furnished in the EPM beneficiary’s home or place of residence would apply to the face-to-face encounter required as part of the home health certification when that encounter is furnished via telehealth. In other words, when a face-to-face encounter furnished via telehealth is used to meet the requirement for home health certification, the usual Medicare telehealth rules apply with respect to geography and eligibility of the originating site. We expect that this policy will not limit EPM beneficiaries’ access to medically-necessary home health services because beneficiaries receiving home health services during a proposed EPM episode will have had a face-to-face encounter with either the physician or an allowed nonphysician practitioner during their anchor hospitalization or a physician or allowed nonphysician practitioner during a post-acute facility stay prior to discharge directly to home health services.

Under the proposed waiver of the geographic site requirement and originating site requirement, all telehealth services would be required to be furnished in accordance with all Medicare coverage and payment criteria, and no additional payment would be made to cover set-up costs, technology purchases, training and education, or other related costs. The facility fee paid by Medicare to an originating site for a telehealth service would be waived if there is no facility at the originating site (that is, the service was originated in the beneficiary’s home).

Finally, providers and suppliers furnishing a telehealth service to a EPM beneficiary in his or her home or place of residence during the episode would not be permitted to bill for telehealth services that were not fully furnished when an inability to provide the intended telehealth service is due to technical issues with telecommunications equipment required for that service. Beneficiaries would be able to receive services furnished pursuant to the telehealth waivers only during the proposed EPM episode.

We plan to monitor patterns of utilization of telehealth services under the proposed EPMs to monitor for overutilization or reductions in medically-necessary care, and significant reductions in face-to-face visits with physicians and nonphysician practitioners. We plan to specifically monitor the distribution of new telehealth home visits that we did propose, as we anticipate greater use of lower level visits. Given our concern that auxiliary licensed clinical staff be present for level 4 and 5 visits, we will monitor our proposed requirement that these visits be billed on the same claim with the same date of service as a home nursing visit, during a period authorized home health care, or that the physician document the presence of auxiliary licensed clinical staff in the home or an explanation as to the specific circumstances precluding the need for auxiliary staff for the specific visit.

The existing set of codes used to report evaluation and management (E/M) visits are extensively categorized and defined by the setting of the service, and the codes describe the services furnished when both the patient and the practitioner are located in that setting. Section 1834(m) of the Act provides for particular conditions under which Medicare can make payments for office visits when a patient is located in a health care setting (the originating sites authorized by statute) and the eligible practitioner is located elsewhere. However, in the proposed rule, we stated that we did not believe that the kinds of E/M services furnished to patients outside of health care settings via real-time, interactive communication technology are accurately described by any existing E/M codes. This would include circumstances when the patient is located in his or her home and the location of the practitioner is at another location. Therefore, in order to create a mechanism to report E/M services furnished outside the office or outpatient E/M codes but adjusted to reflect the location as the beneficiary’s residence and the virtual presence of the practitioner. Specifically, we proposed to create a specific set of HCPCS G-codes to describe the E/M services furnished to EPM beneficiaries in their homes via telehealth when the physician or practitioner is in another location.

Among the existing E/M visit services, we stated that we envision these services would be most similar to those described by the office and other outpatient E/M codes. Therefore, we proposed to structure the new codes similarly to the office and outpatient E/M codes but adjusted to reflect the location as the beneficiary’s residence and the virtual presence of the practitioner.

We stated that we envision these services would be most similar to those described by the office and other outpatient E/M codes. Therefore, we proposed to structure the new codes similarly to the office and outpatient E/M codes but adjusted to reflect the location as the beneficiary’s residence and the virtual presence of the practitioner.

Specifically, we proposed to create a parallel structure and set of descriptors currently used to report office or other outpatient E/M services, (CPT codes 99201 through 99205 for new patient visits and CPT codes 99212 through 99215 for established patient visits). For example, in the proposed rule we discussed a HCPCS G-code for a level 3 E/M visit for an established patient that would be a telehealth visit for the evaluation and management of an
established patient in the patient’s home, which requires at least 2 of the following 3 key components:

- An expanded problem focused history.
- An expanded problem focused examination.
- Medical decision making of low complexity.

Counseling and coordination of care with other physicians, other qualified health care professionals or agencies are provided consistent with the nature of the problem(s) and the patient’s or family’s needs or both. Usually, the presenting problem(s) are of low to moderate severity. Typically, 15 minutes are spent with the patient or family or both via real-time, audio and video intercommunications technology. The preceding text would be included in the code descriptor for the proposed level 3 established patient telehealth E/M visit HCPCS G-code, just as this information is currently included in the code descriptor for the corresponding level 3 established patient office/outpatient E/M CPT code.

In the proposed rule, we noted that we were not proposing a HCPCS G-code to parallel the level 1 office/outpatient visit for an established patient, since that service does not require the presence of the physician or other practitioner. We stated our belief that this would duplicate the home visits for non-homebound beneficiaries previously discussed in this section.

We proposed to develop payment rates for these new telehealth G-codes for E/M services in the patient’s home that are similar to the payment rates for the office/outpatient E/M services, since the codes will describe the work involved in furnishing similar services. Therefore, we proposed to include the resource costs typically incurred when services are furnished via telehealth. In terms of the relative resource costs involved in furnishing these services, in the proposed rule we stated our belief that the efficiencies of virtual presentation generally limit resource costs other than those related to the professional time, intensity, and MP risk to marginal levels. Therefore, we proposed to adopt work and MP RVUs associated with the corresponding level of office/outpatient codes as the typical service because the practitioner’s time and intensity and MP liabilities when conducting a visit via telehealth are comparable to the office visit. We stated that final RVUs under the CY 2016 PFS would be included in the EPM final rule. Additionally, we proposed to update these values each year to correspond to final values established under the PFS.

We considered whether each level of visit typically would warrant support by auxiliary licensed clinical staff within the context of the EPMs. The cost of such staff and any associated supplies, for example, would be incorporated in the practice expense (PE) RVUs under the PFS. For the lower level visits, levels 1 through 3 for new visits and 2 and 3 for established visits, we did not believe that the visit would necessarily require auxiliary clinical staff to be available in the patient’s home. We anticipated these lower level visits would be the most commonly furnished and would serve as a mechanism for the patient to consult quickly with a practitioner for concerns that can be easily described and explained by the patient. We did not propose to include PE RVUs for these services, since we did not believe that virtual visits envisioned for this model typically incur the kinds of costs included in the PE RVUs under the PFS. For higher level visits, we typically would anticipate some amount of support from auxiliary clinical staff. For example, wound examination and minor wound debridement would be considered included in an E/M visit and would require licensed clinical staff to be present in the beneficiary’s home during the telehealth visit in order for the complete service to be furnished. We stated our belief that it would be rare for a practitioner to conduct as complex and detailed a service as a level 4 or 5 E/M home visit via telehealth for EPM beneficiaries in the EPM episodes without licensed clinical staff support in the home.

However, we also noted that the proposed model already includes several avenues for licensed clinical staff to be in the patient’s home, either through a separately paid home visit as proposed for the model or through home health services as discussed earlier in this final rule. Therefore, although we considered support by auxiliary clinical staff to be typical for level 4 or 5 E/M visits furnished to EPM beneficiaries in the home via telehealth, we did not propose to incorporate these costs through PE RVUs. Given the anticipated complexity of these visits, we noted that we would expect to observe level 4 and 5 E/M visits to be reported on the same claim with the same date of service as a home visit or during a period of authorized home health care. If neither of these occurs, we proposed to require the physician to document in the medical record that auxiliary licensed clinical staff were available on site in the patient’s home during the visit and if they were not, to document the reason that such a high-level visit would not require such personnel.

We noted that because the services described by the HCPCS G-codes for the proposed model, by definition, are furnished remotely using telecommunications technology, they therefore are paid under the same conditions as in-person physicians’ services and they do not require a waiver to the requirements of section 1834(m) of the Act. We also noted that because these home telehealth services would be E/M services, all other coverage and payment rules regarding E/M services would continue to apply.

We additionally noted that under the EPMs, this proposal to waive the originating site requirements and create new home visit telehealth HCPCS codes would support the greatest efficiency and timely communication between providers and beneficiaries by allowing beneficiaries to receive telehealth services at their places of residence. We supported the proposed waivers with respect to telehealth services, and the proposed creation of the home visit telehealth codes.

The following is a summary of the comments received and our responses.

Comment: Many commenters supported the waiver of originating site and geographic site requirements and allowing telehealth visits for the EPMs. One commenter urged CMS to clarify that EPM participants can provide telehealth services that are not covered by Medicare or not paid for when provided free of charge if that supports the goal of improving quality while reducing costs. Another commenter suggested that CMS waive the requirement that services furnished under this waiver be performed by physicians or nonphysician practitioners and to permit the provision of telehealth services by HHAs through licensed clinicians to individuals who are not receiving Medicare-covered home health services.

Another commenter cautioned CMS against the use of wasteful telehealth services that increase costs without improving health care access or quality. One commenter recommended that CMS allow even greater flexibility for EPM episode services and proceed further by allowing a waiver for technological restrictions and to offer up-front payment for investment in telehealth services beyond those currently covered under the telehealth benefit. One commenter requested that this waiver, if implemented, be authorized for any provider types that are allowed to provide telehealth services per state laws. Another commenter urged CMS to engage with
patients and providers to determine the most effective ways to test telehealth in populations that need it most. **Response:** We appreciate the information from commenters on alternative approaches to providing care other than in-person. In the CJR Final Rule, we responded to similar comments regarding the telehealth waivers (80 FR 73448). As with the CJR model, the EPM is not testing a telehealth model and, therefore, we do not intend to fundamentally change the scope of telehealth requirements for payment under Medicare. Rather, we proposed to waive certain existing telehealth requirements to provide participating hospitals with additional tools to improve episode quality and efficiency given the constraints on physician time for in-person visits at distant locations or in the beneficiary’s home. The proposed waivers would allow greater physician engagement via telehealth in EPM beneficiary care coordination and management following an EPM anchor hospitalization, regardless of the beneficiary’s geographic location or home location. We believe that under the EPM it is important for beneficiaries to receive telehealth services in a way that permits them to interact with treating health care professionals in real-time, including being able to both see and interact with those providers, and the treating health care professionals being able to see and listen to the beneficiaries. Beneficiaries recovering at home following an EPM anchor hospitalization benefit from meaningful engagement in care that is patient-centered in order to improve their understanding and adherence to treatment regimens. Therefore, we do not believe it would be appropriate to allow telehealth services to be furnished to EPM model beneficiaries that do not meet the existing Medicare telehealth requirements for communications technology.

As with CJR model, we continue to believe that it would not be appropriate to allow telehealth services to be furnished to EPM beneficiaries that do not meet the existing Medicare telehealth requirements for communications technology. Finally, in response to the commenter requesting that we clarify that EPM participants can provide telehealth services free-of-charge, when they are not covered and paid by Medicare, we refer to section III.I.9. of this final rule for discussion of the requirements for in-kind beneficiary engagement incentives that may be provided by EPM participants under the EPMs.

**Comment:** One commenter strongly objected to the proliferation of new telehealth-specific HCPCS G-codes when there is a suitable CPT code to describe the service and urged CMS to allow for telehealth coverage of any related CPT/HCPCS procedure codes for physical medicine and rehabilitation. Another commenter was concerned that new codes are without clinical merit or distinction and undermine parity of clinical standards of care between services provided by telehealth means and service provided in-person.

**Response:** As discussed in the CJR Final Rule (80 FR 73450), we continue to believe that specific HCPCS G-codes are the most appropriate way for telehealth visits furnished in a model beneficiary’s home or place of residence to be reported and paid. The work and MP RVUs for these new HCPCS G-codes will be the same as those for the comparable office and other outpatient E/M visit codes under the CY 2017 PFS. The HCPCS G-codes, their descriptors, and the CPT codes upon which their RVUs are based are displayed in Table 50. While we acknowledge that telehealth services are likely to incur practice expenses, as discussed in the proposed rule, we do not believe that virtual visits envisioned for this model typically incur the kinds of costs included in the PE RVUs under the PFS; we believe that these are merely a subset of the expenses incurred for in-person visits. And while we would be interested in examining any publicly available data regarding these costs relative to the costs included in the RVUs for other PFS services, we are finalizing our proposal not to include PE RVUs in the payment rate for these unique EPM services. Accordingly, we are waiving section 1834(m)(4)(2)(B) to allow this deviation from the payment of office/outpatient visits for purposes of the EPM telehealth in-home visit services. Finally, we will consider new CPT codes as they are released according to our usual processes, and will specifically evaluate whether they may be used in the future to report home telehealth visits for CJR model and EPM beneficiaries.

**Final Decision:** After consideration of the public comments received, we are finalizing our proposal, without modification, to waive the geographic site requirements of section 1834(m)(4)(C)(ii)(I) through (III) of the Act that limit telehealth payment to services furnished within specific types of geographic areas or in an entity participating in a federal telemedicine demonstration project approved as of December 31, 2000. Any service on the list of Medicare-approved telehealth services and reported on a claim with an ICD–10–CM principal diagnosis code that is not excluded from the EPM episode definition (see section III.C.3.b. of this final rule) can be furnished to an EPM beneficiary, regardless of the beneficiary’s geographic location. We also are finalizing our proposal to waive the originating site requirements of section 1834(m)(4)(C)(i)(I) through (VIII) of the Act that specify the particular sites at which the eligible telehealth individual must be located at the time the service is furnished via a telecommunications system only when telehealth services are being furnished in the EPM beneficiary’s home or place of residence during the episode. Any service on the list of Medicare-approved telehealth services and reported on a claim with an ICD–10–CM principal diagnosis code that is not excluded from the EPM episode definition (see section III.C.3.b. of this final rule) can be furnished to a EPM beneficiary in his or her home or place of residence, unless the service’s HCPCS code descriptor precludes delivering the service in the home or place of residence. We will continue to require that telehealth services furnished under the EPM telehealth waiver be furnished using an interactive telecommunications system, consistent with the current requirement for payment of telehealth services under the PFS. The waiver of certain telehealth requirements is set forth at § 512.605.

We are finalizing the proposal, without modification, to create 9 HCPCS G-codes to report home telehealth E/M visits furnished under the EPM waiver as displayed in Table 50. These codes will be payable for EPM beneficiaries beginning July 1, 2017, the start date of the EPM performance year as discussed in section III.D.2. of this final rule. Rather than finalizing the RVUs for the new HCPCS codes in this final rule, we are finalizing them through reference to the RVUs for other CPT codes paid under the PFS as equal to the work and MP RVUs established for the comparable office/outpatient visits.

The final CY 2017 RVUs, geographic practice cost indices and conversion factor that determine the payment rates for the CPT codes are included in the CY 2017 PFS Final Rule.

We will update the RVUs for the EPM HCPCS telehealth G-codes annually by crosswalking them to the corresponding CPT codes as part of the annual PFS update, and information on the updates will be included in the PFS final rule each year.

6. SNF 3-Day Rule

a. Waiver of SNF 3-Day Rule

Pursuant to section 1861(i) of the Act, a beneficiary must have a prior inpatient hospital stays of no fewer than 3 consecutive days, within a short period of time (generally 30 days), in order to be eligible for Medicare coverage of inpatient SNF care. We refer to this as the SNF 3-day rule. We note that the SNF 3-day rule has been waived for Medicare SNF coverage under other episode payment models, including BPCI Model 2 and the CJR model. BPCI Model 2 awardees that request and are approved for the waiver can discharge Model 2 beneficiaries in fewer than 3 days from an anchor hospital stay to a SNF, where services are covered under Medicare Part A as long as all other coverage requirements for such services are satisfied. Under the CJR model, we adopted a waiver of the SNF 3-day rule that applies beginning in performance year 2 as hospitals are not bearing risk in their first year. As discussed in section V.N. of this final rule, we are revising the effective date of the waiver of the SNF 3-day rule for the CJR model, and we are stating that participant hospitals may begin using the waiver for episodes that begin on or after January 1, 2017.

6. SNF 3-Day Rule

a. Waiver of SNF 3-Day Rule

Pursuant to section 1861(i) of the Act, a beneficiary must have a prior inpatient hospital stays of no fewer than 3 consecutive days, within a short period of time (generally 30 days), in order to be eligible for Medicare coverage of inpatient SNF care. We refer to this as the SNF 3-day rule. We note that the SNF 3-day rule has been waived for Medicare SNF coverage under other episode payment models, including BPCI Model 2 and the CJR model. BPCI Model 2 awardees that request and are approved for the waiver can discharge Model 2 beneficiaries in fewer than 3 days from an anchor hospital stay to a SNF, where services are covered under Medicare Part A as long as all other coverage requirements for such services are satisfied. Under the CJR model, we adopted a waiver of the SNF 3-day rule that applies beginning in performance year 2 as hospitals are not bearing risk in their first year. As discussed in section V.N. of this final rule, we are revising the effective date of the waiver of the SNF 3-day rule for the CJR model, and we are stating that participant hospitals may begin using the waiver for episodes that begin on or after January 1, 2017.

We proposed EPM payment policies, similar to CJR payment policies which would require participating EPM hospitals to repay Medicare for excess episode spending beginning in performance year 2. Episode payment models like BPCI, CJR, and those being finalized in this final rule have the potential to mitigate the existing incentives under the Medicare program to overuse SNF benefits for beneficiaries, as well as to furnish many fragmented services that do not reflect significant coordinated attention to and management of complications following hospital discharge. The removal of these incentives in an EPM lays the groundwork for offering EPM participants greater flexibility around the parameters that determine SNF stay coverage. BPCI participants considering the early discharge of a beneficiary pursuant to the waiver during a Model 2 episode must evaluate whether early discharge to a SNF is clinically-appropriate and SNF services are medically-necessary. Next, they must balance that determination and the potential benefits to the hospital in the form of internal cost savings due to greater financial efficiency with the understanding that a subsequent hospital readmission, attributable to premature discharge or low quality SNF care, could substantially increase episode spending while also resulting in poorer quality of care for the beneficiary. Furthermore, early hospital discharge for a beneficiary who would otherwise not require a SNF stay (that is, the beneficiary has no identified skilled nursing or rehabilitation need that cannot be provided on an outpatient basis) following a hospital stay of typical length does not improve episode efficiency under episode-based payment models such as BPCI, the CJR model, or the EPMs in this final rule.

Because of the potential benefits we see for participating EPM hospitals, their provider partners, and beneficiaries, we proposed to waive in certain instances, where it is clinically-appropriate, the SNF 3-day rule for coverage of a SNF stay following the anchor hospitalization under EPM for episodes that begin on or after April 1, 2018. While our intent is to align the effective date of the availability of this program waiver with performance year 2 of the model, when repayment responsibility for actual episode spending that exceeds the target price begins, we believe that an effective date based on the start of the episode will be clearer to participant hospitals, SNFs, and others in determining whether the waiver is available for an EPM beneficiary. We believe that clarity regarding whether a waiver applies to SNF services furnished to a particular beneficiary is important to help ensure compliance with the conditions of the waiver and also improve our ability to monitor waivers for misuse. We proposed to use our authority under section 1115A of the Act with respect to certain SNFs that furnish Medicare Part A post-hospital extended care services to beneficiaries included in an EPM episode. We believe this waiver is necessary to the model test so that EPM participants can redesign care throughout the episode continuum of care extending to 90 days post-discharge from the anchor hospital stay in order to maximize quality and hospital financial efficiency, as well as reduce episode spending under Medicare. However, we did not propose to waive this requirement in performance year 1, when EPM participants are not responsible for excess actual episode spending. We believe that there is some potential for early hospital discharge...
followed by a SNF stay to increase actual episode spending over historical patterns unless EPM participants are particularly mindful of this potential unintended consequence. Without participant repayment responsibility in performance year 1, we are concerned that Medicare would be at full risk under the model for increased episode spending because, without a financial incentive to closely manage care, hospitals might be more likely to discharge beneficiaries to SNFs early leading to increased episode spending for which the hospital would bear no responsibility. For EPM episodes beginning on or after April 1, 2018, we proposed to waive the SNF 3-day rule, where clinically-appropriate, because participants will bear partial or full responsibility (capped at the proposed stop-loss limit described in section III.D.7.b. of this final rule) for excess episode actual spending, thereby providing a strong incentive in those years for participants to redesign care with both quality and efficiency outcomes as priorities. All other Medicare rules for coverage and payment of Part A-covered SNF services would continue to apply to EPM beneficarians in all performance years of the model.

In addition, for the EPMs being finalized in this final rule and for future EPMs where this waiver is clinically-appropriate and the average LOS for Medicare beneficarians hospitalized for certain EPM procedures without major complications or comorbidities may be already relatively short at 3 days we believe that we should protect immediate EPM beneficary safety and optimizing health outcomes. Therefore, we proposed to require that participants may only discharge an EPM beneficary under this proposed waiver of the SNF 3-day rule to a SNF rated an overall of three stars or better by CMS based on both quality and efficiency outcomes as priorities. All other Medicare rules for coverage and payment of Part A-covered SNF services would continue to apply to EPM beneficaries in all performance years of the model.

For the CJR model, we justified the waiver of the SNF 3-day rule by reviewing data specific to the characteristics of CJR beneficaries, such as, the geometric mean hospital LOS for the MS–DRGs associated with lower extremity joint replacement (3 to 7 days) and the frequency and length of SNF usage (typically 30 days) for CJR beneficaries. We stated in the CJR Final Rule that we believe this waiver is necessary to the model test so that CJR participant hospitals could redesign care throughout the episode continuum of care extending to 90 days post-discharge from the anchor hospital stay in order to maximize quality and financial efficiency, as well as reduce episode spending under Medicare. However, the waiver does not apply in performance year 1, when CJR participant hospitals are not responsible for excess actual episode spending.

Based on our analysis of data discussed in section III.J.3. of this final rule, we believe some program and patient outcome vulnerabilities may exist with adopting the waiver of the SNF 3-day rule for the proposed AMI, CABG, and SHFFT models or under future EPMs. To mitigate these possible vulnerabilities, we believe it will be necessary to determine if the waiver applies to EPMs on a model-specific basis as follows:

- **AMI Model**—AMI beneficaries have geometric mean hospital LOSs that are similar to CJR beneficaries, 2.0–4.5 days (see Table 47). Most AMI beneficaries, regardless of AMI medical treatment or PCI treatment for AMI, are not discharged to post-acute care. There is no research that shows increased mortality associated with the hospital LOS. Therefore, we believe that is may be clinically-appropriate to propose to waive the SNF 3-day rule for the AMI model for episodes beginning on or after April 1, 2018, as participant hospitals are not bearing risk in their first performance year or performance year 2 (NDR).

We proposed that the waiver be available for the AMI beneficary’s care. The SNF would insert a Treatment Authorization Code on the claim for a beneficary in the model where the SNF seeks to the use the waiver. This process would promote coordination between the SNF and the AMI model participant, as the SNF would need to be in close

---

134 [https://www.medicare.gov/NursingHomeCompare/](https://www.medicare.gov/NursingHomeCompare/)
communication with the EPM participant to ensure that the beneficiary is in the model at the time the waiver is used. We proposed that where the beneficiary would be eligible for inclusion in an AMI episode of care at the time of hospital discharge, use of the waiver would be permitted where it is medically-necessary and appropriate to discharge the beneficiary to a SNF prior to a 3-day inpatient stay. A beneficiary would be eligible to receive services furnished under the 3-day rule waiver only during the AMI episode.

• CABG Model—CABG beneficiaries have a geometric mean hospital LOS of 6.0 to 11.6 days (see Table 47), much longer than the CJR model’s mean LOS. While most CABG beneficiaries are discharged to SNFs, a mean hospital LOS well above 3 days indicates that it would not be clinically-appropriate for early discharges provided with this waiver. Therefore, we did not propose to waive the SNF 3-day rule for the CABG model.

• SHFFT Model—SHFFT beneficiaries have a geometric mean hospital LOS of 3.7–6.7 days (see Table 47), somewhat close to the CJR model’s mean LOS. However, studies show that shorter than average hospital LOSs for hip fracture are associated with higher mortality. While most SHFFT beneficiaries are discharged to SNFs, a mean hospital LOS above 3 days along with a higher mortality rates associated with shorter than average hospital LOSs indicates that it would not be clinically-appropriate for early discharges provided with this waiver. Therefore, we proposed not to waive the SNF 3-day rule for the SHFFT model.

We plan to monitor patterns of SNF utilization under the EPM, particularly with respect to hospital discharge in fewer than 3 days to a SNF, to ensure that beneficiaries are not being discharged prematurely to SNFs and that they are able to exercise their freedom of choice without patient steering. We sought comment on our proposal to waive the SNF 3-day stay rule for stays in SNFs rated overall as 3 stars or better following discharge from the anchor hospitalization in EPM episodes.

The following is a summary of the comments received and our responses.

Comment: Commenters generally supported the proposal to allow EPM beneficiaries to be discharged to a SNF after less than a 3-day inpatient hospital stay, though one commenter recommended CMS not adopt its proposal to permit EPM participants under any condition to waive the SNF 3-Day Stay Rule when referring EPM beneficiaries to a SNF.

Commenters urged CMS to implement the waiver on July 1, 2017, rather than delaying until April 1, 2018 so that providers have an opportunity to use the waiver and redesign care pathways in ways that streamline and improve the quality of care before the measurement period begins for cost reconciliations. One commenter was concerned that limiting the 3-day SNF waiver to discharges from the anchor hospitalization would be problematic if a patient is readmitted to a hospital during the 90-day post-discharge episode duration and subsequently needs SNF care. One commenter strongly suggested a broader waiver of the 3-day Rule for small and rural hospitals than CMS proposed.

A few commenters requested that CMS make the SNF waiver available regardless of the star rating of the admitting SNF. Some of these commenters acknowledged the rationale for a quality requirement for the admitting SNF but asserted that the proposed use of the star rating would not be appropriate for determining the quality requirement. A couple of commenters asserted that the overall star rating would not directly correlate to an AMI episode and would therefore not be predictive of which SNFs would be most capable of caring for AMI beneficiaries under the waiver. A few commenters recommended that CMS modify the proposed criteria of “at least 3 stars” to “at least 3 stars overall OR at least 3 stars on both the staffing and quality measure components.” Another commenter suggested the waiver apply only if the facility has a star-rating of 4 stars or above, while another commenter suggested the waiver apply to any SNF with a star rating of two stars or above. One commenter recommended that some allowance/methodology be developed to allow new SNFs that have not received a Star Rating to participate in the Waiver. Another commenter was concerned that the demand on SNFs with three or more stars will create capacity issues and limit the ability to discharge patients to those facilities, and a few commenters were concerned that the quality requirement would constrain beneficiary freedom of choice.

Response: In the CJR Final Rule, we responded to similar comments regarding the SNF waiver (80 FR 73456). As we discussed in the EPM proposed rule and the CJR Final Rule, an episode payment model or the EPM has the potential to mitigate the existing incentives under the Medicare program to overuse SNF benefits for beneficiaries, as well as to furnish many fragmented services that do not reflect significant coordinated attention to and management of complications following hospital discharge. The reduction of these incentives in an episode payment model lays the groundwork for offering participant hospitals greater flexibility around the parameters that determine SNF stay coverage. As discussed in the CJR Final Rule, we understand from many current BPCI Model 2 participants engaged in LEJR episodes that this waiver plays an important role in their care redesign efforts to streamline and improve the quality of care, as they work closely with their SNF partners.

Regarding the delay in availability of the 3-day rule waiver, we linked the proposed availability of the 3-day rule waiver to the downside risk of the EPM participant. Specifically, we stated in the proposed rule that since EPM participants had no downside risk during PY 1 (for discharges prior to April 1, 2018), we were concerned that participants may be more likely to discharge beneficiaries to SNFs early leading to increased episode spending for which the participant would bear no responsibility. Accordingly, we proposed to delay the availability of the 3-day rule waiver until PY 2 for discharges on or after April 1, 2018 and beyond.

In section III.D.2.c. of this final rule, based on comments requesting phased-in downside risk beginning later than we proposed for the EPM, we agreed that delaying the date by which participants would be required to assume downside risk would improve participants’ ability to successfully achieve the goals of the models. Accordingly, we are finalizing the policy that EPM participants will not be required to assume downside risk until PY 3—that is, episodes ending on or after January 1, 2019, with anchor hospital discharges that occur on or after October 4, 2018 (90 days prior to January 1, 2019). Consistent with linking the availability of the 3-day rule waiver to the participant’s downside risk, for this final rule, we believe it is appropriate to delay the availability of the 3-day rule waiver until PY 3. For the purposes of implementing this waiver, we will allow the 3-day rule waiver for anchor hospital discharges that occur on or after October 4, 2018. We believe that implementing this waiver with an effective date for discharges that occur on or after October 4, 2018, rather than implementing this waiver with an effective date for episodes ending on or

after January 1, 2019, provides clarity to the anchor hospital and the recipient SNF whether the waiver applies to SNF services furnished to a particular beneficiary. We believe this clarity is important to help ensure compliance with the conditions of the waiver and also improves our ability to operationally monitor waivers for misuse.

Also, we are allowing participants to voluntarily elect downside risk for episodes ending on or after January 1, 2018 (PY 2). However, we will not provide the waiver for those participants who elect voluntary early downside risk in PY 2. It is operationally infeasible for us to first allow use of the waiver in different years for different EPM participants. We expect that most participants will not elect early downside risk, because we do not expect to have more robust risk-adjustment in place until performance year 3. Regarding responses to other 3-day rule comments, we believe that limiting the 3-day SNF waiver to discharges from the anchor hospitalization at an EPM participant is appropriate as the care redesign needed to support a clinically appropriate early discharge from an ACO hospitalization would not necessarily support other types of hospital discharges that might occur during the course of an episode. We note that limiting use of the waiver to discharges from the anchor hospitalization does not preclude a beneficiary from receiving SNF care at other points during the 90-day episode. Medicare will continue to cover SNF stays for EPM beneficiaries who require SNF care and remain in the hospital 3 days or longer under all existing rules for Medicare coverage and payment of Part A-covered SNF services, and these rules do not include a star rating requirement. In this way, the EPM waiver of the SNF 3-day stay rule is an extension of existing coverage for a Part A-covered SNF stay, and is not a limit to it.

Comment: Some commenters believed that 3-day rule waiver should apply to CABG and SHFFT models in addition to the AMI model. Some of these commenters asserted that the waiver should be available for all clinical episodes under the EPMs, with participant hospitals given the flexibility to evaluate on a case-by-cases basis when early discharge to a SNF is clinically appropriate and the SNF services are medically necessary, with some recommending that CMS also implement the SNF 3-day rule waiver for Medicare Advantage Organizations and all Shared Savings Program ACOs.

Response: As discussed in the proposed rule, to mitigate program and patient outcome vulnerabilities that may exist with adopting the waiver of the SNF 3-day rule, we believe it will be necessary to determine if this waiver applies to EPMs on a model-specific basis. Based on our analysis of data discussed in section III.J.3 of this final rule, we continue to believe the 3-day rule waiver should not be applied to CABG and SHFFT model beneficiaries, given the typical severity of their clinical conditions treated with surgery that is followed by relatively lengthy inpatient hospital care. We will continue to monitor this waiver during the EPM testing to determine if modification of this limited waiver is warranted. We note that recommendations regarding the waivers under Medicare programs other than the EPM or CJR model are out of scope of this rule.

Comment: One commenter recommended that instead of requiring SNF to insert a Treatment Authorization Code on the claim for a beneficiary in the AMI model where the SNF seeks to the use the waiver. This process would promote coordination between the SNF and the AMI model participant, as the SNF would need to be in close communication with the AMI model participant to ensure that the beneficiary is in the model at the time the waiver is used. Where the beneficiary is an AMI model beneficiary on the date of discharge from an anchor hospitalization, use of the waiver would be permitted where it is medically necessary and appropriate to discharge...
the beneficiary to a SNF prior to a 3-day inpatient stay.

All other Medicare rules for coverage and payment of Part A-covered SNF services continue to apply. The waiver of the SNF 3-day rule is set forth at § 512.610.

b. Additional Beneficiary Protections Under the SNF 3-Day Stay Rule Waiver

For those specific proposed EPMs, where proposed to allow the SNF 3-day rule waiver, we proposed beneficiary protections against financial liability in addition to the beneficiary protections discussed elsewhere in this final rule. In proposing additional beneficiary protections that may be necessary to ensure proper use of the SNF 3-day rule waiver under the proposed EPMs, we noted that there are existing, well-established payment and coverage policies for SNF services based on sections 1861(i), 1862(a)(1), and 1879 of the Act that include protections for beneficiary liability for certain non-covered SNF charges. These existing payment and coverage policies for SNF services continue to apply under the EPMs, including SNF services furnished pursuant to the SNF 3-day waiver. (For example, see section 70 in the Medicare Claims Processing Manual, Chapter 30—Financial Liability Protections on the CMS Web site at https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/clm104c30.pdf; and Medicare Coverage of Skilled Nursing Facility Care at https://www.medicare.gov/Pubs/pdf/10153.pdf; Medicare Benefit Policy Manual, Chapter 8—Coverage of Extended Care (SNF) Services Under Hospital Insurance at https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/downloads/bp102c08.odf). In general, CMS requires that the SNF inform a beneficiary in writing about services and fees before the beneficiary is discharged to the SNF (§ 483.10(b)(6)); a beneficiary cannot be required to request extra services as a condition of continued stay (§ 483.10(c)(6)(iii)(B)); and the SNF must inform a beneficiary that requests an item or service for which a charge will be made that there will be a charge for the item or service and what the charge will be (§ 483.10(c)(6)(iii)(C)). (See also Chapter 6 of Medicare Coverage of Skills Nursing Facility Care at https://www.medicare.gov/Pubs/pdf/10153.pdf.)

As discussed in the CJR Final Rule, commenters expressed concern regarding the impact on the CJR beneficiary’s Medicare eligibility status change and a participant hospital’s awareness of that change. There may be cases in which a SNF waiver is used by a participant hospital because the participant hospital believes that the beneficiary meets the criteria, based on the information available to the hospital and SNF at the time of the beneficiary’s admission to the SNF, but in fact the beneficiary’s Medicare eligibility status has changed and the hospital was unaware of it based on available information. We recognize that despite good faith efforts by participant hospitals and SNFs to determine a beneficiary’s Medicare status for the model, it may occur that a beneficiary is not eligible to be included in the CJR model at the time the SNF waiver is used.

As discussed in section V.N. of this final rule, for the CJR model we proposed to cover services furnished under the SNF waiver at § 510.610 when the information available to the provider at the time the services under the SNF waiver were furnished indicated that the beneficiary was included in the CJR model (see 81 FR 50968 through 50971). Similarly for EPM, we proposed to cover services furnished under the SNF waiver at proposed § 512.61 when the information available to the provider at the time the services furnished under the SNF waiver were furnished indicated that the beneficiary was included in the CJR model (see 81 FR 50941 through 50943).

In addition, as discussed in the CJR Final Rule, we noted that we would continue to evaluate the waiver of the SNF 3-day rule, including further lessons learned from Innovation Center models in which a waiver of the SNF 3-day rule is being tested. We indicated that in the event we determine that additional safeguards or protections for beneficiaries or other changes were necessary, such as to incorporate additional protections for beneficiaries, we would propose the necessary changes through future rulemaking.

We have continued to learn from implementation of the SNF 3-day rule waiver in the CJR model, other models, and the Shared Savings Program. Based on these experiences, we believe there are situations where it would be appropriate to require additional beneficiary financial protections under the SNF 3-day rule waiver for the applicable proposed EPMs. Specifically, we are concerned about potential beneficiary financial liability for non-covered Part A SNF services that might be directly related to use of the SNF 3-day waiver under the applicable EPMs. For instance, it is unacceptable that a beneficiary could be charged for non-covered SNF services if an EPM participant discharges a beneficiary to a SNF that does not meet the quality requirement (3 stars or higher in 7 of the last 12 months), and the beneficiary is not provided a discharge planning notice, as described in proposed § 512.450(b). Another scenario would be where the EPM participant applies the SNF 3-day rule waiver for episodes that begin prior to April 1, 2018, when this waiver is not applicable (as proposed), and payment to the qualified SNF for furnishing Medicare covered SNF services is denied. A third scenario would be if an EPM participant applies the SNF 3-day rule waiver for a specific proposed EPM where the waiver is not allowed, such as under the CABG and SHEFT episodes in this final rule. In any of these circumstances, we assume the EPM participant’s intent was to rely upon the SNF 3-day rule waiver, but the waiver requirements were not met.

When this occurs, we are concerned that once the claim is rejected, the beneficiary may not be protected from financial liability under existing Medicare rules because the waiver would not be available, and the beneficiary would not have had a qualifying inpatient hospital stay. Thus, the EPM beneficiary could be charged by the SNF for non-covered SNF services that were a result of an inappropriate attempt to use the waiver. In these cases, Medicare would deny payment of the SNF claim, and the beneficiary could potentially be charged by the SNF for these non-covered SNF services, potentially subjecting such beneficiaries to significant financial liability. We believe that the rejection of the claim, in these cases, could easily have been avoided if the hospital had confirmed that the requirements for applying of the SNF 3-day waiver were satisfied.

Other models have addressed similar issues in which the beneficiary may be subject to financial liability for non-covered SNF services related to the waiver. The Next Generation ACO Model generally places the risk on the SNF, where the SNF did not qualify under the waiver or otherwise knew or reasonably could be expected to have known that payment would not be made for the non-covered SNF services. In such cases, CMS makes no payment for the services, and the SNF may not charge the beneficiary for the services and must return any monies collected from the beneficiary. Additionally, under the Next Generation ACO Model, the ACO must indemnify and hold the beneficiary harmless for the services. In the proposed rule, we stated our belief that it is appropriate to adopt a similar...
In these preceding instances, we proposed to apply the following rules:

- CMS shall make no payment to the SNF for such services.
- The SNF shall not charge the beneficiary for the expenses incurred for such services, and the SNF shall return to the beneficiary any monies collected for such services.
- The hospital shall be responsible for the cost of the non-covered SNF services furnished during the SNF stay.
- In addition, if the EPM participant discharges an EPM beneficiary to a SNF that does not meet the quality requirement (3 stars or higher in 7 of the last 12 months) and a discharge planning notice, as described in proposed §512.450(b), is provided to the EPM beneficiary alerting them of potential financial liability then the hospital will not be financially liable for the cost of the SNF stay and the normal Medicare FFS rules for coverage of SNF services will apply.
- The discharge notice absolves the EPM participant of liability. However, we are requiring EPM participants to keep a record of discharge planning notice distribution to EPM beneficiaries. We will monitor EPM participants’ use of discharge notification letters to protect EPM beneficiaries from potential abuse of the waiver. Nevertheless, we recognize there are some situations in which a beneficiary may wish to be discharged before a qualifying 3-day stay and may accept financial liability for a non-qualifying stay, in which case the participant hospital will not be held financially liable for the SNF stay.
- Therefore, when the EPM participant has discharged a beneficiary to a SNF that does not qualify under the conditions of the waiver, we believe it is reasonable that the ultimate responsibility and financial liability for a non-covered SNF stay should rest with the EPM participant. We considered holding the SNF responsible but decided that since hospitals, not SNFs, are the EPM participants, they therefore should be held responsible for complying with the SNF 3-day rule waiver conditions for the reasons stated previously.

To protect EPM beneficiaries from being charged for non-covered SNF charges in instances when the waiver was used appropriately, we proposed to add certain beneficiary protection requirements in proposed §512.610. These requirements would apply for SNF services that would otherwise have been covered except for lack of a qualifying 3-day hospital stay.

Specifically, we proposed if, subsequent to an EPM participant applying the SNF 3-day rule waiver, we determine that the following waiver requirements were not met then the EPM participant will be financially liable for the SNF stay:

- The EPM participant discharges a beneficiary that is in a specific EPM where the SNF 3-day rule waiver does not apply.
- The EPM participant discharges a beneficiary prior to April 1, 2018 (as proposed), where the SNF 3-day rule waiver does not apply.
- The EPM participant discharges a beneficiary to a SNF that does not meet the quality requirement (3 stars or higher in 7 of the last 12 months) and does not provide a discharge planning notice, as described in proposed §512.450(b), to the beneficiary alerting them of potential financial liability.

A couple of commenters expressed concern that non-covered SNF charges in instances where the EPM participant discharges a beneficiary to a SNF that did not qualify for waiver use and did not provide the beneficiary with a discharge planning notice. We sought comment on whether SNFs instead of, or in addition to, the EPM participant should be held liable for such claims and under what circumstances. Finally, we sought comment on any other related issues that we should consider in connection with these proposals to protect beneficiaries from significant financial liability for non-covered SNF services related to the waiver of the SNF 3-day rule under the proposed EPMs.

We may address those issues through future notice and comment rulemaking.

The following is a summary of the comments received and our responses.

Comment: Many commenters expressed support for CMS’ proposal to cover services furnished under the SNF waiver based on an EPM participant’s knowledge of beneficiary eligibility for the EPM at the time the services under the waiver were furnished. A few commenters sought clarification whether CMS was proposing this policy for both the CJR model and the EPM, though these same commenters expressed their support and asserted that the same protection should be extended to both CJR and EPM beneficiaries.

Response: We appreciate commenters’ support for this proposed policy. We will finalize our proposal to cover services furnished under the SNF waiver based on the EPM participant’s knowledge of beneficiary eligibility for the applicable proposed EPMs, as determined by Medicare status, at the time the services under the waiver were furnished. We refer readers to section V.N. of this final rule for a discussion of the additional beneficiary protections under the SNF 3-day stay rule waiver for CJR beneficiaries.

Comment: Commenters agreed that beneficiaries should not be charged for non-covered SNF charges in instances where the EPM participant discharges a beneficiary to a SNF that did not qualify for waiver use and did not provide the beneficiary with a discharge planning notice. Some commenters asserted that hospitals should not be solely responsible for non-covered SNF services resulting from discharging a beneficiary to a SNF that does not meet the quality requirement as it is challenging for hospitals to keep track of changes in SNF ratings or to identify EPM beneficiaries in a timely manner. A few of these commenters recommended that CMS provide EPM participants with a list of eligible SNFs on a quarterly or periodic basis.

A couple of commenters expressed concern that independent physicians could refer and admit a beneficiary to a SNF that does not meet the quality...
requirement without including the hospital, yet the hospital would be financially liable for the non-covered SNF stay under the proposed policy. Some commenters suggested that the SNF should share in financial liability for non-covered SNF services related to misuse of the waiver as the SNF is providing and billing for these non-covered services, and CMS should consider ways in which it could ensure the SNFs take steps to ensure that patients discharged to the SNF with less than a 3-day inpatient stay qualify to receive services under the waiver.

Response: We appreciate commenters’ support for our proposal that beneficiaries should not be charged for non-covered SNF charges in instances where the EPM participant discharges a beneficiary to a SNF that did not qualify for waiver use and did not provide the beneficiary with a discharge planning notice. However, we believe that the established process for discharge planning would typically involve the hospital. EPM participants are required to be aware of the 3-day waiver requirements, and the EPM participants will make the decision as to whether it is appropriate to discharge a beneficiary without a 3-day stay. We note that if the beneficiary chooses a SNF that does not qualify under the waiver based on a physician’s recommendation and the hospital provides proper notification of non-coverage, the beneficiary would be financially liable for the SNF stay, while the EPM participant would not be financially liable for the SNF stay.

We considered the suggestions of commenters that SNFs share in financial liability for non-covered SNF services related to the waiver of the SNF 3-day rule under the proposed EPMs. EPM participants are required to be aware of the 3-day waiver requirements. SNFs are not EPM participants, and we believe that SNFs will rely upon the hospital as the EPM participant, to determine whether the waiver is appropriate. As we gain experience with the EPM, we may revisit this issue in future rulemaking.

Comment: One commenter suggested that CMS assume responsibility for providing the beneficiary notice as an objective, informed and trusted voice in this process. Another commenter requested that CMS provide clarification as to what an EPM participant needs to maintain as documentation showing the hospital has provided the proper discharge notice to the patient prior to discharge, which would absolve the EPM participant of financial liability if the SNF waiver is not appropriate. One commenter recommended that CMS require EPM participant to inform beneficiaries of their options, including (1) waiving the 3-day hospital stay and going to a 3-star or higher rated SNF with no additional financial consequences for the beneficiary; (2) beneficiary can opt to stay in the hospital the full 3 days and then select a SNF of their choosing regardless of star status; or (3) beneficiary can accept the 3-day stay waiver and choose any SNF understanding that they are liable for the full cost of that care, as it would not be a Medicare eligible expense. One commenter urged CMS to modify its proposal so that beneficiaries are held harmless for non-covered SNF services for which they are referred by the originating hospital, regardless of whether a discharge planning notice is provided.

Response: As discussed in section III.G. of this final rule, hospitals are required to provide beneficiaries with written notification of their post-acute care options upon discharge. Given the existing relationship between the hospital and the patient, and the hospital’s established role in discharge planning, we believe that it is appropriate to require the EPM participant to provide beneficiaries with written notification if the EPM participant makes any referrals for non-covered services as part of the discharge planning process. We do not believe that it would be practical or consistent with existing Medicare policy for CMS to provide the beneficiary with notice at time of discharge if the SNF waiver is not appropriate and the services would not be covered. With respect to the commenter’s suggested approach for notifying the beneficiary of the range of options available post-discharge, we refer to section III.G. of this final rule for discussion of discharge planning requirements for EPM participants and the essential elements that are required for proper beneficiary notification.

Comment: One commenter was concerned that the proposal does not address cases in which Medicare accepts a beneficiary’s appeal of Medicare Provider Non-Coverage. We acknowledge that an independent Medicare Provider Non-Coverage reviewer of the most recent rolling 12 months based on a review of the most recent rolling 12 months of overall star ratings, and we proposed to post on the CMS Web site the list of qualified SNFs in advance of the calendar quarter. As discussed in the previous section, the waiver of the SNF 3-day rule only applies to circumstances where the beneficiary is medically appropriate for discharge and requires a SNF stay after less than a 3-day inpatient hospital stay. Medicare will continue to cover SNF stays for EPM beneficiaries who require SNF care and remain in the hospital 3 days or longer under all existing rules for Medicare coverage and payment of Part A-covered SNF services, and these rules do not include a star rating requirement. In this way, the EPM waiver of the SNF 3-day stay rule is an extension of existing coverage for a Part A-covered SNF stay, and is not a limit to it. An EPM participant that believes it is incapable of identifying qualifying SNFs or EPM beneficiaries is not required to use the waiver.

As discussed in the previous section, the waiver provides EPM participants with additional flexibilities to redesign care in order to maximize quality and efficiency, as well as reduce episode spending and generate hospital internal cost savings. Therefore, we believe that it is appropriate to hold the EPM participants financially responsible for misusing the waiver in situations where waiver requirements are not met.
waiver requirements were not met then the EPM participant will be financially liable for the SNF stay:

- The EPM participant discharges a beneficiary that is in a specific EPM where the SNF 3-day rule waiver does not apply.
- The EPM anchor hospital discharges a beneficiary prior to October 4, 2018 (as finalized in section III.F.6.a. of this final rule), where the SNF 3-day rule waiver does not apply.
- The EPM participant discharges a beneficiary to a SNF that does not meet the quality requirement (3 stars or higher in 7 of the last 12 months) and does not provide a discharge planning notice, as described in proposed § 512.450(b)(3), to the beneficiary alerting them of potential financial liability.

In these preceding instances, we proposed to apply the following rules:
- CMS shall make no payment to the SNF for such services.
- The SNF shall not charge the beneficiary for the expenses incurred for such services, and the SNF shall return to the beneficiary any monies collected for such services.
- The hospital shall be responsible for the cost of the non-covered SNF services furnished during the SNF stay.
- The final policies for financial liability for non-covered SNF services provided due to incorrect application of the SNF 3-day rule waiver are set forth in § 512.610(c).

7. Waivers of Medicare Program Rules To Allow Reconciliation Payment or Repayment Actions Resulting From The Net Payment Reconciliation Amount

In order to make a reconciliation payment to or carry out recoupment from a participant that results from the NPRA calculation for each performance year as discussed in section III.D.5. of this final rule, we believe we would need to waive certain Medicare program rules. Therefore, in accordance with the authority in section 1115A(d)(1) of the Act, we proposed to waive requirements of the Act for all Medicare Part A and Part B payment systems only to the extent necessary to make reconciliation payments or receive repayments based on the NPRA that reflect the episode payment methodology under this proposed payment model for EPM participants selected in accordance with CMS’s proposed selection methodology. In addition, reconciliation payments or repayments would not change beneficiary cost-sharing from the regular Medicare program cost-sharing for the related Part A and Part B payment systems only to the extent necessary to make reconciliation payments or receive repayments based on the NPRA calculated.

We did not receive any comments suggesting changes to this waiver thus, we are finalizing the proposal, without modification, to waive requirements of the Act for all Medicare Part A and Part B payment systems only to the extent necessary to make reconciliation payments or receive repayments based on the NPRA that reflect the episode payment methodology under this proposed payment model for EPM participants selected in accordance with CMS’s proposed selection methodology. In addition, reconciliation payments or repayments would not change beneficiary cost-sharing from the regular Medicare program cost-sharing for the related Part A and Part B services that were paid for EPM beneficiaries and aggregated to determine actual episode spending in the calculation of the NPRA. We therefore would waive the requirements of sections 1813 and 1833(a) of the Act to the extent that they would otherwise apply to reconciliation payments or repayments from an EPM participant. We sought comment on our proposed waivers related to repayment and recoupment actions as a result of the NPRA calculated.

We did not receive any comments suggesting changes to this waiver thus, we are finalizing the proposal, without modification, to waive requirements of the Act for all Medicare Part A and Part B payment systems only to the extent necessary to make reconciliation payments or receive repayments based on the NPRA that reflect the episode payment methodology under this proposed payment model for EPM participants selected in accordance with CMS’s proposed selection methodology. In addition, reconciliation payments or repayments would not change beneficiary cost-sharing from the regular Medicare program cost-sharing for the related Part A and Part B services that were paid for EPM beneficiaries and aggregated to determine actual episode spending in the calculation of the NPRA. We therefore would waive the requirements of sections 1813 and 1833(a) of the Act to the extent that they would otherwise apply to reconciliation payments or repayments from an EPM participant. We sought comment on our proposed waivers related to repayment and recoupment actions as a result of the NPRA calculated.

We did not receive any comments suggesting changes to this waiver thus, we are finalizing the proposal, without modification, to waive requirements of the Act for all Medicare Part A and Part B payment systems only to the extent necessary to make reconciliation payments or receive repayments based on the NPRA that reflect the episode payment methodology under this proposed payment model for EPM participants selected in accordance with CMS’s proposed selection methodology. In addition, reconciliation payments or repayments would not change beneficiary cost-sharing from the regular Medicare program cost-sharing for the related Part A and Part B services that were paid for EPM beneficiaries and aggregated to determine actual episode spending in the calculation of the NPRA. We therefore would waive the requirements of sections 1813 and 1833(a) of the Act to the extent that they would otherwise apply to reconciliation payments or repayments from an EPM participant. We sought comment on our proposed waivers related to repayment and recoupment actions as a result of the NPRA calculated.
beneficiary cost-sharing, allowing home services which then may affect the beneficiaries receive CR and ICR does not have a negative effect on how waiver to ensure this program flexibility approaches we may take to monitor this services. We solicited comments on providers or suppliers of CR and ICR model beneficiaries and monitoring may involve an analysis of for EPM beneficiaries that receive CR incentive payment model. We proposed a waiver would also be in the CR incentive payment on model participants.

Response: We appreciate the commenters’ interest in ensuring the availability of CR/ICR services for AMI and CABG model beneficiaries, including those beneficiaries who would also be in the CR incentive payment model. We proposed a waiver that would allow, in addition to a physician, a nonphysician practitioner to perform the functions of supervisory physician, prescribing exercise, and establishing, reviewing, and signing an individualized treatment plan for patients other than CABG beneficiaries. As a result, the added flexibility will not occur in practice, limiting its intended effect. Thus, the commenters recommend implementation of a site-specific rather than a condition-specific physician supervision waiver which should be extended to all Medicare beneficiaries receiving CR/ICR services at designated institutions.

Some commenters recommended that CMS consider applying this waiver to all CR and ICR programs, including those in the control groups, as it would benefit the entire Medicare patient population. Some of these commenters asserted that the effects of the waiver and the incentive payment will be confounded in the EPMs and CR incentive payment model as proposed, while extending the waiver to all CR/ICR programs would allow CMS to isolate the impact of the EPMs and CR incentive payment on model participants.

Response: We appreciate the commenters’ interest in ensuring the availability of CR/ICR services for AMI and CABG model beneficiaries, including those beneficiaries who would also be in the CR incentive payment model. We proposed a waiver that would allow, in addition to a physician, a nonphysician practitioner to perform the functions of supervisory physician, prescribing exercise, and establishing, reviewing, and signing an individualized treatment plan for a provider or supplier of CR and ICR services, at § 410.26 of this subpart.

For a nonphysician practitioner to perform the functions of supervisory physician, prescribing exercise, and establishing, reviewing, and signing an individualized treatment plan for patients other than CABG beneficiaries. As a result, the added flexibility will not occur in practice, limiting its intended effect. Thus, the commenters recommend implementation of a site-specific rather than a condition-specific physician supervision waiver which should be extended to all Medicare beneficiaries receiving CR/ICR services at designated institutions.

Some commenters recommended that CMS consider applying this waiver to all CR and ICR programs, including those in the control groups, as it would benefit the entire Medicare patient population. Some of these commenters asserted that the effects of the waiver and the incentive payment will be confounded in the EPMs and CR incentive payment model as proposed, while extending the waiver to all CR/ICR programs would allow CMS to isolate the impact of the EPMs and CR incentive payment on model participants.

Response: We appreciate the commenters’ interest in ensuring the availability of CR/ICR services for AMI and CABG model beneficiaries, including those beneficiaries who would also be in the CR incentive payment model. We proposed a waiver that would allow, in addition to a physician, a nonphysician practitioner to perform the functions of supervisory physician, prescribing exercise, and establishing, reviewing, and signing an individualized treatment plan for a provider or supplier of CR and ICR services, at § 410.26 of this subpart.

For an EPM beneficiary in an AMI or CABG episode, we proposed that this waiver will apply to any provider or supplier of CR and ICR services furnished to an EPM beneficiary during an AMI or CABG episode. We do not believe a nonphysician practitioner is qualified to act in the capacity of a medical director. Thus, we proposed to specifically exclude the medical director function from this waiver. In addition, we proposed that all other definitions and requirements related to a physician or supervising physician under § 410.49 continue to apply. We proposed to codify the waiver at § 412.630.

For an EPM beneficiary in an AMI or CABG episode, we proposed that this waiver will apply to any provider or supplier that furnishes CR and ICR services to that beneficiary. We anticipate monitoring outcomes of care for EPM beneficiaries that receive CR and ICR services under this waiver during an AMI or CABG episode. The monitoring may involve an analysis of all or a sample of claims, medical records, or other clinical data for AMI and CABG model beneficiaries and providers or suppliers of CR and ICR services. We solicited comments on approaches we may take to monitor this waiver to ensure this program flexibility does not have a negative effect on how beneficiaries receive CR and ICR services which then may affect the outcome of the EPM beneficiary’s care.

We also reviewed other program requirements, such as waiving beneficiary cost-sharing, allowing home nursing visits/home monitoring, and allowing telehealth visits in the home under the AMI and CABG models. We did not find clinical data and literature that we believed sufficient to support propose any additional waivers to the CR/ICR program requirements in this final rule. We solicited comments on the proposed CR/ICR waiver to allow nonphysician practitioners to perform the aforementioned physician functions specified for the provision of CR/ICR services, as well as comments on possible other CR/ICR program requirement waivers.

The following is a summary of the comments received and our responses.

Comment: Many commenters expressed appreciation and support for the proposed waiver, though a number of commenters stated that implementing this kind of regulatory flexibility for only a subset of CR/ICR patients that are AMI and CABG beneficiaries in the CR/ICR program would have limited impact on increasing the availability of CR/ICR services. The commenters observed that providers and suppliers of CR/ICR services still would have to comply with physician supervision requirements for patients other than CABG beneficiaries. As a result, the added flexibility will not occur in practice, limiting its intended effect. Thus, the commenters recommend implementation of a site-specific rather than a condition-specific physician supervision waiver which should be extended to all Medicare beneficiaries receiving CR/ICR services at designated institutions.

Some commenters recommended that CMS consider applying this waiver to all CR and ICR programs, including those in the control groups, as it would benefit the entire Medicare patient population. Some of these commenters asserted that the effects of the waiver and the incentive payment will be confounded in the EPMs and CR incentive payment model as proposed, while extending the waiver to all CR/ICR programs would allow CMS to isolate the impact of the EPMs and CR incentive payment on model participants.

Response: We appreciate the commenters’ interest in ensuring the availability of CR/ICR services for AMI and CABG beneficiaries, including those beneficiaries who would also be in the CR incentive payment model. We proposed a waiver that would allow, in addition to a physician, a nonphysician practitioner to perform the functions of supervisory physician, prescribing exercise, and establishing, reviewing, and signing an individualized treatment plan for a provider or supplier of CR and ICR services, at § 410.26 of this subpart. We do not believe a nonphysician practitioner is qualified to act in the capacity of a medical director. Thus, we proposed to specifically exclude the medical director function from this waiver. In addition, we proposed that all other definitions and requirements related to a physician or supervising physician under § 410.49 continue to apply. We proposed to codify the waiver at § 412.630.
any provider or supplier throughout AMI and CABG episodes, as discussed in section III.D.2. of this final rule. Therefore, we are not confident that we could identify specific institutions for a site-specific CR/ICR physician supervision waiver and still preserve AMI and CABG beneficiary freedom of choice of providers and suppliers, if certain institutions were afforded the opportunity under the AMI and CABG models to furnish CR/ICR services with more flexibility to AMI and CABG beneficiaries and others were not. The other possibility we considered in response to commenters’ concerns was providing the waiver of physician supervision to any CR/ICR site where an AMI or CABG beneficiary was being treated, an approach that would provide the same flexibilities regarding CR/ICR services to any CR/ICR provider or supplier chosen by the AMI or CABG beneficiary, thereby not interfering with beneficiary freedom of choice. However, this latter scenario would greatly expand the CR/ICR physician supervision waiver by potentially applying it to the CR/ICR services furnished to a large number of Medicare beneficiaries who are not in the AMI or CABG model just because they are being treated in the same CR/ICR program as even a single AMI or CABG beneficiary. While some commenters urged us to apply the proposed CR/ICR physician supervision waiver to all CR/ICR programs, including those in the AMI and CABG model control groups, based on their rationale that it would benefit the entire Medicare patient population, we may only provide waivers that are necessary to test the AMI and CABG models with regard to the cost and quality of care for AMI and CABG beneficiaries, not those that we believe would benefit all Medicare beneficiaries. Therefore, we do not believe such an expansion is necessary to test the AMI and CABG models.

We continue to believe that the proposed waiver that would allow, in addition to a physician, a nonphysician practitioner to perform the functions of supervisory physician, prescribing exercise, and establishing, reviewing, and signing an individualized treatment plan for a provider or supplier of CR and ICR services furnished to an AMI or CABG beneficiary during an AMI or CABG episode is a waiver that is necessary to test the AMI and CABG models. At this time, we will not modify the proposed waiver to expand the waiver of the CR/ICR physician supervision requirement to any beneficiaries that are not in AMI or CABG episodes. We will continue to seek input from AMI and CABG model participants, including those who are also EPM-CR participants, throughout implementation of the models and may consider making future proposals if we observe that limited availability of CR/ICR services is affecting beneficiaries’ access to CR/ICR services under the models.

Comment: Some commenters expressed their support for a current legislative bill that would expand access to cardiac rehabilitation by allowing physicians assistants, nurse practitioners and clinical nurse specialists to supervise cardiac intensive cardiac and pulmonary rehabilitation programs. The commenters requested that CMS provide Congress with data from the AMI and CABG models that support the value of cardiac rehabilitation.

Response: Upon receiving a specific request from Congress, the Secretary will provide the necessary technical assistance.

Comment: Some commenters sought clarification whether the proposed waiver would allow nonphysician practitioners to independently refer, that is, sign the order for CR/ICR services, per state scope of practice laws, therefore directly addressing the delay between hospital discharge, referral, and enrollment into CR/ICR services.

Response: The waiver of physician definition for prescribing exercise would allow nonphysician practitioners to independently sign the order for CR/ICR services, subject to state scope of practice laws.

Comment: A few commenters recommended that CMS extend the waiver to allow qualified nonphysician practitioners to perform the functions of a Medical Director for a provider or supplier of CR or ICR services.

Response: We do not believe that extending the waiver to cover the functions of the Medical Director is medically appropriate for testing the AMI and CABG models.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to provide a waiver to the definition of a physician to include a nonphysician practitioner (defined for the purposes of this waiver as a physician assistant, nurse practitioner, or clinical nurse specialist as authorized under sections 1861(s)(2)(K)(i) and (ii) of the Act and defined in section 1861(aa)(5) of the Act, or in §§ 410.74, 410.75, and 410.76 of the regulations). Thus, this waiver will allow, in addition to a physician practitioner to perform the functions of supervisory physician, prescribing exercise, and establishing, reviewing, and signing an individualized treatment plan for a provider or supplier of CR and ICR services furnished to an AMI beneficiary during an AMI or CABG episode. The waiver of physician definition for furnishing cardiac rehabilitation and intensive cardiac rehabilitation services to an EPM beneficiary is set forth at § 512.630.

K. Data Sharing

1. Overview

In section III.D.2. (81 FR 50843 through 50845) of the proposed rule, we proposed models similar to the CJR model, to financially incentivize EPM participants to engage in care redesign efforts to improve quality of care and reduce spending for the aggregate Part A and B FFS spending for beneficiaries included in the models during the inpatient hospitalization and 90 days post-discharge. Consistent with the CJR model, we proposed retrospective bundled payment models that would provide financial incentives for EPM participants to work with other health care providers and suppliers to improve the quality and efficiency of care for Medicare beneficiaries by paying EPM participants or holding them responsible for repaying Medicare based on EPM participants’ performance with respect to the quality and spending for AMI, CABG, and SHFFT episodes.

In addition to the CJR model, we have experience with a range of efforts designed to improve care coordination for Medicare beneficiaries through financial incentives similar to those proposed, including the Shared Savings Program, the Pioneer ACO model and the BPCI initiative, all of which make certain data available to participants to better enable them to achieve their goals. For example, participants in the Shared Savings Program initially receive aggregate information on their historical financial performance as well as quarterly data throughout their tenure in the program. In addition, Shared Savings ACOs receive certain beneficiary-identifiable claims information in accordance with our regulations. As noted in the June 9, 2015 Medicare Shared Savings Program final rule (80 FR 32733), ACOs participating in the Shared Savings Program have reported that the beneficiary-identifiable claims data that they receive from CMS are being used effectively to better understand the FFS beneficiaries that are receiving services from their providers. As stated in that rule, these data give ACOs valuable insight into patterns of care for their beneficiary population and enable them to improve
care coordination among and across providers and suppliers and sites of care. Similarly, participants in the Pioneer ACO model were given the ability to request historical claims data of beneficiaries aligned with the particular Pioneer ACO entity. (For more information see the CMS Web site http://innovation.cms.gov/Files/fact-sheet/Pioneer-ACO-Model-Beneficiaries- Rights-Fact-Sheet.pdf).

In addition, we provide BPCI participants with the opportunity to request beneficiary claims data regarding their own patients, both for the historical period used to set baseline prices for entities participating in BPCI as well as ongoing monthly claims fees containing Medicare FFS claims for beneficiaries that could have initiated an episode of care for that particular BPCI participant. These monthly claims feeds provide BPCI participants with data for both acute and post-acute care spending for beneficiaries that could have initiated an episode of care at that BPCI participant.

Based on our experience with these efforts, we believe that making certain data available to EPM participants can have a salutary effect on their performance and is necessary for them to, among other things, adequately structure their care pathways, coordinate care for beneficiaries, make practice changes supported under the models, identify services furnished to beneficiaries receiving services under the models, and estimate spending across provider types within EPM episodes. Therefore, we believe that providing EPM participants with certain claims and summary information on beneficiaries in accordance with applicable privacy and security laws and established privacy and security protections would improve their ability to monitor their performance and understand the totality of care provided during an episode of care. With this greater awareness and understanding, we anticipate that EPM participants would be better equipped to evaluate and modify their practice patterns and actively manage care delivery so that care for beneficiaries is better coordinated, quality and efficiency are improved, and payments are aligned more appropriately to the medically necessary services beneficiaries have a right to receive.

Accordingly, in the proposed rule, we proposed to provide EPM participants in the proposed AMI, CABG, and SHFFT models with beneficiary-level claims data for the historical period used to set episode benchmark and quality-adjusted target prices as well as with ongoing quarterly beneficiary-identifiable claims data in response to their request for such data in accordance with our regulations (81 FR 50944 through 50946). Given that we also proposed to incorporate regional pricing in the calculation of benchmark and quality-adjusted target prices, we also proposed to provide EPM participants with aggregate regional data (81 FR 50945). Our proposal to make these data available to EPM participants was included in §512.350. We note that, consistent with CJR, the EPM participant with which we would share data is the acute care hospital that is held accountable for spending during the episode of care. We believe our proposal to share data as we do under the CJR model would be the most effective approach under the proposed AMI, CABG, and SHFFT models, and that proposing different processes for these models would increase administrative complexity for CMS and model participants as well as create confusion, especially given that we proposed in section III.B.1. of the proposed rule (81 FR 50813) that some of the hospitals participating in CJR would also participate in the proposed EPMs. We requested comments on these proposals, particularly regarding possible ways, if any, to further align our proposed policies with those finalized under the CJR model, as well as any appropriate bases for treating these models differently.

The following is a summary of the comments received and our responses. Comment: Some commenters requested that CMS explicitly encourage the use of health IT to allow clinicians to communicate across settings of care. A commenter further suggested that CMS encourage post-acute care adoption of health information technology through incentives. The commenter stated that to date, there has not been a focus on post-acute care health information technology adoption or any standardization of data sharing platforms for clinical, financial or patient experience data between acute and post-acute care providers.

Response: While we do not explicitly require the use of health information exchange mechanisms in this final rule for all proposed EPM tracks, we do encourage EPM participants to collaborate with their post-acute care providers in their care redesign and to the extent that health information technology (health IT) is useful to that end we would encourage its use. Providing incentives for such use is beyond the scope of this final rule but in the evaluation of the EPMs we will certainly look to see the impact that health IT has on care coordination to the extent that participants use health IT to communicate with their preferred post-acute care providers.

2. Beneficiary Claims Data

As we stated in the proposed rule, based on our experience with BPCI and CJR participants, we recognize that EPM participants could vary with respect to the kinds of beneficiary claims information that would be most helpful. For example, we believe that while many EPM participants could find the ability to analyze raw claims data, other EPM participants could find it more useful to have a summary of these data. Given this, we proposed to make beneficiary claims information for AMI, CABG, and SHFFT episodes available through two formats both for the baseline period and on an ongoing basis during their participation in the model as we do for CJR (81 FR 50944–50945).

First, for EPM participants that lack the capacity to analyze raw claims data, we proposed to provide summary beneficiary claims data reports on beneficiaries’ use of health care services during the baseline and performance periods upon request and in accordance with applicable privacy and security laws and established privacy and security protections. Such summary reports would provide tools to monitor, understand, and manage utilization and expenditure patterns as well as to develop, target, and implement quality improvement programs and initiatives. For example, if the data provided by CMS to a particular EPM participant reflected that, relative to their peers, a certain provider was associated with significantly higher rates of inpatient readmissions than the rates experienced by other beneficiaries with similar care needs, that may be evidence that the EPM participant could consider, among other things, the appropriateness of that provider, whether other alternatives might be more appropriate, and whether there exist certain care interventions that could be incorporated post-discharge to lower readmission rates.

Such reports would allow EPM participants to assess summary data on their relevant beneficiary population without requiring a more complicated analysis of raw claims data.

Therefore, for both the baseline period and on a quarterly basis during an EPM participant’s performance period, we proposed to provide EPM participants with an opportunity to request summary claims data that would encompass the total expenditures and claims for episodes under the proposed AMI, CABG, and SHFFT models in which they are participating, including the procedure, inpatient stay, and all related costs associated with the episode assessed.
care covered under Medicare Parts A and B within the 90 days after discharge, including hospital care, post-acute care, and physician services for the EPM participant’s beneficiaries with an anchor diagnosis at discharge that is included under one of the proposed AMI, CABG, or SHFFT models.

We also proposed that these summary claims data reports, at a minimum, would also contain payment information, based upon the following categories for each episode initiated under the models:

- Inpatient
- Outpatient
- Skilled Nursing Facility
- Home Health
- Hospice
- Carrier/Part-B
- Durable Medical Equipment

These files would provide summary spending data such as episode counts, total average spending for each episode, and a breakdown of the episode counts and spending averages by each of the most common categories listed previously (for example, Inpatient, Outpatient, etc.). These reports should allow participants to assess summary data on their relevant beneficiary population without requiring analysis of raw claims data.

Alternatively, for EPM participants with the capacity to analyze raw claims data, we proposed to make more detailed beneficiary-level information available upon request and in accordance with applicable privacy and security laws and established privacy and security protections. These files would be much more detailed and include all beneficiary-level raw claims for all of the categories listed for each episode payment model episode. In addition, they would include episode summaries, indicators for excluded episodes, diagnosis and procedure codes, and enrollment and dual eligibility information for beneficiaries that initiate AMI, CABG, and SHFFT episodes. Through analysis, these detailed claims data would provide EPM participants with information to improve their ability to coordinate and target care strategies, as well as information to monitor, understand, and manage utilization and expenditure patterns. Such data would also aid them in developing, targeting, and implementing quality improvement programs and initiatives. We proposed that the data files would be packaged and sent to a data portal (to which the EPM participant must request and be granted access) in a “flat” or binary format for the EPM participant to retrieve. We would also note that, for both the summary and more detailed claims data, information that is subject to the regulations governing the confidentiality of alcohol and drug abuse patient records (42 CFR part 2) would be excluded from the data shared with an EPM participant. Our proposal to make available to EPM participants, through the most appropriate means, data that CMS determines may be useful to EPM participants to determine appropriate ways to increase the coordination of care, improve quality, enhance efficiencies in the delivery system, and otherwise achieve the goals of the proposed episode payment models was included in § 512.350. Further, CMS would make beneficiary-identifiable data available to an EPM participant in accordance with applicable privacy and security laws and only in response to the EPM participant’s request for such data for a beneficiary who has been furnished a billable service by the participant corresponding to the episode definitions for AMI, CABG, and SHFFT episodes.

We requested comments on this proposal.

The following is a summary of the comments received and our responses.

**Comment:** Commenters overwhelmingly supported our proposal to make data, in the form of raw claims and summary format, available upon request. Multiple commenters stated that meaningful and accurate data is a necessity for success under the CJR model and will be critical to success under the proposed EPMs. However, some commenters had suggestions on how to improve the data that we proposed to provide based on their experiences with other CMS models such as CJR and BPCI. These commenters stated that they have heard from multiple BPCI and CJR participants that there is a need for more sophisticated data in order to better understand performance and opportunities for improvement. They also stated that the data shared to date in CJR is resource-intensive to interpret and is not always actionable and that improved claims data quality would help EPM participants. Another commenter agreed that CMS should improve the quality of reports it provides hospitals. They noted that many hospitals do not have the capability to manipulate claims level data in house nor can they afford to purchase that capability. The commenters stated that CMS has clearly indicated it is moving toward longitudinal payment models and that CMS contractors therefore need to develop performance and reporting capabilities (and reports) that will fully support providers.

**Response:** Based on our experience on other CMS models like BPCI and CJR and feedback we have received through learning events, affinity groups, and collaboration site discussion boards, we generally believe we have proposed to make available the relevant data needed to succeed in the EPMs. However, we will take these comments into consideration when creating the data feeds for the new models. We will also work with our contractors to standardize, refine, and improve the data we disseminate to better inform providers.
reason to expect that contractor performance should fall short of expectations and thus do not anticipate a need for a special ombudsman to address data complaints and assess penalties. We will establish an open communication system with EPM participants so that they can immediately bring any issues surrounding file or data quality to our attention so that we can investigate and resolve problems quickly should they arise.

Comment: Another commenter encouraged CMS to use master data management technology to ensure correct patient-provider alignment across programs to ensure quality, timeliness, and proper assigning of data.

Response: We appreciate this comment and will explore options for incorporating this technology with our contractors.

Comment: A commenter requested that CMS consider adding hierarchical condition category (HCC) risk scores to the data files, citing that they may help EPM participants identify outliers and patients requiring more intense services.

Response: At this time, we do not plan to add HCC risk scores to the data files we will provide because we do not believe they are necessary data elements for EPM participants to conduct day-to-day operations in the EPMs given the current structure of the EPM models and payment calculations. Therefore, those data elements would not meet the HIPAA Privacy Rule’s “minimum necessary” standard, which applies to “health care operations” disclosures.

Comment: A commenter, who stated that they are a current CJR participant, noted the difficulties in mining the data they received to exclude BPCI episodes and other cancelled episodes. They added that participants need to ensure they are identifying every patient whose care is included in the bundle and to confirm those patients were moved into cost-effective care coordination pathways.

Response: We appreciate this comment and we plan to explore adding indicators to the beneficiary-identifiable claims data supplied to EPM participants that will provide information about circumstances that could result in EPM episode cancellation, such as admission of a beneficiary to a hospital that initiates episodes under BPCI for care that could potentially cancel an EPM episode. To the extent that adding such indicators to the claims data is feasible, providing this information through the claims data to EPM participants would ensure that EPM participants are informed as frequently as quarterly about circumstances that could result in EPM episode cancellation. We also note that at reconciliation, complete information would be provided to EPM participants about those episodes that were ultimately included in the participant’s reconciliation report as discussed in section III.D.5. of this final rule. Additional discussion on this can be found in sections III.C.4. (EPM Episodes) and III.D.6. (Adjustments for Overlaps) of this final rule.

Comment: We received some comments expressing concerns with the logistics of receiving EPM data from some participants with past experience in CJR. A few of these commenters recommended that CMS ensure appropriate processes are in place for the proposed EPMs to ensure that providers will actually be able to access data when needed. Another commenter also provided some specific examples of improvements that could be made to the data delivery process to improve efficiency for users that may work with multiple EPM hospitals and models.

Some examples include a mechanism to download multiple sets of files simultaneously, delivering the data through a secure FTP site, and providing accurate file layouts before data is released. In addition, they requested specific points of contact for hospital systems participating in EPM for issues related to data dissemination.

Response: We appreciate these comments and will take them into consideration when developing the data dissemination process and creating the data portal for the EPMs. We will provide EPM participants with specific points of contact for data issues at the time they register for their portal account access.

Comment: Some commenters also expressed that they are sensitive to the increasing volume of requests that CMS is likely experiencing in parallel with expanding care and payment redesign models, and they encouraged CMS to carefully consider how potential backlogs and delays in data availability may impact the target implementation date.

Response: We appreciate this comment and understand this concern. We realize that timely access to data prior to model implementation is important to model participants and will work with our contractors and other CMS components to disseminate data as soon as feasible once the final rule is published.

Comment: A commenter cited CMS’ interpretation of Section 105(b) of MACRA (Pub. L. 114–114) (see 81 FR 44471 for CMS interpretation) and requested that CMS provide qualified clinical data registries (QCDRs) with access to Medicare data for purposes of linking such data with clinical outcomes data and performing scientifically valid analysis or research to support quality improvement or patient safety. In addition, they encouraged CMS to indicate “fact of death” by matching Medicare claims data with Social Security Death Masterfile (SSDMF) death data (or another source of vital statistics) before providing it to QCDRs.

Response: We believe these comments are outside the scope of this final rule, but we would encourage QCDRs to contact ResDAC for more information on requesting the files they desire at: http://www.resdac.org/cms-data/request/cms-data-request-center.

Comment: A few commenters also remarked on CMS’ proposal to exclude individually identifiable data related to substance abuse from claims files as it currently does in other programs. Commenters noted that this information is key for hospitals understanding the full risk associated with patients and identify appropriate care management. Some comments suggested that CMS should provide cost and claim data for these services since hospitals will be forced to bear risk for these patients. A few commenters also requested that CMS provide the de-identified cost and claims data for these services and stated that if this is not possible CMS should, at a minimum, provide the aggregate payment amount for these services.

Another commenter encouraged the Innovation Center to use its waiver authority to make beneficiary-specific claims-level substance abuse information available to hospitals. In addition, they recommended that CMS work with the Congress to create an exception to 42 CFR part 2 to provide beneficiary-specific claims level substance abuse information.

Response: Section 1115A of the Act does not authorize the waiver of the requirements under 42 CFR part 2. Moreover, our proposal to exclude this information is consistent with our treatment of these data in other similar CMS programs and models where providers must take on risk in managing the care of their beneficiaries, such as the Shared Savings Program and the BPCI initiative. We would note that, based on our experience to date, we are unaware of this policy being a significant impediment to the operations of these efforts. We also appreciate the suggestions to make these data available in a de-identified manner. We have considered this and are not currently aware of a means to make de-identified beneficiary-specific data
available in a way that would provide useful information to participating hospitals without potentially making it possible to identify beneficiaries. Similarly, we have also not identified a way in which to make meaningful aggregate data available on a limited basis without potentially compromising beneficiary confidentiality. However, we will continue to consider these comments and the feasibility of making such data available in a way that is both meaningful to participating hospitals and in compliance with 42 CFR part 2.

Final Decision: After consideration of the public comments received, we are finalizing our proposals at § 512.350 (a) to make available to EPM participants, through the most appropriate means and in the manner described previously, summary and beneficiary-level claims data that CMS determines may be useful to EPM participants for purposes of the EPMs. We are also finalizing our proposal to exclude information that is subject to the regulations governing the confidentiality of alcohol and drug abuse treatment records (42 CFR part 2) from any summary or beneficiary-level claims data shared with an EPM participant. CMS will make beneficiary-identifiable data available to an EPM participant in accordance with applicable privacy and security laws and established privacy and security protections and only in response to the EPM participant’s request for such data for a beneficiary who has been furnished a billable service by the participant corresponding to the episode definitions for AMI, CABG, and SHFFT episodes.

3. Aggregate Regional Data

As discussed in section III.D.4.b.(6) (81 FR 50855 and 50856) of the proposed rule, we proposed to incorporate regional pricing data when establishing target prices for EPM participants as we do in the CJR model pricing methodology. As indicated in the CJR final rule (80 FR 73510), we finalized our proposal to share regional pricing data with CJR participants because it was a factor affecting target prices. Given the similarities between the CJR model and the proposed EPMs, particularly our proposal to incorporate regional pricing data when establishing target prices under the model, we proposed to provide aggregate expenditure data available for all claims associated with AMI, CABG, and SHFFT episodes for the U.S. Census Division in which the EPM participant is located, as we similarly provide to hospitals participating in the CJR model.

Final Decision: After consideration of the public comments received, we are finalizing our proposal to provide EPM participants with aggregate data on the total expenditures during an acute inpatient stay and 90-day post-discharge period for all Medicare FFS beneficiaries who would have initiated an episode under our proposed episode definitions in section III.C. of the proposed rule (81 FR 50829). This data would be provided at the regional level; that is, we proposed that an EPM participant would receive, if requested from CMS, aggregate regional data for potential episode payment model AMI, CABG, and/or SHFFT episodes initiated in the U.S. Census Division where the EPM participant is located.

These regional data would be in a format similar to the proposed summary claims data reports and would provide summary information on the average episode spending for AMI, CABG, and SHFFT episodes in the U.S. Census Division in which the EPM participant is located. We sought comments on our proposal to provide these data to EPM participants.

The following is a summary of the comments received and our responses. Comment: We received comments supporting our proposal to provide the opportunity to request aggregate regional data that includes information about average episode spending. However, commenters also included several suggestions for how this data could be improved. A commenter stated that they believe this data can be made more actionable by including key utilization metrics such as—

- Percent of episodes with at least one readmission
- Percent of episodes that include skilled nursing facility (SNF) care
- Percent of episodes that include home health care
- Percent of episodes that include an inpatient rehabilitation (IP rehab) stay
- Index hospitalization average length of stay (ALOS)
- SNF ALOS for episodes that include SNF
- IP rehab ALOS for episodes that include IP rehab

They stated that these metrics would serve as benchmarks for EPM participants, and help identify opportunities for improvement and inform care intervention strategies.

Response: We appreciate the comments supporting our proposal to provide the opportunity to request aggregate regional data. In addition, we will continually work to improve the data we provide to EPM participants and we will explore the feasibility of including the additional utilization metrics suggested by the commenter in the aggregate regional data files.

4. Timing and Period of Baseline Data

We recognize that providing the ability to request certain baseline data will be important for EPM participants to be able to estimate episode spending, coordinate care, and identify areas for practice transformation, and that early release of this data can facilitate their efforts to do so. Also, as discussed in section III.D.4.b.(3) of the proposed rule (81 FR 50854), episode benchmark prices would be calculated using an EPM participant’s historical episode spending during their baseline period. Further, we believe that EPM participants will view the episode payment model effort as one involving continuous improvement. As a result, changes initially contemplated by an EPM participant could be subsequently revised based on updated information and experiences.

Therefore, as with CJR and BPCI, we proposed to make 3 years of baseline data available to EPM participants and intend to make these data available upon request prior to the start of the first episode payment model performance year and in accordance with applicable privacy and security laws and established privacy and security protections. We believed that 3 years of baseline data is sufficient to reflect both an EPM participant’s most recent performance and recent performance trends. Moreover, making data available for a 3-year period aligns with our proposal to set a target price based on a 3-year period of baseline data in section III.D. of this final rule. As we stated in the proposed rule, we believe that if an EPM participant has access to baseline data for the 3-year period used to set its episode benchmark and quality-adjusted target prices, then it would be better able to assess its practice patterns, identify cost drivers, and ultimately redesign its care practices to improve efficiency and quality.

Therefore, we proposed that the 3-year period utilized for the baseline period match the baseline data used to create EPM participants episode benchmark and quality-adjusted target prices, as discussed in section III.D. of this final rule. Specifically, we proposed that the baseline beneficiary-level and
summary data (both EPM participant-level and regional summary data) would be available for episodes that began January 1, 2013 through December 31, 2015. We requested comments on these proposals.

The following is a summary of the comments received and our responses.

Comment: We received many comments about the importance of providing timely data prior to the start of the model. Many commenters requested that CMS make historical and program design data available to EPM participants as soon as CMS is able to do so after the publication of the final rule. The commenters stated that they would need the data as early as possible in order to allow for enough time to review the data, to understand the needs and utilization patterns of the population, and to tailor interventions based on findings. They also stated that the data would help identify the facilities and provider types most frequently used by patients after discharge. In addition, commenters pointed out that early data would be essential for EPM participants to understand how their episodes compare to others in the region and where they stand at the start of the EPMs. A commenter recommended that CMS provide historical claims data a minimum of 6 months prior to the commencement of the models so as to allow providers the opportunity to analyze the data for care coordination opportunities, evaluate post-acute care providers for partnership opportunities, and negotiate care arrangements. Another commenter further requested all the historical data used to set the target prices be provided to EPM participants by December 31, 2016 for a July 1, 2017 start date and that we also provide guidance and technical support to assist participants once this data is shared.

Response: We appreciate comments and understand the usefulness of these data to EPM participants’ ability to understand and adjust their performance and partner with collaborators. We will make every effort to make this data available for request as soon as possible after the final rule is published while complying with applicable privacy and security laws. Additionally, we will provide guidance and technical support during the process to request, retrieve, and evaluate the data received.

Comment: A few commenters cited that data challenges, including the significant financial investment, time and cost involved in developing and using the necessary infrastructure, along with substantial transaction fees for sharing health information necessitate a delay in the start of the EPMs. They went on to state that EPM participants should be provided data with at least as much preparatory time as BPCI participants.

Response: We appreciate these comments and again acknowledge the importance of providing timely access to data. As previously noted, we will work to make this data available for request as soon as feasible while complying with applicable privacy and security laws. To the extent that it may be relevant, we note that we have revised our proposal to begin downside risk across the board as of April 1, 2018. As discussed in detail in section III.D.2.c. of this final rule, we are finalizing an option to allow the voluntary selection of downside risk for performance year 2 and to extend our proposed date for required downside risk to performance year 3, which should provide participants with more lead time to understand their data prior to taking on 2 sided risk under the EPMs.

Final Decision: After consideration of the public comments received, we are finalizing our proposal, without modification to make 3 years of baseline data available to EPM participants and intend to make these data available to participants upon request prior to the start of the first episode payment model performance year (July 1, 2017) and in accordance with applicable privacy and security laws and established privacy and security protections. The 3-year period utilized for the baseline period matches the baseline data used to create EPM participants’ episode benchmark prices. Specifically, the baseline beneficiary-level and summary data (both EPM participant-level and regional summary data) will be available for episodes that began January 1, 2013 through December 31, 2015.

5. Frequency and Period of Claims Data Updates for Sharing Beneficiary-Identifiable Claims Data During the Performance Period

As we stated in the proposed rule (81 FR 50946), in addition to baseline data, we believe that the availability of periodically updated beneficiary-identifiable claims data (both summary and beneficiary-level) will assist EPM participants in the proposed AMI, CABG, and SHFFT models to identify areas where they might wish to change their care practice patterns, as well as monitor the effects of any such changes. With respect to these purposes, we have considered the most appropriate period and frequency for making updated claims information available to EPM participants, while complying with the HIPAA Privacy Rule’s “minimum necessary” standard.

As stated in the proposed rule, we believe that, as is the case with CJR, making claims data available that would represent up to 6 quarters of information upon receipt of a request for such information that meets the requirements of the HIPAA Privacy Rule, would be representative of total spending and useful to hospitals as they consider long-term practice changes. We note that we intend for the data for the model to be consistent with our proposed performance year of January 1 through December 31 (July 1 through December 31 for performance year 1). To accomplish this for the first year of the models (2017), we proposed to provide, upon request and in accordance with the HIPAA Privacy Rule, claims data from July 1, 2017 to June 30, 2018 on as frequently as a running quarterly basis, as claims were available (81 FR 50946). For each quarter and extending through June 30, 2018, we proposed that participants during that first year would receive data for up to the current quarter and all of the previous quarters going back to July 1, 2017. These data sets would contain all claims for all potential episodes that were initiated on or after July 1, 2017 and capture a sufficient amount of time for relevant claims to have been processed. We noted that we would limit the content of this data set to the minimum data necessary for the participating hospital to conduct quality assessment and improvement activities and effectively coordinate care of its patient population.

Accordingly, we proposed to make updated claims data available to EPM participants, representing up to 6 quarters of data, upon receipt of a request for such information that meets CMS’ requirements to ensure the applicable HIPAA conditions for disclosure have been met. Also, consistent with our procedures for CJR, we proposed to make these data available as frequently as a quarterly basis. Given that we have received requests in other initiatives to make data available on a more frequent basis, we also proposed to eventually make these data available on at least as frequently as a monthly basis if practicable. In addition, we proposed that for an EPM participant to receive data on episode spending, they would only need to make a single initial request rather than multiple periodic requests for data. CMS would make such data available on at least as frequently as a quarterly basis.
that they no longer wish to receive these data.

Our proposal to make the minimum data necessary for EPM participants to conduct quality assessment and improvement activities and effectively coordinate care of its patient population as frequently as on a quarterly basis throughout the EPM participant’s participation or until they notify CMS that they no longer wish to receive these data is included at § 512.350(b)(2). We sought comments on this proposal.

The following is a summary of the comments received and our responses.

Comment: Many commenters were supportive of CMS’ proposal to make data available as frequently as monthly if practical, but strongly encouraged the monthly release of the data to the EPM participants as soon as the EPMs are implemented, as opposed to quarterly. A commenter stated that a quarterly timeline would significantly delay EPM participants in identifying inefficiencies arising with regard to beneficiary utilization and noted that issues could occur in the continuum of care delivery and coordination. Another commenter indicated that monthly data is essential, especially at the beginning of the EPMs, and that the quarterly data has a lag so the initial file will contain mostly incomplete episodes. Other commenters referenced the BPCI initiative which currently provides monthly data to its Awardees.

Response: We appreciate these comments and realize that frequent data will assist many EPM participants that are selected for the EPMs. As proposed, we will work with our contractors to provide data monthly as opposed to quarterly as soon as it is feasible for us to do so.

Comment: We received some comments on providing reconciliation data and results more frequently than annually. Commenters referenced the quarterly reconciliation timelines in BPCI and one commenter stated that the quarterly results would allow providers to assess their performance and understand if care interventions are working, or need to be altered. Another commenter strongly encouraged CMS to provide EPM participants with quarterly updates for completed episodes through a mechanism similar to other Innovation Center initiatives.

Response: Based on our experience in BPCI, quarterly reconciliation can lead to large variation in NPRA and uncertainty for providers, in addition to being a very resource-intensive process for providers and CMS. While we understand that monthly reconciliation results and data could be helpful for providers to assess their performance, we believe that the beneficiary claims data we plan to disseminate will allow providers to do this. Additionally, we note that we will be working with our contractors to explore the feasibility of providing a high-level interim report on reconciliation status during the payment year which should help EPM participants assess how they are doing under the model. Therefore, as stated in section III.D.5. of this final rule, we plan to finalize our policy for annual reconciliation data and results in the same way we have done this for CJR. Additional discussion on this topic can be found in section III.D.5. of this final rule.

Comment: Commenters requested that data be made available automatically without a specific request for the data. These commenters noted the potential for additional administrative burden associated with requesting the data. A commenter recommended that an EPM participant should only need to register to receive data and provide the appropriate contact.

Response: We want to limit administrative burden for EPM participants participating in these models and wish to clarify that while we will make data available to EPM participants only upon request, participants would be able to make a single request for these data for each model prior to the start of the performance period and the data would be available to them for the duration of their participation or until they notify CMS that they no longer wish to receive these data. To be consistent with the HIPAA Privacy Rule’s “minimum necessary” standard, we will continue to make data available only in response to a request.

Comment: Other commenters appreciated our proposal that EPM participants only need to make an initial single request rather than multiple periodic requests for data as this will impose less of an administrative burden on hospitals.

Response: We appreciate these comments.

Final Decision: After consideration of the public comments received, we are finalizing our proposal at § 512.350(b)(1) to provide up to 6 quarters of claims data (both summary and beneficiary-level) to EPM participants upon request and in accordance with applicable privacy and security laws. We are also finalizing our proposal that for an EPM participant to receive data on episode spending, they need only make a single initial request rather than multiple periodic requests. Additionally, we are finalizing our proposal to make these data available on a quarterly basis and as frequently as a monthly basis if practicable. Consistent with our proposal to make these data available as frequently as monthly if practicable, we are updating our proposal at § 512.350(b)(2) to provide that updated claims data will be made available not “as frequently as on a quarterly basis throughout the EPM participant’s participation,” but instead “no less frequently than on a quarterly basis.”

6. Legal Permission To Share Beneficiary-Identifiable Data

As we have stated previously (80 FR 73513), we recognize that there are a number of issues and sensitivities surrounding the disclosure of beneficiary-identifiable health information, and note that a number of laws place constraints on sharing individually identifiable health information. For example, section 1106 of the Act bars the disclosure of information collected under the Act without consent unless a law (statute or regulation) permits the disclosure. Here, the HIPAA Privacy Rule allows for the proposed disclosure of individually identifiable health information by CMS.

In the proposed rule, we proposed to make EPM participants financially responsible for services that may have occurred outside of the hospital during the 90-day post-discharge period (81 FR 50946). Although we expect EPM participants to be actively engaged in post-discharge planning and other care during the 90-day post-discharge period for beneficiaries receiving services under the proposed AML, CABG, and SHFFT models, we believe that it is necessary for the purposes of these models to provide EPM participants with beneficiary-level claims data, either in summary or line-level claim formats for a 3-year historical period as well as on a quarterly basis during the performance period. We believe that these data constitute the minimum information necessary to enable the participant hospital to understand spending patterns during the episode, appropriately coordinate care, and target care strategies toward individual beneficiaries furnished care by the participant hospital and other providers and suppliers.

Under the HIPAA Privacy Rule, covered entities (defined as health care plans, providers that conduct covered transactions, including hospitals, and health care clearinghouses) are barred from using or disclosing individually identifiable health information (called “protected health information” or PHI) in a manner that is not permitted or required under the HIPAA Privacy Rule. The Medicare FFS
program, a “health plan” function of the Department, is subject to the HIPAA Privacy Rule limitations on the disclosure of PHI. The hospitals and other Medicare providers and suppliers are also covered entities, provided they are health care providers as defined by 45 CFR 160.103 and they conduct (or someone on their behalf conducts) one or more HIPAA standard transactions electronically, such as for claims transactions. In light of these relationships, we believe that the proposed disclosure of the beneficiary claims data for an acute inpatient stay plus 90-day post-discharge for episodes included under the proposed models would be permitted by the HIPAA Privacy Rule under the provisions that permit disclosures of PHI for “health care operations” purposes. Under those provisions, a covered entity is permitted to disclose PHI to another covered entity for the recipient’s health care operations purposes if both covered entities have or had a relationship with the subject of the PHI to be disclosed, the PHI pertains to that relationship, and the recipient will use the PHI for a “health care operations” function that falls within the first two paragraphs of the definition of “health care operations” in the HIPAA Privacy Rule (45 CFR 164,506(c)(4)).

The first paragraph of the definition of health care operations includes “conducting quality assessment and improvement activities, including outcomes evaluation and development of clinical guidelines,” and “population-based activities relating to improving health or reducing health costs, protocol development, case management and care coordination” (45 CFR 164,501).

Under our proposal, EPM participants would be using the data on their patients to evaluate the performance of the participant hospital and other providers and suppliers that furnished services to the patient, conduct quality assessment and improvement activities, and conduct population-based activities relating to improving health for their patients. When done by or on behalf of a covered entity, these are covered functions and activities that would qualify as “health care operations” under the first and second paragraphs of the definition of health care operations at 45 CFR 164,501. Hence, as previously discussed, we believe that this provision is extensive enough to cover the uses we would expect an EPM participant to make of the beneficiary-identifiable data and would be permissible under the HIPAA Privacy Rule. Moreover, our proposed disclosures would be made only to HIPAA covered entities that have (or had) a relationship with the subject of the information, the information we would disclose would pertain to such relationship, and those disclosures would be for purposes listed in the first two paragraphs of the definition of “health care operations”.

When using or disclosing PHI, or when requesting this information from another covered entity, covered entities must make “reasonable efforts to limit” the information that is used, disclosed or requested to the “minimum necessary” to accomplish the intended purpose of the use, disclosure or request (45 CFR 164.502(h)). We believe that the provision of the proposed data elements listed previously would constitute the minimum data necessary to accomplish the EPM’s goals of the participant hospital.

The Privacy Act of 1974 also places limits on agency data disclosures. The Privacy Act applies when the federal government maintains a system of records by which information about individuals is used or disclosed by the individual’s personal identifiers (names, Social Security numbers, or any other codes or identifiers that are assigned to the individual). The Privacy Act prohibits disclosure of information from a system of records to any third party without the prior written consent of the individual to whom the records apply (5 U.S.C. 552a(b)).

“Routine uses” are an exception to this general principle. A routine use is a disclosure outside of the agency that is compatible with the purpose for which the data was collected. Routine uses are established by means of a publication in the Federal Register about the applicable system of records describing to whom the disclosure will be made and the purpose for the disclosure. We believe that the proposed data disclosures are consistent with the purpose for which the data discussed in the final rule was collected and may be disclosed in accordance with the routine uses applicable to those records.

We note that, as is the case with CJR, in the proposed rule, we proposed to disclose beneficiary-identifiable data to only the hospitals that are bearing risk for an AMI, CABG, or SHFFT episode and not with their collaborators (81 FR 50947). As stated in the final CJR rule (80 FR 73515), we believe that the hospitals that are specifically held financially responsible for an episode should make the determination as to which data are needed to manage care and care processes with their collaborators as well as which data they might disclose in the randomly selected MSAs, if any, to their collaborators provided they are in compliance with the HIPAA Privacy Rule. We note that beneficiaries have the right to request restrictions on the use of their data in accordance with the HIPAA Privacy Rule, but covered entities are not required to agree to such requests. We believe our data sharing proposals are permitted by and are consistent with the authorities and protections available under the aforementioned statutes and regulations.

The following is a summary of the comments received and our responses.

Comment: Multiple commenters agreed with our proposals to provide EPM participants with the opportunity to request 3 years of historical or baseline data prior to the start of the first EPM performance year. However, some commenters requested that CMS make this data available to all hospitals regardless of whether they located in a randomly selected MSA or not. A commenter pointed out that because there is not a voluntary avenue for participation in these proposed models by hospitals that are not included in the selected MSAs, such hospitals could face a competitive disadvantage by not being provided the same kinds of financial and performance data as hospitals that are included in these EPMs. Other commenters requested that CMS begin providing data to all hospitals so that they may begin to understand their patients clinical care paths, episode spending, and compare themselves to their peers.

Response: We appreciate the comments supporting our proposal to make 3 years of historical or baseline data available to EPM participants. For hospitals that are not in selected MSAs, we understand that this data would assist in identifying opportunities for improving efficiency and care coordination, but we do not have the authority to expand the availability of these data beyond what we proposed. We proposed to make EPM data available under the HIPAA Privacy Rule provision that permits the disclosure of information for “health care operations” purposes and in accordance with the “minimum necessary” standard.

We thank commenters for their input on our proposals to provide beneficiary-level data to EPM participants, upon request, under the HIPAA Privacy Rule provisions that permit disclosures of PHI for “health care operations” purposes. We are not modifying our proposals to provide hospitals that are not included in the randomly selected EPM MSAs with the opportunity to request EPM data.
7. Data Considerations With Respect to EPM and CJR Collaborators

As noted earlier in this section and as is the case with CJR (80 FR 73515), we proposed to disclose beneficiary-identifiable data to only the EPM participants that are bearing risk for an AMI, CABG, or SHFFT episode and not with their collaborators because we believed that the EPM participants that are specifically held financially responsible for an episode should make the determination as to which data are needed to manage care and care processes with their collaborators as well as what data they might re-disclose in accordance with applicable privacy and security laws. Based on our experience in implementing CJR, however, we understood that some CJR collaborators under that model believed that not having comparable data poses challenges to their ability to assess their own performance in the context of the model and the region in which they operate. As such, these collaborators believed that it would be helpful to have additional data with which they could better assess their own performance, including information about care patterns within their region.

We are considering ways in which to address the concerns raised by these CJR collaborators and potentially similar future concerns that could arise among EPM collaborators as well as what additional data might be helpful for these purposes and which could be disclosed in accordance with existing statutory and regulatory requirements. As previously discussed, EPM participants, like CJR participants, may share data with their EPM (or CJR) collaborators provided they are “business associates” in compliance with the HIPAA Privacy Rule, and we encourage them to make data available to their EPM collaborators to the extent they deem it appropriate and in compliance with these strictures.

In addition, given our view that the HIPAA Privacy Rule limits our ability to share beneficiary-identifiable data with non-EPM (or non-CJR) participants, we are considering whether it would be feasible and appropriate to make additional non-beneficiary-identifiable aggregate data publicly available through some means. For example, we are exploring whether it would be helpful to make available aggregate summary data organized by anchor MS–DRI, provider type, and region for care that would be included in episodes that would meet the criteria for inclusion in the regional component of EPM (or CJR) episode benchmark prices as described in section III.D.4.b. of this final rule (or 80 FR 73337 with respect to CJR), assuming all IPPS hospitals nationally were EPM (or CJR) participants. We will refer to these episodes as simulated episodes later in this section. We were interested in whether information such as the following would be helpful to EPM (or CJR) collaborators:

- Number of simulated episodes and number of hospitals with each anchor MS–DRG at discharge in the simulated episodes.
- For AMI model anchor MS–DRGs, the number of simulated episodes with chained anchor admissions by the price MS–DRG that would have been assigned to the simulated episode.
- For AMI model anchor MS–DRGs, the number of simulated episodes with readmissions resulting in discharge under a CABG MS–DRG by the CABG MS–DRG.
- Average (mean and median) and standard deviation of total spending on those simulated episodes.
- Number of simulated episodes with and mean acute care payments for the anchor hospitalization and readmission.
- Number of simulated episodes with and mean Part B payments.
- Number of simulated episodes with and mean inpatient rehabilitation facility payments.
- Number of simulated episodes with and mean skilled nursing facility payments.
- Number of simulated episodes with and mean home health payments.
- Proportion of total simulated episode spending attributable to acute care payments for the anchor hospitalization and readmissions.
- Proportion of total simulated episode spending attributable to Part B payments.
- Proportion of total simulated episode spending attributable to inpatient rehabilitation facility payments.
- Proportion of total simulated episode spending attributable to skilled nursing facility payments.
- Proportion of total simulated episode spending attributable to home health payments.

To assist us as we consider future options for potentially increasing the availability of data to collaborators under the EPMs or similar models such as CJR, we sought comments on what kinds of actions and data would be most helpful to EPM, or similar model (such as CJR) collaborators, and which could be disclosed in accordance with the existing statutory and regulatory requirements for sharing data. We note that the number of simulated episodes with chained anchor admissions by the price MS–DRG on which we solicited comments for AMI model anchor MS–DRGs is no longer relevant due to the fact that we are not finalizing the AMI transfer policy we proposed, as discussed in detail in section III.C. of this final rule.

The following is a summary of the comments received and our responses.

Response: We appreciate the suggestions commenters offered. While we understand the commenters’ desire for us to provide beneficiary-identifiable claims data to collaborating post-acute care providers, we note that we are unable to do this as we do not have the authority to expand the availability of these data beyond what we proposed. As with CJR, and as indicated earlier, there are significant sensitivities and constraints on our ability to make beneficiary-identifiable data available.

We proposed to make these data available to hospitals participating in the model in recognition of and in compliance with the HIPAA Privacy Rule provision that permits the disclosure of this information for “health care operations” purposes and in accordance with the minimum necessary standard. Requests for EPM specified that claims data should be made available for all EPM collaborators and providers affected by the implementation of EPMs. In particular, they stated that post-acute care providers find it difficult to access the data needed (for example, claims data on readmissions) to support care coordination capabilities. Another commenter requested that any provider who treats an EPM beneficiary during the episode should also have access to the claims data so that providers would be able to analyze the data and develop approaches to care redesign, especially when the hospital has not expended the resources to do such analytics. They also commented that this analysis would allow post-acute care providers to demonstrate their value to a hospital and would also allow post-acute care providers to better position themselves when entering into gainsharing arrangements with a participating hospital. Other comments suggested that CMS should require that EPM data be shared equitably among the participating entities, regardless of which entity is charged with coordinating the fiscal arrangement according to CMS.
these data. Although providers and suppliers (physicians, post-acute care providers, etc.) that are collaborators with hospitals participating in the EPMs might be eligible to receive data under HIPAA, provided that they had a “business associate” relationship with the beneficiary, we do not believe it is appropriate for CMS to provide collaborators these data directly because hospitals are the entities designated under the model to assume risk and responsibility for a beneficiary’s episode of care under the model. Accordingly, as the responsible entity (and as a covered entity under HIPAA), we believe that hospitals should decide what data they need to manage care and care processes with their collaborators and, in consultation with their own legal counsel, what data they may or may not wish to make available to those collaborators provided they are in compliance with the HIPAA Privacy Rule.

Comment: Other commenters made suggestions regarding the types of data we considered to provide publicly to EPM collaborators. They stated that the data should include information included in the Quality and Resource Use Reports (QRUR) so that collaborators will be able to understand their own costs as well as those for downstream providers in order to effectively enter into these financial and clinical arrangements.

Response: We appreciate the support and at the patient level. We will also account the impact of the models at the geographic unit level, the hospital level, and other provider characteristics and market characteristics. The random method of selection for participating MSAs will allow the evaluation to observe the operation of the model in a variety of circumstances and among providers and suppliers who may not otherwise choose to participate in an alternative payment model.

As stated in the proposed rule, we plan to use a range of analytic methods, including regression and other multivariate methods, and difference-in-differences methods to examine each of our measures of interest. Measures of interest could include, for example, quality of and access to care, utilization patterns, expenditures, and beneficiary experience. With these methodologies, we would be able to examine the experience over time relative to those in the comparison groups controlling for as many of the relevant confounding factors as is possible. The evaluation would also include rigorous qualitative analyses in order to capture the evolving nature of the care model interventions.

In our design, as we stated in the proposed rule, we plan to take into account the impact of the bundled payment program data. A commenter added that the BPCI model recognized the need for a facilitator convenor—an entity that serves an administrative and technical assistance function for one or more designated awardees/awardee conveners, and who would not have an agreement with CMS, bear financial risk, or receive any payment from CMS. Another commenter requested that CMS consider bundling all claims data necessary under a shared use agreement (DUA) process similar to how beneficiary-identifiable claims data are currently distributed under the BPCI program. They stated that this would allow third-party entities to provide data analysis services to EPM participants who lack the capabilities and infrastructure to do so.

Response: We appreciate the support offered by these commenters. In addition, we will require a data request and attestation form and will have a mechanism in place for business associates, as defined under HIPAA, to receive data directly from CMS on an EPM participant’s behalf (if approved by that EPM participant). This form would also allow business associates of selected hospitals to provide administrative or technical assistance to multiple hospitals.

IV. Evaluation Approach

A. Background

As stated in the proposed rule, the EPMs are intended to enable CMS to better understand the effects of episode payment approaches on a broader range of Medicare providers and suppliers than would choose to participate in a model such as is currently being tested under BPCI. Obtaining information that is representative of a wide and diverse group of episode initiators will best inform us on how such a payment model might function were it to be more fully integrated within the Medicare program. The CR incentive model is intended to enable CMS to assess whether the incentive improves patient quality and access to this covered benefit without increasing overall payments. All CMS models, which would include the EPMs and CR incentive model, are rigorously evaluated on their ability to improve quality and reduce costs. In addition, we routinely monitor CMS models for potential unintended consequences of the model that run counter to the stated objective of lowering costs without adversely affecting quality of care.

Outlined in the following section are the proposed design and evaluation methods, the data collection methods, key evaluation research questions, and the evaluation period and anticipated reports for the EPMs as well as our response to comments received and our final decisions.

B. Design and Evaluation Methods

As stated in the proposed rule, our evaluation methodology for the EPMs and CR incentive model is consistent with the standard Innovation Center evaluation approaches we have taken in other projects such as the BPCI initiative, the CJR model, the Acute Care Episode (ACE) Demonstration, the Pioneer ACO model, and other Innovation Center models. Specifically, the evaluation design and methodology we proposed is designed to allow for a comparison of historic patterns of care among the participants to any changes made in these patterns in response to the models. In addition, the overall design would include a comparison of participants in EPM or CR areas with a matched comparison group in areas not participating in a specific episode to help us discern simultaneous and competing provider and market level forces that could influence our findings. Comparison group members for the EPMs would be selected based on how well they match the EPM participants along a variety of measurable dimensions, such as size, expenditures, and other provider characteristics and market characteristics.
consider various statistical methods to address factors that could confound or bias our results. For example, we would use statistical techniques to account for clustering of patients within hospitals and markets. Clustering allows our evaluation to compensate for commonalities in beneficiary outcomes by hospitals and by markets. Thus, in our analysis, if a large hospital consistently has poor performance, clustering would allow us to still be able to detect improved performance in the other, smaller hospitals in a market rather than place too much weight on the results of one hospital and potentially lead to biased estimates and mistaken inferences. Finally, we plan to use various statistical techniques to examine the effects of the models while also taking into account the effects of other ongoing interventions such as BPCI and the Shared Savings Program. For example, we will consider additional regression techniques to help identify and evaluate the incremental effects of adding the EPMs in areas where patients and market areas are already subject to these other interventions as well as potential interactions among these efforts.

C. Data Collection Methods

We will consider multiple sources of data to evaluate the effects of the EPMs and CR Incentive models. We expect to base much of our analysis on secondary data sources such as Medicare FFS claims. The beneficiary claims data will provide information such as use of CR, expenditures in total and by type of provider and service as well as whether or not there was an inpatient hospital readmission or a subsequent AMI. In conjunction with the secondary data sources mentioned previously, we will consider a CMS-administered survey of beneficiaries who received a qualifying procedure during the performance period in the EPMs’ evaluation. This survey would be administered to beneficiaries who were in the EPMs qualifying episode or similar patients selected as part of a control group. The primary focus of this survey would be to obtain information on the beneficiary’s experience in EPMs’ episodes relative to usual care. The administration of this beneficiary survey would be coordinated with administration of the HCAHPS survey so as to not conflict with or compromise HCAHPS efforts. For the evaluation of both the EPMs and the CR incentive model, we will consider a survey administered by CMS and guided interviews by CMS with providers and suppliers including, but not limited to, initiating and transfer hospitals, physicians, and post-acute care providers participating in the models. These surveys would provide insight on providers’ experience under the model and further information on the care redesign strategies undertaken.

In addition, we will consider CMS evaluation contractor administered site visits and focus groups with selected hospitals, physicians, and post-acute care providers in EPMs and CR evaluation efforts. We believe that these qualitative methods will provide contextual information that would help us better understand the dynamics and interactions occurring among participants. For example, these data could help us better understand hospitals’ intervention plans as well as how they were implemented and what they achieved. Moreover, in contrast to relying on quantitative methods alone, qualitative approaches would enable us to view program nuances as well as identify factors that are associated with successful interventions and distinguish the effects of multiple interventions that may be occurring, such as simultaneous ACO and bundled payment participation.

We anticipated that secondary data sources will be the source of most if not all data collection for the FFS-non CR control group; however, we may initiate some data collection from primary data sources for this group if warranted.

D. Key Evaluation Research Questions

Our evaluation would assess the impact of the models on the aims of improved care quality and efficiency as well as reduced health care costs. This would include assessments of patient experience of care, utilization, outcomes, Medicare expenditures, quality, and access. Our key evaluation questions would include, but would not be limited to, the following:

- PAYMENT. Is there a reduction in Medicare expenditures in absolute terms? By subcategories? Do the participants reduce or eliminate variations in utilization and/or expenditures that are not attributable to differences in health status? If so, how have they accomplished these changes?
- UTILIZATION. Are there changes in Medicare utilization patterns overall and for specific types of services? How do these patterns compare to matched comparators, historic patterns, regional variations, and national patterns of care? How are these patterns of changing utilization associated with Medicare payments, patient outcomes, and general clinical judgment of appropriate care? For example, in the AMI and CABG episodes, what changes to hospital transfer patterns, if any, could be seen under the models? Has there been any changes to utilization of cardiac rehabilitation services and does this appear to be associated with access to the cardiac rehabilitation incentive payment, participation in the cardiac EPMs or a combination of the two?
- REFERRAL PATTERNS AND MARKET IMPACT. How has the behavior in the selected MSAs changed under the models? Have the referral patterns of type and specific providers changed?
- OUTCOMES/QUALITY. Is there either a negative or positive impact on quality of care and/or better patient experiences of care? Did the incidence of relevant clinical outcomes including but not limited to complications, mortality, readmissions and other subsequent clinically relevant events, and beneficiary pain, functioning, and independence experiences remain constant or decrease? Were there changes in beneficiary outcomes under the models compared to appropriate comparison groups? Was there an impact on quality during the episode/CR care period or in the period immediately preceding or following the episode/CR care period? Was there an impact on measures of relevant long term quality such as mortality at one year after the initiating event?
- UNINTENDED CONSEQUENCES. Did the models result in any unintended consequences, including adverse selection of patients, access problems, cost shifting beyond the episode/CR care period, evidence of delay or stinting of appropriate care, anti-competitive effects on local health care markets, or evidence of inappropriate referrals practices? Is so, how, to what extent, and for which beneficiaries or providers?
- POTENTIAL FOR EXTRAPOLATION OF RESULTS. What was the typical patient case mix and how did this compare to regional and national patient populations? What were the characteristics of impacted markets, providers, and patients and to what extent were they reflective of the national sample? Were EPMs and/or the CR incentive model more successful in reducing payments and improving quality in certain types of markets, providers, or patients? To what extent would the results be able to be extrapolated to similar markets and/or nationally?
- EXPLANATIONS FOR VARIATIONS IN IMPACT. What factors are associated with the pattern of results stated previously? Specifically, are they related to:
  ++ Characteristics of the administrative features of the models
including variations by year and factors such as presence of downside risk;
++ The EPM or CR participant’s specific features and structure, including such factors as the number of relevant cases, whether they have ability to handle complex cases, profit status, proportion of dually eligibility patients served, and other considerations;
++ The EPM or CR participant’s care redesign or other interventions and their ability to carry out their planned interventions;
++ The characteristics of the providers and suppliers serving patients during the entirety of the episode or CR care period and the nature of the interaction of these providers and suppliers with the EPM or CR participants;
++ The characteristics of the markets and MSAs, and
++ The clinical and socio-demographic characteristics associated with the patient populations served.

E. Evaluation Period and Anticipated Reports

The models have a 5-year performance period and the evaluation periods would encompass the entire 5-year period and up to 2 years after. We plan to evaluate the EPMs on an annual basis. However, we recognize, that interim results are subject to issues such as sample size and random fluctuations in practice patterns. Hence, while CMS intends to have internal periodic summaries to offer useful insight during the course of the effort, a final analysis after the end of the 5-year performance period will be important for ultimately synthesizing and validating results.

We sought comments on our design, evaluation, data collection methods, and research questions.

The following is a summary of the comments received and our responses.

Comment: Several commenters expressed concerns with the manner in which quality is examined under the EPMs. Specifically, there was concern that the understanding of the impact on quality for these models should include a more comprehensive approach beyond just those quality measures used in the reconciliation methodology. Commenters expressed the belief that the quality measures used in reconciliation were not adequate for the purpose of determining if access and clinical quality were adversely affected. A commenter suggested that CMS examine quality related to the performance of providers aside from the model participant hospitals and that CMS incorporate measures that reflect the totality of care received in the episode.

Response: We thank the commenters for their thoughts and acknowledge the importance of examining the impact of the EPMs on measures of quality of care beyond what is used in the reconciliation methodology. Our intention in the evaluation is to conduct a multifaceted and multi-pronged examination of issues of quality, access, and unintended consequences. The final evaluation design plan for the evaluation of the EPMs will be developed at a future date and will include quality as a key area of research focus. CMS intends to examine issues of quality of care using a variety of metrics and for a variety of patient and provider subgroups.

Comment: A few commenters expressed concern with the possible impact of the EPMs on reducing access to new or to more expensive but higher quality technology and devices. A commenter requested that CMS conduct a formal evaluation of the impact of the EPMs on patient access to newer technology and that CMS make adjustments to care if patient access is compromised. Similarly, another commenter expressed concern that the focus of the model on short-term costs might cause a shift away from new technologies such as angiography with use of Fractional Flow Reserve (FFR). The commenter encouraged CMS to use incentives for newer technologies shown to improve patient outcomes. In addition, a commenter expressed concern that the EPMs would induce undue pressure to use device choices based on cost rather than quality in the treatment of SHFFT.

Response: We appreciate the commenters’ concerns and will be evaluating treatment patterns and shifts in the evaluation of this mode. We address the issue of new technology and payment in section III.C.3.(b) of this final rule. We note that we do not anticipate data collection related to device use or new technology beyond what is currently available in claims data. The issue of physician or other providers’ perception of shifting care or unintended consequences is an issue that may arise in qualitative data collection efforts such as interviews and focus groups. As with all evaluation topics, CMS will strive to balance the amount of burden placed on the sites with regards to primary data collection in choosing its areas of focus.

Response: We appreciate the commenters’ concerns and will be evaluating treatment patterns and shifts in the evaluation of this mode. We address the issue of new technology and payment in section III.C.3.(b) of this final rule. We note that we do not anticipate data collection related to device use or new technology beyond what is currently available in claims data. The issue of physician or other providers’ perception of shifting care or unintended consequences is an issue that may arise in qualitative data collection efforts such as interviews and focus groups. As with all evaluation topics, CMS will strive to balance the amount of burden placed on the sites with regards to primary data collection in choosing its areas of focus.

Comment: Two commenters recommended that CMS increase the frequency with which monitoring and evaluation reports are made public. Quarterly reporting was suggested as commenters believed quarterly public reports would be useful to both the public and the provider community and would help to provide feedback to providers as to what is occurring under the model with respect to unintended consequences so as to allow for adjustments as needed.

Response: We appreciate the need for frequent data updates for these models and strive to provide at least quarterly data feeds to model participants. We refer readers to section III.K. of this final rule for a detailed discussion on the provision of data and claims to participants under the EPMs. One of the purposes for the distribution of this quarterly claims information is to allow for participants to conduct self-assessments of their performance under the model. CMS will be conducting regular interim assessments of the results between the annual reports which will be made publically available. These interim reports examine key metrics which are subject to issues such as sample size and random fluctuations in practice patterns that may be more confusing than illuminative to distribute. Their primary purpose is to highlight possible trends to examine and explore in the annual reports. CMS will consider public release of interim data points on a case by case basis depending on the nature of the findings and the degree of certainty in the results but cannot commit to providing publically available reports on a quarterly basis.

Comment: A variety of commenters expressed interest in the evaluation of the impact of the EPMs on quality and outcomes. Commenters suggested that the CMS evaluation should incorporate an assessment of whether EPMs had an impact on issues such as:
• Overall procedure volume,
• Shifting of care beyond the 90-day episode,
• Stinting of care and reduction in the quality of devices used in SHFFT procedures,
• Patient shared-decision making related to device selection,
• Hospital to hospital transfers in the Cardiac EPMs. The commenter was particularly interested in the extent to which transfers patterns between participating and non-participating hospitals were altered under the model,
• Process measures of quality such as statin use or cardiac rehab referrals, and
• Over or inappropriate use of home health services.

Response: The topic areas mentioned by commenters are in alignment with CMS’ intended research questions in the evaluation. We appreciate the commenters’ interests and insight behind these comments and the focus they offer towards refining the evaluation’s areas
of emphasis in understanding the impact of the EPM on the delivery of care.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification.

V. Comprehensive Care for Joint Replacement Model

A. Participant Hospitals in the CJR Model

In the CJR proposed rule (80 FR 41207), we proposed to require that almost all hospitals paid under the IPPS that are physically located in a county in an MSA selected for participation in the CJR model would be required to participate. In the final rule (80 FR 73288), we finalized this proposal, noting that we would use the primary physical address associated with a hospital’s CCN to identify whether or not a given hospital was physically located in an MSA selected for participation. In response to a commenter’s inquiry as to whether all hospitals under a CCN would be required to participate in CJR if a CCN included multiple hospital campuses and some of these campuses were physically located in the MSA while others were not, we stated that since CMS tracks and identifies hospitals using the CCN, all hospital locations associated with that CCN would be required to participate in the model. In order to identify hospitals located in the MSAs selected to participate in the CJR model, we will utilize the primary physical address associated with the CCN. In cases where a CCN is associated with multiple hospital campuses, if the primary CCN address is located in a selected MSA, all hospital campuses associated with that CCN would be required to participate in CJR unless otherwise excluded. We also noted that our initial analysis of the acute care hospitals in the MSAs selected to participate in CJR indicated that none of the CCNs in the MSAs selected for CJR included multiple campuses crossing MSA boundaries. That is, none of the CCNs with a primary physical address in one of the selected MSAs had multiple campuses physically located in different MSAs that would result in inclusion of a hospital campus not physically located in a selected MSA.

We are not aware of any participant hospitals currently in the CJR model that are not physically located in one of the 67 MSAs chosen to participate in CJR. However, given the comments we received from the public on the CJR proposed rule (80 FR 41207) and questions from stakeholders during our implementation of the CJR model, we noted that if a hospital that is not physically located in one of the 67 MSAs participating in CJR bills under a CCN with a primary address in one of the 67 CJR MSAs, whether through a merger or other organizational change, that hospital will be considered a CJR participant as of the date in which the hospital began to bill under the CCN address located within the 67 MSAs. This policy has been in effect since the start of the CJR model on April 1, 2016 and is laid out at § 510.2 (definition of participant hospital).

B. Inclusion of Reconciliation and Repayment Amounts When Updating Data for Quality-Adjusted Target Prices

In response to the CJR proposed rule, commenters encouraged us to include reconciliation payments in updated historical episode spending totals when calculating quality-adjusted target prices for performance years 3 and 4 (based on spending for episodes beginning in years 2014 through 2016) and performance year 5 (based on spending for episodes beginning in 2016 through 2018). (Note that we proposed to replace the term “target price” with the term “quality-adjusted target price,” as described further in section V.C. of this final rule.) Commenters were concerned that if we excluded those payments, we would not account for care coordination services that are not paid for under Medicare FFS, but that participant hospitals paid for using reconciliation payments. As a result, we would underestimate hospital costs and prices by not accounting for care coordination services paid for with reconciliation payments. We finalized our proposal to exclude reconciliation payments from expenditure data, noting our view that including reconciliation payments would result in Medicare paying participant hospitals their quality-adjusted target price, regardless of whether the participant hospital’s expenditures were above or below that price. We also noted that we had not proposed an alternative in our proposed rule, and that we might consider including reconciliation payments in updating the set of historical years used to calculate quality-adjusted target prices for participant hospitals. By including these amounts from both initiatives we will avoid distorting the regional component of historical LEJR episode spending, which will be especially important once we move to setting prices based on 100 percent regional episode data in performance year 4 of the model. This policy mirrors our proposal to include these reconciliation reconciliation amounts when updating the historical periods used for EPM quality-adjusted target prices; we refer readers to section III.D.3.e. of this final rule for further discussion of our rationale for this approach.

We proposed to amend our regulations to add a new subsection § 510.300(b)(8) to reflect this proposal. We sought comment on our proposal. The following is a summary of the comments received and our responses.

Comment: A few commenters expressed support for our proposal to improving quality, and we recognize that such activities are not directly reimbursed by Medicare. We agree that including reconciliation payments would more fully recognize the total costs of care under an episode payment model than would excluding those payments. The number of comments we previously received on this topic indicates that excluding reconciliation payments could discourage such investment, due to concerns that quality-adjusted target prices would underestimate the true cost of care. Although including the entire reconciliation payment in our updated quality-adjusted target price calculations could result in overpaying for care coordination services, the impact of including these payments on quality-adjusted target prices will decrease as we move to regional pricing. In addition, we stated our belief that our proposal to also include the number of comments when updating historical data used to calculate quality-adjusted target prices would mitigate any potential overpayment for care coordination services.

