(2) The Financial Institution and Adviser adhere to the following standards:

(i) When providing investment advice to the Retirement Investor, the Financial Institution and the Adviser(s) provide investment advice that is, at the time of the recommendation, in the Best Interest of the Retirement Investor. As further defined in Section VIII(c), such advice reflects the care, skill, prudence, and diligence under the circumstances then prevailing that a prudent person acting in a like capacity and familiar with such matters would use in the conduct of an enterprise of a like character and with like aims, based on the investment objectives, risk tolerance, financial circumstances, and needs of the Retirement Investor, without regard to the financial or other interests of the Adviser, Financial Institution or any Affiliate, Related Entity, or other party;

(ii) The recommended transaction does not cause the Financial Institution, Adviser or their Affiliates or Related Entities to receive, directly or indirectly, compensation for their services that is in excess of reasonable compensation within the meaning of ERISA section 408(b)(2) and Code section 4975(d)(2).

(iii) Statements by the Financial Institution and its Advisers to the Retirement Investor about the recommended transaction, fees and compensation, Material Conflicts of Interest, and any other matters relevant to a Retirement Investor’s investment decisions, are not materially misleading at the time they are made.

(3) Disclosures. The Financial Institution complies with applicable disclosure obligations under state insurance law with respect to the sale of the Fixed Annuity Contract, and provides to the Retirement Investor, prior to the transmittal of the annuity application to the insurance company, a single written disclosure that clearly and prominently:

(i) Affirmatively states that the Financial Institution and the Adviser(s) act as fiduciaries under ERISA or the Code, or both, with respect to the recommendation;

(ii) Sets forth the standards in paragraph (d)(1) of this Section and affirmatively states that it and the Adviser(s) adhered to such standards in recommending the transaction;

(iii) Describes the Financial Institution’s Material Conflicts of Interest; and

(iv) Discloses to the Retirement Investor whether the Financial Institution offers Proprietary Products or

receives Third Party Payments with respect to any Fixed Annuity Contract recommendations; and to the extent the Financial Institution or Adviser limits Fixed Annuity Contract recommendations, in whole or part, to Proprietary Products or investments that generate Third Party Payments, notifies the Retirement Investor of the limitations placed on the universe of investment recommendations. The notice is insufficient if it merely states that the Financial Institution or Adviser “may” limit investment recommendations based on whether the investments are Proprietary Products or generate Third Party Payments, without specific disclosure of the extent to which recommendations are, in fact, limited on that basis.

(v) The disclosure may be provided in person, electronically or by mail. It does not have to be repeated for any subsequent recommendations during the Transition Period.

(vi) The Financial Institution will not fail to satisfy this Section IX(d)(3) solely because it, acting in good faith and with reasonable diligence, makes an error or omission in disclosing the required

information, provided the Financial Institution discloses the correct information as soon as practicable, but not later than 30 days after the date on which it discovers or reasonably should have discovered the error or omission. To the extent compliance with this Section IX(d)(3) requires Financial Institutions to obtain information from entities that are not closely affiliated with them, they may rely in good faith on information and assurances from the other entities, as long as they do not know, or unless they should have known, that the materials are incomplete or inaccurate. This good faith reliance applies unless the entity providing the information to the Adviser and Financial Institution is (1) a person directly or indirectly through one or more intermediaries, controlling, controlled by, or under common control with the Adviser or Financial Institution; or (2) any officer, director, employee, agent, registered representative, relative (as defined in ERISA section 3(15)), member of family (as defined in Code section 4975(e)(6)) of, or partner in, the Adviser or Financial Institution.

(4) The Financial Institution approves in advance all written marketing materials used by Advisers after determining that such materials provide a balanced description of the risks and features of the annuity contracts to be recommended;

(5) The Financial Institution designates a person or persons, identified by name and title or function, responsible for addressing Material Conflicts of Interest and monitoring Advisers’ adherence to the Impartial Conduct Standards and the person approves, in writing, recommended applications for Fixed Annuity Contracts involving Retirement Investors prior to transmitting them to the insurance company; and

(6) The Financial Institution complies with the recordkeeping requirements of Section V(b) and (c).

Signed at Washington, DC, this 12th day of January, 2017.

Lyssa Hall,

*Director of Exemption Determinations,
Employee Benefits Security Administration,

2 CFR Part 3474

Open Licensing Requirement for Competitive Grant Programs; Final Rules

DEPARTMENT OF EDUCATION**2 CFR Part 3474****RIN 1894-AA07****[Docket ID ED-2015-OS-0105]****Open Licensing Requirement for Competitive Grant Programs****AGENCY:** Office of the Secretary, Department of Education.**ACTION:** Final regulations.

SUMMARY: The Secretary amends the regulations of the Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards in order to require, subject to certain categorical exceptions and case-by-case exceptions, that Department grantees awarded competitive grant funds openly license to the public copyrightable grant deliverables created with Department grant funds.

DATES: These regulations are effective March 20, 2017.

FOR FURTHER INFORMATION CONTACT:

Sharon Leu, U.S. Department of Education, 400 Maryland Avenue SW., Room 6W224, Washington, DC 20202. Telephone: (202) 453-5646 or by email: tech@ed.gov.

If you use a telecommunications device for the deaf (TDD) or text telephone (TTY), call the Federal Relay Service (FRS), toll free, at 1-800-877-8339.

SUPPLEMENTARY INFORMATION:**Background and Summary of This Regulatory Action**

On November 3, 2015, the Secretary published a notice of proposed rulemaking (NPRM) in the **Federal Register** (80 FR 67672) that would amend regulations regarding the Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards. Under the amendments proposed in the NPRM, the Department would require, with certain categorical exceptions and the ability to grant case-by-case exceptions, that entities receiving Department funds under a competitive grant program openly license all copyrightable intellectual property created with those funds. These final regulations adopt the proposed amendments with modifications that we discuss in greater detail in these final regulations.

Under the Department's current regulations, title to intellectual property, including copyright, acquired under Department grant funds vests in the grantee. At the same time, for any work

subject to copyright that was developed or for which ownership was acquired under a grant award, the Department reserves a royalty-free, non-exclusive, and irrevocable right to reproduce, publish, or otherwise use for Federal purposes, and to authorize others to do so (referred to as a "Federal purpose license"). This license allows the government the ability to authorize others to use work funded by Department grants.

Grantees under the Department's competitive grant programs create a number of copyrightable works using Department competitive grant funds that have significant benefit for students, parents, teachers, school districts, States, institutions of higher education, and the public overall. These copyrightable works are wide ranging in nature and include instructional materials, personalized learning delivery systems, assessment systems, language tools, and teacher professional development training modules, just to name a few. The Department's grantees creating these works include State educational agencies (SEAs), local educational agencies (LEAs), institutions of higher education (IHEs), and non-profit organizations and while the works are created under a specific grant program and therefore may target a specific school or group of students, the resources are such that other education stakeholders would significantly benefit from being able to access them, reuse them, and in some cases, modify them to address their needs and goals.

It is the Department's experience, however, that copyrightable works created under competitive grants made by the Department generally have not been disseminated widely to the public. This is the case despite the existence of the Federal purpose license and efforts by the Department and grantees to proactively make them available. Although the Department provides individualized technical assistance and actively works with all grantees on dissemination planning, we have found that many education stakeholders and other members of the public are generally not aware of the educational resources created as a result of the Department's competitive grant programs. We believe this is because the education resources often are created and disseminated locally or disseminated to limited audiences by grantees in presentations at research conferences, through professional associations, or by commercial mechanisms that are not easily accessed by the general public or to a wider group of stakeholders. Even when the

resources are known to exist, stakeholders and the public are not sure how to access them, what usage rights or permissions are necessary to use them, or how to obtain those rights or permissions. Accordingly, while the Department's Federal purpose license does allow for the public to obtain a copy of these works from the Department, this has rarely occurred.

We believe that the open licensing regulation we are adopting here will address these key problems. Through an open license, grantees under the Department's competitive grant programs will explicitly give permission to the public to access, reproduce, publicly perform, publicly display, and distribute the copyrightable work; prepare derivative works, as defined in the Copyright Act, 17 U.S.C. 101, and reproduce, publicly perform, publicly display and distribute those derivative works; and otherwise use the copyrightable work, created in whole or in part with competitive grant funds provided by the Department, provided that in all such instances attribution is given to the copyright holder. Copyrightable grant deliverables, or deliverables, are final versions of a work developed to carry out the purpose of the grant, as specified in the grant announcement (*i.e.*, notice inviting applications or application package). The requirement will apply both to the deliverables themselves and any final version of program support materials necessary to the use of the deliverables. We believe that this will result in significantly enhanced dissemination of deliverables created with Department competitive grant funds and provide education stakeholders and members of the public with a simpler and more transparent framework to access, use, and possibly modify these deliverables for the benefit of their education communities.

The approach the Department is taking with this rule is limited in scope. It will apply only to grantees receiving Department competitive grant funds, which constitutes approximately 10 percent of the Department's total discretionary funding. Within that category of grants, we anticipate approximately 60 percent would potentially be subject to the rule. The rule will not apply to grants that provide funding for general operating expenses; grants that provide supports to individuals (*e.g.*, scholarships, fellowships); grant deliverables that are jointly funded by the Department and another Federal agency if the other Federal agency does not require the open licensing of its grant deliverables for the relevant grant program;

copyrightable works created by the grantee or subgrantee that are not created with Department funds; any copyrightable work incorporated in the grant deliverable that is owned by a party other than the grantee or subgrantee, unless the grantee or subgrantee has acquired the right to provide such a license in that work; peer-reviewed scholarly publications that arise from any scientific research funded, either fully or partially, from grants awarded by the Department; or grants under the Department's Ready to Learn Television Program. Grantees receiving funds under the Department's formula grant programs will not be subject to the rule. Further, the rule will not apply to a grantee for which compliance with the rule would conflict with, or materially undermine the ability to protect or enforce, other intellectual property rights or obligations of the grantee or subgrantee, in existence or under development, including those rights provided under 15 U.S.C. 1051, *et seq.*, 18 U.S.C. 1831–1839, and 35 U.S.C. 200, *et seq.* Similarly, the rule does not alter any applicable rights in the grant deliverable available under 17 U.S.C. 106A, 203 or 1202, 15 U.S.C. 1051, *et seq.*, or State law.

The rule also provides for the Department to consider individual grantee requests for exception to the open licensing requirement. We note in the rule some examples of situations that may be appropriate for an exception to the open licensing requirement, such as where the Secretary has determined that the grantee or subgrantee's dissemination plan would likely achieve meaningful dissemination equivalent to or greater than the dissemination likely to be achieved through the open licensing requirement. Similarly, we provide the example of a situation in which the open licensing requirement would impede the grantee's ability to form the required partnerships necessary to carry out the purpose of the grant. The list of examples in the rule is not exhaustive and is intended to indicate the types of situations in which an exception may be appropriate depending on the specific circumstances.

In designing competitions that would not fall within any of the categorical exceptions specified in the rule, the Department will also consider whether to make an exception for a grant program for a particular year's competition. In that regard, the Department will consider whether the open licensing requirement conflicts with the statutory purpose of the program and whether harm caused to

the program by implementing the open licensing requirement would outweigh its benefit. In granting exceptions, we may consider factors such as the following: (1) Possible negative effect on the statutory purpose of the program if an open licensing requirement is applied; (2) Possible barriers to the intended benefits of broad dissemination if an open licensing requirement is applied, for example, if the broadest possible dissemination can be achieved only through exclusive private entity partnerships; (3) The public need for, or benefit from, the opportunity to access or use the copyrightable grant deliverable given the context of the particular program; and (4) Other economic considerations, such as an undue financial hardship on the grantees to implement the rule. The Secretary's designee(s) will make final decisions about whether a program-level exception is granted. In each Notice Inviting Applications for a competitive grant program, the Department will clearly communicate whether or not the program is subject to the open licensing requirement or has received an exception.

The Department recognizes that implementation of these regulations represents a change from current practice and therefore plans to take a phased approach to implementing the rule for new competitive grants announced in FY 2017 and will fully implement it for all applicable competitive grant programs across the Department in FY 2018. This approach will provide us additional opportunities to take steps such as preparing administrative procedures regarding the consideration of requests for exceptions and providing relevant staff training. In FY 2017, each new competitive grant competition announcement will clearly indicate whether this rule will apply so that eligible applicants can make informed decisions regarding their participation in the competition.

Public Comment: In the NPRM we published on November 3, 2015, we proposed to amend regulations regarding the Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards in order to require that all Department grantees awarded competitive grant funds openly license to the public copyrightable intellectual property created with Department grant funds. The NPRM established a December 3, 2015, deadline for the submission of written comments. To ensure that all interested parties were provided sufficient opportunity to submit comments, we published a notice in the **Federal Register** (80 FR 74715) on

November 30, 2015, which extended the public comment period to December 18, 2015.

In response to our invitation in the NPRM, 146 parties submitted comments. We group major issues according to subject and by comments submitted in response to the five additional questions we posed. Generally, we do not address technical and other minor changes or suggested changes the Secretary is not legally authorized to make under applicable statutory authority. In some cases, comments addressed issues beyond the scope of the proposed regulations. Although we appreciate commenters' concerns for broader issues affecting open access, because those comments are beyond the scope of this regulatory action, we do not discuss them here.

Analysis of Comments and Changes: An analysis of the comments and changes in the regulations since publication of the NPRM follows. We note that we have renumbered some of the paragraphs from the proposed rule in this final rule. As a result, some of the provisions in the proposed rule have different paragraph numbers in this final rule.

General Comments

Comments: The Department received many positive comments regarding the proposed regulations. These commenters praised the Department for taking steps to provide broader access for taxpayers to deliverables produced with Department grant funds.

Discussion: We appreciate the commenters' support.

Changes: None.

Request for Extension of the Comment Period

Comments: We received several comments requesting that the Department extend the public comment period for the NPRM, indicating that additional time would be helpful to analyze and respond to the Department's proposals.

Discussion: The Department agreed that additional time for public comment would be helpful and extended the comment period by an additional 15 days. We believe that 45 days provided the public a meaningful opportunity to comment on the proposed rule, and this is supported by the complex and thoughtful comments we received.

Changes: None.

Legal Issues

Comments: One commenter requested clarification regarding the basis for the determination that this regulatory action

is significant under Executive Order 12866.

Discussion: This regulatory action is economically significant under section 3(f)(1) of Executive Order 12866 as we estimate that it will have an annual effect on the economy of more than \$100 million. We explain this determination further in the *Regulatory Impact Analysis* section of these regulations.

Changes: None.

Comments: Several commenters stated that the Department has not complied with Executive Order (EO) 13563, which requires agencies to base all regulatory frameworks on the best available science. As an example, one commenter noted that the impact analysis does not cite empirical data or evidence from research and is instead based on speculative statements.

Discussion: The Department has provided further analysis of the economic impacts of the regulations in accordance with both Executive Order 13563 and Executive Order 12866 in the *Regulatory Impact Analysis* section of these regulations. However, we note that Section 1 of EO 13563 reiterates principles established by EO 12866 and asks agencies “to use the best available techniques to quantify anticipated present and future costs as accurately as possible, such as identifying changing future compliance costs that might result from technological innovation or anticipated behavioral changes.” Section 1 also recognizes that in some cases, careful and accurate quantification may not be possible and allows agencies to consider values including equity, human dignity, fairness, and distributive impacts that are difficult or impossible to quantify. Section 4 requires agencies to identify and consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public. In this case, our grantees retain the ability to choose to apply to receive funding through our grant competitions.

Each year, the Department funds a wide variety of competitive grant programs that support a diverse array of grant-funded copyrightable works. Conducting an empirical analysis of the exact costs and benefits of this final rule would require data not historically collected in the course of the administration of Department grants. Consistent with Section 1 of EO 13563, in our analysis of the rule, the Department considered qualitative values, including, transparency, equity, and distributive impacts, and recognized that some benefits and costs are difficult to quantify.

Changes: None.

Comments: A few commenters asserted that the NPRM ignores the statutory mandate of the Information Quality Act (IQA) (also commonly referred to as the Data Quality Act, such as by the commenter). Specifically, one commenter stated that the NPRM lacks information indicating that the Department has taken necessary steps to ensure that the disseminated information is reliable, in accordance with the Office of Management and Budget’s (OMB) IQA guidelines. The commenter indicated that to the extent that direct competitive grant funding is a mechanism of the Department to create and disseminate information, the Department has not taken those steps.

Discussion: The Department disagrees with the commenters’ interpretation of the IQA and the assertion that the Department is not in compliance with the requirements of the IQA. Although the comment mentioned OMB’s Data Quality Act guidelines, the applicable guidelines here are the Department’s Information Quality Act (IQA) guidelines, which were issued pursuant to the direction of OMB’s IQA guidelines and the IQA. The IQA is a procedural statute that requires the Department to issue guidelines: (1) Ensuring and maximizing the quality, objectivity, utility, and integrity of information (including statistical information) disseminated by the agency, and (2) to establish administrative mechanisms allowing affected persons to seek and obtain correction of information maintained and disseminated by the agency that does not comply with the guidelines. In addition, the IQA requires the Department to send reports to the Director of OMB periodically.

The Department has developed the guidelines required under the IQA, which are available at: <http://www2.ed.gov/policy/gen/guid/iq/infoqualguide.pdf>. Notably, those guidelines provide that an affected person who does not believe the information the Department disseminates complies with the guidelines must provide, among other things: (1) A detailed description of the information that the requester believes does not comply with the Department’s or OMB’s guidelines; and (2) an explanation of the reason(s) that the information should be corrected (*i.e.*, describe clearly and specifically the elements of the information quality guidelines that were not followed). We note that these guidelines do not govern all information of the Department, nor do they cover all information disseminated by the Department. The IQA guidelines cover information in

four categories that is disseminated by the Department and subject to the Paperwork Reduction Act (44 U.S.C. 3502(1)): (1) Information about education programs; (2) research studies and program evaluation information; (3) administrative and program data; and (4) statistical data. As a general matter, these guidelines do not cover materials created through the support of competitive grants, research findings, or other information published by grantees.

We note that the IQA guidelines do provide a procedure for the public to register complaints to the Department for applicable information covered by the IQA. According to these procedures, any member of the public may provide a detailed explanation of the specific data being sought or the specific elements of the guidelines that it believes we have not followed. If the commenter had provided this information we could have attempted to either provide this data in the final rule or explain why the data is unavailable to us. If the commenter wishes to submit another request under our IQA guidelines, in compliance with the procedures those guidelines set out, we would be happy to review such a request.

Changes: None.

Comments: Several commenters asserted that the proposed regulations conflict with the Patent and Trademark Law Amendments Act, also known as the Bayh-Dole Act (Pub. L. 96–517, 35 U.S.C. 200 *et seq.*, which covers the intellectual property rights for patentable inventions resulting from Federal funding, as well as E.O. 12591. Many of these commenters questioned whether the Department was aware that 35 U.S.C. 212 provides to institutions the rights for copyrightable intellectual property or whether the Department has the legal authority to require an open license under the provisions of that section.

Commenters citing these conflicts note specifically that computer software source code can be both patentable and copyrightable and that under the Bayh-Dole Act, inventors, rather than the Federal government, are entitled to the title of the patents. These commenters suggested that further clarification of rights is necessary in order to avoid both confusion and litigation. One commenter noted that the proposed requirement to apply an open license to computer software source code is overly broad and could potentially cover all patentable inventions, trade secrets, or other intangible rights.

Other commenters who supported the proposed regulation stated that the

proposed open licensing requirement does not present a conflict with the Bayh-Dole Act, since the Bayh-Dole Act applies only to patentable inventions and not to copyrightable works. In the case of computer software, these commenters stated that for the subset of software that is considered patentable, the open licensing requirement does not prevent the inventor from also seeking patent protection under the legal conditions established by the Bayh-Dole Act.

Discussion: We appreciate the commenters raising these issues and agree that further clarification is necessary as to the rule's scope and application. The Department notes the distinction between copyrightable works, patentable inventions, and information that may be protected as trade secrets under applicable laws. The Department further acknowledges that products such as computer software may contain elements that would be protected under copyright laws, patent laws, and trade secret laws, giving rise to commenters' concerns. The Department did not intend that this regulation would interfere with other intellectual property rights of grantees, including the rights to protect trade secrets and to obtain patent protection on inventions. Thus, we have revised the rule to clarify this issue.

Changes: We have revised § 3474.20(d)(1)(viii) to expressly provide that the rule does not apply to grantees if compliance with the rule would conflict with, or materially undermine the ability to protect or enforce, other intellectual property rights or obligations of the grantee or subgrantee, in existence or under development, including those provided under 15 U.S.C. 1051, *et seq.*, 18 U.S.C. 1831–1839, and 35 U.S.C. 200, *et seq.*

Comment: Several commenters raised concerns that the proposed regulation contradicts the purpose of the Small Business Innovation Research (SBIR) program. These commenters noted that the stated purpose of the SBIR program is to encourage domestic small businesses to commercialize research-based innovations and that loss of exclusive copyright would contradict this purpose. Similarly, commenters also note that the proposed regulation would conflict with SBIR program directives issued by the Small Business Administration. Other commenters urged the Department to provide an exemption to the SBIR and Small Business Technology Transfer (STTR) program from this requirement.

Discussion: We note that the Department's SBIR program is currently awarded through contract competition

rather than grant competition. As a result, SBIR operates under the regulations as described in the Federal Acquisition Regulations at 48 CFR parts 1–99 and Executive Order 13329 rather than 2 CFR part 3474. The Department's SBIR program, therefore, is not currently covered by 2 CFR part 3474 of the Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards and would not be subject to this final rule. The SBIR program is established under the Small Business Innovation Development Act of 1982 (Pub. L. 97–219) and operates according to the Small Business Administration Policy Directives found at: https://www.sbir.gov/sites/default/files/sbir_pd_with_1-8-14_amendments_2-24-14.pdf. Additional information about the regulations, legislation, and guidance for SBIR can be found at: <http://www2.ed.gov/programs/sbir/legislation.html>.

Changes: None.

Comment: Many commenters suggested that any licensing requirements should align with current requirements used by other Federal agencies. Many commenters who supported the open licensing requirement recommended that the Department consider similar requirements implemented at the U.S. Department of Labor, the U.S. Department of State, and the United States Agency for International Development (USAID). These commenters noted that at these agencies, the open licensing requirement for grant programs and contracts specifically requires Creative Commons¹ licenses. Some commenters suggested that the regulations be aligned with current practice at the National Science Foundation.

Discussion: In developing these final regulations, the Department did take into account the experiences of other Federal agencies with open licensing. Specifically, we (1) considered the Office of Management and Budget's (OMB) Open Government Directive in M–13–13 Memorandum for Heads of Executive Departments and Agencies on Open Data Policy, which describes the Administration's intent to promote use of open licenses, in consultation with Project Open Data, the online, public repository intended to promote the continual improvement of the Open Data Policy, that allow minimal restrictions on copying, publishing,

distributing, transmitting, adapting, or otherwise using the information for non-commercial or for commercial purpose; and (2) consulted with other grant-making agencies through an inter-agency working group on open education to better understand their grant-making processes and implementation best practices. These final regulations are based on our review of these issues and reflect our determination as to how best to tailor an open licensing requirement to the needs of our grant programs and grantees.

We also note that the Department regularly engages our colleagues at other Federal agencies to explore the use of openly licensed resources in advancing the goals of our programs. In June 2016, the Department, in collaboration with NSF and the Institute for Museum and Library Services (IMLS), convened an Open Educational Resources (OER) Research Meeting, attended by representatives from #GoOpen States and Districts, leading principal investigators of projects funded by NSF, IMLS, and the Department's Institute of Education Sciences (IES) programs, as well as with other knowledgeable education stakeholders and researchers. The convening was designed around articulating key OER research issues, identifying OER research infrastructure needs, and exploring potential partnerships to pursue research and development projects. A separate, more detailed discussion regarding the suggestion to use Creative Commons licenses is below.

Changes: None.

Comment: Several commenters stated that this rule is unnecessary because, under current policy, the Department can already disseminate works created through grant funds. These commenters cite the current policy in 2 CFR 200.315(b) that provides the Federal awarding agency with a royalty-free, nonexclusive and irrevocable right to reproduce, publish, or otherwise use the work for Federal purposes, and to authorize others to do so.

Discussion: As we discuss elsewhere in these final regulations, in practice, the Department has exercised the Federal purpose license described in 2 CFR 200.315(b), and previously established in 34 CFR parts 74 and 80, only in rare cases and in those instances the license did not allow the public to access resources directly without first contacting the Department. This regulation should enable deliverables produced under our competitive grants to be more readily available to the public. As discussed earlier, we are concerned that the current policy has

¹ Creative Commons is a global non-profit organization whose mission is to promote sharing and reuse through free legal tools. The organization is most well-known for public copyright licenses known as Creative Commons licenses.

not allowed for broad or efficient dissemination of copyrightable works.

Changes: None.

Comment: One commenter noted language in the preamble to the proposed rule where the commenter thought that, in order to ensure an open license, the grantee must not be allowed to copyright works resulting from Department funding. The commenter noted that, in fact, licenses of any kind are only needed when one party has legal rights, such as those established by copyright.

Discussion: We agree that the explanation in the preamble of the NPRM could have been clearer and appreciate the opportunity to clarify these issues. The NPRM did not propose to amend the Copyright Act of 1976 (17 U.S.C. 101 *et seq.*), which would be outside of the scope of the Department's authority. The legal framework for open licenses is built on the foundation established by the Copyright Act, which automatically gives protection to original works of authorship at the moment they are fixed in any tangible medium of expression and provides certain exclusive rights to authors of these works, 17 U.S.C. 106. In addition to those exclusive rights, the Copyright Act and other provisions of federal and state law provide various elements of what are known internationally as "moral rights."² In addition, the Copyright Act provides for termination rights, *i.e.*, the right of the author or her statutorily designated successors in interest to terminate a copyright transfer or license during a five-year period beginning several decades after the date of the grant or of first publication of the work. Thus, in the final rule, we clarify that grantees will retain ownership of their respective copyrights to their original works of authorship but, by accepting Department grant funds, agree to license to the public the right to exercise their exclusive rights. We also clarify that the rule does not alter any applicable rights in the grant deliverable available under 17 U.S.C. 106A, 203 or 1202, 15 U.S.C. 1051, *et seq.*, or State law. We have revised the regulatory text to make these clarifications.

We note that the proposed rule excluded current 2 CFR 200.315(b) from

the Department's regulations. We proposed this exception to avoid any inconsistency between the proposed open licensing rule and the provision in 2 CFR 200.315(b) recognizing a copyright to material developed with grant funds. In light of the comment we received, however, we recognize that there is not an inconsistency and therefore, there is no need to exclude 2 CFR 200.315(b) from our regulations. As the commenter pointed out, a grantee must hold a copyright to any material to which it provides a copyright license. Indeed, central to the functionality of this final rule is the existence of provisions that give title for intangible property created with Federal support to the creators that is provided in 2 CFR 200.315(a) and (b).

Changes: In final 2 CFR 3474.20, we have removed the exception of § 200.315(b) from the Department's regulations. We also removed proposed § 3474.20(d), which retains the Federal government's rights to copyrighted material, because the substance of that paragraph is already contained in § 200.315(b). Additionally, we have added an exception to § 3474.20(d)(2) to expressly provide that the rule does not alter any applicable rights in the grant deliverable available under 17 U.S.C. 106A, 203 or 1202, 15 U.S.C. 1051, *et seq.*, or State law.

Scope and Definitions

Comment: None.

Discussion: For the purposes of this regulatory action, there is no substantive difference between "direct competitive discretionary grant" and "competitive grant." We have selected the shorter term for the sake of clarity and to enable better understanding in the field.

Changes: Throughout this rule, we replaced "direct competitive discretionary grant" with "competitive grant."

Comment: One commenter noted that the term "grantee" is not defined in 2 CFR part 200 and that its use in the NPRM could include both for-profit and not-for-profit entities. The commenter made several observations related to the applicability of the proposed rule for different types of grantees and suggested that the Department separately review impacts on for-profit and not-for-profit entities and specifically questioned whether the NPRM should apply to for-profit entities.

Discussion: Although the term "grantee" is not defined in 2 CFR part 200, our regulations at 34 CFR 77.1 define the term "grantee." As defined in 77.1, a "grantee" includes any entity that receives a grant, which can include both for-profit and not-for-profit

entities. Applying this rule to for-profit entities is consistent with 2 CFR 200.101(c), which provides that a Federal awarding agency may apply the Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards regulations to for-profit entities unless there is a conflict with international obligations. We note that, in general, the eligibility requirements for our programs contained in statute limit eligibility to governmental entities and not-for-profit entities and for-profit entities are only eligible for our competitive grant funds in rare instances. Thus, the suggestion to review the impact of this rule on each type of grantee (not-for-profit and for-profit entities) separately is unnecessary.

In reviewing this issue, we realized that the proposed rule was not clear on whether the open licensing requirement would apply to subgrantees. We believe that it would and have revised the rule to make clear that it applies to the subgrantees of competitive grantees that are subject to this rule.

Changes: We have added "subgrantee" to various paragraphs throughout the rule.

Comment: One commenter requested a definition of the meaning of "Federal purpose," as used in the NPRM.

Discussion: Because we removed the proposed exception to 2 CFR 200.315(b), this final rule does not use the term "Federal purpose." Therefore, there is no need to elaborate on the meaning of this term for the purposes of this final rule.

Changes: None.

Comment: One commenter requested a more precise definition of Open Education Resources (OER). This commenter stated that the broad definition provided in the NPRM of openly licensed educational resources could lead to confusion on usage rights.

Discussion: It is important to note that for the purposes of this regulation, we do not use the term OER. Instead, we are requiring that an open license be applied to all grant deliverables, including final versions of program support materials that are necessary to the use of the deliverables, developed to carry out the purpose of the grant, that are created by Department grantees or subgrantees, wholly or in part with Department competitive grant funds. A subset of the resources that may be required to be openly licensed will meet the common definition of OER, but this rule is not limited to only OER. Furthermore, we believe that the education-focused policy reflected in these final regulations establishes clearly the conditions of an open

² Moral rights include the rights "(1) to claim authorship of their works ('the right of paternity'); and (2) to object to distortion, mutilation or other modification of their works, or other derogatory action with respect thereto, that would prejudice their honor or reputation (the 'right of integrity')." S. Rep. No. 100-352 at 9 (1988); see Berne Convention for the Protection of Literary and Artistic Works, Art. 6bis. The sources for such rights under U.S. law include various provisions of the Copyright Act and Lanham Act, and various state laws. S. Rep. No. 100-352 at 9.

license. That is, the grantee or subgrantee must “grant to the public a worldwide, non-exclusive, royalty-free, perpetual, and irrevocable license to (i) access, reproduce, publicly perform, publicly display, and distribute the copyrightable work; (ii) prepare derivative works and reproduce, publicly perform, publicly display and distribute those derivative works; and (iii) otherwise use the copyrightable work, provided that in all such instances attribution is given to the copyright holder.” However, we believe that greater clarity concerning usage rights would be achieved by including a definition of “derivative works” and we have revised the rule to do so.

Changes: We have modified § 3474.20(f)(2) to provide that “[a] “derivative work” means a “derivative work” as defined in the Copyright Act, 17 U.S.C. 101.”

Comment: One commenter requested a clearer definition of the term “peer-reviewed research publications.”

Discussion: The proposed rule used the term “peer-reviewed research publications” in describing materials that will not be covered by this final rule. This is terminology that differs slightly from the terminology used in the IES Policy Regarding Public Access to Research (“public access policy”)³ that uses the term “peer-reviewed scholarly publications.” For the purposes of this final rule, we use the term “peer-reviewed scholarly publications” to refer to final peer-reviewed manuscripts accepted for publication, that arise from research funded, either fully or partially, by Federal funds awarded through a Department of Education grant, procurement contract, or other agreement. A final peer-reviewed manuscript is the author’s final manuscript of a peer-reviewed scholarly paper accepted for publication, including all modifications from the peer review process. The final peer-reviewed manuscript is not the same as the final published article, which is defined as a publisher’s authoritative copy of the paper, including all modifications from the publishing peer-review process, copyediting, stylistic edits, and formatting changes. However, the content included in both the final peer-reviewed manuscript and the final published article is identical.

We note that we have expanded the exception in § 3474.20(d)(1)(v) to include all peer-reviewed scholarly publications that arise from any scientific research funded, either fully or partially, from grants awarded by the

Department. This change is discussed further elsewhere in this preamble. Although the final rule no longer references the IES public access policy specifically, we are using the term “peer reviewed scholarly publications” because it is used by IES grantees, who represent a majority of those covered by this exception and is widely used in the field.

Changes: We have revised 2 CFR 3474.20(d)(1)(v) to use the same term defined in the IES public access policy, “peer-reviewed scholarly publications.”

Comment: Many commenters generally appreciated the conditions of the open license required in § 3473.20(a) and praised the Department for including terms that would ensure the broadest possible use by eliminating barriers while ensuring authors receive attribution for their work.

Discussion: We appreciate the commenters’ support.

Changes: None.

Comment: Many commenters that supported the conditions of the open license proposed in the NPRM suggested that these conditions be expanded to explicitly include the “right to redistribute” openly licensed materials, including adapted derivative works. These commenters note that without this explicit right, grantees may interpret the conditions to restrict downstream users from distributing any modifications or adaptations made to these materials. The commenters assert that the free distribution of modifications or adaptations makes open licenses powerful tools for innovation when any member of the public can modify or adapt grant-funded resources. Conversely, some commenters proposed additional modifications that would explicitly prohibit downstream users of the openly licensed materials, including adapted derivative works, from restricting usage or commercially distributing derivative works. These include Creative Commons licenses with Non-Commercial and Share-Alike restrictions.

Discussion: The Department agrees with the importance of having the ability to adapt and modify openly licensed materials, and to distribute those adaptations and modifications. We generally believe that where there are few restrictions on the terms of use and distribution, the Department’s grant-funded resources will be disseminated widely. To that end, we have expressly clarified that for copyrightable grant deliverables created in whole or in part with Department competitive grant funds, the grantee or subgrantee must include as a term of the

open license, the right to prepare derivative works and reproduce, publicly perform, publicly display and distribute those derivative works. At the same time, we appreciate commenters’ concerns regarding ensuring that a grantee or subgrantee has the discretion to select an open license, including a license that limits use of the grant deliverable to noncommercial purposes. Although we intended in the proposed rule that a grantee would have this discretion, we realize this was not clear and are revising the regulation to reflect the grantee’s or subgrantee’s discretion in this area.

For copyrightable works that are not funded by the Department, we have similarly left the terms under which any derivative works may be licensed to the discretion of the owner of the derivative work (e.g., if a grantee created a deliverable with grant funds and then creates a derivative work with other funding, the grantee would have the flexibility to choose how to license the derivative work, such as through commercial channels).

Finally, as discussed earlier in this section, we have defined the term “derivative work” to have the same meaning as contained in the Copyright Act.

Changes: We have modified § 3474.20(b)(1) to explicitly provide the right to prepare derivative works based upon the openly licensed works, as well as the right to reproduce, publicly perform, publicly display and distribute those derivative works. We have also revised § 3474.20(b)(2) to reflect that a grantee or subgrantee has the discretion to select a license that limits use of the grant deliverable to noncommercial purposes. In addition, we have modified § 3474.20(f)(2) to provide that “[a] “derivative work” means a “derivative work” as defined in the Copyright Act, 17 U.S.C. 101.”

Comment: In addition to comments on the conditions of open licenses, many commenters recommended that the Department specify the type of licenses that grantees should use under this rule. In particular, commenters suggested that the Department clearly reference or require the use of Creative Commons licenses. Commenters offered a number of considerations.

First, commenters noted that without a commonly understood licensing framework, lack of clarity over terms of use would impede the Department’s goals of widespread sharing and dissemination. For example, individual grantees could each create their own open licenses by following the conditions provided in the proposed rule. While their intent would be to

³ <https://ies.ed.gov/funding/researchaccess.asp>.

meet the requirements of the rule, the proliferation of novel licenses could result in confusion about usage rights or concerns about interoperability with other existing licenses. In these cases, the new or non-standardized licensing language may discourage or delay adoption or integration of resources due to the additional time and resources required to interpret the unfamiliar language and to verify legal interoperability issues and widespread sharing and dissemination could decrease, rather than increase. Directing grantees towards a licensing framework with broad familiarity would enhance the utility of the requirement and enable more immediate impact. These commenters cite Creative Commons licenses as the most commonly known, easily recognizable, and widely-used public license. To support this claim, commenters cited Web sites such as Wikipedia, Flickr, and Whitehouse.gov as well-known repositories of content that is openly licensed using Creative Commons licenses. Others note that Creative Commons recently reported that one billion works are licensed using one of their public licenses.

Second, commenters stated that the Department should adopt a Creative Commons licensing framework because it would align with frameworks already in place at other organizations. This alignment would enable entities to collaborate and share resources across these projects with fewer barriers. For example, commenters pointed to open licensing and access policies by other funders including the Bill and Melinda Gates Foundation, the William and Flora Hewlett Foundation, the Ford Foundation, the World Health Organization, and the World Bank, that require use of Creative Commons licenses. Commenters also pointed to other governments (the United Kingdom, Australia, and Poland) that have identified Creative Commons licenses as they begin to implement similar policies. Many commenters pointed to grant programs at the Department of State, including USAID, and the Department of Labor's Trade Adjustment Assistance Community College and Career Training (TAACCCT) grant program as examples of programs at other Federal agencies that have already implemented open licensing requirements using Creative Commons licenses. Commenters noted that Creative Commons licenses have been embraced by open courseware projects that have produced diverse educational materials and innovative textbook offerings currently used at hundreds of

major colleges and universities and K-12 schools throughout the country.

Third, commenters stated that individually created licenses may satisfy the conditions provided in the proposed rule, but may not have the same force or effect of law. Commenters asserted that Creative Commons licenses are legally robust, internationally recognized licenses that are enforceable and easily adopted worldwide as they were written to conform to the international treaties governing copyright.

Finally, commenters noted the practicality of a Creative Commons license. These commenters stated that while Creative Commons licenses have a three-layered design (legal, human readable, machine-readable), the process of selecting and affixing the license and license deed is simple. In addition, commenters pointed to the wide availability of tools and resources developed to support the implementation of the Creative Commons licensing framework in various contexts. By adopting the same licensing framework, the Department could also utilize these existing tools and resources in its own implementation and training activities.

Discussion: We agree that the particular terms of the Creative Commons Attribution licenses (CC BY) are an example of a permissible type of license. However, we are concerned that limiting the license to only a CC BY license would result in less flexibility for grantees and would not account for changes and developments that could occur with respect to the types of licenses commonly used. We believe an appropriate balance of these concerns is to maintain our description of an open license.

However, we have revised § 3474.20(b)(2) to provide greater specificity concerning the requirements for the open licenses that a grantee may use under this rule that ensure that licenses selected are readily identified, either visually or electronically, and to minimize confusion about licensing terms and usage rights. These include the requirement that grantees use a symbol or device that readily communicates to users the permissions granted concerning the use of the copyrightable work, machine-readable code for digital resources, readily accessed legal terms, and the statement of attribution and disclaimer specified in 34 CFR 75.620(b).

Changes: In § 3474.20(b)(2) we added provisions requiring that any license used contain the following features: (i) A symbol or device that readily communicates to users the permissions

granted concerning the use of the copyrightable work; (ii) machine-readable code for digital resources; (iii) readily accessed legal terms; and (iv) the statement of attribution and disclaimer specified in 34 CFR 75.620(b).

Comment: Many commenters suggested that the Department expand the scope of the proposed rule beyond competitive grants to include all grants funded by the Department, including those grants funded by formula. These commenters note that while the absolute amount of funding that is available through competitive grant programs is not insignificant, it is small proportionally, when compared with the total funding available through formula programs. The commenters noted that in excluding formula grant programs funded under the Elementary and Secondary Education Act of 1965 (ESEA), as amended by the Every Student Succeeds Act (ESSA), and the Individuals with Disabilities Education Act (IDEA), the Department overlooks valuable resources created as a result of these programs. A few of these commenters specifically noted that with the passage of ESSA, many programs that were previously funded as competitive grants have been converted to State block grants, further decreasing the number of programs that would be covered by the proposed rule. The commenters noted the loss of public benefit, and encouraged the Department to promote greater development of open educational resources as a critical strategy to ensuring educational equity, especially for those served by schools in less wealthy communities.

Discussion: In developing the proposed rule, we considered whether it should apply to formula grants but we believe it is most appropriate to limit the applicability of the rule to competitive grants. Based on our experience in implementing this final rule for the Department's competitive grant programs, we will explore whether it is appropriate to expand its coverage to other Department grant programs.

With respect to ESSA, we note a few provisions that may be helpful in establishing the broader context of the Department's work to increase dissemination of educational materials through the use of open educational resources and educational technology. In particular, we note that while Title IV of ESSA authorizes block grants for services that previously were provided under competitive grants under ESEA, openly licensed resources are now incorporated more broadly into all digital education interventions funded by ESSA formula programs. For example, ESSA incorporates open

educational resources into the definition of digital learning in section 4102. As a result, open educational resources may be more easily incorporated into programs authorized under section 4101 to expand digital learning opportunities to rural and remote areas or to develop courses or curricula that incorporate digital learning technologies and under section 4109, to allow LEAs receiving subgrants from States to implement similar measures in their districts. Separately, States receiving allotments under section 4104 may use them to increase access to personalized learning experiences, including “making content widely available through open educational resources.”

Change: None.

Comment: Some commenters requested that the Department explicitly communicate which of the Department’s grant programs would be impacted by the open licensing requirement. These commenters noted that the language of the NPRM leaves open to interpretation the particular grant programs covered and has resulted in confusion over whether it would be applicable to grants awarded under the SBIR program.

Discussion: We address these comments on identifying the Department’s grants that would be impacted by this rule in the *Regulatory Impact Analysis* section of these final regulations because this issue of applicability is closely tied to budgetary and regulatory impact concerns. We address the question of whether this rule applies to the SBIR program in a separate *Discussion* section above.

Changes: None.

Comment: One commenter asked whether the requirements and exemption provided in proposed § 3474.20(c)(3) applied only to peer-reviewed research publications that result from IES-funded research or whether it is applicable to publications resulting from all Department-funded research. The commenter also asked whether the proposed rule would require that the work of writing the article also be funded by the grant, in order for the requirements to apply.

Other commenters suggested that the Department eliminate the exception for peer-reviewed research publications under the proposed rule. These commenters noted that, although the IES’ public access policy makes peer-reviewed scholarly publications available for the public to access, these same publications would still be subject to copyright restrictions. These commenters expressed concern that exempting peer-reviewed research unintentionally overlooks materials that would be of value to the public and to

the scientific community and encouraged the Department to apply the rule uniformly for all grant-funded materials, including these publications. The commenters recognized that IES’ current public access policy is consistent with the requirements laid out in the 2013 Office of Science and Technology Policy (OSTP) Memorandum for Heads of Executive Departments and Agencies https://www.whitehouse.gov/sites/default/files/microsites/ostp/ostp_public_access_memo_2013.pdf. However, they stated that requiring an open license, in addition to requiring public access, could provide an opportunity to accelerate scientific discovery and fuel innovation. One commenter recommended that research publications be made available under a CC BY license, aligning our rule to requirements for publications resulting from scientific research funded by other organizations, such as the Bill and Melinda Gates Foundation. Another noted the high cost of access to research publications and that removing the exception would ease financial constraints on some institutions.

Other commenters that did not support the proposed rule applauded the Department for exempting peer-reviewed research publications covered by the IES’ public access plan. These commenters noted that the 2013 OSTP Memorandum provides an example of a policy that appropriately balances policy benefits of open access while accommodating journal publisher subscription business models.

Discussion: While the majority of research and development activities at the Department are supported through competitive grants administered by the two IES research centers, commenters rightly observe that research and development investments are also supported by other offices within the Department. These include the Office of Innovation and Improvement, the Office of Special Education and Rehabilitative Services (OSERS), the Office of Postsecondary Education (OPE), and the Office of Career, Technical, and Adult Education (OCTAE).

The exception in proposed § 3474.20(c) would have applied only to IES grantees because peer reviewed scholarly publications produced under those grants are subject to the IES’ public access policy, which ensures that those publications are made available to the public through posting on the Education Resources Information Center (ERIC). In the final rule, we have broadened this exception to cover any peer-reviewed scholarly publications funded by any Department grant, not

just an IES grant. We do not believe this significantly changes the practical application of this exception; rather, we believe it makes the application of our rule more consistent. We note that the majority of research and development activities at the Department are the result of IES research grants. For IES grants that result in peer reviewed scholarly publications, the requirements of the IES public access plan will still apply. Currently, the Department is exploring the development of a rule, which would be subject to Administrative Procedures Act notice and comment requirements, which would extend the IES public access requirements for peer-reviewed scholarly publications to all Department grantees. Additionally, we have removed the reference to the IES public access plan from the exception in the corresponding final § 3474.20(d)(1)(v) because that plan is not applicable to Department grants funded outside of IES. The IES public access policy is a document that, under 20 U.S.C. 9581, could be revised without rulemaking. In light of the fact the document could continue to evolve, we do not think it is appropriate to rely on it for the scope of the exception.

One commenter also correctly noted that the work of writing publications may not always be funded by research and development grants. Regardless of whether the work of writing the article is grant-funded, if the research on which the publication is based is supported in whole or in part by grant funds, then the exception in final § 3474.20(d)(1)(v) applies.

Conversely, some grant programs may fund the authorship of articles for publication that do not arise from any scientific research funded by the Department. In these cases, the grantee would be required to apply open licenses to the new works of authorship as described in final § 3474.20(a).

In response to the comments to eliminate the exception in proposed § 3474.20(c)(3), we think that at this time, it is necessary to provide for an exception for peer-reviewed scholarly publications. The research community benefits from allowing the results of scientific research, including research funded by the Department, to be published in scientific journals and subjected to the rigors of peer-review that is a prerequisite to such publication. We note that we are not maintaining the exception in order to accommodate journal publisher subscription business models. Rather, we recognize that there are limited number of open access research journals. Requiring these grantees to

openly license the publications at this time may limit their ability to distribute rigorously reviewed scholarly publications without this exception.

Changes: We have moved this exception from proposed paragraph (c)(3) and into final paragraph (d)(1)(v) and removed the reference to the IES public access policy from the exception. We also expanded the exception to include all peer-reviewed scholarly publications resulting from research grants awarded by any office within the Department.

Comment: Many commenters expressed concern that the open licensing requirement would cause grantees to violate existing copyright or licensing restrictions if they were required to openly license materials. For example, one commenter noted that grant-funded educational resources could incorporate the use of licensed stock photos. Similarly, some commenters note that in many cases, the new modifications to existing intellectual property may require the original, copyrighted work in order for context or application. Another commenter indicated there was confusion in understanding the difference between our usage of the phrases “pre-existing content” and “existing intellectual property.” Many commenters pointed in particular to modifications of computer software, where improvements would not be useful without access to the original licensed programs.

Discussion: It is not our intent to cause any grantee to violate any existing copyrights or licensing restrictions. First, this rule covers only those grant deliverables that are created wholly or in part with Department competitive grant funds, and that constitute new copyrightable works. In instances where the grant deliverables consist of copyrightable modifications to a pre-existing work, the rule only extends to those modifications that can be separately identified and only to the extent that open licensing is permitted under the terms of any licenses or other legal restrictions on the use of pre-existing works. This rule does not impose a requirement to license pre-existing works. This rule also does not require the grantee to modify the terms of any pre-existing license or restrictions, irrespective of whether the grantee is the copyright owner. To ensure these points are clear, we are revising the rule to reflect that it does not cover copyrightable works that are not created with Department grant funds or any copyrightable work incorporated in the grant deliverable that is owned by a party other than the grantee or

subgrantee, unless the grantee or subgrantee has acquired the right to provide such a license in that work. Further, the rule does not apply to grantees or subgrantees where compliance would result in a conflict with the grantee’s or subgrantee’s other intellectual property-related obligations, such as those under the terms of a license agreement.

Similarly, this rule does not require that grantees provide access to computer programs protected under copyright or other laws. We understand that in many cases, the modifications may only be viable within the context of existing commercial software or platforms. However, we believe that these modifications, accompanied by any supporting documentation, may benefit other users of the same commercial software or platforms to the extent that these modifications can be separately identified and extracted from the underlying proprietary work and that open licensing would be permissible under the terms of any restrictions applicable to that underlying work. In light of these comments, we have revised the text of the rule to make this distinction more salient.

Finally, we agree that the references to “pre-existing content” and “existing intellectual property” required appropriate revisions in order to provide greater clarity to the public.

Changes: We have revised § 3474.20(a) to provide that the rule applies to copyrightable modifications to pre-existing works, to the extent such modifications can be separately identified and only to the extent that open licensing is permitted under the terms of any licenses or other legal restrictions on the use of pre-existing works.” Additionally, § 3474.20(d)(1)(iv) and (e), now provide, respectively, that the rule does not apply to “[c]opyrightable works created by the grantee or subgrantee that are not created with grant funds,” or “any copyrightable work incorporated in the grant deliverable that is owned by a party other than the grantee or subgrantee, unless the grantee or subgrantee has acquired the right to provide such a license in that work.” Also, § 3474.20(d)(1)(vi) now provides that the rule does not apply to “[g]rantees or subgrantees for which compliance with these requirements would conflict with, or materially undermine the ability to protect or enforce, other intellectual property rights or obligations of the grantee or subgrantee, in existence or under development, including those provided under 15 U.S.C. 1051, *et seq.*, 18 U.S.C. 1831–1839, and 35 U.S.C. 200, *et seq.*”

Finally, the references to “pre-existing content” and “existing intellectual property” have been removed and the rule now refers to “pre-existing works.”

Comment: Many commenters stated that the requirement to openly license copyrightable works is overly broad. Commenters noted that the Department appears to intend to implement the regulation indiscriminately, without regard for how to distribute works for maximum benefit or without regard for whether the public would benefit from the intellectual property. Specifically, one commenter noted that emails, deliberative work product, and assessments, among other resources would be included in this requirement.

Discussion: Our intention with these regulations is to ensure broad dissemination of and access to high-quality educational resources. We recognize that, in the course of developing these resources, grantees will generate additional copyrightable materials such as email correspondence, administrative documentation, or deliberative work products. Although these materials are items that are considered copyrightable works produced through a grant project, many of them will not be considered program support materials necessary to the use of the deliverables and therefore would not need to be openly licensed. Others, however, may be considered program support materials necessary in order to understand, learn from, and replicate deliverables. For example, some outreach materials may describe grant deliverables to stakeholders, or others may document best practices in implementation for specific target populations. These program support materials that are considered necessary to the use of grant deliverables, must be openly licensed and made available to the public. Other items, such as staff training curricula, production guides or planning documents that are created as a result of implementing the grant project, may or may not provide useful information for understanding the administration of grant activities. In these cases, the Department is committed to working with grantees to determine whether these should be part of their dissemination plan. In cases where these support materials are appropriately considered records, grantees should follow record-keeping requirements in 34 CFR 75.730–732. Our goal is to ensure that the public may benefit from the sharing of those grant products that may have significant value, but not to unduly burden grantees.

We agree with the commenters that our intentions and the rule’s scope

should be clarified and are revising the final rule to narrow the scope of the copyrightable works that must be openly licensed under § 3474.20(a) to copyrightable grant deliverables. Specifically, we are including a definition of “grant deliverable” in the final regulations and specifying that the open licensing requirement only applies to grant deliverables. Under the definition, a “grant deliverable” is a final version of a work, including any final version of program support materials necessary to the use of the deliverable, developed to carry out the purpose of the grant, as specified in the grant announcement.

The Department is committed to working with grantees to develop licensing and dissemination strategies that are particular to their grant program, offer appropriate privacy protection, do not create duplicative work for the grantee, and are consistent with the goals of the grant program and this final rule. Department staff will be trained to address these items throughout the implementation period of the rule. We note that it is impossible for us to make specific determinations in advance about which resources would be of use to various stakeholders in the field and believe our goals are best accomplished when the public is given access to the broadest array of materials created to make their own determination regarding their usefulness. The Department will provide further guidance to grantees concerning grant deliverables during implementation of grant programs.

Changes: We have added § 3474.20(f) to provide a definition of “grant deliverable” to mean a final version of a work, including any final version of program support materials necessary to the use of the deliverable, developed to carry out the purpose of the grant, as specified in the grant announcement.

Comment: One commenter expressed concern over the potential negative effects of the proposed regulation on grantees of the Department’s Ready to Learn Television grant program, and recommended the Department add an exception for “grants that provide funding for public television entities.” The commenter detailed consequences of the final regulation in three broad categories.

First, the commenter indicated that under existing programmatic requirements, content and resources created by the Ready to Learn grant program are already distributed as broadly as possible. In implementing these distribution and outreach requirements, the commenter noted that grant-funded television content is

distributed over-the-air to almost every household in America and grant-funded transmedia content such as mobile applications and other digital resources are already available at no cost to teachers, parents, and children.

Second, the commenter indicated that the quality and sustainability of materials created with Ready to Learn grant funds would be undermined. The commenter noted that Ready to Learn grant funding serves as seed funding for many of the public television series and transmedia content and asserted that without non-exclusive distribution rights it would be impossible to secure additional funding through public-private partnerships. In addition, the commenter noted that it would be impossible to secure partnerships with experienced producers of top quality educational series. Similarly, the commenter noted that Ready to Learn grantees, together with experienced producers, have been able to create resources that are qualitatively different than content created by other grantees and that the open license requirement would preclude production of any further content.

Finally, the commenter stated that the impact of the open license would extend beyond loss of revenue to encompass loss of educational content that would not be produced in response to this regulation. In addition, the commenter noted that resources produced by Ready to Learn funding can be used broadly by educators in accordance with the fair use provisions of copyright law and that testing and research have shown that there is no indication of a further need for educators to create derivative works. The commenter also stated that contrary to the Department’s expectation that the proposed regulations would not have a significant economic impact on a substantial number of small entities, the proposed regulation would have a significant impact on a substantial number of small entities as it would reduce the programming available for small entity licensee stations to air, and would degrade community and foundation financial support for stations by constraining stations’ ability to engage with and serve their local communities.

Discussion: The Department values the work of our Ready to Learn grant recipients. We appreciate the commenter’s data on the broad distribution and availability of the television and digital content created by public television entities through the Ready to Learn Television grant program. We commend the Ready to Learn Television program grantees for

creating high quality, research-based transmedia content that is readily available to early learners of many diverse backgrounds.

We have added an exception in § 3474.20(d)(1)(vi) for grantees or subgrantees under the Ready to Learn Program because of two factors unique to the design and statutory mandate of the Ready to Learn program. First, one stated goal of the proposed regulation is the broad distribution of materials funded by the Department. The commenter provided evidence that the particular qualities of the Ready to Learn distribution model and transmedia strategy, and the specific programmatic and statutory requirements to broadly distribute these materials have achieved market dissemination at least equivalent to the dissemination likely to be achieved through compliance with this final rule. Second, a stated goal of the proposed regulation is to spur innovation through creative reuse of grant-funded materials. As the commenter notes, many of the resources created under the Ready to Learn program are based on pre-existing intellectual property and the intellectual property owned by the grantee in the final grant deliverable, in isolation, would provide minimal opportunity for meaningful adaptation, modification, or other re-use.

We disagree with the commenter’s recommendation that the Department adopt a categorical exception for all grants that provide funding for public television entities. Although it is apparent from the comment that the recommended exception was specifically with reference to the Ready to Learn television grant program, we note that public television entities may also be the recipient or sub-recipient of other Department grants subject to this regulation. For example, public television entities have received funding as partners in the Special Education Educational Technology, Media, and Materials for Individuals with Disabilities Program (formerly Technology and Media Services for Individuals with Disabilities). The recommended exception, as written, would apply too broadly to any grant in which a public television entity was a recipient or sub-recipient, without sufficient evidence that all public television entities would be adversely affected by this rule in a similar manner.

The reasons the commenter gave for a categorical exception are seemingly unique to grantees under the Ready to Learn grant program.

Changes: We have revised the final regulations to provide that grantees under the Ready To Learn Television

Program, as authorized in section 2431 of the ESEA, 20 U.S.C. 6775, are excepted from the rule's requirements.

Comment: A few commenters expressed concerns with the proposed rule in the context of the Department's broader #GoOpen initiative to encourage States, school districts, and educators to use openly licensed educational materials. One commenter disagreed with the Department's assertion that openly licensed materials will increase equity, suggesting that inequality of connectivity and hardware necessary to access openly licensed resources and costs of printing of digital materials instead preserves the existing inequalities between schools. This commenter also stated that rather than empowering teachers, adaptable, openly licensed resources actually impose additional burdens on already overtaxed teachers. Finally, another commenter similarly questioned whether the Department, in expressing a preference for openly licensed educational resources, might be distorting fair market competition for educational materials.

Discussion: We appreciate the comments on the #GoOpen initiative. Because the #GoOpen initiative is an activity separate from this rulemaking, many of these concerns are beyond the scope of this regulatory action. However, we believe a few clarifications will limit any confusion between these activities, and their differing scopes.

The #GoOpen movement is a specific movement where districts and states voluntarily participate in a community of practice focused on the use of openly licensed, digital resources. For these #GoOpen districts and States, openly licensed resources provide opportunities for cost savings and dissemination and innovation beyond the mere digitization and print reproduction of resources across the socioeconomic spectrum. The #GoOpen movement supports districts and States, in curating curricular materials that teachers can use or reuse or adopt based on the unique needs of their students or to suit their individual approaches to instruction. These teachers are afforded tools and professional learning resources from their district or State and from other districts and States so that they can capitalize on the opportunities provided by openly licensed and other digital resources. This is consistent with other policies, such as those reflected in the ESEA the authorization of appropriations for, among other professional development activities, training on the use of digital and openly sourced materials. Beyond individual classroom teachers, the #GoOpen

initiative encourages administrators, technology directors, parents, and students themselves to work collaboratively in order to ensure the best opportunities for success. Through the #GoOpen movement, the Department actively supports partnerships between States, districts, and educators; promoting promising models of leadership; and aligning public and private efforts.

The #GoOpen movement is one specific initiative of the Department, where the Department coordinates the community of practice for States, school districts, and educators that voluntarily use openly licensed educational materials. We believe that a consideration to move towards openly licensed textbooks must include an objective evaluation of relevance and quality, as well as cost. Those resource decisions are made at the State and local level. Our efforts through the #GoOpen movement encourage State and district leaders to give equal consideration to openly licensed resources in making the best possible decision for educators and students.

This rule does not impose requirements for teachers or any other stakeholders to use openly licensed resources or encourage them to eschew publisher textbooks.

Changes: None.

Comment: Several commenters stated that the proposed rule would conflict with patent rules, stating that the existing technology transfer mechanism established at research institutions through current regulations is the most effective means of promoting innovation and commercialization of grant funded intellectual property. The commenters assert that requiring an open license on grant-funded materials would reduce rather than increase innovation and dissemination.

These commenters note that the technology transfer infrastructure established as a result of the Bayh-Dole Act and other patent provisions has incentivized commercial entities to develop grant-funded works into successful products and services with greater reach. One commenter provided data from articles analyzing the impact of the Bayh-Dole Act which state that federally funded research has resulted in nearly 10,000 patented products and enabled the launch of 4,200 new companies with a net product sales of \$22 billion in 2013 alone. The commenter concluded from this data that the profits from these sales have incentivized partnerships with Department grantees that result in broad and relevant dissemination of products. Other commenters similarly note that

public-private partnerships are critical to enabling sustainability of grant-funded products. In cases where grantees that have created computer software source code, that code itself often requires additional investment in product development, marketing, distribution, and support services for updates and upgrades. In cases where grant-funded research has resulted in creating interventions, these partnerships can allow continuous refinement and improvement of the intervention.

Those commenters that warned the Department about the unintended effects of an open license on the incentive to innovate asserted that profit incentives are the engine of innovation. The commenters stated that, this rule would remove these incentives, which would stifle new ideas and result in fewer innovations. Similarly, some commenters stated that commercialization was the only means by which intellectual property becomes widely distributed and that open licenses would irrevocably harm product dissemination for grant funded materials.

Other commenters expressed concerns that the loss of profit incentives would cause stakeholders to pursue alternate, non-Federal funding, rather than Department grant funding.

Discussion: The Department agrees with the commenters that commercialization is an important means of promoting innovation and can result in broad dissemination of patents and other types of intellectual property. Grantees that comply with the legal requirements to openly license grant funded copyrightable works identified in the rule may still wish to seek patent protection on any invention created with grant funds. To ensure clarity about the rule's application, we are revising the rule to provide that it would not apply in instances in which compliance with the rule would conflict with or materially undermine the ability to protect or enforce other intellectual property rights or obligations of the grantee or subgrantee, in existence or under development. For example, the rule would not apply to a grantee or subgrantee in instances where the application of the rule would materially undermine the grantee's rights if the grantee or subgrantee had developed, or was in the process of developing, an invention that it wishes to patent.

Alternatives to commercialization also exist that can promote innovation in the field of education, act as an efficient means of broad dissemination of educational research or resources, and help sustain innovations after grant

periods end. As shown elsewhere in this document, there have been many examples of the broad dissemination and innovations developed from high-quality openly licensed educational content.

We again note that any derivative works created based upon grant deliverables using non-Department grant funds are not covered by this rule. Grantees may leverage works created under an open license to establish or maintain a relationship with a private entity for the purpose of commercialization.

The Department appreciates the commenters' concerns that our stakeholders may eschew Department grants in favor of other funding without these requirements. Our competitive grant programs are intended to support equal access to high-quality education for all students. By allowing others to freely use, with minimal restrictions, the educational resources created with our funding, we are providing opportunities for the global community of stakeholders to pursue solutions to their challenges. As previously mentioned, commercial incentives are not the only drivers of innovation in the field of education; similarly, we do not believe economic motive to be the sole consideration for stakeholders to participate in our grant programs. We observe that after implementing their similar policy, the Department of Labor continued to require applicants to form public-private partnerships in numerous notices inviting applicants for competitive grants. Despite the requirement that grantees make copyrightable intellectual property available under a Creative Commons Attribution (CC BY) license, the many programs covered since the enactment of their regulation have received a large pool of applicants. We recognize, however, that there may be some situations where a grantee may have difficulty forming a partnership with a private entity to create a grant deliverable. We believe that such situations are best addressed on a case-by-case basis and are revising the final regulation to include this situation as an example of where the Secretary may consider it appropriate to grant an exception to the open licensing requirement.

Changes: We have revised § 3474.20(d)(1)(viii) to provide that the open licensing requirement does not apply to “[g]rantees or subgrantees for which compliance with these requirements would conflict with, or materially undermine the ability to protect or enforce other intellectual property rights or obligations of the

grantee or subgrantee, in existence or under development, including those provided under 15 U.S.C. 1051, *et seq.*, 18 U.S.C. 1831–1839, and 35 U.S.C. 200, *et seq.*” We also have included in § 3474.20(d)(1)(vii) examples of situations in which the Secretary may consider it appropriate to grant an individual exception to the open licensing requirement. One of these examples is the situation in which the grantee's compliance with the open licensing requirement would impede the grantee's or subgrantee's ability to form the required partnership to carry out the purpose of the grant. The other example is discussed later in this section.

Comment: Commenters stated their concerns related to openly licensing research-based interventions resulting from the Department's research grants. These comments fall into three general categories. First, commenters noted that grantees often receive research funds to produce early prototype models or interventions that have not yet benefited from robust efficacy studies. Openly licensing these resources would allow the public to access them ahead of testing and could lead to adoption of ineffective or potentially harmful resources. Commenters noted that this would especially harm disadvantaged populations. Second, commenters stated that the interventions developed through research grants are complex to administer, often requiring expert training or technical support in order to maintain quality control and ensure valid outcomes. Commenters noted that quality could be diminished through uncontrolled adaptations or derivatives that deviate from the evidence base or context established by the original researchers. Similarly, commenters also stated that in some cases, individuals could deliberately ignore the original parameters or context established by the researchers and pursue inappropriate use. In all of these cases, the reputation of the researcher could be compromised and the effectiveness of the original resource dismissed.

Third, many commenters noted that research institutions exercise good stewardship over grant resources and already employ a number of strategies to broadly disseminate their findings. Many commenters also provided examples of existing initiatives that result in broad dissemination of research-based interventions. Some of these examples included use of strong partnerships with a commercial partner to allow for continued refinements to the products, reinvestment into future research, and technical support for implementation, even after the end of

the grant period. These commenters also note that many research institutions do not have the expertise or capacity to effectively scale interventions, and even if openly licensed resources were available, wide dissemination would not occur without these partnerships. Additionally, some commenters stated that the existing IES goal structure was the most effective model of ensuring research-based interventions are scaled and disseminated widely, and recommended that IES maintain this goal structure.

Discussion: We appreciate the concern that many IES grantees and education researchers have expressed related to implementation of the rule. In general, we note that this rule is intended to apply across competitive grant programs, not only to IES grantees.

We agree with commenters that rigorous efficacy testing is necessary to ensure high quality resources, including interventions, products, and assessments, benefit students. We note that in addition to the early prototype models or interventions themselves, any final versions of program support materials necessary to the use of the prototype model or intervention, including professional development and training materials, research findings, and documentation of the context and efficacy of the resources created with grant funds would also be made available through an open license. Additionally, any materials created as part of IES research grants would also include rigorous peer-reviewed scholarly publications that would be available through ERIC. The availability of these supporting materials will allow the public to readily discern which resources could be appropriately used and which resources have not yet reached maturity. In some cases, these materials will prescribe the appropriate context and correct implementation methodology of the resource. We believe that practitioners should not be denied access to materials because of the possibility that they will misunderstand or misuse them. By openly licensing the supporting materials, data, and other program support materials, grantees can ensure that practitioners have the tools necessary to understand, learn from, and replicate deliverables, and to consult with researchers as appropriate.

In response to the commenters' concerns, we make three observations. First, even before product maturity, prototypes and early stage research, including supporting documentation, can greatly benefit other researchers, allowing them to also test and refine the resource, potentially creating prototypes for different applications. We believe

this will result in developing resources at a rapid speed and encouraging innovation in the educational research field. We note that although peer-reviewed scholarly publications are excepted from this rule, those publications that are supported by IES grant funds are subject to the requirements of the IES' Policy Regarding Public Access to Research. As noted earlier, the Department is exploring other administrative means for expanding the requirements currently followed by for IES grant-supported peer-reviewed scholarly publications to all Department grants. We believe that the combination of the open access to publications and data with the openly licensed resources will enable the community of education and scientific stakeholders to use the early research effectively and responsibly.

Second, we share in the concerns related to the misapplication of scientific research and misuse of educational tools. Nevertheless, we note that these issues may occur regardless of whether the research or tools are under copyright or available through an open license. We also note that members of the public, policymakers, educational practitioners, and other stakeholders, often incorrectly attribute their assertions to researchers, resulting in loss of reputation to the researcher. We do not believe that the root cause of these unfortunate circumstances is the availability of resources through an open license. In fact, a machine-readable license format on digital resources may actually facilitate the discovery of the original research and underlying frameworks for implementation. We also note that separate from the IES Policy Regarding Public Access to Research, many research institutions have already established faculty open access policies that enable public access to research and data.⁴

Third, we acknowledge that in many cases, research entities lack expertise and capacity to scale the adoption of new resources and that in many cases, private entities play an important role in the iterative improvement of resources, often contributing funding in the process. For the purposes of this rule, the Department believes that the primary barrier to broad dissemination is not the lack of capacity; rather it is the lack of access to resources. Even if one research entity does not have the capacity to scale a resource, an open license enables other entities, some with greater expertise and resources, to disseminate them. We note that this

regulation does not cover derivative works, funded privately through these partnerships.

Finally, we note that this regulation does not alter the structure or statutory requirements for any existing grant program, including the goal structure of IES-funded grant programs. As discussed elsewhere in this regulation, peer-reviewed scholarly publications that arise from scientific research funded, either fully or partially, from grants awarded by the Department are excepted from this regulation. This plan provides access both to research findings and the scientific data, encouraging researchers, practitioners, and the general public to test and improve findings and resources and otherwise enhance value for all stakeholders.

Changes: None.

Additional Questions

In the NPRM we posed five questions that requested comments on whether the proposed regulations should include certain additional implementation requirements. The responses provided to the five questions are summarized below.

Question 1: Should the Department require that copyrightable works be openly licensed prior to the end of the grant period as opposed to after the grant period is over? If yes, what impact would this have on the quality of the final product?

Comments: Commenters that responded to this question were divided over whether it would be best to require that the open licenses be applied prior to the end of the grant or after the grant is over. In general, all commenters that opposed the requirements of the NPRM did not believe that open licenses should be applied prior to the end of the grant period. These commenters noted that this would result in a number of negative public consequences. For example, prior to the end of the grant period, products or interventions may not yet be complete or useful and may harm the public if disseminated too early or without proper training on their implementation. In addition, openly licensing and distributing non-final versions could create confusion for the public about which version to adopt or hinder the peer review process.

Conversely, some commenters stated that applying open licenses and distributing materials prior to completion will give opportunity for more feedback and review and give the grantee additional time to make adjustments or refinements prior to the end of the grant period leading to a better final product. In addition, by

making their work known, duplicative efforts can be avoided.

Other commenters stated that the decision of whether the license is applied prior to the end of the grant period should be made based on the goals and circumstances of the grant program.

Discussion: We considered the variety of viewpoints reflected in the comments and the variety of grant programs funded by the Department. We believe that it would be difficult to prescribe a single timing requirement appropriate for all programs. Depending on the goals of the particular grant program or the individual project proposal, the grantee may elect to openly license the intellectual property created through the grant before the grant period has ended, though that is not a requirement. The final rule does not specify whether copyrightable grant deliverables should be openly licensed prior to the end of the grant period or after the grant period is over, thereby leaving it to each grant program to decide.

Changes: None.

Question 2: Should the Department include a requirement that grantees distribute copyrightable works created under a direct competitive grant program? If yes, what suggestions do you have on how the Department should implement such a requirement?

Comments: Commenters were divided in their response to the proposed requirement for grantees to distribute Department-funded works. Many commenters supported an additional requirement to distribute Department-funded works. Of these, some commenters proposed that the Department be nonspecific about the method of distribution. One commenter expressed concerns that specificity would drive away institutions currently implementing other distribution methods. Others suggested more specific methods, including the use of a CC BY license or dissemination of works through online platforms. Some of these commenters accompanied their suggestions with proposals for additional Federal requirements, such as a sustainability plan in the grant application or a final report containing a link to the location of the work in an online repository.

Other commenters disagreed with requiring distribution by grantees. These commenters suggested that the responsibility of distribution resides with the Department, such as through the use of the ERIC, an online library of education research and information, sponsored by IES. Similarly, others suggested partnership with existing repositories or the creation of another

⁴ <http://sparcopen.org/coapi-members/>.

online repository. Commenters also noted that the Department should make funding or other resources available to grantees if it establishes distribution requirements or allow grantees to monetize modifications to the grant-funded materials.

Discussion: We note the variety of suggestions that reflect the experience of the diversity of our grant recipients. In reading the suggestions, we believe that the specific mode of dissemination enabled by open licenses should remain at the discretion of the program in order to be appropriate to the needs of the grantees and align with the statutory goals of that program. However, we believe that our goals would be best achieved by including a requirement that grantees provide information about the resources that have been created with support of Department grant funds. As a result, we have added a requirement for grantees to submit a plan for dissemination of their openly licensed resources. We would encourage grantees to provide links to public Web sites of their works if that is appropriate based on the nature of their resource. We note that for a grantee that does not have its own Web site, there are a number of free methods to distribute digital openly licensed materials through publicly available Web sites, learning resource, and metadata repositories.

We also recognize that a grantee may develop a robust dissemination plan that could demonstrate meaningful dissemination that is equivalent to or greater than the dissemination likely to be achieved by compliance with the open licensing requirements. Accordingly, we are revising the regulation to provide this situation as an example of a scenario in which the Secretary would consider granting an exception to the open licensing requirement.

Changes: We have added final § 3474.20(c) to state that a grantee or subgrantee that is awarded competitive grant funds must have a plan to disseminate the openly licensed grant deliverables that were created in whole, or in part, with Department grant funds. In final § 3474.20(d)(1)(vii), we have also provided an example of a basis for providing an exception under 2 CFR 3474.5 and 200.102 where the Secretary has determined that the grantee's dissemination plan would likely achieve meaningful dissemination equivalent to or greater than the dissemination likely to be achieved through compliance with paragraph (a) or (b) of this final rule.

Question 3: What further activities would increase public knowledge about

the materials and resources that are created using the Department's grant funds and broaden their dissemination?

Comments: The Department thanks commenters for the numerous recommendations regarding activities that would broaden the dissemination of materials and resources created using the Department's grant funds. Several commenters suggested the adoption of an existing online, open platform, such as OER Commons, GitHub, and OpenStax CNX. Others stated the need to create and enforce an entirely new repository of works and related reports or an index containing links to pages where the specific resource can be located.

Aside from online platforms, commenters suggested the launch of a large advertising campaign of Department-funded works including the use of media such as emails, newsletters, and speeches where the Department highlights openly licensed materials and resources. Finally, a few commenters stated the need for the Department to communicate with grantees directly to discuss what exactly open licensing entails and how dissemination practices can be funded.

Discussion: We appreciate the variety of suggestions provided by commenters. In addition, we appreciate the concern for public awareness. We will consider these recommendations as we work to increase the public's knowledge of materials that are openly licensed pursuant to this final rule. It is our intention to also provide robust training to grantees on how to satisfy this requirement. We note that at this time, the Department does not have the funding to support the development of an online repository solution.

Changes: None.

Question 4: What technical assistance should the Department provide to grantees to promote broad dissemination of their grant-funded intellectual property?

Comments: Commenters suggested that the Department provide guidance for grantees for a variety of topics, such as licensing standards, metadata, formatting, information on how to access openly licensed resources to incorporate them into original works, and creating accessible materials. The commenters suggested that this guidance be provided through formal workshops and training. Other commenters suggested that the Department promote dissemination by creating a user-friendly central repository of works and related reports, developing a directory of funded materials, or establishing a funding mechanism specific to distribution.

One commenter suggested that grantees should continue to work with technology transfer offices at their institutions.

Discussion: We thank the commenters for the numerous suggestions provided. The Department has taken these into account and will incorporate these into future training for grant recipients. At this time, we will not be providing funding for the creation of a central repository of works or reports, nor is there any additional funding available specific to distribution.

Changes: None.

Question 5: What experiences do you have implementing requirements of open licensing policy with other Federal agencies? Please share your experiences with these different approaches, including lessons learned and recommendations that might be related to this document.