In addition, we proposed to include in regional historical episode payments any reconciliation payments and repayment amounts from historical BPCI LEJR episodes initiated at regional hospitals in order to most fully capture the total costs of care under episode payment models. We stated that, if we included reconciliation payments and repayment amounts for CJR episodes but not BPCI LEJR episodes, we would likely underestimate the regional total costs of care to hospitals, which would result in artificially lowered quality-adjusted target prices for participant hospitals, in effect penalizing participant hospitals. By including these amounts from both initiatives we will avoid distorting the regional component of historical LEJR episode spending, which will be especially important once we move to setting prices based on 100 percent regional episode data in performance year 4 of the model. This policy mirrors our proposal to include these reconciliation amounts when updating the historical periods used for EPM quality-adjusted target prices; we refer readers to section III.D.3.e. of this final rule for further discussion of our rationale for this approach.

We proposed to amend our regulations to add a new subsection § 510.300(b)(8) to reflect this proposal. We sought comment on our proposal. The following is a summary of the comments received and our responses.
include reconciliation payment and repayment amounts in our calculations for updating quality adjusted target prices. One commenter stated that we should apply this policy for calculating quality adjusted target prices earlier than performance year 3.

Response: We appreciate the commenters’ support for our proposal. We disagree with the comment suggesting that we implement this change prior to performance year 3. We note that, because reconciliation takes place 2 months after the completion of a performance year, we will not have calculated reconciliation and repayment amount totals from performance year 1 in adequate time to incorporate them into baseline spending totals used to construct quality-adjusted target prices for performance year 2, even if we were to shift the historical baseline period forward. Since we will not be re-calcultating historical baseline episode spending until we set quality-adjusted target prices for performance year 3 based on data from 2014 through 2016, we will not implement this change prior to performance year 3.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to include CJR reconciliation payment and repayment amounts, as well as BPCI LEJR reconciliation payment and repayment amounts from regional hospitals, in the historical episode spending amounts used to calculate quality adjusted target prices for Performance Years 3, 4, and 5 for CJR model participants.

C. Quality-Adjusted Target Price

We proposed to change the term we use to refer to a CJR participant hospital’s episode benchmark price incorporating the effective discount factor based on the participant hospital’s quality category to “quality-adjusted target price.” This term will replace our prior term, “episode target price,” which referred to the episode benchmark price with a 3 percent discount applied. The term quality-adjusted target price would represent the price used at reconciliation to determine whether a CJR participant hospital is eligible for a reconciliation payment or repayment, and the amount of the reconciliation payment or repayment. To clarify, this change would be a change of terminology to more accurately reflect the impact of quality scores on the reconciliation process, and would not change the actual data that hospitals receive. In addition, our proposal to replace the term “episode target price” with “quality-adjusted target price” mirrors the terminology for the proposed EPMs and will reduce confusion for hospitals participating in more than one model.

In accordance with 42 CFR 510.300(b)(7), CMS provides prospective prices to CJR participant hospitals prior to the performance period in which they apply, incorporating the 3 percent discount that would apply if the hospital is eligible for a reconciliation payment and achieves an “Acceptable” composite quality score category. As discussed in the CJR final rule, a hospital’s effective discount percentage may be reduced at reconciliation to account for quality performance (80 FR 73378). At the conclusion of a performance year, CMS will calculate a composite quality score for each hospital, which determines the effective discount percentage at reconciliation. The CJR final rule outlines the relationship between the composite quality score and the effective discount percentage (80 FR 73365). That is, a participant hospital may be eligible to earn a greater reconciliation payment or have a lower repayment amount as a result of its quality performance under the model (80 FR 73378). Hospitals are therefore aware that a different effective discount factor, and thus different quality-adjusted target price, may be utilized at reconciliation to reflect their quality performance under the model, and they could easily estimate the range of potential quality-adjusted target prices that could apply at reconciliation.

We also clarified the terminology we use to describe the discount factor included in the quality-adjusted target price. The discount factor included in the quality-adjusted target price based on the quality score is referred to as the “effective discount factor.” In contrast, the discount factor used to determine repayment amounts in performance years 2 and 3, during which repayment responsibility is being phased in and a lower discount factor applies for purposes of calculating repayment amounts will be referred to as the “applicable discount factor.” In performance years 2 and 3, the effective discount factor would continue to apply for hospitals that qualify for and earn a reconciliation payment; the applicable discount factor would only be applied in those cases where a hospital exceeded expected episode spending and would be responsible for repayment.

We proposed to implement these terminology changes in all communications with participant hospitals 60 days after the change is finalized. We proposed to establish these definitions in the regulations at §510.2 and update our regulations at §510.300 and §510.315 to reflect our use of the term “quality-adjusted target price” in lieu of “episode target price” and our use of the term “applicable discount factor.” We received no comments regarding our proposed payment terminology changes.

Final Decision: We are finalizing the proposal, without modification, to use the term “quality-adjusted target price” in lieu of “episode target price,” and to use the term “applicable discount factor” to refer to the discount used to determine repayment amounts in performance years 2 and 3. We are making one technical change to our proposed regulations text to avoid inadvertently deleting existing §510.300(a)(5), by renumbering it to (a)(6).

D. Reconciliation

In this final rule, in addition to the changes we proposed, detailed later in this section, we also want to correct an example of a reconciliation calculation that we included in the preamble to the CJR final rule (80 FR 73399). This example incorrectly suggested that stop-loss and stop-gain limits would be applied separately for each MS–DRG/fracture level. In actuality, we will apply stop-loss and stop-gain limits after aggregating quality-adjusted target prices at reconciliation and episode spending across all MS–DRG/fracture levels for a given hospital participant. This methodology is correctly described in the regulatory text of the CJR final rule 42 CFR 510.305(e).

In addition, we are correcting the definition of HCPSC in §510.2 to read Healthcare Common Procedure Coding System.

1. Hospital Responsibility for Increased Post-Episode Payments

As discussed in the CJR final rule, participant hospitals will be responsible for repaying Medicare for post-episode spending that exceeds 3 standard deviations from the regional mean (80 FR 73408). We refer readers to the CJR final rule (80 FR 73407) for further discussion of our rationale for holding participant hospitals financially accountable for significant increases in Medicare Parts A and B spending during the 30 days after a CJR episode ends. We also finalized a policy to include the result of our post-episode spending calculation (the amount exceeding 3 standard deviations above the regional mean) in a participant hospital’s NPRA for a given performance year; as a result, a hospital’s financial responsibility for post-episode spending would be subject to the stop-loss and stop-gain limits we
We proposed to modify our policy to hold hospitals responsible for post-episode payments that exceed 3 standard deviations from the regional mean. First, we proposed to calculate post-episode payments using the same timeframes we use for the subsequent reconciliation calculation, not when we conduct the initial reconciliation for a performance year (80 FR 73383). Given that we will begin reconciliation calculations 2 months after the conclusion of a performance year, we do not believe there would be sufficient time for claims run-out in order to set a reliable regional threshold for determining post-episode spending. Since in all cases any responsibility for post-episode payments would decrease a participant hospital’s reconciliation payment or increase its repayment amount, our proposed change would more accurately and fairly hold hospitals accountable for increased post-episode spending. We believe instances in which a CJR participant hospital is responsible for post-episode spending repayment will be rare, given our belief that hospitals in the CJR model will focus on care redesign during the LEJR episode and our other monitoring efforts under the CJR model. Our intent is to prevent hospitals from delaying services or care until the conclusion of a CJR episode by monitoring for cases in which hospitals have significantly increased spending in the 30 days following the episode.

Assessing post-episode spending when we have more complete claims information would allow a more accurate assessment of hospitals’ behavior under the model and prevent potentially high fluctuations in results that may occur if we calculate regional thresholds and hold hospitals responsible for post-episode spending beginning 2 months after the conclusion of a performance year. We proposed that this modified timeline would be applied to our reconciliation of the first CJR performance year and all performance years thereafter.

In the CJR final rule, we finalized a policy to account for overlap in situations where a portion of the CJR discount percentage is paid out as savings to an ACO participating in the Shared Savings Program or specified ACO models. We refer readers to the CJR final rule for further discussion of this policy and our rationale for this approach (80 FR 73395–73398). We proposed a modification to how we will account for such cases of overlap in the CJR model at reconciliation. In the final CJR rule, we specified that the results of this overlap calculation would be included in the subsequent reconciliation calculation that occurs 14 months after the conclusion of a performance year (80 FR 73383). We proposed that the subsequent reconciliation calculation not include the results of this ACO overlap calculation; that is, the subsequent reconciliation calculation will only include calculating the prior performance year’s episode spending spending a second time with more complete claims data and comparing it to the quality-adjusted target price. The ACO overlap calculation will be a separate calculation from the subsequent reconciliation (although both calculations will occur concurrently) and added with the NPRA, subsequent reconciliation calculation, and post-episode spending calculation to determine the reconciliation payment or repayment amount at reconciliation. The effect of this proposal will be that these overlap amounts will not be subject to the stop-loss or stop-gain limits that apply to the calculation of the NPRA and subsequent reconciliation calculation. We believed this change was appropriate because the subsequent reconciliation calculation is intended to account for claims run-out and canceled episodes, and to reassess CJR episode spending during the model performance years. The stop-loss limit, therefore, is intended to protect hospitals that do not reduce actual episode payments below the quality-adjusted target price have a limit on the amount they must repay Medicare due to spending during CJR episodes.

We proposed to modify our policy to hold hospitals responsible for post-episode spending that will not be subject to the stop-loss and stop-gain limits. Although we believe, as noted previously, that hospital responsibility for post-episode spending will be rare, we also believe that in those cases where a hospital has financial responsibility for post-episode spending, such hospitals should be responsible in full for these amounts. The CJR model includes stop-loss limits, including more generous limits for certain types of hospitals (80 FR 73403), which are designed to limit a participant hospital’s responsibility for episode spending above the quality-adjusted target price during the anchor hospitalization and 90-day post-discharge period. The stop-loss limits are not intended to protect hospitals that engage in inappropriate behavior or shifting of care beyond the episode from financial responsibility for such actions.

We proposed to implement this policy change when we conduct the subsequent reconciliation calculation for performance year 1 of the model in the first 2 quarters of 2018 and for all performance years thereafter. That is, when we conduct the reconciliation for performance year 1 in early 2017, we would not assess post-episode spending for performance year 1 at that time. Although hospitals would not have been aware of these proposed changes to our reconciliation process during performance year 1 of the model, the proposed changes will not impact the performance year 1 NPRA. We proposed to amend our regulations at §510.305(e), §510.305(h)(6), and add a new paragraph §510.305(j)(2) to reflect these proposals. We sought comment on our proposals. We received no comments on our proposal to calculate post-episode spending at the time of the subsequent reconciliation and to exempt post-episode spending from stop-loss limits.

Final Decision: We are finalizing the proposal, without modification, to calculate post-episode spending for each performance year at the time of the subsequent reconciliation for that performance year, and to exempt post-episode spending from stop-loss limits.

2. ACO Overlap and Subsequent Reconciliation Calculation

In the CJR final rule, we finalized a policy to account for overlap in situations where a portion of the CJR discount percentage is paid out as savings to an ACO participating in the Shared Savings Program or specified ACO models. We refer readers to the CJR final rule for further discussion of this policy and our rationale for this approach (80 FR 73395–73398). We proposed a modification to how we will account for such cases of overlap in the CJR model at reconciliation. In the final CJR rule, we specified that the results of this overlap calculation would be included in the subsequent reconciliation calculation that occurs 14 months after the conclusion of a performance year (80 FR 73383). We proposed that the subsequent reconciliation calculation not include the results of this ACO overlap calculation; that is, the subsequent reconciliation calculation will only include calculating the prior performance year’s episode spending spending a second time with more complete claims data and comparing it to the quality-adjusted target price. The ACO overlap calculation will be a separate calculation from the subsequent reconciliation (although both calculations will occur concurrently) and added with the NPRA, subsequent reconciliation calculation, and post-episode spending calculation to determine the reconciliation payment or repayment amount at reconciliation. The effect of this proposal will be that these overlap amounts will not be subject to the stop-loss or stop-gain limits that apply to the calculation of the NPRA and subsequent reconciliation calculation. We believed this change was appropriate because the subsequent reconciliation calculation is intended to account for claims run-out and canceled episodes, and to reassess CJR episode spending during the model performance years. The stop-loss limit, therefore, is intended to ensure that participant hospitals that do not reduce actual episode payments below the quality-adjusted target price have a limit on the amount they must repay Medicare due to spending during CJR episodes. The stop-gain limit, conversely, is intended to place judicious limits on the degree to which hospitals can be rewarded based on responsible stewardship of CMS resources. In contrast, the ACO overlap calculation is intended to account for cases in which a portion of the CJR discount percentage is paid out to an ACO as shared savings, and does not hinge upon a participant hospital’s performance in the CJR model. If ACO overlap amounts are included in calculations of the stop-loss limit, CMS could in some cases pay twice for the same cost-reducing activities, thereby skewing the model results. We believe the stop-loss and stop-gains should provide limits on the amount a hospital could earn or lose due to episode spending, not limit CMS's ability to adjust for overlap between models. For these reasons, we do not believe our policy to avoid paying out savings twice for the same beneficiary during the same period should be subject to the stop-loss or stop-gain limits. Moving forward, we intend to determine how the proposed modification will impact the steps involved in the reconciliation
process are provided further in this section.

We proposed to implement the policy change when we conduct the subsequent reconciliation calculation for performance year 1 of the model in the first 2 quarters of 2018 and for all performance years thereafter. Although hospitals would not have been aware of these proposed changes to our reconciliation process during performance year 1 of the model, we believed this timeframe was reasonable for the following reasons. First, if CMS must recoup a portion of the CJR discount percentage paid out as shared savings, this calculation must occur during the same timeframe as the subsequent reconciliation calculation for a given performance year to ensure that the ACO models and program have already completed their financial reconciliation for a given performance year. Second, this policy change (that is, not including the ACO overlap calculation in assessing whether a hospital has met the stop-loss or stop-gain limits) will not impact the performance year 1 NPRA.

We proposed to add a new paragraph to our regulations at §510.305(i). We sought comment on our proposal. We received no comments on our proposal to calculate ACO overlap amounts separately from the subsequent reconciliation, so that ACO overlap amounts will not be subject to stop-loss limits.

Final Decision: We are finalizing the proposal, without modification, to perform ACO overlap calculations separately from the subsequent reconciliation, so that ACO overlap amounts will not be subject to stop-loss limits.

3. Stop-Loss and Stop-Gain Limits

In the CJR final rule, we finalized our proposal to limit the amount a CJR participant hospital will be required to repay Medicare or could earn as a reconciliation payment under the CJR model. Specifically, we stated that CJR participant hospitals would be subject to the following stop-loss limits: 5 percent in performance year 2, 10 percent in performance year 3, and 20 percent in performance years 4 and 5. Similarly, we finalized symmetrical stop-gain limits: 5 percent in performance years 1 and 2, 10 percent in performance year 3, and 20 percent in performance years 4 and 5 (80 FR 73401 through 73402). We finalized separate limits to provide additional financial protections for rural hospitals, Medicare-dependent hospitals, rural referral centers, and sole community hospitals (80 FR 73406). These limits are intended to provide financial protections for CJR participant hospitals, who may have varying levels of experience with episode payment models. We finalized symmetrical stop-gain limits to ensure hospitals do not have an incentive to excessively reduce services provided during episodes or shift services outside the CJR episode (80 FR 73398). As noted previously in this section, we proposed a modification to our application of the stop-loss and stop-gain limits for the CJR model by excluding the post-episode spending amount and situations in which the CJR discount percentage is paid out to an ACO as shared savings.

In light of our proposal to exclude the ACO overlap and post-episode spending adjustments from the stop-loss and stop-gain limits, to calculate the stop-loss and stop-gain limits, we would use a hospital’s quality-adjusted target price at reconciliation. For example, a hospital with benchmark episode spending of $30,000 and a composite quality score of “excellent,” would have an effective discount percentage of 1.5 percent and a quality-adjusted target price of $29,550 at reconciliation. The hospital’s stop-loss and stop-gain limits for year 2 (assuming for simplicity that the hospital has only 1 episode) would be 5 percent of the quality-adjusted target price, or $1,477.50. This is consistent with our proposed calculation of stop-loss and stop-gain limits for the proposed PEMs described in section III.C. of this final rule. This approach is also consistent with our regulations at §510.305(e)(1)(vi)(A) and §510.305(e)(1)(v)(B) to calculate stop-loss and stop-gain based on the effective discount factor at reconciliation.

In order to determine whether a participant hospital has reached the stop-loss or stop-gain limits, we would compare actual episode payments during the performance year to the quality-adjusted target price to calculate the NPRA. In the example previously noted, if the participant hospital had actual episode spending of $35,000 during performance year 2 this would be compared against its quality-adjusted target price of $29,550. The difference between the quality-adjusted target price and actual episode spending is $5,450, but since the applicable stop-loss limit is $1,477.50, the hospital would need to repay Medicare $1,477.50. In this example, any post-episode spending amount or adjustment for ACO overlap from the prior performance year (performance year 1 in this example) would not be included in determining whether a hospital has met the stop-loss or stop-gain limit for a performance year, but rather would be added, unadjusted, to the performance year 2 NPRA in order to calculate the reconciliation payment or repayment amount. Therefore, if the hospital in this example owed $1,000 due to post-episode spending in performance year 1, and we determined that $2000 represented the CJR discount percentage that was paid out as shared savings for performance year 1, the full $3000 would be added to the hospital’s performance year 2 NPRA regardless of stop-loss, resulting in a repayment of $4,477.50. In addition, when performing the subsequent reconciliation calculation for performance year 2, which would be done simultaneously with the calculation of NPRA for performance year 3, we would apply the results of the performance year 2 subsequent reconciliation calculation to the year 2 stop-loss limit of $1,477.50 to ensure that, aggregated across all episodes in the performance year, the participant hospital is not responsible for repaying Medicare more for episode spending above the quality-adjusted target price than the stop-loss limit for that performance year. Thus, if the subsequent reconciliation calculation determined that the hospital in our example had actually spent $36,000 during performance year 2, resulting in a larger difference between actual spending and the quality-adjusted target price, the higher amount of $6,450 would still be subject to the stop-loss limit of $1,477.50, so the hospital would not be responsible for the additional $1,000 of episode spending beyond the quality-adjusted target price.

As discussed previously in this section, we proposed to implement these changes to our reconciliation process beginning with the reconciliation for performance year 1.

We proposed to amend our regulations at §510.305(e), §510.305(f), and add a new paragraph (j) to reflect these proposals. We also proposed to streamline §510.305(j)(2) for clarity.

We sought comment on our proposal. The following is a summary of the comments received and our responses.

Comment: One commenter requested that stop-loss be capped at 10 percent for all years of the model.

Response: While we appreciate the commenter’s thoughts on capping stop loss, we note that we did not propose to change the stop-loss and stop-gain limits. As we noted in the CJR final rule (80 FR 73401), we believe that we have taken sufficient steps to limit downside risk by capping high cost episodes and phasing in downside risk more gradually than originally proposed over performance years 2 and 3. Our proposal here was limited to the manner
in which the stop-loss and stop-gain limits are applied and therefore we decline to adopt the commenter’s suggested approach.

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal, without modification to apply the stop-loss or stop-gain amount calculated in the first reconciliation to the NPRAs of both the first reconciliation and the subsequent reconciliation NPRAs, but not to post-episode spending or ACO overlap adjustments.

4. Modifications to Reconciliation Process

As previously discussed in this section, we proposed several modifications to how we conduct the reconciliation process for participant hospitals in the CJR model for all performance years. We proposed how these steps would modify the CJR reconciliation process we finalized in the CJR final rule (80 FR 73383).

The following example illustrates our proposed modifications to the reconciliation process, reflecting our proposals to compare actual episode payments to the quality-adjusted target price; calculate post-episode spending beginning 14 months after the conclusion of a performance year; calculate post-episode spending amounts and the ACO overlap calculation separately from the NPRAs and subsequent reconciliation calculation; and apply the stop-loss and stop-gain limits only to calculations of NPRAs and the subsequent reconciliation calculation (that is, exclude post-episode spending amounts and the ACO overlap calculation) for a given performance year.

Beginning 2 months after the conclusion of performance year 2, CMS would compare actual episode payments to the quality-adjusted target prices for the episodes at a CJR participant hospital. The quality-adjusted target price that applies at reconciliation would be based on a participant hospital’s composite quality score for performance year 2. We would aggregate episodes at each CJR participant hospital and calculate the hospital’s NPRAs. The NPRA would be the difference between the quality-adjusted target price times the number of episodes and actual episode payments times the number of episodes during the performance year. We would apply the stop-loss and stop-gain limits of 5 percent of the quality-adjusted target price to determine if a hospital reached the limit.

We would simultaneously perform the subsequent reconciliation calculation for performance year 1, to account for claims run-out and canceled episodes from performance year 1. We would reapply the stop-loss limit for performance year 1, by summing the result of the subsequent reconciliation calculation for performance year 1 and the performance year 1 NPRAs (which was calculated during the prior reconciliation). For example, if the participant hospital’s NPRA for performance year 1 was greater than the stop-loss limit and the result of the subsequent reconciliation calculation for performance year 1 was positive, the subsequent reconciliation calculation would not be added to the reconciliation payment made to the participant hospital in the second quarter of 2018, because the stop-loss limit had already been reached for performance year 1.

Concurrently with our subsequent reconciliation calculation, we would also determine if a participant hospital is responsible for post-episode spending from performance year 1, as well as determine any potential amount of the CJR discount percentage that was paid out as savings to an ACO entity as previously described in this section during performance year 1. In this example, the results of all three calculations (the subsequent reconciliation calculation for performance year 1—subject to the stop-loss and stop-gain limits—and the post-episode spending calculation and ACO overlap calculation) would be added to the NPRAs calculated for performance year 2 in order to determine any potential amount of the reconciliation payment or repayment amount. (The exception to this pattern will be performance year 5, as the subsequent reconciliation, post-episode spending, and ACO overlap calculations will occur in 2022 without a concurrent NPRA calculation.)

We note that this approach mirrors the reconciliation process we proposed for the AMI, CABG, and SHFFT models at III.D.5. of this final rule. We refer readers to that section for additional discussion of our approach. The following is a summary of the comments received and our responses.

**Comment:** One commenter requested that reconciliation be performed on a quarterly basis, in order to provide faster feedback to help hospitals improve their overall quality and cost performance.

**Response:** As we did not propose to change the frequency of reconciliation, we decline to adopt this change. As we noted in the CJR final rule (80 FR 73385), we order our approach with the BPCI quarterly reconciliation process has shown that, because providers and suppliers have a calendar year to submit FFS claims for payment, many claims are incomplete at the time of an initial quarterly reconciliation, leading to significant fluctuation between initial and subsequent reconciliation calculations. Time spent in such frequent reconciliation and appeals processes can detract from participants’ efforts focusing on care redesign and coordination with providers and suppliers engaged in furnishing care for beneficiaries under the model. While quarterly data feeds are subject to similar limitations with respect to the completeness of claims, we believe the quarterly data records that hospitals receive, which include both line-level and summary claims data, provide sufficiently detailed and timely feedback to guide quality improvement efforts.

**Final Decision:** After consideration of the public comments received, we are finalizing the proposals to the CJR pricing and reconciliation process without modification.

E. Use of Quality Measures and the Composite Quality Score

1. Hospitals Included in Quality Performance Distribution

As finalized in the CJR final rule, CMS computes quality performance points for each quality measure based on the participant hospital’s performance percentile relative to the national distribution of all hospitals’ performance on that measure. We proposed to compute quality performance points for each quality measure based on the participant hospital’s performance relative to the distribution of performance of all “subsection (d)” hospitals reporting the measure that are eligible for payment under IPPS and meet the minimum patient case or survey count for that measure. This approach is similar to the methodologies of other CMS programs, such as the HVBP Program. In addition, comparing CJR participant hospitals’ quality performance to IPPS-eligible subsection (d) hospitals’ quality performance on the same measures is a fairer comparison of quality performance, as CJR participant hospitals are all IPPS-eligible subsection (d) hospitals. Defining and limiting the relative distribution in this way will minimize variability due to factors that are unrelated to quality, thereby increasing the validity of the quality performance score.

We proposed to amend the regulations at 50 CFR 315(c) to reflect this change. We also proposed a technical change to the regulations to renumber...
certain subparagraphs. We sought comment on our proposals.

Final Decision: We did not receive any comments on this section. Therefore, we are finalizing the proposal without modification.

2. Quality Improvement Points

As finalized in the CJR final rule, quality improvement points for each measure are added to the composite quality score if the hospital’s score on that quality measure increases by at least 3 deciles on the performance percentile scale compared to the previous performance year. We proposed to clarify that, for performance year 1, we will compare the hospital’s performance percentile with the corresponding time period in the previous year, not the previous performance year. We proposed this clarification because there is no performance year preceding performance year 1. For performance years 2 through 5, we will still compare the hospital’s performance percentile with the previous performance year. We also proposed to modify this policy to define quality measure improvement as an increase of at least 2 deciles on the performance percentile scale compared to the previous performance year. Reducing the threshold for improvement from 3 deciles to 2 deciles will increase the number of CJR participant hospitals eligible for quality improvement points and provide CJR participant hospitals at all current levels of quality performance, including those historically lagging, with significant incentives to achieve improvement in the quality of care. Quality improvement points can contribute up to 1.8 points toward a CJR participant hospital’s composite quality score, so increasing the number of CJR participant hospitals that are eligible for these points may also increase the number of CJR participant hospitals that are eligible for a reduced quality-adjusted target price. As defined in section V.C. of this final rule, the quality-adjusted target price is the price used at reconciliation to determine whether a CJR participant hospital is eligible for a reconciliation payment or repayment and the amount of the reconciliation payment or repayment. This mirrors the approach we proposed for the proposed EPMs as discussed in section III.E.3.c. of this final rule.

We proposed to amend our regulations at §510.315(d) to reflect these changes. We sought comment on our proposal.

Final Decision: We did not receive any comments on this section.

Therefore, we are finalizing the proposal without modification.

3. Relationship of Composite Quality Score to Quality Categories

As finalized in the CJR final rule, CMS will place participant hospitals into one of four quality categories to determine reconciliation payment eligibility and, if applicable, the value of the effective discount percentage at reconciliation. We refer readers to the CJR final rule for a full discussion of our approach (80 FR 73363–73381). We described a technical correction to our composite quality scores that will determine reconciliation payment eligibility and the effective discount percentage at reconciliation. We noted that this technical correction does not affect our estimation of savings due to the CJR model, because the measure distribution used for such calculations in the CJR final rule was the correct one we describe in this section.

As stated in the proposed rule, participating hospitals will be required to achieve a minimum composite quality score of greater than or equal to 5.0 to be eligible for a reconciliation payment if actual episode spending is less than the target price. Participating hospitals with a composite quality score less than 5.0 will be assigned to the “Below Acceptable” quality category and will not be eligible for a reconciliation payment if actual episode spending is less than the target price. Participating hospitals with a composite quality score greater than or equal to 5.0 and less than 6.9 will be assigned to the “Acceptable” quality category and will be eligible for a reconciliation payment if actual episode spending is less than the target price. Participating hospitals in the “Acceptable” category will not be eligible to receive a reduced effective discount percentage at reconciliation. Participating hospitals with a composite quality score greater than or equal to 6.9 and less or equal to 15.0 will be assigned to the “Good” quality category and will be eligible for a reconciliation payment if actual episode spending is less than the target price. Participating hospitals in the “Good” quality category will be eligible to receive a reduced effective discount percentage (80 FR 73378).

The following is a summary of the comments received and our responses.

Comment: Several commenters expressed concern that this technical correction would penalize hospitals because fewer hospitals would fall into the “Acceptable” category and, as a result, fewer hospitals would be eligible for a reconciliation payment. Commenters stated that CJR participant hospitals have been modeling savings based on the composite quality scores and corresponding quality categories published in the CJR final rule, and, thus, changing these values would result in a funding shortfall for hospitals that have budgeted for savings based on the original values. Some of these commenters suggested that CMS ensure that all the hospitals that fell into the “Acceptable” category based on composite quality scores and corresponding quality categories in the final rule would also fall in the “Acceptable” category using the proposed corrected values.

Response: We appreciate the commenters’ concern that the proposed technical correction to the composite quality scores and corresponding quality categories would penalize CJR participant hospitals. In the CJR final rule, we described calculating the quality improvement points separately from the quality performance points for each measure. For example, as finalized in the CJR final rule, hospitals could earn a maximum of 8.0 quality performance points (80 FR 73376) and a maximum of 0.8 quality improvement points (80 FR 73380) for the HCAHPS Survey measure. Instead, we should have calculated improvement points as part of the total composite quality score points for a measure. For example, assigning a maximum of 7.2 quality performance points for the HCAHPS Survey measure would have allowed for the addition of a maximum of 0.8 quality improvement points, for a total of 8.0 maximum composite quality score points for the HCAHPS Survey measure. This correct method—calculating improvement points as part of the total composite quality score points for a measure—was the method used to estimate savings for the CJR model.

To correct this error, we are finalizing our proposal to change the composite quality scores and corresponding quality categories. We appreciate that this could present a challenge for some hospitals that were expecting to fall into a certain category based on modeling their own composite quality score values. Similar to the method used to estimate savings for the CJR model, the composite quality scores and corresponding quality categories we are
5. Acknowledgement of Voluntary Data Submission

Our regulations at § 510.400(c)(3) state that although we do not publicly report the voluntary patient-reported outcomes and limited risk variable data during the CJR model, we do indicate whether a hospital has voluntarily submitted such data. We proposed to amend § 510.400(c)(3) to clarify that we would acknowledge only CJR participant hospitals that successfully submit voluntary patient-reported outcomes and limited risk variable data, in accordance with § 510.400(b). We sought comment on our proposal.

Final Decision: CMS did not receive any comments on this section. Therefore, we are finalizing the proposal without modification.

6. Calculation of the HCAHPS Linear Mean Roll-Up (HLMR) Score

We proposed to calculate the HCAHPS Linear Mean Roll-up (HLMR) score by taking the average of the linear mean scores (LMS) for 10 of the 11 publicly reported HCAHPS measures for IPPS hospitals with 100 or more completed HCAHPS surveys in a 4-quarter period. The HLMR will summarize HCAHPS performance on all of the publicly reported measures, except for Pain Management. We proposed this change because removal of Pain Management from the HVBP Program was proposed in the Hospital Outpatient Prospective Payment System and Ambulatory Surgical Center Payment System Proposed Rule (81 FR 45603).

This mirrors the approach we proposed for the proposed EPMS as discussed in section III.E.4.d.(1)(f) of this final rule. Our regulations do not include the methods to calculate the HLMR, so we refer readers to section III.E.4.d.(1)(f) of this final rule for additional discussion of our approach.

We proposed to implement the proposed changes to hospitals included in the quality performance distribution, the maximum number of points in the composite quality score, the change from 3 to 2 deciles for assessing quality improvement, and the calculation of the HLMR score starting with the reconciliation for performance year 1 of the CJR model, when we calculate each participant hospital’s composite quality score for year 1.

Final Decision: CMS did not receive any comments on this section. Therefore, we are finalizing the proposal without modification.

F. Accounting for Overlap With CMS ACO Models and the Shared Savings Program

The CJR final rule details our policies to address cases of overlap in which beneficiaries that are aligned or attributed to an ACO model or Shared Savings Program participant are also included in a CJR episode. We recognize that there will be circumstances in which a Medicare beneficiary in a CJR episode is also aligned or attributed to an ACO participating in the Shared Savings Program or a CMS ACO model. In the CJR final rule, we finalized an approach to allow for such cases of overlap and minimize any double counting of savings through the following policies. We will conduct our annual reconciliation prior to the ACO reconciliation process, and make our reconciliation payments and repayment amounts available for the ACO models and program to take into account when performing their reconciliation, as their financial methodologies permit. In addition, in cases where a portion of the CJR discount percentage is paid out as shared savings to a participant hospital that participates in an ACO as a participant or provider/supplier, we would make an adjustment to the participant hospital’s reconciliation results. We refer readers to the CJR final rule for a full discussion of our approach and the options we considered (80 FR 73387).

Given commenters’ concerns about our approach, which are summarized in the final rule (80 FR 73387) we have continued to consider alternative options for accounting for overlap between the ACO models and program and the CJR model. Specifically, we considered, as some commenters suggested, attributing savings achieved during CJR episodes in which beneficiaries are also aligned or attributed to an ACO accepting downside risk to the ACO entity, not the participant hospital. We recognize that ACOs are engaged in care management activities for beneficiaries across the spectrum of care, which may also include care redesign during acute episodes. As a result, we proposed to cancel (or never initiate) a CJR episode for beneficiaries that are prospectively aligned to a Next Generation ACO or ESRD Seamless Care Organization (ESCO) in the Comprehensive ESRD Care initiative in tracks with downside risk for financial losses. While the CJR model excludes beneficiaries whose eligibility for Medicare is on the basis of end stage renal disease, not all beneficiaries aligned to ESCOs meet this criterion. Thus, some beneficiaries aligned to ESCOs could be included in the CJR model.

We proposed to implement this policy for episodes beginning on or after July 1, 2017, to align with the timeframe for implementation of the proposed AMI, CABG, and SHFFT models which proposed the same exclusion of
beneficiaries aligned to Next Generation ACOs and ESCOs in downside risk tracks. We proposed this change to how we determine episodes included in CJR because these ACOs and ESCOs are accepting a high level of financial risk for the total cost of care for their aligned beneficiaries; for example, Next Generation ACOs are held to as much as 80 percent to 100 percent of first dollar losses. In addition, beneficiaries are prospectively aligned to ACOs in both initiatives. We believe that if we were to implement a policy where we would cancel CJR episodes based on a given beneficiary’s ACO alignment status, we would do so only in those cases where the ACO alignment is prospective and does not change during a performance year. In such cases, CJR model participant hospitals could be aware of a beneficiary’s ACO alignment status, reducing uncertainty as to whether a given beneficiary is included in the CJR model. We note that we proposed elsewhere in this final rule to exclude beneficiaries prospectively aligned to a Next Generation ACO model participant or an ESCO in the Comprehensive ESRD Care Initiative in a downside risk track from the proposed AMI, CABG, and SHFFT model episodes because we wish to test this alternative approach to ACO overlap. We did not propose to exclude beneficiaries assigned to Shared Savings Program Track 3 ACOs, however, because we intended to test the approach of excluding prospectively-aligned ACO beneficiaries from the CJR model with the limited number of beneficiaries assigned to Next Generation ACOs and ESCOs in a downside risk track. We did not seek to disrupt the operations of our large, permanent ACO program to test this novel approach for accounting for overlap. The Shared Savings Program is a national program; we did not believe that testing a new approach to addressing overlap in a national program would be appropriate prior to testing such an approach with a smaller population. However, we sought comment on whether we should extend this proposed policy—that is, excluding from the CJR model beneficiaries who are prospectively assigned to an ACO—to beneficiaries who are assigned to a Track 3 Shared Savings Program ACO. We refer readers to section III.D.6.c. of this final rule for further discussion of our proposed approach and rationale, including details on how we would operationalize the approach if finalized for CJR or the proposed EPMs.

In cases where a beneficiary is in a CJR episode and also aligned to a Pioneer ACO, Medicare Shared Savings Program ACO, or ESCO not participating in a downside risk track, we would not cancel the CJR episode. The policies we previously finalized for accounting for such overlap would continue to apply. We refer readers to the CJR final rule (80 FR 73391 through 73398) for additional discussion of our policies.

The Shared Savings Program is a novel approach for accounting for downside risk and prospectively aligning beneficiaries to ACOs. We did not seek to operationalize the approach if finalized for CJR or the proposed EPMs.

Returning to our proposed approach and rationale, this final rule for further discussion of our proposed approach to model overlaps underscores ACOs. One commenter noted that ACOs have invested significant resources in managing acute and post-acute care already and overlap with the CJR model deprives them of a key source of savings and of a return on their investment. In support of this perspective, several commenters recommended the ACO exclusions from CJR should be extended to include beneficiaries attributed to any ACO unless a collaborative agreement is in place. If there is no collaborative agreement in place between a CJR model participant and an ACO that it is not part of, then beneficiaries attributed to that ACO should be excluded from the CJR model episodes.

Response: We acknowledge the range of perspectives expressed by commenters and appreciate the many specific suggestions for handling these overlaps. We also acknowledge the operational challenge both ACOs and CJR hospital participants face and the financial implications for both when there are overlaps. We believe the level and range of comments reflect the challenge in balancing multiple perspectives that we discussed in the proposed rule. The predominance of commenters supported our proposal to exclude from the CJR model those beneficiaries attributed to Next Generation ACOs and the downside risk track of Comprehensive ESRD Care models, and a significant number of commenters made compelling arguments for extending it to Shared Savings Program Track 3 ACOs. These comments have convinced us that the best way to balance the interests of both ACOs and CJR hospital participants, as well as CMS’s interest in maximizing population health and lowering total costs of care, is to finalize our original proposal with the addition of Shared Savings Program Track 3 ACO beneficiaries.

As we describe more fully in section III.D.6.c of this final rule, we believe that existing ACO models that assume downside risk and prospectively commit to coordinating a beneficiary’s care during an LEJR episode of care. Post-acute care, in particular, is an area in which ACOs have made significant investments, and existing ACOs that assume both downside risk and prospective responsibility for a beneficiary’s care should have the opportunity to share in the cost savings achieved during an LEJR episode of care. Post-acute care, in particular, is an area in which ACOs have made significant investments, and existing ACOs that assume both downside risk and prospective responsibility for a beneficiary’s care should have the opportunity to share in the cost savings achieved during an LEJR episode of care. Post-acute care, in particular, is an area in which ACOs have made significant investments, and existing ACOs that assume both downside risk and prospective responsibility for a beneficiary’s care should have the opportunity to share in the cost savings achieved during an LEJR episode of care. Post-acute care, in particular, is an area in which ACOs have made significant investments, and existing ACOs that assume both downside risk and prospective responsibility for a beneficiary’s care should have the opportunity to share in the cost savings achieved during an LEJR episode of care. We continue to be concerned about depleting the existing population of CJR participants, which would not only diminish the power of the model test and potentially
exclude patients who would not ultimately be assigned to an ACO, but would also deprive CJR participant hospitals of opportunities to save under the model.

For these reasons, we are finalizing our proposal with the one modification: that is, we are excluding from the CJR model those beneficiaries that are assigned to a Shared Savings Program ACO participating in Track 3. In order to accurately reflect these changes and align beneficiary inclusion criteria with EPMs, we are also incorporating these changes into the CJR model beneficiary inclusion criteria, which will apply to CJR episodes that begin on or after July 1, 2017.

Comment: Many commenters expressed concern about the challenge of having accurate and timely information on patient attribution with multiple models. They believed it was unrealistic to expect hospital staff and others to be able to accurately identify patients in excluded ACO models and questioned how CJR participants and their partners would be able to verify a patient’s status.

Response: We appreciate the operational challenges that CJR participants and their collaborating partners face in an environment where there are many, potentially overlapping models in place. We are actively looking for opportunities to reduce operational barriers where we can practically and effectively do so. To this end, we are in the process of developing a web portal where CJR participant hospitals can, at the point of care, look up and identify beneficiaries prospectively assigned to ACOs who will be excluded from the CJR model. This system, which is being developed consistent with the requirements of the Privacy Act and is currently in testing, is expected to be operational when EPMs are implemented in July of 2017. Model participants will be provided with more specific information on this portal project as it is rolled out.

Final Decision: After consideration of the public comments received, we are finalizing our proposal with the one modification; that is, we are excluding from the CJR model those beneficiaries that are assigned to a Medicare Shared Savings Program ACO participating in Track 3. As discussed in the proposed rule (81 FR 50955), these exclusions would apply for episodes that begin on or after July 1, 2017. We also note that CMS will implement an on-line system for verification of attribution to support CJR participant hospitals in their ability to identify such excluded beneficiaries. We are also incorporating modifications to the beneficiary inclusion criteria at § 510.205 to indicate that, for episodes beginning on or after July 1, 2017, the CJR model will include Medicare beneficiaries not prospectively assigned to—

- An ACO in the Next Generation ACO model;
- An ACO in a track of the Comprehensive ESRD Care Model incorporating downside risk for financial losses; or
- A Shared Savings Program ACO in Track 3.

G. Appeals Process

Currently, the CJR model provides that participant hospitals may dispute a calculation that involves a matter related to payment, reconciliation amounts, repayment amounts, or determinations associated with quality measures affecting payment. The hospital is required to provide written notice of the error in a form and manner specified by CMS, if the hospital wishes to dispute such calculation. Unless the participant hospital provides a written notice of the error, the CJR reconciliation report is deemed final 45 calendar days after it is issued, and CMS will then proceed with the payment or repayment process as applicable. In order to further specify our timeline for this process, we proposed that a timely notice of a calculation error means a notice received by CMS within 45 calendar days of CMS issuing a participant hospital’s reconciliation report.

In continuing our efforts to be clear and concise, we proposed to add language to our regulations highlighting the available appeals process for a participant hospital that receives a notice of termination from the CJR model. We previously described the appeals process for notice of termination in the CJR final rule at § 510.310(c), by using the notice of termination as an example of an exception to a participant hospital having to provide CMS with notice of calculation error. A notice of calculation error continues not to be required by participant hospitals that receive a notice of termination, as this matter does not involve an issue contained in, or a calculation that contributes to, a CJR reconciliation report. We proposed that if a participant hospital receives notification that it has been terminated from the CJR model and wishes to dispute such termination, it must provide a written request for reconsideration to CMS requesting review of the termination within 10 calendar days of the notice. Following receipt of the participant hospital’s timely written request, CMS would have 30 days to respond to the participant hospital’s request for review. If the participant hospital fails to notify CMS, the termination would be deemed final.

We proposed to amend the regulations at § 510.310 to reflect the proposals, and to correct a technical error in paragraph (d)(6) (which would be renumbered (e)(6)). We also proposed to delete § 510.310(a)(3) in the current regulations as it is duplicative with § 510.310(a)(1). We sought comment on our proposal.

Comment: No comments unique to the CJR model were submitted in response to our proposed amendments to the appeals process in the CJR model.

Response: We appreciate the comments surrounding the appeals processes for the CJR model and EPMs. We refer to section III.C.8 of this final rule for a detailed discussion of comments and responses in regards to the appeal processes for these models.

Final Decision: In current CJR regulations at § 510.310(a), a participant hospital may dispute a calculation that involves a matter related to ‘determinations associated with quality measures affecting payment.’ We explain in the preamble of the CJR final rule that determinations associated with quality measures affecting payment may include the calculation of the percentiles of quality measure performance to determine eligibility to receive a reconciliation payment (80 FR. 73411). For consistency with the final EPM regulation text in § 512.310(a) that was modified in response to comments in order to more fully identify those determinations associated with quality measures affecting payment that may be disputed under this provision, we are making a technical change in this final rule to the regulation text at § 510.310(a), that a participant hospital may dispute a calculation that involves a matter related to the use of quality measure results in determining the composite quality score, or the application of the composite quality score during reconciliation. This does not change the substantive standard that we proposed and finalized in the CJR final rule, but rather refines the regulatory text to better reflect our final policy. Therefore, § 510.310(a) is finalized as follows:

- Notice of calculation error (first level of appeal). Subject to the limitations on review in subpart D of Part 510, if a participant hospital wishes to dispute calculations involving a matter related to payment, reconciliation amounts, repayment amounts, the use of quality measure results in determining the composite quality score, or the application of the
composite quality score during reconciliation, the participant hospital is required to provide written notice of the calculation error, in a form and manner specified by CMS.

H. Beneficiary Notification

As stated in the proposed rule, CMS currently requires participant hospitals and CJR collaborators to provide written notice to any Medicare beneficiary that meets certain criteria in § 510.205 of his or her inclusion in the CJR model. The notification must detail the structure of the model, the existence of providers and suppliers with whom the participant hospital has a sharing arrangement, and the fact that the beneficiary retains the freedom of choice. We refer readers to the CJR final rule (80 FR 73516–73521) for further discussion of these requirements, which are codified under § 510.405. Although we did not propose specific changes to § 510.405(a)(1), which requires that participant hospitals provide CJR beneficiaries with the list of all post-acute care providers in an area, we did propose a parallel beneficiary notification provision for the EPMs. As discussed in detail in section III.G.2 of this final rule, we received comments on both the EPM beneficiary notification proposals and the existing CJR provision and we are making changes to the EPM beneficiary notification regulations in response to these comments. Since we proposed to maintain alignment between the CJR model and the EPMs to the extent possible as referenced in sections V.C; V.I.1; V.J.1 through V.J.4; and V.K. of the proposed rule, we are also making conforming changes to § 510.405(a)(1) for the CJR model to match the modifications we are finalizing for the EPMs in §512.450(a)(1). Specifically, we are revising § 510.405(a)(1) to state that as part of discharge planning and referral, participant hospitals must provide a complete list of HHA's, SNFs, IRFs, or LTCHs that are participating in the Medicare program, and that serve the geographic area (as defined by the HHA) in which the patient resides, or in the case of the SNF, IRF, or LTCH, the geographic area requested by the patient. This list must be presented to CJR beneficiaries for whom home health care, SNF, IRF, or LTCH services are medically necessary. In addition, we are defining the area of the EPM’s area within the boundaries of a State, or a State or other jurisdiction, designated as constituting an area with respect to which a Professional Standards Review Organization or a Utilization and Quality Control Peer Review Organization has been or may be designated.” We note that we expect the SNF list provided to a CJR beneficiary would also include all rural hospital providers of SNF-level care in swing beds in the geographic area requested by the patient. We believe that these changes will clarify and streamline the requirements for the provision of the list of post-acute care providers, as well as reduce the burden on participant hospitals.

In the proposed rule, we proposed to amend § 510.405 to include all CJR collaborators in the requirements for delivery of beneficiary notices and to streamline our current regulations. We also proposed to require participant hospitals and CJR collaborators to be able to generate and provide to CMS upon request a list of all beneficiaries who received a notice, including the type of notice and the date it was delivered. We sought comments on all aspects of this proposal. We also noted that we proposed, but did not summarize in the preamble, new language for § 510.405(b) that would permit delivery of the hospital detailed beneficiary notice as soon as reasonably practicable after admission, but during the stay and prior to discharge, when a beneficiary’s medical condition makes notice on admission infeasible.

The following is a summary of the comments received and our responses.

Comment: Commenters expressed concern that the multiple beneficiary notifications required under CMS’ proposal would create an overload for CJR beneficiaries, would result in administrative burden on providers, and would be infeasible in some cases. Several commenters also expressed concern about the times at which beneficiaries must receive beneficiary notifications from participant hospitals or CJR collaborators, the requirement that beneficiary notifications be in writing, and a participant hospital’s ability to generate lists of all beneficiaries that received beneficiary notifications.

Response: We appreciate the commenter's feedback. We disagree with the commenter’s suggestion to require that the notification state that all hospitals within the applicable metropolitan area are required to participate in the CJR model, because some hospitals in the MSA are not required to participate in light of the exception in § 510.100(b). Moreover, other than participant hospitals, no providers or suppliers are required to participate in the CJR model or enter into a sharing arrangement; therefore, the CJR model does not restrict Medicare beneficiaries’ ability to choose any other Medicare enrolled provider or supplier. However, to address the commenter’s concern about what the notice template implies, as part of our updates to the template we will explore making changes to provide further information about the scope of the
Comment: One commenter voiced concern that the current beneficiary notification omits outpatient therapy providers in the list of post-acute care options, noting that this omission could influence a Medicare beneficiary to believe certain treatments or services, such as outpatient physical therapy, are not an option for them in this model. The commenter recommended that at a minimum, beneficiaries should be provided a written list of all of the local providers from whom they can choose to receive their rehabilitation therapy.

Response: Under current CJR regulation in § 510.405(a)(1) which complement the discharge planning CoP, participant hospitals must inform beneficiaries of all Medicare participating post-acute care providers in an area and must identify those post-acute care providers with whom they have sharing arrangements. By post-acute care providers we do not mean outpatient providers or other providers or suppliers for follow up Part B-covered services. These are unlikely to be the initial provider/supplier that furnishes rehabilitation services to a CJR beneficiary immediately following discharge from the anchor hospitalization. We mean HHAs, SNFs, IRFs, and LTCHs where post-acute care services may be covered under Part A following hospital discharge. Similar to the discharge planning CoP, we believe the lists provided to CJR beneficiaries at discharge should be of those institutional post-acute care providers that provide Part A-covered services if institutional post-acute care is medically necessary for the beneficiary immediately following hospital discharge in order to specifically safeguard beneficiary freedom of choice about post-acute care providers under the CJR model and establish transparency about financial relationships between post-acute care providers and CJR hospital participants. Under the CJR model, we do not require complete lists of other providers or suppliers of outpatient therapy or any other Part B services that a beneficiary might need during the 90-day post-discharge episode duration to be provided by the CJR participant hospital to the beneficiary, just as the discharge planning CoP does not require lists of other providers or suppliers for follow up Part B-covered services to be provided to a patient. However, as discussed in this section, in response to comments, we are modifying the requirements of § 510.405(a)(1) to provide greater clarity about the complete list of post-acute care providers to be provided to a CJR beneficiary. Under revised § 510.405(a)(1), participant hospitals will be required to provide, to beneficiaries for whom home health care, SNF, IRF, or LTCH services are medically necessary, a complete list of participating HHAs, SNFs, IRFs, or LTCHs that serve the geographic area in which the patient resides (as defined by the HHA) or in the case of SNFs, IRFs, or LTCS, the area requested by the patient. This revised provision makes clear that CJR participant hospitals need only provide a complete list of HHAs, SNFs, IRFs, or LTCHs to a CJR beneficiary if one of these types of post-acute care services is medically necessary and, in that case, only a list of those post-acute care providers that furnish the medically necessary level of services. In situations where home health care, SNF, IRF, or LTCH services are not medically necessary immediately following discharge, CJR participant hospitals may provide recommendations to CJR beneficiaries about follow up services immediately following discharge and thereafter during the CJR episode, including outpatient therapy services, consistent with all existing laws and regulations. However, we believe it is unlikely that outpatient therapy services immediately following hospital discharge would be a medically appropriate option for most CJR beneficiaries, who would likely be homebound for a period of time and require more comprehensive post-acute care services rather than outpatient therapy services.

Comment: A commenter currently participating in the CJR model stated that in cases of emergent fracture, the requirement to provide the beneficiary notification at the time of admission has presented significant operational hurdles, in that these patients upon admission are unable to comprehend the notification and that providing the notification to accompanying family members has resulted in confusion. This commenter recommended that in cases of emergent fracture, the notification should be provided to patients after the surgery, to avoid additional confusion and distress for patients experiencing a traumatic event.

Response: We appreciate the commenter’s feedback. We note that in the case of an emergent patient immediate notification of model participation is not always appropriate, and we note that the first priority of the participant hospital should be providing medical care to the beneficiary. For this reason, we proposed to modify the regulation at § 510.405(b) to permit the notification to be provided to the beneficiary or his or her representative as soon as is reasonably practicable but no later than discharge from the participant hospital accountable for the CJR episode, in cases where the patient’s condition makes it infeasible to deliver the notice at admission. We believe that providing the participant hospital this flexibility will avoid causing additional confusion for the beneficiaries and his or her family members. For the same reasons, we are modifying the proposed requirements for CJR collaborator delivery of notices to permit similar flexibility in consideration of a patient’s condition.

Final Decision: After consideration of the public comments received on EPM and CJR beneficiary notification policies, we are finalizing our proposal to modify § 510.405, with additional modifications. Specifically, we are finalizing changes to § 510.405(a)(1) to specify when a complete list of certain post-acute care providers must be provided to the CJR beneficiary as part of discharge planning and referral. We are also finalizing changes to § 510.405(b) to streamline the requirements for required beneficiary notification and to reduce provider burden and provide additional flexibilities. These changes are effective as of the effective date of this final rule.

Since we are adding to the list of CJR collaborators, as discussed in section V.J.1.a. of the proposed rule and in this final rule, we proposed to amend the beneficiary notification requirements at § 510.405(b) to account for these additional types of CJR collaborators. We are finalizing these proposals with modifications to clarify when beneficiary notifications must be provided to beneficiaries, and to address specific requirements for PGP, NPPGP, TGP, members of the PGP, members of the NPPGP, members of the TGP, ACOs, ACO participants, and ACO providers/suppliers. These modifications are made in response to comments on the proposed changes to § 510.405(b) and the corresponding proposals for the EPMs that are discussed in section II.G.3. However, because elsewhere in this final rule we are finalizing our proposals to permit these new types of CJR collaborators effective July 1, 2017, we are similarly delaying the effective date of the beneficiary notice requirements that would apply to these types of CJR collaborators. We believe this approach will reduce confusion that could result from imposing requirements with respect to entities that cannot be CJR collaborators until July 1, 2017. We proposed to amend § 510.405(b)(4) to reflect changes to the SNF waiver. We did not receive any comments on this
proposals, so we are finalizing the text as proposed, but renumbering to § 510.410(b)(3). We note that we are making conforming changes for related cross-references in § 510.610. These changes are effective as of the effective date of this final rule.

To provide CJR hospitals and their collaborators with more time to come into compliance and to provide consistency with the EPMs, we are delaying until July 1, 2017 the effective date of the requirement proposed as § 510.405(b)(5) to generate a list of beneficiaries who have received notifications upon request until July 1, 2017 and are renumbering to § 510.410(b)(4). Effective July 1, 2017 we also will make certain conforming changes to other provisions of § 510.405(b) to reflect this requirement.

Please refer to the Regulations Text section at the end of this final rule for the final regulation text language.

I. Compliance Enforcement

We proposed numerous amendments to the regulations in § 510.410. The amendments are largely to address the revisions to the CJR model to allow for additional financial relationships and to align terminology so that the CJR model regulations mirror the proposed EPM regulations at § 512.460 in order to avoid confusion for hospitals that are participating in CJR and one or more of the proposed EPMs. Although our proposed changes reflect an intent that compliance enforcement under the CJR model would stay mostly the same, we proposed changes in § 510.410 to adapt it to our proposal to amend the regulations at § 510.500 and § 510.505, as well as to reflect the addition of § 510.506. For example, we proposed to remove the term ‘collaborator agreement’ from § 510.410 in keeping with the proposed deletion of this concept from § 510.500.

1. Failure To Comply

Currently, CMS may take remedial action against a participant hospital if a participant hospital or any of the hospital’s CJR collaborators are noncompliant in any of the ways listed in § 510.410(b)(1). We proposed that CMS may also take remedial action against a participant hospital if any of hospital’s related collaboration agents and downstream collaboration agents were noncompliant in order for CMS to have the ability to address any noncompliance of these collaboration agents or downstream collaboration agents. As discussed in section V.I.1.a. of this proposal, the proposed addition of ACOs as CJR collaborators, combined with the proposed modifications of the financial arrangements available under the CJR model, would allow for many additional entities and individuals to have financial arrangements under the CJR model as collaborators, collaboration agents, or downstream collaboration agent. We believe our compliance enforcement must give us the authority to ensure that all such entities and individuals are advancing the goals of the CJR model, such as maintaining access to care. We believe that CJR participant hospitals should ensure that their sharing arrangements, the distribution arrangements of their collaborators, and the downstream distribution arrangements of their collaboration agents comply with the performance requirements and safeguard program integrity. Therefore, we propose that CMS may take remedial actions against a participant hospital if any collaboration agent of such participant hospital’s CJR collaborators, any downstream collaboration agent of such CJR collaboration agent is not compliant with applicable requirements in any of the ways listed in § 510.410(b)(1). Further, we proposed that CMS may take remedial actions against a participant hospital if a participant hospital or any of the participant hospital’s CJR collaborators, any collaboration agent of such CJR collaborators or any downstream collaboration agent has signed a sharing arrangement, distribution arrangement, or downstream distribution arrangement that is noncompliant with the requirements of part 510.

We proposed to amend the regulations at § 510.410 to include these requirements. We sought comment on our proposal. The following is a summary of the comments received and our response.

Comments: Comments generally supported the amendments to the regulations concerning compliance enforcement. However, some commenters expressed concerns regarding the proposal that participant hospitals are responsible for compliance of CJR collaborators’ collaboration agents, and collaboration agents’ downstream collaboration agents, and believe these requirements are burdensome for the participant hospital, in that participant hospitals do not have direct contractual relationships with collaboration agents or downstream collaboration agents. Additionally, one commenter expressed concern about the proposal in § 510.410(b)(1)(ix) that CMS may take remedial action when the participant hospital or its related CJR collaborator, collaboration agent, or downstream collaboration is subject to action involving violations of the physician self-referral law, civil monetary penalties law, Federal anti-kickback statute, antitrust laws, or any other applicable Medicare laws, rules, or regulations that are relevant to the CJR model. The commenter stated that violations of any other applicable Medicare laws, rules, or regulations that are relevant to CJR model is overly broad and instead, CMS should apply a reasonable knowledge standard to the participant hospital’s awareness of a collaborator’s involvement in such matters. Commenters also requested that CMS provide in the final rule examples of actions that are not clear violations of existing health care fraud and abuse statutes.

Response: We received similar comments and recommendations from commenters for the proposed EPMs compliance enforcement section. Given the proposed amendments to the CJR model regulations for compliance enforcement at § 510.410 mirror the proposed EPM regulations at § 512.460, we refer readers to section III.F.2. for a detailed explanation of our responses as they relate to the CJR model as well as the EPMs.

Final Decision: After consideration of the public comments received, we are finalizing the proposals in § 510.410 for compliance enforcement, with modifications to delete as redundant the proposal to amend § 510.410(b)(vi) to separately authorize CMS to take remedial action based on noncompliance with requirements specified in § 510.120(b). We are also clarifying that the 25 percent that CMS may add to the repayment amount under certain conditions as set forth in existing § 510.410(b)(3) is a penalty. Additionally, since changes to the financial arrangement provisions discussed in V.J. will not be effective until July 1, 2017, we are also making the amendments to related sections effective July 1, 2017 to avoid confusion and preserve the existing CJR regulations until these changes take effect.

J. Financial Arrangements Under the CJR Model

Currently, participant hospitals may engage in financial arrangements under the CJR model. The arrangements published in the CJR final rule (80 FR 73412 through 73437) allow participant hospitals and providers and suppliers caring for CJR beneficiaries to share in the financial risks and rewards under the CJR model, to engage in care redesign and CJR beneficiary care management, and to establish close partnerships with these individuals and entities to promote accountability for...
the quality, cost, and overall care for CJR beneficiaries. In order to ensure that goals of the CJR model are met, and to ensure program integrity and protect from abuse, the CJR model has many requirements for financial arrangements. We proposed a full replacement for the prior CJR regulations for financial arrangements §§ 510.500 and § 510.505 in order to streamline and consolidate our regulations in line with the proposed financial arrangements for the EPMs at § 512.500 and § 512.505. Our proposals reflected changes from the current CJR model regulations that generally fell into the following four categories:

- Removing duplication of requirements in similar provisions.
- Streamlining and reorganizing the provisions for clarity and consistency.
- Providing additional flexibility in response to feedback from CJR participant hospitals and other stakeholders.
- Expanding the scope of financial arrangements available under the model.

Many of our proposed changes were largely organizational in nature, not changes to policy or requirements; however, in several cases we proposed new financial arrangements policies and/or requirements for the CJR model. We discuss these policies in detail later in this section and we also refer readers to section III.I. of this final rule for further discussion and rationale behind our proposed approach.

We proposed that all amendments to regulations discussed in this section V.J. would be effective beginning July 1, 2017, in order to align with the beginning of the first performance year of the proposed EPMs. Therefore, we are finalizing this proposal without modification. In addition, we note that the July 1, 2017 effective date provides CJR participants with additional time to come into compliance with the revised requirements and preserves the existing CJR regulations until these changes take effect. We refer readers to § 510.2 for effective dates of definitions discussed in section V.J.

1. Definitions Related to Financial Arrangements
   a. Addition to the Definition of CJR Collaborators

   In order to align with the proposed financial arrangements for the EPMs and to provide further opportunity for coordination between participant hospitals and their partners in care redesign, we proposed to allow the following entities to be CJR collaborators: ACOs (with the limitations discussed later in this section), hospitals, and CAHs. We believe the proposal would allow for increased care coordination opportunities across the spectrum of care for beneficiaries in CJR episodes. Given that the proposals in this section mirror those proposed for the EPMs in section III.I.3. of this final rule, we refer readers to that section for further discussion of our rationale for allowing ACOs, hospitals, and CAHs to be collaborators.

   Many ACOs and other stakeholders have expressed strong interest in being collaborators in episode payment models such as CJR. In the CJR final rule, we did not include ACOs in the definition of CJR collaborators, responding that we decided to limit the testing of gainsharing relationships to solely those between hospitals and providers and suppliers enrolled in Medicare because we expected enrolled providers and suppliers to be most directly and specifically engaged with the CJR participant hospital in care redesign and episode care for beneficiaries who had surgery at the participant hospitals (80 FR 73417). We also noted that a number of scenarios discussed by commenters to support their request to allow ACOs to be CJR collaborators could be achieved outside of the context of gainsharing relationships between the participant hospital and ACOs. However, with the steady growth in the number of ACOs and ACO-attributed beneficiaries, we have further considered the potential for ACOs to be CJR collaborators, especially given ACO expertise in care coordination and accountability for the quality and expenditures for health care for ACO-attributed beneficiaries over an annual period. In addition, we note that the challenges of attributing savings and changes in the quality of care for beneficiaries simultaneously in CJR and total cost-of-care models or programs, such as ACOs, remain not fully resolved, as discussed in section III.D.6. of this final rule.

   We proposed that “ACOs,” meaning accountable care organizations, as defined at § 425.20, that participate in the Medicare Shared Savings Program and is not in Track 3, be permitted to be CJR collaborators. The proposal would allow locally variable financial arrangements that could account for the way CJR episode care is coordinated and managed in communities, and ensure that entities with appropriate skills and experience are permitted to share in the risks and rewards with participant hospitals. Our proposal would not allow any entities that are not providers or suppliers to be CJR collaborators other than ACOs. Like providers and suppliers, ACOs are regulated by CMS. We can verify that these ACOs meet current Shared Savings Program requirements such that they are suitable for a role as CJR collaborators.

   We also proposed to allow participant hospitals to enter into financial arrangements with other hospitals and CAHs that care for CJR beneficiaries. We believe it is important to allow participant hospitals to enter into financial arrangements with other hospitals and CAHs that care for CJR beneficiaries, in order to align the financial incentives of such other hospitals and CAHs with the CJR model’s goals of improving the quality and efficiency of CJR episodes and to align with the proposed financial arrangements for the EPMs.

   In summary, we proposed the following providers, suppliers, and other entities be added to the list of permissible CJR collaborators: ACOs, hospitals, and CAHs.

   We sought comment on our proposal to include ACOs, hospitals, and CAHs in the definition of CJR collaborators.
The following is a summary of the comments received and our responses. **Comment:** Several commenters requested clarification about whether certain groups of health care professionals that do not include physicians could be CJR collaborators. The commenters requested that, in addition to PGP, groups of certified registered nurse anesthetists (CRNAs), advanced practice registered nurses (APRNs), outpatient speech-language pathologists, physical therapists, and other qualified licensed healthcare professionals who are not physicians, be permitted to be CJR collaborators. One commenter explained that these groups are identified by a TIN.

A number of commenters pointed out that while the proposed rule specifically listed PGPs as eligible to be CJR collaborators, CMS’ proposal did not separately list groups of physical therapists or other therapists as eligible to be CJR collaborators. One commenter asserted that allowing only individual therapists to collaborate and excluding therapy practice groups from entering into sharing arrangements with EPM participants is shortsighted because rehabilitation therapy practices and independent therapists are likely to be significant contributors to SHFFT episodes. The commenters requested that CMS clarify the regulations to explicitly permit groups of therapists to enter into sharing arrangements with participant hospitals. One commenter further proposed that once a therapy practice group contracts with a hospital as a collaborator, it should be up to the practice group to ensure that financial exchanges with the participant hospital were attributed to the physical therapists who directly furnished services to CJR beneficiaries.

**Response:** We appreciate the interest of the commenters in ensuring groups of nonphysician practitioners and groups of therapists have the same opportunities to be CJR collaborators that we proposed for PGPs, as well as their interest in allowing financial exchanges with their members who furnished services to CJR beneficiaries.

Under our current regulation, individual nonphysician practitioners are permitted to be CJR collaborators. Individual therapists are also permitted to be collaborators to the extent that they fall within the collaborator category in the current CJR regulations for provider or supplier of outpatient therapy services. As collaborators, these individuals would be eligible to receive gainssharing payments from participant hospitals. Moreover, our existing definition of proposal defined a PGP member includes a physician, nonphysician practitioner or therapist who is an owner or employee of a PGP who has reassigned to the PGP his or her right to receive Medicare payments. Accordingly, as PGP members, these nonphysician practitioners and therapists would be eligible for distribution payments and downstream distribution payments from a PGP. We agree with the commenters that because the CJR regulations and our proposed revisions to these regulations addressed the role of PGPs without reference to other types of groups, we left some uncertainty about whether groups without a physician owner or employee are eligible to be CJR collaborators and whether under our proposals such groups would be permitted to enter into distribution arrangements or downstream distribution arrangements with their members. We also agree with the commenters that our provision allowing providers and suppliers of outpatient therapy services to be CJR collaborators is potentially unclear, because this term does separately identify therapists in private practice or groups of therapists in private practice on the list of CJR collaborators, as does our regulatory provision regarding physicians and PGPs. We also appreciate the commenters’ uncertainty associated with the fact that we did not address whether a collaborator that was a therapy group practice would be permitted to enter into distribution arrangements or downstream distribution arrangements with their members, given that we did specify this in the language that we proposed for PGPs.

We do not believe it would be appropriate to allow a group of licensed health care professionals to be CJR collaborators if that group consists solely of individuals who are not among the categories of individuals that may be CJR collaborators. However, we believe that if a category of individuals is eligible to be CJR collaborators, then Medicare-enrolled groups that include such individuals should also be permitted to be collaborators. Further, we believe these groups should also be permitted to enter into distribution arrangements or downstream distribution arrangements with their members. We clarify these policies through this final rule.

Groups of nonphysician practitioners that do not include a physician are not included in the category of PGPs that are on the current list of CJR collaborators. However, we believe these groups of nonphysician practitioners should be permitted to be CJR collaborators, just as we allow both individual physicians and nonphysician practitioners to be CJR collaborators. We also believe these groups of nonphysician practitioners should be treated similarly to PGPs with regard to their ability to engage in distribution arrangements and downstream distribution arrangements with their members, consistent with our treatment of nonphysician practitioners who are PGP members. Therefore, we are adding to the list of entities that are eligible to be CJR collaborators a nonphysician practitioner group practice (NPPGP), defined as “an entity that is enrolled in Medicare as a group practice, includes at least one owner or employee who is a nonphysician practitioner, does not include a physician owner or employee, and has a valid and active TIN.” The requirements for sharing arrangements, distribution arrangements, and downstream distribution arrangements for NPPGPs and NPPGP members are discussed in the sections of this final rule that address our policies for these arrangements.

We further believe that our provisions allowing a provider or supplier of outpatient therapy services to be a CJR collaborator should be modified to provide greater clarity about the providers and suppliers of outpatient therapy services that can be CJR collaborators. The Medicare Claims Processing Manual, Chapter 5, Part B Outpatient Rehabilitation and CORF/ OPT Services, Section 10 lists the following Medicare-enrolled providers and suppliers that can submit claims for outpatient therapy services: SNF; outpatient hospital; CAH; HHA; outpatient physical therapy provider (OPT), otherwise known as rehabilitation agency; comprehensive outpatient rehabilitation facility (CORF); physician; nonphysician practitioner; and physical or occupational therapist or speech-language pathologist in private practice.\(^{136}\) We note that the list of CJR collaborators in the current regulations already includes, SNFs, HHAs, physicians, and nonphysician practitioners so their inclusion as collaborators under the definition of provider or supplier of outpatient therapy services is duplicative. Therefore, rather than maintaining a definition of provider of outpatient therapy services which would have included all providers and suppliers of outpatient therapy services, we believe it is clearer to specify individually on the list of CJR collaborators all the types of Medicare-enrolled providers and suppliers that can bill Medicare for

outpatient therapy services. Thus, we are defining a new term therapist in private practice as “a therapist that either: complies with the special provisions for services furnished by physical therapists in private practice in § 410.60(c) of this chapter; or complies with the special provisions for services furnished by occupational therapists in private practice in § 410.59(c) of this chapter; or complies with the special provisions for services furnished by speech-language pathologists in private practice in § 410.62(c) of this chapter.”

We are adding therapist in private practice to the list of CJR collaborators, which ensures that all individual suppliers of outpatient therapy services are on the CJR collaborator list. In addition, we are revising our definition of provider of outpatient therapy services to mean “an entity that is enrolled in Medicare as a provider of therapy services and furnishes one or more of the following: outpatient physical therapy services as defined in § 410.60 of this chapter; outpatient occupational therapy services as defined in § 410.59 of this chapter; outpatient speech-language pathology services as defined in § 410.62 of this chapter.”

Under this revised definition, provider of outpatient therapy services now includes only those entities that enroll in Medicare specifically as a provider of outpatient physical therapy/occupational therapy/speech-language pathology services, and we are revising the list of CJR collaborators to use this defined term in place of “provider or supplier of outpatient therapy services.”

Finally, in addition to finalizing our proposal to add hospitals and CAHs to the list of CJR collaborators, we are adding CORFs to the list of CJR collaborators because it is the only other type of provider that can furnish outpatient therapy services that is not included on the CJR collaborator list under our new and revised terms. Thus, with the addition of therapy group practices as discussed specifically below, in total, these changes to the definitions and supplements to the list of CJR collaborators clarify which individuals and entities may be CJR collaborators by separately specifying each type of supplier and provider of outpatient therapy services that is eligible to be a CJR collaborator.

With respect to the specific interest of commenters in therapy practice groups being eligible to be CJR collaborators that can share payments under CJR financial arrangements with their members, we agree with the commenters that such groups should be permitted to be CJR collaborators and to enter into distribution arrangements and downstream distribution arrangements with their members, consistent with our treatment of PGP and NPPGP. Thus, we are defining therapy group practice (TPG) as “an entity that is enrolled in Medicare as a therapy group in private practice, includes at least one owner or employee that is a therapist in private practice, does not include an owner or employee who is a physician or nonphysician practitioner, and has a valid and active TIN” and adding TGP to the list of CJR collaborators. The requirements for sharing arrangements, distribution arrangements, and downstream distribution arrangements for TPGs and TGP members are discussed in the sections of this final rule that address our policies for these arrangements.

We are finalizing, with the modifications discussed, the definition of CJR collaborator in § 512.2 to mean an ACO or one of the following Medicare-enrolled individuals or entities that enters into a sharing arrangement:

1. SNF.
2. HHA.
3. LTCH.
4. IRF.
5. Physician.
7. Therapist in private practice.
8. CORF.
9. Provider of outpatient therapy services.
10. PGP.
11. Hospital.
12. CAH.
13. NPPGP.
14. TGP.

Comment: A number of commenters expressed support for CMS’ proposed definition of “CJR collaborators,” including the proposed addition of ACOs, hospitals, and CAHs to the types of collaborators that were previously adopted for the CJR model. The commenters claimed that allowing additional health care providers, suppliers, and ACOs to be CJR collaborators would further encourage robust care coordination across the CJR episode. Several commenters asserted that by recognizing the expertise that ACOs may offer participant hospitals as CJR collaborators with regard to managing the cost and quality of care that Medicare beneficiaries receive, ACOs will be able to use their substantial expertise and resources to contribute to the CJR model’s dual goals of limiting spending and increasing quality. One commenter further commended CMS for making the list of CJR collaborators exhaustive and not including third party conveners, who the commenter believes lack a commitment to patients, local providers, or their community.

In contrast, some commenters expressed disappointment that the list of CJR collaborators did not include entities such as pharmaceutical companies; medical device companies; medical technology companies; social services aging networks; and other third parties, such as the types of convening organizations participating in other CMMI models. Several commenters believe that were medical device and pharmaceutical manufacturers allowed to be CJR collaborators, those manufacturers may make meaningful contributions to the success of the CJR model by ensuring their products are used appropriately; aligning financial and other incentives to improve patient outcomes; demonstrating the value of their products; and reducing costs.

Other commenters who favored adding medical technology companies as CJR collaborators asserted that medical technology companies can make a significant, positive impact on care redesign and cost containment as well as provide integrated data analytic infrastructure and services to optimize care and to achieve quality goals. A few commenters suggested that CMS should expand the list of potential CJR collaborators to include non-providers or non-supplier entities that have a track record of providing Medicare providers and suppliers participating in other models with support services such as care redesign, data analytics, and general program support, as well as community-based organizations that are well-equipped and efficient in providing social and supportive services that help beneficiaries stay out of the hospital. Several commenters also encouraged CMS to include all APM entities as CJR collaborators, reasoning that APM entities are similar to ACOs in that they are a legal entity that is separate from its participants.

Additionally, one commenter recommended that Next Generation ACOs be included in the definition of ACOs that are on list on CJR collaborators, so the Next Generation ACO may act on behalf of its providers to enter into financial arrangements with participant hospitals for beneficiaries not assigned to the ACO. The commenter explained that not including Next Generation ACOs in the definition of ACOs that CMS proposed could be CJR collaborators will require ACO participants and ACO providers/suppliers of the Next Generation ACO to enter into CJR sharing arrangements on their own without the Next Generation ACO to represent them.
Finally, one commenter shared its perspective that CMS should not restrict the definition of CJR collaborators because such an approach discourages the introduction of new entities and individuals in the healthcare market. The commenter requested that CMS allow market forces to shape the innovation of CJR participants and their community partners in order to determine the financial partnerships that would be most beneficial to achieving the overarching goals of the CJR model. The commenter asserted that being too prescriptive regarding the individuals and entities that can and cannot enter into financial arrangements under the CJR model would not allow for new organizations to develop in the market that may have the potential to generate substantial cost savings for participant hospitals.

Response: We appreciate the support of the commenters for our proposed list of the types of individuals and entities that can be CJR collaborators, including our proposal to include hospitals, CAHs, and ACOS that would expand the list beyond current CJR collaborators adopted in the CJR Final Rule (80 FR 73418).

We note that some of the potential contributions, such as integrating the data analytic infrastructure and services to optimize care to achieve quality goals, that were suggested by commenters as reasons to allow third parties, such as pharmaceutical, medical device, and medical technology companies as well as other types of commercially interacting organizations participating in other CMMI models, to be CJR collaborators, can be achieved outside of the context of sharing arrangements through other relationships between the participant hospital and those entities. In response to the specific requests that we include APM entities on the list of CJR collaborators, given that an APM entity, as defined in § 414.1305, means an entity that participates in an APM or payment arrangement with a non-Medicare payer through a direct agreement or through Federal or State law or regulation, we believe that adding all APM entities to the list of CJR collaborators would be overly expansive and risk loosening the clinical link between the CJR collaborator, participant hospital, and beneficiary that we believe is important for improving the quality and reducing the cost of care under the model. With the exception of ACOS, PGP, NPPGP, and TGPs, we continue to believe that any CJR collaborator that receives a gainsharing payment must have furnished a billable service included in the episode to a CJR beneficiary and that the payment arrangements for gainsharing payments must be substantially based on the quality of care and the provision of CJR activities. In the case of ACOS, PGP, NPPGP, and TGPs that are CJR collaborators, we require that the entity itself must have contributed to CJR activities and been clinically involved in the care of beneficiaries in order to be eligible to receive a gainsharing payment or be required to make an alignment payment. At this point we are not convinced any APM entities could meet these eligibility criteria, other than ACOS. We also do not agree with the commenter who recommended that we not restrict the definition of CJR collaborators to any specific individuals or entities. We believe it is important for participant hospitals to engage CJR collaborators that have a commitment to their local communities, local providers, and Medicare beneficiaries in order to create the greatest potential for sustained improvements in quality and reductions in cost under the CJR.

We appreciate the commenter’s suggestion that Next Generation ACOS be included in the definition of ACOS that are on the list of CJR collaborators, so the Next Generation ACO may act on behalf of its ACO participants and ACO providers/suppliers to establish sharing arrangements with participant hospitals for beneficiaries not assigned to the ACO. While we understand that the Next Generation ACO would like to enter into a CJR sharing arrangement as a CJR collaborator on behalf of its providers and suppliers, to be eligible to receive a gainsharing payment or be required to make an alignment payment under the sharing arrangement the Next Generation ACO itself must have contributed to CJR activities and been clinically involved in the care of beneficiaries through activities such as providing care coordination services to beneficiaries during and/or after inpatient admission; engaging with a participant hospital in care redesign strategies, and actually performing a role in implementing such strategies, that are designed to improve the quality of care and reduce spending for the CJR episodes; or in coordination with providers and suppliers (such as ACO participants, ACO providers/suppliers, the participant hospital, and post-acute care providers) implementing strategies designed to address and manage the comorbidities of beneficiaries. We are unclear of the role the Next Generation ACO itself would play in the care of beneficiaries that are not assigned to the ACO, beyond serving as a contracting agent for its ACO participants and ACO providers/suppliers. We further believe that such an arrangement would require distinguishing activities on behalf of beneficiaries assigned to the ACO who are excluded from CJR episodes and beneficiaries not assigned to the ACO who are included in CJR episodes, and such distinctions could create confusion for beneficiaries, providers, and suppliers, as well as administrative complexity for the Next Generation ACO. Therefore, we do not believe it would be appropriate to include Next Generation ACOs in the definition of ACOS that may be CJR collaborators.

Finally, we note that as discussed in section III.D.6.c.(3) of this final rule, we are additionally finalizing the exclusion of beneficiaries from CJR episodes who are prospectively assigned to a Shared Savings Program ACO in Track 3. Therefore, for consistency with our policy for Next Generation ACOS whose assigned beneficiaries are also excluded from CJR episodes, we are excluding Shared Savings Program ACOs in Track 3 from the definition of ACOS that may be CJR collaborators. Thus, we are modifying our definition of ACO to read “ACO means an accountable care organization, as defined at § 425.20 of this chapter, that participates in the Shared Savings Program and is not in Track 3.” We emphasize that no CJR policy precludes providers or suppliers who are ACO participants or ACO providers/suppliers in a Next Generation ACO from entering into a sharing arrangement with a participant hospital on their own, provided they are on the list of CJR collaborators.

In summary, at this time we will not adopt a final policy that includes additional entities or individuals that are not providers or suppliers beyond those we proposed to be CJR collaborators. We selected acute care hospitals as the financially responsible entity for the CJR model because we are interested in evaluating the impact of bundled payment and care redesign across a broad spectrum of hospitals with varying levels of infrastructure and experience in entering into risk-based payment arrangements. We believe that it is most appropriate to identify a single type of provider to bear financial responsibility for making repayment to CMS under the CJR model. Given that hospitals perform a central role in coordinating episode-related care and ensuring smooth transitions for beneficiaries, this role factored in our decision to select IPPS hospitals as the financially responsible entity for this model. Under this structure, we believe that limiting the testing of gainsharing relationships to solely those between participant hospitals, certain Shared

Federal Register / Vol. 82, No. 1 / Tuesday, January 3, 2017 / Rules and Regulations 535
Savings Program ACOs, and providers and suppliers enrolled in Medicare is most appropriate because we expect enrolled providers and suppliers to be most directly and specifically engaged with the participant hospitals in care redesign and CJR episode care for beneficiaries. While we recognize that Shared Savings Program ACOs are not providers or suppliers, Medicare has a close relationship with such ACOs, which are regulated by CMS, so we can verify that these ACOs meet current Shared Savings Program requirements that make them suitable for a role as CJR collaborators. Further, by including such ACOs on the list of CJR collaborators, we are permitting locally variable financial arrangements that could account for the way care in CJR episodes is coordinated and managed in communities, and ensure that entities with appropriate skills and experience are permitted to share the CJR’s risks and rewards with participant hospitals. We are finalizing in § 510.2 the definition of ACO, with modification to mean an accountable care organization, as defined at § 425.20 of this chapter, that participates in the Shared Savings Program and is not in Track 3.

Comment: One commenter requested clarification about whether outpatient speech-language pathologists are eligible to be CJR collaborators.

Response: We appreciate the opportunity to clarify that speech-language pathologists are eligible to be CJR collaborators under the existing CJR regulations if they meet the definition of provider of outpatient therapy. Moreover, as discussed previously in this section, speech-language pathologists in private practice are included under the new definition of therapist in private practice when they are therapists that comply with the special provisions for services furnished by speech-language pathologists in private practice in § 410.62(c). In addition, a group of speech-language pathologists in private practice is included under the new definition of TGP when the group is an entity that is enrolled in Medicare as a therapy group in private practice, includes at least one owner or employee that is a therapist in private practice, and provides services furnished by speech-language pathologists in private practice.

In order to reduce duplicative language in § 510.500 and streamline the regulations for financial arrangements between CJR participant hospitals and CJR collaborators, we propose to delete the term “collaborator agreement” in § 510.2 and transition the requirements of collaborator agreements to requirements of sharing arrangements. Overall, the proposal would simplify and streamline the requirements for sharing arrangements under CJR, allow CMS to align the CJR financial arrangements with those of the proposed EPMs, and provide consistent regulations to potential parties that may participate in both the CJR model and the EPMs.

We recognize that current participant hospitals and CJR collaborators already have existing collaborator agreements. However, as noted further in this section, although we proposed to change several terms, the proposed sharing arrangements policies are largely similar to the current policies regarding collaborator agreements. We sought to amend the regulations at § 510.2 by deleting the term collaborator agreement in Part 510. We sought comment on our proposals.

The following is a summary of the comments received and our responses.

Comment: Several commenters requested clarification as to whether the proposed changes to financial arrangements in the CJR model would require CJR participant hospitals to review their current financial arrangements and modify the terminology to reflect the changes if they are finalized. One commenter acknowledged CMS’ efforts to providing consistency between the CJR model and the EPM, but claimed that requiring CJR participant hospitals to review their financial arrangements would constitute a significant burden on CJR participant hospitals.

Response: The proposed changes to CJR financial arrangements in §§ 510.500 and 510.505 would require CJR participant hospitals, and any other individual or entity involved in a financial arrangement under these regulations, to review the changes to the requirements of the CJR model, and to revise their financial arrangements and applicable terminology if necessary. While we acknowledge that the amendments to the financial arrangements requirements in the CJR model will create some short-term administrative burden on CJR participants and other parties involved in these arrangements, we believe that the revised CJR model regulations streamline and clarify the requirements for all parties and will help facilitate compliance with the requirements of the CJR model. In addition, the major policy changes, such as allowing ACOs to be collaborators and adopting the term CJR activities as the comprehensive framework for capturing both direct patient care and care redesign for CJR episodes, received widespread support from commenters. We recognize the time that CJR participant hospitals and CJR collaborators with financial arrangements under the existing requirements will need to review the amended requirements finalized in this final rule and revise their existing financial arrangements in order to be compliant. As such, the amended requirements for financial arrangements in the CJR model will be effective on July 1, 2017, the same date when the first performance year for the EPM begins. Therefore, CJR participant hospitals and CJR collaborators will have knowledge of the federal requirements for CJR financial arrangements approximately 6 months prior to their effective date in the CJR model, which we believe is sufficient to
review and revise their existing financial arrangements if necessary.  

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal without modification to delete the term "CJR activities" to identify certain obligations of parties in a sharing arrangement that are currently described as "changes in care coordination or delivery" in the CJR regulations governing the contents of the written agreement memorializing the sharing arrangement. In addition to the quality of care provided during episodes, we believe the activities that would fall under this proposed definition of CJR activities would encompass the totality of activities upon which it would be appropriate for certain financial arrangements under the CJR model in order to value the contributions of providers, suppliers, and other entities toward meeting the CJR model’s goals of improving the quality and efficiency of episodes. Therefore, for purposes of financial arrangements under the CJR model, we proposed to define CJR activities as activities related to promoting accountability for the quality, cost, and overall care for CJR beneficiaries, including managing and coordinating care; encouraging investment in infrastructure, enabling technologies, and redesigned care processes for high quality and efficient service delivery; the provision of items and services during a CJR episode in a manner that reduces costs and improves quality; or carrying out any other obligation or duty under the CJR model. Sections V.J.2. through V.J.4. of this final rule provide more detail as to how the addition of CJR activities affect other proposals in this part.

We proposed to amend § 510.2 by adding the term "CJR activities." We sought comment on our proposal to add CJR activities as an inclusive and comprehensive framework for capturing direct care and care redesign for CJR episodes that contribute to improving the quality and efficiency of these episodes. We received comments regarding both CJR activities and EPM activities and refer readers to section III.I.4.b. of this final rule for a detailed explanation of the comments and our responses.

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal to add the term "CJR activities," without modifications, effective July 1, 2017.

c. Addition of CJR Activities

We proposed to use the term “CJR activities” to identify certain obligations of parties in a sharing arrangement that are currently described as “changes in care coordination or delivery” in the CJR regulations governing the contents of the written agreement memorializing the sharing arrangement. In addition to the quality of care provided during episodes, we believe the activities that would fall under this proposed definition of CJR activities would encompass the totality of activities upon which it would be appropriate for certain financial arrangements under the CJR model in order to value the contributions of providers, suppliers, and other entities toward meeting the CJR model’s goals of improving the quality and efficiency of episodes. Therefore, for purposes of financial arrangements under the CJR model, we proposed to define CJR activities as activities related to promoting accountability for the quality, cost, and overall care for CJR beneficiaries, including managing and coordinating care; encouraging investment in infrastructure, enabling technologies, and redesigned care processes for high quality and efficient service delivery; the provision of items and services during a CJR episode in a manner that reduces costs and improves quality; or carrying out any other obligation or duty under the CJR model. Sections V.J.2. through V.J.4. of this final rule provide more detail as to how the addition of CJR activities affect other proposals in this part.

We proposed to amend § 510.2 by adding the term "CJR activities." We sought comment on our proposal to add CJR activities as an inclusive and comprehensive framework for capturing direct care and care redesign for CJR episodes that contribute to improving the quality and efficiency of these episodes. We received comments regarding both CJR activities and EPM activities and refer readers to section III.I.4.b. of this final rule for a detailed explanation of the comments and our responses.

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal to add the term "CJR activities," without modifications, effective July 1, 2017.

2. Sharing Arrangements

We believe the proposed amendments to this section will provide participant hospitals and CJR collaborators with more organized, and streamlined regulations.

a. General

With the exception of adding “past or anticipated” to the selection criteria for CJR collaborators, and replacing “collaborator agreement” with “sharing arrangement” the following proposed criteria are similar to the current requirements of the CJR model as finalized in prior regulations at § 510.500. In the proposed rule, we discussed the proposed requirements for sharing arrangements, including both our continuation of policies we finalized in the CJR final rule, and several new proposals. We proposed that participant hospitals must develop, maintain, and use a set of written policies for selecting individuals and entities to be CJR collaborators, and that such policies must include the quality of care delivered by the potential CJR collaborator. The selection criteria cannot be based directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent. Our proposed addition of “past or anticipated” does not effect a substantive change, but merely conforms the way the volume or value standard is articulated in this provision with the way that the volume or value standard is articulated in other provisions at § 510.500. However, by adding “past or anticipated,” we make clear that all previous and future referrals between or among participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent would be encompassed. We do not believe it would be appropriate for sharing arrangements to be based on criteria that include the volume or value of past or anticipated referrals because the sole purpose of sharing arrangements is to create financial alignment between participant hospitals and CJR collaborators toward the CJR model’s goals of improving the quality and efficiency of episode care. Thus, we continue to require that CJR participant hospitals select CJR collaborators based on criteria that include the quality of care furnished by the potential CJR collaborator to ensure that the selection of CJR collaborators takes into consideration the likelihood of their future performance in improving the quality of episode care.

In summary, we proposed to amend § 510.500(a) as follows:

- A participant hospital may enter into a sharing arrangement with a CJR collaborator to make a gainsharing payment, or to receive an alignment payment, or both.
- A participant hospital must not make a gainsharing payment or receive an alignment payment except in accordance with a sharing arrangement.
- A sharing arrangement must comply with the provisions of this section and all other applicable laws and regulations, including the applicable fraud and abuse laws and all applicable payment and coverage requirements.
- Participant hospitals must develop, maintain, and use a set of written policies for selecting individuals and entities to be CJR collaborators. These policies must contain criteria related to, and inclusive of, the quality of care delivered by the potential CJR collaborator. The selection criteria cannot be based directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.
- If a participant hospital enters into a sharing arrangement, its compliance program must include oversight of sharing arrangements and compliance with the applicable requirements of the CJR model.

We sought comment on our proposal. We received a number of comments on our proposal. Because the comments and responses to our proposal for CJR were not substantively different from the comments and responses on proposed § 512.500(a), we refer readers to section III.I.4.a for a discussion of the comments and our responses.

Additionally, we note that the CJR model and the EPMs’ policies surrounding the various requirements of financial arrangements mirror one another. We provided in Table 46 in section III.I.4.a. of this final rule to list the standards related to "volume and value" for EPM financial arrangements, and here provide Table 51 below with
the parallel information for the CJR model.

**Final Decision:** After consideration of the public comments received, we are finalizing effective July 1, 2017, the proposals in § 510.500(a) for the general requirements for CJR sharing arrangements, with modification to clarify that a CJR collaborator selection criterion that considers whether a potential collaborator has performed a reasonable minimum number of services that would qualify as CJR activities will be deemed not to violate the volume or value standard if the purpose of the requirement is to ensure the quality of care furnished to CJR beneficiaries. CJR sharing arrangements must comply with the following general provisions:

- A participant hospital may enter into a sharing arrangement with a CJR collaborator to make a gainsharing payment, or to receive an alignment payment, or both. A participant hospital must not make a gainsharing payment or receive an alignment payment except in accordance with a sharing arrangement.
- A sharing arrangement must comply with the provisions of this section and all other applicable laws and regulations, including the applicable fraud and abuse laws and all applicable payment and coverage requirements.
- The participant hospital must develop, maintain, and use a set of written policies for selecting individuals and entities to be CJR collaborators. These policies must contain criteria related to, and inclusive of, the quality of care delivered by the potential CJR collaborator. The selection criteria cannot be based directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, any individual or entity affiliated with a participant hospital, any CJR collaborator, collaboration agent, or downstream collaboration agent. A selection criterion that considers whether a potential CJR collaborator has performed a reasonable minimum number of services that would qualify as CJR activities will be deemed not to violate the volume or value standard if the purpose of the criterion is to ensure the quality of care furnished to CJR beneficiaries.
- If a participant hospital enters into a sharing arrangement, its compliance program must include oversight of sharing arrangements and compliance with the applicable requirements of the CJR model.

b. **Requirements**

Currently, there are a number of specific requirements for sharing arrangements under the CJR model. We proposed to delete the term “collaborator agreements” and to incorporate many of the requirements from the existing CJR provision at § 510.500(c) into a streamlined provision regarding the requirements for “sharing arrangements.” We discuss the proposal in detail further in this section in order to ensure current and future participant hospitals and CJR collaborators are aware of all requirements that would apply under these proposed revisions.

- We proposed that the sharing arrangement must be in writing, signed by the parties, and entered into before care is furnished to CJR beneficiaries under the sharing arrangement. In addition, participation in a sharing arrangement must be voluntary and without penalty for nonparticipation. We proposed that the sharing arrangement must require the CJR collaborator and its employees, contractors, and subcontractors to comply with certain requirements that are important for program integrity protections under the arrangement. We noted that the terms contractors and subcontractors, respectively, include
The sharing arrangement must require all of the individuals and entities in this group to comply with the applicable provisions of Part 510, including requirements regarding beneficiary notifications, access to records, record retention, and participation in any evaluation, monitoring, compliance, and enforcement activities performed by CMS or its designees, because these individuals and entities all would play a role in CJR care redesign and be part of financial arrangements under the CJR model. The sharing arrangement must also require all individuals and entities in the group to comply with the applicable Medicare provider enrollment requirement at § 424.500, including having a valid and active TIN or NPI, during the term of the sharing arrangement. This is to ensure that the individuals and entities have the required enrollment relationship with CMS under the Medicare program, although we note that they are not responsible for complying with requirements that do not apply to them. Finally, the sharing arrangement must require individuals and entities to comply with all other applicable laws and regulations.

We proposed that the sharing arrangement must not pose a risk to beneficiary access, beneficiary freedom of choice, or quality of care so that financial relationships between participant hospitals and CJR collaborators do not negatively impact beneficiary protections under the CJR.

Further we proposed that sharing arrangements must require the CJR collaborator to have a compliance program that includes oversight of the sharing arrangement and compliance with the requirements of the CJR, just as we would require participant hospitals to have a compliance plan for this purpose as a program integrity safeguard. We noted that the CJR compliance program requirement does not mandate that a CJR collaborator’s compliance program take a particular form or include particular components.

It is necessary that participant hospitals have adequate oversight over sharing arrangements to ensure that all arrangements meet the requirements of this section and provide program integrity protections. Therefore, we proposed that the board or other governing body of the CJR participant hospital have responsibility for overseeing the participant hospital’s participation under the CJR model, its arrangements with CJR collaborators, its payment of gainsharing payments, its receipt of alignment payments, and its use of beneficiary incentives in the CJR.

We proposed that the written agreement memorializing a sharing arrangement must specify a number of parameters of the arrangement, including the following:

- The purpose and scope of the sharing arrangement.
- The identities and obligations of the parties, including specified CJR activities and other services to be performed by the parties under the sharing arrangement.
- Management and staffing information, including type of personnel or contractors that will be primarily responsible for carrying out CJR activities.
- The date of the sharing arrangement.
- The financial or economic terms for payment, including—
  - Eligibility criteria for a gainsharing payment;
  - Eligibility criteria for an alignment payment;
  - Frequency of gainsharing or alignment payment;
  - Methodology and accounting formula for determining the amount of a gainsharing payment that is substantially based on quality of care and the provision of CJR activities; and
  - Methodology and accounting formula for determining the amount of an alignment payment.

Finally, we proposed to require that the terms of the sharing arrangement must not induce the participant hospital, CJR collaborator, or any employees, contractors, or subcontractors of the participant hospital to reduce or limit medically necessary services to any Medicare beneficiary or restrict the ability of a CJR collaborator to make decisions in the best interests of its patients, including the selection of devices, supplies, and treatments. These requirements are to ensure that the quality of care for CJR beneficiaries is not negatively affected by sharing arrangements under the CJR.

We proposed the requirements for sharing arrangements at § 510.500(b). We sought comment on our proposals. Because this proposal mirrors what we proposed for the EPM and the comments on these proposals and our responses are substantially the same, we refer readers to section III.4.b for a detailed explanation of the comments and our responses to them.

Final Decision: After consideration of the public comments received, we are finalizing effective July 1, 2017, the proposals in § 510.500(b) for the requirements for CJR sharing arrangements, with modifications. We are modifying our proposal at § 510.500(b)(4) to specify that the CJR collaborator must have or be covered by a compliance program which must include oversight of the sharing arrangement and compliance with the requirements of the CJR model that apply to its role as a CJR collaborator, including any distribution arrangements. We are also modifying our proposal to remove the requirement that the written agreement memorializing a sharing arrangement include management and staffing information, a change which results in renumbering proposed § 510.500(b)(7)(v) (requiring the financial or economic terms for payment be specified in the written agreement about the sharing arrangement) to § 510.500(b)(7)(iv). CJR sharing arrangements must meet the following requirements:

- A sharing arrangement must be in writing and signed by the parties, and entered into before care is furnished to CJR beneficiaries under the sharing arrangement.
- Participation in a sharing arrangement must be voluntary and without penalty for nonparticipation.
- The sharing arrangement must require the CJR collaborator and its employees, contractors (including collaboration agents), and subcontractors (including downstream collaboration agents) to comply with the following:
  - The applicable provisions of this part (including requirements regarding beneficiary notifications, access to records, record retention, and participation in any evaluation, monitoring, compliance, and enforcement activities performed by CMS or its designees);
  - All applicable Medicare provider enrollment requirements at § 424.500 of this chapter, including having a valid and active TIN or NPI, during the term of the sharing arrangement; and
  - All other applicable laws and regulations.
- The sharing arrangement must require the CJR collaborator to have or be covered by a compliance program that includes oversight of the sharing arrangement and compliance with the requirements of the CJR model that apply to its role as a CJR collaborator, including any distribution arrangements.
- The sharing arrangement must not pose a risk to beneficiary access, beneficiary freedom of choice, or quality of care.
- The board or other governing body of the participant hospital must have
responsibility for overseeing the participant hospital’s participation in the CJR model, its arrangements with CJR collaborators, its payment of gainsharing payments, its receipt of alignment payments, and its use of beneficiary incentives in the CJR model.

- The written agreement memorializing a sharing arrangement must specify the following:
  ++ The purpose and scope of the sharing arrangement.
  ++ The obligations of the parties, including specified CJR activities and other services to be performed by the parties under the sharing arrangement; ++ The date of the sharing arrangement.
  ++ The financial or economic terms for payment, including the following:
    — Eligibility criteria for a gainsharing payment.
    — Eligibility criteria for an alignment payment.
    — Frequency of gainsharing or alignment payment.
    — Methodology and accounting formula for determining the amount of a gainsharing payment or alignment payment.
  ++ The sharing arrangement must not—
    ++ Induce the participant hospital, CJR collaborator, or any employees, contractors, or subcontractors of the participant hospital or CJR collaborator to receive or limit medically necessary services to any Medicare beneficiary; or
    ++ Restrict the ability of a CJR collaborator to make decisions in the best interests of its patients, including the selection of devices, supplies, and treatments.

c. Gainsharing Payment, Alignment Payment, and Internal Cost Savings Conditions and Restrictions

Under the CJR model, we placed a number of conditions and limitations on gainsharing payments, alignment payments, and internal cost savings. Our proposal to amend the limitations and conditions would allow us to reorganize and clarify current policies, account for the addition of ACOs, CAHs, and hospitals as CJR collaborators, and align the CJR model with the proposed financial arrangements for the EPMs. Though many of the proposed requirements under sharing arrangements are largely similar to the current requirements under gainsharing payments, alignment payments, and internal cost savings conditions and restrictions, we discuss these requirements in detail further in this section in order to ensure current and future participant hospitals and CJR collaborators are aware of such requirements, in particular those that we proposed to change.

We proposed that to be eligible to receive a gainsharing payment, or to be required to make an alignment payment, a CJR collaborator other than a PGP or an ACO must have directly furnished a billable item or service to a CJR beneficiary during a CJR episode that occurred in the same performance year for which the participant hospital has calculated a gainsharing payment or been assessed a repayment amount. For purposes of this requirement, we consider a hospital, CAH, or post-acute care provider to have “directly furnished” a billable service if one of these entities billed for an item or service for a CJR beneficiary during a CJR episode that occurred in the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount. The phrase “performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount” does not mean the year in which the gainsharing payment was made. These requirements ensure that there is a required relationship between eligibility for a gainsharing payment and the quality of direct care for CJR beneficiaries during CJR episodes for these CJR collaborators. We believe the provision of direct care is essential to the implementation of effective care redesign, and the requirement provides a safeguard against payments to CJR collaborators other than a PGP or an ACO that are unrelated to direct care for CJR beneficiaries during CJR episodes.

Further, we proposed to establish similar requirements for PGPs and ACOs that vary because these entities do not themselves directly furnish billable services. To be eligible to receive a gainsharing payment or required to make an alignment payment, a PGP must have billed for an item or service that was rendered by one or more members of the PGP to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount. Further, we proposed that to be eligible to receive a gainsharing payment or required to make an alignment payment, an ACO must have had an ACO provider/supplier that directly furnished, or an ACO participant that billed for, an item or service that was rendered to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount. With respect to ACOs, an “ACO participant” and “ACO provider/supplier” have the meaning set forth in § 425.20 of regulations. Like the proposal for CJR collaborators that are not PGPs or ACOs, these proposals also require a linkage between the CJR collaborator that is the PGP or ACO and the provision of items and services to CJR beneficiaries during CJR episodes by PGP members or ACO participants or ACO providers/suppliers, respectively.

Moreover, we further proposed that because PGPs and ACOs do not directly furnish items and services to beneficiaries, in order to be eligible to receive a gainsharing payment or be required to make an alignment payment, the PGP or ACO must have contributed to CJR activities and been clinically involved in the care of CJR beneficiaries during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount. For example, a PGP or ACO might have been clinically involved in the care of CJR beneficiaries by providing care coordination services to CJR beneficiaries during CJR activities and been clinically involved in the care of CJR beneficiaries by providing care coordination services to CJR beneficiaries during and/or after inpatient admission; engaging with a participant hospital in care redesign strategies, and actually performing a role in implementing such strategies that are designed to improve the quality of care for CJR episodes and reduce CJR episode spending; or in coordination with providers and suppliers (such as members of the PGP, ACO participants, ACO provider/suppliers, the participant hospital, and post-acute care providers), implementing strategies designed to address and manage the comorbidities of CJR beneficiaries.

Because internal cost savings may be shared through gainsharing payments with CJR collaborators, we have certain requirements for their calculation as a safeguard against fraud and abuse. We proposed that the internal cost savings reflect care redesign under the CJR in order to be eligible to be shared through gainsharing payments. We also proposed that the methodology used to calculate internal cost savings must reflect the actual, internal cost savings achieved by the participant hospital through the documented
implementation of CJR activities identified by the participant hospital and must exclude any savings realized by any individual or entity that is not the participant hospital and “paper” savings from accounting conventions or past investment in fixed costs. Unlike the current CJR model policy where we require that sharing arrangements document the methodology for accruing, calculating, and verifying the internal cost savings generated by the participant hospital based on the care redesign elements specifically associated with the particular collaborator, we proposed a revised policy to not require in the CJR model that the calculation of internal cost savings be tied to the activities of a specific CJR collaborator. We believe the proposed change recognizes that multiple collaborators and collaboration agents contribute to internal cost savings and provide participant hospitals with flexibility to focus on overall internal cost savings due to model activities, rather than the activities of any specific collaborator or collaboration agent. Rather, we believe it is appropriate for participant hospitals to calculate internal cost savings based on the implementation of CJR activities and then provide gainsharing payments to CJR collaborators that may include internal cost savings, reconciliation payments, or both, based on a methodology that meets the requirements described later in this section.

We proposed that the amount of any gainsharing payments must be determined in accordance with a methodology that is substantially based on quality of care and the provision of CJR activities. Further, we proposed the methodology may take into account the amount of such CJR activities provided by a CJR collaborator relative to other CJR collaborators. While we emphasized that financial arrangements may not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or other so that their sole purpose is to align the financial incentives of the participant hospital and CJR collaborators toward the CJR goals of improved CJR episode care quality and efficiency. We believe that accounting for the relative amount of CJR activities by CJR collaborators in the determination of gainsharing payments does not undermine this objective. Rather, the proposed requirement recognizes that the relative amount of CJR activities (including direct care) furnished by a CJR collaborator to CJR beneficiaries during CJR episodes may contribute relatively more or less to both the internal cost savings and participant hospital’s reconciliation payment that may be available for making a gainsharing payment. We refer readers to section III.I.4. of this final rule for additional discussion of our rationale.

We sought comment on this proposal for gainsharing payments, where the methodology could take into account the amount of CJR activities provided by a CJR collaborator relative to other CJR collaborators. In addition we invited comment on whether additional safeguards or a different standard was needed to allow for greater flexibility to provide certain performance-based payments consistent with the goals of program integrity, protecting against abuse and ensuring the goals of the model are met.

In the CJR model, we continue to have certain limitations on alignment payments. Currently for a performance year, the aggregate amount of all alignment payments received by the participant hospital must not exceed 50 percent of the participant hospital’s repayment amount. In addition, the aggregate amount of gainsharing payments from a CJR collaborator to the participant hospital may not be greater than 25 percent of the participant hospital’s repayment amount for a CJR collaborator that is not an ACO and we proposed 50 percent of the participant hospital’s repayment amount for a CJR collaborator that is an ACO. We proposed to allow a higher percentage of the participant hospital’s repayment amount to be paid by an ACO than by CJR collaborators that are not ACOs in recognition that some ACOs are sizable organizations with significant financial and other resources. In addition, their expertise in managing the cost and quality of care for Medicare beneficiaries over a period of time may make some ACOs uniquely capable of sharing a higher percentage of downside risk under the CJR with the participant hospital under a sharing arrangement between the ACO and CJR participant hospital that meets all requirements for such arrangements, including that participation in the sharing arrangement must be voluntary without penalty for nonparticipation as discussed previously. We sought comment on the proposed limitation that would apply to ACOs that are CJR collaborators.

Additionally, we proposed that all gainsharing payments and alignment payments must be made by check, electronic funds transfer, or another traceable cash transaction. This is different from the current CJR model policy which requires gainsharing payments and alignment payments to be made by electronic funds transfer. We proposed to revise this requirement in the CJR model in order to provide additional flexibility for entities making gainsharing payments and alignment payments. We believe our proposal would mitigate the administrative burden that the EFT requirement would place on the financial arrangements between certain participant hospitals and CJR collaborators, especially individual physicians and nonphysician practitioners and small PGPs, which could discourage participation of those suppliers as CJR collaborators. We sought comment on the effect of this proposal on reducing the administrative barriers to individual physician and nonphysician practitioner and small PGP participation in the CJR as CJR collaborators.

In summary, we proposed the following conditions and restrictions on gainsharing payments, alignment payments, and internal cost savings:

- Gainsharing payments, if any, must—
  ++ Be derived solely from reconciliation payments, or internal cost savings, or both;
  ++ Be distributed on an annual basis (not more than once per calendar year);
  ++ Not be a loan, advance payment, or payment for referrals or other business; and
  ++ Be clearly identified as a gainsharing payment at the time it is paid.
- To be eligible to receive a gainsharing payment, a CJR collaborator must meet quality of care criteria for the performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment. The quality of care criteria must be established by the participant hospital and directly related to the CJR episode.
- To be eligible to receive a gainsharing payment, or to be required to make an alignment payment, a CJR collaborator other than a PGP or an ACO must have directly furnished a billable item or service to a CJR beneficiary during a CJR episode that occurred in the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount.
- To be eligible to receive a gainsharing payment, or to be required to make an alignment payment, a CJR collaborator that is a PGP must meet the following criteria:
  ++ The PGP must have billed for an item or service that was rendered by one or more members of the PGP to a CJR beneficiary during a CJR episode that
occurred during the same performance year for which the participant hospital has calculated a gainsharing payment or been assessed a repayment amount.

++ The PGP must have contributed to CJR activities and been clinically involved in the care of CJR beneficiaries during the same performance year for which the participant hospital has calculated a gainsharing payment or been assessed a repayment amount. For example, a PGP might have been clinically involved in the care of CJR beneficiaries by—

—Providing care coordination services to beneficiaries during and/or after inpatient admission;
—Engaging with a participant hospital in care redesign strategies, and
—In coordination with other providers and suppliers (such as members of the PGP, the participant hospital, and post-acute care providers), implementing strategies designed to address and manage the comorbidities of CJR beneficiaries.
++ To be eligible to receive a gainsharing payment, or to be required to make an alignment payment, a CJR collaborator that is an ACO must meet the following criteria:
++ The ACO must have had an ACO provider/supplier that directly furnished, or an ACO participant that billed for, an item or service that was rendered to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital has calculated a gainsharing payment or been assessed a repayment amount.
++ The ACO must have contributed to CJR activities and been clinically involved in the care of CJR beneficiaries. For example, an ACO might be have been clinically involved in the care of CJR beneficiaries by—

—Providing care coordination services to CJR beneficiaries during and/or after inpatient admission;
—Engaging with a participant hospital in care redesign strategies, and
—In coordination with providers and suppliers (such as ACO participants, ACO providers/suppliers, the participant hospital, and post-acute care providers), implementing strategies designed to address and manage the comorbidities of CJR beneficiaries.
++ The methodology for accruing, calculating and verifying internal cost savings must be transparent, measurable, and verifiable in accordance with generally accepted accounting principles (GAAP) and Government Auditing Standards (The Yellow Book).

• The methodology used to calculate internal cost savings must reflect the actual, internal cost savings achieved by the participant hospital through the documented implementation of CJR activities identified by the participant hospital and must exclude—

++ Any savings realized by any individual or entity that is not the participant hospital; and
++ “Paper” savings from accounting conventions or past investment in fixed costs.

• The total amount of a gainsharing payment for a performance year paid to a CJR collaborator must not exceed the following:

++ In the case of a CJR collaborator who is a physician or nonphysician practitioner, 50 percent of the Medicare-approved amounts under the PFS for items and services furnished by that physician or nonphysician practitioner to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year in which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.
++ In the case of a CJR collaborator that is a PGP, 50 percent of the Medicare-approved amounts under the PFS for items and services billed by the PGP and furnished to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year in which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.
++ The methodology used to calculate internal cost savings must be transparent, measurable, and verifiable in accordance with generally accepted accounting principles (GAAP) and Government Auditing Standards (The Yellow Book).

• The methodology used to calculate internal cost savings must reflect the actual, internal cost savings achieved by the participant hospital through the documented implementation of CJR activities identified by the participant hospital and must exclude—

++ Any savings realized by any individual or entity that is not the participant hospital; and
++ “Paper” savings from accounting conventions or past investment in fixed costs.

• The total amount of a gainsharing payment for a performance year paid to a CJR collaborator must not exceed the following:

++ In the case of a CJR collaborator who is a physician or nonphysician practitioner, 50 percent of the Medicare-approved amounts under the PFS for items and services furnished by that physician or nonphysician practitioner to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year in which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.
++ In the case of a CJR collaborator that is a PGP, 50 percent of the Medicare-approved amounts under the PFS for items and services billed by the PGP and furnished to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year in which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.
++ The methodology used to calculate internal cost savings must be transparent, measurable, and verifiable in accordance with generally accepted accounting principles (GAAP) and Government Auditing Standards (The Yellow Book).

• The methodology used to calculate internal cost savings must reflect the actual, internal cost savings achieved by the participant hospital through the documented implementation of CJR activities identified by the participant hospital and must exclude—

++ Any savings realized by any individual or entity that is not the participant hospital; and
++ “Paper” savings from accounting conventions or past investment in fixed costs.

• The total amount of a gainsharing payment for a performance year paid to a CJR collaborator must not exceed the following:

++ In the case of a CJR collaborator who is a physician or nonphysician practitioner, 50 percent of the Medicare-approved amounts under the PFS for items and services furnished by that physician or nonphysician practitioner to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year in which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.
++ In the case of a CJR collaborator that is a PGP, 50 percent of the Medicare-approved amounts under the PFS for items and services billed by the PGP and furnished to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year in which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.
++ The methodology used to calculate internal cost savings must be transparent, measurable, and verifiable in accordance with generally accepted accounting principles (GAAP) and Government Auditing Standards (The Yellow Book).

• The methodology used to calculate internal cost savings must reflect the actual, internal cost savings achieved by the participant hospital through the documented implementation of CJR activities identified by the participant hospital and must exclude—

++ Any savings realized by any individual or entity that is not the participant hospital; and
++ “Paper” savings from accounting conventions or past investment in fixed costs.

• The total amount of a gainsharing payment for a performance year paid to a CJR collaborator must not exceed the following:

++ In the case of a CJR collaborator who is a physician or nonphysician practitioner, 50 percent of the Medicare-approved amounts under the PFS for items and services furnished by that physician or nonphysician practitioner to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year in which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.
++ In the case of a CJR collaborator that is a PGP, 50 percent of the Medicare-approved amounts under the PFS for items and services billed by the PGP and furnished to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year in which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.
++ The methodology used to calculate internal cost savings must be transparent, measurable, and verifiable in accordance with generally accepted accounting principles (GAAP) and Government Auditing Standards (The Yellow Book).

• The methodology used to calculate internal cost savings must reflect the actual, internal cost savings achieved by the participant hospital through the documented implementation of CJR activities identified by the participant hospital and must exclude—

++ Any savings realized by any individual or entity that is not the participant hospital; and
++ “Paper” savings from accounting conventions or past investment in fixed costs.
• The methodology for determining alignment payments must not directly account for the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

• All gainsharing payments and any alignment payments must be administered by the participant hospital in accordance with generally accepted accounting principles.

• All gainsharing payments and alignment payments must be made by check, electronic funds transfer, or another traceable cash transaction.

We proposed to amend the regulations at § 510.500(c) as described previously. We sought comment on our proposal, including the feasibility of implementing the proposed safeguards in the context of the current regulatory framework applicable to ACOs and whether additional or different safeguards were reasonable, necessary or appropriate to ensure the goals of program integrity, protecting against abuse and ensuring the goals of the model are met.

Because this proposal mirrors what was proposed for the EPM and the comments on those proposals and our responses are substantially the same, we refer readers to section III.I.4.c for a detailed explanation of the comments and our responses to them.

Final Decision: After consideration of the public comments received, we are finalizing the proposals, with modifications, for gainsharing payments, alignment payments, and internal cost savings conditions and restrictions, in § 510.500(c). In addition to the modifications discussed in our responses in section III.I.4.c, we are specifying that to be eligible to receive a gainsharing payment or to be required to make an alignment payment, an NPPGP or TGP (like PGPs) must have billed for an item or service that was rendered by one or more NPPGP members or TGP members respectively to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount.

As finalized, effective July 1, 2017 gainsharing payments, alignment payments, and internal cost savings must meet the following conditions and restrictions:

• Gainsharing payments, if any, must—
  ++ Be derived solely from reconciliation payments, or internal cost savings, or both;
  ++ Be distributed on an annual basis (not more than once per calendar year);
  ++ Not be a loan, advance payment, or payment for referrals or other business; and
  ++ Be clearly identified as a gainsharing payment at the time it is paid.

++ To be eligible to receive a gainsharing payment, a CJR collaborator must meet quality of care criteria for the performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment. The quality of care criteria must be established by the participant hospital and directly related to CJR episodes.

++ To be eligible to receive a gainsharing payment, or to be required to make an alignment payment, a CJR collaborator other than an ACO, PGP, NPPGP, or TGP must have directly furnished a billable item or service to a CJR beneficiary during a CJR episode that occurred in the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount.

++ To be eligible to receive a gainsharing payment, or to be required to make an alignment payment, a CJR collaborator that is a PGP, NPPGP, or TGP must meet the following criteria:

—The PGP, NPPGP, or TGP must have billed for an item or service that was rendered by one or more PGP member, NPPGP member, or TGP member respectively to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount; and

++ The ACO must have had an ACO provider/supplier that directly furnished, or an ACO participant that billed for, an item or service that was rendered to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount; and

++ The ACO must have contributed to CJR activities and been clinically involved in the care of CJR beneficiaries during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount for example, a PGP, NPPGP, or TGP might have been clinically involved in the care of CJR beneficiaries by—

++ Providing care coordination services to CJR beneficiaries during and/or after inpatient admission;

++ Engaging with a participant hospital in care redesign strategies, and actually performing a role in implementing such strategies, that are designed to improve the quality of care for CJR episodes and reduce CJR episode spending; or

++ In coordination with other providers and suppliers (such as PGP members, NPPGP members, or TGP members; the participant hospital; and post-acute care providers), implementing strategies designed to address and manage the comorbidities of CJR beneficiaries.

—To be eligible to receive a gainsharing payment, or to be required to make an alignment payment, a CJR collaborator that is an ACO must meet the following criteria:

++ The ACO must have made an alignment payment, or been required to make an alignment payment, a CJR collaborator that is a PGP, NPPGP, or TGP must have directly furnished a billable item or service to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount; and

++ The ACO must have contributed to CJR activities and been clinically involved in the care of CJR beneficiaries during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount for example, a PGP, NPPGP, or TGP might have been clinically involved in the care of CJR beneficiaries by—

++ Providing care coordination services to CJR beneficiaries during and/or after inpatient admission;

++ Engaging with a participant hospital in care redesign strategies, and actually performing a role in implementing such strategies, that are designed to improve the quality of care for CJR episodes and reduce CJR episode spending; or
In coordination with providers and suppliers (such as ACO participants, ACO providers/suppliers, the CJR participant hospital, and post-acute care providers), implementing strategies designed to address and manage the comorbidities of CJR beneficiaries.

The methodology for accruing, calculating and verifying internal cost savings must be transparent, measurable, and verifiable in accordance with generally accepted accounting principles (GAAP) and Government Auditing Standards (The Yellow Book).

The methodology used to calculate internal cost savings must reflect the actual, internal cost savings achieved by the participant hospital through the documented implementation of CJR activities identified by the participant hospital and must exclude:

—Any savings realized by any individual or entity that is not the CJR participant hospital; and
—“Paper” savings from accounting conventions or past investment in fixed costs.

The total amount of a gainsharing payment for a performance year paid to a CJR collaborator must not exceed the following:

++ In the case of a CJR collaborator who is a physician or nonphysician practitioner, 50 percent of the Medicare-approved amounts under the PFS for items and services furnished by that physician or nonphysician practitioner to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.

++ In the case of a CJR collaborator that is a PGP or NPPGP, 50 percent of the Medicare-approved amounts under the PFS for items and services billed by that PGP or NPPGP and furnished to the participant hospital’s CJR beneficiaries by the PGP members or NPPGP members respectively during CJR episodes that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.

++ The amount of any gainsharing payments must be determined in accordance with a methodology that is substantially based on quality of care and the provision of CJR activities. The methodology may take into account the amount of such CJR activities provided by a CJR collaborator relative to other CJR collaborators.

For a performance year, the aggregate amount of all gainsharing payments that are derived from a reconciliation payment the participant hospital receives from CMS must not exceed the amount of that reconciliation payment.

++ No entity or individual, whether a party to a sharing arrangement or not, may condition the opportunity to make or receive gainsharing payments or to make or receive alignment payments directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

++ A participant hospital must not make a gainsharing payment to a CJR collaborator if CMS has notified the participant hospital that such collaborator is subject to any action for noncompliance with this part or the fraud and abuse laws, or for the provision of substandard care to CJR beneficiaries or other integrity problems.

++ The sharing arrangement must require the participant hospital to recoup any gainsharing payment that contained funds derived from a CMS overpayment on a reconciliation report or was based on the submission of false or fraudulent data.

++ Alignment payments from a CJR collaborator to a participant hospital may be made at any interval that is agreed upon by both parties, and must not be—

++ Issued, distributed, or paid prior to the calculation by CMS of a repayment amount reflected in a reconciliation report:

 Loans, advance payments, or payments for referrals or other business;
 or
++ Assessed by a participant hospital if it does not owe a repayment amount.

++ The CJR participant hospital must not receive any amounts under a sharing arrangement from a CJR collaborator that are not alignment payments.

++ For a performance year, the aggregate amount of all alignment payments received by the CJR participant hospital must not exceed 50 percent of the participant hospital’s repayment amount.

++ The aggregate amount of all alignment payments from a CJR collaborator to the participant hospital may not be greater than—

++ With respect to a CJR collaborator other than an ACO, 25 percent of the participant hospital’s repayment amount; or

++ With respect to a CJR collaborator that is an ACO, 50 percent of the participant hospital’s repayment amount.

++ The amount of any alignment payments must be determined in accordance with a methodology that does not directly account for the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

++ With respect to a CJR collaborator if CMS has notified the participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

++ All gainsharing payments and any alignment payments must be administered by the participant hospital in accordance with generally accepted accounting principles (GAAP) and Government Auditing Standards (The Yellow Book).

++ All gainsharing payments and alignment payments must be made by check, electronic funds transfer, or another traceable cash transaction.

d. Documentation

We proposed revisions to § 510.500(d) for organization and formatting purposes, and to align with the proposed regulations of the EPMs. Besides the proposed definitional changes, these revisions would not change any policies under the current documentation section of the CJR model.

In summary we proposed the following requirements for documentation:

++ Participant hospitals must—

++ Document the sharing arrangement contemporaneously with the establishment of the arrangement;

++ Maintain accurate current and historical lists of all CJR collaborators, including collaborator names and addresses; update such lists on at least a quarterly basis; and publicly report the current and historical lists of CJR collaborators on a Web page on the participant hospital’s Web site; and

++ Maintain and require each CJR collaborator to maintain contemporaneous documentation with respect to the payment or receipt of any gainsharing payment or alignment payment that includes at a minimum the—
—Nature of the payment (gainsharing payment or alignment payment);
—Identity of the parties making and receiving the payment;
—Date of the payment;
—Amount of the payment; and
—Date and amount of any recoupment of all or a portion of a CJR collaborator’s gainsharing payment.
• The participant hospital must keep records of the following:
  ++ Its process for determining and verifying its potential and current CJR collaborators’ eligibility to participate in Medicare.
  ++ Information on the accounting systems used to track internal cost savings.
  ++ A description of current health information technology, including systems to track reconciliation payments and internal cost savings.
  ++ Its plan to track gainsharing payments and alignment payments.
• The participant hospital must retain and provide access to, and must require each CJR collaborator to retain and provide access to, the required documentation in accordance with § 510.110.

In the proposed § 510.500(d)(3), we proposed that participant hospitals must retain and provide access to the required documentation in accordance with § 510.110 and must obligate CJR collaborators to do the same. We proposed to add a new section, § 510.110, to the CJR regulations, which would apply all records access and retention requirements under the CJR model, including those for financial arrangements as well as beneficiary notifications and beneficiary incentives. Because we proposed to consolidate all records access and retention requirements in one place in the regulations, we proposed to delete § 510.500(e) from the current CJR regulations. We discussed further our proposal to consolidate the requirements under the CJR model for access to records and record retention and apply them more broadly in the model. This approach mirrors our proposed records retention policies for the EPMs, which are discussed in detail in section III.H. of this final rule. We refer readers to that section for further discussion of our proposed policies and rationale.

We proposed to amend the regulations at § 510.500(d). We sought comment on our proposals. We received no specific comments on the proposed documentation requirements for CJR sharing arrangements other than the comment discussed in section III.L.4.d. previously requesting further documentation related to the criteria for selection of CJR collaborators.