Comments: We thank the commenters who responded to this question and had a wide breadth of experience implementing other open licensing requirements. Only one commenter had direct experience as a Department grantee. Though open licensing was not a requirement of their grant project, the grantee elected to use an open license to ensure that grant-funded resources would be made available to as many individuals as possible. This grantee reported positive experience running a grant-funded education center that provides services to individuals with disabilities. In addition to distribution, the grantee reported that with equal availability as a foundation, "openness" enabled cooperation between multiple organizations to address the common challenge of STEM accessibility. The grantee made several recommendations, including use of Creative Commons licenses, that materials be released under an open license at time of completion or wide distribution during the grant period, that materials be made available on the internet without obstructions, and that metadata be listed on a resource site such as the Learning Registry. The grantee also recommended that the Department host all grant funded materials on a resource site.

A few commenters had direct experience implementing open licensing policies of other Federal agencies, including the Departments of Labor and the National Science Foundation. Based on their experience these commenters recommended that the Department direct grantees to use licenses that are interoperable that allow a broad range of reuse, including specifically, Creative Commons licenses. One commenter had experience leading open repository

development and technical assistance on numerous projects including establishing the Department of Labor's repository for the TAACCCT grant program, the National Science Foundation National Digital Library of Science, and the California Affordable Learning Solutions initiative. This commenter noted the importance of providing an online library of all grant-funded resources to enable quality and continuous improvement. In addition, the commenter noted the importance of providing support to institutional leaders in developing and implementing a change management strategy for their institution to locally design and implement culturally aligned, locally supported, and collectively valued ecosystems of intellectual property strategies, recognition, and incentives for openly sharing intellectual property, and an institutional mission for improving society through quality education.

One commenter stated that they did not know of any other Federal funding agencies that would make this regulation a grant requirement, as it would require forfeiture of intellectual property.

Discussion: We thank these commenters for sharing their experiences. All of the suggestions have been discussed elsewhere in this regulation, except for the suggestion to list metadata on a resource site such as Learning Registry. The Department believes that Learning Registry is a valuable metadata repository for open educational resources. Grantees of the Department are encouraged to consider using Learning Registry or other public, freely available platforms to enable sharing of resources.

In reviewing these comments, we noted that our proposed rule did not account for situations in which a grant deliverable is jointly funded by both the Department and another Federal agency where the other Federal agency does not require the open licensing of its grant deliverables for that program. In these instances, we recognize that complying with the Department's open licensing requirement may cause confusion regarding a grantee's ability to comply with the requirements of that other Federal agency regarding the grant deliverable, so we are revising the regulation to provide that the rule would not apply to these types of grant deliverables.

Changes: We have revised § 3474.30(d)(1)(iii) to provide that the open licensing requirement does not apply to grant deliverables that are jointly funded by the Department and another Federal agency if the other

Federal agency does not require the open licensing of its grant deliverables for the relevant grant program.

Executive Orders 12866 and 13563

Regulatory Impact Analysis

Under Executive Order 12866, the Secretary must determine whether this regulatory action is "significant" and, therefore, subject to the requirements of the Executive order and subject to review by the Office of Management and Budget (OMB). Section 3(f) of Executive Order 12866 defines a "significant regulatory action" as an action likely to result in a rule that may—

(1) Have an annual effect on the economy of \$100 million or more, or adversely affect a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities in a material way (also referred to as an "economically significant" rule);

(2) Create serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impacts of entitlement grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles stated in the Executive order.

This final regulatory action will have an annual effect on the economy of more than \$100 million because of the benefits that will be realized as a result of the dissemination of openly licensed resources required under this rule. Although the costs associated with this rule are relatively low, we believe the benefits from the resources that will be readily available to the public through broad dissemination will reach more than \$100 million. We explain these costs and benefits in more detail in the *Costs and Benefits* section of this *Regulatory Impact Analysis*. Therefore, this final action is "economically significant" and subject to review by OMB under section 3(f)(1) of Executive Order 12866. We have also reviewed these regulations under Executive Order 13563, which supplements and explicitly reaffirms the principles, structures, and definitions governing regulatory review established in Executive Order 12866. To the extent permitted by law, Executive Order 13563 requires that an agency—

(1) Propose or adopt regulations only upon a reasoned determination that their benefits justify their costs (recognizing that some benefits and costs are difficult to quantify);

(2) Tailor its regulations to impose the least burden on society, consistent with obtaining regulatory objectives and taking into account—among other things and to the extent practicable—the costs of cumulative regulations;

(3) In choosing among alternative regulatory approaches, select those approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity);

(4) To the extent feasible, specify performance objectives, rather than the behavior or manner of compliance a regulated entity must adopt; and

(5) Identify and assess available alternatives to direct regulation, including economic incentives—such as user fees or marketable permits—to encourage the desired behavior, or provide information that enables the public to make choices.

Executive Order 13563 also requires an agency "to use the best available techniques to quantify anticipated present and future benefits and costs as accurately as possible." The Office of Information and Regulatory Affairs of OMB has emphasized that these techniques may include "identifying changing future compliance costs that might result from technological innovation or anticipated behavioral changes."

We are issuing these final regulations only on a reasoned determination that their benefits would justify their costs. In choosing among alternative regulatory approaches, we selected those approaches that maximize net benefits. Based on the analysis that follows, the Department believes that these final regulations are consistent with the principles in Executive Order 13563.

We also have determined that this regulatory action would not unduly interfere with State, local, and tribal governments in the exercise of their governmental functions.

Need for Regulatory Action, Potential Impacts, and Costs and Benefits

Need for Regulatory Action

Grantees under the Department's competitive grant programs create a number of copyrightable grant deliverables using Department grant funds that may have significant benefit for students, parents, teachers, school districts, States, institutions of higher education, and the public overall. These copyrightable works are wide ranging in nature and include instructional materials, personalized learning delivery systems, assessment systems,

language tools, and teacher professional development training modules, just to name a few. The Department's grantees creating these works include SEAs, LEAs, IHEs, and non-profit organizations and while the works are created under a specific grant program and therefore may target a specific school or group of students, the resources are such that other education stakeholders would significantly benefit from being able to readily and freely access them, use them, and in some cases, modify them to address their needs and goals.

As we note earlier, wide dissemination of these types of copyrightable works has not occurred under the Department's current regulations. We found very few instances in the last decade where program offices received a request to make grant-funded resources available under the Federal purpose license. However, we do have evidence of the impacts of open licensing in those competitive grant programs where open licensing was required or where the grantee voluntarily openly licensed its copyrightable works.

For example, the Department's First in the World (FITW) program has an existing open licensing requirement and thus provides a basis for estimating the potential benefit of these final regulations. In FY 2015, the Department awarded approximately \$60 million in FITW funds to 18 institutions of higher education, research organizations, and education agencies. This total included 16 FITW development grants intended to seed and evaluate early stage innovations, where new intellectual property would be created, and two validation grants to test at a broad scale existing interventions supported by significant evidence.

We estimate that the 16 development grantees will produce at least 1,400 new resources that would be openly licensed, approximately 90 resources per grantee. This estimate is based on work that the FY 2015 grantees project they will do over a four-year period and we generally anticipate that most resources would be available for dissemination and licensing in the last two years of the grant period. We also note that the total number of resources to be created across the 16 grantees varies widely as a result of the different activities and innovative approaches proposed in their projects. For example, CSU-Los Angeles is proposing to redesign every first year science course, resulting in the largest estimate of resources created, while Delaware State is proposing to develop an analytics framework and tool for matching

student interests to programs, which we believe would result in the creation of fewer resources. These two projects would impact approximately the same number of students, but one approach involves the creation of a large number of resources while another invests resources towards creation of a platform tool and a smaller number of resources associated with that tool.

Moreover, we believe that our estimates for the FITW grantees are likely to be higher than what we would expect for most other Department competitive grant programs, including those at the higher education level and those focused on elementary and secondary education. For example, in the higher education space, the Federal TRIO programs, which accounted for nearly half of all competitive awards to IHEs in FY 2015, have a more narrowly focused statutory purpose to provide basic services (e.g., tutoring, counseling, mentoring) to needy students using strategies and generally are less likely to produce copyrightable resources.

On the other hand, the Department also funds a number of activities that, under the final regulations, would be likely to produce significantly higher numbers of copyrightable resources than FITW grantees. For example, our National Language Resource Centers (LRC) program funds IHEs to research and develop resources for Less Commonly Taught Languages (LCTL), http://www.nflrc.org/lrc_broc_full.pdf. In the FY 2014–FY 2017 grant cycle, we awarded approximately \$2.8 million to 16 IHEs to support National Language Resource Centers (LRC) for research and development of resources for LCTL. There was no requirement for the grantees to openly license their resources, but one grantee did so of its own volition. Specifically, the University of Texas at Austin received approximately \$200,000 in FY 2015 to fund the Center for Open Educational Resources and Language Learning (COERLL), which creates fully openly licensed language and pedagogical materials for 16 languages, in addition to an open platform for discovery, remix, and repurposing of these language resources, and open research. The Department estimates that there are approximately 500 educational resources, including curricula, lessons, worksheets, assessments, textbooks, videos, podcasts, research studies, open apps for student learning, and interactive platform, materials, openly licensed on the COERLL Web site (<https://www.coerll.utexas.edu/coerll/>).

Based on the experience with UT-Austin, we believe that if an open license requirement were in place at the

time these awards were made to the 15 other grantees, we could assume that 15 times more language learning materials would be made available, or an additional 7,500 pieces of openly licensed content across the different language areas. Moreover, the enhanced availability of these materials potentially would have increased the impact of each of the individual centers by encouraging and supporting vibrant communities of practice focused on language instruction and learning at institutions that do not have the resources themselves. For example, this would have enabled discovery and use of resources created by the University of Indiana National African Resource Center, whose lack of broad dissemination leaves the public without information about what resources are available, where to access any materials, or how to seek permission to use any resources found. Since this is the only African language program in this cohort, the result is also the loss of resources for this entire language family.

Analysis of Potential Impacts

In FY 2016, the Department made new and continuation awards under roughly 110 unique discretionary competitive and non-competitive grant programs that totaled \$44.155 billion (excluding Pell). Of this total we estimate that 66 programs would be subject to the open licensing requirements of the final regulations. In addition to the Ready to Learn program, of the 43 programs (roughly \$39.932 billion in FY 2016) that we estimate would be exempt from open licensing, approximately 30 are non-competitive programs that allocate funds on the basis of a formula, and approximately 13 support competitive grants in which program funds are only used to support activities that clearly fit within one or more of the categorical exemptions in this rule (e.g., approximately 7 are competitive programs that only support fellowships or scholarship awards to individuals, and the other 6 provide support for general operating expenses).

Within the group of 66 competitive grant programs (which received \$4.223 billion in FY 2016) subject to the rule, not all grantees will produce intellectual property. For example, in the IDEA Personnel Development to Improve Services and Results for Children with Disabilities Program, many cohorts of grantees do not produce intellectual property at all and, therefore, this rule would not apply to those specific grantee cohorts. We note that the required activities in grant competitions often change over time, so the impact of

the rule may vary from one competition and cohort to the next.

In addition, in some cases, only a portion of activities and funding would result in the creation of resources that would be required to be openly licensed under the final regulations. For example, in the case of IES's Education Research, Development, and Dissemination program, grants are awarded competitively to support research programs that both create interventions and resources and peer-reviewed publications that arise from scientific research (receiving an exception). The Department also has developed an agency-level exceptions process where any program could ultimately be granted either partial or complete exception to the requirements of the final regulations. For all of these reasons, we estimate that the potential impact of these final regulations will be limited to a relatively small but important subset of the programs and projects funded by the Department in any given year. The final regulations will ensure that those programs and projects that do produce copyrightable educational materials and resources, including materials and resources proven effective through rigorous evaluation, make such resources freely and widely available to the public for the potential benefit of students, teachers, and schools across the nation.

Potential Costs and Benefits

The final regulations will not impose significant costs on entities that receive assistance through the Department's competitive grant programs. We note that annual variation in the total volume of new and continuing discretionary grant awards, as well as in the purposes and priorities associated with such grants, limits the precision of our estimates, but we estimate that the upper bound total cost of these regulations, over ten years, will be approximately \$22.6 million in labor fees, at an annualized rate of \$3.2 million per year, with no additional costs to support technology infrastructure. This estimate assumes a discount rate of three to seven percent.

Analysis of Technology Infrastructure Costs

While the benefits of the final regulations depend on the broad, accessible dissemination of copyrightable educational materials and resources, we estimate that such dissemination will result in no additional technology infrastructure costs to grantees subject to the open licensing requirements, for two reasons. First, the near-universal adoption of

digital tools and devices means that grantees will be creating and refining grant deliverables in digital formats that facilitate dissemination at no additional technology cost. Second, grantees may readily access and use a number of free methods to distribute digital openly licensed materials, including publicly available Web sites, content, or metadata repositories at no cost. Thus, we expect that grantees generally will be able to meet the dissemination requirements of the final regulations without incurring additional technology infrastructure costs.

Analysis of Technology Labor Costs

Even though there will generally be no additional costs associated with technology infrastructure, we estimate that over a period of 10 years there may be a likely high-end labor cost of \$22.6 million. This cost represents an upper bound estimate of the labor necessary to disseminate copyrightable products expected to be generated by all new ED grantees over a period of 10 years. To develop this upper bound estimate, we started by analyzing the volume of ED grantees that could potentially be impacted by the rule. In 2016, the most recent year preceding this final rule, the Department made approximately 5,470 new competitive grant awards. We know not all of these grantees will generate copyrightable products requiring dissemination under this final rule, so for purposes of this upper bound estimate we estimate that the Department will continue to make 5,470 new competitive grants each year, and that 30 percent of these awards will produce copyrightable content and consequently will be affected by the final rule. Further, we assume that for each year the rule is in effect after year one, every cohort of continuation awards will also be affected by the final rule. So, based on past data, we estimate that in the first year the final rule takes effect 1,641 grants will generate copyrightable products (30 percent of 5,470 total new grant awards made), and that by year four a total of 6,564 new and continuation awards would be impacted by the rule. Likewise, from years 4 through 10 this number plateaus and remains stable at 6,564.

Next, consistent with the estimates in the *Need for Regulatory Action* section, we estimate that each grantee will generate an average of approximately 90 copyrightable products requiring dissemination over the duration of their grant award (typically ED grantees have 4 or 5 year grant performance periods). As stated previously, we know that many non-exempt programs have a narrowly focused statutory purpose that

often involves provision of services (e.g., tutoring, counseling, mentoring), and that grantees under such programs are much less likely to produce copyrightable resources. But, again, for purposes of developing an upper bound estimate we analyzed a handful of grantees for which dissemination of products or content is a core purpose of their grant. Since dissemination is a core activity for grantees included in this sample, we know these grantees are likely to generate significantly more products requiring dissemination each year than grantees focusing on other activities such as service provision. Further, since it generally takes grantees some time to scale up their projects we assume, taking into account the past production rate of grantees, the following "outlay" rate (over an assumed project length of 4 years) for all grantees affected by the rule: Year One 5 copyrightable products produced and disseminated; Year Two 15 copyrightable products produced and disseminated; Year Three 20 copyrightable products produced and disseminated; and Year Four 50 copyrightable products produced and disseminated.

Assuming a total of 1,641 new competitive grantees would generate copyrightable product during the first year the rule is in effect, with each new grantee producing 5 total deliverables in the first year, the overall volume of resources requiring dissemination would be 8,205 (1,641 grantees producing an average of 5 copyrightable products each). In the second year, with new grantees expected to produce 15 total deliverables on average, the overall volume of copyrightable products would be 49,230 (3,282 grantees producing an average of 15 copyrightable products). In year three the overall volume would increase to 98,460 (4,923 grantees producing and average of 20 copyrightable products), and by year 4 this number would be 328,200 (6,564 grantees producing an average of 50 copyrightable products).

Finally, we estimate the likely time and salary that would be required for individual grantees to complete these requirements. As an example of the specific steps that might be necessary for an individual grantee to complete dissemination requirements envisioned in the final rule, the grantee would:

1. Use the Creative Commons License tool to select and apply the symbol to the work and generate the machine readable code and affix to the work (<http://www.creativecommons.org/chooser>)
2. Upload the resource and metadata, including the name, description,

license, publisher, and URL of the resource, to a shared learning resource repository or educator Web site:

We estimate the time for completion of Steps 1 and 2 to be approximately 30 minutes total per resource. We also recognize that the actual time for completion may be substantially shorter in the case of automated or bulk resource uploads. Assuming a pay rate of \$15/hour for data entry,⁵ new grantees generating 5 products in the first year would require approximately 2.5 hours per year in total labor to complete these steps at an annualized cost of approximately \$38 per grantee. By year four of implementation these estimates would plateau at approximately 45 hours required per year in total labor costs at an annualized cost of approximately \$675 per grantee.

Taking into account these assumptions, we estimate that a reasonable upper bound estimate of the maximum likely labor costs for all expected grantees to implement this final rule over a period of 10 years to be \$22.6 million, at an average total annual cost of \$2.26 million.

Other Potential Costs

Under current regulations, title to intellectual property acquired under Department grant funds, including copyright, vests in the grantee. With respect to copyrighted works, under 2 CFR 200.315(b), the Department also reserves a royalty-free, non-exclusive, and irrevocable right to reproduce, publish, or otherwise use for Federal purposes, and to authorize others to do so. No further action is necessary to designate these rights. Grantees may establish terms and conditions that permit use of their works to any member of the public, for each instance of use or for each created work. That the Department does not frequently exercise its Federal purpose license may create the false impression that any grantee can use the copyrighted works it creates with Federal grant funds for revenue generating purposes without any concern that third parties will have free access to those materials for Federal purposes.

This final rule requires that grantees openly license copyrightable grant deliverables created with Department funds to enable the public to use the work without restriction, so long as the public provides attribution to the copyright holder. While the type of

license will differ depending on the type of work created, applying an open license to a grant product typically involves the addition of a brief license identification statement or insertion of a license symbol or device. This could occur following the development of the product, at the same time that the disclaimer currently required under 34 CFR 75.620 is applied.

In this context, the regulations could reduce commercial incentives for an eligible entity to apply to participate in a competitive grant program. For example, we believe that under some competitive grant programs, grant recipients may produce materials that will be subsequently sold or licensed to third parties, such as publishing companies or others in the field. Although an open license does not preclude the grantee or any individual from developing commercial products and derivatives from the grant funded material, it could diminish certain competitive advantages that these grantees currently possess as the copyright holder. In addition, publishers and other third parties may incur loss of revenue since their commercial product will potentially compete with freely available versions of a similar product or may hesitate to enter into licensing agreements with grantees.

In response to these concerns, we note that derivative works built upon the Department funded copyrightable works using non-Department funds are considered new works to the extent of the modifications and are not covered by this regulation. As long as the grantee or subgrantee does not elect an open license with a noncommercial use requirement, using non-Department funds, any other entity can improve upon the grant-funded copyrightable works resulting in a derivative work that can be commercialized for financial gain or as part of a sustainability plan. For purposes of clarity, noncommercial licenses would not limit the ability of grantees to commercialize their own derivative works. It is the underlying Department grant-funded copyrightable works that will be freely available to the public. This allows multiple entities to enter into a commercial market for derivative works, potentially resulting in multiple derivative products. In the event that a grantee or subgrantee selects an open license with a noncommercial use requirement, members of the public would likely need to contact the grantee or subgrantee directly in order to obtain broader usage rights.

Nothing in this regulation prevents the grantee itself from entering this

marketplace, or from entering into private, commercial relationships with select commercial entities to distribute derivative works based upon the openly licensed works. In this case, the grantee's expertise as the original creator could allow it to retain market leverage, if its commercial product demonstrated market value that outcompeted other commercial derivatives. We believe that the grantee may be best positioned to create derivative works with the most economic value since it best understands both the present utility and future potential of the product and can anticipate the enhancements that would need to be taken to address unmet market needs.

Third, based on the Department's past grant making experiences, relatively few grantees have developed and marketed copyrighted works paid for with Department funds. In those cases, the open license requirement would not preclude their ability to continuously iterate and improve their product through copyrighted commercial derivatives.

We further note that in the competitions in which we required that grant-funded copyrightable works be openly licensed, it was not our experience that the requirement deterred grantees from applying or attracting partners. The two rounds of FITW grant competitions attracted over 500 applications in FY 2014 for 24 awards and over 300 applicants in FY 2015 for 18 awards. We have not heard from grantees that attracting partners has been or would be problematic. In addition, one of the considerations for granting a program level exception will be whether the open licensing requirement would impede the grantee's ability to form the required partnerships necessary to carry out the purpose of the grant. Thus, we believe we can address this concern through our exceptions process.

Benefits

We believe that the benefits of the open licensing requirement in the education field will significantly outweigh the costs our grantees might incur. The education sector has had considerable recent experience with successful implementation of open licenses as a mechanism that enables dissemination, broad access, and use. Open licenses have enabled the Department's own grantees, including the New York State Department of Education (NYSED) to have broad reaching impacts and enabled collaboration that has resulted in significant cost savings for SEAs, LEAs,

⁵ Unless otherwise noted, all hourly wages are non-loaded wage rates and are based on median hourly earnings as reported in the May 2014 National Occupational Employment and Wage Estimates from the Bureau of Labor Statistics (see www.bls.gov/oes/current/999201.htm).

and other stakeholders. In the case of NYSED, in 2010, the Department awarded New York State Department of Education (NYSED) approximately \$700 million in funding through the Race to the Top (RTT) grant program. NYSED invested \$12.9 million of that award in the creation of openly licensed curriculum in math and English Language Arts called “EngageNY” that was made freely available to the public under a Creative Commons Non-Commercial Share-Alike (CC-SA-NC) license.⁶ The EngageNY curriculum created by NYSED has been implemented statewide in New York. Because this curriculum is openly licensed, California, Louisiana, and Washington have adapted and used these materials statewide as a foundation for their standards aligned curriculum. Additionally, teachers at schools across the nation have been freely accessing, using, and adapting the EngageNY content.⁷

The open license has also enabled other organizations to create derivative works that enhance the original curriculum. For example, Unbounded, a non-profit educational organization, has adapted the original materials created by the grant, developed supplemental digital content, English language learner support, and is offering curated sets of these materials to the public at no cost. In addition to the content, Unbounded has developed new teacher professional development materials and offers paid teacher training on using these and other open resources. Thus, the open license has enabled a single investment to result in broad, national dissemination and stimulated a derivative marketplace of services and supplemental content. Since the EngageNY content is freely available, other teachers, SEAs, and LEAs do not have to duplicate investments in curricula in these same content areas, resulting in a more efficient use of resources.

In addition, between 2012 and 2015, the Office of Career Technical and Adult Education (OCTAE) invested national activities funds in accelerating the teaching and learning of STEM competencies through high-quality OERs and high-quality adult education instruction of STEM by funding adult educators who located, used, evaluated, and shared science and math OER that are appropriate for adult education classes. The project also developed

online professional development courses for teachers on how to use OER for math and science instruction in their adult education classrooms that are freely available in multiple repositories.⁸ Adult educators, working in Teacher User Groups located, used, evaluated, and shared science and math OERs that are appropriate for adult education classes. The reviews are posted within www.OERCommons.org, part of a newly formed “adult education” category with over 2,400 resources that can now be searched and accessed freely through this repository. The project also developed online professional development courses for teachers on how to use OER that are freely available in multiple national repositories for math and science instruction in their adult education classrooms. The Department’s investment of funding has resulted in a valuable resource that is searchable on public repositories and widely available to members of the public that would not have been otherwise reached by the Department’s National Activity Activities funds.

Under the National Language Resource Centers (LRC) grant program, the Department awarded funds to IHEs for research and development of resources for Less Commonly Taught Languages (LCTL). Though there was no specific requirement for the grantees to openly license their resources, one grantee did choose to do so. As previously discussed, the University of Texas at Austin created the Center for Open Educational Resources and Language Learning (COERLL), which creates fully openly licensed language and pedagogical materials for 16 languages, in addition to an open platform for discovery, remixing, and repurposing of these language resources, and open research. There are hundreds of different and diverse open materials, including curricula, lessons, worksheets, assessments, textbooks, videos, podcasts, research studies, open apps for student learning, and interactive platform, materials openly licensed on their Web site available under an open license and publically available on their Web site. These resources include language learning materials such as OER for K’ichee’ Maya, an indigenous language spoken in Guatemala; software that allows a group of users to annotate the same text together; a series of native speaker

surveys; a teacher professional development digital badge system; research on the perception and use of foreign language OER; and a Web site supporting a community of practice on Open Education in language learning.

Finally, the Department’s FITW grant program has required grantees to openly license intellectual property.⁹ The online remediation tool created by the Southern New Hampshire University under this grant program will help underprepared, underrepresented, and low-income working adults obtain a postsecondary credential and reduce the time to degree completion. Under the terms of the grant, the open license will allow any other IHE or adult education provider to use this tool to serve the working adults in its service areas, without incurring costs or duplicating efforts of development.

Elsewhere in the Federal government, as noted previously, the Department of Labor was the earliest user of open copyright licenses. The Department of Labor first piloted the open license requirement in FY 2011, through the \$2 billion TAACCCT grant program, which required all new resources created with TAACCCT funding to be made available under CC BY license.¹⁰ With this requirement, TAACCCT grantees have created thousands of openly licensed learning resources that have been downloaded and reused hundreds of thousands of times, including courses, curriculum, modules, and assessments that are freely available at <https://www.skillscommons.org>.¹¹ The open resources have enabled partnerships and collaborations between colleges, with other Federal agencies, State agencies, and even international education systems and expanded the investment beyond one single grantee to a broad range of stakeholders. For example, an openly licensed basic computer skills training online course (BITS)¹² created by the Wisconsin Technical College system is being used by the Ohio Workforce Investment board to provide computer training to adults at 89 American Job Centers statewide, has been used across the 15 community colleges in the Iowa Community College System, and is being customized by the Technical College System of Georgia. Competency based training along aerospace and energy career pathways developed by

consortia of community colleges in Washington State and Arizona and major employers and industry partners were adapted through Rutas (Routes), a USAID-funded workforce development program operating along Mexico's northern border. Relying on the open license, USAID grantees were able to translate the curricula into Spanish, rather than using funds to create their own materials from scratch, and created additional educational pathways suitable for the Mexican technical high school system.¹³ In each of these examples, an open license allowed uses that would have otherwise involved separate and duplicative investments, either by the same or separate Federal agency, by a State agency, or through other public funding, and has resulted in significant discount to the public. Because of these early successes, the Department of Labor expanded the requirement across the agency through regulation¹⁴ and is the first Federal Agency to require grantees to apply Creative Commons Attribution licenses to all grant funded materials.

Privately funded openly licensed projects also have a long history of creating educational resources with significant benefit to the public. For example, organizations such as Rice University's OpenStax and California State University's Multimedia Educational Resource for Learning and Online Teaching (MERLOT)¹⁵ have over 20 years of experience creating and curating OER and developing national

communities of practice for teaching and learning with digital resources. In public comments submitted by OpenStax, it was noted that its openly licensed college textbooks, first introduced in 2012, are currently used by more than 650,000 students in 1,600 educational institutions in the United States alone, saving those students \$66,000,000 in that short span of time.¹⁶ Despite not expending any resources on marketing activities, their textbooks have been downloaded by three million users worldwide. More than the broad dissemination of the textbooks, the open licenses have enabled an ecosystem of more than 38 different for-profit and not for-profit organizations to develop content in interactive and adaptive learning systems and through other ancillary products, providing greater reach than OpenStax could have achieved on its own. Similarly the Washington State Board for Community and Technical Colleges (SBCTC), the State agency that instituted the nation's first open licensing policy, did so to address issues of educational access. Since its inception in 2010,¹⁷ the policy has been implemented for competitive awards funded or managed by SBCTC totaling more than \$25,000,000. The end products from these projects have been widely distributed with a CC BY license benefiting faculty members and the students across the country. For example, a textbook developed during one of the competitive grant projects has been downloaded 127,000 times and

students have purchased over 5,000 copies of the book for approximately \$15. These regulations build on the lessons learned through these efforts and seek to scale the benefits of these early successes across multiple Department competitive grant programs and education stakeholder groups.

In sum, we believe that these regulations will help to ensure the broader and more effective dissemination of Department grant-funded works to the public. Department stakeholders, such as LEAs, SEAs, IHEs, students, and others beyond direct grant recipients would be able to freely use and access the technology and high-quality materials. The framework established by these regulations will also result in greater transparency and efficiencies in how these stakeholders and other members of the public can access these valuable educational resources.

Accounting Statement

As required by OMB Circular A-4 (available at www.whitehouse.gov/sites/default/files/omb/assets/omb/circulars/a004/a-4.pdf) in the following table we have prepared an accounting statement showing the classification of the expenditures associated with provisions of these final regulations. This table provides our best estimate of the changes in annual monetized costs, benefits, and transfers as a result of the final regulations.

Category	Benefits	
Broader and more effective dissemination of Department grant-funded works to the public	Not quantified	
Category	Cost	
	7%	3%
Labor Costs (dissemination activities)	\$3,181,331	\$3,218,633

Alternatives Considered

In determining whether to pursue regulatory action, we first considered other options that might accomplish our goals of enhancing dissemination and transparency. First, we considered whether we should establish an open licensing requirement as a supplemental priority, creating an authority for the Department to require open licensing in any appropriate grant program for fiscal year 2017 and future years. Although

supplemental priorities provide opportunities for program offices to select or exempt certain grant programs from this requirement as appropriate, it would only lead to change program-by-program. We believe that it will be far more efficient to establish the requirement as a general rule for our competitive grant programs, while also building in the program-level and grantee exceptions process when an exception is appropriate.

We also considered whether we could instead license all copyrightable material to the public using our Federal purpose license. This approach would allow for access to and dissemination of grant-funded resources. However, as previously discussed, the Federal purpose license requires significantly increased administrative capacity at the Department. From an administrative perspective, use of the Federal purpose license places the burden on the

Authorizing legislation: RCW 28A.300.803 created the Open Education Resources project to create openly licensed K-12 resources aligned to Common Core standards: <http://app.leg.wa.gov/rcw/default.aspx?cite=28A.300.803>. See also: <http://www.k12.wa.us/Communications/PressReleases2016/GoOpen.aspx>.

Department to exercise the license for each program and grantee and copyrightable work, and is therefore not an efficient approach. Each grantee already has direct control over its work, can use Department grant funds to implement the open licensing requirement, and is in a far better position than the Department to make the work publicly available directly. Therefore, we believe this final rule will greatly expand the scope of dissemination compared with what the Department could achieve.

The Department recognizes that the variety of our programs require grantees to adopt a wide range of strategies for implementation. As previously discussed, we believe this final rule advances our goals of broad dissemination by requiring an open license that does not restrict the distribution of derivative works, such as through commercial channels, or create additional restrictions on future licensing of derivative works not created with Department grant funds. We recognize that in some instances, placing limitations on the license (e.g. non-commercial licenses) or restricting the ability to use/reuse materials may be appropriate and we are committed to working with grantees to develop licensing strategies that are aligned to their grant projects and that are consistent with the goals of the final rule.

We also recognize that there will be cases where implementation of the requirements of this regulation would be inconsistent with statutory requirements of the grant programs or the Department's general goals. In cases such as those, the Secretary retains the ability to make exceptions to the open licensing requirement for those programs on a case-by-case basis under 2 CFR 3474.5(a)¹⁸ and 2 CFR 200.102(b) and (c).

Paperwork Reduction Act of 1995

Section 3474.20(c) contains an information collection requirement. Under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3507(d)), the Department has submitted a copy of this section as part of a change request to OMB for its review under OMB Control Number(s) 1894-0006, and 1894-0009 to reflect this new requirement. There will be no increase or decrease in

burden. This change request has been approved by OMB.

A Federal agency may not conduct or sponsor a collection of information unless OMB approves the collection under the PRA and the corresponding information collection instrument displays a currently valid OMB control number. Notwithstanding any other provision of law, no person is required to comply with, or is subject to penalty for failure to comply with, a collection of information if the collection instrument does not display a currently valid OMB control number.

Intergovernmental Review: These final regulations affect direct grant programs of the Department that are subject to Executive Order 12372 and the regulations in 34 CFR part 79. One of the objectives of the Executive order is to foster an intergovernmental partnership and a strengthened federalism. The Executive order relies on processes developed by State and local governments for coordination and review of proposed Federal financial assistance.

This document provides early notification of our specific plans and actions for these programs.

Assessment of Educational Impact

In the NPRM we requested comments on whether the proposed regulations would require transmission of information that any other agency or authority of the United States gathers or makes available. We received no comments.

Accessible Format: Individuals with disabilities can obtain this document in an accessible format (e.g., braille, large print, audiotope, or compact disc) on request to the person listed under **FOR FURTHER INFORMATION CONTACT**.

Electronic Access to This Document: The official version of this document is the document published in the **Federal Register**. Free Internet access to the official edition of the **Federal Register** and the Code of Federal Regulations is available via the Federal Digital System at: www.gpo.gov/fdsys. At this site you can view this document, as well as all other documents of this Department published in the **Federal Register**, in text or Adobe Portable Document Format (PDF). Dated: January 11, 2017.

John B. King, Jr.,

Secretary of Education.

For the reasons discussed in the preamble, the Secretary amends part 3474 of title 2 of the Code of Federal Regulations as follows:

¹⁸ 2 CFR 3474.5(a), “. . . the Secretary of Education, after consultation with OMB, may allow exceptions for classes of Federal awards or non-Federal entities subject to the requirements of this part when exceptions are not prohibited by statute. However, in the interest of maximum uniformity, exceptions from the requirements of this part will be permitted only in unusual circumstances.”

**PART 3474—UNIFORM
ADMINISTRATIVE REQUIREMENTS,
COST PRINCIPLES, AND AUDIT
REQUIREMENTS FOR FEDERAL
AWARDS**

■ 1. The authority citation for part 3474 continues to read as follows:

Authority: 20 U.S.C. 1221e–3 and 3474 unless otherwise noted.

■ 2. Add § 3474.20 to read as follows:

§ 3474.20 Open licensing requirement for competitive grant programs.

For competitive grants awarded in competitions announced after February 21, 2017:

(a) A grantee or subgrantee must openly license to the public the rights set out in paragraph (b)(1) of this section in any grant deliverable that is created wholly or in part with Department competitive grant funds, and that constitutes a new copyrightable work; provided, however, that when the deliverable consists of modifications to pre-existing works, the license shall extend only to those modifications that can be separately identified and only to the extent that open licensing is permitted under the terms of any licenses or other legal restrictions on the use of pre-existing works.

(b)(1) With respect to copyrightable work identified in paragraph (a) of this section, the grantee or subgrantee must grant to the public a worldwide, non-exclusive, royalty-free, perpetual, and irrevocable license to—

(i) Access, reproduce, publicly perform, publicly display, and distribute the copyrightable work;

(ii) Prepare derivative works and reproduce, publicly perform, publicly display and distribute those derivative works; and

(iii) Otherwise use the copyrightable work, provided that in all such instances attribution is given to the copyright holder.

(2) Grantees and subgrantees may select any open licenses that comply

with the requirements of this section, including, at the grantee's or subgrantee's discretion, a license that limits use to noncommercial purposes. The open license also must contain—

(i) A symbol or device that readily communicates to users the permissions granted concerning the use of the copyrightable work;

(ii) Machine-readable code for digital resources;

(iii) Readily accessed legal terms; and

(iv) The statement of attribution and disclaimer specified in 34 CFR 75.620(b).

(c) A grantee or subgrantee that is awarded competitive grant funds must have a plan to disseminate the openly licensed copyrightable works identified in paragraph (a) of this section.

(d)(1) The requirements of paragraphs (a), (b), and (c) of this section do not apply to—

(i) Grants that provide funding for general operating expenses;

(ii) Grants that provide support to individuals (e.g., scholarships, fellowships);

(iii) Grant deliverables that are jointly funded by the Department and another Federal agency if the other Federal agency does not require the open licensing of its grant deliverables for the relevant grant program;

(iv) Copyrightable works created by the grantee or subgrantee that are not created with Department grant funds;

(v) Peer-reviewed scholarly publications that arise from any scientific research funded, either fully or partially, from grants awarded by the Department;

(vi) Grantees or subgrantees under the Ready To Learn Television Program, as defined in the Elementary and Secondary Education Act of 1965, as amended, Title II, Subpart 3, Sec. 2431, 20 U.S.C. 6775;

(vii) A grantee or subgrantee that has received an exception from the Secretary under 2 CFR 3474.5 and 2 CFR 200.102 (e.g., where the Secretary

has determined that the grantee's dissemination plan would likely achieve meaningful dissemination equivalent to or greater than the dissemination likely to be achieved through compliance with paragraph (a) or (b) of this section, or compliance with paragraph (a) or (b) of this section would impede the grantee's ability to form the required partnerships necessary to carry out the purpose of the grant); and

(viii) Grantees or subgrantees for which compliance with these requirements would conflict with, or materially undermine the ability to protect or enforce, other intellectual property rights or obligations of the grantee or subgrantee, in existence or under development, including those provided under 15 U.S.C. 1051, *et seq.*, 18 U.S.C. 1831–1839, and 35 U.S.C. 200, *et seq.*

(2) The requirements of paragraphs (a), (b), and (c) of this section do not alter any applicable rights in the grant deliverable available under 17 U.S.C. 106A, 203 or 1202, 15 U.S.C. 1051, *et seq.*, or State law.

(e) The license set out in paragraph (b)(1) of this section shall not extend to any copyrightable work incorporated in the grant deliverable that is owned by a party other than the grantee or subgrantee, unless the grantee or subgrantee has acquired the right to provide such a license in that work.

(f) *Definition.* For purposes of this section,

(1) A *grant deliverable* is a final version of a work, including any final version of program support materials necessary to the use of the deliverable, developed to carry out the purpose of the grant, as specified in the grant announcement.

(2) A *derivative work* means a derivative work as defined in the Copyright Act, 17 U.S.C. 101.

Health and Environmental Protection Standards for Uranium and Thorium
Mill Tailings; Proposed Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 192

[EPA-HQ-OAR-2012-0788; FRL-9958-12-OAR]

RIN 2060-AP43

Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: The U.S. Environmental Protection Agency (EPA) is proposing new health and environmental protection standards under the Uranium Mill Tailings Radiation Control Act (UMTRCA) of 1978. The standards proposed in this action would be applicable to byproduct materials produced by uranium in-situ recovery (ISR) and would be implemented by the U.S. Nuclear Regulatory Commission (NRC) and NRC Agreement States. The EPA initially proposed new health and environmental protection standards for ISR facilities on January 26, 2015; however, the EPA has decided to re-propose the rule and seek additional public to comment on changes to the original proposal, including changes in the regulatory framework and approach, based on public comment and new information received from stakeholders.

The first standards for uranium recovery were issued by the EPA in 1983 when conventional mining and milling were the predominant methods of uranium extraction, and were last amended in 1995. Since the early 1990s, ISR has mostly replaced conventional milling. This proposed rule would strengthen the existing regulations for uranium recovery by adopting new standards addressing groundwater hazards specific to ISR facilities. As with the original proposal, the primary focus of this proposal is groundwater protection, restoration and long-term stability.

The most significant changes from the original proposal include: Removing the default 30-year long-term monitoring provision and shifting to a Resource Conservation and Recovery Act (RCRA) Subtitle C corrective action framework as a model rather than a RCRA Subtitle C landfill framework; adding specific criteria and procedures for approving termination of long-term stability monitoring; deleting gross alpha particle activity from proposed Table 1 to subpart F of 40 CFR part 192, and

allowing more flexibility for the NRC or Agreement States to determine on a site-specific basis the constituents for which concentration based standards are set. The EPA has also sought to clarify how these standards under UMTRCA complement, and do not overlap with, the requirements of the Safe Drinking Water Act (SDWA).

This action also proposes amendments to certain provisions of the existing rule to address a ruling of the Tenth Circuit Court of Appeals, to update a cross-reference to another environmental standard and to correct certain technical and typographical errors. The proposed rule has been informed by input from the NRC, the U.S. Department of Energy (DOE), states, tribes, industry, environmental groups and other stakeholders, and would promote public health and protect groundwater by reducing the potential for groundwater contamination after production has ceased, and in aquifers adjacent to ISR facilities during uranium recovery.

DATES: Comments must be received on or before July 18, 2017.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA-HQ-OAR-2012-0788, by one of the following methods:

- *www.regulations.gov:* Follow the on-line instructions for submitting comments.
- *Email:* a-and-r-docket@epa.gov.
- *Fax:* (202) 566-9744.
- *Mail:* Air and Radiation Docket, Environmental Protection Agency, Mailcode: 2822T, 1200 Pennsylvania Ave. NW., Washington, DC 20460.
- *Hand Delivery:* EPA West Building, Room 3334, 1301 Constitution Ave. NW., Washington, DC 20004. Such deliveries are only accepted during the Docket's normal hours of operation; special arrangements should be made for deliveries of boxed information.

Instructions: Direct your comments to Docket ID No. EPA-HQ-OAR-2012-0788. The EPA's policy is that all comments received will be included in the public docket without change and may be made available online at *www.regulations.gov*, including any personal information provided, unless the comment includes information claimed to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI or otherwise protected through *www.regulations.gov* or *email*. The *www.regulations.gov* Web site is an "anonymous access" system, which means the EPA will not know

your identity or contact information unless you provide it in the body of your comment. If you send an email comment directly to the EPA without going through *www.regulations.gov*, your email address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, the EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD-ROM you submit. If the EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, the EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses. For additional information about the EPA's public docket visit the EPA Docket Center homepage at <http://www.epa.gov/epahome/dockets.htm>.

Docket: All documents in the docket are listed in the *www.regulations.gov* index. Although listed in the index, some information is not publicly available, e.g., CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, will be publicly available only in hard copy. Publicly available docket materials are available either electronically in *www.regulations.gov* or in hard copy at the Office of Air and Radiation Docket, EPA/DC, EPA West, Room 3334, 1301 Constitution Ave. NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566-1744, and the telephone number for the Air and Radiation Docket is (202) 566-1742.

FOR FURTHER INFORMATION CONTACT:

Ingrid Rosencrantz, Office of Radiation and Indoor Air, Radiation Protection Division, Mailcode 6608T, U.S. Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460; telephone number: (202) 343-9286; fax number: (202) 343-2304; email address: Rosencrantz.ingrid@epa.gov.

SUPPLEMENTARY INFORMATION:

A. Does this action apply to me?

The regulated categories and entities potentially affected by the proposed standards include:

Category	NAICS code ¹	Examples of regulated entities
Industry: Uranium Ores Mining and/or Beneficiating.	212291	Facilities that extract or concentrate uranium from any ore processed primarily for its source material content.
Leaching of Uranium, Radium or Vanadium Ores.	212291	Facilities that extract or concentrate uranium from any ore processed primarily for its source material content.

¹ North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by this proposed action.

B. What should I consider as I prepare my comments to EPA?

Submitting CBI. Do not submit CBI information to the EPA through www.regulations.gov or email. Clearly mark the part or all of the information that you claim to be CBI. For CBI information contained on a disk or CD ROM that you mail to the EPA, mark the outside of the disk or CD ROM as CBI and then identify electronically within the disk or CD ROM the specific information that is claimed as CBI. In addition to one complete version of the comment that includes information claimed as CBI, a copy of the comment that does not contain the information claimed as CBI must be submitted for inclusion in the public docket. Information marked as CBI will not be disclosed except in accordance with procedures set forth in 40 CFR part 2.

Tips for preparing your comments. When submitting comments, remember to:

- Identify the rulemaking by docket number and other identifying information (subject heading, **Federal Register** date and page number).
- Follow directions—The agency may ask you to respond to specific questions or organize comments by referencing a Code of Federal Regulations (CFR) part or section number.
- Explain why you agree or disagree, suggest alternatives, and substitute language for your requested changes.
- Describe any assumptions and provide any technical information and/or data that you used.
- If you estimate potential costs or burdens, explain how you arrived at your estimate in sufficient detail to allow for it to be reproduced.
- Provide specific examples to illustrate your concerns, and suggest alternatives.
- Explain your views as clearly as possible, avoiding the use of profanity or personal threats.
- Submit your comments by the comment period deadline.

C. When would a public hearing occur?

If anyone contacts the EPA requesting to speak at a public hearing concerning this proposed rule by February 21, 2017, the EPA will hold a public hearing. If you are interested in attending a public hearing, contact Mr. Anthony Nesky at (202) 343–9597. If a public hearing is held, the Agency will announce the date, time and venue on the EPA Web site at <http://www.epa.gov/radiation/tenorm/40CFR192.html>.

D. What documents are referenced in today's proposal?

The EPA refers to a number of documents that provide supporting information for the Agency's proposed uranium and thorium mill tailings standards. All documents relied upon by the EPA in regulatory decision making may be found in the EPA docket (EPA–HQ–OAR–2012–0788) accessible via <http://www.regulations.gov/>. Other documents (e.g., statutes, regulations, and proposed rules) are readily available from public sources. The EPA documents listed below are referenced most frequently in today's proposal.

EPA 402/D–14–001, “Considerations Related to Post Closure Monitoring of Uranium In-Situ Leach/In-Situ Recovery (ISL/ISR) Sites,” EPA, 2014.

EPA 402/R–14–003, “Economic Analysis: Proposed Revisions to the Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings Rule (40 CFR part 192),” EPA, 2016.

EPA 530/R–09–007, “Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities—Unified Guidance,” EPA, 2009.

F. Organization of This Document

The information presented in this preamble is organized as follows:

- I. Executive Summary
 - A. Background
 - B. Purpose of the Regulatory Action
 - C. Summary of the Major Provisions
 - D. Summary of the Costs and Benefits
 - E. Statutory Authority for This Action
- II. Summary of the Proposed Rule
 - A. Proposed Standards for Uranium ISR Operations
 - B. Amendments to 40 CFR Part 192, Subparts C and D
- III. Summary of Changes Made to the Original Proposal and Rationale for Those Changes
 - A. Incorporation of the Initial and Long-Term Stability Standards in Proposed 40 CFR 192.52
 - B. Groundwater Protection Standards
 - C. Preoperational Monitoring Requirements
 - D. Exempted Aquifers
 - E. Excursions
 - F. Initial and Long-Term Stability
 - G. Corrective Action Program
 - H. Costs and Economic Impacts
 - I. Other Miscellaneous Changes
- IV. Responses to Other Significant Comments That Did Not Result in Changes to the Original Proposal
 - A. Authority To Set and Enforce Standards
 - B. Need for New Standards for Uranium ISR Facilities
 - C. Applicability
 - D. The 95 Percent Confidence Level
- V. Summary of Environmental, Cost and Economic Impacts
 - A. Environmental Impacts of the Proposed Rule on Groundwater Quality
 - B. Incremental Costs of Complying With the Proposed Rule
 - C. Economic Impacts of the Proposed Rule on the Market for Uranium and the Uranium Industry

- D. Benefits of the Proposed Rule
- VI. Statutory and Executive Order Reviews
 - A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review
 - B. Paperwork Reduction Act
 - C. Regulatory Flexibility Act
 - D. Unfunded Mandates Reform Act
 - E. Executive Order 13132: Federalism
 - F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
 - G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks
 - H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution or Use
 - I. National Technology Transfer Advancement Act
 - J. Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations

I. Executive Summary

A. Background

ISR is a method by which uranium is leached from underground ore bodies by the introduction of a solvent solution, called a lixiviant, through injection wells drilled into the ore zone. The process does not require excavation to extract the ore body from the ground or conventional milling to extract the uranium from the mined ore. After the lixiviant is injected underground, it passes through the ore zone and mobilizes the uranium. The uranium-bearing solution is then pumped to the surface via extraction wells, and the solution is processed to extract the uranium. During uranium production, the fluids injected to mobilize uranium change the chemistry of the aquifer from its original state, thereby mobilizing uranium and many other minerals and metals. Groundwater from the ISR production zone can migrate from the production zone and contaminate nearby groundwater with arsenic, barium, cadmium, chromium, lead, mercury, selenium, silver, nitrate, molybdenum, radium and uranium and other constituents. The standards proposed in this action would minimize the risk of undetected groundwater degradation and constituent migration during and after ISR operations have ceased.

The EPA initially proposed new health and environmental protection standards for ISR facilities on January 26, 2015 (hereinafter “original proposal”), with the intention of finalizing the new standards in 2016.¹ During the public comment period, the

Agency received over 5,380 public comment letters from a wide range of stakeholders, with comments covering more than 80 different topics. In addition, during interagency review, more than 15 groups of stakeholders met with Office of Management and Budget (OMB) to voice comments on the original proposal. Commenters were particularly concerned about the default 30-year long-term monitoring requirement, felt that the optional method by which a licensee could request permission to cease long-term stability monitoring lacked sufficient specificity and believed the number of constituents required to be monitored was unreasonably burdensome. Several commenters thought the economic analysis underestimated the compliance costs and identified several additional categories of costs related to the long-term monitoring requirements they felt had been omitted from the analysis or were not representative of the actual costs incurred. Other commenters felt that several additional types of benefits should be included in the benefits analysis. After consulting with the NRC and other agencies and collecting additional information from industry, including participation in stakeholder meetings during interagency review with OMB, the EPA decided to make several changes to the original proposal and solicit additional public comment rather than finalize the rule with the changes. These changes are described in detail in section III of this preamble. The most significant changes include removing the default 30-year long-term monitoring provision and shifting to more of a RCRA Subtitle C corrective action framework as a model rather than a RCRA Subtitle C landfill framework, adding specific criteria and procedures for approving termination of long-term stability monitoring, deleting gross alpha particle activity from proposed Table 1 to subpart F, and allowing more flexibility for the NRC and Agreement States (hereinafter “regulatory agency”) to determine on a site-specific basis the constituents for which concentration-based standards are set. The EPA has also sought to clarify how these standards under UMTRCA complement, and do not overlap with, the requirements of the SDWA. In addition to these more significant changes, the EPA has also made minor changes to the original proposal, such as moving the initial and long-term monitoring standards to the proposed § 192.52 and moving the requirements for alternate concentration limits (ACLs) to a separate section (see proposed § 192.54). In addition to making changes to the

rule text, the EPA also re-calculated the incremental compliance costs to incorporate estimated non-monitoring costs (e.g., licensing, leasing fees, continued surety, maintenance) and incorporated additional cost information provided by industry. The EPA re-evaluated the economic and energy impacts to both address the concerns raised by commenters and to incorporate the changes the Agency made to the standards since the original proposal was published. The revised costs and economic analysis for this proposal are discussed in section V of this preamble. While the majority of the changes to the original proposal are relatively minor, the EPA decided it was appropriate to re-propose the rule due to the high level of public interest in this rulemaking. This action provides the public an opportunity to review and provide comment on the changes made to the original proposal and allows the EPA to consider and make any additional changes based on those comments before finalizing the rule. The EPA is requesting comment on all aspects of this proposed action. Because this is a re-proposal, and the EPA wishes to consider comments in context, please re-submit any relevant comments that may have been submitted on the original proposal.

Several commenters also voiced concerns about information and data collection, including review of Agreement State regulatory programs that address ISRs. Although the EPA requested and collected data and information as outlined in section IV.B of this preamble, the Agency understands stakeholders concerns and are inviting stakeholders to submit additional data and analyses to further clarify the ISR process, including any additional monitoring results and analyses. The EPA will be collecting additional information on state regulatory programs, as recommended by several states.

B. Purpose of the Regulatory Action

The EPA is proposing to add new health and environmental protection standards to regulations promulgated under UMTRCA. The proposed standards would regulate byproduct materials produced by ISR, including both surface and groundwater standards, with a primary focus on groundwater protection, restoration and stability. By explicitly addressing the most significant environmental and public health hazards presented by ISR activities, these proposed standards would address the shift toward ISR as the dominant form of uranium recovery that has occurred since the standards for

¹ See 80 FR 4156, January 26, 2015.

uranium and thorium mill tailings were promulgated in 1983.

This rule would provide the necessary framework for consistent and sustainable protection of groundwater at ISR sites that will continue to have beneficial uses even if the aquifer has been exempted from protection under the SDWA.

Groundwater is a scarce resource that is under increasing pressure, particularly in the arid West where groundwater has multiple uses, including for livestock production, crop irrigation, wildlife support, and human consumption. As groundwater resources are depleted, it becomes even more important to preserve those resources for future uses. Stakeholders in these areas are already finding a need to use groundwater that is of lower quality than desired.² Groundwater that contains mineral resources, such as uranium, is not necessarily of such poor quality that it cannot be used for these purposes. By altering the chemical composition of groundwater, ISR creates reasons to be concerned about impacts to groundwater, which may be used for human drinking water, as well as for other purposes, such as livestock watering, crop irrigation and wildlife support.

While an aquifer or portions of an aquifer may have been exempted from the protections of the SDWA, the aquifer may be needed in the future for human drinking water or other purposes. The standards proposed in this action do not require licensees to improve groundwater quality, only to provide confidence that: (1) In the area mined, the applicable constituent concentration standards (set at either background or health-based levels, whichever is higher), are met and remain stable; and (2) that uranium recovery operations will not endanger adjacent aquifers. EPA requests comment on whether groundwater, once it meets the constituent concentration standards, could or would potentially be used for drinking water or other purposes.

UMTRCA directs the EPA to establish standards of general application, while the NRC is vested with implementing the EPA's standards under its licensing and enforcement authority. The EPA has previously promulgated general standards under UMTRCA for surface disposal of mill tailings from

conventional uranium mining and milling, but ISR has become the dominant form of uranium extraction since the 1990s. In 2006, an NRC commissioner observed that ISR-specific rules were needed to provide a national approach to bring predictability to the industry and state regulators. This view was not predicated on specific documented instances of groundwater contamination outside of the ISR production zone. The scope and level of protection of the SDWA differs from the UMTRCA. The purpose of the SDWA UIC program is to prevent endangerment of underground sources of drinking water. In determining whether an aquifer may be exempted from the protection of the SDWA, the EPA does not consider its use for purposes other than human drinking water (e.g., agriculture and other uses).

As the highlighted portions of the SDWA regulations below show, there is no requirement to demonstrate poor water quality prior to issuing an aquifer exemption if the aquifer is or could be mineral producing. Under the SDWA's UIC regulations, aquifer exemptions are used to allow for mineral recovery in aquifers that would otherwise be protected as sources of drinking water when certain criteria are met. In the SDWA regulations, § 146.4 provides that: "An aquifer or a portion thereof which meets the criteria for an "underground source of drinking water" in § 146.3 may be determined under § 144.7 of this chapter to be an "exempted aquifer" for Class I–V wells if it meets the criteria in paragraphs (a) through (c) of this section. Class VI wells must meet the criteria under paragraph (d) of this section: (a) It does not currently serve as a source of drinking water; and (b) It cannot now and will not in the future serve as a source of drinking water because: (1) It is mineral, hydrocarbon or geothermal energy producing, or can be demonstrated by a permit applicant as part of a permit application for a Class II or III operation to contain minerals or hydrocarbons that considering their quantity and location are expected to be commercially producible; or (2) It is situated at a depth or location which makes recovery of water for drinking water purposes economically or technologically impractical; or (3) It is so contaminated that it would be economically or technologically impractical to render that water fit for human consumption; or (4) It is located over a Class III well mining area subject to subsidence or catastrophic collapse; or (5) The total dissolved solids content of the ground water is more than 3,000

and less than 10,000 mg/l and it is not reasonably expected to supply a public water system . . .".

In addition, although a portion of an aquifer may be exempted from the protections of the SDWA, there are no federal requirements preventing recovery and use of the water within exempted aquifers (including where ISR operations were previously conducted) for private drinking water supply, public water supply, or other uses.

UMTRCA provides authority that can be used to protect aquifers during and after uranium recovery operations, regardless of whether the aquifer meets the definition of an underground source of drinking water (USDW) as defined in the EPA's UIC regulations or is exempted from the protections of the SDWA because it meets the existing regulatory criteria for exemption. UMTRCA directs the Administrator to promulgate "standards of general application for the protection of public health, safety, and the environment from radiological and non-radiological hazards associated with the processing, and possession, transfer, and disposal of byproduct material".³ The statute further provides that "[i]n establishing such standards, the Administrator shall consider the risk to the public health, safety, and the environment, the economic costs of applying such standards, and such other factors as the administrator determines to be appropriate".⁴

In areas being mined for uranium, the SDWA does not require operators or regulators to collect the level of data needed to definitively confirm or disprove drinking water contamination or contamination of water for other purposes that may also impact humans, such as livestock watering and crop irrigation. Additionally, data that the EPA's UIC Program have received and evaluated at or near at least one ISR facility are consistent with an excursion beyond the boundary of the exempt aquifer (i.e., leading to elevated uranium levels outside the ISR facility area).

The proposed 40 CFR part 192, subpart F would afford protections that do not currently exist under federal UIC regulations and would be complementary to existing regulations (e.g., UIC regulations) at uranium ISR facilities. For example, these new provisions proposed under the authority of UMTRCA would address corrective action, broad baseline development, monitoring well placement and aquifer restoration. The proposed provisions would also provide assurance that once

³ See 42 U.S.C. 2022(b)(1).

⁴ *Ibid.*

a facility decommissions a site, the water will meet the applicable constituent concentration standards in 40 CFR 192.52(c)(1) and will remain stable over time.

The proposed 40 CFR part 192, subpart F also would ensure that industry maintains responsibility for protection of public health and the environment at uranium ISR facilities during and after uranium recovery operations.

Since ISR alters the chemical composition of groundwater, it creates reasons to be concerned about risk to public health, safety and the environment from radiological and non-radiological hazards associated with the processing and disposal of byproduct material. Industry commenters and others say that there is no need for this rule because the EPA has not identified an instance in which an ISR operation has contaminated a source of drinking water. First, the Agency notes that this proposal addresses groundwater protection at ISR facilities both in and around the production zone and in surrounding aquifers. Focusing on the area of surrounding or adjacent aquifers, the EPA acknowledges that the Agency does not have sufficient information to document a specific instance of contamination of a public source of drinking water caused by an ISR. The Agency remains concerned, however, that the available data may not be capturing some instances of contamination that this proposed rule seeks to prevent. In other words, the Agency remains concerned that the lack of data does not demonstrate that no contamination is occurring, as industry commenters assert, but instead merely demonstrates the lack of data available to be able to make such a determination, especially where there has been limited post-restoration monitoring. The monitoring requirements in this proposal address the issue of lack of data.

As explained in this preamble, in documents supporting this proposal, and as included in the docket for this proposal, there is ample evidence of excursions occurring as the result of ISR facilities. For example, data that the EPA's UIC Program have received and evaluated at or near at least one ISR facility are consistent with an excursion beyond the boundary of the exempt aquifer, leading to elevated uranium levels outside the ISR facility. In addition, there is data in the proposal's Background Information Document (BID) describing numerous excursions from several ISR facilities. Moreover, data in attachment 5 of the BID shows that several ISR facilities have not met

background or health-based levels after restoration of the production zone. This data, when considered with the understanding that groundwater flow is often extremely slow, raises concerns that there has been insufficient monitoring conducted by these ISR facilities to identify the actual contamination that may be occurring or may occur in the future beyond the production zone and in sources of drinking water. The EPA solicits comment on industry's assertion that in no case have any excursions from ISR facilities resulted in contamination in aquifers being used as public sources of drinking water or for other uses. In addition, the EPA also requests comment on the kinds of data that would be needed to clearly link ISR operations with off-site contamination or that would support claims that there is no contamination of concern.

The EPA notes that several NRC-regulated ISR facilities are continuing to work toward restoring groundwater, with restoration and monitoring being conducted for as long as 10 years after ceasing production. The Agency understands that restoration does not always meet original background levels as evidenced by the number of restoration goals exceeding background or the levels proposed in Table 1 to subpart F. Additionally, the NRC acknowledges that efficiency could be gained by codifying its longstanding effective regulatory regime into regulations specific to ISR facilities. Historically, restoration and monitoring at ISR facilities are typically conducted for only a short period, and a longer period would provide more confidence to demonstrate that restoration of the affected groundwater is complete and that long-term stability is established with confidence before license termination. The initial and long-term stability monitoring and corrective action program included in this proposal would ensure that both of these requirements are met before ISR facilities can be decommissioned.

At ISR facilities, the groundwater is directly impacted by the injection of lixiviant into the aquifer, which alters the geochemistry of the ore-bearing formation and increases the concentration of radionuclides and other metals in the water. Restoration activities attempt to restore the water quality for specific constituents to the applicable constituent concentration standards inside the production zone. Although subpart D to 40 CFR part 192 (hereinafter "subpart D") addresses contamination of aquifers, it explicitly addresses only contamination resulting from releases from uranium mill tailings

impoundments used to store uranium byproduct material (e.g., conventional tailings impoundments, evaporation or holding ponds). Under the proposed subpart F, the licensee is required to restore groundwater in the production zone and surrounding aquifers to the applicable constituent concentration standards, to the extent possible, and to show some level of stability in the production zone prior to terminating the license. Because ISR changes the geochemistry of the groundwater, more rigorous stability-based standards together with corrective action programs are necessary to ensure that the production zone is restored and the applicable constituent concentration standards will continue to be met in the future.

As described in the preamble to the 2015 proposal, the EPA solicited technical advice on key issues related to groundwater protection at ISR sites from the Radiation Advisory Committee (RAC) of the Agency's Science Advisory Board (SAB) (80 FR 156). The final report of the SAB/RAC, along with the EPA's response, can be found at: <https://yosemite.epa.gov/sab/sabproduct.nsf/c91996cd39a82f648525742400690127/0314cef928df63cc8525775200482fa3!OpenDocument&TableRow=2.4#2>.

The SAB/RAC further considered this issue in 2015, and the Agency provided a detailed cross-walk to the 2015 proposed rule to show how the RAC's advice had been addressed. The SAB determined that no further action was needed on its part. See [https://yosemite.epa.gov/sab/sabproduct.nsf/02ad90b136fc21ef85256eba00436459/8DA59AB1BE0EA14B85257E660071F2EF/\\$File/EPA-SAB-15-009+unsigned.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/02ad90b136fc21ef85256eba00436459/8DA59AB1BE0EA14B85257E660071F2EF/$File/EPA-SAB-15-009+unsigned.pdf). In general, the BID addresses topics specifically addressed by the RAC as follows:

The EPA has evaluated available data for all phases of ISR activities to address the SAB recommendations. Section 5 of the BID analyzes data and examines specific case studies for baseline and restoration, with particular attention given to establishment of baseline at the Dewey-Burdock site in South Dakota (Attachment A). Sections 6 and 7.8 and Attachment F provide extensive analysis of post-restoration monitoring at the Crow Butte, Christensen, Highland, and Irigaray ISR sites, including regression analysis and statistical testing, and cumulative complementary distribution functions (CCDF). Results are presented by analyte, mine unit, and well.

Section 6 addresses in detail SAB recommendations related to influences on groundwater chemistry and their effects on time frames for stability

monitoring, in particular fate and transport processes (speciation, including a case study of the Crow Butte facility, and solubility) and natural attenuation processes (adsorption, presence of secondary minerals, and biological mechanisms).

This action also proposes amendments to certain provisions in the current rule, located at 40 CFR part 192. Specifically, this action addresses a ruling of the Tenth Circuit Court of Appeals, updates a cross-reference to another environmental standard and corrects other technical and typographical errors.

C. Summary of the Major Provisions

The proposed rule includes a new subpart, subpart F, within 40 CFR part 192, which sets standards to protect groundwater at uranium ISR operations. Specifically, subpart F would set standards of general application to protect groundwater beyond the production zone during ISR operational and restoration phases and to ensure, once the wellfield is restored, that the restoration is complete and stable. The proposed rule includes three types of groundwater protection standards: (1) Constituent concentration standards, (2) initial stability standards, and (3) long-term stability standards. The proposed rule also includes monitoring requirements to establish statistically valid background water quality levels, excursion monitoring (for the operational and restoration phases), and monitoring to meet the initial and long-term stability standards. The proposed rule also includes a requirement to establish a corrective action program. Once finalized, these standards will be implemented by the regulatory agency. Once the regulatory agency incorporates the new standards into its regulations, or takes other appropriate steps to implement the new standards, this will provide a nationally consistent approach for the licensing process for ISR facilities.⁵

D. Summary of the Costs and Benefits

The costs and benefits of this rulemaking are described briefly in Table 2 of this preamble. The costs reflect the difference in costs that would be incurred by ISR licensees under the

proposed rule and costs that would be incurred by those facilities in the absence of the proposed rule. These incremental costs include added costs associated with monitoring and non-monitoring compliance actions under the proposed rule. For additional details on the incremental costs of the proposed rule, see section V.B of this preamble and section 3 of the document titled, "Economic Analysis: Revisions to the Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings Rule (40 CFR part 192)," available in Docket ID No. EPA-HQ-OAR-2012-0788.

Complying with the proposed standards may require some existing ISR facilities to monitor groundwater for additional constituents that they are not currently monitoring. It would also require all ISR facilities to continue monitoring for a period of at least three years after the initial stability standard is met, and to conduct geochemical modeling and other analysis to demonstrate that the applicable constituent concentration standards will continue to be met in the future. The additional monitoring, modeling and analysis that would be required under this proposed rule could increase costs to ISR facilities. The additional years during which ISR facilities' license, surety, insurance, maintenance and other non-monitoring activities would have to be maintained would also increase costs. The EPA estimates the rule imposes annualized incremental costs on the ISR industry of approximately \$11.9 million, including incremental monitoring costs and other non-monitoring costs.

In its economic analysis, the EPA analyzed potential economic impacts of the rule on small entities (7 companies) using a range of assumptions about revenues of firms that own ISR facilities and costs of complying with the rule. The "average revenue" assumption is based on a market price of \$55 per pound of U₃O₈e and production that is 25% of facility capacity. The "low revenue" assumption reflects revenues 10% lower, and the high revenue assumption reflects revenues that would be 20% higher. With average costs, cost-to-sales ratios for small firms range from 0.7% to 3.1% for the low revenue scenario and from 0.5% to 2.3% under the higher revenue scenario. These assumptions are intended to reflect the range of possible market conditions at the time when the rule would take effect (likely 2022 to 2025). Uranium market projections for the longer term are generally optimistic, reflecting growth in nuclear power in China and India and other countries; 57 new reactors are

currently under construction with 65% of those projected to come online by 2020, and world-wide electricity consumption is projected to increase by 50% between 2013 and 2035 (only part of the increase is estimated to be met by nuclear energy) (Cameco, 2016).

Outlook for the near term, however, is less positive, and the rate of recovery is uncertain.

The EPA acknowledges that current uranium market conditions reflect depressed demand for uranium (due to lingering effects of the Fukushima incident, slow recovery of demand for electricity since the recession and low prices of substitute sources of energy) and some reliance on alternative (non-mine) sources of uranium. As a result, both the price and production of uranium have fallen. The long-term contract price of uranium has declined from around \$60 per pound of U₃O₈e in 2012 to around \$40 per pound in 2016. Spot prices have generally been 20% lower than contract prices. While market forces have driven the market price for uranium down by \$20 to \$30 dollars over the past 5 years, the rule is estimated to increase the cost of producing uranium using ISR methods by between \$1.27 per pound U₃O₈e and \$2.45 per pound of U₃O₈e, depending on the cost scenario.

Because of these market conditions, several ISR facilities that are fully licensed and permitted are not currently producing uranium (including previously operational facilities that have been placed on standby and licensed and permitted facilities that have never gone into production), and development of new ISR facilities has largely been put on hold. Further, several ISR facilities have changed ownership in the past few years, as companies have been forced by market conditions to sell assets. In other words, some ISR firms currently are unable to profitably operate their facilities even in the absence of the rule. Several of the small firms report little or no revenue from sales of uranium. Even the relatively small incremental costs required to comply with the rule's provisions would not currently be affordable for such firms. This is not due to the magnitude of the rule's costs; it is due to current conditions in the world's economy generally and in the market for uranium in particular. The EPA considers that when the market for uranium recovers, as it is projected to do, ISR uranium production and price will increase; under those conditions, facilities that are currently unprofitable without the rule would likely be profitable with the rule's costs included. However, the EPA solicits public

⁵ Currently, the process used by the NRC for licensing ISR facilities is based on a combination of NRC regulations, site-specific license conditions, and guidance. The process used by the Agreement States is based on regulations that vary by state for Agreement States that regulate ISR facilities. The NRC and many of the Agreement States have an established hearing process that allows for interested parties to request a hearing on the merits for the issuance and amendment of ISR facility licenses.

comment on this rule's expected impact on the domestic ISR industry.

The EPA compared these costs to the potential financial, ecological and human health benefits that would result from the proposed rule. Although the EPA is unable to quantify all the potential benefits, the EPA has identified several categories of benefits that can be attributable to the rule. The proposed rule would require groundwater at ISR facilities to be restored to the constituent concentration standards. Licensees would have to demonstrate stability of groundwater at those constituent concentration standards by completing at least 6 years of monitoring (3 years to meet the initial stability standards plus 3 years to meet the long-term stability standards), and conduct modeling and analysis to demonstrate there is a reasonable assurance that the applicable constituent concentration standards will continue to be met in the future. This provision would minimize the risk of degradation of valuable groundwater resources and the potential exposure of human, domestic livestock or ecological receptors to radiological or other

constituents. The proposed rule would also minimize the potential contamination of surface water and potential adverse health impacts resulting from such contamination. In addition, the proposed rule would avoid the potential costs associated with remediating contaminated aquifers; the cost of remediating a single plume of contamination could exceed the nationwide incremental costs associated with the proposed rule. The EPA estimated the cost savings due to avoided pump and treat remediation for hypothetical contaminant migration examples using the Conceptual Mine Unit, under three plume scenarios. For each scenario, the EPA computed the estimated cost savings by computing the difference in the cost of remediating a large plume (which might result if the plume were not detected for many years) and the cost of remediating a small plume discovered through monitoring prior to facility closure. The total estimated avoided costs over the entire remediation episode in this illustration, remediating three different sized plumes, ranged from \$23.7 million to \$608 million, depending on the

scenario. Annualized, these avoided costs range from \$1.5 million to \$11.1 million per year. To reflect the recognition that the proposed rule would reduce the likelihood of contamination relative to existing regulatory requirements, but not eliminate it entirely, the EPA further assumed a range of probability that the illustrative example contamination episode would be prevented by the proposed rule, but not identified under current requirements. The EPA assumed that the likelihood that the proposed rule would prevent the contamination, but current requirements would not, would range from 20% to 80%. Thus, the values shown in the table are 20% of the lower bound value (\$0.3 million) to 80% of the upper bound value (\$8.9 million). However, because the EPA is unable to quantify the number or characteristics of contamination episodes that could occur in the absence of the proposed rule, the EPA is unable to estimate nationwide cost savings. Thus, the EPA has not compared these illustrative costs savings with the estimated national costs of the proposed rule or computed the net benefits.

TABLE 2—CHARACTERIZATION OF THE COSTS AND BENEFITS OF 40 CFR PART 192, SUBPART F

Incremental costs (2015 dollars)	Benefits
Annualized costs of monitoring, modeling and analysis ranging from \$0.2 to \$7.3 million. Annual non-monitoring costs, including license, surety, lease, maintenance: \$7.6 million.	Protection of groundwater quality. Possible protection of surface water quality. Potentially reduced risk of exposure of human or ecological receptors to radiological pollutants. Potentially reduced human health impacts, including cancer. Annualized avoided cost of single remediation effort would be between \$0.3 million and \$8.9 million. ¹

¹ The costs presented are not an estimate of the nationwide remediation cost savings. They are the estimated cost of remediation for a simplified example of a single wellfield, for three contaminant plume scenarios.

E. Statutory Authority for This Action

The EPA is proposing the new standards and amendments under its authority in section 275 of the Atomic Energy Act (AEA), as added by section 206 of UMTRCA.⁶ Section 206 of UMTRCA authorizes the EPA to promulgate standards of general application for the protection of public health, safety, and the environment from radiological and non-radiological hazards associated with (a) residual radioactive materials located at specifically listed inactive uranium milling sites, nearby contaminated "vicinity properties," and depository sites for such materials selected by the Secretary of Energy (commonly referred

to as Title I sites); and (b) the processing and the possession, transfer and disposal of byproduct material at sites that process ores primarily for their uranium and thorium source material content⁷ or disposal of such byproduct material (commonly known as Title II sites). See 42 U.S.C. 2022.⁸ These public health, safety and environmental standards are contained in 40 CFR part 192 and are implemented by the NRC

⁷ "Source material" is defined as "(1) Uranium or thorium or any combination of uranium or thorium in any chemical or physical form; or (2) Ores that contain, by weight, one-twentieth of one percent (0.05 percent), or more, of uranium or thorium, or any combination of uranium or thorium." See 42 U.S.C. 2014(z), 10 CFR 20.1003.

⁸ Although the statute covers both uranium and thorium mill tailings sites, there are no existing thorium mill tailings sites.

and its Agreement States, as well as the DOE.

Title I of UMTRCA covers inactive uranium milling sites, nearby contaminated "vicinity properties" and depository sites. The EPA was directed to set general standards that are consistent with the requirements of the Solid Waste Disposal Act (later amended as the Resource Conservation and Recovery Act, or RCRA) to the maximum extent practicable. The Title I standards are located in EPA regulations at 40 CFR part 192, subparts A–C.

This proposed rule is based on Title II of the Act, which covers operating uranium processing or disposal facilities licensed by the NRC or NRC Agreement States. The EPA has authority to promulgate standards of general

⁶ See 42 U.S.C. 2022.

application to protect public health, safety and the environment from hazards associated with processing, possession, transfer and disposal of byproduct material at such facilities. Such standards must address both radiological and non-radiological hazards; further, standards applicable to non-radiological hazards must be consistent with the standards required under Subtitle C of the Solid Waste Disposal Act (*i.e.*, RCRA).⁹ The NRC is required to implement these standards at Title II sites. See 42 U.S.C. 2022(b), (d).

II. Summary of the Proposed Rule

A. Proposed Standards for Uranium ISR Operations

In today's action, the EPA is proposing to add a new subpart, subpart F, to the EPA's existing regulations for uranium and thorium mill tailings in 40 CFR part 192. The proposed standards would apply only to ISR facilities and are designed to protect public health, safety and the environment from contamination associated with their uranium recovery operations. The proposed standards are summarized in the following sections.

1. Who is subject to the proposed standards?

Subpart F would apply to new and existing ISR facilities, including facilities that have temporarily ceased uranium production (*i.e.*, ISR facilities in standby). Subpart F would not apply to Title I sites, facilities that use only conventional or heap leach uranium production methods, or Title II ISR wellfields that have already begun or completed restoration within three years of the rule's effective date. The NRC and NRC Agreement States would develop regulations or take other appropriate steps to implement the new subpart F standards, once they are finalized.

2. What are the proposed surface and groundwater standards for ISR facilities?

In the proposed new subpart, the EPA has cross-referenced subpart D to indicate that the existing standards for protecting surface waters and groundwater also apply to ISR facilities. The subpart D standards were initially written to address the handling, storing and disposal of byproduct material produced from the processing of uranium ore.

⁹ With the restriction that the EPA not require any RCRA permit for the processing, possession, transfer or disposal of byproduct material at such facilities.

3. What are the proposed groundwater protection standards for ISR facilities?

Consistent with the original proposal, this proposed rule includes the following three types of groundwater protection standards for ISR facilities: (1) Constituent concentration standards (including provisions for Alternate Concentration Limits (ACLs)); (2) initial stability standards; and (3) long-term stability standards.¹⁰ These standards of general application would apply to all ISR facilities and are intended to prevent the mobilization of uranium and other constituents beyond the production zone during the operational and restoration phases and to ensure, once the wellfield is restored, that the restoration is complete and stable, both immediately after restoration and into the foreseeable future.

Constituent Concentration Standards. The constituent concentration standards are numerical concentration limits for a set of groundwater constituents that are present in or affected by ISR operations. When corrective action is necessary after an excursion has occurred, the licensee would have to clean-up the groundwater to meet these proposed constituent concentration standards. In addition, during the restoration and stability monitoring phases, these proposed constituent concentration standards would be the levels to which restoration must be achieved and maintained.

In this proposal, the appropriate constituent concentration standards for an ISR facility would be determined by the regulatory agency for each licensee. The constituent concentration standard for each constituent would be the highest level of the following values: (1) The lowest regulatory standard for that constituent found in 40 CFR 141.62, 141.66, 141.80, 143.3, 264.94, and Table 1 to subpart A of 40 CFR part 192; (2) that constituent's preoperational background level in the wellfield; or (3) an ACL for that constituent as approved by the regulatory agency. When setting the constituent concentration standards for a licensee, the regulatory agency would consider a minimum of 12 constituents. The regulatory agency would not be required to set standards for all 12 constituents, but the regulatory agency would have to set a

¹⁰ The initial stability standards and the long-term stability standards were originally included in the proposed monitoring programs section of the rule. The initial stability standards (called "short-term stability" in the proposal) was proposed in 40 CFR 192.53(d)(2)(i) and the long-term stability standards were proposed in 40 CFR 192.53(e)(1)(iii). To improve clarity, the initial and long-term stability standards have been moved to 40 CFR 192.52(c)(2) and (c)(3), respectively.

constituent concentration standard for each of the listed constituents that is present in or could be affected by the ISR operation. The regulatory agency would have to identify the constituents during the preoperational monitoring phase. The regulatory agency would need to consider the following 12 constituents when setting the constituent concentration standards for an ISR operation: Arsenic, barium, cadmium, chromium, lead, mercury, selenium, silver, nitrate (as N), molybdenum, combined radium-226 and radium-228, and uranium (total). The original proposal included gross alpha particle activity (excluding radon and uranium), however, this constituent was not included in this proposal for the reasons explained in section III.3.2. The EPA is specifically requesting comment on the deletion of gross alpha particle activity (excluding radon and uranium) from the list of constituents. The regulatory agency may also set constituent concentration standards for additional constituents beyond these 12 constituents for situations where the regulatory agency considers concentration standards for other constituents necessary due to facility-specific conditions.

Once these proposed standards are finalized and the regulatory agency implements the subpart F standards, the constituent concentration standards would have to be established in accordance with the provisions in § 192.52 for all new wellfields and expansions to existing wellfields, and for all existing wellfields that are already operating, excluding those that are in and remain in the restoration and stability monitoring phases, as of the date three years after the effective date of this rule. Wellfields that begin and remain in restoration, initial stability monitoring or long-term stability monitoring at a licensed facility prior to the date three years after the effective date of the rule would need to meet the standards established when their license was issued or as otherwise specified by the regulatory agency.

Alternate Concentration Limits. Consistent with the original proposal, this proposal would allow licensees the flexibility to request ACLs when the best practicable active restoration has taken place, as determined by the regulatory agency, and the licensee demonstrates one or more of the constituent concentration standards cannot be met through further groundwater restoration. The best practicable active restoration must be used before the licensee can apply to the regulatory agency for a provisional ACL. Under this proposal, once the regulatory

agency establishes a provisional ACL, and the licensee can demonstrate the ACL has been met for three consecutive years, the regulatory agency can consider finalizing the ACL.

It must be understood that granting an ACL is an indication that restoration has not returned the affected groundwater to either preoperational background levels or other health-based levels. However, there are some overarching principles that must be considered when establishing ACLs. In general, as described in § 192.54, any provisional or final ACL should not pose a substantial present or potential hazard to human health and the environment, as determined by the regulatory agency. Points of exposure are defined in the proposal as locations identified by the regulatory agency that represent possible future areas of exposure where the receptor can come into contact with groundwater (e.g., areas of recoverable groundwater). The groundwater at the point of exposure should be protective of the receptor. The EPA specifically requests comment on this approach, especially with regard to the overall regulatory model of how ACL application would work, the definition of points of exposure and the use of this term, and the overall environmental, human health and safety protection goals for setting and using ACLs. Commenters, including interagency commenters, raised questions concerning the integration of an aquifer exemption under the SDWA and point of exposure as it was defined in the EPA's original proposal and the differing jurisdictions of the SDWA and UMTRCA.

Under this proposal, when considering setting an ACL, the regulatory agency would consider a list of factors, including potential adverse effects on groundwater quality, physical and chemical characteristics of the constituent, including the potential for migration, hydrogeological characteristics of the area, proximity and withdrawal rates of local groundwater users, current and anticipated future uses of the groundwater, existing quality of the groundwater, potential for health risks, potential to damage wildlife, crops, vegetation and physical structures, the persistence and permanence of the potential effects, adverse impacts on hydraulically connected surface water (including several factors) and the presence of any USDW.

The EPA expects that setting a provisional and final ACL will require consideration of the hydrologic and other characteristics of the wellfield and surrounding area, any potential areas of

groundwater withdrawal or discharge and be protective of human health into the foreseeable future.

Consistent with UMTRCA, the Tenth Circuit Court of Appeals in the *Environmental Defense Fund v. NRC* decision,¹¹ and current practice, the regulatory agency would be responsible for reviewing and approving ACL requests. Although not a proposed provision, the EPA considers it good practice for the regulatory agency to make public the information used for determining whether a provisional ACL is warranted and at what concentration before approving a provisional ACL. Although the NRC has not issued an ACL to date for an ISR wellfield, the NRC current practice would result in making such information publicly available and would support the EPA's effort to increase the effectiveness of the rule.

Stability Standards. In addition to the constituent concentration standards discussed above, licensees would also need to meet initial and long-term stability standards. The initial stability standards would require three consecutive years of quarterly monitoring results showing no statistically significant increasing trends exceeding the ISR facility's constituent concentration standards at the 95 percent confidence level. The long-term stability standards would require an additional three consecutive years of quarterly monitoring results showing no statistically significant increasing trends exceeding the ISR facility's constituent concentration standards at the 95 percent confidence level and also would require the licensee to demonstrate through geochemical modeling and other analysis that the applicable constituent concentration standards will continue to be met in the future. Consistent with the original proposal, the regulatory agency issuing the license would be responsible for determining whether there is reasonable assurance that the applicable constituent concentration standards will continue to be met at the ISR facility in the future.

4. What are the proposed general and preoperational monitoring requirements?

In order to understand the hydrogeology and geochemistry of the production zone and surrounding area and to set the preoperational background for the constituent concentration standards, licensees would develop a preoperational monitoring plan for the wellfield. The preoperational monitoring plan would

characterize the hydrogeology and geochemistry of the area, support identification of any potential future excursions from the production zone during the operational and restoration phases, and support the monitoring, modeling and other analysis as determined by the regulatory agency to be necessary to meet the proposed initial and long-term stability standards.

The preoperational monitoring determines the groundwater flow regime and the background groundwater concentrations of the 12 listed constituents and any additional constituents required by the regulatory agency. The data collected during this period would be used to select the indicator parameters and set the upper control limits (UCLs) for these parameters. The indicator parameters would be monitored during the operational and restoration phases and, when the UCL is exceeded, indicate that lixiviant or other constituents are migrating beyond the production zone. The preoperational monitoring would be conducted at wells within the production zone and in areas surrounding the production zone, including aquifers immediately above and below the production zone, and in areas laterally adjacent to the production zone, both up and down gradient. A sufficient number of wells would have to be installed and monitored so that the sampling data collected could be used to statistically determine appropriate background levels and support statistical tests, modeling and other analysis determined by the regulatory agency to be necessary during the operational, restoration, initial stability and long-term stability phases. The licensee would collect a sufficient number of sample sets per well over a time period sufficient to indicate a statistically valid background concentration that is not affected by well installation or temporal variations. In areas where temporal (e.g., seasonal) variation could occur (e.g., ore zones in unconfined aquifers), the preoperational monitoring would be conducted for at least one year in a sufficient number of wells to adequately represent the hydrologic system.

In addition to monitoring the concentrations of the constituents required by the regulatory agency, the licensee would collect any other data necessary to establish background conditions to support future modeling and other analysis in preparation to meet the proposed long-term stability standards in § 192.52(c)(3).

¹¹ 866 F.2d 1263 (10th Cir. 1989).

5. What are the proposed monitoring requirements for the operational and restoration phases?

To ensure that no lixiviant, uranium or other constituents are migrating outside of the production zone, the licensee would monitor groundwater for specified indicator parameters at a set of monitoring wells surrounding the production zone. These excursion monitoring wells would be located around the perimeter of the production zone and in any aquifers immediately above or below the production zone that may be impacted by ISR activities. That is, the excursion monitoring wells need to surround the production zone in three dimensions. The excursion monitoring wells would be of sufficient number, density, and placement to detect the possibility of an excursion from the production zone. The regulatory agency would be responsible for reviewing and, when appropriate, approving well placement and installation, indicator parameters, the UCLs for the indicator parameters, as well as background levels for constituents for which constituent concentration standards are set.

Typical indicator parameters used to identify possible excursions include chloride, conductivity and total alkalinity. Other parameters may be appropriate as well. In the proposed rule, an excursion has occurred when either (1) two indicator parameters exceed their respective UCLs in any excursion monitoring well; or (2) as determined by the regulatory agency, one indicator parameter significantly exceeds its UCL in any excursion monitoring well. The EPA specifically requests comment on this proposed definition of an excursion and suggestions for other approaches for determining when an excursion has occurred. If an excursion occurs, the licensee would need to initiate corrective action in accordance with its facility-specific corrective action program and would be required to test for all constituents for which a constituent concentration standard was established. At a minimum, the constituents from Table 1 that are typically present and that warrant monitoring during an excursion are uranium, radium, arsenic and selenium. The regulatory agency would be allowed to identify additional constituents that are present in the groundwater and need to be monitored on a facility-specific basis.

In some cases, a licensee may have temporarily stopped recovering uranium and the facility may be in a phase commonly called "standby" by the

industry. In such instances, the EPA considers the facility to be in the operational phase and the licensee would be required under the proposed rule to continue monitoring and taking actions, such as maintaining an inward hydraulic gradient, to prevent excursions.

6. What monitoring is proposed for the initial stability standards?

Once the licensee believes restoration is near completion and believes they can, over time, demonstrate that the proposed initial stability standards in § 192.52(c)(2) can be met, the EPA expects that the licensee would begin monitoring the groundwater constituent concentrations throughout the wellfield to determine when the initial stability standards have been met. To meet the proposed initial stability standards, the licensee would need to demonstrate stability by providing three consecutive years of quarterly monitoring results showing no statistically significant increasing trend exceeding each established constituent concentration standard. For all monitored constituents, this trend would need to be demonstrated at the 95 percent confidence level. The licensee would be required to develop and implement a compliance monitoring program approved by the regulatory agency that identifies compliance points encompassing the entire affected area of the wellfield.

The purpose of the proposed stability monitoring is to determine whether constituent levels in the entire affected area of the wellfield, including the production zone, have returned to levels below the established constituent concentration standards and stable conditions are established. Hence, compliance wells must include wells previously used as excursion monitoring wells and those previously used as production related wells. The location of the compliance wells used to determine compliance with the initial stability standards would need to be approved by the regulatory agency and would need to be located in areas likely to be affected by ISR operations. Therefore, compliance well would be located within the production zone, adjacent to the production zone and in aquifers located immediately above and below the production zone, as approved by the regulatory agency. The number and location of compliance wells will vary depending on the size and characteristics of the wellfield, but should encompass the entire affected area of the wellfield.

To meet the proposed initial stability standards of § 192.52(c)(2),

measurements would need to be taken quarterly at each well. If one or more constituents exceed a constituent concentration standard during the initial stability monitoring, then the licensee would follow the corrective action program approved by the regulatory agency. When monitoring to assess whether the initial stability standards have been met, constituent concentrations may fluctuate above the respective standard. The corrective action program should address the possibility of and the regulatory agency should consider potential responses to an exceedance of the constituent concentration standards while the licensee is establishing a statistically adequate trend. The regulatory agency may allow continued monitoring, if appropriate, or require the licensee to undertake a remedy. Regardless of the action taken, the licensee would be required by the proposed standards to achieve three consecutive years of stable measurements. Furthermore, as in all phases, if lixiviant or other constituents escape the production zone, the licensee would be required to take the necessary actions to return the aquifer to below the constituent concentration standards.

When the licensee demonstrates three consecutive years of quarterly monitoring results showing no statistically significant increasing trends exceeding the established constituent concentration standards at the 95 percent confidence level, then the facility has met the proposed initial stability standards and the licensee may, upon the determination of the regulating agency that the initial stability standards have been satisfied, begin long-term stability monitoring.

7. What are the proposed requirements for the long-term stability standards?

During the proposed long-term stability monitoring, the licensee continues quarterly monitoring to demonstrate compliance with the constituent concentration standards using the compliance wells established for monitoring during the initial stability phase. To meet the proposed long-term stability standards in § 192.52(c)(3), the licensee would need to first demonstrate quarterly monitoring results for a minimum of three consecutive years showing no statistically significant increasing trends exceeding the established constituent concentration standards (including any approved ACLs) at the 95 percent confidence level.

To approve cessation of long-term stability monitoring, the regulatory agency would be responsible for determining whether there is reasonable

assurance that the applicable constituent concentration standards will continue to be met at the ISR facility in the future. To make this determination, an analysis of geochemical hydrologic and other conditions within and around the production zone should be prepared by the licensee and reviewed by the regulatory agency. The EPA requests comment on the specificity of the regulatory language for this final determination of stability and the elements to be considered. In general, the EPA expects that the review should examine various features within the production zone and use a combination of sample collection and analysis of the restored production zone, data review, geochemical modeling and analysis to integrate the various types of data and to assess groundwater conditions. Various types of geochemical models may be employed from saturation index calculations to reactive transport models that can evaluate changing hydrologic and geochemical conditions within the wellfield. The EPA believes the licensee's long-term stability assessment should include the following elements:

- (i) Conceptual hydrogeochemical modeling for the mine unit/production zone;
- (ii) Ground water and solid (core) data used for geochemical model(s), including field parameters;
- (iii) Incorporation of ground water data in an initial geochemical model (*i.e.*, saturation indices calculations and assessment);
- (iv) Demonstration that stability (mainly reduction-oxidation or redox) conditions can be maintained in the production zone;
- (v) Demonstration that ground water migrating into the production zone will not significantly change the geochemical stability within the production zone;
- (vi) Demonstration of alternative geochemical conditions that demonstrate stability (uranium and other elements); and

(vii) Inter-relationships and contradictory claims (unintended consequences) for these various elements need to be identified and assessed in the context of the conceptual hydrogeochemical model.

The EPA requests comment on whether these seven elements should be required at all sites and thus included in the standards in 40 CFR part 192, subpart F.

The regulatory agency has the responsibility to establish the timeframe for long-term stability monitoring, based on facility-specific conditions at the wellfield and the results of long-term stability monitoring, modeling and analysis. If one or more constituents exceed their concentration standard (or approved ACL) or show a statistically significant increasing trend during the long-term stability phase, the regulatory agency may require the licensee to take corrective action as specified in the facility's corrective action program.

8. What are the proposed corrective action requirements?

Each licensee would be required to develop a corrective action program that addresses the actions it will take when an excursion is detected during the operational and restoration phases, or when monitoring during the stability phases shows a concentration higher than the established constituent concentration standard or a statistically significant increasing trend. Corrective action, as identified in the corrective action program and approved by the regulatory agency, would be initiated as soon as practicable and would begin within 60 days of the date the excursion or exceedance of a constituent concentration standard is detected. The corrective action program would consider a range of possibilities for action from the operational phase through the long-term stability monitoring phase. Corrective action may include removing or treating in place any constituents that exceed the constituent concentration standards (or

approved ACL). If the concentration of one or more constituents exceeds the constituent concentration standard (or approved ACL) during long-term stability monitoring, the licensee would be required to take corrective action to restore the groundwater to comply with the proposed constituent concentration standards; once restoration is complete, the licensee would begin again with initial stability monitoring.

B. Proposed Amendments to 40 CFR Part 192, Subparts C and D

As part of this rulemaking, the EPA is also proposing several minor amendments to the provisions in 40 CFR part 192, subparts C and D. These amendments are described in this section and are not related to the new standards for ISR facilities added in 40 CFR part 192, subpart F.

1. What are the proposed revisions to § 192.32(a)(2)(v)?

This proposed rule deletes the requirement in § 192.32(a)(2)(v) for the NRC to obtain concurrence from the EPA before the NRC may approve alternative requirements or proposals under AEA section 84(c).¹² As the EPA stated in the proposal, this portion of § 192.32(a)(2)(v) was effectively struck down by the Tenth Circuit Court of Appeals in *Environmental Defense Fund vs. U.S. Nuclear Regulatory Commission*, 866 F.2d 1263 (10th Cir. 1989). In its decision, the Court ruled that the NRC has authority under AEA section 84(c) to independently make these facility-specific determinations, and that the NRC has no duty to obtain the EPA's concurrence.

2. What are the proposed miscellaneous updates and corrections?

The EPA is also proposing several minor amendments to subparts C and D to correct cross-references, typographical and punctuation errors. These amendments include the following:

Section	Description of proposed technical correction	Rationale for correction
40 CFR part 192, subpart C		
192.20(b)(3)	Delete reference to “Pub. L. 92–314 (10 CFR part 712)” ..	The Grand Junction Remedial Action Criteria to which this reference applied no longer exist in the CFR. Methods were found to be ineffective and are no longer recommended as remedial options for radon mitigation.
192.20(b)(3)	Delete language referencing sealants and filtration	
40 CFR part 192, subpart D		
§ 192.31(a)	Replace “Uranium Mill Tailings Radiation Control Act” with “Uranium Mill Tailings Radiation Control Act”.	Corrects a typographical error.

¹² See 42 U.S.C. 2114(c).

Section	Description of proposed technical correction	Rationale for correction
§ 192.31(f)	Replace “pile containing uranium by product materials” with “pile containing uranium byproduct materials”.	Corrects a typographical error.
§ 192.32(a)(2)(v)	Replace “laser fusion, of soils, etc.” with “laser fusion of soils, etc.”.	Corrects a punctuation error.

III. Summary of Changes Made to the Original Proposal and Rationale for Those Changes

As previously indicated, the standards proposed in today's action differ from those standards proposed on January 26, 2015 (80 FR 4156). This section of the preamble describes the most significant changes made to the original proposal and the rationale for those changes. Many of the changes were made in response to public comments and additional information provided by stakeholders. In response to the original proposal, the EPA received over 5,380 public comment letters on the proposed amendments, of which 5,192 were duplicate letters. The comments covered more than 80 different topics and were submitted by a wide range of stakeholders, including private citizens, public interest groups, industry, Indian tribes, state agencies and other federal agencies. For the original proposal, the EPA also held public hearings in Corpus Christi, TX (April 14, 2015); Washington, DC (March 10, 2015); Casper, WY (May 13 and 14, 2015); and Chadron, NE (May 12, 2015), where 114 stakeholders provided comments.

In addition to describing the changes made to the original proposal, this section also discusses and responds to the significant comments that resulted in many of those changes. The significant comments received that did not result in changes to the original proposal are discussed in section IV of the preamble.

A. Incorporation of the Initial and Long-Term Stability Standards in Proposed 40 CFR 192.52

For clarity, the EPA has restructured the proposed rule to move the initial and long-term stability standards that were originally included with the monitoring requirements in § 192.53 to the standards in § 192.52. The initial stability standards (called “stability” or “short-term stability” in the original proposal) were proposed in § 192.53(d)(2)(i), and the long-term stability standards were proposed in § 192.53(e)(1)(iii). In this proposal, the initial and long-term stability standards have been moved to § 192.52(c)(2) and (c)(3), respectively.

B. Groundwater Protection Standards

1. Clarifications to Terminology

The original January 2015 proposal listed 13 constituents for which a facility-specific concentration limit must be set for each constituent that is present in the groundwater. In the original proposal, the EPA referred to these facility-specific concentration limits as “groundwater protection standards” and “restoration goals” (see § 192.52(c) of the original proposed rule). Since the use of these two terms may lead to confusion, the EPA is no longer using the term “restoration goals” but is instead using the term “constituent concentration standards” throughout the proposed rule to refer to these facility-specific concentration limits.

In the original proposed rule, the EPA also used the phrase “identified in the groundwater” when referring to constituents for which constituent concentration standards should be established (see § 192.52(c) of the original proposed rule). The EPA intended concentration standards to be set for any constituent that is present in groundwater before or after ISR activities have begun. Some constituents may not be initially present in the groundwater but may become soluble only after lixiviant is injected and groundwater chemistry has been altered. However, the phrase “identified in the groundwater” could be misinterpreted to mean only those that are present during preoperational monitoring. For clarification, the EPA has revised the original proposal to specify that constituent concentration standards must be established for all constituents that are “identified as present or affected by operations in the groundwater.”

2. Gross Alpha Particle Activity

In the original proposal, the list of constituents in Table 1 of subpart F included gross alpha particle activity.¹³ Several commenters opposed listing gross alpha particle activity, stating that it provided no useful information that could not be otherwise obtained from the required measurement of

radionuclides, such as radium 226. In addition, commenters noted the wide uncertainty range for the radiochemistry analytical methodology currently used to measure gross alpha activity.

The EPA tends to agree with commenters who suggested that gross alpha measurements are likely to be of limited value when other radionuclides of concern are also being sampled. The Agency also recognizes that the uncertainty associated with gross alpha measurements may be greater than those for other constituents, which may make the application of statistical tests especially complicated. However, gross alpha is specified as a constituent to be sampled in other subparts of 40 CFR part 192, and it does have a maximum contaminant level (MCL), which cannot be overlooked. Further, there may be instances where gross alpha measurements provide information regarding the presence of decay products such as lead and polonium. The EPA is specifically requesting comment on the deletion of gross alpha particle activity as one of the original proposal's 13 constituents, whether it provides useful information, and how measurement uncertainty might be addressed.

C. Preoperational Monitoring Requirements

In the original proposal, the EPA included provisions for preoperational monitoring that were designed to characterize the groundwater flow regime, geology and geochemistry. The EPA originally proposed that preoperational monitoring would measure the background concentrations of radiological and non-radiological constituents, including all the constituents listed in Table 1 of subpart F, and any additional constituents or parameters specified by the regulatory agency or needed for calculations or groundwater modeling. The original proposal required preoperational monitoring be continued for a minimum of one year in order to account for any temporal changes occurring in the aquifer. The EPA also proposed some requirements for the location of the wells, requiring monitoring wells to be located in overlying aquifers, underlying aquifers, inside the exempted aquifer and outside the exempted aquifer, including areas that

¹³ The SDWA MCL of 15 pCi/L for gross alpha particle activity excludes alpha particle activity contributions from radon and uranium.

are up- and downgradient from the future production zone. The original proposal specified standards for installing the monitoring wells, including requirements for casings and for sealing the wells to prevent contamination.

1. Duration of Preoperational Monitoring

The EPA received a number of comments on the duration of the proposed preoperational monitoring requirements. Some commenters supported the one-year timeframe, while others recommended the time period be extended to up to two years. Many commenters cited the NRC Criterion 7 from 10 CFR part 40, Appendix A, which requires uranium mills to complete one or more years of preoperational monitoring before a company can submit a license application. Two commenters noted that some aquifers do not experience seasonal variations in groundwater constituents. For example, commenters asserted there may be no seasonally influenced fluctuation in the concentrations of groundwater constituents in deeper target ore production aquifers.

Based on all of these comments, the EPA has refined the approach to preoperational monitoring. Instead, the Agency is proposing that preoperational monitoring of wells screened in areas where temporal variations are not expected to occur, such as in deep ore zones in confined aquifers, would be allowed to monitor for periods of less than one year. However, the licensee would collect several sets of samples over a time period sufficient to demonstrate seasonal variability does not occur. For example, in some cases, four sets of samples collected over several months would be adequate to determine the background for systems that do not exhibit seasonal changes. In this proposal, sample sets collected over a period of at least one year would still be necessary for facilities that operate in areas where constituent concentrations are expected to exhibit seasonal fluctuations. The regulatory agency would determine whether the licensee's preoperational monitoring is of sufficient duration and that sampling occurs at appropriate intervals to establish the background concentrations for all 12 constituents, as well other constituents identified by the regulatory agency and all indicator parameters. To provide flexibility where appropriate, the EPA did not propose an across-the-board two-year monitoring requirement, although the regulatory agency would be allowed to do what is necessary to

reflect seasonal or other variation in background constituent concentrations or flow.

2. Changes to the Well Completion Requirements

The Agency received several comments on the original proposed requirements for well completions. A general concern expressed by the commenters is that true baseline conditions of the groundwater constituents cannot be established if the well drilling and development methods introduce oxygen into the groundwater. The commenters explained that since oxygen may increase the solubility of uranium, elevated baseline concentrations will lead to artificially high restoration goals. Commenters suggested several methods to alleviate this concern, including air-rotary drilling with recirculated nitrogen gas instead of air and a foam surfactant that contains organic constituents to eliminate oxygen.

After considering these comments, the EPA believes sufficient monitoring should be completed to ensure all perturbations associated with well construction are resolved prior to establishing the background concentrations. To achieve this goal, under this proposed action, the licensee would collect several sets of samples over a time period sufficient to demonstrate baseline conditions that are unaffected by monitoring well construction. In the proposal, the EPA requires the sampling frequency to be sufficient to ensure statistically valid background levels that are not influenced by well construction. The samples used for this purpose may be the same as those used for the temporal variability analyses, if technically feasible. The regulatory agency would determine whether the licensee's well construction follows appropriate protocols and that sampling occurs at appropriate intervals to establish accurate background concentrations.

D. Exempted Aquifers

The EPA originally proposed that preoperational monitoring wells, excursion monitoring wells used during the operational and restoration phases, and compliance wells used during the initial and long-term stability monitoring phases (referred to as "point(s) of compliance") be located inside and outside of "exempted aquifers" (see the proposed definition for "point(s) of compliance" at 80 FR 4184). In the original proposal, the EPA also defined the term "point(s) of exposure" as the "intersection of a vertical plane with the boundary of the

exempted aquifer" and the term "adjacent aquifer" as an aquifer or portion of an aquifer that "shares a border or end point with the exempted aquifer or the exempted portion of an aquifer" (see 80 FR 4183–4184). As the EPA explained in the original proposal, the term "exempted aquifer" refers to aquifers that are exempted from the protections afforded by the SDWA (see 80 FR 4160).

Under the SDWA, the EPA sets health-based standards for drinking water to protect against naturally occurring and anthropogenic contaminants that may be found in surface and groundwater sources of drinking water. Additionally, under SDWA authority, the EPA promulgated Underground Injection Control (UIC) Program regulations to ensure protection of USDWs,¹⁴ which may be consumed now or in the future, where injection activities are occurring. The UIC regulations at 40 CFR 144.12 prohibit any injection activity that allows the movement of fluid containing any contaminant into USDWs if the presence of that contaminant may cause a violation of any primary drinking water standard or otherwise adversely affect the health of persons. Under UIC Program regulations, an aquifer or a portion of an aquifer may be exempted from the protections afforded USDWs, under the SDWA, if (a) it does not currently serve as a source of drinking water; and (b) it cannot now and will not in the future serve as a source of drinking water because one of four specified conditions is met, or (c) the total dissolved solids content of the groundwater is more than 3,000 mg/L and less than 10,000 mg/L and it is not reasonably expected to supply a public water system (see § 146.4). The four conditions referenced above for the aquifer exemption criteria at 40 CFR 146.4(b) are:

(1) It is mineral, hydrocarbon or geothermal energy producing, or can be demonstrated by a permit applicant as part of a permit application for a Class II or III operation to contain minerals or hydrocarbons that considering their quantity and location are expected to be commercially producible.

(2) It is situated at a depth or location which makes recovery of water for drinking water purposes economically or technologically impractical;

¹⁴ USDWs are defined, by regulation at 40 CFR 144.3, as: "An aquifer or its portion: (a)(1) Which supplies any public water system; or (2) Which contains a sufficient quantity of ground water to supply a public water system; and (i) Currently supplies drinking water for human consumption; or (ii) Contains fewer than 10,000 mg/l total dissolved solids; and (b) Which is not an exempted aquifer."

(3) It is so contaminated that it would be economically or technologically impractical to render that water fit for human consumption; or

(4) It is located over a Class III well mining area subject to subsidence or catastrophic collapse.

1. Removal of References to “Exempted Aquifer”

In this proposal, the EPA has removed references to “exempted aquifers”, deleted the definitions of “adjacent aquifer” and “exempted aquifer” from § 192.51, and removed the phrase “exempted aquifer” from the definition of “background” in § 192.51 and from the requirements specifying where monitoring wells must be located. This change to the original proposal was made to help clarify that these standards under UMTRCA complement, and do not overlap with, the requirements of the SDWA. As discussed in section I.B., the scope and level of protection of the SDWA differs from the UMTRCA as groundwater at uranium ISR sites could have beneficial uses even if the aquifer has been exempted from protection under the SDWA. Since UMTRCA provides authority that can be used to protect aquifers during and after uranium recovery operations, regardless of whether the aquifer meets the definition of an USDW as defined in EPA’s UIC regulations or is exempted from the protections of the SDWA, the scope of UMTRCA’s protection should be reflected in the regulatory text of these standards rather than relying on the SDWA UIC exemption regulations. Thus, the regulatory text proposed in this action does not depend on or use the term exempt aquifer. Also, although a remote possibility, because ISR facilities may be located in aquifers that are not designated as “exempted aquifers” under the SDWA, under the original proposal there would have been a lack of clarity on how a facility located in a non-exempt aquifer would comply with a rule using “exempt aquifer” boundaries in the regulatory text.

Aquifer Exemptions at ISR facilities. The EPA recognizes that almost all ISR facilities may be considering Class III injection into a formation that meets the UIC regulatory definition of a USDW and is afforded SDWA protection. In such scenarios, in addition to applying for a Class III permit, a Class III owner or operator must (1) apply to the appropriate UIC Program for an aquifer exemption pursuant to requirements at 40 CFR 144.7 and 146.4 (or applicable state requirements), or (2) ensure that the boundaries of an existing exemption are appropriately delineated for the proposed injection activity. While

aquifer exemptions facilitate commercial production of minerals and hydrocarbons under specific conditions, the UIC Program requirements are intended to ensure protection of non-exempted portions of a formation which meet the definition of a USDW even where ACLs may be established at an ISR site located within an exempted portion of that aquifer.

As stated above, this proposed rule is established under the UMTRCA and not under the SDWA; however, both the UMTRCA and the SDWA requirements may apply to ISR facilities. As discussed above and in section I.A., the requirements of these statutes are complementary and not overlapping or duplicative. The SDWA requirements provide for permits to inject lixiviant and recover uranium and possible exemption of the production zone from SDWA requirements. The proposed UMTRCA requirements protect adjacent aquifers that are not exempt from SDWA by requiring monitoring and corrective action, if necessary, during the operational and restoration phases in and around the ore zone after production ceases. The SDWA does not prevent recovery and use of the water within exempted aquifers (including where ISR operations were previously conducted) for private drinking water supply, public water supply, or other uses.

2. Changes to the Definition of “Point(s) of Exposure”

Points of exposure are defined in the proposal as locations identified by the regulatory agency that represent possible future areas of exposure where the receptor can come into contact with groundwater (e.g., areas of recoverable groundwater). The groundwater at the point of exposure should be protective of the receptor. As noted earlier in this preamble, commenters, including interagency commenters, raised questions concerning the integration of an aquifer exemption under the SDWA and point of exposure as it was defined in the EPA’s original proposal and the differing jurisdictions of the SDWA and UMTRCA. The EPA specifically requests comment on this approach, especially with regard to the overall regulatory model of how ACL application would work, the definition of points of exposure and the use of this term, and the overall environmental, human health and safety protection goals for setting and using ACLs.

E. Excursions

In the original proposal, the EPA defined an excursion as “the movement of fluids containing uranium byproduct

materials from an ISR production zone into surrounding groundwater” and specified that an excursion has occurred when “. . . any two indicator parameters . . . exceed their respective upper control limits” (see 80 FR 4184).

1. Changes to the Definition

Although the EPA generally considers that an excursion has occurred when any two parameters are above the UCL, in this proposal, the EPA provides flexibility for the regulatory agency to determine that an excursion has occurred when any single indicator parameter significantly exceeds its UCL. The EPA made this change to the proposed definition because in some situations a single parameter may be sufficiently high to indicate a possible excursion. The EPA emphasizes that this would be a judgement of the regulatory agency, and the Agency’s understanding is that it is consistent with current NRC practice.

In this proposal, the EPA also revised the definition of excursion to indicate that an excursion includes the movement of fluids containing lixiviant, as well as any fluids containing uranium byproduct material, because these fluids may migrate outside of the ISR production zone. The EPA replaced the reference to “the ISR production zone” with “ISR wellfield” to indicate a broader scope of consideration is necessary in order to ensure that background is appropriately addressed and to ensure that areas within and surrounding the production zone are stable.

2. Changes to the Constituents Required To Be Monitored During the Different Phases of Operation

The EPA originally proposed that licensees would be required to monitor for all constituents listed in Table 1 of 40 CFR part 192, subpart F, during the different phases of operation at an ISR facility. In this proposal, the EPA changed this requirement such that facilities would be required only to monitor for those constituents that are expected to be present (e.g., uranium, radium, selenium and arsenic) based on the preoperational monitoring and any other constituents identified by the regulatory agency. The EPA made this change to the monitoring parameters to ensure monitoring requirements are established based on data indicating the expected contaminants. This change reduces the monitoring burden for ISR facilities compared to the original proposal. This proposed change also provides the regulatory agency flexibility to specify any other constituents not listed in Table 1 of 40

CFR part 192, subpart F, that are expected to be present. Under this proposal, the EPA considers it unnecessary to monitor for constituents that are not present. Hence, facilities would be required to monitor only for those constituents that are likely to be present.

F. Initial and Long-Term Stability

After restoration ends, ISR facilities must demonstrate compliance with the proposed constituent concentration standards, and also demonstrate those levels will persist and remain stable in the future. In the original proposal, to demonstrate stability, the EPA proposed three consecutive years of stability monitoring with stability demonstrated at the 95 percent confidence level followed by long-term monitoring for an additional period of 30-years. The originally proposed long-term stability monitoring would have allowed facilities to cease monitoring once they had completed monitoring for 30 years. However, the original proposal also allowed a licensee to shorten the 30-year long-term stability monitoring period by demonstrating geochemical stability through monitoring and geochemical modeling.

1. Statutory Authority and 30-Year Long-Term Monitoring

The EPA derived the 30-year long-term stability monitoring period in the original proposal based on consideration of the Agency's statutory mandate to be consistent with the requirements applied to managing hazardous waste under RCRA.

Numerous commenters thought the proposed 30 years of long-term monitoring was not justified, and was excessive and unnecessary. The general positions of these commenters were that these very specific monitoring time frames were outside the EPA's statutory authority under the UMTRCA to promulgate "standards of general application" and that there is no evidence that ISR facilities have impacted offsite underground sources of drinking water. Commenters also thought the requirement would have a significant economic impact, including impacts on leasing and surety costs that would place a number of ISR companies out of business. Other commenters noted that ISR facilities are not equivalent to RCRA hazardous waste facilities and should not be similarly regulated. Some commenters were concerned the long-term monitoring requirements would increase radiologic dose to employees maintaining the processing plant and well fields, which would be inconsistent with the NRC's

ALARA (As Low As Reasonably Achievable) regulations found in 10 CFR part 20. However, other commenters strongly supported the 30-year monitoring time frame or recommended a longer time frame. These commenters felt that 30 or more years of monitoring would provide sufficient time to detect instability and potential migration of constituents.

2. Proposed Requirements for Initial and Long-Term Stability

Under UMTRCA, the EPA has authority to promulgate "standards of general application" for the protection of public health, safety and the environment from the radiological and non-radiological hazards associated with the processing and the possession, transfer and disposal of byproduct material at uranium ISR facilities. 42 U.S.C. 2022(b). The Tenth Circuit Court of Appeals has clearly recognized that this authority encompasses the ability for the EPA to include monitoring as part of its "standards of general application." *American Mining Congress et al. v. Thomas*, 772 F.2d 640, 644, 647–649 (10th Cir. 1985) ("The regulations necessitate monitoring programs."). In the proposal, the EPA has retained the initial and long-term stability monitoring requirements but has removed the default requirement for 30 years of long-term monitoring. The initial stability monitoring period remains the same as in the original proposed rule (*i.e.*, at least three years). Under this proposal, the duration of the long-term stability monitoring must be at least three years, and the regulatory agency would determine the appropriate length of any additional long-term stability monitoring based on criteria that will enable the licensee to demonstrate, as appropriate, that there is reasonable assurance that the applicable constituent concentration standards will continue to be met in the future. Similar performance criteria were part of the standards in the original proposed rule, where the EPA had proposed that licensees would be required to demonstrate three consecutive years of initial stability monitoring and then maintain long-term stability monitoring for an additional period of 30 years. The original proposal included an option that allowed a licensee to shorten the 30-year timeframe by demonstrating long-term geochemical stability through modeling. Under this proposal, modeling would no longer be optional. Consistent with the original proposal, the EPA is proposing that the regulatory agency would be responsible for reviewing the licensee's data and analysis, and making

the determination of when the licensee could discontinue long-term stability monitoring and initiate decommissioning.

While many commenters supported the 30-year monitoring requirement, and some even preferred a longer period, the proposal maintains the same performance-based standards for the long-term stability phase as the original proposal and hence ensures the same level of protection the EPA anticipated in the original proposal. The Agency emphasizes the role of modeling in achieving that objective. As explained in the original proposal, the Agency expected that licensees would make extensive efforts to develop robust models that would significantly shorten the long-term monitoring period. In fact, as presented in the proposal, it would have been possible for a licensee to submit modeling such that no (or minimal) long-term monitoring would be necessary. However, should licensees be unable to provide such modeling, or choose not to, the additional monitoring would have provided the level of confidence necessary for the regulatory agency to determine that long-term stability had been demonstrated. This revised proposal relies on modeling and analysis to as an essential element in concluding that groundwater will continue to meet the applicable constituent concentration standards into the foreseeable future, leading to the Agency's judgment that the revised approach is comparable in protectiveness to the original proposal.

As noted above, other commenters stated that 30 years of monitoring would not add value and would put many companies out of business. ISR facilities that disturb groundwater and mobilize constituents of concern are responsible for restoring disturbed groundwater to background or health-based conditions regardless of the time required to achieve this goal. However, the EPA also agrees with commenters who noted the time period necessary to establish stability at an ISR facility is variable due to differences in geology, hydrology and geochemistry. As reflected by one of the commenters, after 10 years of monitoring at the Kingsville Dome ISR facility, it appears that reducing conditions have not been re-established in the production zone. Restoration at Christensen Ranch has not been approved by the NRC because the NRC found that restoration was not complete and water quality was not stable after completion of uranium recovery in 2005.¹⁵ Uranium concentrations also

¹⁵ NRC (2012), "Technical Evaluation Report: Christensen Ranch Mine Units 2 through 6

increased in a production monitoring well at Smith Highlands Ranch after restoration was completed.

This proposal defines the initial stability standards as “three consecutive years of quarterly monitoring results with no statistically significant increasing trends exceeding the constituent concentration standards at the 95 percent confidence level.” These performance-based standards would apply after the licensee completes restoration and, once met, would demonstrate that restoration was initially successful. The EPA requests comment on this approach and the wording of the regulatory text. Alternative language the EPA considered for this proposal for both initial and long term stability, included requiring the licensee to show “. . . three consecutive years of quarterly monitoring results demonstrating a statistically significant non-increasing trend at the 95 percent confidence level remaining below each constituent concentration standard.” This alternative approach, which would require the licensee to demonstrate that the trend line is either horizontal or decreasing (“non-increasing”), has been applied in the Superfund program. It has the clear advantage of accepting only trend lines that are not increasing, which can provide some additional confidence that the trend is not in a direction that could (eventually) threaten to exceed the constituent concentration standards.

However, based on discussions with the NRC, the agency responsible for implementing this rule after promulgation, it is clear that licensees may see increasing, but not statistically significant trends in constituent concentrations during stability monitoring. Consequently, the EPA opted to change the language to “no statistically significant increasing trend” to provide the NRC flexibility in addressing this specific scenario. Further, the EPA is concerned that specifying a non-increasing trend may introduce complications in applying statistical techniques, particularly when working from the hypothesis that there is no slope to the trend line. The level of natural variation present may itself forestall the ability to determine a non-increasing slope with the level of confidence the EPA believes necessary. The level of statistical significance associated with an increasing trend that would be unacceptable is left to the

regulatory agency to determine based on site-specific conditions.

The EPA requests public comment on the proposed approach as well as the alternatives. Specifically, the EPA would like to know whether this language is sufficiently protective and whether there are any other practical approaches the Agency should consider as possible alternatives.

In this proposal, the EPA has defined the long-term stability standards as a two-part test, with the following elements: (1) The licensee must provide an additional three consecutive years of quarterly monitoring data demonstrating no statistically significant increasing trend exceeding the constituent concentration standard for each applicable constituent at the 95 percent confidence level; and (2) the licensee must provide geochemical modeling and other analysis to demonstrate that constituent concentrations within the production zone will be met in the future. The regulatory agency would evaluate the modeling and other analysis and make a determination as to whether there is reasonable assurance that the applicable constituent concentration standards will continue to be met in the future. In this proposal, only after this determination has been made by the regulatory agency would the licensee cease long-term monitoring.

The three-year long-term monitoring period represents a different application of the RCRA paradigm than the 30-year post-closure monitoring. The three-year monitoring period is consistent with RCRA corrective action requirements, which can be seen as analogous with groundwater restoration at ISR sites. The Agency believes the three-year performance standard for the long term is appropriate to provide additional confidence in restoration of these sites and provides sufficient time to conduct a trend analysis, as well as being consistent with RCRA requirements of three years of monitoring to demonstrate no exceedance associated with corrective action. The EPA finds that this alternative approach will provide the necessary protectiveness and is particularly responsive to industry comments regarding the potential costs associated with a 30-year monitoring period.

G. Corrective Action Program

The EPA originally proposed that facilities be required to take corrective action as soon as practicable but no later than 90 days after an excursion or exceedance is detected. The original proposal also required that the concentrations of constituents be returned to the constituent

concentration standards “within the production zone and the maximum constituent level in adjacent aquifers” (see § 192.54(a) of the proposed rule). Groundwater monitoring for a period of at least three years after corrective action had been terminated was proposed with reference to the proposed monitoring requirements for the initial and long-term stability phases.

A few commenters supported the requirement to take corrective action as soon as practicable. However, most commenters disagreed with the original proposed requirement to require ISR facilities to implement a corrective action program within 90 days. One commenter was concerned the compliance costs would be high because the wellfield and associated equipment would have to be maintained at the ISR facility for many years in order for corrective action to be started within the required 90 days. Another commenter thought a longer time period was justified due to the low velocity of groundwater at ISR facilities. This commenter asserted that additional time may be needed for drilling wells and installing pump and treat equipment, particularly during the long-term stability period when equipment has been removed. This commenter recommended a period of two years be allowed for implementing a corrective action program and stated that groundwater may move only 10 to 20 feet over this time period. Another commenter noted that the NRC already has regulations covering corrective action in 10 CFR part 40, Appendix A, Criterion 5D, which specify that a licensee has up to 18 months to implement a corrective action program. One commenter found the proposed requirements for groundwater monitoring confusing and questioned why the proposed rule referenced the initial and long-term stability monitoring requirements. This commenter thought the groundwater monitoring applied to excursions and questioned why additional monitoring was necessary for excursions occurring during the operational phase.

The EPA has made several changes to the corrective action requirements in this proposal. First, the EPA would require ISR facilities to *begin* (but not necessarily complete) corrective action no later than 60 days after an excursion or exceedance is detected. The EPA made this change to be consistent with the NRC’s current practice for excursions.¹⁶ Full implementation may

Restoration Report, Uranium One USA, Inc. Willow Creek ISR Project.” Available at <http://www.nrc.gov/docs/ML1217/ML1217A048.pdf>.

¹⁶ NRC (2003), “Standard Review Plan for In-Situ Leach Uranium Extraction License Applications

take additional time, as recognized by the NRC in 10 CFR Appendix A, Criterion 5D. The time for the initiation and completion of the corrective action in all phases of operation would be addressed in the corrective action program and approved by the regulatory agency.

Second, the EPA is acknowledging that corrective action in the initial stability phase may be different than in the long-term stability phase, as during the initial stability phase data are being collected to show the initial trend and may be more subject to fluctuation. One exceedance may be acceptable during the initial stability phase, but not for the long-term stability phase, without taking corrective action. The EPA is proposing the regulatory agency would have the authority to determine whether an exceedance truly warrants action or continued monitoring while the licensee is trying to establish the data trend during the initial stability phase. The need for action or monitoring during each phase of operation would be anticipated and addressed in the corrective action program. Whether or not the regulatory agency has determined that corrective action is necessary does not negate or affect the proposed initial stability standards requiring three consecutive years of quarterly monitoring results with no statistically significant increasing trends exceeding the constituent concentration standards at the 95 percent confidence level. The corrective action program would have to return the constituent concentrations to levels below the constituent concentration standards established by the regulatory agency.

Finally, the EPA is proposing to change the groundwater monitoring provisions proposed for § 192.54(c) (80 FR 4187) to better reflect the requirements applicable to ISR facilities that experience exceedances of constituent concentration standards during the long-term stability phase. The EPA agrees with a commenter who stated that the proposed rule language for the groundwater monitoring requirements in § 192.54(c) could easily be misinterpreted. The change to the original proposed rule makes it explicit that corrective action is followed by another round of initial stability monitoring followed by long-term stability monitoring. Under this proposal, the ISR facility would need to first meet the three-year initial stability standards, and then meet the long-term stability standards of § 192.53(c)(3)(i) and (ii), before it is eligible to apply to

the regulatory agency for approval to cease long-term stability monitoring. These changes to § 192.54(c) would not add any new requirements but simply clarify the requirements that were originally proposed.

H. Costs and Economic Impacts

1. Compliance Costs

Commenters expressed concern that the EPA had not considered the entire spectrum of legal, regulatory and other costs required to hold and preserve the ISR facility, lands and wellfields during the stability monitoring periods. The EPA reviewed and updated the economic analysis to incorporate estimated non-monitoring costs (e.g., licensing, leasing fees, continued surety, maintenance) identified in the comments. Commenters also recommended that the EPA consult the ISR industry to better characterize costs, and the EPA requested additional information from some of the uranium recovery companies that had provided cost data during the public comment period to clarify the information provided. The additional cost information received from the uranium recovery companies was incorporated into the economic analysis. A listing of the non-monitoring costs that were identified in the comments and added to the revised analysis, along with a comparison of non-monitoring costs provided by industry and the average values used in the economic model, can be found in the economic analysis report (see sections 3.2 and 3.3). The addition of non-monitoring costs added \$2,300 per acre to the modeled average facility costs excluding license and surety. The estimated total annualized incremental non-monitoring costs projected to be incurred by firms owning existing ISR facilities ranged between \$0.1 million and \$4.1 million, with total national non-monitoring costs of \$7.6 million for all firms. All costs in the economic analysis have been adjusted from 2011 to 2015 dollars, as suggested by commenters.

Another concern expressed by commenters was that the EPA had not considered additional costs to self-funded regulatory programs, and that these costs would be passed along to the uranium recovery companies. The revised standards reflect the practices that have become more common between the NRC and ISR facilities; therefore, this proposal is not expected to add significant burden to regulatory programs.

Compliance for existing ISR facilities also concerned commenters. As in the proposal, § 192.52(a) of this proposal

makes clear that these standards would not apply to wellfields that are currently in and remaining in restoration or stability monitoring.

Commenters also expressed concern that the costs of monitoring were not adequately reflected due to inaccurate assumptions for current monitoring requirements. The EPA adjusted the monitoring costs in the economic analysis based on guidance received from the NRC regarding current monitoring practices and requirements, as opposed to historical practices that were noted by some commenters as common to more developed ISR facilities. Also, a commenter noted that the rule discussion in the proposal preamble at 80 CFR 4186 (§ 192.53(a)(3) of the original proposal) required monitoring well locations outside of the monitoring well ring and that these costs were not included in the economic analysis. The proposal maintains the requirement in the original proposal for down-gradient monitoring wells outside the monitoring well ring where needed, and at the discretion of the regulating agency, especially when an adjacent aquifer is present. Initially, the EPA's proposal required monitoring at locations down-gradient from the wellfield in exempted aquifers. However, placement of down-gradient monitoring wells outside the well ring was not found to be common practice at existing sites and the EPA removed these wells from the cost model. The EPA also assumed in the proposal that monitoring and hydrogeologic and geochemical modeling requirements would allow most sites to demonstrate that groundwater conditions down-gradient of the wellfield would trap any mobilized constituents, thus ensuring that groundwater quality is protected. Reference to the "exempted aquifer" has also been removed from this proposal, as discussed in section III.D of this preamble.

Comments were also received on the methodology used to extrapolate a cost per acre for operating ISR facilities based on a conceptual ISR unit, and while it was acknowledged that the method may be appropriate for fully developed ISR facilities, the commenters were concerned that this methodology may not capture the full costs of implementation for facilities in earlier stages of development. The EPA further reviewed and used available information from facility surety and license reports to estimate and account for the proposed and anticipated number of ISR units at each ISR facility that was included in the cost model.

In light of the adjustments described above, the EPA considers the estimated

monitoring costs for existing ISR facilities that it developed for purposes of the proposal to be reasonable; however, the Agency continues to recognize that there are uncertainties inherent to the process used to extrapolate the monitoring costs associated with these standards as compared to actual costs to ISR facilities.

2. Energy Impacts Summary

Several commenters noted the importance of nuclear power to shift the nation's reliance away from carbon-based energy resources and expressed concern that the proposed standards would reduce the viability of uranium recovery and continued development of nuclear energy. In response to these comments, the EPA reevaluated the incremental costs of the selected option to existing and planned ISR facilities, which further substantiated that this action is not a "significant energy action" as defined in Executive Order 13211 (66 FR 28355, May 22, 2001). The proposed standards, in large part, codify groundwater monitoring practices and requirements already being implemented at permitted operations; further, domestic uranium has historically provided less than 10 percent of total uranium supplied to civilian owners and operators (COOs) of nuclear power stations. Because the proposal would increase the costs of facilities that produce a relatively small share of uranium traded in U.S. markets, the EPA estimate that a \$1.96 increase per pound in the cost of ISR uranium production would increase the price of uranium paid by COOs by only \$0.11 per pound. Because nuclear generation provides a relatively small share of total domestic electricity, the \$0.11 increase in the price of uranium would increase the price of electricity very little (less than 0.1 percent). Although the proposal would slightly increase the costs of domestic uranium production relative to international sources, this rule is not expected to directly and adversely affect productivity, competition or prices in the energy sector. For more information, please see section VI.H of this preamble and sections 5.3 and 6.9 of the document titled, "Economic Analysis: Revisions to the Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings Rule (40 CFR part 192)," available in Docket ID No. EPA-HQ-OAR-2012-0788.

3. Groundwater Resource Impacts of Restoration

Several commenters expressed concern that the proposed rule would

cause an unnecessary waste of groundwater resources beyond diminishing returns, due to prolonged additional restoration to satisfy the proposed requirement for 95 percent statistical confidence of groundwater stability. The EPA disagrees and believes that the 95 percent statistical confidence level is widely accepted and used in other environmental standards. For more information on the 95 percent confidence level, see section IV.D of the preamble.

One commenter stated that the EPA ignored its authority under CERCLA that allows the Agency to require former operators and their successors to clean up post-license termination, thereby unnecessarily increasing monitoring costs for ISR facilities. The EPA does not believe it is appropriate to rely upon expectations of future cleanup rather than make reasonable efforts to prevent groundwater contamination in the first place. The intent of this rule is to protect groundwater and prevent its degradation, thereby eliminating the need for remedial actions under CERCLA that, by the time discovered, could be far costlier. This approach is fully consistent with the EPA's Groundwater Protection Strategy, which emphasizes pollution prevention over remediation. Also, commenters asserted that the groundwater modeling was inadequate, and flawed inputs were used to estimate the duration of remediation to clean up a plume after facility closure. The EPA understands that the contaminant transport models used to estimate costs of remediating a contaminant plume are simplistic, the inputs used are based on limited ISR facility data, and selected parameterizations are based on assumptions. Nevertheless, the flow model provides a reasonable estimate for the duration of an illustrative general pump and treat remediation scenario, based on the EPA's extensive pump and treat remediation experience under CERCLA and other remedial programs, and, upon review, the models and inputs were determined to be adequate to illustrate potential cost savings for purposes of the economic analysis.

I. Other Miscellaneous Changes

1. Clarification of "Operational Phase"

In the original proposal, the EPA defined the operational phase of an ISR facility as "the time period during which uranium extraction by in-situ recovery occurs" and noted that "operations end when the operator permanently ceases injection of lixiviant and recovery of uranium-bearing solution for processing" (see 80 FR

4160). However, the EPA notes there are periods when the ISR facility is not actively recovering uranium for various reasons (e.g., market conditions), but production is intended to resume when conditions are more favorable. These periods are sometimes referred to as "standby" by operators. In the original proposal, the EPA expressed the view that it would not be appropriate to allow a standby period for ISR facilities if the gradient within the wellfield is not being maintained, and that stopping the extraction cycle should require the operator to enter the restoration phase. Commenters acknowledged that ISR facilities can experience extended periods of standby and noted that active pumping during these periods is necessary to prevent contamination of groundwater in areas outside the production zone. One commenter recommended the EPA minimize the amount of time during which an ISR facility in standby is not pumping. Other commenters thought ISR facilities entering standby should be required to initiate restoration and recommended that the EPA require ISR facilities to commence restoration within a specified time period after ceasing active uranium recovery.

The EPA agrees with the commenters who said ISR facilities must be responsible for ensuring that lixiviant and constituents do not migrate outside of the production zone during standby periods. The EPA disagrees with the commenter who suggested ISR facilities that temporarily cease operations should be required to commence restoration. The EPA agrees, however, that during standby periods the migration of constituents mobilized by the prior injection of lixiviant may continue even if the decision is made to stop extracting uranium. Excursions beyond the production zone are more likely to occur if the hydraulic gradient within the wellfield is not maintained. For this reason, the EPA considers standby to be part of the operational phase, and facilities should not cease pumping during standby periods since it is important that an inward hydraulic gradient is maintained during these periods. For this reason, the EPA is proposing that all requirements applicable to the operational phase remain in effect during these standby periods. Provided the licensee complies with the operational phase monitoring and corrective action requirements in the proposed rule, ISR facilities in standby would not need to enter restoration because groundwater in areas surrounding the production zone will be afforded the same level of

protection as required during restoration. In this proposal, the EPA has revised the definition of “operational phase” in original proposal to clarify that standby mode is considered part of the operational phase and that ISR facilities in standby must maintain appropriate groundwater controls to prevent constituents from leaving the production zone.

2. Changes to the Definition of “Point(s) of Compliance”

As stated in the original proposal, during the restoration phase, the definition of “point(s) of compliance” may include “monitoring, injection, and extraction wells in the production zone” (see 80 FR 4184). Points of compliance during the initial stability and long-term stability phases should include locations within the former production zone, including existing monitoring, injection and extraction wells. To clarify these requirements, in this proposal, the EPA revised the definition of “point(s) of compliance” to indicate that excursion monitoring wells are considered points of compliance during all phases of ISR operation and that during the initial and long-term stability monitoring phases, points of compliance should also include locations, identified by the regulatory agency, where a potential receptor can come into contact with contaminated groundwater. The EPA is specifically requesting comment on the definition of “point(s) of compliance” and how it is applied. Again, the EPA is requesting comment on the definition of point of exposure and conceptual framework for establishing ACLs.

IV. Responses to Other Significant Comments That Did Not Result in Changes to the Original Proposal

The EPA carefully reviewed and considered comments from a wide range of different groups in preparing this proposal. As discussed in section III of this preamble, the EPA modified and clarified various aspects of the proposed rule based on the information and views provided, including comments on the original proposal. However, not all comments resulted in modifications to the proposed rule. Those significant comments that did not result in changes, together with the EPA’s responses, are summarized in this section of the preamble.

A. Authority To Set Generally Applicable Standards

Some commenters thought the proposed rules were legally invalid and felt the EPA was overreaching its authority under UMTRCA by proposing

standards that are too detailed and prescriptive. The commenters argued the EPA was redefining what UMTRCA established as the EPA’s role to set general standards while making the NRC responsible for implementing those standards through its licensing process. These commenters believe that UMTRCA limits the EPA’s authority to setting general standards that do not include any prescriptive implementation requirements. Some of these commenters cited a statement from the legislative history of UMTRCA in which a House Committee advised that “[t]he EPA standards and criteria should not interject any detailed or site-specific requirements for management, technology, or engineering methods on licensees or the Department of Energy.”

However, other commenters thought the proposal was an appropriate exercise of the EPA’s authority under the UMTRCA because the proposed rule would not supplant the NRC’s jurisdiction or impede its licensing authority. They cited the statutory provisions that assign the authority to set standards to the EPA and the authority to implement and enforce the standards to the NRC (See 42 U.S.C. 2022(b), (d)). The commenters thought the proposed standards were an appropriate application of the EPA’s authority under the UMTRCA and felt that the EPA had correctly left implementation of the new standards to the NRC and Agreement States.

The Agency disagrees with those commenters who believe the EPA has redefined its role or overreached its authority in developing the new standards for ISR facilities. Section 206 of the UMTRCA clearly authorizes the EPA to promulgate standards of general application for the protection of public health, safety and the environment from radiological and non-radiological hazards associated with the processing and the possession, transfer and disposal of byproduct material at uranium ISR facilities. See 42 U.S.C. 2022(b). The Tenth Circuit Court of Appeals affirmed EPA’s authority to set such standards under UMTRCA in two companion cases challenging the original part 192 rules. See *American Mining Congress et al. v. Thomas*, 772 F.2d 617 (10th Cir. 1985) (“*AMC I*”); *American Mining Congress et al. v. Thomas*, 772 F.2d 640 (10th Cir. 1985) (“*AMC II*”). Consistent with the reasoning of these opinions, the new standards proposed in this action would apply the same requirements to all ISR facilities and would establish general requirements to (1) meet constituent concentration standards and demonstrate groundwater conditions are

stable with 95 percent confidence; (2) conduct monitoring; and (3) develop and implement a corrective action program. Within the framework of these generally applicable standards, the regulatory agency would be responsible for implementing the proposed new standards on a site-specific basis through the licensing process and would retain the authority to determine when an ISR license can be terminated. *AMC II*, 772 F.2d at 647–648 (“General application standards that allow the Nuclear Regulatory Commission (NRC) to choose the means of implementation are consistent with the authority Congress vested in the EPA.”).

The first of these three components of the proposed standards has two integral parts—numerical constituent concentration standards and groundwater stability standards. This proposal sets forth minimum requirements for the constituent concentration standards, but implementation of those standards on a site-specific basis remains the responsibility of the regulatory agency. However, a numerical concentration standard by itself is not sufficient to address “the risk to public health, safety, and the environment” that the EPA is required by statute to consider when setting general standards. 42 U.S.C. 2022(b)(1). Since ISR facilities alter the natural groundwater flow, this risk includes the risk that constituent concentrations in the groundwater will not remain the same over time if the groundwater remains unstable. Thus, to address this risk, the proposed rule contains a general requirement to demonstrate that groundwater conditions are stable after production ends at a site. For example, to satisfy the proposed initial stability standards, ISR facilities would provide three consecutive years of quarterly monitoring results demonstrating no statistically significant increasing trends exceeding the constituent concentration standards at the 95 percent confidence level. This proposed requirement to demonstrate groundwater stability is an integral part of the standard. The proposed general standard for stability is defined by a level of statistical confidence that is applicable to all sites. EPA believes this level of statistical confidence is necessary at all sites to ensure that the stability standards are sufficiently stringent to address the risk that groundwater exceeding the applicable constituent concentration standards poses to public health, safety and the environment from ISR facilities that have ceased operation. Contrary to some commenters’ remarks (see Section

IV.D below), the proposal does not include any “detailed or site-specific requirements” regarding how an ISR facility must satisfy the 95 percent confidence level. Hence, these proposed standards lack any “management, technology or engineering methods” pertaining to this confidence level. The proposed stability standards do not prescribe what specific statistical methods, sampling methods, or monitoring equipment should be used to show 95 percent confidence. Such decisions are left to the regulatory agency through its licensing of each facility. The Tenth Circuit has recognized that other provisions with these characteristics are within EPA’s standard-setting authority under UMTRCA. *AMC I*, 772 F.2d at 630 (“Furthermore, because the standards are general in nature—they apply to all sites—we do not view them as site-specific ‘management, technology or engineering methods.’”); *AMC II*, 772 F.2d at 645–646 (“Most of the arguments by the various petitioners are substantially identical to those in the consolidated *Inactive Sites Case* decided this day. On the basis of the analysis in that opinion, we again hold . . . that the EPA’s standards do not unlawfully impose management, design, and engineering requirements. . . .”).

Some commenters argued the long-term monitoring requirements in the original proposal were too prescriptive and that the EPA would be effectively dictating when a license could be terminated. As noted above, the Tenth Circuit has clearly recognized that the EPA’s standard-setting authority under UMTRCA enables the EPA to include monitoring as part of its “standards of general application.” *AMC II*, 772 F.2d at 644 (“The regulations necessitate monitoring programs.”). In affirming the monitoring provisions in the original part 192 rule (monitoring provisions that are very similar to those in this proposal), the Court in *AMC II* readily distinguished between monitoring that is properly included as part of a standard the EPA promulgates and more prescriptive monitoring requirements that should be left to the regulatory agency. *AMC II*, 772 F.2d at 647–648 (“The regulations require the industry to satisfy SWDA drinking water concentration standards at specified distances from the pile, but they do not dictate the kind of monitoring system that must be used or the method by which purity levels must be achieved. These decisions are left to the implementing agency, the NRC.”). The EPA has not included detailed

monitoring requirements in these proposed standards (e.g. what kind of monitors to use), but has instead left those details up to the review and approval of the NRC or the Agreement State.

Several comments were also critical of the EPA’s authority to require corrective action programs. While the term “standard” includes numerical limitations, such as the concentration-based limits for the listed constituents in groundwater, the EPA has long interpreted this term to also encompass the actions a source must take to reduce, remediate or otherwise avoid release of pollutants. The EPA notes that the existing rule, in subpart D, includes similar non-numerical standards to those included in this proposed rule. For example, 40 CFR 192.32(a)(2)(iii) requires affected sources to implement detection monitoring programs, while 40 CFR 192.32(a)(3)(i) requires uranium mill tailings piles or impoundments to have a permanent barrier.

In sum, the regulatory agency must determine the constituent concentration standards applicable to each site, approve the number, location, and installation of all wells used for monitoring, and determine when the initial and long-term stability standards are satisfied. See *AMC II*, 772 F.2d at 647–648 (Court affirms standards because “they do not dictate the kind of monitoring system that must be used or the method by which purity levels must be achieved. These decisions are left to the implementing agency, the NRC.”) The regulatory agency is also responsible for approving the licensee’s corrective action program and, when an excursion has occurred, determining when corrective action should begin and when it can cease. The regulatory agency may also bring enforcement actions against any non-compliant ISR facility. Thus, as required by UMTRCA, and consistent with the case law affirming the EPA’s previous part 192 rulemakings, the implementation and enforcement of the proposed new standards remain with the regulatory agency.

B. Need for New Standards for Uranium ISR Facilities

Several commenters concurred with the EPA’s assessment that new standards are necessary for ISR facilities. These commenters noted that environmental impacts from ISR are significantly different from the impacts of conventional mining and milling. Commenters supported the EPA’s conclusion that a more rigorous approach is warranted for determining background groundwater

concentrations. They considered the preoperational monitoring requirements as necessary to establish appropriate concentration-based standards for each ISR facility. They also supported the stability-phase monitoring, which they considered important for demonstrating groundwater stability after restoration and for providing assurance groundwater quality will not degrade over time and that constituent migration will not occur in the future. One commenter felt that more rigorous standards with detailed restoration and long-term stability demonstrations were necessary to bring “coherency and accountability” to ISR facilities. However, other commenters thought the rule was unnecessary and provided a variety of reasons to support their contentions. Most commenters felt the standards were not justified because the industry was already regulated, arguing that the EPA had failed to provide or quantify sufficient evidence that ISR poses a risk, or had failed to consider relevant data. A number of commenters asserted that EPA had not adequately addressed recommendations of the Agency’s SAB. Many commenters noted that ISR facilities are already regulated by the EPA, the NRC, and states, and that the success of the existing regulatory oversight over the last 40 years proved that further regulation was not needed. In support of their statements, these commenters stated that there were no documented cases of off-site contamination of drinking water supplies from ISR activities in the United States. Other commenters noted that the new standards were unnecessary because ISR facilities are located in exempted aquifers under the SDWA in 40 CFR 146.4 and cannot serve as sources of drinking water because the EPA has already determined the water is unsafe for human consumption. One commenter stated that the SDWA UIC program has requirements prohibiting injection of fluids where production fluids could migrate into non-exempt aquifers and stated that these existing requirements were sufficient to protect groundwater. Other commenters argued the regulations were unnecessary because ISR facilities already collect background water quality data, restore groundwater impacted during recovery, and monitor for stabilization after restoration under the existing regulations. Some commenters felt the migration of uranium from ISR facilities was unproven. These commenters cited papers they said showed uranium had

not migrated from ISR facilities.¹⁷ A few commenters recommended the EPA postpone promulgation of the rule until additional research could be completed and the health and environmental risks better understood.

The EPA disagrees with commenters who contend that new standards are unnecessary. First, it is in the national interest to protect groundwater resources. Water is becoming a scarce resource, particularly in the arid regions where most ISR currently operate. Groundwater in this region is not exclusively used for human consumption, and has other uses such as livestock production, crop irrigation, and wildlife support. The best way to preserve groundwater for all such uses is to prevent contamination by addressing the source of contamination. The SDWA UIC program plays an important role in protecting underground sources of drinking water. However, as discussed in section I.A. above, the scope and level of protection of the SDWA differs from the UMTRCA. The SDWA does not prevent recovery and use of the water within exempted aquifers (including where ISR operations were previously conducted) for private drinking water supply, public water supply, or other uses. UMTRCA provides authority that can be used to require restoration of the groundwater in the production zone and to protect the groundwater outside the production zone aquifer, during and after uranium recovery operations, regardless of whether the aquifer has been exempted from the protections of the SDWA.

Thus, this proposed rule under UMTRCA is needed to establish generally-applicable groundwater standards for ISR facility restoration and require more extensive monitoring, modeling and analysis to ensure that groundwater restoration will endure. ISR alters the chemical composition of groundwater and creates reasons to be concerned about risk of mobilization of constituents. The EPA notes that several NRC-regulated sites are continuing to work toward restoring groundwater with restoration and monitoring being conducted for as long as 10 years after

ceasing production.¹⁸ In addition, restoration does not always meet original background levels as evidenced by the number of restoration goals above background or Table 1 levels.¹⁹ In addition, the NRC acknowledges that efficiency could be gained by codifying its longstanding effective regulatory regime into regulations specific to ISRs. As described in the original proposal, this rulemaking was initially prompted by the NRC's conclusion that ISR-specific rules are needed to create a more workable and sustainable regulatory framework for this activity, and is not based on any specific instances of identified contamination.²⁰ The EPA considers the approach to protecting groundwater in this proposal to be reasonable and responsible. The EPA further notes that remediation of contaminated groundwater is more expensive and difficult to achieve than for surface waters because it is not easily accessible. It is more cost-effective to prevent contamination by ISR facilities than to clean it up after wide-spread contamination occurs.

Second, the information the EPA has reviewed indicates that current industry practices for restoration and monitoring of the affected aquifer may not be adequate to prevent degradation of water quality at ISR facilities or the more widespread contamination of surrounding groundwater that is suitable for human consumption. Historically, once restoration is halted, stability demonstrations at ISR facilities are typically conducted for only a short period, which may not be adequate to determine that restoration is complete and long-term stability established. Several instances are noted in section III.F.2 where facilities have monitored for lengthy periods after restoration was deemed to be complete, but have not been able to demonstrate stability for even the more limited times typically required under current practice. The initial and long-term stability monitoring and corrective action program included in the new proposed rule would provide greater confidence that both of these requirements are met before ISR facilities can be decommissioned.

Finally, the EPA considers the existing regulations at 40 CFR part 192

to be inadequate for addressing groundwater contamination from ISR facilities. Subparts A, B and C of 40 CFR part 192 apply to inactive uranium milling facilities, vicinity properties, and depository sites (*i.e.*, Title I sites). Only subpart D is applicable to active uranium processing and disposal sites; however, subpart D primarily targets conventional milling as it contains provisions for managing uranium byproduct materials during and following the processing of uranium ore and for the restoration of disposal sites. Although the standards in subpart D applied to ISR facilities, ISR was not the predominant uranium extraction method at the time the standards were promulgated. ISR differs significantly from conventional mining and milling and consequently presents different environmental concerns from those of conventional mining and milling operations. For example, ISR does not generate large volumes of solid waste materials or require permanent tailings impoundments as does conventional mining and milling. At ISR facilities, the groundwater is directly impacted by the injection of lixiviant into the aquifer, which alters the geochemistry of the ore-bearing formation and increases the concentration of radionuclides and other metals in the water. The purpose of restoration activities is to restore the groundwater to the applicable constituent concentration standards. Although subpart D addresses contamination of aquifers, it explicitly addresses only contamination resulting from releases from uranium mill tailings impoundments used to store uranium byproduct material (*e.g.*, conventional tailings impoundments, evaporation or holding ponds). Under subpart F, the operator would be required to restore the groundwater in the production zone aquifer and surrounding aquifers to the applicable constituent concentration standards, to the extent possible, and to show some level of stability in the production zone prior to terminating the license. Because ISR changes the geochemistry of the groundwater, more rigorous stability-based standards together with corrective action programs are necessary to ensure that the production zone is restored and that restoration will persist in the future.

Regarding comments that the EPA did not request or collect data from industry, the Agency disagrees. The EPA has appropriately considered available data to support its proposed rules and requested additional data from industry. During the SAB's public teleconferences in 2011, industry stakeholders stated that additional data

¹⁷ The commenter cited the following two papers: (1) Basu, Anirban, et al., "Isotopic and Geochemical Tracers for U(VI) Reduction and U Mobility at an In Situ Recovery U Mine", *Environmental Science Technology*, April 24, 2015, 49(10), pages 5939–5947; and (2) Reimus, Paul, "Field Evaluation of the Restorative Capacity of the Aquifer Down Gradient of a Uranium In Situ Recovery Mining Site" presented at the "2015 In situ Recovery of Uranium Research Symposium" held at the University of Wyoming, Laramie, Wyoming, April 21, 2015.

¹⁹ *Ibid.*

²⁰ NRC (2006), "Regulation of Groundwater Protection at In-Situ Leach Uranium Extraction Facilities," COMJSM-06-001, January 17, 2006; <http://www.nrc.gov/reading-rm/doc-collections/commission/comm-secy/2006/2006-0001comjasm.pdf>.

was available beyond that contained in EPA's draft report. The EPA requested this information from the National Mining Association in January 2012; however, the EPA found that the data provided by NMA had already been considered by the EPA. The EPA also provided an additional 60 days for public comment on the original proposal for industry stakeholders to provide additional data. While the data did in some cases appear to involve longer-term monitoring at some sites, the information was largely piecemeal and lacking in context. Consequently, the EPA did not find this information useful.

The EPA further believes the commenters have misinterpreted the SAB recommendation to constructing a database to support modeling and build an evidence base for EPA's rulemaking. In section 3.2, page 8, the SAB discusses the development of such a database. However, in section 3.3, the SAB goes on to recommend that "for the near term, *until the needed large evidence base is accumulated and systematized*, that the EPA [should] articulate a set of guiding principles and assumptions on which to base regulations. The proposed standards *can be based on these assumptions during the next several years*, and superseded if evidence of their unsuitability becomes available." (emphases added). The SAB clearly did not intend for EPA's rulemaking to be held in abeyance until all available data had been collected, systematized, and analyzed. Rather, the SAB viewed this as a longer-term effort in which EPA's standards could be modified should the underlying assumptions not be supported by additional data. Further, because of the limited long-term data available for sites once they have been deemed "stable," which the SAB members recognized during the July 2011 meetings, in EPA's view this necessarily involved a period during which EPA's standards would be effective and require collection of such longer-term data.

However, as mentioned earlier, given the concern about data collection and the comments concerning lack of state data, the EPA will consider additional data collection and analysis, including review of affected state regulatory programs. The Agency also takes issue with some comments characterizing the UIC program requirements. An aquifer exemption is not a judgment that the water is unsafe for human consumption. In most, if not all, cases, an ISR facility is provided with an aquifer exemption solely because of the presence of uranium that is economically producible. Further, while the UIC

program objective is to prevent endangerment of USDWs, it is the responsibility of the permittee to operate in a manner that does not allow production fluids to migrate into non-exempt aquifers. 40 CFR 144.12(a).

C. Applicability

Consistent with the original proposal, this proposed rule does not apply to licensed ISR facilities that are engaged in restoration, initial stability monitoring, or long-term stability monitoring. However, some commenters stated that the original proposed rule should not apply to existing ISR facilities that are currently operating. These commenters noted that it was not clear how an existing ISR facility would comply with the proposed rule for ISR wellfields that are already in the operational, restoration or stability monitoring phase. Commenters stated that preoperational background water quality would have already been established for operational wellfields, but the methods used to establish the background concentrations may not be consistent with the requirements in the proposed rule. They noted that it would not be possible to resample for background water quality for operating wellfields since the aquifers have already been changed by uranium recovery operations.