Final Decision: We are finalizing the proposals in § 510.500(d) for CJR documentation requirements, with the modification previously discussed to require the participant hospital to publicly post the written policies for selecting CJR collaborators on a Web page on the participant hospital’s Web site and the reorganization to consolidate and streamline the documentation requirements related to public posting. CJR sharing arrangements must meet the following documentation requirements:
• The participant hospital must do all of the following:
  ++ Document the sharing arrangement contemporaneously with the establishment of the arrangement.
  ++ Publicly post (and update on at least a quarterly basis) on a Web page on the CJR participant hospital’s Web site;
  ++ Accurate current and historical lists of all CJR collaborators, including CJR collaborator names and addresses.
  ++ Written policies for selecting individuals and entities to be CJR collaborators required by § 510.500(a)(3).
  ++ Maintain and require each CJR collaborator to maintain contemporaneous documentation with respect to the payment or receipt of any gainsharing payment or alignment payment that includes at a minimum all of the following:
    —Nature of the payment (gainsharing payment or alignment payment).
    —Identity of the parties making and receiving the payment.
    —Date of the payment.
    —Amount of the payment.
    —Date and amount of any recoupment of all or a portion of a CJR collaborator’s gainsharing payment.
    —Explanation for each recoupment, such as whether the CJR collaborator received a gainsharing payment that contained funds derived from a CMS overpayment on a reconciliation report, or was based on the submission of false or fraudulent data.
• The participant hospital must keep records of the following:
  ++ Its process for determining and verifying its potential and current CJR collaborators’ eligibility to participate in Medicare.
  ++ Its plan to track internal cost savings.
  ++ Information on the accounting systems used to track internal cost savings.
  ++ A description of current health information technology, including systems to track reconciliation payments and internal cost savings.
  ++ Its plan to track gainsharing payments and alignment payments.
• The participant hospital must retain and provide access to, and must require each EPM collaborator to retain and provide access to, the required documentation in accordance with § 510.110.

3. Distribution Arrangements

Though we proposed a complete revision of the regulations in § 510.505, these changes are mainly to accommodate our proposals to add ACOs as CJR collaborators, add the term ‘collaboration agent,’ remove the term ‘collaborator agreement,’ move the requirements for such agreements to appear as requirements for sharing arrangements, and to mirror the proposed EPM regulations at § 512.505 to avoid confusion for hospitals that are participating in CJR as well as one or more of the proposed EPMs. Our proposed changes to the regulations reflect that the requirements and rules regarding distribution arrangements under the CJR model would stay largely the same.

a. General

We proposed that certain financial arrangements between CJR collaborators and other individuals or entities called “collaboration agents” be termed “distribution arrangements.” A distribution arrangement is a financial arrangement between a CJR collaborator that is an ACO or PGP and a collaboration agent for the sole purpose of sharing a gainsharing payment received by the ACO or PGP. A collaboration agent is an individual or entity that is not a CJR collaborator and that is either a PGP member that has entered into a distribution arrangement with the same PGP in which he or she is an owner or employee or an ACO participant or ACO provider/supplier that has entered into a distribution arrangement with the same ACO in which it is participating. Where a payment from a CJR collaborator to a collaboration agent is made pursuant to a distribution arrangement, we proposed to define that payment as a “distribution payment.” A collaboration agent may make a distribution payment only in accordance with a distribution arrangement which complies with the provisions of § 510.505 and all other applicable laws and regulations, including the fraud and abuse laws. We solicited comment on whether the requirements for distribution payments by ACOs under the proposal were reasonable, necessary and appropriate to
promote program integrity, prevent fraud and abuse, and achieve the goals of the model. In addition, we solicited comment on how the regulation of the financial arrangements the proposal may interact with and on how these or similar financial arrangements are regulated under the Medicare Shared Savings Program.

We received no specific comments on the proposed general provisions for distribution arrangements under the CJR model. However, as discussed previously, we are finalizing revisions to allow NPPGPs to be eligible to be CJR collaborators and we are modifying our general provisions for distribution arrangements to allow NPPGPs to enter into distribution arrangements with NPPGP members. Similarly, we are modifying our general provisions for distribution arrangements to allow TGP members to enter into distribution arrangements with TGP members. In addition, we are modifying the EPM proposals in response to the comments that we received, and therefore, consistent with our proposed to amend the CJR regulations to streamline and simply requirements for CJR and to align them with the EPMs, we are making corresponding changes to the CJR regulations. We believe these modifications also will reduce any burden that could arise from having to comply with different requirements for each model for hospitals participating in both CJR and EPMs. We refer readers to the discussion at III.1.5. for further information.

**Final Decision:** We are finalizing effective July 1, 2017 the proposals in §510.505(a) for the general requirements for CJR distribution arrangements, with modification to allow NPPGPs or TGP members to enter into distribution arrangements with NPPGP members or TGP members respectively. Similar to PGP members when they are CJR collaborators, we believe it is appropriate to allow NPPGP members or TGP members to enter into distribution arrangements with NPPGP members or TGP members respectively for the sole purpose of sharing a gainsharing payment received by the NPPGP or TGP. Distribution arrangements under the CJR model must comply with the following general provisions:

- An ACO, PGP, NPPGP, or TGP that has entered into a sharing arrangement with a CJR participant hospital may distribute all or a portion of any gainsharing payment it receives from the participant hospital only in accordance with a distribution arrangement.
- All distribution arrangements must comply with the provisions of this section and all other applicable laws and regulations, including the fraud and abuse laws.

**b. Requirements**

We proposed to amend the requirements for distribution payments in §510.505 as discussed in this section. We proposed the opportunity to make or receive a distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between, or among the participant hospital, any CJR collaborator, collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent. The proposed requirement is substantively the same as the existing requirement in the CJR model. By adding the word "past or anticipated," the proposed provision makes clear that all previous and future referrals between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent are encompassed.

Currently, methodologies for determining distribution payments must not directly account for volume or value of referrals, or business otherwise generated, by, between or among the participant hospital, CGP, other CJR collaborators, any collaboration agent, any downstream collaboration agent, and any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent. We proposed to change the requirement as follows.

Like our proposal for gainsharing payments discussed previously, we proposed a more flexible standard for the determination of the amount of distribution payments from an ACO or a methodology previously described for distribution payments from an ACO or in a manner that complies with §411.352(g). The proposal would allow a PGP the choice either to comply with the general standard that the amount of a distribution payment must be substantially based on quality of care and the provision of CJR activities or to provide its members a financial benefit through the CJR without consideration of the PGP member’s individual quality of care. In the latter case, PGP members who are collaboration agents (including those who furnished no services to CJR beneficiaries) would be able receive a share of the profits from their PGP that includes the monies contained in a gainsharing payment. We believe that our proposal to modify the current CJR regulations to allow the amount of the distribution payment from a PGP to a PGP member to be determined in a manner that complies with §411.352(g) is an appropriate exception to the general standard for determining the amount of distribution payment under the CJR model from a PGP to a PGP member. CMS has determined under the physician self-referral law that payments from a group...
We proposed to amend the regulations at § 510.505(b)(4) and (b)(5). We sought comment on the proposal and specifically whether additional safeguards or a different standard was needed to allow for greater flexibility in calculating the amount of distribution payments consistent with the goals of promoting program integrity, protecting against abuse, and ensuring that the goals of the model are met. In addition, we solicited comment on the proposal to allow distribution payments by a PGP to its members that comply with § 411.352(g) or whether additional/different safeguards are reasonable, necessary, and appropriate.

Except for a distribution payment from a PGP to a PGP member that complies with § 411.352(g), we proposed to continue the limits in the current CJR regulations on the total amount of distribution payments to physician, nonphysician practitioners, and PCGPs as we proposed for gainsharing payments. Specifically, in the case of a collaboration agent that is a physician or nonphysician practitioner, absent the alternative safeguards afforded by compliance with § 411.352(g), we would limit the total amount of distribution payments paid for a performance year to the collaboration agent to 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the collaboration agent to the CJR participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

We proposed that all distribution payments must be made by check, electronic funds transfer, or another traceable cash transaction. The proposal would provide additional flexibility for entities making distribution payments as well as would mitigate the administrative burden that the EFT requirement previously placed on the financial arrangements between certain participant hospitals and CJR collaborators, especially individual physicians and nonphysician practitioners and small PCGPs, which could discourage participation of those suppliers as CJR collaborators.

Finally, we proposed at § 510.505(b)(15) that CJR collaborators must retain and provide access to the required documentation under § 510.110 and must require each collaboration agent to do so as well. We discussed further our proposal to consolidate the requirements under the CJR model for access to records and record retention and apply them more broadly in the model. The approach mirrors our proposed records retention policies for the EPMs, which are discussed in detail in section III.I.5. of this final rule. We refer readers to that section for further discussion of our proposed policies and rationale.

We sought comment on our proposals regarding distribution arrangements. The following is a summary of the comments received and our responses.

Comment: We received comments on the requirements of a distribution arrangement under the CJR model and EPM, including the proposed cap on distribution and downstream distribution payments, which are discussed in section III.I.5.b.

Response: We appreciate the comments on the requirements of a distribution arrangement under the CJR model and the EPM. We refer to section III.I.5.b for a detailed discussion of comments and responses in regards to distribution arrangements under these models.

We are finalizing in §§ 510.505(6) and 510.510(6) that the amount of any distribution payments or downstream distribution payments from a PGP to a PGP member must be determined either in a manner that complies with § 411.352(g) of this chapter or in a manner based on quality of care and the provision CJR activities.

Comment: One commenter requested clarification about whether outpatient therapy providers can receive distribution or downstream distribution payments as either a member of a PGP who is a CJR collaborator or as a member of a PGP that is an ACO participant in an ACO that has a distribution arrangement with a CJR collaborator.

Response: Certain outpatient therapy providers are included in the definition of a member of a PGP or PGP member which means “a physician, nonphysician practitioner, or therapist who is an owner or employer of a PGP and who has reassigned to the PGP his or her right to receive Medicare payment.” Thus, therapists who are PGP members may be eligible to receive distribution payments or downstream distribution payments when those PGPs enter into financial arrangements under the CJR model in accordance with all the requirements in this final rule.

Final Decision: After consideration of the public comments received, we are finalizing the proposals in § 510.505(b) for the requirements for CJR distribution arrangements, with modification to include policies for NPPGPs or TGP members that enter into distribution arrangements with NPPGP members or TGP members respectively. Like a PGP, an NPPGP that is an ACO participant in an ACO that is a CJR collaborator may enter into distribution arrangement with the ACO. The distribution payments to the NPPGP are subject to the same requirements as distribution payments to PGPs that are collaboration agents. The NPPGP is eligible to receive a distribution payment only if the collaboration agent billed for an item or service rendered to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed. The distribution payment to the NPPGP is capped at 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the NPPGP for items and services furnished by NPPGP members to the CJR participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

If an NPPGP is a CJR collaborator, it may enter into a distribution arrangement with an NPPGP member, which is defined as a nonphysician...
practitioner or therapist who is an owner or employee of an NPPGP and who has reassigned to the NPPGP his or her right to receive Medicare payment. The requirements for NPPGP distribution payments under those distribution arrangements are the same as those for PGPs, except that we allow the amount of any distribution payments from a PGP to a PGP member to be determined in a manner that complies with § 411.352(g). While CMS has determined under the physician self-referral law that payments from a group practice as defined under § 411.352 to its members that comply with § 411.352(g) are appropriate, NPPGPs do not fall under this definition of group practice. Therefore, the amount of any distribution payments from an NPPGP to an NPPGP member must always be determined in accordance with a methodology that is substantially based on quality of care and the provision CJR activities, the same standard that applies to PGP distribution payments that are not determined in a manner that complies with § 411.352(g). Like the requirement for PGP members when a distribution payment does not comply with § 411.352(g), an NPPGP member is eligible to receive a distribution payment only if the collaboration agent furnished an item or service to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

If a TGP is a CJR collaborator, it may enter into a distribution arrangement with a TGP member, who is a therapist who is an owner or employee of a TGP and who has reassigned to the TGP his or her right to receive Medicare payment. Like distribution payments from an NPPGP to an NPPGP member, the amount of any distribution payments from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision CJR activities, the same standard that applies to PGP distribution payments that are not determined in a manner that complies with § 411.352(g). Like the requirement for PGP members when a distribution payment does not comply with § 411.352(g) and for NPPGP members, a TGP member is eligible to receive a distribution payment only if the collaboration agent furnished an item or service to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

In addition, with respect to the distribution of any gainsharing payment received by an NPPGP, the total amount of all distribution payments must not exceed the amount of the gainsharing payment received by the CJR collaborator from the CJR participant hospital.

Like a PGP and NPPGP, a TGP that is an ACO participant in an ACO that is a CJR collaborator may enter into a distribution arrangement with the ACO. The distribution payments to the TGP are not subject to the cap that applies to PGPs and NPPGPs. While we cap distribution payments to physicians and nonphysician practitioners, we will not cap such payments to therapists in private practice for the same reasons discussed for gainsharing payments to these individuals and, therefore, we will not cap distribution payments to TGP.

Like PGPs and NPPGPs, the TGP is eligible to receive a distribution payment only if the collaboration agent billed for an item or service rendered to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

The amount of any distribution payments for a TGP, the total amount of distribution payments for a TGP member, and the amount of any distribution payments from an ACO, from an NPPGP, from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision CJR activities and that may take into account the amount of such CJR activities provided by a collaboration agent relative to other collaboration agents.

All distribution arrangements must be in writing and signed by the parties, contain the date of the agreement, and be entered into before care is furnished to CJR beneficiaries under the distribution arrangement.

Participation in a distribution arrangement must be voluntary and without penalty for nonparticipation.

The distribution arrangement must require the collaboration agent to comply with all applicable laws and regulations.

The opportunity to make or receive a distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

The amount of any distribution payments from an ACO, from an NPPGP to an NPPGP member, or from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision CJR activities that may take into account the amount of such CJR activities provided by a collaboration agent relative to other collaboration agents.

The amount of any distribution payments from a PGP must be determined either in a manner that complies with § 411.352(g) of this chapter or in accordance with a methodology that is substantially based on quality of care and the provision CJR activities and that may take into account the amount of such CJR activities provided by a collaboration agent relative to other collaboration agents.

The opportunity to make or receive a distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

Participation in a distribution arrangement must be voluntary and without penalty for nonparticipation.

The distribution arrangement must require the collaboration agent to comply with all applicable laws and regulations.

The opportunity to make or receive a distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

All distribution arrangements must be in writing and signed by the parties, contain the date of the agreement, and be entered into before care is furnished to CJR beneficiaries under the distribution arrangement.

Participation in a distribution arrangement must be voluntary and without penalty for nonparticipation.

The distribution arrangement must require the collaboration agent to comply with all applicable laws and regulations.

The opportunity to make or receive a distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

The amount of any distribution payments from an ACO, from an NPPGP, or from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision CJR activities and that may take into account the amount of such CJR activities provided by a collaboration agent relative to other collaboration agents.

The amount of any distribution payments from a PGP must be determined either in a manner that complies with § 411.352(g) of this chapter or in accordance with a methodology that is substantially based on quality of care and the provision CJR activities and that may take into account the amount of such CJR activities provided by a collaboration agent relative to other collaboration agents.

The opportunity to make or receive a distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.
++ In the case of a collaboration agent that is a physician or nonphysician practitioner, 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the collaboration agent to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

++ In the case of a collaboration agent that is a PGP or NPPGP, 50 percent of the total Medicare-approved amounts under the PFS for items and services billed by that PGP or NPPGP for items and services furnished by PGP members or NPPGP members to the CJR participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

• With respect to the distribution of any gainsharing payment received by an ACO, PGP, NPPGP, or TGP, the total amount of all distribution payments must not exceed the amount of the gainsharing payment received by the CJR collaborator from the CJR participant hospital.
• All distribution payments must be made by check, electronic funds transfer, or another traceable cash transaction.
• The collaboration agent must retain the ability to make decisions in the best interests of the patient, including the selection of devices, supplies, and treatments.
• The distribution arrangement must not—
  ++ Induce the collaboration agent to reduce or limit medically necessary items and services to any Medicare beneficiary; or
  ++ Reward the provision of items and services that are medically unnecessary.
• The CJR collaborator must maintain contemporaneous documentation regarding distribution arrangements in accordance with §512.110, including the following:
  The relevant written agreements.
  ++ The date and amount of any distribution payment(s);
  ++ The identity of each collaboration agent that received a distribution payment; and
  ++ A description of the methodology and accounting formula for determining the amount of any distribution payment.

• The CJR collaborator may not enter into a distribution arrangement with any individual or entity that has a sharing arrangement with the same CJR participant hospital.
• The CJR collaborator must retain and provide access to, and must require collaboration agents to retain and provide access to, the required documentation in accordance with §512.110.

4. Downstream Distribution Arrangements Under the CJR Model

a. General

We proposed that the CJR model allow for certain financial arrangements within an ACO between a PGP and its members. We discussed our proposals for downstream distribution arrangements, which mirror our proposals for the proposed EPMs described in section III.I.6. of this final rule. Specifically, we proposed that financial arrangements between a collaboration agent that is both a PGP and an ACO participant and other individuals termed “downstream collaboration agents” be termed a “downstream distribution arrangement.” A downstream distribution arrangement is a financial arrangement between a collaboration agent that is both a PGP and an ACO participant and a downstream collaboration agent for the sole purpose of sharing a distribution payment received by the PGP. A downstream collaboration agent is an individual who is not a CJR collaborator or a collaboration agent and who is a PGP member that has entered into a downstream distribution arrangement with the same PGP in which he or she is an owner or employee, and where the PGP is a collaboration agent. Where a payment from a collaboration agent to a downstream collaboration agent is made pursuant to a downstream distribution arrangement, we defined that payment as a “downstream distribution payment.” A CJR collaboration agent may only make a downstream distribution payment in accordance with a downstream distribution arrangement which complies with the requirements of this section and all other applicable laws and regulations, including the fraud and abuse laws.

The proposals for the general provisions for downstream distribution arrangements under the CJR model are included in §510.506. These provisions mirror those proposed for the proposed EPMs in §512.510(a). We sought comment on our proposals for these general provisions, as well as any alternatives to this structure.

We received no specific comments on the proposed general provisions for downstream distribution arrangements under the CJR model. However, we are modifying the EPM proposals in response to the comments that we received, and therefore, consistent with our proposal to amend the CJR regulations to align them with the EPMs, we are making corresponding changes to the CJR regulations. We believe these modifications also will reduce any burden on hospitals participating in both CJR and an EPM that could arise from having to comply with different requirements for each model. We refer readers to the discussion at III.I.6. for further information.

Final Decision: We are finalizing effective July 1, 2017 the proposals in §510.510(a) for the general requirements for CJR downstream distribution arrangements with modification to allow NPPGPs or TGPs to enter into downstream distribution arrangements with NPPGP members or TGP members respectively. Downstream distribution arrangements under the CJR model must comply with the following general provisions:

• An ACO participant that is a PGP, NPPGP, or TGP and that has entered into a distribution arrangement with a CJR collaborator that is an ACO may distribute all or a portion of any distribution payment it receives from the CJR collaborator only in accordance with a downstream distribution arrangement.

• All downstream distribution arrangements must comply with the provisions of this section and all applicable laws and regulations, including the fraud and abuse laws.

b. Requirements

We proposed a number of specific requirements for downstream distribution arrangements to help ensure that their sole purpose is to create financial alignment between collaboration agents that are PGPs which are also ACO participants and downstream collaboration agents toward the goal of the CJR model to improve the quality and efficiency of CJR episodes. We refer readers to section III.I.6.(b) of this final rule for further discussion of our proposals regarding downstream distribution arrangements and our rationale for each proposal. Our proposed requirements largely parallel those proposed in §§510.510(b) and §510.505(b) for sharing and distribution arrangements and gainsharing and distribution payments based on similar reasoning for these
As listed in § 510.506 and described in detail in III.I.6(b) of this final rule, we proposed requirements addressing the agreements governing downstream distribution arrangements, eligibility for receipt of downstream distribution payments, a cap on the amount of such payments, the methodologies used to determine the amount of downstream distribution payments, and documentation regarding downstream distribution arrangements. Specifically, we proposed that all downstream distribution arrangements must be in writing and signed by the parties, contain the date of the agreement, and entered into before care is furnished to CJR beneficiaries under the distribution arrangement. We proposed that participation must be voluntary and without penalty for nonparticipation, and the downstream distribution arrangement must require the downstream collaboration agent to comply with all applicable laws and regulations.

As with our proposals for gainsharing and distribution payments, we proposed that the opportunity to make or receive a downstream distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent. In determining the amount of downstream distribution payments we proposed a more flexible approach, as we did with the proposed EPMs. Consistent with our proposal for distribution payments, we proposed that the amount of any downstream distribution payments must be determined in a manner that complies with § 411.352(g) or that is substantially based on quality of care and the provision of CJR activities and that may take into account the amount of CJR activities provided by a downstream collaboration agent relative to other downstream collaboration agents. We also proposed that the amount of a downstream distribution payment from a PGP to a PGP member may be determined in a manner that complies with § 411.352(g) or in a manner that is substantially based on quality of care and the provision of CJR activities.

Similarly to our proposed requirements for distribution arrangements for those EPM collaborators that are PGPs, we proposed that, except for a downstream distribution arrangement that complies with § 411.352(g), a downstream collaboration agent is eligible to receive a downstream distribution payment only if the PGP billed for an item or service furnished by the downstream collaboration agent to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprise the gainsharing payment from which the ACO made the distribution payment to the PGP that is an ACO participant. This approach mirrors our proposed requirements for distribution arrangements between collaborators and collaboration agents, as well as the proposed approach for the EPMs.

With regard to limitations on the amount of downstream distribution payments made to downstream collaboration agents, we proposed the same limit as that proposed for distribution payments by CJR collaborators that are PGPs. With the exception of downstream distribution payments that comply with § 411.352(g), we proposed to limit the total amount of downstream distribution payments paid for a performance year to a downstream collaboration agent to 50 percent of the total Medicare-approved amounts under the PFS for services billed by the PGP and furnished by the downstream collaboration agent to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year in which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment from which the ACO made the distribution payment to the PGP. We further proposed that the total amount of all downstream distribution payments made to downstream collaboration agents must not exceed the amount of the distribution payment received by the collaboration agent (PGP that is an ACO participant) from the ACO that is a CJR collaborator. In addition, all downstream distribution payments must be made by check, electronic funds transfer, or another traceable cash transaction, as with our proposed approach for gainsharing, alignment, and distribution payments. Finally, the distribution arrangement must not induce the downstream collaboration agent to reduce or limit medically necessary items and services to any Medicare beneficiary or reward the provision of items and services that are medically unnecessary.

We proposed that the PGP must maintain contemporaneous documentation regarding downstream distribution arrangements in accordance with § 510.110, including:

- The relevant written agreements;
- The date and amount of any downstream distribution payment(s);
- The identity of each downstream collaboration agent that received a downstream distribution payment; and
- A description of the methodology and accounting formula for determining the amount of any downstream distribution payment.

We proposed that the PGP may not enter into a downstream distribution arrangement with any PGP member who has a sharing arrangement with a participant hospital or distribution arrangement with the ACO in which the PGP is a participant. Finally, we proposed that the PGP must retain and provide access to, and must require downstream collaboration agents to retain and provide access to, the required documentation in accordance with § 510.110.

The proposals for downstream distribution arrangement requirements are included in § 510.506. We sought comment on our proposals.

We received no specific comments on the proposed requirements for downstream distribution arrangements under the CJR model.

Final Decision: We are finalizing effective July 1, 2017 the proposals in § 510.510(b) for the requirements for CJR downstream distribution arrangements, with modification to include policies for NPPGPs or TGP GPs that enter into downstream distribution arrangements with NPPGP members or TGP members respectively. Consistent with commenters’ overall request that we streamline the regulations, we are also modifying proposed § 510.510(b)(6), which is final § 510.510(b)(7), to eliminate one of the two proposed requirements for eligibility of a downstream collaboration agent to receive a downstream distribution payment, specifically the requirement that the PGP bill for the item or service furnished by the downstream collaboration agent. Instead, we base downstream collaboration agent eligibility only on whether the downstream collaboration agent furnished an item or service to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment from which the ACO made the distribution payment to the PGP.
NPPGP, or TGP that is an ACO participant. This approach is parallel to § 510.505(b)(7), which applies to distribution payments from ACOs to ACO participants or ACO providers/suppliers and certain distribution payments from PGPs to PG members, and ensures that the member of the PGP, NPPGP, or TGP receiving the downstream distribution payment furnished items and services to a CJR beneficiary during a CJR episode, without explicitly requiring that the PGP, NPPGP, or TGP to which the member of the PGP, NPPGP, or TGP would have reassigned his or her benefits also billed for the item or service. This latter additional requirement adds complexity that is unnecessary when our objective of the requirement is only to ensure that the recipient of the downstream distribution payment furnished an item or service to a CJR beneficiary during a CJR episode in order to link the payment to actual care. Finally, as discussed previously, in order to achieve consistency in the parameters for gainsharing payments and distribution payments to therapists and to streamline programmatic requirements, we are revising proposed § 510.510(b)(7), which is final in § 510.510(b)(8), by removing the cap on downstream distribution payments to PG members as applied to therapists who are PG members.

An NPPGP that is an ACO participant that has entered into a distribution arrangement with a CJR collaborator that is an ACO may enter into a downstream distribution arrangement with an NPPGP member, who is a nonphysician practitioner or therapist who is an owner or employee of an NPPGP and who has reassigned to the NPPGP his or her right to receive Medicare payment. The requirements for NPPGP downstream distribution payments under those downstream distribution arrangements are the same as those for PGPs, except that we allow the amount of any downstream distribution payments from a PGP to be determined in a manner that complies with § 411.352(g). The amount of any downstream distribution payments from an NPPGP to an NPPGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision CJR activities, the same standard that applies to PG downstream distribution payments that are not determined in a manner that complies with § 411.352(g). Like the requirement for PGP members when a distribution payment does not comply with § 411.352(g), an NPPGP member is eligible to receive a downstream distribution payment only if the downstream collaboration agent furnished an item or service to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment from which the ACO made the distribution payment to the NPPGP that is an ACO participant. Finally, the total amount of downstream distribution payments paid for a performance year to the NPPGP member who is a nonphysician practitioner may not exceed 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the NPPGP member to the CJR participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment from which the ACO made the distribution payment to the NPPGP that is an ACO participant. In addition, the total amount of all downstream distribution payments made to downstream collaboration agents must not exceed the amount of the distribution payment received by the NPPGP from the ACO.

A TGP that is an ACO participant that has entered into a distribution arrangement with a CJR collaborator that is an ACO may enter into a downstream distribution arrangement with a TGP member, who is a therapist who is an owner or employee of an NPPGP and who has reassigned to the TGP his or her right to receive Medicare payment. Like downstream distribution payments from an NPPGP to an NPPGP member, the amount of any downstream distribution payments from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision CJR activities, the same standard that applies to PG downstream distribution payments that are not determined in a manner that complies with § 411.352(g). Like the requirement for PGP members when a distribution payment does not comply with § 411.352(g) and for NPPGP members, a TGP member is eligible to receive a distribution payment only if the downstream collaboration agent furnished an item or service to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment from which the ACO made the distribution payment to the NPPGP that is an ACO participant. We will not cap the total amount of downstream distribution payments paid for a performance year to a TGP member. Finally, the total amount of all downstream distribution payments made to downstream collaboration agents must not exceed the amount of the distribution payment received by the TGP from the ACO.

Like PGPs, NPPGPs and TGP must maintain contemporaneous documentation regarding downstream distribution arrangements. Similarly, the NPPGP or TGP may not enter into a downstream distribution arrangement with any NPPGP member or TGP member respectively who has a sharing arrangement with a CJR participant hospital or a distribution arrangement with the ACO the NPPGP or TGP is a participant in.

Downstream distribution arrangements under the CJR model must comply with the following requirements:

- All downstream distribution arrangements must be in writing and signed by the parties, contain the date of the agreement, and be entered into before care is furnished to CJR beneficiaries under the downstream distribution arrangement.
- Participation in a downstream distribution arrangement must be voluntary and without penalty for nonparticipation.
- The downstream distribution arrangement must require the downstream collaboration agent to comply with all applicable laws and regulations.
- The opportunity to make or receive a downstream distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the CJR participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a CJR participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.
- The amount of any downstream distribution payments from an NPPGP to an NPPGP member or from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision CJR activities and that may take into account the amount of such CJR activities provided by a
downstream collaboration agent relative to other downstream collaboration agents.

- The amount of any downstream distribution payments from a PGP to a PGP member must be determined either in a manner that complies with §411.352(g) of this chapter or in accordance with a methodology that is substantially based on quality of care and the provision CJR activities, and the methodology may take into account the amount of such CJR activities by a downstream collaboration agent relative to other downstream collaboration agents.

- Except for a downstream distribution payment from a PGP to a PGP member that complies with §411.352(g), a downstream collaboration agent is eligible to receive a downstream distribution payment only if the downstream collaboration agent furnished an item or service to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the distribution payment being distributed.

- The total amount of all downstream distribution payments made to downstream collaboration agents must not exceed the amount of the distribution payment received by the PGP, NPPG, or TGP from the ACO.

- All downstream distribution payments must be made by check, electronic funds transfer, or another traceable cash transaction.

- The downstream collaboration arrangement must not—
  - Induce the downstream collaboration agent to reduce or limit medically necessary services to any Medicare beneficiary; or
  - Reward the provision of items and services that are medically unnecessary.

- The PGP, NPPG, or TGP must maintain contemporaneous documentation regarding downstream distribution arrangements in accordance with §510.110, including the following:
  - The relevant written agreements.
  - The date and amount of any downstream distribution payment.
  - The identity of each downstream collaboration agent that received a downstream distribution payment.
  - A description of the methodology and accounting formula for determining the amount of any downstream distribution payment.

- The PGP, NPPG, or TGP may not enter into a downstream distribution arrangement with any PGP member, NPPG member, or TGP member who has—
  - A sharing arrangement with a CJR participant hospital; or
  - A distribution arrangement with the ACO that the PGP, NPPG, or TGP is a participant in.

- The PGP, NPPG, or TGP must retain and provide access to, and must require downstream collaboration agents to retain and provide access to, the required documentation in accordance with §510.110.

5. Summary of Proposals for Sharing, Distribution, and Downstream Distribution Arrangements Under the CJR Model.

Figure 4 summarizes the proposals for the defined terms and financial arrangements discussed in section V.J. of this final rule.
Our final policies for financial arrangements reflect a number of changes to the proposals for the CJR model financial arrangements in response to comments on the proposed rule. Figure 4 summarizes the policies for financial arrangements we proposed for CJR, whereas Figure 5 summarizes the policies we are finalizing for these arrangements as discussed in sections V.J.4. through V.J.6. of this final rule. Given the changes to the financial arrangement provisions discussed in V.J. will not be effective until July 1, 2017, Figure 5 is not applicable until July 1, 2017.
K. Beneficiary Incentives Under the CJR Model

We proposed numerous amendments to the regulations in §510.515. These are mainly for organizational purposes, to more clearly specify our policies, and for the CJR model regulations to mirror the proposed EPM regulations at §512.525 to avoid confusion for hospitals that are participating in CJR as well as one or more of the proposed EPMs. Our proposed changes to the regulations reflect that the requirements and rules regarding the use of beneficiary incentives under the CJR model would stay largely the same. However, we proposed several changes in order to ensure adequate documentation of beneficiary incentives by participant hospitals and to align with our proposed requirements for the EPMs.

First, as a program safeguard against misuse of beneficiary incentives under the CJR model, we would clarify our existing requirements for documentation of beneficiary incentives. Documentation regarding items of technology exceeding $100 in retail value must also include contemporaneous documentation of any attempt to retrieve the technology at the end of a CJR episode. Documented, diligent, good faith attempts to retrieve items of technology will be deemed to meet the retrieval requirement.

We also proposed to add as a requirement that participant hospitals retain and provide access to required documentation pertaining to beneficiary incentives as discussed throughout section V.L. of this final rule and proposed in §510.110 of the regulations. Participant hospitals retaining and providing access to documentation in accordance with §510.110 would promote parallel record retention for all CJR model. As discussed in section V.L. of this final rule, the proposed section §510.110 would apply to beneficiary incentives as well as financial arrangements and beneficiary notification requirements under the CJR model; therefore, we proposed to delete §510.515(e) to avoid duplicative requirements and language and to align the applicable CJR model regulations with the proposed regulations of the EPMs.

We proposed to include these requirements in the regulations at §§510.515(d)(3) and 510.515(d)(4). We sought comment on our proposal. We also sought comment on the proposed
additional requirements for compliance with proposed section § 510.110 and the deletion of § 510.515(e). No comments were submitted in response to our proposed amendments to the beneficiary engagement incentives under the CJR model. Though we did not propose to change our policies regarding beneficiary engagement incentives under the CJR model commenters provided comments on beneficiary engagement incentives for the EPM, which mirrors the CJR model’s policies.

We refer readers to section III.I.9 for a detailed discussion of comments and responses in regards to beneficiary engagement incentives under these models.

Final Decision: After consideration of the public comments received, we are finalizing the proposals, without modification. We are making changes related to beneficiary incentives effective July 1, 2017 in order to align the CJR model with the EPMs, avoid confusion and preserve the existing CJR regulations until these changes take effect.

L. Access to Records and Record Retention

We proposed to consolidate the requirements under CJR for access to records and record retention and apply them more broadly in the model. The approach mirrors our proposed records retention policies for the EPMs, which are discussed in detail in section III.H. of this final rule. We refer readers to that section for further discussion of our proposed policies and rationale.

We proposed to add § 510.110 to the CJR regulations, which would apply to documentation regarding beneficiary notifications, financial arrangements, and beneficiary incentives. Because we proposed to consolidate all of the existing records access and retention requirements in one place, we proposed to delete §§ 510.500(e) and 510.515(c).

We further proposed to require participant hospitals, CJR collaborators, collaboration agents, downstream collaboration agents, and any other individuals or entities performing CJR activities to allow the Government, including CMS, OIG, HHS, and the Comptroller General or their designees, scheduled and unscheduled access to all books, contracts, records, documents and other evidence sufficient to enable the audit, evaluation, inspection or investigation of the individual or entity’s compliance with CJR model requirements, the calculation, distribution, receipt, or recoupment of gainsharing payments, alignment payments, distribution payments, and downstream distribution payments, the obligation to repay any reconciliation payments owed to CMS, the quality of the services furnished to a CJR beneficiary during a CJR episode, and the sufficiency of CJR beneficiary notifications.

In general, we proposed that such documents be maintained for a period of 10 years from the last day of the participant hospital’s participation in the CJR model or from the date of completion of any audit, evaluation, inspection, or investigation.

We believe these safeguards regarding access to records and record retention are necessary to ensure program integrity and protect against abuse in view of the CJR model’s design and requirements. We believe that by providing access to CJR records, we promote transparency of activities in the CJR model. Further, the proposed access to records and record retention requirements would ensure that the compliance of participant hospitals, CJR collaborators, collaboration agents, downstream collaboration agents, and any other individuals or entities performing CJR activities can be monitored and assessed. Also, these records may be necessary in the event that a participant hospital appeals any matter that is subject to dispute resolution through CMS. As such, CMS would have the resources necessary to prepare and respond to any such appeal.

Finally, we proposed to establish CEHRT use attestation for CJR participant hospitals so that a CJR participant hospital could be in Track 1 of the CJR model that meets the proposed requirements in the Quality Payment Program proposed rule to be an Advanced APM as discussed in section III.A.2. of this final rule. Thus, we proposed to require access to records and record retention about the accuracy of each Track 1 CJR model participant hospital’s submissions under CEHRT use requirements. Specifically, attestation to CEHRT use and submission of clinician financial arrangements lists are key requirements for Track 1 of the CJR model that is an Advanced APM, and the access to records and record retention requirements provide a program integrity safeguard by allowing us to assess the completeness and accuracy of the participant hospital’s compliance with the requirements for those submissions.

In summary, we proposed in § 510.110 that participant hospitals, CJR collaborators, collaboration agents, downstream collaboration agents, and any other individuals or entities performing providing CJR activities must allow the Government, including CMS, OIG, HHS and the Comptroller General or their designees, scheduled and unscheduled access to all books, contracts, records, documents and other evidence (including data related to utilization and payments, quality criteria, billing, lists of CJR collaborators, sharing arrangements, distribution arrangements, downstream distribution arrangements and the documentation required under § 510.500(d) and § 510.525(c) sufficient to enable the audit, evaluation, inspection or investigation of the following:

• Individual’s or entity’s compliance with CJR model requirements.
• The calculation, distribution, receipt, or recoupment of gainsharing payments, alignment payments, distribution payments, and downstream distribution payments.
• The obligation to repay any reconciliation payments owed to CMS.
• The quality of the services furnished to a CJR beneficiary during a CJR episode.
• The sufficiency of CJR beneficiary notifications.
• The accuracy of CJR beneficiary notifications.
• The accuracy of the CJR participant hospital’s submission under CEHRT use requirements.

Further, we proposed that participant hospitals, CJR collaborators, collaboration agents, downstream collaboration agents, and any other individuals or entities performing providing CJR activities maintain all such books, contracts, records, documents, and other evidence for a period of 10 years from the last day of the participant hospital’s participation in the CJR model or from the date of completion of any audit, evaluation, inspection, or investigation, whichever is later, unless CMS determines a particular record or group of records should be retained for a longer period and notifies the participant hospital at least 30 calendar days before the disposition date or there has been a dispute or allegation of fraud or similar fault against the participant hospital, CJR collaborator, collaboration agents, downstream collaboration agents, or any other individual or entity performing CJR activities related to the CJR model. In this case, the records must be maintained for 6 years from the date of any resulting final resolution of the dispute or allegation of fraud or similar fault.

We sought comment on our proposals, including whether additional or different requirements are appropriate to promote program integrity, prevent fraud and abuse and promote the goals of the model. The following is a
summary of the comments received and our responses.  

Comment: Generally, commenters were supportive of our proposal in § 510.110 to consolidate the requirements under the CJR model for access to records and record retention and apply them more broadly in the CJR model. However one commenter stated that requiring participant hospitals, CJR collaborators, collaboration agents, downstream collaboration agents, and any other individuals or entities performing CJR activities to maintain all such books, contracts, records, documents, and other evidence for a period of 10 years from the last day of the participant hospital’s participation in the CJR model or from the date of completion of any audit, evaluation, inspection, or investigation, whichever is later, is an excessive policy, and would burden entities and individuals involved in the CJR model. The commenter suggested that CMS reduce the 10 year record retention to 6 years, as the commenter believes that proposal is more consistent with other CMS programs. Further, one commenter recommended that CMS also request access to records on gainsharing and other savings-related payments so as to help examine the extent to which savings are equitably being shared by facilities with participating physicians and other healthcare professionals.  

Response: We note that the 10-year record retention policy is the current policy of the CJR model. While we understand the commenter’s concern that 10 years is excessive, we note that, once initiated, appeals and recalculation disputes can be lengthy processes and believe that maintaining this requirement as proposed would give both the participant and CMS as well as those conducting any audit, evaluation, inspection, or investigation, the resources to prepare and respond to issues that may take several years to surface. We appreciate the comment concerning CMS requesting access to records on gainsharing and other savings-related payments, and note that in these final regulations CMS may request from participant hospitals and their related CJR collaborators, collaboration agents, and downstream collaboration agents, records of the calculation, distribution, receipt, or recoupment of gainsharing payments, alignment payments, distribution payments, and downstream distribution payments.  

Final Decision: After consideration of the public comments received, we are finalizing the proposal without modification.  

M. Waivers of Medicare Program Rules To Allow Reconciliation Payment or Repayment Actions Resulting From the Net Payment Reconciliation Amount  

In order to correct a technical error in the CJR final rule (42 CFR 510.620), we proposed to waive the requirements of section 1833(a) of the Act to the extent that they would otherwise apply to reconciliation payments or repayments from a participant hospital under the CJR model. We proposed this policy in the CJR proposed rule (80 FR 41274) and received no comments from the public on our proposal; the proposal was finalized in the CJR final rule. We refer readers to the CJR final rule (80 FR 73460 and 73461) for further discussion. We proposed to amend our regulations at § 10.620 to reflect this change.  

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification.  

N. SNF 3-Day Waiver Beneficiary Protections  

The Medicare SNF benefit is for beneficiaries who require a short-term intensive stay in a SNF, requiring skilled nursing, or skilled rehabilitation care, or both. Under section 1861(i) of the Act, beneficiaries must have a prior inpatient hospital stay of no fewer than 3 consecutive days in order to be eligible for Medicare coverage of inpatient SNF care. In the November 2015 final rule (80 FR 73454 through 73460), we provided hospitals in the CJR model with additional flexibility to attempt to increase quality and decrease costs by allowing a waiver of the SNF 3-day rule for beneficiaries in a CJR episode beginning in performance year 2. Program requirements for this waiver are codified at § 510.610. Specifically, under § 510.610, for SNFs that meet all specified requirements, we waive the requirement in section 1861(i) of the Act for a 3-day inpatient hospital stay prior to a Medicare covered post-hospital extended care service for eligible beneficiaries in a CJR episode. The CJR SNF waiver will only be available to participant hospitals that are active participants in the CJR model. If a participant hospital no longer participates in the CJR model, due to a merger or other reason, it cannot continue to use the CJR SNF waiver. All other provisions of the statute and regulations regarding Medicare Part A post-hospital extended care services continue to apply.  

We believe that clarity regarding whether a waiver applies to SNF services furnished to a particular beneficiary is important to help ensure compliance with the conditions of the waiver and also improve our ability to monitor waivers for misuse. Therefore, in the CJR final rule (80 FR 73454 through 73460), we discussed how the waiver can be utilized when a beneficiary is in a CJR episode at the time when the waiver is applied. In addition, at § 510.405 we require participant hospitals to provide a discharge planning notice to beneficiaries in cases where there is potential beneficiary liability for the SNF stay (80 FR 73548 through 73549). Based on our experiences under BPCI Model 2, the Pioneer ACO Model, and other initiatives, we established certain requirements under § 510.610 for hospitals and SNFs with respect to the SNF 3-day rule waiver under the CJR model. As discussed in the final rule, commenters expressed concern about beneficiary liability in cases where the beneficiary’s eligibility status has changed, but the hospital is unaware of the change at the time it uses the waiver. We noted that we would continue to evaluate the waiver of the SNF 3-day rule, including further lessons learned from Innovation Center models in which a waiver of the SNF 3-day rule is being tested. We indicated that in the event we determine that additional safeguards or protections for beneficiaries or other changes were necessary, such as to incorporate additional protections for beneficiaries, we would propose the necessary changes through future rulemaking.  

In considering additional beneficiary protections that may be necessary to ensure proper use of the SNF 3-day waiver under the CJR model, we noted that there are existing, well-established payment and coverage policies for SNF services based on sections 1861(i), 1862(a)(1), and 1879 of the Act that include protections for beneficiaries from liability for certain non-covered SNF charges. These existing payment and coverage policies for SNF services continue to apply under the model, including SNF services furnished pursuant to the SNF 3-day waiver. (For example, see section 70 in the Medicare Claims Processing Manual, Chapter 30—Financial Liability Protections on the CMS Web site at https://www.cms.gov/Regulations-and-Guidance/Guidance-Manuals/Downloads/clm104c30.pdf; and Medicare Coverage of Nursing Facility Care at https://www.medicare.gov/Pubs/pdf/10153.pdf;
Medicare Benefit Policy Manual, Chapter 8—Covered Services Under Hospital Insurance at https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/downloads/hp102c08.pdf). In general, CMS requires that the SNF inform a beneficiary in writing about services and fees before the beneficiary is discharged to the SNF ($483.10(b)(6)); the beneficiary cannot be charged by the SNF for items or services that were not requested ($483.10(c)(6)(iii)(A)); a beneficiary cannot be required to request extra services as a condition of continued stay ($483.10(c)(6)(iii)(B)); and the SNF must inform a beneficiary that requests an item or service for which a charge will be made that there will be a charge for the item or service and what the charge will be ($483.10(c)(6)(iii)(C)). (See also section 6 of Medicare Coverage of Skilled Nursing Facility Care at https://www.medicare.gov/Pubs/pdf/10153.pdf.)

As we discussed in the CJR final rule (80 FR 73454 through 73460), commenters expressed concern regarding the lag between a CJR beneficiary’s Medicare coverage or eligibility status change and a participant hospital’s awareness of that change. There may be cases in which a SNF waiver is used by a participant hospital because the participant hospital believes that the beneficiary meets the inclusion criteria, based on the information available to the hospital and SNF at the time of the beneficiary’s admission to the SNF, but in fact the beneficiary’s Medicare coverage has changed and the hospital was unaware of it based on available information. We recognize that despite good faith efforts by participant hospitals and SNFs to determine a beneficiary’s Medicare status for the model, it may occur that a beneficiary is not eligible to be included in the CJR model at the time the SNF waiver is used. In these cases, we will cover services furnished under the waiver when the information available to the provider at the time the services were furnished indicated that the beneficiary was included in the model.

Since publication of our final rule, we have continued to learn from implementation and refinement of the SNF 3-day waiver in other models and the Shared Savings Program. Based on these experiences, we believe there are situations where it would be appropriate to require additional beneficiary financial protections under the SNF 3-day waiver for the CJR model. Specifically, we are concerned about potential beneficiary financial liability for non-covered Part A SNF services that might be directly related to use of the SNF 3-day waiver under the CJR model. We are concerned that there could be scenarios where a beneficiary could be charged for non-covered SNF services that were a result of a participant hospital’s inappropriate use of the SNF waiver. Specifically, we are concerned that a beneficiary could be charged for non-covered SNF services if a participant hospital discharges a beneficiary to a SNF that does not meet the quality requirement (3 stars or higher in 7 of the last 12 months), and payment for SNF services is denied for lack of a qualifying inpatient hospital stay. We recognize that requiring a discharge planning notice ($510.405) will help mitigate concerns about beneficiaries’ potential financial liability for non-covered services. Nevertheless, we are concerned that in this scenario, once the claim is denied, the beneficiary may not be protected from financial liability under existing Medicare rules because the waiver would not be available, and the beneficiary would not have had a qualifying inpatient hospital stay. Thus, the CJR beneficiary could be charged by the SNF for non-covered SNF services that were a result of an inappropriate attempt to use the waiver. In this scenario, Medicare would deny payment of the SNF claim, and the beneficiary could potentially be charged by the SNF for these non-covered SNF services, potentially subjecting such beneficiaries to significant financial liability. In this circumstance, we assume the participant hospital’s intent was to rely upon the SNF 3-day waiver, but the waiver requirements were not met. We believe that in this scenario, the rejection of the claim could easily have been avoided if the hospital had confirmed that the requirements for use of the SNF 3-day waiver were satisfied or if the beneficiary had been provided the discharge planning notice and elected to go to a SNF that met the quality requirement.

Other models have addressed similar issues in which the beneficiary may be subject to financial liability for non-covered SNF services related to the waiver. The Next Generation ACO Model generally places the risk on the SNF, where the SNF did not qualify under the waiver or otherwise knew or reasonably could be expected to have known that payment would not be made for the non-covered SNF services. In such cases, CMS makes no payment for the services, and the SNF may not charge the beneficiary for the services and must return any monies collected from the beneficiary. Additionally, under the Next Generation ACO Model, the ACO must indemnify and hold the beneficiary harmless for the services. As we stated in the proposed rule, we believe it was appropriate to propose to adopt a similar policy under the CJR model. In contrast to the Next Generation ACO Model, however, we believe it is most appropriate to hold the participant hospitals financially responsible for misusing the waiver in situations where waiver requirements are not met, because participant hospitals are required to be aware of the 3-day waiver requirements. Participant hospitals are the entities financially responsible for episode spending under the model and will make the decision as to whether it is appropriate to discharge a beneficiary without a 3-day stay. In addition, we clearly laid out the requirements for use of the SNF waiver in the CJR final rule. Participant hospitals may begin using the waiver for episodes that begin in performance year 2, and may only utilize the waiver to discharge a beneficiary to a SNF that meets the quality requirements. CMS will post on the public Web site a list of SNFs that do not meet the quality requirements. Participant hospitals are required to consult the published list of SNFs prior to utilizing the SNF waiver. As described later in this section, we proposed that when the hospital provides the beneficiary with the discharge notice in accordance with the requirements of $510.405(b)(4) (which elsewhere in this final rule we are renumbering as §510.405(b)(3), and therefore will refer to this provision by its new number throughout this section), the hospital would not have financial liability for non-covered SNF services that result from inapplicability of the waiver. In other words, when the participant hospital has discharged a beneficiary to a SNF that does not qualify under the conditions of the waiver, and has not provided the required notice so that the beneficiary is aware that he or she is accepting financial liability for non-covered SNF services as a result of not having a qualifying inpatient stay, as we stated in the proposed rule, we believe it is reasonable that the ultimate responsibility and financial liability for the non-covered SNF stay should rest with the participant hospital. For this reason, we proposed to require hospitals to keep a record of discharge planning notice distribution to CJR beneficiaries. We proposed to modify the CJR participant hospitals’ use of discharge planning notices to assess the potential for their
misuse. We also considered holding the SNF responsible but decided that since hospitals, not SNFs, are the CJR model participants, they therefore should be held responsible for complying with the 3-day waiver conditions for the reasons stated previously in this section.

To protect CJR beneficiaries from being charged for non-covered SNF charges in instances when the waiver was used inappropriately, we proposed to add certain beneficiary protection requirements in §510.610. These requirements would apply for SNF services that would otherwise have been covered except for lack of a qualifying hospital stay. Specifically, we proposed that beginning with episodes that are initiated on or after January 1, 2017, when the SNF waiver is available, if a participant hospital discharged a beneficiary without a qualifying 3-day inpatient stay to a SNF that was not on the published list of SNFs that meet the CJR SNF waiver quality requirements as of the date of admission to the SNF, the hospital would be financially liable for the SNF stay if no discharge planning notice was provided to the beneficiary, alerting them of potential financial liability. If the participant hospital provides a discharge planning notice in compliance with the requirements of §510.405(b)(3), we proposed that the participant hospital would not be financially liable for the cost of the SNF stay and the normal Medicare FFS rules for coverage of SNF services will apply. We proposed that, in cases where the participant hospital provides a discharge planning notice in compliance with the requirements of §510.405(b)(3) and the beneficiary chooses to obtain care from a non-qualified SNF without a qualifying inpatient stay, the beneficiary assumes financial liability for services furnished (except those covered by Medicare Part B during a non-covered inpatient SNF stay).

In the event a CJR beneficiary is discharged to a SNF without a qualifying 3-day inpatient stay, but the SNF is not on the qualified list as of the date of admission to the SNF, the participant hospital has failed to provide a discharge planning notice, as specified in §510.405(b)(3), we proposed that CMS apply the following rules:

- CMS shall make no payment to the SNF for such services.
- The SNF shall not charge the beneficiary for the expenses incurred for such services; and the SNF shall return to the beneficiary any monies collected for such services.
- The hospital shall be responsible for the cost of the uncovered SNF stay.

In addition, we proposed to amend our regulations to clarify that the SNF 3-day waiver will be available in performance years 2 through 5 for those episodes beginning on or after January 1, 2017. In the CJR final rule, we discussed how the SNF 3-day waiver will be available beginning in performance year 2. We proposed to clarify that the waiver does begin in performance year 2, but only for those episodes that begin on or after January 1, 2017 when the waiver goes into effect.

We sought comment on these proposals. Specifically, we sought comment on whether it is reasonable to—(1) cover services furnished under the SNF waiver based on participant hospital knowledge of beneficiary eligibility for the CJR model as determined by Medicare coverage status at the time the services under the waiver were furnished; and (2) to hold the participant hospital financially responsible for denied SNF claims if a CJR beneficiary is discharged to a SNF without a qualifying 3-day inpatient stay, but the SNF is not on the qualified list as of the date of admission to the SNF, and the participant hospital has failed to provide a discharge planning notice as specified in §510.405(b)(3).

We sought comment on whether SNFs received instead of, or in addition to, the participant hospital should be held liable for such claims and under what circumstances. Finally, we sought comment on any other related issues that we should consider in connection with the proposal to protect beneficiaries from significant financial liability for non-covered SNF services related to the waiver of the SNF 3-day rule under the CJR model. We may address those issues through future notice and comment rulemaking.

We proposed to amend our regulations at §510.610 to reflect the change. We also proposed to clarify the language in §510.610 to reflect that the CJR SNF waiver will be available for use for episodes that begin on or after January 1, 2017.

We received comments on similar waivers for the EPM, which we addressed in III.J of the EPM final rule. The following is a summary of the comments received on the CJR SNF 3-day waiver and our responses.

**Comment:** Commenters requested clarification discharge planning as it relates to application and use of the SNF 3-day waiver.

**Response:** CMS requires participant hospitals to provide written notice to beneficiaries informing them of potential financial liability associated with non-covered services presented as an option as part of discharge planning, as outlined at §510.405(b)(4) of the CJR final rule, and amended in this final rule as §510.405(b)(3). We refer readers to the CJR final rule (80 FR 73516–73521) and §510.405(b)(3) for further discussion of this requirement.

**Comment:** Some commenters proposed that CMS modify the Bundled Payments for Care Initiative (BPCI) SNF 3-day waiver to more closely align with the CJR model’s SNF 3-day waiver.

**Response:** We did not make any proposals in this rule with respect to BPCI.

**Comment:** Some commenters inquired about the process if a hospital wishes to utilize the SNF 3-day waiver, but the beneficiary wishes to remain in the hospital.

**Response:** As stated in 80 FR 73516, the CJR model does not seek to limit the beneficiary’s ability to choose among Medicare providers or the range of services available. Decisions about the length of an inpatient stay are not addressed in this rule.

**Final Decision:** After consideration of the public comments received, we are finalizing the proposal without modification to cover services furnished under the SNF waiver in cases where the beneficiary met the criteria at §510.205 on the date of discharge from the anchor hospitalization, based on information available as of that date. We are also finalizing the proposal to hold the participant hospital financially responsible for denied SNF claims if a CJR beneficiary is discharged to a SNF without a qualifying 3-day inpatient stay, but the SNF is not on the qualified list as of the date of admission to the SNF, and the participant hospital has failed to provide a discharge planning notice as specified in §510.405(b)(3).

We are not finalizing the proposal to specify that the SNF waiver will be available for use for episodes that begin on or after January 1, 2017, as the change is no longer necessary given the effective date of this final rule. The final policies for financial liability for non-covered SNF services provided due to incorrect application of the SNF 3-day rule waiver are set forth in §510.610.

**O. Advanced Alternative Payment Model Considerations**

1. **Overview for CJR**

The MACRA created two paths for eligible clinicians to link quality to payments: The MIPS and Advanced APMs. These two paths create a flexible payment system called the Quality Payment Program as proposed by CMS in the Quality Payment Program
proposed rule (81 FR 28161 through 28586).

As proposed in the Quality Payment Program proposed rule, an APM must meet three criteria to be considered an Advanced APM (81 FR 28298). First, the APM must provide for payment for covered professional services based on quality measures comparable to measures described under the performance category described in section 1848(q)(2)(B)(i) of the Act, which is the MIPS quality performance category. We refer to the discussion following our proposals for the final criteria required for the APM to be an Advanced APM. Under the Quality Payment Program proposed rule, we proposed that the quality measures on which the Advanced APM bases payment for covered professional services (as that term is defined in section 1848(k)(3)(A) of the Act) must include at least one of the following types of measures, provided that they have an evidence-based focus and are reliable and valid (81 FR 28302):

• Quality measures included on the proposed annual list of MIPS quality measures.
• Quality measures that are endorsed by a consensus-based entity.
• Quality measures developed under section 1848(s) of the Act.
• Quality measures submitted in response to the MIPS Call for Quality Measures under section 1848(q)(2)(D)(ii) of the Act.
• Any other quality measures that CMS determines to have an evidence-based focus and be reliable and valid.

As we discussed in the Quality Payment Program proposed rule, because the statute identifies outcome measures as a priority measure type and we wanted to encourage the use of outcome measures for quality performance assessment in APMs, we further proposed in that rule, that in addition to the general quality measure requirements, an Advanced APM must include at least one outcome measure if an appropriate measure is available on the MIPS list of measures for that specific QP Performance Period, determined at the time when the APM is first established (81 FR 28302 through 28303).

Second, the APM must either require that participating APM Entities bear risk for monetary losses of a more than nominal amount under the APM or be a Medical Home Model expanded under section 1115A(c) of the Act. Except for Medical Home Models, we proposed in the Quality Payment Program proposed rule that, for an Advanced APM to meet the nominal amount standard, the specific level of marginal risk must be at least 30 percent of losses in excess of expected expenditures; a minimum loss rate, to the extent applicable, must be no greater than 4 percent of expected expenditures; and total potential risk must be at least 4 percent of expected expenditures (81 FR 28306).

Third, the APM must require participants to use CEHRT (as defined in section 1848(o)(4) of the Act), as specified in section 1833(z)(3)(D)(i)(I) of the Act, to document and communicate clinical care with patients and other health care professionals. Specifically, where the APM participants are hospitals, the APM must require each hospital to use CEHRT (81 FR 28298 through 28299).

In the proposed rule (81 FR 50794), we proposed to adopt two different tracks for CJR—Track 1 in which CJR and its participant hospitals would meet the criteria for Advanced APMs as proposed in the Quality Payment Program proposed rule, and Track 2 in which CJR and its participant hospitals would not meet those proposed criteria. We refer to the discussion following our proposals for the final criteria required for the APM to be an Advanced APM.

The CJR model incorporates a pay-for-performance methodology including quality measures that we believe would meet the proposed Advanced APM quality measure requirements in the Quality Payment Program proposed rule. Both of the required quality measures in the CJR model are NQF-endorsed, have an evidence-based focus, and are reliable and valid. We believe they would meet the proposed Advanced APM general quality measure requirements.

The CJR pay-for-performance methodology includes one outcome measure that is NQF-endorsed, has an evidence-based focus, and is reliable and valid. The pay-for-performance methodology incorporates the Hospital-level RSCR following elective primary THA and/or TKA (NQF #1530) (Hip/Knee Complications) outcome measure. Thus, we believe the CJR model would meet the requirement proposed for Advanced APMs in the Quality Payment Program proposed rule for use of an outcome measure that also meets the general quality measure requirements.

In terms of the proposed nominal risk criteria for Advanced APMs, beginning in performance year 2 for episodes ending between January 1, 2017 and December 31, 2017, participating hospitals would begin to bear downside risk for excess actual CJR episode spending above the quality-adjusted target price. We believe the risk for excess actual CJR episode spending above the quality-adjusted target price would be 100 percent over the range of spending up to the stop-loss limit, which would exceed 30 percent marginal risk, and there would be no minimum loss rate. As a result, we believe the CJR model would meet the marginal risk and minimum loss rate elements of the nominal risk criteria for Advanced APMs proposed in the Quality Payment Program proposed rule. Total potential risk for most CJR participant hospitals is 5 percent of expected expenditures in the performance year 2, and increasing in subsequent performance years.

Therefore, we believe the total potential risk applicable to most participant hospitals, with the lowest total potential risk being 5 percent for CJR episodes ending on or after January 1, 2017 in performance year 2, would meet the total potential risk element of the nominal risk amount standard for Advanced APMs proposed in the Quality Payment Program proposed rule because it is greater than the value of at least 4 percent of expected expenditures.

We note that participant hospitals that are rural hospitals, sole community hospitals (SCHs), Medicare Dependent Hospitals (MDHs) and Rural Referral Centers (RRCs) will have a stop-loss limit of 3 percent in performance year 2. Because 3 percent is less than the proposed threshold of at least 4 percent of expected expenditures for total potential risk proposed for Advanced APMs in the Quality Payment Program proposed rule, those rural hospitals, SCHs, MDHs, and RRCs that are CJR participant hospitals subject to special protections would be in Track 2 of the CJR model and would not meet the proposed nominal risk standard for Advanced APMs for performance year 2. We recognize that the proposal might initially limit the ability of rural hospitals, SCHs, MDHs, and RRCs to be in an Advanced APM for performance year 2. We believe this potential limitation on rural hospitals, SCHs, MDHs, and RRCs is appropriate for the following reasons: (1) Greater risk protections for these hospitals under the CJR model beginning in performance year 2 and subsequent performance years compared to other participant hospitals are necessary, regardless of their implications regarding Advanced APMs based on the nominal risk standard proposed in the Quality Payment Program proposed rule, because these hospitals have unique challenges that do not exist for most other hospitals, such as being the only source of health care services for beneficiaries or certain beneficiaries living in rural areas or being located in...
areas with fewer providers, including fewer physicians and post-acute care facilities; and (2) under the CJR risk arrangements, these hospitals would not bear an amount of risk in performance year 2 that we determined to be more than nominal in the Quality Payment Program proposed rule. However, we sought comment on whether we should allow participant hospitals that are rural hospitals, SCHs, MDHs, or RRCs to elect a higher stop-loss limit for performance year 2 where downside risk applies in order to permit these hospitals to be in Track 1 of the CJR model for performance year 2. We noted that by performance year 3, the stop-loss limit for these hospitals with special protections under the CJR model would increase to 5 percent under our proposal, so the hospitals could be in Track 1 based on the nominal risk standard proposed in the Quality Payment Program proposed rule.

As addressed in the Quality Payment Program proposed rule, it is necessary for an APM to require the use of CEHRT in order to meet the criteria to be considered an Advanced APM. Therefore, according to the requirements proposed in the Quality Payment Program proposed rule, so that the CJR model may meet the proposed criteria to be an Advanced APM, we proposed to require participant hospitals to use CEHRT (as defined in section 1848(o)(4) of the Act) to participate in Track 1 of the CJR model. We proposed that Track 1 participant hospitals must use certified health IT functions in accordance with the definition of CEHRT under our regulation at 42 CFR 414.1305, to document and communicate clinical care with patients and other health care professionals as proposed in the Quality Payment Program proposed rule (81 FR 28320). We believe the proposal would allow Track 1 of CJR to be able to meet the proposed criteria to be an Advanced APM.

Without the collection of identifying information on eligible clinicians (physicians, non-physician practitioners, physical and occupational therapists, and qualified speech-language pathologists) who would be considered affiliated practitioners as proposed in the Quality Payment program proposed rule under the CJR model, CMS would not be able to consider participation in the model in making determinations as to whom could be considered a QP (81 FR 28320). As detailed in the Quality Payment Program proposed rule, these determinations are based on the whether the eligible clinician meets the QP threshold under either the Medicare Option starting in payment year 2019 or the All-Payer Combination Option, which is available starting in payment year 2021 (81 FR 28165). Thus, we made proposals in subsequent sections to specifically address these issues that might otherwise preclude the CJR model from being considered an Advanced APM, or prevent us from operationalizing it as an Advanced APM. Based on the proposals for Advanced APM criteria in the Quality Payment Program proposed rule, we sought to align the design of the CJR model with the proposed Advanced APM criteria and enable CMS to have the necessary information on eligible clinicians to make the requisite QP determinations.

Based on the proposals for Advanced APM criteria in the Quality Payment Program proposed rule (81 FR 28161), we sought to align the design of the CJR model Advanced APM track with the proposed Advanced APM criteria and enable CMS to have the necessary information on Eligible Clinicians to make the requisite QP determinations. As detailed in the Quality Payment Program final rule with comment period, QP determinations are based on whether the Eligible Clinician meets the QP threshold under either the Medicare Option starting in payment year 2019 or the All-Payer Combination Option, which is available starting in payment year 2021 (81 FR 77013). The three criteria for an Advanced APM were finalized in the Quality Payment Program final rule with comment period (81 FR 77008), and we continue to align the design of the CJR model Advanced APM track with the finalized Advanced APM criteria so that the CJR track that meets such criteria may be an Advanced APM. To be determined to be an Advanced APM, an APM must meet three Advanced APM criteria identified in § 414.1415 and discussed specifically later in this section.

First, the APM must require participants to use CEHRT (as defined in section 1848(o)(4) of the Act), as specified in section 1833(l)(3)(I) of the Act, to document and communicate clinical care with patients and other health care professionals (81 FR 77406). Specifically, where the APM participants are hospitals, the APM must require each hospital to use CEHRT. As addressed in the Quality Payment Program final rule with comment period, it is necessary for an APM to require the use of CEHRT in order to meet the criteria to be considered to be an Advanced APM. Therefore, according to the requirements now finalized in the Quality Payment Program final rule with comment period, so that a track of the CJR model may meet the finalized criteria to be an Advanced APM, we proposed that those CJR participant hospitals who choose to participate in Track 1 of the CJR model must use certified health IT functions, in accordance with the definition of CEHRT under our regulation at 42 CFR 414.1305, to document and communicate clinical care with patients and other health care professionals. We believe that this proposal set forth in the EPM proposed rule would allow CJR participant hospitals who use and attest to the use of CEHRT to be in an APM that meets the first finalized Advanced APM criterion.

Second, the APM must provide for payment to participants based on quality measures comparable to measures described under the performance category described in section 1848(q)(2)(B)(i) of the Act, which is the MIPS quality performance category. We interpret this criterion to require the APM to incorporate quality measure results as a factor when determining payment to participants under the terms of the APM as described in the Quality Payment Program final rule with comment period (81 FR 77414). In order to align the CJR model Advanced APM track with the Quality Payment Program final rule with comment period, the quality measures on which the Advanced APM bases payment to participants must include at least one of the following types of measures, provided that they have an evidence-based focus and are reliable and valid (81 FR 77419):

Any of the quality measures included on the proposed annual list of MIPS quality measures.

Quality measures that are endorsed by a consensus-based entity.

Quality measures developed under section 1848(s) of the Act.

Quality measures submitted in response to the MIPS Call for Quality Measures under section 1848(q)(2)(D)(ii) of the Act.

Any other quality measures that CMS determines to have an evidence-based focus and be reliable and valid.

As we discussed in the Quality Payment Program final rule with comment period, because the statute identifies outcome measures as a priority measure type and we want to encourage the use of outcome measures for quality performance assessment in APMs, we further finalized in that rule that, in addition to the general quality measure requirements, an Advanced APM must include at least one outcome measure if an appropriate measure is available on the MIPS list of measures.
for that specific QP Performance Period, determined at the time when the APM is first established (81 FR 77418). Therefore, according to the requirements finalized in the Quality Payment Program final rule with comment period and the quality measures adopted for the CJR model in the CJR Final Rule (80 FR 73375), the CJR model will meet the second finalized criterion of the Advanced APM criteria.

Third, the Quality Payment Program final rule with comment period requires that for an APM to meet the Advanced APM criteria, the APM must either require that participating APM Entities bear risk for monetary losses of a more than nominal amount under the APM or be a Medical Home Model expanded under section 1115A(c) of the Act. For the purposes of the EPM, the generally applicable nominal amount standard for an Advanced APM in the Quality Payment Program final rule with comment period (81 FR 77425) means the total amount an APM Entity potentially owes CMS or foregoes under an APM must be at least equal to 3 percent of the expected expenditures for which an APM Entity is responsible under the APM. The generally applicable financial risk standard (81 FR 77422) means when an APM Entity’s actual expenditures for which the APM Entity is responsible under the APM exceed expected expenditures during a specified QP Performance Period, the APM Entity is required to owe payment(s) to CMS. We refer to the Quality Payment Program final rule with comment period for a discussion regarding why we did not finalize the specific level of marginal risk or minimum loss rate (81 FR 77426).

However, consistent with the commitments we made to adhere to the proposed marginal risk and minimum loss rate requirements in the Quality Payment Program proposed rule, we note that the financial risk in this final rule when the EPMs involve downside risk exceeds the proposed marginal risk and minimum loss rate requirements proposed for the Quality Payment Program. As discussed in section III.C. of the CJR Final Rule (80 FR 73324 through 73358), the final total initial risk of expected expenditures for EPM participants of 5 percent, except for rural hospitals, SCHs, MDHs, and RRCs subject to special protections at 3 percent, beginning in performance year 2 when downside risk first applies to all participants would meet the total potential level of the nominal risk amount standard for Advanced APMs finalized in the Quality Payment Program final rule with comment period (81 FR 77427) because it is greater than the value of at least 3 percent of expected expenditures. Therefore, according to the requirements finalized in the Quality Payment Program final rule with comment period and the payment methodology for CJR participant hospitals finalized in the CJR Final Rule (80 FR 73324 through 73358), all CJR participant hospitals in performance year 2 will be in an APM that meets the third finalized criterion of the Advanced APM criteria.

Finally, we finalized in the Quality Payment Program final rule with comment period (81 FR 77442) that for Advanced APMs, such as episode payment models, in which there are some Advanced APM Entities that include Eligible Clinicians on a Participation List and other Advanced APM Entities that identify Eligible Clinicians only on an Affiliated Practitioner List, we will identify Eligible Clinicians for QP determinations based on the composition of the Advanced APM Entity. In the scenario that applies to the CJR model, which includes only hospitals as Advanced APM Entities on the Participation List, for those Advanced APM Entities where there is an Affiliated Practitioner List that identifies Eligible Clinicians, that Affiliated Practitioner List will be used to identify the Eligible Clinicians for purposes of QP determinations, and those Eligible Clinicians will be assessed individually. Thus, to operationalize the CJR model as an Advanced APM, our proposal for the CJR model to identify Eligible Clinicians on a clinician financial arrangements list to construct the Affiliated Practitioner list would identify those Eligible Clinicians for purposes of QP determination, consistent with the policies finalized in the Quality Payment Program final rule with comment period.

2. CJR Participant Hospital Tracks

To be considered an Advanced APM, the APM must require participants to use CEHRT (as defined in section 1848(o)(4) of the Act), as specified in section 1833(z)(3)(B)(I)(I) of the Act. We proposed that all participant hospitals must choose whether to meet the CEHRT use requirement. Participant hospitals that do not meet and attest to the CEHRT use requirement would be in Track 2 of the CJR model. Participant hospitals selecting to meet the CEHRT use requirement would be in Track 1 of the CJR model and would be required to attest in a form and manner specified by CMS to their use of CEHRT that meets the definition in our regulation at section 414.1305 to document and communicate clinical care with patients and other health professionals, consistent with the proposal in the Quality Payment Program proposed rule for the CEHRT requirement for Advanced APMs (81 FR 28299). Participant hospitals choosing not to meet and attest to the CEHRT use requirement would not be required to submit an attestation.

We believe that the selection by the participant hospital to meet and attest to the CEHRT use requirement would not otherwise change any participant hospital’s requirements or opportunity under the CJR model. However, to the extent the eligible clinicians who enter into financial arrangements related to Track 1 CJR participant hospitals are considered to furnish services through an Advanced APM, those services could be considered for purposes of determining whether the eligible clinicians are QPs.

The proposals for CEHRT use and attestation for participant hospitals are included in §510.120(a). We sought comment on our proposals for CJR tracks and participant hospital requirements.

We received a number of comments on our proposals in this section that applied to both the EPMs and the CJR model, and no comments unique to the CJR model. We refer to sections III.A.2.a. and b. of this final rule for a summary of the comments and our responses.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, with modification to use the term “specified” for consistency with CEHRT attestation in other CMS programs, to include in § 510.120(a) the CEHRT use and attestation for CJR participant hospitals.

For performance year 2 through 5, CJR participant hospitals choose either of the following:

- CEHRT use. Participant hospitals attest in a form and manner specified by CMS to their use of CEHRT as defined in §414.1305 of this chapter to document and communicate clinical care with patients and other health professionals.
- No CEHRT use. Participant hospitals do not attest in a form and manner specified by CMS to their use of CEHRT as defined in §414.1305 of this chapter to document and communicate clinical care with patients and other health professionals.
3. Clinician Financial Arrangements Lists Under the CJR Model

In order for CMS to make determinations as to eligible clinicians who could be considered QPs based on services furnished under the CJR model (to the extent the model is determined to be an Advanced APM), we require accurate information about eligible clinicians who enter into financial arrangements under Track 1 of CJR under which the Affiliated Practitioners support the participant hospitals’ cost or quality goals as discussed in section V.J. of this final rule. We note that eligible clinicians could be CJR collaborators engaged in sharing arrangements with a CJR participant hospital; PGP members who are collaboration agents engaged in distribution arrangements with a PGP that is a CJR collaborator; or PGP members who are downstream collaboration agents engaged in downstream distribution arrangements with a PGP that is also an ACO participant in an ACO that is a CJR collaborator. These terms as they apply to individuals and entities with financial arrangements under CJR are discussed in section V.J. of this final rule. A list of physicians and nonphysician practitioners in one of these three types of arrangements could be considered an Affiliated Practitioner List of eligible clinicians who are affiliated with and support the Advanced APM Entity in its participation in the Advanced APM as proposed in the Quality Payment Program proposed rule. Therefore, this list could be used to make determinations of who would be considered for a QP determination based on services furnished under the CJR model (81 FR 28320).

Thus, we proposed that each participant hospital that chooses to meet and attest to the CEHRT use requirements must submit to CMS a clinician financial arrangements list in a form and manner specified by CMS on a no more than quarterly basis. The list must include the following information for the period of the CJR performance year specified by CMS:

- For each collaboration agent who is a physician or nonphysician practitioner of a PGP that is a CJR collaborator during the period of the CJR performance year specified by CMS—
  - The TIN of the PGP that is the CJR collaborator, and the name and NPI of the physician or nonphysician practitioner; and
  - The start date and, if applicable, end date, for the distribution arrangement between the CJR collaborator that is a PGP and the physician or nonphysician practitioner who is a PGP member.
- For each downstream collaboration agent who is a physician or nonphysician practitioner member of a PGP that is also an ACO participant in an ACO that is a CJR collaborator during the period of the CJR performance year specified by CMS—
  - The TIN of the PGP that is the ACO participant, and the name and NPI of the physician or nonphysician practitioner; and
  - The start date and, if applicable, end date, for the downstream distribution arrangement between the collaboration agent that is both PGP and an ACO participant and the physician or nonphysician practitioner who is a PGP member.
- If there are no individuals that meet the requirements to be reported as CJR collaborators, collaboration agents, or downstream collaboration agents, the participant hospital must attest in a form and manner required by CMS that there are no individuals to report on the clinician financial arrangements list.

As discussed in the Quality Payment program proposed rule, those physicians or nonphysician practitioners who are included on the Affiliated Practitioner List as of December 31 of a performance period would be assessed to determine whether they qualify for APM Incentive Payments (81 FR 28320). The Quality Payment Program final rule with comment period (81 FR 77444) modified this process to identify eligible clinicians on the Affiliated Practitioner List for QP determinations at any one of three snapshots. The first snapshot will be on March 31 of the QP Performance Period, the second snapshot will be on June 30 of the QP Performance Period, and the third snapshot will be on August 31, which will be the last day of the QP Performance Period.

While the submission of this required information may create some additional administrative requirements for certain participant hospitals, we expect that Track 1 participants could modify their contractual relationships with their CJR collaborators and, correspondingly, require those collaborators to include similar requirements in their contracts with collaboration agents and in the contracts of collaboration agents with downstream collaboration agents.

The proposal for the submission of a clinician financial arrangements list by participant hospitals that meet and attest to the CEHRT use requirements for the CJR model is included in § 510.120(b). We sought comments on the proposal for submission of this information. We noted that we were especially interested in comments about approaches to information submission, including the periodicity and method of submission to CMS that would minimize the reporting burden on participant hospitals while providing CMS with sufficient information about eligible clinicians in order to facilitate QP determinations to the extent the CJR model is considered to be an Advanced APM.

We received a number of comments on our proposals in this section that applied to both the EPMs and the CJR model and no comments unique to the CJR model. We refer to section III.A.2.c. of this final rule for a summary of the comments and our responses.

Final Decision: After consideration of the public comments received, we are finalizing the proposal in § 510.120(b), with modification to include on the clinician financial arrangements list all individuals with financial arrangements under the CJR model in 2017 through June 30, 2017 under the existing definitions and provisions of Part 510 and from July 1, 2017 and thereafter under the provisions effective July 1, 2017 as finalized in section V.J. of this final rule, and for CJR participant hospitals that meet and attest to the CEHRT use requirement to also submit on a no more than quarterly basis a clinician financial arrangements list. While we are finalizing the regulations generally as proposed, effective with the effective date of this final rule, we are delaying until July 1, 2017 the effective date of certain provisions that refer to individuals with financial arrangements for which the financial arrangements provisions take effect July 1, 2017. The implementation of the reporting requirements for the clinician financial arrangements list in two stages in 2017 will ensure that all physicians, nonphysician practitioners, and therapists with financial arrangements in association with CJR hospital participants that attest to CEHRT use can be reported on the clinician financial arrangements lists during the snapshots in 2017 for the Quality Payment Program, regardless of the
changes to the definitions and types of collaborators under the CJR model effective July 1, 2017.

Effective with the effective date of this final rule, each participant hospital that chooses CEHRT use must submit to CMS a clinician financial arrangements list in a form and manner specified by CMS on a no more than quarterly basis. The list must include the following information on individuals and entities for the period of the CJR performance year specified by CMS:

- CJR collaborators. For each CJR collaborator who is a physician, nonphysician practitioner, or therapist in private practice during the period of the CJR performance year specified by CMS:
  ++ The name, TIN, and NPI of the CJR collaborator.
  ++ The start date and, if applicable, end date, for the sharing arrangement between the CJR participant hospital and the CJR collaborator.

- Practice collaboration agents. For each physician, nonphysician practitioner, or therapist who is a CJR practice collaboration agent during the period of the CJR performance year specified by CMS:
  ++ The name and TIN of the CJR collaborator and the name, TIN, and NPI of the practice collaboration agent.
  ++ The start date and, if applicable, end date, for the distribution arrangement between the CJR collaborator and the practice collaboration agent.

- Attestation to no individuals. If there are no individuals that meet the requirements to be reported, the participant hospital must attest in a form and manner required by CMS that there are no individuals to report on the clinician financial arrangements list.

Effective July 1, 2017, the provisions for practice collaboration agents on the clinician financial arrangements list will be revised to use the term collaboration agent instead, stating:

- Collaboration agents. For each physician, nonphysician practitioner, or therapist who is a collaboration agent during the period of the CJR performance year specified by CMS:
  ++ The name and TIN of the CJR collaborator and the name, TIN, and NPI of the collaboration agent.
  ++ The start date and, if applicable, end date, for the distribution arrangement between the CJR collaborator and the collaboration agent.

Effective July 1, 2017, new provisions for downstream collaboration agents on the clinician financial arrangements list will be added, stating:

- Downstream collaboration agents.
  For each physician, nonphysician practitioner, or therapist who is a downstream collaboration agent during the period of the CJR performance year specified by CMS—
  ++ The name and TIN of the CJR collaborator and the name and TIN of the collaboration agent and the name, TIN, and NPI of the downstream collaboration agent.
  ++ The start date and, if applicable, end date, for the downstream distribution arrangement between the collaboration agent and the downstream collaboration agent.

4. Documentation Requirements

For each participant hospital that chooses to meet and attest to CEHRT use, we proposed that the participant hospital must maintain documentation of its attestation to CEHRT use and clinician financial arrangements lists submitted to CMS. These documents would be necessary to assess the completeness and accuracy of materials submitted by a participant hospital in Track 1 of CJR and to facilitate monitoring and audits. For the same reason, we further proposed that the participant hospital must retain and provide access to the required documentation in accordance with §510.110.

The proposal for documentation of attestation to CEHRT use and clinician financial arrangements lists submitted to CMS is included in §510.120(c). We sought comment on this proposal for required documentation.

Final Decision: We did not receive comments pertaining to §510.120(c). Therefore, we are finalizing the proposal for CJR participant hospital documentation of attestation to CEHRT use and clinician financial arrangements lists submitted to CMS, with modification to implement the documentation provisions in two stages.

The following documentation requirements apply to CJR participant hospitals choosing CEHRT use. We note that while the requirement for CJR participant hospitals to maintain documentation of attestation to CEHRT use and clinician financial arrangements lists will be effective on the effective date of this final rule, the effective date of the provision for retention and the provision of access to the required documentation will delayed until July 1, 2017 to correspond to the similar delay in the effective date of §510.110 to July 1, 2017, for reasons described elsewhere in this final rule.

- Each participant hospital that chooses CEHRT use must maintain documentation of their attestation to CEHRT use and clinician financial arrangements lists.
- The participant hospital must retain and provide access to the required documentation in accordance with §510.110.

VI. Cardiac Rehabilitation Incentive Payment Model

A. Background

For patients with coronary and other atherosclerotic vascular disease, the American Heart Association and the American College of Cardiology Foundation’s 2011 practice guideline for secondary prevention and risk reduction therapy specifically highlights health care treatment strategies following AMI or CABG. These strategies include smoking cessation, close monitoring of blood pressure and cholesterol, and the use of certain medications.

The medical literature further indicates that cardiac rehabilitation (CR) and intensive cardiac rehabilitation (ICR) services, which incorporate the strategies discussed previously, are capable of achieving significant improvements in long-term patient outcomes. A January 2016 Cochrane Database of Systematic Reviews article reviewed 63 trials randomizing almost 15,000 patients and found that in long-term follow up (median 12 months), exercise-based CR services reduced cardiovascular mortality (but not total mortality), improved health-related quality of life, and reduced the risk of hospital admission.

Despite the evidence from multiple studies that CR services improve health outcomes, the literature also indicates that these services are underutilized, estimating that only about 35 percent of AMI patients receive this indicated treatment. Recent analysis confirms a similar pattern of underutilization for Medicare beneficiaries who are eligible for and could benefit from CR. This pattern is virtually unchanged over the past 2 decades, despite clinical practice guidelines for CR that were published in 1995 and subsequently endorsed by a number of professional associations and

CMS. Among beneficiaries hospitalized with a diagnosis of AMI in 2013, only about 15 percent had at least one claim for CR services, and of those who received CR services, slightly more than half received 25 or more CR sessions. Among beneficiaries hospitalized with an ICD–9–CM procedure code for percutaneous transluminal coronary angioplasty or coronary stenting in 2013, the findings on CR use were similar to those for AMI beneficiaries, with only about 23 percent having at least one claim for CR services, and of those who received CR services, slightly more than half received 25 or more CR sessions. Finally, among beneficiaries hospitalized in 2013 with ICD–9–CM procedure codes for coronary artery bypass surgery, about 45 percent had at least one claim for CR services, and slightly over 60 percent of those beneficiaries received 25 CR sessions or more, indicating slightly higher rates for utilization for these beneficiaries. Barriers to CR utilization include low beneficiary referral rates (particularly of women, older adults, and ethnic minorities); lack of strong physician endorsement of CR to their patients; lack of awareness of CR; the financial burden on beneficiaries due to coinsurance and lost work; lack of accessibility of CR program sites; the Medicare requirement for physician supervision of CR; and inadequate insurance payment. Moreover, beneficiaries with CAD often receive care in many different settings from multiple providers and suppliers over the long-term and subsequently commonly experience care that is fragmented and uncoordinated. For example, inpatient hospitals, physicians, and CR programs currently are paid separately for the services they provide, with limited financial incentives for providing care management and preventive services, limiting overuse of tests and procedures, and coordinating across care settings. Lack of coordination, of both care and financial incentives, across the continuum of CAD care, results in higher than necessary rates of adverse drug events, hospital readmissions, diagnostic errors, and other adverse outcomes, as well as lower than appropriate utilization of evidence-based treatments.

Medicare Part B generally covers CR/ICR services for all Medicare beneficiaries who are referred by their physician after having an AMI or CABG. As specified in section 1861(eee) of the Act, CR/ICR programs must include all of the following: (1) Physician-prescribed exercise; (2) cardiac risk factor modification, including education, counseling, and behavioral intervention, tailored to the patient’s individual needs; (3) psychosocial assessment; (4) outcomes assessment; and (5) an individualized treatment plan established, reviewed, and signed by a physician every 30 days that details how components are utilized for each patient. The CR/ICR services must be provided in a physician’s office or a hospital outpatient setting, and a physician must be immediately available and accessible to furnish assistance and direction at all times when cardiac rehabilitation services are being furnished under the program. The number of CR program sessions are limited to a maximum of 2 one-hour sessions per day for up to 36 sessions over up to 36 weeks with the option for an additional 36 sessions over an extended period of time if approved by the Medicare Administrative Contractor under section 1862(a)(1)(A) of the Act. ICR program sessions are limited to 72 one-hour sessions, up to 6 sessions per day, over a period of up to 18 weeks. To be approved as an ICR program, a program must demonstrate through peer-reviewed published research that it has accomplished at least one of the following: (1) Positively affecting the progression of coronary heart disease; (2) reducing the need for coronary bypass surgery; or (3) reducing the need for PCl. B. Overview of the CR Incentive Payment Model 1. Rationale for the CR Incentive Payment Model Considering the evidence demonstrating that CR/ICR services improve long-term patient outcomes, the room for improvement in CR/ICR service utilization for beneficiaries eligible for this benefit, and the need for ongoing, chronic treatment for underlying CAD among beneficiaries that have had an AMI or a CABG, we believe that there is a need for improved long-term care management and care coordination for beneficiaries that have had an AMI or a CABG and that incentivizing the use of CR/ICR services is an important component of meeting this need. We want to reduce barriers to high-value care by testing a financial incentive for hospitals that encourages the management of beneficiaries that have had an AMI or a CABG in ways that may contribute to long-term improvements in quality and reductions in Medicare spending. We believed that there were important advantages to proposing such an incentive in conjunction with the proposed EPMs that are also discussed in this final rule. First, we wish to understand whether and how the effects of a financial incentive for the use of CR/ICR services differ depending upon whether a beneficiary’s care is covered under an EPM or the Medicare FFS program. The proposed AMI and CABG models could be effective to provide the foundation for beneficiaries to receive improved coordination, care management, and secondary risk reduction during the model episodes through greater use of medically necessary CR/ICR services, even if accountability for beneficiary care ultimately transitions to other entities, such as ACOs or PCMHs, after the AMI or CABG model episode ends. Therefore, the AMI and CABG models
could make the proposed CR incentive payment more effective (if it is amplified by the broader care coordination infrastructure encouraged by the EPM in comparison with its effect in the Medicare FFS payment methodology) or less effective (if the care coordination infrastructure encouraged by the EPM is itself sufficient to ensure appropriate use of CR/ICR services such that the CR incentive payment itself has less effect than in the Medicare FFS payment methodology). Second, we wish to be able to examine each intervention’s separate effects on the quality and efficiency of the care beneficiaries receive. We believe that coordinating the design, implementation, and evaluation of the EPM and the CR incentive payment model is the best way to ensure that we accomplish both of these goals.

The following is a summary of the comments received and our responses. 

Comment: Many commenters encouraged CMS to use explicit financial incentives to encourage timely referral of beneficiaries that have had an AMI or a CABG to CR programs. Other commenters stated their support for the development of an incentive payment model and reminded CMS that they believe timely referral of beneficiaries hospitalized for treatment of AMI or CABG to encourage care coordination and greater utilization of CR/ICR services, including The Million Hearts initiative to focus on clinical attention on the prevention of heart attack and stroke, could complement these incentive payments.

Response: We appreciate the recognition from commenters that evidence from multiple studies show that CR services improve health outcomes, but also that these services are underutilized. Considering the evidence demonstrating that CR/ICR services improve long-term patient outcomes, the room for improvement in CR/ICR service utilization for beneficiaries eligible for this benefit, and the need for ongoing treatment among beneficiaries that have had an AMI or a CABG, we believe that incentivizing the use of CR/ICR services is an important component of meeting this need. We continue to believe the proposed approach will permit CMS to appropriately evaluate this model and support testing the proposed hypotheses—to understand whether and how the effects of a financial incentive for the use of CR/ICR services differ depending upon whether a beneficiary’s care is covered under an EPM or the Medicare FFS program and to examine each intervention’s separate effects on the quality and efficiency of the care beneficiaries receive—with the strongest available evidence. We recognize that education programs about the value of CR/ICR services, including The Million Hearts national initiative to focus on clinical attention on the prevention of heart attack and stroke, could complement these incentive payments.

2. General Design of the CR Incentive Payment Model

We proposed the CR incentive payment model to test the effects on quality of care and Medicare expenditures of providing explicit financial incentives to hospitals (hereinafter CR participants) for beneficiaries hospitalized for treatment of AMI or CABG to encourage care coordination and greater utilization of medically necessary CR/ICR services for 90 days post-hospital discharge where the beneficiary’s overall care is paid under either an EPM or the Medicare FFS program. Under the EPMs, we proposed to provide a CR incentive payment specifically to selected beneficiaries that have had an AMI or a CABG whose care is paid under the Medicare FFS program. Hospitals provide over 95 percent of CR/ICR services to Medicare beneficiaries and the beneficiaries in the Medicare FFS program are identified based on a hospitalization for AMI or CABG. Thus, we believe that hospitals are an appropriate entity to take on care coordination responsibility for increasing the utilization of medically necessary CR/ICR services for those beneficiaries following AMI or CABG who are in the CR incentive payment model.

To test strategies to encourage CR participants to prioritize referring beneficiaries following an AMI or CABG for important CR/ICR services, monitoring for beneficiary adherence to the treatment plan, and coordinating care, we proposed to establish a per-service CR incentive amount for beneficiary CR use at two levels that would initially incentivize the use of any CR/ICR services and that would increase once a beneficiary meets or exceeds the proposed CR/ICR service utilization benchmark. We believe that encouraging timely referral of beneficiaries that have had an AMI or a CABG to CR/ICR programs would promote better adherence to CR/ICR services.
Historical claims data show that more than half of beneficiaries who receive one CR session go on to complete at least 25 sessions. Thus, providing a CR incentive payment to reward increased referrals to CR/ICR programs, as well as monitoring for beneficiary adherence with the referral and participation in the sessions, may encourage better CAD-specific care management and care coordination for beneficiaries that have had an AMI or a CABG and, ultimately, improve quality and reduce spending long-term for these beneficiaries with CAD. CR participants that would be eligible for these CR incentive payments could further reduce potential beneficiary barriers to CR/ICR services by utilizing other flexibilities we proposed for the AMI and CABG models and the CR incentive payment model, such as beneficiary engagement incentives as discussed in section III.I.9. and IV.F.6. of this final rule for EPM–CR participants and FFS–CR participants, respectively.

Furthermore, we refer to section III.J.8. of this final rule for a discussion of the proposal to provide greater CR/ICR program flexibility that may increase the availability of CR/ICR services for AMI and CABG model beneficiaries by providing a waiver of the definition of a physician to include a physician or nonphysician practitioner (defined for the purposes of this waiver as a physician assistant, nurse practitioner, or clinical nurse specialist) in performing specific physician functions. We also refer to section IV.F.7. of this final rule for discussion of the proposal for a similar waiver of the physician definition to provide greater CR/ICR program flexibility to increase the availability of these services for beneficiaries in a FFS–CR participant, as defined later in this section.

While we recognize there are other services focused on secondary prevention for beneficiaries with CAD such as diabetes self-management training, as well as treatments including drugs for blood pressure and cholesterol control, we believe that CR/ICR services are unique as an underutilized Medicare-covered benefit with a strong evidence-base of improved health outcomes for beneficiaries who have had an AMI or a CABG. Therefore, we believe that CR/ICR services are uniquely appropriate for CR incentive payments to selected AMI and CABG model participants as well as selected hospitals that would not be participating in these models in order to reward their efforts where we observe increased CR/ICR service utilization for CR incentive payment model beneficiaries. By proposing to provide CR incentive payments to encourage CR/ICR service utilization, we maximized our opportunity to positively affect the quality of care and reduce the cost-of-care for beneficiaries that have had an AMI or a CABG both within the short- and long-term. Like under other Innovation Center models, beneficiaries in the CR incentive payment model would retain freedom of choice to choose providers and services, although the proposed model provides financial incentives to CR participants to specifically encourage and support beneficiaries in adhering to a prescribed CR treatment plan following AMI or CABG.

By making CR incentive payments available to selected EPM–CR and FFS–CR participants and comparing them to EPM participants and hospitals paid under the Medicare FFS program for AMI and CABG care who are not CR participants, we would be able to observe the effects of the proposed CR incentive payments on utilization of CR/ICR services and short-term (within the episode or care period) and longer-term outcomes, including mortality, hospitalizations, complications, and other clinically relevant events, as well as on Medicare expenditures. In testing the effects of a CR incentive payment, we wanted to account for a range of factors and interactions that could potentially affect the outcomes we observed. We believe our proposed methodology would enable us to test and improve our understanding of the effects of the CR incentive payment within the context of an EPM and the Medicare FFS program, as well as examine potential interactions between the proposed CR incentive payment and the underlying EPM and FFS payment methodologies.

The following is a summary of the comments received and our responses.

Comment: MedPAC commented that, while there are many barriers to enrollment for CR/ICR services, it is not clear which barriers create the biggest hurdles to effective care, and this lack of clarity makes the determination of the best corrective action difficult. MedPAC noted in comment that, for example, if one of the most significant barriers is low referral rates, CMS could encourage greater referral to CR/ICR by creating

---

155 Analysis of CR/ICR services utilization in 2013 Medicare FFS Parts A and B claims.
beneficiaries for the 90-day post-discharge duration included in the episode and could be able to capitalize on that engagement to encourage greater use of medically appropriate CR/ICR services if they were also selected for participation in the CR incentive payment model. Therefore, we are finalizing the proposal to implement the CR/ICR incentive payment model simultaneously with the EPMs, rather than test multiple incentives for the provision of CR/ICR services.

Comment: A commenter referencing the CR incentive payment model expressed concern that this voluntary program may become required in the future and encouraged CMS to utilize this model to identify the patient population for whom this service improves outcomes.

Response: We appreciate the commenter’s concern however the design of this model will not identify additional populations of beneficiaries who might show improved health outcomes beyond those undergoing AMI or CABG. Furthermore, we believe there is strong evidence already identifying those patient populations for whom CR/ICR services improve health outcomes.156

Comment: Several commenters stated support for the concept of cardiac rehabilitation incentive payments as proposed, whether or not these payments are tied to episode payments. A few commenters noted that CMS does not expressly define the proposed CR/ICR incentive payment model as separate and distinct from the EPMs. Given the similarities in patient populations and the proposed overlap of certain MSAs, these commenters expressed concern that there could be some confusion as to whether or not these models are in fact separate and distinct, and requested that CMS clarify in expressed terms what the case may be.

Response: In the proposed rule, we describe the proposed CR/ICR incentive payments as separate and distinct from reconciliation payments and Medicare repayments for EPM–CR participants determined under § 512.305(d). The proposed CR/ICR incentive payment under the CR/ICR incentive payment model is a more specific payment designed to financially incentivize increased utilization of CR/ICR services which may improve quality and reduce costs for AMI and CABG model beneficiaries.

C. CR Incentive Payment Model Participants

The selection of MSAs for participation in the CABG and AMI EPMs is described in section III.B.5. of this final rule. The selection process would identify the 98 EPM MSAs from the 294 MSAs eligible for selection for the AMI and CABG models under the proposed rule. We proposed that 45 MSAs be selected from within the pool of the 98 EPM MSAs for the CR incentive payment model (hereinafter EPM–CR MSAs). An additional 45 MSAs would be selected for the CR incentive payment model from the pool of MSAs who were eligible but not selected for EPM (hereinafter FFS–CR MSAs). The approach for both selections is discussed in the following paragraphs.

We are interested in identifying control group MSAs that are similar to the treatment MSAs in ways that might impact the nature of their response to the CR incentive payment model. Having well-matched MSAs in the four types of MSAs (FFS–CR, FFS-non CR, EPM–CR and EPM/non CR) is important to our ability to assess the specific impact of the CR incentive payment while holding other considerations constant. We were concerned that a simple random selection of FFS–CR and EPM–CR areas would have a large probability of selecting MSAs that are insufficiently similar to the EPM-non CR areas due to the small number of MSAs from which to choose. As such, we proposed the selection of the EPM–CR MSAs to balance the incidence of key characteristics between the EPM–CR and EPM–non CR MSAs and the selection of FFS–CR MSAs to be based on similarity to the randomly selected EPM MSAs.

The 294 MSAs originally eligible for selection would be classified into groups based on combinations of several key dimensions related to CR or ICR service provision within the MSA in the reference year including—

- Percent Starting CR/ICR services: Percent of eligible cases in the MSA who received one or more CR or ICR services in the reference year. CMS considered dividing MSAs through alternative cut points of this metric including 20 percent and 30 percent;
- Percent Completing CR/ICR services: Percent of eligible cases in the MSA who completed 25 or more CR or ICR services in the reference year. CMS considered dividing MSAs through alternative cut points including 50 percent, 60 percent and 70 percent of this metric; and
- Number of CR/ICR providers: The number of providers who billed for CR/ICR services in the MSA during the reference year. CMS considered dividing MSAs according to whether they had one hospital who billed for CR services or more than one hospital. MSAs would be assigned into a group based on combinations of these measures. An example of a possible group would be a group of MSAs that are “low starters, high users.” Such a group might be defined as MSAs in which—(1) less than 20 percent of eligible patients start CR/ICR services; (2) more than 60 percent of individuals who start CR/ICR complete 25 or more sessions; and (3) more than one hospital bills for CR services.

We proposed the selection of CR MSAs via a modified stratified random selection algorithm in which these groups serve as the selection strata. Specifically, we proposed that the number of EPM–CR and FFS–CR MSAs selected from each group equals the number of EPM MSAs in the group multiplied by 0.46. This rate was chosen with the goal of selecting 45 EPM–CR MSAs out of 98 EPM MSAs (45/98 is approximately equal to 0.46). As an example of this approach to selection, consider a hypothetical group with 16 EPM MSAs and 28 FFS MSAs. We would randomly select 7 EPM–CR MSAs from the 16 EPM MSAs (7 is equal to 0.46 × 16 with rounding). The remaining 9 would be EPM-non CR. We would also randomly select 7 FFS–CR MSAs from the 28 FFS MSAs. The remaining 21 MSAs would be FFS-non CR MSAs. This approach would ensure balance with respect to group membership between EPM–CR MSAs and EPM-non-CR MSAs, as well as between EPM–CR MSAs and FFS–CR MSAs; it would not necessarily achieve balance with respect to group membership for other comparisons among model arms.

We also considered other approaches to selection. Under one alternative approach, we would select a number of EPM–CR MSAs from each group equal to the number of EPM MSAs in the group multiplied by 0.46 and a number of FFS–CR MSAs from each group equal to the number of FFS MSAs in the group multiplied by 0.23. As previously discussed, the rate 0.46 was chosen with the goal of selecting 45 EPM–CR MSAs out of 98 EPM MSAs. The rate 0.23 is based on the goal of selecting 45 FFS–CR MSAs out of 196 FFS MSAs (45/196 is approximately equal to 0.23). As in our proposed approach, the calculated number of MSAs to be selected from each group would be rounded to the nearest integer as necessary. This

approach would ensure balance with respect to group membership between EPM–CR MSAs and EPM-non-CR MSAs, as well as between FFS–CR MSAs and FFS-non-CR MSAs; it would not necessarily achieve balance with respect to group membership for other comparisons among model arms.

Under another alternative approach, we would use a stratified random assignment approach to determine both EPM participation and CR participation. Specifically, under this approach, the number of EPM–CR and FFS–CR MSAs selected from each group would each be equal to the total number of MSAs in that group multiplied by 0.15, the number of EPM-non-CR MSAs selected from each group would be equal to the total number of MSAs in the group multiplied by 0.18, and the remaining MSAs in each group would be assigned to be FFS-non-CR MSAs. The rate 0.15 was chosen with the goal of selecting 45 EPM–CR MSAs and 45 FFS–CR MSAs out of 294 total MSAs (45/294 is approximately equal to 0.15), and the rate 0.18 was chosen with the goal of selecting 53 EPM-non-CR MSAs out of 294 total MSAs (53/294 is approximately equal to 0.18). As in our proposed approach, the calculated number of MSAs to be selected into each arm would be rounded to the nearest integer as necessary. This approach would ensure balance with respect to group membership for all comparisons across the four arms—EPM–CR, FFS–CR, EPM-non-CR, and FFS-non-CR—but would forgo the simplicity of a random assignment approach to select EPM MSAs.

For the purposes of being able to evaluate the CR incentive payment model as a whole, we proposed to implement it in a consistent manner between the EPM–CR areas and the FFS–CR areas. As such, we proposed to use similar approaches to identifying CR participants in each while also coordinating with the specifications and requirements of the AMI and CABG models. We proposed that EPM–CR participants are hospitals that are AMI or CABG model participants located in the MSAs selected for the EPM–CR participation based on the methodology previously described in section VLC. of this final rule. We similarly proposed that FFS–CR participants are hospitals located in the MSAs selected for FFS–CR participation based on the methodology previously described in section VLC. of this final rule and that meet all provisions in sections III.B.2. through III.B.4. of this final rule to be an EPM–CR participant. We also proposed that FFS–CR participants are located in an MSA selected for the AMI or CABG model. We believe that requiring FFS–CR participants to meet all provisions in sections III.B.2. through III.B.4. of this final rule would ensure that FFS–CR participants resemble EPM–CR participants as closely as possible, which would contribute to our ability to test and evaluate the effect of the CR incentive payment and specifically whether there are differential effects of the CR incentive payment in the underlying EPM and FFS payment methodologies.

The proposal to select MSAs for the CR incentive payment model and to identify CR participants is included in § 512.703. We sought comments on our proposed approach to selecting MSAs and identifying CR participants. The following is a summary of the comments received and our responses.

Response: While we acknowledge that many barriers to CR/ICR services exist, and multiple provider types furnish CR/ICR services, it would be unreasonable to test multiple proposals to address these concerns simultaneously, as such tests would make the assignment of appropriate controls difficult and assessment of impacts and outcomes from such proposals challenging to attribute to just one proposal. CMS proposed that EPM–CR participants be defined as hospitals that are AMI or CABG model participants located in the MSAs selected for the EPM–CR participation, and similarly proposed that FFS–CR participants are hospitals located in the MSAs selected for FFS–CR participation. We continue to believe the proposed approach will permit CMS to appropriately evaluate this model and support testing the proposed hypotheses—to understand whether and how the effects of a financial incentive for the use of CR/ICR services differ depending on whether a beneficiary’s care is covered under an EPM or the Medicare FFS program and to examine each intervention’s separate effects on the quality and efficiency of the care beneficiaries receive—with the strongest available evidence. We continue to believe it is in the interest of the Medicare program and its beneficiaries for us to identify new models that maintain beneficiary choice, and disagree that the design of the CR/ICR incentive payment model will limit access to CR/ICR services for Medicare beneficiaries, as the payment model does not limit a beneficiary’s ability to choose among Medicare providers and suppliers or the range of services that are available to them. Beneficiaries may continue to choose any Medicare enrolled provider or supplier, or any physician or practitioner who has opted out of Medicare, with the same costs, copayments and responsibilities as they have with other Medicare services.

We continue to expect that EPM participants would be highly engaged in care management of beneficiaries for the 90-day post-discharge duration included in the episode and could be able to capitalize on that engagement to encourage greater use of medically appropriate CR/ICR services if they were also selected for participation in the CR incentive payment model. Therefore, we are finalizing the proposal to determine CR incentive payment model participants to include EPM–CR participants because they are already engaged in managing the AMI or CABG model beneficiary’s overall care for a period of time following hospital discharge and will compare these participants to FFS–CR participants. We understand that there may be providers and suppliers other than hospitals caring for beneficiaries with AMI or CABG whose care is paid under the Medicare FFS program and that could assume responsibility for encouraging greater utilization of CR/ICR services under the CR incentive payment model. However, for comparability to the roles and responsibilities of the hospitals that are the EPM participants selected for CR incentive payment model participation, we proposed to identify hospitals as the participants in the CR incentive payment model participation, and we continue to believe the proposed approach will permit CMS to appropriately evaluate this model and support testing the proposed hypotheses—to understand whether and how the effects of a financial incentive for the use of CR/ICR services differ depending on whether a beneficiary’s care is covered under an EPM or the Medicare FFS program and to examine each intervention’s separate effects on the quality and efficiency of the care beneficiaries receive—with the strongest available evidence.
CABG who are in the CR incentive payment model but that are not in an EPM.

Comment: Several commenters suggested that the CR incentive payment model be expanded beyond what was proposed. A commenter requested that all providers involved in any cardiac episode payment model be able to access the CR payment incentive. A commenter believed that the CR incentives should be available to all 98 cardiac EPM MSAs and thought it unfair that these would not be made universally available to all cardiac EPM participant providers. A commenter suggested that all 98 cardiac EPM MSAs be enrolled in the CR incentive payment model as well as an additional 98 FFS–MSAs. Another commenter recommended that all cardiac EPM participant MSAs and an equal number of random eligible non-participant MSAs be enrolled in this model.

Similarly, another commenter urged that similar CR incentive payments be made available to BPCI Model 2 PGP episode initiators in order to compare and contrast physician-led cardiac episodes and hospital-led episodes.

Response: CMS is encouraged by the positive reception to the CR Incentive Payment Model and the belief that it is immediately suitable for expansion. At the same time, the incentive payments represent an additional outlay of funds beyond the current payment systems. In its role as a prudent steward of financial resources, CMS is committed to assessing the impact of this additional expenditure prior to a wider scale implementation. CMS is interested in conducting a test of the CR incentive payment model in order to assess the impact it has on both utilization and outcomes.

CMS initially considered providing access to the CR incentive to the 98 cardiac EPM MSAs only. However, after consideration, CMS decided that it was important to be able to assess the performance of EPM–CR areas relative to EPM non-CR areas, as well as the performance of EPM–CR MSAs versus FFS–CR areas and FFS–CR compared to FFS non-CR areas. The examination of all these combinations will provide insight into what factors are associated with the impacts observed.

Comment: A commenter requested additional details regarding any characteristics used in the selection of MSAs for the CR model.

Response: The characteristics for selection of the MSAs as stated in the proposed rule will include 3 dimensions of starting and completing CR services and number of CR/ICR providers and we refer the reader to section VLC for further details. Groupings within an MSA based on these dimensions will be created and then a stratified random selection process will be used to select participant MSAs. There will be an equal number of MSAs for eligible MSAs (EPM–CR MSAs) and those eligible but not selected for EPM (FFS–CR).

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to define CR incentive payment model participants in §512.703, and specifically include both EPM–CR MSAs and FFS–CR MSAs participants as being located in the selected MSAs meeting all requirements in §512.100(b) to be an AMI and CABG model participant if the hospital were located in an MSA selected for the AMI and CABG EPM.

If a participant changes their eligibility status during the period of performance, they will become eligible for the CR incentive payment model. This may occur through concluding their participation as a BPCI initiating hospital or other means such as a new hospital being opened. The re-assessment and updating of hospital eligibility status will be performed on an ongoing periodic basis as frequently as quarterly if needed.

The selection of the CR areas will proceed as proposed with a two-step process in which 98 cardiac EPM MSAs would be chosen first and then the EPM–CR and the FFS–CR would be chosen from within CR selection groups. Seven CR selection groups were created using information about the utilization of CR in the MSA in the reference year. The groups were defined based on combinations of the following: (1) Whether there was more than one hospital provider who billed for CR services in the MSA in the reference year, (2) whether the percent of eligible Medicare FFS beneficiaries who received CR services was less than or equal to 20 percent, 20 to 30 percent or more than 30 percent, and (3) whether at least 60 percent of eligible patients who start CR services complete at least 25 sessions. The definition of seven groups used in the selection is shown in Table 52. The number of EPM–CR MSAs and the number of FFS–CR MSAs to be selected from each group is also shown in Table 52 and is proportional to the number of selected cardiac EPM MSAs in each group.

As shown in Table 52, we are randomly selecting 2 EPM–CR and 2 FFS–CR MSAs from CR Selection Group 1 where the number two is derived by multiplying the number of cardiac EPM MSAs in the group by the selection percent and then rounding (round (4 × 0.46) = 2). The number of MSAs to be selected within the 7 CR Selection.
We selected the participating FFS–CR and EPM–CR MSAs through random selection within groups. We selected 45 MSAs via stratified random sample from both AMI and CABG EPM participant MSAs and traditional fee for service MSAs (those not selected to participate in the AMI and CABG EPMs). EPM–CR MSAs were randomly selected from the EPM MSAs in the same selection group. Similarly, the same number of FFS–CR MSAs were randomly selected from within the MSAs in the CR selection group who were eligible for but not chosen as a cardiac EPM area. Based on our sampling methodology, SAS for Windows Version 9.4 software was used to run a computer algorithm designed to randomly select MSAs. SAS for Windows Version 9.4 and the computer algorithm used to conduct selection represents an industry standard for generating advanced analytics and provides a rigorous, standardized tool by which to satisfy the requirements of randomized selection. The key SAS commands employed include a "PROC SURVEYSELECT" statement coupled with the "METHOD=SRS" option used to specify desired random sampling as the sample selection method. A random number seed was generated for each of the fourteen strata by using fourteen number seeds corresponding to birthdates and anniversary dates of participants present in the room. The random number seeds for strata were through fourteen were as follows: 19851201, 20151024, 19841124, 20120827, 19590625, 19650907, 19870213, 19850714, 20090712, 20091024, 19800919, 19781023, 20120807, and 20140928. For more information on this procedure and the underlying statistical methodology, please reference SAS support documentation at: http://support.sas.com/documentation/cdl/en/statug/63033/HTML/default/viewer.htm#statug_surveypicksect003.htm/.

Table 53 shows the list of EPM–CR MSAs. Table 54 shows the list of FFS–CR MSAs.

### D. CR/ICR Services That Count Towards CR Incentive Payments

We proposed to identify CR/ICR services that count towards CR incentive payments on the basis of the presence of the HCPCS codes on PFS and OPPS claims that report CR/ICR services as displayed in Table 55. These HCPCS codes have been active since October 4, 2010.

158 MLN Matters® Number: MM6850 Revised.

Related Change Request #: 6850; Related CR Release

We proposed that within the AMI and CABG models, CR/ICR services paid by Medicare to any provider or supplier for AMI and CABG model beneficiaries during AMI and CABG model episodes would result in EPM–CR participant eligibility for CR incentive payments. For FFS–CR participants, we proposed to use the terms “AMI care period” and “CABG care period” to refer to a period of AMI or CABG care, respectively, that would meet the requirements to be an AMI or CABG model episode in accordance with all provisions in subpart B if the FFS–CR participant were an AMI or CABG model participant. CR/ICR services paid by Medicare to any provider or supplier for beneficiaries during AMI care periods and CABG care periods would result in FFS–CR participant eligibility for CR incentive payments. Defining AMI care periods and CABG care periods using the AMI and CABG model episode definitions ensures that the care covered under AMI care periods and CABG care periods is comparable to AMI and CABG model episodes. This comparability would contribute to our ability to test and evaluate the effects of the CR incentive payment and specifically to assess whether there are differential effects of the CR incentive payment in the underlying EPM and FFS payment methodologies.

We also proposed that AMI and CABG model episodes take precedence over AMI care periods and CABG care periods. That is, an AMI care period or CABG care period would not begin if the beneficiary is in an AMI or CABG model episode when the AMI care period or CABG care period would otherwise begin. Similarly, an AMI care period or CABG care period would be canceled if at any time during the AMI care period or CABG care period the beneficiary initiates an AMI or CABG model episode. We believe that this is appropriate because AMI and CABG model participants would have ultimate responsibility for care coordination and the quality and cost of a beneficiary’s care during an AMI or CABG model episode. Giving precedence to AMI and CABG model episodes would also ensure that Medicare does not make duplicative CR incentive payments for a beneficiary and that a single beneficiary is not in an AMI or CABG model episode and an AMI care period or CABG care period at the same time.

We proposed that for the purposes of the CR incentive payment, all AMI and CABG model episodes and all AMI care periods and CABG care periods must begin on or after July 1, 2017 and end on or before December 31, 2021. Thus, the CR performance years would be the same as the performance years proposed for the EPMs in section III.D.2.a. of this final rule. Given that the CR incentive payment model seeks to determine whether there are differential effects of the CR incentive payment in the underlying EPM and FFS payment methodologies, it is important the EPM and CR performance years be aligned for EPM–CR participants.

The proposal to establish which CR/ICR services count towards CR incentive payments is included in § 512.705. We sought comments on our proposal to establish which CR/ICR services count towards CR incentive payments.

The following is a summary of the comments received and our responses.

Comment: Some commenters expressed confusion regarding the process by which CR/ICR services for the CR incentive payment model in future CR performance years should CMS adopt different or additional HCPCS codes for reporting these services. We continue to believe that CR/ICR services are unique as an underutilized Medicare-covered benefit with a strong evidence base of improved health outcomes for beneficiaries who have had an AMI or a CABG. Therefore, we believe that CR/ICR services uniformly appropriate for CR incentive payments to selected AMI and CABG model participants as well as selected hospitals that would not be participating in these models in order to reward their efforts where we observe increased CR/ICR service utilization for CR incentive payment model beneficiaries. As a result, we are finalizing this proposal because we continue to believe this structured approach will contribute to our ability to test and evaluate the effects of the CR incentive payment and specifically whether there are differential effects of the CR incentive payment in the underlying EPM and FFS payment methodologies.

Comment: Some commenters stated that they believe the NCD process approval under the NCD process, as this commenter believes the NCD process serves an important function in

Response: We proposed to identify CR and ICR services that count towards CR incentive payments on the basis of the presence of the HCPCS codes on FFS and OPPS claims that report CR/ICR services as displayed in Table 55. These HCPCS codes have been active since prior to 2013 through the present. We note that CMS specifies the CR/ICR HCPCS codes in implementing the statutory coverage provisions for CR and ICR programs, and we would update this list of HCPCS codes for CR/ICR services for the CR incentive payment model in future CR performance years should CMS adopt different or additional HCPCS codes for reporting these services. We continue to believe that CR/ICR services are unique as an underutilized Medicare-covered benefit with a strong evidence base of improved health outcomes for beneficiaries who have had an AMI or a CABG. Therefore, we believe that CR/ICR services are uniquely appropriate for CR incentive payments to selected AMI and CABG model participants as well as selected hospitals that would not be participating in these models in order to reward their efforts where we observe increased CR/ICR service utilization for CR incentive payment model beneficiaries. As a result, we are finalizing this proposal because we continue to believe this structured approach will contribute to our ability to test and evaluate the effects of the CR incentive payment and specifically whether there are differential effects of the CR incentive payment in the underlying EPM and FFS payment methodologies.

Comment: Commenters generally agreed with the proposed CR/ICR services that should count towards CR incentive payments. There were additional recommendations from commenters to consider incentive payments with other aspects of a CR/ICR program, such as duration or frequency of sessions, while other commenters proposed alternative programs including examples such as physical and occupational therapy, pulmonary rehabilitation, home health therapy, and construction of a new program termed virtual cardiac rehabilitation to take place in the patient’s home.
ensuring that these programs meet the underlying statutory requirements.

Response: Approved ICR programs will continue to be required to meet the statutory requirements set forth in section 1861(eee)(4) of the Act. The NCD process, as authorized by section 1862(l) of the Act will continue to be used to determine whether an ICR program falls within the scope of this Part B benefit. An ICR program will continue to be evaluated in an open, transparent, and publicly engaging process. The standards for an ICR program are included in Section 410.49(c) of this subpart. CR participants without their own CR/ICR programs will receive the CR incentive payment based on the CR/ICR service utilization of beneficiaries attributed to them, regardless of the specific provider or supplier that furnished the CR/ICR services to the beneficiary during the episode or care period.

Comment: A commenter believes a significant majority of PFS claims for CR services are simple coding errors. This commenter submitted an analysis of Medicare PFS claims for HCPCS code 93798 by specialty and identified the top five most frequently occurring specialties to be cardiology, internal medicine, family practice, cardiology electrophysiology, and emergency medicine. Based on these data, the commenter strongly questioned the appropriateness of the physician’s office for the provision of CR services, and urged CMS to scrutinize PFS claims paid for delivery of CR services, as the commenter believes these claims are simple coding errors, or possible fraud/abuse. The commenter recommended that OPPS claims for CR/ICR services would be the accurate source to track for the CR incentive payment model.

Response: We thank the commenter for providing their analysis. While most CR/ICR services are billed and paid under the OPPS because they are furnished in the hospital outpatient department, CR/ICR services are also covered under Medicare when furnished in a physician’s office where they are paid under the PFS. 159 PFS claims for CR/ICR services furnished in the physician’s office report place of service code 11 (office). Our analysis showed that more than 95 percent of CR/ICR services for beneficiaries with AMI or CABG were billed under the OPPS. In addition, for CR/ICR services billed under the PFS, the physician’s office was more frequently reported than the hospital outpatient department. In some cases, there were OPPS and PFS claims for the same beneficiary for the same day and the same CR/ICR service HCPCS code, but it was extremely rare for the PFS claim to have a place of service code for the physician’s office in these cases, occurring in only 0.01 percent of AMI care periods and 0.02 percent of CABG care periods. These uncommon circumstances could either reflect incorrect billing or an actual care pattern where the same beneficiary received CR/ICR services on the same day in both the hospital outpatient department and physician’s office. Nevertheless, our analysis of historical claims data showed no concerning patterns about coding errors on claims for CR/ICR services.

As discussed in the CY 2010 PFS Final Rule (74 FR 61879), we note that when a CR/ICR service is furnished in a hospital outpatient department, a physician cannot bill the Medicare contractor for CR/ICR unless the physician personally performs the CR/ICR service. To personally perform the CR/ICR service, the physician would provide direct care to a single patient for the entire session of CR/ICR that is being reported. The hospital would report the CR/ICR service and be paid the OPPS payment amount for the facility services associated with the CR/ICR services. The physician would report place of service code 19 or 22 (Off Campus-Outpatient Hospital or On Campus-Outpatient Hospital, respectively) on the PFS claim. A physician cannot bill under the PFS for CR/ICR services furnished in a hospital for which the physician furnishes only supervision or for services furnished in part by others. If the physician furnishes no direct CR/ICR services for a given session on a given day or provides direct CR/ICR services for less than the full session, then only the hospital would report the CR/ICR services and these services would be paid only under the OPPS. Thus, to be sure that we are capturing all unique sessions of CR/ICR services furnished in the hospital outpatient department or physician’s office, without duplication in counting those services, we will include all CR/ICR services paid under the OPPS but only those CR/ICR services that report place of service code 11 on PFS claims in the CR/ICR services that count toward CR incentive payments.

We note that CR/ICR services will continue to be paid by the Medicare program under the OPPS and the PFS throughout the CR incentive payment model performance years for CR beneficiaries and are subject to all applicable rules governing the submission of claims for services for payment by Medicare. We refer to sections III.J.8. and VI.F.7. of this final rule for our discussion of the waiver of the physician definition to allow, in addition to a physician, a nonphysician practitioner to perform the functions of supervisory physician; prescribing exercise; and establishing, reviewing, and signing an individualized treatment plan for a provider or supplier of CR/ICR services furnished to an EPM–CR or FFS–CR beneficiary during an AMI or CABG episode or AMI care period or CABG care period, respectively. We will rely upon the CR/ICR services paid by Medicare under the OPPS or to any supplier reporting place of service code 11 on the PFS claim for determining the CR/ICR services furnished to EPM–CR and FFS–CR participants. All CR/ICR services billed to Medicare must also meet the billing requirements outlined in the Medicare Claims Processing Manual. 160 CR/ICR services billed to Medicare outside the episode must continue to meet coverage requirements described in 42 CFR 410.94 and any applicable National Coverage Determinations.

We will monitor throughout the CR incentive payment model the utilization of CR/ICR services, including the place of service. If this monitoring raises concerns about erroneous claims or potential fraud and abuse based on significant changes in the distribution of CR/ICR services being billed and paid for CR beneficiaries in the physician’s office and the hospital outpatient department compared to historical patterns and current patterns of CR/ICR services furnished to Medicare beneficiaries not in the CR incentive payment model, we may more closely examine the claims for these services and/or refer these circumstances to Medicare contractors for further investigation.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, with modification, to establish which CR/ICR services count towards CR incentive payments in $ 512.705 as CR/ICR services identified by the HCPCS codes for CR/ICR services in the CR performance year when those CR/ICR services are paid under the OPPS or to

159 Analysis of cardiac rehabilitation utilization in care periods for AMI and CABG beneficiaries initiated by all U.S. IPPS hospitals not in Maryland and constructed using standardized Medicare FFS Parts A and B claims, as proposed in this rule that began in CYs 2012–2014.

160 Claims Processing Requirements for Cardiac Rehabilitation (CR) and Intensive Cardiac Rehabilitation (ICR) Services Furnished on or After January 1, 2010. Chapter 32, Section 140.2.2. Medicare Claims Processing Manual.

any supplier reporting place of service code 11 on a PFS claim. This modification to limit CR/ICR services from suppliers to those reporting place of service code 11 on the PFS claim, rather than all CR/ICR services from suppliers, ensures that we can establish a unique, unduplicated count of CR/ICR services furnished in the hospital outpatient department and in the physician’s office to a CR beneficiary for purposes of the CR incentive payment to CR participants.

Table 56 displays the HCPCS codes currently used for reporting CR/ICR services and that will be used counting CR/ICR services under the CR incentive payment model.

E. Determination of CR Incentive Payments

1. Determination of CR Amounts That Sum To Determine a CR Incentive Payment

Given the potential benefits of CR/ICR services, in conjunction with the low adoption of these services, we sought to propose an incentive for CR participants that was sufficient to encourage them to increase clinically appropriate CR/ICR service referrals for beneficiaries; reduce barriers to beneficiary adherence to a CR/ICR service treatment plan by making additional resources available for transportation to and from CR/ICR services; and incentivize CR participant monitoring and support of beneficiary adherence to all prescribed sessions of the CR/ICR program. As such, in addition to the usual payments that Medicare makes to providers and suppliers that furnish CR/ICR services, we proposed to establish a two-level per-service CR incentive amount that would initially incentivize the use of any CR/ICR services and that would increase once a beneficiary meets or exceeds the proposed CR/ICR service utilization benchmark. The CR amount would be the dollar amount determined by the two-level per-service CR incentive amounts that apply to the number of CR/ICR services paid by Medicare to any provider or supplier for a beneficiary in an AMI or CABG model episode or AMI care period or CABG care period. CR amounts across all of a CR participant’s beneficiaries that received CR/ICR services would be summed for the CR performance year to determine the CR incentive payment for a CR participant. CMS would pay the CR incentive payment from the Part B Trust Fund to the CR participant after the end of each CR performance year, and the beneficiary-specific CR amounts would be submitted to the CMS Master Database Management (MDM) System.

For the purpose of determining the CR incentive payment, we proposed to count the number of CR/ICR services for the relevant time periods under the OPPS and PFS on the basis of the presence on paid claims of the HCPCS codes that report CR/ICR services as displayed in Table 55 and the units of service billed. The initial level of the per-service CR incentive amount that would count toward the CR amount would be $25 per CR/ICR service for each of the first 11 CR/ICR services paid for by Medicare during an AMI or CABG model episode or AMI care period or CABG care period. We believe that $25 is an appropriate amount to account for the additional resources that CR participants would expend to reduce beneficiary barriers to utilizing any CR/ICR services and to support beneficiary adherence to all prescribed services in the CR/ICR program.

After 11 CR/ICR services are paid for by Medicare for a beneficiary, the level of the per-service CR incentive amount would increase to $175 per CR/ICR service for each additional CR/ICR service paid for by Medicare during the AMI or CABG model episode or AMI care period or CABG care period. This higher payment would account for the additional resources that CR participants expend to reduce beneficiary barriers to CR/ICR service utilization and also would reward CR participants for AMI or CABG model episodes or AMI care periods or CABG care periods in which beneficiaries meet or exceed the service utilization benchmark of 12 CR/ICR services.

We set the proposed service utilization benchmark based on evidence from the literature that shows reduced mortality for Medicare beneficiaries that complete at least 12 CR sessions relative to Medicare beneficiaries who complete 1–11 CR sessions. A study by Hammill et al found that over a 4-year follow-up period beneficiaries who completed 12–23 CR sessions had lower mortality compared to beneficiaries who completed 1–11 CR sessions and that beneficiaries who completed 24 or more CR sessions had lower mortality compared to beneficiaries that completed 12–23 sessions.162 Figure 6 replicates Figure 2 from that study.

Another study by Suaya et al. showed that over a 5-year period beneficiaries who were hospitalized for coronary conditions or cardiac revascularization procedures and completed 1–24 CR sessions had lower mortality compared to beneficiaries who were probable candidates for CR but completed 0 CR sessions and that beneficiaries who completed 25 or more CR sessions had lower mortality compared to beneficiaries who completed 1–24 CR sessions. Figure 7 replicates Figure 1 from that study.

---

**FIGURE 6: CUMULATIVE INCIDENCE OF MORTALITY BY NUMBER OF CARDIAC REHABILITATION SESSIONS ATTENDED**

![Graph showing cumulative incidence of mortality by number of cardiac rehabilitation sessions attended.](image)

---

163 Figure 2 of Hammill BG, Curtis LH, Schulman KA, Whellan DJ. Relationship between cardiac rehabilitation and long-term risks of mortality and myocardial infarction among elderly Medicare beneficiaries. Circulation. 2010; 121:63–70. Note that the 30,161 overall beneficiaries in the table contained in the figure refers to the number of Medicare beneficiaries that initiated cardiac rehabilitation services between January 1, 2000 and December 31, 2005 in the national 5 percent sample used by Hammill et al.

We did not propose to set a cap on the number of CR/ICR services that would count toward the CR amount during an AMI or CABG model episode or AMI care period or CABG care period because the literature showed incremental improvements in outcomes associated with more CR/ICR services through 36 or more sessions. The duration of AMI and CABG model episodes and AMI care periods and CABG care periods is only 90 days post-discharge from the hospitalization that begins the episode or care period, or roughly 13 weeks, and Medicare already limits the number of covered CR/ICR services for a beneficiary. The number of CR program sessions are limited to a maximum of 2 one-hour sessions per day for up to 36 sessions over up to 36 weeks, with the option for an additional 36 sessions over an extended period of time if approved by the Medicare Administrative Contractor under section 1862(a)(1)(A) of the Act. CR program sessions are limited to 72 one-hour sessions, up to 6 sessions per day, over a period of up to 18 weeks.

We believe that the higher per-service CR incentive amount that would count toward the CR amount when CR/ICR services paid by Medicare to any provider or supplier for a beneficiary in an AMI or CABG model episode or AMI care period or CABG care period meet or exceed the evidence-based service utilization benchmark would strengthen the financial incentive for CR participants to ensure beneficiary adherence to all prescribed CR/ICR services beyond the initial $25 per-service CR incentive amount for the first 11 CR/ICR services. Moreover, the higher level of the per-service CR incentive amount when a beneficiary completes at least 12 CR/ICR services provides a strong incentive for CR participants to expand CR referrals and to increase the likelihood that beneficiaries complete a clinically meaningful number of CR services. The proposal creates a continuous, significant incentive for increased CR/ICR service utilization that provides value beyond the service utilization benchmark of 12 CR/ICR services, consistent with the literature that shows a decrease in mortality for beneficiaries that complete more CR sessions relative to beneficiaries that complete fewer CR sessions.

The CR amount for a beneficiary in a CR participant’s AMI and CABG model episodes or AMI care periods and CABG care periods in a CR performance year would be the sum of the $25 per-service CR incentive amount for each additional CR/ICR service paid by Medicare beyond the first 11. The CR participant’s CR incentive payment for a CR performance year would be determined based on the sum of the CR amounts across all of its beneficiaries for that CR performance year.

We believe that this comprehensive CR incentive payment methodology would be appropriate because it would create an explicit, strong incentive for CR participants to expand the utilization of CR/ICR services to achieve at least the evidence-based service utilization benchmark of 12 CR/ICR services and then significantly and continuously incentivize the provision of additional CR/ICR services that provide additional value, even if the full benefit of CR/ICR services for beneficiaries that have had an AMI or a CABG is not realized until after an episode or care period ends. Moreover, the CR incentive payment could offset resource costs incurred by CR participants that successfully increase utilization of CR/ICR services, such as FFS–CR participants providing transportation or EPM–CR participants providing beneficiary engagement incentives as discussed in sections III.I.9. and VI.F.6. of this final rule for EPM–CR and FFS–CR participants, respectively.

Because the CR incentive payment would be made to the CR participant...
retrospectively after the end of a CR performance year as discussed in section VI.E.4. of this final rule, the CR incentive payment would represent the totality of financial reward to the CR participant based on the proposed methodology for determining the payment based on CR/ICR service utilization during the CR performance year. The CR participant’s resources required to support the increased utilization of CR/ICR services are likely to vary among beneficiaries. For example, it is possible that greater CR participant resources may be required to encourage and support the utilization of a beneficiary’s first CR/ICR services during an AMI or CABG model episode or AMI care period or CABG care period, in comparison with promoting adherence to additional prescribed CR/ICR services once the care pattern is well-established for that beneficiary. The proposed retrospective payment approach means CR participants would have the flexibility to redesign care to meet the needs of their beneficiaries regarding increased utilization of CR/ICR services, even though the CR incentive payment methodology only provides the higher level per-service CR incentive amount when CR/ICR service utilization achieves levels associated with improved outcomes. The approach is consistent with the model payment methodology that is designed to reward the value and not the volume of services by providing a higher total financial reward for utilization of services that has been shown to result in improved outcomes.

The proposals for determining the amount of the CR incentive payments were proposed in §512.710(a) and (b). We would also note that we expect to revisit the levels of the CR incentive payment and the service utilization benchmark over the CR performance years as we observe the effects of the model policies on CR/ICR service utilization and the long-term outcomes and Medicare expenditures for CR incentive payment model beneficiaries under the EPMs and Medicare FFS program methodologies for overall care. For example, it is possible that the proposed CR incentive payment methodology could lead to substantial increases in CR/ICR service utilization such that the proposed CR incentive payment model policies may no longer be necessary or appropriate once new care patterns are well-established.

The following is a summary of the comments received and our responses. Comment: A few commenters requested CMS consider the feasibility of expanding the number of CR/ICR incentive payment model beneficiaries to include all diagnoses eligible for CR coverage through Medicare and/or enable all EPM participants which are selected for the AMI/CABG model to be eligible for participation in the CR program.

Response: While we acknowledge that CR/ICR services are provided for many indications, it would be unreasonable to test multiple proposals to address these concerns simultaneously, as such tests would make the assignment of appropriate controls difficult and assessment of impacts and outcomes from such proposals challenging to attribute to just one proposal. CMS proposed that EPM–CR participants be defined as hospitals that are AMI or CABG model participants located in the MSAs selected for the EPM–CR participation, and similarly proposed that FFS–CR participants are hospitals located in the MSAs selected for FFS–CR participation. We proposed the CR incentive payment model to test the effects on quality of care and Medicare expenditures of providing explicit financial incentives in addition to, rather than in lieu of, current Medicare expenditures to CR participants for beneficiaries hospitalized for treatment of AMI or CABG to encourage care coordination and greater utilization of medically necessary CR/ICR services for 90 days post-hospital discharge where the beneficiary’s overall care is paid under either an EPM or the Medicare FFS program. We continue to expect that EPM participants would be highly engaged in care management of beneficiaries for the 90-day post-discharge duration included in the episode and could be able to capitalize on that engagement to encourage greater use of medically appropriate CR/ICR services if they were also selected for participation in the CR incentive payment model.

Comment: Commenters offered a variety of perspectives on the duration of the period of time for which the CR/ICR incentive payment would be made. A commenter suggested that the incentives as stated should be sufficient to encourage the timely enrollment of patients in to CR but noted that the 90-day period will likely not be sufficient to maximize their full effect on improving adherence if they are only in effect for 90 days after index event. A few commenters further encouraged CMS to consider the option of having the incentives maintained beyond the 90-day period. In contrast, one commenter noted that the timing of the payments as proposed may serve as an incentive to enroll patients as soon as possible and make program adjustments to allow for more active participation during the 90-day time period.

Response: While we acknowledge that CR/ICR incentive payments will persist for EPM beneficiaries after their 90-day EPM episode ends, citing their experiences of a lag in time before which a referral for CR/ICR services is made and their experience with the period of time over which a CR/ICR course of treatment takes place. Similarly, several commenters requested that CMS confirm that CR/ICR incentive payments will be made in addition to, rather than in lieu of, the underlying Medicare FFS payments to providers for CR/ICR services.

Response: While we acknowledge that CR/ICR services often continue beyond the 90-day post-discharge duration we proposed for the CR incentive payment model, it would be unreasonable to test multiple proposals to address these concerns simultaneously, as such tests would make the assignment of appropriate controls difficult and assessment of impacts and outcomes from such proposals challenging to attribute to just one proposal. We proposed the CR incentive payment model to test the effects on quality of care and Medicare expenditures of providing explicit financial incentives in addition to, rather than in lieu of, current Medicare expenditures to CR participants for beneficiaries hospitalized for treatment of AMI or CABG to encourage care coordination and greater utilization of medically necessary CR/ICR services for 90 days post-hospital discharge where the beneficiary’s overall care is paid under either an EPM or the Medicare FFS program. We continue to expect that EPM participants would be highly engaged in care management of beneficiaries for the 90-day post-discharge duration included in the episode and could be able to capitalize on that engagement to encourage greater use of medically appropriate CR/ICR services.
reasonable when it aligns with the AMI or CABG episode of care because these participants are already engaged in managing the AMI or CABG model beneficiary’s overall care for a period of time following hospital discharge and will compare these participants to FFS–CR participants.

Comment: Commenters raised concern that the proposed timing of the CR incentive payment model did not align with the panoply of patient experiences. A commenter stated that not all patients need the full complement of CR/ICR sessions, and another stated that not all cardiac patients are candidates for cardiac rehabilitation services. To this end, commenters submitted alternative proposals, including combining payments for CR/ICR services into the bundled payment for AMI and CABG.

Response: While we agree that improved outcomes have been demonstrated in patients who participate in as little as one CR session per week over 36 weeks (74 FR 61875), the proposed general design of the CR incentive payment model is consistent with the belief that encouraging timely referral of beneficiaries that have had an AMI or a CABG to CR/ICR programs would promote better adherence to CR/ICR service protocols, an expectation that is supported by data showing that patients who are referred early to CR were more likely to enroll. We believe this model may yield improved coordination, care management, and secondary risk reduction during the episode of care after AMI or CABG for the beneficiary. Additionally, CMS proposed the CR incentive payment model to test the effects of quality of care and Medicare expenditures of providing explicit financial incentives to CR participants for beneficiaries hospitalized for treatment of AMI or CABG to encourage care coordination and greater utilization of medically necessary CR/ICR services for 90 days post-hospital discharge where the beneficiary’s overall care is paid under either an EPM or the Medicare FFS program, and believe that extending CR/ICR incentive payments beyond the 90-day episode is not aligned with the proposed rationale. We remind all commenters that section 410.49(f) includes coverage for a maximum of two 1-hour CR sessions per day for up to 36 sessions over up to 36 weeks with the option for an additional 36 sessions over an extended period of time if approved by the Medicare Administrative Contractor under section 1862(a)(1)(A) of the Act.

Comment: Many commenters expressed support for the CR/ICR incentive payments as proposed, and encouraged implementation, as they believe the result will show support of its broader use. A commenter noted that the incentive payments are in the right amounts and appropriately tiered for the initial demonstration program. Several commenters expressed opposing viewpoints as to the sufficiency of the CR/ICR incentive payment, and MedPAC questioned whether such a large amount would be necessary to induce changes in provider behavior. A commenter noted that it does not have the expertise to determine whether the proposed monetary payment is sufficient to achieve the stated goal, and encouraged CMS to seriously consider comments from hospitals and the community of cardiology professionals to ensure the sufficiency of the incentive payment. Another commenter encouraged CMS to reexamine the amount of the incentive payments after 6 months to observe the effects of the model policies on service utilization, long-term outcomes, and Medicare expenditures to assess if they are sufficiently high to encourage plan participants to identify and remove beneficiary barriers to provision of CR/ICR services. A commenter noted that despite the CR/ICR incentive payment, even participant hospitals that share CMS’ goal of increasing clinically appropriate services may be unlikely to be able to devote staff and financial resources to encourage beneficiary participation in programs such as CR/ICR whose benefits, while important, primarily affect the cost of services needed by beneficiaries long after the AMI or CABG episode ends. Many commenters questioned the extent to which CMS provided sufficient evidence supporting the sufficiency of the CR incentive payment amount.

Several other commenters submitted both general and specific concerns with the proposed CR/ICR incentive payment amount. MedPAC commented that the proposed incentive payment of $175 per CR/ICR service once a beneficiary completes 1–24 CR sessions. MedPAC commented that the proposed incentive payment of $175 per CR/ICR service once a beneficiary completes 1–11 CR sessions exceeds the amount Medicare pays for each service itself, could add up to a substantial amount per beneficiary, and expressed uncertainty as to how CMS determined the level of the proposed payment incentive amount. Several commenters proposed alternative amounts for CR/ICR incentive payments, including (1) bundled payment for all CR/ICR services, which could be divided into the following four categories: 5 or less sessions, $500 allowed; 6–12 sessions, $1000; 13–24 sessions, $2000; 25–36 sessions, $3000; (2) offer of a higher level of per-service CR/ICR incentive amount or adding a tier for increasing the number of enrollees from an underserved group; (3) make interim incentive payments during the year; and (4) increase in payment for the initial session of CR/ICR services provided to the patient from $25 to $175 as this first session is fundamental to enrolling the beneficiary, beginning the rehabilitation process, and reflecting the intense resources necessary in the initial evaluation, enrollment, and education of the patient.

Response: We understand the commenters’ concerns and appreciate alternative proposals that are in the spirit of testing the outcomes of the proposed model. We set the proposed service utilization benchmark based on evidence from the literature that shows reduced mortality for Medicare beneficiaries that complete at least 12 CR sessions relative to Medicare beneficiaries who complete 1–11 CR sessions and evidence that beneficiaries who completed 25 or more CR sessions had lower mortality compared to beneficiaries who completed 1–24 CR sessions. Furthermore, we did not propose to set a cap on the number of CR/ICR services that would count toward the CR payment amount during an AMI or CABG model episode or AMI care period or CABG care period. We believe the proposed approach, rather than the alternative recommendations of the commenters, is consistent with the model payment methodology that is designed to reward the value and not the volume of services by providing a higher total financial reward for

Relationship between cardiac rehabilitation and long-term risks of mortality and myocardial infarction among elderly Medicare beneficiaries. Circulation. 2010; 121:63–70. Note that the 30,161 overall cases plot is the entire data contained in the figure refers to the number of Medicare beneficiaries that initiated cardia rehabilitation services between January 1, 2000 and December 31, 2005 in the national 5 percent sample used by Hammill et al.

utilization of services that has been shown to result in improved outcomes. Since such incentive payments specific to the provision of CR/ICR services have not previously been tested in this way, we will test to determine whether there are sufficient payment amounts applicable and available to increase utilization of CR/ICR services. We do know that an important design element of any incentive payment model is the threshold or benchmark\(^\text{173}\) used to determine which CR participants will receive incentive payments. For this design element, we believe we have presented strong evidence in support of proposed benchmarks that are clear, transparent, and for which CR participants can attain meaningful improvements. Therefore, the proposed incentive payment amount provides a strong incentive for CR participants to expand CR referrals and to increase the likelihood that beneficiaries complete a clinically meaningful number of CR services. We use levels of the CR incentive payment and the service utilization benchmark over the CR performance years as we observe the effects of the model policies on CR/ICR service utilization and the long-term outcomes and Medicare expenditures for CR incentive payment model beneficiaries under the EPMs and Medicare FFS program payment methodologies for overall care.

Comment: A minority of commenters stated confusion as to the extent to which CR incentive payments would be made in addition to or in lieu of payments to providers for CR/ICR services.

Response: We reiterate that under the CR incentive payment model, a CR incentive payment to EPM–CR and FFS–CR participants would be made under the model. Regular Medicare program payments would continue to be made to providers and suppliers that furnish and bill for CR/ICR services to beneficiaries in AMI or CABG episodes or AMI care periods or CABG care periods.

Comment: A few commenters raised concern as to the means to implement a value-based incentive design for a CR/ICR model, as these commenters believe the proposed CR/ICR incentive payment model to be a utilization-based model. Such alternative proposals included a general focus on outcomes associated with use of CR/ICR services and a specific focus on outcome metrics (for example, 30-day mortality, re-hospitalization rates) as well as process metrics (referral to CR, statin use) for those processes that are well established and evidence-based. To this end, a few commenters requested that CMS work with the healthcare community to determine appropriate patient-reported outcomes measures for CR/ICR services prior to finalizing the proposed EPMs. Without specific outcome measures attributed to this model, commenters suggested that some policy makers might incorrectly conclude that CR/ICR services are not important. Furthermore, commenters stated that these quality measures would permit alignment with tracks for Advanced APMs and MIPS APMs. Several commenters suggested inclusion of patient-reported outcome (PRO) metrics, and requested that CMS work with the healthcare community to determine appropriate PRO metric(s). It was suggested by these commenters that such outcomes may identify appropriate length of rehabilitation. Additionally, MedPAC recommended creating claims-based physician or hospital measures for all providers who care for beneficiaries with AMI and CABG, and then such measures could gauge the share of beneficiaries who receive CR/ICR services.

Response: The CR incentive payment for EPM–CR participants is specifically tied to increased utilization of CR/ICR services within AMI and CABG model episodes and, the rationale for utilization of such services is built on a strong evidence base of improved health outcomes for beneficiaries who had an AMI or a CABG. Therefore, this model is designed to reward increased EPM–CR participant referral of AMI and CABG model beneficiaries to CR/ICR programs. Additionally, we remind all commenters that historical claims data show that more than half of beneficiaries who receive one CR session go on to complete at least 25 sessions.\(^\text{174}\) Furthermore, we note that an outcomes assessment is part of the CR benefit established by Congress in section 144(a) of the MIPPA, which is designed to ensure CR programs enhance the patient’s clinical outcomes. Section 410.49 of this subpart further describes the assessment of outcomes. While we appreciate the remark that quality measures are required for an APM to qualify as an Advanced APM under the QPP final rule, we remind all commenters that an APM must also require participants to bear financial risk (or be a Medical Home Model expanded under section 1115A(c) of the Act) and utilize CEHRT, which CMS did not propose for the CR/ICR incentive payment model. Thus, we are finalizing our CR incentive payment model without including separate and distinct quality measures.

Comment: MedPAC commented that the same outcomes could be accomplished by simply carving out payment for CR/ICR services from the EPM bundled payment and continuing to pay for these services separately, without incentive payments for EPM participants.

Response: CMS proposed the CR incentive payment model to test the effects on quality of care and Medicare expenditures of providing explicit financial incentives to CR participants for beneficiaries hospitalized for treatment of AMI or CABG to encourage care coordination and greater utilization of medically necessary CR/ICR services for 90 days post-hospital discharge where the beneficiary’s overall care is paid under either an EPM or the Medicare FFS program. Therefore, we disagree that the same test could be accomplished by simply carving out CR/ICR services from a bundled payment for a broadly defined cardiac episode-of-care. The CR incentive payment is not a payment for the CR/ICR services themselves. Rather, it is for the CR participant work to coordinate and increase the utilization of the beneficiary’s participation in CR/ICR services following hospital discharge. A carve-out of the payments for CR/ICR services from the EPM episode would also not allow us to examine the effects of a CR incentive payment in the context of an underlying episode or FFS payment methodology for overall care. We will continue to monitor the effects of this model on EPM–CR and FFS–CR participants.

Comment: Most commenters agreed that the primary goal of an incentive payment model should be to recruit the vast majority of prospective patients into cardiac rehabilitation, with much less emphasis on how many sessions they attend. A commenter shared their experience that for patients who have been diligent in performing an exercise program prior to cardiac event and/or performing a home exercise program since cardiac event, only one or several sessions may be all that is necessary to insure that these patients will obtain the documented benefits of regular exercise. Another commenter shared their experience, particularly in the past 5–10 years, that most cardiac rehabilitation participants, particularly those who have not been very active pre- and post-cardiac event, can achieve reasonable improvements in exercise skills and

\(^{174}\)Analysis of CR/ICR services utilization in 2013 Medicare FFS Parts A and B claims.
confidence with just 6 to 24 sessions of cardiac rehabilitation exercise. To this end, many commenters expressed concern that they believe there is a lack of standardization around CR programs, and it may be unclear which number of sessions be tied to CR/ICR incentive payments. A commenter encouraged CMS to study the appropriate length of these programs.

Response: We disagree, and refer the commenters to research demonstrating that beneficiaries who completed more CR sessions had lower mortality compared to beneficiaries that completed fewer sessions.\textsuperscript{175}\textsuperscript{176} We believe that the CR incentive payment model has an evidence-based focus on payment of the CR incentive payment based on the number of sessions beneficiaries attend. The proposed model is also focused in scope so as to best understand the effects on quality of care and Medicare expenditures for providing explicit financial incentives to CR participants to increase CR/ICR utilization for beneficiaries following hospitalization for treatment of AMI or CABG. Therefore, we believe that such research and development of a standardized CR program is outside the scope of the proposed rule.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, with modification as discussed in the previous section, for determining the amount of the CR incentive payments in §512.710(a) based on CR/ICR services paid by Medicare to any provider or any supplier reporting place of service code 11 on the claim for CR beneficiaries. We are finalizing the proposal, without modification, in §512.710(b) for determination of the CR incentive payment. However, we are revising our proposed definitions of the terms CR amount and CR service count used in §512.710(b) to incorporate the same limitation to include only those CR/ICR services on supplier claims that report place of service code 11 as previously discussed. Therefore, CR amount means the dollar amount determined by the number of CR/ICR services paid by Medicare to any provider or any supplier reporting place of service code 11 on the claim for a beneficiary in an AMI or CABG model episode or AMI care period or CABG care period.

Similarly, CR service count means the number of CR/ICR services paid by Medicare to any provider or to any supplier reporting place of service code 11 on the claim for a beneficiary in an AMI or CABG model episode or AMI care period or CABG care period. As we proposed, we will determine the CR amount for a beneficiary in an AMI or CABG model episode or AMI care period or CABG care period with a CR service count less than 12 by multiplying the CR service count by $25. We will determine the CR amount for a beneficiary in an AMI or CABG model episode or AMI care period or CABG care period with a CR service count of 12 or more as the sum of $275 ($25 multiplied by 11 for the first 11 CR/ICR services paid for by Medicare) and $175 multiplied by the difference between the CR service count and 11.

Finally, we will sum the CR amounts determined previously across the CR participant’s beneficiaries in AMI and CABG model episodes or AMI care periods and CABG care periods for a given CR performance year to determine the CR incentive payment for the CR performance year. The determination of the CR incentive payment occurs at the same time that CMS carries out the reconciliation process for an EPM performance year.

2. Relation of CR Incentive Payments to EPM Pricing and Payment Policies and Sharing Arrangements for EPM-CR Participants

We view the proposed CR incentive payments as separate and distinct from reconciliation payments and Medicare repayments for EPM–CR participants determined under §512.305(d). The determination of these latter payments is based on an assessment of actual episode payments and quality of the totality of episode services and coordination of those services during AMI and CABG model episodes within a performance year, consistent with the goals of improving quality and reducing costs within the model episode itself. In contrast, the proposed CR incentive payment under the CR incentive payment model is a more circumscribed and specific payment design to financially incentivize increased utilization of CR/ICR services which may improve quality and reduce costs for AMI and CABG model beneficiaries in the long-term, after the episodes end. Thus, we proposed to determine and apply the CR incentive payment separately from the determination and application of reconciliation payments and Medicare repayments for EPM–CR participants. Moreover, we would also note that we proposed to make CR incentive payments to EPM–CR participants without application of the limitation on gains as specified in §512.305(c)(2)(iii)(B). This is because the limitation on gains is designed to mitigate potential excessive reductions in utilization under the EPMs, and by construction, the CR incentive payment would only be made when an EPM–CR participant increases utilization of CR/ICR services. Therefore, the CR incentive payment is unrelated to the comparison of actual EPM episode payment to the quality-adjusted target price in calculating the NPRA, to which the limitation on gains applies and that may ultimately result in a reconciliation payment to an EPM-CR participant.

Consistent with the aforementioned proposal and for the aforementioned reasons, in contrast to reconciliation payments, we proposed to not permit the inclusion of CR incentive payments in sharing arrangements for EPM-CR participants specified in §512.500. As discussed in section III.I.1. of this final rule, we believe that EPM participants may wish to enter into financial arrangements with providers and suppliers caring for EPM beneficiaries to share financial risks and rewards under the EPM, in order to align the financial incentives of those providers, suppliers, and Medicare ACOs with the EPM goals of improving quality and efficiency for EPM episodes. In contrast, the CR incentive payment for EPM-CR participants is specifically tied to increased utilization of CR/ICR services within AMI and CABG model episodes and, therefore, is designed to reward increased EPM-CR participant referral of AMI and CABG model beneficiaries to CR/ICR programs, as well as supporting beneficiary adherence to the referral and participation in CR/ICR services, rather than the quality and efficiency of EPM episodes themselves. Thus, we did not propose to allow CR incentive payments to be included in sharing arrangements, and the CR incentive payments may be shared with other individual and entities only under circumstances which comply with all existing laws and regulations, including fraud and abuse laws. Similarly, we did not propose that CR incentive payments be allowed to be shared by FFS–CR participants with other individuals and entities other than under circumstances which comply with all existing laws and regulations, including fraud and abuse laws. We refer to section VI.G. of this final rule for further discussion of considerations regarding financial arrangements under the CR incentive payment model.

Likewise, we proposed to exclude CR incentive payments when updating

\textsuperscript{175}Hamill BT, Curtis LH, Schulman KA, Whellan DJ. Relationship between cardiac rehabilitation and long-term risks of mortality and myocardial infarction among elderly Medicare beneficiaries. Circulation. 2006; 121:53–70.

\textsuperscript{176}Suaya JA, Stason WB, Ades PA, Normand ST, Shepard DS. Cardiac rehabilitation exercise and survival in older coronary patients. Journal of the American College of Cardiology 2006; 54:25–33.
quality-adjusted target prices for EPM-CR participants for performance years 3–5 of the EPMs because payments for CR/ICR services already would be captured in the claims used to update those quality-adjusted target prices. Therefore, we believe that including the CR incentive payments would result in double counting expenditures for CR/ICR services when updating quality-adjusted target prices. We note that while the CR incentive payments would not be included in the calculation of actual EPM episode spending or when updating quality-adjusted target prices for EPM-CR participants, the claims for those CR/ICR services upon which the CR incentive payment was determined would be included in both calculations.

The proposals for keeping CR incentive payments, if any, separate from reconciliation payments and Medicare repayments as well as excluding them from sharing arrangements and updating quality-adjusted target prices for EPM-CR participants are included in §512.710(c) through (e). We sought comments on our proposals to keep CR incentive payments separate and exclusive.

The following is a summary of the comments received and our responses. We refer to section VLG of this final rule for a summary of the comments and our response on our discussion in the proposed rule of financial arrangements under the CR incentive payment model.

Comment: A commenter raised concern that while CMS proposed to exclude CR incentive payments from the calculation of episode spending and quality-adjusted target prices for AMI and CABG episodes, the actual FFS payments to providers of CR/ICR services will be included in both calculations. To this end, another commenter suggested that if efforts to increase CR utilization are successful, many EPM participants will not be eligible for reconciliation payments; in addition, this commenter believes that EPM participant hospitals that do not have their own CR/ICR programs will not be eligible for CR incentive payments under the CR incentive payment model.

Response: We acknowledge that FFS payments for CR/ICR services will be included in the calculation of AMI and CABG actual episode spending because these services are related and included in AMI and CABG episodes. We proposed that the CR incentive payment itself be separate and excluded from AMI and CABG episodes because this incentive payment is a more circumscribed and specific payment designed to financially incentivize increased utilization of CR/ICR services which may improve quality and reduce costs for AMI and CABG model beneficiaries in the long-term, after the episodes end. However, we also believe that there is potential for CR/ICR services to improve the quality of care and reduce spending during the AMI and CABG episodes themselves. For example, CR/ICR services for which a CR incentive payment may ultimately be made under the CR incentive payment model may provide additional transferable benefits on cost and quality to beneficiaries during EPM episodes, including the potential benefit experienced by beneficiaries simply by virtue of their participation in CR/ICR programs, increased interaction with the health care delivery system, and frequent follow-up. Furthermore, EPM-CR participants may see benefit from the patient’s own behavior change as a result of being under supervision, as such interactions through CR/ICR services could impact, for example, adherence to medication therapies after discharge, and/or seeking of follow-up care from a primary care physician or appropriate specialist. Therefore, any increased spending for CR/ICR services for beneficiaries in AMI and CABG episodes attributable to EPM–CR participants may be offset by reductions in spending for other episode services, such as readmissions or emergency care. We disagree with the assumption that EPM–CR participants cannot achieve savings in the EPMs that result in reconciliation payments due to reduced spending on other episode service after referring EPM beneficiaries for an increased number of CR/ICR services over historical CR/ICR utilization. We also reiterate that EPM–CR participants that do not have their own CR/ICR programs will be eligible for CR incentive payments under the CR incentive payment model based on the CR/ICR utilization of AMI and CABG model beneficiaries attributed to them, regardless of where those beneficiaries receive CR/ICR services. Finally, as we stated previously, the design of the CR incentive payment model will enable us to test and improve our understanding of the effects of the CR incentive payment within the context of an EPM and the Medicare FFS program, as well as identify potential interactions between the CR incentive payment and the underlying EPM and FFS payment methodologies.

Comment: A commenter recommended that the cardiac rehabilitation payment should be included in the bundled payment for AMI and CABG.

Response: We assume that this comment refers to the CR incentive payment, and we disagree with such a recommendation as this model proposed a specific payment designed to financially incentivize increased utilization of CR/ICR services which may improve quality and reduce costs for AMI and CABG model beneficiaries. FFS payments for CR/ICR services themselves are included in EPM episode spending. Thus, we proposed and are finalizing that the CR incentive payment be separate for EPM–CR participants.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, to keep CR incentive payments, if any, separate from reconciliation payments and Medicare repayments, as well as excluding them from sharing arrangements and updating quality-adjusted target prices for EPM–CR participants in §512.710(c) through (e).

3. CR Incentive Payment Report

For CR participants to receive timely and meaningful feedback on their performance with respect to the proposed CR incentive payments, we proposed to annually issue to CR participants a report containing at a minimum—

• 1—The number of AMI and CABG model episodes or AMI care periods and CABG care periods attributed to the CR participant in which Medicare paid for 11 or fewer CR/ICR services for a beneficiary during the CR performance year, if any;
• 2—The total number of CR/ICR services Medicare paid for during AMI and CABG model episodes or AMI care periods and CABG care periods identified in (1);
• 3—The amount of the CR incentive payment attributable to the AMI and CABG model episodes or AMI care periods and CABG care periods identified in (1);
• 4—The number of AMI and CABG model episodes or AMI care periods and CABG care periods attributed to the CR participant in which Medicare paid for 12 or more CR/ICR services for a beneficiary during the CR performance year, if any;
• 5—The total number of CR/ICR services Medicare paid for during AMI and CABG model episodes or AMI care periods and CABG care periods identified in (4);
• 6—The amount of the CR incentive payment attributable to the AMI and CABG model episodes or AMI care periods and CABG care periods identified in (4);
• 7—The total amount of the CR incentive payment.
We also considered including additional information in the CR incentive payment report, including information on the number of CR/ICR services paid for by Medicare during each AMI or CABG model episode or AMI care period or CABG care period attributed to the CR participant during the CR performance year. However, because EPM–CR participants and FFS–CR participants can request more specific beneficiary-level data that would contain information on CR/ICR services paid for by Medicare for each AMI or CABG model episode or AMI care period or CABG care period attributed to the CR participant during the CR performance year, as discussed in sections III.K.2. and VI.F.3. of this final rule, we did not include such additional information in the CR incentive payment report.

For EPM–CR participants, we proposed to issue this annual report at the same time we issue the reconciliation report specified in § 512.305(f). For FFS–CR participants, we proposed to issue this report at the same time proposed for EPM–CR participants.

The proposal to issue a CR incentive payment report is included in § 512.710(f). We sought comments on our proposal to issue a CR incentive payment report to CR participants and what other information, if any, would be helpful to include in the CR incentive payment report.

We received no comments specific to our proposals for the CR incentive payment report.

Final Decision: We are finalizing our proposal, without modification, in § 512.710(f) to issue a CR incentive payment report for each CR performance year to EPM–CR and FFS–CR participants to include at a minimum —

1—The number of AMI and CABG model episodes or AMI care periods and CABG care periods attributed to the CR participant in which Medicare paid for 11 or fewer CR/ICR services for a beneficiary during the CR performance year, if any;

2—The total number of CR/ICR services Medicare paid for during AMI and CABG model episodes or AMI care periods and CABG care periods identified in (1);

3—The amount of the CR incentive payment attributable to the AMI and CABG model episodes or AMI care periods and CABG care periods identified in (1);

4—The number of AMI and CABG model episodes or AMI care periods and CABG care periods attributed to the CR participant in which Medicare paid for 12 or more CR/ICR services for a beneficiary during the CR performance year, if any;

5—The total number of CR/ICR services Medicare paid for during AMI and CABG model episodes or AMI care periods and CABG care periods identified in (4);

6—The amount of the CR incentive payment attributable to the AMI and CABG model episodes or AMI care periods and CABG care periods identified in (4); and

7—The total amount of the CR incentive payment.

4. Timing for Making CR Incentive Payments

We proposed to make CR incentive payments on a retrospective basis. In the case of an EPM–CR participant, these payments would occur concurrently with EPM reconciliation payments or repayment amounts assessed for a specific CR performance year which is the same as the performance year for the EPM, subject to the relation of the CR incentive payment described in section VI.E.2. of this final rule and the appeals process for EPM participants described in section III.D.8. of this final rule. In the case of a FFS–CR participant, these payments would occur at the same time as was proposed for EPM–CR participants, subject to the appeals process described in section VI.F.2. of this final rule.

The proposed timing for making CR incentive payments is included in § 512.710(g). We sought comments on our proposed timing for making CR incentive payments.

The following is a summary of the comments received and our responses.

Comment: A commenter stated support for the proposal to establish an incentive payment that would be paid retrospectively, as this commenter believes that cardiac rehabilitation is very important in improving patient health outcomes and reducing hospital readmissions. In contrast, another commenter offered an alternative proposal for the timing of CR incentive payments, and recommended CMS make interim incentive payments during the year so as to monitor take-up rates to see if the incentive level needs to be adjusted.

Response: We appreciate the comments on the proposed timing for making CR incentive payments. However, we will not make interim CR incentive payments through the performance year based on claims for CR/ICR services furnished to CR beneficiaries that reflect less than a full model performance year. Given the lag in claims submission and payment in the Medicare FFS program for Part B services, we are not confident that we could gather sufficient reliable information in a period of less than a year that would cause us to reconsider the CR incentive payment methodology, including the amount, based on accurate observations of complete CR/ICR service utilization for model beneficiaries. In addition, changing the CR incentive payment methodology, including the amount, would require rulemaking, for which we would need sufficient information on true utilization changes and evaluation findings to propose a revised methodology.

Therefore, we believe that the proposed retrospective methodology that provides the CR incentive payment once per year to each CR participant after the end of the CR performance year is administratively straightforward for CMS and CR participants and will allow us to provide accurate CR incentive payments based on the CR/ICR utilization for CR beneficiaries. It will be possible with this payment methodology to monitor utilization of CR/ICR services for beneficiaries attributable to EPM–CR and FFS–CR participants, and we will continue to consider whether future proposals to change the CR incentive payment methodology are warranted based on our monitoring and early model implementation experience. Thus we are finalizing our proposed timing for the CR incentive payment.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, for the timing of making CR incentive payments in § 512.710(g). CMS makes CR incentive payments on a retrospective basis subject to the appeals process for EPM participants in § 512.310 and makes the CR incentive payments, if any, at the same time as for EPM–CR participants, subject to the provisions in § 512.720.

F. Provisions for FFS–CR Participants

1. Access to Records and Retention for FFS–CR participants

In section III.H. of this final rule, we discuss our proposals for record access and retention under the EPM. The proposals describe the access to records and retention requirements for all EPM participants, including EPM–CR participants and other individuals and entities with respect to the EPM and CR incentive payment model, if the latter is applicable to the EPM participant. Two of the six categories of information subject to the requirements, specifically compliance with the CR incentive payment model and the obligation to repay any CR incentive
payments owed to CMS, are relevant only to the CR incentive payment model. Thus, we proposed to establish CR incentive payment model access to records and retention requirements for FFS–CR participants and any other individuals or entities providing items or services to a FFS–CR beneficiary that are the same as we proposed for EPM–CR participants and other individuals and entities but only for the two categories of information that are applicable to the CR incentive payment model. The other four categories of information proposed for records access and retention under the EPM, specifically the calculation, distribution, receipt, or recoupment of gainsharing payments, alignment payments, distribution payments, and downstream distribution payments; the quality of the services furnished; the sufficiency of beneficiary notifications; and the accuracy of the EPM participant’s submissions under CEHRT use requirements, are not relevant to the CR incentive payment model for FFS–CR participants and other individuals and entities providing items and services to FFS–CR beneficiaries because the CR incentive payment model includes no policies that relate directly to these categories of information.

The proposals for access to records and record retention for FFS–CR participants and other individuals and entities providing items and services to FFS–CR beneficiaries are included in §512.715. We sought comment on our proposals, including whether it is necessary and appropriate to impose these access and retention obligations on the FFS–CR participant and other individuals and entities providing items and services to FFS–CR beneficiaries for the proposed categories of information to be retained and made accessible. In addition, we sought comment on whether additional or different safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the CR incentive payment model are met.

The following is a summary of the comments received and our responses.

Comment: A commenter requested that CMS lower the duration of record retention requirement for the CR incentive payment model from ten years, as this commenter believes ten years is an excessive amount of time for participating hospitals, collaborators, collaboration agents, and downstream collaboration agents to maintain documentation on this model.

Response: While we appreciate the comments, we note that ten years may seem excessive, we note that, once initiated, appeals and recalculation disputes can be lengthy processes and believe that maintaining this requirement as proposed would give both the participant and CMS, as well as those completing any audit, evaluation, inspection, or investigation, the resources to prepare and respond to issues that may take several years to surface. We continue to believe that these record retention requirements can be applied to categories of information that are broader than those solely related to financial arrangements, and therefore will consider requesting access to records that will assist in evaluating and measuring the CR incentive payment model goals.

Final Decision: After consideration of the public comments received, we are finalizing the proposal, without modification, for access to records and record retention for FFS–CR participants and other individuals and entities providing items and services to FFS–CR beneficiaries in §512.715.

2. Appeals Process for FFS–CR Participants

a. Overview

In section III.D.8. (81 FR 50877 through 50880) of the proposed rule, we discuss our proposals for the appeals process under the EPMs. The proposal outlines the appeals process requirements for all EPM participants, including EPM–CR participants, with respect to the EPM and CR incentive payment model, if the latter is applicable to the EPM participant. CR incentive payments as well as non-payment related issues, such as enforcement matters, are relevant only to the CR incentive payment model. Thus, we proposed to establish CR incentive payment model appeals process for FFS–CR participants that have the same requirements as we proposed for the EPM but based on only the CR incentive payment and non-payment related issues, such as enforcement matters. All other appealable items under the EPM, specifically related to payment, reconciliation amounts, repayment amounts, determinations associated with quality measures affecting payment are not relevant to the CR incentive payment model for any FFS–CR participants because the CR incentive payment model includes no policies that relate directly to these categories of information.

Final Decision: After consideration of the public comments received, we are finalizing the proposal without modification.

b. Notice of Calculation Error (First Level Appeal)

We proposed the following calculation error process for the CR incentive payment model to contest matters related to the calculation of the FFS–CR participant’s CR incentive payment as reflected in the CR incentive payment report. FFS–CR participants would review their CR incentive payment report and be required to provide written notice of any error in a calculation error form that must be submitted in a form and manner specified by CMS. Unless the FFS–CR participant provides such notice, the CR incentive payment report would be deemed final within 45 calendar days after it is issued, and CMS would proceed with payment. If CMS receives a timely notice of an error in the calculation, CMS would respond in writing within 30 calendar days to either confirm or refute the calculation error, although CMS would reserve the right to an extension upon written notice to the participant. We proposed that if a FFS–CR participant does not submit timely notice of a calculation error, which is notice within 45 calendar days of the issuance of the CR incentive payment report, the FFS–CR participant would be precluded from later contesting the CR incentive payment report for that CR performance year.

In summary, we proposed the following requirements in §512.720(a) for notice of calculation error:

• Subject to the limitations on review in subpart H of this part, if a FFS–CR participant wishes to dispute calculations involving a matter related to a CR incentive payment, the FFS–CR participant is required to provide written notice of the calculation error, in a form and manner specified by CMS.

• Unless the FFS–CR participant provides such notice, CMS deems final the applicable CR incentive payment report 45 calendar days after the applicable CR incentive payment report is issued and proceeds with the payment as applicable.

• If CMS receives a notice of a calculation error within 45 calendar days of the issuance of the applicable CR incentive payment report, CMS responds in writing within 30 calendar days to either confirm that there was an error in the calculation or verify that the calculation is correct, although CMS reserves the right to an extension upon written notice to the FFS–CR participant.

• Only FFS–CR participants may use the notice of calculation error process described in this subpart.
We sought comment on the proposed notice of calculation error requirements. Final Decision: We did not receive any comments on this section. Therefore, we are finalizing the proposal without modification.

c. Dispute Resolution Process (Second Level of Appeal)

We proposed the following dispute resolution process. First, we proposed that only a FFS–CR participant may utilize the dispute resolution process. Second, in order to access the dispute resolution process a FFS–CR participant must have timely submitted a calculation error form, as previously discussed, regarding the CR incentive payment. We proposed these matters would include any amount or calculation indicated on a CR incentive payment report, including calculations not specifically reflected on a CR incentive payment report but which generated figures or amounts reflected on a CR incentive payment report. We proposed calculation of CR incentive payment amounts would need to be first adjudicated by the calculation error process as previously detailed. If a FFS–CR participant wants to engage in the dispute resolution process with regard to the calculation of a CR incentive payment amount, we proposed it would first need to submit a calculation error form. Where the FFS–CR participant does not timely submit a calculation error form, we proposed the dispute resolution process would not be available to the FFS–CR participant with regard to the CR incentive payment report for that CR performance year.

If the FFS–CR participant did timely submit a calculation error form and the FFS–CR participant is dissatisfied with CMS’ response to the FFS–CR participant’s notice of calculation error, the FFS–CR participant would be permitted to request reconsideration review by a CMS reconsideration official. The reconsideration review request would be submitted in a form and manner to an individual or office specified by CMS. The reconsideration review request would provide a detailed explanation of the basis for the dispute and include supporting documentation for the FFS–CR participant’s assertion that CMS or its representatives did not accurately calculate CR incentive payment in accordance with CR incentive payment model rules. Where the matter is unrelated to payment, such as termination from the CR incentive payment model, the FFS–CR participant need not submit a calculation error form. We proposed to require the FFS–CR participant to timely submit a request for reconsideration review, in a form and manner to be determined by CMS. Where such request is timely received, we proposed CMS would process the request as discussed later in this section.

We proposed that the reconsideration review would be an on-the-record review (a review of briefs and evidence only). The CMS reconsideration official would make reasonable efforts to notify the FFS–CR participant in writing within 15 calendar days of receiving the FFS–CR participant’s reconsideration review request of the date and time of the review, the issues in dispute, the review procedures, and the procedures (including format and deadlines) for submission of evidence (the “Scheduling Notice”). The CMS reconsideration official would make reasonable efforts to schedule the review to occur no later than 30 days after the date of the Scheduling Notice. The provisions at §425.804(b), (c), and (e) (as in effect on the publication date of this final rule) would apply to reviews conducted pursuant to the reconsideration review process for the CR incentive payment model. The CMS reconsideration official would make reasonable efforts to issue a written determination within 30 days of the review. The determination would be final and binding.

In summary, we proposed the following requirements in §512.720(b) for the reconsideration process:

- If the FFS–CR participant is dissatisfied with CMS’ response to the notice of a calculation error, the FFS–CR participant may request a reconsideration review in a form and manner as specified by CMS.
- The reconsideration request must provide a detailed explanation of the basis for the dispute and include supporting documentation for the FFS–CR participant’s assertion that CMS or its representatives did not accurately calculate CR incentive payment in accordance with part H of this part.
- If CMS does not receive a request for reconsideration from the FFS–CR participant within 10 calendar days of the issue date of CMS’ response to the FFS–CR participant’s notice of calculation error, then CMS’ response to the calculation error is deemed final and CMS proceeds with the applicable processes, as described in subpart H of this part.
- The CMS reconsideration official notifies the FFS–CR participant in writing within 15 calendar days of receiving the FFS–CR participant’s review request of the following:

++ The date, time, and location of the review.
++ The issues in dispute.
++ The review procedures.
++ The procedures (including format and deadlines) for submission of evidence. The CMS reconsideration official takes all reasonable efforts to schedule the review to occur no later than 30 days after the date of receipt of notification.
- The provisions at §425.804(b), (c), and (e) of this chapter are applicable to reviews conducted in accordance with the reconsideration review process for the FFS–CR participant.
- The CMS reconsideration official issues a written determination within 30 days of the review. The determination is final and binding.
- Only a FFS–CR participant may utilize the dispute resolution process described in this subpart. We sought comment on the proposed reconsideration process for the CR incentive payment model. Final Decision: We did not receive any comments on this section. Therefore, we are finalizing the proposal without modification.

d. Exception to the Notice of Calculation Error Process and Notice of Termination

If the FFS–CR participant contests a matter that does not involve an issue contained in, or a calculation which contributes to a CR incentive payment report, a notice of calculation error is not required. In instances where a notice of calculation error is not required, for example a FFS–CR participant’s termination from the CR incentive payment model, we proposed the FFS–CR participant provide a written notice to CMS requesting review within 10 calendar days of the notice. CMS has 30 days to respond to the FFS–CR participant’s request for review. If the FFS–CR participant fails to notify CMS, the decision is deemed final.

In summary, we proposed the following requirements in §512.720(c) for an exception to the notice of calculation error process:

- If the FFS–CR participant contests a matter that does not involve an issue contained in, or a calculation which contributes to a CR incentive payment report a notice of calculation error is not required. In these instances, if CMS does not receive a request for reconsideration from the FFS–CR participant within 10 calendar days of the notice of the initial determination, the initial determination is deemed final and CMS proceeds with the applicable processes, as indicated in the final determination. This does not apply to the limitations on review in sub-paragraph (e).
In summary, we proposed the following requirements in §512.720(d) for notice of termination:

- If an FFS–CR participant receives notification that it has been terminated from the CR incentive payment model, it must provide a written request for reconsideration to CMS requesting review of the termination within 10 calendar days of the notice. CMS has 30 days to respond to the FFS–CR participant’s request for review. If the FFS–CR participant fails to notify CMS, the termination is deemed final.

We sought comment on the proposed exception to the process and notice of termination.

**Final Decision:** CMS did not receive any comments on this section. Therefore, we are finalizing the proposal without modification.

### e. Limitations on Review

In summary, we proposed the following requirements in §512.720(e) for limitations on review:

- In accordance with section 1115A(d)(2) of the Act, there is no administrative or judicial review under sections 1869 or 1878 of the Act or otherwise for the following:
  - The selection of models for testing or expansion under section 1115A of the Act.
  - The selection of organizations, sites, or participants to test those models selected.
  - The elements, parameters, scope, and duration of such models for testing or dissemination.
  - Determinations regarding budget neutrality under section 1115A(b)(3) of the Act.
  - The termination or modification of the design and implementation of a model under section 1115A(b)(3)(B) of the Act.
  - Decisions to expand the duration and scope of a model under section 1115A(c) of the Act, including the determination that a model is not expected to meet criteria described in paragraph (e)(1) or (2) of this section.

We sought comment on the proposed limitations on review.

The proposals for the appeals process for FFS–CR participants are included in §512.720. We sought comment on our proposals for the appeals process as it related to FFS–CR participants. The two-step appeal process for payment matters—(1) calculation error form, and (2) reconsideration review—is used broadly in other CMS models. We sought comment on whether additional or different safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the CR incentive payment model are met.

**Final Decision:** CMS did not receive any comments on this section. Therefore, we are finalizing the proposal without modification.

### 3. Data Sharing for FFS–CR Participants

#### a. Overview

Section III.K. of the proposed rule (81 FR 50945 through 50948) discussed our proposed policies for the types and formats of financial data that we would make available to EPM participants, the frequency with which we would make these data available, and the authority for making these data available to EPM participants. Specifically, in section III.K.2. of the proposed rule (81 FR 50946), we proposed to provide certain financial data in two formats. First, we proposed to make summary beneficiary claims data reports on beneficiaries’ use of health care services during the baseline and performance periods upon request and in accordance with applicable privacy and security laws and established privacy and security protections. These data would consist of summary claims data reports that would contain payment information such as episode counts, total average spending for each episode, based upon categories, including, inpatient services, outpatient services, skilled nursing facility services, and carrier/Part B services.

Alternatively, for EPM participants with the capacity to analyze raw claims data, we proposed to make more detailed beneficiary-level information available upon request and in accordance with applicable privacy and security laws and established privacy and security protections. In addition to these more detailed data, we proposed to include episode summaries, indicators for excluded episodes, diagnosis and procedure codes, and enrollment and dual eligibility information for beneficiaries that initiate EPM episodes.

In section III.K.2. of the proposed rule (81 FR 50945 through 50947), we also noted our view that making this information available to EPM participants would provide the participants with tools to monitor, understand, and manage utilization and expenditure patterns as well as to develop, target, and implement quality improvement programs and initiatives.

In addition to the aforementioned data, we proposed in section III.K.3. of the proposed rule (81 FR 50945) to provide comparable aggregate regional data to EPM participants. Our proposal to make these regional data available was based on our proposal to use regional pricing data to determine benchmark and quality-adjusted target prices for EPM participants, and those aggregate regional data would assist participants in better understanding the basis of these prices. In section III.K.4. of the proposed rule (81 FR 50946), we proposed to make 3 years of baseline data available to EPM participants prior to the models’ start date, which we believe would help the participants assess their practice patterns, identify cost drivers, and ultimately redesign their care practices to improve efficiency and quality. In section III.K.5. of the proposed rule (81 FR 50946), we proposed to provide to EPM participants, upon request and in accordance with the HIPAA Privacy Rule, up to 6 quarters of claims data as frequently as on a quarterly basis throughout the EPM participant’s participation or until they notify CMS that they no longer wish to receive these data.

As we stated in section III.K.6 of the proposed rule (81 FR 50946 through 50947), we believe our proposals are consistent with and authorized under the HIPAA Privacy Rule under the provisions that permit disclosures of PHI for “health care operations” purposes. Under those provisions, a covered entity is permitted to disclose PHI to another covered entity for the recipient’s health care operations purposes if both covered entities have or had a relationship with the subject of the PHI to be disclosed, the PHI pertains to that relationship, and the recipient would use the PHI for a “health care operations” function that falls within the first two paragraphs of the definition of “health care operations” in the HIPAA Privacy Rule (45 CFR 164.506(c)(4)). The first paragraph of the definition of health care operations includes “conducting quality assessment and improvement activities, including outcomes evaluation and development of clinical guidelines,” and “population-based activities relating to improving health or reducing health costs, protocol development, case management and care coordination” (45 CFR 164.501). As we stated in section III.K.6. of the proposed rule (81 FR 50944 through 50945), EPM participants would be using the data on their patients to evaluate the performance of the participant hospital and other providers and suppliers that furnished services to the patient, conduct quality assessment and improvement activities, and conduct population-based activities relating to improved health for their patients. When done by or on behalf of a covered entity, these are covered...
functions and activities that would qualify as “health care operations” under the first and second paragraphs of the definition of health care operations at 45 CFR 164.501. Hence, we noted our view that this provision covers the uses we would expect under the proposed EPMs. We also noted our view that, in proposing to make available the “minimum necessary” data to accomplish the intended purpose of the use, our proposal was consistent with 45 CFR 164.502(b). Last, we stated our belief that our proposed data disclosures are consistent with the purpose for which the data discussed in the proposed rule was collected and may be disclosed in accordance with the routine uses exception to the Privacy Act, which would otherwise prohibit disclosure of information from a system of records to any third party without the prior written consent of the individual to whom the records apply (5 U.S.C. 552a(b)). For a more detailed discussion of our proposals and authority for sharing data with EPM participants, please see section III.K. of this final rule.

b. Data Sharing With CR Participants

As is the case with the proposed EPMs, we believe that making certain beneficiary-identifiable claims information available, upon request and in accordance with applicable privacy and security laws and established privacy and security protections, is necessary for CR participants to best improve their performance with respect to increasing utilization of CR/ICR services, which we believe should result in improved health care outcomes and reduced health care costs. However, we believe that a more limited set of data would be needed for purposes of testing the CR incentive payment model than would be made available under the proposed EPMs. This is because the purposes and processes related to the proposed CR incentive payment model are narrower in focus than under the proposed EPMs where hospitals must coordinate care across a broader array of providers and services to improve health care quality across a broader range of dimensions. Also, unlike the EPMs where a participant’s performance each performance year is compared against historical spending, the CR incentive payments are based only on a CR participant’s CR/ICR service utilization performance within a given CR performance year. Further, CR incentive payments are tied only to the CR participant’s performance and are unrelated to performance within a region.

Thus, upon request and in accordance with applicable privacy and security laws and established privacy and security protections, we proposed to make the following data available to FFS–CR participants:

- Inpatient claims—containing potential admissions for CABG and AMI MS–DRGs (and PCI DRGs with an AMI ICD–CM diagnosis code in the principal or any secondary diagnosis code position).
- Carrier and Outpatient claims—containing CR/ICR services that occurred in the 90-day period after discharge (called the AMI care period or CABG care period).

We would note that our proposal pertains only to FFS–CR participants and not to EPM–CR participants. This is because an EPM–CR participant that has requested data under the EPM would already have had the data previously described made available to them under their broader data sharing request. As such, we believe that also making these data separately available to EPM–CR participants would be duplicative and could create confusion for participants. We also note that we did not propose to make historical payment or aggregate regional payment data available to FFS–CR participants. This is because, as previously discussed, neither historical nor regional CR/ICR service utilization performance would be factors considered when determining their eligibility for or the amount of a CR incentive payment.

As is the case for our proposed data sharing with EPM participants, we proposed to make these data available in either summary or claims-level format, depending on the FFS–CR participant’s request. Also, we proposed to make these data available consistent with the same schedule we proposed to use for making data available to EPM participants and to make available up to 6 quarters of claims data as frequently as on a quarterly basis throughout the FFS–CR participant’s participation or until they notify CMS that they no longer wish to receive these data. As is the case with the EPMs, we proposed that the data files would be packaged and sent to a data portal (to which the FFS–CR participants must request and be granted access) in a “flat” or binary format for the FFS–CR participant to retrieve.

The proposal to share data with FFS–CR participants is included in §512.725(b)(2). We sought comments on our data sharing proposals.

The following is a summary of the comments received and our responses.

Comment: Commenters were supportive of our proposal to make this data available as frequently as monthly, and encouraged us to follow a monthly data release schedule for FFS–CR participants as soon as the EPMs are implemented, instead of sending the FFS–CR data quarterly since more frequent data updates would be useful in managing care under EPMs.

Response: We appreciate these comments and realize that more frequent data releases will assist many hospitals that are selected for the CR incentive payment model in understanding care patterns and identifying opportunities for improved efficiencies in care delivery.

Accordingly, we are modifying our proposal to make these data available on a quarterly basis to make these data available “no less frequently” than on a quarterly basis with the goal of making these data available on a monthly basis as soon as we have the operational capabilities needed for monthly distribution.

Final Decision: After consideration of the public comments we received, we are modifying our proposal at §512.725(b)(2) to no longer limit the availability of updated CR data to a frequency “as frequently as on a quarterly basis throughout the FFS–CR participant’s participation” to instead “no less frequently than on a quarterly basis throughout the FFS–CR participant’s participation” with the goal of making these data available as frequently as on a monthly basis if practicable.

4. Compliance Enforcement for FFS–CR Participants and Termination of the CR Incentive Payment Model

In section III.F. (81 FR 50911 through 50914) of the proposed rule, we discuss our proposals for compliance enforcement under the EPM. The proposal outlines the non-compliance by EPM participants, including EPM–CR participants with respect to the EPMs and CR incentive payment model, if the latter is applicable to the EPM participant that may trigger compliance enforcement by CMS and the enforcement mechanisms available to CMS. Four out of the seven remedial actions, specifically issuing a warning letter to the EPM participant, requiring the EPM participant to develop a corrective action plan, commonly referred to as a CAP, reducing or eliminating the EPM participant’s CR incentive payment, and terminating the EPM participant from the CR incentive payment model, are relevant to the CR incentive payment model. Thus, we
proposed to establish compliance enforcement for the CR incentive payment model for FFS–CR participants that is substantively similar to the requirements as we proposed for the EPM but that the CMS enforcement mechanisms may use with FFS–CR participants be the four remedial actions previously listed in this section. All other types of enforcement mechanisms under the EPMs, specifically, reducing or eliminating the EPM participant’s reconciliation payment, requiring the EPM participant to terminate a sharing arrangement with an EPM collaborator and prohibiting the EPM collaborator from further engagement in sharing arrangements with the EPM participant, and allowing CMS to add 25 percent to a repayment amount on an EPM participant’s reconciliation report under certain circumstances, are not relevant to the CR incentive payment model for any FFS–CR participants because the CR incentive payment model includes no policies that relate directly to these categories of activity.

Another distinction between the policies proposed under the EPMs and the CR incentive payment model is regarding prevention of EPM–CR participants from avoiding the high cost and high severity patients and targeting low cost and low severity patients. Under the EPMs, we prohibit EPM participants from avoiding both potentially high cost or high severity patients and targeting both potentially low cost or low severity patients. Under the EPMs, we prohibit EPM participants from avoiding both potentially high cost or high severity patients and targeting low cost or low severity patients. Under the CR incentive payment model we are only concerned with FFS–CR participants avoiding high severity patients and targeting low severity patients. The goal of EPMs is to maintain or improve quality and coordination of care while reducing program expenditures. In contrast, the goals of the CR incentive payment model are to reduce cardiovascular mortality, improve health-related quality of life, and reduce the risk of hospital admission. The EPMs explicit prohibition of avoiding high cost and targeting low cost patients is not included for FFS–CR participants as cost savings are not a goal for participants under the CR incentive payment model.

We proposed that CMS would have the remedial actions detailed in this section available for use against FFS–CR participants where such FFS–CR participant furnishing CR services to a beneficiary during the CR incentive payment model is not compliant in a manner listed in § 512.730(b)(1). These mechanisms would support CMS’ goal for the CR incentive payment model to prevent overutilization of CR services that are not medically necessary, prevent FFS–CR participants from avoiding high severity patients and seeking out low severity patients, safeguard program integrity, protect against fraud and abuse, and deter noncompliance with CR incentive payment model requirements.

Upon discovering an instance of noncompliance by a FFS–CR participant with the requirements of the CR incentive payment model, CMS, HHS, or a designee of such Agencies may take remedial action against such FFS–CR participant. Any information collected by CMS in relation to termination of a participant from the model would be shared with our program-integrity colleagues at HHS, the Department of Justice, and their respective designees. Should such participant, or one of its EPM collaborators, collaboration agents, or downstream collaboration agents, be noncompliant with the requirements of the EPMs or engage in unlawful behavior related to participation in the EPMs, we note that such information could be used in proceedings unrelated to the enforcement mechanisms in this section. FFS–CR participants also would be subject to all applicable requirements and conditions for Medicare participation not otherwise waived under section 1115A(d)(1) of the Act.

In summary, we proposed in § 512.730 that FFS–CR participants must comply with all requirements outlined in subpart H. Except as specifically noted in subpart H, the regulations under this part must not be construed to affect the payment, coverage, program integrity, or other requirements (such as those in parts 412 and 482 of this chapter) that apply to providers and suppliers under this chapter.

Further, we proposed in § 512.730 that CMS may take the remedial actions later discussed in this section, if a FFS–CR participant—

• Fails to comply with any requirements of this subpart or is identified as noncompliant through monitoring by HHS (including CMS and OIG) of the CR incentive payment model, including but not limited to—
  ++ Avoiding potentially high-severity patients;
  ++ Targeting potentially low-severity patients;
  ++ Failing to provide medically appropriate services or systematically engaging in the over or under-delivery of appropriate care;
  ++ Failing to provide beneficiaries with complete and accurate information; or
• Takes any action that threatens the health or safety of patients;
• Avoids at risk Medicare beneficiaries, as this term is defined in § 425.20 of this chapter;
• Avoids patients on the basis of payer status;
• Is subject to sanctions or final actions of an accrediting organization or federal, state, or local government agency that could lead to the inability to comply with the requirements of this subpart;
• Takes any action that CMS determines for program integrity reasons is not in the best interests of the CR incentive payment model, or fails to take any action that CMS determines for program integrity reasons should have been taken to further the best interests of the CR incentive payment model;
• Is subject to action by HHS (including OIG and CMS) or the Department of Justice to redress an allegation of fraud or significant misconduct, including intervening in a False Claims Act qui tam matter, issuing a pre demand or demand letter under a civil action, or similar actions; or
• Is subject to action involving violations of the physician self-referral law, civil monetary penalties law, federal anti-kickback statute, antitrust laws, or any other applicable Medicare laws, rules, or regulations that are relevant to the CR incentive payment model.

We proposed the remedial actions to include the following:

• Issuing a warning letter to the FFS–CR participant;
• Requiring the FFS–CR participant to develop a corrective action plan, commonly referred to as a CAP;
• Reducing or eliminating the FFS–CR participant’s CR incentive payment.
• Terminating the FFS–CR participant from the CR incentive payment model.

The proposals for compliance enforcement for FFS–CR participants are included in § 512.730. We sought comment on our proposals for compliance enforcement as it is related to FFS–CR participants. In addition, we sought comment on whether additional or different safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the CR incentive payment model are met.

We further proposed under § 512.905, CMS may terminate the CR incentive payment model for reasons including but not limited to—

• CMS no longer has the funds to support the CR incentive payment model;
• CMS terminates the applicable model in accordance with section
We are finalizing the proposals in §512.735 for the enforcement authority for FFS–CR participants. In the enforcement authority for FFS–CR participants, without modification. In the final provisions:

- OIG authority is not limited or restricted by the provisions of the CR incentive payment model, including the authority to audit, evaluate, investigate, or inspect the FFS–CR participants. Additionally, no CR incentive payment model provisions limit or restrict the authority of any other Government agency permitted by law to restrict the authority of any other Government agency to audit, investigate, or inspect the FFS–CR participants. Additionally, no CR incentive payment model provisions limit or restrict the authority of any other Government agency to audit, evaluate, investigate, or inspect the FFS–CR participants. Additionally, no CR incentive payment model provisions limit or restrict the authority of any other Government agency to audit, evaluate, investigate, or inspect the FFS–CR participants. Additionally, no CR incentive payment model provisions limit or restrict the authority of any other Government agency to audit, evaluate, investigate, or inspect the FFS–CR participants.

We proposed to allow EPM participants to provide beneficiary engagement incentives under certain conditions as discussed in section III.I.9. of the proposed rule (81 FR 50929 through 50931) based on the goals of the EPM to improve EPM episode quality and efficiency. The goals of the CR incentive payment model in which some EPM participants would also participate are to increase CR/ICR service care coordination and the medically necessary utilization of CR/ICR services in AMI and CABG model episodes for EPM–CR participants and in AMI care periods and CABG care periods for FFS–CR participants. In the proposed rule, we discussed our belief that one mechanism that may be useful to CR participants in achieving this goal would be the provision of transportation to CR/ICR services as in-kind patient engagement incentives to AMI and CABG model beneficiaries and beneficiaries in AMI care periods and CABG care periods (hereinafter FFS–CR beneficiaries). As discussed earlier in this section, lack of accessibility of CR program sites can be a significant barrier to beneficiary adherence to a CR treatment plan. We did not believe there were beneficiary engagement incentives other than transportation that would be important for achieving the CR incentive payment model goals of increasing CR/ICR service care coordination and the medically necessary utilization of CR/ICR services. However, we believed that EPM–CR and FFS–CR participants should generally have the same regulatory flexibilities that are directly relevant to advancing the CR incentive payment model goals so that we could evaluate the CR incentive payment model under the two different underlying payment methodologies for AMI and CABG care (episode or FFS) and draw conclusions about the relationship between the CR incentive payment model and the underlying payment methodology for care.

Under the proposed beneficiary engagement incentive policies for the EPM, EPM–CR participants would be able to provide beneficiary transportation to CR/ICR services in order to achieve the clinical goal of the EPM of beneficiary adherence to a care plan, subject to certain conditions on these incentives that are necessary to ensure that their provision is solely for the purpose of achieving the EPM goals of improvements in episode quality and efficiency. When transportation is provided by an EPM–CR participant as a beneficiary engagement incentive for CR/ICR services, its use would also be aligned with the CR incentive payment model goals of increasing CR/ICR service care coordination and the medically necessary utilization of CR/ICR services. Thus, our proposal for beneficiary engagement incentives under the EPM met the potential need for transportation to CR/ICR services for AMI and CABG model beneficiaries under an EPM–CR participant.

We proposed to allow FFS–CR participants to provide transportation to CR/ICR services as a beneficiary engagement incentive for FFS–CR beneficiaries during AMI care periods and CABG care periods to allow these participants similar use of beneficiary engagement incentives to achieve the CR incentive payment model goals as would be available to EPM–CR participants for that purpose. We proposed the same conditions on beneficiary engagement incentives provided by FFS–CR participants as would be applicable to EPM beneficiary engagement incentives when those beneficiary incentives are transportation.

The proposed conditions for transportation when provided as a beneficiary engagement incentive by FFS–CR participants were—

- The incentive must be provided directly by the FFS–CR participant or by an agent of the FFS–CR participant under the FFS–CR participant’s direction and control to the FFS–CR beneficiary during an AMI care period or CABG care period;
- Transportation must not be tied to the receipt of items or services other than CR/ICR services during AMI care periods or CABG care periods;
- Transportation must not be tied to the receipt of items or services from a particular provider or supplier; and
- The availability of transportation must not be advertised or promoted except that a beneficiary may be made aware of the availability of transportation at the time the beneficiary could reasonably benefit from it:
  - The cost of transportation must not be shifted to another federal health care program, as defined at section 1128B(f) of the Act.

In addition, as we would apply to transportation as a beneficiary engagement incentive under the EPMs, we proposed the same documentation requirements for beneficiary engagement incentives provided by FFS–CR participants:

- FFS–CR participants must maintain documentation of transportation furnished as a beneficiary engagement incentive that exceeds $25 in retail value;
- The documentation established contemporaneously with the provision of transportation must include at least the following:
  + The date the transportation is provided;
  + The identity of the beneficiary to whom the transportation was provided.
• The FFS–CR participant must retain and provide access to the required documentation in accordance with § 512.715.

Our proposals for beneficiary engagement incentives provided by FFS–CR participants were included in proposed § 512.740. We sought comment on our proposed provisions for beneficiary engagement incentives for FFS–CR participants and welcomed comment on additional or alternative program integrity safeguards. We also sought comment about beneficiary engagement incentives other than transportation that could advance the CR incentive payment model goals of increased CR/ICR service care coordination and the medically necessary utilization of CR/ICR services in AMI care periods and CABG care periods.

The following is a summary of the comments received and our responses. Comment: Multiple commenters claimed that a significant barrier to CR/ICR program participation is beneficiary cost-sharing due to the high cumulative costs associated with completion of multi-session CR/ICR treatment, although the evidence is largely anecdotal. A commenter referenced a recent study that found that in a multiracial population, low socioeconomic status, lack of insurance and copayment were independent risk factors of poor adherence to CR after adjusting for race. They stated that additional research in this area would be helpful in addressing cost as a barrier to participation in CR/ICR services. The commenters urged CMS to lower or eliminate beneficiary copayments under the CR incentive payment model. A commenter suggested that a tiered-copayment structure could be applied that would provide successive reductions in copayments the longer the beneficiary remains in the program. In this example, the first six sessions would be a full copayment, followed by a percentage reduction for the next six and an additional percentage reduction for the remaining sessions. Another commenter requested that CMS allow CR incentive payment model participants to use the CR incentive payment to decrease the cumulative copayment for CR services and claims that this would assist in increasing the utilization of CR/ICR services.

Response: We appreciate the interest of the commenters in additional strategies that could assist in beneficiary adherence to the recommended CR/ICR treatment plan for those who are included in the CR/ICR incentive payment model. We note that most beneficiaries in traditional Medicare have supplemental coverage, specifically employer-sponsored, Medicaid, and Medicare in descending order of prevalence. In 2011, only 19 percent of beneficiaries in traditional Medicare did not have supplemental coverage. Thus, while we recognize that without supplemental coverage the cumulative copayments associated with multiple sessions of CR/ICR services could be significant and discourage beneficiary participation, most of the beneficiaries in the CR/ICR incentive payment model would not experience significant out-of-pocket costs for the services themselves because their supplemental coverage would help to cover those costs. Thus, we do not believe it is necessary to lower or eliminate beneficiary copayments in order to test the CR incentive payment model under Medicare FFS, and we have concerns that such provisions could result in program integrity issues such as patient steering toward a particular provider.

Comment: A number of commenters expressed concern about the potential for FFS–CR participants to offer payment for transportation as a beneficiary engagement incentive, the commenters urged CMS to broaden the types of beneficiary engagement incentives that can be provided by FFS–CR participants to model beneficiaries beyond transportation. A commenter pointed out that the proposal would allow EPM–CR participants to provide the broader set of beneficiary engagement incentives available under the EPM to EPM–CR beneficiaries, allowing EPM–CR participants the flexibility to choose the most appropriate incentives, as long as the requirements for providing them under the EPM are met. The commenter reiterated CMS’ stated intent in the proposed rule to create parity between EPM–CR and FFS–CR participants regarding the available regulatory flexibilities directly relevant to advancing the CR incentive payment model goals and disagreed that CMS’ proposal for beneficiary engagement incentives that could be offered by FFS–CR participants would meet that objective. The commenter urged CMS to apply the EPM beneficiary engagement incentive provisions to both EPM–CR and FFS–CR participants. The commenter reasoned that doing so would enable all CR participants to develop innovative methods of increasing beneficiary utilization of CR/ICR programs and improving beneficiary adherence to CR/ICR program regimens. The commenter further acknowledged that even if in practice the vast majority of CR/ICR programs ultimately relied exclusively on providing transportation as a beneficiary engagement incentive, CMS would nevertheless have created the opportunity for both EPM–CR and FFS–CR participants to explore alternatives.

Other commenters provided specific examples of items and services that could be provided as beneficiary engagement incentives that would assist in increasing CR/ICR program enrollment and adherence to the CR/ICR

---

treatment plan, including mobile applications for phones to text health messages between sessions; activity devices to track calories and steps; and evidence-based support/counseling weight management services or programs. A commenter asserted that these items and services would be allowed as beneficiary engagement incentives in the EPM and have been shown to improve adherence and foster self-management behaviors in the CR setting. Several commenters recommended that CR participants be able to offer financial incentives to model beneficiaries, such as a per session payment of $10 to $20 if the beneficiary completes the treatment program; payment by the CR participant to rebate part of the beneficiary’s copayment to reward adherence; or a financial incentive that offers assistance to accommodate work or child/elder care obligations while the beneficiary attends CR/ICR sessions. Other commenters suggested that beneficiary engagement incentives could include vouchers for continued enrollment in exercise programs; gym memberships; diet and nutrition services and tobacco cessation services; and a preventive cardiology visit for review and reassessment of patient-centric goals. Another commenter requested clarification about regarding beneficiary engagement incentives can be used to assist with incorporating technology platforms needed to operate home-based cardiac rehabilitation.

Response: We appreciate the support of the commenters for our proposal to allow FFS–CR participants to provide transportation as a beneficiary engagement incentive to FFS–CR beneficiaries and the robust information provided by the commenters about other beneficiary engagement incentives that could help FFS–CR participants to advance the goals of the CR incentive payment model of increasing CR/ICR service care coordination and the medically necessary utilization of CR/ICR services for beneficiaries following hospitalization for AMI or CABG. As we stated in the proposed rule (81 FR 50897), we believe that EPM–CR and FFS–CR participants should generally have the same regulatory flexibilities that are directly relevant to advancing the CR incentive payment model goals so that we can evaluate the CR incentive payment model under the two different underlying payment methodologies for AMI and CABG care (episode or FFS) and draw conclusions about the relationship between the CR incentive payment model and the underlying payment methodology for care. While undoubtedly transportation has the potential to be an important beneficiary engagement incentive for FFS–CR beneficiaries to enhance their adherence to the CR/ICR treatment plan, we believe that our proposal for FFS–CR beneficiary engagement incentives was too narrow and would not have allowed FFS–CR participants sufficient flexibility to provide other beneficiary engagement incentives to help advance the goals of the model, while EPM–CR participants may be able to provide those incentives based on their participation in the EPM, as discussed in section III.I.9. of this final rule. Therefore, we will adopt beneficiary engagement incentive requirements for FFS–CR participants that are modeled closely after those we are finalizing for the EPMs to address the interests of the commenters in providing a broader array of beneficiary incentives under the CR incentive payment model and aligning the requirements for EPM–CR and FFS–CR participants who want to furnish beneficiary incentives to EPM–CR and FFS–CR beneficiaries. We sought comment in the proposal for beneficiary engagement incentives in the EPMs and respond to those comments in section III.I.9. of this final rule. We note that under the EPMs, the item or service provided as a beneficiary engagement incentive must be a preventive care item or service or an item or service that advances a clinical goal for a beneficiary in an EPM episode, where the goals are—

- Beneficiary adherence to drug regimens;
- Beneficiary adherence to care plan;
- Reduction of readmissions and complications resulting from treatment for the EPM clinical condition; and
- Management of chronic disease and conditions that may be affected by treatment for the EPM clinical condition.

FFS–CR participants are responsible for increasing CR/ICR service care coordination and the medically necessary utilization of CR/ICR services for beneficiaries following hospitalization for AMI or CABG. The AMI and CABG models both focus on beneficiaries with the same clinical conditions as the CR incentive payment model. The CR incentive payment model’s ultimate goal is improving beneficiary health and reducing the cost of health care. Increased utilization of CR/ICR services for beneficiaries following AMI and CABG is known to contribute to that ultimate goal based on the components of the CR/ICR program, and the utilization of CR/ICR services for which the model will make a CR incentive payment is only an interim process measure that has an association with the longer-term outcomes we are seeking to achieve.

Section 410.490(b)(2) defines the components of a cardiac rehabilitation and an intensive cardiac rehabilitation program as:

- Physician-prescribed exercise each day cardiac rehabilitation items and services are furnished;
- Cardiac risk factor modification, including education, counseling, and behavioral intervention, tailored to the patients’ individual needs;
- Psychosocial assessment;
- Outcomes assessment; and
- An individualized treatment plan detailing how components are utilized for each patient.

Therefore, we believe that the clinical goals of the CR model for the purpose of FFS–CR participating beneficiary engagement incentives can be appropriately identified as the same as those of the EPMs, related to improving beneficiary adherence to recommended treatments and improving beneficiary health. We will identify the same clinical goals for beneficiary engagement incentives that may be provided by FFS–CR participants as for the EPMs, noting that some contribute to the immediate CR incentive payment model objective of increasing CR/ICR service utilization (for example, beneficiary adherence to a care plan) and others to the longer-term improvement of beneficiary health that is expected to result from increased utilization of CR/ICR services (for example, management of chronic disease and conditions that may be affected by treatment for AMI or CABG).

The final regulations for the beneficiary engagement incentive payments that may be provided by FFS–CR participants are parallel to the final regulations for beneficiary engagement incentives under the EPMs, with the exception of the conforming changes that are necessary due to FFS–CR participant participation in the CR incentive payment model, rather than an EPM; the specific clinical conditions of AMI and CABG that are included in the CR incentive payment model; and use of the terms AMI care period and CABG care period rather than EPM episode to define the duration of time during which the beneficiary engagement incentive can be provided by the FFS–CR participant.

We note that, like the EPMs, the FFS–CR participant beneficiary engagement incentive requirements allow the provision of items and services as in-kind patient engagement incentives but do not allow FFS–CR participants to pay
money to FFS–CR participants for any purpose, including completion of the treatment program or as a rebate of CR copayments. While we can understand the potential benefit of such payments in engaging FFS–CR beneficiaries to advance the goals of the CR incentive payment model by financially rewarding their participation in CR/ICR services, we do not believe that we could include provide sufficient safeguards against patient steering if we were to permit such payments as beneficiary engagement incentives. With regard to the commenters requesting specific clarification about transportation incentives, the final beneficiary engagement incentives requirement for FFS–CR participant use no longer are specific to transportation. Therefore, we encourage those commenters to review the final requirements and ensure that all beneficiary engagement incentives, including transportation, provided by FFS–CR participants to FFS–CR beneficiaries meet the requirements. We note that the final requirements include that the item or service must not be tied to the receipt of items or services from a particular provider or supplier so that a FFS–CR participant who offers transportation as a beneficiary engagement incentive to CR/ICR services furnished by the FFS–CR participant would need to make comparable transportation support available for CR/ICR services furnished by another provider so that the availability of transportation would not be used to steer the beneficiary to a particular CR/ICR service provider.

Regarding the request by a commenter for clarification about whether beneficiary engagement incentives can be used to assist with incorporating technology platforms needed to operate home-based cardiac rehabilitation, we note that Medicare does not cover home-based CR. Any home-based CR activities could not be billed to Medicare and would not contribute to the FFS–CR participant’s CR incentive payment.178 In addition, technology platforms provided as a beneficiary engagement incentive by a FFS–CR participant would need to meet all the requirements specified in this final rule for beneficiary engagement incentives for FFS–CR participant use.

We are finalizing the proposals in § 512.740 beneficiary engagement incentives to be provided by FFS–CR participants, with modification to our proposals for comparability to EPM beneficiary engagement incentives. Pursuant to section 1115A(d)(1) of the Act, the Secretary will consider whether waivers of certain fraud and abuse laws are necessary to test the CR incentive payment model in FFS–CR participants. Such waivers would be promulgated separately from this final regulation by OIG (as to sections 1128A and 1128B of the Act) and CMS (as to section 1877 of the Act), to which the respective authorities have been delegated. Any fraud and abuse waivers issued in connection with the FFS–CR beneficiary engagement incentives model will be available at https://www.cms.gov/Medicare/Fraud-and-Abuse/PhysicianSelfReferral/Fraud-and-Abuse-Waivers.html and on OIG’s Web site. No waivers of any fraud and abuse authorities are being issued in this final rule.

Comment: A commenter requested clarification about what considerations could be given for beneficiary adherence to a CR/ICR treatment plan when the most convenient CR/ICR service provider is a rural CAH and the CR participant’s location where their CR program resides is beyond a reasonable distance from the beneficiary’s home. The commenter recommended that CR participants be permitted to extend transportation beneficiary engagement incentives to model beneficiaries who are receiving CR from rural non-CR participants due to a distance barrier in order for transportation cost barriers to CR service adherence to be reduced for rural beneficiaries as it is for beneficiaries receiving CR at the CR participant. Other commenters who requested that CMS broaden the beneficiary engagement incentives permitted for FFS–CR participants requested clarification about whether these incentives could still be provided if a FFS–CR beneficiary was referred to a CR program at a location other than at the FFS–CR participant.

Response: We appreciate the opportunity to clarify the beneficiary engagement incentive policies for CR participants whose model beneficiaries obtain CR/ICR services at different locations. Under our policies that apply to CR participants, beneficiary engagement incentives must be provided directly by the EPM–CR or FFS–CR participant or by an agent of the EPM–CR or FFS–CR participant under the EPM or FFS–CR participant’s direction and control to the EPM–CR or FFS–CR beneficiary during an AMI episode or AMI care period, respectively, or during a CABG episode or CABG care period. Therefore, while we limit who may provide the beneficiary engagement incentives to a model beneficiary to safeguard against patient steering to any particular provider, transportation to CR/ICR services or other items and services provided as in-kind patient engagement incentive may be provided by the FFS–CR participant to the model beneficiary, regardless of where the beneficiary receives CR/ICR services. Therefore, in the example raised by the commenter, the CR participant where the beneficiary was hospitalized for AMI or CABG that initiated the AMI episode or AMI care period would be permitted to provide transportation to CR services at the CAH near the beneficiary’s home as an in-kind patient engagement incentive, subject to all the other requirements for beneficiary engagement incentives for EPM or FFS–CR participants, as applicable to the specific CR participant, being met. In this scenario, we note that the CR incentive payment for CR/ICR services utilized by the beneficiary would be made to the CR participant, not the CAH, although the CAH would be paid for all CR services furnished to the beneficiary under the applicable Medicare FFS payment system.

Final Decision: After consideration of the public comments received, we are finalizing the proposals in § 512.740 for beneficiary engagement incentives provided by FFS–CR participants, with modification to allow beneficiary engagement incentives that are subject to the same overall requirements as the EPM but as applicable to AMI care periods and CABG care periods under the CR incentive payment model. Beneficiary engagement incentives provided by FFS–CR participants must meet the following requirements:

- FFS–CR participants may choose to provide in-kind patient engagement incentives to beneficiaries in an AMI care period or CABG care period under the CR incentive payment model, subject to the following conditions:
  - The incentive must be provided directly by the FFS–CR participant or by an agent of the FFS–CR participant under the FFS–CR participant’s direction and control to the FFS–CR beneficiary during an AMI care period or CABG care period.
  - The item or service provided must be reasonably connected to medical care provided to an FFS–CR beneficiary during an AMI care period or CABG care period.
  - The item or service must be a preventive care item or service or an item or service that advances a clinical goal, as listed later in this section, for a beneficiary during an AMI care period or CABG care by engaging the

beneficiary in better managing his or her own health.
  • The item or service must not be tied to the receipt of items or services outside the AMI care periods or CABG care periods.
  • The item or service must not be tied to the receipt of items or services from a particular provider or supplier.
  • The availability of items or services must not be advertised or promoted except that a beneficiary may be made aware of the availability of items or services at the time the beneficiary could reasonably benefit from them.
  • The cost of the item or service must not be shifted to another federal health care program, as defined at section 1128B(f) of the Act.

Beneficiary engagement incentives involving technology are subject to the following additional conditions:
  • Items or services involving technology provided to a beneficiary may not exceed $1,000 in retail value for any one beneficiary in any one AMI care period or CABG care period.
  • Items or services involving technology provided to a beneficiary must be the minimum necessary to advance a clinical goal, as listed in paragraph (c) of this section, for a beneficiary in an AMI care period or CABG care period.
  • Items of technology exceeding $100 in retail value must—
    ++ Remain the property of the FFS–CR participant; and
    ++ Be retrieved from the beneficiary at the end of the AMI care period or CABG care period. The FFS–CR participant must document all retrieval attempts, including the ultimate date of retrieval. Documented, diligent, good faith attempts to retrieve items of technology will be deemed to meet the retrieval requirement.

The following are the clinical goals of the CR incentive payment model, which may be advanced through beneficiary incentives:
  • Beneficiary adherence to drug regimens.
  • Beneficiary adherence to a care plan.
  • Reduction of readmissions and complications resulting from treatment for AMI or CABG.
  • Management of chronic diseases and conditions that may be affected by treatment for AMI or CABG.

Documentation of beneficiary engagement incentives:
  • FFS–CR participants must maintain documentation of items and services furnished as a beneficiary engagement incentive that exceeds $25 in retail value.
  • The documentation established contemporaneously with the provision of the items and services must include at least the following:
    ++ The date the incentive is provided.
    ++ The identity of the beneficiary to whom the item or service was provided.
  • The documentation regarding items of technology exceeding $100 in retail must also include contemporaneous documentation of any attempt to retrieve technology at the end of an AMI care period or CABG care period as described previously in this section.
  • The FFS–CR participant must retain and provide access to the required documentation in accordance with §512.715.

7. Waiver of Physician Definition for FFS–CR Participants Furnishing CR and ICR Services

a. Overview of Program Rule Waivers Under an EPM

In section III.J. of this final rule, we finalized the waivers of certain program rules that we believe offers providers and suppliers more flexibility so that they may increase coordination of care and management of beneficiaries in EPM episodes. The purpose of such flexibilities is to increase EPM episode quality and decrease episode spending or internal costs or both of providers and suppliers that results in better, more coordinated care for beneficiaries and improved financial efficiencies for Medicare, providers, and beneficiaries. These additional flexibilities are implemented through our waiver authority under section 1115A of the Act, which affords broad authority for the Secretary to waive statutory Medicare program requirements as necessary to carry out the provisions of section 1115A. We have used this authority to implement similar program rule waivers in other models, such as the CJR model, as discussed in section III.J. of this final rule.

b. General Physician Requirements for Furnishing CR and ICR Services

A cardiac rehabilitation (CR) program, as defined in §410.49(a) of regulations, means a physician-supervised program that furnishes physician prescribed exercise, cardiac risk factor modification, psychosocial assessment, and outcomes assessment. An intensive cardiac rehabilitation (ICR) program, as defined in §410.49(a) of the regulations, means a physician-supervised program that furnishes cardiac rehabilitation and has shown, in peer-reviewed published research, that it improves patients’ cardiovascular disease through specific outcome measurements described in §410.49(c). A physician is defined under §410.49(a), and under §1861(r)(1) of the Act as a doctor of medicine or osteopathy.

In general, the following physician functions are required under §410.49 in furnishing CR/ICR services:
  • Medical director—defined at §410.49(a) as a physician that oversees or supervises the cardiac rehabilitation or intensive rehabilitation program at a particular site;
  • Supervising physician—defined at §410.49(a) as a physician that is immediately available and accessible for medical consultations and medical emergencies at all times items and services are being furnished to individuals under cardiac rehabilitation and intensive cardiac rehabilitation programs;
  • Physician–prescribed exercise—defined at §410.49(a) as aerobic exercise combined with other types of exercise (that is, strengthening, stretching) as determined to be appropriate for individual patients by a physician; and
  • Establish, review, and sign an individualized treatment plan every 30 days, as described at §410.49(b)(2)(v).

c. Waiver of Physician Definition for EPM–CR Participants Furnishing CR and ICR Services

In section III.J.B. of this final rule, for cardiac rehabilitation and intensive cardiac rehabilitation services provided in an EPM–CR participant under the proposed AMI and CABG models, we are waiving the physician definition, under §410.49, to allow a physician or a qualified nonphysician practitioner to perform the functions of supervising physician, prescribing exercise, and establishing, reviewing, and signing an individualized treatment plan every 30 days. A nonphysician practitioner, for the purposes of the EPM–CR waiver is defined as a physician assistant, nurse practitioner, or clinical nurse specialist as authorized under sections 1861(s)(2)(K)(i) and (ii) of the Act and defined in section 1861(aa)(5) of the Act, or in §§410.74, 410.75, and 410.76 of the regulations. We are implementing the EPM–CR waiver to provide greater program flexibility that might increase the availability of CR and ICR services to AMI and CABG model beneficiaries. This waiver is codified at §512.630 in this final rule.

d. Waiver of Physician Definition for FFS–CR Participants Furnishing CR and ICR Services

Services provided under CR and ICR programs may be furnished to those beneficiaries in a FFS–CR participant hospital eligible to receive a CR incentive payment. To provide greater
program flexibility that might increase the availability of CR and ICR services to beneficiaries in a FFS–CR participant hospital, we proposed to provide a waiver to the definition of a physician to include a nonphysician practitioner (defined for the purposes of this waiver as a physician assistant, nurse practitioner, or clinical nurse specialist as authorized under sections 1861(s)(2)(K)(i) and (ii) of the Act and defined in section 1861(aa)(5) of the Act, or in §§ 410.74, 410.75, and 410.76 of the regulations). Thus, this proposed waiver for FFS–CR participants would allow, in addition to a physician, a nonphysician practitioner to perform the functions of supervisory physician, prescribing exercise, and establishing, reviewing, and signing an individualized treatment plan in furnishing CR and ICR services under § 410.49. This proposed waiver for FFS–CR participants is similar to the physician definition waiver for EPM–CR participants discussed in section III.J.8. of this final rule. All other definitions and requirements related to a physician or supervising physician under § 410.49 continue to apply. This proposed waiver of the physician definition would be terminated if the FFS–CR participant is terminated or is not in compliance with the CR incentive payment model. This waiver for FFS–CR participants is codified at § 512.745 in this final rule.

G. Considerations Regarding Financial Arrangements Under the CR Incentive Payment Model

As discussed in section VI.E.2. of the proposed rule (81 FR 50981), we proposed to not permit the inclusion of CR incentive payments in sharing arrangements for EPM participants specified in proposed § 512.500. Similarly, we did not propose to allow specific financial arrangements for FFS–CR participants. Thus, financial arrangements regarding CR incentive payments paid by CMS to CR participants would be subject to all existing laws and regulations, including all fraud and abuse laws and applicable CR payment and coverage requirements. Given that more than 95 percent of CR/ICR services were historically furnished by hospital outpatient departments (HOPDs) to beneficiaries in the 90 days following discharge from a hospitalization for AMI or CABG, in the proposed rule we described our expectation that in many cases the CR participant that would be accountable under the CR incentive payment model would itself carry out the model implementation activities, including coordination of CR/ICR services to CR beneficiaries, through the hospital’s own CR program. However, in other cases, depending on beneficiary choices and the availability of CR/ICR services and expertise in a CR participant’s local community, CR participants might wish to engage other individuals and entities that are not providers and suppliers, in order to advance the CR incentive payment model goals of increased CR/ICR service care coordination and the medically necessary utilization of CR/ICR services in AMI and CABG model episodes and AMI care periods and CABG care periods. Thus, we expected that all financial relationships with other individuals and entities under the CR incentive payment model would be narrowly focused on certain activities related to the CR participant’s specific plan to advance the goals of model. For example, we expected that CR participants may choose to engage with providers, suppliers, and other organizations that are neither providers nor suppliers to assist with matters such as CR/ICR service utilization data analysis; beneficiary outreach; CR beneficiary care coordination and management for CR/ICR service referral and adherence to a treatment plan; CR participant compliance with the terms and conditions of the CR incentive payment model; or other model activities. These individuals and entities might play important roles in a CR participant’s plans to implement the CR incentive payment model based on their direct clinical care for beneficiaries in AMI or CABG model episodes or AMI care periods and CABG care periods; their prior experience with cardiovascular risk-factor reduction and management initiatives; their care coordination expertise; or their familiarity with the local community and access to resources that may reduce barriers to beneficiary utilization of CR/ICR services. We expected that all relationships established between CR participants and other individuals and entities for such purposes of the CR incentive payment model would only be those permitted under existing law and regulation. We would also expect that all of these relationships would solely be based on the level of engagement of the individual’s or entity’s resources to directly support the CR participant’s CR incentive payment model implementation.

We recognized in the proposed rule, however, that we do not have precedent with other CMS models and programs that have a similar design to the CR incentive payment model. Thus, we sought comment on whether there are other types of financial arrangements that CR participants would wish to pursue in advancing the model goals of increased CR/ICR service care coordination and the medically necessary utilization of CR/ICR services in AMI and CABG model episodes and AMI care periods and CABG care periods. We specifically requested comments on which individuals and entities would be parties to the financial arrangements; what specific CR incentive payment model implementation activities would be included in the financial arrangements; and what methodologies would be used for sharing the CR incentive payment under such financial arrangements. In addition, we sought comment on what safeguards would be needed to ensure program integrity, protect against abuse, and ensure that the goals of the CR incentive payment model would be met. Based on comments and our early implementation experience with the CR
incentive payment model, we noted that we may make specific proposals around CR incentive payment model financial arrangements in future rulemaking.

The following is a summary of the comments received and our responses.

Comment: Several commenters urged CMS to allow CR participants to share CR incentive payments with other providers under the CR incentive payment model to assist CR participants in meeting the model goals of increasing CR/ICR service care coordination and the medically necessary utilization of CR/ICR services for beneficiaries following hospitalization for AMI or CABG. Without sharing arrangements that are not permissible under existing fraud and abuse laws, the commenters believe the model goals may be challenging to achieve while retaining beneficiary freedom of choice of CR/ICR service provider, especially in some geographic areas of the country. In one example provided by a commenter, a tertiary referral center could receive patients for treatment of AMI from distant hospitals with more limited cardiac capacity. While the tertiary referral center would be the EPM–CR or FFS–CR participant in the CR incentive payment model, the beneficiary would commonly return home to their community for CR/ICR services. The commenter claimed that the opportunity for the tertiary referral center to share some of the CR incentive payment with the referring community hospital to augment the available resources of the local CR/ICR program to facilitate service availability and beneficiary adherence to the CR/ICR treatment plan would be valuable. Some commenters expressed concern that without permitting sharing arrangements of the CR incentive payment between the CR participant and other providers of CR/ICR services, the CR incentive payment model would not incentivize adherence to CR/ICR programs at rural hospitals, CAHs, and any other CR program that is not a CR participant. The commenters believe that beneficiaries should have the choice to select where they receive CR/ICR services, and encouraged CMS to design the model such that it supports and incentivizes this choice. In general, a number of commenters urged CMS to adopt flexibility in the financial arrangements permitted under the CR incentive payment model, which they believe would lead to broader utilization of CR/ICR services.

Response: We appreciate the information provided by the commenters about the potential benefits of certain financial arrangements under the CR incentive payment model. In response to the commenters who expressed concerns about beneficiary freedom of choice of CR/ICR provider under the CR incentive payment model, we do not agree that the absence of specific financial arrangements being permitted under the model is a risk to beneficiary freedom of choice or results in the model not incentivizing CR/ICR treatment plan adherence at any CR provider that is not a CR participant. The CR participant will receive a CR incentive payment based on the totality of CR/ICR services furnished to beneficiaries in AMI and CABG episodes or AMI care periods and CABG care periods, regardless of where the beneficiary receives CR/ICR services. Therefore, the model provides a financial incentive to CR participants to coordinate CR/ICR services with any CR/ICR program selected by the beneficiary, although as we noted in the proposed rule (81 FR 50989), historically that CR program has been most commonly that of the discharging hospital who would be the CR participant. We also expect that CR participants will support the beneficiary’s choice of CR/ICR provider that is most likely to result in greater beneficiary adherence to the CR/ICR treatment plan, and that the choice of a local CR/ICR provider would often be of mutual benefit to the beneficiary and CR participant by increasing the likelihood that the beneficiary will receive more CR/ICR services than at a remote CR program. While we appreciate the interest of some commenters in sharing the CR incentive payment with other providers, our model design generally relies on the CR participant who is accountable under the CR incentive payment model itself carrying out the model implementation activities, including coordination of CR/ICR services to CR beneficiaries. To the extent CR participants may wish to engage other individuals and entities to advance the CR incentive payment model goals of increased CR/ICR service care coordination and the medically necessary utilization of CR/ICR services, we expect that financial relationships with these individuals and entities will be narrowly focused on certain activities related to the CR participant’s specific plan to advance the goals of the model. We also expect that all of these relationships will solely be based on the level of engagement of the individual’s or entity’s resource to directly support the CR participant’s CR incentive payment model implementation.

We made no proposals for financial arrangements under the CR incentive payment model. As we stated in the proposed rule (81 FR 50989), based on the comments on this rulemaking and our early implementation experience with the CR incentive payment model, we may make specific proposals around CR incentive payment model financial arrangements in future rulemaking. We especially need to consider the safeguards that would be needed for such financial arrangements to ensure program integrity, protect against abuse, and ensure that the goals of the CR incentive payment model would be met, because we do not have precedent with other CMS models and programs that have a similar design to the CR incentive payment model. Thus, we expect that all relationships established between CR participants and other individuals and entities for purposes of the CR incentive payment model will only be those permitted under existing law and regulation.

Final Decision: We made no specific proposals for financial arrangements under the CR incentive payment model that would allow CR participants to enter into financial arrangements with other individuals and entities to share CR incentive payments, beyond relationships permitted under existing law and regulation. We will consider the information provided by the commenters and our early implementation experience with implementation of the model and we make proposals about financial arrangements in future rulemaking.

VII. Collection of Information Requirements

As stated in section 1115A(d)(3) of the Act, Chapter 35 of title 44, United States Code, shall not apply to the testing and evaluation of models under section 1115A of the Act. As a result, the information collection requirements contained in this final rule need not be reviewed by the Office of Management and Budget. However, we have summarized the anticipated information collection requirements in the Regulatory Impact Analysis.

VIII. Regulatory Impact Analysis

We have examined the impact of this rule as required by Executive Order 12866 and other laws and Executive Orders requiring economic analysis of the effects of final rules.

A. Statement of Need

1. Need for EPM Final Rule

This final rule is necessary in order to implement and test three new EPMs under the authority of section 1115A of the Act, which allows the Innovation Center to test innovative payment and service delivery models in order to “reduce program expenditures while...
preserving or enhancing the quality of care furnished to individuals.” Under the FFS program, Medicare makes separate payments to providers and suppliers for the items and services furnished to a beneficiary over the course of treatment (an episode of care). With the amount of payments dependent on the volume of services delivered, providers may not have incentives to invest in quality-improvement and care-coordination activities. As a result, care may be fragmented, unnecessary, or duplicative. The goal for the EPMs we are finalizing in this rule is to improve the quality of care provided to beneficiaries in an applicable episode while reducing episode spending through financial accountability.

Payment approaches that reward providers for assuming financial and performance accountability for a particular episode of care can create incentives for the implementation and coordination of care redesign between participants and other providers and suppliers such as physicians and post-acute care providers. Under the EPMs we are finalizing in this rule, CMS will test whether an EPM for AMI, CABG, and SHFFT episodes of care will reduce Medicare expenditures while preserving or enhancing the quality of care for Medicare beneficiaries. We believe the EPM models have the potential to benefit Medicare beneficiaries by improving the coordination and transition of care, improving the coordination of items and services paid for through the FFS program, encouraging more provider investment in infrastructure and redesigned care processes for higher-quality and more efficient service delivery, and incentivizing higher-value care across the inpatient and post-acute care spectrum. The goal for the EPMs we are finalizing in this rule is to improve the quality of care provided to beneficiaries in an applicable episode while reducing episode spending.

The AMI, CABG, and SHFFT models require the participation of hospitals in multiple geographic areas that might not otherwise participate in testing episode payment for the EPM episodes of care. CMS is testing other episode payment models with the BPCI initiative and the CJR model. The BPCI initiative is voluntary: risk-bearing organizations applied to participate and chose from 48 clinical episodes. In the CJR model, acute care hospitals in selected geographic areas are required to participate in the CJR model for all eligible LEJR episodes that initiate at a CJR model participant hospital.

Realizing the full potential of the new EPMs requires the engagement of an even broader set of providers than have participated to date in our episode payment models such as the BPCI initiative and the CJR model. As such, we will test and evaluate the impact of episode payment for three EPMs (AMI, CABG, and SHFFT models) in a variety of circumstances, including those hospitals that may not otherwise participate in such a test.

2. Need for CJR Modifications

This final rule also includes modifications to the CJR model. Acute care hospitals in selected geographic areas are required to participate in the CJR model for LEJR episodes that initiate at a CJR model participant hospital. The modifications finalized in this rule clarify and update provisions of the CJR model and create alignment between CJR and the AMI, CABG, and SHFFT models. The primary impact of these changes are: (1) Incorporation of BPCI and CJR reconciliation payments and Medicare reporting in setting quality-adjusted target prices in performance years 3–5; and (2) updates to the calculation of composite quality scores.

3. Need for CR Incentive Payment Model

CR and intensive CR services are capable of achieving significant improvements in patient outcomes beyond the AMI and CABG model 90-day post-discharge care period. Despite evidence from multiple studies that CR services improve health outcomes, these services remain underutilized. Beneficiaries with CAD often receive care in many different settings from multiple providers over the long-term and subsequently commonly experience care that is fragmented and uncoordinated. Lack of coordination, of both care and financial incentives, across the continuum of CAD care, results in higher than necessary rates of adverse drug events, hospital readmissions, diagnostic errors, and other adverse outcomes, as well as lower than appropriate utilization of evidence-based treatments. The CR incentive payment model will test whether a financial incentive for hospitals that encourages the management of beneficiaries that have had an AMI or a CABG in ways that may contribute to long-term improvements in quality and reductions in Medicare spending.

4. Aggregate Impact of EPMs, CJR, and CR Incentive Payment Model

As detailed in Table 57, we estimate a total aggregate impact of $159 million in net Medicare savings over the duration of the AMI, CABG, and SHFFT models, July 2017 through December 2021. As detailed in Table 59, we estimate the changes in the CJR model finalized in this final rule, along with the revised assumption about the percentage of participating hospitals that will report voluntary quality data during the performance years, will lower the net Medicare savings by $26 million over the duration of the CJR model (April 2016 through December 2020) relative to the financial estimate published in the CJR final rule (80 FR 73288). These estimated impacts represent the net effect of federal transfers that incent hospitals for improving care while making it more efficient. Furthermore, the AMI, CABG, and SHFFT models may benefit beneficiaries since the models require participants to be accountable for episodes extending 90 days post-hospital discharge, which may potentially improve the coordination of FFS items and services, and encourage investment in infrastructure and redesigned care processes for high quality and efficient service delivery that demonstrate a dedication and focus toward patient-centered care. Although it is possible that participants may respond to the model test through improvements in the efficiency of care that reduce FFS Medicare spending during these episodes, such reductions in Medicare spending will be largely offset through greater reconciliation payments paid by the Medicare program to the participating hospital. As long as reductions in Medicare FFS spending for participating hospitals are equally offset through greater reconciliation payments from the Medicare program to those participating hospitals, the financial impact to the Medicare program should not be significantly different from our estimate.

As detailed in Table 60, we estimate a total aggregate impact between $29 million in net Medicare costs and $32 million in net Medicare savings from July 2017 through December 2024 through the cardiac rehabilitation incentive payment model. These estimated impacts represent the net effect of federal transfers to CR–EPM and CR–FFS participants and savings related to decreased future utilization in beneficiaries who receive CR/ICR services. A range of potential impacts is provided due to uncertainty in the likely increase in CR/ICR utilization based on the CR incentive provided.

B. Overall Impact

We have examined the impacts of this rule as required by Executive Order
C. Anticipated Effects

1. Overall Magnitude of the Model and Its Effects on the Market
a. EPMs

Nationally, the total number of historical episodes ending in CY 2014 that began with IPPS hospitalizations and extended 90 days post-hospital discharge were approximately 168,000 for AMI; 48,000 for CABG; and 109,000 for SHFFT. The total Medicare spending for these historical episodes was approximately $4.1 billion, $2.3 billion, and $4.7 billion, respectively. Based on analysis of Medicare claims for historical episodes in 2012–2014, the mean estimated total payment for AMI episodes (defined based on ICD–CM diagnosis code and DRGs as described in section III.C of this final rule) is about $24,000, where approximately 61 percent of the spending is attributable to hospital inpatient services, 18 percent is attributable to post-acute care services and 21 percent to physician, outpatient hospital and other spending. For CABG episodes (defined based on DRGs as described in section III.C of this final rule) the mean estimated total payment is about $47,000, where approximately 68 percent of the spending is attributable to hospital inpatient services, 12 percent is attributable to post-acute care services and 20 percent to physician, outpatient hospital and other spending. For SHFFT episodes (defined based on DRGs as described in section III.C of this final rule) the mean estimated total payment is about $43,000, where approximately 33 percent of the spending is attributable to hospital inpatient services, 50 percent is attributable to post-acute care services and 17 percent to physician, outpatient hospital and other spending.

We finalized our proposal to test the AMI and CABG models in 98 MSAs out of 293 MSAs (we proposed to use 294 MSAs, however, due to the Vermont All Payer model being exempted from the final EPMs as discussed in section III.B.2 of this final rule, the number of eligible MSAs dropped to 293) eligible for selection, as described in section III.B.5. of this final rule; we finalized our proposal to test the SHFFT model in 67 MSAs in which CJR is currently operating as discussed in section III.B.4. of this final rule. In the 2014 calendar year there were 136,000 episodes for AMI, and 42,000 for CABG in the 294 MSAs proposed as eligible for selection, and 33,000 episodes for SHFFT in the 67 MSAs eligible for participation.

b. CJR

The overall magnitude of the CJR model is described in the CJR final rule (80 FR 73288). The modifications finalized in this rule are not related to episode definition or hospital selection and therefore do not affect the number of episodes included in the model or the mean episode payment. The primary impact of the changes we finalized relate to the calculation of quality-adjusted target prices, which will now incorporate reconciliation payments and Medicare repayments in years 3 through 5 of the model and include modifications to the calculation of composite quality scores. For the CJR final rule we assumed that hospitals would not report voluntary THA/TKA patient-reported outcome-based data to CMS. Given our experience with performance year 1 of CJR, we revised our assumption for this analysis to assume that 27 percent of participants in performance years 1 and 2, 63 percent of participants in performance year 3, and 99 percent of participants in performance years 4 and 5 will report this quality data. These modifications along with the revised assumptions regarding quality reporting raise the costs estimated to the Medicare program by $26 million from the estimate of $343 million in savings as published in the CJR final rule (80 FR 73288).

c. CR Incentive Payment Model

We finalized our proposal to test the CR incentive payment model in 45 of the 98 MSAs selected for the AMI and CABG EPMs, as well as 45 FFS MSAs selected through stratified random sampling, as described in section VI of this final rule. As discussed subsequently in this analysis and displayed in Table 60, this is likely to result in an impact between $29 million in net Medicare costs and $32 million in net Medicare savings from July 2017 through December 2024.

d. Aggregate Effects on the Market

There may also be spillover effects in the non-Medicare market, or even in the Medicare market in other areas as a result of the EPM and CR models. Changes in Medicare payment policy often have substantial implications for non-Medicare payers. As an example, non-Medicare patients may benefit if participating EPM hospitals introduce system wide changes that improve the coordination and quality of health care. Other payers may also be developing episode payment models and may align their payment structures with the EPM and CR models or may utilize results from CMS evaluations of these models.
Because it is unclear whether and how spillover effects may apply to a test of a new payment model (as opposed to a change in permanent policy), our analyses assume that spillovers effects on non-Medicare payers will not occur, although this assumption is subject to considerable uncertainty.

2. Effects on the Medicare Program

a. EPMs

Under this final rule, we will test whether an EPM for AMI, CABG, and SHFFT episodes of care will reduce Medicare expenditures while preserving or enhancing the quality of care for Medicare beneficiaries. Payment approaches that reward providers for assuming financial and performance accountability for a particular episode of care can potentially create incentives for the implementation and coordination of care redesign between participants and other providers and suppliers such as physicians and post-acute care providers. The EPMs could enable hospitals to consider the most appropriate strategies for care redesign, including—(1) increasing post-hospitalization follow-up and medical management for patients; (2) coordinating across the inpatient and post-acute care spectrum; (3) conducting appropriate discharge planning; (4) improving adherence to treatment or drug regimens; (5) reducing readmissions and complications during the post-discharge period; (6) managing chronic diseases and conditions that may be related to the proposed EPM episodes; (7) choosing the most appropriate post-acute care setting; and (8) coordinating between providers and suppliers such as hospitals, physicians, and post-acute care providers.

We will test and evaluate the impact of episode payment for the AMI, CABG, and SHFFT models in a variety of circumstances, including those hospitals that may not otherwise participate in such a test. The clinical circumstances of these episodes differ in important ways from the LEJR episodes included in the CJR model. We expect the patient population included in these episodes would be substantially different from the patient population in CJR episodes, due to the clinical nature of the cardiac and SHFFT episodes. Beneficiaries in these episodes commonly have chronic conditions that contribute to the initiation of the episodes, and need both planned and unplanned care throughout the EPM episode following discharge from the initial hospitalization that begins the episode. Both AMI and CABG model episodes primarily include beneficiaries with cardiovascular disease, a chronic condition which likely contributed to the acute events or procedures that initiate the episodes. About half the average AMI model historical episode spending was for the initial hospitalization, with the majority of spending following discharge from the initial hospitalization due to hospital readmissions, while there was relatively less spending on SNF services, Part B professional services, and hospital outpatient services. In CABG model historical episodes, about three-quarters of episode spending was for the initial hospitalization, with the remaining episode spending relatively evenly divided between Part B professional services and hospital readmissions, and a lesser percentage on SNF services. Similar to AMI episodes, post-acute care provider use was relatively uncommon in CABG model historical episodes, while hospital readmissions during CABG model historical episodes were relatively common. SHFFT model historical episodes also were accompanied by substantial spending for hospital readmissions, and post-acute care provider use in these episodes also was high.

We believe that by requiring participation by a large number of hospitals with diverse characteristics, the EPMs will result in a robust data set for evaluating this payment approach, and will stimulate the rapid development of new evidence-based knowledge. Testing the EPMs in this manner will also allow us to learn more about patterns of inefficient utilization of health care services and how to possibly incentivize quality improvement for beneficiaries receiving services in AMI, CABG, and SHFFT episodes.

Under the EPMs, as described further in section III.B. of this final rule, an AMI, CABG, or SHFFT model episode would begin with an inpatient admission assigned to one of the following MS–DRGs upon beneficiary discharge: For AMI episodes, AMI MS–DRGs (280–282) and those PCI MS–DRGs (246–251) representing IPPS admissions for AMI that are treated with PCIs; CABG MS–DRGs (231–236); and SHFFT MS–DRGs (480–482). Episodes will end 90 days after the date of discharge from the anchor hospitalization. The EPM episodes will include the inpatient stays and all related care covered under Medicare Parts A and B within the 90 days after discharge, including hospital care, post-acute care, and physician services. Furthermore, we have designated EPM participant hospitals to be the episode initiators and to be financially responsible for episode cost under the proposed EPMs. We require all hospitals paid under the IPPS and physically located in selected geographic areas to participate, with limited exceptions. Eligible beneficiaries who receive care at these hospitals will automatically be included in the models. Participating geographic areas, based on MSAs, were selected through a random sampling methodology. We believe the EPMs may have financial and quality of care effects on non-hospital providers that are involved in the care of Medicare beneficiaries during model episodes, improving the coordination of items and services paid for through Medicare FFS, encouraging more provider investment in infrastructure and redesigned care processes for higher quality and more efficient service delivery, and incentivizing higher value across the inpatient and post-acute care spectrum spanning the episode of care.

As described in section III.D.3. of this final rule, we will continue paying hospitals and other providers and suppliers according to the usual Medicare FFS payment systems. After the completion of a performance year, the Medicare claims payments for services furnished to the beneficiary during the EPM episode, based on claims data, will be combined to calculate an actual EPM episode payment. The actual EPM episode payment will then be reconciled against an established EPM quality-adjusted target price. The amount of this calculation, if positive, will be paid to the participant in a reconciliation payment. If negative, we will require repayment from the participant beginning in performance year 2 of the EPMs for participants who elect early downside risk and performance year 3 for participants who do not elect early downside risk. EPM participants’ quality performance also will be assessed at reconciliation. A participant would receive a composite quality score and a corresponding quality category. EPM participants achieving a quality category of “acceptable” or higher will be eligible for a reconciliation payment. We will phase in the requirement that participants whose actual EPM episode payments exceed the quality-adjusted target price pay the difference back to Medicare during performance years 2, 3, and 4 for participants who elect early downside risk and during performance years 3 and 4 for those who do not elect...
early downside risk. Under this final rule, Medicare will not require repayment from participants for performance year 1 for actual EPM episode payments that exceed their quality-adjusted target price in performance year 1, and an applicable discount factor would be used for calculating repayment amounts for performance years 2, 3 and 4 for participants who elect early downside risk beginning January 1, 2018 and for performance years 3 and 4 for participants who do not elect early downside risk.

Due to the clinical characteristics and common patterns of care in AMI model episodes, we will perform payment adjustments in the cases of certain transfers and readmissions of beneficiaries to inpatient hospitals for these episodes. These payment adjustments are discussed in detail in section III.D. of this final rule. We also will limit how much a participant can gain or lose based on its actual EPM episode payments relative to quality-adjusted target prices; we are finalizing additional policies to further limit the risk of high payment cases for all EPM participants and for special categories of EPM participants as described in section III.D. of this final rule.

Based on the mix of financial and quality incentives, the EPMs could result in a range of possible outcomes for participants. The effects on hospitals of potential savings and liabilities will have varying degrees.

(1) Assumptions

We used standardized Medicare claims data from January 2013 through March 2016 to simulate the impact that the EPMs would have on Medicare spending for AMI, CABG, and SHFFT model episodes. Specifically, we applied the methodology provided in this final rule for calculating quality-adjusted target prices. For the SHFFT model, we applied this methodology to hospitals in the MSAs in which CJR is currently operating which have historical data for SHFFT procedures. For the AMI and CABG models, we applied this methodology to the hospitals in the 98 MSAs selected for participation in the cardiac EPMs. Quality-adjusted target prices were calculated based on hospital performance from 90-day episodes starting between January 2013 and December 2015. Specifically, all IPPS hospitals in the selected MSAs were included in this analysis after applying the model-specific hospital exclusions based on participation in CJR Model 2 or 4 for the AMI, PCI, CABG, or SHFFT models, as appropriate, as established in this final rule. Individual episodes were removed if they initiated a BPCI episode that had precedence over the EPM.

We identified the anchor hospitalization based on episode definition criteria in section III.C. of this final rule and included the related spending that occurred 90 days after discharge. We removed payments excluded from the episode as unrelated to the EPM episode diagnosis and procedures based on clinical rationale, as defined in section III.C.3.b. of this final rule. Payments during the 90-day episodes were calculated using standardized Medicare payment amounts.

We trended utilization and prices in the prior years to match national performance for episodes starting from January 2015 through December 2015. BPCI reconciliation payments were then credited to BPCI episodes during this time frame. We then incorporated the final outlier policy to cap spending for high cost outliers such that payments were capped at the price MS–DRG anchor value that is 2 standard deviations above the regional mean as described in section III.D. of this final rule.

After we pooled episodes for each price MS–DRG, we calculated average episode prices for each hospital and region, as well as a hospital-specific weight representing a case mix value for each hospital that is dependent only on episode volume for a given price MS–DRG and the national anchor factor. We then calculated blended prices for each hospital, with prices set at two-thirds of the hospital’s experience and one-third of the region’s average experience for performance years 1 and 2 of the model, as one-third of the hospital’s experience and two-thirds of the region’s experience performance year 3 of the model, and as the region’s average experience for performance years 4 and 5 of the model. We made an exception for hospitals with low historical episode volume across the 3 historical years, with low volume as defined in section III.D.7.c. of this final rule, by setting their episode benchmark price as the region’s experience. These average prices were then disaggregated based on the national severity factor of average episode spending as described in section III.D. of this final rule. The computed hospital-specific weight, the hospital’s wage index, and a discount specific to the hospital’s quality category based on historical quality performance for EPM participants was then applied back to the price MS–DRG.

After calculating quality-adjusted target prices for applicable MS–DRGs for each hospital for performance years 1 and 2, we compared these quality-adjusted target prices against actual performance between January 2015 and December 2015. We capped actual spending for individual episodes based on the methodology in this final rule for high cost outlier spending episodes. After incorporating the outlier policy, total Medicare FFS spending was reconciled against the quality-adjusted target price and total number of episodes for the hospital. The aggregate impacts were then determined by multiplying by the total episodes for each price MS–DRG.

We summed the difference between each episode’s actual payment and the relevant quality-adjusted target price (calculated as quality-adjusted target price subtracted by actual episode payment) and aggregated the difference for all episodes for a participant within the performance year, creating the NPRA. Any positive NPRA amount greater than the stop-gain limit was capped at the stop-gain limit of 5 percent in performance years 1, 2, and 3, 10 percent in performance year 4, and 20 percent in performance year 5. In addition, any negative NPRA amount exceeding the stop-loss limit was capped at the stop-loss limit as described in section III.D. of this final rule, with a 5 percent repayment limit in performance year 2 (for participants who elect early downside risk), 5 percent repayment limit in performance year 3, 10 percent repayment limit in performance year 4, and 20 percent repayment limit in performance year 5. For rural hospitals, MDHS, SCHs and RRCs, the repayment limit was capped at the stop-loss limit as described in section III.A.2.a. of this final rule, with a 3 percent repayment limit in performance year 2 (for participants who elect early downside risk), 3 percent repayment limit in performance year 3, and 5 percent repayment limit in performance years 4 and 5. As described in section III.D.7.e. of this final rule, if average 30-day post-episode spending for an EPM participant in any given EPM performance year is greater than 3 standard deviations above the regional average 30-day post-episode spending, based on the 30-day post-episode spending for episodes attributed to all regional hospitals in the same region as the EPM participant hospital, the EPM participant hospital must repay Medicare for the difference. Assuming the impact to hospital behavior, very few hospitals are expected to have average post-episode spending exceeding 3 standard deviations from their regional mean. Based on an analysis of 30-day
post episode spending for EPMs starting in the 2015 calendar year, very few hospitals in the MSAs selected for the EPM had average post-episode spending exceeding 3 standard deviations. The estimates in the impact analysis are rounded to the nearest million, and the estimated post-episode reconciliation payments to be made from hospitals to the Medicare program are minimal and estimated to round down to 0 million.

As described in section III.E. of this final rule, we are finalizing the use of a composite quality score for each EPM, where the composite quality score reflects a combination of outcome and patient experience measures, and, as described later in this section, we have incorporated this approach in our estimate of impacts. Under the EPMs, points for quality performance and improvement (as applicable) will be awarded for each episode measure and then summed to develop a composite quality score that will determine the EPM participant’s quality category for the episode. Quality performance will make up the majority of available points in the composite quality score, with improvement points available as “bonus” points for the measure. Additionally, participants may voluntarily submit outcome measures data all EPMs, resulting in an extra 2 points in their overall quality scores, up to a maximum score of 20. The composite quality score will be used as part of a pay-for-performance methodology to assign respective EPM participants to four quality categories. Hospitals assigned as ‘below acceptable’ will not be eligible for a reconciliation payment and will be subject to a 3 percent discount. Hospitals assigned as ‘acceptable’ will be eligible for a reconciliation payment and will be subject to a 3 percent discount. Hospitals assigned as ‘good’ will be eligible for a reconciliation payment and will be subject to a 2 percent discount. Lastly, hospitals assigned as ‘excellent’ will be eligible for a reconciliation payment and will be subject to a 1.5 percent discount.

Specifically, we used the following data to model the impact of this policy: To calculate performance for the AMI model, we utilized: Hospital 30-day, all-cause, risk-standardized mortality rate following acute myocardial infarction hospitalization (NQF #0230) measure results based on the performance period of April 1, 2012 through March 31, 2015; excess days in acute care after hospitalization for acute myocardial infarction measure results based on the performance period of April 1, 2012 through March 31, 2015; and HCAHPS survey data (NQF #0166) 2015 based on the performance period of January 1, 2015 through December 31, 2015.

To calculate improvement for the AMI model, we utilized: Hospital 30-day, all-cause, risk-standardized mortality rate following acute myocardial infarction hospitalization (NQF #0230) measure results based on the performance period of April 1, 2011 through March 31, 2014; excess days in acute care in performance year 3, and 99 percent standard deviation. The AMI excess days measure was not available for the AMI excess days measure, we randomly assigned improvement points for this
measure (0.5 points) to 10 percent of hospitals. For SHFFT, hospitals in the participating MSAs were assigned to a performance percentile and assigned the corresponding quality performance score points listed in Table 30 of this final rule, based on their performance in the historical performance data described earlier. Hospitals that did not have a reported measure result were assigned to the 50th performance percentile. Hospitals assigned a quality measure performance percentile for the most recent year that improved by at least 2 deciles from the prior year received quality improvement points.

Based on these composite quality scores, hospitals were assigned to a quality category of “below acceptable”, “acceptable”, “good” or “excellent” based on their composite quality scores. As discussed in section III.E. of this final rule, composite quality scores will affect hospitals’ eligibility for reconciliation payments and determine hospitals’ effective discount percentages at reconciliation.

To simulate the impact for performance year 1 (July 1, 2017 through December 31, 2017), we calculated the NPRA using a blended quality-adjusted target price calculated for performance year 1, that is two-thirds hospital experience and one-third regional experience, and applied no downside risk to participants as defined in section III.D.2.c. of this final rule. For the simulation in performance year 2, we rebased episode prices to incorporate the reconciliation payments (as described in section III.D. of this final rule) simulated from the first performance year. To simulate reconciliation for performance years 2, 3, 4, and 5, we used the quality-adjusted target price calculated as one-third of the hospital’s experience and two-thirds of the regional experience. We included a 5 percent stop-loss and stop-gain limit on reconciliation payments and repayments for participants with the exception of a 3 percent stop-loss and stop-gain limit for rural hospitals, sole community hospitals, and low-volume hospitals as defined in section III.D.2.c of this final rule.

The first performance year of the EPMs is expected to cost the Medicare program $10 million in reconciliation payments made to participants. Participants that receive reconciliation payments must earn a quality rating of “Acceptable” or better and are the participants that provide lower cost care relative to quality adjusted target prices, which reflect both hospital and regional historical spending.