The EPA sees no need to omit existing ISR facilities from this rule due to preoperational considerations. The NRC already requires ISR facilities to establish background conditions prior to beginning operation under 10 CFR part 40, Appendix A, Criterion A. Under this NRC guideline, an ISR facility must implement a preoperational monitoring program that provides complete baseline data on the facility and its surrounding area. In addition to the NRC guidelines, ISR facilities conduct studies of the ore zone prior to beginning production to collect data necessary for designing the ISR facility. Although the most appropriate monitoring would consist of a statistically representative sample of wells spatially distributed throughout the wellfield, the EPA recognizes that operating facilities cannot collect unaffected background samples at ISR facilities that are already operating. However, facilities that are already operating, but have not yet entered the restoration phase, can use the background data they collected prior to operation to set their constituent concentration standards. Even with limited data, existing ISR facilities can analyze the preoperational data they collected and develop a statistically meaningful data set to use as the basis

for the constituent concentration standards and also define other aspects of the system, such as the flow regime, that are necessary to develop site models. Selecting high or the highest values of the chemical monitoring data would not be considered an appropriate basis for establishing background conditions. Further the collection of data to demonstrate stability would be essentially the same for all facilities.

D. The 95 Percent Confidence Level

The original proposed rule contained a requirement to gather monitoring data sufficient to demonstrate the stability of groundwater with 95 percent confidence. Some commenters thought the 95 percent confidence level was too restrictive. These commenters stated that the EPA did not address properly the cost, both in dollars and water resources, required to achieve a 95 percent confidence level. Some of these commenters misinterpreted the 95 percent confidence requirement as a restoration goal requiring the constituent concentrations to be reduced by 95 percent, rather than a level of confidence in the statistical tests used to assess stability. Most commenters thought the 95 percent confidence level was too high, while a few thought it was too low. A few comments addressed the general requirements to demonstrate that the hydrogeological and geochemical properties have been returned to preoperational condition and expressed concern the 95 percent confidence level would be required for the statistical tests. Many of these comments indicated a concern with the high variability of these properties at ISR facilities. Concerns were raised that many of the ionic species are reported in the parts per billion and parts per million concentrations and duplication of analysis on the same sample can vary a few parts per million when samples are rerun.

Some commenters thought that the original proposed rule was not sufficiently prescriptive. Several commenters expressed concern with the statistical tests recommended for detecting trends and for the comparison with baseline values. These commenters noted that important details required to implement the statistical tests are not provided in the proposed rule, including whether the statistical analysis is conducted for the well field as a whole, within clusters or well-by-well; what parameter should be tested; and what requirements there are for the tests, particularly for the trend test.

This proposal retains a 95 percent confidence level but makes it clear that

this is part of the generally applicable stability standard in both the initial and long-term stability phases. The 95 percent confidence level is used to define stability, and EPA considers a confidence level a measure of stringency of the standard. This is one approach for defining stability, but not necessarily the only approach. However, the EPA is concerned that a stability standard that lacks any statistical criterion would provide insufficient assurances that full restoration has been achieved and allow stringency of the standard to vary from site-to-site, thus failing to fulfill EPA's obligation to produce standards of general application. See *AMC I*, 772 F.2d at 638–639 (finding the EPA failed to specify generally applicable standards by directing the regulatory agency to determine standards that could vary on site-specific basis). The EPA requests comment on alternative approaches that would present a rigorous benchmark against which to measure and ensure stability.

The 95 percent confidence criterion would apply for all constituents. The proposed standards to demonstrate initial and long-term stability with 95 percent confidence would be applied after restoration has been completed to confirm that the restoration was successful and likely to persist. Again, the EPA requests that commenters share examples where the 95 percent confidence level cannot be used or met and the limitations of these examples and the Agency invites commenters to propose other options that would clearly represent a valid and explicit groundwater stability standard that includes a measure of stringency.

The EPA understands that NRC staff has attempted to use the 95 percent confidence level for at least one facility (see the NRC presentation in the BID) but has concerns about its use in every case. The Agency considered changing the level of confidence, however the 95 percent confidence level is the standard used under other regulatory programs, including the EPA's hazardous waste program. It is a widely accepted standard used across many industries that must monitor groundwater. Again, the EPA requests comment on the use of the 95 percent confidence level as part of the stability standard and whether there are better or more practical ways to word the standards such that they present a clear level of stringency.

The costs of conducting the statistical tests are related largely to the number of wells monitored and the duration and frequency of baseline and post-restoration monitoring. These costs are not related to the dollar and resource costs of restoration. The EPA recognizes

there is a trade-off between the cost of additional monitoring and the level of confidence achieved in the confirmatory statistical tests. Due to the high variability in hydrogeological and geochemical properties it may be necessary to do more monitoring to compensate for the higher variability.

While the proposed initial and long-term stability standards define stability as attaining 95 percent confidence, the methods to be used to demonstrate compliance would be determined by the regulatory agency. The BID²¹ provides suggested sampling plans for stability monitoring that include instructions for applying the parametric and nonparametric statistical tests to detect trends and for comparing with baseline values. Each statistical test has its own set of parameters, null and alternative hypotheses, decision rules and underlying assumptions about the data. However, it was not the intention of the EPA to provide detailed instructions for conducting the statistical tests in the rule. The licensee would be responsible for selecting the specific statistical test to be used for stability monitoring and comparisons with the baseline values. EPA expects that the regulatory agency would provide additional guidance regarding the statistical analysis required and the reasons for using the statistical test, the concepts of Type 1 and Type 2 errors, the calculations required to perform the test, and how test results are interpreted. Information about what parameter is tested, the null and alternative hypotheses, requirements for implementing the statistical tests and tables for interpreting test results is included in the BID. Decisions concerning whether the statistical analyses are conducted for the well field as a whole, within clusters, or well-by-well would remain a responsibility of the regulatory agency.

V. Summary of Environmental, Cost and Economic Impacts

A. Environmental Impacts of the Proposed Rule on Groundwater Quality

This proposed action reduces the risk of undetected contamination of groundwater resources surrounding ISR facilities both during uranium production and after production has ceased. During uranium production, the fluids injected to mobilize uranium change the chemistry of the aquifer from its original state, thereby mobilizing uranium and many other minerals and metals. Groundwater from the ISR

production zone can migrate from the production zone and contaminate nearby groundwater with arsenic, barium, cadmium, chromium, lead, mercury, selenium, silver, nitrate, molybdenum, radium and uranium and other constituents. The new standards proposed in this action would reduce the risk of groundwater degradation both during the ISR operational phase and after an ISR operator's license is terminated and the facility is closed. This would be achieved through provisions requiring characterization of groundwater prior to uranium recovery and standards set to protect groundwater from excursions during the operational phase and standards for restoration to pre-operating conditions and stability after the operational phase ends. These proposed requirements would significantly reduce the probability that groundwater down-gradient from an ISR facility will become contaminated by radiological and non-radiological constituents. Through monitoring and corrective action programs, the new proposed standards would ensure potential excursions are detected and remedied in a timely manner. The proposed initial and long-term stability standards would ensure the ISR aquifer is stable prior to closure, reducing the potential for contamination to occur after uranium recovery has ceased and the ISR facility's operating license has been terminated following closure.

B. Incremental Costs of Complying With the Proposed Rule

Using information on the uranium extraction industry, the EPA estimated incremental costs resulting from this proposal. Under this proposal, ISR facilities would be required to complete the following additional activities: (1) A comprehensive preoperational characterization of the area (including characterization of geochemical conditions); (2) monitoring for excursions during the operational and restoration phases; (3) three years of initial stability monitoring; and (4) long-term stability assessment, with a minimum of three years of additional monitoring, with the total duration of the long-term stability monitoring determined by the regulatory agency based on modeling and monitoring of geochemical conditions.

Incremental costs attributable to the proposal are costs that would be higher under the proposal than they would be if 40 CFR part 192 was not revised. If no revisions were made to 40 CFR part 192, ISR facilities would be required by the NRC or agreement states to characterize preoperational conditions,

²¹ EPA (2016), "Considerations Related to Post Closure Monitoring of Uranium In-Situ Leach/In-Situ Recovery Sites", available in in Docket ID No. EPA-HQ-OAR-2012-0788.

monitor for excursions during operational and restoration phases, and monitor after restoration to show that conditions are stable. The EPA consulted with the NRC to ensure that its characterization of compliance requirements in the absence of the rule accurately reflected current trends in the NRC's permit requirements. To estimate incremental costs of complying with the proposed rule, the EPA estimated the costs of complying with the proposal and then subtracted the costs of complying with the NRC's requirements in the absence of the rule. EPA requests comment on this approach.

Under the proposal, the EPA estimates that ISR facilities would incur higher costs, for several reasons: (1) More monitoring wells would be required under the proposal; (2) more constituents would be monitored under the proposal; and/or (3) monitoring during the preoperational and stability phases would be required to continue for a longer period of time under the proposal. In addition, because the overall duration of monitoring prior to closure and license termination would be longer under the proposal, other non-monitoring costs would be incurred for several additional years, compared to requirements in the absence of the proposal.

To estimate the incremental costs for complying with these additional proposed requirements, the EPA used ISR operations listed by the U.S. Energy Information Administration as likely affected ISR operations and a projected 2017 ISR uranium production of 3.3 million pounds. From this analysis, the EPA estimated low, average and high incremental costs of complying with the proposal; average incremental costs of complying with the proposal at approximately \$1.96 per pound of uranium and an annual cost of \$181,000 to \$6.4 million for firms owning ISR facilities, depending on the number and scale of the ISR facilities they own. Nationally, the EPA estimates the incremental total annual cost of the proposal to be approximately \$11.9 million, including incremental annualized capital costs and monitoring costs (\$4.3 million) and incremental annual non-monitoring costs (\$7.6 million). The EPA's estimated national incremental annualized costs for the original proposed rule totaled \$13.5 million for monitoring and capital costs alone. Since the original proposal, the EPA learned from discussions with the NRC that many of the monitoring requirements of the proposed rule (and also those of the proposal) would already be embodied in expected NRC

license requirements in the absence of the proposal. In addition, the EPA revised some of the rule's requirements to increase flexibility and reduce burden. For these reasons, the difference between the monitoring requirements and costs for the proposal and those for current practice (the incremental monitoring costs of the proposal) are estimated to be considerably lower than the estimates for the proposed rule. This reduction in incremental monitoring costs is largely offset by including, in response to public comment, estimated incremental non-monitoring costs). Overall, the EPA's estimate of incremental annualized costs of complying with the proposed rule is slightly lower than the costs estimated for the original proposal. For additional information regarding the methodology used to estimate the costs, see the technical document titled, "Economic Analysis: Revisions to the Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings Rule (40 CFR part 192)" available in Docket ID No. EPA-HQ-OAR-2012-0788.

C. Economic Impacts of the Proposed Rule on the Market for Uranium and the Uranium Industry

The EPA estimated the impact of the proposal on the market for uranium using a simplified model of the U.S. market for uranium in 2017, using 2015 market quantities as a proxy for market quantities in 2017. EPA requests comment on this approach. The partial equilibrium model of the U.S. uranium market estimated market impacts and revealed the following: (a) Changes in the quantity of uranium purchased by U.S. COOs of nuclear power plants; (b) changes in the sales of domestically produced uranium and imports; and (c) changes in the market price for uranium. Based on average incremental costs of complying with the proposal, the EPA found that the market quantity of uranium purchased for use in electric generation is expected to decline by less than 0.01 percent and the market price to increase by approximately 0.2 percent. Domestic ISR facilities are projected to decrease their production by approximately 6.7 percent, and imports of uranium are expected to increase by 0.4 percent. Because the cost of uranium is a very small share of the cost of electricity, the EPA estimates that the cost of generating electricity will likely increase by less than 0.1 percent due to this action. Although the national total annual cost of the proposal (approximately \$11.9 million, based on average costs) is well below the \$100 million threshold that is one of

the criteria used to identify a significant regulatory action, the industry has only a small number of companies operating a small number of ISR facilities.

The EPA used existing and planned ISR operations and the companies that own them as models for the types of facilities and companies affected by the proposal. This proposal would affect approximately 15 ISR facilities that are currently operating or may operate in the near future. The 15 ISR facilities are owned by 9 firms. This action would apply to the following ISR facilities identified by the Energy Information Administration in 2015 as either operating, permitted and licensed, developing, or partially permitted and licensed: (1) Crow Butte (Nebraska) and (2) Smith Ranch-Highland (Wyoming), both owned by Cameco Resources; (3) Alta Mesa (Texas), and (4) Nichols Ranch (Wyoming) both owned by Energy Fuels; (5) Willow Creek, (6) Jab and Antelope, and (7) Moore Ranch (Wyoming), all owned by Uranium One/Rosatom; (8) Hobson-La Palangana and (9) Goliad (Texas), both owned by Uranium Energy Corp.; (10) Lost Creek (Wyoming), owned by Ur-Energy Inc.; (11) Church Rock and (12) Crownpoint (New Mexico), both owned by Laramide; (13) Reno Creek (Wyoming), owned by Bayswater; (14) Dewey Burdock (South Dakota), owned by Azarga Uranium Corp.; and (15) Ross (Wyoming), owned by Peninsula Energy. Three other ISR projects (Kingsville Dome, Rosita, and Vasquez, owned by Uranium Resources, Inc.) are out of scope for the analysis because they are undergoing restoration or reclamation as of 2015. Using the Small Business Administration size standard for NAICS code 212291 (*i.e.*, fewer than 250 employees) all the parent company firms except Cameco Resources and Rosatom/Uranium One Americas, Inc. qualify as small businesses. Thus, the majority of the firms in NAICS 212291 are small firms.

To evaluate the magnitude of the economic impacts of the proposed revisions to 40 CFR part 192 on firms owning ISR facilities, the EPA estimated the incremental costs that would be incurred by affected facilities including both monitoring and non-monitoring costs, summed costs to the firm-level, and compared each firm's estimated costs to estimated or reported firm revenues. EPA requests comment on this approach.

Compiling these estimated costs at the parent company level and comparing them to estimated sales or reported sales for the parent company, average estimated annualized costs would range from 0.66 percent to 2.78 percent of

average company sales for the seven small businesses, and 0.2 percent and 2.6 percent for the two large businesses. Of the seven small businesses, one firm has cost-to-sales ratio below 1 percent, three firms have cost-to-sales ratios between 1 percent and 2 percent, and three have cost-to-sales ratios between 2 percent and 3 percent. The EPA's estimated costs may overstate actual annual costs, especially for ISR facilities with large acreage, because the cost estimates are scaled based on the entire wellfield acreage, while ISR facilities typically have some wellfields in the operational phase and others in various stages of development and restoration or reclamation. Average costs based on total acreage may overstate costs incurred at some times during the life of the project. Further, the EPA included costs associated with all phases of operation for all ISR facilities; this would overstate costs for all wellfields currently operating, because it includes costs for preoperational monitoring and assessment. In addition, the EPA assumed that all ISR facilities would monitor for all Table 1 constituents during all phases of monitoring; in fact, the regulatory agency may specify monitoring for only those constituents expected to be present based on preoperational monitoring, which would reduce costs. While some costs may have been over-estimated, the EPA considers that values for firm revenues may be under-estimated. For facilities for which the EPA estimated sales revenues, the EPA assumed that production equaled 25 percent of capacity (based on average levels of capacity utilization over the period 2011 to 2015, which is a period with relatively low production). The EPA multiplied these relatively low estimated production values times market price to estimate revenue. For firms for which the EPA used 2015 reported revenues, these revenues similarly represent a time period when both production and price are lower than usual. Thus, the EPA may have underestimated the revenues ISR firms may earn in the future. Because no small firms incur costs exceeding 3 percent of sales, and because the costs may be overestimated while the future revenues underestimated, the EPA concludes that the proposal will not result in a significant impact to a substantial number of small entities. In addition to the direct economic impacts on ISR producers, the proposal may have indirect impacts on businesses that supply inputs to ISR producers (supply chain impacts), businesses located in areas near ISR facilities (consumption

impacts), and local governments in those areas (revenue impacts). Some businesses and governments potentially indirectly affected by the proposal may be small entities. EPA's analysis projects that the costs of the proposal and direct impacts on ISR producers will generally be small; indirect impacts are typically smaller than direct impacts. Thus, the EPA projects that indirect impacts of the proposal would generally be small. Details of the economic analysis are presented in the technical document titled, "Economic Analysis: Revisions to the Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings Rule (40 CFR part 192)" available in the docket for this action. EPA requests comment on the economic analysis.

D. Benefits of the Proposed Rule

The EPA has conducted a qualitative assessment of the benefits of the proposal and has identified three principal benefits. First, the proposed rule would reduce the potential human health risks associated with human exposure to radionuclides, metals and other constituents in well water used for drinking and agriculture. The EPA considers water contaminated with radionuclides to be a potential pathway for exposure to radiation that can cause cancer and other health effects (*e.g.*, kidney damage). Likewise, heavy metals and other contaminants can cause cancer and/or non-cancer health effects. By reducing the potential for contaminants to migrate into aquifers adjacent to ISR facilities, the proposal would reduce the potential human exposure to radionuclides, heavy metals and other groundwater contaminants from ISR operations and thus reduces the potential human health risks from these contaminants.

Second, the proposal would protect valuable groundwater resources for future generations. Groundwater provides a valuable resource that is increasingly threatened by population growth and technological advances that have significantly increased groundwater extraction. Declining groundwater resources, especially in arid regions where ISR operations are mostly located, are a growing concern. Although the EPA is unable to quantify the value of the groundwater resources that would be protected by the proposal, groundwater resources are likely to become more valuable over time. By reducing the potential for groundwater contamination and ensuring that any migration of constituents from ISR operations is detected early, the proposal would help protect groundwater from contamination. Rapid

detection of constituent migration from an ISR operation reduces the overall amount of contamination that must be remediated; early detection can trigger corrective action before a contaminated plume migrates into overlying and underlying aquifers and in areas located down-gradient from ISR facilities, thus reducing the risk of exposure to hazardous constituents. Reducing the risk of contamination of groundwater also protects the surface water bodies to which affected aquifers discharge. By combining sufficient duration of stability monitoring with hydrogeological and geochemical modeling and other analyses to demonstrate that groundwater constituent concentration standards will continue to be met, the proposal would reduce the risk that such migration of constituents above constituent concentration standards might occur after the ISR site is decommissioned and its license terminated.

Finally, the proposed standards would reduce or avoid the costs of remediating contaminated groundwater by reducing the potential for groundwater contamination to occur and by causing any contamination that does occur to be discovered and remedied sooner than would be the case if the new standards were not issued. The costs incurred for cleaning up a plume of contamination may be significant. To illustrate the potential magnitude of the benefits associated with reduced or avoided remediation costs, the EPA compared remediation costs for a model facility under two scenarios: One without the proposed rule and one with the proposed rule. The difference in the total pump and treat remediation under the two scenarios illustrates the cost savings that could result from the rule for this hypothetical contamination episode. Using this approach, the EPA was able to illustrate the benefits of the proposed rule to be between \$23.7 million and \$608 million in avoided remediation costs over the entire remediation period for a single plume, including capital/well development costs and annual costs. The EPA was unable to estimate the potential avoided costs of remediation that would result from the proposed rule on a national scale because the EPA could not predict the number of incidents of groundwater contamination that would require remediation with and without the rule, or how long it would take for the groundwater contamination to be detected. However, the avoided remediation costs of this rule at the national level could be substantial based

on the estimated avoided remediation costs for a single model plume. The EPA requests comment on this approach. For additional information regarding the methodology used to estimate avoided costs, see section 4.2.3 in the document titled, "Economic Analysis: Revisions to the Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings Rule (40 CFR part 192)," available in Docket ID No. EPA-HQ-OAR-2012-0788.

VI. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is a significant regulatory action that was submitted to the OMB for review. This action is considered a significant regulatory action because it may "raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order." Accordingly, the EPA has described the need for the proposal, prepared an economic analysis of the potential costs and benefits associated with this action, considered non-regulatory approaches, and submitted the rule to OMB for review. The economic and benefits analysis is contained in the document "Economic Analysis: Final Revisions to the Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings Rule (40 CFR part 192)," December 2016, available in the docket for this action. Any changes made in response to OMB recommendations have been documented in the docket.

B. Paperwork Reduction Act (PRA)

This action does not impose an information collection burden under the provisions of the PRA because it does not impose any reporting requirements on affected facilities.

C. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. The small entities subject to the requirements of this action are small businesses with fewer than 250 employees that are primarily engaged in leaching or beneficiation of uranium, radium or vanadium ores as defined by NAICS code 212291. No small organizations or small governmental entities have been identified that would be impacted by this proposed rulemaking.

The Agency has determined that the seven small firms owning ISR facilities may experience an impact to average estimated annualized costs of between 0.66 percent and 2.78 percent of average company sales, with one firm expected to have a cost-to-sales ratio of below 1 percent, three firms between 1 percent and 2 percent, and three between 2 percent and 3 percent. Details of this analysis are presented in the technical document titled, "Economic Analysis: Revisions to the Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings Rule (40 CFR part 192)," December 2016, available in the docket for this action.

D. Unfunded Mandates Reform Act (UMRA)

This proposed action does not contain an unfunded mandate of \$100 million or more as described in the UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local or tribal governments or the private sector. This action contains no regulatory requirements or obligations that apply to small governments.

E. Executive Order 13132: Federalism

This proposed action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This proposed action does not have tribal implications, as specified in Executive Order 13175 (65 FR 67249, November 9, 2000). The action imposes requirements on licensees of ISR facilities and not on tribal governments. Thus, Executive Order 13175 does not apply to this action.

Consistent with the EPA Policy on Consultation and Coordination with Indian Tribes, the EPA solicited and considered information submitted by tribal officials during the development of this action.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This proposed action is not subject to Executive Order 13045 because it is not an economically significant regulatory action as defined by Executive Order 12866. This action's health and risk

assessments are contained in the document titled "Ground Water Modeling Studies at In-Situ Leaching Facilities and Evaluation of Doses and Risks to Off-Site Receptors from Contaminated Ground Water" available in Docket EPA-HQ-OAR-2012-0788. The EPA evaluated several regulatory strategies for assuring groundwater restoration and stability at ISR facilities and selected the option providing greatest assurance that groundwater systems will remain in a chemically reduced state. By setting new groundwater standards, which include improved monitoring and requirements to plan for and implement corrective measures for excursions and exceedances, this proposed rule reduces children's risk of exposure to contaminated groundwater.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution or Use

This proposed action is not a "significant energy action" because it is not likely to have a significant adverse effect on the supply, distribution or use of energy. This action proposes standards applicable for uranium ISR facilities that do not directly impact energy supply, distribution or use. The proposed rule would increase the costs of domestic uranium producers relative to foreign producers; however, because domestic-source uranium generally constitutes between 10 percent and 15 percent of total uranium purchased by COOs of nuclear power plants, the EPA does not expect the proposed rule to have a significant impact on uranium quantities or prices available to nuclear power generators, and essentially no impact on the quantity or price of electricity. Thus, the EPA has concluded that this proposed action is not likely to have any adverse effects on productivity, competition, or prices in the energy sector.

I. National Technology Transfer and Advancement Act

This proposed rulemaking does not involve technical standards.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this proposed action does not have disproportionately high and adverse human health or environmental effects on minority populations, low-income populations or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994).

The documentation for this decision is contained in the document titled “Ground Water Modeling Studies at In-Situ Leaching Facilities and Evaluation of Doses and Risks to Off-Site Receptors from Contaminated Ground Water” available in Docket EPA–HQ–OAR–2012–0788. The proposed rule will reduce exposure to all populations by setting new groundwater standards, which include improved monitoring and requirements for planning for and implementing corrective measures when excursions and exceedances occur at ISR facilities. By increasing the level of environmental protection for all affected populations, including minority and low-income populations, this action will have a positive impact on human health and the environment.

List of Subjects in 40 CFR Part 192

Environmental protection, Hazardous substances, Radiation protection, Radioactive materials, Reclamation, Uranium, Waste treatment and disposal, Water resources.

Dated: January 3, 2017.

Gina McCarthy,
Administrator.

For the reasons stated in the preamble, title 40, Chapter I of the Code of Federal Regulations is proposed to be amended as set forth below:

PART 192—HEALTH AND ENVIRONMENTAL PROTECTION STANDARDS FOR URANIUM AND THORIUM MILL TAILINGS

■ 1. The authority citation for 40 CFR part 192 continues to read as follows:

Authority: Sec. 275 of the Atomic Energy Act of 1954, 42 U.S.C. 2022, as added by the Uranium Mill Tailings Radiation Control Act of 1978, Pub. L. 95–604, as amended.

Subpart C—Implementation

■ 2. Section 192.20 is amended by revising paragraph (b)(3) as follows:

§ 192.20 Guidance for implementation.

* * * * *

(b) * * *

(3) Compliance with § 192.12(b) may be demonstrated by methods that the Department of Energy has approved for use or methods that the implementing agencies determine are adequate. Residual radioactive materials should be removed from buildings exceeding 0.03 WL so that future replacement buildings will not pose a hazard [unless removal is not practical, see § 192.21(c)]. However, ventilation devices and other radon mitigation methods recommended by the EPA may provide reasonable assurance of reductions from

0.03 WL to below 0.02 WL. In unusual cases, indoor radiation may exceed the levels specified in § 192.12(b) due to sources other than residual radioactive materials. Remedial actions are not required in order to comply with the standard when there is reasonable assurance that residual radioactive materials are not the cause of such an excess.

* * * * *

Subpart D [Amended]

■ 3. The heading for Subpart D is revised to read as set forth below.

■ 4. Section 192.31 is amended by revising paragraphs (a), (f), and the second sentence of paragraph (m).

The revisions read as follows:

Subpart D—Standards for the Management of Uranium Byproduct Materials

* * * * *

§ 192.31 Definitions and cross-references.

(a) Unless otherwise indicated in this subpart, all terms shall have the same meaning as in Title II of the Uranium Mill Tailings Radiation Control Act of 1978, subparts A and B of this part, or parts 190, 260, 261, and 264 of this chapter. For the purposes of this subpart, the terms “waste,” “hazardous waste” and related terms, as used in parts 260, 261, and 264 of this chapter, shall apply to byproduct material.

* * * * *

(f) *Disposal area* means the region within the perimeter of an impoundment or pile containing uranium byproduct materials to which the post-closure requirements of § 192.32(b)(1) apply.

* * * * *

(m) * * * This term shall not be construed to include extraordinary measures or techniques that would impose costs that are grossly excessive as measured by practice within the industry or one that is reasonably analogous (such as, by way of illustration only, unreasonable overtime, staffing or transportation requirements, etc., considering normal practice in the industry; laser fusion of soils, etc.), provided there is reasonable progress toward emplacement of a permanent radon barrier. * * *

* * * * *

■ 5. Section 192.32 is amended by revising paragraph (a)(2)(v) as follows:

§ 192.32 Standards.

(a) * * *

(2) * * *

(v) The functions and responsibilities designated in part 264 of this chapter as

those of the “Regional Administrator” with respect to “facility permits” shall be carried out by the regulatory agency.

* * * * *

■ 6. Part 192 is amended by adding subpart F to read as follows:

Subpart F—Public Health, Safety and Environmental Protection Standards for Byproduct Materials Produced by Uranium In-Situ Recovery

Sec.

192.50 Purpose and applicability.

192.51 Definitions and cross-references.

192.52 Standards.

192.53 Monitoring programs, modeling and other analysis.

192.54 Alternate concentration limits.

192.55 Corrective action program.

192.56 Effective date.

Subpart F—Public Health, Safety and Environmental Protection Standards for Byproduct Materials Produced by Uranium In-Situ Recovery

§ 192.50 Purpose and applicability.

(a) This rule contains standards of general application that the regulatory agency will implement and enforce to protect groundwater at in-situ uranium recovery facilities.

(b) This subpart applies to the management of uranium byproduct materials prior to, during and following the processing of uranium ores utilizing uranium in-situ recovery methods, and to the protection of groundwater at such facilities. Within three years of the effective date of this rule, the regulatory agency shall apply these standards of general application to ISR facilities licensed to process uranium byproduct material.

§ 192.51 Definitions and cross-references.

(a) Unless otherwise indicated in this subpart, all terms shall have the same meaning as in Title II of the Uranium Mill Tailings Radiation Control Act of 1978, subparts A, B, and D of this part, or parts 190, 260, 261, and 264 of this chapter.

(b) *Agreement State*. Any State with which the Nuclear Regulatory Commission (NRC) or the Atomic Energy Commission has entered into an effective agreement under subsection 274b of the Atomic Energy Act.

(c) *Alternate Concentration Limit (ACL)*. An alternate concentration limit approved by the regulatory agency for a groundwater constituent after the regulatory agency determines that best practicable restoration activities have been completed and that concentrations of the constituent cannot be restored to the applicable standards in 40 CFR 192.52(c)(1)(i) or (c)(1)(ii), following the process prescribed in § 192.54.

(d) *Aquifer*. A geological formation, group of formations, or part of a formation that is capable of yielding a significant amount of water to a well or spring. See 40 CFR 144.3.

(e) *Background*. The condition of groundwater, including the radiological and non-radiological constituent concentrations, prior to the beginning of ISR operations.

(f) *Constituent*. A detectable component within the groundwater.

(g) *Constituent concentration standard*. A concentration limit for a constituent in groundwater set according to § 192.52(c)(1).

(h) *Exceedance of a constituent concentration standard*. An exceedance has occurred when, during stability monitoring, a constituent concentration standard is exceeded at any point of compliance well, as determined by the regulatory agency.

(i) *Excursion*. The movement of fluids containing lixiviant or uranium byproduct materials from the production zone into surrounding groundwater. An excursion is considered to have occurred when two indicator parameters (e.g., chloride, conductivity, total alkalinity) exceed their respective upper control limits in any excursion monitoring well, or, as determined by the regulatory agency, when one indicator parameter significantly exceeds its upper control limit in any excursion monitoring well.

(j) *Excursion Monitoring Wells*. Wells located around the perimeter of the production zone, including in overlying and underlying aquifers, which are used to detect any excursions from the production zone. These wells may also be used to demonstrate compliance with stability standards once restoration has been completed.

(k) *Extraction Well*. Well used to extract uranium enriched solutions from the ore-bearing aquifer; also known as a production well. Extraction and injection wells may be converted from one use to the other.

(l) *Indicator Parameter*. A constituent, such as chloride, conductivity or total alkalinity, whose upper control limit is used to identify an excursion. Indicator parameters are not necessarily contaminants, but relate to geochemical conditions in groundwater.

(m) *Initial Stability Phase*. The period immediately following the restoration phase when the wellfield is monitored to determine if and when the initial stability standards are met. This is the period in which provisional alternate concentration limits may be established and implemented, if necessary.

(n) *Injection Well*. A well into which fluids are being injected. See 40 CFR 144.3.

(o) *In-Situ Recovery (ISR)*. A method by which uranium is leached from underground ore bodies by the introduction of a solvent solution, called a lixiviant, through injection wells drilled into the ore body. The process does not require the extraction of ore from the ground. The lixiviant is injected, passes through the ore body, and mobilizes the uranium; the uranium-bearing solution is pumped to the surface via extraction wells. The pregnant leach solution is processed to extract the uranium.

(p) *Listed Constituent*. One of the twelve groundwater constituents specified in Table 1 to this subpart.

(q) *Lixiviant*. A liquid medium used to recover uranium from underground ore bodies through in-situ recovery. This liquid medium typically contains native groundwater and an added oxidant, such as oxygen or hydrogen peroxide, as well as sodium carbonate, sodium bicarbonate or carbon dioxide.

(r) *Long-Term Stability Phase*. The period after the constituent concentration standards have been met and initial stability has been demonstrated according to § 192.52(c)(2), as determined by the regulatory agency. The regulatory agency sets the extent of time the facility remains in the long-term stability phase.

(s) *Maximum Constituent Concentration*. The maximum permissible level of a constituent in groundwater, as established under § 192.52(c)(1).

(t) *Maximum Contaminant Level (MCL)*. The maximum permissible level of a contaminant in water delivered to any user of a community water system. See 40 CFR 141.2.

(u) *Monitoring Wells*. Wells used to obtain groundwater levels and water samples for the purpose of determining the hydrogeological regime and the amounts, types and distribution of constituents in the groundwater. Wells are located in the production zone, around the perimeter of the production zone and in overlying and underlying aquifers.

(v) *Operational Phase*. The time period during which uranium recovery occurs. Operation begins when extraction begins and lixiviant is injected. Operation ends when the operator permanently ceases injection of lixiviant and recovery of uranium-bearing solution for processing purposes. The operational phase includes periods during which the ISR temporarily ceases uranium recovery

(i.e., when the ISR is in “stand-by” mode) but the ISR still needs to maintain appropriate groundwater controls to prevent contaminants from leaving the production zone.

(w) *Overlying Aquifer*. An aquifer that is immediately vertically shallower than (i.e., directly above) the production zone aquifer.

(x) *Point(s) of Compliance*. Locations where groundwater protection standards are generally applied. The regulatory agency reviews and approves the location of points of compliance for the wellfield. During all phases of ISR, points of compliance should include excursion monitoring well locations; during the initial and long-term stability phases, points of compliance should also include wells in the production zone.

(y) *Point(s) of Exposure*. Used in setting ACLs, points of exposure are locations identified by the regulatory agency that represent possible future areas of exposure where the receptor can come into contact with groundwater (e.g., areas of recoverable groundwater). The groundwater at that point of exposure must be protective of the receptor.

(z) *Preoperational Monitoring*. Measurement of groundwater conditions in the production zone, up and down gradient of the production zone and in overlying and underlying aquifers, when present. Preoperational monitoring plans are subject to approval by the regulatory agency prior to the operational phase.

(aa) *Production Zone*. The portion of the aquifer in which in-situ recovery occurs. The production zone lies within the wellfield.

(bb) *Regulatory Agency*. The NRC or an Agreement State.

(cc) *Restoration (Act of)*. The process of remediating groundwater to a state where it meets the constituent concentration standards listed in 40 CFR 192.52(c)(1).

(dd) *Restoration Phase*. The period immediately after lixiviant injection permanently ceases, during which restoration activities occur.

(ee) *Underlying Aquifer*. An aquifer that is immediately vertically deeper (i.e., directly below) than the production zone aquifer.

(ff) *Upper Control Limit (UCL)*. Upper control limits are maximum concentrations for excursion indicator parameters that, when exceeded, indicate lixiviant or other constituents are migrating beyond the production zone.

(gg) *Uranium Recovery Facility*. A facility licensed to process uranium ores primarily for the purpose of recovering

uranium (and/or thorium) and to manage uranium (and/or thorium) byproduct materials that result from processing of ores. Common names for these facilities include, but are not limited to, the following: A conventional uranium mill, an in-situ recovery (or leach) facility, and a heap leach facility or pile.

(hh) *Wellfield*. The area of an ISR operation that encompasses the array of injection, extraction and monitoring wells, ancillary equipment and interconnected piping employed in the uranium in-situ recovery process. The area of the wellfield exceeds that of the production zone.

§ 192.52 Standards.

(a) No later than three years after the effective date of this rule, all operating wellfields, new wellfields and expansions of wellfields at ISR facilities must meet the standards in this section. These standards do not apply to those wellfields at licensed ISR facilities that, within three years of the effective date of this rule, are in and remain in the restoration, initial stability monitoring or long-term stability monitoring phases.

(b) *Surface impoundments*. (1) Surface impoundments associated with ISR activities shall conform to the standards of § 192.32.

(2) Disposal of solid uranium byproduct materials produced by ISR activities shall conform to the standards in § 192.32.

(c) *Groundwater protection standards*. The constituent concentration standards, in paragraph (c)(1) of this section, must be met after restoration or corrective action and are also incorporated into the initial and long-term stability standards. The initial stability standards, in paragraph (c)(2) of this section, are a measure of the effectiveness of restoration and must be met prior to meeting the long-term stability standards. The long-term stability standards, in paragraph (c)(3) of this section, must be met prior to decommissioning and termination of the ISR facility's license.

(1) *Constituent concentration standards*. The licensee shall propose and the regulatory agency shall review and approve constituent concentration standards for each of the constituents listed in Table 1 to this subpart that are identified by the licensee and approved by the regulatory agency as being

present or affected by operations in the production zone. The limit for each constituent is the highest level of the following values:

(i) That constituent's preoperational background level in and around the wellfield, as determined by preoperational monitoring conducted under § 192.53(a); or

(ii) the lowest regulatory standard for that constituent found in 40 CFR 141.61, 141.62, 141.66, 141.80, 143.3, 264.94, or Table 1 of subpart A of this part. For any constituent not listed in Table 1 to this subpart, but designated by the regulatory agency for monitoring, a constituent concentration standard at or above the background level should be established from the values in 40 CFR parts 141, 143 or 264, if such values exist. For a constituent not found in 40 CFR parts 141, 143 or 264, the constituent concentration standard above the background level should be established at a concentration level that represents a cumulative excess lifetime risk no greater than 10^{-4} to an average individual;

(iii) an alternate concentration limit for that constituent as approved by the regulatory agency under § 192.54.

TABLE 1 TO SUBPART F—MAXIMUM CONCENTRATION OF CONSTITUENTS FOR GROUNDWATER PROTECTION AT ISR FACILITY SITES

Constituent	Maximum concentration
Arsenic, Barium, Cadmium, Chromium, Lead, Mercury, Selenium, Silver, Nitrate (as N), Molybdenum, Radium-226 and radium-228 (combined), Uranium (uranium-234, uranium-235 and uranium-238 combined).	The constituent concentration standard is the primary or secondary MCL listed in 40 CFR 141.61, 141.62, 141.66, 141.80, and 143.3, the maximum concentration of hazardous constituents for groundwater protection under 40 CFR 264.94, or the maximum constituent concentration specified in Table 1 to subpart A of this part, whichever value is the lowest. Where a background concentration is determined to be higher than the lowest value in the applicable regulations, the background concentration will serve as the constituent concentration standard.

(2) *Initial Stability Standards*. The licensee must demonstrate to the satisfaction of the regulatory agency that groundwater conditions are stable by showing three consecutive years of quarterly monitoring results with no statistically significant increasing trends that would exceed the constituent concentration standards at the 95 percent confidence level. This showing shall be based on monitoring data collected in accordance with § 192.53(c).

(3) *Long-term Stability Standards*. After meeting the initial stability standards in paragraph (c)(2) of this section, the licensee must demonstrate to the satisfaction of the regulatory agency that groundwater conditions will

remain stable into the future by showing:

(i) Three consecutive years of quarterly monitoring results demonstrating no statistically significant increasing trends that would exceed the constituent concentration standards at the 95 percent confidence level. This showing shall be based on monitoring data collected in accordance with the § 192.53(d); and

(ii) the applicable constituent concentration standards will continue to be met into the future. This showing shall be based on the information collected under § 192.53(d), including monitoring data, geochemical modeling, and other analysis required by the regulatory agency.

§ 192.53 Monitoring programs, modeling and other analysis.

Licensees subject to this subpart must conduct a groundwater monitoring program, subject to review and approval by the regulatory agency, at prospective and licensed ISR wellfields. The components of the program include preoperational monitoring to determine statistically valid background levels, excursion monitoring to identify and correct excursions, and initial and long-term stability monitoring. This program shall address all phases of the uranium recovery activities and must be conducted as follows:

(a) *General monitoring program requirements and preoperational monitoring*.

(1) A sufficient number of wells, at appropriate locations and depths, shall

be installed in such a manner as to yield representative samples in order to define the groundwater flow regime and measure preoperational conditions and water quality during background determination, operations, restoration, initial stability and long-term stability.

(2) All monitoring wells must be installed and developed as directed by the regulatory agency to maintain well integrity, allow for accurate sample collection and prevent contamination of samples.

(3) The preoperational monitoring shall include the production zone and areas immediately surrounding the production zone, as identified by the regulatory agency, including up- and down-gradient areas outside of the production zone.

(4) During the preoperational monitoring effort, relevant data documenting geology, hydrology and geochemistry for radiological and non-radiological constituents shall be collected as required by the regulatory agency, both in the production zone and in surrounding areas that may be affected by the ISR operations.

(i) The monitoring effort shall be of sufficient scope and duration to adequately characterize temporal (e.g., no less than one year where seasonal variation is expected) and spatial variations in groundwater, using statistically valid approaches to evaluate groundwater quality trends and ensure adequate background characterization of the wellfield and adjacent areas. If monitoring is to be conducted for less than one year, it must be sufficient to demonstrate that the measured constituents do not reflect impacts associated with well construction.

(ii) Preoperational monitoring shall be focused on determining background concentrations of constituents and indicator parameters in the following locations:

(A) Points of compliance within the proposed production zone; and

(B) Points of compliance outside the production zone including point of compliance screened in potentially affected overlying and underlying aquifers (when present); and points of compliance screened in upgradient and downgradient aquifers (when present).

(5) The licensee shall employ appropriate statistical techniques to analyze background concentrations measured in individual wells within the wellfield and in any other wells identified by the regulatory agency for the purpose of determining constituent concentration standards. Background concentrations used to establish the constituent concentration standards may be representative of individual

wells, multiple wells, or all wells within the proposed production zone and are subject to review and approval by the regulatory agency.

(6) Radiological and non-radiological constituents to be monitored during the preoperational phase shall include:

(i) All constituents listed in Table 1 of this subpart;

(ii) Constituents and parameters as determined by the regulatory agency to be necessary to characterize the geochemistry of the groundwater and to demonstrate that the applicable constituent concentration standards have been met and will continue to be met into the future; and

(iii) Any additional constituents or parameters required by the regulatory agency, such as metals potentially mobilized by the recovery process.

(b) *Excursion Monitoring.*

(1) Indicator parameters, as established by the regulatory agency, shall be monitored in excursion monitoring wells surrounding the production zone, including aquifers above and below the production zone, at a minimum throughout the operational and restoration phases of ISR activities.

(2) If an excursion is detected as evidenced by indicator parameters exceeding established upper control limits, as determined by the regulatory agency, corrective action under § 192.55 must be initiated and constituents listed in Table 1 of this subpart expected to be present (e.g., uranium, radium, arsenic, and selenium) and any other constituent identified by the regulating agency shall be monitored until the excursion is controlled.

(c) *Initial Stability Monitoring.*

(1) Once the regulatory agency determines restoration is complete, the licensee shall begin its initial stability monitoring as described in paragraphs (c)(2), (3), and (4) of this section to meet its initial stability standards as described in § 192.52(c)(2).

(2) The constituents to be monitored at the points of compliance shall include:

(i) All constituents having a constituent concentration standard and expected to be present, as determined by the regulatory agency under § 192.52(c)(1);

(ii) Any additional constituents required by the regulatory agency, such as:

(A) Constituents and parameters necessary to characterize the geochemistry of the groundwater and other analysis to demonstrate that the applicable constituent concentration standards have been met and will continue to be met into the future;

(B) Components of the lixiviant fluids injected during uranium recovery and any fluids injected during restoration; or

(C) Metals potentially mobilized by the uranium recovery process that could reasonably be expected to be found in the groundwater.

(3) If the licensee finds that the initial stability standard in § 192.52(c)(2)

cannot be demonstrated for one or more constituents, the regulatory agency may:

(i) Require the licensee to resume active restoration efforts; or

(ii) After all best practicable active restoration activities have been completed, establish a provisional alternate concentration limit according to the requirements of § 192.54. Once initial stability according to the standard in § 192.52(c)(2) at the provisional alternate concentration limit has been documented, the regulatory agency may establish a final alternate concentration limit according to the requirements of § 192.54.

(4) If the regulatory agency determines that a constituent exceeds a constituent concentration standard in § 192.52(c)(1) at a point of compliance, the licensee, as directed by the regulatory agency, must undertake corrective action under § 192.55 until the regulatory agency determines that the exceedance of the constituent concentration standard is adequately remedied.

(d) *Long-term stability monitoring, modeling and other analysis.*

(1) Once the regulatory agency determines the initial stability standards have been met, the licensee shall begin conducting long-term stability monitoring as described in paragraph (d)(2) of this section to demonstrate it meets its long-term stability standards, established under § 192.52(c)(3).

(2) The constituents to be monitored at the points of compliance shall include:

(i) All constituents having a constituent concentration standard expected to be present, as determined by the regulatory agency under § 192.52(c)(1);

(ii) Any additional constituents required by the regulatory agency, such as:

(A) Constituents and parameters necessary to characterize the geochemistry of the groundwater and modeling and other analysis to demonstrate that the applicable constituent concentration standards have been met and will continue to be met into the future;

(B) Components of the lixiviant fluids injected during uranium recovery and any fluids injected during restoration; or

(C) Metals potentially mobilized by the uranium recovery process that could

reasonably be expected to be found in the groundwater.

(3) If the regulatory agency finds that one or more constituents at a point of compliance within the wellfield exceeds a constituent concentration standard as defined in § 192.52(c)(1) then, as directed by the regulatory agency, the licensee must undertake corrective action under § 192.55 until the regulatory agency determines that the exceedance of the constituent concentration standard(s) is adequately remedied.

(4) If the licensee finds that the long-term stability standard in § 192.52(c)(3) cannot be demonstrated for one or more constituents, the regulatory agency may:

(i) Require the licensee to resume active restoration efforts; or

(ii) After all best practicable active restoration activities have been completed, establish an alternate concentration limit according to the requirements of § 192.54.

(5) In addition to the long-term stability monitoring requirements described in paragraph (d)(2) of this section, the licensee must provide to the regulatory agency geochemical modeling and other analysis sufficient to demonstrate that the long-term stability standard in § 192.52(c)(3) has been met.

(6) The licensee must continue its long-term stability monitoring until the regulatory agency determines that the long-term stability standard in § 192.52(c)(3) has been met and releases the facility from monitoring.

§ 192.54 Alternate Concentration Limits.

(a) *Provisional Alternate Concentration Limits.* The regulatory agency may establish a provisional alternate concentration limit within the production zone for any constituent that meets the following conditions:

(1) The regulatory agency determines that all best practicable active restoration activities have been completed in accordance with the license, and that the previously approved constituent concentration standard under § 192.52(c)(1)(i) or (ii) are not reasonably achievable; and

(2) The constituent will not pose a substantial present or potential hazard to human health or the environment as long as the provisional alternate concentration limit is not exceeded; and

(3) The constituent concentration standard, as determined under paragraph (c)(1) of this section, is satisfied at all points of exposure in the wellfield and in surrounding aquifers.

(b) *Final Alternate Concentration Limits.* The regulatory agency may approve a final alternate concentration

limit provided that the following conditions are met:

(1) The licensee has demonstrated initial groundwater stability as defined in § 192.52(c)(2); and (2) The constituent will not pose a substantial present or potential future hazard to human health or the environment as long as the final alternate concentration limit is not exceeded.

(c) In deciding whether to approve a provisional or a final alternate concentration limit, the regulatory agency shall consider, at a minimum, the following factors:

(1) Potential adverse effects on groundwater quality, considering:

(i) The physical and chemical characteristics of constituents in the groundwater at the site, including their potential for migration;

(ii) The hydrogeological characteristics (e.g., groundwater velocity) of the site and surrounding land;

(iii) The quantity of groundwater and the direction of groundwater flow;

(iv) The proximity and withdrawal rates of local groundwater users;

(v) The current and anticipated future uses of groundwater in the region surrounding the site;

(vi) The existing quality of groundwater, including other sources of contamination and their cumulative impact on groundwater quality;

(vii) The potential for health risks caused by human exposure to constituents;

(viii) The potential damage to wildlife, crops, vegetation, and physical structures caused by exposure to constituents; and

(ix) The persistence and permanence of the potential adverse effects.

(2) Potential adverse effects on hydraulically-connected surface-water quality, considering:

(i) The volume and physical and chemical characteristics of the groundwater at the site;

(ii) The hydrogeological characteristics of the site and surrounding land;

(iii) The quantity and quality of groundwater, and the direction of groundwater flow;

(iv) The patterns of rainfall in the region;

(v) The proximity of the site to surface waters;

(vi) The current and future uses of surface waters in the region surrounding the site and any water quality standards established for those surface waters;

(vii) The existing quality of hydraulically-connected surface water, including other sources of contamination and their cumulative impact on surface water quality;

(viii) The potential for health risks caused by human exposure to constituents;

(ix) The potential damage to wildlife, crops, vegetation, and physical structures caused by exposure to constituents; and

(x) The persistence and permanence of the potential adverse effects.

(3) The presence of any underground source of drinking water.

§ 192.55 Corrective action program.

(a) A corrective action program shall be developed by the licensee and approved by the regulatory agency for each ISR site at the time of licensing. The plan shall address a range of possible scenarios (e.g., types and routes of potential excursions) and list options for corrective action for operational through long-term stability phases. If an excursion is detected at a licensed ISR facility at any time, a constituent concentration standard is exceeded during the initial or long-term stability phases, or the regulatory agency is concerned about an increasing trend in stability monitoring results, the applicable portions of the corrective action program shall be initiated as soon as is practicable, and in no event later than 60 days after such an occurrence. With the objective of returning constituent concentration levels in groundwater to the constituent concentration standards established under § 192.52(c)(1), the corrective action program shall address removing constituents at the point of compliance or treating them in place.

(b) The licensee shall continue corrective action measures to the extent necessary to achieve and maintain compliance with the constituent concentration standards in § 192.52(c)(1). The regulatory agency will determine when the licensee may terminate corrective action measures based on data from the groundwater monitoring program and other information that provides reasonable assurance that the constituent concentration standards in § 192.52(c)(1) will not be exceeded.

(c) Upon termination of any corrective action initiated during long-term stability monitoring, the licensee shall then be subject to the initial and long-term stability standards specified in § 192.53(c)(2) and (3).

§ 192.56 Effective date.

Subpart F shall be effective on [60 DAYS AFTER DATE OF PUBLICATION OF FINAL RULE IN **FEDERAL REGISTER**].

Environmental Protection Agency

40 CFR Part 751

Trichloroethylene (TCE); Regulation of Use in Vapor Degreasing Under
TSCA Section 6(a); Proposed Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 751

[EPA-HQ-OPPT-2016-0387; FRL-9950-08]

RIN 2070-AK11

Trichloroethylene (TCE); Regulation of Use in Vapor Degreasing Under TSCA Section 6(a)

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: Trichloroethylene (TCE) is a volatile organic compound widely used in industrial and commercial processes and has some limited uses in consumer and commercial products. EPA identified significant health risks associated with TCE use in vapor degreasing and EPA's proposed determination is that these risks are unreasonable risks. To address these unreasonable risks, EPA is proposing under section 6 of the Toxic Substances Control Act (TSCA) to prohibit the manufacture (including import), processing, and distribution in commerce of TCE for use in vapor degreasing; to prohibit commercial use of TCE in vapor degreasing; to require manufacturers, processors, and distributors, except for retailers of TCE for any use, to provide downstream notification of these prohibitions throughout the supply chain; and to require limited recordkeeping.

DATES: Comments must be received on or before March 20, 2017.

ADDRESSES: Submit your comments, identified by docket identification (ID) number EPA-HQ-OPPT-2016-0387, at <http://www.regulations.gov>. Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or withdrawn. EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.*, on the Web, cloud, or other file sharing system). For additional submission methods (*e.g.*, mail or hand delivery), the full EPA public comment policy, information about CBI or multimedia submissions,

and general guidance on making effective comments, please visit <http://www2.epa.gov/dockets/commenting-epa-dockets>.

Docket. Docket ID No. EPA-HQ-OPPT-2016-0387 contains supporting information used in developing the proposed rule, comments on the proposed rule, and additional supporting information. In addition to being available online at <http://www.regulations.gov>, the docket is available for inspection and copying between 8:30 a.m. and 4:30 p.m., Monday through Friday, excluding federal holidays, at the U.S. Environmental Protection Agency, EPA Docket Center Reading Room, WJC West Building, Room 3334, 1301 Constitution Avenue NW., Washington, DC 20004. A reasonable fee may be charged for copying.

For general information contact: The TSCA-Hotline, ABVI-Goodwill, 422 South Clinton Ave., Rochester, NY 14620; telephone number: (202) 554-1404; email address: TSCA-Hotline@epa.gov.

SUPPLEMENTARY INFORMATION:

I. Executive Summary

A. Does this action apply to me?

You may be potentially affected by this proposed action if you manufacture (defined under TSCA to include import), process, or distribute in commerce TCE or commercially use TCE in vapor degreasers. The following list of North American Industrial Classification System (NAICS) codes is not intended to be exhaustive, but rather provides a guide to help readers determine whether this document applies to them. Potentially affected entities may include:

- Petroleum Refineries (NAICS code 324110).
- Petroleum Lubricating Oil and Grease Manufacturing (NAICS code 324191).
- Petrochemical Manufacturing (NAICS code 325110).
- Industrial Gas Manufacturing (NAICS code 325120).
- Other Basic Inorganic Chemical Manufacturing (NAICS code 325180).
- All Other Basic Organic Chemical Manufacturing (NAICS code 325199).

- Plastics Material and Resin Manufacturing (NAICS code 325211).
- Synthetic Rubber Manufacturing (NAICS code 325212).
- Paint and Coating Manufacturing (NAICS code 325510).
- Adhesive Manufacturing (NAICS code 325520).
- Soap and Other Detergent Manufacturing (NAICS code 325611).
- Polish and Other Sanitation Good Manufacturing (NAICS code 325612).
- All Other Miscellaneous Chemical Product and Preparation Manufacturing (NAICS code 325998).
- Unlaminated Plastics Film and Sheet (except Packaging) Manufacturing (NAICS code 326113).
- All Other Plastics Product Manufacturing (NAICS code 326199).
- Rubber and Plastics Hoses and Belting Manufacturing (NAICS code 326220).
- All Other Rubber Product Manufacturing (NAICS code 326299).
- Cement Manufacturing (NAICS code 327310).
- Ground or Treated Mineral and Earth Manufacturing (NAICS code 327992).
- Iron and Steel Pipe and Tube Manufacturing from Purchased Steel (NAICS code 331210).
- Steel Wire Drawing (NAICS code 331222).
- Copper Rolling, Drawing, Extruding, and Alloying (NAICS code 331420).
- Nonferrous Metal (except Copper and Aluminum) Rolling, Drawing, and Extruding (NAICS code 331491).
- Nonferrous Metal Die-Casting Foundries (NAICS code 331523).
- Powder Metallurgy Part Manufacturing (NAICS code 332117).
- Metal Crown, Closure, and Other Metal Stamping (except Automotive) (NAICS code 332119).
- Saw Blade and Hand Tool Manufacturing (NAICS code 332216).
- Metal Window and Door Manufacturing (NAICS code 332321).
- Power Boiler and Heat Exchanger Manufacturing (NAICS code 332410).
- Other Fabricated Wire Product Manufacturing (NAICS code 332618).
- Machine Shops (NAICS code 332710).
- Precision Turned Product Manufacturing (NAICS code 332721).
- Bolt, Nut, Screw, Rivet, and Washer Manufacturing (NAICS code 332722).
- Metal Heat Treating (NAICS code 332811).
- Metal Coating, Engraving (except Jewelry and Silverware), and Allied Services to Manufacturers (NAICS code 332812).

- Electroplating, Plating, Polishing, Anodizing, and Coloring (NAICS code 332813).
- Oil and Gas Field Machinery and Equipment Manufacturing (NAICS code 333132).
- Cutting Tool and Machine Tool Accessory Manufacturing (NAICS code 333515).
- Small Arms, Ordnance, and Ordnance Accessories Manufacturing (NAICS code 332994).
- Fluid Power Pump and Motor Manufacturing (NAICS code 333996).
- All Other Miscellaneous Fabricated Metal Product Manufacturing (NAICS code 332999).
- Oil and Gas Field Machinery and Equipment Manufacturing (NAICS code 333132).
- Industrial and Commercial Fan and Blower and Air Purification Equipment Manufacturing (NAICS code 333413).
- Cutting Tool and Machine Tool Accessory Manufacturing (NAICS code 333515).
- Pump and Pumping Equipment Manufacturing (NAICS code 333911).
- Fluid Power Pump and Motor Manufacturing (NAICS code 333996).
- Search, Detection, Navigation, Guidance, Aeronautical, and Nautical System and Instrument Manufacturing (NAICS code 334511).
- Automatic Environmental Control Manufacturing for Residential, Commercial, and Appliance Use (NAICS code 334512).
- Motor and Generator Manufacturing (NAICS code 335312).
- Primary Battery Manufacturing (NAICS code 335912).
- Carbon and Graphite Product Manufacturing (NAICS code 335991).
- Motor Vehicle Brake System Manufacturing (NAICS code 336340).
- Aircraft Manufacturing (NAICS code 336411).
- Other Aircraft Parts and Auxiliary Equipment Manufacturing (NAICS code 336413).
- Guided Missile and Space Vehicle Manufacturing (NAICS code 336414).
- Ship Building and Repairing (NAICS code 336611).
- Dental Equipment and Supplies Manufacturing (NAICS code 339114).
- Other Chemical and Allied Products Merchant Wholesalers (NAICS code 424690).
- Petroleum Bulk Stations and Terminals (NAICS code 424710).
- Hazardous Waste Treatment and Disposal (NAICS code 562211).
- Solid Waste Combustors and Incinerators (NAICS code 562213).

This action may also affect certain entities through pre-existing import certification and export notification

rules under TSCA. Persons who import any chemical substance governed by a final TSCA section 6(a) rule are subject to the TSCA section 13 (15 U.S.C. 2612) import certification requirements and the corresponding regulations at 19 CFR 12.118 through 12.127; see also 19 CFR 127.28. Those persons must certify that the shipment of the chemical substance complies with all applicable rules and orders under TSCA. The EPA policy in support of import certification appears at 40 CFR part 707, subpart B. In addition, any persons who export or intend to export a chemical substance that is the subject of this proposed rule are subject to the export notification provisions of TSCA section 12(b) (15 U.S.C. 2611(b)), and must comply with the export notification requirements in 40 CFR part 707, subpart D.

If you have any questions regarding the applicability of this proposed action to a particular entity, consult the technical information contact listed under **FOR FURTHER INFORMATION CONTACT**.

B. What is the Agency's authority for taking this action?

Under TSCA section 6(a) (15 U.S.C. 2605(a)), if EPA determines after risk evaluation that a chemical substance presents an unreasonable risk of injury to health or the environment, without consideration of costs or other non-risk factors, including an unreasonable risk to a potentially exposed or susceptible subpopulation identified as relevant to the risk evaluation, under the conditions of use, EPA must by rule apply one or more requirements to the extent necessary so that the chemical substance or mixture no longer presents such risk.

For a chemical substance listed in the 2014 update to the TSCA Work Plan for Chemical Assessments for which a completed risk assessment was published prior to the date of enactment of the Frank R. Lautenberg Chemical Safety for the 21st Century Act, TSCA section 26(l)(4) expressly authorizes EPA to issue rules under TSCA section 6(a) that are consistent with the scope of the completed risk assessment and consistent with the other applicable requirements of TSCA section 6. TCE is such a chemical substance. It is listed in the 2014 update to the TSCA Work Plan and the completed risk assessment was published on June 25, 2014. The scope of the completed risk assessment includes vapor degreasing.

C. What action is the Agency taking?

EPA's proposed determination is that the use of TCE in vapor degreasing presents an unreasonable risk of injury

to health. Accordingly, EPA is proposing under TSCA section 6 to prohibit the manufacture (including import), processing, and distribution in commerce of TCE for use in vapor degreasing; to prohibit commercial use of TCE in vapor degreasing; and to require manufacturers, processors, and distributors, except for retailers, to provide downstream notification of this prohibition throughout the supply chain (e.g., via a Safety Data Sheet (SDS)), and to keep records. The application of this supply chain approach is necessary so that TCE no longer presents the identified unreasonable risks. EPA is requesting public comment on this proposal.

This proposal is related to the proposed rule on TCE aerosol degreasing and spot cleaning in dry cleaning facilities that published in the **Federal Register** on December 16, 2016 (81 FR 91592) (FRL-9949-86) (Ref. 1). This proposal and the earlier proposal together address risks for workers and consumers associated with exposure to TCE through inhalation that were identified in the 2014 TCE risk assessment and EPA intends to finalize both actions together.

D. Why is the Agency taking this action?

Based on EPA's analysis of worker exposures to TCE, EPA's proposed determination is that the use of TCE in vapor degreasing presents an unreasonable risk to human health. More specifically, this use results in significant non-cancer risks under both acute and chronic exposure scenarios and significant cancer risks from chronic exposures. These adverse health effects include those resulting from developmental toxicity (e.g., cardiac malformations, developmental immunotoxicity, developmental neurotoxicity, fetal death), toxicity to the kidney (kidney damage and kidney cancer), immunotoxicity (such as systemic autoimmune diseases, e.g., scleroderma, and severe hypersensitivity skin disorder), non-Hodgkin's lymphoma, reproductive and endocrine effects (e.g., decreased libido and potency), neurotoxicity (e.g., trigeminal neuralgia), and toxicity to the liver (impaired functioning and liver cancer) (Ref. 2). TCE may cause fetal cardiac malformations that begin in utero. Cardiac malformations can be irreversible and impact a person's health for a lifetime. In addition, fetal death, possibly resulting from cardiac malformation, can be caused by exposure to TCE. In utero exposure to TCE may cause other effects, such as damage to the developing immune system, which manifest later in adult

life and can have long-lasting health impacts. Certain effects that follow adult exposures, such as kidney and liver cancer, may develop many years after initial exposure.

As discussed in Unit I.C., EPA is not proposing to prohibit all manufacturing, processing, distribution in commerce, and use of TCE. As such, the application of this proposal's supply chain approach tailored to specific uses that present unreasonable risks to human health is necessary so that the chemical substance no longer presents the identified unreasonable risks.

E. What are the estimated incremental impacts of this action?

EPA has evaluated the potential costs of multiple regulatory options, including the proposed approach of prohibiting the manufacture (including import), processing, and distribution in commerce of TCE for use in vapor degreasing; prohibiting the commercial use of TCE in vapor degreasing; and requiring manufacturers, processors, and distributors, except for retailers, to provide downstream notification of these prohibitions throughout the supply chain as well as associated recordkeeping requirements. This analysis (Ref. 3), which is available in the docket, is discussed in Unit VI., and is briefly summarized here.

Alternatives to TCE with similar performance characteristics are readily available. Most of the costs of the rule would be borne by commercial users of TCE in vapor degreasing equipment, because they would have to switch solvents and likely equipment as well. EPA has estimated that the costs to users range from \$30M to \$45M when annualized over 20 years at a 3% discount rate, and from \$32M to \$46M over 20 years at a 7% discount rate. These are the total estimated costs of this proposal. The costs of the downstream notification and recordkeeping requirements to manufacturers, processors, and distributors of TCE, estimated to be approximately \$3,200 and \$4,400 annualized over 20 years using 3% and 7% discount rates respectively. For additional information see Unit 5.1.3 of the Economic Analysis. (Ref. 3) However, because these notification and recordkeeping costs were already accounted for in the economic analysis accompanying the earlier TCE proposal (Ref. 1), they are not included in the total costs for this proposal. EPA accounted for these costs in the prior proposal because it believes the universe of entities distributing TCE for both sets of uses are the same. EPA is taking comment on whether the same

firms distribute TCE for these two sets of uses.

Although TCE causes a wide range of non-cancer adverse effects and cancer, monetized benefits included only benefits associated with reducing cancer risks. The Agency does not have sufficient information to include a quantification or valuation estimate for non-cancer benefits in the overall benefits at this time. The monetized benefits for the proposed approach range from approximately \$65 to \$443 million on an annualized basis over 20 years at 3% and \$31 million to \$225 million at 7% (Ref. 3). The non-monetized benefits resulting from the prevention of the non-cancer adverse effects associated with TCE exposure from use in vapor degreasers include developmental toxicity, toxicity to the kidney, immunotoxicity, reproductive and endocrine effects, neurotoxicity, and toxicity to the liver (Ref. 2). Some of the effects that can be caused by exposure to TCE, such as cardiac malformations and fetal death, occur in utero and can impact a person for a lifetime; other effects, such as damage to the developing immune system, may first manifest when a person is an adult and can have long lasting impacts. Also see Unit VI.D.

F. Children's Environmental Health

This action is consistent with the 1995 EPA Policy on Evaluating Health Risks to Children (<http://www.epa.gov/children/epas-policy-evaluating-risk-children>). EPA has identified women of childbearing age and the developing fetus as a susceptible subpopulation relevant to its risk assessment for TCE. After evaluating the developmental toxicity literature for TCE, the Integrated Risk Information System (IRIS) TCE assessment concluded that fetal heart malformations are the most sensitive developmental toxicity endpoint associated with TCE inhalation exposure (Ref. 4). In its TSCA Chemical Work Plan Risk Assessment for TCE, EPA identified developmental toxicity as the most sensitive endpoint for TCE inhalation exposure (*i.e.*, fetal heart malformations) for the most sensitive human life stage (*i.e.*, women of childbearing age between the ages of 16 and 49 years and the developing fetus) (Ref. 2). EPA used developmental toxicity endpoints for both the acute and chronic non-cancer risk assessments based on its developmental toxicity risk assessment policy that a single exposure of a chemical within a critical window of fetal development may produce adverse developmental effects (Ref. 5). For the identified susceptible subpopulations, the

proposed regulatory action is protective of the fetal heart malformation endpoint and, for the exposed population as a whole, the proposal is also protective of cancer risk. In addition, the supporting non-cancer risk analysis of children and women of childbearing age conducted in the TSCA Chemical Work Plan Risk Assessment for TCE (Ref. 2) also meets the 1995 EPA Policy on Evaluating Health Risks to Children (Ref. 6). Supporting information on TCE exposures and the health effects of TCE exposure on children are also available in the IRIS Toxicological Review of Trichloroethylene (Ref. 4) and the TSCA Chemical Work Plan Risk Assessment on Trichloroethylene (Ref. 2), as well as Unit VI of this preamble.

II. Overview of TCE and the Use Subject to This Proposed Rule

A. What chemical is included in the proposed rule?

This proposed rule applies to TCE (Chemical Abstract Services Registry Number 79-01-6) for use in vapor degreasing.

B. What are the uses of TCE?

In 2011, global consumption of TCE was 945 million pounds and consumption in the United States was 255 million pounds. TCE is produced within and imported into the United States. Nine companies, including domestic manufacturers and importers, reported a total production and import of 225 million pounds of TCE in 2011 to EPA pursuant to the Chemical Data Reporting (CDR) rule (Ref. 2).

The majority (about 83.6%) of TCE is used as an intermediate chemical for manufacturing refrigerant HFC-134a. This use occurs in a closed system that has low potential for human exposure (Ref. 2). EPA did not assess this use and is not proposing to regulate this use of TCE under TSCA at this time. However, this does not mean that EPA found that this use or other uses not included in the TCE risk assessment present low risk. Much of the remainder, about 14.7%, is used as a solvent for degreasing of metals. A relatively small percentage, about 1.7%, accounts for all other uses, including TCE use in products, such as aerosol degreasers.

Based on the Toxics Release Inventory (TRI) data for 2012, 38 companies used TCE as a formulation component, 33 companies processed TCE by repackaging the chemical, 28 companies used TCE as a manufacturing aid, and 1,113 companies used TCE for ancillary uses, such as degreasing (Ref. 2). Based on the latest TRI data from 2014, the number of users of TCE has significantly

decreased since 2012: 24 companies use TCE as a formulation component, 20 companies process TCE by repackaging the chemical, 20 companies use TCE as a manufacturing aid, and 97 companies use TCE for ancillary uses, such as degreasing. The TRI data does not represent all of the facilities manufacturing, processing, and/or using TCE because only certain industries and types of facilities are required to report. EPA estimates that there are 2,632 to 6,232 firms using TCE for vapor degreasing in the U.S. (Ref. 3).

The use assessed by EPA that is the subject of this proposal, commercial use of TCE in vapor degreasing, is estimated to represent up to 14.7% of total use of TCE. This use is discussed in detail in Unit VI.

C. What are the potential health effects of TCE?

A broad set of relevant studies including epidemiologic studies, animal bioassays, metabolism studies, and mechanistic studies show that TCE exposure is associated with an array of adverse health effects. TCE has the potential to induce developmental toxicity, immunotoxicity, kidney toxicity, reproductive and endocrine effects, neurotoxicity, liver toxicity, and several forms of cancer (Ref. 2).

TCE is fat soluble (lipophilic) and easily crosses biological membranes. TCE has been found in human maternal and fetal blood and in the breast milk of lactating women (Ref. 2). EPA's IRIS assessment (Ref. 4) concluded that TCE poses a potential health hazard for non-cancer toxicity including fetal heart malformations and other developmental effects, immunotoxicity, kidney toxicity, reproductive and endocrine effects, neurotoxicity, and liver effects. The IRIS assessment also evaluated TCE and its metabolites. Based on the results of *in vitro* and *in vivo* tests, TCE metabolites have the potential to bind or induce damage to the structure of deoxyribonucleic acid (DNA) or chromosomes (Ref. 4).

An evaluation of the overall weight of the evidence of the human and animal developmental toxicity data suggests an association between pre- and/or post-natal TCE exposures and potential adverse developmental outcomes. TCE-induced heart malformations and immunotoxicity in animals have been identified as the most sensitive developmental toxicity endpoints for TCE. Human studies examined the possible association of TCE with various prenatal effects. These adverse effects of developmental TCE exposure may include: Death (spontaneous abortion, perinatal death, pre- or post-

implantation loss, resorptions); decreased growth (low birth weight, small for gestational age); congenital malformations, in particular heart defects; and postnatal effects such as reduced growth, decreased survival, developmental neurotoxicity, developmental immunotoxicity, and childhood cancers. Some epidemiological studies reported an increased incidence of birth defects in TCE-exposed populations from exposure to contaminated water. As for human developmental neurotoxicity, studies collectively suggest that the developing brain is susceptible to TCE toxicity. These studies have reported an association with TCE exposure and central nervous system birth defects and postnatal effects such as delayed newborn reflexes, impaired learning or memory, aggressive behavior, hearing impairment, speech impairment, encephalopathy, impaired executive and motor function and attention deficit disorder (Ref. 2).

Immune-related effects following TCE exposures have been observed in adult animal and human studies. In general, these effects were associated with enhanced immune response as opposed to immunosuppressive effects. Human studies have reported a relationship between systemic autoimmune diseases, such as scleroderma, with occupational exposure to TCE. There have also been a large number of case reports in TCE-exposed workers developing a severe hypersensitivity skin disorder, often accompanied by systemic effects to the lymph nodes and other organs, such as hepatitis (Ref. 2).

Studies in both humans and animals have shown changes in the proximal tubules of the kidney following exposure to TCE (Ref. 2). The IRIS TCE assessment concluded that TCE is carcinogenic to humans based on convincing evidence of a causal relationship between TCE exposure in humans and kidney cancer (Ref. 4). A recent review of TCE by the International Agency for Research on Cancer (IARC) also supported this conclusion (Ref. 7). The 12th report on carcinogens (RoC) by the National Toxicology Program also concluded that TCE is reasonably anticipated to be a human carcinogen 2015 (Ref. 8). These additional recent peer reviews are consistent with EPA's classification that TCE is carcinogenic to humans by all routes of exposures based upon strong epidemiological and animal evidence (Refs. 2, 4).

TCE metabolites appear to be the causative agents that induce renal toxicity, including cancer. S-dichlorovinyl-L-cysteine (DCVC), and

to a lesser extent other metabolites, appears to be responsible for kidney damage and kidney cancer following TCE exposure. Toxicokinetic data suggest that the TCE metabolites derived from glutathione conjugation (in particular DCVC) can be systemically delivered or formed in the kidney. Moreover, DCVC-treated animals showed the same type of kidney damage as those treated with TCE (Ref. 2). The toxicokinetic data and the genotoxicity of DCVC further suggest that a mutagenic mode of action is involved in TCE-induced kidney tumors, although cytotoxicity followed by compensatory cellular proliferation cannot be ruled out. As for the mutagenic mode of action, both genetic polymorphisms (Glutathione transferase (GST) pathway) and mutations to tumor suppressor genes have been hypothesized as possible mechanistic key events in the formation of kidney cancers in humans (Ref. 2).

The toxicological literature provides support for male and female reproductive effects following TCE exposure. Both the epidemiological and animal studies provide evidence of adverse effects to female reproductive outcomes. However, more extensive evidence exists in support of an association between TCE exposures and male reproductive toxicity. There is evidence that metabolism of TCE in male reproductive tract tissues is associated with adverse effects on sperm measures in both humans and animals. Furthermore, human studies support an association between TCE exposure and alterations in sperm density and quality, as well as changes in sexual drive or function and altered serum endocrine levels (Ref. 2).

Neurotoxicity has been demonstrated in animal and human studies under both acute and chronic exposure conditions. Evaluation of multiple human studies revealed TCE-induced neurotoxic effects including alterations in trigeminal nerve and vestibular function, auditory effects, changes in vision, alterations in cognitive function, changes in psychomotor effects, and neurodevelopmental outcomes. These studies in different populations have consistently reported vestibular system-related symptoms such as headaches, dizziness, and nausea following TCE exposure (Ref. 2).

Animals and humans exposed to TCE consistently experience liver toxicity. Specific effects include the following structural changes: Increased liver weight, increased DNA synthesis (transient), enlarged hepatocytes, enlarged nuclei, and peroxisome proliferation. Several human studies

reported an association between TCE exposure and significant changes in serum liver function tests used in diagnosing liver disease, or changes in plasma or serum bile acids. There was also human evidence for hepatitis accompanying immune-related generalized skin diseases, jaundice, hepatomegaly, hepatosplenomegaly, and liver failure in TCE-exposed workers (Ref. 2).

TCE is characterized as carcinogenic to humans by all routes of exposure as documented in EPA's IRIS TCE assessment (Ref. 4). This conclusion is based on strong cancer epidemiological data that reported an association between TCE exposure and the onset of various cancers, primarily in the kidney, liver, and the immune system, *i.e.*, non-Hodgkin's lymphoma (NHL). Further support for TCE's characterization as a carcinogen comes from positive results in multiple rodent cancer bioassays in rats and mice of both sexes, similar toxicokinetics between rodents and humans, mechanistic data supporting a mutagenic mode of action for kidney tumors, and the lack of mechanistic data supporting the conclusion that any of the mode(s) of action for TCE-induced rodent tumors are irrelevant to humans. Additional support comes from the 2014 evaluation of TCE's carcinogenic effects by IARC, which classifies TCE as carcinogenic to humans (Ref. 7). The 12th NTP RoC also concluded that TCE exposure is reasonably anticipated to be a human carcinogen (Ref. 8). These additional recent peer reviewed documents are consistent with EPA's classification that TCE is carcinogenic to humans by all routes of exposures based upon strong epidemiological and animal evidence (Refs. 2, 4).

D. What are the environmental impacts of TCE?

Pursuant to TSCA section 6(c), this unit describes the effects of TCE on the environment and the magnitude of the exposure of the environment to TCE. The unreasonable risk determination of this proposal is based solely on risks to human health since those risks are the most serious consequence of use of TCE and are sufficient to support this proposed action. The following is a discussion of the environmental impacts of TCE.

1. Environmental effects and impacts. TCE enters the environment as a result of emissions from metal degreasing facilities, and spills or accidental releases, and historic waste disposal activities. Because of its high vapor pressure and low affinity for organic matter in soil, TCE evaporates fairly

rapidly when released to soil; however, where it is released onto land surface or directly into the subsurface, TCE can migrate from soil to groundwater. Based on TCE's moderate persistence, low bioaccumulation, and low hazard for aquatic toxicity, the magnitude of potential environmental impacts on ecological receptors is judged to be low for the environmental releases associated with the use of TCE for vapor degreasing. This should not be misinterpreted to mean that the fate and transport properties of TCE suggest that water and soil contamination is likely low or does not pose an environmental concern. EPA is addressing TCE contamination in groundwater, drinking water, and contaminated soils at a large number of sites. While the primary concern with this contamination has been human health, there is potential for TCE exposures to ecological receptors in some cases (Ref. 2).

2. What is the global warming potential of TCE? Global warming potential (GWP) measures the potency of a greenhouse gas over a specific period of time, relative to carbon dioxide, which has a high GWP of 1 regardless of the time period used. Due to high variability in the atmospheric lifetime of greenhouse gases, the 100-year scale (GWP100) is typically used. TCE has relatively low global warming potential at a GWP100 of 140 and thus the impact is low (Ref. 2).

3. What is the ozone depletion potential of TCE? TCE is not an ozone-depleting substance and is listed as acceptable under the Significant New Alternatives Policy (SNAP) program for degreasing and aerosols. In 2007, TCE was identified as a substitute for two ozone depleting chemicals, methyl chloroform and CFC-113, for metals, electronics, and precision cleaning (72 FR 30142, May 30, 2007) (FRL-8316-8) (Ref. 9).

4. Is TCE a volatile organic compound (VOC)? TCE is a VOC as defined at 40 CFR 51.100(c). A VOC is any compound of carbon, excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate, which participates in atmospheric photochemical reactions.

5. Does TCE persist in the environment and bioaccumulate? TCE may be persistent, but it is not bioaccumulative. TCE is slowly degraded by sunlight and reactants when released to the atmosphere. Volatilization and microbial biodegradation influence the fate of TCE when released to water, sediment or soil. The biodegradation of TCE in the environment is dependent on a variety of factors and so a wide range of

degradation rates have been reported (ranging from days to years). TCE is not expected to bioconcentrate in aquatic organisms based on measured bioconcentration factors of less than 1000 (Ref. 2).

III. Regulatory Actions Pertaining to TCE

Because of its potential health effects, TCE is subject to state, federal, and international regulations restricting and regulating its use, which are summarized in this unit. None of these actions addresses the unreasonable risks under TSCA that EPA is seeking to address in this proposed rule.

A. Federal Actions Pertaining to TCE

Since 1979, EPA has issued numerous rules and notices pertaining to TCE under its various authorities.

- **Toxic Substances Control Act:** On December 16, 2016, EPA issued a proposed rule under TSCA section 6 to prohibit the manufacture (including import), processing, distribution in commerce and commercial use of TCE in aerosol degreasers and as a spot removal agent in dry cleaning facilities (Ref. 1). In addition, EPA published a final Significant New Use Rule (SNUR) that would require manufacturers (including importers) and processors of TCE to notify the Agency before starting or resuming any significant new uses of TCE in certain consumer products, including in spray fixatives used to finish arts and crafts (81 FR 20535, April 8, 2016) (Ref. 10).

- **Safe Drinking Water Act:** EPA has issued drinking water standards for TCE pursuant to section 1412 of the Safe Drinking Water Act. EPA promulgated the National Primary Drinking Water Regulation (NPDWR) for TCE in 1987 (52 FR 25690, July 8, 1987). The NPDWR established a non-enforceable maximum contaminant level (MCL) goal of zero milligrams per liter (mg/L) based on classification as a probable human carcinogen. The NPDWR also established an enforceable MCL of 0.005 mg/L. EPA is evaluating revising the TCE drinking water standard as part of a group of carcinogenic volatile organic compounds.

- **Clean Water Act:** EPA identified TCE as a toxic pollutant under section 307(a)(1) of the Clean Water Act (33 U.S.C. 1317(a)(1)) in 1979 (44 FR 44502, July 30, 1979) (FRL-1260-5). In addition, EPA developed recommended TCE ambient water quality criteria for the protection of human health pursuant to section 304(a) of the Clean Water Act.

- **Clean Air Act:** TCE is a hazardous air pollutant (HAP) under the Clean Air Act (42 U.S.C. 7412(b)(1)). EPA

promulgated National Emission Standards for Hazardous Air Pollutants (NESHAPs) for TCE for several industrial source categories, including halogenated solvent cleaning, fabric printing, coating, and dyeing, and synthetic organic chemical manufacturing. The halogenated solvent cleaning NESHAP, controls emissions of several halogenated solvents, including TCE, from halogenated solvent cleaning machines (40 CFR subpart T). The NESHAP includes multiple compliance alternatives to allow maximum compliance flexibility. In 2007, EPA promulgated the Halogenated Solvent Cleaning NESHAP RTR (Risk and Technology Review) Rule (72 FR 25138, May 3, 2007) (FRL-8303-6), in which EPA evaluated the health and environmental risks remaining after promulgation of the original NESHAP and established revised standards that further limit emissions of TCE (and other solvents) in halogenated solvent cleaning. Specifically, EPA promulgated a facility-wide emission limit of 60,000 kilograms per year (kg/year) methylene chloride equivalent, a unit which combines emissions of methylene chloride, trichloroethylene, and perchloroethylene. The facility-wide emission limit applied to all halogenated solvent cleaning machines with the exception of halogenated solvent cleaning machines used by the following industries: Facilities that manufacture narrow tubing, facilities that use continuous web cleaning machines, aerospace manufacturing and maintenance facilities, and military maintenance and depot facilities. EPA also promulgated a facility-wide emission limit of 100,000 kg/year methylene chloride equivalent for halogenated solvent cleaning machines used at military maintenance and depot facilities. TCE is also regulated under the NESHAP rule for synthetic organic chemical manufacturing. This rule consists of four subparts in 40 CFR part 63. In 2003, EPA issued a final NESHAP rule to reduce toxic air pollutant emissions from fabric and other textile coating, printing, and dyeing facilities. The final rule applied to new and existing facilities that emit 10 tons per year or more of a single toxic air pollutant listed in the Clean Air Act or 25 tons per year or more of a combination of those pollutants, including TCE. In addition, EPA has established VOC standards for consumer products under section 183(e) of the Clean Air Act.

• *Resource Conservation and Recovery Act (RCRA)*: EPA classifies certain wastes containing TCE as

hazardous waste subject to Subtitle C of RCRA pursuant to the toxicity characteristics or as a listed waste. RCRA also provides authority to require cleanup of hazardous wastes containing TCE at RCRA facilities.

• *Comprehensive Environmental Response, Compensation and Liability Act (CERCLA)*: EPA designated TCE as a hazardous substance with a reportable quantity pursuant to section 102(a) of CERCLA and EPA is actively overseeing cleanup of sites contaminated with TCE pursuant to the National Contingency Plan (NCP). While many of the statutes that EPA is charged with administering provide statutory authority to address specific sources and routes of TCE exposure, none of these can address the serious human health risks from TCE exposure that EPA is proposing to address under TSCA section 6(a) with this proposed rule.

The Occupational Safety and Health Administration (OSHA) established a permissible exposure limit (PEL) for TCE in 1971. The PEL is an 8-hour time-weighted average (TWA) TCE concentration of 100 ppm. In addition, the TCE PEL requires that exposure to TCE not exceed 200 ppm (ceiling) at any time during an eight hour work shift with the following exception: Exposures may exceed 200 ppm, but not more than 300 ppm (peak), for a single time period up to 5 minutes in any 2 hours (Ref. 11). OSHA acknowledges that many of its PELs are not sufficiently protective of worker health. OSHA has noted that “with few exceptions, OSHA’s PELs, which specify the amount of a particular chemical substance allowed in workplace air, have not been updated since they were established in 1971 under expedited procedures available in the short period after the OSH Act’s adoption . . . Yet, in many instances, scientific evidence has accumulated suggesting that the current limits are not sufficiently protective” (Ref. 12 at p. 61386), including the PEL for TCE.

To provide employers, workers, and other interested parties with a list of alternate occupational exposure limits that may serve to better protect workers, OSHA’s Web page highlights selected occupational exposure limits derived by other organizations. For example, the National Institute for Occupational Safety and Health considers TCE a potential occupational carcinogen and recommended an exposure limit of 25 ppm as a 10-hour TWA in 2003 (Ref. 13). The American Conference of Governmental Industrial Hygienists recommended an 8-hour TWA of 10 ppm and an acute, or short term, exposure limit of 25 ppm in 2004 (Ref. 14).

B. State Actions Pertaining to TCE

Many states have taken actions to reduce risks from TCE use. TCE is listed on California’s Safer Consumer Products regulations candidate list of chemicals that exhibit a hazard trait and are on an authoritative list and is also listed on California’s Proposition 65 list of chemicals known to cause cancer or birth defects or other reproductive harm. In addition, the California Code of Regulations, Title 17, Section 94509(a) lists standards for VOCs for consumer products sold, supplied, offered for sale, or manufactured for use in California (Ref. 15). As part of that regulation, use of consumer general purpose degreaser products that contain TCE are banned in California and safer substitutes are in use.

In Massachusetts, TCE is a designated high hazard substance, with an annual reporting threshold of 1,000 pounds (Ref. 16). Minnesota classifies TCE as a chemical of high concern (Ref. 17). Many other states have considered TCE for similar chemical listings (Ref. 18). Several additional states have various TCE regulations that range from reporting requirements to product contamination limits to use reduction efforts aimed at limiting or prohibiting TCE content in products.

Most states have set PELs identical to the OSHA 100 ppm 8-hour TWA PEL (Ref. 18). Nine states have PELs of 50 ppm (Ref. 18). California’s PEL of 25 ppm is the most stringent (Ref. 15). All of these PELs are significantly higher than the exposure levels at which EPA identified unreasonable risks for TCE use for vapor degreasing and would not be protective.

C. International Actions Pertaining to TCE

TCE is also regulated internationally and the international industrial and commercial sectors have moved to alternatives. TCE was added to the EU Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH) restriction of substances classified as a carcinogen category 1B under the EU Classification and Labeling regulation in 2009 (Ref. 19). The restriction prohibits the placing on the market or use of TCE as a substance, as a constituent of other substances, or in mixtures for supply to the general public when the individual concentration of TCE in the substance or mixture is equal to or greater than 0.1% by weight (Ref. 19). In 2010, TCE was added to the Candidate List of substances for inclusion in Annex XIV of REACH, or the Authorisation List. Annex XIV includes substances of very high concern that are subject to use

authorization due to their hazardous properties. TCE meets the criteria for classification as a carcinogen. In 2011, TCE was recommended for inclusion in Annex XIV of REACH due to the very high volumes allocated to uses in the scope of authorization and because at least some of the described uses appeared to result in significant exposure of workers and professionals, and could be considered widely dispersive uses.

In 2013, the Commission added TCE to Annex XIV of REACH, making it subject to authorization. As such, entities that wanted to use TCE were required to apply for authorization by October 2014, and those entities without an authorization were required to stop using TCE by April 2016. The European Chemicals Agency (ECHA) received 19 applications for authorization from entities interested in using TCE beyond April 2016. Two of those were for vapor degreasing applications (Refs. 20, 21). In each case, the opinion of the Committee for Risk Assessment was that it was not possible to determine a derived no-effect level (DNEL) for the carcinogenicity properties of the substance in accordance with REACH and that the operational conditions and risk management measures in the applications appeared not to limit the risk. Those measures included use in a specific type of closed vapor degreasing system with personal protective equipment (PPE). Final decisions have not yet been made on the applications.

Canada conducted a hazard assessment of TCE in 1993 and concluded that “trichloroethylene occurs at concentrations that may be harmful to the environment, and that may constitute a danger in Canada to human life or health. It has been concluded that trichloroethylene occurs at concentrations that do not constitute a danger to the environment on which human life depends” (Ref. 22). In 2003, Canada issued the Solvent Degreasing Regulations (SOR/2003–283) to reduce releases of TCE into the environment from solvent degreasing facilities using more than 1,000 kilograms of TCE per year (Ref. 23). In 2013, Canada added TCE to the Toxic Substances List—Schedule 1 because TCE “is entering or may enter the environment in a quantity or concentration or under conditions that: (a) Have or may have an immediate or chronic harmful effect on the environment or its biological diversity, and (c) constitute or may constitute a danger in Canada to human life or health.” (Ref. 23).

In Japan, the Chemical Substances Control Law considers TCE a Class II substance (substances that may pose a

risk of long-term toxicity to humans or to flora and fauna in the human living environment, and that have been, or in the near future are reasonably likely to be, found in considerable amounts over a substantially extensive area of the environment) (Ref. 24). Japan also controls air emissions and water discharges containing TCE, as well as aerosol products for household use and household cleaners containing TCE.

TCE is listed in the Australian National Pollutant Inventory, a program run cooperatively by the Australian, State and Territory governments to monitor common pollutants and their levels of release to the environment. Australia classifies TCE as a health, physicochemical and/or ecotoxicological hazard, according to the Australian National Occupational Health and Safety Commission (Ref. 25).

IV. TCE Risk Assessment

In 2013, EPA identified TCE use as a solvent degreaser (aerosol degreasing and vapor degreasing) and spot remover in dry cleaning operations as a priority for risk assessment under the TSCA Work Plan. This Unit describes the development of the TCE risk assessment and supporting analysis and expert input on vapor degreasing, the use that is the subject of this proposed rule. A more detailed discussion of the risks associated with TCE use in vapor degreasing can be found in Unit VI.

A. TSCA Work Plan for Chemical Assessments

In 2012, EPA released the TSCA Work Plan Chemicals: Methods Document in which EPA described the process the Agency intended to use to identify potential candidate chemicals for near-term review and assessment under TSCA (Ref. 26). EPA also released the initial list of TSCA Work Plan chemicals identified for further assessment under TSCA as part of its chemical safety program (Ref. 27).

The process for identifying these chemicals for further assessment under TSCA was based on a combination of hazard, exposure, and persistence and bioaccumulation characteristics, and is described in the TSCA Work Plan Chemicals Methods Document (Ref. 26). Using the TSCA Work Plan chemical prioritization criteria, TCE ranked high for health hazards and exposure potential and was included on the initial list of TSCA Work Plan chemicals for assessment.

B. TCE Risk Assessment

EPA finalized a TSCA Work Plan Chemical Risk Assessment for TCE (TCE risk assessment) in June 2014, following

the July 2013 peer review of the December 2012 draft TCE risk assessment. All documents from the July 2013 peer review of the draft TCE risk assessment are available in EPA Docket Number EPA–HQ–OPPT–2012–0723. TCE appears in the 2014 update of the TSCA Work Plan for Chemical Assessments and the completed risk assessment is noted therein. The TCE risk assessment evaluated commercial and consumer use of TCE as a solvent degreaser (aerosol degreasing and vapor degreasing), commercial use of TCE as a spotting agent at dry cleaning facilities, and consumer use of TCE as a spray-applied protective coating for arts and crafts (Ref. 2).

The uses selected for the TCE risk assessment were chosen because they were expected to involve frequent or routine use of TCE in high concentrations and/or have high potential for human exposure (Ref. 2). However, this does not mean that EPA found that other uses not included in the TCE risk assessment present low risk.

As described in the TCE risk assessment, solvent cleaning or degreasing is widely used to remove grease, oils, waxes, carbon deposits, fluxes, and tars from metal, glass, or plastic surfaces. With respect to vapor degreasing, there are two general types of degreasing machines: Batch and in-line. Batch cleaning machines are the most common type, while in-line cleaners are typically used in large-scale industrial operations. There are a number of variations of each general type of machine. Emissions from degreasing machines typically result from:

- Evaporation of the solvent from the interface between the solvent and the air,
- “Carry out” of excess solvent on cleaned parts, and
- Evaporative losses of the solvent during filling and draining of the degreasing machine.

In its assessment of vapor degreasing, the TCE risk assessment concentrated on open top vapor degreasing machines because they are the most prevalent, particularly for smaller operations. The risk assessment identified acute and chronic non-cancer risks for workers who conduct TCE-based solvent vapor degreasing at small degreasing facilities, as well as occupational bystanders to those activities. More specifically, the TCE risk assessment identified risks for non-cancer developmental effects resulting from acute exposure. The risk assessment also identified risks for a range of non-cancer health effects resulting from chronic exposure. Within

this range of effects, the greatest risk is for developmental effects (*i.e.*, fetal cardiac defects), although there also are risks for kidney effects and immunotoxicity. In addition, there are risks for adverse reproductive effects, neurotoxicity, and liver toxicity associated with chronic exposures (Ref. 2).

Margins of exposure (MOEs) were used in this assessment to estimate non-cancer risks for acute and chronic exposures. The MOE is the health point of departure (an approximation of the no-observed adverse effect level) for a specific endpoint divided by the exposure concentration for the specific scenario of concern. The benchmark MOE accounts for the total uncertainty factor based on the following uncertainty factors: Intraspecies, interspecies, subchronic to chronic, and lowest observed adverse effect level (LOAEL) to no-observed adverse effect level (NOAEL). Uncertainty factors are intended to account for (1) the variation in sensitivity among the members of the human population (*i.e.*, interhuman or intraspecies variability); (2) the uncertainty in extrapolating animal data to humans (*i.e.*, interspecies variability); (3) the uncertainty in extrapolating from data obtained in a study with less-than-lifetime exposure to lifetime exposure (*i.e.*, extrapolating from subchronic to chronic exposure); and (4) the uncertainty in extrapolating from a LOAEL rather than from a NOAEL (Ref. 28). MOEs provide a non-cancer risk profile by presenting a range of estimates for different non-cancer health effects for different exposure scenarios, and are a widely recognized method for evaluating a range of potential non-cancer health risks from exposure to a chemical.

The acute inhalation risk assessment used developmental toxicity data to evaluate the acute risks for the TCE use scenarios. As indicated in the TCE risk assessment, EPA's policy supports the use of developmental studies to evaluate the risks of acute exposures. This science-based policy presumes that a single exposure of a chemical at a critical window of fetal development may produce adverse developmental effects (Ref. 5). This is the case with cardiac malformation. EPA reviewed multiple studies for suitability for acute risk estimation including a number of developmental studies of TCE exposure and additional developmental studies of TCE metabolites (Appendix N) (Ref. 2). EPA based its acute risk assessment on the most sensitive health endpoint (*i.e.*, fetal heart malformations) representing the most sensitive human life stage (*i.e.*, the developing fetus) (Ref. 2). The acute

risk assessment used the physiologically-based pharmacokinetic (PBPK)-derived hazard values (HEC50, HEC95, or HEC99; HECXX is the Human Equivalent Concentration at a particular percentile) from the Johnson et al. (2003) (Ref. 29) developmental toxicity study for each vapor degreaser use scenario. Note that the differences among these hazard values is small and no greater than 3-fold (*i.e.*, 2-fold for HEC50/HEC95 ratios; 3-fold for HEC50/HEC99 ratios; 1.4-fold for HEC95/HEC99 ratios). The IRIS TCE assessment used the HEC99 for the non-cancer dose-response derivations because the HEC99 was interpreted to be protective for a sensitive individual in the population (Ref. 4). While the HEC99 was used to find the level of risk to be used in making the proposed TSCA section 6(a) determination, the small variation among HEC50, HEC95 and HEC99 would not result in a different risk determination.

For non-cancer effects, EPA estimated exposures that are significantly greater than the point of departure. The baseline cancer risk is estimated to be 3.66×10^{-1} for users of open top vapor degreasing systems.

The levels of acute and chronic exposures estimated to present low risk for non-cancer effects also result in low risk for cancer.

Given these identified risks, EPA conducted an additional analysis consistent with the scope of the TCE risk assessment to better characterize the risk to workers and occupational bystanders from the use of TCE in batch vapor degreasing machines as well as in two different types of in-line systems (conveyor and continuous web cleaning machines) (Ref. 30). This analysis also evaluated the exposure reductions that would result from switching from an open-top vapor degreasing system to a closed-loop vapor degreasing system. More information on the different types of vapor degreasing machines can be found in Unit VI.A.1. In the supplemental analysis, EPA identified short-term and long-term non-cancer and cancer risks for all types of vapor degreasing machines, although the risks for closed-loop machines are estimated to be lower than for any of the other types (Ref. 30).

C. Stakeholder Input on TCE and Vapor Degreasing

On July 29, 2014, EPA held a 2-day public workshop on TCE degreasing (Ref. 31). The purpose of the workshop was to collect information from users, academics, and other stakeholders on the use of TCE as a degreaser in various applications, *e.g.*, in degreasing metal

parts, availability and efficacy of safer alternatives, safer engineering practices and technologies to reduce exposure to TCE, and to discuss possible risk reduction approaches. The workshop included presentations by experts, breakout sessions with case studies, and public comment opportunities (Ref. 31) and informed EPA's assessment of the alternatives to TCE considered in this proposed rule. All documents from the public workshop are available in EPA Docket Number EPA-HQ-OPPT-2014-0327. Informed in part by the workshop and other analysis, including discussion with the Toxics Use Reduction Institute at the University of Massachusetts Lowell, EPA has concluded that TCE alternatives are available for all applications subject to this proposed rule as well as EPA's earlier proposal (Ref. 1). The discussions at the public workshop demonstrated that alternatives are available for the vapor degreasing uses that are being addressed in this proposed rulemaking.

On June 1, 2016, EPA convened a Small Business Advocacy Review (SBAR) Panel on TCE in vapor degreasing. The Panel solicited input from eighteen Small Entity Representatives (SERs) and made several recommendations on aspects of this rulemaking. The Panel process, including the final report of the Panel (Ref. 32), is discussed in Unit XII.

V. Regulatory Approach

A. TSCA Section 6 Unreasonable Risk Analysis

Under TSCA section 6(a), if the Administrator determines that a chemical substance presents an unreasonable risk of injury to health or the environment, without consideration of costs or other non-risk factors, including an unreasonable risk to a potentially exposed or susceptible subpopulation identified as relevant to the Agency's risk evaluation, under the conditions of use, EPA must by rule apply one or more requirements to the extent necessary so that the chemical substance no longer presents such risk.

The TSCA section 6(a) requirements can include one or more, or a combination of, the following actions:

- Prohibit or otherwise restrict the manufacturing, processing, or distribution in commerce of such substances (§ 6(a)(1)).
- Prohibit or otherwise restrict manufacturing, processing, or distribution in commerce of such substances for particular uses or for uses in excess of a specified concentration (§ 6(a)(2)).

- Require minimum warning labels and instructions (§ 6(a)(3)).
- Require record keeping or testing (§ 6(a)(4)).
- Prohibit or regulate any manner or method of commercial use (§ 6(a)(5)).
- Prohibit or otherwise regulate any manner or method of disposal (§ 6(a)(6)).
- Direct manufacturers and processors to give notice of the determination to distributors and the public and replace or repurchase substances (§ 6(a)(7)).

EPA analyzed a wide range of regulatory options under TSCA section 6(a) in order to select the proposed regulatory approach. EPA considered whether a regulatory option (or combination of options) would address the identified unreasonable risks so that the chemical substance no longer presents such risks. To do so, EPA initially analyzed whether the regulatory options could reduce risks (non-cancer and cancer) to levels below those of concern, based on EPA's technical analysis of exposure scenarios. For the non-cancer risks, EPA found an option could be protective against the risk if it could achieve the benchmark MOE for the most sensitive non-cancer endpoint. EPA's assessments for these uses indicate that when exposures meet the benchmark MOE for the most sensitive endpoint, they also result in low risk for cancer.

After the technical analysis, which represents EPA's assessment of the potential for the regulatory options to achieve risk benchmarks based on analysis of exposure scenarios, EPA then considered how reliably the regulatory options would actually reach these benchmarks. For the purposes of this proposal, EPA found that an option addressed the risk so that it was no longer unreasonable if the option could achieve the benchmark MOE or cancer benchmark for the most sensitive endpoint. In evaluating whether a regulatory option would ensure that the chemical substance no longer presents the identified unreasonable risks, the Agency considered whether the option could be realistically implemented or whether there were practical limitations on how well the option would mitigate the risks in relation to the benchmarks, as well as whether the option's protectiveness was impacted by environmental justice or children's health concerns.

B. TSCA Section 6(c)(2) Considerations

TSCA section 6(c)(2) requires EPA to consider and publish a statement based on reasonably available information with respect to the:

- Health effects of the chemical substance or mixture (in this case, TCE) and the magnitude of human exposure to TCE;
- Environmental effects of TCE and the magnitude of exposure of the environment to TCE;
- Benefits of TCE for various uses;
- Reasonably ascertainable economic consequences of the rule, including: The likely effect of the rule on the national economy, small business, technological innovation, the environment, and public health; the costs and benefits of the proposed and final rule and of the one or more primary alternatives that EPA considered; and the cost effectiveness of the proposed rule and of the one or more primary alternatives that EPA considered.

In addition, in selecting among prohibitions and other restrictions available under TSCA section 6(a), EPA must factor in, to the extent practicable, these considerations. Further, in deciding whether to prohibit or restrict in a manner that substantially prevents a specific condition of use of a chemical substance or mixture, and in setting an appropriate transition period for such action, EPA must also consider, to the extent practicable, whether technically and economically feasible alternatives that benefit health or the environment will be reasonably available as a substitute when the proposed prohibition or other restriction takes effect.

EPA's analysis of the health effects of and magnitude of exposure to TCE can be found in Units IV and VI, which discuss the TCE risk assessment and EPA's regulatory assessment of the use of TCE in vapor degreasing. A discussion of the environmental effects of TCE can be found in Unit II.D.

With respect to the costs and benefits of this proposal and the alternatives EPA considered, as well as the impacts on small businesses, the full analysis is presented in the economic analysis document (Ref. 3) To the extent information was available, EPA considered the benefits realized from risk reductions (including monetized benefits, non-monetized quantified benefits, and qualitative benefits), offsets to benefits from countervailing risks (e.g., risks from chemical substitutions and alternative practices), the relative risk for environmental justice populations and children and other potentially exposed or susceptible subpopulations (as compared to the general population), and the cost of regulatory requirements for the various options. A discussion of the benefits EPA considered can be found in Units VI.C. and VII.

EPA considered the estimated costs to regulated entities as well as the cost to administer and enforce the options. For example, an option that includes use of a respirator would include inspections to evaluate compliance with all elements of a respiratory protection program. EPA took into account reasonably available information about the functionality and performance efficacy of the regulatory options and the ability to implement the use of chemical substitutes or other alternatives (e.g., PPE). Reasonably available information included the existence of other Federal, state, or international regulatory requirements associated with each of the regulatory options as well as the commercial history for the options. A discussion of the costs EPA considered can be found in Units VI.E. and VII, along with a discussion of the cost effectiveness of the proposal and the alternatives that EPA considered. In addition, a discussion of the impacts on small businesses can be found in Unit XII.C.

With respect to the anticipated effects of this proposal on the national economy, EPA considered the number of businesses and workers that would be affected and the costs and benefits to those businesses and workers. In addition, EPA considered the employment impacts of this proposal, as discussed in the economic analysis for this proposal (Ref. 3). EPA found that the direction of change in employment is uncertain, but the expected short term and longer term employment effects are expected to be small.

The benefits of TCE in vapor degreasing are discussed in Unit VI.D., along with the availability of alternatives. The dates that the proposed restrictions would take effect are discussed in Unit X.D., as is the availability of alternatives to TCE vapor degreasing on those dates.

Finally, with respect to this proposal's effect on technological innovation, EPA expects this action to spur innovation, not hinder it. (Ref. 3) An impending ban on the use of TCE in vapor degreasing is likely to increase demand for alternatives, which would be expected to result in the development of new alternatives.

C. Regulatory Options Receiving Limited Evaluation

As discussed previously, EPA analyzed a wide range of regulatory options under TSCA section 6(a). One of the options EPA evaluated involved a TSCA section 6(a)(3) requirement for warning labels or instructions on containers of TCE or on vapor degreasing equipment. However, EPA

reasoned that warning labels and instructions alone could not mitigate the identified unreasonable risks presented by TCE to workers operating vapor degreasing equipment. In making this finding, EPA considered several factors including the fact that, in many cases, the workers being exposed are not in a position to influence their employer's decisions about the type of solvent or the type of degreasing equipment that will be used, or ensure that their employer provides appropriate PPE and an adequate respiratory protection program. EPA also considered the analysis of relevant studies that was discussed in the prior proposal on TCE (Ref. 33). This analysis found that even professional users do not consistently pay attention to labels; they often do not understand label information; and they often base a decision to follow label information on previous experience and perceptions of risk (Ref. 33).

EPA found that presenting information about TCE on a label would not adequately address the identified unreasonable risks because the nature of the information the user or owner would need to read, understand, act upon, convey, and ensure adherence to is extremely complex. It would be challenging to most users or owners to follow or convey the complex product label instructions required to explain how to reduce exposures to the extremely low levels needed to minimize the risk from TCE. Rather than a simple message, the label would need to explain a variety of inter-related factors, including but not limited to the use of local exhaust ventilation, respirators and assigned protection factor for the user and bystanders, and time periods during pregnancy with susceptibility of the developing fetus to acute developmental effects, as well as effects to bystanders. It is unlikely that label language changes for this use will result in widespread, consistent, and successful adoption of risk reduction measures by users and owners.

While labeling alone would not address the identified unreasonable risks so that TCE used in vapor degreasing no longer presents such risks, EPA recognizes that the TSCA section 6(a)(3) warnings and instruction requirement can be an important component of an approach that addresses identified unreasonable risks with a specific use prohibition. EPA has included a simple downstream notification requirement as part of this proposed rule to ensure that users would be made aware of the ban on the use of TCE in vapor degreasing.

In addition, early in the process, EPA identified two regulatory options under

TSCA section 6(a) that do not pertain to this action and were therefore not evaluated for this proposed rulemaking. First, EPA reasoned that the TSCA section 6(a)(1) regulatory option to prohibit the manufacture (including import), processing or distribution in commerce of TCE or limit the amount of TCE which may be manufactured (including imports), processed or distributed in commerce is not germane because the Agency is not proposing to ban or limit the manufacture (including import), processing or distribution in commerce of TCE for uses other than in vapor degreasing, aerosol degreasing or for spot cleaning in dry cleaning facilities at this time. In addition, EPA reasoned that the TSCA section 6(a)(6) regulatory option to prohibit or otherwise regulate any manner or method of disposal of the chemical is not applicable since EPA did not evaluate the risks associated with ongoing TCE disposal.

VI. Regulatory Assessment of TCE Use in Vapor Degreasing

This Unit describes the current use of TCE in vapor degreasing, the unreasonable risks presented by this use, and how EPA identified which regulatory options address those unreasonable risks so that TCE in vapor degreasing no longer presents such unreasonable risks.

A. Description of the Current Use

Vapor degreasing is a cleaning process that uses a solvent vapor to remove contaminants such as grease, oils, dust, and dirt from fabricated parts. Solvents such as TCE are boiled in a degreasing unit to produce a hot vapor. When parts are placed into the degreaser, the hot vapor within the unit condenses onto the parts, causing beading and dripping. The dripping action carries the contaminants away from the fabricated part, leaving behind a clean surface. After vapor degreasing, the parts are suspended on a rack in order to drain the solvent (Ref. 30). Vapor degreasing is used in a variety of occupational settings such as metal plating, electronics assembly, metal or composite part fabrication, and repair shops.

Vapor degreasing may take place in batches or as part of an in-line (*i.e.*, continuous) system. In batch machines, each load (parts or baskets of parts) is loaded into the machine after the previous load is completed. With in-line systems, parts are continuously loaded into and through the vapor degreasing equipment as well as the subsequent drying steps.

The five basic types of batch vapor degreasers are described in the following paragraphs (Ref. 30):

As the name suggests, open-top vapor degreasers are open at the top to allow introduction of the parts to be cleaned. Heating elements at the bottom of the cleaner heat the liquid solvent to above its boiling point. Solvent vapor rises in the machine to the height of chilled condensing coils on the inside walls of the cleaner. The condensing coils cool the vapor, causing it to condense and return to the bottom of the cleaner. Cleaning occurs in the vapor zone above the liquid solvent and below the condensing coils, as the hot vapor solvent condenses on the cooler work surface. The workload or a parts basket is lowered into the heated vapor zone with a mechanical hoist. While the condensing coils reduce the amount of solvent that escapes the vapor zone, they do not eliminate emissions, and throughout the degreasing process, significant vapor emissions of the solvent can occur. These vapor emissions are hazardous to workers operating the machine, as well as nearby workers. In addition, replacing solvent lost to emissions can be costly. In assessing the use of TCE in vapor degreasers, the TCE risk assessment focused on the use of open top vapor degreasing systems.

Vapor emissions of solvent can be reduced by enclosing the vapor degreasing machine. Open top vapor degreasing systems with enclosures operate in the same manner as standard open top vapor degreasing systems, except that the machine is enclosed on all sides during degreasing. The enclosure is opened and closed when adding or removing parts, and solvent is exposed to the air when the cover is open. Nearly all open top vapor degreasing systems regulated by the NESHAP have a cover because that is a more common compliance strategy than complying with the overall emission limit. A variety of additional controls may be needed to comply with the NESHAP, including two-part covers, extended freeboard (the area above the vapor zone), freeboard refrigeration devices, and holding cleaned parts in the freeboard to allow draining. Enclosed vapor degreasing systems may be vented directly to the atmosphere or first vented to an external carbon filter and then to the atmosphere.

Solvent emissions can be further reduced by using a sealed, closed-loop degreasing system. In airtight closed-loop systems, parts are placed into a basket, which is then placed into an airtight work chamber. The door is closed and solvent vapors are sprayed

onto the parts. When cleaning is complete, vapors are exhausted from the work chamber and circulated over a cooling coil to condense and recover the solvent. The parts are dried by forced hot air. Air is circulated through the chamber and residual solvent vapors are captured by carbon adsorption. The door is opened when the residual solvent vapor concentration has reached a specified level.

A refinement of the airtight closed-loop degreasing system is the airless degreasing system. An airless system removes air at some point during the degreasing process. Typically, this takes the form of drawing vacuum, but some machines purge the air with nitrogen. In airless degreasing systems with vacuum drying, a vacuum is generated, typically below 5 torr, which dries the parts. A vapor recovery system recovers the solvent.

The greatest solvent emission reductions are achieved with the airless vacuum-to-vacuum degreasing system. These systems are referred to as airless because the entire cycle is operated under vacuum. Typically, parts are placed into the chamber, the chamber sealed, and then vacuum drawn within the chamber. The parts are then sprayed with hot solvent vapor, which raises the pressure in the chamber. The parts are dried by again drawing vacuum in the chamber. Solvent vapors are recovered through compression and cooling. An air purge then removes residual vapors which can be routed to an optional carbon adsorber and then out a vent. Finally, air is introduced to return the chamber to atmospheric pressure so that the chamber can be opened. These systems have the added benefit of generating vapor at a much lower temperature than open-top degreasing systems because the boiling point of TCE is lower at the lower pressure of these systems.

In contrast to batch degreasers, in-line vapor degreasing systems use an automated parts handling system, often a conveyor, to automatically provide a continuous supply of parts to be cleaned (Ref. 30). Conveyorized vapor degreasing systems are usually fully enclosed except for the conveyor inlet and outlet portals. Conveyorized degreasers are likely used in the same applications as batch vapor degreasers, except that they would be used in larger operations, where the number of parts being cleaned is large enough to warrant the use of a conveyorized system. Conveyorized degreasers use different methods for transporting the parts through the cleaning zone. For example, monorail degreasers use a straight-line conveyor to transport parts into and out

of the cleaning zone; these systems are typically used when parts are already being transported through manufacturing areas by a conveyor. Cross-rod degreasers use two parallel chains connected by a rod to support the parts, which are typically loaded manually into perforated baskets or cylinders. Ferris wheel degreasing systems, generally the smallest of the conveyorized degreasers, rotate manually-loaded baskets or cylinders of parts vertically through the cleaning zone and back out. Belt degreasers are used for simple and rapid loading and unloading of parts; the parts are loaded onto a mesh conveyor belt that transports them through the cleaning zone and out the other side.

There are also continuous web cleaning machines (Ref. 30). These in-line degreasers differ from typical conveyorized degreasers in that they are specifically designed for cleaning parts that are coiled or on spools such as films, wires, metal strips, and metal sheets. In continuous web degreasers, parts are uncoiled and loaded onto rollers that transport the parts through the cleaning and drying zones at speeds typically greater than 11 feet per minute. The parts are then recoiled or cut after exiting the machine.

B. Analysis of Regulatory Options

In this unit, EPA explains how it evaluated whether the regulatory options considered would address the unreasonable risks presented by the current use so that TCE in vapor degreasing no longer presents such unreasonable risks. First, EPA characterizes the unreasonable risks associated with the current use of TCE in vapor degreasers. Then, the Agency describes its initial analysis of which regulatory options have the potential to reach the protective non-cancer and cancer benchmarks. The levels of acute and chronic exposures estimated to present low risk for non-cancer effects also result in low risk for cancer. Lastly, this unit evaluates how well those regulatory options would address the identified unreasonable risks in practice.

1. Risks associated with the current use. a. General impacts. The TCE risk assessment identified cancer and non-cancer risks from acute and chronic exposure for workers operating vapor degreasers and for occupational bystanders, nearby workers who have the potential to be exposed to TCE but are not directly involved with degreasing operations (Ref. 2). Because the TCE risk assessment focused on open top vapor degreasing systems, EPA performed supplemental analysis

consistent with the methodology used in the risk assessment for closed-loop, conveyorized, and continuous web degreasers and identified cancer and non-cancer risks from acute and chronic exposure for each of the scenarios (Ref. 30). EPA estimates that there are approximately 2,600 to 6,000 open top vapor degreasing systems currently using TCE, 120 closed-loop systems currently using TCE, and 150 in-line (either conveyorized or continuous web) systems currently using TCE, with an estimated 17 workers and occupational bystanders per machine (Ref. 3). This means that there are an estimated 40,800 to 102,000 persons exposed to TCE from open top vapor degreasing systems, 2,040 persons exposed to TCE from closed-loop systems, and 2,550 persons exposed to TCE from in-line systems.

b. Impacts on minority and low income populations. There is no known disproportionate representation of minority or low income populations in these occupations.

c. Impacts on children. EPA has concerns for effects on the developing fetus from acute and chronic worker and occupational bystander exposures to TCE used in vapor degreasers. The risk estimates are focused on pregnant women because one of the most sensitive health effects associated with TCE exposure from vapor degreasing is adverse effects on the developing fetus. The potential risk due to exposure during pregnancy is significant. Approximately half of all pregnancies are unintended. If a pregnancy is not planned before conception, a woman may not be in optimal health for childbearing (Ref. 34). More specifically, in this case, a woman who is not planning a pregnancy may not take steps to avoid exposure to TCE in vapor degreasing. EPA estimates that there are over 1,000 pregnant women exposed to TCE as a result of vapor degreasers.

d. Specific vapor degreaser exposure information. In the supplemental analysis (Ref. 30), EPA estimated baseline exposures for all batch vapor degreasing machines, regardless of facility size, and for in-line vapor degreasing machines (both conveyorized and continuous web). Baseline exposures for in-line machines were not specifically calculated in the TCE risk assessment. For the supplemental analysis, estimating the baseline exposures involved using a near-field/far-field modeling approach to estimate airborne concentrations of TCE and Monte Carlo simulation to establish the range and likelihood of exposures. The near-field/far-field model estimates airborne concentrations in a near field (a

zone close to the source of exposure) and a far field (a zone farther from the source of exposure but within the occupational building). Controls required by the 2007 NESHAP were accounted for in the estimations. (Ref. 30) EPA used these estimated airborne concentrations to estimate 8-hour time weighted average (TWA) exposures for workers (*i.e.*, in the near field) and occupational bystanders (*i.e.*, in the far field). Details of the modeling and estimation method for calculating exposure levels during vapor degreasing are available in the supplemental analysis document (Ref. 30). This analysis is based on the methodology used in the peer reviewed TCE risk assessment (Ref. 2). Prior to promulgation of the final rule, EPA will peer review the "supplemental Occupational Exposure and Risk Reduction Technical Report in Support of Risk Management Options for Trichloroethylene (TCE) Use in Vapor Degreasing" (Ref. 30).

The estimated 8-hour TWA exposure levels for open top vapor degreasing systems ranged from 2.74 ppm to 491.36 ppm for workers, with the 50th percentile at 55.16 ppm and the 99th percentile at 190.17 ppm. For occupational bystanders, the exposure levels ranged from 0.33 ppm to 440.61 ppm, with the 50th percentile at 20.45 ppm and the 99th percentile at 144.93 ppm. The estimated 8-hour TWA exposure levels for conveyorized degreasers were even higher, ranging from 5.14 ppm to 32,722 ppm for workers, with the 50th percentile and 99th percentile being 180.74 ppm and 1162.6 ppm, respectively. For bystanders, the levels ranged from 0.63 ppm to 29,410 ppm, with the 50th percentile and 99th percentile being 80.93 ppm and 745.11 ppm, respectively. The estimated 8-hour TWA exposure levels for continuous web degreasers were lower overall than for open top vapor degreasing systems or conveyorized degreasers. These estimates ranged from 4.18 ppm to 50.61 ppm for workers, with the 50th percentile and 99th percentile being 8.18 ppm and 22.42 ppm, respectively. For bystanders, the levels ranged from 0.52 ppm to 45.49 ppm, with the 50th percentile and 99th percentile being 3.70 ppm and 17.49 ppm, respectively.

As part of this supplemental analysis, EPA also evaluated the exposure reductions that would result from switching from an open top vapor degreasing system to a closed-loop vapor degreasing system. The data available on TCE emissions from closed-loop systems was not sufficient to enable EPA to distinguish between the

three types of closed-loop systems (airtight, airless, and airless vacuum-to-vacuum) with respect to employee exposures. As a result, for the purpose of assessing exposure, EPA assumed that all of the closed-loop systems achieve a 98% reduction in exposure compared to open top vapor degreasing systems (Ref. 30). This assumption leads to exposure estimates of 0.05 ppm to 9.8 ppm for workers.

However, the assumption of a 98% reduction in exposures compared to open top vapor degreasing systems may be an overestimate for airtight systems, and an underestimate for airless vacuum-to-vacuum systems. EPA requests information and data on TCE emissions from all vapor degreasing systems, particularly information and data that would enable EPA to better distinguish between the different types of closed-loop systems.

The SBAR Panel convened in support of this action heard from several SERs who disagreed with EPA's exposure estimates. These SERs indicated that fewer employees were involved in the degreasing operation, or that the machines were operated for fewer hours per day than EPA estimated. However, another SER stated that his degreasing machines run ten hours a day during the week and six hours on Saturdays, which exceeds EPA's estimate. In addition, most SERs thought that EPA's estimated TWAs were too high, and EPA received some monitoring data indicating lower exposures, but several SERs stated that they complied with the recommended exposure limit of the American Conference of Governmental Industrial Hygienists (ACGIH) of 10 ppm, which is within the exposure ranges estimated by EPA. However, EPA specifically requests exposure data, especially data involving employee exposure monitoring.

e. Specific risks for TCE use in vapor degreasers. Inhalation risks were estimated for all acute exposure scenarios and risks were identified for all types of machines, regardless of the type of exposure (typical vs. reasonable worst case scenario). For acute exposures associated with open top vapor degreasing systems, the MOE is 0.00006 for fetal heart malformations. This equates to exposures that are many times greater than the benchmark MOE of 10. The MOE for fetal heart malformations from acute exposures associated with conveyorized systems is 0.00001, while for continuous web systems, the MOE is 0.0005. Even for acute exposures with closed-loop systems, which we assume reduce TCE emissions as much as 98% from open top vapor degreasing systems, the MOE

for fetal heart malformations is 0.003. The MOEs for every vapor degreasing scenario are below the benchmark MOE. Based on this assessment, EPA's proposed determination is that acute TCE exposures from vapor degreasing present unreasonable risks.

Chronic exposures from TCE use in vapor degreasing also present risks. For non-cancer effects, the most sensitive of which are developmental, the benchmark MOE is also 10. For chronic exposures associated with open top vapor degreasing systems, conveyorized systems, continuous web systems, and closed-loop systems, the MOEs are 0.00008, 0.00001, 0.00007, and 0.004, respectively. With respect to cancer, the risk posed to workers ranges from 5.16×10^{-1} for open top vapor degreasing systems to 1×10^{-2} for closed-loop systems, exceeding common cancer benchmarks of 10^{-6} to 10^{-4} (Refs. 2, 30). Therefore, EPA's proposed determination is that chronic TCE exposures due to vapor degreasing also present unreasonable risks.

The SBAR Panel convened in support of this action heard from several SERs who expressed concerns about the underlying TCE risk assessment. Many of the concerns expressed by these SERs were already expressed in the public comments and the peer review comments on the risk assessment. The Summary of External Peer Review and Public Comments and Disposition document explains how EPA responded to the comments received (Ref. 35).

2. Initial analysis of potential regulatory options. Having identified unreasonable risks from the use of TCE in vapor degreasing, EPA evaluated whether regulatory options under TSCA section 6(a) could reach the risk (non-cancer and cancer) benchmarks.

EPA assessed a number of exposure scenarios associated with risk reduction options in order to find variations in TCE exposure from vapor degreasing, including: Reducing the amount of TCE in the degreasing formulation, with concentrations varying from 5% to 95% by weight in the product, engineering controls, equipment substitution, and use of PPE. EPA also assessed combinations of these options.

For the engineering controls risk reduction option exposure scenarios, EPA evaluated using local exhaust ventilation to improve ventilation near the vapor degreaser, with an assumed 90% reduction in exposure over baseline levels. The equipment substitution risk reduction option was only evaluated with respect to open top vapor degreasing systems, the evaluation assumed substitution of a closed-loop system for the open top

vapor degreasing system. EPA did not identify any equipment substitution options for either conveyorized or continuous web systems; it is likely that a closed-loop system, being a batch-process system, would not meet the specialized production requirements of facilities currently using conveyorized or continuous web systems. EPA requests comment, information, and data on potential equipment substitution options for these systems, including both emissions and cost information. The PPE risk reduction option exposure scenarios evaluated workers and occupational bystanders wearing respirators with an assigned protection factor (APF) varying from 10 to 10,000. Additionally, EPA evaluated various combinations of these options, including PPE with each of the other three options and reducing the amount of TCE in the solvent solution with each of the other three options. The way that closed-loop systems operate may render local exhaust ventilation redundant, because ventilation is being done as part of the closed system, so EPA did not evaluate local exhaust ventilation and equipment substitution together. EPA requests comment on the accuracy of EPA's assumption that these control options are mutually exclusive.

EPA has estimated that, in order to avoid cancer and non-cancer unreasonable risks, the 8-hour TWA exposure should be approximately 1 ppb (Ref. 36). However, EPA's inhalation exposure level estimates for all types of vapor degreasing machines exceed that figure by several orders of magnitude.

Of the control options evaluated by EPA in its supplemental analysis (Ref. 30), which did not include a ban on the use of TCE in vapor degreasing, the only control options that achieved the necessary exposure reductions for workers operating the degreaser involved PPE in addition to other measures. Even switching from an open top vapor degreasing system to a closed-loop system did not achieve the necessary reductions without the addition of PPE with an APF of 10,000. For that control option, equipment substitution plus PPE, EPA estimated that worker exposure levels would be 0.4 ppb. Other combinations of control options, such as reducing the amount of TCE in the solvent solution and PPE with an APF of 10,000, or reducing the amount of TCE in the solvent solution and engineering controls and PPE, achieved exposure reductions of approximately the same magnitude. However, EPA found that these combinations are unlikely to be practical for users because the exposure

reductions needed would only be achieved by a reduction in the concentration of TCE in the degreasing solution to 5%. At 5% TCE, the effectiveness of the solution would be greatly reduced. Additional exposure level estimates for various scenarios are available in the supplemental analysis document, which also documents options that did not meet the risk benchmarks and which do not, for purposes of this proposal, address the identified unreasonable risks (Ref. 30).

3. *Assessment of whether regulatory options address the identified unreasonable risks to the extent necessary so that TCE no longer presents such unreasonable risks.* After excluding the unrealistic options involving reductions in the amount of TCE in the solvent solution, only two options were left that had the potential to address the identified unreasonable risks. These options were: (a) Prohibiting under TSCA section 6(a)(2) the manufacturing (including import), processing, and distribution in commerce of TCE for use in vapor degreasing, prohibiting the commercial use of TCE in vapor degreasing under TSCA section 6(a)(5), and requiring downstream notification under TSCA section 6(a)(3) when distributing TCE; and (b) prohibiting under TSCA section 6(a)(2) the manufacturing (including import), processing, and distribution in commerce of TCE for use in vapor degreasing except in closed-loop vapor degreasing machines, prohibiting under TSCA section 6(a)(5) the commercial use of TCE in vapor degreasing except in closed-loop vapor degreasing machines, requiring downstream notification under TSCA section 6(a)(3) when distributing TCE, and requiring, under TSCA section 6(a)(5), appropriate PPE (or an exposure limit alternative) for both workers operating closed-loop vapor degreasing machines containing TCE and for occupational bystanders.

a. *Proposed approach to prohibit manufacturing (including import), processing, distribution in commerce, and use of TCE for vapor degreasing and require downstream notification.* As noted previously, the proposed regulatory approach is to prohibit the manufacturing (including import), processing, and distribution in commerce of TCE for vapor degreasing under TSCA section 6(a)(2), prohibit the commercial use of TCE in vapor degreasing under TSCA section 6(a)(5), and require manufacturers, processors, and distributors, except for retailers, to provide downstream notification, e.g., via a Safety Data Sheet (SDS), of the prohibition under TSCA section 6(a)(3).

As discussed in Unit IV, the baseline risk for exposure to workers and occupational bystanders for vapor degreasing does not achieve the non-cancer MOE benchmarks for all non-cancer effects (e.g., developmental effects, kidney toxicity, and immunotoxicity) or the common cancer benchmarks. Under this proposed approach, exposures to TCE from use in vapor degreasing would be completely eliminated. As a result, both non-cancer and cancer risks from this use of TCE would be eliminated.

The proposed approach would ensure that employees are no longer at risk from TCE exposure associated with vapor degreasing. Prohibiting the manufacturing (including import), processing and distribution in commerce of TCE for use in vapor degreasing would minimize the availability of TCE for vapor degreasing. The downstream notification of these restrictions ensures that processors, distributors, and other purchasers are aware of the manufacturing (including import), processing, distribution in commerce and use restrictions for TCE in vapor degreasing, and helps to ensure that the rule is effectively implemented by discouraging off-label use of TCE manufactured for other uses. Downstream notification is important because EPA is not proposing to prohibit manufacturing, processing and all uses of TCE, just those activities associated with vapor degreasing. This integrated supply chain approach is necessary to address the identified unreasonable risks presented by the use of TCE in vapor degreasing. In addition, the proposed approach would provide staggered compliance dates for implementing the prohibition on manufacturing (including import), processing, distribution in commerce, and commercial use in order to avoid undue impacts on the businesses involved.

b. *Variation of the proposed approach that would allow the use of TCE in closed-loop vapor degreasing systems and require under TSCA section 6(a)(5) the use of personal protective equipment in vapor degreasing operations in which TCE is used.* Another regulatory option that EPA considered was to allow the use of TCE in closed-loop vapor degreasing systems and require respiratory protection equipment for workers operating the equipment in the form of a full face piece self-contained breathing apparatus (SCBA) in pressure demand mode or other positive pressure mode with an APF of 10,000 with an alternative to the specified APF respirator of an air exposure limit. EPA's analysis found

that use of a SCBA with an APF of 10,000 for workers operating closed-loop vapor degreasing systems that contain TCE could control TCE air concentration to levels that ensure that TCE no longer presents the identified unreasonable risks. Depending on air concentrations and proximity to the vapor degreasing equipment, other employees in the area would also need to wear respiratory protection equipment.

Although respirators could reduce exposures to levels that are protective of non-cancer and cancer risks, there are many documented limitations to successful implementation of respirators with an APF of 10,000. Not all workers can wear respirators. Individuals with impaired lung function, due to asthma, emphysema, or chronic obstructive pulmonary disease, for example, may be physically unable to wear a respirator. Determination of adequate fit and annual fit testing is required for a tight fitting full-facepiece respirator to provide the required protection. Also, difficulties associated with selection, fit, and use often render them ineffective in actual application, preventing the assurance of consistent and reliable protection, regardless of the assigned capabilities of the respirator. Individuals who cannot get a good facepiece fit, including those individuals whose beards or sideburns interfere with the facepiece seal, would be unable to wear tight fitting respirators. In addition, respirators may also present communication problems and vision problems, increase worker fatigue, and reduce work efficiency (Ref. 37). According to OSHA, “improperly selected respirators may afford no protection at all (for example, use of a dust mask against airborne vapors), may be so uncomfortable as to be intolerable to the wearer, or may hinder vision, communication, hearing, or movement and thus pose a risk to the wearer’s safety or health.” (Ref. 37, at 1189–1190). Nonetheless, it is sometimes necessary to use respiratory protection to control exposure. The OSHA respiratory protection standard requires employers to establish and implement a respiratory protection program to protect their respirator-wearing employees (Ref. 38). This OSHA standard contains a number of implementation requirements, *e.g.*, for program administration; worksite-specific procedures; respirator selection; employee training; fit testing; medical evaluation; respirator use; respirator cleaning, maintenance, and repair; and other provisions that would be difficult to fully implement in some small

business settings where they are not already using respirators.

In addition, OSHA adopted a hierarchy of controls established by the industrial hygiene community used to protect employees from hazardous airborne contaminants, such as TCE (see, *e.g.*, 29 CFR 1910.134(a)(1), 29 CFR 1910.1000(e), and OSHA’s substance specific standards in 29 CFR 1910 subpart Z). According to the hierarchy, substitution of less toxic substances, engineering controls, administrative controls, and work practice controls are the preferred method of compliance for protecting employees from airborne contaminants and are to be implemented first, before respiratory protection is used. OSHA permits respirators to be used where engineering controls are not feasible or during an interim period while such controls are being implemented.

Under this approach, a company could choose to use a closed-loop system coupled with an air exposure limit. In order to reach the health benchmarks, the air exposure limit would have to be 1 ppb as an 8-hour TWA. Based on EPA’s analysis, the only way to achieve an air exposure limit of 1 ppb is with a combination of a closed-loop vapor degreaser and a respirator with an APF of 10,000. However, as previously discussed, EPA acknowledges that available data is limited, particularly with respect to the different types of closed-loop vapor degreasers. It is possible that the more sophisticated airless vacuum-to-vacuum closed-loop systems have lower emissions than EPA estimated, and, therefore, respiratory protection with an APF of 10,000 may not be necessary for operators. As part of this approach, EPA believes it would be necessary to establish employee exposure monitoring requirements to ensure that employee exposures are measured accurately and that employees are not exposed to the identified unreasonable risks associated with TCE use in vapor degreasing. EPA would require upfront monitoring representative of each exposed employee’s exposures and would model the requirements on comparable OSHA requirements as well as on the New Chemical Exposure Limit (NCEL) requirements that EPA has long used in addressing employee exposure to chemicals undergoing review under TSCA section 5 (Refs. 38–39). The requirements would specify how and when sampling must be performed and how the samples would have to be analyzed.

EPA is not proposing this option because substitutes for TCE are commercially available and

implementation of a respiratory protection program is likely to be difficult for many vapor degreasing facilities. In addition, EPA’s economic analysis indicates that this option is more expensive than switching to a different solvent or cleaning system. However, EPA requests comment, information, and data on the utility and feasibility of this option and whether, if it were adopted, it should be implemented by specifying the vapor degreasing technology and either requiring specific PPE or compliance with an air exposure limit. If EPA were to specify both the vapor degreasing technology and the required PPE with the alternative air exposure limit in the final rule, EPA would require the vapor degreasing system to be an airless vacuum-to-vacuum closed-loop system and the PPE to have an APF of 10,000 or otherwise meet the air exposure limit of 1 ppb as an 8-hour TWA. As previously discussed, EPA’s assessment of worker exposure from closed-loop systems relies on an assumption that emissions from each closed-loop system are 98% less than the emissions from an open top vapor degreasing system. EPA is requesting information on whether releases from the use of TCE in an airless vacuum-to-vacuum closed-loop system would result in air levels that are at or below the air exposure limit of 1 ppb. To the extent that EPA receives information that indicates that this is the case, EPA would consider finalizing this rule to exclude airless vacuum-to-vacuum closed-loop systems. In contrast, this assumption of a 98% reduction may be overly generous for the most basic of the closed-loop systems, and operators of such systems, even when wearing PPE with an APF of 10,000, would continue to be exposed to the identified unreasonable risks. Under the optional approach, companies choosing to keep using TCE would have to comply with all of OSHA’s requirements for respiratory protection programs, including fit-testing and medical monitoring.

C. Adverse Health Effects and Related Impacts That Would Be Prevented by the Proposed Option

The proposed option would prevent exposure to TCE from vapor degreasing and thus would prevent the risks of adverse effects and associated impacts. As discussed in Unit IV., TCE exposure is associated with a wide array of adverse health effects. These health effects include those resulting from developmental toxicity (*e.g.*, cardiac malformations, developmental immunotoxicity, developmental neurotoxicity, fetal death), toxicity to

the kidney (kidney damage and kidney cancer), immunotoxicity (systemic autoimmune diseases such as scleroderma) and severe hypersensitivity skin disorder, non-Hodgkin's lymphoma, endocrine and reproductive effects (e.g., decreased libido and potency), neurotoxicity (e.g., trigeminal neuralgia), and toxicity to the liver (impaired functioning and liver cancer) (Ref. 2). These health effects associated with exposure to TCE are serious and can have impacts throughout a lifetime. The following is a discussion of the impacts of significant acute, chronic non-cancer, and cancer effects associated with TCE exposure during vapor degreasing, including the severity of the effect, the manifestation of the effect, and how the effect impacts a person during their lifetime.

1. *Developmental effects.* The TCE risk assessment (and EPA's 2011 IRIS Assessment) identified developmental effects as the critical effect of greatest concern for both acute and chronic non-cancer risks. There are increased health risks for developmental effects to the estimated 454 to 1,066 pregnant women exposed to TCE during the use of vapor degreasers (Ref. 3). Specifically, these assessments identified fetal cardiac malformations in the offspring of mothers exposed to TCE during gestation as the critical effect. Although fetal cardiac defects are the effect of greatest concern and are the focus of the discussion in this Unit, TCE exposures can result in other adverse developmental outcomes, including prenatal (e.g., spontaneous abortion and perinatal death, decreased birth weight, and congenital malformations) and postnatal (e.g., reduced growth, decreased survival, developmental neurotoxicity, developmental immunotoxicity, and childhood cancers) effects. TCE exposure during development results in qualitatively different immunotoxic effects than when exposure occurs during adulthood. TCE exposure during development can influence the development of the immune system and result in impairment of the immune system's ability to respond to infection, whereas TCE exposures during adulthood result in a more pronounced immune effect related to autoimmune responses.

Cardiac defects, which can result from low-level exposure to TCE, affect the structural development of a baby's heart and how it works. The defects impact how blood flows through the heart and out to the rest of the body. The impact can be mild (such as a small hole in the heart) or severe (such as missing or

poorly formed septal wall and valves of the heart). While diagnosis for some cardiac defects can occur during pregnancy, for other cardiac defects, detection may not occur until after birth or later in life, during childhood or adulthood. These cardiac defects can be occult or life-threatening with the most severe cases causing early mortality and morbidity. While the incidences in the following paragraphs reflect adverse health outcomes beyond just exposure to TCE, the general population numbers provide a context for understanding the impact of the adverse health effects TCE can cause.

Nearly 1% or about 40,000 births per year in the United States are affected by cardiac defects (Ref. 40). About 25% of those infants with a cardiac defect have a critical defect. Infants with critical cardiac defects generally need surgery or other procedures in their first year of life. Some estimates put the total number of individuals (infants, children, adolescents, and adults) living with cardiac defects at 2 million (Ref. 40). Cardiac defects can be caused by genetics, environmental exposure, or an unknown cause.

Infant deaths resulting from cardiac defects often occur during the neonatal period. One study indicated that cardiac defects accounted for 4.2% of all neonatal deaths. Of infants born with a non-critical cardiac defect, 97% are expected to survive to the age of one, with 95% expected to survive to 18 years of age. Of infants born with a critical cardiac defect, 75% are expected to survive to one year of age, with 69% expected to survive to 18 years of age (Ref. 41). A child with a cardiac defect is 50% more likely to receive special education services compared to a child without birth defects (Ref. 40).

Treatments for cardiac defects vary. Some affected infants and children might need one or more surgeries to repair the heart or blood vessels. In other instances, a heart defect cannot be fully repaired, although treatments have advanced such that infants are living longer and healthier lives. Many children are living into adulthood and lead independent lives with little or no difficulty. Others, however, may develop disability over time, making it difficult to predict and quantify impacts.

Even though a person's heart defect may be repaired, for many people this is not a cure. They can still develop other health problems over time, depending on their specific heart defect, the number of heart defects they have, and the severity of their heart defect. For example, some related health problems that might develop include

irregular heart beat (arrhythmias), increased risk of infection in the heart muscle (infective endocarditis), or weakness in the heart (cardiomyopathy). In order to stay healthy, a person needs regular checkups with a cardiologist. They also might need further operations after initial childhood surgeries (Ref. 40).

Depending upon the severity of the defect, the costs for surgeries, hospital stays, and doctor's appointments to address a baby's cardiac defect can be significant. The costs for the defects may also continue throughout a person's lifetime. In 2004, hospital costs in the United States for individuals with a cardiac defect were approximately \$1.4 billion (Ref. 40).

Beyond the monetary cost, the emotional and mental toll on parents who discover that their child has a heart defect while *in utero* or after birth will be high (Ref. 41). They may experience anxiety and worry over whether their child will have a normal life of playing with friends and participating in sports and other physical activities, or whether their child may be more susceptible to illness and be limited in the type of work and experiences they can have. In addition, parents can be expected to experience concerns over potential unknown medical costs that may be looming in the future, lifestyle changes, and being unable to return to work in order to care for their child.

The emotional and mental toll on a person throughout childhood and into adolescence with a heart defect also should be considered (Ref. 41). Cardiac patients who are children may feel excluded from activities and feel limited in making friends if they have to miss school due to additional surgeries, or may not be able to fully participate in sports or other physical exercise. Children may feel self-conscious of the scars left by multiple surgeries. This, in turn, adds emotional and mental stress to the parents as they observe their child's struggles.

As a person with a heart defect enters adulthood, the emotional or mental toll of a cardiac defect may continue or in other instances the problem may only surface as an adult. If a cardiac defect impacts a person's ability to enter certain careers, this could take a monetary as well as emotional toll on that person and on their parents or families who may need to provide some form of financial support. The monetary, emotional, and mental costs of heart defects can be considerable, and even though neither the precise reduction in individual risk of developing a cardiac defect from reducing TCE exposure or the total

number of cases avoided can be estimated, their impact should be considered.

2. *Kidney toxicity. a. Non-cancer chronic effects.* The TCE risk assessment identified kidney toxicity as a significant concern from TCE exposure with the risk from this non-cancer effect being from chronic exposure. There are increased health risks for kidney toxicity to the approximately 2,670 to 6,270 workers and 42,720 to 100,320 occupational bystanders in facilities that use TCE for vapor degreasing, where exposure to TCE is a result of vapor degreasing operations (Ref. 3).

Exposure to TCE can lead to changes in the proximate tubules of the kidney. This damage may result in signs and symptoms of acute kidney failure that include; decreased urine output, although occasionally urine output remains normal; fluid retention, causing swelling in the legs, ankles or feet; drowsiness; shortness of breath, fatigue, confusion, nausea, seizures or coma in severe cases; and chest pain or pressure. Sometimes acute kidney failure causes no signs or symptoms and is detected through lab tests done for another reason.

Kidney toxicity means the kidney(s) has suffered damage that can result in a person being unable to rid their body of excess urine and wastes. In extreme cases where the kidney(s) is impaired over a long period of time, the kidney(s) could be damaged to the point that it no longer functions. When a kidney(s) no longer functions, a person needs dialysis and ideally a kidney transplant. In some cases, a non-functioning kidney(s) can result in death. Kidney dialysis and kidney transplantation are expensive and incur long-term health costs if kidney function fails (Ref. 42).

Approximately 31 million people, or 10% of the adult population, in the United States have chronic kidney disease. In the United States, it is the ninth leading cause of death. About 93% of chronic kidney disease is from known causes, including 44% from diabetes and 28.4% from high blood pressure. Unknown or missing causes account for about 6.5% of cases, or about 2 million people (Ref. 43).

The monetary cost of kidney toxicity varies depending on the severity of the damage to the kidney. In less severe cases, doctor visits may be limited and hospital stays unnecessary. In more severe cases, a person may need serious medical interventions, such as dialysis or a kidney transplant if a donor is available, which can result in high medical expenses due to numerous hospital and doctor visits for regular dialysis and surgery if a transplant

occurs. The costs for hemodialysis, as charged by hospitals, can be upwards of \$100,000 per month (Ref. 44).

Depending on the severity of the kidney damage, kidney disease can impact a person's ability to work and live a normal life, which in turn takes a mental and emotional toll on the patient. In less severe cases, the impact on a person's quality of life may be limited, while in instances where kidney damage is severe, a person's quality of life and ability to work would be affected. While neither the precise reduction in individual risk of developing kidney toxicity from reducing TCE exposure or the total number of cases avoided can be estimated, these costs must still be considered because they can significantly impact those exposed to TCE.

b. *Cancer effects.* Chronic exposure to TCE can also lead to kidney cancer. The estimated value of the annualized benefit is \$12 million to \$108 million at 3% and \$6 million to \$57 million at 7% over 20 years. Kidney cancer rarely shows signs or symptoms in its early stages. As kidney cancer progresses, the cancer may grow beyond the kidney, spreading to lymph nodes or distant sites like the liver, lung or bladder, increasing the impacts on a person and the costs to treat it. This metastasis is highly correlated with fatal outcomes. Impacts of kidney cancer that are not monetized include the emotional, psychological and treatment impacts of the cancer on the well-being of the person.

3. *Immunotoxicity. a. Non-cancer chronic effects.* The TCE risk assessment identified immunotoxicity as a chronic non-cancer effect that is associated with TCE exposure. There are increased health risks for immunotoxicity to the approximately 2,670 to 6,270 workers and 42,720 to 100,320 bystanders exposed to TCE as a result of vapor degreasing operations (Ref. 3).

Human studies have demonstrated that TCE exposed workers can suffer from systemic autoimmune diseases (e.g., scleroderma) and severe hypersensitivity skin disorders. Scleroderma is a chronic connective tissue disease with autoimmune origins. The annual incidence is estimated to be 10 to 20 cases per 1 million persons (Ref. 45), and the prevalence is four to 253 cases per 1 million persons (Ref. 46). About 300,000 Americans are estimated to have scleroderma. About one third of those people have the systemic form of scleroderma. Since scleroderma presents with symptoms similar to other autoimmune diseases, diagnosis is difficult. There may be

many misdiagnosed or undiagnosed cases (Ref. 46).

Localized scleroderma is more common in children, whereas systemic scleroderma is more common in adults. Overall, female patients outnumber male patients about 4-to-1. Factors other than a person's gender, such as race and ethnic background, may influence the risk of getting scleroderma, the age of onset, and the pattern or severity of internal organ involvement. The reasons for this susceptibility are not clear. Although scleroderma is not directly inherited, some scientists believe there is a slight predisposition to it in families with a history of rheumatic diseases (Ref. 46).

The symptoms of scleroderma vary greatly from person to person with the effects ranging from very mild to life threatening. If not properly treated, a mild case can become much more serious. Relatively mild symptoms are localized scleroderma, which results in hardened waxy patches on the skin of varying sizes, shapes and color. The more life threatening symptoms are from systemic scleroderma, which can involve the skin, esophagus, gastrointestinal tract (stomach and bowels), lungs, kidneys, heart and other internal organs. It can also affect blood vessels, muscles and joints. The tissues of involved organs become hard and fibrous, causing them to function less efficiently.

Severe hypersensitivity skin disorders include exfoliative dermatitis, mucous membrane erosions, eosinophilia, and hepatitis. Exfoliative dermatitis is a scaly dermatitis involving most, if not all, of the skin. Eosinophilia, on the other hand, is a chronic disorder resulting from excessive production of a particular type of white blood cells. If diagnosed and treated early, a person can lead a relatively normal life (Ref. 45).

The monetary costs for treating these various immunotoxicity disorders will vary depending upon whether the symptoms lead to early diagnosis and this early diagnosis can then influence whether symptoms progress to mild or life-threatening outcomes. For mild symptoms, doctors' visits and outpatient treatment could be sufficient, while more severe immunotoxicity disorders, may require hospital visits. Treatments for these conditions with immune modulating drugs also have countervailing risks.

These disorders also take an emotional and mental toll on the person as well as on their families. Their quality of life may be impacted because they no longer have the ability to do certain activities that may affect or

highlight their skin disorder, such as swimming. Concerns over doctor and hospital bills, particularly if a person's ability to work is impacted, may further contribute to a person's emotional and mental stress. While neither the precise reduction in individual risk of developing this disorder from TCE exposure or the total number of cases avoided can be estimated, this should be considered.

b. Cancer effects: Non-Hodgkin's Lymphoma. EPA's 2011 IRIS assessment for TCE found that TCE is carcinogenic. Chronic exposure to TCE, by all routes of exposure, can result in non-Hodgkin's lymphoma (NHL), one of the three cancers for which the EPA IRIS TCE assessment based its cancer findings. There are increased health risks for NHL for the approximately 2,670 to 6,270 workers and 42,720 to 100,320 occupational bystanders exposed to TCE as a result of vapor degreasing operations (Ref. 3).

NHL is a form of cancer that originates in a person's lymphatic system. For NHL, there are approximately 19.7 new cases per 100,000 men and women per year with 6.2 deaths per 100,000 men and women per year. NHL is the seventh most common form of cancer (Ref. 47). Some studies suggest that exposure to chemicals may be linked to an increased risk of NHL. Other factors that may increase the risk of NHL are medications that suppress a person's immune system, infection with certain viruses and bacteria, or older age (Ref. 48).

Symptoms are painless, swollen lymph nodes in the neck, armpits or groin, abdominal pain or swelling, chest pain, coughing or trouble breathing, fatigue, fever, night sweats, and weight loss. Depending on the rate at which the NHL is advancing, the approach may be to monitor the condition, while more aggressive NHL could require chemotherapy, radiation, stem cell transplant, medications that enhance a person's immune system's ability to fight cancer, or medications that deliver radiation directly to cancer cells.

Treatment for NHL will result in substantial costs for hospital and doctors' visits in order to treat the cancer. The treatments for NHL can also have countervailing risks and can lead to higher susceptibility of patients to secondary malignancies (Ref. 49). The emotional and mental toll from wondering whether a treatment will be successful, going through the actual treatment, and inability to do normal activities or work will most likely be high. This emotional and mental toll will extend to the person's family and friends as they struggle with the

diagnosis and success and failure of a treatment regime. If a person has children, this could affect their mental and emotional well-being and may impact their success in school. The estimated value of the monetized benefit is \$32 million to \$201 million at 3% and \$15 million to \$98 million at 7% annualized over 20 years.

4. Reproductive and endocrine effects. The TCE risk assessment identified risks of chronic non-cancer reproductive effects for workers and bystanders exposed to TCE. There are increased health risks for reproductive effects for the approximately 2,670 to 6,270 workers and 42,720 to 100,320 occupational bystanders exposed to TCE as a result of vapor degreasing operations (Ref. 3).

The reproductive effect for both females and males can be altered libido. The prevalence of infertility is estimated at about 10–15% of couples with a decreased libido among the factors of infertility (Ref. 50). For females, there can be reduced incidence of fecundability (6.7 million women ages 15 to 44 or 10.9% affected) (Ref. 51), increase in abnormal menstrual cycles, and amenorrhea (the absence of menstruation). Reproductive effects on males can be decreased potency, gynaecomastia, impotence, and decreased testosterone levels, or low T levels. Approximately 2.4 million men age 40 to 49 have low T levels, with a new diagnosis of about 481,000 androgen deficiency cases a year. Other estimates propose a hypogonadism prevalence of about 13 million American men (Ref. 52). Low T levels are associated with aging; an estimated 39% of men 45 or older have hypogonadism, resulting in low T levels (Ref. 53). Hormone therapy and endocrine monitoring may be required in the most severe cases.

The monetary costs of these potential reproductive effects involve doctor's visits in order to try to determine a diagnosis. In some instances, a person or couple may need to visit a fertility doctor.

The impact of a reduced sex drive can take an emotional and mental toll on single people as well as couples. For people trying to get pregnant, decreased fertility can add stress to a relationship as the cause is determined and avenues explored to try to resolve the difficulties in conceiving. A person or couples' quality of life can also be affected as they struggle with a reduced sex drive. Similar to other non-cancer effects discussed previously, while neither the precise reduction in individual risk of developing this disorder from reducing TCE exposure or the total number of

cases avoided can be estimated, the Agency still must consider their impact.

5. Neurotoxicity. The TCE risk assessment identified neurotoxicity risks for workers and bystanders from chronic TCE exposures. There are increased health risks of neurotoxicity for the approximately 2,670 to 6,270 workers and 42,720 to 100,320 occupational bystanders exposed to TCE as a result of vapor degreasing operations (Ref. 3).

Studies have also demonstrated neurotoxicity from acute exposures. Neurotoxic effects observed include alterations in trigeminal nerve and vestibular function, auditory effects, changes in vision, alterations in cognitive function, changes in psychomotor effects, and neurodevelopmental outcomes. Developmental neurotoxicity effects include delayed newborn reflexes, impaired learning or memory, aggressive behavior, hearing impairment, speech impairment, encephalopathy, impaired executive and motor function and attention deficit (Ref. 4).