Table 57 summarizes the estimated impact for the AMI, CABG, and SHFFT models. Our model estimates that the Medicare program will save $159 million over the 5 performance years (2017 through 2021).
In the second performance year of the EPMs, the Medicare program on net is expected to pay $25 million to participants. This includes $26 million in reconciliation payments made by the Medicare program to participants, and $1 million in payments made to the Medicare program from participants that elect downside risk in year 2. Participants may elect early downside risk beginning January 1, 2018 as discussed in section III.D.2.c. of this final rule. For participants who do not elect early downside risk, downside risk will not be applied for the entirety of the second performance year. For participants who elect early downside risk in performance year 2, a 5 percent stop-loss and stop-gain limit will apply, subject to a 3 percent stop-loss and stop-gain limit for rural hospitals, sole community hospitals, Medicare dependent hospitals, rural referral center hospitals and certain low-volume hospitals. These limits would cap the total amount of repayments paid by participants to the Medicare program.

For this analysis, we assumed 10 percent of participants will elect early downside risk.

In the third performance year of the models, net reconciliation payments are expected to be $34 million in savings to the Medicare program. This includes $33 million in payments from the Medicare program to participants, and $67 million in payments from participants to the Medicare program. For performance years 4 and 5 of the models, the episode quality-adjusted target price will be based on full regional pricing. This is expected to create greater variation between the quality-adjusted target price and participants’ own experience. The stop-gain and stop-loss limits of 20 percent for performance year 5 apply, with a stop-gain and stop-loss limit of 5 percent for rural hospitals, sole community hospitals, Medicare dependent hospitals, rural referral centers hospitals, and certain low-volume hospitals. As a result, net payments are expected to be $49 million from participants to the Medicare program in the fourth year and $112 million in the fifth year. In performance year 4 this includes $59 million in payments from the Medicare program to participants, and $108 million in payments from participants to the Medicare program. In performance year 5 this includes $59 million in payments from the Medicare program to participants, and $171 million in payments from participants to the Medicare program. These estimated savings in years 4 and 5 represent an average of 2.1 percent of total episode spending in those years. The total savings to the Medicare program after the 5 performance years is expected to be $159 million out of $15.0 billion or 1.0 percent of total episode spending.

Table 58 summarizes the estimated reconciliation payments for the AMI, CABG, and SHFFT models over the 5 performance years (2017 through 2021) for the selected MSAs.

(3) Uncertainties

These estimates are somewhat uncertain. As a result, the EPMs could produce more Medicare savings or could result in additional costs to the Medicare program. This analysis assumes that the incentives under the models drive no change in utilization of services within the episode, as this would not materially affect the estimated financial impacts to the Medicare program. The prospective prices for the episodes incorporate price updates from the FFS payment systems, but no change in utilization for the performance years is assumed. If there is a national increase in utilization within each episode that is not driven by the incentives under the models, then savings to the Medicare program may increase due to greater repayments paid back to Medicare. If there is a national decrease in utilization within each episode that is not driven by the incentives under the models, then costs to the Medicare program may increase due to greater reconciliation payments paid by Medicare to participants.

We also assume that 27 percent of hospitals will submit voluntary measures in performance years 1 and 2, consistent with current experience in performance year 1 for CJR. We assume the percentage of hospitals that submit quality data will increase in 63 percent in performance year 3, and 99 percent in performance years 4 and 5 to qualify for the reduced discount. As a sensitivity test, if no hospitals report the voluntary measures for any of the three EPMs, the models together are estimated to save the Medicare program an additional $27 million over the 5 performance years.

Additionally, we were unable to fully estimate the impact of the proposal in section III.D. of this final rule, which addresses beneficiaries in EPMs who are also aligned or attributed to a Medicare Shared Savings Program participant or a participant in an ACO model initiated by the CMS Innovation Center. Savings achieved during an EPM episode will be attributed to the EPM participant, with EPM reconciliation payments for ACO-aligned beneficiaries treated as ACO expenditures, which should serve to minimize the financial impact of ACO expenditures on overall savings. As described in section III.D.6. of this final rule, beginning in July 2017 we will exclude from AMI, CABG, and SHFFTI episodes beneficiaries aligned to ACOs in the Next Generation ACO model, Shared Savings Program Track 3, and ESRD ESCOs in the Comprehensive ESRD Care Initiative in tracks with downside risk for financial losses. Excluding these beneficiaries from the EPMs will have the effect of reducing the number of eligible episodes and therefore the expected savings generated by implementation of the EPMs. To model the impact of these exclusions, we assume that the percentage of the FFS population aligned to the Next Generation ACO model, Shared Savings Program Track 3, and ESRD ESCOs in the Comprehensive ESRD Care initiative remains constant over the 5 performance years of the EPM model, and is similar to the distribution of beneficiaries aligned to these models for the 2017 calendar year.

Due to the uncertainty of estimating the impacts of the EPMs, actual results could be higher or lower than these estimates. Additionally, we note that for these estimates, we did not make assumptions for changes in efficiency or utilization over the course of the performance period. Our analysis presents the cost and transfer payment effects of this final rule to the best of our ability. We solicited comments on the assumptions and analysis presented.

The following is a summary of the comments received and our responses. Response: We appreciate the interest of the commenter to obtain a breakdown of costs and savings attributable to the cardiac rehabilitation incentive payment model separate from the AMI, CABG and SHFFTI EPM costs and savings and requested that we provide this information.

Response: We appreciate the commenters’ concern for the potential economic impact that the EPMs may have on beneficiaries’ families and family caregivers such as increased home health care needs. The commenter stated that they believe there is a great deal of economic impact on families due to missed work or other out of pocket costs which might increase due to shortened stays at inpatient or rehabilitation facilities resulting from the EPMs. The commenter requested that CMS provide greater detail with regard to the modeling methods utilized in our estimates. The commenter requested that we further explain the implications on physician practice under the model.

Response: Our estimates of the impacts of the EPMs do not include assumptions about behavioral change on the part of providers and suppliers or other entities other than participating hospitals as a result of the EPMs. The EPMs could enable participants to consider the most appropriate strategies for care redesign with collaborating entities including physicians, such as—

1. increasing post-hospitalization follow-up and medical management for patients;
2. coordinating across the inpatient and post-acute care spectrum;
3. conducting appropriate discharge planning;
4. improving adherence to treatment or drug regimens;
5. reducing readmissions and complications during the post-discharge period;
6. managing chronic diseases and conditions that may be related to the proposed EPM episodes; and

(8) coordinating between providers and suppliers such as hospitals, physicians, and post-acute care providers.

In addition, as discussed in section I.B.5 of this final rule, the EPMs create an opportunity for physicians to collaborate in order to participate in Track 1 of the EPMs to be eligible for qualification for Advanced APM. For purposes of modeling impacts, we have assumed that only 1 percent of participants will elect to take on downside risk in performance year 2 to qualify as an Advanced APM. Participation in the Advanced APMs may result in net profits or losses for collaborating physicians. For more information on Advanced APMs, please see the MIPS and Alternative Payment Model (APM) Incentive Under the Physician Fee Schedule, and Criteria for Physician-Focused Payment Models final rule with comment period (81 FR 77008 through 77831). We refer readers to Table 57, where we provide the estimated impact associated with the implementation of the EPMs.

b. CJR

We are finalizing our proposal to modify the CJR model to include reconciliation payments and Medicare repayments in our calculations when updating CJR episode quality-adjusted target prices for performance years 3 through 5. We are also finalizing our proposal to create consistency between the CJR composite quality scores and SHFFT composite quality scores by—(1) awarding quality improvement points based on an improvement of 2 deciles (rather than 3 deciles as in the final CJR rule); (2) capping the total composite quality score at 20; and (3) utilizing an updated HCAHPS algorithm.

(1) Assumptions and Uncertainties

We used final action Medicare claims data from January 1, 2012 through December 31, 2014 to update the impact originally outlined in the CJR final rule (80 FR 73288) to reflect the changes finalized in this final rule for the CJR model. Specifically, we estimated the effect of including BPCI and CJR reconciliation payments and Medicare repayments in setting quality-adjusted target prices for performance years 3–5. We also updated our prior assumption regarding CJR participation with voluntary reporting of quality data to be more consistent with prior experience. The estimates assume that 27 percent of CJR participants will submit quality data in performance years 1 and 2, consistent with preliminary results regarding quality reporting in performance year 1. The model then assumes that more hospitals will submit quality data over time to qualify for a lower discount, with 63 percent reporting quality data in performance year 3, and 99 percent in performance years 4 and 5.

To simulate changes in the calculation of the CJR composite scores, we used quality data as publicly reported on Hospital Compare in 2015 and 2016 to estimate the impact of this policy, with 2016 measures used to calculate performance and the difference between 2015 and 2016 measures used to calculate improvement. We calculated the HLMR by using 10 of the 11 publicly reported measures, taking the average of all publicly reported measures except how well hospital staff help patients manage pain, consistent with revisions under consideration for this HCAHPS measure. Calculations are as follows:

- To calculate performance for the CJR model, we utilized hospital-level risk-standardized complication rate following elective primary total hip arthroplasty (THA) and/or total knee arthroplasty (TKA) measure results based on the performance periods of April 1, 2012 through March 31, 2015 and HCAHPS survey data (NQF #0166) 2015 based on the performance period of January 1, 2015 through December 31, 2015.

- To calculate improvement for CJR, we utilized hospital-level risk-standardized complication rate following elective primary total hip arthroplasty (THA) and/or total knee arthroplasty (TKA) measure results based on the performance periods of April 1, 2011 through March 31, 2015 and HCAHPS survey data (NQF #0166) 2015 based on the performance period of January 1, 2014 through December 31, 2014.

For the purpose of this analysis, we assumed that 99 percent of hospitals participating in the CJR model will voluntarily submit patient-reported outcome measures to qualify for the lower discount by performance year 4. CJR participants were assigned to a performance percentile and assigned the corresponding quality performance score as described in the CJR final rule (80 FR 73288). Hospitals that did not have a reported measure result were assigned to the 50th performance percentile. Hospitals assigned a quality measure performance percentile for the most recent year that improved by at least 2 deciles from the prior year received quality improvement points, with the total composite quality score capped at 20. These composite quality scores, consistent with the methodology finalized in section III.E., were then applied to the development of quality-adjusted target prices as described in the CJR final rule (80 FR 73288).

We note that we finalized a modification to the application of the stop-loss and stop-gain limits to exclude hospital responsibility for post-episode spending from the application of these limits. The number of hospitals estimated to be affected by the post-episode spending calculation is anticipated to be small, and the estimated post-episode reconciliation amount is estimated to round down to 0 million.

<tr>
<td>CJR modifications net financial impact</td>
</tr>
</tbody>
</table>

* In millions. Totals do not necessarily equal the sums of rounded components.

Modifications to the CJR model as established in this final rule would begin at the time of reconciliation for performance year 1 and therefore affect estimates of the impact of the model from April 2016–December 2020. The change in the estimated net financial impact to the Medicare program from the CJR model modifications in this final rule is $22 million in spending, and the updated assumptions regarding the number of hospitals that will report
quality data result in an increase of $4 million in spending. The total estimated net financial impact to the Medicare program from both the modifications in the final rule and revised assumptions are $26 million in Medicare spending. Due to the uncertainty of estimating the impacts of this model, actual results could be higher or lower than this estimate. We are also unable at this time to estimate the impacts of considering certain CJR and EPM providers and Affiliated Practitioners to be participating in Advanced APMs. Eligible clinicians that qualify as QPs for a year through participation in EPMs and CJR will receive a bonus equal to 5 percent of their prior year Medicare payments, thereby increasing Medicare expenditures.

c. CR Incentive Payment Model

As detailed in section VI of this final rule, the CR incentive payment model will test whether a financial incentive for hospitals that encourages the management of beneficiaries that have had an AMI or a CABG in ways that may contribute to long-term improvements in quality and reductions in Medicare spending. The CR incentive payment model will test the effects on quality of care and Medicare expenditures of providing explicit financial incentives to CR participants for beneficiaries hospitalized for treatment of AMI or CABG to encourage care coordination and greater utilization of medically necessary CR/ICR services for 90 days post-hospital discharge where the beneficiary’s overall care is paid under either an EPM or the Medicare FFS program.

Under the CR incentive payment model, we will provide a CR incentive payment to selected hospitals with financial responsibility for AMI or CABG model episodes (hereinafter EPM–CR participants) because they are already engaged in managing the AMI or CABG model beneficiary’s overall care for a period of time following hospital discharge. We will also provide a CR incentive payment to selected hospitals that are not AMI or CABG model participants (hereinafter FFS–CR participants), enabling us to test and improve our understanding of the effects of the CR incentive payment within the context of an EPM and the Medicare FFS program, as well as to identify potential interactions between the CR incentive payment and the underlying EPM and FFS payment methodologies. We will test the CR incentive payment model in 45 of the 98 MSAs selected for the AMI and CABG EPMs, as well as 45 FFS MSAs selected through stratified random sampling.

(1) Assumptions and Uncertainties

We used final action Medicare claims data from January 1, 2012 through December 31, 2015 to identify CR and ICR services that count towards CR incentive payments on the basis of the presence of the HCPCS codes on PFS and OPPS claims and APC codes on OPPS claims that report CR/ICR services. We then compared total Medicare spending over 3 years post hospital discharge for AMI and CABG for beneficiaries that received cardiac rehabilitation services within 90 days of discharge, to beneficiaries that did not receive cardiac rehabilitation services within 90 days of discharge. We found that among beneficiaries continuously enrolled over 3 years in FFS Medicare Part A and B those receiving cardiac rehabilitation services within 90 days of discharge from an AMI and or CABG hospitalization had lower Medicare spending relative to beneficiaries whom did not receive cardiac rehabilitation services post discharge from an AMI and or CABG hospitalization, even after adjusting for differences in age, sex, and case-mix between the two populations. The difference in average spending between the group that did take cardiac rehabilitation services and the group that did not receive cardiac rehabilitation services within 90 days of discharge represents the reduction in Medicare spending we would anticipate from an additional beneficiary receiving cardiac rehabilitation services due to the cardiac rehabilitation incentive payment model. However, adjusting for age, sex and case-mix may not fully account for other characteristics in the cardiac rehabilitation population compared to patients who did not receive such services that may account for the difference in Medicare spending.

CR incentive payments apply to CR/ICR sessions during the 90-day episode (for EPM participants) or 90-day care period (for FFS participants) from date of discharge. CR and ICR services paid by Medicare to any provider or supplier for model beneficiaries during AMI or CABG model episodes/care periods would result in participant eligibility for CR incentive payments. To model the impact of the cardiac rehabilitation incentive payment model, we calculated the costs of the incentive payments for beneficiaries receiving cardiac rehabilitation services, as well as any reduction in Medicare spending due to more beneficiaries receiving cardiac rehabilitation services. For the 90 MSAs selected for the cardiac rehabilitation incentive payment model, we used final action Medicare claims data for the 2015 calendar year to calculate what the cardiac rehabilitation incentive payments would be for all beneficiaries receiving cardiac rehabilitation services within 90 days of an AMI and CABG hospitalization. For a given increase in the proportion of beneficiaries observed in the 2015 calendar year that received cardiac rehabilitation services (see table 60), we calculated both the cost of the cardiac rehabilitation incentive payments for these additional beneficiaries, as well as the estimated reduction in Medicare spending over a 3-year period due to these additional beneficiaries receiving cardiac rehabilitation services. We estimated spending based on the pricing structure described in section VI.E. of this final rule. For a given rate of beneficiaries receiving cardiac rehabilitation services, we summed the costs of CR incentive payments. We then subtracted the estimated reduction in Medicare spending due to the increase in the rate of beneficiaries receiving cardiac rehabilitation services relative to the rate receiving such services in the 2015 calendar year to arrive at the net financial impact. This analysis considers the impact of increased utilization on transfer payments from Medicare to providers, as well as beneficiary copays and coinsurance.

We recognize that utilization of CR/ICR services is driven by many factors, and we lack sufficient data to reliably estimate the effect of a CR incentive payment on beneficiary utilization of CR/ICR services, particularly during the 90-day episode/care period. Therefore, we calculated a range of potential impacts based on alternatives in the increase in cardiac rehabilitation utilization, ranging from no change to an increase in utilization of 4 percentage points.

(2) Analyses
Table 60 summarizes the estimated impact for the CR incentive payment model. Our model estimates that the impact on Medicare spending may range from up to $29 million of spending to $32 million of savings between 2017 and 2024, depending on the change in utilization of CR/ICR services under the model. The estimate only considers the financial effects of additional beneficiaries receiving CR/ICR services, and does not take into account potential changes in the volume of CR/ICR services that beneficiaries may receive within 90-days of hospital discharge. Increasing CR/ICR services within 90 days of hospital discharge will increase CR/ICR incentive payments, and may influence Medicare spending after the 90 day episode. Due to the uncertainty of estimating the impacts of this model, actual results could be higher or lower than this estimate. Our analysis presents the cost and transfer payment effects of this final rule to the best of our ability. We solicited comments on our assumptions and analysis presented in the proposed rule (81 FR 50989 through 51002). However, we did not receive comments on this topic.

d. Further Consideration

We can use our experience in previous implementation of bundled payment models to help inform our impact analyses. We have previously used our statutory authority to create payment models such as the BPCI initiative and the ACE Demonstration to test bundled payments, as well as the CJR model. Under the authority of section 1866C of the Act, the Medicare program funded a 3-year demonstration, the ACE Demonstration. The demonstration used a prospective global payment for a single episode-of-care as an alternative approach to payment for service delivery under traditional Medicare FFS. The episode-of-care was defined as a combination of Parts A and B services furnished to Medicare FFS beneficiaries during an inpatient hospital stay for any one of a specified set of cardiac and orthopedic MS–DRGs. The discounted bundled payments generated an average gross savings to Medicare of $585 per episode for a total of $7.3 million across all episodes (12,501 episodes) or 3.1 percent of the total expected costs for these episodes. After netting out the savings produced by the Medicare Parts A and B discounted payments and some increased PAC costs that were observed at two sites, Medicare saved approximately $4 million, or 1.72 percent of the total expected Medicare spending.

Additionally, we are currently testing the BPCI initiative. Under this initiative, entities enter into payment arrangements with CMS that include financial and performance accountability for episodes of care. The BPCI initiative is evaluating the effects of episode-based payment approaches on patient experience of care, outcomes, and cost of care for Medicare FFS beneficiaries. We believe that our experiences with BPCI support the design of the EPMs.

Although there is some evidence from BPCI and ACE suggesting that providers may improve their performance, the participants that volunteered to participate may be in a better position to reduce episode spending relative to the average provider. The CJR model is testing the first bundled payment model under the Innovation Center authority in which providers are required to participate. The CJR model test began in April 2016 and we are finalizing refinements to the CJR in this final rule to support successful implementation. The design of the EPMs finalized in this rule incorporates early learnings from the CJR model.

Finally, although we project savings to Medicare under the EPMs and updated CJR, as stated earlier, we note that under section 1115A(b)(3)(B) of the Act, the Secretary is required to terminate or modify a model unless certain findings can be made with respect to savings and quality after the model has begun. If during the course of testing it is determined that termination or modification is necessary, such actions would be undertaken through rulemaking.

3. Effects on Beneficiaries

We believe that episode payment models may have the potential to benefit beneficiaries because the intent of the models is to test whether providers under episode payment models are able to improve the coordination and transition of care, invest in infrastructure and redesigned care processes for high quality and efficient service delivery, and incentivize higher value care across the inpatient and post-acute care spectrum spanning the episode of care. We believe that episode payment models have a patient-centered focus such that they incentivize improved healthcare delivery and communication delivered around the needs of the beneficiary, thus potentially benefitting the beneficiary community. However, the EPMs do not affect beneficiary cost sharing for services or premiums paid by beneficiaries. If there is a shift in services utilized within each episode, then beneficiary cost sharing could be higher or lower than would otherwise be experienced.

We finalized the use of several patient outcomes and patient experience measures to tie payment to quality performance with the intent that this approach encourages the provider community to focus on and deliver improved quality care for Medicare beneficiaries. Additionally, participants must meet an acceptable level of quality performance in order to qualify to

*In millions of dollars. Totals do not necessarily equal the sums of rounded components.
receive a reconciliation payment. The accountability of participants for both quality and cost of care provided for Medicare beneficiaries within episodes provides participants with new incentives to improve the health and well-being of the Medicare beneficiaries they treat.

Additionally, the EPMs and CJR do not affect the beneficiary’s freedom of choice to obtain health services from any individual or organization qualified to participate in the Medicare program guaranteed under section 1802 of the Act. Eligible beneficiaries who choose to receive services from a participant would not have the option to opt out of inclusion in the models. Although the EPMs and CJR allow participants to enter into risk-sharing arrangements with certain other providers, and participants may recommend those providers to the beneficiary, participants may not prevent or restrict beneficiaries to any list of preferred or recommended providers.

Many controls exist under Medicare to ensure beneficiary access and quality, and we have proposed to use our existing authority, if necessary, to audit participants if claims analysis indicates an inappropriate change in delivered services. As described in section III.G. of this final rule, given that participants would receive a reconciliation payment when they are able to reduce average spending per episode and achieve acceptable or greater quality performance, they could have an incentive to avoid complex, high cost cases by referring them to nearby facilities or specialty referral centers. We intend to monitor the claims data from participants—for example, to compare a hospital’s case mix relative to a pre-model historical baseline to determine whether complex cases are being systematically excluded.

Furthermore, we also proposed to require providers to supply beneficiaries with written information regarding the design and implications of these EPMs as well as their rights under Medicare, including their right to use their provider of choice.

We have proposed to implement several safeguards to ensure that Medicare beneficiaries do not experience a delay in services. We believe that the longer the episode duration, the lower the risk of delaying care beyond the episode duration, and we believe that a 90-day post-hospital discharge episode duration is sufficiently long to minimize the risk that any episode-related care will be delayed beyond the end of the episode. Moreover, we are finalizing that as part of the payment definition (see section III.D. of this final rule) that participants would be financially responsible for certain outlier post-episode payments occurring in the 30-day window subsequent to the end of the 90-day episode.

Lastly, we note that Medicare payments for services will continue to be made for each Medicare FFS payment system under the CJR model and the EPMs. Because we are finalizing our proposal to waive beneficiary coinsurance for reconciliation payments and repayments, beneficiaries will be subject to copayments, deductibles, and coinsurance consistent with Medicare FFS payments, rather than as determined by quality-adjusted target prices. In our analysis of impacts, we assume that beneficiary payments will not be affected, as only the participant will be subject to the reconciliation process. If participants are successful in improving quality or care while reducing costs, beneficiaries may benefit through reduced out-of-pocket expenditures across the episode.

Alternatively, if participants respond to the incentives under the models by shifting medical care outside of the 90-day bundle, than this may negatively impact the quality of care that beneficiaries receive.

4. Effects on Small Rural Hospitals

Section 1102(b) of the Social Security Act requires us to prepare a regulatory impact analysis if a proposed rule or final rule may have a significant impact on the operations of a substantial number of small rural hospitals. This analysis must conform to the provisions of section 604 of the RFA. For purposes of section 1102(b) of the Act, a small rural hospital is defined as a hospital that is located outside of an MSA and has fewer than 100 beds. The models finalized in this rule do not require participation of hospitals located outside of MSAs. We have included a more protective stop-loss policy for certain IPPS hospitals that are located in a rural area in accordance with § 412.64(b) or in a rural census tract within an MSA defined at § 412.103(a)(1) or reclassified to rural in accordance with § 412.103. The models finalized in this rule will affect some rural hospitals based on this definition.

Because of our concerns that rural hospitals may have lower risk tolerance and less infrastructure and support to achieve efficiencies for high payment episodes, we have finalized additional financial protections for rural hospitals (in addition to other protections under the EPMs) in rural hospitals, Rural Referral Centers, Sole Community and certain low-volume participants. In performance year 2, a rural hospital which qualifies for reduced stop-loss and stop-gain limits and elects downside risk could owe Medicare no more than 3 percent of the sum of quality-adjusted target prices for the hospital’s episodes in an EPM. In performance year 3, a rural hospital could owe Medicare no more than 3 percent of quality-adjusted target prices for the hospital’s episodes in an EPM. In performance years 4 and 5, a rural hospital could owe Medicare no more than 5 percent of the sum of quality-adjusted target prices for the hospital’s episode in an EPM. Although we are finalizing these additional protections, we believe that few rural hospitals will be included in the models, and therefore that few will need these protections. AMI, CABG, and SHFFT episodes account for less than 5 percent of all discharges, and because relatively few of these procedures are performed at small rural hospitals, and because the EPMs are designed to minimize adverse effects on rural hospitals, we do not believe that rural hospitals will experience significant adverse economic impacts. Accordingly, we conclude that this final rule would not have a significant impact on the operations of a substantial number of small rural hospitals.

We solicited public comments on our estimates and analysis of the impact of our proposals on small rural hospitals. The following is a summary of the comments received and our responses.

Comment: Some commenters were concerned that this rule may have a negative impact or create unnecessary burden on small rural hospitals. One commenter reported concern that the EPMs could have a negative financial impact on small rural hospitals. Another commenter stated that the EPMs may reduce access for rehabilitation services in rural areas. This commenter stated that they are concerned non-rural EPM participant hospitals may encourage beneficiaries to receive care at providers affiliated with or within close proximity to the non-rural EPM participant hospital, which could negatively impact volume of services provided by rural hospitals. The commenter also stated that beneficiaries living in rural settings might therefore be forced to choose between relocating to less rural areas to receive appropriate care or simply not receive appropriate post-acute care and follow-up.

Response: We understand the commenters’ concern that the EPMs may have negative financial implications on rural hospitals. To limit the impact on rural hospitals, we have largely excluded them from the MSAs.
eligible for EPM. As discussed in section III.D.7.c.(1) of this final rule, we provide additional protections for rural hospitals in the EPMs. We have also established, in § 512.450, that participants may not limit beneficiary choice to any list of providers or suppliers in any manner other than that permitted under applicable statutes and regulations including small rural hospitals.

We recognize that rural IPPS hospitals, SCHs, MDH and RRCs often serve as the only sites of care for beneficiaries living in rural areas, and these providers may have limited resources to contain costs under the EPMs. Additionally, they may have a limited number of providers and suppliers with which to coordinate care, such as CAHs that are reimbursed at a higher cost-based rate. As a result, we have provided for more protective stop-loss limits for these groups of IPPS hospitals in order to include them in the models while alleviating some financial risk. We believe that these models will not have a significant impact on the operations of a substantial number of small rural hospitals. The discussion of separate financial loss limits for certain hospitals that may be less equipped to tolerate risk is included in § 512.305(c)(2)(iii)(C).

We appreciate the comment regarding the potential impact of this model on rural providers, particularly small rural hospitals. As we note in section III.D.7.c.(1) of this final rule, we are providing additional protections for rural IPPS hospitals. SCHs, MDHs, RRCs and certain low-volume hospitals located in the MSAs selected for participation in the models. As discussed in section III.D.7.c.(1), we note that these categories of hospitals often have special payment protections or additional payment benefits under the Medicare program because we recognize the importance of preserving Medicare beneficiaries’ access to care from these hospitals.

5. Effects on Small Entities

The RFA requires agencies to analyze options for regulatory relief of small entities, if a rule has a significant impact on a substantial number of small entities. For purposes of the RFA, small entities include small businesses, nonprofit organizations, and small governmental jurisdictions. We estimate that most hospitals and most other providers and suppliers are small entities, either by virtue of their nonprofit status or by qualifying as small businesses under the Small Business Administration’s size standards (revenues of less than $7.5 to $38.5 million in any 1 year; NAIC Sector–62 series). States and individuals are not included in the definition of a small entity. For details, see the Small Business Administration’s Web site at http://www.sba.gov/content/smallbusiness-size-standards.

For purposes of the RFA, we generally consider all hospitals and other providers and suppliers to be small entities. We believe that the provisions of this final rule relating to acute care hospitals would have some effects on a substantial number of other providers involved in these episodes of care including surgeons and other physicians, skilled nursing facilities, physical therapists, and other providers. Although we acknowledge that many of the affected entities are small entities, and the analysis discussed throughout this final rule discusses aspects of episode payment models that may or will affect them, we have no reason to assume that these effects will reach the threshold level of 3 percent of revenues used by HHS to identify what are likely to be “significant” impacts. We assume that all or almost all of these entities will continue to serve beneficiaries, and receive payments in accordance with Medicare FFS payment methodologies.

Accordingly, we have determined that this final rule will not have a significant impact on a substantial number of small entities.

6. Effects on Collection of Information

There are three primary sets of information collection activities that EPM participants may be engaged in: Activities related to quality reporting, activities related to Advanced APM participation, and ad hoc reporting of beneficiary notification upon request by CMS. Here, we briefly describe the anticipated scope and effects of information collection in each of these three areas for EPM participants.

Quality reporting associated with the EPMs includes EPM-specific quality measures, HCAHPS, and voluntarily reported quality measures (AMI, CABG and SHFFT models), described in more detail in section III.E. of this final rule. IPPS hospitals are subject to incentives under quality reporting incentives such as the HVBP program and Medicare Electronic Health Record (EHR) Incentive Program, among others. Most IPPS hospitals already report information for the EPM-specific quality measures and HCAHPS for other CMS programs, and those hospitals that do not otherwise report this information to CMS will be required to report under the EPMs. Thus, for EPM participants there will be no required information collection activities for the EPMs.

For the AMI model, participants have the option of reporting data for the Hybrid AMI Mortality measure. This measure includes a combination of claims and EHR data for a total of five EHR-based clinical data elements and six claims-based elements. AMI voluntary data submission must occur within 60 days of most recent data collection period. Successful submission of optional Hybrid AMI Mortality measure data will be based upon inclusion of five key clinical data elements.

We anticipate that participants who choose to engage in voluntary reporting of the Hybrid AMI Mortality measure will engage in the following process:

• Hospitals receive the measure authoring tool (MAT) output, a template layout for the data reporting file, and other artifacts that describe what they are supposed to do and how. The only data elements required are simple lab results and vital signs that are collected consistently in structured fields. All hospitals with EHRs should be able to extract these from structured fields. Many will have some experience based on work with eCQMs.

• Hospitals review the MAT output and submit questions or request clarification via ongoing Q&A.

• Hospitals create a query for their EHR database using the MAT output and populate the reporting file with the core clinical data elements (CCDE). The hospital IT staff will typically run some queries on a small set of admissions and look at the corresponding charts to make sure they are getting the right data and may modify the query if needed.

• Hospitals submit the CCDE to CMS on the prescribed template (QRDA, consolidated clinical document architecture (CCDA), or simple excel file are all options).

• Hospitals do not need to do any measurement calculation. Once data elements are submitted, CMS will link with claims data to calculate measure scores.

Given this process, the initial effort of establishing operability will create the majority of burden. Once the initial effort of establishing the query is complete, the burden will be minimal, as the same query can be run against the EHR for ongoing reporting. We assume that the primary cost for a hospital will be the IT support to set up the initial query and ensure the correct data is being pulled from the EHR. The data elements should be less burdensome than a typical eCQM because participants do not need to create new fields, all data are feasibly accessed in
current EHRs without creating new clinical workflows, and hospitals do not need to do any measure calculation. AMI model participants must meet the following requirements for each performance year in order to fulfill the successful Hybrid AMI Mortality data collection criterion. In performance year 1, participants will be required to submit this data for 50 percent of eligible AMI episodes occurring during the 2-month period between July 1, 2017 and August 31, 2017. In performance year 2, AMI voluntary data submission will be for 10 months of eligible discharges. In performance years 3 through 5, participants will need to submit data for the entire performance year. Furthermore, in performance years 2 through 5, participants will need to submit the five key clinical data elements for at least 90 percent of eligible AMI discharges to receive credit for successful submission and two additional points toward the participant’s AMI model composite quality score.

We are unable to provide a direct cost estimate for hospitals at this time, but expect to learn more as part of the CABG model testing.

For the SHFFT model, the voluntary quality measure is based on THA/TKA patient-reported outcome-based measure data submission, which draws upon patient interviews to gain insights into patient experience and related outcomes.

We anticipate that participants who choose to engage in voluntary reporting of the THA/TKA patient-reported outcome-based data will engage in the following process:

- Participating hospitals will need to establish a means to collect patient-reported outcome data from patients pre-operatively and, again, post-operatively. In addition, they would need to collect select additional risk variables from patient charts.
- The specific instruments (and risk variables) have been vetted by a Technical Expert Panel and public comment: Veterans RAND 12 Item Health Survey (VR-12) or Patient-Reported Outcomes Measurement Information System (PROMIS) Global-10 generic PRO survey; Hip disability and Osteoarthritis Outcome Score (HOOS)/Knee injury and Osteoarthritis Outcome Score (KOOS) Jr. or HOOS/KOOS subscales PRO survey; additional risk variables that can be physician-reported or chart-abstracted.
- If hospitals select the least burdensome instruments, data collection requires patients to answer 16 through 17 outcome questions and 3 risk factor questions. Estimates from instrument developers, input from the patient members of a Technical Expert Panel, and empirical results from a survey of physicians collecting similar data on THA/TKA patients support minimal patient burden (under 5 minutes) to collect the required data.
- Pre-operative survey completion could be arranged to be completed online, by phone, or at pre-operative clinic or hospital admission intake visits. Post-operative survey completion must occur between 270 and 365 days after the eligible elective primary procedure, and may occur in a variety of ways such as online or by phone.
- Hospitals will collect or extract 6 risk variables that are commonly available in the medical record.

Currently available data suggests costs associated with information collection for this measure can vary tremendously. We anticipate the SHFFT patient-reported outcomes reporting costs to a participant hospital would decrease over time as the collection process is streamlined and integrated into clinical care workflows. A number of hospitals have already submitted data either as a part of an established registry or for participation in the existing CJR. For these participants, the burden of developing data collection systems will be minimal.

Participating hospitals must meet the following information submission requirements for each performance year in order to fulfill the successful THA/TKA patient-reported outcome-based data collection criterion. In performance year 1, participants must submit pre-operative data for at least 60 percent of eligible procedures or at least 75 cases performed between September 1, 2016 and June 30, 2017. In performance year 2, participants must submit post-operative data for at least 60 percent of eligible procedures or at least 75 cases performed between September 1, 2016 and June 30, 2017 and also must submit pre-operative data for at least 70 percent of eligible procedures or at least 100 cases. In performance year 3, participants must submit post-operative data for at least 70 percent of eligible procedures or at least 100 cases performed between July 1, 2017 and June 30, 2018 and also must submit pre-operative data for at least 80 percent of eligible procedures or at least 200 cases performed between July 1, 2018 and June 30, 2019. In performance year 4, participants must submit post-operative data for at least 80 percent of eligible procedures or at least 200 cases performed between July 1, 2018 and June 30, 2019 and also must submit pre-operative data for at least 80 percent of eligible procedures or at least 200 cases performed between July 1, 2019 and June 30, 2020. In performance year 5, participants must submit post-operative data for at least 90 percent of eligible procedures or at least 200 cases performed between July 1, 2019 and June 30, 2020 and also must submit post-operative data for at least 90 percent of eligible procedures or at least 200 cases performed between July 1, 2020 and June 30, 2021.

We are unable to provide a direct cost estimate for hospitals at this time, but expect to learn more as part of SHFFT and CJR model testing.

Overall, we anticipate the net burden of voluntary data submissions in the AMI, CABG and SHFFT models will be minimal, as we anticipate hospitals will only choose to proceed with optional data submission if they believe the net financial benefit will be positive.

Information collection related to the Track 1 EPMs and the Track 1 CJR model to meet the Advanced APM requirements included in the Quality Payment Program proposed rule and to operationalize the EPMs and CJR as advanced APMs in Track 1 CJR participant attestation to CEHRT and clinician financial arrangements lists.
submission. We believe that the selection by EPM and CJR participants to meet and attest to the CEHRT use requirement would create no significant additional administrative burden on EPM and CJR model participants. The submission of clinician financial arrangements lists (no more frequently than quarterly) for Track 1 EPMs and the Track 1 CJR model may create some additional administrative requirements for certain EPM and CJR participants. Finally, we expect that participants are able to produce lists of beneficiaries who have received compliant notification of participation in model. We provided flexible guidelines for this requirement as specific record keeping methods can be chosen by individual participants so long as the necessary information is maintained readily available to report upon request. We sought comment on any burden derived from this requirement. In total, we anticipate marginal additional reporting burden resulting from this final rule.

The following is a summary of the comments received and our responses.

Comment: A commenter expressed concern over increased quality data reporting in the EPMs and the CJR model. The commenter stated that, to date, they have utilized extensive resources to maintain compliance with CJR quality reporting requirements and are concerned about further quality reporting requirements for the EPMs. The commenter requested that CMS delay quality reporting requirements due to the resource investment necessary to comply with EPM quality reporting requirements.

Response: We appreciate the commenter’s concern over potential burden associated with quality data reporting in the EPMs. As discussed in section III.E.3. of this final rule, EPM participants are not required to report quality data for reconciliation payment eligibility. While EPM participants may choose to increase their financial opportunity under the model by successfully submitting data for future measure development, as discussed in sections III.E.3.a of this final rule, reporting data for future measure development is not required for reconciliation payment eligibility.

7. Unfunded Mandates

Section 202 of the Unfunded Mandates Reform Act of 1995 (UMRA) also requires that agencies assess anticipated costs and benefits before issuing any rule whose mandates require spending by state, local or tribal governments, in the aggregate, or by the private sector in the amount of $146 million in any 1 year.

D. Alternatives Considered

Throughout this final rule, we have identified the policies and alternatives that we have considered, and provided information as to the possible effects of these alternatives and the rationale for each of the policies finalized. We solicited and welcomed comments on our proposals, on the alternatives we identified, and on other alternatives that we should consider, as well as on the costs, benefits, or other effects of these. We note that our estimates are limited to hospitals in the CJR model, hospitals that will be included in the SHFFT model, hospitals selected to participate in the AMI and CABG models, and the FFS–CR participants. This final rule will not impinge directly on hospitals that are not participating in CJR or the EPMs. However, it may encourage innovations in health care delivery in other areas or in care paid through other payers. For example, a hospital and affiliated providers may choose to extend their arrangements for an EPM to other payers, not just those beneficiaries paid under Medicare FFS. Alternatively, a hospital and affiliated providers in one city may decide to hold themselves forth as “centers of excellence” for patients from other cities, both those included and not included in the EPMs. We welcomed comments that address these or other possibilities.

We present the implications of alternatives considered in the development of the EPMs here. As discussed in section III.C. of this final rule, we will define beneficiary inclusion in the AMI model by discharge under an AMI MS–DRG (280–282), representing those individuals admitted with AMI who receive medical therapy but no revascularization, and discharge under a PCI MS–DRG (246–251) with an ICD–10–CM diagnosis code of AMI on the IPPS claim for the anchor hospitalization in the principal or secondary diagnosis code position. Alternately, we could have defined beneficiary inclusion based only on the principal diagnosis code which would have reduced the number of episodes included in the EPMs.

As discussed in section III.E. of this final rule, we allow participants to qualify for a higher composite quality score in the AMI, CABG and SHFFT models based on submission of voluntary data. If we had not provided the option for participants to achieve an increased composite quality score for voluntary reporting (or if we assume no hospitals report this data), the AMI, CABG and SHFFT models are estimated to result in an additional $32 million savings over the 5 performance years.

As discussed in section VI of this final rule, we have finalized our proposal for the selection of CR MSAs via a modified stratified random selection based on several key dimensions related to CR/ICR service provision, including percent of eligible cases in the MSA who receive CR/ICR services, percent who complete CR or ICR services, and the number of CR/ICR providers. In the proposed rule, we outlined alternative MSA selection strategies and solicited comments on the MSA selection approach. We anticipate that, because these approaches drew from the same pool of eligible MSAs without regard to MSA size or total cost of care during the episode or care period, the overall financial impact of different selection methodologies will be minimal, and the primary impact of varied MSA selection approaches will be on balance among model arms for evaluation.

E. Accounting Statement and Table

As required by OMB Circular A–4 under Executive Order 12866 (available at http://www.whitehouse.gov/omb/circulars_a004_a-4) in Table 61, we have prepared an accounting statement showing the classification of transfers, benefits, and costs associated with the provisions in this final rule. The accounting statement is based on estimates provided in this regulatory impact analysis. As described in Table 57, we estimate this final EPM model will result in savings to the federal government of $159 million over the 5 performance years of the model from 2017 to 2021. Table 58 shows the annualized change in net federal monetary transfers, and potential reconciliation payments to participants net of repayments from participants that are associated with the EPM provisions of this final rule as compared to baseline. As described in Table 59, we estimate the modifications to the CJR model finalized in this final rule will result in a reduced savings to the federal government of $26 million over the 5 performance years of the model from 2016 to 2020. As described in Table 60, we estimate the range of impact for this final CR model to be between a cost of $29 to a savings of $32 million over 2017 to 2024. In Table 61, the overall annualized change in payments (for all provisions finalized in this final rule) is based on a 7 percent discount rate, results in net federal monetary transfer from the participant...
F. Conclusion

This analysis, together with the remainder of this preamble, provides the Regulatory Impact Analysis of a rule with a significant economic effect. As a result of this final rule, we estimate that the financial impact of the AMI, CABG, and SHFFT EPM models proposed here would be net federal savings of $159 million over a 5-year performance period (2017 through 2021), the financial impact of the CJR model as modified here with the revised assumptions on hospital reporting of quality data would be an estimated net federal decrease in savings of $26 million over a 5-year period (2016 through 2020) relative to the estimates published in the CJR final rule. The financial impact of the CR incentive payment model would be net change in federal spending between $29 million in additional costs and $32 million in savings to the Medicare program over a 5-year period (2016 to 2021). With a significant additional administrative burden on participants.

F. Conclusion

This analysis, together with the remainder of this preamble, provides the Regulatory Impact Analysis of a rule with a significant economic effect. As a result of this final rule, we estimate that the financial impact of the AMI, CABG, and SHFFT EPM models proposed here would be net federal savings of $159 million over a 5-year performance period (2017 through 2021), the financial impact of the CJR model as modified here with the revised assumptions on hospital reporting of quality data would be an estimated net federal decrease in savings of $26 million over a 5-year period (2016 through 2020) relative to the estimates published in the CJR final rule. The financial impact of the CR incentive payment model would be net change in federal spending between $29 million in additional costs and $32 million in savings to the Medicare program over an 8-year period (2017 through 2024).

In accordance with the provisions of Executive Order 12866, this regulation was reviewed by the Office of Management and Budget.

List of Subjects

42 CFR Parts 510
Administrative Practice and Procedure, Health facilities, Health professions, Medicare, and Reporting and recordkeeping requirements.

42 CFR Part 512
Administrative practice and procedure, Health facilities, Medicare, Reporting and recordkeeping requirements.

For the reasons set forth in the preamble, under the authority at section 1115A of the Social Security Act, the Centers for Medicare & Medicaid Services amends 42 CFR Chapter IV as follows:

Subchapter H—Health Care Infrastructure and Model Programs

PART 510—COMPREHENSIVE CARE FOR JOINT REPLACEMENT MODEL

1. The authority citation for part 510 continues to read as follows:

Authority: Secs. 1102, 1115A, and 1871 of the Social Security Act (42 U.S.C. 1302, 1315(a), and 1395hh).

2. Section 510.2 is amended by—

a. Adding in alphabetical order definitions for “Applicable discount factor”, “Area”, “CEHRT”, “CJR beneficiary,” and “Episode benchmark price”;

b. Removing the definition of “Episode target price”;

c. Revising the definitions of “HCPCS”, “HHA”, and “Historical episode payment”;

d. Adding in alphabetical order a definition for “Hospital”;

e. Removing the definition of “IPPS hospital (or hospital)”;

f. Adding in alphabetical order a definition for “Quality-adjusted target price”;

g. Revising the definition of “Quality improvement points”; and

h. Adding in alphabetical order a definition of “Therapist in private practice”.

The additions and revisions read as follows:

§510.2 Definitions.

Applicable discount factor means the discount percentage established by the participant hospital’s quality category as determined in §510.315 and that is applied to the episode benchmark price for purposes of determining a participant hospital’s Medicare repayment in performance years 2 and 3.

Area means, as defined in §400.200 of this chapter, the geographical area within the boundaries of a State, or a State or other jurisdiction, designated as constituting an area with respect to which a Professional Standards Review Organization or a Utilization and Quality Control Peer Review Organization has been or may be designated.

CEHRT means certified electronic health record technology that meets the requirements of 45 CFR 170.102.

CJR beneficiary means a beneficiary who meets the beneficiary inclusion criteria in §510.205 and who is in a CJR episode.

Episode benchmark price means a dollar amount assigned to CJR episodes based on historical episode payment data (3 years of historical Medicare payment data grouped into CJR episodes according to the episode definition as described in §510.200(b)) prior to the application of the effective discount factor or applicable discount factor, as described in §510.300(c).

HCPCS stands for Healthcare Common Procedure Coding System.

HHA means a Medicare-enrolled home health agency.

Historical episode payment means the expenditures for historical episodes that occurred during the historical period used to determine the episode benchmark price.

Hospital means a provider subject to the prospective payment system specified in §412.1(a)(1) of this chapter.
Quality-adjusted target price means the dollar amount assigned to CJR episodes as the result of adjusting the episode benchmark price by the participant hospital’s effective discount factor or applicable discount factor based on the participant hospital’s quality category, as described in §§ 510.300(c) and 510.315(f).

Quality improvement points are points that CMS adds to a participant hospital’s composite quality score for a measure if the hospital’s performance percentile on an individual quality measure for performance years 2 through 5 increases from the previous performance year by at least 2 deciles on the performance percentile scale, as described in § 510.315(d). For performance year 1, CMS adds quality improvement points to a participant hospital’s composite quality score for a measure if the hospital’s performance percentile on an individual quality measure increases from the corresponding time period in the previous year by at least 2 deciles on the performance percentile scale, as described in § 510.315(d).

Therapist in private practice means a therapist that—
   (1) Complies with the special provisions for physical therapists in private practice in § 410.60(c) of this chapter;
   (2) Complies with the special provisions for occupational therapists in private practice in § 410.59(c) of this chapter; or
   (3) Complies with the special provisions for speech-language pathologists in private practice in § 410.62(c) of this chapter.

3. Section 510.2 is further amended, effective July 1, 2017, by—
   a. Revising the definition of “ACO”;
   b. Adding in alphabetical order definitions for “ACO participant” and “ACO provider/supplier”;
   c. Revising the definition for “Alignment payment”;
   d. Revising the definition of “CJR collaborator”;
   e. Adding in alphabetical order a definition for “Collaboration agent”;
   f. Removing the definition of “Collaborator agreement”;
   g. Adding in alphabetical order a definition for “CORF”;
   h. Revising the definitions of “Distribution arrangement” and “Distribution payment”;
   i. Adding in alphabetical order definitions for “Downstream collaboration agent”, “Downstream distribution arrangement”, “Downstream distribution payment”,
   j. Adding in alphabetical order definitions for “Member of the NPPGP or NPPGP member”, “Member of the TGP or TGP member”, and “NPPGP”;
   k. Removing the definition of “Practice collaboration agent”;
   l. Revising the definition of “Provider of outpatient therapy services”;
   m. Adding in alphabetical order definitions of “TGP”; and
   n. In the definition of “Therapist” by removing the phrase “the following as defined at § 484.4:” and adding in its place the phrase “the following individuals as defined at § 484.4 of this chapter.”;

The additions and revisions read as follows:

§ 510.2 Definitions.

ACO means an accountable care organization, as defined at § 425.20 of this chapter, that participates in the Shared Savings Program and is not in Track 3.

ACO participant has the meaning set forth in § 425.20 of this chapter.

ACO provider/supplier has the meaning set forth in § 425.20 of this chapter.

Alignment payment means a payment from a CJR collaborator to a participant hospital under a sharing arrangement, for the sole purpose of sharing the participant hospital’s responsibility for making repayments to Medicare.

CJR activities means activities related to promoting accountability for the quality, cost, and overall care for CJR beneficiaries, including managing and coordinating care; encouraging investment in infrastructure enabling technologies and redesigned care processes for high quality and efficient service delivery; the provision of items and services during a CJR episode in a manner that reduces costs and improves quality; or carrying out any other obligation or duty under CJR.

CJR collaborator means an ACO or one of the following Medicare-enrolled individuals or entities that enters into a sharing arrangement:

(1) SNF.
(2) HHA.
(3) LTCH.
(4) IRF.
(5) Physician.
(6) Nonphysician practitioner.
(7) Therapist in private practice.
(8) CORF.
(9) Provider of outpatient therapy services.
(10) Physician Group Practice (PGP).
(11) Hospital.
(12) CAH.
(13) Non-Physician Provider Group Practice (NPPGP).
(14) Therapy Group Practice (TGP).

Collaboration agent means an individual or entity that is not a CJR collaborator and that is either of the following:

(1) A member of a PGP, NPPGP, or TGP that has entered into a distribution arrangement with the same PGP, NPPGP, or TGP in which he or she is an owner or employee, and where the PGP, NPPGP, or TGP is a CJR collaborator.

(2) An ACO participant or ACO provider/supplier that has entered into a distribution arrangement with the same ACO in which it is participating, and where the ACO is a CJR collaborator.

CORF stands for comprehensive outpatient rehabilitation facility.

Distribution arrangement means a financial arrangement between a CJR collaborator that is an ACO, PGP, NPPGP, or TGP and a collaboration agent for the sole purpose of distributing some or all of a gainsharing payment received by the ACO, PGP, NPPGP, or TGP.

Distribution payment means a payment from a CJR collaborator that is an ACO, PGP, NPPGP, or TGP to a collaboration agent, under a distribution arrangement, composed only of gainsharing payments.

Downstream collaboration agent means an individual who is not a CJR collaborator or a collaboration agent and who is a PGP member, an NPPGP member, or a TGP member that has entered into a downstream distribution arrangement with the same PGP, NPPGP, or TGP in which he or she is an owner or employee, and where the PGP, NPPGP, or TGP is a collaboration agent.

Downstream distribution arrangement means a financial arrangement between a collaboration agent that is both a PGP, NPPGP, or TGP and an ACO participant and a downstream collaboration agent for the sole purpose of distributing some or all of a distribution payment received by the PGP, NPPGP, or TGP.

Downstream distribution payment means a payment from a collaboration agent that is both a PGP, NPPGP, or TGP and an ACO participant to a downstream collaboration agent, under a downstream distribution arrangement,
composed only of distribution payments.

* * * * *

Member of the NPPGP or NPPGP member means a nonphysician practitioner or therapist who is an owner or employee of an NPPGP and who has reassigned to the NPPGP his or her right to receive Medicare payment.

   Member of the TGP or TGP member means a therapist who is an owner or employee of a TGP and who has reassigned to the TGP his or her right to receive Medicare payment.

* * * * *

NPPGP means an entity that is enrolled in Medicare as a group practice, includes at least one owner or employee who is a nonphysician practitioner, does not include a physician owner or employee, and has a valid and active TIN.

* * * * *

Provider of outpatient therapy services means an entity that is enrolled in Medicare as a provider of therapy services and furnishes one or more of the following:

(1) Outpatient physical therapy services as defined in §410.60 of this chapter.

(2) Outpatient occupational therapy services as defined in §410.59 of this chapter.

(3) Outpatient speech-language pathology services as defined in §410.62 of this chapter.

* * * * *

TGP means an entity that is enrolled in Medicare as a therapy group in private practice, includes at least one owner or employee who is a therapist in private practice, does not include an owner or employee who is a physician or nonphysician practitioner, and has a valid and active TIN.

* * * * *

§ 510.110 Access to records and retention.

Participant hospitals, CJR collaborators, collaboration agents, downstream collaboration agents, and any other individuals or entities performing CJR activities must do all of the following:

(a) Allow the Government, including CMS, OIG, HHS and the Comptroller General or their designees, scheduled and unscheduled access to all books, contracts, records, documents and other evidence (including data related to utilization and payments, quality criteria, billings, lists of CJR collaborators, sharing arrangements, distribution arrangements, downstream arrangements and the documentation required under §§510.500(d) and 510.525(c)) sufficient to enable the audit, evaluation, inspection or investigation of any of the following:

   (1) The individual’s or entity’s compliance with CJR model requirements.

   (2) The calculation, distribution, receipt, or recoupment of gainsharing payments, alignment payments, distribution payments, and downstream distribution payments.

   (3) The obligation to repay any reconciliation payments owed to CMS.

   (4) The quality of the services furnished to a CJR beneficiary during a CJR episode.

   (5) The sufficiency of CJR beneficiary notifications.

   (6) The accuracy of the CJR participant hospital’s submissions under CEHRT use requirements.

(b) Maintain all such books, contracts, records, documents, and other evidence for a period of 10 years from the last day of the participant hospital’s participation in the CJR project or from the date of completion of any audit, evaluation, inspection, or investigation, whichever is later, unless—

   (1) CMS determines a particular record or group of records should be retained for a longer period and notifies the participant hospital at least 30 calendar days before the disposition date; or

   (2) There has been a dispute or allegation of fraud or similar fault against the participant hospital, CJR collaborator, collaboration agent, downstream collaboration agent, or any other individual or entity performing CJR activities in which case the records must be maintained for 6 years from the date of any resulting final resolution of the dispute or allegation of fraud or similar fault.

§ 510.120 CJR participant hospital CEHRT use requirements.

(a) CJR CEHRT use. For performance years 2 through 5, CJR participant hospitals choose either of the following:

   (1) CEHRT use. Participant hospitals attest in a form and manner specified by CMS to their use of CEHRT as defined in §414.1305 of this chapter to document and communicate clinical care with patients and other health professionals.

   (b) Clinician financial arrangements list. Each participant hospital that chooses CEHRT use as provided in paragraph (a)(1) of this section must submit to CMS a clinician financial arrangements list in a form and manner specified by CMS on a no more than quarterly basis. The list must include the following information on individuals and entities for the period of the CJR performance year specified by CMS:

      (i) The name, TIN, and NPI of the CJR collaborator.

      (ii) The start date and, if applicable, end date, for the sharing arrangement between the CJR participant hospital and the CJR collaborator.

(b) Practice collaboration agents. For each physician, nonphysician practitioner, or therapist who is a practice collaboration agent during the period of the CJR performance year specified by CMS:

      (i) The name and TIN of the CJR collaborator and the name, TIN, and NPI of the practice collaboration agent.

      (ii) The start date and, if applicable, end date, for the distribution arrangement between the CJR collaborator and the practice collaboration agent.

   (3) [Reserved.]

   (4) Attestation to no individuals. If there are no individuals that meet the requirements to be reported, as specified in paragraphs (b)(1) through (3) of this section, the CJR participant hospital must attest in a form and manner required by CMS that there are no individuals to report on the clinician financial arrangements list.

   (c) Documentation requirements. (1) Each CJR participant hospital that chooses CEHRT use as provided in paragraph (a)(1) of this section must maintain documentation of their attestation to CEHRT use and clinician financial arrangements lists.

   (2) [Reserved.]

§ 510.120 CJR participant hospital CEHRT track requirements.

(a) § 510.500(d) and 510.525(c) sufficient to enable the audit, evaluation, inspection or investigation of any of the following:

   (1) The individual’s or entity’s compliance with CJR model requirements.

   (2) The calculation, distribution, receipt, or recoupment of gainsharing payments, alignment payments, distribution payments, and downstream distribution payments.

   (3) The obligation to repay any reconciliation payments owed to CMS.

   (4) The quality of the services furnished to a CJR beneficiary during a CJR episode.

   (5) The sufficiency of CJR beneficiary notifications.

   (6) The accuracy of the CJR participant hospital’s submissions under CEHRT use requirements.

(b) Maintain all such books, contracts, records, documents, and other evidence for a period of 10 years from the last day of the participant hospital’s participation in the CJR project or from the date of completion of any audit, evaluation, inspection, or investigation, whichever is later, unless—

   (1) CMS determines a particular record or group of records should be retained for a longer period and notifies the participant hospital at least 30 calendar days before the disposition date; or

   (2) There has been a dispute or allegation of fraud or similar fault against the participant hospital, CJR collaborator, collaboration agent, downstream collaboration agent, or any other individual or entity performing CJR activities in which case the records must be maintained for 6 years from the date of any resulting final resolution of the dispute or allegation of fraud or similar fault.
therapist who is a collaboration agent during the period of the CJR performance year specified by CMS:

(i) The name and TIN of the CJR collaborator and the name, TIN, and NPI of the collaboration agent.

(ii) The start date and, if applicable, end date, for the distribution arrangement between the CJR collaborator and the collaboration agent.

(3) Downstream collaboration agents.

For each physician, nonphysician practitioner, or therapist who is a downstream collaboration agent during the period of the CJR performance year specified by CMS—

(i) The name and TIN of the CJR collaborator and the name and TIN of the collaboration agent and the name, TIN, and NPI of the downstream collaboration agent.

(ii) The start date and, if applicable, end date, for the downstream distribution arrangement between the collaboration agent and the downstream collaboration agent.

§ 510.205 Beneficiary inclusion criteria.

(a) * * * * *

(c) * * *

(2) The CJR participant hospital must retain and provide access to the required documentation in accordance with § 510.110.

7. Section 510.205 is amended by adding paragraph (a)(6) to read as follows:

§ 510.205 Beneficiary inclusion criteria.

(a) * * * * *

(6) For episodes beginning on or after July 1, 2017, are not prospectively assigned to—

(i) An ACO in the Next Generation ACO model;

(ii) An ACO in a track of the Comprehensive ESRD Care Model incorporating downside risk for financial losses; or

(iii) A Shared Savings Program ACO in Track 3.

* * * * *

§ 510.300 Determination of episode quality-adjusted target prices.

(a) General. CMS establishes episode quality-adjusted target prices for participant hospitals for each performance year of the model as specified in this section. Episode quality-adjusted target prices are established according to the following:

(1) MS–DRG and fracture status. MS–DRG assigned at discharge for anchor hospitalization and present of hip fracture diagnosis for anchor hospitalization—

(i) MS–DRG 469 with hip fracture;

(ii) MS–DRG 469 without hip fracture;

(iii) MS–DRG 470 with hip fracture; or

(iv) MS–DRG 470 without hip fracture.

(2) Applicable time period for performance year episode quality-adjusted target prices. Episode quality-adjusted target prices are updated to account for Medicare payment updates no less than 2 times per year, for updated quality-adjusted target prices effective October 1 and January 1, and at other intervals if necessary.

(3) Episodes that straddle performance years or payment updates. The quality-adjusted target price that applies to the type of episode as of the date of admission for the anchor hospitalization is the quality-adjusted target price that applies to the episode.

* * * * *

(5) Quality performance. Quality-adjusted target prices reflect effective discount factors or applicable discount factors based on a hospital’s composite quality score, as specified in §§ 510.300(c) and 510.315(f).

* * * * *

(b) Episode quality-adjusted target price.

(1) CMS calculates quality-adjusted target prices based on a blend of each participant hospital’s hospital-specific and regional episode expenditures. The region corresponds to the U.S. Census Division associated with the primary address of the CCN of each participant hospital’s hospital-specific and regional component is based on all hospitals in said region, except as follows. In cases where an MSA selected for participation in CJR spans more than one U.S. Census Division, the entire MSA will be grouped into the U.S. Census Division where the largest city by population in the MSA is located for quality-adjusted target price and reconciliation calculations. The calendar years used for historical expenditure calculations are as follows:

* * * * *

(3) Exception for low-volume hospitals. Quality-adjusted target prices for participant hospitals with fewer than 20 CJR episodes in total across the 3 historical years of data used to calculate the quality-adjusted target price are based on 100 percent regional historical episode payments.

* * * * *

(5) Exception for high episode spending. Episode payments are capped at 2 standard deviations above the mean regional episode payment for both the hospital-specific and regional components of the quality-adjusted target price.

* * * * *

(7) Communication of episode quality-adjusted target prices. CMS communicates episode quality-adjusted target prices to participant hospitals before the performance period in which they apply.

(8) Inclusion of reconciliation payments and repayments. For performance years 3, 4, and 5 only, reconciliation payments and repayment amounts under § 510.305(f)(2) and (f)(3) and from LEJR episodes included in the BPCI initiative are included in historical episode payments.

(c) Discount factor. A participant hospital’s episode quality-adjusted target prices incorporate discount factors to reflect Medicare’s portion of reduced expenditures from the CJR model as described in this section.

(1) Discount factors affected by the quality incentive payments and the composite quality score. In all performance years, the discount factor may be affected by the quality incentive payment and composite quality score as provided in § 510.315 to create the effective discount factor or applicable discount factor used for calculating reconciliation payments and repayment amounts. The quality-adjusted target prices incorporate the effective or applicable discount factor at reconciliation.

(2) Discount factor for reconciliation payments. The discount factor for reconciliation payments in all performance years is 3.0 percent.

(3) Discount factors for repayment amounts. The discount factor for repayment amounts is—

(i) Not applicable in performance year 1, as the requirement for hospital repayment under the CJR model is waived in performance year 1;

(ii) In performance years 2 and 3, 2.0 percent; and

(iii) In performance years 4 and 5, 3.0 percent.

* * * * *

9. Section 510.305 is amended by—

a. Revising paragraphs (e) introductory text, (h)(1)(i) and (v), (f)(1)(ii) and (ii), (f)(2), (g)(2), and (h)(6);

b. Adding paragraph (h)(7);

c. Revising paragraph (f); and

d. Adding paragraph (j).
§ 510.305 Determination of the NPRA and reconciliation process.

* * * * *

(e) Calculation of the NPRA. By comparing the quality-adjusted target prices described in § 510.300 and the participant hospital’s actual episode spending for the performance year and applying the adjustments in paragraph (e)(1)(v) of this section, CMS establishes an NPRA for each participant hospital for each performance year.

(1) * * * * *

(ii) Multiplies each episode quality-adjusted target price by the number of episodes included in the performance year (other than episodes that have been canceled in accordance with § 510.210(b)) by which that episode quality-adjusted target price applies.

* * * * *

(v) Applies the following prior to determination of the reconciliation payment or repayment amount:

(A) Limitation on loss. Except as provided in paragraph (e)(1)(v) of this section, the total amount of the NPRA and subsequent reconciliation calculation for a performance year cannot exceed the following:

(1) For performance year 2 only, 5 percent of the amount calculated in paragraph (e)(1)(iii) of this section for the performance year.

(2) For performance year 3, 10 percent of the amount calculated in paragraph (e)(1)(iii) of this section for the performance year.

(3) For performance years 4 and 5, 20 percent of the amount calculated in paragraph (e)(1)(iii) of this section for the performance year.

(4) As provided in paragraph (i) of this section, the subsequent reconciliation calculation reassesses the limitation on loss for a given performance year by applying the limitations on loss to the aggregate of the 2 reconciliation calculations.

(B) Limitation on gain. The total amount of the NPRA and subsequent reconciliation calculation for a performance year cannot exceed the following:

(1) Fourteen months after

(i) Subject to paragraph (f)(1)(iii) of this section, for performance year 1, the reconciliation payment (if any) is equal to the NPRA.

(ii) Subject to paragraph (f)(1)(iii) of this section, for performance years 2 through 5, results from the subsequent reconciliation calculation for a prior year’s reconciliation as described in paragraph (i) of this section and the post-episode spending and ACO overlap calculations as described in paragraph (j) of this section are added to the current year’s NPRA in order to determine the reconciliation payment or repayment amount.

* * * * *

(2) Reconciliation payment. If the amount described in paragraph (f)(1) of this section is positive and the composite quality score described in § 510.315 is acceptable (defined as greater than or equal to 5.00 and less than or equal to 6.9), good (defined as greater than or equal to 6.9 and less than or equal to 15.0), or excellent (defined as greater than 15.0), and the hospital is determined to have a positive NPRA under § 510.305(e), the hospital is eligible for a reconciliation payment.

* * * * *

(6) The post-episode spending amount and ACO overlap calculation for the previous performance year, as applicable.

(7) The reconciliation payment or repayment amount.

(i) Subsequent reconciliation calculation. (1) Fourteen months after the end of each performance year, CMS performs an additional calculation, using claims data available at that time, to account for final claims run-out and any additional episode cancellations due to overlap between the CJR model and other CMS models and programs, or for other reasons as specified in § 510.210(b).

(2) The subsequent calculation for performance years 1 through 4 occurs concurrently with the first reconciliation process for the following performance year. If the result of the subsequent calculation is different than zero, CMS applies the stop-loss and stop-gain limits in paragraph (e) of this section to the aggregate calculation of the amounts described in paragraphs (e)(1)(iv) and (i)(1) of this section for that performance year (the initial reconciliation and the subsequent reconciliation calculation) to ensure such amount does not exceed the applicable stop-loss or stop-gain limits. Because there will be no additional performance year after performance year 5, the subsequent reconciliation calculation for performance year 5 will occur independently in 2022.

(j) Additional adjustments to the reconciliation payment or repayment amount. (1) In order to account for shared savings payments, CMS will reduce the reconciliation payment or increase the repayment amount for the subsequent performance year (for years 1 through 4) by the amount of the participant hospital’s discount percentage that is paid to the ACO in the prior performance year as shared savings. (This amount will be assessed independently for performance year 5 in 2022.) This adjustment is made only when the participant hospital is a participant or provider/supplier in the ACO and the beneficiary in the CJR episode is assigned to one of the following ACO models or programs:

(i) The Pioneer ACO model.
(ii) The Medicare Shared Savings Program (excluding Track 3 for CJR episodes that initiate on or after July 1, 2017).

(iii) The Comprehensive ESRD Care Initiative (excluding a track with downside risk for CJR episodes that initiate after July 1, 2017).

(iv) The Next Generation ACO model (excluding CJR episodes that initiate on or after July 1, 2017).

(2) Increases in post-episode spending. If the average post-episode Medicare Parts A and B payments for a participant hospital in the prior performance year is greater than 3 standard deviations above the regional average post-episode payments for the same performance year, then the spending amount exceeding 3 standard deviations above the regional average post-episode payments for the same performance year is subtracted from the net reconciliation or added to the repayment amount for the subsequent performance year for years 1 through 4, and assessed independently for year 5.

10. Section 510.310 is amended by—

a. Revising paragraphs (a) introductory text and (a)(1) and (2);

b. Removing paragraph (a)(1);
c. Redesignating paragraph (a)(4) as paragraph (a)(3);
d. Adding a new paragraph (a)(4);
e. Revising paragraph (c);
f. Redesignating paragraph (d) as paragraph (e);
g. Adding a new paragraph (d); and

h. Revising newly designated paragraph (e)(6).

The revisions and additions read as follows:

§ 510.310 Appeals process.

(a) Notice of calculation error (first level of appeal). Subject to the limitations on review in subpart D of this part, if a participant hospital wishes to dispute calculations involving a matter related to payment, reconciliation amounts, repayment amounts, the use of quality measure results in determining the composite quality score, or the application of the composite quality score during reconciliation, the participant hospital is required to provide written notice of the calculation error, in a form and manner specified by CMS.

(1) Unless the participant hospital provides such notice, CMS deems final the CJR reconciliation report 45 calendar days after it is issued and proceeds with the payment or repayment processes as applicable.

(2) If CMS receives a notice of a calculation error within 45 calendar days of the issuance of the reconciliation report, CMS responds in writing within 30 calendar days to either confirm that there was an error in the calculation or verify that the calculation is correct, although CMS reserves the right to an extension upon written notice to the participant hospital.

(4) Only participant hospitals may use the notice of calculation error process described in this part.

(c) Exception to the process. If the participant hospital contests a matter that does not involve an issue contained in, or a calculation that contributes to, a CJR reconciliation report, a notice of calculation error is not required. In these instances, if CMS does not receive a request for reconsideration from the participant hospital within 10 calendar days of the notice of the initial determination, the initial determination is deemed final and CMS proceeds with action indicated in the initial determination. This does not apply to the limitations on review in paragraph (e) of this section.

(d) Notice of a participant hospital’s termination from the CJR model. If a participant hospital receives notification that it has been terminated from the CJR model, it must provide a written notice to CMS requesting review of the termination. If the participant hospital fails to notify CMS, the termination is deemed final.

(e) * * *

(6) Decisions about expansion of the duration and scope of a model under section 1115A(c) of the Act, including the determination that a model is not expected to meet criteria described in section 1115A(c)(1) or (2) of the Act.

11. Section 510.315 is amended by—

a. Revising paragraph (c) introductory text;

b. Redesignating paragraph (c)(1)(ix) as paragraph (c)(1)(viii);
c. Redesigning paragraph (c)(2)(ix) as paragraph (c)(2)(viii); and

d. Revising paragraphs (d) and (f).

The revisions read as follows:

§ 510.315 Composite quality scores for determining reconciliation payment eligibility and quality incentive payments.

(4) Only participant hospitals may use the notice of calculation error process described in this part.

(d) Quality improvement points. For performance year 1, if a participant hospital’s quality performance percentile on an individual measure described in § 510.400(a) increases from the corresponding time period in the previous year by at least 2 deciles on the performance percentile scale, then the hospital is eligible to receive quality improvement points equal to 10 percent of the total available point for that individual measure up to a maximum composite quality score of 20 points. For performance years 2 through 5, if a participant hospital’s quality performance percentile on an individual measure described in § 510.400(a) increases from the previous performance year by at least 2 deciles on the performance percentile scale, then the hospital is eligible to receive quality improvement points equal to 10 percent of the total available point for that individual measure up to a maximum composite quality score of 20 points.

(f) Quality incentive payments. CMS provides incentive payments to participant hospitals that demonstrate good or excellent quality performance on the composite quality scores described in paragraph (b) of this section. These incentive payments are implemented in the form of the following reductions to the effective discount factors or applicable discount factors as described in § 510.300(c):

(1) A 1.0 percentage point reduction to the effective discount factor or applicable discount factor for participant hospitals with good quality performance, defined as composite quality scores that are greater than or equal to 6.9 and less than or equal to 15.0.

(2) A 1.5 percentage point reduction to the effective discount factor or applicable discount factor for participant hospitals with excellent quality performance, defined as composite quality scores that are greater than 15.0.

12. Section 510.400 is amended by revising paragraph (c)(3) to read as follows:

§ 510.400 Quality measures and reporting.

(3) Does not publicly report the voluntary patient-reported outcomes and limited risk variable data during this model, but indicates whether a hospital has successfully submitted
such data in accordance with § 510.404(b).

13. Section 510.405 is amended by revising paragraph (a)(1) and (b) to read as follows:

§ 510.405 Beneficiary choice and beneficiary notification.

(a) * * *

(1) As part of discharge planning and referral, participant hospitals must provide a complete list of HHAs, SNFs, IRFs, or LTCHs that are participating in the Medicare program, and that serve the geographic area (as defined by the HHA) in which the patient resides, or in the case of a SNF, IRF, or LTCH, in the geographic area requested by the patient.

(i) This list must be presented to CJR beneficiaries for whom home health care, SNF, IRF, or LTCH services are medically necessary.

(ii) Participant hospitals must specify on the list those post-acute care providers on the list with whom they have a sharing arrangement.

(iii) Participant hospitals may recommend preferred providers and suppliers, consistent with applicable statutes and regulations.

(iv) Participant hospitals may not limit beneficiary choice to any list of providers or suppliers in any manner other than that permitted under applicable statutes and regulations.

(v) Participant hospitals must take into account patient and family preferences when they are expressed.

(b) Required beneficiary notification—

(1) Participant hospital detailed notification. Each participant hospital must provide written notification to any Medicare beneficiary that meets the criteria in §510.205 of his or her inclusion in the CJR model. The notification must be provided upon admission to the participant hospital if the admission that initiates the CJR episode is not scheduled with the participant hospital in advance. If the admission is scheduled in advance, then the participant hospital must provide notification as soon as the admission is scheduled. In circumstances where, due to the patient’s condition, it is not feasible to provide notification at such times, the notification must be provided to the beneficiary or his or her representative as soon as is reasonably practicable but no later than discharge from the participant hospital accountable for the CJR episode. The beneficiary notification must contain all of the following:

(A) A detailed explanation of the model and how it might be expected to affect the beneficiary’s care.

(ii) Notification that the beneficiary retains freedom of choice to choose providers and services.

(iii) Explanation of how patients can access care records and claims data through an available patient portal, and how they can share access to their Blue Button® electronic health information with caregivers.

(iv) A statement that all existing Medicare beneficiary protections continue to be available to the beneficiary. These include the ability to report concerns of substandard care to Quality Improvement Organizations or the 1-800-MEDICARE helpline.

(v) A list of the providers, suppliers, and ACOs with whom the CJR participant hospital has a sharing arrangement. This requirement may be fulfilled by the participant hospital including in the detailed notification a Web address where beneficiaries may access the list.

(2) CJR collaborator notice. A participant hospital must require every CJR collaborator to provide written notice to applicable CJR beneficiaries of the structure of the CJR model and the existence of its sharing arrangement with the participant hospital.

(i) A CJR participant hospital must require every CJR collaborator (other than PGPs) that furnishes an item or service to a CJR beneficiary during a CJR episode to provide written notice to the beneficiary of the structure of the model and the existence of the individual’s or entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from the CJR collaborator during a CJR episode. In circumstances where, due to the patient’s condition, it is not feasible to provide notification at such time, the notification must be provided to the beneficiary or his or her representative as soon as is reasonably practicable.

(ii) A participant hospital must require every PGP that is a CJR collaborator to provide written notice to the beneficiary in accordance with paragraph (b)(3)(i) of this section that the beneficiary will be responsible for payment for the services furnished by the SNF during that stay, except those services that would be covered by Medicare Part B during a non-covered inpatient SNF stay.

14. Section 510.405 is further amended, effective July 1, 2017, by revising paragraphs (b)(1) and (2) and adding paragraph (b)(4) to read as follows:

§ 510.405 Beneficiary choice and beneficiary notification.

(b) * * *

(1) Participant hospital detailed notification. Each participant hospital must provide written notification to any Medicare beneficiary that meets the criteria in §510.205 of his or her inclusion in the CJR model. The notification must be provided upon admission to the participant hospital if the admission that initiates the CJR episode is not scheduled with the participant hospital in advance. If the admission is scheduled in advance, then the participant hospital must provide notification as soon as the admission is scheduled. In circumstances where, due to the patient’s condition, it is not feasible to provide notification at such times, the notification must be provided to the beneficiary or his or her representative as soon as is reasonably practicable but no later than discharge from the participant hospital accountable for the CJR episode. The beneficiary notification must contain all of the following:

(A) A detailed explanation of the model and how it might be expected to affect the beneficiary’s care.

(ii) Notification that the beneficiary retains freedom of choice to choose providers and services.

(iii) Explanation of how patients can access care records and claims data through an available patient portal, and how they can share access to their Blue Button® electronic health information with caregivers.

(iv) A statement that all existing Medicare beneficiary protections continue to be available to the beneficiary. These include the ability to report concerns of substandard care to Quality Improvement Organizations or the 1-800-MEDICARE helpline.

(v) A list of the providers, suppliers, and ACOs with whom the CJR participant hospital has a sharing arrangement. This requirement may be fulfilled by the participant hospital including in the detailed notification a Web address where beneficiaries may access the list.

(vi) A CJR collaborator notice. A participant hospital must require every CJR collaborator (other than PGPs) that furnishes an item or service to a CJR beneficiary during a CJR episode to provide written notice to the beneficiary of the structure of the model and the existence of its sharing arrangement with the participant hospital.

(i) A CJR participant hospital must require every CJR collaborator (other than PGPs) that furnishes an item or service to a CJR beneficiary during a CJR episode to provide written notice to the beneficiary of the structure of the model and the existence of its sharing arrangement.

(ii) A participant hospital must require every PGP that is a CJR collaborator to provide written notice to the beneficiary in accordance with paragraph (b)(3)(i) of this section that the beneficiary will be responsible for payment for the services furnished by the SNF during that stay, except those services that would be covered by Medicare Part B during a non-covered inpatient SNF stay.

(3) Discharge planning notice. A participant hospital must provide the beneficiary with a written notice of any potential financial liability associated with non-covered services recommended or presented as an option as part of discharge planning, no later than the time that the beneficiary discusses a particular post-acute care option or at the time the beneficiary is discharged, whichever occurs earlier.

(i) If the participant hospital knows or should have known that the beneficiary is considering or has decided to receive a non-covered post-acute care service or other non-covered associated service or supply, the participant hospital must notify the beneficiary that the service would not be covered by Medicare.

(ii) If the participant hospital is discharging a beneficiary to a SNF prior to the occurrence of a 3-day hospital stay, and the beneficiary is being transferred to or is considering a SNF that would not qualify under the SNF 3-day waiver in §510.610, the participant hospital must notify the beneficiary in accordance with paragraph (b)(3)(i) of this section that the beneficiary will be responsible for payment for the services furnished by the SNF during that stay, except those services that would be covered by Medicare Part B during a non-covered inpatient SNF stay.
receiving such notification, including the date on which the notification was provided to the beneficiary, to CMS or its designee upon request. The beneficiary notification must contain all of the following:

(i) A detailed explanation of the model and how it might be expected to affect the beneficiary’s care.

(ii) Notification that the beneficiary retains freedom of choice to choose providers and services.

(iii) Explanation of how patients can access care records and claims data through an available patient portal, and how they can share access to their Blue Button* electronic health information with caregivers.

(iv) A statement that all existing Medicare beneficiary protections continue to be available to the beneficiary. These include the ability to report concerns of substandard care to Quality Improvement Organizations or the 1-800-MEDICARE helpline.

(v) A list of the provider, suppliers, and ACOs with whom the CJR participant hospital has a sharing arrangement. This requirement may be fulfilled by the participant hospital including in the detailed notification a Web address where beneficiaries may access the list.

(2) CJR collaborator notice. A participant hospital must require every CJR collaborator to provide written notice to applicable CJR beneficiaries of the structure of the CJR model and the existence of its sharing arrangement with the participant hospital.

(i) With the exception of ACOs, PGP, NPPGPs, and TGP, a CJR participant hospital must require every CJR collaborator that furnishes an item or service to a CJR beneficiary during a CJR episode to provide written notice to the beneficiary of the structure of the model and the existence of the individual’s or entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any ACO participant or ACO provider/supplier and the required ACO notice may be provided by that ACO participant or ACO provider/supplier respectively. In circumstances where, due to the patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The ACO must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS upon request.

(ii) The participant hospital fails to comply with any requirements of this part or is identified as noncompliant through monitoring by HHS (including CMS and OIG) of the CJR model, including but not limited to the following:

* * * * *

(F) Failing to follow the requirements related to sharing arrangements.

(ii) Has signed a sharing arrangement, distribution arrangement, or downstream distribution arrangement that is noncompliant with the requirements of this part.

* * * * *

(ii) Issuing a warning letter to the participant hospital.

(iii) Reducing or eliminating a participant hospital’s reconciliation payment.

(iv) Requiring a participant hospital to terminate a sharing arrangement with a CJR collaborator and prohibiting further engagement in sharing arrangements with the participant hospital by that CJR collaborator.

(v) Terminating the participant hospital’s participation in the CJR model. Where a participant is terminated from the CJR model, the participant hospital will remain liable for all negative NPRA generated from episodes of care that ended prior to termination.

(3) CMS may add a 25 percent penalty to repayment amount on the participant hospital’s reconciliation report if all of the following conditions are met:

(i) CMS has required a corrective action plan from a participant hospital;

(ii) The participant hospital owes a repayment amount to CMS; and

(iii) The participant hospital fails to timely comply with the corrective action plan or is noncompliant with the CJR model’s requirements.

16. Section 510.500 is revised, effective July 1, 2017, to read as follows:

§ 510.500 Sharing arrangements under the CJR model.

(a) General. (1) A participant hospital may enter into a sharing arrangement with a CJR collaborator to make a gainsharing payment, or to receive an alignment payment, or both. A participant hospital must not make a gainsharing payment or receive an alignment payment except in accordance with a sharing arrangement.
A sharing arrangement must comply with the provisions of this section and all other applicable laws and regulations, including the applicable fraud and abuse laws and all applicable payment and coverage requirements.

Participant hospitals must develop, maintain, and use a set of written policies for selecting individuals and entities to be CJR collaborators. These policies must contain criteria related to, and inclusive of, the quality of care delivered by the potential CJR collaborator. The selection criteria cannot be based directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent. A selection criterion that considers whether a potential CJR collaborator has performed a reasonable minimum number of services that would qualify as CJR activities will be deemed not to violate the volume or value standard if the purpose of the criterion is to ensure the quality of care furnished to CJR beneficiaries.

If a participant hospital enters into a sharing arrangement, its compliance program must include oversight of sharing arrangements and compliance with the applicable requirements of the CJR model.

Requirements. (1) A sharing arrangement must be in writing and signed by the parties, and entered into before care is furnished to CJR beneficiaries under the sharing arrangement.

Participation in a sharing arrangement must be voluntary and without penalty for nonparticipation.

The sharing arrangement must include the CJR collaborator and its employees, contractors (including collaboration agents), and subcontractors (including downstream collaboration agents) to comply with all of the following:

(i) The applicable provisions of this part (including requirements regarding beneficiary notifications, access to records, record retention, and participation in any evaluation, monitoring, compliance, and enforcement activities performed by CMS or its designees).

(ii) All applicable Medicare provider enrollment requirements at §424.500 of this chapter, including having a valid and active TIN or NPI, during the term of the sharing arrangement.

(iii) All other applicable laws and regulations.

(4) The sharing arrangement must require the CJR collaborator to have or be covered by a compliance program that includes oversight of the sharing arrangement and compliance with the requirements of the CJR model that apply to its role as a CJR collaborator, including any distribution arrangements.

(5) The sharing arrangement must not pose a risk to beneficiary access, beneficiary freedom of choice, or quality of care.

(6) The board or other governing body of the participant hospital must have responsibility for overseeing the participant hospital’s participation in the CJR model, its arrangements with CJR collaborators, its payment of gainsharing payments, its receipt of alignment payments, and its use of beneficiary incentives in the CJR model.

(7) The written agreement memorializing a sharing arrangement must specify the following:

(i) The purpose and scope of the sharing arrangement.

(ii) The obligations of the parties, including specified CJR activities and other services to be performed by the parties under the sharing arrangement.

(iii) The date of the sharing arrangement.

(iv) The financial or economic terms for payment, including the following:

(A) Eligibility criteria for a gainsharing payment.

(B) Eligibility criteria for an alignment payment.

(C) Frequency of gainsharing or alignment payment.

(D) Methodology and accounting formula for determining the amount of a gainsharing payment or alignment payment.

(8) The sharing arrangement must not—

(i) Induce the participant hospital, CJR collaborator, or any employees, contractors, or subcontractors of the participant hospital or CJR collaborator to reduce or limit medically necessary services to any Medicare beneficiary; or

(ii) Restrict the ability of a CJR collaborator to make decisions in the best interests of its patients, including the selection of devices, supplies, and treatments.

(c) Gainsharing payment, alignment payment, and internal cost savings conditions and restrictions. (1) Gainsharing payments, if any, must—

(i) Be derived solely from reconciliation payments, or internal cost savings, or both;

(ii) Be distributed on an annual basis (not more than once per calendar year); and

(iii) Not be a loan, advance payment, or payment for referrals or other business; and

(iv) Be clearly identified as a gainsharing payment at the time it is paid.

(2)(i) To be eligible to receive a gainsharing payment, a CJR collaborator must meet quality of care criteria for the performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment.

(ii) To be eligible to receive a gainsharing payment, or to be required to make an alignment payment, a CJR collaborator other than ACO, PGP, NPPGP, or TGP must have directly furnished a billable item or service to a CJR beneficiary during a CJR episode that occurred in the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount.

(iii) To be eligible to receive a gainsharing payment, or to be required to make an alignment payment, a CJR collaborator that is a PGP, NPPGP, or TGP must meet the following criteria:

(A) The PGP, NPPGP, or TGP must have billed for an item or service that was rendered by one or more PGP member, NPPGP member, or TGP member respectively to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount.

(B) The PGP, NPPGP, or TGP must have contributed to CJR activities and been clinically involved in the care of CJR beneficiaries during the same performance year for which the CJR participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount. For example, a PGP, NPPGP, or TGP might have been clinically involved in the care of CJR beneficiaries by—

(1) Providing care coordination services to beneficiaries during and/or after inpatient admission;

(2) Engaging with a participant hospital in care redesign strategies, and actually performing a role in implementing such strategies, that are...
designed to improve the quality of care for CJR episodes and reduce CJR episode spending; or

(3) In coordination with other providers and suppliers (such as PGP members, NPPGP members, or TGP members; the participant hospital; and post-acute care providers), implementing strategies designed to address and manage the comorbidities of CJR beneficiaries.

(iv) To be eligible to receive a gainsharing payment, or to be required to make an alignment payment, a CJR collaborator that is an ACO must meet the following criteria:

(A) The ACO must have had an ACO provider/supplier that directly furnished, or an ACO participant that billed for, an item or service that was rendered to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount; and

(B) The ACO must have contributed to CJR activities and been clinically involved in the care of CJR beneficiaries during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed the repayment amount. For example, an ACO might be have been clinically involved in the care of CJR beneficiaries by—

(1) Providing care coordination services to CJR beneficiaries during and/or after inpatient admission;

(2) Engaging with a participant hospital in care redesign strategies, and actually performing a role in implementing such strategies, that are designed to improve the quality of care and reduce spending for CJR episodes; or

(3) In coordination with providers and suppliers (such as ACO participants, ACO provider/suppliers, the participant hospital, and post-acute care providers), implementing strategies designed to address and manage the comorbidities of CJR beneficiaries.

(i) The methodology for accruing, calculating and verifying internal cost savings must be transparent, measurable, and verifiable in accordance with generally accepted accounting principles (GAAP) and Government Auditing Standards (The Yellow Book).

(ii) The methodology used to calculate internal cost savings must reflect the actual, internal cost savings achieved by the participant hospital through the documented implementation of CJR activities identified by the participant hospital and must exclude—

(A) Any savings realized by any individual or entity that is not the participant hospital; and

(B) “Paper” savings from accounting conventions or past investment in fixed costs.

(4) The total amount of a gainsharing payment for a performance year paid to a CJR collaborator must not exceed the following:

(i) In the case of a CJR collaborator who is a physician or nonphysician practitioner, 50 percent of the Medicare-approved amounts under the PFS for items and services furnished by that physician or nonphysician practitioner to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.

(ii) In the case of a CJR collaborator that is a PGP or NPPGP, 50 percent of the Medicare-approved amounts under the PFS for items and services furnished by that PGP or NPPGP and furnished to the participant hospital’s CJR beneficiaries by the PGP members or NPPGP members respectively during CJR episodes that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.

(iii) In the case of a CJR collaborator that is an ACO, 25 percent of the Medicare-approved amounts under the PFS for items and services furnished by that ACO and furnished to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.

(5) The amount of any gainsharing payments must be determined in accordance with a methodology that is substantially based on quality of care and the provision of CJR activities. The methodology may take into account the amount of such CJR activities provided by a CJR collaborator relative to other CJR collaborators.

(6) For a performance year, the aggregate amount of all gainsharing payments that are derived from a reconciliation payment the CJR participant hospital receives from CMS must not exceed the amount of that reconciliation payment.

(7) No entity or individual, whether a party to a sharing arrangement or not, may condition the opportunity to make or receive gainsharing payments or to make or receive alignment payments directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any downstream collaboration agent, an ACO participant, any collaboration agent, any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

(8) A participant hospital must not make a gainsharing payment to a CJR collaborator if CMS has notified the participant hospital that such collaborator is subject to any action for noncompliance with this part or the fraud and abuse laws, or for the provision of substandard care to CJR beneficiaries or other integrity problems.

(9) The sharing arrangement must require the participant hospital to recoup any gainsharing payment that contained funds derived from a CMS overpayment on a reconciliation report or was based on the submission of false or fraudulent data.

(10) Alignment payments from a CJR collaborator to a participant hospital may be made at any interval that is agreed upon by both parties, and must not be—

(i) Issued, distributed, or paid prior to the calculation by CMS of a repayment amount reflected in a reconciliation report;

(ii) Loans, advance payments, or payments for referrals or other business; or

(iii) Assessed by a participant hospital if it does not owe a repayment amount.

(11) The participant hospital must not receive any amounts under a sharing arrangement from a CJR collaborator that are not alignment payments.

(12) For a performance year, the aggregate amount of all alignment payments received by the participant hospital must not exceed 50 percent of the participant hospital’s repayment amount.

(13) The aggregate amount of all alignment payments from a CJR collaborator to the participant hospital may not be greater than—

(i) With respect to a CJR collaborator other than an ACO, 25 percent of the participant hospital’s repayment amount.

(ii) With respect to a CJR collaborator that is an ACO, 50 percent of the participant hospital’s repayment amount.

(14) The amount of any alignment payments must be determined in accordance with a methodology that does not directly account for the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration
agent, or downstream collaboration agent.

(15) All gainsharing payments and any alignment payments must be administered by the participant hospital in accordance with generally accepted accounting principles (GAAP) and Government Auditing Standards (The Yellow Book).

(16) All gainsharing payments and alignment payments must be made by check, electronic funds transfer, or another traceable cash transaction.

(d) Documentation requirements. (1) Participants hospitals must—(i) Document the sharing arrangement contemporaneously with the establishment of the arrangement;

(ii) Publicly post (and update on at least a quarterly basis) on a Web page on the CJR participant hospital’s Web site—

(A) Accurate and historical lists of all CJR collaborators, including CJR collaborator names and addresses.

(B) Written policies for selecting individuals and entities to be CJR collaborators required by §510.500(g)(3).

(iii) Maintain and require each CJR collaborator to maintain contemporaneous documentation with respect to the payment or receipt of any gainsharing payment or alignment payment that includes at a minimum:

(A) Nature of the payment (gainsharing payment or alignment payment);

(B) Identity of the parties making and receiving the payment;

(C) Date of the payment;

(D) Amount of the payment;

(E) Date and amount of any recoupment of all or a portion of a CJR collaborator’s gainsharing payment.

(F) Explanation for each recoupment, such as whether the CJR collaborator received a gainsharing payment that contained funds derived from a CMS overpayment on a reconciliation report, or was based on the submission of false or fraudulent data.

(2) The participant hospital must keep records of all of the following:

(i) Its process for determining and verifying its potential and current CJR collaborators’ eligibility to participate in Medicare.

(ii) Its plan to track internal cost savings.

(iii) Information on the accounting systems used to track internal cost savings.

(iv) A description of current health information technology, including systems to track reconciliation payments and internal cost savings.

(v) Its plan to track gainsharing payments and alignment payments.

(3) The participant hospital must retain and provide access to, and must require each CJR collaborator to retain and provide access to, the required documentation in accordance with §510.110.

17. Section 510.505 is revised, effective July 1, 2017, to read as follows:

§510.505 Distribution arrangements.

(a) General. (1) An ACO, PGP, NPPGP, or TGP that has entered into a sharing arrangement with a participant hospital may distribute all or a portion of any gainsharing payment it receives from the participant hospital only in accordance with a distribution arrangement.

(2) All distribution arrangements must comply with the provisions of this section and all other applicable laws and regulations, including the fraud and abuse laws.

(b) Requirements. (1) All distribution arrangements must be in writing and signed by the parties involved, contain the date of the agreement, and be entered into before care is furnished to CJR beneficiaries under the distribution arrangement.

(2) Participation in a distribution arrangement must be voluntary and without penalty for nonparticipation.

(3) The distribution arrangement must require the collaboration agent to comply with all applicable laws and regulations.

(4) The opportunity to make or receive a distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

(5) The amount of any distribution payments from an ACO, from an NPPGP to an NPPGP member, or from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision of CJR activities and that may take into account the amount of such CJR activities provided by a collaboration agent relative to other collaboration agents.

(6) The amount of any distribution payments from a PGP must be determined either in a manner that complies with §411.352(g) of this chapter or in accordance with a methodology that is substantially based on quality of care and the provision of CJR activities and that may take into account the amount of such CJR activities provided by a collaboration agent relative to other collaboration agents.

(7) Except for a distribution payment from a PGP to a PGP member that complies with §411.352(g) of this chapter, a collaboration agent is eligible to receive a distribution payment only if the collaboration agent furnished or billed for an item or service rendered to a CJR beneficiary under the distribution arrangement during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

(8) Except for a distribution payment from a PGP to a PGP member that complies with §411.352(g) of this chapter, the total amount of distribution payments for a performance year paid to a collaboration agent must not exceed the following:

(i) In the case of a collaboration agent that is a physician or nonphysician practitioner, 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the collaboration agent to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

(ii) In the case of a collaboration agent that is a PGP or NPPGP, 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the collaboration agent to the participant hospital’s CJR beneficiaries during CJR episodes that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

(9) With respect to the distribution of any gainsharing payment received by an ACO, PGP, NPPGP, or TGP, the total amount of all distribution payments must not exceed the amount of the gainsharing payment received by the CJR collaborator from the participant hospital.

(10) All distribution payments must be made by check, electronic funds transfer, or another traceable cash transaction.

(11) The collaboration agent must retain the ability to make decisions in the best interests of the patient,
§ 510.506 Downstream distribution arrangements.

(a) General. (1) An ACO participant that is a PGP, NPPGP, or TGP and that has entered into a distribution arrangement with a CJR collaborator that is an ACO may distribute all or a portion of any distribution payment it receives from the CJR collaborator only in accordance with downstream distribution arrangements.

(2) All downstream distribution arrangements must comply with the provisions of this section and all applicable laws and regulations, including the fraud and abuse laws.

(b) Requirements. (1) All downstream distribution arrangements must be in writing and signed by the parties, contain the date of the agreement, and be entered into before care is furnished to CJR beneficiaries under the downstream distribution arrangement.

(2) Participation in a downstream distribution arrangement must be voluntary and without penalty for nonparticipation.

(3) The downstream distribution arrangement must require the downstream collaboration agent to comply with all applicable laws and regulations.

(4) The opportunity to make or receive a downstream distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

(5) The amount of any downstream distribution payments from an NPPGP to an NPPGP member or from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision CJR activities and that may take into account the amount of such CJR activities provided by a downstream collaboration agent relative to other downstream collaboration agents.

(6) The amount of any downstream distribution payments from a PGP must be determined in a manner that complies with § 411.352(g) of this chapter or in accordance with a methodology that is substantially based on quality of care and the provision CJR activities and that may take into account the amount of such CJR activities provided by a downstream collaboration agent relative to other downstream collaboration agents.

(7) Except for a downstream distribution payment from a PGP to a PGP member that complies with § 411.352(g) of this chapter, a downstream collaboration agent is eligible to receive a downstream distribution payment only if the downstream collaboration agent furnished an item or service by the downstream collaboration agent to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the distribution payment being distributed.

(8) Except for a downstream distribution payment from a PGP to a PGP member that complies with § 411.352(g) of this chapter, the total amount of downstream distribution payments for a performance year paid to a downstream collaboration agent who is a physician or nonphysician practitioner or former member of a PGP or a member of an NPPGP must not exceed 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the downstream collaboration agent to the participant hospital’s CJR beneficiaries during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the distribution payment being distributed.

(9) The total amount of all downstream distribution payments made to downstream collaboration agents must not exceed the amount of the distribution payment received by the PGP, NPPGP, or TGP from the ACO.

(10) All downstream distribution payments must be made by check, electronic funds transfer, or another traceable cash transaction.

(11) The downstream collaboration agent must retain his or her ability to make decisions in the best interests of the patient, including the selection of devices, supplies, and treatments.

(12) The downstream distribution arrangement must not—

(i) Reduce the amount of any downstream distribution payment.

(ii) Reward the provision of items and services that are medically unnecessary.

(iii) Induce the downstream collaboration agent to reduce or limit medically necessary services to any Medicare beneficiary; or

(iv) A description of the methodology and accounting formula for determining the amount of any downstream distribution payment.

(b) Requirements. (1) All downstream distribution arrangements in accordance with § 510.110, including the following:

(i) The relevant written agreements;

(ii) The date and amount of any distribution payment(s);

(iii) The identity of each collaboration agent that received a distribution payment; and

(iv) A description of the methodology and accounting formula for determining the amount of any distribution payment.

(2) All downstream distribution arrangements must comply with the fraud and abuse laws.

(3) The downstream distribution arrangement must require the downstream collaboration agents.

(4) The opportunity to make or receive a downstream distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

(5) The amount of any downstream distribution payments from an NPPGP to an NPPGP member or from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision CJR activities and that may take into account the amount of such CJR activities provided by a downstream collaboration agent relative to other downstream collaboration agents.

(6) The amount of any downstream distribution payments from a PGP must be determined either in a manner that complies with § 411.352(g) of this chapter or in accordance with a methodology that is substantially based on quality of care and the provision CJR activities and that may take into account the amount of such CJR activities provided by a downstream collaboration agent relative to other downstream collaboration agents.

(7) Except for a downstream distribution payment from a PGP to a PGP member that complies with § 411.352(g) of this chapter, a downstream collaboration agent is eligible to receive a downstream distribution payment only if the downstream collaboration agent furnished an item or service by the downstream collaboration agent to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the distribution payment being distributed.

(8) Except for a downstream distribution payment from a PGP to a PGP member that complies with § 411.352(g) of this chapter, the total amount of downstream distribution payments for a performance year paid to a downstream collaboration agent who is a physician or nonphysician practitioner or former member of a PGP or a member of an NPPGP must not exceed 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the downstream collaboration agent to the participant hospital’s CJR beneficiaries during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the distribution payment being distributed.

(9) The total amount of all downstream distribution payments made to downstream collaboration agents must not exceed the amount of the distribution payment received by the PGP, NPPGP, or TGP from the ACO.

(10) All downstream distribution payments must be made by check, electronic funds transfer, or another traceable cash transaction.

(11) The downstream collaboration agent must retain his or her ability to make decisions in the best interests of the patient, including the selection of devices, supplies, and treatments.

(12) The downstream distribution arrangement must not—

(i) Reduce the amount of any downstream distribution payment.

(ii) Reward the provision of items and services that are medically unnecessary.

(iii) Induce the downstream collaboration agent to reduce or limit medically necessary services to any Medicare beneficiary; or

(iv) A description of the methodology and accounting formula for determining the amount of any downstream distribution payment.

(b) Requirements. (1) All downstream distribution arrangements in accordance with § 510.110, including the following:

(i) The relevant written agreements;

(ii) The date and amount of any distribution payment(s);

(iii) The identity of each downstream collaboration agent that received a downstream distribution payment.

(iv) A description of the methodology and accounting formula for determining the amount of any downstream distribution payment.

(2) All downstream distribution arrangements must comply with the fraud and abuse laws.

(3) The downstream distribution arrangement must require the downstream collaboration agents.

(4) The opportunity to make or receive a downstream distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the participant hospital, any CJR collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with a participant hospital, CJR collaborator, collaboration agent, or downstream collaboration agent.

(5) The amount of any downstream distribution payments from an NPPGP to an NPPGP member or from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision CJR activities and that may take into account the amount of such CJR activities provided by a downstream collaboration agent relative to other downstream collaboration agents.

(6) The amount of any downstream distribution payments from a PGP must be determined either in a manner that complies with § 411.352(g) of this chapter or in accordance with a methodology that is substantially based on quality of care and the provision CJR activities and that may take into account the amount of such CJR activities provided by a downstream collaboration agent relative to other downstream collaboration agents.

(7) Except for a downstream distribution payment from a PGP to a PGP member that complies with § 411.352(g) of this chapter, a downstream collaboration agent is eligible to receive a downstream distribution payment only if the downstream collaboration agent furnished an item or service by the downstream collaboration agent to a CJR beneficiary during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the distribution payment being distributed.

(8) Except for a downstream distribution payment from a PGP to a PGP member that complies with § 411.352(g) of this chapter, the total amount of downstream distribution payments for a performance year paid to a downstream collaboration agent who is a physician or nonphysician practitioner or former member of a PGP or a member of an NPPGP must not exceed 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the downstream collaboration agent to the participant hospital’s CJR beneficiaries during a CJR episode that occurred during the same performance year for which the participant hospital accrued the internal cost savings or earned the reconciliation payment that comprises the distribution payment being distributed.

(9) The total amount of all downstream distribution payments made to downstream collaboration agents must not exceed the amount of the distribution payment received by the PGP, NPPGP, or TGP from the ACO.

(10) All downstream distribution payments must be made by check, electronic funds transfer, or another traceable cash transaction.

(11) The downstream collaboration agent must retain his or her ability to make decisions in the best interests of the patient, including the selection of devices, supplies, and treatments.

(12) The downstream distribution arrangement must not—

(i) Reduce the amount of any downstream distribution payment.

(ii) Reward the provision of items and services that are medically unnecessary.

(iii) Induce the downstream collaboration agent to reduce or limit medically necessary services to any Medicare beneficiary; or

(iv) A description of the methodology and accounting formula for determining the amount of any downstream distribution payment.

(b) Requirements. (1) All downstream distribution arrangements in accordance with § 510.110, including the following:

(i) The relevant written agreements;

(ii) The date and amount of any distribution payment(s);

(iii) The identity of each downstream collaboration agent that received a downstream distribution payment.

(iv) A description of the methodology and accounting formula for determining the amount of any downstream distribution payment.

(2) All downstream distribution arrangements must comply with the fraud and abuse laws.

(3) The downstream distribution arrangement must require the downstream collaboration agents.
The revisions read as follows:

§ 510.515 Beneficiary incentives under the CJR model.

(a) * * *
(1) Items or services involving technology provided to a beneficiary must be reasonably connected to medical care provided to a beneficiary during a CJR episode of care.
(2) The item or service provided must be a preventive care item or service or an item or service that advances a clinical goal, as listed in paragraph (c) of this section, for a beneficiary in a CJR episode by engaging the beneficiary in better managing his or her own health.

(b) Technology provided to a CJR beneficiary. Beneficiary engagement incentives involving technology are subject to the following additional conditions:
(1) Items or services involving technology provided to a beneficiary may not exceed $1,000 in retail value for any one beneficiary in any one CJR episode.
(2) Items or services involving technology provided to a beneficiary must be the minimum necessary to advance a clinical goal, as listed in paragraph (c) of this section, for a beneficiary in a CJR episode.
(3) Items of technology exceeding $100 in retail value must—
(i) Remain the property of the CJR participant; and
(ii) Be retrieved from the beneficiary at the end of the CJR episode. The participant hospital must document all retrieval attempts, including the ultimate date of retrieval. Documented, diligent, good faith attempts to retrieve items of technology will be deemed to meet the retrieval requirement.
(4) The participant hospital must maintain documentation of items and services furnished as beneficiary incentives that exceed $25 in retail value.

(c) Clinical goals of the CJR model. The following are the clinical goals of the CJR model, which may be advanced through beneficiary incentives:
(1) Beneficiary adherence to drug regimens.
(2) Beneficiary adherence to a care plan.
(3) Reduction of readmissions and complications resulting from LEJR procedures.
(4) Management of chronic diseases and conditions that may be affected by the LEJR procedure.

(d) Documentation of beneficiary incentives. (1) Participant hospitals must maintain documentation of items and services furnished as beneficiary incentives that exceed $25 in retail value.
(2) The documentation must be established contemporaneously with the provision of the items and services and must include at least the following:

(i) The date the incentive is provided.
(ii) The identity of the beneficiary to whom the item or service was provided.
(iii) The documentation regarding items of technology exceeding $100 in retail value must also include contemporaneous documentation of any attempt to retrieve technology at the end of a CJR episode as described in paragraph (b)(3) of this section.
(4) The CJR participant hospital must retain and provide access to the required documentation in accordance with § 510.110.

§ 510.610 Waiver of SNF 3-day rule.

(a) Waiver of the SNF 3-day rule. For episodes being tested in performance years 2 through 5 of the CJR model, CMS waives the SNF 3-day rule for coverage of a SNF stay for a beneficiary who is a CJR beneficiary on the date of discharge from the anchor hospitalization, but only if the SNF is identified on the applicable calendar quarter list of qualified SNFs at the time of the CJR beneficiary’s admission to the SNF.

(b) Waiver of SNFs for Medicare Part A and Part B payment systems only to the extent necessary to make reconciliation payments or receive repayments based on the NPRA that reflect the episode payment methodology under the final payment model for CJR participant hospitals.

§ 510.620 Waiver of deductible and coinsurance that otherwise apply to reconciliation payments and repayments.

(a) Waiver of deductible and coinsurance. CMS waives the requirements of sections 1813(a) and 1833(a) of the Act for Medicare Part A and Part B payment systems only to the extent necessary to make reconciliation payments or receive repayments based on the NPRA that reflect the episode payment methodology under the final payment model for CJR participant hospitals.

§ 510.621 Waiver of the SNF 3-day rule.

(a) Waiver of the SNF 3-day rule. For episodes being tested in performance years 2 through 5 of the CJR model, CMS waives the SNF 3-day rule for coverage of a SNF stay for a beneficiary who is a CJR beneficiary on the date of discharge from the anchor hospitalization, but only if the SNF is identified on the applicable calendar quarter list of qualified SNFs at the time of the CJR beneficiary’s admission to the SNF.

(b) Waiver of deductible and coinsurance that otherwise apply to reconciliation payments and repayments.
Subparts I–J [Reserved]

Subpart K—Model Termination

§512.900 Termination of an episode payment model.

§512.905 Termination of the CR incentive payment model.

Authority: Secs. 1102, 1115A, and 1871 of the Social Security Act (42 U.S.C. 1302, 1315(a), and 1395hh).

Subpart A—General Provisions

§512.1 Basis and scope.

(a) Basis. This part implements the test of episode payment models under section 1115A of the Act. Except as specifically noted in this part, the regulations under this part must not be construed to affect the payment, coverage, program integrity, or other requirements (such as those in parts 412 and 482 of this chapter) that apply to providers and suppliers under this chapter.

(b) Scope. This part sets forth the following:

1. The participants in each episode payment model.

2. The episodes being tested in each episode payment model.

3. The methodology for pricing and payment under each episode payment model.

4. Quality performance standards and quality reporting requirements.

5. Safeguards to ensure preservation of beneficiary choice and beneficiary notification.

§512.2 Definitions.

For purposes of this part, the following definitions are applicable unless otherwise stated:

ACO means an accountable care organization, as defined at §425.20 of this chapter, that participates in the Shared Savings Program and is not in Track 3.

ACO participant has the meaning set forth in §425.20 of this chapter.

ACO provider/supplier has the meaning set forth in §425.20 of this chapter.

Actual episode payment means the sum of Medicare claims payments and certain non-claims-based payments for items and services that are included in the episode in accordance with §512.210(a), excluding the items and services described in §512.210(b).

Alignment payment means a payment from an EPM collaborator to an EPM participant under a sharing arrangement, for the sole purpose of sharing the EPM participant’s responsibility for making repayments to Medicare.

AMI means acute myocardial infarction, an event caused by diminished blood supply to the heart leading to irreversible heart muscle cell damage or death.

AMI care period means a period of AMI care that would meet the requirements to be an AMI model episode in accordance with all provisions in subpart B of this part if the FFS–CR participant were an AMI model participant.

AMI model means the EPM for AMI.

AMI model participant means an EPM participant that is an IPPS hospital (other than those hospitals specifically excepted under §512.100(b)) with a CCN primary address in one of the geographic areas selected for participation in the AMI model in accordance with §512.105(b), as of the date of selection or any time thereafter during any performance year.

Anchor hospitalization means a hospitalization that initiates an EPM episode.

Anchor hospitalization portion means the part of an EPM episode that occurs during the anchor hospitalization.

Anchor MS–DRG means the MS–DRG assigned to the hospitalization discharge, which initiates an EPM episode.

Applicable discount factor means the discount percentage established by the EPM participant’s quality category as determined in §512.315, that is applied to the episode benchmark price for purposes of determining an EPM participant’s Medicare repayment in performance year 2 for EPM participants who elect early downside risk and performance years 3 and 4 for all EPM participants.

Area means, as defined in §400.200 of this chapter, the geographical area within the boundaries of a State, or a State or other jurisdiction, designated as constituting an area with respect to which a Professional Standards Review Organization or a Utilization and Quality Control Peer Review Organization has been or may be designated.

BPCI stands for the Bundled Payment for Care Improvement initiative.

CABG means coronary artery bypass graft, a surgical procedure that diverts the flow of blood around a section of a blocked or partially blocked artery in the heart, creating a new pathway that improves blood flow to heart muscle.

CABG care period means a period of CABG care that would meet the requirements to be a CABG model episode in accordance with all...
provisions in subpart B of this part if the FFS–CR participant were a CABG model participant. 

**CABG model** means the EPM for CABG.

**CABG model participant** means an EPM participant that is an IPPS hospital (other than those hospitals specifically excepted under §512.100(b)) with a CCN primary address in one of the geographic areas selected for participation in the CABG model in accordance with §512.103(b), as of the date of selection or any time thereafter during any performance period.

**CAH** means a critical access hospital designated under subpart F of part 485 of this chapter.

**CCN** stands for CMS certification number.

**CEC** stands for Comprehensive ESRD Care Model.

**CEHRT** means certified electronic health record technology that meet the requirements of 45 CFR 170.102.

**Collaboration agent** means an individual or entity that is not an EPM collaborator and that is either of the following:

(1) A PGP member, an NPPGP member, or a TGP member that has entered into a distribution arrangement with the same PGP, NPPGP, or TGP in which he or she is an owner or employee, and where the PGP, NPPGP, or TGP is an EPM collaborator.

(2) An ACO participant or ACO provider/supplier that has entered into a distribution arrangement with the same ACO in which it is participating, and where the ACO is an EPM collaborator.

**Core-based statistical area (CBSA)** means a statistical geographic entity consisting of the county or counties associated with at least one core (urbanized area or urban cluster) of at least 10,000 population, plus adjacent counties having a high degree of social and economic integration with the core as measured through commuting ties with the counties containing the core.

**CR** stands for comprehensive outpatient rehabilitation facility.

**CR amount** means the dollar amount determined by the number of CR/ICR services paid by Medicare under the OPPS or to any supplier reporting place of service code 11 on the PFS claim for a beneficiary in an AMI or CABG model episode or AMI care period or CABG care period.

**CR incentive payment** means a payment made by CMS to an EPM–CR participant or FFS–CR participant for CR/ICR service use that is the sum of the CR amounts as determined in accordance with §512.710.

**CR incentive payment model** means the model testing CR incentive payments for CR/ICR service use made in accordance with subpart H of this part.

**CR participant** means all EPM–CR participants and FFS–CR participants.

**CR performance year** means one of the years in which the CR incentive payment model is being tested.

Performance years for the CR incentive payment model correlate to calendar years with the exception of performance year 1, which is July 1, 2017 through December 31, 2017.

**CR service count** means the number of CR/ICR services paid by Medicare under the OPPS or to any supplier reporting place of service code 11 on the PFS claim for a beneficiary in an AMI or CABG model episode or AMI care period or CABG care period.

**Distribution arrangement** means a financial arrangement between an EPM collaborator that is an ACO, PGP, NPPGP, or TGP and a collaboration agent for the sole purpose of distributing some or all of a gainsharing payment received by the ACO, PGP, NPPGP, or TGP.

**Distribution payment** means a payment from an EPM collaborator that is an ACO, PGP, NPPGP, or TGP to a collaboration agent, under a distribution arrangement, composed only of gainsharing payments.

**DME** stands for durable medical equipment.

**Downstream collaboration agent** means an individual who is not an EPM collaborator or a collaboration agent and who is a PGP member, an NPPGP member, or a TGP member that has entered into a downstream distribution arrangement with the same PGP, NPPGP, or TGP in which he or she is an owner or employee, and where the PGP, NPPGP, or TGP is a collaboration agent.

**Downstream distribution arrangement** means a financial arrangement between a collaboration agent that is both a PGP, NPPGP, or TGP and an ACO participant and a downstream collaboration agent for the sole purpose of distributing some or all of a distribution payment received by the PGP, NPPGP, or TGP.

**Episode benchmark price** means all EPM–CR model participant’s level of quality performance and improvement and successful reporting of voluntary data, if

**Episode attribute** means the process of assigning financial responsibility for an EPM episode to an EPM participant.

**Episode benchmark price** means a dollar amount assigned to EPM episodes based on historical episode data (3 years of historical Medicare payment data grouped into EPM episodes according to the EPM episode definitions as discussed in §512.300(b)) prior to the application of the effective discount factor, as described in §512.300(d).

**Episode payment model (EPM)** means the AMI model, CABG model, SHFFT model, or another model with payment made on an episode basis in accordance with this part. Each section of the regulations applies in its entirety to each model.

**EPM activities** means activities related to promoting accountability for the quality, cost, and overall care for EPM beneficiaries, including managing and coordinating care; encouraging investment in infrastructure, enabling technologies, and redesigned care processes for high quality and efficient service delivery; the provision of items and services during an EPM episode in a manner that reduces costs and improves quality; or carrying out any other obligation or duty under the EPM.

**EPM beneficiary** means a beneficiary who meets the beneficiary inclusion criteria in §512.230 and who is in an EPM episode.

**EPM collaborator** means an ACO or one of the following Medicare-enrolled individuals or entities that enters into a sharing arrangement:

(1) SNF.
(2) HHA.
(3) LTCH.
(4) IRF.
(5) Physician.
(6) Nonphysician practitioner.
(7) Therapist in private practice.
(8) CORF.
(9) Provider of outpatient therapy services.
(10) PGP.
(11) Hospital.
(12) CAH.
(13) NPPGP.
(14) TGP.

**EPM composite quality score** means a score computed for each EPM participant’s level of quality, performance and improvement and successful reporting of voluntary data, if
§ 512.305(c)(2)(iii)(D). the requirements under means an EPM participant that meets in § 512.240 that begins with the day of discharge itself from the anchor hospitalization being counted as the first day of the 90-day post-discharge period.

EPM participant means a Medicare provider or supplier that is eligible to receive payment from CMS on an episode basis for services rendered to EPM beneficiaries.

EPM volume protection hospital means an EPM participant that meets the requirements under § 512.305(c)(2)(iii)(D).

ESRD stands for end-stage renal disease.

FFS–CR beneficiary means a beneficiary attributed to an FFS–CR participant and receiving care during an AMI care period or CABG care period.

FFS–CR participant means a hospital that is not an EPM participant and that is eligible to receive CR incentive payments from CMS in accordance with § 512.710.

Gainsharing payment means a payment from an EPM participant to an EPM collaborator, under a sharing arrangement, composed of only reconciliation payments or internal cost savings or both.

HCAGHS stands for Hospital Consumer Assessment of Healthcare Providers and Systems.

HCPCS stands for CMS Common Procedure Coding System.

Health Insurance Claim Number (HICN) means the unique number assigned by the Social Security Administration to an individual for the purpose of identifying that individual as a Medicare beneficiary.

HHA means a Medicare-enrolled home health agency.

Historical episode payment means the expenditures for episodes that occurred during the historical period used to determine the EPM episode benchmark price.

Hospital means a provider subject to the prospective payment system specified in § 412.10(a)(1) of this chapter. Each ICD–CM stands for International Classification of Diseases, Clinical Modification.

ICD means intensive cardiac rehabilitation as defined in § 410.49(a) of this chapter, a physician-supervised program that furnishes cardiac rehabilitation and has shown, in peer-reviewed published research, that it improves patients’ cardiovascular disease through specific outcome measurements described in § 410.49(c) of this chapter.

Inpatient prospective payment systems (IPPS) means the payment systems for subsection (d) hospitals as defined in section 1886(d)(1)(B) of the Act.

Internal cost savings means the measurable, actual, and verifiable cost savings realized by the EPM participant resulting from care redesign undertaken by such participant in connection with providing items and services to beneficiaries within specific EPM episodes. Internal cost savings does not include savings realized by any individual or entity that is not the EPM participant.

Intracardiac procedures means procedures performed within the heart chambers, rather than within coronary artery blood vessels, through percutaneous access to blood vessels. These procedures are indicated for the treatment of congenital cardiac malformations, cardiac valve disease, and cardiac arrhythmias.

IPF stands for inpatient psychiatric facility.

IRF stands for inpatient rehabilitation facility.

LTCH stands for long-term care hospital.

MDH means a Medicare-dependent, small rural hospital that meets the classification criteria specified under § 412.108 of this chapter.

Member of the PGP or PGP member means a physician, nonphysician practitioner, or therapist who is an owner or employee of a PGP and who has reassigned to the PGP his or her right to receive Medicare payment.

Member of the NPPGP or NPPGP member means a nonphysician practitioner or therapist who is an owner or employee of an NPPGP and who has reassigned to the NPPGP his or her right to receive Medicare payment.

Member of the TGP or TGP member means a therapist who is an owner or employee of a TGP and who has reassigned to the TGP his or her right to receive Medicare payment.

MSA stands for metropolitan statistical area and means a CBSA associated with at least one urbanized area that has a population of at least 50,000.

MS–DRG stands for Medicare severity diagnosis-related group, which is the classification of inpatient hospital discharges updated in accordance with § 412.10 of this chapter.

Nonphysician practitioner means (except for purposes of subpart G of this part) one of the following:

(1) A physician assistant who satisfies the qualifications set forth at § 410.74(a)(2)(i) and (ii) of this chapter.

(2) A nurse practitioner who satisfies the qualifications set forth at § 410.75(b) of this chapter.

(3) A clinical nurse specialist who satisfies the qualifications set forth at § 410.76(b) of this chapter.

(4) A certified registered nurse anesthetist (as defined at § 410.69(b) of this chapter).

(5) A clinical social worker (as defined at § 410.73(a) of this chapter).

(6) A registered dietitian or nutrition professional (as defined at § 410.134 of this chapter).

NPI stands for National Provider Identifier.

NPPGP means an entity that is enrolled in Medicare as a group practice, includes at least one owner or employee who is a nonphysician practitioner, does not include a physician owner or employee, and has a valid and active TIN.

NPRA means the net payment reconciliation amount determined in accordance with § 412.305(c).

OIG stands for the Department of Health and Human Services Office of Inspector General.

OPPS stands for the Medicare Outpatient Prospective Payment System.

PAC stands for post-acute care.

PBPM stands for per-beneficiary-per-month.

PCI means percutaneous coronary intervention, a procedure used to open blocked arteries in the heart through percutaneous placement of a small wire mesh tube that keeps the artery open and minimizes the risk of it later narrowing.

Performance year means one of the years in which the EPM is being tested. Performance years for the EPMs correlate to calendar years with the exception of performance year 1, which is July 1, 2017 through December 31, 2017.

PFS means the Medicare Physician Fee Schedule authorized under section 1848 of the Act.

PGP stands for physician group practice.

Physician means the meaning set forth in section 1861(r) of the Act.

Post-anchor hospitalization portion means the part of an episode that occurs after the anchor hospitalization.

Post-episode spending amount means the sum of Medicare Parts A and B
payments for items and services that are furnished to a beneficiary within 30 days after the end of the beneficiary’s EPM episode.

Provider of outpatient therapy services means an entity that is enrolled in Medicare as a provider of therapy services and furnishes one or more of the following:

1. Outpatient physical therapy services as defined in §410.60 of this chapter.
2. Outpatient occupational therapy services as defined in §410.59 of this chapter.
3. Outpatient speech-language pathology services as defined in §410.62 of this chapter.

Quality-adjusted target price means the dollar amount assigned to EPM episodes as the result of reducing the episode benchmark price by the EPM participant’s effective discount factor based on the EPM participant’s quality category, as described in §512.315(b)(5), (c)(5), or (d)(5).

Quality improvement points are points that CMS adds to an EPM participant’s EPM composite quality score for a measure if the EPM participant’s performance improves from the previous performance year according to the relevant EPM measure improvement methodology.

Quality performance points are points that CMS adds to an EPM participant’s EPM composite quality score for a measure based on the performance percentile scale and for successful submission of voluntary data if applicable to the EPM.

Reconciliation payment means a payment made by CMS to an EPM participant as determined in accordance with §512.305(d).

Reconciliation payment means the amount owed by an EPM participant to CMS, as reflected on a reconciliation report.

RRC means a rural referral center that satisfies the criteria set forth in §412.96 of this chapter.

Rural hospital means an IPPS hospital that meets one of the following definitions:

1. Is located in a rural area as defined under §412.64 of this chapter.
2. Is located in a rural census tract defined under §412.103(a)(1) of this chapter.
3. Has reclassified as a rural hospital under §412.103 of this chapter.

SCH means a sole community hospital that meets the classification criteria specified in §412.92 of this chapter.

Sharing arrangement means a financial arrangement between an EPM participant and an EPM collaborator for the sole purpose of making gainsharing payments or alignment payments under the EPM.

SHFFT stands for surgical hip/femur fracture treatment and means surgical treatment for hip and femur fractures, other than hip replacements, consisting primarily of hip fixation procedures, with or without reduction of the fracture, as well as open and closed surgical approaches.

SHFFT model means the EPM for SHFFT.

SHFFT model participant means an EPM participant that is an IPPS hospital (other than those hospitals specifically exempted under §512.100(b)) with a CCN primary address in one of the geographic areas selected for participation in a SHFFT model in accordance with §512.105(a), as of the date of selection or any time thereafter during any performance year.

SNF stands for skilled nursing facility.

TGP means an entity that is enrolled in Medicare as a therapy group in private practice, includes at least one owner or employee who is a therapist in private practice, does not include an owner or employee who is a physician or nonphysician practitioner, and has a valid and active TIN.

THA/TKA stands for total hip arthroplasty/total knee arthroplasty.

Therapist means one of the following individuals as defined at §494.4 of this chapter:

1. Physical therapist.
2. Occupational therapist.

Therapist in private practice means a therapist that either—

1. Complies with the special provisions for services furnished by physical therapists in private practice in §410.60(c) of this chapter;
2. Complies with the special provisions for services furnished by occupational therapists in private practice in §410.59(c) of this chapter; or
3. Complies with the special provisions for services furnished by speech-language pathologists in private practice in §410.62(c) of this chapter.

TIN stands for taxpayer identification number.

Two-sided risk arrangement means an arrangement in which the ACO may share savings with the Medicare program, if it meets the requirements for doing so, and is also liable for sharing losses incurred under the program or model, if it meets the criteria under which sharing losses occurs.

Subpart B—Episode Payment Model Participants

§512.100 EPM episodes being tested.

(a) Initiation of an episode. An episode is initiated when an EPM participant admits a Medicare beneficiary described in §512.230 for an anchor hospitalization.

(b) Hospital exclusions. (1) A hospital is excluded from participating in EPMs for EPM anchor MS–DRGs that are included in BPCI episodes in which the hospital currently participates.

(2) These exclusions cease to apply as of the date that the hospital no longer meets the conditions specified in this paragraph (b) or September 30, 2018, whichever date is sooner.

(c) Types of EPM episodes. An EPM episode is initiated by a beneficiary’s admission to an EPM participant for an anchor hospitalization that is paid under an EPM anchor MS–DRG and, in the case of the AMI model, with an AMI ICD–10–CM diagnosis code if the admission is under a PCI MS–DRG. The EPM anchor MS–DRGs and ICD–10–CM diagnosis codes for the EPM episodes are as follows:

1. Acute myocardial infarction (AMI).
   (i) Discharge under an AMI MS–DRG (MS–DRGs 231 to 236).
   (ii) Discharge under a PCI MS–DRG (MS–DRGs 246 to 251) with an ICD–10–CM diagnosis code of AMI on the claim for the anchor hospitalization in the principal or secondary diagnosis code position.

2. Coronary artery bypass graft (CABG). Discharge under a CABG MS–DRG (MS–DRGs 231 to 236).

3. Surgical hip/femur fracture treatment (SHFFT). Discharge under a SHFFT MS–DRG (MS–DRGs 480 to 482).

(d) Identifying AMI historical episodes and EPM episodes with AMI ICD–CM diagnosis codes. CMS develops a list of AMI ICD–9–CM and ICD–10–CM diagnosis codes that identify the initiation of historical episodes or initiate AMI model episodes when reported in the principal or secondary diagnosis code position on the inpatient hospital claim for a historical hospitalization or the anchor hospitalization discharged under PCI MS–DRGs (MS–DRGs 246 to 251). The list of ICD–9–CM and ICD–10–CM diagnosis codes representing AMI is posted on the CMS Web site.

1. On an annual basis, or more frequently as needed, CMS updates the list of ICD–10–CM diagnosis codes representing AMI to reflect coding changes or other issues brought to CMS’ attention.
(2) CMS applies the following standard when revising the list of ICD–10–CM diagnosis codes representing AMI: The ICD–10–CM diagnosis code is sufficiently specific that it represents an AMI.

(3) CMS posts the following to the CMS Web site:
   (i) Potential AMI ICD–10–CM diagnosis codes for public comment; and
   (ii) A final AMI ICD–10–CM diagnosis code list after consideration of public comment.

(4) CMS excludes AMI historical episodes with PCI MS–DRGs and inpatient claims that contain intracardiac ICD–9–CM procedure codes. CMS excludes historical AMI model episodes discharged under PCI MS–DRGs with an AMI ICD–9–CM diagnosis code in the principal or secondary diagnosis code position on the inpatient hospital claim from the AMI historical episodes that set episode benchmark prices if there is an intracardiac ICD–9–CM procedure code in any procedure code field on the inpatient hospital claim. The intracardiac ICD–9–CM procedure codes are as follows:
   (i) 35.52 (Repair of atrial septal defect with prosthesis, closed technique).
   (ii) 35.96 (Percutaneous balloon valvuloplasty).
   (iii) 35.97 (Percutaneous mitral valve repair with implant).
   (iv) 37.26 (Catheter based invasive electrophysiologic testing).
   (v) 37.27 (Cardiac mapping).
   (vi) 37.34 (Excision or destruction of other lesion or tissue of heart, endovascular approach).
   (vii) 37.36 (Excision, destruction, or exclusion of left atrial appendage).
   (viii) 37.90 (Insertion of left atrial appendage device).

§512.105 Geographic areas.

(a) The SHFFT model must be implemented in the same geographic areas as the CJR model as described under §510.105 of the chapter.

(b) The geographic areas for inclusion in the CABG and AMI models will be obtained using a random sampling of certain MSAs in the United States. All counties within each of the selected MSAs are selected for inclusion in the AMI and CAGB models. CMS excludes MSAs that met the following criteria between January 1, 2014 and December 31, 2014 from the possibility of being selected geographic areas. MSAs are excluded if they—
   (1) Had fewer than 75 AMI episodes;
   (2) Had fewer than 75 AMI episodes that were not attributable to BPCI Model 2 or 4, AMI, CABG or PCI episodes;
   (3) Had more than 50 percent of otherwise qualifying (BPCI or non BPCI) episodes attributable to a BPCI Model 2 or 4 AMI, CABG or PCI episodes; or
   (4) Are in Maryland, Vermont, or another state where CMS is implementing a state-wide all-payer model. In such situations all MSAs in the state may be excluded even if hospitals are otherwise being paid in accordance with the IPPS and would otherwise qualify as an eligible EPM participant.

(c) In all geographic areas where the AMI, CABG, or SHFFT models are being implemented, the accountable financial entity must be an acute care IPPS hospital.

§512.110 Access to records and retention.

EPM participants, EPM collaborators, collaboration agents, downstream collaboration agents, and any other individuals or entities performing EPM activities must:

(a) Allow the Government, including CMS, OIG, HHS, and the Comptroller General or their designees, scheduled and unscheduled access to all books, contracts, records, documents, and other evidence (including data related to utilization and payments, quality of care criteria, billings, lists of EPM collaborators, sharing arrangements, distribution arrangements, downstream distribution arrangements, and the documentation required under §§512.500(d) and 512.525(d)) sufficient to enable the audit, evaluation, inspection, or investigation of the following:
   (1) The individual’s or entity’s compliance with EPM requirements and, if applicable, the individual’s or entity’s compliance with CR incentive payment model requirements.
   (2) The calculation, distribution, receipt, or recoupment of gainsharing payments, alignment payments, distribution payments, and downstream distribution payments.
   (3) The obligation to repay any reconciliation payments or CR incentive payments, if applicable, owed to CMS.
   (4) The quality of the services furnished to an EPM beneficiary during the period of the EPM performance year.
   (5) The sufficiency of EPM beneficiary notifications.
   (6) The accuracy of the EPM participant’s submissions under CEHRT use requirements.
   (b) Maintain all such books, contracts, records, documents, and other evidence for a period of 10 years from the last day of the EPM participant’s participation in the EPM or from the date of completion of any audit, evaluation, inspection, or investigation, whichever is later, unless—
   (1) CMS determines a particular record or group of records should be retained for a longer period and notifies the EPM participant at least 30 calendar days before the disposition date; or
   (2) There has been a dispute or allegation of fraud or similar fault against the EPM participant, EPM collaborator, collaboration agent, downstream collaboration agent, or any other individual or entity performing EPM activities in which case the records must be maintained for 6 years from the date of any resulting final resolution of the dispute or allegation of fraud or similar fault.

§512.120 EPM participant CEHRT track requirements.

(a) EPM CEHRT use. For performance year 2 if the EPM participant elects downside risk and for performance years 3 through 5, EPM participants choose either of the following:
   (1) CEHRT use. EPM participants attest in a form and manner specified by CMS to their use of CEHRT as defined in §414.1305 of this chapter to document and communicate clinical care with patients and other health professionals.
   (2) No CEHRT use. EPM participants do not attest in a form and manner specified by CMS to their use of CEHRT as defined in §414.1305 of this chapter to document and communicate clinical care with patients and other health professionals.

(b) Clinician financial arrangements list. Each EPM participant that chooses CEHRT use as provided in paragraph (a)(1) of this section must submit to CMS a clinician financial arrangements list in a form and manner specified by CMS on a no more than quarterly basis. The list must include the following information on individuals and entities for the period of the EPM performance year specified by CMS:
   (1) EPM collaborators. For each physician, nonphysician practitioner, or therapist in private practice who is an EPM collaborator during the period of the EPM performance year specified by CMS:
      (i) The name, TIN, and NPI of the EPM collaborator.
      (ii) The start date and, if applicable, end date, for the sharing arrangement between the EPM participant and the EPM collaborator.
   (2) Collaboration agents. For each physician, nonphysician practitioner, or therapist in private practice who is a collaboration agent during the period of the EPM performance year specified by CMS:
(i) The name and TIN of the EPM collaborator and the name, TIN, and NPI of the collaboration agent.

(ii) The start date and, if applicable, end date, for the distribution arrangement between the EPM collaborator and the collaboration agent.

(3) Downstream collaboration agents. For each physician, nonphysician practitioner, or therapist who is a downstream collaboration agent during the period of the EPM performance year specified by CMS:

(i) The name and TIN of the EPM collaborator, the name and TIN of the collaboration agent and the name, TIN, and NPI of the downstream collaboration agent.

(ii) The start date and, if applicable, end date, for the downstream distribution arrangement between the collaboration agent and the downstream collaboration agent.

(4) Attestation to no individuals. If there are no individuals that meet the requirements to be reported, as specified in paragraphs (b)(1) through (3) of this section, the EPM participant must attest in a form and manner required by CMS that there are no individuals to report on the clinician financial arrangements list.

(c) Documentation requirements. (1) Each EPM participant that chooses CEHRT use as provided in paragraph (a)(1) of this section must maintain documentation of their attestation to CEHRT use and clinician financial arrangements lists.

(2) The EPM participant must retain and provide access to the required documentation in accordance with § 512.110.

Subpart C—Scope of Episodes

§ 512.200 Time periods for EPM episodes.

All AMI, CABG, and SHFFT episodes begin on or after July 1, 2017 and end on or before December 31, 2021.

§ 512.210 Included and excluded services.

(a) Included services for an EPM. All Medicare Parts A and B items and services are included in the EPM episode, except as specified in paragraph (b) of this section. These services include, but are not limited to, the following:

(1) Physicians’ services.
(2) Inpatient hospital services.
(3) IPF services.
(4) LTCH services.
(5) IRF services.
(6) SNF services.
(7) HH services.
(8) Hospital outpatient services.
(9) Independent outpatient therapy services.

(10) Clinical laboratory services.
(11) DME.
(12) Part B drugs and biologicals.
(13) Hospice.
(14) PBPM payments under models tested under section 1115A of the Act.

(b) Excluded services. The following items, services, and payments are excluded from the EPM episode:

(1) Hemophilia clotting factors provided in accordance with § 412.115 of this chapter.

(2) New technology add-on payments for medical devices as defined in part 412, subsection F, of this chapter.

(3) Transitional pass-through payments for medical devices as defined in § 419.66 of this chapter.

(4) Items and services unrelated to the anchor MS–DRG that initiates the EPM episode, as determined by CMS.

Excluded services include, but are not limited to, the following:

(i) Inpatient hospital admissions for MS–DRGs that group to the following categories of diagnoses:

(A) Oncology.
(B) Trauma medical.

(ii) Chronic disease surgical unrelated to a condition likely to have been affected by care during the EPM episode, such as prostatectomy.

(iii) Acute disease surgical unrelated to a condition resulting from or likely to have been affected by care during the EPM episode, such as appendectomy.

(iv) Certain chronic disease diagnoses, as specified by CMS on a diagnosis-by-diagnosis basis depending on whether the condition was likely to have been affected by care during the EPM episode or whether substantial services were provided for the chronic condition during the EPM episode.

(iii) Certain PBPM payments under models tested under section 1115A of the Act that CMS determines to be primarily used for care coordination or care management services for clinical conditions in excluded categories of diagnoses for an EPM, as described in paragraph (b)(4)(iii) of this section.

(iv) All PBPM model payments funded from the Innovation Center apportionments.

(c) Updating the exclusion lists for EPMs. (1) The EPM exclusion list that applies to each anchor MS–DRG for an EPM episode and that displays excluded MS–DRGs, ICD–9–CM and ICD–10–CM diagnosis codes, and CMS model PBPM payments is posted on the CMS Web site.

(2) On an annual basis, or more frequently as needed, CMS updates the EPM exclusion lists to reflect annual coding changes or other issues brought to CMS' attention.

(3) CMS applies the following standards when revising the EPM exclusion lists for reasons other than to reflect annual coding changes:

(i) Items or services that are directly related to the EPM episode or the quality or safety of the EPM episode care are included in the EPM episode.

(ii) Items or services for chronic conditions that may be affected by the EPM episode care are included in the EPM episode.

(iii) Items and services for chronic conditions that are generally not affected by the EPM episode care are excluded from the EPM episode.

(iv) Items and services for acute clinical conditions not arising from existing EPM episode-related chronic clinical conditions or complications of EPM episode care are excluded from the EPM episode.

(v) PBPM payments under CMS models determined to be primarily used for care coordination or care management services for clinical conditions in excluded categories of diagnoses for an EPM, as described in paragraph (b)(4)(iii) of this section, are excluded from the EPM episode.

(4) CMS posts the following on the CMS Web site:

(i) Potential revisions to the EPM exclusion lists to allow for public comment;

(ii) Updated EPM exclusion lists after consideration of public comment.

§ 512.230 Beneficiary inclusion criteria.

EPM episode care is furnished to beneficiaries who meet all of the following criteria upon admission to the anchor hospitalization:

(a) Enrolled in Medicare Part A and Part B.

(b) Eligibility for Medicare is not based on end-stage renal disease, as described in § 406.13 of this chapter.

(c) Not enrolled in any managed care plan (for example, Medicare Advantage, health care prepayment plans, or cost-based health maintenance organizations).

(d) Not covered under a United Mine Workers of America health care plan.

(e) Have Medicare as their primary payer pursuant to the requirements in § 411.20 of this chapter.
§ 512.240 Determination of the EPM episode.

(a) AMI Model—(1) General. The AMI episode begins with the admission of a Medicare beneficiary as described in § 512.230 to an AMI model participant for an anchor hospitalization and ends on the 90th day after the date of discharge, with the day of discharge itself being counted as the first day in the 90-day post-discharge period.

(b) CABG Model—(1) General. The CABG episode begins with the admission of a Medicare beneficiary as described in § 512.230 to a CABG model participant for an anchor hospitalization and ends on the 90th day after the date of discharge, with the day of discharge itself being counted as the first day in the 90-day post-discharge period.

(c) SHFFT Model—(1) General. The SHFFT episode begins with the admission of a Medicare beneficiary as described in § 512.230 to a SHFFT model participant for an anchor hospitalization and ends on the 90th day after the date of discharge, with the day of discharge itself being counted as the first day in the 90-day post-discharge period.

§ 512.300 Determination of episode quality-adjusted target prices and actual episode payments.

(a) General. CMS establishes episode quality-adjusted target prices and calculates actual episode payments for EPM participants for each performance year of the EPMs as specified in this section.

(b) Calculating episode quality-adjusted target prices. Episode quality-adjusted target prices and actual episode payments are calculated for episodes according to the following:

(1) For episodes involving AMI, MS–DRGs.

(i) 280 (Acute myocardial infarction, discharged alive with MCC).

(ii) 281 (Acute myocardial infarction, discharged alive without CC).

(iii) 282 (Acute myocardial infarction, discharged alive with CC).

(iv) 246 (Perc cardiovascular proc with drug-eluting stent with MCC or 4+ vessels/stents).

(v) 247 (Perc cardiovascular proc with drug-eluting stent without MCC).

(vi) 248 (Perc cardiovascular proc with non-drug-eluting stent with MCC or 4+ vessels/stents).

(vii) 249 (Perc cardiovascular proc with non-drug-eluting stent without MCC).

(viii) 250 (Perc cardiovascular proc without coronary artery stent with MCC).

(ix) 251 (Perc cardiovascular proc without coronary artery stent without MCC).

(2) For episodes involving CABG, MS–DRGs.

(i) 231 (Coronary bypass with PTCA with MCC).

(ii) 232 (Coronary bypass with PTCA without MCC).

(iii) 233 (Coronary bypass with cardiac cath with MCC).

(iv) 234 (Coronary bypass with cardiac cath without MCC).

(v) 235 (Coronary bypass without cardiac cath with MCC).

(vi) 236 (Coronary bypass without cardiac cath without MCC).

(vii) 237 (Coronary bypass without drug-eluting stent with MCC).

(viii) 238 (Coronary bypass without drug-eluting stent without MCC).

(ix) 239 (Coronary bypass without non-drug-eluting stent with MCC).

(x) 240 (Coronary bypass without non-drug-eluting stent without MCC).

(x) 241 (Coronary bypass without PCI with MCC).

(xii) 242 (Coronary bypass without PCI without MCC).

(xiii) 243 (Coronary bypass without PCI without drug-eluting stent with MCC).

(xiv) 244 (Coronary bypass without PCI without drug-eluting stent without MCC).

(xv) 245 (Coronary bypass without PCI without non-drug-eluting stent with MCC).

(xvi) 246 (Coronary bypass without PCI without non-drug-eluting stent without MCC).

(3) For episodes involving SHFFT, MS–DRGs.

(i) 480 (Hip and femur procedures except major joint with MCC).

(ii) 481 (Hip and femur procedures except major joint with CC).

(iii) 482 (Hip and femur procedures except major joint without CC or MCC).

(iv) 491 (Knee procedures except major joint with MCC).

(v) 492 (Knee procedures except major joint with CC).

(vi) 493 (Knee procedures except major joint without CC or MCC).

(c) Calculating quality-adjusted target prices. CMS calculates quality-adjusted target prices as specified in § 512.300(c)(1) through (13).

(1) Calculation of the historical expenditures. CMS calculates historical expenditure calculations based on the following calendar years:

(i) Episodes beginning in 2013 through 2015 for performance years 1 and 2.

(ii) Episodes beginning in 2015 through 2017 for performance years 3 and 4.

(iii) Episodes beginning in 2017 through 2019 for performance year 5.

(2) Calculation of the quality-adjusted target prices. CMS calculates quality-adjusted target prices based on a blend of each EPM-participant hospital-specific and regional historical episode expenditures.

(i) The region corresponds to the U.S. Census Division associated with the primary address of the CCN of the EPM participant and the regional component is based on episodes occurring at all acute care hospitals in said region, except as follows.

(ii) In cases where an MSA selected for participation in an EPM spans more than one U.S. Census Division, the entire MSA is grouped into the U.S. Census Division where the largest city by population in the MSA is located for quality-adjusted target price and episode payment calculations.

(3) Calculation of the quality-adjusted target price blend. The quality-adjusted target price blend consists of the following:

(i) Two-thirds of the EPM participant’s own historical episode payments and one-third of the regional historical episode payments for performance years 1 and 2.

(ii) One-third of the EPM participant’s own historical episode payments and two-thirds of the regional historical episode payments for performance year 3.

(iii) Regional historical episode payments for performance years 4 and 5.

(4) Exception for low-volume hospitals. (i) For the SHFFT model, quality-adjusted target prices for participants with fewer than 50 SHFFT...
model episodes in total across the 3 historical years of data used to calculate the quality-adjusted target price are based on 100 percent regional historical episode payments.

(ii) For the AMI model, quality-adjusted target prices for anchor MS–DRGs 280–282 for participants with fewer than 75 AMI model episodes with anchor MS–DRGs 280–282 in total across the 3 historical years of data used to calculate the quality-adjusted target price are based on 100 percent regional historical episode payments.

(iii) For the AMI model, quality-adjusted target prices for anchor MS–DRGs 246–251 for participants with fewer than 125 AMI model episodes with anchor MS–DRGs 246–251 in total across the 3 historical years of data used to calculate the quality-adjusted target price are based on 100 percent regional historical episode payments.

(iv) For the CABG model, quality-adjusted target prices for participants with fewer than 50 CABG model episodes in total across the 3 historical years of data used to calculate the quality-adjusted target price are based on 100 percent regional historical episode payments.

(5) Exception for recently merged or split hospitals. EPM-participant hospital-specific historical episode payments for EPM participants that have undergone a merger, consolidation, spin off or other reorganization that results in a new hospital entity without spin off or other reorganization that results in a new hospital entity without 3 full years of historical claims data are determined using the historical episode payments attributed to their predecessor(s).

(6) Episodes that straddle performance years or payment updates. Where an episode straddles performance years or payment updates, the quality-adjusted target price is based on the quality-adjusted target price for the type of episode as of the date of admission for the anchor hospitalization.

(7) Adjustments for certain hospitalizations under the AMI and CABG models—(i) Adjustments for CABG model episodes with anchor MS–DRGs 231–236. The episode benchmark price for an episode with CABG anchor MS–DRG 231–236 is set based on the sum of expenditures during the anchor hospitalization portion and post-anchor hospitalization portion of the episode as follows:

(A) The anchor hospitalization portion of the episode benchmark price is set based on the CABG anchor MS–DRG at discharge.

(B) The post-anchor hospitalization portion of the episode benchmark price is set separately for episodes:

1. With AMI ICD–CM diagnosis code on the anchor inpatient claim and CABG anchor MS–DRG with major complication or comorbidity (231, 233, or 235).

2. With AMI ICD–CM diagnosis code on the anchor inpatient claim and CABG anchor MS–DRG without major complication or comorbidity (232, 234, or 236).

3. Without AMI ICD–CM diagnosis code on the anchor inpatient claim and CABG anchor MS–DRG with major complication or comorbidity (231, 233, or 235).

4. Without AMI ICD–CM diagnosis code on the anchor inpatient claim and CABG anchor MS–DRG without major complication or comorbidity (232, 234, or 236).

(ii) Adjustments for Certain AMI Model Episodes with CABG Readmissions. The episode benchmark price for an AMI model episode with AMI anchor MS–DRG 280–282 or PCI anchor MS–DRG 246–251 with a readmission to any of CABG anchor MS–DRGs 231–236 is the sum of the anchor hospitalization portion of the CABG episode benchmark price corresponding to the MS–DRG of the CABG readmission and the episode benchmark price for the corresponding anchor MS–DRG that would be applied to the episode if it did not include a CABG readmission.

(8) Inclusion of reconciliation payments and Medicare repayments. CMS will include certain reconciliation payments and Medicare repayments when updating quality adjusted target prices.

(i) Inclusion of reconciliation payments and Medicare repayments in BPCI initiative. Reconciliation payments and Medicare repayments under § 512.305(d)(2) and (3) and those from episodes in the BPCI initiative are included when updating quality-adjusted target prices for performance years 3 through 5, subject to the adjustment for CABG model episodes in paragraph (c)(8)(ii) of this section.

(ii) Inclusion of reconciliation payments and Medicare repayments in CABG model episodes. When updating prices for CABG episodes, reconciliation payments and Medicare repayments under § 512.305(d)(2) and (d)(3) and from episodes included in the BPCI initiative will be apportioned proportionally to the anchor hospitalization and post-anchor hospitalization portions of historical CABG episodes. The proportions will be based on based on regional average historical episode payments that occurred during the anchor hospitalization portion of CABG model episodes and regional average historical episode payments that occurred during the post-anchor anchor hospitalization portion of CABG model episodes that were initiated during the 3 historical years.

(9) Communication of quality-adjusted target prices. CMS communicates quality—adjusted target prices to EPM participants prior to the beginning of the performance period in which they apply.

(10) Applicable time period for updating quality-adjusted target prices. In general quality-adjusted target prices are updated to account for Medicare payment updates no less than 2 times per year, for updated quality-adjusted target prices effective October 1 and January 1, and at other intervals if necessary as determined by CMS.

(i) For CABG model episodes, quality-adjusted target prices are updated by separately updating the anchor hospitalization portion of the episode benchmark price and the post-anchor hospitalization portion of the episode benchmark price and then applying the effective discount factor.

(ii) [Reserved].

(11) Trending of historical expenditure data. CMS trends historical expenditure data by applying separate national trend factors to episode payments. A trend factor is calculated for each of the first 2 years in the historical period based on the ratio of national average episode payments in the third year of the historical period to national average episode payments in each of the first 2 years in the historical period, for the following scenarios:

(i) Separately for each SHFFT anchor MS–DRGs 480 through 482.

(ii) Separately for each AMI anchor MS–DRGs 280 through 282 and PCI anchor MS–DRGs 246 through 251 for AMI model episodes without CABG readmissions.

(iii) For CABG model episodes, separately for the anchor hospitalization portion and post-anchor hospitalization portion as follows:

(A) For the anchor hospitalization portion of CABG model episodes, separately for each CABG anchor MS–DRGs 231 through 236.

(B) For the post-anchor hospitalization portion of CABG model episodes, separately for episodes:

1. With AMI ICD–CM diagnosis code on the anchor inpatient claim and CABG anchor MS–DRG with major complication or comorbidity (231, 233, or 235).

2. With AMI ICD–CM diagnosis code on the anchor inpatient claim and CABG anchor MS–DRG without major complication or comorbidity (232, 234, or 236).
prices. (3) Without AMI ICD–CM diagnosis code on the anchor inpatient claim and CABG anchor MS–DRG with major complication or comorbidity (232, 233, or 235).

(4) Without AMI ICD–CM diagnosis code on the anchor inpatient claim and CABG anchor MS–DRG without major complication or comorbidity (232, 234, or 236).

(12) Normalizing for wage variation. CMS applies the CMS Price (Payment) Standardization Detailed Methodology to remove wage level differences in calculating EPM-episode benchmark prices and actual EPM-episode payments. CMS reintroduces wage index variations by multiplying the blended and updated historical wage payments by a wage normalization factor of 0.7 * IPPS wage index + 0.3.

(13) Combining episodes to set stable benchmark and quality-adjusted target prices. For purposes of having sufficient episode volume to set stable EPM benchmark and quality-adjusted target prices, where applicable, CMS aggregates EPM episodes and portions of EPM episodes across dimensions that include anchor MS–DRGs, the presence of an AMI ICD–CM diagnosis code on the anchor inpatient claim, and the presence of a major complication or comorbidity for anchor CABG MS–DRGs.

(A) For SHFFT model episodes, CMS combines episodes with anchor MS–DRGs 480 through 482.

(B) For AMI model episodes with AMI anchor MS–DRGs 280 through 282 or PCI anchor MS–DRGs 246 through 251 and without readmissions for CABG MS–DRGs 231 through 236, payments are capped separately from episode payments during the post-anchor hospitalization portion.

(C) For CABG model episodes with CABG MS–DRGs 231 through 236, payments are capped separately for episodes with AMI ICD–CM diagnosis code on the anchor inpatient claim and CABG anchor MS–DRG with major complication or comorbidity (232, 233, or 235).

(D) For AMI episodes with either AMI anchor MS–DRGs 280 through 282 or PCI anchor MS–DRGs 246 through 251 and with readmission for a CABG MS–DRG 231 through 236, the cap is applied separately to the payments during the CABG readmission and all other payments during the episode.

(ii) For CABG model episodes with AMI anchor MS–DRGs 231 through 236, episode payments during the anchor hospitalization portion are capped separately from episode payments during the post-anchor hospitalization portion as follows:

(1) With AMI ICD–CM diagnosis code on the anchor inpatient claim and CABG anchor MS–DRG with major complication or comorbidity (231, 233, or 235).

(2) Without AMI ICD–CM diagnosis code on the anchor inpatient claim and CABG anchor MS–DRG without major complication or comorbidity (232, 234, or 236).

(ii) After blending EPM-participant hospital-specific and regional-specific components of the combined episodes, CMS separates episodes to calculate EPM-episode benchmark prices according to the episode anchor MS–DRG, subject to adjustments described in §512.300(c)(7).

Effective discount factor. An EPM participant’s quality-adjusted target prices incorporate an effective discount factor to reflect Medicare’s portion of reduced expenditures from the EPM as described in this section.

Effective discount factor for reconciliation payments. The effective discount factor for reconciliation payment in all performance years is determined based on the EPM participant’s quality category as provided in §512.315(b)(5), (c)(5), and (d)(5).

Applicable discount factor for repayment amounts. The applicable discount factor for repayment amounts is—

(i) Not applicable in performance year 1, as the requirement for EPM participant repayment is waived.

(ii) Not applicable in performance year 2 as the requirement for EPM participant repayment is waived except for an EPM participant that has elected downside risk for that performance year.

(iii) In performance year 2 for an EPM participant that has elected downside risk and performance years 3 and 4 when partial EPM participant repayment applies, as determined by the EPM participant’s quality category as provided in §512.315(b)(5), (c)(5), and (d)(5).

(iv) Not applicable in performance year 5 when full EPM participant repayment applies, as determined by the EPM participant’s quality category as provided in paragraph (d)(1) of this section.

Exceptions that apply to both quality-adjusted target prices and actual episode payments—(1) For payments during the anchor hospitalization portion of the episode, the cap is applied for the anchor hospitalization portion of a CABG readmission portion of the episode, the cap is applied for the anchor hospitalization portion of a CABG readmission portion of the episode.
episode for the corresponding CABG readmission MS–DRG.

(B) For all other payments during the episode, the cap is applied to the AMI model episodes with AMI anchor MS–DRGs 280 through 282 or PCI anchor MS–DRGs 246 through 251 and without readmission for CABG MS–DRGs corresponding to the AMI anchor MS–DRG.

(2) Exclusion of incentive programs and add-on payments under existing Medicare payment systems. Certain incentive programs and add-on payments are excluded by CMS’ application of the CMS Price (Payment) Standardization Detailed Methodology used for the Medicare spending per beneficiary measure in the Hospital Value-Based Purchasing Program and Physician Value-Based Payment Modifier Program as specified in §414.1235(a)(6) and (c)(1) of this chapter.

(f) Allocation of payments for services that straddle the episode—(1) General. Services included in the episode that begin before the start of or continue beyond the end of an EPM episode are prorated so that only the portion attributable to care furnished during the episode are included in the calculation of actual episode payments.

(2) Proration of services. Payments for services that straddle the episode are prorated using the following methodology:

(i) Non-IPPS inpatient services and other inpatient services. Non-IPPS inpatient services, and services furnished by other inpatient providers that extend beyond the end of the episode are prorated according to the percentage of days, starting with the first billable service date (start of care date) and through and including the last billable service date, that occur during the episode. This methodology is applied in the same way if the home health services begin (the start of care date) prior to the start of the episode.

(ii) Home health agency services. Home health services paid under the prospective payment system in part 484, subpart E of this chapter are prorated according to the percentage of days, starting with the first billable service date (start of care date) and through and including the last billable service date, that occur during the episode. This methodology is applied in the same way if the home health services begin (the start of care date) prior to the start of the episode.

(3) IPPS services. IPPS claim amounts that extend beyond the end of the episode are prorated according to the geometric mean length of stay, using the following methodology:

(i) The first day of the IPPS stay is counted as 2 days.

(ii) The actual length of stay that occurred during the episode is equal to or greater than the MS–DRG geometric mean, the normal MS–DRG payment is fully allocated to the episode.

(iii) If the actual length of stay that occurred during the episode is less than the geometric mean, the normal MS–DRG payment amount is allocated to the episode based on the number of inpatient days that fall within the episode.

(iv) If the full amount is not allocated to the episode, any remainder amount is allocated to the post-episode spending calculation (determined in §512.307(c)).

§512.305 Determination of the NPRA and reconciliation process.

(a) General. Providers and suppliers furnishing items and services included in the EPM episode bill for such items and services in accordance with existing rules and as if this part were not in effect.

(b) Annual reconciliation. CMS annually performs the processes described in paragraphs (c) and (d) of this section to allocate actual episode payments for each EPM episode for the performance year (except for episodes that have been canceled in accordance with §512.240(a)(2), (b)(2), and (c)(2)) and determines the amount of a reconciliation payment to or Medicare repayment amount from EPM participants, if any, for that performance year.

(c) Annual reconciliation to establish NPRA. (1) Beginning 2 months after the end of each performance year and using the most recent claims data and non-claims-based payment data available, CMS performs a reconciliation calculation to establish an NPRA for each EPM participant based on the following process.

(2) CMS—

(i) Assesses whether EPM participants are in an acceptable or better quality category under §512.315; and

(ii) Calculates the NPRA for each EPM participant for each performance year by comparing the quality-adjusted target prices and the EPM participant’s actual episode payments for the performance year or portion of that performance year as described in §512.300 as follows:

(A) Determines actual EPM episode payments for each EPM episode included in the performance year or portion of that performance year.

(B) Multiplies the quality-adjusted target price by the number of non-canceled EPM episodes included in the performance year or portion of that performance year to which that episode quality-adjusted price applies and aggregates these amounts.

(C) Subtracts the amount determined under paragraph (c)(2)(ii)(A) of this section from the amount determined under paragraph (c)(2)(ii)(B) of this section.

(iii) Applies the following:

(A) Limitation on loss. Except as provided in paragraphs (c)(2)(ii)(C) and (D) of this section, the total amount of the NPRA and subsequent reconciliation calculation for a performance year or portion of that performance year cannot exceed the following:

(1) For performance year 2—

(i) Five percent of the amount calculated in paragraph (c)(2)(ii)(B) of this section for the performance year if the EPM participant elected downside risk for that year.

(ii) Zero percent of the amount calculated in paragraph (c)(2)(ii)(B) of this section for the performance year for all other EPM participants.

(2) For performance year 3, 5 percent of the amount calculated in paragraph (c)(2)(ii)(B) of this section for the performance year.

(3) For performance year 4, 10 percent of the amount calculated in paragraph (c)(2)(ii)(B) of this section for the performance year.

(4) For performance year 5, 20 percent of the amount calculated in paragraph (c)(2)(ii)(B) of this section for the performance year.

(B) Limitation on gain. The total amount of the NPRA and subsequent reconciliation calculation for a performance year cannot exceed the following:

(1) For performance years 1, 2, and 3, 5 percent of the amount calculated in paragraph (c)(2)(ii)(B) of this section for the performance year.

(2) For performance year 4, 10 percent of the amount calculated in paragraph (c)(2)(ii)(B) of this section for the performance year.

(3) For performance year 5, 20 percent of the amount calculated in paragraph (c)(2)(ii)(B) of this section for the performance year.

(C) Financial loss limits for rural hospitals, SCHs, MDHs, and RRCs. The total amount of the NPRA and subsequent reconciliation calculation for a performance year cannot exceed the following:

(1) For performance year 2—

(i) Three percent of the amount calculated in paragraph (c)(2)(ii)(B) of this section for the performance year if the EPM participant elected downside risk for that year.

(ii) Zero percent of the amount calculated in paragraph (c)(2)(ii)(B) of this section for the performance year for all other EPM participants.

(2) For performance year 3, 3 percent of the amount calculated in paragraph (c)(2)(ii)(B) of this section for the performance year.
(3) For performance years 4 and 5, 5 percent of the amount calculated in paragraph (c)(2)(ii)(B) of this section for the performance year.

(D) Financial loss limits for EPM volume protection hospitals. EPM participants may be determined to be an EPM volume protection hospital under an EPM.

(1) An EPM participant is determined to be an EPM volume protection hospital under a model if their total volume of EPM historical episodes is at or below the 10th percentile of hospital-specific historical EPM episodes for hospitals with one or more episodes located in the MSAs eligible for selection into that specific EPM.

(2) CMS establishes thresholds as specified in paragraph (c)(2)(ii)(D)(1) of this section based on episodes beginning in the time period specified in §512.300(c)(1)(i).

(3) For an EPM participant determined to have a low volume of episodes within a model as specified in paragraph (c)(2)(ii)(D)(1) but not paragraph (c)(2)(ii)(C) of this section, then the financial loss limits specified under paragraph (c)(2)(ii)(C) of this section are applied.

(iv) CMS posts to the CMS Web site the threshold established in this section and a list of CCNs of EPM participants that are classified as EPM volume protection hospitals.

(v) CMS communicates to each EPM participant whether it is classified as an EPM volume protection hospital at the same time that CMS communicates quality-adjusted target prices as described in §512.300(c)(9).

(E) Application of limitations on losses and gains. CMS establishes limits on losses and gains specifically with respect to and separately for each EPM.

(d) Determination of reconciliation or repayment amount—(1) General. (i) Subject to paragraphs (c)(2)(ii)(B) and (d)(1)(ii) of this section, for performance year 1, the reconciliation payment (if any) is equal to the NPRA. (ii) Subject to paragraphs (c)(2)(ii)(A) through (D) and (d)(1)(ii) of this section, for performance years 2 through 5, results from the subsequent reconciliation calculation for a prior year’s reconciliation, as described in §512.307, and the post-episode spending and ACO overlap calculations, as described in §512.307(b) and (c), are added to the current year’s NPRA in order to determine the reconciliation or repayment amount.

(iii) The reconciliation or repayment amount may be adjusted as described in §512.460(b).

(2) Reconciliation payment. If the amount described in paragraph (d)(1) of this section is positive and the EPM participant quality category as described in §512.315 is acceptable, good, or excellent, Medicare pays the EPM participant a reconciliation payment in an amount equal to the amount described in paragraph (d)(1) of this section. If the EPM participant’s quality category as described in §512.315 is unacceptable, the EPM participant is not eligible to pay a reconciliation payment.

(3) Repayment amount. If the amount described in paragraph (d)(1) of this section is negative, the EPM participant pays to Medicare an amount equal to the amount described in paragraph (d)(1) of this section, in accordance with §405.371 of this chapter. CMS waives this requirement for performance year 1.

(e) EPM participants found to be engaged in inappropriate and systemic under delivery of care. If the EPM participant is found to be engaged in an inappropriate and systemic under delivery of care as specified in §512.460(b)(1)(ii)(C), the quality of the care provided must be considered to be seriously compromised and the EPM participant must be ineligible to receive or retain a reconciliation payment for any period in which such under delivery of care was found to occur.

(f) Reconciliation report. (1) CMS issues each EPM participant a reconciliation report for the performance year. Each reconciliation report contains the following:

(i) Information on the EPM participant’s composite quality score described in §512.315.

(ii) The total actual episode payments for the EPM participant.

(iii) The NPRA.

(iv) Whether the EPM participant is eligible for a reconciliation payment or must make a repayment to Medicare.

(v) The NPRA and subsequent reconciliation calculation amount for the previous performance year, as applicable.

(vi) The post-episode spending amount and ACO overlap calculation for the previous performance year, as applicable.

(vii) The reconciliation payment or repayment amount.

(2) For performance year 2, the reconciliation report would also include information separately for the performance year 2 (DR) and performance year 2 (NDR) portions of that year.

§512.307 Subsequent calculations.

(a) Subsequent reconciliation calculation. (1) Fourteen months after the end of each performance year, CMS performs an additional calculation, which accounts for changes since the calculation of the initial NPRA, using claims data and non-claims-based payment data available at that time, to account for final claims run-out, final changes in non-claims-based payment data, and any additional episode cancellations due to overlap or other reasons as specified in §512.240(a)(2), (b)(2), and (c)(2).

(2) The additional calculation occurs concurrently with the reconciliation process for the most recent performance year and determines the subsequent calculation amount as follows:

(i) If the result of the subsequent reconciliation calculation is different than zero, CMS applies the stop-loss and stop-gain limits in §512.305(c)(2)(ii)(C), before application of the stop-loss and stop-gain limits, and the subsequent reconciliation calculation to ensure the calculations in aggregate do not exceed the stop-loss or stop-gain limits. CMS then takes the difference between that amount and the initial NPRA after application of the stop-loss and stop-gain limits in §512.305(c)(2)(ii)(A) through (D) to determine the subsequent calculation amount.

(ii) CMS then applies the subsequent calculation amount to the NPRA for the most recent performance year in order to determine the reconciliation amount or repayment amount for the most recent performance year.

(iii) Because EPM participants that elected downside risk in performance year do not have financial repayment responsibility for performance year 1, for the performance year 2 reconciliation report only, the subsequent calculation amount (for performance year 1) is applied to the performance year 1 NPRA to ensure that the combined amount is not less than zero.

(iv) Because EPM participants that have not elected downside risk in performance year 2 do not have financial repayment responsibility for performance years 1 or 2, for the performance year 2 and performance year 3 reconciliation reports only, the subsequent calculation amount (for performance year 1 or performance year 2) is applied to the performance year 1 NPRA or performance year 2 NPRA to ensure that the combined amount is not less than zero.

(b) Additional calculations to determine the reconciliation payment or repayment amount. CMS reduces the reconciliation payment or increase the
repayment amount for the subsequent performance year to account for shared savings paid to the ACO in the prior performance year by the amount of the EPM discount factor paid out to the ACO as shared savings in the prior performance year. This adjustment is only made when the EPM participant is a participant or provider/supplier in the ACO and the EPM beneficiary is not prospectively assigned to one of the following:

(1) An ACO in the Next Generation ACO model.
(2) An ACO in Track 3 of the Medicare Shared Savings Program.
(3) An ACO in the Comprehensive ESRD Care Model that includes downside risk.

(c) Increases in post-episode spending. If the average post-episode Medicare Parts A and B payments for an EPM participant in the prior performance year is greater than 3 standard deviations above the regional average post-episode payments for the same performance year, then the spending amount exceeding 3 standard deviations above the regional average post-episode payments for the same performance year is added to the calculation of the reconciliation or repayment amount for the subsequent performance year.

§512.310 Appeals process.

(a) Notice of calculation error (first level of appeal). Subject to the limitations on review in subpart D of this part, if an EPM participant wishes to dispute calculations involving a matter related to payment, a CR incentive payment, reconciliation amounts, repayment amounts, the use of quality measure results in determining the composite quality score, or the application of the composite quality score during reconciliation, the EPM participant is required to provide written notice of the calculation error, in a form and manner specified by CMS.

(1) Unless the EPM participant provides such notice, CMS deems final the reconciliation report and CR incentive payment report 45 calendar days after the reconciliation report or CR incentive payment report is issued and proceeds with the payment or repayment processes as applicable.

(2) If CMS receives a notice of a calculation error within 45 calendar days of the issuance of the reconciliation report or CR incentive payment report, CMS responds in writing within 30 calendar days to either confirm that there was an error in the calculation or verify that the calculation is correct, although CMS reserves the right to an extension upon written notice to the EPM participant.

(3) Only EPM participants may use the notice of calculation error process described in this part.

(b) Dispute resolution process (second level of appeal). (1) If the EPM participant is dissatisfied with CMS’ response to the notice of a calculation error, the EPM participant may request a reconsideration review in a form and manner as specified by CMS.

(2) The reconsideration request must provide a detailed explanation of the basis for the dispute and include supporting documentation for the EPM participant’s assertion that CMS or its representatives did not accurately calculate the NPRA, the reconciliation payment, the CR incentive payment, or the repayment amount in accordance with subpart D of this part.

(3) If CMS does not receive a request for reconsideration from the EPM participant within 10 calendar days of the issue date of CMS’ response to the EPM participant’s notice of calculation error, then CMS’ response to the calculation error is deemed final and CMS proceeds with the applicable processes, as described in subpart D of this part.

(4) The CMS reconsideration official notifies the EPM participant in writing within 15 calendar days of receiving the EPM participant’s review request of the following:

(i) The date, time, and location of the review.

(ii) The issues in dispute.

(iii) The review procedures.

(iv) The procedures (including format and deadlines) for submission of evidence.

(5) The CMS reconsideration official takes all reasonable efforts to schedule the review to occur no later than 30 days after the date of receipt of the notification.

(b) The provisions at §425.804(b), (c), and (e) of this chapter are applicable to reviews conducted in accordance with the reconsideration review process for the EPM.

(7) The CMS reconsideration official issues a written determination within 30 days of the review. The determination is final and binding.

(b) Only EPM participants may use the dispute resolution process described in this part.

(c) Exception to the notice of calculation error process. If the EPM participant contests a matter that does not involve an issue contained in, or a calculation which contributes to, a reconciliation report or CR incentive payment report a notice of calculation error is not required. In these instances, if CMS does not receive a request for reconsideration from the EPM participant within 10 calendar days of the notice of the initial determination, the initial determination is deemed final and CMS proceeds with the action indicated in the initial determination. This does not apply to the limitations on review in paragraph (e) of this section.

(d) Notice of an EPM participant’s termination from the EPM. If an EPM participant receives notification that it has been terminated from the EPM and wishes to appeal such termination, it must provide a written request for reconsideration to CMS requesting review of the termination within 10 calendar days of the notice. CMS has 30 days to respond to the EPM participant’s request for review. If the EPM participant fails to notify CMS, the termination is deemed final.

(e) Limitations on review. In accordance with section 1115A (d)(2) of the Act, there is no administrative or judicial review under sections 1869 or 1878 of the Act or otherwise for the following:

(1) The selection of models for testing or expansion under section 1115A of the Act.

(2) The selection of organizations, sites, or participants to test those models selected.

(3) The elements, parameters, scope, and duration of such models for testing or dissemination.

(4) Determinations regarding budget neutrality under section 1115A(b)(3) of the Act.

(5) The termination or modification of the design and implementation of a model under section 1115A(b)(3)(B) of the Act.

(6) Decisions to expand the duration and scope of a model under section 1115A(c) of the Act. The determination that a model is not expected to meet criteria described in paragraph (e)(1) or (2) of this section.

§512.315 Composite quality scores for determining reconciliation payment eligibility and effective and applicable discount factors.

(a) General. An EPM participant’s eligibility for a reconciliation payment under §512.305, and the determination of effective discount factors and applicable discount factors for reconciliation and repayment, respectively, under paragraphs (b)(5), (c)(5), and (d)(5) of this section, for a performance year depend on the EPM participant’s EPM composite quality score (including any quality performance points and quality improvement points earned) for that performance year.
(b) AMI model—(1) AMI model composite quality score. CMS calculates an AMI model composite quality score for each AMI model participant for each performance year, which equals the sum of the following:

(i) The AMI model participant’s quality performance points for the Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (NQF #0230) measure described in § 512.411(a)(1). This measure is weighted at 50 percent of the AMI model composite quality score.

(ii) The AMI model participant’s quality performance points for the Excess Days in Acute Care after Hospitalization for AMI measure described in § 512.411(a)(2). This measure is weighted at 20 percent of the AMI model composite quality score.

(iii) The AMI model participant’s quality performance points for the Hospital Consumer Assessment of Healthcare Providers and Systems Survey (NQF #0166) measure described in § 512.411(a)(3), CMS assigns the AMI model participant measure value to a performance percentile and then quality performance points are assigned based on the following performance percentile scale:

- (A) 4.00 points for ≥ 90th.
- (B) 3.70 points for ≥ 80th and < 90th.
- (C) 3.40 points for ≥ 70th and < 80th.
- (D) 3.10 points for ≥ 60th and < 70th.
- (E) 2.80 points for ≥ 50th and < 60th.
- (F) 2.50 points for ≥ 40th and < 50th.
- (G) 2.20 points for ≥ 30th and < 40th.
- (H) 0.00 points for < 30th.

(iii) For the Hospital Consumer Assessment of Healthcare Providers and Systems Survey (NQF #0166) measure described in § 512.411(a)(3), if the participant does not meet the minimum 25 case count.

(B) Excess Days in Acute Care after Hospitalization for AMI measure described in § 512.411(a)(2) if the participant does not meet the minimum 25 case count.

(C) Hospital Consumer Assessment of Healthcare Providers and Systems Survey (NQF #0166) measure described in § 512.411(a)(3), the AMI model participant measure point estimate from the previous year on an individual measure described in § 512.411(a), regardless of the participant’s measure point estimate starting and ending values, falls into the top 10 percent of all subsection (d) hospitals that are eligible for payment under the IPPS and meet the minimum measure patient case or survey count.

(i) For the Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (AMI) Hospitalization (NQF #2473) measure voluntary data submission as described in § 512.411(b)(2). Successful submission is weighted at 10 percent of the AMI model composite quality score.

(2) AMI model quality performance points. CMS computes quality performance points for each quality measure based on the AMI model participant’s performance percentile relative to the national distribution of all subsection (d) hospitals that are eligible for payment under the IPPS and meet the minimum measure patient case or survey count.

(i) Reconciliation payment eligibility and effective and applicable discount factors. CMS determines reconciliation payment eligibility and the effective discount factor for reconciliation payments in all performance years and repayment amounts in performance year 5, as well as the applicable discount factor for repayment amounts in performance year 2 for AMI model participants who elect early downside risk, and performance years 3 and 4 for all AMI model participants based on the AMI model composite quality score described in paragraph (b)(3) of this section.

(ii) Reconciliation payment eligibility requires an acceptable or better quality category, defined as an AMI model composite quality score of greater than or equal to 3.8.

(iii) Effective discount factor for reconciliation payments.

(A) A 3.0 percentage point effective discount factor for AMI model participants in the unacceptable or unacceptable category, defined as an AMI model composite quality score that is less than 6.3.

(B) A 2.0 percentage point effective discount factor for AMI model participants in the good quality category, defined as an AMI model composite quality score that is greater than or equal to 6.3 and less than or equal to 10.0.

(C) A 1.5 percentage point effective discount factor for AMI model participants in the excellent quality category, defined as an AMI model composite quality score that is greater than 10.0.
early downside risk, and years 3 and 4 for all AMI model participants.

(A) A 2.0 percentage point applicable discount factor for AMI model participants in the unacceptable or acceptable quality category, defined as an AMI model composite quality score of less than 6.3.

(B) A 1.0 percentage point applicable discount factor for AMI model participants in the good quality category, defined as an AMI model composite quality score that is greater than or equal to 6.3 and less than or equal to 15.0.

(C) A 0.5 percentage point applicable discount factor for AMI model participants in the excellent quality category, defined as an AMI model composite quality score that is greater than 15.0.

(iv) Effective discount factor for repayment amount in performance year 5 for all AMI model participants.

(A) A 3.0 percentage point applicable discount factor for AMI model participants in the unacceptable or acceptable quality category, defined as an AMI model composite quality score of less than 6.3.

(B) A 2.0 percentage point applicable discount factor for AMI model participants in the good quality category, defined as an AMI model composite quality score that is greater than or equal to 6.3 and less than or equal to 15.0.

(C) A 1.5 percentage point applicable discount factor for AMI model participants in the excellent quality category, defined as an AMI model composite quality scores that is greater than 15.0.

(c) CABG model—(1) CABG model composite quality score. CMS calculates a CABG model composite quality score for each CABG model participant for each performance year, which equals the sum of the following:

(i) The CABG model participant’s quality performance points for the Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery (NQF #2558) measure described in § 512.412(a)(1). This measure is weighted at 70 percent of the CABG model composite quality score.

(ii) The CABG model participant’s quality performance points for the Hospital Consumer Assessment of Healthcare Providers and Systems Survey (NQF #0116) measure described in § 512.412(a)(2). This measure is weighted at 20 percent of the CABG model composite quality score.

(iii) If applicable, 2 additional points for successful submission of the STS CABG data that supports the following 7 measures:

(A) NQF #0134—CABG: Use of Internal Mammary Artery in Patients with Isolated CABG Surgery.

(B) NQF #0236—CABG: Preoperative Beta Blocker in Patients with Isolated CABG Surgery.

(C) NQF #0129—CABG: Prolonged Intubation (defined as >24hrs post surgery).

(D) NQF #0130—CABG: Deep Sternal Wound Infection Rate.

(E) NQF #0131—CABG: Stroke.

(F) NQF #0114—CABG: Postoperative Renal Failure.

(G) NQF #0115—CABG: Surgical Re-Exploration. The submission of this measure data is weighted at 10 percent of the CABG model composite quality score.

(iv) Any additional quality improvement points the CABG model participant may earn as a result of demonstrating improvement on the quality measures in paragraphs (b)(1)(i) and (ii) of this section, as described in paragraph (c)(3) of this section.

(2) CABG model quality performance points. CMS computes quality performance points for each quality measure based on the CABG model participant’s performance percentile relative to the national distribution of all subsection (d) hospitals that are eligible for payment under the IPPS and meet the minimum measure patient case or survey count.

(i) For the Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery (NQF #2558) measure described in § 512.412(a)(1), CMS assigns the 50th percentile quality performance points to the hospital for the individual measure.

(ii) For the Hospital Consumer Assessment of Healthcare Providers and Systems Survey (NQF #0116) measure described in § 512.412(a)(2) if the CABG model participant does not meet the minimum 25 case count.

(iii) If applicable, 2 additional points for successful submission of the STS CABG data that supports the following 7 measures:

(A) NQF #0134—CABG: Use of Internal Mammary Artery in Patients with Isolated CABG Surgery.

(B) NQF #0236—CABG: Preoperative Beta Blocker in Patients with Isolated CABG Surgery.

(C) NQF #0129—CABG: Prolonged Intubation (defined as >24hrs post surgery).

(D) NQF #0130—CABG: Deep Sternal Wound Infection Rate.

(E) NQF #0131—CABG: Stroke.

(F) NQF #0114—CABG: Postoperative Renal Failure.

(G) NQF #0115—CABG: Surgical Re-Exploration. The submission of this measure data is weighted at 10 percent of the CABG model composite quality score.

(iv) Any additional quality improvement points the CABG model participant may earn as a result of demonstrating improvement on the quality measures in paragraphs (b)(1)(i) and (ii) of this section, as described in paragraph (c)(3) of this section.

(3) CABG model quality improvement points. If a CABG model participant’s own improvement in the participant’s measure point estimate from the previous year on an individual measure described in § 512.412(a), regardless of the participant’s measure point estimate starting and ending values, falls into the top 10 percent of all subsection (d) hospitals that are eligible for payment under the IPPS and based on the national distribution of measure improvement over the most recent 2 years, then the CABG model participant is eligible to receive quality improvement points up to 10 percent of the total available points for that measure. The total CABG model composite quality score is capped at 20 points.

(4) Exception for CABG model participants without a measure value. In the case of a CABG model participant without a measure value that would allow CMS to assign quality performance points for that quality measure, CMS assigns the 50th percentile quality performance points to the hospital for the individual measure.

(i) A CABG model participant does not have a measure value for the—

(A) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery (NQF #2558) measure described in § 512.412(a)(1) if the CABG model participant does not meet the minimum 25 case count.

(B) Hospital Consumer Assessment of Healthcare Providers and Systems Survey (NQF #0116) measure described in § 512.412(a)(2) if the CABG model participant does not meet the minimum 100 completed surveys and does not have 4 consecutive quarters of HCAHPS data.

(C) Measures described in paragraphs (c)(4)(i)(A) and (c)(4)(i)(B) of this section, if CMS identifies an error in the data used to calculate the measure and suppresses the measure value.

(5) Establishing CABG model reconciliation payment eligibility and effective and applicable discount factors. CMS determines reconciliation payment eligibility and the effective discount factor for reconciliation payments in all performance years and repayment amounts in performance year 5, as well as applicable discount factor for repayment amounts in performance years 3 and 4 for all CABG model participants, who elect early downside risk, and years 3 and 4 for all AMI model participants.
model composite quality score described in paragraph (c)(1) of this section.

(i) Reconciliation payment eligibility requires an acceptable or better quality category, defined as a CABG model composite quality score of greater than 2.2.

(ii) Effective discount factor for reconciliation payments.

(A) A 3.0 percentage point effective discount factor for CABG model participants in the unacceptable or acceptable quality category, defined as a CABG model composite quality score that is less than or equal to 3.4.

(B) A 2.0 percentage point effective discount factor for CABG model participants in the good quality category, defined as a CABG model composite quality score that is greater than 3.4 and less than or equal to 16.2.

(C) A 1.5 percentage point effective discount factor for CABG model participants in the excellent quality category, defined as a CABG model composite quality score of greater than 16.2.

(iii) Applicable discount factor for repayment amount in performance year 2 for CABG model participants who elect early downside risk, and years 3 and 4 for all EPM participants.

(A) A 2.0 percentage point applicable discount factor for CABG model participants in the unacceptable or acceptable quality category, defined as a CABG model composite quality score of less than or equal to 3.4.

(B) A 1.0 percentage point applicable discount factor for CABG model participants in the good quality category, defined as a CABG model composite quality score that is greater than 3.4 and less than or equal to 16.2.

(C) A 0.5 percentage point applicable discount factor for CABG model participants in the excellent quality category, defined as a CABG model composite quality scores that is greater than 16.2.

(iv) Effective discount factor for repayment amount in performance year 5 for all CABG model participants.

(A) A 3.0 percentage point applicable discount factor for CABG model participants in the unacceptable or acceptable quality category, defined as a CABG model composite quality score of less than or equal to 3.4.

(B) A 2.0 percentage point applicable discount factor for CABG model participants in the good quality category, defined as a CABG model composite quality score that is greater than 3.4 and less than or equal to 16.2.

(C) A 1.5 percentage point applicable discount factor for CABG model participants in the excellent quality category, defined as a CABG model composite quality scores that is greater than 16.2.

16.2.

than 3.4 and less than or equal to 3.4.

participants in the poor quality category, defined as a CABG model composite quality score of greater than 3.4.

composite quality score that is greater than 3.4 and less than or equal to 16.2.

participants in the good quality category, defined as a CABG model composite quality score that is greater than 3.4 and less than or equal to 16.2.

participants in the excellent quality category, defined as a CABG model composite quality score of greater than 16.2.

(i) The SHFFT model participant’s quality performance points for the Hospital-Level Risk-Standardized Complication Rate following Elective Primary Total Hip Arthroplasty and/or Total Knee Arthroplasty (NQF #1550) measure described in § 512.413(a)(1). This measure is weighted at 40 percent of the SHFFT model composite quality score.

(ii) The SHFFT model participant’s quality performance points for the Hospital Consumer Assessment of Healthcare Providers and Systems Survey (NQF #0166) measure described in § 512.413(a)(2). This measure is weighted at 50 percent of the SHFFT model composite quality score.

(iii) Any additional quality improvement points the SHFFT model participant may earn as a result of demonstrating improvement on either or both of the quality measures in paragraphs (d)(1)(i) and (ii) of this section, as described in paragraph (d)(3) of this section.

(iv) If applicable, 2 additional points for successful THA/TKA voluntary data submission of patient-reported outcomes and limited risk variable data, as described in § 512.413(b)(2). Successful submission is weighted at 10 percent of the SHFFT model composite quality score.

2) SHFFT model quality performance points. CMS computes quality performance points for each quality measure based on the SHFFT model participant’s performance percentile on that measure relative to the national distribution of all subsection (d) hospitals that are eligible for payment under the IPPS and meet the minimum measure patient case or survey count.

(i) For the Hospital-Level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty and/or Total Knee Arthroplasty (NQF #1550) measure described in § 512.413(a)(1), CMS assigns the SHFFT model participant measure value to a performance percentile and then quality performance points are assigned based on the following performance percentile scale:

(A) 7.00 points for ≥ 50th and < 60th.

(F) 6.25 points for ≥ 40th and < 50th.

(G) 5.50 points for ≥ 30th and < 40th.

(H) 0.00 points for < 30th.

(ii) For the Hospital Consumer Assessment of Healthcare Providers and Systems Survey (NQF #0166) measure described in § 512.413(a)(2), CMS assigns the SHFFT model participant measure value to a performance percentile and then quality performance points are assigned based on the following performance percentile scale:

(A) 8.00 points for ≥ 90th.

(B) 7.40 points for ≥ 80th and < 90th.

(C) 6.80 points for ≥ 70th and < 80th.

(D) 6.20 points for ≥ 60th and < 70th.

(E) 5.60 points for ≥ 50th and < 60th.

(F) 5.00 points for ≥ 40th and < 50th.

(G) 4.40 points for ≥ 30th and < 40th.

(H) 0.00 points for < 30th.

3) SHFFT quality improvement points. If a SHFFT model participant’s quality performance percentile on an individual measure described in § 512.413(a) increases from the previous performance year by at least 2 deciles on the performance percentile scale, then the SHFFT model participant is eligible to receive quality improvement points up to 10 percent of the total available points for that individual measure. The total SHFFT model composite quality score is capped at 20 points.

4) Exception for SHFFT model participants without a measure value. In the case of a SHFFT model participant without a measure value that would allow CMS to assign quality performance points for that quality measure, CMS assigns the 50th percentile quality performance points to the participant for the individual measure.

(i) A SHFFT model participant does not have a measure value for the—

(A) Hospital-Level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty and/or Total Knee Arthroplasty (NQF #1550) measure described in § 510.413(a)(1) if the participant does not meet the minimum 25 case count; or

(B) Hospital Consumer Assessment of Healthcare Providers and Systems Survey measure (NQF #0166) described in § 510.413(a)(2) if the participant does not meet the minimum of 100 completed surveys and does not have 4 consecutive quarters of HCAHPS data.

(C) Measures described in paragraphs (d)(4)(i)(A) and (d)(4)(i)(B) of this section, if CMS identifies an error in the data used to calculate the measure and suppresses the measure value.

5) Establishing SHFFT model reconciliation payment eligibility and effective and applicable discount factors. CMS determines reconciliation
payment eligibility and the effective discount factor for reconciliation payments in all performance years and repayment amounts in performance year 5, as well as applicable discount factor for repayment amounts in performance year 2 for SHFFT model participants who elect early downside risk and for performance years 3 and 4 for all SHFFT model participants, based on the SHFFT model composite quality score described in paragraph (d)(1) of this section.

(i) Reconciliation payment eligibility requires an acceptable or better quality category, defined as a SHFFT model composite quality score of greater than or equal to 5.0.

(ii) Effective discount factor for reconciliation payments.

(A) A 3.0 percentage point effective discount factor for SHFFT model participants in the unacceptable or acceptable quality category, defined as a SHFFT model composite quality score that is less than 6.9.

(B) A 2.0 percentage point effective discount factor for SHFFT model participants in the excellent quality category, defined as a SHFFT model composite quality score that is greater or equal to 6.9 and less than 15.0.

(C) A 1.5 percentage point effective discount factor for SHFFT model participants in the good quality category, defined as a SHFFT model composite quality score that is greater than or equal to 15.0.

(iii) Applicable discount factor for repayment amount in performance year 2 for SHFFT model participants who elect early downside risk, and years 3 and 4 for all EPM participants.

(A) A 2.0 percentage point applicable discount factor for SHFFT model participants in the unacceptable or acceptable quality category, defined as a SHFFT model composite quality score of less than 6.9.

(B) A 1.0 percentage point applicable discount factor for SHFFT model participants in the good quality category, defined as a SHFFT model composite quality score that is greater than or equal to 6.9 and less than 15.0.

(C) A 0.5 percentage point applicable discount factor for SHFFT model participants in the excellent quality category, defined as a SHFFT model composite quality scores that is greater than 15.0.

(iv) Effective discount factor for repayment amount in performance year 5 for all SHFFT model participants.

(A) A 3.0 percentage point applicable discount factor for SHFFT model participants in the unacceptable or acceptable quality category, defined as a SHFFT model composite quality score of less than 6.9.

(B) A 2.0 percentage point applicable discount factor for SHFFT model participants in the good quality category, defined as a SHFFT model composite quality score that is greater than or equal to 6.9 and less than 15.0.

(C) A 1.5 percentage point applicable discount factor for SHFFT model participants in the excellent quality category, defined as a SHFFT model composite quality score that is greater than or equal to 15.0.

§512.320 Treatment of incentive programs or add-on payments under existing Medicare payment systems.

No EPM replaces any existing Medicare incentive programs or add-on payments. The quality-adjusted target prices and NPRAs for an EPM participant under such models are independent of, and do not affect, any incentive programs or add-on payments under existing Medicare payment systems.

§512.350 Data sharing.

(a) General. CMS makes available to EPM participants, through the most appropriate means, data that CMS determines may be useful to EPM participants to do the following:

(1) Determine appropriate ways to increase the coordination of care.

(2) Improve quality.

(3) Enhance efficiencies in the delivery of care.

(4) Otherwise achieve the goals of the models described in this section.

(b) Beneficiary-identifiable data. (1) CMS makes beneficiary-identifiable data available to an EPM participant in accordance with applicable privacy and security laws and only in response to the EPM participant’s request for such data for a beneficiary who has been furnished a billable service by the EPM participant corresponding to the episode definitions for the EPM.

(2) The minimum data necessary to achieve the goals of the EPM, as determined by CMS, may be provided under this section for an EPM participant’s baseline period and no less frequently than on a quarterly basis throughout the EPM’s participation in an EPM.

Subpart E—Quality Measures, Beneficiary Protections, and Compliance Enforcement

§512.400 Quality measures and reporting—general.

(a) Reporting of quality measures.

Quality measures are used for public reporting, for determining whether an EPM participant is eligible for reconciliation payments under §512.305(d)(1)(iii), and for assigning the effective and applicable discount factors for the performance year to an EPM participant as described in §512.315(b)(5), (c)(5), and (d)(5).

(b) Quality measures. Quality measures differ by EPM.

(c) Public reporting. CMS—

(1) Makes the required quality measurement results for each EPM participant in each performance year publicly available on the CMS Web site in a form and manner as determined by CMS;

(2) Shares each EPM participant’s quality metrics with the participant prior to display on the CMS Web site; and

(3) Does not publicly report the voluntary measure data submitted under an EPM in §512.411(b) or §512.413(b) but does indicate whether an EPM participant has voluntarily submitted such data.

§512.411 Quality measures and reporting for AMI model.

(a) Required measures. (1) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (SMR) Following Acute Myocardial Infarction (NQF #0230) (MORT–30–AMI).

(2) Excess Days in Acute Care after Hospitalization for AMI (AMI Excess Days).

(3) HCAHPS Survey (NQF #0166).

(b) Voluntary measure. (1) Voluntary Hybrid Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) Hospitalization (NQF #2473) (Hybrid AMI Mortality).

(2) To be eligible to receive the additional points added to the AMI composite quality score for successful voluntary data submission of clinical electronic health record data, as described in §512.411(b)(1), AMI model participants must submit the clinical electronic health record data requested by CMS related to each eligible AMI anchor hospitalization during the performance period. The data must be submitted within 60 days of the end of the most recent performance period and be accompanied by the limited risk variable data (five elements finalized) as outlined in §512.315(b)(1)(iv).

(i) For each eligible AMI anchor hospitalization, all five risk variable data elements are required to be submitted. The five risk variables are as follows:

(A) Age.

(B) First-captured heart rate measured within 2 hours of a patient presenting to the hospital.
(C) First-captured systolic blood pressure measured within 2 hours of a patient presenting to the hospital.

(D) First-captured troponin values measured within 24 hours of a patient presenting to the hospitals.

(E) First-captured creatinine values measured within 24 hours of a patient presenting to the hospitals.

(ii) For each eligible AMI anchor hospitalization, six linking variables are required to merge the electronic health record data with the CMS claims data:

(A) AMI model participant CCN.

(B) Medicare Health Insurance Claim Number.

(C) Sex.

(D) Date of birth.

(E) Admission date.

(F) Discharge date.

(iii) For years 1 through 5 of the AMI model an increasing amount of data are requested by CMS for each performance period as follows:

(A) Year 1. Submit electronic health record data on > 50 percent of eligible AMI anchor hospitalizations between July 1, 2017 and August 31, 2017.

(B) Year 2. Submit electronic health record data on over 90 percent of eligible AMI anchor hospitalizations between September 1, 2017 and June 30, 2018.

(C) Year 3. Submit electronic health record data on over 90 percent of eligible AMI anchor hospitalizations between July 1, 2018 and June 30, 2019.

(D) Year 4. Submit electronic health record data on over 90 percent of eligible AMI anchor hospitalizations between July 1, 2019 and June 30, 2020.

(E) Year 5. Submit electronic health record data on over 90 percent of eligible AMI anchor hospitalizations between July 1, 2020 and June 30, 2021.

§512.412 Quality measures and reporting for CABG model.

(a) Required measures. (1) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery (NQF #2558) (MORT–30–CABG).

(2) HCAHPS Survey (NQF #0166).

(b) [Reserved]

§512.413 Quality measures and reporting for SHFFT model.

(a) Required measures. (1) Hospital-Level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty and/or Total Knee Arthroplasty (NQF #1550) (Hip/Knee Complications).

(2) HCAHPS Survey (NQF #0166).

(b) Voluntary measure. (1) Patient-reported outcomes and limited risk variable data following elective primary THA/TKA.

(2) To be eligible to receive the additional points added to the SHFFT model composite quality score for successful voluntary data submission of patient-reported outcomes and limited risk variable data, as described in § 512.315(d)(1)(iv), SHFFT model participants must submit the THA/TKA patient-reported outcome and limited risk variable data requested by CMS related to the pre- and post-operative periods for elective primary total hip and/or total knee arthroplasty procedures. The data must be submitted within 60 days of the end of the most recent performance period and be accompanied by the patient-reported outcomes and limited risk variable data (eleven elements finalized) as outlined in § 512.315(d)(1)(iv).

(i) For each eligible procedure all eleven risk variable data elements are required to be submitted. The eleven risk variables are as follows:

(A) Date of birth.

(B) Race.

(C) Ethnicity.

(D) Date of admission to anchor hospitalization.

(E) Date of eligible THA/TKA procedure.

(F) Medicare Health Insurance Claim Number.

(G) Body mass index.

(H) Use of chronic (> 90 days) narcotics.

(I) Total painful joint count.

(J) Quantified spinal pain.

(K) Single Item Health Literacy Screening (SILS2) questionnaire.

(ii) Participants must also submit the amount of requested THA/TKA patient-reported outcomes data required for each year of the SHFFT model in order to be considered successful in submitting voluntary data.

(A) The amount of requested THA/TKA patient-reported outcomes data to submit, in order to be considered successful increases each subsequent year of the SHFFT model over the 5 years of the model.

(B) A phase-in approach that determines the amount of requested THA/TKA patient-reported outcomes data to submit over the 5 years of the SHFFT model is applied so that in year 1 successful submission of data would mean CMS received all requested THA/TKA patient-reported outcomes and limited risk variable data on both of the following:

(1) Greater than or equal to 60 percent of eligible procedures or greater than or equal to 75 percent eligible patients during the data collection period.

(2) Submission of requested THA/TKA PRO and limited risk variable data is completed within 60 days of the most recent performance period.

(iii) For years 1 through 5 of the model an increasing amount of data is requested by CMS for each performance period as follows:

(A) Year 1 (2017). Submit pre-operative data on primary elective THA/TKA procedures for ≥ 60 percent or ≥ 75 procedures performed between September 1, 2016 through June 30, 2017, unless CMS requests a more limited data set, in which case, submit all requested data elements.

(B) Year 2 (2018). Submit—

(1) Post-operative data on primary elective THA/TKA procedures for ≥ 60 percent or ≥ 75 procedures performed between September 1, 2016 and June 30, 2017; and

(2) Pre-operative data on primary elective THA/TKA procedures for ≥ 70 percent or ≥ 100 procedures performed between July 1, 2017 and June 30, 2018, unless CMS requests a more limited data set, in which case, submit all requested data elements.

(C) Year 3 (2019). Submit—

(1) Post-operative data on primary elective THA/TKA procedures for ≥ 70 percent or ≥ 100 procedures performed between July 1, 2017 and June 30, 2018; and

(2) Pre-operative data on primary elective THA/TKA procedures for ≥ 80 percent or ≥ 200 procedures performed between July 1, 2018 and June 30, 2019, unless CMS requests a more limited data set, in which case, submit all requested data elements.

(D) Year 4 (2020). Submit—

(1) Post-operative data on primary elective THA/TKA procedures for ≥ 80 percent or ≥ 200 procedures performed between July 1, 2018 and June 30, 2019; and

(2) Pre-operative data on primary elective THA/TKA procedures for ≥ 80 percent or ≥ 200 procedures performed between July 1, 2019 and June 30, 2020, unless CMS requests a more limited data set, in which case, submit all requested data elements.

(E) Year 5 (2021). Submit—

(1) Post-operative data on primary elective THA/TKA procedures for ≥ 80 percent or ≥ 200 procedures performed between July 1, 2019 and June 30, 2020; and

(2) Pre-operative data on primary elective THA/TKA procedures for ≥ 80 percent or ≥ 200 procedures performed between July 1, 2020 and June 30, 2021, unless CMS requests a more limited data set, in which case, submit all requested data elements.

§512.450 Beneficiary choice and beneficiary notification.

(a) Beneficiary choice. The EPMs do not restrict Medicare beneficiaries’
ability to choose any Medicare enrolled provider or supplier, or any physician or practitioner who has opted out of Medicare.

(1) As part of discharge planning and referral, EPM participants must provide a complete list of HHAs, SNFs, IRFs, or LTCHs that are participating in the Medicare program, and that serve the geographic area (as defined by the HHA) in which the patient resides, or in the case of a SNF, IRF, or LTCH, in the geographic area requested by the patient.

(ii) EPM participants must specify on the list those post-acute care providers on the list with whom they have a sharing arrangement.

(iii) EPM participants may recommend preferred providers and suppliers, consistent with applicable statutes and regulations.

(iv) EPM participants may not limit beneficiary choice to any list of providers or suppliers in any manner other than that permitted under applicable statutes and regulations.

(v) EPM participants must take into account patient and family preferences when they are expressed.

(2) EPM participants may not charge any EPM collaborator a fee to be included on any list of preferred providers or suppliers, nor may the EPM participant accept such payments.

(b) Required beneficiary notification—

(1) EPM participant detailed notification. Each EPM participant must provide written notification to any Medicare beneficiary that meets the criteria in §512.240 of his or her inclusion in the EPM. The notification must be provided upon admission to the EPM participant if the admission that initiates the EPM episode is not scheduled with the EPM participant in advance. If the admission is scheduled in advance, then the EPM participant must provide notice as soon as the admission is scheduled. In circumstances where, due to the patient’s condition, it is not feasible to provide notification at such times, the notification must be provided to the beneficiary or his or her representative as soon as is reasonably practicable but no later than discharge from the EPM participant accountable for the EPM episode. The EPM participant must be able to generate a list of all beneficiaries receiving such notification, including the date on which the notification was provided to the beneficiary, to CMS upon request. The beneficiary notification must contain all of the following:

(i) A detailed explanation of the EPM and how it might be expected to affect the beneficiary’s care.

(ii) Notification that the beneficiary retains freedom of choice to choose providers and services.

(iii) Explanation of how patients can access care records and claims data through an available patient portal, and how they can share access to their Blue Button® electronic health information with caregivers.

(iv) A statement that all existing Medicare beneficiary protections continue to be available to the beneficiary. These include the ability to report concerns of substandard care to Quality Improvement Organizations or the 1–800–MEDI CARE helpline.

(2) EPM collaborator notice. An EPM participant must require every EPM collaborator to provide written notice to applicable EPM beneficiaries of the structure of the EPM and the existence of its sharing arrangement with the EPM participant.

(i) An EPM participant must require every EPM collaborator that furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any ACO participant or ACO provider/supplier. In circumstances where, due to the patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The ACO must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS or its designee upon request.

(3) Discharge planning notice. An EPM participant must provide the beneficiary with a written notice of any potential financial liability associated with non-covered services recommended or presented as an option as part of discharge planning, no later than at the time that the beneficiary receives an item or service from the EPM collaborator during an EPM episode. In circumstances where, due to the patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The EPM collaborator must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS upon request.

(ii) An EPM participant must require every EPM collaborator that is a PGP, NPPGP, or TGP where a member of the PGP, member of the NPPGP, or member of the TGP furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any member of the PGP, member of the NPPGP, or member of the TGP, and the required notice may be provided by that member. In circumstances where, due to the patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The PGP, NPPGP, or TGP must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS upon request.

(iii) An EPM participant must require every EPM collaborator that is an ACO where an ACO participant or supplier furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any ACO participant or ACO provider/supplier. In circumstances where, due to the patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The ACO must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS or its designee upon request.

(iv) An EPM participant must require every EPM collaborator that is a PGP, NPPGP, or TGP where a member of the PGP, member of the NPPGP, or member of the TGP furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any member of the PGP, member of the NPPGP, or member of the TGP, and the required notice may be provided by that member. In circumstances where, due to the patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The PGP, NPPGP, or TGP must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS upon request.

(v) An EPM participant must require every EPM collaborator that is an ACO where an ACO participant or supplier furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any ACO participant or ACO provider/supplier. In circumstances where, due to the patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The ACO must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS or its designee upon request.

(vi) An EPM participant must require every EPM collaborator that is a PGP, NPPGP, or TGP where a member of the PGP, member of the NPPGP, or member of the TGP furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any member of the PGP, member of the NPPGP, or member of the TGP, and the required notice may be provided by that member. In circumstances where, due to the patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The PGP, NPPGP, or TGP must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS upon request.

(vii) An EPM participant must require every EPM collaborator that is an ACO where an ACO participant or supplier furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any ACO participant or ACO provider/supplier. In circumstances where, due to the patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The ACO must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS or its designee upon request.

(viii) An EPM participant must require every EPM collaborator that is a PGP, NPPGP, or TGP where a member of the PGP, member of the NPPGP, or member of the TGP furnishes an item or service to an EPM beneficiary during an EPM episode to provide written notice to the beneficiary of the structure of the EPM and the existence of the entity’s sharing arrangement. The notice must be provided no later than the time at which the beneficiary first receives an item or service from any member of the PGP, member of the NPPGP, or member of the TGP, and the required notice may be provided by that member. In circumstances where, due to the patient’s condition, it is not feasible to provide notice at such times, the notice must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. The PGP, NPPGP, or TGP must be able to generate a list of all beneficiaries who received such a notice, including the date on which the notice was provided to the beneficiary, to CMS upon request.
participant must notify the beneficiary in accordance with paragraph (b)(3)(i) of this section that the beneficiary will be responsible for payment for the services furnished by the SNF during that stay, except those services that would be covered by Medicare Part B during a non-covered inpatient SNF stay.

(4) Access to records and retention. Lists of beneficiaries that receive notifications or notices must be retained and access provided to CMS, or its designees, in accordance with § 512.110.

§ 512.460 Compliance enforcement.

(a) General. EPM participants must comply with all of the requirements outlined in this part. Except as specifically noted in this part, the regulations under this part must not be construed to affect the applicable payment, coverage, program integrity, or other requirements under this chapter (such as those in parts 412 and 482 of this chapter).

(b) Failure to comply. (1) CMS may take one or more of the remedial actions set forth in paragraph (b)(2) of this section if an EPM participant or its related EPM collaborator, collaboration agent, or downstream collaboration agent does any of the following:

(i) Fails to comply with any requirements of this part or is identified as noncompliant through monitoring by HHS (including CMS and OIG) of the EPM, including, but not limited to, any of the following:

(A) Avoiding potentially high-cost or high-severity patients.

(B) Targeting potentially low-cost or low-severity patients.

(C) Failing to provide medically appropriate services or systematically engaging in the over- or under-delivery of appropriate care.

(D) Failing to provide beneficiaries with complete and accurate information, including required notices.

(E) Failing to allow beneficiary choice of medically necessary options, including non-surgical options.

(F) Failing to follow the requirements related to sharing arrangements.

(ii) Failing to perform a sharing arrangement, distribution arrangement, or downstream distribution arrangement that is noncompliant with the requirements of this part.

(iii) Takes any action that threatens the health or safety of patients.

(iv) Avoids at-risk Medicare beneficiaries, as this term is defined in § 425.20 of this chapter.

(v) Avoids patients on the basis of payer status.

(vi) Is subject to sanctions or final actions of an accrediting organization or Federal, state, or local government agency that could lead to the inability to comply with the requirements and provisions of this part.

(vii) Takes any action that CMS determines for program integrity reasons is not in the best interests of the EPM, or fails to take any action that CMS determines for program integrity reasons should have been taken to further the best interests of the EPM.

(viii) Is subject to action by HHS (including OIG and CMS) or the Department of Justice to redress an allegation of fraud or significant misconduct, including intervening in a False Claims Act qui tam matter, issuing a pre-demand or demand letter under a civil sanction authority, or similar actions.

(ix) Is subject to action involving violations of the physician self-referral law, civil monetary penalties law, Federal anti-kickback statute, antitrust laws, or any other applicable Medicare laws, rules, or regulations that are relevant to the EPM.

(2) Remedial actions include the following:

(i) Issuing a warning letter to the EPM participant.

(ii) Requiring the EPM participant to develop a corrective action plan, commonly referred to as a CAP.

(iii) Reducing or eliminating the EPM participant’s reconciliation payment.

(iv) Reducing or eliminating the EPM participant’s CR incentive payment.

(v) Requiring the EPM participant to terminate a sharing arrangement with an EPM collaborator and prohibit further engagement by the EPM participant in sharing arrangements with the EPM collaborator.

(vi) Terminating the EPM participant’s participation in the EPM. Where a participant is terminated from an EPM, the EPM participant will remain liable for all negative NPRA generated from EPM episodes that ended prior to termination.

(3) CMS may add a 25-percent penalty to a repayment amount on the EPM participant’s reconciliation report if all of the following conditions are met:

(i) CMS has required a corrective action plan from the EPM participant.

(ii) The EPM participant owes a repayment amount to CMS.

(iii) The EPM participant fails to timely comply with the corrective action plan or is noncompliant with the EPM’s requirements.

Subpart F—Financial Arrangements and Beneficiary Incentives

§ 512.500 Sharing arrangements under the EPM.

(a) General. (1) An EPM participant may enter into a sharing arrangement with an EPM collaborator to make a gainsharing payment, or to receive an alignment payment, or both. An EPM participant must not make a gainsharing payment or receive an alignment payment except in accordance with a sharing arrangement.

(2) A sharing arrangement must comply with the provisions of this section and all other applicable laws and regulations, including the applicable fraud and abuse laws and all applicable payment and coverage requirements.

(3) The EPM participant must develop, maintain, and use a set of written policies for selecting individuals and entities to be EPM collaborators. These policies must contain criteria related to, and inclusive of, the quality of care delivered by the potential EPM collaborator. The selection criteria cannot be based directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent. A selection criterion that considers whether a potential EPM collaborator has performed a reasonable minimum number of services that would qualify as EPM activities will be deemed not to violate the volume or value standard if the purpose of the criterion is to ensure the quality of care furnished to EPM beneficiaries.

(4) If an EPM participant enters into a sharing arrangement, its compliance program must include oversight of sharing arrangements and compliance with the applicable requirements of the EPM.

(b) Requirements. (1) A sharing arrangement must be in writing and signed by the parties, and entered into before care is furnished to EPM beneficiaries under the sharing arrangement.

(2) Participation in a sharing arrangement must be voluntary and without penalty for nonparticipation.

(3) The sharing arrangement must require the EPM collaborator and its employees, contractors (including collaboration agents), and subcontractors (including downstream collaboration agents) to comply with all of the following:

(i) The applicable provisions of this part (including requirements regarding beneficiary notifications, access to records, record retention, and participation in any evaluation,
monitoring, compliance, and enforcement activities performed by CMS or its designees).

(ii) All applicable Medicare provider enrollment requirements at § 424.500 of this chapter, including having a valid and active TIN or NPI, during the term of the sharing arrangement.

(iii) All other applicable laws and regulations.

(4) The sharing arrangement must require the EPM collaborator to have or be covered by a compliance program that includes oversight of the sharing arrangement and compliance with the requirements of the EPM that apply to its role as an EPM collaborator, including any distribution arrangements.

(5) The sharing arrangement must not pose a risk to beneficiary access, beneficiary freedom of choice, or quality of care.

(6) The board or other governing body of the EPM participant must have responsibility for overseeing the EPM participant’s participation in the EPM, its arrangements with EPM collaborators, its payment of gainsharing payments, its receipt of alignment payments, and its use of beneficiary incentives in the EPM.

(7) The written agreement memorializing a sharing arrangement must specify the following:

(i) The purpose and scope of the sharing arrangement;

(ii) The identities and obligations of the parties, including specified EPM activities and other services to be performed by the parties under the sharing arrangement;

(iii) The date of the sharing arrangement;

(iv) The financial or economic terms for payment, including the following:

(A) Eligibility criteria for a gainsharing payment.

(B) Eligibility criteria for an alignment payment.

(C) Frequency of gainsharing or alignment payment.

(D) Methodology and accounting formula for determining the amount of a gainsharing payment that is substantially based on quality of care and the provision of EPM activities.

(E) Methodology and accounting formula for determining the amount of an alignment payment.

(8) The sharing arrangement must not—

(i) Induce the EPM participant, EPM collaborator, or any employees, contractors, or subcontractors of the EPM participant or EPM collaborator to reduce or limit medically necessary services to any Medicare beneficiary; or

(ii) Restrict the ability of an EPM collaborator to make decisions in the best interests of its patients, including the selection of devices, supplies, and treatments.

(c) Gainsharing payment, alignment payment, and internal cost savings conditions and restrictions.

(1) Gainsharing payments, if any, must—

(i) Be derived solely from reconciliation payments, or internal cost savings, or both;

(ii) Be distributed on an annual basis (not more than once per calendar year); and

(iii) Not include the payment of an advance, advance payment, or payment for referrals or other business;

(iv) Be clearly identified as a gainsharing payment at the time it is paid.

(2)(i) To be eligible to receive a gainsharing payment, an EPM collaborator must meet quality of care criteria for the performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment. The quality of care criteria must be established by the EPM participant and directly related to EPM episodes.

(ii) To be eligible to receive a gainsharing payment, or to be required to make an alignment payment, an EPM collaborator other than an ACO, PGP, NPPGP, or TGP must have directly furnished a billable item or service to an EPM beneficiary during an EPM episode that occurred in the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount.

(iii) To be eligible to receive a gainsharing payment, or to be required to make an alignment payment, an EPM collaborator that is a PGP, NPPGP, or TGP must meet the following criteria:

(A) The PGP, NPPGP, or TGP must have billed for an item or service that was rendered to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment or was assessed a repayment amount. For example, an ACO might be have been clinically involved in the care of EPM beneficiaries if—

(i) Providing care coordination services to EPM beneficiaries during and/or after inpatient admission;

(ii) Engaging with an EPM participant in care redesign strategies, and actually performing a role in implementing such strategies, that are designed to improve the quality of care for EPM episodes and reduce EPM episode spending; or

(iii) In coordination with other providers and suppliers (such as ACO providers/suppliers, the EPM participant, and post-acute care providers), implementing strategies designed to address and manage the comorbidities of EPM beneficiaries.
according with generally accepted accounting principles (GAAP) and Government Auditing Standards (The Yellow Book).

(ii) The methodology used to calculate internal cost savings must reflect the actual, internal cost savings achieved by the EPM participant through the documented implementation of EPM activities identified by the EPM participant and must exclude:

(A) Any savings realized by any individual or entity that is not the EPM participant; and

(B) "Paper" savings from accounting conventions or past investment in fixed costs.

(4) The total amount of a gainsharing payment for a performance year paid to certain individuals and entities that are EPM collaborators must not exceed the following:

(i) In the case of an EPM collaborator who is a physician or nonphysician practitioner, 50 percent of the Medicare-approved amounts under the PFS for items and services billed by that physician or nonphysician practitioner to the EPM participant's EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.

(ii) In the case of an EPM collaborator that is a PGP or NPPCP, 50 percent of the Medicare-approved amounts under the PFS for items and services billed by that PGP or NPPCP and furnished to the EPM participant's EPM beneficiaries by the PGP members or NPPCP members respectively during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being made.

(5) The amount of any gainsharing payments must be determined in accordance with a methodology that is substantially based on quality of care and the provision of EPM activities. The methodology may take into account the amount of such EPM activities provided by an EPM collaborator relative to other EPM collaborators.

(6) For a performance year, the aggregate amount of all gainsharing payments that are derived from a reconciliation payment the EPM participant receives from CMS must not exceed the amount of that reconciliation payment.

(iii) Assess by an EPM participant if it does not owe a repayment amount.

(11) The EPM participant must not receive any amounts under a sharing arrangement from an EPM collaborator that are not alignment payments.

(12) For a performance year, the aggregate amount of all alignment payments received by the EPM participant must not exceed 50 percent of the EPM participant's repayment amount.

(13) The aggregate amount of all alignment payments from an EPM collaborator to the EPM participant may not be greater than—

(i) With respect to an EPM collaborator other than an ACO, 25 percent of the EPM participant's repayment amount; or

(ii) With respect to an EPM collaborator that is an ACO, 50 percent of the EPM participant's repayment amount.

(14) The amount of any alignment payments must be determined in accordance with a methodology that does not directly account for the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent.

(5) The amount of any gainsharing payment that contained funds derived from a CMS overpayment on a reconciliation report or was based on the submission of false or fraudulent data.

(16) All gainsharing payments and alignment payments must be made by check, electronic funds transfer, or another traceable cash transaction.
§ 512.505 Distribution arrangements under the EPM.

(a) General. (1) An ACO, PGP, NPPGP, or TGP that has entered into a sharing arrangement with an EPM participant may distribute all or a portion of any gainsharing payment it receives from the EPM participant only in accordance with a distribution arrangement.

(2) All distribution arrangements must comply with the provisions of this section and all other applicable laws and regulations, including the fraud and abuse laws.

(b) Requirements. (1) All distribution arrangements must be in writing and signed by the parties, contain the date of the agreement, and be entered into before care is furnished to EPM beneficiaries under the distribution arrangement.

(2) Participation in a distribution arrangement must be voluntary and without penalty for nonparticipation.

(3) The distribution arrangement must require the collaboration agent to comply with all applicable laws and regulations.

(4) The opportunity to make or receive a distribution payment must not be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business otherwise generated by, between or among the EPM participant, any EPM collaborator, any collaboration agent, any downstream collaboration agent, or any individual or entity affiliated with an EPM participant, EPM collaborator, collaboration agent, or downstream collaboration agent.

(5) The amount of any distribution payments from an ACO, from an NPPGP, or from a TGP to an NPPGP member, or from a TGP to a TGP member must be determined in accordance with a methodology that is substantially based on quality of care and the provision EPM activities and that may take into account the amount of such EPM activities provided by a collaboration agent relative to other collaboration agents.

(6) The amount of any distribution payments from a PGP must be determined either in a manner that complies with §411.352(g) of this chapter or in accordance with a methodology that is substantially based on quality of care and the provision EPM activities and that may take into account the amount of such EPM activities provided by a collaboration agent relative to other collaboration agents.

(7) Except for a distribution payment from a PGP to a PGP member that complies with §411.352(g) of this chapter, a collaboration agent is eligible to receive a distribution payment only if the collaboration agent furnished or billed for an item or service rendered to an EPM beneficiary during an EPM episode that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

(8) Except for a distribution payment from a PGP to a PGP member that complies with §411.352(g) of this chapter, the total amount of distribution payments for a performance year paid to a collaboration agent must not exceed the following:

(i) In the case of a collaboration agent that is a physician or nonphysician practitioner, 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by the collaboration agent to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

(ii) In the case of a collaboration agent that is a PGP or NPPGP, 50 percent of the total Medicare-approved amounts under the PFS for items and services furnished by PGP members or NPPGP members respectively to the EPM participant’s EPM beneficiaries during EPM episodes that occurred during the same performance year for which the EPM participant accrued the internal cost savings or earned the reconciliation payment that comprises the gainsharing payment being distributed.

(9) With respect to the distribution of any gainsharing payment received by an ACO, PGP, NPPGP, or TGP, the total amount of all distribution payments must not exceed the amount of the gainsharing payment received by the EPM collaborator from the EPM participant.

(10) All distribution payments must be made by check, electronic funds transfer, or another traceable cash transaction.

(11) The collaboration agent must retain the ability to make decisions in the best interests of the patient, including the selection of devices, supplies, and treatments.

(12) The distribution arrangement must not—

(i) Induce the collaboration agent to reduce or limit medically necessary items and services to any Medicare beneficiary; or

(ii) Reward the provision of items and services that are medically unnecessary.

(13) The EPM collaborator must maintain contemporaneous documentation regarding distribution arrangements in accordance with §512.110, including the following:

(i) The relevant written agreements.

(ii) The date and amount of any distribution payment.

(iii) The identity of each collaboration agent that received a distribution payment.

(14) The EPM collaborator may not enter into a distribution arrangement with any individual or entity that has a sharing arrangement with the same EPM participant.

(15) The EPM collaborator must retain and provide access to, and must require collaboration agents to retain and provide access to, the required documentation in accordance with §512.110.

§ 512.510 Downstream distribution arrangements under the EPM.

(a) General. (1) An ACO participant that is a PGP, NPPGP, or TGP and that has entered into a distribution arrangement with an EPM collaborator that is an ACO may distribute all or a portion of any distribution payment it receives from the EPM collaborator only in accordance with a downstream distribution arrangement.

(2) All downstream distribution arrangements must comply with the provisions of this section and all applicable laws and regulations, including the fraud and abuse laws.

(b) Requirements. (1) All downstream distribution arrangements must be in writing and signed by the parties, contain the date of the agreement, and be entered into before care is furnished to EPM beneficiaries under the downstream distribution arrangement.

(2) Participation in a downstream distribution arrangement must be voluntary and without penalty for nonparticipation.
§ 512.520 Enforcement authority under the EPM.

(a) OIG authority. OIG authority is not limited or restricted by the provisions of the EPM, including the authority to audit, evaluate, investigate, or inspect the EPM participant, EPM collaborators, or any other person or entity or their records, data, or information, without limitation.

(b) Other authorities. None of the provisions of the EPM limits or restricts the authority of any other government agency permitted by law to audit, evaluate, investigate, or inspect the EPM participant, EPM collaborators, or any other person or entity or their records, data, or information, without limitation.

§ 512.525 Beneficiary engagement incentives under the EPM.

(a) General. EPM participants may choose to provide in-kind patient engagement incentives to beneficiaries in an EPM episode, subject to the following conditions:

(1) The incentive must be provided directly by the EPM participant or by an agent of the EPM participant under the EPM participant’s direction and control to the EPM beneficiary during an EPM episode.

(2) The item or service provided must be reasonably connected to medical care provided to an EPM beneficiary during an EPM episode.

(3) The item or service must be a preventive care item or service or an item or service that advances a clinical goal, as listed in paragraph (c) of this section, for a beneficiary in an EPM episode, subject to the following conditions:

(1) The incentive must be provided in the beneficiary’s direction and control to the receipt of items or services from a particular provider or supplier.

(2) The availability of the items or services must not be advertised or promoted except that a beneficiary may be made aware of the availability of the items or services at the time the beneficiary could reasonably benefit from them.

(b) Technology provided to an EPM beneficiary. Beneficiary engagement incentives involving technology are subject to the following additional conditions:

(1) Items or services involving technology provided to a beneficiary may not exceed $1,000 in retail value for any one beneficiary in any one EPM episode.
Subpart G—Waivers

§512.600 Waiver of direct supervision requirement for certain post-discharge home visits.

(a) General. CMS waives the requirement in §410.26(b)(5) of this chapter that services and supplies furnished incident to a physician’s service must be furnished under the direct supervision of the physician (or other practitioner) to permit home visits as specified in this section. The services furnished under this waiver are not considered to be “hospital services,” even when furnished by the clinical staff of the hospital.

(b) General supervision of qualified personnel. The waiver of the direct supervision requirement in §410.26(b)(5) of this chapter applies only in the following circumstances:

(1) The home visit is furnished during the episode to a beneficiary who has been discharged from an anchor hospitalization.

(2) The home visit is furnished at the beneficiary’s home or place of residence.

(3) The beneficiary does not qualify for home health services under sections 1835(a) and 1814(a) of the Act at the time of any such home visit.

(4) The visit is furnished by clinical staff under the general supervision of a physician or non-physician practitioner. Clinical staff are individuals who work under the supervision of a physician or other qualified health care professional, and who are allowed by law, regulation, and facility policy to perform or assist in the performance of a specific professional service, but do not individually report that professional service.

(5) The number of visits that are furnished to the beneficiary during—

(i) An AMI episode, is up to 13 post-discharge home visits;

(ii) A CABG episode, is up to 9 post-discharge home visits; and

(iii) A SHFFT episode, is up to 9 post-discharge home visits.

(c) Payment. Up to the maximum post-discharge home visits for a specific EPM episode, as described in paragraph (b)(5) of this section, may be billed under Part B by the physician or non-physician practitioner or by the participant hospital to which the supervising physician has reassigned his or her billing rights.

(d) Other requirements. All other Medicare rules for coverage and payment of services incident to a physician’s service continue to apply.

§512.605 Waiver of certain telehealth requirements.

(a) Waiver of the geographic site requirements. Except for the geographic site requirements for a face-to-face encounter for home health certification, CMS waives the geographic site requirements of section 1834(m)(4)(C)(ii)(I) through (III) of the Act for episodes being tested in an EPM, but only for services that—

(1) May be furnished via telehealth under existing requirements; and

(2) Are included in the episode in accordance with §512.210.

(b) Waiver of the originating site requirements. Except for the originating site requirements for a face-to-face encounter for home health certification, CMS waives the originating site requirements under section 1834(m)(4)(C)(ii)(I) through (VIII) of the Act for episodes being tested in an EPM to permit a telehealth visit to originate in the beneficiary’s home or place of residence, but only for services that—

(1) May be furnished via telehealth under existing requirements; and

(2) Are included in an EPM episode in accordance with §512.210.

(c) Waiver of selected payment provisions. (1) CMS waives the payment requirements under section 1834(m)(2)(A) so that the facility fee normally paid by Medicare to an originating site for a telehealth service is not paid if the service is originated in the beneficiary’s home or place of residence.

(2) CMS waives the payment requirements under section 1834(m)(2)(B) to allow the distant site payment for telehealth home visit HCPCS codes unique to this model to more accurately reflect the resources involved in furnishing these services in the home by basing payment upon the comparable office visit relative value units for work and malpractice under the Physician Fee Schedule.

(d) Other requirements. All other requirements for Medicare coverage and payment of telehealth services continue to apply, including the list of specific services approved to be furnished by telehealth.

§512.610 Waiver of SNF 3-day rule.

(a) Applicability of the SNF 3-day rule waiver. CMS determines that the SNF 3-day rule is—

(1) Waived for the AMI model;

(2) Not waived for the CABG model; and

(3) Not waived for the SHFFT model.

(b) Waiver of the SNF 3-day rule. For episodes being tested in those EPMs where the SNF 3-day rule is waived under paragraph (a) of this section, CMS waives the SNF 3-day rule for coverage of a SNF stay for a beneficiary who is an EPM beneficiary on the date of discharge from the anchor hospitalization on or after October 4, 2018, but only if the SNF is identified on the applicable calendar quarter list of qualified SNFs at the time of EPM beneficiary admission to the SNF.

(1) CMS determines the qualified SNFs for each calendar quarter based on a review of the most recent rolling 12 months of overall star ratings on the
Five-Star Quality Rating System for SNFs on the Nursing Home Compare Web site. Qualified SNFs are rated an overall of 3 stars or better for at least 7 of the 12 months.

(2) CMS posts to the CMS Web site the list of qualified SNFs in advance of the calendar quarter and the waiver only applies for a beneficiary who has been discharged from an anchor hospitalization if the SNF is included on the applicable calendar quarter list for the date of the beneficiary’s admission to the SNF.

(c) Financial liability for uncovered SNF services. CMS will determine the financial liability for uncovered SNF services if, subsequent to an EPM hospital applying the SNF 3-day rule waiver under this section, an EPM hospital incorrectly applies the SNF 3-day rule waiver.

(1) If the EPM hospital discharges a beneficiary to a SNF that is not a qualified SNF under paragraph (b) of this section and provides the beneficiary with a discharge planning notice, as described at § 512.450(b)(3), to the beneficiary at the time of discharge to a SNF then the SNF coverage requirements apply and the beneficiary may be financially liable for uncovered SNF services.

(2) The EPM hospital will be financially liable for the SNF stay and the SNF must not bill the beneficiary for the costs of the uncovered SNF services furnished during the SNF stay if, subsequent to an EPM hospital applying the SNF 3-day rule waiver under this section, CMS determines the EPM hospital discharges a beneficiary—

(a) To a SNF that is not a qualified SNF under paragraph (b) of this section and the EPM hospital does not provide the beneficiary with a discharge planning notice, as described at § 512.450(b)(3)

(ii) That is in an EPM where the SNF 3-day rule waiver is not applicable under paragraph (a) of this section; or

(iii) Prior to October 4, 2018, where the SNF 3-day rule waiver is not applicable under paragraph (b) of this section.

(d) Other requirements. All other Medicare rules for coverage and payment of Part A-covered SNF services continue to apply.

§ 512.615 Waiver of certain post-operative billing restrictions.

(a) Waiver to permit certain services to be billed separately during the 90-day post-operative global surgical period. CMS waives the billing requirements for global surgeries to allow the separate billing of certain post-discharge home visits described under § 512.600, including those related to recovery from the surgery, as described in paragraph (b) of this section, for episodes being tested in an EPM.

(b) Services to which the waiver applies. Up to the maximum post-discharge home visits for a specific EPM episode, as described in § 512.600(b)(5), including those related to recovery from the surgery, per EPM episode may be billed separately under Medicare Part B by the physician or non-physician practitioner, or by the participant hospital to which the physician or non-physician practitioner has reassigned his or her billing rights.

(c) Other requirements. All other Medicare rules for global surgery billing during the 90-day post-operative period continue to apply.

§ 512.620 Waiver of deductible and coinsurance that otherwise apply to reconciliation payments or repayments.

(a) Waiver of deductible and coinsurance. CMS waives the requirements of sections 1813 and 1833(a) of the Act for Medicare Part A and Part B payment systems only to the extent necessary to make reconciliation payments or receive repayments based on the NPRA that reflect the episode payment methodology under the final payment model for EPM participant hospitals.

(b) Reconciliation payments or repayments. Reconciliation payments or repayments do not affect the beneficiary cost-sharing amounts for the Medicare Part A and Part B services provided under an EPM.

§ 512.630 Waiver of physician definition for furnishing cardiac rehabilitation and intensive cardiac rehabilitation services to an EPM beneficiary.

(a) General. Section 410.49 of this chapter requires cardiac rehabilitation (CR) and intensive cardiac rehabilitation (ICR) services to be furnished under the direction of a physician as defined in § 410.49(a) of this chapter.

(b) Waiver of the physician definition. For a provider or supplier of CR and ICR services to an EPM beneficiary during an AMI and CABG model episode, as defined in § 512.2, CMS waives the physician definition to allow the functions of supervising physician, prescribing exercise, and establishing, reviewing, and signing an individualized treatment plan for CR and ICR services to be furnished under the direction of—

(1) A physician, as defined in section 1861(r)(1) of the Act; or

(2) A qualified nonphysician practitioner, as defined by CMS.

(c) Other definitions and requirements. All other definitions and requirements in § 410.49 of this chapter related to a physician or supervising physician continue to apply.

Subpart H—CR Incentive Payment Model for EPM and Medicare Fee-for-Service Participants

§ 512.700 Basis and scope.

(a) Basis. This subpart implements the cardiac rehabilitation (CR) and intensive cardiac rehabilitation (ICR) incentive payment model under section 1115A of the Act.

(b) Scope. This subpart sets forth the following:

(1) The participants in the CR incentive payment model.

(2) The CR/ICR services that count toward CR incentive payments.

(3) The methodology for determining CR incentive payments.

(4) Provisions for FFS–CR participants that are not EPM participants.

§ 512.703 CR incentive payment model participants.

(a) Selection of CR MSAs. The MSAs eligible for selection for AMI and CABG models were classified into one of seven groups based on their historic utilization of CR/ICR services. Within each group, EPM–CR and FFS–CR MSAs were randomly selected. The number of EPM–CRs selected within each group are distributed proportionately between the groups based on the assignment of the 98 EPM MSAs. The same number of FFS–MSAs were then drawn from each group.

(b) Hospitals eligible for CR incentive payments. (1) Hospitals that are AMI and CABG model participants located in the EPM–CR MSAs.

(i) FFS–CR participants. Hospitals located in the FFS–CR MSAs that would meet all requirements in § 512.100(b) to be an AMI or CABG model participant if the hospital were located in an MSA selected for the AMI and CABG models.

§ 512.705 CR/ICR services that count towards CR incentive payments.

(a) Identification of CR/ICR services. CR/ICR services are identified by the HCPCS codes for CR/ICR services included in the CMS change request that implements the National Coverage Determination in the CR performance year.

(b) CR participant eligibility for CR incentive payment. (1) For EPM–CR participants, CR/ICR services paid by Medicare under the OPPS or to any supplier reporting place of service code 11 on the PFS claim for AMI and CABG model beneficiaries during AMI and CABG model episodes result in eligibility for CR incentive payments.

(2) For FFS–CR participants, CR/ICR services paid by Medicare under the
OPPS or to any supplier reporting place of service code 11 on the PFS claim for beneficiaries during AMI care periods and CABG care periods that would meet the requirements to be AMI and CABG model episodes in accordance with all provisions in subpart B if the FFS–CR participant were an EPM participant result in eligibility for CR incentive payments.

(c) Overlap between AMI care periods and CABG care periods with AMI and CABG model episodes. (1) An AMI care period or CABG care period does not begin if the beneficiary is in an AMI or CABG model episode when the AMI care period or CABG care period would otherwise begin.

(2) An AMI care period or CABG care period is canceled if at any time during the AMI care period or CABG care period the beneficiary initiates an AMI or CABG model episode.

(d) CR incentive payment time period. All AMI and CABG model episodes and AMI care periods and CABG care periods begin on or after July 1, 2017 and end on or before December 31, 2021.

§512.710 Determination of CR incentive payments.

(a) General. CMS provides a CR incentive payment for each CR performance year to each EPM–CR participant and FFS–CR participant based on CR/ICR services paid by Medicare under the OPPS or to any supplier reporting place of service code 11 on the PFS claim for beneficiaries in AMI and CABG model episodes or AMI and CABG care periods, respectively. CMS makes CR incentive payments from the Medicare Part B Trust Fund to CR participants, and also submits beneficiary-specific CR amounts to the CMS Master Database Management System. The initial level of the per-service CR incentive amount is $25 per CR/ICR service for each of up to 11 CR/ICR services paid for by Medicare. For those CR/ICR services in an AMI or CABG model episode or AMI care period or CABG care period that exceed 11, the per-service CR incentive amount increases to $175 per CR/ICR service for each additional CR/ICR service paid for by Medicare.

(b) Determination of CR incentive payment. At the same time that CMS carries out the determination of NPRA and reconciliation process for an EPM performance year as specified in §512.305 for EPM participants, CMS also determines each CR participant’s CR incentive payment for the CR performance year according to the following:

(1) CR amount when the CR service count is less than 12. CMS determines the CR amount for a beneficiary in an AMI or CABG model episode or AMI care period or CABG care period with a CR service count less than 12 by multiplying the CR service count by $25.

(2) CR amount when the CR service count is 12 or more. CMS determines the CR amount for a beneficiary in an AMI or CABG model episode or AMI care period or CABG care period with a CR service count of 12 or more as the sum of $275 ($25 multiplied by 11 for the first 11 CR/ICR services paid for by Medicare) and $175 multiplied by the difference between the CR service count and 11.

(c) CR incentive payment. CMS sums the CR amounts determined in paragraphs (b)(1) and (2) of this section across the CR participant’s beneficiaries in AMI and CABG model episodes or AMI care periods and CABG care periods for a given CR performance year to determine the CR incentive payment for the CR performance year.

(d) Relation of CR incentive payments to reconciliation and Medicare repayments under EPMS. CR incentive payments to EPM–CR participants determined under §512.710(b) are exclusive of reconciliation payments and Medicare repayment amounts determined under §512.305(d).

(e) Exclusion of CR incentive payments when updating quality-adjusted target prices for EPM–CR participants. CR incentive payments under §512.710(b) are excluded when updating quality-adjusted target prices for EPM performance years 3 through 5.

(f) CR incentive payment report. At the same time CMS issues the reconciliation report as specified in §512.305(b) to EPM participants, CMS issues each EPM–CR participant and each FFS–CR participant a CR incentive payment report for the CR performance year. Each report contains the following:

(1) The number of AMI and CABG model episodes or AMI care periods and CABG care periods attributed to the CR participant in which Medicare paid for 11 or fewer CR/ICR services for a beneficiary during the CR performance year, if any.

(2) The total number of CR/ICR services Medicare paid for during AMI and CABG model episodes or AMI care periods and CABG care periods identified in paragraph (f)(1) of this section.

(3) The amount of the CR incentive payment attributable to the AMI and CABG model episodes or AMI care periods and CABG care periods identified in paragraph (f)(1) of this section.

(g) Timing of CR incentive payments. CMS makes CR incentive payments on a retrospective basis subject to the following:

(1) For EPM–CR participants, CMS makes the CR incentive payment, if any, concurrently with EPM reconciliation payments or repayment amounts assessed for a specific EPM and CR performance year, subject to the appeals process for EPM participants in §512.310.

(2) For FFS–CR participants, CMS makes the CR incentive payments, if any, at the same time as for EPM–CR participants, subject to the provisions in §512.720.

Provisions for FFS–CR Participants

§512.715 Access to records and retention for FFS–CR participants.

FFS–CR participants and any other individuals or entities providing items or services to a FFS–CR beneficiary must do all of the following:

(a) Allow the Government, including CMS, OIG, HHS and the Comptroller General or their designees, scheduled and unscheduled access to all books, contracts, records, documents, and other evidence (including data related to CR/ICR service utilization and payments, billings, and the documentation required under §512.740(d)) sufficient to enable the audit, evaluation, inspection, or investigation of the following:

(1) The individual’s or entity’s compliance with CR incentive payment model requirements.
(2) The obligation to repay any CR incentive payments owed to CMS.

(b) Maintain all such books, contracts, records, documents, and other evidence for a period of 10 years from the last day of the FFS–CR participant’s participation in the CR incentive payment model or from the date of completion of any audit, evaluation, inspection, or investigation, whichever is later, unless—

(1) CMS determines a particular record or group of records should be retained for a longer period and notifies the FFS–CR participant at least 30 calendar days before the disposition date; or

(2) There has been a dispute or allegation of fraud or similar fault against the FFS–CR participant or any other individual or entity providing items or services to a FFS–CR beneficiary, in which case the records must be maintained for 6 years from the date of any resulting final resolution of the dispute or allegation of fraud or similar fault.

§512.720 Appeals process for FFS–CR participants.

(a) Notice of calculation error (first level of appeal). Subject to the limitations on review in subpart H of this part, if a FFS–CR participant wishes to dispute calculations involving a matter related to a CR incentive payment, the FFS–CR participant is required to provide written notice of the calculation error, in a form and manner specified by CMS.

(1) Unless the FFS–CR participant provides such notice, CMS deems final the applicable CR incentive payment report 45 calendar days after the applicable CR incentive payment report is issued and proceeds with the payment as applicable.

(2) If CMS receives a notice of a calculation error within 45 calendar days of the issuance of the applicable CR incentive payment report, CMS responds in writing within 30 calendar days to either confirm that there was an error in the calculation or verify that the calculation is correct, although CMS reserves the right to an extension upon written notice to the FFS–CR participant.

(3) Only FFS–CR participants may use notice of calculation error process described in this part.

(b) Dispute resolution process (second level of appeal). (1) If the FFS–CR participant is dissatisfied with CMS’ response to the notice of a calculation error, the FFS–CR participant may request a reconsideration review in a form and manner as specified by CMS.

(2) The reconsideration request must provide a detailed explanation of the basis for the dispute and include supporting documentation for the FFS–CR participant’s assertion that CMS or its representatives did not accurately calculate the CR incentive payment in accordance with subpart H of this part.

(3) If CMS does not receive a request for reconsideration from the FFS–CR participant within 10 calendar days of the issue date of CMS’ response to the FFS–CR participant’s notice of calculation error, then CMS’ response to the calculation error is deemed final and CMS proceeds with the applicable processes, as described in subpart H of this part.

(4) The CMS reconsideration official notifies the FFS–CR participant in writing within 15 calendar days of receiving the FFS–CR participant’s review request of the following:

(i) The date, time, and location of the review.

(ii) The issues in dispute.

(iii) The review procedures.

(iv) The procedures (including format and deadlines) for submission of evidence.

(5) The CMS reconsideration official takes all reasonable efforts to schedule the review to occur no later than 30 days after the date of receipt of the notification.

(6) The provisions at §425.804(b), (c), and (e) of this chapter are applicable to reviews conducted in accordance with the reconsideration review process for the FFS–CR participant.

(7) The CMS reconsideration official issues a written determination within 30 days of the review. The determination is final and binding.

(8) Only FFS–CR participants may use the dispute resolution process described in this part.

(c) Exception to the notice of calculation error process. If the FFS–CR participant contests a matter that does not involve an issue contained in, or a calculation which contributes to a CR incentive payment report a notice of calculation error is not required. In these instances, if CMS does not receive a request for reconsideration from the FFS–CR participant within 10 calendar days of the notice of the initial determination, the initial determination is deemed final and CMS proceeds with the action indicated in the initial determination. This does not apply to the limitations on review in paragraph (e) of this section.

(d) Notice of FFS–CR participant termination from the CR incentive payment model. If an FFS–CR participant receives notification that it has been terminated from the CR incentive payment model, it must provide a written request for reconsideration to CMS requesting review of the termination within 10 calendar days of the notice. CMS has 30 days to respond to the FFS–CR participant’s request for review. If the FFS–CR participant fails to notify CMS, the termination is deemed final.

(e) Limitations on review. In accordance with section 1115A(d)(2) of the Act, there is no administrative or judicial review under sections 1869 or 1678 of the Act or otherwise for the following:

(1) The selection of models for testing or expansion under section 1115A of the Act.

(2) The selection of organizations, sites, or participants to test those models selected.

(3) The elements, parameters, scope, and duration of such models for testing or dissemination.

(4) Determinations regarding budget neutrality under section 1115A(b)(3) of Act.

(5) The termination or modification of the design and implementation of a model under section 1115A(b)(3)(B) of Act.

(6) Decisions to expand the duration and scope of a model under section 1115A(c) of the Act, including the determination that a model is not expected to meet criteria described in paragraph (e)(1) or (2) of this section.

§512.725 Data sharing for FFS–CR participants.

(a) General. CMS makes available to FFS–CR participants, through the most appropriate means, data that CMS determines may be useful to FFS–CR participants to do the following:

(1) Determine appropriate ways to increase the coordination of care.

(2) Improve quality.

(3) Enhance efficiencies in the delivery of care.

(4) Otherwise achieve the goals of the model described in this section.

(b) Beneficiary-identifiable data. (1) CMS makes beneficiary-identifiable data available to a FFS–CR participant in accordance with applicable privacy and security laws and only in response to the FFS–CR participant’s request for such data for a beneficiary who has been furnished a billable service by the FFS–CR participant corresponding to the AMI care period or CABG care period definitions.

(2) The minimum data necessary to achieve the goals of the CR incentive payment test, as determined by CMS, may be provided under this section no less frequently than on a quarterly basis throughout the FFS–CR participant’s
participation in the CR incentive payment test.

§ 512.730 Compliance enforcement for FFS–CR participants.

(a) General. FFS–CR participants must comply with all of the requirements outlined in this subpart. Except as specifically noted in this subpart, the regulations under this subpart must not be construed to affect the payment, coverage, program integrity, or other requirements (such as those in parts 412 and 482 of this chapter) that apply to providers and suppliers under this chapter.

(b) Failure to comply. (1) CMS may take one or more of the remedial actions set forth in paragraph (b)(2) of this section if a FFS–CR participant does any of the following:

(i) Fails to comply with any requirements of this subpart or is identified as noncompliant through monitoring by HHS (including CMS and OIG) of the CR incentive payment model, including but not limited to the following:

(A) Avoiding potentially high-severity patients.

(B) Targeting potentially low-severity patients.

(C) Failing to provide medically appropriate services or systematically engaging in the over or under-delivery of appropriate care.

(D) Failing to provide beneficiaries with complete and accurate information.

(ii) Takes any action that threatens the health or safety of patients.

(iii) Avoids at risk Medicare beneficiaries, as this term is defined in § 425.20 of this chapter.

(iv) Avoids patients on the basis of payer status.

(v) Is subject to sanctions or final actions of an accrediting organization or Federal, state, or local government agency that could lead to the inability to comply with the requirements and provisions of this subpart.

(vi) Takes any action that CMS determines for program integrity reasons is not in the best interests of the CR incentive payment model, or fails to take any action that CMS determines for program integrity reasons should have been taken to further the best interests of the CR incentive payment model.

(vii) Is subject to action by HHS (including OIG and CMS) or the Department of Justice to redress an allegation of fraud or significant misconduct, including intervening in a False Claims Act qui tam matter, issuing a pre-demand or demand letter under a civil sanction authority, or similar actions.

(ix) Is subject to action involving violations of the physician self-referral law, civil monetary penalties law, Federal anti-kickback statute, antitrust laws, or any other applicable Medicare laws, rules, or regulations that are relevant to the CR incentive payment model.

(2) Remedial actions include the following:

(i) Issuing a warning letter to the FFS–CR participant.

(ii) Requiring the FFS–CR participant to develop a corrective action plan, commonly referred to as a CAP.

(iii) Reducing or eliminating the FFS–CR participant’s CR incentive payment.

(iv) Terminating the FFS–CR participant from the CR incentive payment model.

§ 512.735 Enforcement authority for FFS–CR participants.

(a) OIG authority. OIG authority is not limited or restricted by the provisions of the CR incentive payment model, including the authority to audit, evaluate, investigate, or inspect the FFS–CR participant, or any other person or entity or their records, data, or information, without limitation.

(b) Other authorities. None of the provisions of the CR incentive payment model limits or restricts the authority of any other government agency permitted by law to audit, evaluate, investigate, or inspect the FFS–CR participant or any other person or entity or their records, data, or information, without limitation.

§ 512.740 Beneficiary engagement incentives for FFS–CR participant use.

(a) General. FFS–CR participants may choose to provide in-kind patient engagement incentives to beneficiaries in an AMI care period or CABG care period, subject to the following conditions:

(1) The incentive must be provided directly by the FFS–CR participant or by an agent of the FFS–CR participant under the FFS–CR participant’s direction and control.

(2) The item or service provided must be reasonably connected to medical care provided to a FFS–CR beneficiary during an AMI care period or CABG care period.

(3) The item or service must be a preventive care item or service or an item or service that advances a clinical goal, as listed in paragraph (c) of this section, for a beneficiary during an AMI care period or CABG care period.

(4) The item or service must not be tied to the receipt of items or services outside the AMI care period or CABG care period.

(5) The item or service must not be tied to the receipt of items or services from a particular provider or supplier.

(6) The availability of items or services must not be advertised or promoted except that a beneficiary may be made aware of the availability of items or services at the time the beneficiary could reasonably benefit from them.

(7) The cost of the item or service must not be shifted to another federal health care program, as defined at section 1128B(f) of the Act.

(b) Technology provided to an FFS–CR beneficiary. Beneficiary engagement incentives involving technology are subject to the following additional conditions:

(1) Items or services involving technology provided to a beneficiary may not exceed $1,000 in retail value for any one beneficiary in any one AMI care period or CABG care period.

(2) Items or services involving technology provided to a beneficiary must be the minimum necessary to advance a clinical goal, as listed in paragraph (c) of this section, for a beneficiary in an AMI care period or CABG care period.

(3) Items of technology exceeding $100 in retail value must:

(i) Remain the property of the FFS–CR participant; and

(ii) Be retrieved from the beneficiary at the end of the AMI care period or CABG care period. The FFS–CR participant must document all retrieval attempts, including the ultimate date of retrieval.

(4) The technology will be deemed to meet the retrieval requirement.

(5) The clinical goals of the CR incentive payment model. The following are the clinical goals of the CR incentive payment model, which may be advanced through beneficiary incentives:

(1) Beneficiary adherence to drug regimens.

(2) Beneficiary adherence to a care plan.

(3) Reduction of readmissions and complications resulting from treatment for AMI or CABG.

(4) Management of chronic diseases and conditions that may be affected by treatment for AMI or CABG.

(5) Documentation of beneficiary engagement incentives. (1) FFS–CR participants must maintain documentation of items and services furnished as a beneficiary engagement incentive that exceed $25 in retail value.

(2) The documentation established contemporaneously with the provision
of the items and services must include at least the following:

(i) The date the incentive is provided.
(ii) The identity of the beneficiary to whom the item or service was provided.

(3) The documentation regarding items of technology exceeding $100 in retail must also include contemporaneous documentation of any attempt to retrieve technology at the end of an AMI care period or CABG care period as described in paragraph (b)(3) of this section.

(4) The FFS–CR participant must retain and provide access to the required documentation in accordance with § 512.715.

§ 512.745 Waiver of physician definition for furnishing CR and ICR services to a FFS–CR beneficiary.

(a) General. Section 410.49 of this chapter requires cardiac rehabilitation and intensive cardiac rehabilitation services to be furnished under the direction of a physician as defined in § 410.49(a) of this chapter.

(b) Waiver of the physician definition. For a provider or supplier of CR or ICR services to a FFS–CR beneficiary during an AMI care period or CABG care period, as defined in § 512.2. CMS waives the physician definition to allow the functions of supervising physician, prescribing exercise, and establishing, reviewing, and signing an individualized treatment plan for CR or ICR services to be furnished under the direction of—

(1) A physician, as defined in section 1861(r)(1) of the Act; or
(2) A qualified nonphysician practitioner, as defined by CMS.

(c) Other definitions and requirements. All other definitions and requirements in § 410.49 of this chapter related to a physician or supervising physician continue to apply.

Subparts I–J [Reserved]

Subpart K—Model Termination

§ 512.900 Termination of an episode payment model.

CMS may terminate any EPM for reasons including but not limited to: (a) CMS no longer has the funds to support the EPM; or (b) CMS terminates the EPM in accordance with section 1115A(d)(2) of the Act. As provided by section 1115A(d)(2) of the Act, termination of the model is not subject to administrative or judicial review.

§ 512.905 Termination of the CR incentive payment model.

CMS may terminate the CR incentive payment model for reasons including, but not limited to, one of the following:

(a) CMS no longer has the funds to support the CR incentive payment model.
(b) CMS terminates the CR incentive payment model in accordance with section 1115A(b)(3)(B) of the Act. As provided by section 1115A(d)(2) of the Act, termination of the model is not subject to administrative or judicial review.

Dated: December 13, 2016.

Equal Employment Opportunity Commission

29 CFR Part 1614
Affirmative Action for Individuals With Disabilities in Federal Employment; Final Rule
EQUAL EMPLOYMENT OPPORTUNITY COMMISSION

29 CFR Part 1614
RIN 3046-AA94

Affirmative Action for Individuals With Disabilities in Federal Employment

ACTION: Final rule.

SUMMARY: The Equal Employment Opportunity Commission (EEOC or Commission) is issuing its final rule to amend the regulations that require federal agencies to engage in affirmative action for individuals with disabilities. These changes clarify the obligations that the Rehabilitation Act of 1973 imposes on federal agencies, as employers, that are over and above the obligation not to discriminate on the basis of disability. The regulation does not apply to the private sector or to state or local governments.

DATES: Effective date: This final rule will be applicable on March 6, 2017. Applicability date: The applicability date for this final rule shall be January 3, 2018.

FOR FURTHER INFORMATION CONTACT: Christopher Kuczynski, Assistant Legal Counsel, (202) 663–4665, or Aaron Konopasky, Senior Attorney-Advisor, (202) 663–4127 (voice), or (202) 663–7026 (TTY), Office of Legal Counsel, U.S. Equal Employment Opportunity Commission. (These are not toll free numbers.) Requests for this document in an alternative format should be made to the Office of Communications and Legislative Affairs at (202) 663–4191 (voice) or (202) 663–4494 (TTY). (These are not toll free numbers.)