The impacts of neurotoxic effects due to TCE exposure can last a person's entire lifetime. Changes in vision may impact a person's ability to drive, which can create difficulties for daily life. Impaired learning or memory, aggressive behavior, hearing impairment, speech impairment, encephalopathy, impaired executive and motor function and attention deficit can impact a child's educational progression and an adolescent's schooling and ability to make friends, which in turn can impact the type of work or ability to get work later in life.

Neurotoxicity in adults can affect the trigeminal nerve, the largest and most complex of the 12 cranial nerves, which supplies sensations to the face, mucous membranes, and other structures of the head. Onset of trigeminal neuralgia generally occurs in mid-life and known causes include multiple sclerosis, sarcoidosis and Lyme disease. There is also a co-morbidity with scleroderma and systemic lupus. Some data show that the prevalence of trigeminal neuralgia could be between 0.01% and 0.3% (Ref. 54). Alterations to this nerve function might cause sporadic and sudden burning or shock-like facial pain to a person. One way to relieve the burning or shock-like facial pain is to undergo a procedure where the nerve fibers are damaged in order to block the pain. This treatment can have lasting impact on sensation which may also be deleterious for normal pain sensation. The potential side effects of this

procedure includes facial numbness and some sensory loss.

The monetary health costs can range from doctor's visits and medication to surgeries and hospital stays. Depending upon when the neurotoxic effect occurred, the monetary costs may encompass a person's entire lifetime or just a portion.

The personal costs (emotional, mental, and impacts to a person's quality of life) cannot be discounted. Parents of a child with impaired learning, memory, or some other developmental neurotoxic effect may suffer emotional and mental stress related to worries about the child's performance in school, ability to make friends, and quality of the child's life because early disabilities can have compounding effects as they grow into adulthood. The parent may need to take off work unexpectedly and have the additional cost of doctor visits and/or medication.

For a person whose trigeminal nerve is affected, there is an emotional and mental toll as they wonder what is wrong and visit doctors in order to determine a diagnosis. Depending on the severity of the impact to the nerve, they may be unable to work. Doctor visits and any inability to work will have a monetary impact to the person. There are varying costs (emotional, monetary, and impacts to a person's quality of life) from the neurotoxic effects due to TCE exposure. However, while neither the precise reduction in individual risk of developing this disorder from reducing TCE exposure or the total number of cases avoided can be estimated, this is not a reason to disregard their impact.

6. Liver toxicity. The TCE risk assessment identified liver toxicity as an adverse effect of chronic TCE exposure. There are increased health risks for liver toxicity to the approximately 2,670 to 6,270 workers and 42,720 to 100,320 occupational bystanders exposed to TCE as a result of vapor degreasing operations (Ref. 2).

Specific effects to the liver can include increased liver weight, increase in DNA synthesis (transient), enlarged hepatocytes, enlarged nuclei, and peroxisome proliferation (Ref. 2). In addition, workers exposed to TCE have shown hepatitis accompanying immune-related generalized skin diseases, jaundice, hepatomegaly, hepatosplenomegaly, and liver failure (Ref. 2).

Some form of liver disease impacts at least 30 million people, or 1 in 10 Americans (Ref. 55). Included in this number is at least 20% of those with nonalcoholic fatty liver disease

(NAFLD) (Ref. 55). NAFLD tends to impact people who are overweight/obese or have diabetes. However, an estimated 25% do not have any risk factors (Ref. 55). The danger of NAFLD is that it can cause the liver to swell, which may result in cirrhosis over time and could even lead to liver cancer or failure (Ref. 55). The most common known causes to this disease burden are attributable to alcoholism and viral infections, such as hepatitis A, B, and C. In 2013, there were 1,781 reported acute cases of viral hepatitis A and the estimated actual cases were 3,500 (Ref. 56). For hepatitis B in 2013 there were 3,050 reported acute cases, while the estimated actual incidence was 19,800, and the estimated chronic cases in the United States is between 700,000 to 1.4 million (Ref. 56). For hepatitis C, in 2013 there were 2,138 reported cases; however, the estimated incidence was 29,700 and the estimated number of chronic cases is between 2.7 to 3.9 million (Ref. 56). These known environmental risk factors of hepatitis infection may result in increased susceptibility of individuals exposed to organic chemicals. While the incidences in this paragraph reflect adverse health outcomes beyond just exposure to TCE, the general population numbers provide a context for understanding the impact of the adverse health effects that TCE can cause.

Effects from TCE exposure to the liver can occur quickly. Liver weight increase has occurred in mice after as little as 2 days of inhalation exposure (Ref. 4). Human case reports from eight countries indicated symptoms of hepatitis, hepatomegaly and elevated liver function enzymes, and in rare cases, acute liver failure developed within as little as 2–5 weeks of initial exposure to TCE (Ref. 4).

Chronic exposure to TCE can also lead to liver cancer. There is strong epidemiological data that reported an association between TCE exposure and the onset of various cancers, including liver cancer. The estimated value of the annualized benefit is estimated to be \$21 million to \$133 million at 3% and \$11 million to \$71 million at 7% over 20 years.

Additional medical and emotional costs are associated with non-cancer liver toxicity from TCE exposure, although they cannot be quantified. These costs include doctor and hospital visits and medication costs. In some cases, the ability to work can be affected, which in turn impacts the ability to get proper ongoing medical care. Liver toxicity can lead to jaundice, weakness, fatigue, weight loss, nausea, vomiting, abdominal pain, impaired

metabolism, and liver disease.

Symptoms of jaundice include yellow or itchy skin and a yellowing of the whites of the eye, and a pale stool and dark urine. These symptoms can create a heightened emotional state as a person tries to determine what is wrong with them.

Depending upon the severity of the jaundice, treatments can range significantly. Simple treatment may involve avoiding exposure to the TCE; however, this may impact a person's ability to continue to work. In severe cases, the liver toxicity can lead to liver failure, which can result in the need for a liver transplant, if a donor is available. Liver transplantation is expensive (with an estimated cost of \$575,000) and there are countervailing risks for this type of treatment (Ref. 57). The mental and emotional toll on an individual and their family as they try to determine the cause of sickness and possibly experience an inability to work, as well as the potential monetary cost of medical treatment required to regain health are significant.

D. Availability of Alternatives

TCE is commonly used in vapor degreasing systems for a variety of reasons. It is able to dissolve the greases, fats, oils, waxes, resins, gums and rosin fluxes generally used in metalworking operations and it is compatible with most metal substrates. TCE is non-flammable and it has a relatively low boiling point. It is also available at a relatively low cost. Several SERs providing input to the SBAR Panel convened in support of this rulemaking noted that TCE is particularly well-suited for use in vapor degreasing in the narrow tube, razor blade, and aerospace industries (Ref. 32).

Nevertheless, EPA identified a wide variety of technically and economically feasible alternatives for vapor degreasing with TCE. See Unit 4 of the Economic Analysis for a complete discussion of the technically and economically feasible alternatives to TCE. (Ref. 3). While some substitutes, such as methylene chloride or 1–BP, also present risks to workers, there are numerous other solvents available. These include designer solvents such as hydrofluorocarbon (HFC) and hydrofluoroether (HFE) solvent blends and hydrofluoroolefin (HFO), as well as other alternative solvents and cleaning systems, such as terpene-based cleaners, volatile methyl siloxanes, soy-based cleaners, and water-based cleaners.

Alternatives to TCE fall within several broad categories: Drop-in solvent alternatives, non-drop-in solvent alternatives (designer solvents, such as

hydrofluorocarbons, hydrofluoroolefins, and hydrofluoroethers), aqueous cleaning systems, other cleaning solvents (such as glycol ethers, siloxanes, terpenes, soy-based cleaners), and cold cleaning with TCE (Ref. 58).

EPA considered a solvent to be a drop-in alternative if it could be used in an existing vapor degreasing system with only minor modifications. One important consideration for many vapor degreasing machines is the flammability of the solvent. Heating a flammable solvent up to its boiling point increases the likelihood that, if there is a source of ignition or if the vapor concentration exceeds certain limits, the solvent will ignite or explode. Halogens (fluorine, chlorine and bromine) suppress flammability, hence their common use as fire extinguishants. For this reason, halogenated solvents are commonly used in vapor degreasing, although solvent flammability is less of a concern in closed-loop systems operated under vacuum. Depending on the type of vapor degreasing system, the drop-in solvent alternatives identified by EPA include methylene chloride, 1-bromopropane (1-BP or n-propyl bromide), and perchloroethylene. Like TCE, methylene chloride and perchloroethylene are hazardous air pollutants (HAPs) under the Clean Air Act and their use is regulated under the Halogenated Solvent NESHAP (40 CFR part 63, subpart T). Therefore, facilities that switch from TCE to methylene chloride or perchloroethylene will still be regulated by the NESHAP. In addition, although 1-BP is not currently listed as a HAP, EPA is currently considering a petition to list this chemical (Ref. 59).

There are significant hazards associated with all three of these drop-in replacements for TCE in vapor degreasing systems. However, based on EPA's analysis, the adverse effects associated with TCE exposure occur at exposure levels below the levels at which the adverse effects associated with the replacement chemicals occur (Ref. 58). With respect to methylene chloride, in August 2014, EPA issued a risk assessment of its use for paint and coating removal and EPA intends to issue a proposal to regulate this use of methylene chloride. While EPA has not specifically assessed the risks associated with using methylene chloride in vapor degreasing applications for this rulemaking, there are a number of hazard concerns associated with this chemical. The potential effects of methylene chloride exposure include death, liver toxicity, kidney toxicity, reproductive toxicity, specific cognitive impacts, and cancer (Ref. 60). Some of

these effects result from a very short, acute exposure; others follow years of occupational exposure. Acute exposures may cause confusion and respiratory suppression in humans and there have been a number of deaths associated with worker exposures in homes and other job sites due to the buildup of carbon monoxide in the blood. Methylene chloride is likely to be carcinogenic in humans, so chronic exposures may increase cancer risk. Chronic exposures to methylene chloride may also lead to liver effects. However, these adverse effects are generally seen at higher exposure levels than those associated with TCE toxicity.

With respect to environmental effects, methylene chloride is volatile and releases of methylene chloride are likely to evaporate to the atmosphere, or if released to soil, migrate to groundwater (Ref. 59). It has a global warming potential (GWP) of 8.7 relative to carbon dioxide and thus can act as a greenhouse gas. Methylene chloride has been shown to biodegrade over a range of rates and conditions and is considered to be moderately persistent in the environment. Measured bioconcentration factors suggest that its bioconcentration potential is low.

EPA also has concerns for 1-BP. In May of 2016, a peer review meeting was held on EPA's draft TSCA Work Plan Chemical Risk Assessment for 1-BP. This draft assessment specifically evaluated the risks associated with the use of 1-BP in vapor degreasing (Ref. 61). According to the peer review draft, most acute exposure scenarios for vapor degreasing identified risks for adverse developmental effects that may occur as a result of a single exposure to 1-BP during a critical window of susceptibility. Likewise, chronic exposure risks for adverse neurological and developmental effects were identified in the draft risk assessment for all uses evaluated without engineering controls. In addition, the draft weight-of-evidence analysis for the cancer endpoint is sufficient to support a probable mutagenic mode of action for 1-BP carcinogenesis. However, these adverse effects are generally seen at higher exposure levels than those associated with TCE toxicity.

1-BP is a volatile liquid with high vapor pressure, moderate water solubility, and high mobility in soil (Ref. 61). It is expected to exhibit low adsorption to soil and thus can migrate rapidly through soil to groundwater. 1-BP is slowly degraded by sunlight and reactants when released to the atmosphere. Based on the estimated half-life of nine to twelve days, long range transport via the atmosphere is

possible. Biotic and abiotic degradation studies have not shown this substance to be persistent (overall environmental half-life less than two months). While no measured bioconcentration studies for 1-BP are available, an estimated bioaccumulation factor of 12 suggests that bioconcentration and bioaccumulation in aquatic organisms are low.

EPA is also concerned about the adverse health effects associated with perchloroethylene (tetrachloroethylene) exposure. Based on the available human epidemiologic data and experimental and mechanistic studies, EPA has concluded that it poses a potential human health hazard for noncancer toxicity to the central nervous system, kidney, liver, immune and hematologic system, and on development and reproduction. (Ref. 62) Neurotoxicity has been identified as a sensitive endpoint following either oral or inhalation exposure. In addition, EPA has determined that perchloroethylene (tetrachloroethylene) is likely to be carcinogenic to humans by all routes of exposure (Ref. 62). As with methylene chloride and 1-BP, the adverse health effects associated with perchloroethylene (tetrachloroethylene) are generally seen at higher exposure levels than those associated with TCE toxicity. Perchloroethylene presents low to moderate risk to aquatic organisms (Ref. 62). It is moderately persistent, with a low bioaccumulation potential.

In contrast, aqueous cleaning systems present less risk to workers. Water-based cleaners have been used for many years in applications where users originally used TCE or other chlorinated solvents in vapor degreasing. In these systems, water-based cleaners are used to clean grease or oil from parts, the parts are rinsed, sometimes with deionized water if a spot free part is required for the next process, and dried. The cleaner concentrate, typically made up of boric acid or gluconic acid and other constituents, is generally diluted to between about 5% and 20% in a heated wash bath, depending on the cleaning task and the agitation in the equipment. The rinse is generally heated as well. Often driers composed of air knives that drive the water from the part are used.

Depending on the circumstances, several different types of equipment capable of using water-based cleaners can replace vapor degreasing machines that use TCE. Ultrasonic cleaning systems have transducers for generating the ultrasonic action in a bath. There are some immersion systems where the parts are placed on a platform and moved up and down in the cleaning

agent. In certain circumstances parts can be sprayed at pressures of about 60 psi and greater in spray cabinets. Conveyorized spray systems, where the parts go through high pressure spray at between about 80 and 120 psi, are also used in some cases. These systems often have wash, rinse and dry sections.

Water-based cleaners have a few characteristics to consider when evaluating replacements for TCE vapor degreasing (Ref. 63). Since TCE is used primarily to clean metal parts, the water cleaners often contain rust or corrosion inhibitors, which typically are present at very low concentrations, to protect the metals (Ref. 61). In addition, in order to be used in spray equipment, water-based cleaners must be formulated with a non-foaming surfactant. However, there are numerous water-based cleaners available on the market that have been formulated for these purposes (Ref. 64). In addition, the SBAR Panel convened in support of this rulemaking heard from several SERs about the increased water use associated with aqueous cleaning systems (more than 10,000 gallons a day). While this water can be reused in the degreasing system, any effluent is considered industrial wastewater for which a permit may be required under the Clean Water Act (Ref. 32).

SERs providing input to the SBAR Panel noted that, in general the use of TCE in vapor degreasing is declining very rapidly in certain sectors, but is still the method of choice for some, especially for small, intricate parts and substrates (e.g., small tubes). Several SERs contended that none of the currently available chemical alternatives are good substitutes for TCE because of the health hazards associated with the substitutes, potential upcoming regulations and use restrictions on substitutes, compliance with the NESHAP limitations, and cost. In addition, some degreasing applications require highly efficient cleaning, such as electronics and glass to metal seals, which must be absolutely free of soil. A SER stated that no substitutes for critical glass to metal seals have been identified. Several SERs stated that substitutes with lower boiling points are not viable alternatives because they volatilize during processes involving elevated temperatures and because they cannot be shipped in standard drums. Most SERs indicated that replacing their open-top vapor degreasing systems with more sophisticated systems or alternative systems using aqueous cleaners would be very expensive, estimates ranged from \$350,000 to \$650,000. In contrast, one SER noted that water-based, or aqueous cleaning

systems can be developed to replace most TCE-based vapor degreasing systems (Ref. 32). This same SER also stated that potential drawbacks to aqueous cleaning systems are the increased water use and the need for additional facility space. According to this SER, aqueous systems are typically much larger than vapor degreasing systems and aqueous operations often require multiple stages to reach the same cleaning efficiency as vapor degreasers.

Based on this input from the SERs, EPA is specifically requesting additional comments, information, and data to assist EPA in evaluating the availability of alternatives to TCE in vapor degreasing applications, including information on the costs to achieve TCE exposure reductions or to transition to alternative chemicals or processes. In addition, EPA will consider granting a time-limited exemption, under the authority of TSCA section 6(g), for a specific condition of use for which EPA can obtain documentation: That the specific condition of use is a critical or essential use for which no technically and economically feasible safer alternative is available, taking into consideration hazard and exposure; that compliance with the proposed ban would significantly disrupt the national economy, national security, or critical infrastructure; or that TCE vapor degreasing in a specific application, as compared to reasonably available alternatives, provides a substantial benefit to health, the environment, or public safety. To this end, EPA requests comment on a process for receiving and evaluating petitions and requesting EPA promulgate critical use exemption rules. Under this process, entities who believe that their specific condition of use is a critical or essential use under TSCA section 6(g) would submit a petition for an exemption rulemaking with supporting documentation that they believe demonstrates that the use meets the statutory criteria. EPA would review the petition for completeness and, if the documentation warrants further action, respond to the petition by publishing a proposal in the **Federal Register** inviting comment on a proposed exemption. EPA would consider the comments received, along with any additional information reasonably available, and then take final action on the proposed exemption. EPA requests comment on the specific kinds of documentation that should be required from entities seeking an exemption rulemaking in order to facilitate EPA's and later, the public's review. EPA also requests comment on the appropriate

timeframes for EPA action, given that the documentation for any given use could be technical and extensive, and that EPA may also need to develop additional information, such as economic estimates, in order to promulgate an exemption rule under TSCA section 6(g). Finally, members of the potentially regulated community who believe that their operation is a critical or essential use should provide as much detail as possible to EPA about their operation during this comment period, including information on any evaluations of alternatives, the costs to transition to another chemical or process, and any other relevant information. This would assist EPA in reviewing the specific condition of use, as well as in establishing provisions for future exemption petitions.

EPA urges vapor degreasing facilities to think strategically about their choices should TCE be banned for their use or if they are in the market to replace or upgrade vapor degreasing equipment for other reasons. To the extent that a process currently using TCE in a vapor degreasing system can be converted to a significantly less toxic alternative, such as an aqueous cleaning system, it will avoid significant risks to workers and also reduce the likelihood that further actions on toxic solvents by EPA or other regulatory authorities will spur another process change.

E. Impacts of the Proposed and Alternative Regulatory Options

This unit describes the estimated costs of the proposed and alternative regulatory actions that EPA considered.

1. Proposed approach to prohibit manufacturing (including import), processing, distribution in commerce, and use of TCE for vapor degreasing and require downstream notification. The costs of the proposed approach are estimated to include equipment modification costs, product costs, electricity, disposal, and other costs associated with using alternative solvents or systems. Although the proposal imposes costs resulting from downstream notification and recordkeeping requirements, these actions required under this proposed rule are identical in requirement and coverage to those included as part of the earlier proposed rule on TCE use in aerosol degreasing and spot cleaning at dry cleaning facilities (Ref. 1) that is a companion to this proposed rule. These notification and recordkeeping costs were accounted for as part of that proposal and are not included in the costs for this rule. Overall, EPA estimates that 50% of users will switch to drop-in alternatives, 25% will

convert to aqueous cleaning systems, and 25% will convert to other alternatives. The total costs for switching from TCE-based vapor degreasing to a substitute are estimated to be approximately \$30 million to \$45 million per year (annualized at 3% over 20 years) and \$32 million to \$46 million (annualized at 7% over 20 years).

2. *Option that bans manufacturing (including import), processing, distribution in commerce, and use of TCE for vapor degreasing except in airless vacuum-to-vacuum closed-loop systems where proper PPE is used and a requirement for downstream notification.* Given equipment costs and the burden of establishing a respiratory protection program which involves training, respirator fit testing and the establishment of a medical monitoring program, EPA anticipates that companies not currently using airless vacuum-to-vacuum systems would choose to switch to substitutes instead of purchasing an airless system and adopting a program for PPE because substitutes are readily available and are more technically and economic feasible. EPA also assumes that this would be the case even if this alternative were expressed as a performance-based air exposure limit for TCE. The estimated annualized costs of switching to a respiratory protection program requiring PPE of APF 10,000 are \$30,000 at 3% and \$32,000 at 7% per vapor degreasing machine over 20 years. In addition, there would be higher EPA administration and enforcement costs with respiratory protection program than there would be with an enforcement program under the proposed approach. Further, even if cost were not an impediment, there are many limitations to the successful implementation of respirators with an APF of 10,000 in a workplace.

3. *Options that exclude downstream notification.* For those options that exclude downstream notification, the options are less cost effective and more burdensome to enforce. This is even though EPA assumes monetized enforcement costs to be the same under all options for the purpose of this proposed rulemaking because EPA was unable to monetize the extent to which enforcement costs would vary by regulatory option. The proposed approach to prohibit manufacturing (including import), processing, distribution in commerce, and use of TCE for vapor degreasing and require downstream notification is relatively easy to enforce because key requirements are directly placed on a small number of suppliers and because the supply chain approach minimizes to

the greatest extent the potential for TCE products to be intentionally or unintentionally misdirected into the prohibited uses. Enforcement under the other options would be more difficult since the key requirements are directly placed on the larger number of product users. Under these other options, enforcement activities must target firms that might perform the activity where a TCE use is restricted or prohibited. Therefore, EPA considers downstream notification to be a critical component of this proposal and EPA also finds that incorporating downstream notification reduces the burden on society by easing implementation, compliance, and enforcement.

VII. Monetized Benefits and Costs of the Proposed Rule, the Alternatives EPA Considered, and Comparison of Benefits and Costs

The health endpoints associated with TCE exposure are serious. The following is a discussion of the impacts of the most significant cancer and non-cancer effects associated with TCE exposure, including the severity of the effect, the manifestation of the effect, and how the effect impacts a person during their lifetime.

A. Benefits of the Proposed Rule and the Alternatives That EPA Considered

The risk reduction from preventing TCE exposure cannot be comprehensively quantified or monetized even though the adverse effects are well-documented, the TCE risk assessment estimating these risks has been peer-reviewed, and the benefits of reducing the risk of these health endpoints can be described. It is relatively straightforward to monetize the benefits of reducing the risk of the costs of the effects of cancer (kidney cancer, liver cancer, non-Hodgkin's lymphoma) due to TCE exposure. The estimated value of the annualized benefit is estimated to be \$65 million to \$447 million at 3% and \$32 million to \$227 million at 7% over 20 years. It is currently not possible to monetize the benefits of reducing the risks of the costs of non-cancer effects (all developmental toxicity, kidney toxicity, immunotoxicity, reproductive toxicity, neurotoxicity, and liver toxicity) of TCE exposure. There are two reasons for this. First, dose response information and concentration response functions in humans are not available. This information would allow EPA to estimate the number of population-level non-cancer cases that would be avoided by reducing exposures to levels corresponding with MOE benchmarks. Second, even if it were possible to

calculate the number of cases avoided, EPA may not be able to monetize the benefits of these avoided cases due to limitations in data needed to apply established economic methodologies. However, being unable to quantitatively assess individual risk and population-level non-cancer cases avoided from TCE exposure does not negate the impact of these effects. Similarly, the inability to monetize an adverse effect does not reflect the severity of the effect, the lifetime nature of the impact, or the magnitude of the benefit in preventing the adverse impact from TCE exposure, such as a cardiac malformation, on a person. In considering the benefits of preventing TCE exposure, EPA considered the type of effect, the severity of the effect, the duration of the effect, and costs and other monetary impacts of the health endpoint.

The alternative options that EPA considered are unlikely to result in the same health benefits as the proposed rule for the reasons discussed in Unit VI. However, EPA was unable to quantify the differences in benefits that would result from the alternatives.

B. Costs of the Proposed Rule and the Alternatives That EPA Considered

The details of the costs of the proposed approach for use of TCE in vapor degreasing are discussed in Unit VI.C. Under the proposed option, costs to users of TCE in vapor degreasing applications range from \$30 million to \$45 million (annualized at 3% over 20 years) and \$32 million to \$46 million (annualized at 7% over 20 years). Costs of downstream notification and recordkeeping for manufacturers, processors, and distributors on an annualized basis over 20 years are \$3,200 and \$4,400 using 3% and 7% discount rates respectively. However, the costs of the downstream notification and recordkeeping requirements were already accounted for in the prior proposal on TCE use in aerosol degreasing and as a spotting agent in dry-cleaning facilities, and thus are not included in the total costs for this proposal.

The primary alternative that EPA considered is a requirement that TCE be used for vapor degreasing only in certain closed systems and that workers operating the systems and in the immediate area wear PPE with an APF of 10,000. The estimated annualized costs of this option are \$32 million to \$46 million annualized over 20 years at 3% and \$34 million to \$47 million annualized over 20 years at 7%.

C. Comparison of Benefits and Costs

The monetized benefits for preventing the risks resulting from TCE exposure from this use significantly outweigh the estimated costs. Simply comparing the costs and monetized benefits of prohibiting the manufacture (including import), processing, and distribution in commerce of TCE for use in vapor degreasing, prohibiting commercial use of TCE in vapor degreasing, and requiring downstream notification demonstrates that the monetized benefits of this proposed action outweigh the costs. However, EPA believes that the balance of costs and benefits cannot be fairly described without considering the additional, non-monetized benefits of mitigating the non-cancer adverse effects as well as cancer. As discussed previously, the multitude of potential adverse effects associated with TCE exposure can profoundly impact an individual's quality of life. Some of the adverse effects associated with TCE exposure can be immediately experienced and can affect a person from childhood throughout a lifetime (e.g., cardiac malformations, developmental neurotoxicity, and developmental immunotoxicity). Others (e.g., adult immunotoxicity, kidney and liver failure or cancers) can have impacts that are experienced for a shorter portion of life, but are nevertheless significant in nature.

While the risk of non-cancer health effects associated with TCE exposure cannot be quantitatively estimated, the qualitative discussion in this Unit highlights how some of these non-cancer effects occurring much earlier in life from TCE exposure may be as severe as cancer's mortality and morbidity and thus just as life-altering. These effects include not only medical costs but also personal costs such as emotional and mental stress that are impossible to accurately measure.

While the impacts of non-cancer effects cannot be monetized, EPA considered the impacts of these effects in deciding how best to address the unreasonable risks presented by TCE use in vapor degreasing. Considering only monetized benefits would significantly underestimate the impacts of TCE-induced non-cancer adverse outcomes on a person's quality of life to perform basic skills of daily living, including the ability to earn a living, the ability to participate in sports and other activities, and the impacts on a person's family and relationships.

Thus, considering costs, benefits that can be monetized (risk of cancer), and benefits that cannot be quantified and

subsequently monetized (risk of developmental toxicity, kidney toxicity, immunotoxicity, reproductive toxicity, neurotoxicity, and liver toxicity), including benefits related to the severity of the effects and the impacts on a person throughout her/his lifetime in terms of medical costs, effects on earning power and personal costs, and the emotional and psychological costs, the benefits of preventing exposures to TCE emissions from vapor degreasing systems outweigh the costs. Further, if EPA were to consider only the benefits that can be monetized in comparison to the cost, the monetized benefits from preventing kidney and liver cancer and non-Hodgkin's lymphoma from the use of TCE in vapor degreasing (the annualized monetized benefits on a 20 year basis range from approximately \$65 million to \$447 million at 3% and \$32 million to \$227 million at 7%) far outweigh the costs of the proposal to ban the use of TCE in vapor degreasing (the annualized costs on a 20 year basis range from approximately \$30 million to \$45 million at 3% and \$32 million to \$46 million at 7%). Considering the costs and benefits of the proposed and alternative options, while both address the unreasonable risks from TCE exposure, the proposed approach is more cost effective because it achieves the same or greater benefits at lower costs. For more information, see Section 7 in the Economic Analysis.

VIII. Overview of Uncertainties

A discussion of the uncertainties associated with this proposed rule can be found in the TCE risk assessment (Ref. 2) and in the supplemental analysis (Ref. 30) for use of TCE in vapor degreasing. A summary of these uncertainties follows.

EPA used a number of assumptions in the TCE risk assessment and supporting analysis to develop estimates for occupational exposure scenarios and to develop the hazard/dose-response and risk characterization. EPA recognizes that the uncertainties may underestimate or overestimate actual risks. These uncertainties include the possibility that releases of and exposures to TCE vary from one vapor degreasing machine to the next. EPA attempted to quantify this uncertainty by evaluating multiple scenarios to establish a range of releases and exposures. In estimating the risk from vapor degreasing, there are uncertainties in the number of workers exposed to TCE and in the inputs and algorithms of the models used to estimate exposures.

In addition to the uncertainties in the risks, there are uncertainties in the cost and benefits. The uncertainties in the

benefits are most pronounced in estimating the benefits from preventing the non-cancer adverse effects because these benefits generally cannot be monetized due to the lack of concentration-response functions in humans leading to the ability to estimate the number of population-level non-cancer cases and limitations in established economic methodologies. Additional uncertainties in benefit calculations include the potential risks for adverse health effects that the alternatives may pose and the estimates of the alternatives that users might choose to adopt. While there are some products that have comparable risks, there are a number of alternatives that are likely to be of lower risk, although EPA is unable to estimate the incremental change in the risk. To account for this uncertainty, EPA includes a lower and a higher estimate for the benefits from eliminating exposure to TCE. The lower benefits estimate assumes no benefits for TCE users that keep the same vapor degreasing machines and switch to methylene chloride, perchloroethylene, 1-BP, or designer solvent alternatives, assumes that TCE users switching to any other alternative suffer no adverse health effects associated with the alternatives (i.e., accrue the full benefits from eliminating TCE exposure), and applies a lowering factor to cancer risk estimates. The higher benefits estimate includes the benefit from entirely eliminating TCE exposure for all alternative compliance strategies, assumes that no risks are introduced by alternatives, and does not apply a lowering factor to cancer risk estimates. This inability to adequately account for adverse health effects of alternatives in the benefits analysis is expected to contribute most to the uncertainty in the estimates.

In addition, under certain assumptions EPA's economic analysis estimates that some TCE users will see a cost savings when switching to aqueous systems and certain other solvents. Standard economic theory suggests that financially rational companies would choose technologies that maximize profits so that regulatory outcomes would not typically result in a cost savings for the regulated facilities. There could be several reasons that cost savings might occur in the real world. Potential reasons include lack of complete information or barriers to obtaining information on the cost savings associated with alternatives as well as investment barriers or higher interest rates faced by firms. Additionally, there may be costs

associated with these alternatives that are not adequately accounted for in the analysis. To evaluate the effect of this uncertainty, EPA has included a sensitivity analysis that sets the cost savings to zero for these compliance alternatives (Ref. 3 at section 8.2). EPA also recognizes that these firms might experience positive costs of compliance rather than zero costs, so that the actual total costs could be higher than those in the sensitivity analysis. However, EPA has no current basis to estimate these potentially higher costs, since the available data appear to show that there are lower cost substitutes available. EPA requests comment and/or data on any hidden costs that may be missing from the analysis, or any other information that may help explain why some firms appear to be missing current opportunity for cost-savings substitutes.

There are also uncertainties in the estimates of the number of affected vapor degreasing machines, and for numbers of processors and distributors of TCE-containing products not prohibited by the proposed rule who are required to provide downstream notification and/or maintain records. The estimate for number of facilities using TCE-containing vapor degreasing machines is based upon available industry information and an industry expert (Ref. 3). To estimate the number of processors, EPA relied on public 2012 CDR data. The number of sites is reported in the CDR data as a range. The midpoint of the reported ranges was used to estimate the total number of sites using the chemical. Furthermore, the CDR data only includes processors immediately downstream of those reporting to CDR. Finally, EPA estimated the number of wholesaler firms distributing products containing TCE by taking a ratio of the number of Chemical and Allied Products Merchant Wholesaler firms to Basic Chemical Manufacturing firms and applying it to the estimated number of manufacturers and processors of TCE (Ref. 3).

EPA will consider additional information received during the public comment period. This includes public comments, scientific publications, and other input submitted to EPA during the comment period.

IX. Analysis Under TSCA Section 9 and TSCA Section 26(h) Considerations

A. TSCA Section 9(a) Analysis

Section 9(a) of TSCA provides that, if the Administrator determines in her discretion that an unreasonable risk may be prevented or reduced to a sufficient extent by an action taken under a Federal law not administered by EPA,

the Administrator must submit a report to the agency administering that other law that describes the risk and the activities that present such risk. If the other agency responds by declaring that the activities described do not present an unreasonable risk or if that agency initiates action under its own law to protect against the risk within the timeframes specified by TSCA section 9(a), EPA is precluded from acting against the risk under sections 6(a) or 7 of TSCA.

TSCA section 9(d) instructs the Administrator to consult and coordinate TSCA activities with other Federal agencies for the purpose of achieving the maximum enforcement of TSCA while imposing the least burden of duplicative requirements. For this proposed rule, EPA has consulted with OSHA.

OSHA assures safe and healthful working conditions for working men and women by setting and enforcing standards and by providing training, outreach, education and assistance. OSHA adopted an eight-hour time weighted average PEL of 100 ppm along with a ceiling limit in 1971 shortly after the agency was formed. It was based on the ACGIH recommended occupational exposure limit that was in place at that time. OSHA recognizes that the TCE PEL and many other PELs issued shortly after adoption of the OSHA Act in 1970 are outdated and inadequate for ensuring protection of worker health. OSHA recently published a Request for Information on approaches to updating PELs and other strategies to managing chemicals in the workplace (Ref. 12). OSHA's current regulatory agenda does not include revision to the TCE PEL or other regulations addressing the risks EPA has identified when TCE is used in vapor degreasing or the uses identified in a prior proposal (Ref. 1), aerosol degreasing or for spot cleaning in dry cleaning facilities (Ref. 12).

This proposed rule and the related proposal (Ref. 1), which EPA intends to finalize together, address risks in both workplace (both private- and public-sector) and consumer settings from exposure to TCE in vapor degreasers, aerosol spray degreasers, and as a spot cleaner at dry cleaning facilities. With the exception of TSCA, there is no Federal law that provides authority to prevent or sufficiently reduce these cross-cutting exposures. No other Federal regulatory authority, when considering the exposures to the populations and within the situations in its purview, can evaluate and address the totality of the risk that EPA is addressing in this proposal and the prior proposal on TCE uses (Ref. 1). For

example, OSHA may set exposure limits for workers but its authority is limited to the workplace and does not extend to consumer uses of hazardous chemicals. Further, OSHA does not have direct authority over state and local employees, and it has no authority at all over the working conditions of state and local employees in states that have no OSHA-approved State Plan under 29 U.S.C. 667. Other Federal regulatory authorities, such as CPSC, have the authority to only regulate pieces of the risks posed by TCE, such as when used in consumer products.

Moreover, recent amendments to TSCA, Public Law 114-182, alter both the manner of identifying unreasonable risk under TSCA and EPA's authority to address unreasonable risk under TSCA, such that risk management under TSCA is increasingly distinct from analogous provisions of the Consumer Product Safety Act (CPSA), the Federal Hazardous Substances Act, or the OSH Act. These changes to TSCA reduce the likelihood that an action under the CPSA, FHSA, or the OSH Act would reduce the risk of TCE from these uses to a sufficient extent under TSCA. Whereas (in a TSCA section 6 rule) an unreasonable risk determination sets the objective of the rule in a manner that excludes cost considerations, 15 U.S.C. 2605(b)(4)(A), subject to time-limited conditional exemptions for critical chemical uses and the like, 15 U.S.C. 2605(g), a consumer product safety rule under the CPSA must include a finding that "the benefits expected from the rule bear a reasonable relationship to its costs." 15 U.S.C. 2058(f)(3)(E). Additionally, recent amendments to TSCA reflect Congressional intent to "delete[] the paralyzing 'least burdensome' requirement," 162 Cong. Rec. S3517 (June 7, 2016). However, a consumer product safety rule under the CPSA must impose "the least burdensome requirement which prevents or adequately reduces the risk of injury for which the rule is being promulgated." 15 U.S.C. 2058(f)(3)(F). Analogous requirements, also at variance with recent revisions to TSCA, affect the availability of action under the FHSA relative to action under TSCA. 15 U.S.C. 1262. Gaps also exist between OSHA's authority to set workplace standards under the OSH Act and EPA's amended obligations to sufficiently address chemical risks under TSCA. To set PELs for chemical exposure, OSHA must first establish that the new standards are economically feasible and technologically feasible. 79 FR 61387 (2014). But under TSCA, EPA's substantive burden under TSCA § 6(a) is

to demonstrate that, as regulated, the chemical substance no longer presents an unreasonable risk, with unreasonable risk being determined without consideration of cost or other nonrisk factors.

TSCA is the only regulatory authority able to prevent or reduce risks from these uses of TCE to a sufficient extent across the range of uses and exposures of concern. In addition, these risks can be addressed in a more coordinated, efficient and effective manner under TSCA than under two or more different laws implemented by different agencies. Furthermore, there are key differences between the newly amended finding requirements of TSCA and those of the OSH Act, CPSA, and the FHSA. For these reasons, in her discretion, the Administrator does not determine that unreasonable risks from the use of TCE in vapor degreasers, aerosol spray degreasers, and as a spot cleaner at dry cleaning facilities may be prevented or reduced to a sufficient extent by an action taken under a Federal law not administered by EPA.

B. TSCA Section 9(b) Analysis

If EPA determines that actions under other Federal laws administered in whole or in part by EPA could eliminate or sufficiently reduce an unreasonable risk, section 9(b) of TSCA instructs EPA to use these other authorities unless the Administrator determines in the Administrator's discretion that it is in the public interest to protect against such risk under TSCA. In making such a public interest finding, TSCA section 9(b)(2) states: "the Administrator shall consider, based on information reasonably available to the Administrator, all relevant aspects of the risk . . . and a comparison of the estimated costs and efficiencies of the action to be taken under this title and an action to be taken under such other law to protect against such risk."

Although several EPA statutes have been used to limit TCE exposure, as discussed in Unit III.A., regulations under these EPA statutes have limitations because they largely regulate releases to the environment, rather than direct human exposure. SDWA only applies to drinking water. CAA does not apply directly to worker exposures or consumer settings where TCE is used. Under RCRA, TCE that is discarded may be considered a hazardous waste and subject to requirements designed to reduce exposure from the disposal of TCE to air, land and water. RCRA does not address exposures during use of products containing TCE. Only TSCA provides EPA the authority to regulate the manufacture (including import),

processing, and distribution in commerce, and use of chemical substances.

For these reasons, the Administrator does not determine that unreasonable risks from the use of TCE in vapor degreasers, aerosol spray degreasers, and as a spot cleaner at dry cleaning facilities could be eliminated or reduced to a sufficient extent by actions taken under other Federal laws administered in whole or in part by EPA.

C. Section 26(h) Considerations

EPA has used scientific information, technical procedures, measures, methods, protocols, methodologies, and models consistent with the best available science. For example, EPA based its proposed determination of unreasonable risk presented by the use of TCE in vapor degreasing systems on the completed risk assessment, which followed a peer review and public comment process, as well as using the best available science and methods (Ref. 2). A supplemental analysis was performed to better characterize the exposed populations and estimate the effects of various control options. This supplemental analysis was performed consistent with the methods and models used in the risk assessment. These analyses were developed for the purpose of determining whether the particular risks are unreasonable. They were also developed to support risk reduction by regulation under section 6 of TSCA, to the extent risks were determined to be unreasonable. It is reasonable and consistent to consider these analysis in this rulemaking for such relevant purposes.

The extent to which the various information, procedures, measures, methods, protocols, methodologies or models, as applicable, used in EPA's decision have been subject to independent verification or peer review is adequate to justify their use, collectively, in the record for this rule. Additional information on the peer review and public comment process, such as the peer review plan, the peer review report, and the Agency's response to comments, can be found on EPA's Assessments for TSCA Work Plan Chemicals Web page at <https://www.epa.gov/assessing-and-managing-chemicals-under-tscassessments-tscawork-plan-chemicals>.

X. Major Provisions and Enforcement of the Proposed Rule

This proposal relies on general provisions in the proposed Part 751, Subpart A, which can be found at 81 FR 91592 (December 16, 2016).

A. Prohibitions on TCE Manufacturing (Including Import), Processing, Distribution in Commerce, and Commercial Use

This proposal would prohibit the manufacture (including import), processing, distribution in commerce, and commercial use of TCE in vapor degreasing.

B. Downstream Notification

EPA has authority under TSCA section 6 to require that a substance or mixture or any article containing such substance or mixture be marked with or accompanied by clear and adequate warnings and instructions with respect to its use, distribution in commerce, or disposal or with respect to any combination of such activities. Many TCE manufacturers and processors are likely to manufacture or process TCE or TCE containing products for other uses that would not be regulated under this proposal. Other companies may be strictly engaged in distribution in commerce of TCE, without any manufacturing or processing activities, to customers for uses that are not regulated. As discussed in the prior proposal on TCE use in aerosol degreasers and as a spot remover agent in dry cleaning facilities, EPA is proposing a requirement for downstream notification by manufacturers (including importers), processors, and distributors of TCE for any use to ensure compliance with the proposed prohibitions on the manufacture, processing, distribution in commerce, and commercial use of TCE. Downstream notification is necessary for effective enforcement of the rule because it provides a record, in writing, of notification on use restrictions throughout the supply chain, likely via modifications to the Safety Data Sheet. Downstream notification also increases awareness of restrictions on use, which is likely to decrease unintentional uses of TCE. Downstream notification represents minimal burden and is necessary for effective enforcement of the rule. The specific requirement, that persons who manufacture (including import), process, or distribute in commerce TCE for any use would have to provide written notification of the restrictions to persons to whom TCE is shipped, was included in an earlier proposal on TCE use (Ref. 1). The specific recordkeeping requirements were also contained in the prior proposal (Ref. 1). Those provisions would require manufacturers (including importers), processors, and distributors of TCE for any use to retain documentation of the identity and

contact information for persons to whom TCE was shipped as well as the amount of TCE shipped, and a copy of the notification that was provided. This documentation would have to be retained for 3 years from the date of shipment.

As presented in the prior proposal (Ref. 1), the estimated costs of downstream notification and recordkeeping on an annualized basis over 20 years are \$3,200 and \$4,400 using 3% and 7% discount rates respectively.

C. Enforcement

TSCA section 15 makes it unlawful to fail or refuse to comply with any provision of a rule promulgated under TSCA section 6. Therefore, any failure to comply with this proposed rule when it becomes effective would be a violation of TSCA section 15. In addition, TSCA section 15 makes it unlawful for any person to: (1) Fail or refuse to establish and maintain records as required by this rule; (2) fail or refuse to permit access to or copying of records, as required by TSCA; or (3) fail or refuse to permit entry or inspection as required by TSCA section 11.

Violators may be subject to both civil and criminal liability. Under the penalty provision of TSCA section 16, any person who violates TSCA section 15 could be subject to a civil penalty for each violation. Each day of operation in violation of this proposed rule when it becomes effective could constitute a separate violation. Knowing or willful violations of this proposed rule when it becomes effective could lead to the imposition of criminal penalties and imprisonment. In addition, other remedies are available to EPA under TSCA sections 7 and 17.

Individuals, as well as corporations, could be subject to enforcement actions. TSCA sections 15 and 16 apply to "any person" who violates various provisions of TSCA. EPA may, at its discretion, proceed against individuals as well as companies. In particular, EPA may proceed against individuals who report false information or cause it to be reported.

D. Implementation Dates and Incentives

As proposed in the prior action on TCE use (Ref. 1), the downstream notification requirements and the recordkeeping requirements applicable to manufacturers (including importers) and processors of TCE for any use and persons who distribute TCE in commerce for any use (other than retailers) would take effect 45 days after the final rule is issued. EPA is proposing to make the ban on

manufacturing (including importing), processing, or distributing in commerce TCE for vapor degreasing uses, the downstream notification requirements, and the recordkeeping requirements effective 18 months after publication of the final rule. The ban on the use of TCE in vapor degreasing systems would take effect six months after that, or two years after publication of the final rule. EPA heard from the SERs who provided input to the SBAR Panel that converting from a vapor degreasing system that uses TCE to one that does not is often a time-intensive process (Ref. 32). SERs had different ideas on how long it would take for the conversion process. One SER observed that many users do not know exactly how clean their products must be, or how clean their existing system gets them. According to this SER, testing is needed to determine the required cleaning efficiency, and it can take six months for the testing. Changing to a new system could take an additional twelve to eighteen months. Another SER agreed with the estimate of two years for a changeover, while still another SER thought it could take anywhere from six months to four years. In light of this input, EPA believes that it is reasonable to establish the compliance date for the prohibition on TCE in vapor degreasing at two years from the date the final rule is promulgated. EPA believes that, in most cases, the transition can be made within this time, but EPA requests comment on whether there are special situations which may require more time.

EPA would like to encourage as many companies as possible to adopt less hazardous technologies, such as aqueous cleaning systems, instead of switching to an alternative that also presents health risks for workers, albeit of a lower magnitude than TCE. EPA's analysis indicates that the best answer for many vapor degreasing operations may be a switch to water-based cleaners, even though there are higher upfront costs. An effective system that works for a given application and that is acceptable to customers must be researched and designed, new equipment and cleaning solutions must be purchased, new permits may be required, operating and safety procedures must be updated, and affected employees must learn to operate the new equipment. However, once the system is up and running properly, operation of the system on an annual basis is likely to be less expensive and much less hazardous to employees than a vapor degreasing system using TCE.

EPA requests comment on its analysis of the alternatives and the impacts of

switching to less hazardous cleaners. EPA is particularly interested in comments and information on water and energy use associated with water-based cleaners and other less-toxic solvents, as well as on the costs of conversion from a system that uses TCE and the length of time such a conversion would take.

EPA is also requesting comment on potential incentives for vapor degreasing facilities to switch to less toxic alternatives. TSCA does not provide the authority for EPA to offer incentives such as tax credits, so there are a limited number of regulatory incentives available to EPA. One potential incentive would be a delayed implementation date for a ban on TCE use in vapor degreasing. This incentive would allow vapor degreasing facilities that intend to convert to aqueous cleaning systems a longer period of time to make the conversion. One way to administer this incentive would be to require vapor degreasing facilities to specifically request an extension for a certain length of time. Of course, in order to limit misuse of this extension opportunity, EPA would have to also require documentation of the facility's clear intention to convert to an aqueous cleaning system. This might include a description of the steps the company has already taken to implement a change to aqueous substitutes, or a description of the specific plan for implementing the change within the extension period requested, with some sort of documentation, such as a contract to purchase equipment. EPA also notes that TSCA section 6(d) generally provides that compliance dates for the start of a ban or phase-out promulgated under section 6(a) must be as soon as practicable, but not later than five years after the rule is promulgated, except for those critical or essential uses exempted under TSCA section 6(g). EPA requests comments on all aspects of this potential incentive, including comments on the length of time that should be allowed for an extension, what documentation should be required, and which technologies or solvents should be eligible for an extension and how to define them. EPA also requests comments on other potential incentives or regulatory flexibilities that EPA could incorporate to encourage the adoption of safer degreasing technologies. Finally, in keeping with the SBAR Panel recommendation regarding flexibility for small businesses, EPA requests comment on whether there are flexibilities other than delayed implementation dates that would be particularly advantageous for small

businesses while still ensuring that they address the unreasonable risks to which their workers may be exposed.

XII. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at <http://www2.epa.gov/laws-regulations/laws-and-executive-orders>.

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is an economically significant regulatory action that was submitted to the Office of Management and Budget (OMB) for review under Executive Orders 12866 (58 FR 51735, October 4, 1993) and 13563 (76 FR 3821, January 21, 2011). Any changes made in response to OMB recommendations have been documented in the docket. EPA prepared an economic analysis of the potential costs and benefits associated with this action, which is available in the docket and summarized in Unit VII. (Ref. 3).

B. Paperwork Reduction Act (PRA)

The information collection requirements in this proposed rule have been submitted to OMB for review and comment under the PRA, 44 U.S.C. 3501 *et seq.* The Information Collection Request (ICR) document prepared by the Agency has been assigned EPA ICR No. 2541.02. You can find a copy of the ICR in the docket for this proposed rule (Ref. 65), and it is briefly summarized here.

The information collection activities required under the proposed rule include a downstream notification requirement and a recordkeeping requirement. The downstream notification would require companies that ship TCE to notify companies downstream in the supply chain of the prohibitions of TCE in the proposed rule. The proposed rule does not require the regulated entities to submit information to EPA. The proposed rule also does not require confidential or sensitive information to be submitted to EPA or downstream companies. The recordkeeping requirement mandates companies that ship TCE to retain certain information at the company headquarters for three years from the date of shipment. These information

collection activities are necessary in order to enhance the prohibitions under the proposed rule by ensuring awareness of the prohibitions throughout the TCE supply chain, and to provide EPA with information upon inspection of companies downstream who purchased TCE. EPA believes that these information collection activities would not significantly impact the regulated entities.

Respondents/Affected Entities: TCE manufacturers, processors, and distributors.

Respondent's Obligation to Respond: Mandatory.

Estimated Number of Respondents: 697.

Frequency of Response: On occasion.

Total Estimated Burden: 348.5 hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total Estimated Cost: \$16,848 (per year).

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR are listed in 40 CFR part 9.

Submit your comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden to EPA using the docket identified at the beginning of this proposed rule. You may also send your ICR-related comments to OMB's Office of Information and Regulatory Affairs via email to oira_submission@omb.eop.gov. Attention: Desk Officer for EPA. Since OMB is required to make a decision concerning the ICR between 30 and 60 days after receipt, OMB must receive comments no later than February 21, 2017. EPA will respond to any ICR-related comments in the final rule.

C. Regulatory Flexibility Act (RFA)

Pursuant to section 603 of the RFA, 5 U.S.C. 601 *et seq.*, EPA prepared an initial regulatory flexibility analysis (IRFA) that examines the impact of the proposed rule on small entities along with regulatory alternatives that could minimize that impact. The complete IRFA is available for review in the docket and is summarized here (Ref. 66).

1. Need for the rule. Under TSCA section 6(a) (15 U.S.C. 2605(a)), if EPA determines after risk evaluation that a chemical substance presents an unreasonable risk of injury to health or the environment, without consideration of costs or other non-risk factors, including an unreasonable risk to a

potentially exposed or susceptible subpopulation identified as relevant to the risk evaluation, under the conditions of use, EPA must by rule apply one or more requirements to the extent necessary so that the chemical substance or mixture no longer presents such risk. Based on EPA's risk assessment of TCE (Ref. 2), EPA's proposed determination is that the use of TCE in vapor degreasing presents an unreasonable risk of injury to health and that the provisions of this proposal are necessary to address the unreasonable risk.

2. Objectives and legal basis. The legal basis for this proposal is TSCA section 6(a), which provides authority for the Administrator to apply requirements to the extent necessary so that a chemical substance or mixture no longer presents an unreasonable risk of injury to health or the environment. Additionally, for a chemical substance, such as TCE, which is listed in the 2014 update to the TSCA Work Plan for Chemical Assessments for which a completed risk assessment was published prior to the date of enactment of the Frank R. Lautenberg Chemical Safety for the 21st Century Act, TSCA section 26(l)(4) expressly authorizes EPA to issue rules under TSCA section 6(a) that are consistent with the scope of the completed risk assessment and consistent with the other applicable requirements of TSCA section 6.

3. Small entities covered by this proposal. EPA estimates that the proposal would affect approximately 2,500 to 6,000 small entities. The majority of these entities are commercial users of TCE in vapor degreasing machines in a variety of occupational settings such as metal plating, electronics assembly, metal or composite part fabrication, and repair shops.

4. Compliance requirements and the professional skills needed. To address the unreasonable risks that EPA has identified, this proposal would prohibit the manufacture (including import), processing, and distribution in commerce of TCE for use in vapor degreasing; prohibit commercial use of TCE in vapor degreasing; and require manufacturers, processors, and distributors, except for retailers, to provide downstream notification of this prohibition throughout the supply chain (e.g., via a Safety Data Sheet (SDS)), and to keep records. Complying with the prohibitions, the downstream notification, and the recordkeeping requirements involve no special skills. However, design and implementation of an alternative to vapor degreasing with

TCE may involve special skills, such as engineering experience.

5. Other Federal regulations. Other Federal regulations that affect the use of TCE in vapor degreasing are discussed in Unit III.A. of this preamble. Because the NESHAP regulates only emissions from vapor degreasing facilities, not worker exposures, and because the 1971 OSHA PEL is not sufficiently protective, EPA's proposal is not duplicative of other Federal rules nor does it conflict with other Federal rules.

6. Regulatory alternatives considered. EPA considered a wide variety of control measures and the Economic Analysis (Ref. 3) examined several alternative analytical options. However, EPA determined that most of the alternatives did not effectively address the unreasonable risk presented by TCE in vapor degreasing. The primary alternative considered by EPA was to allow the use of TCE in closed-loop vapor degreasing systems and require respiratory protection equipment for workers operating the equipment in the form of a full face piece self-contained breathing apparatus (SCBA) in pressure demand mode or other positive pressure mode with an APF of 10,000 with an alternative to the specified APF respirator of an air exposure limit. Depending on air concentrations and proximity to the vapor degreasing equipment, other employees in the area would also need to wear respiratory protection equipment. While this option would address the unreasonable risks presented by TCE in vapor degreasing, EPA's Economic Analysis indicates that this option is more expensive and, thus less cost effective than switching to a different solvent or cleaning system.

As required by section 609(b) of the RFA, EPA also convened a Small Business Advocacy Review (SBAR) Panel to obtain advice and recommendations from small entity representatives that potentially would be subject to the rule's requirements. The SBAR Panel evaluated the assembled materials and small-entity comments on issues related to elements of an IRFA. A copy of the full SBAR Panel Report is available in the rulemaking docket. The Panel recommended that EPA seek additional information on critical uses; availability, effectiveness, and costs of alternatives; implementation timelines; and exposure information to provide flexibility to lessen impacts to small entities, as appropriate. Throughout this preamble, EPA has requested information with respect to these and other topics. The Panel made the following specific recommendations:

a. *Critical uses.* The Panel recommended that EPA provide exemption, in accordance with TSCA section 6(g), for those critical uses for which EPA can obtain adequate documentation that:

- No technically and economically feasible safer alternative is available;
- Compliance with the ban would significantly disrupt the national economy, national security, or critical infrastructure; or
- The specific condition of use, as compared to reasonably available alternatives, provides a substantial benefit to health, the environment, or public safety.

To that end, the Panel recommended that EPA include in its proposal specific targeted requests for comment directed towards identifying critical uses (such as the aeronautics industry and national security) and obtaining information to justify exemptions. The Panel also recommended that EPA request public comment on allowing the use of TCE in closed-top vapor degreasing systems with the use of appropriate PPE.

b. *Alternatives.* The Panel recommended that EPA ensure that its analysis of the available alternatives to TCE in vapor degreasing complies with the requirements of section 6(c)(2)(C) and includes consideration, to the extent legally permissible and practicable, of whether technically and economically feasible alternatives that benefit health or the environment, compared to the use being prohibited or restricted, will be reasonably available as a substitute when the proposed requirements would take effect. Specifically, the Panel recommended that EPA:

- Evaluate the feasibility of using alternatives, including the cost, relative safety, and other barriers (such as space constraints, cleaning efficiency, increased energy use, cycle time, boiling points, and water use restrictions); and
- Take into consideration the current and future planned regulation of compounds the Agency has listed as alternatives.

c. *Implementation timelines.* The Panel recommended that EPA provide regulatory flexibility, as applicable, based on additional information, such as delayed compliance or a phase-out option, for small businesses that may be affected by the rule and in its proposal specifically request additional information regarding timelines for transitioning to alternative chemicals or technologies.

d. *Cost information.* The Panel also recommended that EPA specifically evaluate the cost to small business degreasing services without a viable

alternative to TCE (*i.e.*, the cost of going out of business). The Panel recommended that EPA request additional information on the cost to achieve reduced exposures in the workplace or to transition to alternative chemicals or technologies.

e. *Exposure information.* The Panel recommended that EPA include in its proposal specific requests for additional pertinent exposure data that may be available.

f. *Risk assessment.* The Panel recommended that EPA recognize the concerns that the SERs had on the risk assessment by referring readers to the risk assessment and the Agency's Summary of External Peer Review and Public Comments and Disposition document, which addresses those concerns, in the preamble of the proposed rulemaking.

D. Unfunded Mandates Reform Act (UMRA)

This action does not contain an unfunded mandate of \$100 million or more as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The requirements of this action would primarily affect persons who commercially use TCE in vapor degreasing equipment. The total estimated annualized cost of the proposed rule is approximately \$30 million to \$45 million at 3% and \$32 million to \$46 million at 7% (Ref. 3).

E. Executive Order 13132: Federalism

EPA has concluded that this action has federalism implications, as specified in Executive Order 13132 (64 FR 43255, August 10, 1999), because regulation under TSCA section 6(a) may preempt state law. EPA provides the following preliminary federalism summary impact statement. The Agency consulted with state and local officials early in the process of developing the proposed action to permit them to have meaningful and timely input into its development. EPA invited the following national organizations representing state and local elected officials to a meeting on May 13, 2015, in Washington DC: National Governors Association; National Conference of State Legislatures, Council of State Governments, National League of Cities, U.S. Conference of Mayors, National Association of Counties, International City/County Management Association, National Association of Towns and Townships, County Executives of America, and Environmental Council of States. A summary of the meeting with these organizations, including the views that they expressed, is available in the

docket (Ref. 67). Although EPA provided these organizations an opportunity to provide follow-up comments in writing, no written follow-up was received by the Agency.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications, as specified in Executive Order 13175 (65 FR 67249, November 9, 2000). This rulemaking would not have substantial direct effects on tribal government because TCE is not manufactured, processed, or distributed in commerce by tribes. TCE is not regulated by tribes, and this rulemaking would not impose substantial direct compliance costs on tribal governments. Thus, EO 13175 does not apply to this action. EPA nevertheless consulted with tribal officials during the development of this action, consistent with the EPA Policy on Consultation and Coordination with Indian Tribes.

EPA met with tribal officials in a national informational webinar held on May 12, 2015 concerning the prospective regulation of TCE under TSCA section 6, and in another teleconference with tribal officials on May 27, 2015 (Ref. 68). EPA also met with the National Tribal Toxics Council (NTTC) in Washington, DC and via teleconference on April 22, 2015 (Ref. 68). In those meetings, EPA provided background information on the proposed rule and a summary of issues being explored by the Agency. These officials expressed concern for TCE contamination on tribal lands and supported additional regulation of TCE.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This action is subject to Executive Order 13045 (62 FR 19885, April 23, 1997), because it is an economically significant regulatory action as defined by Executive Order 12866, and EPA believes that the environmental health or safety risk addressed by this action has a disproportionate effect on children, specifically on the developing fetus. Accordingly, we have evaluated the environmental health or safety effects of TCE used in vapor degreasing on children. The results of this evaluation are discussed in Units I.F., II.C., IV., and VI.C. of this preamble and in the economic analysis (Ref. 3).

Supporting information on the exposures and health effects of TCE exposure on children is also available in the Toxicological Review of Trichloroethylene (Ref. 4) and the TCE risk assessment (Ref. 2).

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution in Commerce, or Use

This proposed rule is not subject to Executive Order 13211 (66 FR 28355, May 22, 2001), because this action is not expected to affect energy supply, distribution in commerce, or use. This rulemaking is intended to protect against risks from TCE, and does not affect the use of oil, coal, or electricity.

I. National Technology Transfer and Advancement Act (NTTAA)

This proposed rulemaking does not involve technical standards, and is therefore not subject to considerations under NTTAA section 12(d), 15 U.S.C. 272 note.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

Executive Order 12898 (59 FR 7629, February 16, 1994) establishes federal executive policy on environmental justice. Its main provision directs federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing,

as appropriate, disproportionately high and adverse health or environmental effects of their programs, policies and activities on minority populations and low-income populations in the U.S. Units IV. and VI. of this preamble address public health impacts from TCE. EPA has determined that there would not be a disproportionately high and adverse health or environmental effects on minority, low income, or indigenous populations from this proposed rule.

List of Subjects in 40 CFR Part 751

Environmental protection, Chemicals, Export certification, Hazardous substances, Import certification, Recordkeeping.

Dated: January 11, 2017.

Gina McCarthy,
Administrator.

Therefore, 40 CFR part 751, as proposed to be added at 81 FR 91592 (December 16, 2016), is proposed to be further amended to read as follows:

PART 751—REGULATION OF CERTAIN CHEMICAL SUBSTANCES AND MIXTURES UNDER SECTION 6 OF THE TOXIC SUBSTANCES CONTROL ACT

■ 1. The authority citation for part 751 continues to read as follows:

Authority: 15 U.S.C. 2605.

■ 2. In § 751.303, add the definition “Vapor” in alphabetical order to read as follows:

§ 751.303 Definitions.

* * * * *

Vapor degreasing means a cleaning process involving heating a solvent to produce a hot vapor which is then used to remove contaminants such as grease, oils, dust, and dirt from fabricated parts and other materials.

■ 3. Add § 751.309 to read as follows:

§ 751.309 Vapor degreasing.

(a) After [*date 18 months after the date of publication of the final rule*], all persons are prohibited from manufacturing (including import), processing, and distributing in commerce TCE and mixtures containing TCE for use in vapor degreasing.

(b) After [*date 2 years after the date of publication of the final rule*], all persons are prohibited from commercial use of TCE and mixtures containing TCE in vapor degreasing.

Environmental Protection Agency

40 CFR Part 751

Methylene Chloride and N-Methylpyrrolidone; Regulation of Certain Uses
Under TSCA Section 6(a); Proposed Rule

ENVIRONMENTAL PROTECTION AGENCY**40 CFR Part 751**

[EPA-HQ-OPPT-2016-0231; FRL-9958-57]

RIN 2070-AK07

Methylene Chloride and N-Methylpyrrolidone; Regulation of Certain Uses Under TSCA Section 6(a)**AGENCY:** Environmental Protection Agency (EPA).**ACTION:** Proposed rule.

SUMMARY: Methylene chloride, also called dichloromethane, is a volatile chemical that has a variety of uses, including paint and coating removal. N-methylpyrrolidone (NMP) is a solvent used in a variety of applications, including paint and coating removal. For each of these chemicals, EPA has identified risks of concern associated with their use in paint and coating removal. EPA proposes a determination that these are unreasonable risks. EPA is proposing to prohibit the manufacture (including import), processing, and distribution in commerce of methylene chloride for consumer and most types of commercial paint and coating removal under section 6 of the Toxic Substances Control Act (TSCA). EPA is also proposing to prohibit the use of methylene chloride in these commercial uses; to require manufacturers (including importers), processors, and distributors, except for retailers, of methylene chloride for any use to provide downstream notification of these prohibitions throughout the supply chain; and to require recordkeeping. EPA is proposing an initial ten-year time-limited exemption from these proposed regulations on methylene chloride for coating removal uses critical for national security. First, EPA is proposing to prohibit the manufacture (including import), processing, and distribution in commerce of NMP for all consumer and commercial paint and coating removal; to prohibit the use of NMP for all commercial paint and coating removal; to require, consistent with methylene chloride restrictions, downstream notification of these prohibitions throughout the supply chain; to require recordkeeping; and to provide a time-limited exemption from these proposed regulations on NMP for coating removal uses critical for national security. For NMP, as an alternate proposal, EPA is proposing that (1) commercial users of NMP for paint and coating removal establish a worker protection program for dermal and respiratory protection

and not use paint and coating removal products that contain greater than 35 percent NMP by weight (except for product formulations destined to be used by DoD or its contractors performing work only for DOD projects); and (2) processors of products containing NMP for paint and coating removal reformulate products such that these products do not exceed a maximum of 35 percent NMP by weight, identify gloves that provide effective protection for the formulation, and provide warning and instruction labels on the products.

DATES: Comments must be received on or before April 19, 2017.

ADDRESSES: Submit your comments, identified by docket identification (ID) number EPA-HQ-OPPT-2016-0231, at <http://www.regulations.gov>. Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or withdrawn. EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.*, on the web, cloud, or other file sharing system). For additional submission methods (*e.g.*, mail or hand delivery), the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit <http://www2.epa.gov/dockets/commenting-epa-dockets>.

Docket. Docket number EPA-HQ-OPPT-2016-0231 contains supporting information used in developing the proposed rule, comments on the proposed rule, and additional supporting information. A public version of the docket is available for inspection and copying between 8:30 a.m. and 4:30 p.m., Monday through Friday, excluding federal holidays, at the U.S. Environmental Protection Agency, EPA Docket Center Reading Room, WJC West Building, Room 3334, 1301 Constitution Avenue NW., Washington, DC 20004. A reasonable fee may be charged for copying.

FOR FURTHER INFORMATION CONTACT: For technical information contact: Ana Corado, Chemical Control Division, Office of Pollution Prevention and

Toxics, Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460-0001; telephone number 202-564-0140; email address: corado.ana@epa.gov. For other information contact: Niva Kramek, Chemical Control Division, Office of Pollution Prevention and Toxics, Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460-0001; telephone number: 202-564-4830; email address: kramek.niva@epa.gov.

For general information contact: The TSCA-Hotline, ABVI-Goodwill, 422 South Clinton Ave., Rochester, NY 14620; telephone number: (202) 554-1404; email address: TSCA-Hotline@epa.gov.

SUPPLEMENTARY INFORMATION:**I. Executive Summary***A. Does this action apply to me?*

You may potentially be affected by this proposed action if you manufacture (defined under Toxic Substances Control Act (TSCA) to include import), process, distribute in commerce, or use methylene chloride or NMP for paint and coating removal. Paint and coating removal, also referred to as paint stripping, is the process of removing paint or other coatings from a surface. The following list of North American Industrial Classification System (NAICS) codes is not intended to be exhaustive, but rather provides a guide to help readers determine whether this document applies to them. Potentially affected entities may include:

- Chemical and Allied Products Manufacturers (NAICS code 32411).
- Ship building and repairing (NAICS code 336611)
- Aircraft manufacturing (NAICS code 336411)
- Museums (NAICS code 712110)
- Independent Artists, Writers, and Performers (NAICS code 711510)
- Reupholster and furniture repair (NAICS code 811420)
- Automotive body, paint, and interior repair and maintenance (NAICS code 81121)
- Flooring contractors (NAICS code 238330)
- Painting and wall covering contractors (NAICS code 238320)

This action may also affect certain entities through pre-existing import certification and export notification rules under TSCA. Persons who import any chemical substance governed by a final TSCA section 6(a) rule are subject to the TSCA section 13 (15 U.S.C. 2612) import certification requirements and the corresponding regulations at 19 CFR

12.118 through 12.127; see also 19 CFR 127.28. Those persons must certify that the shipment of the chemical substance complies with all applicable rules and orders under TSCA. The EPA policy in support of import certification appears at 40 CFR part 707, subpart B. In addition, any persons who export or intend to export a chemical substance that is the subject of this proposed rule are subject to the export notification provisions of TSCA section 12(b) (15 U.S.C. 2611(b)), and must comply with the export notification requirements in 40 CFR part 707, subpart D.

If you have any questions regarding the applicability of this proposed action to a particular entity, consult the technical information contact listed under **FOR FURTHER INFORMATION CONTACT**.

B. What is the Agency's authority for taking this action?

Under TSCA section 6(a) (15 U.S.C. 2605(a)), if EPA determines after risk evaluation that a chemical substance presents an unreasonable risk of injury to health or the environment, without consideration of costs or other non-risk factors, including an unreasonable risk to a potentially exposed or susceptible subpopulation identified as relevant to the risk evaluation, under the conditions of use, EPA must by rule apply one or more requirements to the extent necessary so that the chemical substance or mixture no longer presents such risk.

With respect to a chemical substance listed in the 2014 update to the TSCA Work Plan for Chemical Assessments for which a completed risk assessment was published prior to the date of enactment of the Frank R. Lautenberg Chemical Safety for the 21st Century Act, TSCA section 26(l)(4) (15 U.S.C. 2625(l)(4)) expressly authorizes EPA to issue rules under TSCA section 6(a) that are consistent with the scope of the completed risk assessment and consistent with the other applicable requirements of TSCA section 6. Methylene chloride and NMP are such chemical substances (Ref. 1). They are listed in the 2014 update to the TSCA Work Plan and the completed risk assessments were published in 2014 and 2015, respectively. The scope of each completed risk assessment includes consumer and commercial paint and coating removal.

C. What action is the Agency taking?

EPA proposes a determination that the uses of methylene chloride or NMP in paint and coating removal present an unreasonable risk of injury to health. Accordingly, for methylene chloride,

EPA is proposing under section 6 of TSCA to prohibit the manufacture (including import), processing, and distribution in commerce of methylene chloride for all consumer and for most types of commercial paint and coating removal uses. EPA is also proposing under TSCA section 6 to prohibit the use of methylene chloride for commercial paint and coating removal in the specified sectors, which include painting and decorating, floor refinishing, automotive refinishing, civilian aircraft refinishing, graffiti removal, renovations and contracting, bridge repair and repainting, and marine craft refinishing and repair. EPA is not proposing at this time to regulate the use of methylene chloride in commercial furniture refinishing, also referred to as furniture stripping or refinishing conducted by professionals or commercial workers. EPA is also proposing to exempt certain uses of methylene chloride for coating removal that EPA proposes are critical for national security.

EPA is also proposing to require that any paint or coating removal products containing methylene chloride that continue to be distributed be packaged in containers with a volume no less than 55 gallons, except for formulations specifically manufactured for the Department of Defense, which may be distributed in containers with volumes no less than 5 gallons. EPA is also proposing to require manufacturers (including importers), processors, and distributors, except for retailers, of methylene chloride for any use to provide downstream notification of these requirements and prohibitions throughout the supply chain; and to require limited recordkeeping. More details on this supply chain approach are in Unit VI.C.3.

EPA intends to issue a separate proposal on methylene chloride in paint and coating removal in commercial furniture refinishing, but plans to issue one final rule covering both this proposal and the future proposed rule on methylene chloride in paint and coating removal in commercial furniture refinishing. More information on such a future proposal that would directly address methylene chloride in paint and coating removal in furniture refinishing is in Unit XI.

For NMP, EPA is co-proposing two different options to reduce the unreasonable risks presented by NMP in paint and coating removal for consumers and commercial users. EPA is co-proposing these two options because the Agency is interested in public consideration of these approaches, and is soliciting comments

regarding the extent to which these approaches could reduce the unreasonable risks the Agency has identified.

Under the first approach co-proposed for NMP (option 1), EPA is proposing to prohibit the manufacture (including import), processing, and distribution in commerce of NMP for all consumer and commercial paint and coating removal, with exemptions for certain coating removal uses that EPA proposes are critical to national security. EPA is also proposing to prohibit the commercial use of NMP for paint and coating removal, with exemptions for certain coating removal uses that EPA proposes are critical to national security. These exemptions include the condition that any exempt paint and coating removal products containing NMP be packaged in containers with a volume no less than 5 gallons. Unlike the option proposed for methylene chloride, these exemptions do not include the use of NMP in furniture refinishing. EPA is also proposing to require manufacturers (including importers), processors, and distributors, except for retailers, of NMP for any use to provide downstream notification of these prohibitions throughout the supply chain; and to require limited recordkeeping.

Under the second approach proposed for NMP, EPA is proposing a reformulation, PPE, and labeling approach. This would require product reformulation to limit the concentration of NMP in paint and coating removal products; testing of product formulations to identify specialized gloves that provide protection; relabeling of products to provide additional information to consumers; an occupational dermal and respiratory protection program for commercial use of NMP in paint and coating removal, downstream notification when distributing NMP for other uses, and limited recordkeeping. Under this approach, no exemption is proposed for coating removal identified as critical for national security because paint and coating removal products containing NMP would continue to be available for these national security uses under this option, even without establishing a national security exemption.

EPA is requesting public comment on these proposals.

D. Why is the Agency taking this action?

Based on EPA's analysis of worker and consumer populations' exposures to methylene chloride and NMP in paint and coating removal, EPA proposes a determination that methylene chloride and NMP in paint and coating removal present an unreasonable risk to human

health. For methylene chloride, the health impacts of its use in paint and coating removal include death (due to asphyxiation), liver toxicity, kidney toxicity, reproductive toxicity, specific cognitive impacts, and cancers such as brain cancer, liver cancer, certain lung cancers, non-Hodgkin's lymphoma, and multiple myeloma (Ref. 2). Some of these effects result from a very short, acute exposure; others follow years of occupational exposure. For NMP, these health effects include developmental toxicity (e.g., fetal death or decreased infant birth weight), neurotoxicity, immunotoxicity, liver and kidney toxicity, and reproductive toxicity (Ref. 3).

It is important to note that while both methylene chloride and NMP are used in paint and coating removal, products containing NMP have in recent years become increasingly popular substitutes for users interested in avoiding the health effects or odors known to be associated with products containing methylene chloride. While exposures to these chemicals have been assessed using different health endpoints, EPA proposes a determination that the use of either methylene chloride or NMP in paint and coating removal presents unreasonable risks. For this reason, EPA proposes to address the unreasonable risks presented by both chemicals in one rule.

Although EPA proposes to determine that the identified risks to workers exposed to methylene chloride in commercial furniture refinishing are unreasonable, EPA is not proposing to regulate these risks at this time. EPA intends to issue a separate proposal addressing the use of methylene chloride in paint and coating removal in commercial furniture refinishing. See Unit XI.

As discussed in Unit V.C., EPA is not proposing to prohibit all manufacturing, processing, distribution in commerce, and use of methylene chloride or NMP, of which paint and coating removal is estimated to comprise 25% and 9% of the use of each chemical, respectively (Refs. 2 and 3).

E. What are the estimated incremental impacts of this action?

EPA proposes to determine that the identified risks from methylene chloride and NMP in paint and coating removal are unreasonable. Apart from that proposed determination, EPA has evaluated the potential costs of the proposed approach of (1) prohibiting the manufacture (including import), processing, and distribution in commerce of methylene chloride for all consumer paint and coating removal in

the sectors specified in section I.C of this preamble, exempting specific uses critical to national security; (2) prohibiting the commercial use of methylene chloride for paint and coating removal in the specified sectors; (3) requiring any paint and coating removal products containing methylene chloride to be packaged for distribution in commerce in containers with volumes no less than 55 gallons so as to reduce diversion to restricted uses, except for formulations specifically manufactured for the Department of Defense; (4) requiring manufacturers (including importers), processors, and distributors, except for retailers, to provide downstream notification of these prohibitions throughout the supply chain; and (5) requiring associated recordkeeping requirements. EPA has also evaluated the costs of the two co-proposed options for NMP.