SUPPLEMENTARY INFORMATION:

Executive Summary

This final rule (Final Rule or Rule) amends 29 CFR 1614.203 to clarify the affirmative action obligations that Section 501 of the Rehabilitation Act of 1973 (Section 501) imposes on federal agencies as employers. The Rule codifies a variety of obligations currently placed on federal agencies by management directives and Executive Orders. It also adds two substantive affirmative action requirements. First, the Rule requires agencies to take specific steps that are reasonably designed to gradually increase the number of employees who have a disability as defined under Section 501, and the number of employees who have a “targeted disability,” which is defined for purposes of this Rule to mean a disability that is either designated as “targeted disability or health condition” on the Office of Personnel Management’s (OPM’s) Standard Form 256 (SF–256), or that falls under one of the first 12 categories of disability listed in Part A of Question 5 of the EEOC’s Demographic Information on Applicants form (Applicant Flow Form), until they meet specific goals set by the EEOC. This is consistent with the approach taken by the Department of Labor’s Office of Federal Contract Compliance Programs in regulations issued to implement the obligation of federal contractors to engage in affirmative action for individuals with disabilities pursuant to Section 503 of the Rehabilitation Act of 1973, 29 U.S.C. 793 (Section 503).

Second, the Rule requires agencies to provide personal assistance services (PAS) to employees who, because of targeted disabilities, require such assistance in order to be at work or participate in work-related travel. PAS are services that help individuals with disabilities perform activities of daily living, including, for example, assistance with removing and putting on clothing, eating, and using the restroom. Such services do not, however, include medical care, and need not be provided by someone who has medical training or qualifications.

The Commission recognizes that agencies may need some time to develop the capacity to meet these requirements. The Rule gives agencies one year to make any necessary changes in policy, staff, or other aspects of their operations. The applicability date of the Rule is thus January 3, 2018. Prior to that date, the Commission will provide extensive outreach and training to help agencies prepare to meet the new requirements.

The Commission’s economic analysis estimates that the Rule will have a one-time initial cost to the federal government of approximately $145,580.40; an annual cost to the federal government of between $23,151,538.70 and $70,954,568.10; and an annual economic benefit to the federal government of approximately $6,617,619.00. The Rule is also expected to have a variety of non-monetizable qualitative and dignitary benefits for individuals with disabilities and individuals with targeted disabilities.

Background

Section 501 imposes two distinct obligations on federal agencies. First, it prohibits agencies from discriminating against individuals with disabilities pursuant to the same standards that are “applied under title I of the Americans with Disabilities Act of 1990 . . . and the provisions of sections 501 through 504, and 510, of the Americans with Disabilities Act of 1990 . . . as such sections relate to employment.” Second, the current EEOC regulations provide substantial guidance on these standards at 29 CFR part 1630. Additional guidance is provided in many EEOC appellate decisions on complaints of employment discrimination brought under Section 501. These decisions are published on the EEOC’s Web site, and significant decisions are compiled in a publicly available digest updated annually by the Commission’s Office of Federal Operations. This Final Rule does not change any of the substantive nondiscrimination requirements that
President Bill Clinton issued Executive Order 13163 on July 26, 2000 “to support the goals articulated in section 501 of the Rehabilitation Act of 1973.” Under this Executive Order, each federal agency was required to prepare a plan to increase the opportunities for individuals with disabilities to be employed in the agency, and to submit the plan to OPM within 60 days from the date of the order. The Executive Order stated that “based on current hiring patterns and anticipated increases from expanded outreach efforts and appropriate accommodations, the Federal Government, over the next 5 years, will be able to hire 100,000 qualified individuals with disabilities.”

The regulations currently implementing the Section 501 affirmative action requirement simply state that the federal government shall be a “model employer of individuals with disabilities,” and that federal agencies shall “give full consideration to the hiring, placement, and advancement of qualified individuals with disabilities.” Over the years, however, the EEOC has issued various Management Directives to provide guidance on how an agency’s Plan should result in the federal government being a model employer of individuals with disabilities. In addition, several Executive Orders have been issued, setting numerical objectives for hiring by the federal government of individuals with disabilities, to support the goals of Section 501.

In 1987, the Commission issued Management Directive 713 (MD–713), setting forth guidelines by which the Commission would evaluate an agency’s Plan with regard to the hiring of people with disabilities. MD–713 required agencies to set employment objectives (goals) for employment of people with targeted disabilities, and to report the number of people with targeted disabilities employed by the agency.

9 Management Directive 712 (MD–712) preceded MD–713 by four years. See EEOC, Management Directive 712, 1983 WL 410824 (March 29, 1983). MD–712 created documentation requirements for agencies’ affirmative action plans, but did not include reporting requirements. MD–712 required agencies to focus on the employment of individuals with targeted disabilities; included detailed requirements for program administration and management, including staffing commitments and responsibilities; and required agencies with more than 1,000 employees to establish objectives for hiring people with targeted disabilities. For a general history of the EEOC’s Management Directives, see Office of Fed. Operations, EEOC, A
The Rule

On May 15, 2014, the Commission published an Advance Notice of Proposed Rulemaking (ANPRM) requesting public comment on specific inquiries regarding ways to strengthen its Section 501 affirmative action regulations.24 A total of 89 comments were received.25 Taking the comments into account, the Commission published a Notice of Proposed Rulemaking (NPRM) proposing specific revisions to the Section 501 regulations on February 24, 2016.26 The NPRM also asked for public input on 7 specific aspects of the proposal.27 The Commission received a total of 103 comments on the proposed rule, representing the opinions of 73 individuals, 52 disability advocacy organizations, 5 federal agencies, 2 federal government organizations, 3 state government organizations, 2 vocational rehabilitation organizations, and 1 group of administrative law students.28 Twenty-one of the comments were non-responsive. The comments are available for review at the Federal eRulemaking Portal at http://www.regulations.gov.

The Commission has reviewed and given due consideration to all comments received during the public comment period, and now issues its Final Rule amending 29 CFR 1614.203 and 1614.601(f) to update, clarify, and put in one place the standards that the Commission will use to review and approve agency Plans. The comments resulted in numerous changes to the specific requirements proposed in the NPRM. Relevant comments and Commission responses are discussed in detail in the Section-by-Section Analysis below. The Commission also made several stylistic changes that do not affect the substantive requirements of the Rule.

Commenters also offered suggestions for additional requirements not proposed in the NPRM. In some cases, the suggested requirements were not added because the Commission lacked the requisite authority. For example, the Rule does not amend Workers’ Compensation laws; revise regulations governing the hiring authority for individuals with intellectual disabilities, severe physical disabilities, or psychiatric disabilities, as set forth at 5 CFR 213.3102(u) (Schedule A hiring authority for persons with certain disabilities) by, for example, extending the trial employment period or changing the eligibility criteria; create or abolish other hiring authorities; prohibit agencies from making their own hiring decisions; or extend Section 501 obligations to state and local governments, federal contractors,29 or businesses in the private sector generally.

The Commission also did not add a provision that either grants or denies a private right of action to enforce the affirmative action regulations, as suggested by some commenters. The Commission requested public input on the ability of individuals to seek enforcement of the requirement to provide PAS, codified at paragraph (d)(5) of the Rule as amended, in individual cases. Nonetheless, this is a matter of first impression, and the Commission believes that its procedural regulations governing complaints of discrimination in the federal sector, found at 29 CFR 1614, subpart A, are the most appropriate place to address this question. As such, this Rule takes no position on the availability of a private remedy for either the PAS obligation or the affirmative action obligations more generally.

Other requirements were not added because they concerned issues that were beyond the scope of this rulemaking. For example, the Rule does not provide that a change in supervisors is a reasonable accommodation, that inaccessible job application processes may give rise to claims of employment discrimination, or that individuals have a right to representation during the interactive process, because these suggestions pertain to Section 501’s nondiscrimination requirements, which are the same as the nondiscrimination requirements of Title I30 and certain provisions of Title V 31 of the Americans with Disabilities Act (ADA) applicable to private and state and local government employers.32 The EEOC has regulations describing the ADA’s nondiscrimination requirements at 29 CFR part 1630. For similar reasons, the Rule does not address methods of oversight established elsewhere in part 1614.

In some cases, suggested requirements were not added because they would affect matters governed by both EEOC and OPM regulations. For example, the Commission has not added requirements to the Rule designed to prevent violations of Section 501’s qualification standard provisions.33 Qualification standards are governed by EEOC’s nondiscrimination regulations at 29 CFR part 1630.34 These regulations clarify that the ADA/Section 501 qualification standard provisions require federal agencies to exempt an individual from a qualification standard, test, or other selection criterion if there is sufficient evidence that he or she cannot meet such standard, test, or criterion because of a disability, but can nevertheless perform the essential functions of the position with a reasonable accommodation (if one is required).35 However, qualification standards are also governed by OPM regulations.36 Similarly, the Final Rule does not address vacancy announcements; benefit programs such as return-to-work programs; or alternative models of employment such as apprenticeship programs, customized employment, and job splitting, which are also affected by OPM regulations. EEOC and OPM are working together to develop coordinated strategies on some of these issues and other matters over which both agencies have jurisdiction.

One commenter stated that the Rule should include an exemption for small agencies. However, except in the case of the workforce analysis and goal requirements imposed by paragraphs

24 The Federal Sector’s Obligation to Be a Model Employer of Individuals with Disabilities, 79 FR 27,824 (May 15, 2014) (to be codified at 29 CFR 1614.203,.601(f)).

25 In addition to the 89 comments, the Commission received several duplicate comments.

26 Affirmative Action for Individuals with Disabilities in the Federal Government, 81 FR 9123 (Feb. 24, 2016) (to be codified at 29 CFR 1614.203,.601(f)).

27 Id. at 9130.

28 Some comments represented the opinions of more than one entity, and some individuals submitted more than one comment.

29 The ADA prohibits “using qualification standards, employment tests or other selection criteria that screen out or tend to screen out an individual with a disability or a class of individuals with disabilities,” unless a defense applies. 42 U.S.C. 12112(b)(6), 12113(a). These provisions were made applicable to federal agencies when Congress incorporated all of the ADA’s employment discrimination provisions into Section 501. See Rehabilitation Act Amendments, 106 Stat. at 4424.

30 The Commission’s ADA regulations were incorporated into EEOC’s Section 501 regulations, via full notice and comment, after Congress incorporated the ADA’s employment discrimination provisions into Section 501. See Federal Sector Equal Employment Opportunity, 67 FR 35,732, 35,735 [May 21, 2002] (codified at 29 CFR 1614.203(b)]. Further guidance on the nondiscrimination requirements pertaining to qualification standards can be found in several cases issued through the federal sector complaint process.

31 See 29 CFR 1630.10, .15(b), .15(c); 29 CFR pt. 1630, app. 1630.10, .15(b) and (c).

rules to fill any gap left, implicitly or explicitly, by Congress." 46 This gap, together with the Commission’s "generally conferred authority" under Section 501, make it "apparent . . . that Congress . . . expect[s] the agency to be able to speak [to the issue] with the force of law . . . ."44 The Commission thus has both the authority and the responsibility to issue regulations providing specific guidance to federal agencies on what they must do to satisfy their Section 501 obligation to engage in affirmative action for individuals with disabilities.

The Commission’s prior regulations implementing the affirmative action requirement, requiring agencies to be "model employers" of individuals with disabilities and to give "full consideration to the hiring, placement, and advancement" of qualified individuals with disabilities, were promulgated pursuant to the above authority in 1982.42 The Commission has also used its authority under Section 501 to provide subregulatory guidance to federal agencies on the contents of affirmative action programs for individuals with disabilities since 1987.43 Now, having found that its prior regulatory and subregulatory guidance was not sufficiently advancing the employment of qualified individuals with disabilities, the Commission again exercises its authority under Section 501 to strengthen the regulations implementing the affirmative action requirement.44 The Final Rule strengthens the regulations by—

• gathering longstanding requirements previously found in a variety of documents into a single regulation, making them easier to find and clarifying that they have the force and effect of law;
• imposing a new requirement to take specific steps that are reasonably designed to gradually increase the number of employees with disabilities and employees with targeted disabilities until they meet specific goals set by the EEOC; and

• imposing a new requirement to provide PAS to employees with targeted disabilities who need them during work hours and work-related travel.

Section-by-Section Analysis

1614.203(a) Definitions

Paragraph (a) of the proposed rule provided definitions of key terms. Many of the proposed definitions were simple abbreviations: (a)(1) provided that "ADA" refers to those portions of the ADA that are enforced by the Commission;45 (a)(4) provided that "Plan" refers to an agency’s affirmative action plan, as required under 29 U.S.C. 791(b); (a)(5) provided that "Schedule A hiring authority for persons with certain disabilities" refers to the hiring authority for individuals with intellectual disabilities, severe physical disabilities, and psychiatric disabilities, as set forth at 5 CFR 213.3102(u); and (a)(6) provided that "Section 501" means Section 501 of the Rehabilitation Act, codified at 29 U.S.C. 791. The Commission received no objections to these definitions, which are retained in the Rule.46

Paragraph (a)(2) of the proposed rule provided that the term "disability" has the same meaning as set forth in 29 CFR part 1630. One commenter stated that the term should instead be defined using a "standard set of disability identifiers" developed pursuant to section 4302 of the Affordable Care Act.47 Because the Rule implements Section 501, and not the Affordable Care Act, the Commission is required to adopt the definition of "disability" that applies under Section 501. The proposed definition of "disability" has therefore been retained.48

Proposed paragraph (a)(8), providing that the term "undue hardship" has the same meaning as set forth in 29 CFR part 1630, has also been retained.48 Undue hardship, which is both a limitation on an agency’s obligation to make reasonable accommodations and to provide personal assistance services, considers the nature, extent, and cost of an accommodation or of providing personal assistance services in relation to an agency’s overall resources and the
impact of the accommodation or of the requirement to provide personal assistance services on the operation of the agency’s business. The term is one that agencies have been familiar with since they have been required to comply with Section 501 of the Rehabilitation Act, and agency’s written reasonable accommodation procedures typically explain the term’s meaning and application.

Paragraph (a)(3) of the proposed rule provided that the term “hiring authority that takes disability into account” means any hiring authority that permits an agency to consider disability status in the selection of individuals for employment. To improve clarity, the definition has been revised to state that the term means any hiring authority that permits an agency to consider disability status “during the hiring process.”

Paragraph (a)(7) of the proposed rule defined the term “targeted/severe disability” to mean disabilities specifically designated as “targeted/severe” on the SF–256.49 As explained in the NPRM, disabilities that fall under this term are a subset of those that meet the definition of “disability” as defined under (a)(2). This subset is the focus of additional attention under several paragraphs in the Rule, discussed below. Some commenters stated that the Rule should use the term “significant disability” rather than “targeted/severe disability,” because some individuals find the term “severe” to be stigmatizing. One of these commenters stated further that the Rule should adopt the definition of “significant disability” given in Section 7 of the Rehabilitation Act of 1973.50

The Commission declines to use the term “significant disability” in place of “targeted/severe disability.” The term “significant disability,” as used by the federal government, refers to a group of disabilities that qualify an individual to receive certain government-funded services and benefits.51 By contrast, the term “targeted/severe disability,” as used in the proposed rule, was intended to refer to a group of disabilities that “have historically been used to exclude qualified individuals from employment.”52 and therefore that, “as a matter of policy, [have been] identified for special emphasis in affirmative action programs.”53 We believe that use of a single term—“significant disability”—to refer both to disabilities that have historically been used to exclude qualified individuals from employment, and, at the same time, to a different group of disabilities that qualify an individual to receive certain government-funded services and benefits, is likely to cause confusion. The Final Rule does, however, use the term “targeted disability” in place of “targeted/severe disability.”54 OPM’s revised SF–256 uses the term “targeted disabilities or serious health conditions” rather than “targeted/severe disabilities.” The revision to the Rule therefore both conforms the Rule to OPM’s new terminology and addresses the commenters’ concern that some individuals find the term “severe” to be stigmatizing. In addition, the definition of the term has been widened to include disabilities that fall under one of the first 12 categories of disability listed in Part A of question 9 on the EEOC’s Applicant Flow Form, which include several disabilities that have historically been used to exclude qualified individuals from employment, but that are not designated as “targeted” on the SF–256 (for example cerebral palsy).55 The EEOC recognizes that it will be helpful for agencies to have an updated SF–256 that conforms to the Applicant Flow Form. The EEOC continues to work with OPM in such an effort. In the meantime, the EEOC will consider both sets of disabilities to be “targeted” for purposes of the Rule.

Definitions of the terms “personal assistance services” and “personal assistance service provider” have been added to the paragraph at (a)(5) and (a)(6), because several commenters expressed confusion over the meaning of the term in the proposed rule. We discuss the definition in connection with paragraph (d)(5) below.

1614.203(b) Nondiscrimination

Paragraph 1614.203(b) of the existing regulations states that Section 501 prohibits disability discrimination in employment, and that the standards used to determine whether an agency has violated the prohibition against discrimination are those applied under the ADA. The NPRM proposed minor revisions to improve clarity. The Commission received no objections to the proposed revisions, which have been retained in the Final Rule.

1614.203(c) Model Employer

This paragraph redesignates and revises paragraph 1614.203(a) of the current regulations, which provides that the federal government shall be a “model employer” of individuals with disabilities, and that agencies shall “give full consideration to the hiring, placement, and advancement of individuals with disabilities.”

The NPRM did not propose any textual changes to the paragraph. However, some commenters objected to the use of the term “placement,” both here and throughout the regulation, because some individuals with disabilities find it offensive. Accordingly, alternate language has been incorporated here and throughout the Rule where possible. However, because Section 501 itself uses the term “placement,”56 the Rule retains the term where it directly references the language of the statute. Other commenters stated that the paragraph should be revised to reflect the affirmative action requirements imposed through this rulemaking. The Commission agrees. Accordingly, the paragraph has been revised to state that “[a]gencies shall [ ] take affirmative action to promote the recruitment, hiring, and advancement of qualified individuals with disabilities, with the goal of eliminating under-representation of individuals with disabilities in the federal workforce,” and that agencies shall give “full consideration to the . . . retention of qualified individuals with disabilities in the federal workforce.”

1614.203(d) Affirmative Action Plan

As provided by Section 501, this paragraph states that each agency shall adopt and implement a Plan that

49 At the time the NPRM was published, the SF–256 used the term “targeted/severe disability,” rather than “targeted disability.”

50 29 U.S.C. 705(21) (“Except as provided in subparagraph (B) or (C), the term ‘individual with a significant disability’ means an individual with a disability—the term ‘individual with a significant disability’ means an individual with a disability—(i) who has a severe physical or mental impairment which seriously limits one or more functional capacities (such as mobility, communication, self-care, self-direction, interpersonal skills, work tolerance, or work skills) in terms of an employment outcome; (ii) whose vocational rehabilitation can be expected to require multiple vocational rehabilitation services over an extended period of time; and (iii) who has one or more physical or mental disabilities resulting from amputation, arthritis, autism, blindness, burn injury, cancer, cerebral palsy, cystic fibrosis, deafness, head injury, heart disease, hemiplegia, hemophilia, respiratory or pulmonary dysfunction, intellectual disability, mental illness, multiple sclerosis, muscular dystrophy, muscular-skeletal disorders, neurological disorders (including stroke and epilepsy), paraplegia, quadriplegia, and other spinal cord conditions, sickle cell anemia, specific learning disability, end-stage renal disease, or another disability or combination of disabilities determined on the basis of an assessment for determining eligibility and vocational rehabilitation needs described in subparagraphs (A) and (B) of paragraph (2) to cause comparable substantial functional limitation.”).

51 See, e.g., 29 U.S.C. 796b (“Services may be provided under [29 U.S.C. ch. 16, subch. VII, pt. A] to any individual with a significant disability, as defined in section 705(21)(B) of (title 29).”)

52 Promoting Employment, supra note 21, at 1.

53 MD–715, supra note 16, at app. A.

54 The definition of “targeted disability” appears in paragraph (a)(9) of the Final Rule.

55 See Applicant Flow Form, supra note 4, at 2.

56 See 29 U.S.C. 791(b).
provides sufficient assurances, procedures, and commitments to provide adequate recruitment, hiring, and advancement opportunities for individuals with disabilities at all levels of federal employment. It also sets forth the requirements that the Plan must meet in order to be approved by the Commission. The specific requirements are discussed in separate sections below.

Several commenters stated that the term “adequate,” as used in the statutory language quoted above, should be defined to mean “adequate to ensure meeting the goals required under paragraph (d)(7) of this section.” The Commission disagrees. If, on the one hand, the proposed definition was intended simply to clarify the meaning of the word, the Commission believes that the clarification is unnecessary. Section 501 requires the Commission to approve agency Plans if they “provide[ ] sufficient assurances, procedures, and commitments to provide adequate recruitment, hiring, and advancement opportunities for individuals with disabilities at all levels of federal employment.” By setting forth the criteria that the Commission will use to determine whether to approve a Plan in paragraph (d), the Rule effectively defines the meaning of that phrase as a whole. If, on the other hand, the definition was suggested in order to create additional criteria by which the Commission will evaluate agency Plans, the Commission disagrees with the suggestion because it would imply, contrary to (f) and to the Commission’s intention, that paragraph (d) does not set forth an exhaustive list of Plan criteria.

1614.203(d)(1)(i) Disability Hiring and Advancement Program: Recruitment

Paragraph (d)(1)(i) of the proposed rule required agencies to use programs and resources that identify applicants who are eligible to be appointed under hiring authorities that take disabilities into account, examples of which include specialized training programs and databases of potential job applicants with disabilities. The paragraph also required agencies to establish and maintain contacts with organizations that specialize in the employment of individuals with disabilities, such as American Job Centers, State Vocational Rehabilitation Agencies, the Veterans’ Vocational Rehabilitation and Employment Program, Centers for Independent Living, and Employment Network Service providers. In addition, the NPRM stated that the Rule should require agencies to maintain a file or database of individuals who have been determined to be eligible for appointment under a hiring authority that takes disability into account, but who were not hired, and, if so, whether inclusion in the database should be voluntary.

A significant number of commenters stated that recruitment of individuals with targeted disabilities should receive additional emphasis in the paragraph. Consistent with the federal government’s policy of giving targeted disabilities “special emphasis in affirmative action programs,” paragraph (d)(1)(i) has been amended to require agencies to use programs and resources that identify job applicants with disabilities, “including individuals with targeted disabilities,” who are eligible for appointment under a special hiring authority, and to establish and maintain contacts with organizations that specialize in providing assistance to individuals with disabilities, “including individuals with targeted disabilities,” in securing and maintaining employment. Some commenters stated that agencies should be required to use all of the programs and resources, and to maintain contact with all of the disability organizations, given as examples in the paragraph. Some stated that use of additional programs and resources, such as internship programs and community message boards, and contact with additional disability organizations, such as state Protection and Advocacy organizations, Ticket to Work networks, supported and customized employment providers, college or university career centers that cater to individuals with disabilities, and local education authorities, should also be mandatory.

The Commission is not persuaded that every agency will benefit from the same set of programs, resources, and disability organizations in their efforts to recruit individuals with disabilities and individuals with targeted disabilities. The particular programs, resources, and disability organizations referenced in the paragraph have therefore been kept as examples. Because there is no need to make the list of examples exhaustive, most of the suggested additions were not included in the final paragraph, though they certainly may be appropriate resources to assist agencies in meeting their affirmative action obligations. However, because it was a particularly common suggestion, internship programs were added as examples of programs or resources that can be used to identify individuals who may be appointed under hiring authorities that take disability into account.

Some commenters stated, instead of requiring agencies to “maintain contacts” with organizations that specialize in the employment of individuals with disabilities, the Commission should require agencies to establish and maintain “linkage agreements or other formal arrangements” with such organizations. The paragraph has been revised to state that the required contacts may include formal agreements, but does not make formal agreements mandatory. The EEOC lacks the information necessary to determine, for example, how many formal agreements each agency should have, what each party to the agreement should be obligated to do, and what should happen if a party fails to meet an obligation in the agreement. Further, the Commission suspects that different approaches may be appropriate for different agencies.

Many commenters responding to the proposal to require a file or database of individuals who have been determined to be eligible for appointment under a hiring authority that takes disability into account but who have not been hired generally favored some version of the proposal, but there was disagreement regarding the location of the database. For example, several commenters stated that the file/database needs to be government-wide in order to be effective. Other commenters stated that the databases should be required, but that they would be more effective if each agency maintained its own database of individuals with disabilities who had already evidenced interest in the agency.

Upon further consideration, however, the Commission has concluded that agencies should be encouraged to maintain such databases, rather than making such databases mandatory for every agency. Databases containing the résumés of applicants eligible for appointment under the Schedule A hiring authority for individuals with certain disabilities, and similar resources, will greatly assist agencies in locating and hiring qualified job applicants with disabilities and targeted disabilities. Such databases will be of significant help as agencies seek to meet their targets with regarding to hiring such individuals.

The Commission therefore retains “databases of potential job applicants with disabilities” as an example of programs and resources that identify such applicants in paragraph (d)(1)(i)(A) of the Rule, and encourages agencies to develop new databases or augment existing résumé databases to fulfill these
functions. Should an agency decide to maintain such a database, the Commission advises the agency to include individuals in the database on a voluntary basis only, and to retain in the database only such information as is necessary to determine an applicant’s identity, qualifications, and eligibility for appointment under a hiring authority that takes disability into account. Medical information about an individual’s specific disability should not be included. The Commission is willing to provide technical assistance to any agency with regard to maintaining a database consistent with all applicable privacy and record retention laws and regulations.

1614.203(d)(1)(iii) Disability Hiring and Advancement Program: Application Process

Paragraph (d)(1)(iii) of the proposed rule required agencies to ensure that they have sufficient staff to handle any disability-related issues that arise during the application and selection processes. It also required the agency to provide such staff with training, support, and other resources sufficient to enable them to (A) answer any disability-related questions from members of the public regarding the application and hiring processes; (B) provide job applicants with necessary reasonable accommodations; (C) accept applications for appointment under hiring authorities that take disability into account; (D) determine whether individuals who have applied for appointment under a hiring authority that takes disability into account are eligible for such appointment; (E) forward the application of an individual who has applied for appointment to a particular position under a hiring authority that takes disability into account and who is eligible to the relevant hiring officials, and explain to those officials how and when the individual may be appointed; and (F) oversee any other disability-related hiring programs. Proposed paragraphs (d)(1)(iii)(E) and (d)(1)(iii)(E) were combined into a single paragraph (d)(1)(iii)(E) in the Final Rule, in order to clarify that agencies are not required to determine whether an individual is eligible for appointment under a hiring authority that takes disability into account unless such individual is being considered for a particular position.

Some commenters stated that the paragraph should be more specific as to who should perform the duties described above. Commenters suggested, for example, that only employees who focus on disability-related issues full time, employees who themselves have disabilities, or employees who are not under the supervision of the office of human resources should perform the duties. One commenter stated that the paragraph should specify the number of staff members who are assigned to these duties.

The Commission believes that agencies should be afforded some flexibility in how the duties are carried out and declines to adopt a one-size-fits-all approach. Some small agencies, for example, may not need an employee who works on disability-related issues on a full-time basis, and the proper number of employees required to handle duties related to the hiring of individuals with disabilities will vary depending on an agency’s size and structure. Additionally, we see no reason to conclude categorically that employees who handle issues related to applications from individuals with disabilities should not be under the supervision of an agency’s human resources office, though we caution that a human resources specialist assigned to handle applications for a particular job may not necessarily have the necessary expertise to handle requests for reasonable accommodation, questions about hiring authorities that take disability into account, and other questions from job applicants with disabilities. Finally, the Commission does not believe that employees with disabilities are necessarily the only individuals capable of effectively handling duties related to the hiring of other individuals with disabilities, and embodying such an assumption in the Final Rule may actually work to encourage the segregation of individuals with disabilities into specific job categories.

Some commenters stated that the paragraph should require agencies to provide relevant staff members with accurate information on reasonable accommodation, the Schedule A hiring authority for persons with certain disabilities, the affirmative action requirements imposed under this rulemaking, and other disability-related issues. Because the paragraph already requires agencies to provide “sufficient training, support, and other resources to carry out” the tasks listed above, the Commission concludes that no additional language is necessary.

6614.203(d)(1)(iii) Disability Hiring and Advancement Program: Advancement

This paragraph of the proposed rule required agencies to take specific steps to ensure that current employees with disabilities have sufficient opportunities for advancement, such as engaging in efforts to ensure that employees with disabilities are informed of and have opportunities to enroll in relevant training, developing and maintaining mentoring programs, and administering exit interviews that address the recruitment, hiring, inclusion, and advancement of individuals with disabilities.

Some commenters stated that all of the specific steps referenced in the paragraph should be mandatory. Others stated that they should be made more specific, by, for example, requiring agencies to hire dedicated “disability advancement staff”; approach all employees with disabilities when training opportunities arise; give all notices of training opportunities “promptly” to individuals with disabilities in accessible formats; hire full-time assistive technology experts, and make use of the programs, resources, and disability organizations referenced in paragraph (d)(1)(ii) to facilitate advancement. Again, the Commission is not persuaded that every agency will benefit from the same strategies for improving advancement opportunities for individuals with disabilities and individuals with targeted disabilities. The Rule has therefore retained the original examples.

Some commenters stated that the paragraph should contain prohibitions against disability discrimination. For example, commenters stated that the paragraph should require agencies to make reasonable accommodations available to participants in mentoring...
programs, that individuals with disabilities must be afforded equal opportunities to gain work experience, and that individuals appointed under the Schedule A hiring authority for persons with certain disabilities should be afforded supervision similar to that given other employees.61 As explained above, the Commission believes that it is inappropriate to provide new guidance on nondiscrimination obligations applicable to federal agencies, as well as to private and state and local government employers, in a regulation that applies only to the affirmative action obligations of federal agencies.

Some commenters stated that the paragraph should require review of all adverse actions taken against individuals with disabilities by, for example, the head of the agency or a neutral, non-agency party. Federal employees already possess several means of subjecting adverse actions to further review. Depending on the issues involved, employees may make use of existing internal mechanisms including alternative dispute resolution, if available; file complaints of employment discrimination pursuant to 29 CFR 1614.106; file appeals with the Merit Systems Protection Board; and file appeals with the U.S. Office of Special Counsel.62 The Commission has been given no reason to believe that an additional layer of review would improve either the accuracy or the speed with which reviews are carried out. Indeed, because an additional layer of review would not toll existing time frames for filing complaints of discrimination, it is quite likely that such a requirement would significantly burden agencies while resulting in little if any impact on the number of discrimination complaints filed, or worse, cause confusion for employees with disabilities that could result in late filing of complaints. The commenters’ suggestion therefore was not incorporated into the Rule.

1614.203(d)(2) Disability Anti-Harassment Policy

Paragraph (d)(2) of the proposed rule required agencies to state expressly in their anti-harassment policies that disability-based harassment is prohibited. The Commission received no comments objecting to the requirement. It therefore has been retained in the Final Rule. Some commenters stated that the paragraph should also require agencies to provide training on the disability-based harassment policy. The Commission is not persuaded that the addition is necessary. Agencies routinely provide training on their anti-harassment policies. If, as required under this paragraph, an agency’s policy expressly states that disability-based harassment is prohibited, the training should naturally address the topic. The Commission notes that Chai R. Feldblum and Victoria A. Lipnic recently published a report on how agencies and other employers can improve efforts to prevent harassment that discusses disability-based harassment throughout, and that includes a section specifically on the prevalence of disability-based harassment.63

1614.203(d)(3)(i) Reasonable Accommodation: Procedures

Proposed paragraph (d)(3)(i) required agencies to make reasonable accommodation procedures available to job applicants and employees in both written and accessible formats. It also required the procedures to address a minimum of 20 specific topics, including expedited processing, interim accommodations, reasonable accommodation requests, confidentiality, processing deadlines, the process for filing complaints pursuant to 29 CFR 1614.106, and notice of denied requests.

Commenters did not object to the proposal to make reasonable accommodation procedures available in written and accessible formats. One commenter stated that the paragraph should require the procedures to be available online. Recognizing the central importance of online access in the modern workplace, the paragraph now provides that “[t]he Plan shall require the agency to . . . post on its public Web site, and make available to all job applicants and employees in written and accessible formats, reasonable accommodation procedures.” Some commenters suggested adding a statement that “accessible formats” include American Sign Language (ASL). The requirement to make reasonable accommodation procedures available in written “and accessible formats” was drafted so as not to require the accessible format to be “written,” and to provide job applicants with maximum flexibility to request a type of accessible format that meets his or her particular needs. The language is sufficiently general that it should be interpreted to encompass ASL, as well as documents in Braille or large print, documents in an electronic format that can be read by screen reading software, an individual who can read the document aloud, and other types of accessible formats.

Most of the public comments addressing this paragraph concerned the requirement to provide reports on the prevalence of disability-based harassment.

61 One commenter stated that the Rule should prohibit individuals appointed under the Schedule A hiring authority for people with certain disabilities from filing discrimination complaints. Because this paragraph does not implement principles of affirmative action, it has not been included.

64 For reasons of clarity, the proposed paragraph was split into 2 paragraphs in the Final Rule.

65 42 U.S.C. 12112(b)(5)(A); 29 CFR 1630.9; 29 CFR pt. 1630, app. 1630.9, §6(e).
the suggested statement. However, in response to the commenters’ concerns, the proposed paragraph has been revised to state that reassignment “is” a reasonable accommodation, and that such reassignment “must” be considered if the agency determines that no other reasonable accommodation would permit the employee to perform the essential functions of his or her current position. One commenter stated that the paragraph should clarify that only employees, and not job applicants, may require reassignment as a reasonable accommodation. Because the paragraph requires an agency’s procedures to state that it will consider reassignment when the “employee” can no longer perform the essential functions of his or her “current position,” no further clarification is required.

One commenter stated that the paragraph should require agencies to develop and maintain a database of vacant positions within the agency, and to require that agency officials use the database when considering whether to provide reassignment as a reasonable accommodation. The Commission believes that the addition is unnecessary, as long as an agency “[n]otify[s] supervisors and other relevant agency employees how and where they are to conduct searches for available vacancies when considering reassignment as a reasonable accommodation” as required under revised paragraph (d)(3)(i)(C).

*    *    *    *

The proposed paragraph required the procedures to explain the agency’s right to require documentation that may be necessary to establish the existence of a disability and the need for accommodation. To the extent that the proposed cap would further restrict agencies, it would have the effect of denying them documentation that may be necessary to carry out the interactive process, potentially resulting in denials of needed accommodations. Therefore, the Commission has declined to impose a cap on the number of agency requests for documentation to support an accommodation request.

- (d)(3)(i)(L) (redesignated (d)(3)(i)(M)) and (d)(3)(i)(O): Deadlines. The proposed paragraph required the procedures to designate a maximum amount of time, absent extenuating circumstances, that the agency has to either provide a requested accommodation or deny the request. It also required the procedures to explain that the time limit begins to run when the accommodation is first requested, and that, where a particular reasonable accommodation can be provided in less than the maximum amount of time allowed, failure to respond promptly may result in a violation of the Rehabilitation Act.

One commenter stated that the Commission should eliminate the time limit requirement. The suggestion runs counter to longstanding federal policy. Executive Order 13164 states that each agency’s procedures must “[d]esignate a time period during which reasonable accommodation requests will be granted or denied, absent extenuating circumstances.” As instructed by Executive Order 13164, the Commission provided further clarification of the requirement in guidance, which is still in effect.

Some commenters stated that the paragraph should require the procedures to provide additional information on the types of extenuating circumstances that would justify a delay in providing a reasonable accommodation. Commenters stated, for example, that the procedures should list all possible extenuating circumstances, should provide that an inability to secure funding is not an extenuating circumstance, should state that a delay is justified “as long as both parties are actively engaged in the interactive process,” or should state that a requester’s failure to engage in the interactive process, for example by failing to provide necessary documentation, constitutes an extenuating circumstance.

Extenuating circumstances are, by definition, factors that cannot “reasonably have been anticipated or avoided in advance of the request for accommodation.” Thus, it is not possible to specify all such circumstances in a regulation. In addition, some agencies may define certain acts or omissions during the interactive process as “extenuating circumstances,” while others may not. For example, the inability to provide equipment needed as a reasonable accommodation because a vendor has suddenly and unexpectedly gone out of business might be an extenuating circumstance for a small agency making a purchase of the equipment for the first time, but not for a large agency that has extensive experience with providing reasonable accommodations.

The Commission therefore believes that it is not possible to create a definitive list of what constitute extenuating circumstances. However, a new paragraph has been added at (d)(3)(i)(N) clarifying the Commission’s longstanding position that “the agency will not be expected to adhere to its usual timelines if an individual’s health professional fails to provide needed documentation in a timely manner.”

- (d)(3)(i)(N) (redesignated (d)(3)(i)(P)): Interim accommodations. The proposed paragraph required the agency’s procedures to explain that, where a reasonable accommodation cannot be provided immediately, the agency must provide an interim accommodation whenever possible.

One commenter stated that the paragraph should not require an agency’s procedures to state an interim accommodation “must” be provided “whenever possible,” but rather that the agency will “seek to” provide interim accommodations during a delay. Another commenter stated that the procedures should not require the agency to provide interim accommodations if the existence of a disability, the need for accommodation, and the effectiveness of the proposed accommodation have not been established.

The Commission disagrees that agencies should only be required to “seek to” provide an interim accommodation when there is a delay in providing a preferred accommodation. Interim accommodations may be necessary in order to avoid, for example, a worsening of symptoms, exacerbation

66 See, e.g., 13164 Guidance, supra note 15.
67 For reasons of clarity, the paragraph on deadlines in the proposed rule was split into 2 paragraphs in the Final Rule.
68 Executive Order No. 13164, supra note 14.
69 See 13164 Guidance, supra note 15.
of a medical condition, or pain. They therefore may play a crucial role in preserving the requesting individual’s ability to work. The Commission also disagrees that interim accommodations should only be required once the existence of a disability, the need for accommodation, and the effectiveness of a proposed accommodation have been established. The term “establish” connotes a formal finding. There may be reasons why an agency does not make a formal finding even though it is reasonably likely that the requesting individual is entitled to a reasonable accommodation, such as where a disability is obvious even though the appropriate accommodation has not been established.

For the foregoing reasons, the paragraph has been amended to require an interim accommodation that allows the requesting individual to perform some or all of the essential functions of his or her job when “all the facts and circumstances known to the agency make it reasonably likely that [the] individual will be entitled to a reasonable accommodation, . . . [and] it is possible to do so without imposing undue hardship on the agency.” Other commenters stated that agencies should be required to address topics in addition to the 20 proposed in the NPRM in their reasonable accommodation procedures. For example, commenters stated that the procedures should be required to explain that employees and applicants do not need to use “magic words” in order to begin the interactive process; that reasonable accommodations may be available to help applicants meet qualification standards; that the interactive process is “ongoing”; and that employees and job applicants have an obligation to participate in the interactive process. None of the requirements were added because they are implicit in existing EEOC requirements. For example, the requirement to explain that employees and applicants do not need to use “magic words” in order to begin the interactive process is implicit in the existing requirement to “[p]rovide guidance to supervisors on how to recognize requests for reasonable accommodation” at (b)(1)(3)(G).

Moreover, the list of 20 topics is only intended to set a minimum; agencies are free to address additional topics in the procedures if they wish to do so.

The Commission made an unrequested change to proposed paragraph (d)(3)(i)(G) (designated (d)(3)(i)(H) in the Final Rule), clarifying that decision makers should communicate with individuals who have requested a reasonable accommodation early in the interactive process “and throughout the process.” The revision does not represent a change in Commission policy.

1614.203(d)(3)(ii) Reasonable Accommodation: Cost of Accommodations

Paragraph (d)(3)(ii) of the proposed rule required agencies to inform all employees who are authorized to grant or deny requests for reasonable accommodation that, pursuant to the regulations implementing the undue hardship defense at 29 CFR part 1630, all available resources are considered when determining whether a denial of reasonable accommodation based on cost is appropriate. As a clarificator, this portion of the paragraph has been revised to state that all available resources are considered, “excluding those designated by statute for a specific purpose that does not include reasonable accommodation.” The paragraph also required the agency to ensure that relevant decision-makers are informed about various external resources that may be used in providing reasonable accommodations, including, for example, a centralized fund specifically created by the agency for providing reasonable accommodations, the Department of Defense Computer and Electronic Accommodations Program (CAP),72 and agency funds that, although not designated specifically for providing reasonable accommodations, may be used for that purpose. The purpose of the paragraph was to ensure that sufficient funds are available for more costly accommodations when necessary.

Many commenters stated that the paragraph should require a centralized fund. In the NPRM, the Commission stated that it did not require a centralized fund due to practical concerns regarding the precise manner in which an agency’s appropriated funds are held, requested, and disbursed, and due to the fact that centralized funding does not ensure that sufficient funds are available for costly accommodations where, for example, the fund is too small or relevant decision-makers do not know how to access the fund. The commenters argued that these concerns could be overcome by, for example, requiring agencies to base the size of the fund on costs in previous years and instructing relevant personnel how to access the fund.

The EEOC has supported the use of a centralized fund to pay for reasonable accommodation.73 We think that a centralized fund is one of the best and easiest ways to ensure that requests for reasonable accommodation are not denied for reasons of cost, and that individuals with disabilities are not excluded from employment due to the anticipated cost of a reasonable accommodation, if the resources available to the agency as a whole would enable it to provide one without undue hardship.

However, the Commission is not persuaded that a centralized fund is the only way to achieve this objective. For example, centralized contracting vehicles may be an effective alternative. The paragraph has thus been amended to require agencies to take specific steps—which may include adoption of a centralized fund—to achieve these goals. The paragraph further states that such steps must be reasonably designed to:

• ensure that anyone who is authorized to grant or deny requests for reasonable accommodation or to make hiring decisions is aware of, pursuant to the regulations implementing the undue hardship defense at 29 CFR part 1630, all resources available to the agency as a whole, excluding those designated by statute for a specific purpose that does not include reasonable accommodation, are considered when determining whether a denial of reasonable accommodation based on cost is lawful; and
• ensure that anyone authorized to grant or deny requests for reasonable accommodation or to make hiring decisions is aware of, and knows how to arrange for the use of, agency resources available to provide the accommodation, including any centralized fund the agency may have for that purpose.

The revised paragraph requires agencies to adopt systems that perform the same valuable functions of centralized funds, while providing them with flexibility to work within existing budgetary schemes.

1614.203(d)(3)(iii) Reasonable Accommodation: Notification of Basis for Denial

Paragraph (d)(3)(iii) of the proposed rule required agencies to provide a job applicant or employee who is denied a reasonable accommodation a written notice that explains the reason.

employees in actions against other agencies. The paragraph has been modified to clarify that agencies are only required to provide information on where to file a complaint against another agency when an investigation shows that such other agency is responsible for an alleged violation.

1614.203(d)(5) Personal Services Allowing Employees To Participate in the Workplace

Currently, agencies are required to provide certain job-related services to individuals with disabilities as reasonable accommodations if doing so would enable them to apply for a job, perform job functions, or enjoy the benefits and privileges of employment, absent undue hardship. For example, an agency may be required to provide sign language interpreters, readers, assistance with note taking or photocopying, or permission to use a job coach as a reasonable accommodation. However, provision of PAS that are needed on the job, such as assistance with eating or using the restroom, is not considered a reasonable accommodation under the ADA or as a matter of nondiscrimination under Section 501.

The NPRM proposed to place this obligation on agencies as an affirmative action requirement under Section 501.

Paragraph (d)(5) of the proposed rule required agencies to provide PAS, such as assistance with removing and putting on clothing, eating, and using the restroom, to employees who need them because of a disability during work hours and job-related travel, unless doing so would impose undue hardship. It further provided that agencies are permitted to assign PAS providers to more than one individual with a disability, and to require them to do non-PAS tasks as time permits. In addition, the NPRM requested public input on (a) whether the description of PAS in the proposed paragraph was adequate; (b) whether the requirement to provide PAS should be kept in the Final Rule; (c) whether individuals who provide PAS should be assigned to particular individuals or, instead, asked to provide services to multiple individuals as needed; and (d) whether the agency should be allowed to assign other tasks to PAS providers when no personal assistance is needed.

Many commenters responding to the question of whether the NPRM’s description of PAS was adequate complained that the description was vague. Commenters offered various suggestions for making the description more precise—some stated that it

---

76 See 29 CFR pt. 1630, app. 1630.9.
should include additional examples, one stated that it should exclude medical services, one stated that the list of examples should be exhaustive, and two stated that the paragraph should incorporate language used in the definition of PAS given elsewhere in the Rehabilitation Act.  

The Commission has chosen the last option. The term “personal assistance services,” as it is used in the disability community, expresses an open-ended concept. It is therefore not possible to provide an exhaustive list of examples, and addition of a few examples will necessarily fail to capture the full meaning. New paragraph (a)(5) thus provides that the term “personal assistance service” means “assistance with performing activities of daily living that an individual would typically perform if he or she did not have a disability, and that is not otherwise required as a reasonable accommodation, including, for example, assistance with removing and putting on clothing, eating, and using the restroom.” New paragraph (a)(4) defines the related term “personal assistance service provider” to mean “an employee or independent contractor whose primary job functions include provision of personal assistance services.”

Comments on whether the PAS requirement should be kept in the Final Rule were mixed. Many disability advocacy organizations and individuals strongly favored the requirement, emphasizing that a lack of PAS in the workplace poses a major barrier to employment for some individuals with disabilities. Other commenters objected. Some argued that the associated costs would be too high. Some argued that the Commission lacked the authority to impose the requirement. Others objected that compliance with the requirement would be extremely difficult or impossible because, for example, it would require agencies to violate appropriations and antideficiency laws; require them to coordinate with local nursing boards; lead to the depletion of reasonable accommodation funds; result in reduced hiring of individuals with disabilities; conflict with merit systems principles and veterans’ preference rules, at least to the extent that it would require agencies to hire providers chosen by the individuals who need them; require agencies to provide services in a variety of locations; or lead to the hiring and retention of unqualified employees.

The Final Rule retains the requirement to provide PAS during work hours 78 and job-related travel, absent undue hardship, and further clarifies in revised paragraph (d)(5)(iii) that agencies may not take adverse actions against job applicants and employees on the basis of their need, or perceived need, for PAS. Public comments from advocacy organizations and individuals confirm that lack of PAS in the workplace and/or the fear of losing PAS provided by means-tested assistance programs are stubborn and persistent barriers to employment for individuals with certain disabilities. For many individuals with targeted disabilities such as paralysis or cerebral palsy, full participation in the workplace is impossible without PAS.

The Commission is not persuaded by the objections raised by commenters. First, the issue of cost is addressed in the section on Executive Orders 13563 and 12866 below. Second, we disagree that the Commission lacks authority to impose the requirement. As explained above, the Commission has Section 501 rulemaking authority under Section 505 and Executive Order 12067, and, having found that its prior regulatory and subregulatory guidance was not sufficiently advancing the employment of qualified individuals with disabilities, here exercises its authority to strengthen the regulations implementing the Section 501 affirmative action requirement. 79

Because public comments confirm that a lack of PAS in the workplace is a persistent barrier to employment for individuals with certain significant disabilities, one of the ways in which the regulation is being strengthened is by requiring agencies to provide PAS to individuals who need them during work hours and job-related travel, absent undue hardship.

Third, as to the arguments that compliance would be extremely difficult or impossible, the Commission notes as it did in the preamble to the proposed rule that several federal agencies currently provide PAS on a voluntary basis, and have been doing so for decades without any of the negative consequences imagined by commenters. 80

Responses to the question of whether PAS providers should be assigned to single individuals or to multiple individuals were mixed. Some stated that providers should be assigned to single individuals because (a) PAS are often required on very short notice, (b) receipt of PAS from multiple providers is likely to make the individual with a disability feel uncomfortable, and (c) services are improved if the provider is familiar with the individual’s needs. Others stated that agencies should be given maximum flexibility. Commenters were more uniformly in favor of allowing agencies to assign non-PAS tasks to PAS providers, as long as the PAS-related assignments were given higher priority. One commenter disagreed, arguing that assignment of both PAS and non-PAS tasks to a single individual would create practical problems in contracting, creation of position descriptions, and performance assessment.

In both respects, the Final Rule grants flexibility to agencies in revised paragraph (d)(5)(iii). Again the Commission looks to actual practice for guidance. Federal agencies have used a variety of models for providing PAS to equal effect. The Commission, for example, has hired federal employees to provide PAS to individuals with disabilities on a one-to-one basis, whereas the Department of Labor has contracted for a pool of qualified personnel to provide PAS and other services to multiple employees. 81

Moreover, if an agency finds that a

---

77 See 29 U.S.C. 705[26] (“The term ‘personal assistance services’ means a range of services, provided by one or more persons, designed to assist an individual with a disability to perform daily living activities on or off the job that the individual would typically perform if the individual did not have a disability. Such services shall be designed to increase the individual’s control in life and ability to perform everyday activities on or off the job.”).

78 Work hours include time that an employee is teleworking. Whether the telework is part of an agency telework program available to all employees or is being provided as a reasonable accommodation. The Commission sees no legal reason to treat that provision of PAS to workers who are teleworking any differently from the provision of other services by individuals as a reasonable accommodations, such as sign language interpreters and readers. Determinations of whether PAS can be provided to an employee who is teleworking without undue hardship should be made on a case-by-case basis, as are decisions about reasonable accommodations.

79 See supra notes 37–44 and accompanying text.

80 The Commission provides personal assistant services to employees with disabilities who require them. The Department of Labor, the Department of Transportation, and the Department of Justice’s Civil Rights Division also provide workplace PAS for employees with disabilities. See Department of Labor statement of work on providing personal assistance services as a reasonable accommodation for qualified Department of Labor employees with disabilities (2014) [hereinafter DOL statement] (on file with the Commission); Dep’t of Transp., Disability Resource Center Services Handbook (Nov. 2014), http://www.transportation.gov/individuals/disability/disability-resource-center-rc-services-handbook (providing guidance to the Department of Transportation on meeting its obligations regarding the retention and promotion of individuals with disabilities by providing personal assistance and other services); Civil Rights Div., U.S. Dep’t of Justice, Reasonable Accommodation Manual A.2.5 (not on file with the Commission) (providing that the Civil Rights Division will provide part-time personal care attendants at work or on official travel when necessary and otherwise reasonable).

81 DOL statement, supra note 80.
particular approach is impracticable or does not meet employees’ needs, the paragraph permits the agency to adopt an alternative approach.

Other comments on the requirement raised the following issues:

- **Eligibility.** Some stated that an agency should only be required to provide PAS to individuals who are qualified to perform their jobs. Although the Commission does not believe that the proposed paragraph provided otherwise, it has been revised to state that agencies are required to provide PAS only if they “would, together with any reasonable accommodations required under [29 CFR pt] 1630 . . . , enable the employee to perform the essential functions of his or her position.”

Other commenters stated that an agency should only be required to provide PAS to individuals who have targeted disabilities. As discussed in the NPRM, the Commission believes that individuals who do not have targeted disabilities will not require PAS in order to participate in the workplace. The paragraph has therefore been revised in the manner suggested.

- **Additional services.** Some commenters stated that the paragraph should require agencies to provide additional services to employees with disabilities, including help with getting to and from work, identifying transportation options and accessing transportation, assistance with becoming familiar with surroundings, and “informational and navigational awareness, as well as lightweight communication.” The commenters did not, however, cite to any studies or other objective sources establishing that such services would significantly improve employment of individuals with disabilities, or to any data on which to base an estimate of the economic impact of the requirement. The Commission has not incorporated these suggestions.

A significant number of commenters stated that the Rule should require agencies to permit employees with disabilities to use job coaches and other forms of supported employment paid for by outside sources. The Commission strongly endorses the use of supported employment. Indeed, permission to use a job coach or other forms of supported employment is a reasonable accommodation that may be required if such a person needs those services to perform the essential functions of a position and if providing those services does not impose an undue hardship on the agency. As explained above, however, the Commission believes that it would be inappropriate to provide guidance on nondiscrimination requirements applicable to federal agencies, as well as to private and state and local government employers, in a regulation that applies to the affirmative action obligations of federal agencies.

- **Undue hardship exception.** One commenter stated that agencies should not be required to establish undue hardship in order to deny a request for PAS, because, given the fact that they typically have very large budgets, agencies “will have very limited ability to deny such requests . . . regardless of the nature of the request.” The commenter did not suggest an alternative standard.

The paragraph disagrees with the commenter’s characterization. First, the paragraph does not require agencies to provide PAS to individuals who request them “regardless of the nature of the request.” The paragraph only requires agencies to provide personal assistants, who will assist the employee with eating, using the restroom, and similar activities to individuals who need them because of a targeted disability; it does not require agencies to provide services that the individual does not need in order to participate in the workplace, or services that are needed for reasons other than disability. Second, agencies may be able to establish undue hardship for reasons other than cost.

- **Selection and evaluation of personal assistance service provider.** Some commenters stated that the paragraph should require PAS providers to meet certain qualification standards, such as those imposed by OPM for all government employees and specific standards based on experience and training. Others stated that an agency should be required to consult with individuals who receive PAS during their providers’ performance reviews. These requirements were not incorporated into the Rule because they primarily concern OPM functions. EEOC is not in the best position to treat PAS requests like requests for reasonable accommodation, the paragraph further provides that agencies may satisfy the requirement by stating in their reasonable accommodation procedures that the process for requesting personal assistance services, the process for determining whether such services are required, and the agency’s right to deny such requests when provision of the services would pose an undue hardship, are the same as for reasonable accommodations.

83 Affirmative Action for Individuals with Disabilities in the Federal Government, 81 FR 9123, 9134 n.101 (Feb. 24, 2016) (to be codified at 29 CFR 1614.203, .601(f)).
84 See 29 CFR pt. 1630, app. 1630.9.
86 See 29 CFR pt. 1630, app. 1630.9.
Senior Executive Service (SES); 88 a 12% representation rate for people with disabilities at the GS–10 level and below; a 2% representation rate for individuals with targeted disabilities at the GS–11 level and above, including the SES; and a 2% representation rate for people with targeted disabilities at the GS–10 level and below. Paragraph (d)(6) required agencies to perform the workforce analysis necessary to determine whether these goals have been met annually, based on SF–256 records, records of requests for reasonable accommodation, and records of appointments under hiring authorities that take disability into account. In addition, the NPRM asked for public input on whether the proposed goals were appropriate, and whether there are any data showing that the goals should be raised or lowered. The Commission received a small number of comments requesting clarification of the proposed goals. One commenter asked whether the 2% goals were intended to be sub-goals of the 12% goals, i.e., whether the individuals who are counted as individuals with targeted disabilities for purposes of determining whether a 2% goal has been met may also be counted as individuals with disabilities for purposes of determining whether a 12% goal has been met. The 2% goals are intended to be sub-goals. Disabilities that fall under the term “targeted disability” are a subset of those that fall under the term “disability” as defined under Section 501. Thus, any employee who has a targeted disability, and who therefore counts toward a 2% goal for individuals with targeted disabilities, will necessarily have a condition that meets the Section 501 definition of “disability,” and will therefore also count toward the 12% goal for individuals with disabilities.

Another commenter asked whether the fact that the NPRM proposed a 12% goal for individuals with disabilities at the GS–11 level and above, and a 12% goal for individuals with disabilities at the GS–10 level and below, meant that it proposed a 24% overall goal for individuals with disabilities. Similarly, the commenter wondered whether the 2% goals “combined” to create a 4% overall goal for individuals with targeted disabilities. Because each 12% and each 2% goal applies to a different segment of the workforce, the Rule does not impose goals of 24% and 4% overall.89 A small number of commenters stated that the goals should not be retained in the Final Rule because the proposed methods of measuring agencies’ representation rates—SF–256 records, reasonable accommodation records, and documentation relating to appointment of individuals under hiring authorities that take disability into account—are inaccurate. SF–256 data, according to commenters, are especially likely to underestimate representation rates for individuals with disabilities and individuals with targeted disabilities because many employees are reluctant to disclose disabilities using this form. Some stated that a greater number of employees would self-disclose if, for example, the form did not ask the individual to indicate his or her specific type of disability, or if it included questions on topics other than disability.

The Commission acknowledged in the NPRM that SF–256 data are likely to underestimate representation rates for individuals with disabilities and individuals with targeted disabilities, and, for that reason, used prior SF–256 data as a starting point when it developed the goals.90 As discussed, SF–256 data themselves (together with other data that agencies are permitted to use under (d)(6)) indicate that the federal government as a whole has achieved representation rates that are close to 12% for individuals with disabilities and 2% for individuals with targeted disabilities; actual representation rates may be much larger. The Commission therefore is not persuaded that the proposed goals are overly burdensome due to problems of measurement. However, the Commission does acknowledge commenters’ assertions that there may be ways to improve the accuracy of self-reported data, for example by asking individuals to indicate whether they have disabilities or targeted disabilities without asking for more detailed information. The Commission is not able to amend the SF–256, as suggested by some commenters, because OPM controls the content of the SF–256. Nor can the Commission require OPM to establish an “authoritative” system for tracking disability information, as suggested by another commenter.

Instead, the Final Rule allows, but does not require, agencies to collect disability information using forms other than the SF–256. Paragraph (d)(6)(ii)(A) has thus been amended to allow agencies to classify individuals for purposes of the workforce analysis based on “[t]he individual’s self-identification as an individual with a disability or an individual with a targeted disability on a form, including but not limited to the Office of Personnel Management’s Standard Form 256, which states that the information collected will be kept confidential and used only for statistical purposes, and that completion of the form is voluntary.”91 The paragraph permits agencies to design their own forms or use existing forms as appropriate. For example, agencies are permitted to use the approach taken in EEOC’s Applicant Flow Form. This form asks, among other things, whether the individual has a non-targeted disability. It does not, however, require the individual to identify which non-targeted disability he or she has.92 The Final Rule also periodically request employees to respond to voluntary surveys updating their SF–256 information. If accompanied by an explanation of why self-reporting is important, resurveying can enhance data accuracy. The Commission therefore is not persuaded that the proposed goals are overly burdensome due to problems of measurement.

---

88 High-level leadership positions in the federal government are occupied by members of the SES. SES members have a different pay scale than employees who are part of the GS pay system. See generally Senior Executive Service: Leading America’s Workforce, Office of Pers. Mgmt., http://www.opm.gov/policy-data-oversight/senior-executive-service/ (last visited Dec. 21, 2016).

89 Where X represents the total number of employees on the GS and SES scales and Y represents the total number of employees employed at the GS–10 level and below, 0.02(X) + 0.02(Y) + 0.12(X – Y) = 0.02(X) + 0.12(Y) + 0.12(X – Y) = 0.12X.90 Affirmative Action for Individuals with Disabilities in the Federal Government, 81 FR 9123, 9128–29 (Feb. 24, 2016) (to be codified at 29 CFR 1614.203, 601(f)).

90 The other records discussed in this paragraph will also be kept confidential, because they are subject to the Privacy Act. See 5 U.S.C. 552a. Additionally, records relating to reasonable accommodation are subject to the ADA’s confidentiality requirements, as incorporated. See 42 U.S.C. 12111(d)(4)(A) (imposing the requirements); 29 U.S.C. 791(f) (incorporating the requirements into Section 501); 29 CFR 1630.14(c) (implementing the requirements); 29 CFR pt. 1630, app. 1630.14(c) (discussing the requirements); 29 CFR 1614.203(b) (incorporating the ADA regulations at 29 CFR pt. 1630 into the Section 501 regulations).

91 Applicant Flow Form, supra note 4, at 3.
makes conforming amendments to 29 CFR 1614.601(f) (discussed below).93

One commenter argued that the goals should be eliminated for agencies that have limited opportunities to use the Schedule A hiring authority for persons with certain disabilities, and for small agencies that typically draw from a small applicant pool. The commenter also argued that small agencies should be exempted because it is sometimes possible to determine which employees within the agency have a disability based solely on aggregate data, which, according to the commenter, may result in “per se violations of [the confidentiality requirements of] the Rehabilitation Act.”

The Final Rule does not include exemptions for agencies that have limited opportunities to use the Schedule A hiring authority for persons with certain disabilities or for small agencies. The Commission believes that all agencies are able to take steps to improve employment opportunities for individuals with disabilities, including targeted disabilities. Agencies that have limited opportunities to use the Schedule A hiring authority for persons with certain disabilities may still, for example, take steps to improve the application process as required under (d)(1)(ii); adopt advancement programs as required under (d)(1)(iii), and take other actions recommended under (d)(7)(iii) to the extent permitted by law.

Agencies that typically draw from a small applicant pool may take steps to expand the pool, as required under (d)(1)(i). These and other steps specified throughout paragraph (d) are all that the Rule requires of an agency that fails to achieve a goal—paragraph (f)(2) (discussed below) provides that “failure to achieve a goal” under paragraph (d)(7) of the Rule, by itself, is not grounds for disapproval unless the Plan fails to require the agency to take specific steps that are reasonably designed to achieve the goal.

The Commission does not see how compliance with the goal requirements could lead to “per se violations of the Rehabilitation Act.” The commenter appears to have assumed that the Rule requires agencies to make detailed, grade-level-by-grade-level disability information available to the public. It does not. The Rule only requires agencies to publish representation rates for people with disabilities and people with targeted disabilities in two broadly defined groups. Moreover, nothing in the Rule requires an individual with a disability to self-identify as such; if an individual does not wish to disclose his or her disability status, he or she need not fill out the SF–256 or similar forms.

One commenter stated that agencies should be allowed to set their own goals. After the ANPRM public comment period, the Commission decided to adopt government-wide goals in the proposed rule.94 The commenter did not provide any basis on which to overturn that decision. Upon further consideration, the Commission has determined that the proposed government-wide approach continues to be the most appropriate one.

Most commenters responding to the question of whether the proposed goals were appropriate stated that they were too low. These commenters generally argued that, because existing representation rates for individuals with disabilities and individuals with targeted disabilities are already close to 12% and 2% respectively, the proposed goals would merely “maintain the status quo.”95

The Commission disagrees that the proposed goals would merely “maintain the status quo.” Although it is true that the federal government as a whole has achieved representation rates of close to 12% and 2%, many individual agencies have not.96 For these agencies, meeting the goals would represent significant improvement. Further, because the goals apply at both higher and lower levels of employment, agencies that employ a disproportionately high number of individuals with disabilities in lower paying positions would also see significant improvement by meeting the goals. As noted in the NPRM, the representation rates for individuals with disabilities and individuals with targeted disabilities are significantly lower at the GS–11 level and above than at the GS–10 level and below.97

Additionally, the commenters failed to identify any data on which the Commission could reasonably base higher goals. Many commenters simply picked numbers without justification.

Some commenters stated that the Commission should “look to those agencies that have done the best job of employing people with disabilities, as well as workforce data” to set the goals, but provided no explanation as to how this could reasonably be done, and instead chose goals that did not appear to be connected either with agency benchmarks or with workforce data.98

One commenter stated that the goals should be based on census data. However, the census definition of “disability” matches neither the Section 501 definition of “disability” nor the definition of “targeted disability” under paragraph (a).99 Census data, therefore, are inapposite. Because commenters failed to identify any reasonable alternatives, and because the Commission believes that the 12% and 2% goals are based on the best available data, the Final Rule retains goals of 12% for individuals with disabilities and 2% for individuals with targeted disabilities.

Some commenters stated that the goals should be extended to employees who are on neither the GS nor the SES scale. We agree. However, to avoid the difficulties inherent in establishing “equivalencies” across differing pay

93 One commenter stated that current regulations at 29 CFR part 1630 should also be amended, because those regulations generally prohibit agencies from asking disability-related questions, as would be required under (d)(6). The Commission disagrees. The anti-discrimination regulations permit agencies (and employers generally) to ask disability-related questions for purposes of engaging in affirmative action for individuals with disabilities. Cf. Assoc. Builders & Contractors, Inc. v. Shin, 30 F. Supp. 3d 25, 37–38 (D.D.C. 2014) (holding that the ADA does not prohibit federal contractors from inviting job applicants to self-identify as individuals with disabilities pursuant to regulations implementing the affirmative action requirements of several federal contractors by Section 503), aff’d, 773 F.3d 257 (D.C. Cir. 2014); Letter from Peggy R. Mastroianni, Legal Counsel, EEOC, to Patricia A. Shin, Director, Office of Federal Contract Compliance Programs, Dept. of Labor (Aug. 8, 2013), http://www.dol.gov/ofccp/regs/compliance/section503.htm (follow “EEOC Opinion on the Invitation to Self-Identify” hyperlink) (discussing job applicants).

94 See Affirmative Action for Individuals with Disabilities in the Federal Government, 81 FR at 9128.

95 See, e.g., 2014 Report, supra note 95, at 10.

96 See id. at 25.

97 These commenters recommended goals of “at least” 15% for people with disabilities and 4% for people with targeted disabilities.

98 The ACS collects disability data by asking a series of questions such as whether, due to a physical, mental, or emotional problem, the person has “serious difficulty” hearing, seeing (even with glasses), remembering, concentrating, or making decisions, walking or climbing stairs, bathing or dressing, and/or doing errands alone. See American Community Survey (ACS), U.S. Census Bureau, https://www.census.gov/people/disability/methodology/acs.html (last visited Dec. 21, 2016).
scales, the Commission has decided to classify non-GS employees using a simple pay cutoff. The revised paragraph thus requires agencies to adopt 12% and 2% goals for employees at the GS–11 level and above, together with employees who are not paid under the General Schedule but who have salaries equal to or greater than employees at the GS–11, step 1 level in the Washington, DC locality.100 “Employees at the GS–10 level and below, together with employees who are not paid under the General Schedule but who have salaries less than employees at the GS–11, step 1 level in the Washington, DC locality.” Express reference to the SES was removed from the paragraph because SES employees are included in the category of “employees who are not paid under the General Schedule but who have salaries equal to or greater than employees at the GS–11, step 1 level in the Washington, DC locality.”

Some commenters stated that the Rule should impose separate goals for each individual grade level, or for each individual job series and grade level. The Commission does not believe that the additional burden on agencies of meeting such goals would substantially promote the hiring, retention, and advancement of individuals with disabilities and individuals with targeted disabilities. For example, we see no reason to require agencies to have the same percentage of individuals with disabilities at both the GS–4 and GS–5 levels, and we are unsure what inference should be drawn from the fact that an agency employs a disproportionately low number of individuals at the GS–12 level, for example, but not at the GS–13 level. Of course, significant disparities in the distribution of individuals with disabilities or individuals with targeted disabilities within the pay grouping may raise concerns. For example, an agency that meets goals for the employment of people with targeted disabilities in both

---

100  Pay rates for employees at a given GS level depend on the within-grade level, or “step,” of the employee, which ranges between one and ten, and on the geographic location of the employee. See generally General Schedule Classification and Pay, supra note 87.

---

pay groupings, but that employs most such individuals at the GS–1 through GS–4 and GS–11 through GS–12 levels, is probably insufficiently attentive to its obligations to provide advancement opportunities. However, absent evidence at this time that agencies would attempt to circumvent their affirmative action obligations in this way, the Rule continues to group employees according to whether they are employed at higher or lower levels, rather than according to individual grade level and job series, for purposes of meeting the (d)(7)(i) goals.

Two commenters stated that federal jobs “limit[ing] advancement, or segregat[ing] federal workers on the basis of disability (including segregation into separate work areas or separate lines of advancement)” should not count toward achievement of the goals. We assume that the commenters are referring to positions that “limit, segregate, or classify a job applicant or employee in a way that adversely affects his or her employment opportunities or status on the basis of disability” in violation of Section 501’s nondiscrimination requirements.102 Although we agree with the general principle that an agency should not benefit from employing individuals with disabilities if the agency also discriminates against them, we believe that the appropriate response in these cases is to challenge the discriminatory behavior under 29 CFR 1614.106. Some commenters stated that the Rule should establish a deadline for achieving the goals. The Commission disagrees. As noted in the NPRM, there are many reasons why it may take some agencies more time than others to meet the utilization goals, such as budgetary constraints (including hiring freezes), the number of additional individuals with targeted disabilities that would have to be hired to achieve the goals, and the nature of certain jobs within an agency’s workforce that may include valid physical standards that individuals with certain disabilities may not be able to meet.

Some commenters stated that the paragraph should require agencies to adopt other types of goals in addition to, or instead of, representation rate goals—

• Hiring and promotion goals. Some commenters stated that certain percentages of each agency’s new hires should be, and certain percentages of each agency’s promotions should be given to, individuals with disabilities and individuals with targeted disabilities. As applied to agencies that underperform with respect to employment of individuals with disabilities and individuals with targeted disabilities, hiring and retention goals do not impose more stringent requirements than the corresponding representation rate goals. They were therefore not added.

• Retention rate goals. One commenter stated that agencies should be required to adopt the goal of having a retention rate for employees who were appointed under the Schedule A hiring authority for persons with certain disabilities that is equal to or greater than the retention rate for other employees. The Commission lacks any data establishing what the retention rate for individuals who were appointed under the Schedule A hiring authority for persons with certain disabilities should be. Further, a function of paragraphs (d)(8)(iv) and (d)(8)(v), requiring agencies to keep detailed records on individuals who were appointed under the Schedule A hiring authority for persons with certain disabilities, and paragraph (d)(1)(iii), requiring agencies to report data regarding such individuals, is to ensure that both individuals within the agency and the Commission will be alerted if the agency is experiencing problems with retention. The Commission concludes that a separate goal is unnecessary.

• Goals for utilization of supported employment. Some commenters stated that the Rule should impose goals for hiring and employment of individuals receiving supported employment services. The commenter cited no evidence that such goals would eliminate a significant barrier to employment for a large number of individuals with disabilities, and neither stated what percentage the goal should be nor provided any data on which to base the goal. However, in light of the commenters’ observation that there is an evidence base showing that supported employment services are an effective way to maintain employment for many individuals with disabilities, provision of such services has been added as an example of a strategy that an agency may use to increase the number of employees with disabilities and targeted disabilities in paragraph (d)(7)(ii), discussed below.

1614.203(d)(7)(ii) Progression Toward Goals

Proposed paragraph (d)(7)(ii) required agencies that fail to meet one or more goals required under paragraph (d)(7)(i) to take specific steps that are reasonably designed to gradually increase the number of employees with disabilities and targeted disabilities, examples of
which included increased use of hiring authorities that take disability into account; consideration of disability or targeted disability status as a positive factor in hiring, promotion, or assignment decisions, to the extent permitted by law; additional outreach and recruitment efforts; adoption of training, internship, and mentoring programs for individuals with disabilities; and disability-related training for all employees. Agencies interested in the last example are encouraged to review the components of effective harassment prevention training set forth in the report issued by Commissioners Feldblum and Lipnic in June 2016.103 For reasons indicated in the section immediately above, “[i]ncreased efforts to hire and retain individuals who require supported employment because of a disability, who have retained the services of a job coach at their own expense or at the expense of a third party, and who may be given permission to use the job coach during work hours as a reasonable accommodation without imposing undue hardship on the agency” has been added as an example.

One commenter asked whether the paragraph requires agencies that do not meet the goals to hire individuals with disabilities or individuals with targeted disabilities who are not qualified for the job, or who are less qualified than other candidates. It does not. Hiring authorities that take disability into account do not provide agencies with a means of hiring individuals who are unqualified, and agencies are not required to hire individuals who are unqualified in order to, for example, provide disability-related training for all employees, engage in additional outreach and recruitment efforts, or adopt training, internship, or mentoring programs for individuals with disabilities.

Some commenters stated that agencies should always be required to consider disability status and targeted disability status as positive factors in hiring, promotion, and employment decisions, regardless of whether the agency has failed to meet a goal. Other commenters stated that certain kinds of disability-related training, such as awareness and anti-stigma training, should also be mandatory. The purpose of these efforts is to address problems of underrepresentation. To the extent that an agency is meeting its (d)(7)(i) goals, the Commission is without reason to believe that such efforts are necessary.

1614.203(d)(8) Recordkeeping
This paragraph of the Final Rule requires that each agency keep, and make available to the Commission upon request,104 records of: (i) The number of job applications submitted by individuals with disabilities, and the number of individuals with disabilities who were hired by the agency; (ii) the number of job applications received from individuals with targeted disabilities, and the number of individuals with targeted disabilities who were hired by the agency; (iii) all rescissions of conditional job offers, denotions, and terminations taken against applicants or employees as a result of medical examinations or inquiries; (iv) all agency employees hired under the Schedule A hiring authority for persons with certain disabilities, and each such employee’s date of hire, entering grade level, probationary status, and current grade level; (v) the number of employees appointed under the Schedule A hiring authority for persons with certain disabilities who have been converted to career or career-conditional appointments in the competitive service each year, and the number of such employees who were terminated prior to being converted to a career or career-conditional appointment in the competitive service each year; and (vi) details regarding all requests for reasonable accommodation the agency receives. Aside from minor stylistic and terminological differences, it is identical to paragraph (d)(8) of the proposed rule.105

One federal agency stated that the paragraph should not require agencies to keep records of all reasonable accommodation requests because, in the agency’s opinion, it is more efficient to handle some requests “informally.” The commenter’s position runs counter to longstanding federal policy. Executive Order 13164 instructs agencies to ensure that their systems of recordkeeping “track the processing of requests for reasonable accommodation.”106 and

1614.203(e) Reporting

The paragraph requires each agency to submit to the Commission, on an annual basis, a report that contains a copy of its Plan; the results of its two most recent workforce analyses performed pursuant to paragraph (d)(6) of the Rule showing the percentages of individuals with disabilities and individuals with targeted disabilities in both of the specified pay groups; the number of individuals appointed under the Schedule A hiring authority for persons with certain disabilities during the previous year; the total number of employees whose employment at the agency began by appointment under the Schedule A hiring authority for persons with certain disabilities; and an explanation of any changes that were made to the Plan since the prior submission. The paragraph also requires agencies to make all information submitted to the Commission pursuant to this requirement available to the public by, at a minimum, posting a copy of the submission on its public Web site and providing a means by which members of the public may request copies of the submission in accessible formats. Aside from minor stylistic differences, it is identical to paragraph (e) of the proposed rule.

104 See 13164 Guidance, supra note 15.
105 See 13164 Guidance, supra note 15.
Several commenters stated that the proposed reporting requirements overlapped with those of MD–715, and therefore that, in order to avoid redundancies, MD–715 should be amended. As stated in the NPRM, the Commission intends to modify the requirements of MD–715 after final promulgation of this Rule to eliminate redundancies.

Some commenters stated that the paragraph should require agencies to report (and, if not already required to do so, keep records of) additional information, including, for example, the number of individuals appointed under the Schedule A hiring authority for persons with certain disabilities who were subjected to removal or offered voluntary resignation; the representation rates for individuals with disabilities and individuals with targeted disabilities broken down by grade level; a list of the disability organizations with which the agency maintains partnerships; the retention and performance rates for employees with disabilities and employees with targeted disabilities; the numbers of employees classified as having disabilities on the basis of conditions that developed pre-hire, that developed post-hire, or were service-related; and the number of individuals appointed under each veterans’ authority who identified themselves as having a targeted disability. The Commission is not persuaded that it is necessary to report information at this level of detail in order to determine whether an agency has satisfied its Section 501 obligation to engage in affirmative action for individuals with disabilities.

1614.203(f) Standards for Approval and Disapproval of Plans

Paragraph (f) of the proposed rule provided that the Commission will (1) approve an agency Plan if it determines that the Plan, as implemented, meets the requirements set forth in paragraph (d) of the rule, and (2) disapprove a Plan if it determines that it, as implemented, does not meet those requirements. The paragraph further clarified that failure to achieve a goal set forth in paragraph (d)(8)(i), by itself, is not grounds for disapproval unless the Plan fails to require the agency to take specific steps that are reasonably designed to achieve the goal in the future. Having received no objections, the Commission adopts the paragraph in the Final Rule unchanged.

1614.601(f) EEO Group Statistics

Section 1614.601 requires each agency to establish a system to collect and maintain accurate demographic information about its employees, and paragraph 1614.601(f) specifies how agencies are to gather disability data. As explained above, paragraphs (d)(6)(ii) and (d)(6)(iii) specify how agencies are to gather disability data for purposes of the workforce analyses required under §1614.203(d)(6)(i). In order to avoid any conflict between sections 1614.203 and 1614.601, paragraph 1614.601(f) has been amended to provide that “[d]ata on disabilities shall be collected using a method permitted under §1614.203(d)(6)(ii) and §1614.203(d)(6)(iii).” The revised paragraph imposes no new obligations on federal agencies.

Executive Order 12866 108 and Executive Order 13563 109 (Regulatory Planning and Review)

This Rule has been drafted and reviewed in accordance with Executive Order 12866 and Executive Order 13563. This Rule has been designated a “significant regulatory action” under section 3(f) of Executive Order 12866. Accordingly, the proposed rule has been reviewed by the Office of Management and Budget.

Executive Order 12866 directs agencies to submit a regulatory impact analysis for those regulatory actions that are “economically significant” within the meaning of section 3(f)(1). A regulatory action is economically significant under section 3(f)(1) if it is anticipated (1) to “[h]ave an annual effect on the economy of $100 million or more,” or (2) to “adversely affect a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities.” Executive Order 13563 reaffirms the principles established by Executive Order 12866, and further emphasizes the need to reduce regulatory burden to the extent feasible and permitted by law. It directs agencies to propose or adopt a regulation only upon a reasoned determination that its benefits justify its cost (recognizing that some benefits and costs are difficult to quantify); to tailor its regulations to impose the least burden on society, consistent with obtaining regulatory objectives; and to select, from among alternative regulatory approaches, including the alternative of not regulating, those approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages, distributive impacts, and equity).

As explained above, the Commission has concluded that the existing practice of explaining Section 501’s affirmative action obligations through management directives and sub-regulatory guidance, 113 and not through regulation, 114 has failed to sufficiently advance the employment of qualified individuals with disabilities. Detailed regulations are necessary in order to ensure that the obligations have, and are recognized to have, the force of law. Moreover, the Rule will make it easier for agencies to learn about their affirmative action obligations by presenting them all in one place, rather than in a range of documents, none of which are comprehensive.

EEOC has conducted an economic analysis of this Final Rule in accordance with EO 12866 and EO 13563. The analysis, revised in response to public comments and in light of the revisions discussed above, is presented below.

Except where noted, we assume that work required under the Rule will be performed by GS–12 step 5 level employees in the Washington-Baltimore-Northern Virginia, DC–MD–VA–WV–PA region. The compensation rate for such employees,

110 Executive Order 12866 references “those matters identified as, or determined by the Administrator of [the Office of Information and Regulatory Affairs] to be, a significant regulatory action within the scope of section 3(f)(1).” Executive Order No. 12866, supra note 108. The Office of Management and Budget states that “Executive Order 12866 requires agencies to conduct a regulatory analysis for economically significant regulatory actions as defined by Section 3(f)(1).” Office of Mgmt. & Budget, Circular A–4 (Sept., 2003), http://www.whitehouse.gov/omb/circulars_a004_a-4.

112 Executive Order No. 13563, supra note 109.
113 See supra notes 10–23 and accompanying text.
114 Prior paragraph 1614.203(a) stated only that the federal government shall be a “model employer of individuals with disabilities,” and that federal agencies shall “give full consideration to the hiring, placement, and advancement of qualified individuals with disabilities.”
115 In the NPRM, the Commission assumed that some of the required tasks would be performed by employees at the GS–14 level. On reflection, we believe that they are more likely to be performed by employees at the GS–12 level. The Commission realizes that not all of these tasks will be performed by GS–12 step 5 level employees in the Washington-Baltimore-Northern Virginia, DC–MD–VA–WV–PA region; the assumption is made purely for purposes of the economic analysis.
adjusted to include benefits, is $66.78 per hour or $143,968.85 per year.117

Provisions Imposing No Additional Burden

The NPRM stated that many of the requirements in the proposed rule would have no economic effect, because they did not impose new requirements or burdens on federal agencies—

• Proposed paragraph (a), which set forth definitions of key terms, imposed no substantive requirements.
• Proposed paragraph (b), which provided that Section 501 prohibits discrimination on the basis of disability, and that the standards for determining whether Section 501 has been violated in a complaint alleging employment discrimination are the same standards applied under the ADA, merely revised paragraph (a) in the current regulations for clarity.
• Proposed paragraph (c), which required agencies to be model employers of individuals with disabilities, was identical to paragraph (a) of the current regulations.
• The requirement to adopt an affirmative action plan, in proposed paragraph (d), is imposed by Section 501.118
• Proposed paragraph (d)(1)(iii), which required agencies to take steps to ensure that individuals with disabilities have sufficient advancement opportunities, provided guidance on how to fulfill existing requirements rather than imposing new ones.119

118 29 U.S.C. 791(b).
119 See, e.g., 29 CFR 1614.102(a)(10), (a)(11), (a)(13), (b)(1); Promoting Employment, supra note 21; 13164 Guidance, supra note 15; MD–715, supra note 16. Indeed, the Commission anticipated that the additional guidance contained in the proposed rule, in the form of helpful examples and suggestions, would reduce agency burden by making it easier to satisfy the existing requirements.

115 The number of agencies covered by the requirements of MD–715 varies from year to year. The number of agencies covered in Fiscal Year 2014 was 218.

These paragraphs, however, led us to adjust the estimate—

• Proposed paragraph (d)(3)(ii) has been revised to require agencies to inform all employees who are authorized to make hiring decisions, in addition to employees authorized to grant or deny requests for reasonable accommodation, that all resources available to the agency as a whole, excluding those designated by statute for a specific purpose that does not include reasonable accommodation, are considered when determining whether a denial of reasonable accommodation based on cost is lawful.

The NPRM stated that the following aspects of the proposed rule, all of which required agencies to make certain information more readily available, imposed one-time compliance costs on federal agencies—

• Proposed paragraph (d)(2) required agencies to clarify in their harassment policies that disability-based harassment is prohibited.
• Proposed paragraph (d)(3)(ii) required agencies to inform all employees who are authorized to grant or deny requests for reasonable accommodation that all resources available to the agency as a whole are considered when determining whether a denial of reasonable accommodation based on cost is lawful.

The Commission estimated that agencies would need to spend approximately 5 hours performing these tasks, updating policies, and checking for compliance. The Commission received no objections to this estimate in the public comments. Revisions to

One-Time Costs

The NPRM stated that the following aspects of the proposed rule, all of which required agencies to make certain information more readily available, imposed one-time compliance costs on federal agencies—

• Proposed paragraph (d)(1)(ii) required agencies to inform all employees who are authorized to grant or deny requests for reasonable accommodation that all resources available to the agency as a whole are considered when determining whether a denial of reasonable accommodation based on cost is lawful.
• Proposed paragraph (d)(4) required agencies to make contact information available to employees.
• Proposed paragraph (e)(2) required agencies to make their Plans available to the public.

The Commission estimated that agencies would need to spend approximately 5 hours performing these tasks, updating policies, and checking for compliance. The Commission received no objections to this estimate in the public comments. Revisions to

However, because the Commission did not have any data upon which to base an estimate of time saved, it did not quantify the benefit.
require agencies to assist employees by, for example, typing or reading work materials aloud for someone who requires these services because of a disability, because those types of job-related services are already required as reasonable accommodations absent undue hardship. (Of course, an agency would not be required to provide these specific accommodations if an alternative would be both less expensive and equally effective.) The paragraph also does not require agencies to hire an assistant to perform essential functions of the individual’s job, or to perform tasks that the individual can perform on his or her own. As explained in the NPRM, the Commission suspects that the actual number of current federal employees who will receive PAS pursuant to (d)(5) is close to zero. A federal employee who requires PAS to remain in the workplace, but does not receive PAS from his or her agency, generally would need to pay for such services out-of-pocket. An individual who has no income, by contrast, typically relies on public benefits to pay for PAS. One study has found that an individual would need to earn approximately $40,000.00 per year simply to break even. Nevertheless, because the Commission lacks any additional data, we continue to assume for purposes of the analysis that 1.1% of current federal employees with targeted disabilities require PAS. There are approximately 19,536 individuals with targeted disabilities in the federal workforce. Multiplying by 0.011 yields an estimated total of 215 current federal employees who require PAS. The Commission is aware of 16 current employees who are already given PAS by their agencies. Because provision of PAS to these individuals would not represent new costs, we exclude these individuals from the analysis, leaving an estimated 199 current employees who will receive PAS as a result of (d)(5).

Even though the proposed paragraph allowed agencies to assign PAS providers to multiple individuals, and to perform additional duties, the Commission assumed in the NPRM that agencies would provide each individual with the equivalent of a full-time PAS provider. We provided both a high and a low estimate of associated costs. To calculate the low estimate, we assumed that agencies would contract with vendors to provide each individual with PAS for the equivalent of full-time hours at the minimum hourly rate for federal contractors ($10.10). To calculate the high estimate, the Commission assumed that agencies would hire a PAS provider for each individual at the GS–5 level.

One commenter stated that the estimates were far too low. The commenter further stated that, to accommodate the low-end estimate, the Commission should assume that agencies will hire PAS providers at the GS–6 level, which, according to the commenter, is a level appropriate for practical nurses. The commenter’s assertions are out of step with all available evidence. PAS providers earn, on average, an amount per hour that is approximately equal to the federal minimum wage, and an amount per year that is significantly lower than the annual salary of a GS–5 level employee. Therefore we retain the prior assumptions. To generate the low estimate, we multiply $10.10 by the equivalent of full-time hours (2,080 hours per year), yielding an estimated annual person-cost of $20,800.00. Multiplying by the number of covered agencies yields a total estimated cost for providing PAS to current federal employees of $4,180,592.00 per year. To generate the high estimate, we multiply the annual salary of a GS–5, step 5 level employee in the Washington-Baltimore-
Northern Virginia, DC-MD-VA-WV-PA region ($65,519.67, adjusted to include benefits)\textsuperscript{133} by the number of covered agencies, for a total estimated cost of $13,038,414.33 per year.

In calculating both the high- and low-end costs of providing PAS, the Commission did not include the cost of having PAS providers accompany employees on work-related travel. First, we believe that whether an agency is required to provide PAS or not, it would have the obligation to pay the cost of a PAS provider to travel with an employee as a reasonable accommodation.\textsuperscript{134} Additionally, the Commission lacks any reliable data on which to base such an estimate, since there is no way of knowing how many employees who require PAS would be hired into jobs that require travel and how often travel would be required.

**Paragraph (d)(6)**

In the NPRM, the Commission asserted that proposed paragraph (d)(6), requiring agencies to gather workforce data, imposed no new costs on agencies because they are already required to gather such data under MD–715.\textsuperscript{135} However, paragraph (d)(6)(ii)(A) has been amended to allow agencies to develop novel ways of gathering voluntary self-report data if the SF–256 does not meet their needs. We estimate that 50 agencies will gather voluntary self-identification data using a form other than the SF–256, and that each agency will spend 10 hours per year administering the survey, for a total of 500 additional burden hours. Multiplying by the hourly compensation rate of $66.78, we conclude that paragraph (d)(6) will have a total annual cost of approximately $33,390.00.

\textsuperscript{133} See supra note 117.

\textsuperscript{134} See 29 CFR pt. 1630, app. 1630.2(d) (stating that it may be a reasonable accommodation for an employer to provide “a travel attendant to act as a sighted guide to assist a blind employee on occasional business trips”). Additionally, federal regulations specifically provide for the reimbursement of travel expenses for family members or other attendants needed by an employee with a disability to make work-related travel possible. See 41 CFR 301–12, –13, –70.

\textsuperscript{135} MD–715 requires agencies to conduct annual internal reviews of their policies, practices, and procedures to determine whether they provide sufficient employment opportunities to qualified applicants and employees with disabilities, especially those with targeted disabilities. As part of this analysis, agencies must determine the numerical representation and distribution of applicants and employees with disabilities and targeted disabilities. See MD–715, supra note 16, at B.iii. MD–715 also requires agencies to determine whether they are meeting obligations imposed by Title VII, 42 U.S.C. 2000e–2000e–17, on an annual basis. See id. at A. Those requirements are not relevant to this rulemaking.

**Paragraph (d)(7)**

The NPRM noted that 3 aspects of proposed paragraph (d)(7), requiring agencies to adopt employment goals for individuals with disabilities and individuals with targeted disabilities, were likely to impose recurring costs. First, to determine whether the goals have been met, agencies would need to determine how many individuals with disabilities are employed at each GS and SES level. The NPRM stated that the associated costs would be minimal because agencies could simply request the information from OPM.\textsuperscript{136} The Commission estimated that each agency would spend 2 hours performing the required tasks, for an estimated total of 436 burden hours.

Again, revisions to the Rule require us to adjust the estimate. In addition to the information described above, agencies that have employees who are on neither the GS nor the SES pay scale will need to determine how many such employees—

- are individuals with disabilities and have salaries equal to or greater than an employee at the GS–11 step 1 level in the Washington, DC locality;
- are individuals with targeted disabilities and have salaries equal to or greater than employees at the GS–11 step 1 level in the Washington, DC locality;
- are individuals with disabilities and have salaries less than employees at the GS–11 step 1 level in the Washington, DC locality and;  
- are individuals with targeted disabilities and have salaries less than employees at the GS–11 step 1 level in the Washington, DC locality.  

There are approximately 114 agencies that have employees on non-GS, non-SES pay scales. The Commission estimates that each such agency will spend 2 hours collecting the required information, for a total of 228 additional burden hours. Adding the previous estimate yields an overall estimate of 664 burden hours arising from the obligation to determine whether the employment goals have been met. Multiplying by the hourly compensation rate $66.78 yields a total estimated annual cost of $44,341.92.

Second, the NPRM stated that because paragraph (d)(7)(i) encourages federal agencies to hire individuals with disabilities, it may impose ongoing costs by increasing the number of federal employees who need a reasonable accommodation. We first considered the number of additional employees who would require a reasonable accommodation. Based on OPM data, the Commission estimated that the federal government as a whole would need to hire approximately 384 individuals with targeted disabilities at the GS–10 level or below, and approximately 10,381 individuals with targeted disabilities at the GS–11 level or above (including the SES), to meet the goals.

Because the goals have been revised to cover employees who are on neither the GS nor the SES pay scale, the estimate has been revised—\textsuperscript{137}

- Agencies will need to hire approximately 1,594 additional individuals with targeted disabilities to meet the 2% goal for individuals who are either at the GS–10 level or below or who are not paid under the General Schedule and who have salaries that are less than that of an employee at the GS–11 step 1 level in the Washington, DC locality.\textsuperscript{138}
- Agencies will need to hire approximately 4,262 additional individuals with disabilities to meet the 12% goal for individuals who are either at the GS–11 level or above or who are not paid under the General Schedule and who have salaries equal to or greater than that of an employee at the GS–11 step 1 level in the Washington, DC locality.
- Agencies will need to hire approximately 15,385 additional individuals with targeted disabilities to meet the 2% goal for individuals who are either at the GS–11 level or above or who are not paid under the General Schedule and who have salaries equal to or greater than that of an employee at the GS–11 step 1 level in the Washington, DC locality.

As in the NPRM, we assume that each new hire will require a reasonable accommodation.\textsuperscript{139} and estimate the

\textsuperscript{136} As noted in the NPRM, this is almost certainly an overestimate, because many individuals with disabilities do not require an accommodation. See

\textsuperscript{137} See id. Because OPM reports only limited data regarding federal employees who are on neither the GS nor the SES pay scale, the Commission assumed for purposes of this analysis that employees, employees with disabilities, and employees with targeted disabilities are distributed between higher and lower levels of employment in roughly the same proportions as employees on the GS and SES scales. We also note that, based on an initial review of 2015 data, the number of new hires required to reach the goals would likely be lower than estimated above, resulting in lower costs overall. See Office of Pers. Mgmt., Report on the Employment of Individuals with Disabilities in the Federal Executive Branch: Fiscal Year 2015, 27 (2015), https://www.opm.gov/policy-data-overight/diversity-inclusion/reports/disability-reportfy2015.pdf.

\textsuperscript{138} The regulation does not require agencies to create positions or vacancies for persons with targeted disabilities; agencies may place individuals with targeted disabilities into existing vacancies.

\textsuperscript{139} As noted in the NPRM, this is almost certainly an overestimate, because many individuals with disabilities do not require an accommodation. See
cost of each accommodation to be $500.00 per year.\textsuperscript{140} Multiplying by the total number of estimated new hires (21,241) yields an estimated cost of $10,620,500.00 per year arising from the need to provide reasonable accommodations to new hires.

Third, the NPRM stated that proposed paragraph (d)(7)(i) would impose ongoing costs by encouraging agencies to hire employees who are entitled to PAS under paragraph (d)(5). We assumed that the percentage of individuals who require PAS among new hires with targeted disabilities would reflect the percentage of individuals requiring PAS among individuals who have targeted disabilities, are unemployed, and are looking for work. Based on the 2003 study, and on a 2006 study that investigated the prevalence of reported “self-care difficulties” among employed and unemployed individuals with disabilities,\textsuperscript{141} we estimated that between 1.1% and 2% of individuals who have targeted disabilities, are unemployed, and looking for work require PAS. However, because neither study assessed the need for PAS among unemployed individuals,\textsuperscript{142} we noted at the time that the estimates may be both under- and over-inclusive.

The Commission has refined its approach. We again assume that the percentage of individuals requiring PAS among new hires with targeted disabilities will reflect the percentage of those requiring PAS among individuals who have targeted disabilities, are unemployed, and looking for work. To determine the latter percentage, we first attempt to determine the number of individuals who have targeted disabilities, are unemployed, and are looking for work. We then attempt to determine the number of individuals who have targeted disabilities, are unemployed, are looking for work, and who require PAS. Finally, we compare the two numbers to arrive at a percentage.

To determine the number of individuals who have targeted disabilities, are unemployed, and are looking for work, we rely on census data. As discussed above, the census definition of “disability” matches neither the definition of “disability” nor the definition of “targeted disability” under paragraph (a). However, the census data are the best available to the Commission at this time. Further, because the census definition requires “serious difficulty” with an activity such as seeing or walking, it is likely that most people who meet the census definition have a targeted disability.\textsuperscript{143} We therefore rely on census data to conclude for purposes of the economic analysis that there are approximately 1,282,377 individuals who have targeted disabilities, are unemployed, and are looking for work.\textsuperscript{144}

To determine the number of individuals who have targeted disabilities, are unemployed, are looking for work, and who require PAS, we first note that there are approximately 1,257,000 individuals employed as personal assistance service providers throughout the country.\textsuperscript{145} Assuming that each provider is assigned to a single individual, there are approximately 1,257,000 individuals who require PAS nationally, presumably because of a targeted disability.\textsuperscript{146} Not all of these individuals are unemployed and looking for work, however—some are already employed, some are retired, some are below working age, and some do not participate in the workforce for other reasons.

The Commission is not aware of any data showing how many individuals who require PAS because of a targeted disability are unemployed and looking for work. To arrive at an approximation, we assume that the workforce participation and unemployment rates for such individuals reflect those of individuals who have disabilities that result in self-care difficulty more generally.\textsuperscript{147} Research shows that roughly 8% of these individuals participate in the workforce (are either employed or unemployed and looking for work),\textsuperscript{148} and that their unemployment rate is approximately 18.14%.\textsuperscript{149} Thus, roughly 18.14% of 8%, or 1.4512%, of individuals with disabilities resulting in self-care difficulty are unemployed and looking for work. Applying this percentage to the estimated number of individuals who require PAS because of a targeted disability (1,257,000), we find that there are approximately 18,242 individuals who have a targeted disability, are unemployed, are looking for work, and who require PAS nationally.

Comparing the estimated number of individuals who have targeted disabilities, are unemployed, are looking for work, and who require PAS (18,242) to the estimated total number of individuals who have targeted disabilities, are unemployed, and are looking for work (1,282,377), we find that the former group represents 1.42% of the latter. Assuming, as discussed above, that this relationship will be

\textsuperscript{140} See id. (finding that, if an accommodation has a cost, it will typically be approximately $500.00).

\textsuperscript{141} This is also almost certainly an overestimate, because many individuals with disabilities do not require an accommodation; if an accommodation is required, it is likely to have no cost; and if it does have a cost, the cost does not necessarily recur. See id.

\textsuperscript{142} As explained, the 2003 study assesses the need for PAS among employed individuals with disabilities, and the 2006 study assesses the prevalence of reported self-care difficulties among unemployed individuals with disabilities.

\textsuperscript{143} See supra note 99.

\textsuperscript{144} See Employment Status by Disability Status and Type (2014), U.S. Census Bureau, http://factfinder.census.gov/faces/tableservices/jsf/pages/productview.xhtml?prodId=ACS_14_1YR_E181200&proftype=table (last visited Dec. 21, 2016) [reporting that 1,282,377 individuals who meet the census definition of “disability” are noninstitutionalized, between the ages of 18 and 64, unemployed, and looking for work]. Use of the census data will lead to an overestimate of costs. As noted in the NPRM, some individuals with targeted disabilities, such as individuals with epilepsy or certain psychiatric disabilities, likely do not fall into the census definition. Therefore, the census data are likely to underestimate the total number of individuals with targeted disabilities who are unemployed and looking for work, thereby making the proportion of such individuals needing PAS seem artificially large.

\textsuperscript{145} Personal Assistant Career, supra note 131.

\textsuperscript{146} We recognize that some individuals with disabilities may receive PAS from family members, rather than from persons who work as personal assistance service providers. We have no data, however, about how many such individuals receive PAS exclusively from family members, and consequently, whether and to what extent 1,257,000 individuals who require PAS underestimate the actual number. We believe that any difference would be small, however, since individuals who receive PAS from family members likely also receive PAS from individuals who are PAS providers.

\textsuperscript{147} We suspect that the workforce participation rate for individuals who require PAS is significantly lower than the workforce participation rate for individuals who have disabilities that result in self-care difficulty. But again, because the Commission lacks more specific data, and also because lower workforce participation rates may be offset by higher unemployment rates for individuals who require PAS, we believe that the data on individuals who have disabilities that result in self-care difficulty are adequate for purposes of this analysis.

\textsuperscript{149} In 2014, the number of employed individuals who had disabilities that resulted in self-care difficulty was 548,700, and the number who were unemployed and looking for work was 121,600. The total number of such individuals who participated in the workforce in 2014 was therefore 670,300. The 121,600 who were unemployed and looking for work represent 18.14% of this total. Of all of these figures, we were obtained using the data retrieval tool (Y1R) at Cornell Univ., American Community Survey (ACS) Employment Statistics, Disability Statistics, https://www.disabilitystatistics.org/reports/acs.cfm/statistics-3 (last visited July 7, 2016).
reflected in the estimated 16,979 new hires who have targeted disabilities, we conclude that 241 new hires will require PAS.

To generate an estimate of the associated costs, we rely on the estimated per-person costs for providing PAS calculated in the section on paragraph (d)(5) above. Multiplying 241 by the low estimate of the associated costs ($21,008.00) yields a total estimated cost of $5,062,928.00 per year, and multiplying by the high estimate of the associated costs ($65,519.67) yields a total estimated cost of $15,790,240.47 per year.

In summary, the estimated annual costs arising from paragraph (d)(7) will be $44,341.92 (the estimated cost of determining whether goals have been met) plus $10,620,500.00 (the estimated cost of providing reasonable accommodations to individuals hired pursuant to the goals) plus between $5,062,928.00 and $15,790,240.47 (the estimated cost of providing PAS to individuals hired pursuant to the goals), for a total estimated annual cost of between $15,727,769.92 and $26,455,082.39.

Paragraphs (d)(8)(iii) and (d)(8)(iv)

The requirements of proposed paragraphs (d)(8)(iii) and (d)(8)(iv)—to keep records of all employees hired under the Schedule A hiring authority for persons with certain disabilities, to calculate the number of such employees who have been converted to career or career-conditional appointment, and to calculate the number of such employees who have been terminated prior to conversion—were adopted unchanged in the Final Rule. The NPRM estimated that it would take each agency 2 hours to gather the required data, to perform the required calculations, and to create and maintain the associated records. Multiplying by the number of covered agencies yielded an overall estimate of 436 burden hours per year.

One commenter stated that the estimate is too low for small agencies that do not have “automated [human resources (HR)] systems.” The commenter did not state how many such agencies there are. For purposes of this analysis, the Commission estimates for purposes of this analysis that 20 agencies lack an automated HR system.

The commenter also did not provide an estimate of the amount of time that such agencies would need to perform the required tasks, except to say that the “guidepost . . . is the amount of time it takes to manually prepare the MD–715 report.” We disagree that it would take agencies the same amount of time to meet the requirements of (d)(8)(iii) and (d)(8)(iv) as it would take them to prepare an entire MD–715 report. The commenter is reminded that, to the extent paragraph (d)(8) requires agencies to maintain the same records that are required under MD–715, it imposes no new burden. The (d)(8) requirements exceed those of MD–715 only insofar as they require records relating to the Schedule A hiring authority for persons with certain disabilities. We also note that the associated burden is likely to be proportional to the size of the agency— if an agency is small enough that it lacks an automated HR system, it is not likely to have appointed an overwhelmingly large number of individuals under the Schedule A hiring authority for persons with certain disabilities.

Nevertheless, the Commission estimates for purposes of this analysis that each of the estimated 20 agencies lacking automated HR systems will need to spend an additional 10 hours performing the required tasks, for a total of 200 additional burden hours. Adding this to the previous estimate yields a total estimate of 636 burden hours. Multiplying by the hourly compensation rate of $66.78 yields a total estimated cost for paragraphs (d)(8)(iii) and (d)(8)(iv) of $42,472.08 per year.

Economic Benefits

As stated in the NPRM, the Rule is also expected to have positive economic effects by bringing a greater number of individuals with disabilities into the workforce.150 Because individuals who require PAS throughout the day and who are looking for work most likely rely on government benefits to meet the significant costs of hiring a personal assistant, the NPRM assumed that each individual who receives PAS from an agency would otherwise have relied on Social Security and Supplemental Security Income benefits to pay for those services. Research indicated that, for every individual with a disability who transitions from receipt of benefits to gainful employment, the federal government saves approximately $19,380.00 in paid benefits, and gains approximately $8,079.00 in tax revenue, on an annual basis.151 For a total annual benefit of $27,459.00 per individual.

The Commission received no objections to this analysis. Multiplying by the revised estimate of the number of new hires who are expected to require PAS (241) yields a total estimated economic benefit of $6,617,619.00 per year.

Non-Economic Effects

The NPRM also noted that, in addition to economic effects, the proposed rule would have a variety of qualitative and dignitary benefits, all of which further values identified in Executive Order 13563 such as equity, human dignity, and fairness. Most significantly, the NPRM stated that the rule would increase the number of hiring and advancement opportunities available to individuals with disabilities by making them better aware of federal job openings. Research demonstrates that employment is an important determinant of both perceived quality of life and health status among individuals with disabilities.152 In addition, the NPRM stated that the proposed rule would have qualitative and dignitary benefits, including—

• promotion of human dignity and self-respect, and diminished feelings of exclusion and humiliation;
• reduced prevalence of disability-based stereotypes and associated stigma;
• increased diversity, understanding, and fairness in the workplace; and
• improved interactions with coworkers and workplace morale.

All of these considerations apply equally well to the Final Rule. The Rule is also expected to prevent disability-based employment discrimination by making job applicants, employees, and agency management better aware of the protections against discrimination provided by Section 501.

Summary

In summary, the Commission estimates that the Rule as a whole will have a one-time initial cost to the federal government of approximately $145,580.40, an annual cost to the federal government of between $23,151,538.70 and $70,954,568.10, and an annual economic benefit to the federal government of $6,617,619.00. The Rule is also expected to have a variety of non-monetary qualitative and dignitary benefits for individuals with disabilities and individuals with targeted disabilities.

Regulatory Flexibility Act

The Commission certifies under 5 U.S.C. 605(b) that this Rule will not have a significant economic impact on
a substantial number of small entities, because it applies exclusively to employees and agencies of the federal government. For this reason, a regulatory flexibility analysis is not required.

Unfunded Mandates Reform Act of 1995

This Final Rule will not result in the expenditure by State, local, or tribal governments, in the aggregate, or by the private sector, of $100 million or more in any one year, and it will not significantly or uniquely affect small governments. Therefore, no actions were deemed necessary under the provisions of the Unfunded Mandates Reform Act of 1995.

Congressional Review Act

This action pertains to agency management, personnel and organization and does not substantially affect the rights or obligations of non-agency parties and, accordingly, is not a “rule” as that term is used by the Congressional Review Act (Subtitle E of the Small Business Regulatory Enforcement Fairness Act of 1996. Therefore, the reporting requirement of 5 U.S.C. 801 does not apply.

List of Subjects in 29 CFR Part 1614

Administrative practice and procedure, Age discrimination, Equal employment opportunity, Government employees, Individuals with disabilities, Race discrimination, Religious discrimination, Sex discrimination.

For the reasons set forth in the preamble, the Equal Employment Opportunity Commission amends 29 CFR part 1614 as follows:

PART 1614—FEDERAL SECTOR EQUAL EMPLOYMENT OPPORTUNITY

1. The authority citation for part 1614 continues to read as follows:

2. Revise § 1614.203 to read as follows:

§ 1614.203 Rehabilitation Act.

(a) Definitions. The following definitions apply for purposes of this section:

(2) The term disability means disability as defined under § 1630.2(g) through (i) of this chapter.

(3) The term hiring authority that takes disability into account means a hiring authority that permits an agency to consider disability status during the hiring process, including the hiring authority for individuals with intellectual disabilities, severe physical disabilities, or psychiatric disabilities, as set forth at 5 CFR 213.3102(u); the Veterans’ Recruitment Appointment authority, as set forth at 5 CFR part 307; and the 30% or More Disabled Veteran authority, as set forth at 5 CFR 316.302(b)(4), 316.402(b)(4).

(4) The term personal assistance service provider means an employee or independent contractor whose primary job functions include provision of personal assistance services.

(5) The term personal assistance services means assistance with performing activities of daily living that an individual would typically perform if he or she did not have a disability, and that is not otherwise required as a reasonable accommodation, including, for example, assistance with removing and putting on clothing, eating, and using the restroom.

(6) The term Plan means an affirmative action plan for the hiring, placement, and advancement of individuals with disabilities, as required under 29 U.S.C. 791(b).

(7) The term Schedule A hiring authority for persons with certain disabilities means the hiring authority for individuals with intellectual disabilities, severe physical disabilities, or psychiatric disabilities, as set forth at 5 CFR 213.3102(u).

(9) The term targeted disability means a disability that is designated as a “targeted disability or health condition” on the Office of Personnel Management’s Standard Form 256 or that falls under one of the first 12 categories of disability listed in Part A of question 5 of the Equal Employment Opportunity Commission’s Demographic Information on Applicants form.

(10) The term undue hardship has the meaning set forth in part 1630 of this chapter.

(b) Nondiscrimination. Federal agencies shall not discriminate on the basis of disability in regard to the hiring, advancement or discharge of employees, employee compensation, job training, or other terms, conditions, and privileges of employment. The standards used to determine whether Section 501 has been violated in a complaint alleging employment discrimination under this part shall be the standards applied under the ADA.

(c) Model employer. The Federal Government shall be a model employer of individuals with disabilities. Agencies shall give full consideration to the hiring, advancement, and retention of qualified individuals with disabilities in the federal workforce. Agencies shall also take affirmative action to promote the recruitment, hiring, and advancement of qualified individuals with disabilities, with the goal of eliminating under-representation of individuals with disabilities in the federal workforce.

(d) Affirmative action plan. Pursuant to 29 U.S.C. 791, each agency shall adopt and implement a Plan that provides sufficient assurances, procedures, and commitments to provide adequate hiring, placement, and advancement opportunities for individuals with disabilities at all levels of federal employment. An agency fails to satisfy this requirement unless it has adopted and implemented a Plan that meets the following criteria:

(1) Disability hiring and advancement program—(i) Recruitment. The Plan shall require the agency to take specific steps to ensure that a broad range of individuals with disabilities, including individuals with targeted disabilities, will be aware of and be encouraged to apply for job vacancies when eligible. Such steps shall include, at a minimum—

(A) Use of programs and resources that identify job applicants with disabilities, including individuals with targeted disabilities, who are eligible to be appointed under a hiring authority that takes disability into account, consistent with applicable OPM regulations, examples of which could include programs that provide the qualifications necessary for particular positions within the agency to individuals with disabilities, databases of individuals with disabilities who previously applied to the agency but were not hired for the positions they applied for, and training and internship programs that lead directly to employment for individuals with disabilities; and

(B) Establishment and maintenance of contacts (which may include formal agreements) with organizations that specialize in providing assistance to individuals with disabilities, including...
individuals with targeted disabilities, such as American Job Centers, State Vocational Rehabilitation Agencies, the Veterans’ Vocational Rehabilitation and Employment Program, Centers for Independent Living, and Employment Network service providers.

(ii) Application process. The Plan shall ensure that the agency has designated sufficient staff to handle any disability-related issues that arise during the application and selection processes, and shall require the agency to provide such individuals with sufficient training, support, and other resources to carry out their responsibilities under this section. Such responsibilities shall include, at a minimum—

(A) Ensuring that disability-related questions from members of the public regarding the agency’s application and selection processes are answered promptly and correctly, including questions about reasonable accommodations needed by job applicants during the application and selection processes and questions about how individuals may apply for appointment under hiring authorities that take disability into account;

(B) Processing requests for reasonable accommodations needed by job applicants during the application and placement processes, and ensuring that the agency provides such accommodations when required to do so under the standards set forth in part 1630 of this chapter;

(C) Accepting applications for appointment under hiring authorities that take disability into account, consistent with applicable OPM regulations;

(D) If an individual has applied for appointment to a particular position under a hiring authority that takes disability into account, determining whether the individual is eligible for appointment under such authority, and, if so, forwarding the individual’s application to the relevant hiring officials with an explanation of how and when the individual may be appointed, consistent with all applicable laws;

(E) Overseeing any other agency programs designed to increase hiring of individuals with disabilities.

(iii) Advancement program. The Plan shall require the agency to take specific steps to ensure that current employees with disabilities have sufficient opportunities for advancement. Such steps may include, for example—

(A) Efforts to ensure that employees with disabilities are informed of and have opportunities to enroll in relevant training, including management training when eligible;

(B) Development or maintenance of a mentoring program for employees with disabilities; and

(C) Administration of exit interviews that include questions on how the agency could improve the recruitment, hiring, inclusion, and advancement of individuals with disabilities.

(2) Disability anti-harassment policy. The Plan shall require the agency to state specifically in its anti-harassment policy that harassment based on disability is prohibited, and to include in its training materials examples of the types of conduct that would constitute disability-based harassment.

(3) Reasonable accommodation—(i) Procedures. The Plan shall require the agency to adopt, post on its public Web site, and make available to all job applicants and employees in written and accessible formats, reasonable accommodation procedures that are easy to understand and that, at a minimum—

(A) Explain relevant terms such as “reasonable accommodation,” “disability,” “interactive process,” “qualified,” and “undue hardship,” consistent with applicable statutory and regulatory definitions, using examples where appropriate;

(B) Explain that reassignment to a vacant position for which an employee is qualified, and not just permission to reassign, is a reasonable accommodation, and that the agency must consider providing reassignment to a vacant position as a reasonable accommodation when it determines that no other reasonable accommodation will permit an employee with a disability to perform the essential functions of his or her current position;

(C) Notify supervisors and other relevant agency employees how and where they are to conduct searches for available vacancies when considering reassignment as a reasonable accommodation;

(D) Explain that an individual may request a reasonable accommodation orally or in writing at any time, need not fill out any specific form in order for the interactive process to begin, and need not have a particular accommodation in mind before making a request, and that the request may be made to a supervisor or manager in the individual’s chain of command, the office designated by the agency to oversee the reasonable accommodation process, any agency employee connected with the application process, or any other individual designated by the agency to accept such requests;

(E) Include any forms the agency uses in connection with a reasonable accommodation request as attachments, and indicate that such forms are available in alternative formats that are accessible to people with disabilities;

(F) Describe the agency’s process for determining whether to provide a reasonable accommodation, including the interactive process, and provide contact information for the individual or program office from whom requesters will receive a final decision;

(G) Provide guidance to supervisors on how to recognize requests for reasonable accommodation;

(H) Require that decision makers communicate, early in the interactive process and periodically throughout the process, with individuals who have requested a reasonable accommodation;

(I) Explain when the agency may require an individual who requests a reasonable accommodation to provide medical information that is sufficient to explain the nature of the individual’s disability, his or her need for reasonable accommodation, and how the requested accommodation, if any, will assist the individual to apply for a job, perform the essential functions of a job, or enjoy the benefits and privileges of the workplace;

(J) Explain the agency’s right to request relevant supplemental medical information if the information submitted by the requester is insufficient for the purposes specified in paragraph (d)(3)(iii)(J) of this section;

(K) Explain the agency’s right to have medical information reviewed by a medical expert of the agency’s choosing at the agency’s expense;

(L) Explain the agency’s obligation to keep medical information confidential, in accordance with applicable laws and regulations, and the limited circumstances under which such information may be disclosed;

(M) Designate the maximum amount of time the agency has, absent extenuating circumstances, to either provide a requested accommodation or deny the request, and explain that the time limit begins to run when the accommodation is first requested;

(N) Explain that the agency will not be expected to adhere to its usual timelines if an individual’s health professional fails to provide needed documentation in a timely manner;

(O) Explain that, where a particular reasonable accommodation can be provided in less than the maximum amount of time permitted under paragraph (d)(3)(iii)(M) of this section, failure to provide accommodation in a prompt manner may result in a violation of the Rehabilitation Act;
(P) Provide for expedited processing of requests for reasonable accommodations that are needed sooner than the maximum allowable time frame permitted under paragraph (d)(3)(i)(M) of this section; 

(Q) Explain that, when all the facts and circumstances known to the agency make it reasonably likely that an individual will be entitled to a reasonable accommodation, but the accommodation cannot be provided immediately, the agency shall provide an interim accommodation that allows the individual to perform some or all of the essential functions of his or her job, if it is possible to do so without imposing undue hardship on the agency;

(R) Inform applicants and employees how they may track the processing of requests for reasonable accommodation; 

(S) Explain that, where there is a delay in either processing a request for or providing a reasonable accommodation, the agency must notify the individual of the reason for the delay, including any extenuating circumstances that justify the delay; 

(T) Explain that individuals who have been denied reasonable accommodations have the right to file complaints pursuant to 29 CFR 1614.106; 

(U) Encourage the use of voluntary informal dispute resolution processes that individuals may use to obtain prompt reconsideration of denied requests for reasonable accommodation; 

(V) Provide that the agency shall give the requester a notice consistent with the requirements of paragraph (d)(3)(i)(i) of this section at the time a request for reasonable accommodation is denied; and 

(W) Provide information on how to access additional information regarding reasonable accommodation, including, at a minimum, Commission guidance and technical assistance documents.

(ii) Cost of accommodations. The Plan shall require the agency to take specific steps to ensure that requests for reasonable accommodation are not denied for reasons of cost, and that individuals with disabilities are not excluded from employment due to the anticipated cost of a reasonable accommodation, if the resources available to the agency as a whole, excluding those designated by statute for a specific purpose that does not include reasonable accommodation, would enable it to provide an effective reasonable accommodation without undue hardship. Such steps shall be reasonably designed to, at a minimum—

(A) Ensure that anyone who is authorized to grant or deny requests for reasonable accommodation or to make hiring decisions is aware that, pursuant to the regulations implementing the undue hardship defense at 29 CFR part 1630, all resources available to the agency as a whole, excluding those designated by statute for a specific purpose that does not include reasonable accommodation, are considered when determining whether a denial of reasonable accommodation based on cost is lawful; and 

(B) Ensure that anyone authorized to grant or deny requests for reasonable accommodation or to make hiring decisions is aware of, and knows how to arrange for the use of, agency resources available to provide the accommodation, including any centralized fund the agency may have for that purpose.

(iii) Notification of basis for denial. The Plan shall require the agency to provide a job applicant or employee who is denied a reasonable accommodation with a written notice at the time of the denial, in an accessible format when requested, that—

(A) Explains the reasons for the denial and notifies the job applicant or employee of any available internal appeal or informal dispute resolution processes; 

(B) Informs the job applicant or employee of the right to challenge the denial by filing a complaint of discrimination under this part; 

(C) Provides instructions on how to file such a complaint; and 

(D) Explains that, pursuant to 29 CFR 1614.105, the right to file a complaint will be lost unless the job applicant or employee initiates contact with an EEO Counselor within 45 days of the denial, regardless of whether the applicant or employee participates in an informal dispute resolution process.

(4) Accessibility of facilities and technology—(i) Notice of rights. The Plan shall require the agency to adopt, post on its public Web site, and make available to all employees in written and accessible formats, a notice that—

(A) Explains their rights under Section 508 of the Rehabilitation Act of 1973, 29 U.S.C. 794d, concerning the accessibility of agency technology, and the Architectural Barriers Act, 42 U.S.C. 4151 through 4157, concerning the accessibility of agency building and facilities; 

(B) Provides contact information for an agency employee who is responsible for ensuring the physical accessibility of the agency’s facilities under the Architectural Barriers Act of 1968, and an agency employee who is responsible for ensuring that the electronic and information technology purchased, maintained, or used by the agency is readily accessible to, and usable by, individuals with disabilities, as required by Section 508 of the Rehabilitation Act of 1973; and

(C) Provides instructions on how to file complaints alleging violations of the accessibility requirements of the Architectural Barriers Act of 1968 and Section 508 of the Rehabilitation Act of 1973.

(ii) Assistance with filing complaints at other agencies. If an agency’s investigation of a complaint filed under Section 508 of the Rehabilitation Act of 1973 or the Architectural Barriers Act of 1968 shows that a different entity is responsible for the alleged violation, the Plan shall require the agency to inform the individual who filed the complaint where he or she may file a complaint against the other entity, if possible.

(5) Personal assistance services allowing employees to participate in the workplace—(i) Obligation to provide personal assistance services. The Plan shall require the agency to provide an employee with, in addition to professional services required as a reasonable accommodation under the standards set forth in part 1630 of this chapter, personal assistance services during work hours and job-related travel if—

(A) The employee requires such services because of a targeted disability; 

(B) Provision of such services would, together with any reasonable accommodations required under the standards set forth in part 1630 of this chapter, enable the employee to perform the essential functions of his or her position; and 

(C) Provision of such services would not impose undue hardship on the agency.

(ii) Service providers. The Plan shall state that personal assistance services required under paragraph (d)(5)(i) of this section must be performed by a personal assistance service provider. The Plan may permit the agency to require personal assistance service providers to provide personal assistance services to more than one individual. The Plan may also permit the agency to require personal assistance service providers to perform tasks unrelated to personal assistance services, but only to the extent that doing so does not result in failure to provide personal assistance services required under paragraph (d)(5)(i) of this section in a timely manner.

(iii) No adverse action. The Plan shall prohibit the agency from taking adverse actions against job applicants or employees based on their need for, or
accommodations.

(iv) Selection of personal assistance service providers. The Plan shall require the agency, when selecting someone who will provide personal assistance services to a single individual, to give primary consideration to the individual’s preferences to the extent permitted by law.

(v) Written procedures. The Plan shall require the agency to adopt, post on its public Web site, and make available to all job applicants and employees in written and accessible formats, procedures for processing requests for personal assistance services. An agency may satisfy this requirement by stating, in the procedures required under paragraph (d)(3)(i) of this section, that the process for requesting personal assistance services, the process for determining whether such services are required, and the agency’s right to deny such requests when provision of the services would pose an undue hardship, are the same as for reasonable accommodations.

(b) Utilization analysis—(i) Current utilization. The Plan shall require the agency to perform a workforce analysis annually to determine the percentage of its employees at each grade and salary level who have disabilities, and the percentage of its employees at each grade and salary level who have targeted disabilities.

(ii) Source of data. For purposes of the analysis required under paragraph (d)(6)(i) of this section, an employee may be classified as an individual with a disability or an individual with a targeted disability on the basis of—

(A) The individual’s self-identification as an individual with a disability or an individual with a targeted disability on a form, including but not limited to the Office of Personnel Management’s Standard Form 256, which states that the information collected will be kept confidential and used only for statistical purposes, and that completion of the form is voluntary;

(B) Records relating to the individual’s appointment under a hiring authority that takes disability into account, if applicable and;

(C) Records relating to the individual’s requests for reasonable accommodation, if any.

(iii) Data accuracy. The Plan shall require the agency to take steps to ensure that data collected pursuant to paragraph (d)(6)(i) of this section are accurate.

(7) Goals—(i) Adoption. The Plan shall commit the agency to the goal of ensuring that—

(A) No less than 12% of employees at the GS–11 level and above, together with employees who are not paid under the General Schedule but who have salaries equal to or greater than employees at the GS–11, step 1 level in the Washington, DC locality, are individuals with disabilities;

(B) No less than 12% of employees at the GS–10 level and below, together with employees who are not paid under the General Schedule but who have salaries less than employees at the GS–11, step 1 level in the Washington, DC locality, are individuals with disabilities;

(C) No less than 2% of employees at the GS–11 level and above, together with employees who are not paid under the General Schedule but who have salaries equal to or greater than employees at the GS–11, step 1 level in the Washington, DC locality, are individuals with targeted disabilities; and

(D) No less than 2% of employees at the GS–10 level and below, together with employees who are not paid under the General Schedule but who have salaries less than employees at the GS–11, step 1 level in the Washington, DC locality, are individuals with targeted disabilities.

(ii) Selection of personal assistance services. The Plan shall require the agency to select the services that are reasonably designed to reasonably increase the number of persons with disabilities or targeted disabilities employed at the agency until it meets the goals established pursuant to paragraph (d)(7)(i) of this section. Examples of such steps include, but are not limited to—

(A) Increased use of hiring authorities that take disability into account to hire or promote individuals with disabilities or targeted disabilities, as applicable;

(B) To the extent permitted by applicable laws, consideration of disability or targeted disability status as a positive factor in hiring, promotion, or assignment decisions;

(C) Disability-related training and education campaigns for all employees in the agency;

(D) Additional outreach or recruitment efforts;

(E) Increased efforts to hire and retain individuals who require supported employment because of a disability, who have retained the services of a job coach at their own expense or at the expense of a third party, and who may be given permission to use the job coach during work hours as a reasonable accommodation without imposing undue hardship on the agency; and

(F) Adoption of training, mentoring, or internship programs for individuals with disabilities.