Under the first option, this includes (1) prohibiting the manufacture (including import), processing, and distribution in commerce of NMP for all paint and coating removal, exempting specific uses critical to national security; (2) prohibiting the commercial use of NMP for paint and coating removal exempting specific uses critical to national security; (3) requiring any paint and coating removal products containing NMP to be packaged for distribution in commerce in containers with a volume no less than 5 gallons; (4) requiring manufacturers (including importers), processors, and distributors of NMP for any use, except for retailers, to provide downstream notification of these prohibitions throughout the supply chain; and (5) requiring associated recordkeeping requirements. Under the second option, this includes: (1) Prohibiting the manufacture, processing, and distribution in commerce of paint and coating removal products containing more than 35 percent NMP by weight except for products used for critical national security uses; (2) Requiring product formulators to test gloves for the product formulations being processed and distributed in commerce for other than exempt critical national security uses to identify specialized gloves that provide protection for users and keep records relevant to these tests; (3) Requiring product formulators to label products with information for consumers about the risks presented by the products and how to reduce these risks during use, including identifying which specialized gloves provide protection against the specific formulation; (4) Requiring product formulators to provide information for commercial users about

reducing risks when using the product, via product labels, SDS, and other methods of hazard communication, and to keep records; (5) Prohibiting the commercial use of paint and coating removal products that contain more than 35 percent by weight of NMP, except for critical national security uses; and (6) Requiring commercial users to establish worker protection programs for dermal and respiratory protection, including hazard communication and training, and to require their employees to wear specialized gloves, impervious clothing that covers most of the body, and a respirator with an assigned protection factor (APF) of 10 or compliance with an alternative air exposure limit.

This analysis, which is available in the docket, is discussed in Units VII.A. and XVII.A., and is briefly summarized here.

Costs of the proposed approach and relevant alternate approaches for each chemical are discussed in Units VII.A. for methylene chloride and XVII.A. for NMP. Costs for the whole proposal follow. Costs to users of methylene chloride or NMP for paint and coating removal under the first co-proposed approach for NMP are \$2,517,000 to \$50,801,000 annualized for 20 years at a discount rate of 3% and \$3,114,000 to \$50,916,000 at a discount rate of 7%. Costs to users of methylene chloride or NMP for paint and coating removal under the second co-proposed approach for NMP are \$114,164,860 to \$124,893,000 annualized for 20 years at a discount rate of 3% and \$114,658,000 to \$125,438,000 at a discount rate of 7%. As described in more detail in the Economic Analysis (Ref. 4) and supplement to the Economic Analysis (Ref. 127), there are estimated to be approximately 13,000 commercial firms and 2,002,000 consumers who use methylene chloride or NMP in paint and coating removal that would be affected; costs per firm and for each household are estimated to include costs of alternative formulations of paint removal products, additional time spent applying or removing paint with alternative methods or substitute products, and other cost factors. For product processors and formulators, the costs of paint and coating removal product reformulations for methylene chloride and NMP under the first co-proposed approach for NMP are estimated to be approximately \$17,000 to \$34,000 per year (annualized at 3% over 20 years) and \$23,000 to \$43,000 (annualized at 7% over 20 years). For product processors and formulators, the costs of paint and coating removal product reformulations for methylene

chloride and NMP under the second co-proposed approach for NMP are estimated to be approximately \$25,140 to \$41,140 per year (annualized at 3% over 20 years) and \$34,160 to \$55,160 (annualized at 7% over 20 years). Only 17 firms are estimated to be affected. For manufacturers, processors, and distributors of methylene chloride or NMP under the first co-proposed approach for NMP, the costs of downstream notification and recordkeeping on an annualized basis over 20 years are \$140 and \$160 using 3% and 7% discount rates respectively. For manufacturers, processors, and distributors of methylene chloride or NMP under the second co-proposed approach for NMP, the costs of downstream notification and recordkeeping on an annualized basis over 20 years are \$140 and \$160 using 3% and 7% discount rates respectively (the same as under the first co-proposed approach). Approximately 30 firms are estimated to be affected. Agency costs for enforcement for each chemical, under the first co-proposed approach for NMP, are estimated to be approximately \$114,401 and \$111,718 annualized over 20 years at 3% and 7%, respectively (Ref. 4). Total Agency costs for enforcement, for both chemicals together under the first co-proposed approach for NMP, are estimated to be approximately \$228,802 and \$223,436 annualized over 20 years at 3% and 7%. Agency costs for enforcement for each chemical, under the second co-proposed approach for NMP, are estimated to be approximately \$114,401 and \$111,718 annualized over 20 years at 3% and 7%, respectively for methylene chloride and \$1,024,144 and \$998,711 annualized over 20 years at 3% and 7% respectively for NMP (Ref. 127). Total Agency costs for enforcement, for both chemicals together under the second co-proposed approach for NMP, are estimated to be approximately \$1,138,545 and \$1,110,429 annualized over 20 years at 3% and 7%.

In summary, total costs of the proposed rule under the first co-proposed approach for NMP are estimated to be \$2,763,000 to \$51,070,000 annualized over 20 years at 3% and \$3,361,000 to \$51,163,000 annualized over 20 years at 7% (Ref. 4). Total costs of the proposed rule under the second co-proposed approach for NMP are estimated to be \$114,196,000 to \$124,893,000 annualized over 20 years at 3% and \$114,658,000 to \$125,438,000 annualized over 20 years at 7% (Ref. 127).

Although methylene chloride in paint and coating removal can cause a wide range of non-cancer adverse effects,

cancer, and death and NMP can cause a variety of developmental non-cancer adverse effects, monetized benefits included only the subset of benefits associated with reducing cancer risks or deaths that occur at a known rate among users or bystanders. Methodological limitations prevent EPA from being able to include a quantification or monetary valuation estimate of the other non-cancer benefits at this time, and thus there is not a quantification or monetary valuation estimate for the overall total benefits. Based on the costs and benefits that EPA can estimate, the monetized benefits for the proposed approach range from approximately \$14,354,000 to \$14,558,000 on an annualized basis over 20 years at 3% and \$13,791,000 to \$13,919,000 at 7% (Ref. 4). EPA also considered non-monetized benefits that would result from the prevention of non-cancer adverse effects associated with methylene chloride or NMP in paint and coating removal, including nervous system effects, liver toxicity, kidney toxicity, and reproductive effects from exposure to methylene chloride in paint and coating removal; and developmental toxicity, fetal death, fetal body weight reductions, kidney toxicity, liver toxicity, immunotoxicity, and reproductive toxicity from exposure to NMP in paint and coating removal (Refs. 2 and 3).

F. Children's Environmental Health

This action is consistent with the 1995 EPA Policy on Evaluating Health Risks to Children (<http://www.epa.gov/children/epas-policy-evaluating-risk-children>). In its risk assessments for methylene chloride and NMP, EPA identified risks to children from exposure to methylene chloride and NMP used in paint and coating removal. EPA has also identified women of childbearing age as a potentially exposed or susceptible subpopulation who may be at greater risk than the general population of adverse health effects from exposure to NMP. EPA has identified this subpopulation as relevant to EPA's risk assessment for NMP due to NMP's effects on the developing fetus. Therefore, the risk management standard under Section 6 of TSCA, with respect to NMP, is to reduce the risk posed by NMP so that it no longer presents an unreasonable risk (either to users in the general population or to users who are women of childbearing age). In its TSCA Work Plan Risk Assessment for methylene chloride, EPA identified risks from inhalation exposure to children who may be present as bystanders in homes where paint removal occurs. These risks include neurological effects such as

cognitive impairment, sensory impairment, dizziness, incapacitation, and loss of consciousness (leading to risks of falls, concussion, and other injuries). The supporting non-cancer risk analysis of children as bystanders conducted in the TSCA Work Plan Risk Assessment for methylene chloride meets the 1995 EPA Policy on Evaluating Health Risks to Children. Supporting information on the health effects of methylene chloride exposure to children is available in the Toxicological Review of Methylene Chloride (Ref. 5) and the Final Risk Assessment on Methylene Chloride (Ref. 2), as well as Units VI.C.1. and VI.D.

In the TSCA Work Plan Risk Assessment for NMP, EPA identified developmental toxicity as the most sensitive endpoint for NMP exposure (*i.e.*, fetal death and decreased fetal birth weight) for the most sensitive human life stages (*i.e.*, women of childbearing age between the ages of 16 and 49 years and the fetus) (Ref. 3). The supporting non-cancer risk analysis of children and women of childbearing age conducted in the TSCA Work Plan Risk Assessment for NMP meets the 1995 EPA Policy on Evaluating Health Risks to Children.

II. Overview of Methylene Chloride and Uses Subject to This Proposed Rule

A. What chemical is included in the proposed rule?

This proposed rule would apply to methylene chloride (CASRN 75-09-2) when used in paint and coating removal except for several specified uses, including as part of commercial furniture refinishing and uses critical to national security.

B. What are the uses of methylene chloride?

Methylene chloride is a solvent used in a variety of industrial, commercial and consumer use applications, including (Ref. 2):

- Paint remover
 - Adhesive
 - Aerosol propellant
 - Metal cleaner and degreaser
 - Chemical processor for polycarbonate resins and cellulose triacetate (photographic film)
 - Feedstock in the production of the refrigerant hydrofluorocarbon-32
- Minor uses of methylene chloride include (Ref. 2):

- Extraction solvent for oils, waxes, fats, spices, and hops
- Tablet coating for pharmaceuticals

According to the 2012 Chemical Data Reporting (CDR) information, approximately 260 million pounds of

methylene chloride were produced or imported into the United States that year, with between 80% to 96% produced in the United States (Ref. 2). In terms of environmental releases, 277 facilities reported a total of 3.2 million pounds of releases of methylene chloride to the 2014 Toxics Release Inventory (Ref. 6).

Individuals, including workers, consumers, and the general population, are exposed to methylene chloride from industrial/commercial and consumer sources in different settings such as homes and workplaces, and through multiple routes (inhalation, dermal, and ingestion).

The use assessed by EPA that is the subject of this proposal, methylene chloride in paint and coating removal, represents about 25% of total use of methylene chloride. This is a decrease from the 1980s, when approximately 50% of the total methylene chloride market was composed of paint removal use (Ref. 2). Paint and coating removal is the application of a chemical or use of another method to remove, loosen, or deteriorate any paint, varnish, lacquer, graffiti, surface protectants, or other coatings from a substrate. Substrates can include objects, vehicles, architectural features, or structures. This use is discussed in detail in Unit VI.B.

Although the TSCA Work Plan Chemical risk assessment for methylene chloride focused on the chemical's use in paint and coating removal, EPA announced in December 2016 its designation of methylene chloride as one of the ten chemical substances that will undergo risk evaluation pursuant to section 6(b)(2)(A) of TSCA (81 FR 91927). The Agency is proceeding with this proposed rule addressing methylene chloride in paint and coating removal in accordance with TSCA section 26(l) and asks for comment on its decision to pursue risk management for specific conditions of use of methylene chloride while preparing to conduct a risk evaluation of remaining conditions of use of methylene chloride under TSCA section 6(b).

C. What are the potential health effects of methylene chloride?

Methylene chloride is a likely human carcinogen, a neurotoxicant, and acutely lethal. Acute and chronic exposures to methylene chloride are primarily associated with neurological and hepatic effects. The primary target organ of methylene chloride acute toxicity is the brain, and neurological effects result from either direct narcosis or the formation of carbon monoxide. Carbon monoxide is one of the metabolic byproducts of methylene chloride, and

reversibly binds to hemoglobin as carboxyhemoglobin. Part of the effect of methylene chloride on the central nervous system comes from the accumulation of carboxyhemoglobin in the blood, which can lead to sensory impairment, dizziness, incapacitation, loss of consciousness, heart failure, and death (Ref. 2). Hemoglobin in the fetus has a higher affinity for carbon monoxide than does adult hemoglobin. Thus, the neurotoxic and cardiovascular effects may be exacerbated in fetuses and in infants with higher residual levels of fetal hemoglobin when exposed to high concentrations of methylene chloride (Ref. 2).

During acute exposures, methylene chloride primarily affects the brain, though effects on lung, liver, and kidney have also been reported in humans following acute exposures. Acute exposures to methylene chloride can be fatal; acute lethality in humans following inhalation exposure is related to central nervous system depressant effects. Effects include loss of consciousness and respiratory depression, resulting in irreversible coma, hypoxia, and eventual death. Acute non-lethal effects in humans are similarly related to the central nervous system and can include incapacitation, loss of consciousness, heart failure, and coma. Other acute non-lethal effects in humans include neurobehavioral deficits measured in psychomotor tasks, such as tests of hand-eye coordination, visual evoked response changes, and auditory vigilance (Ref. 2).

Since 1976, more than 40 deaths have been attributed to methylene chloride when used in paint and coating removal (Ref. 7); in some cases, two or more individuals have died during a single job when air concentrations quickly reached lethal levels, potentially in less than 10 minutes. In other situations, individuals have died when entering rooms or facilities in which paint or coating removal was previously conducted and air concentrations of methylene chloride remained dangerously high (Ref. 7).

Chronic exposures to methylene chloride are associated with cancer and non-cancer hepatic effects. Methylene chloride is likely to be carcinogenic in humans with a mutagenic mode of action. This mutagenic mode of action is supported by the weight of evidence from multiple *in vivo* and *in vitro* studies. There is a risk for some specific cancers, including brain cancer, liver cancer, non-Hodgkin lymphoma, and multiple myeloma. Additionally, several cancer bioassays in animals have identified the liver and lung as the most sensitive target organs for tumor

development induced by methylene chloride (Ref. 2).

Non-cancer effects of chronic exposure to methylene chloride are primarily hepatic; the liver is the most sensitive target for non-cancer toxicity. Lifetime exposure in rats dosed with different concentrations is associated with hepatic vacuolation, degeneration, or liver necrosis. Other non-cancer effects of chronic methylene chloride exposure include renal tubular degeneration in rats and mice, testicular atrophy in mice, and ovarian atrophy in mice (Ref. 2).

D. What are the environmental impacts of methylene chloride?

Pursuant to TSCA section 6(c), EPA in this unit describes the effects of methylene chloride on the environment and the magnitude of the exposure of the environment to methylene chloride. The proposed unreasonable risk determination, however, is based solely on risks to human health since these risks are the most serious consequence of use of methylene chloride and are sufficient to support this proposed action.

1. *Environmental effects and impacts.* Methylene chloride is mainly released to the environment in air, and to a lesser extent in water and soil, due to industrial and consumer uses as a solvent, in aerosol products, and in paint and coating removal. Many chemical waste sites contain methylene chloride and these might act as additional sources of environmental contamination through spills, leaks, or evaporation. Because methylene chloride evaporates readily, most releases enter the air. In the air, it is broken down by sunlight and by reaction with other chemicals present in the air. In the air, methylene chloride's half-life is between 53 to 127 days (Ref. 8).

Ecotoxicity studies for methylene chloride have been conducted in fish, aquatic invertebrates, and aquatic plants. Based on available data, in the methylene chloride risk assessment EPA concluded that methylene chloride has low aquatic toxicity for fish, aquatic invertebrates, and aquatic plants (Ref. 2).

While methylene chloride is moderately persistent, given its low bioaccumulation and low hazard for aquatic toxicity, the magnitude of potential environmental impacts on ecological receptors is judged to be low for the environmental releases associated with methylene chloride in paint removal. This should not be misinterpreted to mean that methylene chloride does not pose environmental

concerns. Through other regulations, EPA is addressing methylene chloride releases to air and contamination of groundwater, drinking water, and contaminated soils. While the primary concern with this contamination has been human health, there is potential for methylene chloride exposures to ecological receptors in some cases (Ref. 2). More information about regulations to reduce environmental impacts of methylene chloride is in Unit III.

2. *What is the global warming potential of methylene chloride?* Global warming potential (GWP) measures the potency of a greenhouse gas over a specific period of time, relative to carbon dioxide, which has a high GWP of 1 regardless of the time period used. Due to its volatility, methylene chloride enters the atmosphere where it reacts slowly enough to undergo atmospheric transport and act as a greenhouse gas. Methylene chloride has been reported to the Intergovernmental Panel on Climate Change as a global warming potential chemical with a value of 8.7 GWP, or approximately 8.7 times more heat absorptive than carbon dioxide (Ref. 2).

3. *What is the ozone depletion potential of methylene chloride?* Methylene chloride is not an ozone-depleting substance and is listed as acceptable under the Significant New Alternatives Policy program for metal and electronic cleaning (degreasing), aerosol solvents, foam blowing agents, and other uses (59 FR 13044, March 18, 1994).

4. *Is methylene chloride a volatile organic compound (VOC)?* Though volatile, methylene chloride is exempt from being classified as a VOC as defined at 40 CFR 51.100(c). A VOC is any compound of carbon, excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate, which participates in atmospheric photochemical reactions. Because methylene chloride has negligible atmospheric photochemical reactions, it is not classified as a VOC (40 CFR 51.100(s)(1)).

5. *Does methylene chloride persist in the environment and bioaccumulate?* Due to its volatility, methylene chloride does not significantly partition to solid phases. Therefore, releases of methylene chloride to the environment are likely to evaporate to the atmosphere, or if released to soil, migrate to groundwater. Methylene chloride has been shown to biodegrade over a range of rates and environmental conditions. Measured bioconcentration factors for methylene chloride suggest its bioconcentration potential is low (Ref. 2).

III. Regulatory Actions Pertaining to Methylene Chloride

This section summarizes current state, federal, and international regulations and restrictions on methylene chloride, with a focus on its use in paint and coating removal. None of these actions imposes requirements to the extent necessary so that methylene chloride does not present the unreasonable risk described in this proposed rule.

A. Federal Actions Pertaining to Methylene Chloride

Methylene chloride has been the subject of U.S. federal regulations by EPA, the Consumer Product Safety Commission (CPSC), the Food and Drug Administration (FDA), and the Occupational Safety and Health Administration (OSHA). EPA and other agencies have taken actions (see below) to address the serious human health risks from specific sources and routes of methylene chloride exposure, but none of these actions sufficiently mitigate the risks that EPA is proposing to address under TSCA section 6(a).

EPA has issued several final rules and notices pertaining to methylene chloride under EPA's various authorities.

- *Clean Air Act:* Methylene chloride is designated as a hazardous air pollutant (HAP) under the Clean Air Act (42 U.S.C. 7412(b)(1))CAA). EPA issued a final rule in January 2008 that promulgated National Emission Standards for Hazardous Air Pollutants (NESHAP) for area sources engaged in paint stripping, surface coating of motor vehicles and mobile equipment, and miscellaneous surface coating operations. In this NESHAP, EPA listed "Paint Stripping," "Plastic Parts and Products (Surface Coating)," and "Autobody Refinishing Paint Shops" as area sources of HAPs that contribute to the risk to public health in urban areas. The final rule included emissions standards that reflect the generally available control technology or management practices in each of these area source categories, and applies to paint stripping operations using methylene chloride (73 FR 1738, January 9, 2008). In 2014, EPA issued a final rule for Flexible Polyurethane Foam Manufacturing that banned the use of methylene chloride as a foam-blowing agent (79 FR 48073, August 15, 2014). In 2015, EPA issued a final rule for Aerospace Manufacturing and Rework Facilities, which updated a NESHAP from 1995 by adding limitations to reduce organic and inorganic emissions HAPs, including methylene chloride, from specialty coating application operations; and

removed exemptions for periods of startup, shutdown and malfunction so that affected units would be subject to the emission standards at all times (80 FR 76152, December 7, 2015).

- *Solid Waste Disposal Act:* Methylene chloride is listed as a hazardous waste under the Resource Conservation and Recovery Act (RCRA) (Code U080) (Ref. 2).

- *Emergency Planning and Community Right-to-Know Act:* Methylene chloride is listed on the Toxics Release Inventory (TRI) pursuant to section 313 of the Emergency Planning and Community Right-to-Know Act (Ref. 2).

- *Safe Drinking Water Act:* The Safe Drinking Water Act (SDWA) requires EPA to determine the level of contaminants in drinking water at which no adverse health effects are likely to occur. EPA has set a maximum contaminant level goal of zero and an enforceable maximum contaminant level for methylene chloride at 0.005 mg/L or 5 parts per billion (57 FR 31776, July 17, 1992).

Regulation of methylene chloride by other agencies includes:

- In 1987, CPSC issued a statement of policy explaining that CPSC considers household products containing methylene chloride to be hazardous substances and providing guidance on labeling of such products. Labels of products containing methylene chloride are required to state that inhalation of methylene chloride vapor has caused cancer in certain laboratory animals, and the labels must specify precautions to be taken during use by consumers (52 FR 34698, September 14, 1987). In 2016, CPSC was petitioned by the Halogenated Solvents Industry Alliance to amend the statement of interpretation and enforcement policy regarding labeling of household products containing methylene chloride; CPSC published that petition for public comments (81 FR 60298, September 1, 2016).

- In 1989, FDA banned methylene chloride as an ingredient in all cosmetic products because of its animal carcinogenicity and likely hazard to human health (21 CFR 700.19). Before 1989, methylene chloride had been used in aerosol cosmetic products, such as hairspray (54 FR 27328 (June 29, 1989)).

- OSHA has taken steps to reduce exposure to methylene chloride in occupational settings. In 1997, OSHA lowered the permissible exposure limit (PEL) for methylene chloride from an eight-hour time-weighted average (TWA) of 500 parts per million (ppm) to an eight-hour TWA of 25 ppm and a 15-minute short-term exposure limit

(STEL) of 125 ppm. This standard also includes provisions for initial exposure monitoring, engineering controls, work practice controls, medical monitoring, employee training, personal protective equipment, and recordkeeping (29 CFR 1910.1052).

- The Department of Housing and Urban Development (HUD) has prohibited methylene chloride and other hazardous chemicals for use in removing lead-based paint by HUD contractors and anyone receiving grants or engaging in the HOME Program, which was created by the National Affordable Housing Act of 1990 (Ref. 9).

- The National Institute for Occupational Safety and Health (NIOSH) considers methylene chloride a potential occupational carcinogen and currently recommends an exposure limit of the “lowest feasible concentration” of methylene chloride (Ref. 10). NIOSH and OSHA in 2013 issued a hazard alert for bathtub refinishing with methylene chloride, warning that methylene-chloride based products are extremely dangerous and that the best way to prevent exposure is to use products that do not contain methylene chloride (Ref. 11).

B. State Actions Pertaining to Methylene Chloride

Several states have taken actions to reduce or make the public aware of risks from methylene chloride. For example, since 2011 methylene chloride has been prohibited from use in graffiti removal in the District of Columbia and 11 states (California, Connecticut, Delaware, Illinois, Indiana, Maine, Maryland, Michigan, New Jersey, New York, and Rhode Island) (Ref. 12). Iowa, Indiana, South Carolina, and other states have established detection monitoring regulations for methylene chloride (567 IAC 113.15, 329 IAC 10–21–15, S.C. Code Regs. 16–107.198, Appx. III). In Alaska, methylene chloride is listed as a carcinogenic hazardous substance (18 AAC 75.341). Methylene chloride is listed on California’s Safer Consumer Products regulations candidate list of chemicals that exhibit a hazard trait and are on an authoritative list of either chemical hazard traits or potential exposure concerns (Ref. 13). Methylene chloride is also listed on California’s Proposition 65 list of chemicals known to cause cancer, birth defects, or reproductive harm (Ref. 13). In Minnesota, it has been found that methylene chloride may negatively affect the nervous system and cause cancer (Minn. R. 4717.8200, Minn. R. 4717.8100). The state of Washington has listed methylene chloride as a human carcinogen and a chemical of high

concern to children (WAC 296–62–07473, WAC 173–334–130). In Pennsylvania, it is listed as an environmental and special hazardous substance (34 Pa. Code XIII, Ch. 323.2(a)).

All states have set PELs identical to the OSHA 25 ppm eight-hour time weighted average (TWA) PEL (79 FR 61384, October 10, 2014), however it is worth noting that California, Oregon, and Washington, which have a state PEL identical to the OSHA PEL, have slightly different requirements than OSHA for medical evaluation, fit testing for respirators, and implementation timelines related to methylene chloride (8 CCR 5502, OAR 437–002–1052, WAC 296–62–07470). The OSHA PEL is considerably higher than the levels at which EPA identified risks of concern for methylene chloride in paint and coating removal and would not be protective for the unreasonable risks identified.

C. International Actions Pertaining to Methylene Chloride

Methylene chloride is also regulated internationally and industrial and commercial sectors in certain other countries have moved to alternatives.

In Canada, the Canadian Minister of the Environment published in 2003 a Notice under Part 4 of the “Canadian Environmental Protection Act, 1999” requiring the preparation and implementation of pollution prevention plans for methylene chloride (Ref. 14). This Notice targets persons involved in the use of methylene chloride for the following activities: Aircraft paint stripping; flexible polyurethane foam blowing; pharmaceuticals and chemical intermediates manufacturing and tablet coating; industrial cleaning; and adhesive formulations. Also in 2003, Environment Canada published a Code of Practice for the reduction of methylene chloride emissions from the use of paint and coating removal products in commercial furniture refinishing and other stripping applications (Ref. 14). This Code of Practice was developed by a multi-stakeholder technical working committee, which consisted of industry representatives (*i.e.*, furniture refinishers, auto body shops, formulators of paint and coating removal products, solvent recovery firms), government personnel, and environmental non-governmental organizations.

In the European Union, the European Commission amended its Registration, Evaluation, Authorization, and Restriction of Chemical substances in 2010 to incorporate restrictions for the

use of methylene chloride in paint removers. Methylene chloride is banned in the European Union from: (1) Placement on the market in a new product for consumers/professionals after December 2010; (2) placement on the market in any product for consumers/professionals after December 2011; and (3) use by professionals after June 2012. Member States could allow the use of methylene chloride if they have a program to license and train professionals in the following: Awareness; evaluation and management of risks; use of adequate ventilation; and use of appropriate personal protective equipment (Ref. 15). The United Kingdom has issued a derogation to allow professional use of methylene chloride (Ref. 16). In addition, industrial installations using methylene chloride must have effective ventilation, minimize evaporation from tanks, and have measures for safe handling of methylene chloride in tanks, adequate personal protective equipment, and adequate information and training for operators. Paint and coating removers containing methylene chloride in a concentration equal to or greater than 0.1% by weight must include a label: “Restricted to industrial use and to professionals approved in certain EU Member States—verify where use is allowed” (Ref. 15).

IV. Methylene Chloride Risk Assessment and Outreach

In 2013, EPA identified methylene chloride in paint and coating removal as a priority for risk assessment under the TSCA Work Plan. This unit describes the development of the methylene chloride risk assessment and supporting analysis and expert input on the uses that are the subject of this proposed rule. A more detailed discussion of the risks associated with methylene chloride in paint and coating removal can be found in Unit VI.C.1.

A. TSCA Work Plan for Chemical Assessments

In 2012, EPA released the “TSCA Work Plan Chemicals: Methods Document” in which EPA described the process the Agency intended to use to identify potential candidate chemicals for near-term review and assessment under TSCA (Ref. 17). EPA also released the initial list of TSCA Work Plan chemicals identified for further assessment under TSCA as part of its chemical safety program (Ref. 1).

The process for identifying these chemicals for further assessment under TSCA was based on a combination of hazard, exposure, and persistence and bioaccumulation characteristics, and is

described in the TSCA Work Plan Chemicals Methods Document (Ref. 17). Using the TSCA Work Plan chemical prioritization criteria, methylene chloride ranked high for health hazards and exposure potential and was included on the initial list of TSCA Work Plan chemicals for assessment. Methylene chloride appeared in the 2012 TSCA Work Plan for Chemical Assessments and in the 2014 update of the TSCA Work Plan for Chemical Assessments.

B. Methylene Chloride Risk Assessment

EPA finalized a TSCA Work Plan Chemical Risk Assessment for methylene chloride (methylene chloride risk assessment) in August 2014, following the 2013 peer review of the 2012 draft methylene chloride risk assessment. All documents from the 2013 peer review of the draft methylene chloride risk assessment are available in EPA Docket Number EPA-HQ-OPPT-2012-0725. The completed risk assessment is included in that docket.

The methylene chloride risk assessment evaluated health risks to consumers, workers, and bystanders from inhalation exposures to methylene chloride when used in paint and coating removal (Ref. 2). EPA assumes workers and consumers would be adults of both sexes 16 and older, including pregnant women. EPA assumes bystanders in commercial or occupational settings would be worker non-users or adjacent workers, while bystanders in residential settings would be individuals of any age group (*e.g.*, children, adults, the elderly) nearby during product application. During scoping and problem formulation for the risk assessment, EPA focused on paint and coating removal because it was expected to involve frequent or routine use of methylene chloride in high concentrations and/or have high potential for human exposure (Ref. 2). However, this does not mean that EPA found that other uses not included in the methylene chloride risk assessment present low risk.

The methylene chloride risk assessment characterized human health effects associated with paint removal with methylene chloride. Based on the physical-chemical properties of methylene chloride and the paint and coating removal use scenarios described in the assessment, EPA assessed inhalation as the predominant route of exposure to methylene chloride during paint removal. Though highly volatile compounds such as methylene chloride may also be absorbed through the skin, EPA does not have the data nor the methodology to assess methylene chloride dermal exposure during paint

removal. As a result, the assessment may underestimate total exposures to methylene chloride during paint removal due to this inability to evaluate dermal exposure (Ref. 2).

The methylene chloride risk assessment identified risks of concern following acute (short-term) and chronic exposures for workers and consumers conducting paint removal with methylene chloride, as well as for exposed bystanders, including residents of homes in which paint removal is conducted and worker non-users adjacent to other workers conducting paint removal. The acute risks identified include death; neurological impacts such as coma, incapacitation, loss of consciousness, and dizziness; and liver effects. The chronic risks identified include brain, liver, lung, and hematopoietic cancers and liver damage (Ref. 2).

Margins of exposure (MOEs) were used in this assessment to estimate non-cancer risks for acute exposures (for consumers and workers) and chronic exposures (for workers). The MOE is the point of departure (an approximation of the no-observed adverse effect level (NOAEL)) for a specific health endpoint divided by the exposure concentration for the specific scenario of concern. The benchmark MOE accounts for the total uncertainty in a point of departure, including: (1) The variation in sensitivity among the members of the human population (*i.e.*, interhuman or intraspecies variability); (2) the uncertainty in extrapolating animal data to humans (*i.e.*, interspecies variability); (3) the uncertainty in extrapolating from data obtained in a study with less-than-lifetime exposure to lifetime exposure (*i.e.*, extrapolating from subchronic to chronic exposure); and (4) the uncertainty in extrapolating from a lowest observed adverse effect level rather than from a NOAEL (Ref. 18). MOEs provide a non-cancer risk profile by presenting a range of estimates for different non-cancer health effects for different exposure scenarios, and are a widely recognized method for evaluating a range of potential non-cancer health risks from exposure to a chemical. For non-cancer effects EPA estimated exposures that are significantly larger than the point of departure, thus resulting in MOEs that are significantly less than the benchmark MOE (Ref. 2). For methylene chloride, EPA identified acute or chronic non-cancer risks of concern if the MOE estimates were less than the benchmark MOE of 10 (Ref. 2). The health endpoint used for the benchmark MOE for acute exposure to methylene chloride is central nervous system

effects, such as dizziness or incapacitation; the health endpoint used for the benchmark MOE for chronic exposure to methylene chloride is liver toxicity. These are the most sensitive adverse health effects from exposure to methylene chloride.

Methylene chloride is a likely human carcinogen; cancer risks determine the estimated incremental increased probability of an individual in an exposed population developing cancer over a lifetime following exposure to the chemical under specified use scenarios. Standard cancer benchmarks used by EPA and other regulatory agencies are an increased cancer risk of 1 in 1,000,000 ranging to 1 in 10,000 (*i.e.*, 1×10^{-6} to 1×10^{-4}). For cancer effects, EPA estimated that workers and occupational bystanders exposed to methylene chloride in paint and coating removal have an increase in cancer risk that ranged from 10 times to almost 1,000 times greater than a cancer benchmark of 1 in 1,000,000, depending on the specific way paint or coating removal was conducted with methylene chloride (Ref. 2).

The levels of acute and chronic exposures estimated to present low risk for non-cancer effects also result in low risk for cancer.

The assessment identified the following risks from acute exposures to methylene chloride when used in paint and coating removal (Ref. 2):

- Acute risks of incapacitation, coma, or death in workers exposed to methylene chloride in paint removers when no respiratory protection is used. In some industries with high exposure scenarios, these risks of incapacitation or death are present even when respiratory protection is used.

- Acute risks of neurological effects for most workers. These risks are present even when respiratory protection is used.

- Acute risks of neurological effects for consumer users of methylene chloride as a paint remover.

- Acute risks of neurological effects for bystanders (including children and worker non-users) in the location in which paint removers containing methylene are used by either residents or commercial users. These risks are also present for exposures to methylene chloride in a location after the paint removal work is complete, because methylene chloride can remain in the air in spaces that are enclosed, confined, or lacking ventilation.

Based on the risk assessment scenarios, EPA identified the following non-cancer risks from chronic exposures to methylene chloride in paint and coating removal (Ref. 2):

- Non-cancer risks for liver effects for most workers (including worker non-users, or adjacent workers) in industries conducting paint removal.

- Non-cancer risks occur for most workers (including adjacent workers) when exposed to paint removers containing methylene chloride even when wearing respiratory protection in the exposure scenarios that predominantly demonstrate variations in exposure conditions (*i.e.*, exposure frequency and working years) in facilities reporting central tendency or high-end air levels of methylene chloride. Among all the occupational scenarios, the greatest risk of concern is for workers engaging in long-term use of or exposure to methylene chloride as a paint remover (*i.e.*, 250 days/year for 40 years) with no respiratory protection.

The assessment identified the following cancer risks from chronic exposures to methylene chloride when used in paint removal (Ref. 2):

- Cancer risks for workers (including adjacent workers) exposed to methylene chloride as a paint remover in various industries. These cancer risks include liver cancer, lung cancer, brain cancer, non-Hodgkin lymphoma, and multiple myeloma.

- The greatest cancer risks occur for workers exposed to methylene chloride when used as a paint remover who have no respiratory protection and are exposed for an extended period.

C. Supplemental Analysis Consistent With the Methylene Chloride Risk Assessment

Following the methylene chloride risk assessment, EPA conducted supplemental analyses to inform risk management. These analyses are consistent with the scope of the methylene chloride risk assessment and were based on the peer-reviewed methodology used in the methylene chloride risk assessment. They included identification of baseline and central tendency exposure scenarios, impacts of reduced methylene chloride content in paint removers, addition of local exhaust ventilation (LEV), use of personal protective equipment (PPE), additional consumer exposure scenarios, and methods of monitoring to determine workplace exposures. The results of EPA's analyses are available in this rulemaking docket (Refs. 19, 20, and 21). Prior to promulgation of the final rule, EPA will peer review the "Respirator and Glove Specifications for Workers Exposed to Methylene Chloride in Paint and Coating Removal," "Supplemental Consumer Exposure and Risk Estimation Technical Report for Methylene Chloride in Paint and

Coating Removal", and "Recommendation for an Existing Chemical Exposure Concentration Limit (ECEL) for Occupational Use of Methylene Chloride and Workplace Air Monitoring Methods for Methylene Chloride" (Refs. 19, 20, 21).

D. Outreach

In addition to the consultations described in Unit XXIII.C., EPA engaged in discussions with experts on and users of paint removers (Ref. 22). The purpose of these discussions was to hear from users, academics, manufacturers, and members of the public health community about practices related to paint removal in various industries and by consumers; the importance of methylene chloride and NMP in paint removal; frequently-used substitute chemicals or alternative paint removal methods; engineering control measures and personal protective equipment currently in use or feasibly adoptable for paint removal; and other risk reduction approaches that may have already been adopted or considered for commercial or consumer paint removal. Informed by these discussions and by industry and other governmental research, EPA has concluded that alternatives to methylene chloride and NMP are available for nearly all paint removal uses.

EPA is continuing to gather information, to the extent practicable, regarding the availability of alternatives to methylene chloride for furniture refinishing. EPA plans to continue to engage stakeholders to identify what methods may be available as alternatives to methylene chloride. After collecting the information, EPA expects to address this use of methylene chloride so that the substance no longer poses an unreasonable risk and intends to issue separately a proposal in the future. Also see Unit XI.

V. Regulatory Approach for Methylene Chloride in Paint and Coating Removal

A. TSCA Section 6(a) Unreasonable Risk Analysis

Under TSCA section 6(a), if the Administrator determines that a chemical substance presents an unreasonable risk of injury to health or the environment, without consideration of costs or other non-risk factors, including an unreasonable risk to a potentially exposed or susceptible subpopulation identified as relevant to the Agency's risk evaluation, under the conditions of use, EPA must by rule apply one or more requirements to the extent necessary so that the chemical substance no longer presents such risk.

TSCA section 6(a) requirements can include one or more, or a combination of, the following actions:

- Prohibit or otherwise restrict the manufacturing, processing, or distribution in commerce of such substances (§ 6(a)(1)).
- Prohibit or otherwise restrict the manufacturing, processing, or distribution in commerce of such substances for particular uses or for uses in excess of a specified concentration (§ 6(a)(2)).
- Require minimum warning labels and instructions (§ 6(a)(3)).
- Require recordkeeping or testing (§ 6(a)(4)).
- Prohibit or regulate any manner or method of commercial use (§ 6(a)(5)).
- Prohibit or otherwise regulate any manner or method of disposal (§ 6(a)(6)).
- Direct manufacturers and processors to give notice of the determination to distributors and the public and replace or repurchase substances (§ 6(a)(7)).

EPA analyzed a wide range of regulatory options under section 6(a) for each use in order to select the proposed regulatory approach (Refs. 23 and 24). For each use, EPA considered whether a regulatory option (or combination of options) would address the identified unreasonable risks so that the chemical substance no longer presents such risks. EPA found that an option that could reduce exposures such that they would achieve the benchmark MOE for the most sensitive non-cancer endpoint would address the risk of concern for other non-cancer endpoints. Additionally, EPA's assessments for methylene chloride in paint and coating removal found that exposures that meet the benchmark MOE for the most sensitive non-cancer endpoint would also not result in cancer risks of concern.

After the technical analysis, which represents EPA's assessment of the potential for the regulatory options to achieve risk benchmarks based on analysis of exposure scenarios, EPA then considered how reliably the regulatory options would actually reach these benchmarks. For the purposes of this proposal, EPA found that an option addressed the risk so that it was no longer unreasonable if the option could achieve the benchmark MOE or cancer benchmark for the most sensitive endpoint. In considering whether a regulatory option would ensure the chemical no longer presents the unreasonable risk, the Agency considered whether the option could be realistically implemented or whether there were practical limitations on how well the option would mitigate the risks

in relation to the benchmarks, as well as whether the option's protectiveness was influenced by concerns related to environmental justice, children's health, and potentially exposed or susceptible subpopulations identified as relevant to the Agency's risk evaluation.

B. TSCA Section 6(c)(2) Considerations

TSCA section 6(c)(2) requires EPA to consider and publish a statement based on reasonably available information with respect to the:

- Health effects of the chemical substance or mixture (in this case, methylene chloride) and the magnitude of human exposure to methylene chloride;
- Environmental effects of methylene chloride and the magnitude of exposure of the environment to methylene chloride;
- Benefits of methylene chloride for various uses;
- Reasonably ascertainable economic consequences of the rule, including: The likely effect of the rule on the national economy, small business, technological innovation, the environment, and public health; the costs and benefits of the proposed and final rule and of the one or more primary alternatives that EPA considered; and the cost-effectiveness of the proposed rule and of the one or more primary alternatives that EPA considered.

In addition, in selecting among prohibitions and other restrictions available under TSCA section 6(a), EPA must factor in, to the extent practicable, these considerations. Further, in deciding whether to prohibit or restrict in a manner that substantially prevents a specific condition of use of a chemical substance or mixture, and in setting an appropriate transition period for such action, EPA must also consider, to the extent practicable, whether technically and economically feasible alternatives that benefit health or the environment will be reasonably available as a substitute when the proposed prohibition or other restriction takes effect.

EPA's analysis of the health effects and magnitude of exposure to methylene chloride can be found in Units IV.B., VI.C.1. and VI.D., which discuss the methylene chloride risk assessment and EPA's regulatory assessment of methylene chloride in paint and coating removal. A discussion of the environmental effects of methylene chloride is in Unit II.D.

With respect to the costs and benefits of this proposal and the alternatives EPA considered, as well as the impacts on small businesses, the full analysis is presented in the Economic Analysis

(Ref. 4). To the extent information was reasonably available, EPA considered the benefits realized from risk reductions (including monetized benefits, non-monetized quantified benefits, and qualitative benefits), offsets to benefits from countervailing risks (e.g., risks from chemical substitutions and alternative practices), the relative risk for environmental justice populations and children and other potentially exposed or susceptible subpopulations (as compared to the general population), the cost of regulatory requirements for the various options, and the cost effectiveness of the proposed action and the one or more primary alternate regulatory options. A discussion of the benefits EPA considered can be found in Units VI.D. and VII.B. as well as in the Economic Analysis (Ref. 4).

EPA considered the estimated costs to regulated entities as well as the cost to administer and enforce the options. For example, an option that includes use of a respirator would include inspections to evaluate compliance with all elements of a respiratory protection program (Ref. 25). In understanding the burden, EPA took into account reasonably available information about the functionality and performance efficacy of the regulatory options and the ability to implement the use of chemical substitutes or other alternatives. Reasonably available information included the existence of other Federal, state, or international regulatory requirements associated with each of the regulatory options as well as the commercial history for the options. A discussion of the costs EPA considered and a discussion of the cost-effectiveness of the proposal and the primary alternate regulatory options that EPA considered is in Units VI.F. and VII.A. In addition, a discussion of the impacts on small businesses is in Unit XXIII. and in the Initial Regulatory Flexibility Analysis and Report from the Small Business Advocacy Review Panel (Refs. 26 and 27).

With respect to the anticipated effects of this proposal on the national economy, EPA considered the number of businesses and workers that would be affected and the costs and benefits to those businesses and workers. In addition, EPA considered the employment impacts of this proposal, as discussed in section 9.2 of the Economic Analysis (Ref. 4). EPA found that the direction of change in employment is uncertain, but EPA expects the short term and longer-term employment effects to be small.

The benefits of methylene chloride in paint and coating removal are discussed

in Unit VI.B., along with the availability of alternatives. The dates that the proposed restrictions would take effect are discussed in Unit X. The availability of alternatives to methylene chloride in paint and coating removal on those dates is discussed in Unit VI.E.

Finally, with respect to this proposal's effect on technological innovation, EPA expects this action to spur innovation, not hinder it. An impending prohibition on this use of methylene chloride is likely to increase demand for alternatives, which EPA expects would result in the development of new alternatives. See also section 9.3 in the Economic Analysis (Ref. 4).

C. Regulatory Options Receiving Limited Evaluation

EPA analyzed a wide range of regulatory options under TSCA section 6(a). There are a range of regulatory options under TSCA; only those pertaining to these risks were evaluated in detail. An overview of the regulatory options not evaluated in detail follows.

First, EPA reasoned that the TSCA section 6(a)(1) regulatory option to prohibit the manufacture, processing or distribution in commerce of methylene chloride or limit the amount of methylene chloride which may be manufactured, processed or distributed in commerce is not germane because EPA is not proposing to ban or limit the manufacture, processing or distribution in commerce of methylene chloride for uses other than paint and coating removal.

In addition, EPA determined that the TSCA section 6(a)(6) regulatory option to prohibit or otherwise regulate any manner or method of disposal of the chemical is not applicable since EPA did not assess risks associated with methylene chloride disposal.

Another option EPA evaluated would require warning labels and instructions on paint and coating removal products containing methylene chloride, pursuant to TSCA section 6(a)(3) (Ref. 28). However, EPA reasoned that warning labels and instructions alone could not significantly mitigate the unreasonable risks presented by methylene chloride in paint and coating removal. EPA based its reasoning on an analysis of 48 relevant studies or meta-analyses, which found that consumers and professionals do not consistently pay attention to labels for hazardous substances; consumers, particularly those with lower literacy levels, often do not understand label information; consumers and professional users often base a decision to follow label information on previous experience and perceptions of risk; even if consumers

and professional users have noticed, read, understood, and believed the information on a hazardous chemical product label, they may not be motivated to follow the label information, instructions, or warnings; and consumers and professional users have varying behavioral responses to warning labels, as shown by mixed results in studies (Ref. 28). Additionally, workers being exposed may not be in a position to influence their employer's decisions about the type of paint removal method, or ensure that their employer provides appropriate PPE and an adequate respiratory protection program.

These conclusions are based on the weight-of-evidence analysis that EPA conducted of the available literature on the efficacy of labeling and warnings. This analysis indicates that a label's effectiveness at changing user behavior to comply with instructions and warnings depends on the attributes of the label and the user, and how those interact during multiple human information processing stages, including attention, comprehension, judgement, and action (Ref. 28).

Numerous studies have found that product labels and warnings are effective to some degree. However, the extent of the effectiveness has varied considerably across studies and some of the perceived effectiveness may not reflect real-world situations. This is because interactions among labels, users, the environment, and other factors greatly influence the degree of a label's effectiveness at changing user behavior (Ref. 28). In addition, while some studies have shown that certain components of labels and warnings tend to have some influence, it is less clear how effective labels and warnings are likely to be over time, as users become habituated to both the labels and the products.

Presenting information about methylene chloride on a product label would not adequately address the unreasonable risk presented by this use of this chemical because the nature of the information the user would need to read, understand, and act upon is extremely complex. When the precaution or information is simple or uncomplicated (e.g., do not mix this cleaner with bleach or do not mix this cleaner with ammonia), it is more likely the user will successfully understand and follow the direction. In contrast, it would be challenging to most users to follow the complex product label instructions required to explain how to reduce exposures to the extremely low levels needed to minimize the risk from methylene chloride. Rather than a

simple message, the label would need to explain a variety of inter-related factors, including but not limited to the use of local exhaust ventilation, respirators and assigned protection factor, and effects to bystanders. Currently, though some paint removers containing methylene chloride are labeled with information about its fatal effects if used without "adequate ventilation" (Ref. 28) and this information appears on the product safety data sheet, deaths continue to occur. It is unlikely that label language changes for this use of methylene chloride will result in widespread, consistent, and successful adoption of risk reduction measures by users.

Any use of labels to promote or regulate safe product use should be considered in the context of other potential risk reduction techniques. As highlighted by a 2014 expert report for the Consumer Product Safety Commission (CPSC), "safety and warnings literature consistently identify warnings as a less effective hazard-control measure than either designing out a hazard or guarding the consumer from a hazard. Warnings are less effective primarily because they do not prevent consumer exposure to the hazard. Instead, they rely on persuading consumers to alter their behavior in some way to avoid the hazard" (Ref. 29). Specifically regarding methylene chloride, effective personal protection resulting in risk reduction would require this altered behavior to include the appropriate use of a supplied-air respirator. Consumer users are particularly unlikely to acquire and correctly use such an apparatus in response to reading a warning label (Ref. 19). Any labeling aiming to reduce risks to consumer or commercial users of these products would need to sufficiently and clearly explain the importance of the supplied-air respirator, and would still leave the user with the problem of obtaining and properly using the supplied-air respirator, which is a particularly expensive piece of equipment (Ref. 4). Further, for the effective use of a respirator, particularly an air-supplied respirator, there would need to be fit-testing of the respirator and training in its use.

While EPA reasons that revised labeling will not address the unreasonable risk presented by methylene chloride in paint and coating removal, as a result of recommendations from the Small Business Advocacy Review (SBAR) Panel to solicit information from the public about the potential efficacy of labeling, following advice from the small entity

representatives who participated in the SBAR process (Ref. 27), EPA requests public comments on enhanced labeling requirements for consumer paint and coating removal products containing methylene chloride as a method for reducing exposure to methylene chloride in these products. More information about the SBAR process, the Panel recommendations, and advice from small businesses related to this proposal are in Unit XXIII. and in the Panel Report (Ref. 27).

While this regulatory option alone would not adequately address the unreasonable risks, EPA recognizes that the TSCA section 6(a)(3) warnings and instruction requirement can be an important component of an approach that addresses unreasonable risks associated with a specific use prohibition. EPA has included a downstream notification requirement as part of the proposed rule to ensure that users would be made aware of the prohibition on the use of methylene chloride in paint and coating removal.

An additional regulatory option receiving limited evaluation was a training and certification program for commercial paint and coating removers, similar to the certification process required under EPA's Lead-Based Paint Renovation, Repair, and Painting Rule (73 FR 21692, April 22, 2008). This option was recommended by the small entity representatives as part of the SBAR process (Ref. 27). EPA considered this option as an approach to reducing risks from methylene chloride in paint and coating removal. However, unlike the process for training and certification of commercial workers required under the Lead-Based Paint Renovation, Repair, and Painting Rule, effective risk reduction from commercial use of methylene chloride for paint and coating removal would require additional regulation of distributors of these products. When considering this approach, given the Agency's experience with the training and certification program under the Lead-Based Paint Renovation, Repair, and Painting Rule, EPA viewed the costs and challenges involved in regulating distributors and ensuring that only trained and certified commercial users are able to access these paint and coating removal products as a significant limitation for this approach. EPA seeks public comment on the feasibility of such a program and its potential to reduce risks of exposure to methylene chloride for workers and bystanders so that those risks are no longer unreasonable.

VI. Regulatory Assessment of Methylene Chloride in Paint and Coating Removal

This unit describes the current use of methylene chloride in paint and coating removal, the unreasonable risks presented by this use, and how EPA identified which regulatory options reduce the risks so that they are no longer unreasonable.

A. Methylene Chloride Uses That Are the Focus of This Regulation

The methylene chloride uses that are the focus of this action are:

1. Any consumer use of methylene chloride for paint and coating removal, and
2. Any commercial use of methylene chloride for paint and coating removal except for commercial furniture refinishing, which EPA intends to address in a separate proposal, as described in Unit XI. While EPA proposes to determine that the identified risks from methylene chloride in commercial furniture refinishing are unreasonable, EPA plans to continue public engagement before proposing regulations for methylene chloride in this industry. Additional information is in Unit XI. This is one of the recommendations from SBAR Panel (Ref. 27),

EPA proposes to exempt specific paint and coating removal with methylene chloride from critical corrosion-sensitive components of military aviation and vessels, which the Department of Defense identified as critical for national security purposes. The details of this national security use are in Unit VIII.

B. Methylene Chloride in Paint and Coating Removal

Methylene chloride has been used for decades in paint and coating removal in products intended for both commercial and consumer uses. Paint and coating removal, also referred to as paint stripping, is the process of removing paint or other coatings from a surface. Coatings can include paint, varnish, lacquer, graffiti, polyurethane, or other coatings sometimes referred to as high-performance or specialty coatings; surfaces may be the interior or exterior of buildings, structures, vehicles, aircraft, marine craft, furniture, or other objects. Paint and coating removal can be conducted in occupational or consumer settings. These surfaces, or substrates, include a variety of materials, such as wood, metals, plastics, concrete, and fiberglass. A variety of industries include paint and coating removal in their business

activities, including professionals involved in renovations, bathtub refinishing, automotive refinishing, furniture refinishing, art restoration and conservation, aircraft repair, marine craft repair, and graffiti removers (Ref. 3).

Paint and coatings can be removed by chemical, mechanical, or thermal means. Chemical paint removers can include solvents, such as methylene chloride or NMP, caustic chemicals, or other categories of chemicals. Solvents aid in removing paints and coatings by permeating the top of the coating and dissolving the bond between the coating and the substrate (Ref. 30). Following the application of the chemical paint remover, the coating can be more easily peeled, scraped, or mechanically removed from the substrate. Techniques for applying the paint remover chemical include manual coating or brushing, tank dipping, flow-over systems, and spray applications (manually or through automation). Pouring, wiping and rolling are also possible application techniques and application can be manual or automated (Ref. 3).

In the construction trades, methylene chloride is used to remove paint and coatings from walls, trim, architectural features, patios or decks, ceilings, bathtubs, floors, etc. to prepare them for new coatings during residential and commercial building renovation. Methylene chloride is typically applied to the surface using a hand-held brush. It is then left on to soften the old coating (Ref. 4). Once curing has occurred, the old coating is scraped or brushed off and the surface is cleaned. For bathtub refinishing, methylene chloride is poured and brushed onto a bathtub using a paintbrush and then scraped from the bathtub after leaving the remover to cure for 20 to 30 minutes (Ref. 4). Consumers use methylene chloride in similar ways.

Commercially, methylene chloride is also used to remove paint and coatings from civilian aircraft, marine craft, cars, trucks, railcars, tankers, storage vessels, and other vehicles or their component parts to prepare for new coatings. Similar to the construction trades, applications in the transportation industry tend to be brushed on and scraped off. More information on specific techniques for commercial paint removal and by consumers are in the methylene chloride risk assessment and supplemental materials (Refs. 2, 19, 20, 21, and 31).

Though many users are switching to substitutes and alternative methods, methylene chloride use persists because it is readily available and works quickly on nearly all coatings without damaging

most substrates. In addition, some users may prefer methylene chloride because it is less flammable than some other solvents. However, it is extremely volatile, has strong fumes, and evaporates quickly so that it must be reapplied for each layer of paint or coating to be removed. Additionally, paint and coating removal products formulated with methylene chloride tend to contain high concentrations of co-solvents that are flammable, reducing one perceived advantage of methylene chloride products.

Chemical products for paint and coating removal are used across several industries as well as by consumers or hobbyists, and products intended for one type of use—such as aircraft renovation—have been used in other situations, such as bathtub refinishing (Refs. 11, 32, and 33). Products intended for one specific type of paint removal project can be easily used in a different setting. Additionally, consumers can easily use products intended for or marketed to professional users since paint removal products are readily available at big box and local hardware stores, as well as paint specialty stores.

EPA has identified 59 different products for paint and coating removal that contain methylene chloride, formulated by 10 different firms. This is approximately 54% of the total number of paint and coating removal products EPA identified (109 products) (Ref. 34). Commercial uses of these products include automotive refinishing, furniture refinishing, art conservation and restoration, pleasure craft building and repair, aircraft paint removal, graffiti removal, bathtub refinishing, and renovations in residences or other buildings. Though the number of workers and consumers exposed to methylene chloride during paint and coating removal is uncertain, EPA has several estimates based on industry data and information gathered for rulemakings promulgated previously under other statutes, such as the Clean Air Act, intended to address different risks. As described in more detail in the Economic Analysis, EPA estimates that 32,600 workers annually are exposed to methylene chloride during paint and coating removal activities (Ref. 4). Of them, 15,000 are estimated to be exposed during furniture refinishing; 17,600 are estimated to be exposed during other commercial paint and coating removal processes (Ref. 4).

Consumer use of methylene chloride in paint and coating removal is similar to commercial use but is carried out by do-it-yourself (DIY) consumers and occurs in consumer settings, such as homes, workshops, basements, garages,

and outdoors. Paint and coating removal products containing methylene chloride are the same as those used in many commercial settings, and the process consumers use is similar to commercial methods of brushing or spraying on the paint and coating removal product, allowing time to pass for the product to penetrate the coating, and then scraping the loosened coating from the surface. Manufacturers and retailers of paint and coating removal products containing methylene chloride frequently sell them to consumers in small containers with marketing language or labeling that state they are easy to use and work on a variety of paints, coatings, and surfaces (Ref. 35). Products intended for consumers containing methylene chloride must meet minimum labeling requirements prescribed by CPSC that the product contains methylene chloride and that it may cause cancer (52 FR 34698, September 14, 1987). Information about risks of death as a result of acute exposure or methods to reduce exposure through personal protective equipment or ventilation are not required and frequently are not present on products containing methylene chloride (Refs. 35 and 36). Paint and coating removers containing methylene chloride are frequently sold at home improvement retailers or automotive supply stores that sell products to consumers as well as professional users. Additionally, due to the wide availability of products available on the Internet and through various additional suppliers that serve commercial and consumer customers, consumers may foreseeably purchase a variety of paint and coating removal products containing methylene chloride. EPA estimates that a large percentage of users of paint and coating removal products containing methylene chloride are consumers, rather than occupational users. EPA estimates that approximately 1.3 million consumers annually use paint removal products containing methylene chloride (Ref. 4).

C. Analysis of Regulatory Options

In this unit, EPA explains how it evaluated whether the regulatory options considered would address the risks presented by this use as necessary so that the risks are no longer unreasonable. First, EPA characterizes the unreasonable risks associated with the current use of methylene chloride in paint and coating removal. Then, EPA describes its initial analysis of which regulatory options have the potential to achieve standard non-cancer and cancer benchmarks. The levels of acute and chronic exposures estimated to present no risks of concern for non-cancer

effects also result in no risks of concern for cancer. Lastly, this section evaluates how well those regulatory options would address the unreasonable risk in practice.

1. *Risks associated with the current use.*

a. General impacts. The methylene chloride risk assessment and supplemental analyses identified acute and chronic risks from inhalation of methylene chloride during paint and coating removal by consumers and bystanders in residences; and commercial users and occupational bystanders in workplaces (individuals not using the paint and coating remover but nearby a user) (Refs. 2 and 19). EPA estimates, having refined the numbers since the risk assessment, that, annually, there are approximately 17,600 direct users at 8,600 commercial operations conducting paint and coating removal with methylene chloride for the uses proposed for regulation that will potentially benefit from the risk reduction resulting from this proposed regulation. EPA estimates that approximately 1.3 million consumers who use paint and coating removal products containing methylene chloride each year that will also potentially benefit from risk reduction resulting from this proposal (Ref. 4).

b. Impacts on minority and other populations. While all consumers and workers using paint and coating removal products containing methylene chloride would benefit from risk reduction, some populations are currently at disproportionate risk for the health effects associated with use of methylene chloride in paint and coating removal. In the construction trades, Hispanic workers (of all races) and foreign-born workers are over-represented (Ref. 4). In the U.S. population, 16% of adults are Hispanic, whereas in the construction trades, 35% of workers are Hispanic (Ref. 4). Due to their overrepresentation in the construction trades, Hispanic workers are disproportionately at risk of exposure to methylene chloride when used in paint and coating removal.

Similarly, foreign-born workers are overrepresented in the construction trades. In the U.S. population overall, 17% of workers in all industries are foreign-born, whereas in the construction trades, 28% of workers are foreign-born (Ref. 4). As a result, they may primarily speak a language other than English and could be characterized as having limited English proficiency. Under Executive Order 13166, EPA and other agencies are charged with examining and identifying the needs of individuals with limited English

proficiency (65 FR 50121, August 11, 2000). Like Hispanic workers, foreign-born workers are disproportionately at risk of exposure to methylene chloride when used in paint and coating removal in the construction trades.

EPA's identification of the current disproportionate risks of methylene chloride exposure faced by Hispanic and foreign-born workers in the construction trades is part of the analysis conducted as part of EPA's efforts towards environmental justice. Executive Order 12898 (59 FR 7629, February 16, 1994) establishes federal executive policy on environmental justice; EPA's compliance with this executive order is detailed in Unit XXIII.

c. Impacts on children. In the methylene chloride risk assessment, EPA examined acute risks for bystanders to consumer use of methylene chloride in paint and coating removal in residential settings. Although EPA expects that users of methylene chloride in paint and coating removal would be adult individuals (16 years old and older), bystanders could be individuals of any age group (*e.g.*, children, adults, and the elderly) who are elsewhere in the house during product application and in the hours following application (Ref. 2). In most scenarios, EPA found acute risks of concern for central nervous system effects for other residents of the house, including children, in which paint and coating removal with methylene chloride was conducted (Ref. 2). EPA found risks of concern not only during the application of the product, but also for several hours following (Ref. 2).

Although EPA anticipates that most consumers conducting paint and coating removal with methylene chloride would likely exclude children from the room in which the project was being carried out, it is unclear if they would exclude them from the house overall during and after the product application. Additionally, if the project involved removing the coating from a bathtub, households with only one bathroom would present challenges for bystander exclusion for several hours. As a result, children present in homes where paint and coating removal is being conducted, by family members or by professionals, face acute risks of central nervous system impacts.

EPA was not able to model scenarios in which paint and coating removal was conducted in an apartment building, hotel, or other residence or place in which children may be present other than single-family homes. However, the findings related to bystander exposure suggest risks for children and other

residents of apartments or hotel rooms adjacent to units in which paint and coating removal is being conducted. In these situations, it is even less likely that children would be excluded from all affected areas in order to protect them from acute risks. As a result, methylene chloride is likely to present acute risks to children as bystanders to paint and coating removal with methylene chloride, even if they are excluded from the areas in which work is conducted (Ref. 2).

d. Exposures for this use. Exposures assessed for this use include acute exposures to methylene chloride in paint and coating removal by consumers and residential bystanders, and acute and chronic exposures by commercial workers and occupational bystanders, as described in the methylene chloride risk assessment (Ref. 2). In some cases where commercial paint and coating removal is conducted, such as in workshops or facilities that are within residences (for example, in the case of some small businesses) (Ref. 27), exposed bystanders may include family members, such as children. The exposures assessed included some commercial furniture refinishing, which is not proposed for regulation. Different exposure scenarios were evaluated for workers, occupational bystanders, consumers, and residential bystanders (Ref. 2).

For exposures in commercial settings, EPA assessed acute risks and chronic risks, including cancer risks. For acute risks, EPA assessed four occupational scenarios based on eight-hour TWA exposure concentrations and different variations in exposure conditions, such as presence or absence of respirators and the protection factor of any respirator used. For each commercial use evaluated in the assessment, EPA modeled scenarios using assumed parameters similar to typical use conditions within those industries, such as whether work was conducted indoors or outdoors and what quantity of methylene chloride was estimated to be used. For these acute workplace estimates, the acute methylene chloride exposure concentration evaluated for risk was the eight-hour TWA air concentration in milligrams per cubic meter reported for the various relevant industries. In the risk assessment, EPA assumed that some workers could be rotating tasks and not necessarily carrying out paint and coating removal tasks using methylene chloride on a daily basis. This type of exposure was characterized as acute in this assessment because the worker's body was estimated to have sufficient time to remove methylene chloride and its

metabolites before the next encounter with methylene chloride during paint and coating removal (Ref. 2).

For chronic exposure scenarios, EPA varied not only the parameters described above, but also the number of working days exposed to methylene chloride during paint and coating removal (ranging from 125 to 250 days per year) and exposed working years (varying the number of years the worker was assumed to be exposed) (Ref. 2). Overall, EPA evaluated cancer and chronic non-cancer risks for 16 occupational scenarios.

Worker inhalation exposure data were taken from peer-reviewed literature sources, as cited in the risk assessment (Ref. 2). These data sources often did not indicate whether monitored exposure concentrations were for occupational users or bystanders. Therefore, EPA assumed that these exposure concentrations were for a combination of users and bystanders. EPA evaluated scenarios both with and without respirator use and a range of respirator assigned protection factors (APFs), but did not estimate the overall frequency of respirator use because supporting data on the prevalence of respirator use for these commercial uses was unavailable. Similarly, EPA made assumptions about the exposure frequencies and working years because data were not found to characterize these parameters, and estimated various exposure frequencies (125 and 250 days per year) and working years (20 and 40 years). Thus, EPA evaluated occupational risks by developing hypothetical scenarios under the varying exposure conditions described previously (Ref. 2).

It is important to note that EPA relied on monitoring data for these occupational exposure estimates. Many air concentrations reported and used in the risk assessment exceeded the current OSHA PEL of 25 ppm; in some industries where paint and coating removal was conducted by immersion in tanks or vats of methylene chloride, air concentrations were measured at above 7,000 milligrams per cubic meter, or 2,016 ppm. Even in industries with lower expected exposures, air concentrations frequently were reported in excess of 250 milligrams per cubic meter, or 72 ppm, such as during graffiti removal and automotive refinishing (Ref. 2). The risks associated with these dramatically high air concentrations are discussed in Unit VI.C.1.e.

For consumer and residential bystander exposures, EPA assessed exposure scenarios under which the individual user was presumed to work on one of several types of paint and

coating removal projects (coffee table, chest of drawers, or bathtub). These scenarios take into account that consumers do not reliably use personal protective equipment (respirators) or have access to engineering controls (e.g., exhaust ventilation), since these methods are costly, technically challenging, and not easily available to consumers (Ref. 2). EPA used product label information to establish the time durations (in minutes) that the user would require to complete each step of the paint or coating removal process. User breaks during wait periods were assumed; the scenarios varied the location of where the user rested (in the work space or elsewhere). In addition, back-to-back projects were modeled because it is likely that the user would take breaks during the wait periods specified on product labels. It was further assumed that the paint scrapings were removed from the house as soon as scraping was completed. In each scenario, the bystander was assumed to be somewhere else in the house, and exposed via inhalation to some of the methylene chloride from the workspace (Ref. 2).

EPA developed seven consumer exposure scenarios for the assessment. Similar to the worker exposure assessment, the following factors were considered in developing the exposure scenarios (Ref. 2):

- The type of application (*i.e.*, brush-on or spray-on), weight fraction of methylene chloride in the paint and coating removal product, application rate by the user, surface area of object from which the paint or coating was being removed, and emission rate of the chemical, which can affect the amount of methylene chloride that ultimately is released to the indoor environment;
- The location where the product is applied, which relates to exposure factors such as the room volume and its air exchange rate with outdoor air;
- The house volume and air exchange rate, for reasons similar to those for the product use location; and
- Precautionary behaviors such as opening windows in the application room, the user leaving the application room during the wait period, related changes to the air exchange rates, and the proximity of the user to the source of methylene chloride emissions.

In the absence of representative air monitoring data for consumer users and residential bystanders using paint and coating removal products containing methylene chloride, EPA used the Multi-Chamber Concentration and Exposure Model to estimate consumer and bystander inhalation exposure concentrations (Ref. 2).

EPA's estimates of the exposures during paint and coating removal with methylene chloride experienced by commercial users and bystanders and consumer users and bystanders were used to assess the risks of this use of methylene chloride. The full exposure estimates and risk findings are described in the methylene chloride risk assessment; risk findings are also summarized in Unit VI.C.1.e.

In addition to estimating likely exposures under current use patterns (baseline exposures), for both commercial and consumer users, EPA assessed a number of exposure scenarios associated with risk reduction options in order to identify variations in methylene chloride exposure during paint and coating removal. All variations in the scenarios were applied to industry-specific exposure inputs and evaluated with exposure parameters that were modified to reflect either a reasonable worst-case scenario (also called the baseline) or a scenario in which exposures were moderated by several factors (also called the central tendency scenario). The risk reduction options that varied between scenarios included engineering controls, use of PPE, and well as combinations of these options (Ref. 19).

- Under the PPE risk reduction option exposure scenarios, EPA evaluated respirators with APF 10 to 10,000 for acute and chronic risks, including cancer risks.

- For the engineering controls risk reduction option exposure scenarios, EPA evaluated exposures using local exhaust ventilation (LEV) to improve ventilation near the activity of workers (using furniture refinishing operations as a model), with an assumed 90% reduction in exposure levels.

Overall, EPA evaluated dozens of distinct exposure scenarios for commercial paint and coating removal with methylene chloride; exposure reductions for consumer users are expected to be similar to the acute risk evaluations for professional contractors or workers in furniture refinishing operations, since these commercial activities are most similar to the types of projects in which consumers would engage (Refs. 19 and 20).

e. Specific risks for this use. The acute inhalation risk assessment used central nervous system effects to evaluate the acute risks for occupational, consumer, and bystander exposure during paint and coating removal with methylene chloride. In the risk assessment, a risk of concern was identified if the MOE estimate was less than the benchmark MOE of 10 for acute central nervous system effects (Ref. 2).

EPA assessed acute risks for central nervous system effects from inhalation for all consumer, occupational, and bystander exposure scenarios of paint and coating removal with methylene chloride. For consumers, EPA identified risks of concern for all scenarios, with some consumer scenarios demonstrating risks within the first hour of product use when paint and coating removal was conducted indoors (such as in a workshop or bathroom), regardless of whether the product formulation was brush or spray. Risks for incapacitating nervous system effects were found in some indoor scenarios (such as in a bathroom) within four hours of product use. MOEs for consumer acute risks from exposures of one hour or less ranged from 1.6 to 0.2; this equates to estimated exposures that are between six and 50 times greater than those that are expected to produce no risks of concern (Ref. 2).

For residential bystanders, EPA identified risks of concern for all scenarios, even assuming that any bystander in the house was not in the room where the paint and coating removal occurred. Depending on the parameters of the scenario, MOEs for acute risks ranged from 2.9 to 0.5, or between three and 20 times greater than those that are expected to produce no risks of concern (Ref. 2).

For commercial users, the occupational scenarios in which acute risks for central nervous system effects were identified included nearly all occupational scenarios, irrespective of the absence or presence of respirators, and in both the central-tendency and worst-case assumed air concentrations of methylene chloride. Additionally, EPA found acute risks for incapacitating central nervous system effects for workers who had no respiratory protection in most industries, or with respirators with APFs of 10 or 25 in the industries with highest likely exposures, such as professional contractors, aircraft refinishers, and workers using immersion methods for paint and coating removal in several industries. MOEs for acute risks ranged from an average of 0.11 (automotive refinishing) to 0.037 (graffiti removal), with a lowest end of 0.0063 (workplaces engaged in paint and coating removal using immersion methods). In general, these workplaces are estimated to present exposure levels between 100 times to greater than 1,000 times more than those that are of concern. Not only workers, but also occupational bystanders, or workers engaged in tasks other than paint and coating removal, would be at acute risk for central nervous system effects (Ref. 2). Therefore, EPA's

proposed determination is that acute methylene chloride exposures during paint and coating removal present unreasonable risks.

In the risk assessment, EPA also assessed risks of chronic exposure to methylene chloride during paint and coating removal by commercial users and occupational bystanders (Ref. 2). The methylene chloride risk assessment used liver toxicity as the critical endpoint for chronic exposure. EPA assessed risks for liver toxicity for occupational and bystander exposure scenarios of paint and coating removal with methylene chloride.

Workers and occupational bystanders in most industries evaluated were identified as at risk for non-cancer liver toxicity as a result of chronic exposure to methylene chloride during paint and coating removal under typical exposure scenarios. When workers were exposed repeatedly at facilities they were at risk, even for scenarios evaluated with workers wearing respiratory protection with APF 50 (Ref. 2). The concern is for workers engaging in long-term use of the product (*i.e.*, 250 days/year for 40 years) with no respiratory protection.

For commercial users and bystanders, EPA also assessed cancer risks as a result of chronic exposure to methylene chloride in paint and coating removal. Workers and occupational bystanders showed were estimated to have an excess cancer risk greater than 1 in 1,000,000 for all of the commercial scenarios evaluated if exposed to paint and coating removal with methylene chloride for 250 days per year for 40 years with no respiratory protection. Depending on industry, cancer risks ranged from 6 in 10,000 (graffiti removal) to 2.5 in 1,000 (aircraft refinishing), with a maximum of 4 in 1,000 (workplaces using immersion methods, such as dip tanks for miscellaneous metal items). Workers in all industries showed a relative reduction in cancer risks when estimated to be working for 125 days per year for 20 years with a respirator with APF 50, with cancer risks in some industries estimated to be below benchmark levels in these scenarios. Therefore, EPA's proposed determination is that chronic methylene chloride exposures during paint and coating removal present unreasonable risks.

The SBAR Panel convened in support of this action heard from several SERs who expressed concerns about the underlying methylene chloride risk assessment (Ref. 27). Many of the concerns expressed by these SERs were already expressed in the public comments and the peer review

comments on the methylene chloride risk assessment. The Summary of External Peer Review and Public Comments and Disposition document in the risk assessment docket (EPA-HQ-OPPT-2012-0725) explains how EPA responded to the comments received.

2. *Initial analysis of potential regulatory options.* Having determined that the risks from methylene chloride in paint and coating removal were unreasonable, EPA evaluated whether regulatory options under section 6(a) could reduce the risk (non-cancer and cancer) so that it is no longer unreasonable.

The results of EPA's assessment of consumer uses, exposures, and risks indicate that regulatory options for consumer uses such as reducing the concentration of methylene chloride or advising the use of respirators could not achieve the target MOE benchmarks for acute exposures (benchmark MOE is 10). Similarly, the results of EPA's evaluation indicate that regulatory options for occupational exposures such as reducing the concentration of methylene chloride in products used for paint and coating removal and using local exhaust ventilation to improve ventilation, in the absence of PPE, could not achieve the target MOE benchmarks (benchmark MOE is 10) for non-cancer endpoints for acute and chronic exposures and common cancer risk benchmarks for chronic exposures (Refs. 19 and 20). The results also demonstrate that all risk reduction options meeting the benchmark MOEs and common cancer benchmarks for methylene chloride in paint and coating removal require the use of a respirator, whether used alone or in conjunction with additional levels of protection or the use of an air exposure limit. Therefore, EPA found the options of setting a maximum concentration of methylene chloride in products under TSCA section 6(a)(2) unable to reduce exposures to the risk benchmarks. Options found not to meet the risk benchmarks and, for the purposes of this proposal, found unable to address the unreasonable risk, are documented in EPA's supplemental technical reports on methylene chloride in paint and coating removal (Refs. 19 and 20).

3. *Assessment of whether regulatory options address the identified unreasonable risk so that methylene chloride in paint and coating removal no longer presents such risk.* As discussed earlier, EPA considered a number of regulatory options under TSCA section 6(a) for methylene chloride in paint and coating removal for the uses proposed for regulation. In assessing these options, EPA considered

a wide range of exposure scenarios (Refs. 19, 20, and 38). These include both baseline and risk reduction scenarios involving varying factors such as exposure concentration percentiles, LEV use, respirator use, working lifetimes, etc. As part of this analysis, EPA considered the impacts of regulatory options on consumer users and commercial users separately. However, EPA is proposing to address paint and coating removal with methylene chloride for consumer uses together with many commercial uses, rather than as separate consumer and commercial uses. As described earlier, in Unit VI.B., paint and coating removal products containing methylene chloride frequently are available in the same distribution channels to consumers and professional users. Products are marketed for a variety of projects, and cannot be straightforwardly restricted to a single type of project or user. As highlighted in the investigation into recent deaths among bathtub refinishers using methylene chloride, "ten different products were associated with the 13 deaths [from 2000–2011]. Six of the products were marketed for use in the aircraft industry, the rest for use on wood, metal, glass, and masonry. None of the product labels mentioned bathtub refinishing" (Ref. 33).