(iii) Recordkeeping. The Plan shall require the agency to record the number of such records available to the Commission upon the Commission’s request, including, at a minimum, records of—

(A) The number of job applications received from individuals with disabilities, and the number of individuals with disabilities who were hired by the agency;

(B) The number of job applications received from individuals with targeted disabilities, and the number of individuals with targeted disabilities who were hired by the agency;

(iii) All rescissions of conditional job offers, demotions, and terminations taken against applicants or employees as a result of medical examinations or inquiries;

(iv) All agency employees hired under the Schedule A hiring authority for persons with certain disabilities, and each such employee’s date of hire, entering grade level, probationary status, and current grade level;

(v) The number of employees appointed under the Schedule A hiring authority for persons with certain disabilities who have been converted to career or career-conditional appointments in the competitive service, and the number of such employees who were terminated prior to being converted to a career or career-conditional appointment in the competitive service; and

(vi) Details about each request for reasonable accommodation requested, if any;

(B) The job (occupational series, grade level, and agency component) sought by the requesting applicant or held by the requesting employee;

(C) Whether the accommodation was needed to apply for a job, perform the essential functions of a job, or enjoy the benefits and privileges of employment;

(D) Whether the request was granted (which may include an accommodation different from the one requested) or denied;

(E) The identity of the deciding official;

(F) If denied, the basis for such denial; and

(C) The number of days taken to process the request.
(e) Reporting—(1) Submission to the Commission. On an annual basis, each federal agency shall submit to the Commission for approval, at such time and in such manner as the Commission deems appropriate—
   (i) A copy of its current Plan;
   (ii) The results of the two most recent workforce analyses performed pursuant to paragraph (d)(6) of this section showing the percentage of employees with disabilities and employees with targeted disabilities in each of the designated pay groups;
   (iii) The number of individuals appointed to positions within the agency under the Schedule A hiring authority for persons with certain disabilities during the previous year, and the total number of employees whose employment at the agency began by appointment under the Schedule A hiring authority for persons with certain disabilities; and
   (iv) A list of changes made to the Plan since the prior submission, if any, and an explanation of why those changes were made.

(2) Availability to the public. Each agency shall make the information submitted to the Commission pursuant to paragraph (e)(1) of this section available to the public by, at a minimum, posting a copy of the submission on its public Web site and providing a means by which members of the public may request copies of the submission in accessible formats.

(f) Commission approval and disapproval—(1) Basis for approval. If the Commission determines that an agency has adopted and implemented a Plan that meets the requirements set forth in paragraph (d) of this section, the Commission shall approve the Plan.

(2) Basis for disapproval. If the Commission determines that an agency has failed to adopt and implement a Plan that meets the requirements set forth in paragraph (d) of this section, the Commission shall disapprove the Plan as required by 29 U.S.C. 791(b). Failure to achieve a goal set forth in paragraph (d)(7)(i) of this section, by itself, is not grounds for disapproval unless the Plan fails to require the agency to take specific steps that are reasonably designed to achieve the goal.

3. Amend §1614.601 by revising paragraph (f) to read as follows:

§1614.601 EEO group statistics.

(f) Data on disabilities shall be collected using a method permitted under §1614.203(d)(6)(ii) and §1614.203(d)(6)(iii).

Dated: December 21, 2016.
For the Commission.

Peggy R. Mastroianni,
Legal Counsel.

50 CFR Part 217

[Docket No. 160830798–6798–01]

RIN 0648–BG32

Taking and Importing Marine Mammals; Taking Marine Mammals Incidental to Waterfront Construction

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Proposed rule; request for comments.

SUMMARY: NMFS has received a request from the U.S. Navy (Navy) for authorization to take marine mammals incidental to conducting waterfront construction at Naval Submarine Base Kings Bay, GA, over the course of five years (2017–2022). As required by the Marine Mammal Protection Act (MMPA), NMFS is proposing regulations to govern that take, and requests comments on the proposed regulations.

DATES: Comments and information must be received no later than February 2, 2017.

ADDRESSES: You may submit comments on this document, identified by NOAA–NMFS–2016–0161, by any of the following methods:

• Electronic submission: Submit all electronic public comments via the federal e-Rulemaking Portal. Go to www.regulations.gov/#!docketDetail;D=NOAA-NMFS-2016-0161, click the “Comment Now!” icon, complete the required fields, and enter or attach your comments.

• Mail: Submit written comments to Julie Harrison, Chief, Permits and Conservation Division, Office of Protected Resources, National Marine Fisheries Service, 1315 East-West Highway, Silver Spring, MD 20910. Instructions: Comments sent by any other method, to any other address or individual, or received after the end of the comment period, may not be considered by NMFS. All comments received are a part of the public record and will generally be posted for public viewing on www.regulations.gov without change. All personal identifying information (e.g., name, address), confidential business information, or otherwise sensitive information submitted voluntarily by the sender will be publicly accessible. NMFS will accept anonymous comments (enter “N/A” in the required fields if you wish to remain anonymous). Attachments to electronic comments will be accepted in Microsoft Word, Excel, or Adobe PDF file formats only.

FOR FURTHER INFORMATION CONTACT: Ben Laws, Office of Protected Resources, NMFS, (301) 427–8401.

SUPPLEMENTARY INFORMATION:

Availability

A copy of Navy’s application and any supporting documents, as well as a list of the references cited in this document, may be obtained online at: www.nmfs.noaa.gov/pr/permits/incidental/construction.htm. In case of problems accessing these documents, please call the contact listed above (see FOR FURTHER INFORMATION CONTACT).

National Environmental Policy Act (NEPA)

The Navy is preparing an Environmental Assessment (EA) to consider the direct, indirect and cumulative effects to the human environment resulting from the waterfront construction activities. NMFS has reviewed the draft EA and believes it is appropriate to adopt the EA in order to assess the impacts to the human environment of issuance of regulations and subsequent Letters of Authorization (LOAs) to the Navy and subsequently sign our own FONSI. Information in the Navy’s application, the Navy’s EA, and this notice collectively provide the environmental information related to proposed issuance of these regulations for public review and comment. All documents are available at the aforementioned Web site. We will review all comments submitted in response to this notice as we complete the NEPA processes, including a final decision of whether to adopt the Navy’s EA and sign a FONSI, prior to a final decision on the incidental take authorization request.

Purpose and Need for Regulatory Action

This proposed rule, to be issued under the authority of the Marine Mammal Protection Act (MMPA) (16 U.S.C. 1361 et seq.), would establish a framework for authorizing the take of marine mammals incidental to the Navy’s waterfront construction activities at Naval Submarine Base Kings Bay, GA (NSB Kings Bay). The Navy proposes to repair (including direct repairs and repairs by component replacement) in-water structures at NSB Kings Bay, construct a new Transit Protection System Operational Support Facility, and extend the existing Layberth Pier in order to (1) address critical damage and mission and safety requirements, (2) limit further deterioration and increase the useful life of the structures, and (3) upgrade infrastructure to meet requirements of new submarine technology. Construction will include use of impact and vibratory pile driving, including installation and removal of steel, concrete, composite, and timber piles.

We received an application from the Navy requesting five-year regulations and authorization to take bottlenose dolphins. Take would occur by Level B harassment incidental to impact and vibratory pile installation and removal. The regulations would be valid from 2017 to 2022. Please see the “Background” section below for definitions of harassment.

Legal Authority for the Proposed Action

Section 101(a)(5)(A) of the MMPA (16 U.S.C. 1371(a)(5)(A)) directs the Secretary of Commerce to allow, upon request, the incidental, but not intentional, taking of small numbers of marine mammals by U.S. citizens who engage in a specified activity (other than commercial fishing) within a specified geographical region for up to five years if, after notice and public comment, the agency makes certain findings and issues regulations that set forth permissible methods of taking pursuant to that activity, as well as monitoring and reporting requirements. Section 101(a)(5)(A) of the MMPA and the implementing regulations at 50 CFR part 216, subpart I provide the legal basis for issuing this proposed rule containing five-year regulations, and for any subsequent LOAs. As directed by this legal authority, this proposed rule contains mitigation, monitoring, and reporting requirements.

Summary of Major Provisions Within the Proposed Rule

Following is a summary of the major provisions of this proposed rule regarding Navy waterfront construction activities. We have preliminarily determined that the Navy’s adherence to the proposed mitigation, monitoring, and reporting measures described below would achieve the least practicable adverse impact on the affected marine mammals. These measures include:

• Required monitoring of the waterfront construction areas to detect the presence of marine mammals before beginning construction activities.

• Shutdown of construction activities under certain circumstances to avoid injury of marine mammals.

• Soft start for impact pile driving to allow marine mammals the opportunity
to leave the area prior to beginning impact pile driving at full power.

Background

Paragraphs 101(a)(5)(A) and (D) of the MMPA (16 U.S.C. 1371 (a)(5)(A) and (D)) direct the Secretary of Commerce to allow, upon request, the incidental, but not intentional, taking of small numbers of marine mammals by U.S. citizens who engage in a specified activity (other than commercial fishing) within a specified geographical region if certain findings are made and either regulations are issued or, if the taking is limited to harassment, a notice of a proposed authorization is provided to the public for review.

An authorization for incidental takings shall be granted if NMFS finds that the taking will have a negligible impact on the species or stock(s), will not have an unmitigatable adverse impact on the availability of the species or stock(s) for subsistence uses (where relevant), and if the permissible methods of taking and requirements pertaining to the mitigation, monitoring and reporting of such takings are set forth. NMFS has defined “negligible impact” in 50 CFR 216.103 as “an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival.”

Except with respect to certain activities not pertinent here, section 3 of the MMPA (16 U.S.C. 1362) defines “harassment” as: Any act of pursuit, torment, or annoyance which (i) has the potential to injure a marine mammal or marine mammal stock in the wild (Level A harassment); or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breeding, nursing, feeding, or sheltering (Level B harassment).

Summary of Request

On January 19, 2016, we received an adequate and complete request from Navy for authorization to take marine mammals incidental to waterfront construction activities. We received an initial draft of the request on August 27, 2015, followed by revised drafts on November 6 and December 2, 2015. On February 17, 2016 (81 FR 8048), we published a notice of receipt of Navy’s application in the Federal Register, requesting comments and information related to the request for 30 days. We did not receive any comments. The Navy provided an interim revised draft incorporating minor revisions on March 8, 2016.

The Navy proposes to repair in-water structures at NSB Kings Bay, as well as to construct new facilities and modify existing facilities. These repairs, upgrades, and new construction would include use of impact and vibratory pile driving, including installation and removal of steel, concrete, composite, and timber piles. Hereafter (unless otherwise specified or detailed) we use the term “pile driving” to refer to both pile installation and pile removal. The use of both vibratory and impact pile driving is expected to produce underwater sound at levels that have the potential to result in behavioral harassment of marine mammals. Only the bottlenose dolphin (Tursiops truncatus truncatus) is expected to be present. The requested regulations would be valid for five years, from July 12, 2017, through July 11, 2022.

Description of the Specified Activity

Overview

NSB Kings Bay is the Navy’s east coast home port for ballistic missile nuclear submarines supporting the Trident II (D–5) missile. NSB Kings Bay manages, maintains, and operates Trident ballistic missile (SSBN) and guided missile (SSGN) submarines, Trident II D–5 and Tomahawk Land Attack Missiles and systems, and infrastructure and quality of life facilities and programs. In 2010, the Navy found that conditions of water-based support facilities varied widely from good to seriously deteriorated. Continuous monitoring of these conditions by Navy at NSB Kings Bay has confirmed the advanced deterioration and critical nature of some issues that pose operational and safety risks. Additionally, other areas of initial deterioration were identified which require remedy in order to maintain the useful life of existing structures. Damage observed includes deteriorated concrete piles, pile caps, and deck components (cracked, spalled, delaminated, exposed/corroded internal reinforcing steel structures); marine pest (marine wood borer) damage on wooden piles; broken or unmaintained mooring fittings; and corrosion on steel piles and pile caps. In some cases, it is more cost effective to demolish older structures that are deteriorated and not well configured to fit existing and upcoming assets and replace them with new structures that are specifically designed to meet new mission requirements.

To ensure the Navy can continue its mission of supporting the Fleet Ballistic Missile System and Trident Submarine Program, the Navy proposes to repair (including direct repairs and repairs by component replacement) in-water structures at NSB Kings Bay, construct a new Transit Protection System Operational Support Facility, and extend the existing Layberth Pier. These repairs, upgrades, and new construction would (1) address critical damage and mission and safety requirements, (2) limit further deterioration and increase the useful life of the structures, and (3) upgrade infrastructure to meet requirements of new submarine technology. Construction will include use of impact and vibratory pile driving, including installation and removal of steel, concrete, composite, and timber piles. The specified activity is comprised of six distinct projects, four of which are comprised of multiple smaller projects. These projects and components are summarized in Table 1. Please see Figure 1–2 in the Navy’s application for locations of facilities referred to in Table 1.

Project 3: Waterfront Repair and Replacement Maintenance Program

| 3A .......... | Explosive Handling Wharf #2 Pier with Caps (7). | Repair high-density polyethylene (HDPE) fender pile wraps, sacrificial anodes attached to the steel fender piles, steel safety ladders and treated timber bracing; repair or replace various pile caps, piles, and mooring foundations; and clean and repaint various mooring fittings. |
| 3B .......... | (Dry Dock) Interface Wharf | Replace timber fender bearing strips and wales, repair concrete deck, bullrail, edge beams, and mooring foundations; and repair, paint and recoat cathodic protection on the steel H-pile fender system and sheet pile. |
| 3C .......... | Refit Wharf #1 | Replace various pile caps, piles, and the outboard edge beam; and repair, clean, and paint several mooring fittings. |
| 3D .......... | Refit Wharf #2 | Replace or repair various pile caps, piles, outboard edge beams, and mooring foundations; and reattach underdeck lighting conduit and clean and repaint various mooring fittings. |
| 3E .......... | Refit Wharf #3 | Replace or repair various pile caps, piles, the outboard edge beams, and mooring foundations; and clean and repaint various mooring fittings. |
| 3F .......... | Warping Wharf w/Capstan (4) | Repair HDPE fender pile wraps; replace or repair various pile caps, piles, and mooring foundations; and clean and repaint various mooring fittings. |
| 3G .......... | Tug Pier | Replace timber fender piles with guide piles and small boat access floats; paint mooring fittings; and repair concrete pile caps, concrete piles, concrete underdeck, and storm drain. |

Project 4: Transit Protection System (TPS) Pier and Off-Shore Supply Vessel Berthing Modification Project

| 4A .......... | New TPS Pier | Construct a new pier with full hotel service capability including power; potable water; fire protection; sewage connections; Ship Overboard Drainage collection; fuel; and telephone, cable, and Local Area Network services. |
| 4B .......... | Small Craft Berth Site VI | Once the new TPS pier is constructed, floating berthing slips would be constructed and provided with full hotel service capability. The berthing pier would consist of a pile supported reinforced concrete structure with floating sections. This project includes the installation of two 5,000-gallon above ground storage tanks and provides two associated truck off-loading connections and fuel dispensing units. |

Project 5: Trident Refit Facility Waterfront Facilities Repair, Magnetic Silencing Facility with Crane

| 5 .......... | Magnetic Silencing Facility with Cranes (Trident Refit Facility Waterfront Facilities Repair). | Replace timber fender piles, restraining chains, aluminum utility tray, and concrete pile utility guide bracket; and repair wooden hand rails and the cracked concrete deck underside. |

Project 6: Demolition of the Transit Protection System Pier and Layberth North Trestle

| 6A .......... | Demolition of TPS Pier | Remove the tip of the existing TPS Pier. |
| 6B .......... | Demolition of Layberth North Trestle | Demolish the North Layberth Trestle. |

Dates and Duration

The specified activity may occur at any time during the five-year period of validity of the proposed regulations. Planned dates of individual projects and project components are shown in Table 2, however, project dates may shift. In-water construction activities would occur during daylight hours, defined here as one hour post-sunrise to one hour prior to sunset.

Specified Geographical Region

NSB Kings Bay is located in southeastern Georgia, approximately four miles inland (straight line distance) from the Atlantic Ocean, and approximately eight miles north of the Georgia-Florida border, along the western shore of Cumberland Sound (see Figure 2–1 in the Navy’s application). NSB Kings Bay is an approximately 16,000 acre installation including the land areas and adjacent water areas along Kings Bay and Cumberland Sound between Marianna Creek to the north and Mill Creek to the south, and is restricted from general public access.

This estuarine environment receives salt water input from ocean waters through tidal exchange, and fresh water input from rivers, tributaries, and stormwater outfalls. The large tidal range and strong currents result in tidally mixed waters that are refreshed on a daily basis. Please see section 2 of the Navy’s application for more information.

Detailed Description of Activities

The Navy plans to remove deteriorated timber, concrete, and steel piles and replace them with concrete, composite, and steel piles. New construction would involve installation of steel, concrete, and composite piles. Aspects of construction activities other than pile driving are not anticipated to have the potential to result in incidental take of marine mammals because they are either above water or do not produce levels of underwater sound with likely potential to result in marine mammal disturbance. Therefore, we do not discuss elements of construction...
activity other than pile driving. No concurrent pile driving would occur.

A vibratory hammer would be used for all pile removal work. If use of the vibratory hammer is not feasible for pile installation (i.e., with steel piles), a Delmag Pile Hammer D62–22 or equivalent impact hammer would be used. The Delmag Pile Hammer D62–22 is a single acting diesel impact hammer with energy capacity of 76,899–153,799 foot-pounds. The most effective and efficient method of pile installation available would be implemented for each project. The method fitting these criteria may vary based on specific project requirements and local conditions. In some areas of Kings Bay a limestone layer can be found relatively close to the substrate/water interface. This type of layer requires impact driving because vibratory installation will not drive the piles to a sufficient depth. Impact driving, while generally producing higher levels of sound also minimizes the net amount of active driving time, thus reducing the amount of time during which marine mammals may be exposed to noise. Impact or vibratory pile driving could occur on any day, but would not occur simultaneously.

Vibratory hammers, which can be used to either install or extract a pile, contain a system of counter-rotating eccentric weights powered by hydraulic motors, and are designed in such a way that horizontal vibrations cancel out, while vertical vibrations are transmitted into the pile. The pile driving machine is lifted and positioned over the pile by means of an excavator or crane, and is fastened to the pile by a clamp and/or bolts. The vibrations produced cause liquefaction of the substrate surrounding the pile, enabling the pile to be extracted or driven into the ground using the weight of the pile plus the hammer. Impact hammers use a rising and falling piston to repeatedly strike a pile and drive it into the ground. Impact or vibratory driving could occur on any work day during the period of validity of these proposed regulations.

Steel piles are typically vibratory-driven for their initial embedment depths or to refusal and finished with an impact hammer for proofing or until the pile meets structural requirements, as necessary. Proofing involves striking a driven pile with an impact hammer to verify that it provides the required load-bearing capacity, as indicated by the number of hammer blows per foot of pile advancement. Non-steel piles are typically impact-driven for their entire embedment depth, in part because non-steel piles are often displacement piles (as opposed to pipe piles) and require some impact to allow substrate penetration.

Table 3 shows total piles planned for installation (I) and removal (R) by pile type and size in total and per year. Note that no pile driving is planned for fiscal year (FY) 2019. Below we provide further detail specific to individual projects and project components. For additional detail, please see Table 1 and section 1 of the Navy’s application. As noted previously, all pile removal would be accomplished using a vibratory hammer and all impact driving would be accomplished using a Delmag Pile Hammer D62–22 or equivalent impact hammer.

</table>

**Project 1A: Tug Pier**—The Navy plans to remove deteriorated timber fender piles and replace them with concrete piles. It is anticipated that 5 to 16 piles would be removed or installed per day with a total of up to 65 days of in-water work.

**Project 1B: General Access Pier Crab Island**—Timber guide piles at this pier are damaged and would be replaced by fiberglass reinforced plastic composite guide piles. Extraction and installation would both be performed using a vibratory hammer. It is anticipated that an average of two piles would be installed or removed per day for approximately two days of in-water work.

**Project 2: Unspecified Minor Construction, Layberth Pier**—The Navy plans to install additional steel H-piles to reduce the existing gaps between fender piles, which are considered too wide to adequately support the necessary fender system. No existing piles would need to be removed. It is anticipated that an average of eight piles would be installed per day for approximately seven days of in-water work.

The Waterfront Pile Repair and Replacement Maintenance Program (i.e., Project 3) consists of repairing and/or replacing structurally unsound piles along the waterfront restricted area. This project includes multiple individual projects as follows:

**Project 3A: Explosives Handling Wharf #2 Pier with Capstans**—Upgrading Explosives Handling Wharf #2 would require the installation of two new steel piles and the removal of two guide piles in FY17. Additionally, three concrete piles and ten steel piles would be removed and subsequently replaced in 2022. It is anticipated that two piles would be installed or removed per day for a total of approximately 11 days of in-water work in FY17 and FY22.

**Project 3B: (Dry Dock) Interface Wharf**—Numerous fender piles are in an advanced state of deterioration. Repairing the Interface Wharf would require the installation of new steel H-piles and removal of existing steel H-piles. It is anticipated that an average of 14 piles would be removed or installed per day for approximately 15 days of in-water work.

**Projects 3C-E: Refit Wharfs 1-3**—All three Refit Wharfs are in disrepair and present a safety risk to the personnel and heavy equipment utilizing the piers. In each case, proposed repair work would involve the removal of existing fender piles and replacement with new steel piles. It is anticipated that an average of six piles would be removed or installed per day for approximately two days of in-water work for each of the three projects.

**Project 3F: Warping Wharf with Capstan**—Repairing deterioration of the existing Warping Wharf would require the installation of new steel piles and the removal of eight existing fender piles. It is anticipated that an average of five piles would be removed or installed per day for approximately four days of in-water work.

**Project 4: (Transit Protection System (TPS) Off-Shore Supply Vessel Berthing Modification Project)** involves the construction of a new pier associated with TPS functions and the modification of the existing berthing pier on the north trestle. This project includes multiple individual projects as follows:

**Project 4A: New Facility**—The construction of the new pier would require the installation of new square concrete piles and removal of existing concrete piles. It is anticipated that 16 to 22 piles would be removed and 3 to 12 piles would be installed per day for approximately 80 days of in-water work.

**Proposed Mitigation**

In order to issue an incidental take authorization under section 101(a)(5)(A) of the MMPA, NMFS must set forth the permissible methods of taking pursuant to such activity, “and other means of effecting the least practicable adverse impact on such species or stock and its habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and on the availability of such species or stock for subsistence uses.” NMFS’s implementing regulations require applicants for incidental take authorizations to include information about the availability and feasibility (economic and technological) of equipment, methods, and manner of conducting such activity or other means.

</table>
of effecting the least practicable adverse impact upon the affected species or stocks and their habitat (50 CFR 216.104(a)(11)).

The mitigation strategies described below largely follow those required and successfully implemented under previous incidental take authorizations issued in association with similar construction activities. Measurements from similar pile driving events were coupled with practical spreading loss and other relevant information to estimate zones of influence (ZOI; see “Estimated Take by Incidental Harassment”); these ZOI values were used to develop mitigation measures for pile driving activities at NSB Kings Bay. Background discussion related to underwater sound concepts and terminology is provided in the section on “Description of Sound Sources,” later in this preamble. Practical spreading loss is discussed in further detail in the section on “Zones of Influence,” later in this preamble. The ZOIs effectively represent the mitigation zone that would be established around each pile to prevent Level A harassment to dolphins, while providing estimates of the areas within which Level B harassment might occur. In addition to the specific measures described later in this section, the Navy would conduct briefings for construction supervisors and crews, marine mammal monitoring team, and Navy staff prior to the start of all pile driving activity, and when new personnel join the work, in order to explain responsibilities, communication procedures, marine mammal monitoring protocol, and operational procedures. All relevant personnel would watch applicable sections of the Navy’s Marine Species Awareness Training video. Relevant personnel would also follow NMFS’s “Southeast Region Marine Mammal and Sea Turtle Viewing Guidelines,” which are described in Attachment 1 of Navy’s Monitoring Plan.

**Monitoring and Shutdown for Pile Driving**

The following measures would apply to the Navy’s mitigation through shutdown and disturbance zones:

**Shutdown Zone**—The purpose of a shutdown zone is to define an area within which shutdown of activity would occur upon sighting of a marine mammal (or in anticipation of an animal entering the defined area), thus preventing some undesirable outcome, such as auditory injury or behavioral disturbance of sensitive species (serious injury or death are unlikely outcomes even in the absence of mitigation measures). For all pile driving activities, the Navy would establish a minimum shutdown zone with radial distance of 15 meters (m). This minimum zone is intended to prevent the already unlikely possibility of physical interaction with construction equipment and to establish a precautionary minimum zone with regard to acoustic effects.

Using NMFS’s user spreadsheet, an optional companion spreadsheet associated with the alternative implementation methodology provided in Appendix D of NMFS’s acoustic guidance (NMFS, 2016), we calculated project, pile type, and pile driving methodology-specific zones within which auditory injury (i.e., Level A harassment) could occur. The user spreadsheet is publicly available online at www.nmfs.noaa.gov/pr/acoustics/guidelines.htm. In using the spreadsheet, we assumed practical spreading loss and used supplementary information provided by the Navy regarding assumed number of piles driven per day and number of pile strikes necessary to install a pile (for impact driving) and daily duration of pile driving (for vibratory pile driving). Assumed source levels are provided in Table 7.

In most cases, this minimum shutdown zone of 15 m is expected to contain the area in which auditory injury could occur. All predicted auditory injury zones are less than the minimum 15 m shutdown zone (radial distance range: 0.5–13.1 m), with the exception of impact driving of 30-inch (in) steel piles associated with Project 3F (radial distance of 38 m) and impact driving of 24-in steel piles associated with Project 4B (radial distance of 16.6 m). In all cases, predicted injury zones are calculated on the basis of cumulative sound exposure, as peak pressure source levels are below the injury threshold for mid-frequency cetaceans. For these two scenarios we propose shutdown zones of 40 m and 20 m radial distance, respectively.

Injury zone predictions generated using the optional user spreadsheet are precautionary due to a number of simplifying assumptions. For example, the spreadsheet tool assumes that marine mammals remain stationary during the activity and does not account for potential recovery between intermittent sounds. In addition, the tool incorporates the acoustic guidance’s weighting functions through use of a single-frequency weighting factor adjustment intended to represent the signal’s 95 percent frequency contour percentile (i.e., upper frequency below which 95 percent of cumulative energy is contained; Charif et al., 2010). This will typically result in higher predicted exposures for broadband sounds, since only one frequency is being considered, compared to exposures associated with the ability to fully incorporate the guidance’s weighting functions.

**Disturbance Zone**—Disturbance zones are the areas in which sound pressure levels (SPLs) equal or exceed 160 and 120 dB root mean square (rms) (for impulsive and non-impulsive, continuous sound, respectively). Disturbance zones provide utility for monitoring conducted for mitigation purposes (i.e., shutdown zone monitoring) by establishing monitoring protocols for areas adjacent to the shutdown zones. Monitoring of disturbance zones enables observers to be aware of and communicate the presence of marine mammals in the project area but outside the shutdown zone, and thus prepare for potential shutdowns of activity. However, the primary purpose of disturbance zone monitoring is for documenting incidents of Level B harassment; disturbance zone monitoring is discussed in greater detail later (see “Proposed Monitoring and Reporting”). Nominal radial distances for disturbance zones are shown in Table 8.

In order to document observed incidents of harassment, monitors record all marine mammal observations, regardless of location. The observer’s location and the location of the pile being driven are known, and the location of the animal may be estimated as a distance from the observer and then compared to the location from the pile. It may then be estimated whether the animal was exposed to sound levels constituting incidental harassment on the basis of predicted distances to relevant thresholds in post-processing of observational data, and a precise accounting of observed incidents of harassment created. This information may then be used to extrapolate observed takes to reach an approximate understanding of actual total takes, in cases where the entire zone was not monitored and/or all days of activity were not monitored.

**Monitoring Protocols**—Monitoring would be conducted before, during, and after pile driving activities. In addition, observers will record all incidents of marine mammal occurrence, regardless of distance from activity, and monitors will document any behavioral reactions in concert with distance from piles being driven. Observations made outside the shutdown zone will not result in shutdown; that pile segment will be completed with observation, unless the animal approaches or enters the shutdown zone, at which point all
pile driving activities would be halted. Monitoring will take place from 15 minutes prior to initiation through 30 minutes post-completion of pile driving activities. Pile driving activities include the time to install or remove a single pile or series of piles, as long as the time elapsed between uses of the pile driving equipment is no more than thirty minutes. Observation of shutdown zones will always occur, but observation of the larger disturbance zones will occur on a subset of days associated with each specific project (see project-specific details provided in “Proposed Monitoring and Reporting,” later in this document). Please see the Monitoring Plan, developed by the Navy in agreement with NMFS, for full details of the monitoring protocols.

The following additional measures apply to visual monitoring:

1. Monitoring will be conducted by designated observers, who will be placed at the best vantage point(s) practicable (as defined in the Monitoring Plan) to monitor for marine mammals and implement shutdown/delay procedures when applicable by calling for the shutdown to the hammer operator. Observers would have no other construction-related tasks while conducting monitoring. Observers should have the following minimum qualifications:

- Visual acuity in both eyes (correction is permissible) sufficient for discernment of moving targets at the water’s surface with ability to estimate target size and distance; use of binoculars may be necessary to correctly identify the target;
- Ability to conduct field observations and collect data according to assigned protocols;
- Experience or training in the field identification of bottlenose dolphins, including the identification of behaviors;
- Sufficient training, orientation, or experience with the construction operation to provide for personal safety during observations;
- Writing skills sufficient to document observations including, but not limited to: The number and species of marine mammals observed; dates and times when in-water construction activities were conducted; dates and times when in-water construction activities were suspended to avoid potential incidental injury of marine mammals from construction noise within a defined shutdown zone; and marine mammal behavior; and
- Ability to communicate orally, by radio or in person, with project personnel to provide real-time information on marine mammals observed in the area as necessary.

2. Prior to the start of pile driving activity, the shutdown zone will be monitored for 15 minutes to ensure that it is clear of marine mammals. Pile driving will only commence once observers have declared the shutdown zone clear of marine mammals; animals will be allowed to remain in the shutdown zone (i.e., must leave of their own volition), and their behavior will be monitored and documented. The shutdown zone may only be declared clear, and pile driving started, when the entire shutdown zone is visible (i.e., when not obscured by dark, rain, fog, etc.). In addition, if such conditions should arise during impact pile driving that is already underway, the activity would be halted.

3. If a marine mammal approaches or enters the shutdown zone during the course of pile driving operations, activity will be halted and delayed until either the animal has voluntarily left and been visually confirmed beyond the shutdown zone or fifteen minutes have passed without re-detection of the animal. Monitoring will be conducted throughout the time required to drive a pile and for thirty minutes following the conclusion of pile driving.

Soft Start

The use of a soft start procedure is believed to provide additional protection to marine mammals by warning marine mammals or providing them with a chance to leave the area prior to the hammer operating at full capacity, and typically involves a requirement to initiate sound from the hammer at reduced energy followed by a waiting period. This procedure is repeated two additional times. It is difficult to specify the reduction in energy for any given hammer because of variation across drivers and, for impact hammers, the actual number of strikes at reduced energy will vary because operating the hammer at less than full power results in “bumping” of the hammer as it strikes the pile, resulting in multiple “strikes.” The Navy will utilize soft start techniques for impact pile driving. We require an initial set of three strikes from the impact hammer at reduced energy, followed by a 30-second waiting period, then 2 subsequent 3-strike sets. Soft start will be required at the beginning of each day’s impact pile driving work and at any time following a cessation of impact pile driving of thirty minutes or longer; the requirement to implement soft start for impact driving is independent of whether vibratory driving has occurred within the prior 30 minutes.

We have carefully evaluated the Navy’s proposed mitigation measures and considered a range of other measures in the context of ensuring that we prescribed the means of effecting the least practicable adverse impact on the affected marine mammal species and stocks and their habitat. Our evaluation of potential measures included consideration of the following factors in relation to one another: (1) The manner in which, and the degree to which, the successful implementation of the measure is expected to minimize adverse impacts to marine mammals, (2) the proven or likely efficacy of the specific measure to minimize adverse impacts as planned; and (3) the practicability of the measure for applicant implementation.

Any mitigation measure(s) we prescribe should be able to accomplish, have a reasonable likelihood of accomplishing (based on current science), or contribute to the accomplishment of one or more of the general goals listed below:

1. Avoidance or minimization of injury or death of marine mammals wherever possible (goals 2, 3, and 4 may contribute to this goal).
2. A reduction in the number (total number or number at biologically important time or location) of individual marine mammals exposed to stimuli expected to result in incidental take (this goal may contribute to 1, above, or to reducing takes by behavioral harassment only).
3. A reduction in the number (total number or number at biologically important time or location) of times any individual marine mammal would be exposed to stimuli expected to result in incidental take (this goal may contribute to 1, above, or to reducing takes by behavioral harassment only).
4. A reduction in the intensity of exposure to stimuli expected to result in incidental take (this goal may contribute to 1, above, or to reducing the severity of behavioral harassment only).
5. Avoidance or minimization of adverse effects to marine mammal habitat, paying particular attention to the prey base, blockage or limitation of passage to or from biologically important areas, permanent destruction of habitat, or temporary disturbance of habitat during a biologically important time.
6. For monitoring directly related to mitigation, an increase in the probability of detecting marine mammals, thus allowing for more effective implementation of the mitigation.

Based on our evaluation of the Navy’s proposed measures, we have
preliminarily determined that the proposed mitigation measures provide the means of effecting the least practicable adverse impact on marine mammal species or stocks and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance.

Description of Marine Mammals in the Area of the Specified Activity

We have reviewed the Navy’s species descriptions—which summarize available information regarding status and trends, distribution and habitat preferences, behavior and life history, and auditory capabilities of the potentially affected species and stocks—for accuracy and completeness, and refer the reader to Sections 3 and 4 of Navy’s application, as well as to NMFS’s Stock Assessment Reports (SARs; www.nmfs.noaa.gov/pr/sars/), instead of reprinting the information here. Additional general information (e.g., physical and behavioral descriptions) and information on the U.S. regulatory status of species under the MMPA and ESA may be found on NMFS’s Web site (www.nmfs.noaa.gov/pr/species/mammals/). Table 4 lists all species and stocks with expected potential for occurrence in the specified geographical region where Navy proposes to conduct the specified activity, and summarizes information related to the population or stock, including potential biological removal (PBR). PBR, defined by the MMPA as the maximum number of animals, not including natural mortalities, that may be removed from a marine mammal stock while allowing that stock to reach or maintain its optimum sustainable population, is considered in concert with known sources of ongoing anthropogenic mortality (as described in NMFS’s SARs).

Only one species under NMFS’s jurisdiction is considered to have the potential to co-occur with Navy activities: The bottlenose dolphin. However, multiple stocks of bottlenose dolphin have the potential to be present. The offshore stock of bottlenose dolphins are generally found in deeper waters farther from the coast; biopsy tissue sampling and genetic analysis demonstrated that bottlenose dolphins concentrated close to shore were of the coastal morphotype, while those in waters greater than 40 m depth were from the offshore morphotype (Garrison et al., 2003). However, south of Cape Hatteras, North Carolina, the ranges of the coastal and offshore morphotypes overlap to some degree. Based on genetic analysis of tissue samples collected in nearshore and offshore waters from New York to central Florida, Torres et al. (2003) found the offshore morphotype exclusively seaward of 34 kilometers (km) and in waters deeper than 34 m. Within 7.5 km of shore, all animals were of the coastal morphotype. Garrison et al. (2003) found offshore morphotype animals as close as 7.3 km from shore in water depths of 13 m. Therefore, the offshore stock of bottlenose dolphins is considered extralimital to the project area and is not discussed further in this document. In addition, the West Indian manatee (Trichechus manatus latirostris) may be found in coastal waters of the Atlantic. However, manatees are managed by the U.S. Fish and Wildlife Service and are not considered further in this document. All stocks are assessed in NMFS’s U.S. Atlantic SARs (e.g., Waring et al., 2016).

*1 ESA status: Endangered (E), Threatened (T)/MMPA status: Depleted (D). A dash (—) indicates that the species is not listed under the ESA or designated as depleted under the MMPA. Under the MMPA, a strategic stock is one for which the level of direct human-caused mortality exceeds PBR (see footnote 3) or which is determined to be declining and likely to be listed under the ESA within the foreseeable future.

*2 CV is coefficient of variation; Nmin is the minimum estimate of stock abundance. The most recent abundance survey that is reflected in the abundance estimate is presented; there may be more recent surveys that have not yet been incorporated into the estimate.

*3 Potential biological removal, defined by the MMPA as the maximum number of animals, not including natural mortalities, that may be removed from a marine mammal stock while allowing that stock to reach or maintain its optimum sustainable population size (OSP).

*4 These values, found in NMFS’s SARs, represent annual levels of human-caused mortality plus serious injury from all sources combined (e.g., commercial fisheries, subsistence hunting, ship strike). Annual M/SI often cannot be determined precisely and is in some cases presented as a range.

*5 The Navy considers “rare” to mean that there may be a few confirmed sightings or that the distribution of the stock is near enough to the area of interest that the species could occur there, and that overall the stock may occur but only infrequently or in small numbers. “Likely” is considered to mean that confirmed and regular sightings of the species occur year-round. Extralimital stocks are those that are considered unlikely to co-occur with the activity because the action area is outside the range of normal occurrence, but for which there may be some sighting or stranding records.
Bottlenose dolphins range widely in temperate and tropical waters and are found from deep, offshore to coastal areas, including bays, estuaries and river mouths. In the western North Atlantic, there are two morphologically and genetically distinct bottlenose dolphin morphotypes described as the coastal and offshore forms (Duffield et al., 1983; Hersh and Duffield, 1990; Mead and Potter, 1995; Curry and Smith, 1997; Rosel et al., 2009). These forms are genetically distinct based upon both mitochondrial and nuclear markers (Hoelzel et al., 1998; Rosel et al., 2009). As described above, the offshore form—which is distributed primarily along the outer continental shelf and continental slope—is considered extralimital to the project area and is not discussed here. The coastal morphotype is continuously distributed in nearshore coastal and estuarine waters along the U.S. Atlantic coast south of Long Island, New York, around the Florida peninsula and into the Gulf of Mexico. Primary habitat for coastal dolphins generally includes waters less than 20 m deep (e.g., Garrison et al., 2003).

Initially, a single stock of coastal bottlenose dolphins was thought to migrate seasonally between New Jersey (summer months) and central Florida based on seasonal patterns in strandings during a large scale mortality event occurring during 1987–1988 (Scott et al., 1988). However, re-analysis of stranding data and extensive analysis of genetic, photo-identification, and satellite telemetry data demonstrate a complex mosaic of coastal bottlenose dolphin stocks (Zolman, 2002; McLellan et al., 2002; Rosel et al., 2009; Waring et al., 2016). Integrated analysis of these multiple lines of evidence suggests that there are five coastal stocks of bottlenose dolphins, including the South Carolina/Georgia and northern Florida stocks that may be present in the action area.

The coastal morphotype inhabits estuarine waters in addition to coastal nearshore and continental shelf waters, with multiple lines of evidence supporting demographic separation between bottlenose dolphins residing within different estuaries along the Atlantic coast (Wells et al., 1987; Scott et al., 1990; Wells et al., 1996; Zolman, 2002; Speakman et al., 2006; Stolen et al., 2007; Mazzoil et al., 2008). A few published studies demonstrate that these resident animals are genetically distinct from animals in nearby coastal waters and/or from animals residing in nearby estuarine areas (Caldwell, 2001; Rosel et al., 2009; Litz et al., 2012). However, the degree of spatial overlap between estuarine and coastal populations remains unclear, and the degree of movement of resident estuarine animals into coastal waters on seasonal or shorter time scales is poorly understood (Waring et al., 2016). Bottlenose dolphins inhabiting primarily estuarine habitats are considered distinct stocks from those inhabiting coastal habitats.

The spatial extent of the coastal stocks, their potential seasonal movements, and their relationships with estuarine stocks are poorly understood (Waring et al., 2016). Photo-identification studies documented dolphins in coastal waters off Charleston, South Carolina, that are not known resident members of the estuarine stock (Speckman et al., 2006). Genetic analyses of samples from northern Florida and Georgia and central South Carolina, using both mitochondrial DNA and nuclear microsatellite markers, indicate significant genetic differences between these areas (NMFS, 2001; Rosel et al., 2009). Therefore, NMFS defines separate stocks occurring in coastal Atlantic waters from the North Carolina/South Carolina border south to the Georgia/Florida border, and from the Georgia/Florida border south to 29.4°N. There is likely to be some overlap between actual stock ranges at these borders, which are defined for management purposes, and the action area is located adjacent to the Georgia/Florida border. Therefore, although we would expect that most coastal dolphins encountered would be from the Georgia/South Carolina stock, it is possible that animals from the northern Florida stock could be present.

These five stocks also include migratory stocks that move south seasonally from mid-Atlantic coastal waters. In particular, the southern migratory stock, defined on the basis of satellite tag telemetry studies and stable isotope analysis, is thought to migrate south from waters of southern Virginia and north central North Carolina in the summer to waters south of Cape Fear and as far south as coastal Florida during winter months, where it could overlap with the South Carolina/Georgia coastal stock (and potentially occur in the estuary) (Knoff, 2004; Waring et al., 2016). Also based on tagging studies, the northern migratory stock is not thought to move south of Cape Lookout, North Carolina, during cold water months (Waring et al., 2016). Telemetry data suggest this stock occupies waters of southern North Carolina (south of Cape Lookout) during October-December, before moving south during January-March (as far south as northern Florida). During April-June, the stock moves north back to North Carolina, and is presumed to remain in coastal waters north of Cape Lookout, North Carolina, from July-August (Waring et al., 2016).

However, during its winter movements the southern migratory stock is thought to occur in waters from 10–30 m depth (i.e., remain further offshore than it does in northern waters, where it is more likely to overlap with estuarine system stocks) (Waring et al., 2016). Therefore, we assume that rare occurrence of migratory stock dolphins during January to March may be possible.

There are two resident estuarine stocks of bottlenose dolphin that may occur in the action area: Those present in southern Georgia and Jacksonville estuarine systems (SGES and JES). Balmer et al. (2011) conducted photo-identification studies between 2004 and 2009 in two field sites in south-central Georgia, one in the Turtle/Brunswick River estuary and the second north of the Altamaha River including the Sapelo Island National Estuarine Research Reserve and extending north to Sapelo Sound. The data revealed strong site fidelity to the two regions and supported Altamaha Sound as an appropriate boundary between the two sites (Balmer et al., 2013). Genetic analysis of mitochondrial DNA control region sequences and microsatellite markers of dolphins biopsied in southern Georgia showed significant genetic differentiation from animals biopsied in northern Georgia and southern South Carolina estuaries as well as from animals biopsied in coastal waters greater than 1 km from shore at the same latitude (Waring et al., 2016). Caldwell (2001) investigated the social structure of bottlenose dolphins inhabiting the estuarine waters between the St. Mary’s River (at the Georgia/Florida border) and Jacksonville Beach, Florida, using photo-identification and behavioral data. Multiple behaviorally-different communities were identified during the study, including those inhabiting estuarine waters to the north and south of the St. Johns River, which differed in density, habitat fidelity and social affiliation patterns. Dolphins to the north of the St. Johns River were isolated, with 96 percent of the groups observed containing dolphins that had been photographically identified only in...
this area, demonstrating strong year-round site fidelity (Caldwell, 2001). Cluster analyses suggested that dolphins using the northern area did not socialize with those using the area to the south of the St. Johns River (Caldwell, 2001).

The SGES stock is bounded in the south by the Georgia/Florida border at the Cumberland River out through Cumberland Sound and in the north by the Altamaha River out through Altamaha Sound, and encompasses all estuarine waters in between as well as coastal waters out to 1 km from shore. The southern boundary abuts the northern boundary of the JES stock, which is currently considered to extend south to Jacksonville Beach, Florida. Although both stocks may occur in the action area (the proposed construction site is just north of the shared SGES/JES stock boundary), we assume that animals from the JES stock would occur only rarely if at all due to the strong site fidelity exhibited within areas to the south of the St. Mary’s River and Cumberland Sound.

The best available abundance estimate for the SGES stock is 194 animals (Table 4). However, seasonal mark-recapture, photo-identification surveys informing this estimate cover less than half of the assumed range of the stock and, therefore, the abundance estimate is negatively biased (Waring et al., 2016). The portion of range surveyed did not include the proposed action area. There is no official abundance estimate for the JES stock because existing data are greater than eight years old. However, photo-identification data from 1994–1997 yielded 334 individually identified dolphins, including an unknown number of seasonal residents and transients (Gubbins et al., 2003). Mark-recapture analyses including all individually identifiable dolphins yielded a population abundance estimate of 412 animals (CV = 0.06; Gubbins et al., 2003). This is considered to be an overestimate because it included non-resident and seasonally resident dolphins (Waring et al., 2016). In summary, the SGES stock and the South Carolina/Georgia coastal stock are expected to be the two stocks most likely to be affected by the specified activity. Individual animals from the northern Florida and southern migratory (January to March only) coastal stocks and the JES stock may also occur rarely.

**Biologically Important Areas**—LaBrecque et al. (2015) recognize multiple biologically important areas (BIA) for small and resident populations of bottlenose dolphins in the mid- and south Atlantic. Small and resident population BIAs are areas and times within which small and resident populations occupy a limited geographic extent, and are therefore necessarily important areas for those populations. Here, these include areas defined for the SGES and JES populations and correspond with the stock boundaries described above.

**Unusual Mortality Events (UME)**—A UME is defined under the MMPA as “a stranding that is unexpected, involves a significant die-off of any marine mammal population, and demands immediate response.” Beginning in July 2013, elevated strandings of bottlenose dolphins were observed along the Atlantic coast from New York to Florida. The investigation was closed in 2015, with the UME ultimately being attributed to cetacean morbillivirus (though additional contributory factors are under investigation; www.nmfs.noaa.gov/pr/health/immume/midatldolphins2013.html; accessed November 25, 2016). Dolphin strandings during 2013–2015 were greater than 6 times higher than the average from 2007–2012, with the most strandings reported from Virginia, North Carolina, and Florida. A total of approximately 1,650 bottlenose dolphins stranded from June 2013 to March 2015 and, additionally, a small number of individuals of several other cetacean species stranded during the UME and tested positive for morbillivirus (humpback whale, fin whale, minke whale, pygmy sperm whale, and striped dolphin). Approximately one hundred of the stranded dolphins were recovered along the Georgia coast, with at least 31 found on nearby Cumberland Island. Only one offshore ecotype dolphin has been identified, meaning that over 99 percent of affected dolphins were of the coastal ecotype (D. Fauquier; pers. comm.). Research, to include analyses of stranding samples and post-UME monitoring and modeling of surviving populations, will continue in order to better understand the impacts of the UME on the affected stocks. Notably, an earlier major UME in 1987–1988 was also caused by morbillivirus. Over 740 stranded dolphins were recovered during that event.

A second UME, declared in 2010, affected bottlenose dolphins in the St. Johns River (FL). Affected animals likely belonged to the JES stock; the cause of this UME is undetermined. For more information on UMES, please visit www.nmfs.noaa.gov/pr/health/immume.

**Take Reduction Planning**—Take reduction plans are designed to help recover and prevent the depletion of strategic marine mammal stocks that interact with certain U.S. commercial fisheries, as required by Section 118 of the MMPA. The immediate goal of a take reduction plan is to reduce, within six months of its implementation, the annual human-cause mortality and serious injury (M/SI) of marine mammals incidental to commercial fishing to less than the PBR level. The long-term goal is to reduce, within five years of its implementation, the M/SI of marine mammals incidental to commercial fishing to insignificant levels, approaching a zero serious injury and mortality rate, taking into account the economics of the fishery, the availability of existing technology, and existing state or regional fishery management plans. Take reduction teams are convened to develop these plans.

One take reduction plan has been developed to reduce deaths of Atlantic coastal bottlenose dolphins incidental to commercial fishing. The bottlenose dolphin take reduction plan contains both regulatory and non-regulatory conservation measures, including seasonal gillnet restrictions, gear proximity requirements, and gear length restrictions, as well as continued research and monitoring, enforcement, outreach, and partnership efforts. Gillnet restrictions are in place in Georgia waters. More information is available online at: www.nmfs.noaa.gov/pr/interactions/trt/bdtrp.html.

**Potential Effects of the Specified Activity on Marine Mammals and Their Habitat**

This section includes a summary and discussion of the ways that components of the specified activity may impact marine mammals and their habitat. The “Estimated Take by Incidental Harassment” section later in this preamble will include a quantitative analysis of the number of incidents of take expected to occur incidental to this activity. The “Negligible Impact Analysis” section will include an analysis of how this specific activity will impact marine mammals, and will consider the content of this section, the “Estimated Take by Incidental Harassment” section, and the “Proposed Mitigation” section, to draw conclusions regarding the likely impacts of these activities on the reproductive success or survivorship of individuals, and from that on the affected marine mammal populations or stocks. In the following discussion, we provide general background information on sound and marine mammal hearing before considering potential effects to marine mammals from sound produced by pile driving.
Description of Sound Sources

This section contains a brief technical background on sound, on the characteristics of certain sound types, and on metrics used in this proposal inasmuch as the information is relevant to the specified activity and to a discussion of the potential effects of the specified activity on marine mammals found later in this document.

Sound travels in waves, the basic components of which are frequency, wavelength, velocity, and amplitude. Frequency is the number of pressure waves that pass by a reference point per unit of time and is measured in hertz (Hz) or cycles per second. Wavelength is the distance between two peaks or corresponding points of a sound wave (length of one cycle). Higher frequency sounds have shorter wavelengths than lower frequency sounds, and typically attenuate (decrease) more rapidly, except in certain cases in shallower water. Amplitude is the height of the sound pressure wave or the “loudness” of a sound and is typically described using the relative unit of the decibel (dB). A sound pressure level (SPL) in dB is described as the ratio between a measured pressure and a reference pressure (for underwater sound, this is 1 microPascal (μPa)), and is a logarithmic unit that accounts for large variations in amplitude; therefore, a relatively small change in dB corresponds to large changes in sound pressure. The source level (SL) represents the SPL referenced at a distance of 1 m from the source (referenced to 1 μPa), while the received level is the SPL at the listener’s position (referenced to 1 μPa).

Root mean square (rms) is the quadratic mean sound pressure over the duration of an impulse. Rms is calculated by squaring all of the sound amplitudes, averaging the squares, and then taking the square root of the average (Urick, 1983). Rms accounts for both positive and negative values; squaring the pressures makes all values positive so that they may be accounted for in the summation of pressure levels (Hastings and Popper, 2005). This measurement is often used in the context of discussing behavioral effects, in part because behavioral effects, which often result from auditory cues, may be better expressed through averaged units than by peak pressures.

Sound exposure level (SEL; represented as dB re 1 μPa-s) represents the total energy contained within a pulse, and considers both intensity and duration of exposure. Peak sound pressure (also referred to as zero-to-peak sound pressure or 0-p) is the maximum instantaneous sound pressure measurable in the water at a specified distance from the source, and is represented in the same units as the rms sound pressure.

When underwater objects vibrate or activity occurs, sound-pressure waves are created. These waves alternately compress and decompress the water as the sound wave travels. Underwater sound waves radiate in a manner similar to ripples on the surface of a pond and may be either directed in a beam or beams or may radiate in all directions (omnidirectional sources), as is the case for sound produced by the pile driving activity considered here. The compressions and decompressions associated with sound waves are detected as changes in pressure by aquatic life and man-made sound receptors such as hydrophones.

Even in the absence of sound from the specified activity, the underwater environment is typically loud due to ambient sound. Ambient sound is defined as environmental background sound levels lacking a single source or point (Richardson et al., 1995), and the sound level of a region is defined by the total acoustical energy being generated by known and unknown sources. These sources may include physical (e.g., wind and waves, earthquakes, ice, atmospheric sound), biological (e.g., sounds produced by marine mammals, fish, and invertebrates), and anthropogenic (e.g., vessels, dredging, construction) sound. A number of sources contribute to ambient sound, including the following (Richardson et al., 1995):

- **Wind and waves**: The complex interactions between wind and water surface, including processes such as breaking waves and wave-induced bubble oscillations and cavitation, are a main source of naturally occurring ambient sound for frequencies between 200 Hz and 50 kHz (Mitson, 1995). In general, ambient sound levels tend to increase with increasing wind speed and wave height. Surf sound becomes important near shore, with measurements collected at a distance of 8.5 km from shore showing an increase of 10 dB in the 100 to 700 Hz band during heavy surf conditions.

- **Precipitation**: Sound from rain and hail impacting the water surface can become an important component of total sound at frequencies above 500 Hz, and possibly down to 100 Hz during quiet times.

- **Biological**: Marine mammals can contribute significantly to ambient sound levels, as can some fish and snapping shrimp. The frequency band for biological contributions is from approximately 12 Hz to over 100 kHz.

- **Anthropogenic**: Sources of ambient sound related to human activity include transportation (surface vessels), dredging and construction, oil and gas drilling and production, seismic surveys, sonar, explosions, and ocean acoustic studies. Vessel noise typically dominates the total ambient sound for frequencies between 20 and 300 Hz. In general, the frequencies of anthropogenic sounds are below 1 kHz and, if higher frequency sound levels are created, they attenuate rapidly. Sound from identifiable anthropogenic sources other than the activity of interest (e.g., a passing vessel) is sometimes termed background sound, as opposed to ambient sound.

The sum of the various natural and anthropogenic sound sources at any given location and time—which comprise “ambient” or “background” sound—depends not only on the source levels (as determined by current weather conditions and levels of biological and human activity) but also on the ability of sound to propagate through the environment. In turn, sound propagation is dependent on the spatially and temporally varying properties of the water column and sea floor, and is frequency-dependent. As a result of the dependence on a large number of varying factors, ambient sound levels can be expected to vary widely over both coarse and fine spatial and temporal scales. Sound levels at a given frequency and location can vary by 10–20 dB from day to day (Richardson et al., 1995). The result is that depending on the source type, its intensity, and the receivers’ generalized hearing range, sound from a given activity may be a negligible addition to the local environment or could form a distinctive signal that may affect marine mammals.

The underwater acoustic environment at NSB Kings Bay is dominated by noise from day-to-day port and vessel activities. The base is sheltered from most wave noise, but is a high-use area for naval ships, tugs, submarines, and security vessels. When underway, these sources can create noise between 20 Hz and 16 kHz (Lesage et al., 1999), with broadband noise levels up to 180 dB rms. Normal port operations, including transits, docking, and maintenance by multiple vessels would continue throughout the period proposed for the specified activity. As a result of measurements conducted in February 2015, the Navy found that background sound levels averaged 135 dB rms (Acentech, 2015).
produce non-impulsive, continuous
into the sediment. Vibratory hammers
weight of the hammer to push the pile
surrounding substrate, and allowing the
sounds are all characterized by a
repeated in some succession. Pulsed
that are brief (typically considered to be
impulsive sound types characterized by
increased capacity to induce physical
due to higher peak levels, a potentially
characterized by rapid rise times and
pressure to a maximal pressure value
reduction as compared to sounds that
increase the probability and severity of
the substrate. The impulsive sound
generated by impact hammers is
produced by vibratory pile driving in
particular would have any significant
in the vicinity of NSB Kings Bay. Details
of these two sound types is important
because they have differing potential
to cause physical effects, particularly with
regard to hearing (e.g., Ward, 1997 in
Southall et al., 2007). Please see
Southall et al. (2007) for an in-depth
discussion of these concepts.

Pulsed sound sources (e.g., airguns,
explorations, gunshots, sonic booms,
impact pile driving) produce signals that
are brief (typically considered to be
less than one second), broadband, atonal
transients (ANSI, 1986, 2005; Harris,
1998; NIOSH, 1998; ISO, 2003) and
occur either as isolated events or
repeated in some succession. Pulsed
sounds are all characterized by a
relatively rapid rise from ambient
pressure to a maximal pressure value
followed by a rapid decay period that
may include a period of diminishing,
oscillating maximal and minimal
pressures, and generally have an
increased capacity to induce physical
injury as compared with sounds that
lack these features.

Non-pulsed sounds can be tonal,
short-duration bursts that are very
continuous or non-continuous (ANSI,
1995; NIOSH, 1998). Some of these non-
pulsed sounds can be transient signals
of short duration but without the
essential properties of pulses (e.g., rapid
rise time). Examples of non-pulsed
sounds include those produced by
vessels, aircraft, machinery operations
such as drilling or dredging, vibratory
pile driving, and active sonar systems
(such as those used by the U.S. Navy).
The duration of such sounds, as
received at a distance, can be greatly
extended in a highly reverberant
environment.

Impact hammers operate by using a
piston or weight to drive the pile into
the substrate. The impulsive sound
generated by impact hammers is
characterized by rapid rise times and
high peak levels, a potentially injurious
combination (Hastings and Popper,
2005). Vibratory hammers install piles
by vibrating them, which liquefies
surrounding substrate, and allowing the
weight of the hammer to push the pile
into the sediment. Vibratory hammers
produce non-impulsive, continuous
noise at levels significantly lower than
those produced by impact hammers.
Peak SPLs may be 180 dB or greater, but
are generally 10 to 20 dB lower than
SPLs generated during impact pile
driving of the same-sized pile (Oestman
et al., 2009). Rise time is slower,
reducing the probability and severity of
injury, and sound energy is distributed
over a greater amount of time (Nedwell
and Edwards, 2002; Carlson et al.,
2005).

Acoustic Effects

Here, we first provide background
information on marine mammal hearing
before discussing the potential effects of
the use of active acoustic sources on
marine mammals. Marine Mammal Hearing—Hearing is
the most important sensory modality for
marine mammals underwater, and
exposure to anthropogenic sound can
deliberous effects. To
appropriately assess the potential effects
of exposure to anthropogenic sound is
necessary to understand the frequency ranges marine
mammals are able to hear. Current data
indicate that not all marine mammal
species have equal hearing capabilities
(e.g., Richardson et al., 1995; Wartzok
and Ketten, 1999; Au and Hastings,
2008). To reflect this, Southall et al.
(2007) recommended that marine
mammals be divided into functional
hearing groups based on directly
measured or estimated hearing ranges
on the basis of available behavioral
response data, audiograms derived
using auditory evoked potential
techniques, and other data. Consequently, NMFS (2016)
described generalized hearing ranges for
these marine mammal hearing groups.
Generalized hearing ranges were chosen
based on an approximately 65 dB
threshold from the normalized
frequency cetaceans where the lower
bound was deemed to be biologically
implausible and the lower bound from
Southall et al. (2007) retained.

Functional groups for cetaceans and the
associated frequencies are indicated
below (note that these frequency ranges
correspond to the range for the
core group, with the entire range
not necessarily reflecting the
capabilities of every species within that
group):

- Low-frequency cetaceans
  (mysticetes): Generalized hearing is
  estimated to occur between
  approximately 7 Hz and 35 kHz, with
  best hearing estimated to be from 100
  Hz to 1 kHz.
- Mid-frequency cetaceans (larger
toothed whales, beaked whales, and
most delphinids): Generalized hearing is
  estimated to occur between
  approximately 150 Hz and 160 kHz,
  with best hearing from 10 to less than
  100 kHz.
- High-frequency cetaceans
  (porpoises, river dolphins, and members
  of the genera Kogia and
  Cephalorhynchus; including two
  members of the genus Lagenorhynchus,
  on the basis of recent echolocation data
  and genetic data); generalized hearing
  is estimated to occur between
  approximately 275 Hz and 160 kHz.

For more detail concerning these
groups and associated frequency ranges,
please see NMFS (2016) for a review of
available information. The bottlenose
dolphin is classified as a mid-frequency
cetacean.

Potential Effects of Underwater
Sound—Please refer to the information
given previously ("Description of Active
Acoustic Sources") regarding sound,
characteristics of sound types, and
metrics used in this document. Note
that, in the following discussion, we
refer in many cases to a recent review
article concerning studies of noise-
induced hearing loss conducted from
1996–2015 (i.e., Finneran, 2015). For
study-specific citations, please see that
work. Anthropogenic sounds cover a
broad range of frequencies and sound
levels and can have a range of highly
variable impacts on marine life, from
none or minor to potentially severe
responses, depending on received
levels, duration of exposure, behavioral
context, and various other factors. The
potential effects of underwater sound
can result in one or more of the
following: temporary or permanent
hearing impairment, non-auditory
physical or physiological effects,
behavioral disturbance, stress, and
masking (Richardson et al., 1995;
Gordon et al., 2004; Nowacek et al.,
2007; Southall et al., 2007; Götz et al.,
2009). The degree of effect is
intrinsically related to the signal
characteristics, received level, distance
from the source, and duration of the
sound exposure. In general, sudden,
high level sounds can cause hearing
loss, as can longer exposures to lower
levels. Temporary or permanent
loss of hearing will occur almost
exclusively for noise within an animal’s
hearing range. We first describe specific
manifestations of acoustic effects before
providing discussion specific to Navy’s
pile driving.

Richardson et al. (1995) described
zones of increasing intensity of effect
that might be expected to occur, in
relation to distance from the source and
assuming that the signal is within an
animal’s hearing range. First is the area
within which the acoustic signal would be audible (potentially perceived) to the animal but not strong enough to elicit any overt behavioral or physiological response. The next zone corresponds with the area where the signal is audible to the animal and of sufficient intensity to elicit behavioral or physiological responsiveness. Third is a zone within which, for signals of high intensity, the received level is sufficient to potentially cause discomfort or tissue damage to auditory or other systems. Overlapping these zones to a certain extent is the area within which masking (i.e., when a sound interferes with or masks the ability of an animal to detect a signal of interest that is above the absolute hearing threshold) may occur; the masking zone may be highly variable in size.

We describe the more severe effects (i.e., certain non-auditory physical or physiological effects) only briefly as we do not expect that there is a reasonable likelihood that Navy pile driving may result in such effects. Non-auditory physiological effects or injuries that theoretically might occur in marine mammals exposed to high level underwater sound or as a secondary effect of extreme behavioral reactions (e.g., change in dive profile as a result of an avoidance reaction) caused by exposure to sound include neurological effects, bubble formation, resonance effects, and other types of organ or tissue damage (Cox et al., 2006; Southall et al., 2007; Zimmer and Tyack, 2007). Marine mammals that show behavioral avoidance of pile driving, including some odontocetes, are especially unlikely to incur auditory impairment or non-auditory physical effects, and Navy construction activities do not involve the use of devices such as explosives or mid-frequency active sonar that are associated with these types of effects.

1. Permanent Threshold Shift—Marine mammals exposed to high-intensity sound, or to lower-intensity sound for prolonged periods, can experience hearing threshold shift (TS), which is the loss of hearing sensitivity at certain frequency ranges (Finneran, 2015). TS can be permanent (PTS), in which case the loss of hearing sensitivity is not fully recoverable, or temporary (TTS), in which case the animal’s hearing threshold would recover over time (Southall et al., 2007). Repeated sound exposure that leads to TTS could cause PTS. In severe cases of PTS, there can be total or partial deafness, while in most cases the animal has an impaired ability to hear sounds in specific frequency ranges (Kryter, 1985).

When PTS occurs, there is physical damage to the sound receptors in the ear (i.e., tissue damage), whereas TTS represents primarily tissue fatigue and is reversible (Southall et al., 2007). In addition, other investigators have suggested that TTS is within the normal bounds of physiological variability and tolerance and does not represent physical injury (e.g., Ward, 1997). Therefore, NMFS does not consider TTS to constitute auditory injury.

Relationships between TTS and PTS thresholds have not been studied in marine mammals, and there is no PTS data for cetaceans, but such relationships are assumed to be similar to those in humans and other terrestrial mammals. PTS typically occurs (a 40-dB threshold shift approximates PTS onset; e.g., Kryter et al., 1966; Miller, 1974) at exposure levels at least several decibels above that inducing mild TTS (a 6-dB threshold shift approximates TTS onset; e.g., Southall et al. 2007). Based on data from terrestrial mammals, a precautionary assumption is that the PTS thresholds for impulse sounds (such as impact pile driving pulses as received close to the source) are at least 6 dB higher than the PTS threshold on a peak-pressure basis, and PTS cumulative sound exposure level thresholds are 15 to 20 dB higher than PTS cumulative sound exposure level thresholds (Southall et al., 2007). Given the higher level of sound or longer exposure duration necessary to cause PTS as compared with TTS, it is considerably less likely that PTS could occur.

2. Temporary Threshold Shift—TTS is the mildest form of hearing impairment that can occur during exposure to sound (Kryter, 1985). While experiencing TTS, the hearing threshold rises, and a sound must be at a higher level in order to be heard. In terrestrial and marine mammals, TTS can last from minutes or hours to days (in cases of strong TTS). In many cases, hearing sensitivity recovers rapidly after exposure to the sound ends. Few data on sound levels and durations necessary to elicit mild TTS have been obtained for marine mammals.

Marine mammal hearing plays a critical role in communication with conspecifs, and interpretation of environmental cues for purposes such as predator avoidance and prey capture. Depending on the degree (elevation of threshold in dB), duration (i.e., recovery time), and frequency range of TTS, and the context in which it is experienced, TTS can have effects on marine mammal ranging from discountable to serious. For example, a marine mammal may be able to readily compensate for a brief, relatively small amount of TTS in a non-critical frequency range that occurs during a time where ambient noise is lower and there are not as many competing sounds present. Alternatively, a larger amount and longer duration of TTS sustained during time when communication is critical for successful mother/calf interactions could have more serious impacts.

Currently, TTS data only exist for four species of cetaceans (bottlenose dolphin, beluga whale, harbor porpoise, and Yangtze finless porpoise (Neophocaena asiaeorientalis)) exposed to a limited number of sound sources (i.e., mostly tones and octave-band noise) in laboratory settings (Finneran, 2015). In general, harbor porpoises have a lower TTS onset than other measured cetacean species (Finneran, 2015). Additionally, the existing marine mammal TTS data come from a limited number of individuals within these species. There are no data available on noise-induced hearing loss for mysticetes. For summaries of data on TTS in marine mammals or for further discussion of TTS onset thresholds, please see Southall et al. (2007), Finneren and Jenkins (2012), and Finneran (2015).

3. Behavioral effects—Behavioral disturbance may include a variety of effects, including subtle changes in behavior (e.g., minor or brief avoidance of an area or changes in vocalizations), more conspicuous changes in similar behavioral activities, and more sustained and/or potentially severe reactions, such as displacement from or abandonment of high-quality habitat. Behavioral responses to sound are highly variable and context-specific and any reactions depend on numerous intrinsic and extrinsic factors (e.g., species, state of maturity, experience, current activity, reproductive state, auditory sensitivity, time of day), as well as the interplay between factors (e.g., Richardson et al., 1995; Wartzok et al., 2003; Southall et al., 2007; Weilgart, 2007; Archer et al., 2010). Behavioral reactions can vary not only among individuals but also within an individual, depending on previous experience with a sound source, context, and numerous other factors (Ellison et al., 2012), and can vary depending on characteristics associated with the sound source (e.g., whether it is moving or stationary, number of sources, distance from the source). Please see Appendices B–C of Southall et al. (2007) for a review of studies involving marine mammal behavioral responses to sound.

Habituation can occur when an animal’s response to a stimulus wanes...
with repeated exposure, usually in the absence of unpleasant associated events (Wartzok et al., 2003). Animals are most likely to habituate to sounds that are predictable and unvarying. It is important to note that habituation is appropriately considered as a “progressive reduction in response to stimuli that are perceived as neither aversive nor beneficial,” rather than as, more generally, moderation in response to human disturbance (Bejder et al., 2009). The opposite process is sensitization, when an unpleasant experience leads to subsequent responses, often in the form of avoidance, at a lower level of exposure.

As noted, behavioral state may affect the type of response. For example, animals that are resting may show greater behavioral change in response to disturbing sound levels than animals that are highly motivated to remain in an area for feeding (Richardson et al., 1995; NRC, 2003; Wartzok et al., 2003). Controlled experiments with captive marine mammals have shown pronounced behavioral reactions, including avoidance of loud sound sources (Ridgway et al., 1997). Observed responses of wild marine mammals to loud pulsed sound sources (typically seismic airguns or acoustic harassment devices) have been varied but often consist of avoidance behavior or other behavioral changes suggesting discomfort (Morton and Symonds, 2002; see also Richardson et al., 1995; Nowacek et al., 2007).

Available studies show wide variation in response to underwater sound; therefore, it is difficult to predict specifically how any given sound in a particular instance might affect marine mammals perceiving the signal. If a marine mammal does react briefly to an underwater sound by changing its behavior or moving a small distance, the impacts of the change are unlikely to be significant to the individual, let alone the stock or population. However, if a sound source displaces marine mammals from an important feeding or breeding area for a prolonged period, impacts on individuals and populations could be significant (e.g., Lusseau and Bejder, 2007; Weilgart, 2007; NRC, 2005). There are broad categories of potential response, which we describe in greater detail here, and that include alteration of dive behavior, alteration of foraging behavior, effects on breathing, interference with or alteration of vocalization, avoidance, and flight responses.

Changes in dive behavior can vary widely, and may consist of increased or decreased dive times and surface intervals as well as changes in the rates of ascent and descent during a dive (e.g., Frankel and Clark, 2000; Ng and Leung, 2003; Nowacek et al., 2004; Goldbogen et al., 2013a, b). Variations in dive behavior may reflect interruptions in biologically significant activities (e.g., foraging), or they may be of little biological significance. The impact of an alteration to dive behavior resulting from an acoustic exposure depends on what the animal is doing at the time of the exposure and the type and magnitude of the response.

Disruption of feeding behavior can be difficult to correlate with anthropogenic sound exposure, so it is usually inferred by observed displacement from known foraging areas, the appearance of secondary indicators (e.g., bubble nets or sediment plumes), or changes in dive behavior. As for other types of behavioral response, the frequency, duration, and temporal pattern of signal presentation, as well as differences in species sensitivity, are likely contributing factors to differences in response in any given circumstance (e.g., Croll et al., 1994; Nowacek et al., 2004; Madsen et al., 2006; Yazvenko et al., 2007). A determination of whether foraging disruptions incur fitness consequences would require information on or estimates of the energetic requirements of the affected individuals and the relationship between prey availability, foraging effort and success, and the life history stage of the animal.

Variations in respiration naturally vary with different behaviors, and alterations to breathing rate as a function of acoustic exposure can be expected to co-occur with other behavioral reactions, such as a flight response or an alteration in diving. However, respiration rates in and of themselves may be representative of annoyance or an acute stress response. Various studies have shown that respiration rates may either be unaffected or could increase, depending on the species and signal characteristics, again highlighting the importance in understanding species differences in the tolerance of underwater noise when determining the potential for impacts resulting from anthropogenic sound exposure (e.g., Kastelein et al., 2001, 2005, 2006; Gailey et al., 2007).

Marine mammals vocalize for different purposes and across multiple modes, such as whistling, echolocation click production, calling, and singing. Changes in vocalization behavior in response to anthropogenic noise can occur for any of these modes and may reflect a need to compete with a perceived increase in background noise or may reflect increased vigilance or a startle response. For example, in the presence of potentially masking signals, humpback whales and killer whales have been observed to increase the length of their songs (Miller et al., 2000; Fristrup et al., 2003; Foote et al., 2004), while right whales have been observed to shift the frequency content of their calls upward while reducing the rate of calling in areas of increased anthropogenic noise (Parks et al., 2007). In some cases, animals may cease sound production during production of aversive signals (Bowles et al., 1994).

Avoidance is the displacement of an individual from an area or migration path as a result of the presence of a sound or other stressors, and is one of the most obvious manifestations of disturbance in marine mammals (Richardson et al., 1995). For example, gray whales are known to change direction—deflecting from customary migratory paths—in order to avoid noise from seismic surveys (Malme et al., 1984). Avoidance may be short-term, with animals returning to the area once the noise has ceased (e.g., Bowles et al., 1994; Goold, 1996; Stone et al., 2000; Morton and Symonds, 2002; Gailey et al., 2007). Longer-term displacement is possible, however, which may lead to changes in abundance or distribution patterns of the affected species in the affected region if habituation to the presence of the sound does not occur (e.g., Bejder et al., 2006; Teilmann et al., 2006).

A flight response is a dramatic change in normal movement to a directed and rapid movement away from the perceived location of a sound source. The flight response differs from other avoidance responses in the intensity of the response (e.g., directed movement, rate of travel). Relatively little information on flight responses of marine mammals to anthropogenic signals exist, although observations of flight responses to the presence of predators have occurred (Connor and Heithaus, 1996). The result of a flight response could range from brief, temporary exertion and displacement from the area where the signal provokes flight to, in extreme cases, marine mammal strandings (Evans and England, 2001). However, it should be noted that response to a perceived predator does not necessarily invoke flight (Ford and Reeves, 2008), and whether individuals are solitary or in groups may influence the response.

Behavioral disturbance can also impact marine mammals in more subtle ways. Increased vigilance may result in costs related to diversion of focus and attention (i.e., when a response consists of increased vigilance, it may come at
the cost of decreased attention to other critical behaviors such as foraging or resting). These effects have generally not been demonstrated for marine mammals, but studies involving fish and terrestrial animals have shown that increased vigilance may substantially reduce feeding rates (e.g., Beauchamp and Livoreil, 1997; Fritz et al., 2002; Purser and Radford, 2011). In addition, chronic disturbance can cause population declines through reduction of fitness (e.g., decline in body condition) and subsequent reduction in reproductive success, survival, or both (e.g., Harrington and Veitch, 1992; Daan et al., 1996; Bradshaw et al., 1998). However, Ridgway et al. (2006) reported that increased vigilance in bottlenose dolphins exposed to sound over a five-day period did not cause any sleep deprivation or stress effects.

Many animals perform vital functions, such as feeding, resting, traveling, and socializing, on a diel cycle (24-hour cycle). Disruption of such functions resulting from reactions to stressors such as sound exposure are more likely to be significant if they last more than one diel cycle or recur on subsequent days (Southall et al., 2007). Consequently, a behavioral response lasting less than one day and not recurring on subsequent days is not considered particularly severe unless it could directly affect reproduction or survival (Southall et al., 2007). Note that there is a difference between multi-day substantive behavioral reactions and multi-day anthropogenic activities. For example, just because an activity lasts for multiple days does not necessarily mean that individual animals are either exposed to activity-related stressors for multiple days or, further, exposed in a manner resulting in sustained multi-day substantive behavioral responses.

4. Stress responses—An animal’s perception of a threat may be sufficient to trigger stress responses consisting of some combination of behavioral responses, autonomic nervous system responses, neuroendocrine responses, or immune responses (e.g., Soyle, 1995; Moberg, 2000). In many cases, an animal’s first and sometimes most economical (in terms of energetic costs) response is behavioral avoidance of the potential stressor. Autonomic nervous system responses to stress typically involve changes in heart rate, blood pressure, and gastrointestinal activity. These responses have a relatively short duration and may or may not have a significant long-term effect on an animal’s fitness.

Neuroendocrine stress responses often involve the hypothalamus–pituitary–adrenal system. Virtually all neuroendocrine functions that are affected by stress—including immune competence, reproduction, metabolism, and behavior—are regulated by pituitary hormones. Stress-induced changes in the secretion of pituitary hormones have been implicated in failed reproduction, altered metabolism, reduced immune competence, and behavioral disturbance (e.g., Moberg, 1987; Blecha, 2000). Increases in the circulation of glucocorticoids are also equated with stress (Romano et al., 2004). The primary distinction between stress (which is adaptive and does not normally place an animal at risk) and “distress” is the cost of the response. During a stress response, an animal uses glycogen stores that can be quickly replenished once the stress is alleviated. In such circumstances, the cost of the stress response would not pose serious fitness consequences. However, when an animal does not have sufficient energy reserves to satisfy the energetic costs of a stress response, energy resources must be diverted from other functions. This state of distress will last until the animal replenishes its energetic reserves sufficient to restore normal function.

Relationships between these physiological mechanisms, animal behavior, and the costs of stress responses are well-studied through controlled experiments and for both laboratory and free-ranging animals (e.g., Holberton et al., 1996; Hood et al., 1998; Jessop et al., 2003; Krausman et al., 2004; Lankford et al., 2005). Stress responses due to exposure to anthropogenic sounds or other stressors and their effects on marine mammals have also been reviewed (Fair and Becker, 2000; Romano et al., 2002b) and, more rarely, studied in wild populations (e.g., Romano et al., 2002a). For example, Rolland et al. (2012) found that noise reduction from reduced ship traffic in the Bay of Fundy was associated with decreased stress in North Atlantic right whales. These and other studies lead to a reasonable expectation that some marine mammals will experience physiological stress responses upon exposure to acoustic stressors and that it is possible that some of these would be classified as “distress.” In addition, any animal experiencing TTS would likely also experience stress responses (NRC, 2003).

5. Auditory masking—Sound can disrupt behavior through masking, or interfering with, an animal’s ability to detect, recognize, or discriminate between acoustic signals of interest (e.g., those used for intraspecific communication and social interactions, prey detection, predator avoidance, navigation) (Richardson et al., 1995; Erbe et al., 2016). Masking occurs when the receipt of a sound is interfered with by another coincident sound at similar frequencies and at similar or higher intensity, and may occur whether the sound is natural (e.g., snapping shrimp, wind, waves, precipitation) or anthropogenic (e.g., shipping, sonar, seismic exploration) in origin. The ability of a noise source to mask biologically important sounds depends on the characteristics of both the noise source and the signal of interest (e.g., signal-to-noise ratio, temporal variability, direction), in relation to each other and to an animal’s hearing abilities (e.g., sensitivity, frequency range, critical ratios, frequency discrimination, directional discrimination, age or TTS hearing loss), and existing ambient noise and propagation conditions.

Under certain circumstances, marine mammals experiencing significant masking could also be impaired from maximizing their performance fitness in survival and reproduction. Therefore, when the coincident (masking) sound is man-made, it may be considered harassment when disrupting or altering critical behaviors. It is important to distinguish TTS and PTS, which persist after the sound exposure, from masking, which occurs during the sound exposure. Because masking (without resulting in TS) is not associated with abnormal physiological function, it is not considered a physiological effect, but rather a potential behavioral effect.

The frequency range of the potentially masking sound is important in determining any potential behavioral impacts. For example, low-frequency signals may have less effect on high-frequency echolocation sounds produced by odontocetes but are more likely to affect detection of mysticete communication calls and other potentially important natural sounds such as those produced by surf and some prey species. The masking of communication signals by anthropogenic noise may be considered as a reduction in the communication space of animals (e.g., Clark et al., 2009) and may result in energetic or other costs as animals change their vocalization behavior (e.g., Miller et al., 2000; Foote et al., 2004; Parks et al., 2007; Di Iorio and Clark, 2009; Holt et al., 2009). Masking can be reduced in situations where the signal and noise come from different directions (Richardson et al., 1995), through amplitude modulation of the signal, or through other compensatory behaviors (Houser and Moore, 2014). Masking can
be tested directly in captive species (e.g., Erbe, 2008), but in wild populations it must be either modeled or inferred from evidence of masking compensation. There are few studies addressing real-world masking sounds likely to be experienced by marine mammals in the wild (e.g., Branstetter et al., 2013).

Masking affects both senders and receivers of acoustic signals and can potentially have long-term chronic effects on marine mammals at the population level as well as at the individual level. Low-frequency ambient sound levels have increased by as much as 20 dB (more than three times in terms of SPL) in the world’s ocean from pre-industrial periods, with most of the increase from distant commercial shipping (Hildebrand, 2009). All anthropogenic sound sources, but especially chronic and lower-frequency signals (e.g., from vessel traffic), contribute to elevated ambient sound levels, thus intensifying masking.

**Potential Navy Activity**—As described previously (see “Description of Active Acoustic Sound Sources”), the Navy proposes to conduct pile driving, including impact and vibratory driving. The effects of pile driving on marine mammals are dependent on several factors, including the size, type, and depth of the animal; the depth, intensity, and duration of the pile driving sound; the depth of the water column; the substrate of the habitat; the standoff distance between the pile and the animal; and the sound propagation properties of the environment. With both types of pile driving, it is likely that the onset of pile driving could result in temporary, short term changes in an animal’s typical behavior and/or avoidance of the affected area. These behavioral changes may include (Richardson et al., 1995): changing durations of surfacing and dives, number of blows per surfacing, or moving direction and/or speed; reduced/increased vocal activities; changing/cessation of certain behavioral activities (such as socializing or feeding); visible startle response or aggressive behavior (such as tail/fluke slapping or jaw clapping); avoidance of areas where sound sources are located; and/or flight responses.

The biological significance of many of these behavioral disturbances is difficult to predict, especially if the detected disturbances appear minor. However, the consequences of behavioral modification could be expected to be biologically significant if the change affects survival or reproduction. Significant behavioral modifications that could lead to effects on growth, survival, or reproduction, such as drastic changes in diving/surfacing patterns or significant habitat abandonment are extremely unlikely in this area (i.e., shallow waters in a heavily altered industrial area).

The onset of behavioral disturbance from anthropogenic sound depends on both external factors (characteristics of sound sources and their paths) and the specific characteristics of the receiving animals (hearing, motivation, experience, demography) and is difficult to predict (Southall et al., 2007). Whether impact or vibratory driving, sound sources would be active for relatively short durations, with relation to potential for masking. The frequencies output by pile driving activity are lower than those used by bottlenose dolphins for communication or foraging. We expect insignificant impacts from masking, and any masking event that could possibly rise to Level B harassment under the MMPA would occur concurrently within the zones of behavioral avoidance already estimated for vibratory and impact pile driving, and which have already been taken into account in the exposure analysis.

### Anticipated Effects on Marine Mammal Habitat

The proposed activities would not result in permanent impacts to habitats used directly by marine mammals, but may have potential short-term impacts to food sources such as forage fish. The proposed activities could also affect acoustic habitat (see masking discussion above), but meaningful impacts are unlikely. There are no known foraging hotspots, or other ocean bottom structures of significant biological importance to marine mammals present in the marine waters in the vicinity of the project area. Therefore, the main impact issue associated with the proposed activity would be temporarily elevated sound levels and the associated direct effects on marine mammals, as discussed previously in this preamble. The most likely impact to marine mammal habitat occurs from pile driving effects on likely marine mammal prey (i.e., fish) near NSB Kings Bay and minor impacts to the immediate substrate during installation and removal of piles. **Effects to Prey**—Impact pile driving would produce pulsed sounds, and fish react to sounds which are especially strong and/or intermittent low-frequency sounds. Short duration, sharp sounds can cause overt or subtle changes in fish behavior and local distribution. Hastings and Popper (2005) identified several studies that suggest fish may relocate to avoid certain areas of sound energy. Additional studies have documented effects of pile driving on fish, although several are based on studies in support of large, multyear bridge construction projects (e.g., Scholik and Yan, 2001, 2002; Popper and Hastings, 2009). Sound pulses at various received levels may cause subtle to noticeable changes in fish behavior (Pearson et al., 1992; Skalski et al., 1992). SPLs of sufficient strength have been known to cause injury to fish and fish mortality. The most likely impact to fish from pile driving activities at the project area would be temporary behavioral avoidance of the area. The duration of fish avoidance of this area after pile driving stops is unknown, but a rapid return to normal recruitment, distribution, and behavior is anticipated. In general, impacts to marine mammal prey species are expected to be minor and temporary due to the expected short daily duration of individual pile driving events and the relatively small areas being affected. It is also not expected that the industrial environment of NSB Kings Bay provides important fish habitat or harbors significant amounts of forage fish.

The area likely impacted by the project is relatively small compared to the available habitat in inland waters in the region. Any behavioral avoidance by fish of the disturbed area would still leave significantly large areas of fish and marine mammal foraging habitat in the nearby vicinity. As described in the preceding, the potential for Navy construction to affect the availability of prey to marine mammals or to meaningfully impact the quality of physical or acoustic habitat is considered to be insignificant. Effects to habitat will not be discussed further in this document.

### Estimated Take by Incidental Harassment

Except with respect to certain activities not pertinent here, section 3(18) of the MMPA defines “harassment” as: “. . . any act of pursuit, torment, or annoyance which (i) has the potential to injure a marine mammal or marine mammal stock in the wild (Level A harassment); or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering (Level B harassment).”

Anticipated takes would be by Level B harassment, as pile driving activity has the potential to result in disruption of behavioral patterns for individual
marine mammals. Level A harassment by auditory injury is unlikely to occur as a result of this activity for bottlenose dolphins (i.e., mid-frequency hearing specialists) and, although it is unlikely that take by Level A harassment would occur even in the absence of the proposed mitigation and monitoring measures, the proposed measures are expected to further minimize such potential. The Navy has requested authorization for the incidental taking by Level B harassment of bottlenose dolphins in the vicinity of NSB Kings Bay that may result from pile driving during waterfront construction activities described previously in this document.

**Sound Thresholds**

We have historically used generic sound exposure thresholds (see Table 5) to determine when an activity that produces sound might result in impacts to a marine mammal such that a take by harassment might occur. These thresholds should be considered for auditory injury than do NMFS’s historical criteria. The guidance reflects the best available science on the potential for noise to affect auditory sensitivity by:

- Dividing sound sources into two groups (i.e., impulsive and non-impulsive) based on their potential to affect hearing sensitivity;
- Choosing metrics that better address the impacts of noise on hearing sensitivity, i.e., peak SPL (better reflects the physical properties of impulsive sound sources, to affect hearing sensitivity) and cumulative sound exposure level (cSEL) (accounts for not only level of exposure but also durations of exposure);
- Dividing marine mammals into functional hearing groups and developing auditory weighting functions based on the science supporting that not all marine mammals hear and use sound in the same manner. NMFS’s new guidance (NMFS, 2016) recommends specific thresholds under the dual metric approach (i.e., peak SPL and cSEL) and recommends that marine mammals be divided into functional hearing groups based on measured or estimated functional hearing ranges. The premise of the dual criteria approach is that, while there is no definitive answer to the question of which acoustic metric is most appropriate for assessing the potential for injury, both the intensity and duration of received signals are important to an understanding of the potential for injury. Therefore, peak SPL is used to define a pressure criterion above which tissue injury is predicted to occur, regardless of exposure duration (i.e., any single exposure at or above this level is considered to cause tissue injury), and cSEL is used to account for the total energy received over the duration of sound exposure (i.e., both received level and duration of exposure) (Southall et al., 2007; NMFS, 2016). As a general principle, whichever criterion is exceeded first would be used as the effective injury criterion (i.e., the more precautionary of the criteria). Note that cSEL acoustic threshold levels incorporate marine mammal auditory weighting functions, while peak pressure thresholds do not. NMFS (2016) recommends 24 hours as a maximum accumulation period relative to cSEL thresholds. For further discussion of auditory weighting functions and their application, please see NMFS (2016). Table 6 displays relevant thresholds provided by NMFS (2016).

1 Onset PTS—any level above that which is known to cause TTS.
2 Referenced to 1 μPa; unweighted within generalized hearing range.
3 Referenced to 1 μPa·s; weighted according to appropriate auditory weighting function.

NMFS considers these updated thresholds and associated weighting functions to be the best available information for assessing whether exposure to sound from specific activities is likely to result in changes in marine mammal hearing sensitivity. In this case, Navy submitted a timely

In August 2016, NMFS released its “Technical Guidance for Assessing the Effects of Anthropogenic Sound on Marine Mammal Hearing,” which established new thresholds for predicting auditory injury (NMFS, 2016), and which equates to Level A harassment under the MMPA. For more information, please visit www.nmfs.noaa.gov/pr/acoustics/guidelines.htm. In the August 4, 2016, Federal Register notice announcing the guidance (81 FR 51694), NMFS explained the approach it would take during a transition period, wherein we balance the need to consider this new best available science with the fact that some applicants have already committed time and resources to the development of acoustic analyses based on our previous thresholds and have constraints that preclude the recalculation of take estimates, as well as with a consideration of where the agency is in the decision-making pipeline. In that notice, we included a non-exhaustive list of factors that would inform the most appropriate approach for considering the new guidance, including: how far in the MMPA process the applicant has progressed; the scope of the effects; when the authorization is needed; the cost and complexity of the analysis; and the degree to which the guidance is expected to affect our analysis.

The new guidance identifies the received levels, or thresholds, above which individual marine mammals are predicted to experience changes in their hearing sensitivity (either temporary or permanent) for all underwater anthropogenic sound sources, reflects the best available science, and is intended to better predict the potential...
The general formula for underwater TL is:

\[ TL = B \times \log_{10}(R_1/R_2) \]

Where:
- \( R_1 \) = the distance of the modeled SPL from the driven pile, and
- \( R_2 \) = the distance from the driven pile of the initial measurement.

This formula neglects loss due to scattering and absorption, which is assumed to be zero here. The degree to which underwater sound propagates away from a sound source is dependent on a variety of factors, most notably the water bathymetry and presence or absence of reflective or absorptive conditions including in-water structures and sediments. Spherical spreading occurs in a perfectly unobstructed (free-field) environment, here we assume practical spreading loss (4.5 dB reduction in sound level for each doubling of distance from the source \( 20 \times \log(\text{range}) \)). Cylindrical spreading occurs in an environment in which sound propagation is bounded by the water surface and sea bottom, resulting in a reduction of 3 dB in sound level for each doubling of distance from the source \( 10 \times \log(\text{range}) \)).

Zones of Influence

**Sound Propagation**—Pile driving generates underwater noise that can potentially result in disturbance to marine mammals in the project area. Transmission loss (TL) is the decrease in acoustic intensity as an acoustic pressure wave propagates out from a source. TL parameters vary with frequency, temperature, sea conditions, current, source and receiver depth, water depth, water chemistry, and bottom composition and topography.

**Sources:**

We consider the values presented in Table 7 to be representative of SPLs that may be produced by the specified activity. All calculated distances to and the total area encompassed by the marine mammal sound thresholds are provided in Table 8. Calculated radial distances to the 160 dB threshold assume a field free of obstruction.
However, the waters surrounding NSB Kings Bay do not represent open water conditions and the calculated zone-specific areas take landforms into consideration. Actual zones are depicted in Figures 6–1 through 6–26 of the Navy’s application. Although calculated radial distances to threshold do not change, the actual zone sizes may vary depending on the specific project location.

Areas presented take into account attenuation and/or shadowing by land. Please see Figures 6–1 to 6–26 in the Navy’s application.

### Marine Mammal Density

The Navy conducted marine mammal surveys at NSB Kings Bay during 2006–2007 (McKee and Latusek, 2009). Transect lines were run in the waters around NSB Kings Bay during summer and fall 2006 and during winter and spring 2007. The survey area included estuarine waters extending from the mouth of the St. Marys River north through the Cumberland Sound to approximately eight nautical miles (nmi) inland along the Satilla River. The Crooked River and the Brickhill River, which flow into Cumberland Sound, were also part of the study area, though line transects were not possible in these locations, and census counts were substituted here. The geographic limits ranged from 30°40’ N. to 31°00’ N. and inland limits to 81°40’ W. Nearshore Atlantic waters were not included in the surveys.

Observations were made with 7x50 power binoculars and with the naked eye, scanning from 0–90° relative to the vessel’s line of travel. Sightings, radial distance and angle to animal, and number of individuals were recorded. For census count areas, the vessel was driven along the center line of the river and distance and angle to sightings were noted. Commercially available software (Distance 5.0) was used to analyze the collected data, including area surveyed, and calculate a seasonal density. Seasonal densities were combined to calculate an average annual density of 1.12 dolphins per km².

#### Incidental Take Calculation

The species density described above (1.12 animals/km²) was multiplied by

The Navy has requested authorization for a total of 881 incidents of Level B harassment of bottlenose dolphins over the five-year period of validity of these proposed regulations. Table 9 displays the total take estimate broken out by project and year. However, note that year assignments reflect only the projected project start years. Projects may continue into succeeding years, but neither exact start dates nor whether a project would in fact continue into the succeeding year are known at this time.

Analyses and Preliminary Determinations

Negligible Impact Analysis

NMFS has defined “negligible impact” in 50 CFR 216.103 as “... an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival.” A negligible impact finding is based on the lack of likely adverse effects on annual rates of recruitment or survival (i.e., population-level effects). An estimate of the number of takes alone is not enough information on which to base an impact determination. In addition to considering estimates of the number of marine mammals that might be taken by mortality, serious injury, and Level A or Level B harassment, we consider other factors, such as the likely nature of any behavioral responses (e.g., intensity, duration), the context of any such responses (e.g., critical reproductive time or location, migration), as well as the number and nature of estimated Level A harassment takes (if any), and effects on habitat. We also assess the number, intensity, and context of estimated takes by evaluating this information relative to population status (i.e., the environmental baseline).

Consistent with the 1989 preamble for NMFS’s implementing regulations (54 FR 40338; September 29, 1989), the impacts from other past and ongoing anthropogenic activities are incorporated into these analyses via their impacts on the environmental baseline (e.g., as reflected in the regulatory status of the species, population size and growth rate where known, sources of human-caused mortality).

Pile driving activities associated with the wharf construction projects, as described previously, have the potential to disturb or displace marine mammals. Specifically, the specified activities may result in take, in the form of Level B harassment (behavioral disturbance) only, from underwater sounds generated from pile driving. Potential takes could occur if individual bottlenose dolphins are present in the ensonified zone when pile driving is happening.

No serious injury or mortality would be expected even in the absence of the proposed mitigation measures. No Level A harassment is anticipated given the nature of the activities and measures designed to minimize the possibility of injury. The potential for injury is small, and is expected to be essentially eliminated through implementation of the planned mitigation measures—soft start (for impact driving) and shutdown zones. Impact driving, as compared with vibratory driving, has source characteristics (short, sharp pulses with higher peak levels and much sharper rise time to reach those peaks) that are potentially injurious or more likely to produce severe behavioral reactions. Given sufficient notice through use of soft start, marine mammals are expected to move away from a sound source that is annoying prior to its becoming potentially injurious or resulting in more severe behavioral reactions.

Environmental conditions in waters surrounding NSB Kings Bay are expected to generally be good, with calm sea states, albeit with high turbidity. Nevertheless, we expect conditions would allow a high marine mammal detection capability, enabling a high rate of success in implementation of shutdowns to avoid injury.

Effects on individuals that are taken by Level B harassment, on the basis of reports in the literature as well as monitoring from other similar activities, will likely be limited to reactions such as increased swimming speeds, increased surfacing time, or decreased foraging (if such activity were occurring) (e.g., Thorson and Reyff, 2006; HDR, Inc., 2012; Lerma, 2014). Most likely, individuals will simply move away from the sound source and be temporarily displaced from the areas of pile driving, although even this reaction has been observed primarily only in association with impact pile driving.

The pile driving activities analyzed here are similar to, or less impactful than, numerous other construction activities.
conducted in San Francisco Bay and in the Puget Sound region, which have taken place with no known long-term adverse consequences from behavioral harassment.

The Navy has conducted similar multi-year activities potentially affecting bottlenose dolphins in San Diego Bay and in the same general region at Mayport Florida, that have similarly reported no apparently consequential behavioral reactions or long-term effects on bottlenose dolphin populations (Lerma, 2014; Navy, 2015). Repeated exposures of individuals to relatively low levels of sound outside of preferred habitat areas are unlikely to significantly disrupt critical behaviors. Thus, even repeated Level B harassment of some small subset of the overall stock is unlikely to result in any significant realized decrease in viability for the affected individuals, and thus would not result in any adverse impact to the stock as a whole. Level B harassment will be reduced to the level of least practicable adverse impact through use of mitigation measures described herein and, if sound produced by project activities is sufficiently disturbing, animals are likely to simply avoid the area while the activity is occurring. While vibratory driving associated with some project components may produce sound at distances of multiple kilometers from the pile driving site, thus intruding on higher-quality habitat, the project sites themselves and the majority of sound fields produced by the specified activities are within a heavily impacted, industrialized area. Therefore, we expect that animals annoyed by project sound would simply avoid the area and use more-preferred habitats.

In summary, this negligible impact analysis is founded on the following factors: (1) The possibility of injury, serious injury, or mortality may reasonably be considered discountable; (2) the anticipated incidents of Level B harassment consist of, at worst, temporary modifications in behavior; (3) the absence of any significant habitat within the project area, including known areas or features of special significance for foraging or reproduction; and (4) the presumed efficacy of the proposed mitigation measures in reducing the effects of the specified activity to the level of least practicable adverse impact. In addition, while some of the potentially affected stocks are considered depleted under the MMPA, it is unlikely that minor noise effects in a small, localized area would have any effect on the stocks’ ability to recover. In combination, we believe that these factors, as well as the available body of evidence from other similar activities, demonstrate that the potential effects of the specified activities will have only minor, short-term effects on individuals. The specified activities are not expected to impact rates of recruitment or survival and will therefore not result in population-level impacts.

Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the proposed monitoring and mitigation measures, we preliminarily find that the total marine mammal take from the Navy’s waterfront construction activities will have a negligible impact on the affected marine mammal species or stocks.

Small Numbers Analysis

Please see Table 9 for information relating to this small numbers analysis; as described previously, although we provide exposure estimates broken out by year and project component, we do not have specific information about when each project would be concluded or therefore how many takes may actually accrue in any given year during the five-year period of validity of these propose regulations. The annual average over the course of the five year period is 176 takes. Of these annual average 176 incidents of behavioral harassment predicted to occur for bottlenose dolphin, we have no information allowing us to parse the predicted incidents amongst the stocks of bottlenose dolphin that may occur in the project area. However, because they would be expected to occur only rarely and/or seasonally, we assume that only small numbers of individuals of the northern Florida coastal, southern migratory coastal, and Jacksonville estuarine system stocks would be potentially present and available to be taken.

The South Carolina/Georgia coastal and southern Georgia estuarine system stocks are expected to potentially be present more regularly. For the South Carolina/Georgia coastal stock, the annual average predicted number of incidents of take proposed for authorization would be considered small—approximately four percent—even if each estimated taking occurred to a new individual. This is an extremely unlikely scenario as, for bottlenose dolphins in estuarine and nearshore waters, there is likely to be some overlap in individuals present day-to-day. The total number of authorized takes for bottlenose dolphins, if assumed to accrue solely to new individuals of the SGES stock, is higher relative to the total stock abundance, which is currently estimated at 194 individuals. As described previously, this estimate is the result of surveys covering only a portion of the stock range and is assumed to underestimate the stock abundance. Regardless, these numbers represent the estimated incidents of take, not the number of individuals taken. That is, it is highly likely that a relatively small subset of SGES bottlenose dolphins would be harassed by project activities. SGES bottlenose dolphins range from Cumberland Sound at the Georgia-Florida border north to the Altamaha Sound, Georgia, an area spanning approximately 70 linear km of coastline and including habitat consisting of complex inshore and estuarine waterways. SGES dolphins show strong site fidelity (Balmer et al., 2013), and it is likely that the majority of SGES dolphins would not occur within waters ensonified by project activities. In summary, SGES dolphins are known to exhibit strong site fidelity (i.e., individuals do not generally range throughout the recognized overall SGES stock range), and the specified activity will be stationary within a relatively enclosed industrial area not recognized as an area of any special significance that would serve to attract or aggregate dolphins. We therefore believe that the estimated numbers of take, were they to occur, likely represent repeated exposures of a much smaller number of bottlenose dolphins, and that these estimated incidents of take represent small numbers of bottlenose dolphins.

Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, we preliminarily find that small numbers of marine mammals will be taken relative to the populations of the affected species or stocks.

Proposed Monitoring and Reporting

In order to issue an incidental take authorization for an activity, section 101(a)(5)(A) of the MMPA states that NMFS must set forth “requirements pertaining to the monitoring and reporting of such taking.” The MMPA implementing regulations at 50 CFR 216.104(a)(13) indicate that requests for incidental take authorizations must include the suggested means of accomplishing the necessary monitoring and reporting that will result in increased knowledge of the species and of the level of taking or impacts on populations of marine mammals that are expected to be present in the proposed action area.
Any monitoring requirement we prescribe should improve our understanding of one or more of the following:

- Occurrence of marine mammal species in action area (e.g., presence, abundance, distribution, density).
- Nature, scope, or context of likely marine mammal exposure to potential stressors/impacts (individual or cumulative, acute or chronic), through better understanding of: (1) Action or environment (e.g., source characterization, propagation, ambient noise); (2) affected species (e.g., life history, dive patterns); (3) co-occurrence of marine mammal species with the action; or (4) biological or behavioral context of exposure (e.g., age, calving, or feeding areas).
- Individual responses to acute stressors, or impacts of chronic exposures (behavioral or physiological).
- How anticipated responses to stressors impact either: (1) long-term fitness and survival of an individual; or (2) population, species, or stock.
- Effects on marine mammal habitat and resultant impacts to marine mammals.
- Mitigation and monitoring effectiveness.

The Navy provided a separate Marine Mammal Monitoring Plan, which is available online at www.nmfs.noaa.gov/pr/permits/incidental/construction.htm.

**Visual Marine Mammal Observations**

The Navy will collect sighting data and behavioral responses to construction for marine mammal species observed in the region of activity during the period of activity. All observers will be trained in marine mammal identification and behaviors and are required to have no other construction-related tasks while conducting monitoring. The Navy would monitor all shutdown zones at all times, and would monitor disturbance zones during a varying subset of total project days. Approximately half of disturbance zone monitoring effort is proposed for allocation during the first two years of project activities in order to provide verification during the early stages of the project regarding assumed numbers of bottlenose dolphins present in the area. If compliance monitoring results suggest that the actual number of incidental take events may differ significantly from the number originally authorized, the Navy would consult with NMFS. The Navy would conduct monitoring before, during, and after pile driving activity. Observers located at the best practicable vantage points. Based on our requirements, the Navy would implement the following procedures for pile driving:

- Marine mammal observers would be located at the best vantage point(s) in order to properly see the entire shutdown zone and as much of the disturbance zone as possible.
- During all observation periods, observers will use binoculars and the naked eye to search continuously for marine mammals.
- If the shutdown zones are obscured by fog or poor lighting conditions, pile driving at that location will not be initiated until that zone is visible. Should such conditions arise while impact driving is underway, the activity would be halted.
- The shutdown zone around the pile would be monitored for the presence of marine mammals before, during, and after all pile driving activity, while disturbance zone monitoring would be implemented according to the schedule proposed here.

Notional marine mammal observation locations are depicted in Figures 3–14 of the Navy’s monitoring plan. Total days planned for each project are provided above in Table 2. Project-specific disturbance zone monitoring proposals are described in the following list:

- **Project 1A**—A minimum of three observers would be deployed to monitor the disturbance zone on a minimum of ten days of vibratory pile driving.
- **Project 1B**—Only two total days of work are proposed as part of Project 1B, and no disturbance zone monitoring is proposed.
- **Project 2**—Only impact pile driving is proposed in association with Project 2; therefore, the disturbance zone would be visible during shutdown zone monitoring.
- **Project 3A**—This project is expected to occur in two phases, beginning in FY2017 and FY2022. During phase one, only two total days of work are proposed and no disturbance zone monitoring is proposed. During phase two, a minimum of three observers would be deployed to monitor the disturbance zone on a minimum of three days of vibratory pile driving.
- **Project 3B**—A minimum of three observers would be deployed to monitor the disturbance zone on a minimum of five days of vibratory pile driving.
- **Projects 3C, 3D, and 3E**—A minimum of two observers would be deployed to monitor the disturbance zone during all vibratory driving associated with these projects.
- **Project 3F**—A minimum of three observers would be deployed to monitor the disturbance zone on a minimum of two days of vibratory pile driving.
- **Project 3G**—A minimum of three observers would be deployed to monitor the disturbance zone on a minimum of four days of vibratory pile driving.
- **Project 4A**—A minimum of four observers would be deployed to monitor the disturbance zone on a minimum of eight days of vibratory pile driving.
- **Project 4B**—A minimum of four observers would be deployed to monitor the disturbance zone on a minimum of three days of vibratory pile driving.
- **Project 5**—A minimum of four observers would be deployed to monitor the disturbance zone on a minimum of three days of vibratory pile driving.
- **Projects 6A and 6B**—A minimum of five observers would be deployed to monitor the disturbance zone on a minimum of twelve days of vibratory pile driving.

Individuals implementing the monitoring protocol will assess its effectiveness using an adaptive approach. Monitoring biologists will use their best professional judgment throughout implementation and seek improvements to these methods when deemed appropriate. Any modifications to the protocol will be coordinated between NMFS and the Navy.

**Data Collection**

We require that observers use standardized data forms. Among other pieces of information, the Navy will record detailed information about any implementation of shutdowns, including the distance of animals to the pile and description of specific actions that ensued and resulting behavior of the animal, if any. We require that, at a minimum, the following information be collected on the sighting forms:

- Date and time that monitored activity begins or ends;
- Construction activities occurring during each observation period;
- Weather parameters (e.g., wind speed, percent cloud cover, visibility);
- Water conditions (e.g., sea state, tide state);
- Species, numbers, and, if possible, sex and age class of marine mammals;
- Description of any observable marine mammal behavior patterns, including bearing and direction of travel and distance from pile driving activity;
- Distance from pile driving activities to marine mammals and distance from the marine mammals to the observation point;
- Description of implementation of mitigation measures (e.g., shutdown or delay);
- Locations of all marine mammal observations; and
- Other human activity in the area.
Acoustic Monitoring

The Navy would implement a sound source level verification study during activities associated with specific project components of interest. Because data is relatively lacking for these pile types, data collection would be targeted towards impact and vibratory driving of concrete, timber and composite piles. A sample scope of work for acoustic monitoring is provided as Attachment 3 of the Navy’s monitoring plan. The exact specifications of the acoustic monitoring work would be finalized in consultation with Navy personnel, subject to constraints related to logistics and security requirements. Reporting of measured sound level signals will include the average, minimum, and maximum rms value and frequency spectra for each pile monitored. Peak and single-strike SEL values would also be reported for impact pile driving. Acoustic monitoring would be conducted in association with Project 1A (impact driving of 18–24” concrete piles and vibratory removal of 16” timber piles); Project 2 (impact driving of 14” steel H piles); Project 4A (impact driving of 18–24” concrete piles and vibratory removal of 24” concrete piles); and Projects 6A and 6B (vibratory removal of 24” concrete piles).

Marine Mammal Surveys

Subject to funding availability, additional work would be performed to describe the spatial and temporal distributions of bottlenose dolphins and their densities in areas that may be affected by the specified activities. Surveys would be performed as soon as practicable.

Reporting

A draft report would be submitted to NMFS within 90 days of the completion of the monitoring period for each project. The report will include marine mammal observations pre-activity, during-activity, and post-activity during pile driving days, and will also provide descriptions of any behavioral responses to construction activities by marine mammals and a complete description of all mitigation shutdowns and the results of those actions and an extrapolated total take estimate based on the number of marine mammals observed during the course of construction. A final report must be submitted within thirty days following resolution of comments on the draft report. The Navy would also submit a comprehensive summary report following conclusion of the specified activities.

Adaptive Management

The regulations governing the take of marine mammals incidental to Navy waterfront construction activities would contain an adaptive management component.

The reporting requirements associated with this proposed rule are designed to provide NMFS with monitoring data from the previous year to allow consideration of whether any changes are appropriate. The use of adaptive management allows NMFS to consider new information from different sources to determine (with input from the Navy regarding practicability) on an annual or biennial basis if mitigation or monitoring measures should be modified (including additions or deletions). Mitigation measures could be modified if new data suggests that such modifications would have a reasonable likelihood of reducing adverse effects to marine mammals and if the measures are practicable.

The following are some of the possible sources of applicable data to be considered through the adaptive management process: (1) Results from monitoring reports, as required by MMPA authorizations; (2) results from general marine mammal and sound research; and (3) any information which reveals that marine mammals may have been taken in a manner, extent, or number not authorized by these regulations or subsequent LOAs.

Impact on Availability of Affected Species for Taking for Subsistence Uses

There are no relevant subsistence uses of marine mammals implicated by these actions. Therefore, we have determined that the total taking of affected species or stocks would not have an unmitigable adverse impact on the availability of such species or stocks for taking for subsistence purposes.

Endangered Species Act (ESA)

No marine mammal species listed under the ESA are expected to be affected by these activities. Therefore, we have determined that section 7 consultation under the ESA is not required.

National Environmental Policy Act (NEPA)

The Navy has prepared a draft EA in accordance with NEPA and the regulations published by the Council on Environmental Quality. We have posted it on the NMFS Web site concurrently with the publication of these proposed regulations. NMFS will independently evaluate the EA and determine whether or not to adopt it. We may prepare a separate NEPA analysis and incorporate relevant portions of the Navy’s EA by reference. Information in the Navy’s application, EA, and this notice collectively provide the environmental information related to proposed issuance of the regulations for public review and comment. We will review all comments submitted in response to this notice as we complete the NEPA process, including a decision of whether to sign a FONSI, prior to a final decision on the request for incidental take authorization.

Request for Information

NMFS requests interested persons to submit comments, information, and suggestions concerning the Navy’s request and the proposed regulations (see ADDRESSES). All comments will be reviewed and evaluated as we prepare the final rule and make final determinations on whether to issue the requested authorizations. This notice and referenced documents provide all environmental information relating to our proposed action for public review.

Classification

Pursuant to the procedures established to implement Executive Order 12866, the Office of Management and Budget has determined that this proposed rule is not significant.

Pursuant to section 605(b) of the Regulatory Flexibility Act (RFA), the Chief Counsel for Regulation of the Department of Commerce has certified to the Chief Counsel for Advocacy of the Small Business Administration that this proposed rule, if adopted, would not have a significant economic impact on a substantial number of small entities. Navy is the sole entity that would be subject to the requirements in these proposed regulations, and the U.S. Navy is not a small governmental jurisdiction, small organization, or small business, as defined by the RFA. Because of this certification, a regulatory flexibility analysis is not required and none has been prepared.

This proposed rule does not contain a collection-of-information requirement subject to the provisions of the Paperwork Reduction Act (PRA) because the applicant is a Federal agency. Notwithstanding any other provision of law, no person is required to respond to nor shall a person be subject to a penalty for failure to comply with a collection of information subject to the requirements of the PRA unless that collection of information displays a currently valid OMB control number. These requirements have been approved by OMB under control number 0648–0151 and include applications for
§217.250 Specified activity and specified geographical region.  

(a) Regulations in this subpart apply only to the U.S. Navy (Navy) and those persons it authorizes or funds to conduct activities on its behalf for the taking of marine mammals that occurs in the area outlined in paragraph (b) of this section and that occurs incidental to waterfront construction activities.  

(b) The taking of marine mammals by Navy may be authorized in a Letter of Authorization (LOA) only if it occurs within waters adjacent to Naval Submarine Base Kings Bay and Crab Island.

§217.251 Effective dates.  

Regulations in this subpart are effective from [EFFECTIVE DATE OF FINAL RULE] through [DATE 5 YEARS AFTER EFFECTIVE DATE OF FINAL RULE].

§217.252 Permissible methods of taking.  

(a) Under LOAs issued pursuant to §§216.106 and 217.256 of this chapter, the Holder of the LOA (hereinafter "Navy") may incidentally, but not intentionally, take marine mammals within the area described in §217.250(b) of this chapter by Level B harassment associated with waterfront construction activities, provided the activity is in compliance with all terms, conditions, and requirements of the regulations in this subpart and the appropriate LOA.

(b) Except for pile driving covered under subsections (c) and (d), for all pile driving activity, the Navy shall implement a minimum shutdown zone of 15 m radius around the pile. If a marine mammal comes within or approaches the shutdown zone, such operations shall cease.

(c) For impact pile driving associated with Project 3F (Warping Wharf with Capstan), the Navy shall implement a minimum shutdown zone of 40 m radius around the pile. If a marine mammal comes within or approaches the shutdown zone, such operations shall cease.

(d) For impact pile driving associated with Project 4B (Small Craft Berth Site VI), the Navy shall implement a minimum shutdown zone of 20 m radius around the pile. If a marine mammal comes within or approaches the shutdown zone, such operations shall cease.

(e) The Navy shall deploy marine mammal observers as indicated in the final Marine Mammal Monitoring Plan and as described in §217.255 of this chapter.

(1) For all pile driving activities, a minimum of one observer shall be stationed at the active pile driving rig or reasonable proximity in order to monitor the shutdown zone.

(2) Monitoring shall take place from 15 minutes prior to initiation of pile driving activity through 30 minutes post-completion of pile driving activity. Pre-activity monitoring shall be conducted for 15 minutes to ensure that the shutdown zone is clear of marine mammals, and pile driving may commence when observers have declared the shutdown zone clear of marine mammals. In the event of a delay or shutdown of activity resulting from marine mammals in the shutdown zone, animals shall be allowed to remain in the shutdown zone (i.e., must leave of their own volition) and their behavior shall be monitored and documented. Monitoring shall occur throughout the time required to drive a pile. The shutdown zone must be determined to be clear during periods of good visibility (i.e., the entire shutdown zone and surrounding waters must be visible to the naked eye).

(3) If a marine mammal approaches or enters the shutdown zone, all pile driving activities shall be halted. If pile driving is halted or delayed due to the presence of a marine
mammal, the activity may not commence or resume until either the animal has voluntarily left and been visually confirmed beyond the shutdown zone or fifteen minutes have passed without re-detection of the animal.

(4) Monitoring shall be conducted by trained observers, who shall have no other assigned tasks during monitoring periods. Trained observers shall be placed from the best vantage point(s) practical to monitor for marine mammals and implement shutdown or delay procedures when applicable through communication with the equipment operator.

(f) The Navy shall use soft start techniques for impact pile driving. Soft start for impact drivers requires contractors to provide an initial set of strikes at reduced energy, followed by a thirty-second waiting period, then two subsequent reduced energy strike sets. Soft start shall be implemented at the start of each day’s impact pile driving and at any time following cessation of impact pile driving for a period of thirty minutes or longer.

§ 217.255 Requirements for monitoring and reporting.

(a) Trained observers shall complete applicable portions of the Navy’s Marine Species Awareness Training, as well as a general environmental awareness briefing conducted by Navy staff. At minimum, training shall include identification of bottlenose dolphins and relevant mitigation and monitoring requirements. All observers shall have no other construction-related tasks while conducting monitoring.

(b) For shutdown zone monitoring, the Navy shall report on implementation of shutdown or delay procedures, including whether the procedures were not implemented and why (when relevant).

(c) The Navy shall deploy additional observers to monitor disturbance zones according to the minimum requirements defined in this chapter. These observers shall collect sighting data and behavioral responses to pile driving for marine mammal species observed in the region of activity during the period of activity, and shall communicate with the shutdown zone observer as appropriate with regard to the presence of marine mammals. All observers shall be trained in identification and reporting of marine mammal behaviors.

(1) During Project 1A (Tug Pier), Navy shall deploy a minimum of three additional marine mammal monitoring observers on a minimum of ten days of vibratory pile driving activity.

(2) During the fiscal year 2022 phase of Project 3A (Explosives Handling Wharf #2), Navy shall deploy a minimum of three additional marine mammal monitoring observers on a minimum of three days of vibratory pile driving activity.

(3) During Project 3B ((Dry Dock) Interface Wharf), Navy shall deploy a minimum of three additional marine mammal monitoring observers on a minimum of five days of vibratory pile driving activity.

(4) During Projects 3C, 3D, and 3E (Refit Wharves #1–3), Navy shall deploy a minimum of two additional marine mammal monitoring observers on all days of vibratory pile driving activity.

(5) During Project 3F (Warping Wharf with Capstan), Navy shall deploy a minimum of three additional marine mammal monitoring observers on a minimum of two days of vibratory pile driving activity.

(6) During Project 3G (Tug Pier), Navy shall deploy a minimum of three additional marine mammal monitoring observers on a minimum of four days of vibratory pile driving activity.

(7) During Project 4A (Transit Protection System (TPS) Pier), Navy shall deploy a minimum of four additional marine mammal monitoring observers on a minimum of eight days of vibratory pile driving activity.

(8) During Project 4B (Small Craft Berth Site VI), Navy shall deploy a minimum of four additional marine mammal monitoring observers on a minimum of three days of vibratory pile driving activity.

(9) During Project 5 (Magnetic Silencing Facility Repairs), Navy shall deploy a minimum of four additional marine mammal monitoring observers on a minimum of three days of vibratory pile driving activity.

(10) During Projects 6A (Demolition of TPS Pier) and 6B (Demolition of North Trestle), Navy shall deploy a minimum of five additional marine mammal monitoring observers on a minimum of twelve days of vibratory pile driving activity.

(d) The Navy shall conduct acoustic data collection (sound source verification), in accordance with NMFS’s guidelines, in conjunction with Project 1A (Tug Pier), Project 2 (Unspecified Minor Construction Layberth Fender Pile Modification), and Projects 4A and 6A (TPS Pier).

(e) Reporting: (1) Annual reporting: (i) Navy shall submit an annual summary report to NMFS not later than ninety days following the end of in-water work for each project. Navy shall provide a final report within thirty days following resolution of comments on the draft report.

(ii) These reports shall contain, at minimum, the following:

(A) Date and time that monitored activity begins or ends;

(B) Construction activities occurring during each observation period;

(C) Weather parameters (e.g., wind speed, percent cloud cover, visibility);

(D) Water conditions (e.g., sea state, tide state);

(E) Species, numbers, and, if possible, sex and age class of marine mammals;

(F) Description of any observable marine mammal behavior patterns, including bearing and direction of travel and distance from pile driving activity;

(G) Distance from pile driving activities to marine mammals and distance from the marine mammals to the observation point;

(H) Description of implementation of mitigation measures (e.g., shutdown or delay);

(i) Locations of all marine mammal observations; and

(j) Other human activity in the area.

(2) Navy shall submit a comprehensive summary report to NMFS not later than ninety days following the conclusion of marine mammal monitoring efforts described in this chapter.

(3) Navy shall submit acoustic monitoring reports as necessary pursuant to § 217.255(d) of this chapter.

(f) Reporting of injured or dead marine mammals:

(1) In the unanticipated event that the activity defined in § 217.250 clearly causes the take of a marine mammal in a prohibited manner, Navy shall immediately cease such activity and report the incident to the Office of Protected Resources (OPR), NMFS, and to the Southeast Regional Stranding Coordinator, NMFS. Activities shall not resume until NMFS is able to review the circumstances of the prohibited take. NMFS will work with Navy to determine what measures are necessary to minimize the likelihood of further prohibited take and ensure MMPA compliance. Navy may not resume their activities until notified by NMFS. The report must include the following information:

(i) Time, date, and location (latitude/longitude) of the incident;

(ii) Description of the incident;

(iii) Environmental conditions (e.g., wind speed and direction, Beaufort sea state, cloud cover, visibility);

(iv) Description of all marine mammal observations in the 24 hours preceding the incident;

(v) Species identification or description of the animal(s) involved;
(vi) Fate of the animal(s); and
(vii) Photographs or video footage of the animal(s). Photographs may be taken once the animal has been moved from the waterfront area.

(2) In the event that Navy discovers an injured or dead marine mammal and determines that the cause of the injury or death is unknown and the death is relatively recent (e.g., in less than a moderate state of decomposition), Navy shall immediately report the incident to OPR and the Southeast Regional Stranding Coordinator, NMFS. NMFS will work with Navy to determine whether additional mitigation measures or modifications to the activities are appropriate.

(3) In the event that Navy discovers an injured or dead marine mammal and determines that the injury or death is not associated with or related to the activities defined in §217.250 (e.g., previously wounded animal, carcass with moderate to advanced decomposition, scavenger damage), Navy shall report the incident to OPR and the Southeast Regional Stranding Coordinator, NMFS, within 24 hours of the discovery. Navy shall provide photographs or video footage or other documentation of the stranded animal sighting to NMFS. Photographs may be taken once the animal has been moved from the waterfront area.

§217.256 Letters of Authorization.

(a) To incidentally take marine mammals pursuant to these regulations, Navy must apply for and obtain a LOA.

(b) A LOA, unless suspended or revoked, may be effective for a period of time not to exceed the expiration date of these regulations.

(c) If a LOA expires prior to the expiration date of these regulations, Navy may apply for and obtain a renewal of the LOA.

(d) In the event of projected changes to the activity or to mitigation and monitoring measures required by a LOA, Navy must apply for and obtain a modification of the LOA as described in §217.257 of this chapter.

(e) The LOA shall set forth:

1. Permissible methods of incidental taking;
2. Means of effecting the least practicable adverse impact (i.e., mitigation) on the species, its habitat, and on the availability of the species for subsistence uses; and
3. Requirements for monitoring and reporting.

(f) Issuance of the LOA shall be based on a determination that the level of taking will be consistent with the findings made for the total taking allowable under these regulations.

(g) Notice of issuance or denial of a LOA shall be published in the Federal Register within thirty days of a determination.

(a) A LOA issued under §§216.106 and 217.256 of this chapter for the activity identified in §217.250 shall be renewed or modified upon request by the applicant, provided that:

1. The proposed specified activity and mitigation, monitoring, and reporting measures, as well as the anticipated impacts, are the same as those described and analyzed for these regulations (excluding changes made pursuant to the adaptive management provision in paragraph (c)(1) of this section), and
2. NMFS determines that the mitigation, monitoring, and reporting measures required by the previous LOA under these regulations were implemented.

(b) For a LOA modification or renewal requests by the applicant that include changes to the activity or the mitigation, monitoring, or reporting (excluding changes made pursuant to the adaptive management provision in paragraph (c)(1) of this section) that do not change the findings made for the regulations or that result in no more than a minor change in the total estimated number of takes (or distribution by species or years), NMFS may publish a notice of proposed LOA in the Federal Register, including the associated analysis of the change, and solicit public comment before issuing the LOA.

(c) A LOA issued under §§216.106 and 217.256 of this chapter for the activity identified in §217.250 may be modified by NMFS under the following circumstances:

1. Adaptive Management—NMFS may modify (including augment) the existing mitigation, monitoring, or reporting measures (after consulting with Navy regarding the practicability of the modifications) if doing so creates a reasonable likelihood of more effectively accomplishing the goals of the mitigation and monitoring set forth in the preamble for these regulations.

2. Possible sources of data that could contribute to the decision to modify the mitigation, monitoring, or reporting measures in a LOA:

   A. Results from Navy’s monitoring from previous years.

   B. Results from other marine mammal and/or sound research or studies.

   C. Any information that reveals marine mammals may have been taken in a manner, extent or number not authorized by these regulations or subsequent LOAs.

3. Emergencies—If NMFS determines that an emergency exists that poses a significant risk to the well-being of the species or stocks of marine mammals specified in a LOA issued pursuant to §§216.106 and 217.256 of this chapter, a LOA may be modified without prior notice or opportunity for public comment. Notice would be published in the Federal Register within thirty days of the action.

Public Laws Electronic Notification Service (PENS)

PENS is a free electronic mail notification service of newly enacted public laws. To subscribe, go to http://listserv.gsa.gov/archives/publaws-l.html

Note: This service is strictly for E-mail notification of new laws. The text of laws is not available through this service. PENS cannot respond to specific inquiries sent to this address.
This table is used by the Office of the Federal Register to compute certain dates, such as effective dates and comment deadlines, which appear in agency documents. In computing these dates, the day after publication is counted as the first day. When a date falls on a weekend or holiday, the next Federal business day is used. (See 1 CFR 18.17)

A new table will be published in the first issue of each month.