The options that had the potential to address the unreasonable risks presented by methylene chloride when used for paint and coating removal by consumers, or within the commercial uses proposed for regulation, or for both consumer and these commercial uses included:

a. A supply-chain approach, which would include prohibiting the manufacturing (including import), processing, and distribution in commerce of methylene chloride for paint and coating removal under TSCA section 6(a)(2) for the consumer and commercial uses proposed for regulation; prohibiting the commercial use of methylene chloride in paint and coating removal under TSCA section 6(a)(5) for the commercial uses proposed for regulation; requiring that all paint and coating removers containing methylene chloride be distributed in volumes no less than 55-gallon containers under TSCA section 6(a)(2); requiring downstream notification when distributing methylene chloride under TSCA section 6(a)(3); and limited recordkeeping under TSCA section 6(a)(4);

b. Variations on such an approach, such as just prohibiting the manufacturing, processing, and distribution in commerce of methylene chloride for paint and coating removal

under TSCA section 6(a)(2) for consumer use and for the commercial uses proposed for regulation or just prohibiting the commercial use of methylene chloride for paint and coating removal under TSCA section 6(a)(5) for the commercial uses proposed for regulation;

c. Additional variations on such an approach, such as prohibiting the manufacturing, processing, and distribution in commerce of methylene chloride for paint and coating removal under TSCA section 6(a)(2) for the consumer and commercial uses proposed for regulation and requiring downstream notification (e.g., via a Safety Data Sheet (SDS)) when distributing methylene chloride for other uses under TSCA section 6(a)(3); and

d. Requiring a respiratory protection program, including PPE (a supplied-air respirator with APF 1,000 or 10,000) with an alternative air exposure limit of 1 part per million (ppm) achieved through engineering controls or ventilation alone or in combination with a supplied-air respirator at a lower APF, in commercial facilities where methylene chloride is used for paint and coating removal under TSCA section 6(a)(5) for the commercial uses proposed for regulation.

A discussion of the regulatory options that could potentially reach the risk benchmarks for consumer use, commercial uses proposed for regulation, or both is in this unit, along with EPA's evaluation of how well those regulatory options would address the unreasonable risks in practice.

a. *Proposed approach.* The proposed regulatory approach for methylene chloride in paint and coating removal for the uses proposed for regulation would prohibit the manufacturing, processing, and distribution in commerce of methylene chloride for paint and coating removal under TSCA section 6(a)(2) for consumer uses and for the commercial uses proposed for regulation; would prohibit the commercial use of methylene chloride for paint and coating removal under TSCA section 6(a)(5) for the uses proposed for regulation; would require any remaining paint and coating removal products containing methylene chloride to be distributed in packaged volumes no less than 55-gallon containers, under TSCA section 6(a)(2); would require manufacturers, processors, and distributors to provide downstream notification of the prohibitions under TSCA section 6(a)(3), and would require recordkeeping relevant to these

prohibitions under TSCA section 6(a)(4).

As discussed in Unit VI.C.1., the risks for exposure to consumers, workers, and bystanders for methylene chloride in paint and coating removal vary. The MOEs for non-cancer endpoints range from 50 to 1,000 times below the benchmark MOEs for central nervous system effects (the acute health impact) or liver toxicity (the chronic health impact). Similarly, the increased risk of cancer (including brain, liver, and lung cancer) in some industries is 100 to nearly 1,000 times greater than common cancer benchmarks (Ref. 2). Under this proposed option, exposures to methylene chloride during paint and coating removal would be completely eliminated. As a result, non-cancer and cancer risks would be eliminated.

The proposed approach would reduce the risks to workers, consumers, and bystanders from methylene chloride in paint and coating removal for the uses proposed for regulation so that those risks are no longer unreasonable. Prohibiting the manufacturing, processing and distribution in commerce of methylene chloride for paint and coating removal for the uses proposed for regulation would minimize the overall availability of methylene chloride for paint and coating removal for these uses. Importantly, this proposed regulation is protective of consumer users. EPA cannot regulate consumer use under TSCA section 6(a)(5). The prohibition of the commercial use of methylene chloride for paint and coating removal in the uses proposed for regulation would reduce commercial demand for methylene chloride paint and coating removal products, reduce the likelihood that other types of products formulated with methylene chloride would be used for paint and coating removal, and significantly reduce the potential for consumer use of commercial paint and coating removal products containing methylene chloride. Workers and occupational bystanders would not be exposed to methylene chloride for paint and coating removal in the uses proposed for regulation, and the risk to consumers and residential bystanders would be minimized because commercial paint and coating removal products containing methylene chloride would not be available in volumes smaller than 55-gallon containers. This large volume requirement would ensure that consumers, who typically buy products in much smaller volumes, would not be able to easily divert products from the supply chain intended for commercial furniture refinishing or uses proposed to be

critical to national security. EPA seeks comment on the impact to commercial furniture refinishers of a requirement that paint and coating removal products containing methylene chloride be sold only in 55-gallon containers for commercial paint and coating removal. This request for comment is one of the recommendations of the SBAR Panel, described earlier in Unit V.C. and in more detail in Unit XXIII.C. (Ref. 27). Based on the recommendations from the SBAR Panel, EPA is requesting comment on whether the rule should allow paint and coating removal products containing methylene chloride to be sold in 30-gallon containers, rather than limiting the volume to 55-gallon containers. EPA is also requesting comment on the feasibility of implementing appropriate industrial hygiene controls associated with 30- or 55-gallon containers in order to minimize potential disruptive impacts to those industrial processes where technically feasible substitutes are currently unavailable. The downstream notification of these restrictions ensures that processors and distributors are aware of the manufacturing, processing, distribution in commerce and use restrictions for methylene chloride in paint and coating removal, and enhances the likelihood that the risks associated with this use of methylene chloride are addressed throughout the supply chain. Downstream notification also streamlines compliance and enhances enforcement, since compliance is improved when rules are clearly and simply communicated (Ref. 39). This integrated supply chain proposed approach mitigates the risk to consumers and commercial workers and occupational bystanders in the uses proposed for regulation from methylene chloride in paint and coating removal.

b. Options that are variations of elements of the proposed approach. One variation of the proposed approach would be to prohibit manufacture, processing, and distribution in commerce of methylene chloride for consumer and commercial paint removal for the uses proposed for regulation without the prohibition on commercial use of methylene chloride for paint and coating removal and without the downstream notification of any prohibitions. Without the accompanying prohibition on commercial use and downstream notification that is included in the proposed supply chain approach, this option would leave open the likelihood that commercial users falling within the scope of this proposed rule and consumer users could obtain methylene

chloride (which would continue to be available for other uses, such as degreasing or solvent purposes) and use it for paint and coating removal.

Without downstream notification, unsophisticated purchasers in particular are likely to be unfamiliar with the prohibitions regarding this use and mistakenly use methylene chloride for paint and coating removal, thereby exposing themselves and bystanders to unreasonable risks. Thus, under these variations, EPA anticipates that many users would not actually realize the risk benchmarks. Therefore, these variations fail to protect against the unreasonable risks.

Another regulatory option that EPA considered was to prohibit only the commercial use of methylene chloride for paint and coating removal in the uses proposed for regulation. This approach would reduce both non-cancer and cancer risks for commercial settings, but it would not reduce risks to consumers so that they are no longer unreasonable. By prohibiting use in the commercial sector alone, without a prohibition on the manufacture, processing, and distribution in commerce of paint and coating removal products containing methylene chloride for consumer and commercial use in the uses proposed for regulation, this approach would not address consumer risks as distributors of paint and coating removal products containing methylene chloride could continue to distribute to consumers methylene chloride marked as a paint and coating remover, including products labeled and marketed as “professional strength” or “commercial grade” products. Since it is foreseeable that consumers would continue to purchase products labeled and marketed in this fashion, and consumers would continue to be exposed far above the health benchmarks, they would not be protected from the unreasonable risks posed by methylene chloride.

c. Prohibit the manufacturing, processing, and distribution in commerce of methylene chloride for consumer paint and coating removal under TSCA section 6(a)(2) or prohibit the manufacturing, processing, and distribution in commerce of methylene chloride for consumer paint and coating removal under TSCA section 6(a)(2) and require downstream notification when distributing methylene chloride for other uses under TSCA section 6(a)(3). EPA considered prohibiting the manufacturing, processing, and distribution in commerce of methylene chloride for consumer paint and coating removal including an option with a requirement for downstream

notification of such prohibition. If such a prohibition were effective, this option would mitigate the risks to consumers from methylene chloride in paint and coating removal. However, EPA recognizes that consumers can easily obtain products labeled for commercial use. Indeed, for many consumers, identifying a product as being for commercial use may imply greater efficacy. Coupled with the fact that many products identified as commercial or professional are readily obtainable in a variety of venues (e.g., the Internet, general retailers, and specialty stores, such as automotive stores), EPA does not find that this option would protect consumers. In addition, this option alone would not address the risks to workers from methylene chloride in paint and coating removal.

d. Requiring a respiratory protection program, including PPE, air monitoring, and either a supplied-air respirator of APF 1,000 or 10,000 or an air exposure limit of 1 part per million (ppm) achieved through engineering controls or ventilation, in commercial facilities where methylene chloride is used for paint and coating removal under TSCA section 6(a)(5) for the commercial uses proposed for regulation. Another regulatory option that EPA considered for the commercial uses of methylene chloride for paint and coating removal proposed for regulation was to require risk reduction through an occupational respiratory protection program, which would include air monitoring, medical monitoring, and respiratory protection through use of a supplied-air respirator with an APF of 1,000 or 10,000, depending on the methods used for paint and coating removal with methylene chloride and other workplace characteristics, with a performance-based alternative of meeting an air concentration level of 1 ppm as an exposure limit for methylene chloride. A full-facepiece (or helmet/hood) self-contained breathing apparatus (SCBA) when used in the pressure demand mode or other positive pressure mode has an APF of 10,000. EPA's analysis showed that use of a SCBA with an APF of 10,000 would, in all scenarios evaluated, control the exposure of methylene chloride to levels that allow for meeting the benchmarks for non-cancer and cancer risks. Exposures in most workplaces proposed for regulation could be reduced with an APF of 1,000 to exposure levels that reduce risks to benchmark levels (Ref. 19). It is important to note that current OSHA requirements for dermal and eye protection when using methylene chloride in any way would be

maintained under this approach, in addition to other requirements for work practices, training, and hazard communication put forth in OSHA's Methylene Chloride Standard (29 CFR 1910.1052). It is also important to note that any respirator used would need to be a supplied-air respirator, since methylene chloride can clog or damage filters or cartridges for air-purifying respirators, rendering them non-protective (Ref. 19).

Although respirators, specifically SCBAs, could reduce exposures to levels that are protective of non-cancer and cancer risks, not all workers may be able to wear respirators. Individuals with impaired lung function due to asthma, emphysema, or chronic obstructive pulmonary disease, for example, may be physically unable to wear a respirator. Determination of adequate fit and annual fit testing is required for tight fitting full-face piece respirators to provide the required protection. Individuals with facial hair, like beards or sideburns that interfere with a proper face-to-respirator seal, cannot wear tight fitting respirators. In addition, respirators may also present communication problems, vision problems, worker fatigue, and reduced work efficiency (63 FR 1152, January 8, 1998). According to OSHA, "improperly selected respirators may afford no protection at all (for example, use of a dust mask against airborne vapors), may be so uncomfortable as to be intolerable to the wearer, or may hinder vision, communication, hearing, or movement and thus pose a risk to the wearer's safety or health." (63 FR 1189–1190). Nonetheless, OSHA views respiratory protection as a backup method which is used to protect employees from toxic materials in those situations where feasible engineering controls and work practices are not available or are insufficient to protect employee health (63 FR 1156–1157). The OSHA respiratory protection standard (29 CFR 1910.134) requires employers to establish and implement a respiratory protection program to protect their respirator-wearing employees. This OSHA standard contains several requirements, e.g., for program administration; worksite-specific procedures; respirator selection; employee training; fit testing; medical evaluation; respirator use; respirator cleaning, maintenance, and repair; and other provisions.

In addition, OSHA adopted a hierarchy of controls established by the industrial hygiene community and used to protect employees from hazardous airborne contaminants, such as methylene chloride (29 CFR 1910.1052).

According to this hierarchy, substitution of less toxic substances, engineering controls, administrative controls, and work practice controls are the preferred method of compliance for protecting employees from airborne contaminants and are to be implemented first, before respiratory protection is used. OSHA permits respirators to be used where engineering controls are not feasible or during an interim period while such controls are being implemented.

Given equipment costs and the costs of establishing a respiratory protection program, which involves training, respirator fit testing, and the establishment of a medical monitoring program, EPA anticipates that most companies would choose to switch to substitutes instead of adopting a program for this type of PPE to continue using methylene chloride for paint and coating removal because this type of PPE program is not cost-effective. Further, even if cost were not an impediment, there are many limitations to the successful implementation of respirators with an APF of 1,000 or 10,000 in a workplace. As recommended by the SBAR panel, EPA is requesting comment on and information about workplace experience with respiratory protection programs and air monitoring for methylene chloride (Ref. 27). Specifically, EPA seeks comment on whether companies would opt to substitute an alternate chemical or process instead of implementing a worker protection program for PPE. EPA also requests comment on the scientific and technical support used for development of the 1 ppm air exposure limit (Ref. 21) for methylene chloride and the feasibility of implementing and enforcing this performance-based approach. Additionally, EPA is requesting comment on the cost to achieve reduced exposures in the workplace or to transition to alternative chemicals or technologies.

EPA also considered requiring a combination of local exhaust ventilation and supplied-air respirators with APF of 1,000 or 50, with a performance-based alternative to the respirator of an air exposure limit of 1 ppm as an eight-hour TWA. When properly executed, this option would reduce risks to the health benchmarks for workers and bystanders (Refs. 19, 21, and 38). However, while this option has the benefit of incorporating engineering controls and the use of respirators with a lower APF, the limitations to successful implementation of the use of supplied-air respirators in the workplace discussed previously are still present. EPA is requesting comment on

whether this alternate option of allowing industrial use at specified exposure levels and with appropriate personal protective equipment should be adopted. Specifically, EPA seeks information on whether this alternative approach would incentivize industry to eliminate methylene chloride use in paint and coating removal wherever technically feasible while minimizing disruptive impacts to those processes where technically feasible substitutes are currently unavailable.

Furthermore, neither of the variations of relying upon respiratory protection for commercial paint and coating removal with methylene chloride addresses consumer risks. EPA does not have the authority to require that consumers change use practices or wear PPE. Even if this approach were coupled with a TSCA section 6(a)(2) prohibition on the manufacture, processing and distribution in commerce of methylene chloride for consumer use in paint and coating removal, this would not protect consumers because they would foreseeably continue to buy and use paint and coating removal products containing methylene chloride intended for commercial users, e.g., via the Internet or home improvement or automotive supply retailers. Consumers would continue to be exposed far above the established health benchmarks when using methylene chloride for paint and coating removal (Ref. 20).

Therefore, considering the increased complexity of a respiratory protection program involving supplied-air respirators as well as the general inability to require that consumers adhere to a respiratory protection program resulting in little mitigation of risks to consumers, an option focusing on respiratory protection would not address the unreasonable risks presented by these uses.

D. Adverse Health Effects and Related Impacts That Would Be Prevented by the Proposed Option

The proposed option would prevent exposure to methylene chloride from paint and coating removal and thus would prevent the risks of adverse effects and associated impacts. As discussed in Unit II.C., the range of adverse health effects includes effects on the nervous system, liver, respiratory system, kidneys, and reproductive systems (Ref. 2). These health effects associated with exposure to methylene chloride are serious and can have impacts throughout a lifetime. The following is a discussion of the impacts of significant acute, chronic non-cancer, and cancer effects associated with methylene chloride exposure during

paint and coating removal, including the severity of the effect, the manifestation of the effect, and how the effect impacts a person during their lifetime.

1. Nervous system effects—acute exposures. The methylene chloride risk assessment and EPA's 2011 IRIS assessment identified nervous system effects as the critical effect of greatest concern for acute exposure to methylene chloride. Specifically, these assessments identified sensory impairment and incapacitation (loss of consciousness) as the critical effect of acute exposures (Refs. 2 and 5). Exposure to methylene chloride can rapidly cause death as a result of nervous system depression, but even exposures that may in some cases result only in dizziness or fainting can be fatal if the individual who is disoriented or has fainted is alone. Several individuals have died after becoming incapacitated during paint and coating removal with methylene chloride; after losing consciousness, their nervous system is overcome by the continued accumulation of volatile fumes. As described in a recent report on deaths caused by methylene chloride, “. . . the danger posed by methylene chloride is its one-two punch when fumes accumulate. Because it turns into carbon monoxide in the body, it can starve the heart of oxygen and prompt an attack. The chemical also acts as an anesthetic at high doses: Its victims slump over, no longer breathing, because the respiratory centers of their brains switch off.” (Ref. 7).

There are increased risks of death and nervous system effects for many of the approximately 17,600 workers in 8,600 commercial facilities or companies that use methylene chloride for paint and coating removal for the commercial uses proposed to be regulated, as well as for the estimated 1.3 million consumers and residential bystanders who use or are exposed to paint and coating removers containing methylene chloride each year (Ref. 4).

Although the fact that deaths occur as a result of exposure to methylene chloride is well documented, the exact number of deaths specifically attributable to methylene exposure is unclear. In 2012, the Centers for Disease Control and Prevention Morbidity and Mortality Weekly Report (MMWR) published results of an investigation into deaths among bathtub refinishers using methylene chloride. The authors of the investigation and the MMWR editors emphasized that the reported number of deaths due to methylene chloride is an underestimate and subject to at least three limitations: A lack of reporting to the OSHA incident database

by self-employed individuals, no equivalent database to track consumer incidents and fatalities, and the likelihood that deaths due to methylene chloride exposures are misattributed to heart disease, since the pathology is similar (Ref. 33).

Based on data from OSHA, CPSC, state records, and publicly reported information, EPA has identified 49 fatalities since 1976 resulting from consumer or commercial worker exposure to methylene chloride during paint and coating removal, including for uses not proposed for regulation. However, as described earlier, this is likely an underestimate of the deaths that have occurred. As highlighted in the MMWR report from 2012 and OSHA alert from 2016, health effects from methylene chloride exposure are often misattributed to other causes (Refs. 32 and 33). For example, in several cases, workers were seen in hospital emergency rooms with symptoms of solvent exposure, were not properly diagnosed, and were sent back to the same work that ultimately killed them (Ref. 32).

Thus, EPA is unable to quantify the precise number or frequency of deaths that occur as a result of exposure to methylene chloride during paint and coating removal. However, the sporadically-occurring deaths outside of bathtub refinishing that have been documented as caused by methylene chloride, and the undocumented deaths that have been misattributed to heart disease should not be ignored merely because they cannot be monetized. Death following exposure to methylene chloride during paint and coating removal are characterized by family members as suddenly tragic, particularly when the deceased is young. In 1986 in Colorado, a worker died two hours into his first day on the job using methylene chloride to remove coatings from furniture (Ref. 40). In 2014 in New York, a 20-year old worker died while helping his father with a job refinishing a hotel bathtub (Ref. 41).

Fatalities have also occurred among more experienced workers. In 1990 in Georgia, a worker died while repairing a plastic-coated metal rack; he was found to have fainted and fallen into the tank of methylene chloride the company used to strip rack coatings (Ref. 7). In several instances, pairs of workers were killed while working on the same paint removal project with methylene chloride, such as renovating a squash court or the floor tile of a bathroom in a federal office building (Ref. 40).

In other cases, workers died when helping co-workers in distress. In South Carolina, in 1986, several workers were

killed or hospitalized in one incident: Two workers went to check on a colleague in a basement using a paint remover with methylene chloride; all three died. Five emergency responders arrived at the scene, and three were hospitalized due to inhalation of fumes (Ref. 7).

These sudden, unexpected deaths are not limited to commercial users or occupational bystanders exposed to methylene chloride during paint and coating removal. Consumer fatalities have been recorded, such as the woman who died in her house in 1990 in Ohio after removing paint from furniture with methylene chloride, as reported to the American Association of Poison Control Centers (Ref. 7). Consistent with the underreporting of commercial deaths, EPA estimates there are unreported consumer deaths due to exposure to methylene chloride during paint and coating removal.

These deaths clearly have a significant impact on families, workplaces, and communities, and yet not all of them can be monetized. Similarly, the serious health effects and lifetime impacts on workers who do not die but who are hospitalized with heart failure, coma, or other effects also cannot be quantified or monetized. However, the impacts of these effects should not be ignored. One example is a case in 2012 in California, where one man attempted to save a co-worker who had collapsed while cleaning a paint-mixing tank. The collapsed worker died, and the man attempting to rescue him was incapacitated within several seconds and lost consciousness. Though he survived, he required resuscitation, hospitalization for four days, and lengthy follow-up treatments (Ref. 7). The impacts on workers with severe but non-fatal nervous system impacts include monetary, personal health, and emotional suffering costs that cannot be quantified or monetized, but again, should not be ignored. These severe nervous system impacts can include coma and heart failure (Ref. 2).

Even when less severe, the nervous system effects of acute exposure to methylene chloride can have considerable adverse consequences on an individual, particularly if one is exposed as a bystander who is unaware of why these nervous system effects are occurring. Commercial and consumer users as well as bystanders in workplaces and residences are at risk of dizziness and sensory impairment during most uses of methylene chloride for paint and coating removal. Similarly, chronic exposure to methylene chloride presents risks to the nervous system of commercial users, consumer users, and

bystanders exposed to methylene chloride in paint and coating removal.

2. Nervous system effects—chronic exposures. The methylene chloride risk assessment identified nervous system effects as adverse effects of chronic exposure to methylene chloride exposure in paint and coating removal. There are increased health risks for nervous system effects for many of the approximately 17,600 workers in 8,600 commercial facilities or companies that use methylene chloride for paint and coating removal for the commercial uses proposed to be regulated (Ref. 4).

Chronic exposures in occupational settings put users and bystanders at risk of cognitive impairment (affecting eye-hand coordination, tracking tasks, auditory vigilance); adverse effects on autonomic, neuromuscular, and sensorimotor functions (Ref. 2); and long-term effects on specific cognitive-neurological measures (*i.e.*, attention and reaction time) (Ref. 5).

3. Liver toxicity. The methylene chloride risk assessment identified liver toxicity and liver cancer as adverse effects of chronic exposure to methylene chloride exposure in paint and coating removal. There are increased health risks for liver toxicity and liver cancer for many of the approximately 17,600 workers in 8,600 commercial facilities or companies that use methylene chloride for paint and coating removal for the commercial uses proposed to be regulated (Ref. 4).

Specific effects to the liver include hepatic vacuolation and non-alcoholic fatty liver disease (NAFLD) (Ref. 2). Some form of liver disease impacts at least 30 million people, or 1 in 10 Americans. Included in this number is at least 20% of those with NAFLD. NAFLD tends to impact people who are overweight/obese or have diabetes. However, an estimated 25% do not have any risk factors. The danger of NAFLD is that it can cause the liver to swell, which may result in cirrhosis over time and could even lead to liver cancer or failure (Ref. 42). The most common known causes to this disease burden are attributable to alcoholism and viral infections, such as hepatitis A, B, and C. These known environmental risk factors of hepatitis infection may result in increased susceptibility of individuals exposed to organic chemicals such as methylene chloride.

Chronic exposure to methylene chloride can also lead to liver cancers including hepatocellular carcinomas (HCC), hepatocellular adenomas, and biliary tract cancer (Ref. 2). The monetizable benefits associated with reducing the risk of liver cancers associated with methylene chloride

exposure are discussed in Unit VII.B. However, the impacts of these cancers should not be measured only as dollar valuations. For example, because HCC is frequently diagnosed only after an individual's health has deteriorated, survival is usually measured in months. As a result, "HCC is responsible for a large proportion of cancer deaths worldwide . . . HCC classically arises and grows in silent fashion, making its discovery challenging prior to the development of later stage disease" (Ref. 43). Recommended treatments are aggressive interventions such as the removal of the tumors or sections of the liver; the life expectancy of patients with HCC is a mean survival rate of 6 to 20 months. Advanced cases can metastasize to any organ system, and tends to spread to bones and lungs. Bone pain related to metastasis is frequently the initial presenting symptom of HCC (Ref. 43).

Additional medical and emotional costs are associated with cancer and non-cancer liver toxicity following chronic exposure to methylene chloride in paint and coating removal, although these costs cannot be quantified. These costs include medical visits and medication costs. In some cases, the ability to work can be affected, which in turn impacts the ability to get proper medical care. Liver toxicity can lead to jaundice, weakness, fatigue, weight loss, nausea, vomiting, abdominal pain, impaired metabolism, and liver disease.

Depending upon the severity of the jaundice, treatments can range significantly. Simple treatment may involve avoiding exposure to methylene chloride and other solvents; however, this may impact an individual's ability to continue to work. In severe cases, liver toxicity can lead to liver failure, which can result in the need for a liver transplant. Even if a donor is available, liver transplantation is expensive (with an estimated cost of \$575,000) and there are countervailing risks for this type of treatment (Ref. 44). The mental and emotional toll on an individual and their family as they try to identify the cause of sickness and possibly experience an inability to work, as well as the potential monetary cost of medical treatment required to regain health, are significant.

4. Hematopoietic cancers. EPA's 2011 IRIS assessment for methylene chloride found that it is a likely human carcinogen. Chronic inhalation exposure to methylene chloride such as during paint and coating removal has been shown to result in increased risk for non-Hodgkin's lymphoma (NHL) or multiple myeloma in workers (Ref. 5). There are increased risks for NHL or

multiple myeloma for many of the approximately 17,600 workers in 8,600 commercial facilities or companies that use methylene chloride for paint and coating removal for the commercial uses proposed to be regulated (Ref. 4).

NHL is a form of cancer that originates in the lymphatic system. Approximately 19 new cases per 100,000 adults per year are diagnosed, with approximately 6.2 deaths per 100,000 adults annually (Ref. 45). NHL is the seventh most common form of cancer (Ref. 46). Other factors that may increase the risk of NHL are medications that suppress a person's immune system, infection with certain viruses and bacteria, or older age (Ref. 47).

Symptoms of NHL are swollen lymph nodes in the neck, armpits or groin, abdominal pain or swelling, chest pain, coughing or trouble breathing, fatigue, fever, night sweats, and weight loss. Depending on the rate at which the NHL advances, treatment may consist of monitoring, chemotherapy, radiation, stem cell transplant, medications that enhance the immune system's ability to fight cancer, or medications that deliver radiation directly to cancer cells (Ref. 47).

Multiple myeloma is a related hematopoietic cancer, formed by malignant plasma cells. Multiple myeloma is characterized by low blood counts, bone and calcium problems, infections, kidney problems, light chain amyloidosis, and various forms of abnormal plasma cell growth. Often, multiple myeloma has no clinical symptoms until it reaches an advanced stage (Ref. 48).

Treatments for NHL or multiple myeloma result in substantial costs for hospital and doctors' visits in order to treat the cancer. Treatments for NHL or multiple myeloma can also have countervailing risks and can lead to patients' higher susceptibility for secondary malignancies (Refs. 47 and 48). The emotional and mental toll from wondering whether a treatment will be successful, going through the actual treatment, and inability to do normal activities, or work will most likely be high (Ref. 49). This emotional and mental toll could extend to the person's family and friends as they struggle with the diagnosis and success and failure of a treatment regime.

5. Brain cancer. EPA's 2011 IRIS assessment for methylene chloride found that it is a likely human carcinogen. Chronic inhalation exposure to methylene chloride has been shown to result in brain cancer (Ref. 5). There are increased risks for brain cancer for many of the approximately 17,600 workers in 8,600 commercial facilities

or companies that use methylene chloride for paint and coating removal for the commercial uses proposed to be regulated (Ref. 4).

Researchers at the National Cancer Institute found that "associations of astrocytic brain cancer were observed with likely exposure to carbon tetrachloride, methylene chloride, trichloroethylene, and were strongest for methylene chloride. . . . Risk of astrocytic brain tumors increased with probability and average intensity of exposure, and with duration of employment in jobs considered exposed to methylene chloride. . . . These trends could not be explained by exposures to the other solvents" (Ref. 50).

Cancers that originate in the brain, which include astrocytic brain cancers, are relatively rare. Astrocytic brain cancers are estimated to have an incidence of approximately 10 cases per 1 million people per year, depending on how these types of cancers are defined (Ref. 51). Astrocytic tumors are characterized by varying degrees of growth potential and infiltration into nearby tissues. They include tumors that can spread quickly through the brain stem (brain stem gliomas); affect the pineal gland, which controls the sleeping and waking cycle (pineal astrocytic tumors); grow slowly and can be relatively easily cured (pilocytic astrocytoma); grow slowly but often spread into nearby tissues (diffuse astrocytoma); grow quickly and spread into nearby tissues (anaplastic astrocytoma); and grow quickly, spread quickly into nearby tissues, and usually cannot be cured (glioblastoma) (Ref. 51).

For astrocytic brain cancers, like other primary malignant brain tumors, initial clinical symptoms are frequently headaches and seizures. Lower-grade tumors may persist undetected for years, whereas the faster-growing or faster-spreading tumors may rapidly provoke neurological decline. Other symptoms may include nausea, vomiting, headache, and confusion as a result of increased intracranial pressure (Ref. 51).

Treatment for astrocytic brain cancers varies by the type and stage of the tumor; it can include pharmacological treatment (for many patients, this includes steroids and anti-convulsants if they are experiencing seizures), surgery (depending on location of the tumor, they may be removed or separated from the brain), chemotherapy, hormone modulation, or combinations of these treatments (Ref. 51). Like most cancer treatments, these can have countervailing risks. Additionally, the emotional and mental tolls described in

earlier sections are relevant to these cancer treatments as well (Ref. 49).

6. Lung cancer. EPA's 2011 IRIS assessment for methylene chloride found that it is a likely human carcinogen. Chronic inhalation exposure to methylene chloride has been shown to result in bronchoalveolar carcinomas (BAC) or bronchoalveolar adenomas, which are forms of lung cancer (Ref. 5). There are increased risks for these lung cancers for many of the approximately 17,600 workers in 8,600 commercial facilities or companies that use methylene chloride for paint and coating removal for the commercial uses proposed to be regulated (Ref. 4).

BAC is a small percent of lung cancers (between 2% to 4%) and has unique characteristics. It is notable for its weak relationship with cigarette smoking; about one-third of patients in the United States with BAC were never smokers. Additionally, because it rarely spreads outside the lungs, it is often initially diagnosed as pneumonia or other lung inflammations (Ref. 52). Most patients do not present clinical symptoms (Ref. 52) and are only diagnosed following radiography or biopsy. Treatment requires surgery (Ref. 52). This has clear countervailing risks, and even if successful in removing any tumors present, the BAC may return.

7. Mammary tumors. Exposure to methylene has been shown to result in significant increases in the incidence of adenomas, fibroadenomas, or fibromas in or near the mammary gland (Refs. 2 and 5). These are largely benign tumors (Ref. 2). Though many benign tumors do not require invasive procedures, doctors recommend removing fibroadenomas. Patients need to undergo a biopsy to identify the carcinogenic risk of the tumor, and have the tumors removed if they continue to grow, change the shape of the breast, or are carcinogenic (Ref. 53). If removal is necessary, the procedure may also require the removal of nearby healthy mammary tissue, resulting in scarring and changed shape and texture of the breast (Ref. 53). Women with fibroadenomas and adenomas also have an increased risk of breast cancer, estimated to be approximately 1.5 to 2.0 times the risk of women with no breast changes (Ref. 54).

8. Reproductive effects. EPA's 2011 IRIS assessment for methylene chloride found that exposure can have reproductive effects that include testicular and ovarian atrophy (Ref. 5). At very high exposures, chronic inhalation of methylene chloride during paint and coating removal can result in these reproductive effects, which are related to decreased fertility (Ref. 55).

There are increased risks for these reproductive effects for many of the approximately 17,600 workers in 8,600 commercial facilities or companies that use methylene chloride for paint and coating removal for the commercial uses proposed to be regulated (Ref. 4). Similar to effects discussed previously, while neither the precise reduction in individual risk of developing this disorder from reducing exposure to methylene chloride or the total number of cases avoided can be estimated, EPA still considers their impact.

9. *Kidney toxicity.* EPA's 2011 IRIS assessment for methylene chloride identified kidney effects from exposure to methylene chloride; these effects include renal tubular degeneration (Ref. 5). At very high exposures, chronic inhalation exposure to methylene chloride during paint and coating removal can result in kidney toxicity. There are increased risks for these kidney effects for many of the approximately 17,600 workers in 8,600 commercial facilities or companies that use methylene chloride for paint and coating removal for the commercial uses proposed to be regulated (Ref. 4).

Exposure to methylene chloride can lead to changes in the proximal tubules of the kidney. This damage may result in signs and symptoms of acute kidney failure that include; decreased urine output, although occasionally urine output remains normal; fluid retention, causing swelling in the legs, ankles or feet; drowsiness; shortness of breath; fatigue; confusion; nausea; seizures or coma in severe cases; and chest pain or pressure. Sometimes acute kidney failure causes no signs or symptoms and is detected through lab tests done for another reason.

Kidney toxicity means the kidney has suffered damage that can result in a person being unable to rid their body of excess urine and wastes. In extreme cases where the kidney is impaired over a long period of time, the kidney could be damaged to the point that it no longer functions. When a kidney no longer functions, a person needs dialysis and ideally a kidney transplant. In some cases, a non-functioning kidney can result in death. Kidney dialysis and kidney transplantation are expensive and incur long-term health costs if kidney function fails (Ref. 56).

The monetary cost of kidney toxicity varies depending on the severity of the damage to the kidney. In less severe cases, doctor visits may be limited and hospital stays unnecessary. In more severe cases, a person may need serious medical interventions, such as dialysis or a kidney transplant if a donor is available, which can result in high

medical expenses due to numerous hospital and doctor visits for regular dialysis and surgery if a transplant occurs. The costs for hemodialysis, as charged by hospitals, can be upwards of \$100,000 per month (Ref. 57).

Depending on the severity of the kidney damage, kidney disease can impact a person's ability to work and live a normal life, which in turn takes a mental and emotional toll on the patient. In less severe cases, the impact on a person's quality of life may be limited while in instances where kidney damage is severe, a person's quality of life and ability to work would be affected. While neither the precise reduction in individual risk of developing kidney toxicity from reducing exposure to methylene chloride during paint or coating removal or the total number of cases avoided can be estimated, these costs must still be considered because they can significantly impact those exposed to methylene chloride.

10. *Disproportionate impacts on environmental justice communities.* An additional factor that cannot be monetized is the disproportionate impact on environmental justice communities. As described in Unit VI.C.1.b., Hispanic and foreign-born workers, who may have limited English proficiency, are disproportionately over-represented in construction trades (Ref. 4), in which methylene chloride is used for paint and coating removal. Because they are disproportionately over-represented in this industry, these populations are disproportionately exposed to methylene chloride during paint and coating removal, and are disproportionately at risk to the range of adverse health effects described in this unit.

E. Availability of Alternatives

For almost every situation in which methylene chloride is used to remove paints or coatings, EPA is aware of technically and economically feasible chemical substitutes or alternative methods that are reasonably available. The two situations for which EPA does not know of technically and economically feasible alternatives are the uses that EPA proposes are critical for national security, described in more detail in Unit VIII., and commercial furniture refinishing, discussed in more depth in Unit XI. With respect to the specific coating removal uses that EPA proposes are critical for national security, described in Unit VIII., EPA does not believe that technically and economically feasible alternatives are reasonably available at this time. With respect to the furniture refinishing uses

described in Unit XI., EPA is still investigating whether economically feasible alternatives are reasonably available.

EPA considered chemical substitutes and alternative methods consistent with the requirements of TSCA section 6(c)(2)(C) and as similarly recommended by the SBAR panel (Ref. 27). A full industry profile characterizing manufacturers, processors and end users of methylene chloride for paint and coating removal and a use and substitutes analysis are included in sections 2 and 3 of EPA's economic assessment (Ref. 4). As described below, EPA proposes that alternatives are technologically feasible, economically feasible, reasonably available, and present fewer hazards to human health than methylene chloride in paint and coating removal. EPA requests comment on whether its conclusion that substitutes for methylene chloride identified are available and technically and economically feasible is accurate and whether its consideration of alternatives was sufficient to satisfy the requirements of TSCA section 6(c)(2)(C).

Research into the efficacy of chemical substitutes has identified products currently available for commercial and consumer users of methylene chloride for paint and coating removal, for a variety of coatings on numerous substrates (Refs. 58 and 59). Research by the European Association for Safer Coating Removal in 2006 found that for every use that was studied of methylene chloride in paint and coating removal, there was a suitable substitute (Ref. 60). Other non-chemical methods of paint removal are also available (Ref. 31). Additionally, in most commercial sectors, users have voluntarily adopted substitute chemicals or methods, either due to financial considerations, customer requests, concern for worker or individual health and safety, decreased discharges to air and water, reduced clean-up costs, or reduced cost of protective equipment and respiratory protection programs (Ref. 22).

Many producers of paint and coating removal products containing methylene chloride also produce paint and coating removal products with substitute chemicals (Ref. 4). This was emphasized by a small business who makes such products (Ref. 22); other small businesses separately described the limitations of many alternatives (Ref. 27). Thus, there is already precedent for producers reformulating products to meet demand from commercial or individual customers. Additionally, methylene chloride is prohibited from use in graffiti removal in California,

Connecticut, Delaware, the District of Columbia, Illinois, Indiana, Maine, Maryland, Massachusetts, Michigan, New York, and Rhode Island (Ref. 12). The fact that 11 states and the District of Columbia have specifically prohibited the use of methylene chloride in graffiti removal supports a finding that it is not critical for this use and that there are efficacious substitutes.

Based on the frequent use of substitute chemicals or alternative methods for paint and coating removal in all industries discussed here, and the formulation and distribution of substitute chemicals for paint and coating removal by all formulators of products containing methylene chloride (Ref. 4), EPA finds that technically and economically feasible alternatives to methylene chloride are reasonably available for all uses proposed for regulation.

Primary chemical substitutes for methylene chloride in paint and coating removal include products formulated with benzyl alcohol; dibasic esters; acetone, toluene, and methanol (collectively ATM); and caustic chemicals. EPA evaluated these products for efficacy, toxicity, relative hazards compared to methylene chloride, and other hazards that might be introduced by use of these products (such as environmental toxicity, increased global warming potential, and increased flammability or other hazards to users). Overall, while the efficacies of the substitutes are comparable to the efficacy of methylene chloride, none of the substitute chemicals already available has the level of toxicity associated with methylene chloride.

Products based on benzyl alcohol formulations have been identified as efficacious paint and coating removers in various industry sectors (Refs. 22 and 27). Consumer products containing benzyl alcohol are available for sale (Refs. 22, 27, 35, 58, 59, and 61). There are fewer hazard concerns compared to methylene chloride-based products, and the levels at which benzyl alcohol causes toxicity are higher than for methylene chloride, suggesting lower toxicity (Ref. 34). The relative inhalation exposure potential is lower for benzyl alcohol than for methylene chloride. The relative dermal exposure potential of benzyl alcohol is similar to methylene chloride (Ref. 34). Benzyl alcohol-based paint removers are expected to result in lower risks than methylene chloride products, primarily due to lower toxicity (Ref. 29).

Dibasic ester products can include dimethyl succinate, dimethyl glutarate and dimethyl adipate. They are

generally viewed as efficacious products by commercial users in several sectors, though, because they evaporate slowly, they require a longer dwell time than methylene chloride (Ref. 22, 27). In general, the hazards associated with dibasic esters are less severe and occur at concentrations higher than methylene chloride (Ref. 34). Regarding differential exposures between dibasic esters and methylene chloride, the relative inhalation exposure potential is lower for dibasic esters than for methylene chloride (Ref. 34). The relative dermal exposure potentials of dibasic esters are similar to methylene chloride. Taken together, dibasic ester-based paint removers are expected to result in lower risks than methylene chloride products, primarily due to lower toxicity (Ref. 34).

ATM products contain acetone, toluene, and methanol. Products containing these chemicals may remove coatings very quickly, but may not be effective on every type of coating (Refs. 22 and 27). Acetone, toluene, and methanol evaporate quickly and are very flammable (Ref. 62). However, it is important to note that acetone, toluene, and/or methanol are present in most paint removers that contain methylene chloride, as co-solvents (Ref. 34). As a result, the main difference between paint removers that contain methylene chloride (and typically also contain acetone, toluene, and/or methanol) and ATM products is the absence of methylene chloride. Acetone is readily absorbed via inhalation and the relative inhalation exposure potential is similar to methylene chloride (Ref. 34). Acetone in particular is significantly less toxic than methylene chloride. Toluene and methanol are readily absorbed via inhalation, but the relative inhalation exposure potential is lower than for methylene chloride (Ref. 34). Dermal exposure to acetone, toluene and methanol is slightly less than for methylene chloride (Ref. 34). Taken together, ATM-based paint removers are expected to result in lower cancer risks (Ref. 36).

Products with caustic chemicals typically include calcium hydroxide or magnesium hydroxide. In many uses, they can be effective products, particularly when multiple coatings are being removed from a substrate. Caustic products have been reported to remove up to 30 coats in 24 hours, and in some cases, they have no increased dwell time compared to methylene chloride (Ref. 23). In contrast to methylene chloride-based products, there are no cancer or other repeat dose endpoints of concern associated with caustic products (Ref. 34). Caustic products pose acute concerns due to their

physical chemical properties and can cause chemical burns (Ref. 36). It is important to note that products containing methylene chloride may also cause chemical burns. Additionally, the risks associated with caustic-based products are entirely acute, and can be mitigated by appropriate protective equipment more easily than the acute and chronic risks presented by methylene chloride.

In summary, when NMP is excluded from consideration, the most likely chemical substitutes for methylene chloride in paint and coating removal do not pose a risk of cancer to users, generally have lower exposure potential than methylene chloride, and when acute risks are present, as in the case of caustic chemicals, those risks are self-limiting by the nature of the adverse effects (since a user experiencing those effects is likely to take immediate action to mitigate or cease the effect of the caustic chemical). The chemical formulations that seem to present some risks of concern are ATM products, since they contain toluene and methanol. However, these chemicals are also present in most paint removers that contain methylene chloride, as co-solvents. As a result, no additional risks would be introduced were users to substitute a typical methylene chloride product (which would likely contain acetone, toluene, and/or methanol as co-solvents) with ATM products.

In addition to examining toxicity to humans, EPA reviewed available data on the chemicals in the baseline and alternative products for aquatic toxicity, persistence and bioaccumulation data, as a basis for examining potential environmental toxicity. Only one chemical evaluated (citrus terpenes) may have significant impacts on aquatic toxicity, with concern for environmental persistence and/or bioaccumulation. This chemical is contained in NMP-based paint removal products (Ref. 34).

EPA is also mindful of the risks that may be introduced by substitute chemicals or methods to increase global warming, and has examined the global warming potential of the chemical components of likely chemical substitutes for methylene chloride in paint and coating removal. Methylene chloride presents concerns for global warming; it has a GWP of 8.7 (see Unit II.D.2.). The GWP values of likely substitute chemicals in paint and coating removal are: 0 GWP (benzyl alcohol, ATM) or not assessed (caustics, dibasic esters) (Ref. 23). As such, EPA has not identified any increased risk of global warming that would be introduced by use of chemical products

as substitutes for methylene chloride in paint and coating removal.

In addition to human and environmental toxicity, other hazards associated with chemical methods for paint and coating removal are risks of fire due to flammability of the chemical product, and poisoning or acute injury. Risks of fire are serious when using solvents such as paint and coating removal chemicals. The flammability of methylene chloride is lower than some of the substitute organic solvents. However, many paint and coating removal products containing methylene chloride also contain more flammable chemicals as part of the formulation (Ref. 34). Paint and coating removal products sold to consumers that contain methylene chloride frequently have flammability warnings prominently on them (Ref. 35). Other chemical paint and coating removal products, such as those based on benzyl alcohol and dibasic esters, have low flammability and do not present an increased risk of fire from products containing methylene chloride (Ref. 23). Even among products that fall within the same general product composition category, there is meaningful variability in the specific formulations of paint remover products, and thus in their flammability. Furthermore, it is impracticable for EPA to predict the specific product formulations for which use will increase as a result of prohibitions on methylene chloride in paint and coating removal. It is therefore impracticable for EPA to forecast whether the flammability of popular paint and coating removers would generally increase or decrease as a result of the proposed rule.

In addition to using substitute chemical products, non-chemical methods for paint and coating removal are frequently used. These include thermal removal, sanding, hydroblasting, abrasive blasting, and laser removal (Refs. 22 and 31). Acute and chronic physical hazards (e.g., burns, injuries to bodily parts) to workers and consumers can occur, in addition to any lead-related risks that should be considered when using these methods with lead-based paint.

In this overview, when considering alternatives to methylene chloride that would be available, NMP generally was not considered because, under the first co-proposed option for NMP in this proposed rule, this chemical would also be prohibited from use in paint and coating removal. However, under the second co-proposed approach for reducing the risks of NMP in paint and coating removal, products containing NMP would be available for commercial and consumer paint and coating

removal, with restrictions. Details of the two co-proposed options are in Unit XVI.3. EPA identified developmental risks following acute exposures for consumers and acute and chronic exposures for commercial users of paint and coating removal products containing NMP following exposure through dermal contact, inhalation, and vapor-through-skin. More information on the risks EPA identified related to NMP are in Unit XVI.B.1.

F. Impacts of the Proposed and Alternative Regulatory Options

This unit describes the estimated costs of the proposed and alternative regulatory actions that EPA considered for methylene chloride in paint and coating removal. More information on the benefits and costs of this proposal as a whole can be found in Unit XXIII.

1. Proposed approach for methylene chloride in paint and coating removal. The costs of the proposed approach are estimated to include product reformulation costs, downstream notification costs, recordkeeping costs, and Agency costs. The costs of paint and coating removal product reformulations are estimated to be approximately \$10,000 to \$20,000 per year (annualized at 3% over 20 years) and \$14,000 to \$24,000 (annualized at 7% over 20 years). The cost for reformulation includes a variety of factors such as identifying the appropriate substitute chemical for methylene chloride in the formulation, assessing the efficacy of the new formulation and determining shelf-life. Under the first co-proposed approach for NMP, where the manufacturing, processing, distribution, and commercial use of paint and coating removal products containing NMP would be prohibited, the costs to users of paint and coating removers containing methylene chloride are \$4,217,000 to \$23,436,000 using a 3% discount rate and \$4,592,000 to \$23,485,000 at the 7% discount rate (both rates annualized over 20 years). The costs of downstream notification and recordkeeping on an annualized basis over 20 years are \$40 and \$60 using 3% and 7% discount rates respectively (Ref. 4). Agency costs for enforcement are estimated to be approximately \$114,401 and \$111,718 annualized over 20 years at 3% and 7%, respectively. The total cost of the proposed approach for paint and coating removers containing methylene chloride under the first co-proposed approach for NMP is estimated to be \$4,247,000 to \$23,446,000 and \$4,612,000 to \$23,495,000 annualized over 20 years at 3% and 7%, respectively (Ref. 4). Under

the second co-proposed approach for NMP, where paint and coating removal products containing NMP would be available with some restrictions, the costs to users of paint and coating removers containing methylene chloride are \$67,087,960 to \$68,726,960 using a 3% discount rate and \$67,369,940 to \$69,006,940 at the 7% discount rate (both rates annualized over 20 years). The costs of downstream notification and recordkeeping on an annualized basis over 20 years are the same as under the first co-proposed approach for NMP. Agency costs for enforcement are estimated to be the same as under the first co-proposed approach for NMP. The total cost of the proposed approach for paint and coating removers containing methylene chloride under the second co-proposed approach for NMP is estimated to be \$67,098,000 to \$68,747,000 and \$67,384,000 to \$69,034,000 annualized over 20 years at 3% and 7%, respectively (Refs. 4 and 127).

2. Options that require personal protective equipment for methylene chloride in paint and coating removal. Given equipment costs and the requirements associated with establishing a respiratory protection program which involves training, respirator fit testing and the establishment and maintenance of a medical monitoring program, EPA considers the proposed approach more cost-effective than options that require person protective equipment. This is because EPA anticipates that companies would choose to switch to substitute chemicals instead of adopting a program for PPE, including with a performance-based option of meeting an air concentration level of 1 ppm as an exposure limit for methylene chloride in paint and coating removal. The estimated annualized costs of switching to a respiratory protection program requiring PPE of APF 1,000 are \$13,775,000 to \$26,535,000 at 3% and \$14,202,000 to \$26,708,000 at 7% over 20 years (Ref. 4). In addition, there would be higher EPA administration and enforcement costs with a respiratory protection program under the proposed approach.

3. Options that exclude downstream notification. For those options that exclude downstream notification, the options are less effective and more to challenging to implement. The downstream notification (e.g., via SDS) provides additional information on the prohibitions under the proposed option for processors and distributors of methylene chloride or products containing methylene chloride other than paint and coating removers, and

provides an efficient way for those entities to recognize themselves as affected by the regulation, which contributes to a more effective regulation (Ref. 63). In this way, the downstream notification component of the supply chain approach contributes to the use no longer presenting an unreasonable risk because it streamlines and aids in compliance and implementation (Ref. 64).

G. Summary

The proposed approach is necessary so that methylene chloride in paint and coating removal no longer presents an unreasonable risk. It is also more cost effective than other regulatory options the Agency identified as potentially reducing risks so that they are no longer unreasonable, because it achieves the benefits of reducing the unreasonable risks so they are no longer unreasonable for a lower cost than the primary alternative option. For more information, see section 6 in the Economic Analysis (Ref. 4).

As stated previously in this notice, the proposed approach includes:

- Prohibiting manufacturing (including import), processing, and distribution in commerce of methylene chloride for consumer paint and coating removal and commercial paint and coating removal for the uses proposed for regulation;
- Prohibiting commercial use of methylene chloride for paint and coating removal for the uses proposed for regulation;
- Requiring that any products containing methylene chloride intended or used for paint and coating removal be distributed in volumes no less than 55-gallon containers;
- Requiring downstream notification of the prohibition on manufacturing (including import) processing, and distribution of methylene chloride for paint and coating removal for the prohibited uses; and
- Requiring limited recordkeeping.

Technically and economically feasible substitutes to methylene chloride for paint and coating removal are reasonably available for the uses proposed to be regulated. The supply chain approach ensures protection of consumers from the unreasonable risk by precluding the off-label purchase of commercial products by consumers.

The proposed approach is relatively easy to enforce because key requirements are directly placed on a small number of suppliers and because the supply chain approach minimizes to the greatest extent the potential for methylene chloride products to be intentionally or unintentionally

misdirected into the prohibited uses. Enforcement under the other options would be much more difficult since the key requirements are directly placed on the large number of product users. As described in a recent article on designing more effective rules and permits, “the government can implement rules more effectively and efficiently when the universes of regulated sources are smaller and better-defined. This is because, other factors being equal, governments can more easily identify, monitor, and enforce against fewer, rather than more, entities” (Ref. 63). Under other options, enforcement activities must target firms that might perform the activity where a use of methylene chloride is restricted or prohibited. Identifying which establishments might use paint and coating removers is difficult because paint and coating removal is not strictly specific to any industry (Ref. 4).

VII. Costs and Monetized Benefits of the Methylene Chloride Component of the Proposed Rule, the Alternatives EPA Considered, and Comparison of Costs and Benefits

EPA proposes that the identified risks from methylene chloride and in paint and coating removal are unreasonable risks. Apart from that proposed determination, EPA has evaluated the potential costs and benefits of the proposed approach and alternative approaches.

A. Costs

The details of the costs of the proposed approach for use of methylene chloride in paint and coating removal by consumers and in commercial uses proposed for regulation are discussed in Unit I.E. and in the Economic Analysis (Ref. 4). Under the proposed option for methylene chloride and the first co-proposed option for NMP, costs to users of paint and coating removal products containing methylene chloride are \$4,217,000 to \$23,436,000 annualized for 20 years at a discount rate of 3% and \$4,592,000 to \$23,485,000 at a discount rate of 7%. Costs of paint and coating removal product reformulations are estimated to be approximately \$10,000 to \$20,000 per year (annualized at 3% over 20 years) and \$14,000 to \$24,000 (annualized at 7% over 20 years). Costs of downstream notification and recordkeeping on an annualized basis over 20 years are \$40 and \$60 using 3% and 7% discount rates respectively. Agency costs for enforcement are estimated to be approximately \$114,401 and \$111,718 annualized over 20 years at 3% and 7%, respectively (Ref. 4).

Total costs of the proposed rule relevant to methylene chloride in paint and coating removal under the first co-proposed option for NMP are estimated to be \$4,247,000 to \$23,446,000 annualized over 20 years at 3% and \$4,612,000 to \$23,495,000 annualized over 20 years at 7% (Ref. 4).

Under the proposed option for methylene chloride and the second co-proposed option for NMP, costs to users of paint and coating removal products containing methylene chloride are \$67,087,960 to \$68,726,960 annualized for 20 years at a discount rate of 3% and \$67,369,940 to \$69,006,940 at a discount rate of 7%. Costs of paint and coating removal product reformulations, costs of downstream notification, and Agency costs for enforcement are estimated to be the same as under the first co-proposed option for NMP (Refs. 4 and 127).

Total costs of the proposed rule relevant to methylene chloride in paint and coating removal under the second co-proposed option for NMP are estimated to be \$67,098,000 to \$68,747,000 annualized over 20 years at 3% and \$67,384,000 to \$69,034,000 annualized over 20 years at 7% (Refs. 4 and 127).

Alternatives that EPA considered include the use of PPE as well as an option that would prohibit the use of methylene chloride in paint and coating removal for consumers and for the commercial uses proposed for regulation without the companion prohibition on manufacture, processing, or distribution in commerce for these uses or the downstream notification requirements. As discussed in Unit VI.C.3., EPA found that PPE options did not address the risks presented by methylene chloride in paint and coating removal so that the risks would no longer be unreasonable. This is because consumers could not be required to adopt PPE, resulting in a significant gap in protection for consumers. In addition, EPA also assumed that no commercial users would adopt PPE because the per-facility costs were prohibitively expensive.

EPA also found that a use prohibition alone without downstream notification requirements would not address the unreasonable risks. EPA estimated the costs of this option to be \$4,239,000 to \$23,442,000 annualized over 20 years at 3% and \$4,604,000 to \$23,491,000 annualized over 20 years at 7% (Ref. 4).

B. Benefits

EPA is not fully able to quantify the full monetary benefits that would accrue from preventing all deaths due to methylene chloride in paint and coating

removal. Similarly, EPA is not able to monetize the benefits that would accrue from preventing non-fatal and non-cancer effects from exposure to methylene chloride in paint and coating removal. The subset of benefits that can be monetized from mitigating the risks from methylene chloride in paint and coating removal for consumer uses and for the commercial uses proposed for regulation are estimated to be \$14,363,000 to \$14,565,000 (annualized at 3% over 20 years) and \$13,796,000 to \$13,921,000 (annualized at 7% over 20 years) (Ref. 4). Although the alternatives considered are unlikely to result in the same health benefits as the proposed option, EPA was unable to quantify the differences.

C. Comparison of Benefits and Costs

The monetized subset of benefits for preventing the risks resulting from methylene chloride in paint and coating removal by consumers and by commercial workers for the uses proposed for regulation do not outweigh the estimated monetary costs. EPA believes that the balance of costs and benefits cannot be fairly described without considering the additional, non-monetized benefits of mitigating the non-cancer adverse effects as well as cancer. As discussed previously, the multitude of potential adverse effects associated with methylene chloride in paint and coating removal can profoundly impact an individual's quality of life. Some of the adverse effects associated with methylene chloride exposure can be immediately experienced and can result in sudden death; others can have impacts that are experienced for a shorter portion of life, but are nevertheless significant in nature. While the risk of non-cancer health effects associated with methylene chloride exposure during paint and coating removal cannot all be quantitatively estimated, the qualitative discussion highlights how some of these non-cancer effects may be as severe as cancer and thus just as life altering. These effects include not only medical costs but also personal costs such as emotional and mental stress that are impossible to accurately measure. Considering only monetized benefits would significantly underestimate the impacts of methylene chloride-induced non-cancer adverse outcomes on a person's quality of life.

Thus, considering costs; the subset of benefits that can be monetized (risk of cancer and risk of death in some sectors); and the remaining benefits that cannot be quantified and subsequently monetized (risk of nervous system effects, liver toxicity, reproductive

effects, and kidney toxicity), including benefits related to the severity of the effects and the impacts on a person throughout a lifetime in terms of medical costs, effects on earning power and personal costs, emotional and psychological costs, and the disproportionate impacts on Hispanic communities and individuals with limited English proficiency; the benefits of preventing exposure to methylene chloride in paint and coating removal by an estimated 1.3 million consumers and estimated 17,600 commercial workers for the uses proposed for regulation outweigh the costs.

D. Impacts on the National Economy, Small Businesses, Technological Innovation, the Environment, and Public Health

As described in Unit V.B. and in the Economic Analysis, EPA considered the anticipated effects of this proposal on the national economy. While the impacts of this rule as a whole are described in Unit XXIII.C. and the impacts of the methylene chloride component of this proposal are described in more detail in Unit VII.A. and in Section 9.3 of the Economic Analysis (Ref. 4), EPA does not anticipate these impacts having an effect on the overall national economy. EPA anticipates that a majority of small businesses will have cost impacts of less than one percent of the annual revenue, and the majority of small business bathtub refinishing facilities and professional contractors will have cost impacts greater than one percent of annual revenue.

The proposed approach is anticipated to drive technological innovation by formulators of paint and coating removal products containing methylene chloride, as they continue to develop substitute products, and refine such products already available. It is also anticipated to drive technological innovation by formulators of chemical paint and coating removal products with different chemistries as well as manufacturers and retailers of alternative methods of paint and coating removal. See also section 9.3 in the Economic Analysis (Ref. 4).

The proposed approach is anticipated to have a positive impact on public health, as described in Unit VI.D. There is anticipated to be a positive impact on the environment, as a result of decreased use of methylene chloride, which is a hazardous air pollutant, as described in Unit III.A.

VIII. Uses of Methylene Chloride for Paint and Coating Removal Critical for National Security

As part of interagency collaboration with the Department of Defense (DOD) on this proposed rule, EPA is aware that there are specific military uses for which methylene chloride is essential for paint and coating removal and for which there are no technically feasible alternatives currently available. The military readiness of DOD's warfighting capability is paramount to ensuring national security, which includes ensuring the maintenance and preservation of DOD's warfighting assets. DOD has identified mission-critical uses for methylene chloride for ensuring military aviation and vessel readiness. These mission-critical items require the use of methylene chloride for the removal of coatings from mission-critical corrosion-sensitive components on military aviation and vessels, including safety-critical components made of specialty metallic, nonmetallic, and composite materials. As described in this section, EPA proposes to exempt these uses from the regulations proposed on methylene chloride in paint and coating removal. This exemption is proposed for an initial ten-year period from the publication date of a final rule. EPA will engage with DOD to identify any potential extension that may need to be granted, by further rulemaking, after those ten years.

DOD has actively sought to reduce its use of methylene chloride in paint and coating removal since 1990. DOD has replaced most of its usage of methylene chloride for paint and coating removal with mechanical methods, benzyl alcohol products, other solvents, and laser ablation. For instance, the Navy's Fleet Readiness Center Southwest has undertaken a successful 20-year effort and eliminated all but a single use on safety-critical components. In an effort to reduce the use of all HAPs such as methylene chloride, the Army has conducted tests to identify and test the effectiveness of HAP-free paint and coating removers on military high-performance coatings (Ref. 61). In another example, the Air Force in December 2015 significantly reduced the use of methylene chloride for removing coatings on flight control parts and is now using substitute chemical products, primarily those with benzyl alcohol formulations (Ref. 65). This phase-out was driven by worker safety concerns and the destructive impact the methylene chloride product had on the installation's industrial wastewater treatment processes. The Air Force

sought alternatives for this use of methylene chloride for paint and coating removal in this industrial process and was successful at qualifying an alternative that met technical requirements (Ref. 65).

In light of these efforts to identify and adopt alternative chemicals or methods, it is unlikely that DOD has overlooked potential substitutes. DOD continues and will continue to pursue potential substitutes. However, for mission-critical corrosion-sensitive components on military aviation and vessels, including safety-critical components, DOD has found that currently available substitute chemicals for paint and coating removal have one or more technical limitations. In these critical and essential applications, currently available substitute chemicals cannot completely remove specific military high performance or chemical resistant coatings, resulting in improperly applied, incompletely adhering replacement coatings. The impacts of this are early coating failure, corrosion of underlying critical parts, shortened service life for critical components (some of which are no longer manufactured), and reduced availability and mission readiness of military aircraft and vessels.

Substitute chemicals currently available are also incompatible with underlying metallic, nonmetallic and composite materials, resulting in material damage to critical components (e.g. hydrogen embrittlement) creating immediate damage or longer-term susceptibility to stress fracturing and corrosion. The impacts of this are shortened service life for critical components (some of which are no longer manufactured), reduced availability and mission readiness of military aircraft and vessels, and an increased risk of catastrophic failure of safety critical parts.

Additionally, substitute chemicals or methods currently available do not support the coating removal requirements of safety inspection, non-destructive inspection, material assessment, or field repair processes. This results in an inability to properly perform safety inspections for critical components, leading to undetected fractures and defects. The impacts of this are increased risk of catastrophic failure of safety critical parts.

Under TSCA section 6(g)(1)(B), EPA may grant an exemption from a requirement of a TSCA section 6(a) rule for a specific condition of use of a chemical substance or mixture if compliance with the requirement would significantly disrupt the national economy, national security, or critical

infrastructure. Based on discussions and information provided by DOD, EPA has analyzed the need for the exemption and concurs with DOD that compliance with the proposed regulations on the use of methylene chloride in paint and coating removal would significantly impact national security. DOD has demonstrated that the reduced mission availability of aircraft and vessels for military missions or, in the worst case, the loss of individual military aircraft and vessels, are potential impacts to military readiness that could result from the proposed prohibition of methylene chloride in paint and coating removal. Due to the importance of these military systems for national security, EPA has determined that these uses of methylene chloride for removal of specialized coatings from military aviation and vessel mission-critical corrosion-sensitive components, including safety-critical components, is critical for national security and the safety of personnel and assets. EPA includes in this exemption corrosion-sensitive military aviation and vessel mission-critical components such as landing gear, gear boxes, turbine engine parts, and other military aircraft and vessel components composed of metallic materials (specifically high-strength steel, aluminum, titanium, and magnesium) and composite materials that not only require their coatings be removed for inspection and maintenance but also would be so negatively affected by the use of technically incompatible, substitute paint removal chemicals or methods that the safe performance of the vessel or aircraft could be compromised.

EPA proposes to grant this exemption for a period of 10 years from the date of promulgation of a final rule, with a potential for extension, by further rulemaking, after review by EPA in consultation with DOD. The conditions for this exemption would be: (1) The use of methylene chloride for coating removal by DOD or its contractors performing this work only for DOD projects is limited to the mission-critical corrosion-sensitive components on military aviation and vessels, including safety-critical components; and (2) this paint and coating removal must be conducted at DOD installations, at Federal industrial facilities, or at DOD contractor facilities performing this work only for DOD projects. This exemption granted under TSCA(6)(g)(1)(B) does not impact or lessen any requirements for compliance with other statutes under which the use, disposal, or emissions of methylene chloride is regulated.

As described in Unit VI.C.3., under the proposed approach, any paint and coating removal products containing methylene chloride would be required to be distributed in packaged volumes no less than 55-gallon containers. As part of the exemption for uses identified as critical for national security, for those formulations specifically manufactured for DOD, suppliers may provide paint and coating removal products containing methylene chloride to DOD in containers with a volume no less than 5 gallons. Allowing selective use for national security purposes does not disrupt the efficacy of the supply chain approach described in Unit VI.C.3.

In addition to the exemption described in this unit, EPA will consider granting additional time-limited exemptions, under the authority of TSCA section 6(g), for a specific condition of use for which EPA can obtain documentation: that the specific condition of use is a critical or essential use for which no technically and economically feasible safer alternative is available, taking into consideration hazard and exposure; that compliance with the proposed rule would significantly disrupt the national economy, national security, or critical infrastructure. To this end, EPA requests comment on a process for receiving and evaluating petitions and requesting EPA promulgate critical-use exemption rules. Under this process, entities who believe that their specific condition of use is a critical or essential use under TSCA section 6(g) would submit a petition for an exemption rulemaking with supporting documentation that they believe demonstrates that the use meets the statutory criteria. EPA would review the petition for completeness and, if the documentation warrants further action, respond to the petition by publishing a proposal in the **Federal Register** inviting comment on a proposed exemption. EPA would consider the comments received, along with any additional information reasonably available, and then take final action on the proposed exemption. EPA requests comment on the specific kinds of documentation that should be required from entities seeking an exemption rulemaking in order to facilitate EPA's and later, the public's review. EPA also requests comment on the appropriate timeframes for EPA action, given that the documentation for any given use could be technical and extensive, and that EPA may also need to develop additional information, such as economic estimates, in order to promulgate an exemption rule under TSCA section 6(g). Finally, members of

the potentially regulated community who believe that their operation is a critical or essential use should provide as much detail as possible to EPA about their operation during this comment period, including information on any evaluations of alternatives, the costs to transition to another chemical or process, and any other relevant information. This would assist EPA in reviewing the specific condition of use, as well as in establishing provisions for future exemption petitions.

IX. Overview of Uncertainties for Methylene Chloride in Paint and Coating Removal

A discussion of the uncertainties associated with this proposed rule can be found in the methylene chloride risk assessment (Ref. 2) and in the additional analyses for methylene chloride in commercial and consumer paint and coating removal (Refs. 19, 20, and 38). A summary of these uncertainties follows.

EPA used a number of assumptions in the methylene chloride risk assessment and supporting analysis to develop estimates for occupational and consumer exposure scenarios and to develop the hazard/dose-response and risk characterization. EPA recognizes that the uncertainties may underestimate or overestimate actual risks. These uncertainties include the likelihood that releases of and exposures to methylene chloride vary from one paint and coating removal project to the next. EPA attempted to quantify this uncertainty by evaluating multiple scenarios to establish a range of releases and exposures. In estimating the risk from methylene chloride in paint and coating removal, there are uncertainties in the number of workers, bystanders, and consumers exposed to methylene chloride and in the inputs to the models used to estimate exposures.

In addition to the uncertainties in the risks, there are uncertainties in the cost and benefits. The uncertainties in the benefits are most pronounced in estimating the benefits from preventing deaths due to methylene chloride that have been underreported in most commercial sectors. Additional significant uncertainties in benefits include the entirety of prevention of the non-cancer adverse effects, including underreported deaths (described in Unit VI.E.), because these benefits generally cannot be monetized due to the lack of concentration response functions in humans leading to the ability to estimate the number of population-level non-cancer cases and limitations in established economic methodologies. Additional uncertainties in benefit

calculations arose from EPA's use of a forecast from an industry expert to estimate the categories of alternatives that users might choose to adopt and the potential risks for adverse health effects that the alternatives may pose. While there are no products or methods that have comparable cancer or lethal risks, these substitute products and alternative methods do present hazards. Without information on what alternative methods or chemicals users of methylene chloride for paint and coating removal are likely to switch to, and estimates of the exposures for those alternatives, EPA is unable to quantitatively estimate any change in non-cancer risks due to use of substitute chemicals or alternative methods instead of using methylene chloride for commercial or consumer paint and coating removal.

Additional uncertainties include any benefits accrued by commercial users of methylene chloride for paint and coating removal who would benefit from using substitute chemicals and alternative processes. These users would be able to reduce or eliminate costs incurred for emissions control, hazardous waste disposal, or wastewater treatment, which are all required for commercial users of methylene chloride for any purpose.

In addition to these uncertainties related to benefits, there are uncertainties related to the cost estimates. As noted earlier, there is uncertainty in EPA's estimates of which chemical substitutes or alternative methods users may adopt instead of methylene chloride for paint and coating removal, which in turn produces uncertainty as to the cost of those substitutes or methods. EPA has estimated the cost of substitute chemicals, and, in some sectors, some increase in costs due to increased labor required by some substitute methods, but is not able to fully characterize the total costs to all sectors for using substitute chemicals or alternative products. It is possible that some users with paint removal projects that require removing multiple layers of coatings may ultimately save time by switching to a substitute chemical that is more effective than methylene chloride for this particular use. However, changes in time gained or lost during paint and coating removal projects cannot be estimated for all users potentially affected by this proposed rule. In addition, under certain assumptions EPA's economic analysis estimates that some users of methylene chloride for paint and coating removal will see a cost savings when switching to substitutes. Standard economic theory

suggests that financially rational companies would choose technologies that maximize profits so that regulatory outcomes would not typically result in a cost savings for the regulated facilities. There could be several reasons that cost savings might occur in the real world. Potential reasons include lack of complete information or barriers to obtaining information on the cost savings associated with alternatives as well as investment barriers or higher interest rates faced by firms. Additionally, there may be costs associated with these alternatives that are not adequately accounted for in the analysis. To evaluate the effect of this uncertainty, EPA has included a sensitivity analysis that sets the cost savings to zero for these compliance alternatives (Ref. 4 at Section 7). EPA also recognizes that these firms might experience positive costs of compliance rather than zero costs, so that the actual total costs could be higher than those in the sensitivity analysis. However, EPA has no current basis to estimate these potentially higher costs, since the available data appear to show that there are lower cost substitutes available. EPA requests comments on these assumptions.

Additionally, there are uncertainties due to the estimates of the number of affected commercial and consumer users, and for numbers of processors and distributors of methylene chloride-containing products not prohibited by the proposed rule who are required to provide downstream notification and/or maintain records.

EPA will consider additional information received during the public comment period. This includes scientific publications and other input submitted to EPA during the comment period.

X. Major Provisions and Enforcement of the Proposed Rule for Methylene Chloride in Paint and Coating Removal

This proposal relies on general provisions in the proposed Part 751, Subpart A, which can be found at 81 FR 91592 (December 16, 2016).

A. Prohibitions and Requirements

The rule, when final, would (1) prohibit the manufacturing, processing, and distribution in commerce of methylene chloride for paint and coating removal for consumer uses and for all commercial uses excluding for commercial furniture refinishing (see Unit XI.) and exempting those defined as critical for national security (see Unit VIII.); (2) prohibit commercial use of methylene chloride for paint and coating removal except for commercial

furniture refinishing and for uses defined as critical for national security; (3) require any paint and coating removal products containing methylene chloride to be distributed in containers with a volume no less than 55-gallons, except for formulations manufactured specifically for the Department of Defense; (4) require manufacturers, processors, and distributors of methylene chloride and all products containing methylene chloride, excluding retailers, to provide downstream notification of the prohibitions; and (5) require recordkeeping relevant to these prohibitions. As described in Unit XI., EPA intends to issue separately a proposal to regulate the risks presented by methylene chloride in commercial furniture refinishing so that those risks are no longer unreasonable; EPA intends to finalize that separate proposal and this proposal together.

The prohibition on manufacturing, processing, and distributing in commerce methylene chloride for consumer paint and coating removal would take effect 180 days after publication of a final rule. Similarly, the prohibition on manufacturing, processing, and distributing in commerce methylene chloride for any non-prohibited paint and coating removal commercial uses in containers with volumes less than 55 gallons would take effect 180 days after publication of a final rule. The prohibition on commercial use of methylene chloride for paint and coating removal except in furniture refinishing or for critical national security uses would take effect 270 days after publication of a final rule. These are reasonable transition periods because, as noted in Unit VI.E. and by the small businesses participating in the SBAR process, many formulators of paint and coating removers containing methylene chloride also manufacture products for this use that do not contain methylene chloride (Ref. 27). In addition, alternative paint removal products exist at comparable expense for users to purchase. Six months from publication of the final rule is sufficient time to allow for existing stocks to move through the market place and to allow manufacturers, processors and distributors and users to plan for and implement product substitution strategies.

B. Downstream Notification

EPA has authority under TSCA section 6 to require that a substance or mixture or any article containing such substance or mixture be marked with or accompanied by clear and adequate

minimum warnings and instructions with respect to its use, distribution in commerce, or disposal or with respect to any combination of such activities. Many manufacturers and processors of methylene chloride are likely to manufacture or process methylene chloride or products containing methylene chloride for other uses that would not be regulated under this proposed rule. Other companies may be strictly engaged in distribution in commerce of methylene chloride, without any manufacturing or processing activities, to customers for uses that are not regulated. EPA is proposing a requirement for downstream notification by manufacturers, processors, and distributors of methylene chloride for any use to ensure compliance with the prohibition on manufacture, processing, distribution in commerce, and commercial use of methylene chloride for the uses proposed for regulation. Downstream notification is necessary for effective enforcement of the rule because it provides a record, in writing, of notification on use restrictions throughout the supply chain, likely via modifications to the Safety Data Sheet. Downstream notification also increases awareness of restrictions on the use of methylene chloride for paint and coating removal, which is likely to decrease unintentional uses of methylene chloride by these entities. Downstream notification represents minimal burden and is necessary for effective enforcement of the rule. The estimated cost of downstream notification on an annualized basis over 20 years is \$40 and \$60 using 3% and 7% discount rates respectively (Ref. 4).

The effective date of the requirement for this notification would be 45 days after publication of the final rule. This is a reasonable transition period because regulated entities would only need to provide additional information on their SDS, which are routinely produced and updated.

C. Enforcement

Section 15 of TSCA makes it unlawful to fail or refuse to comply with any provision of a rule promulgated under TSCA section 6. Therefore, any failure to comply with this proposed rule when it becomes effective would be a violation of section 15 of TSCA. In addition, section 15 of TSCA makes it unlawful for any person to: (1) Fail or refuse to establish and maintain records as required by this rule; (2) fail or refuse to permit access to or copying of records, as required by TSCA; or (3) fail or refuse to permit entry or inspection as required by section 11 of TSCA.

Violators may be subject to both civil and criminal liability. Under the penalty provision of section 16 of TSCA, any person who violates section 15 could be subject to a civil penalty for each violation. Each day in violation of this proposed rule when it becomes effective could constitute a separate violation. Knowing or willful violations of this proposed rule when it becomes effective could lead to the imposition of criminal penalties for each day of violation and imprisonment. In addition, other remedies are available to EPA under TSCA.

Individuals, as well as corporations, could be subject to enforcement actions. Sections 15 and 16 of TSCA apply to “any person” who violates various provisions of TSCA. EPA may, at its discretion, proceed against individuals as well as companies. In particular, EPA may proceed against individuals who report false information or cause it to be reported.

XI. Furniture Refinishing (Methylene Chloride)

At this time, following input from small entity representatives received during the SBAR process, and based on the SBAR panel recommendations, EPA is not proposing to regulate methylene chloride when used in paint and coating removal in commercial furniture refinishing, also referred to as professional furniture refinishing (Ref. 27). Although EPA proposes to determine that risks to workers using methylene chloride for commercial furniture refinishing are unreasonable, EPA is seeking additional information about this industry to inform development of future proposed restrictions on methylene chloride in commercial furniture refinishing.

A. Description of Commercial Furniture Refinishing

Commercial furniture refinishing consists of several processes, including but not limited to repair, reupholstery, repainting, and depainting or removing paints and coatings, sometimes referred to as furniture stripping. EPA has defined furniture stripping as paint and coating removal from furniture; it includes application of a chemical or use of another method to remove, loosen, or deteriorate any paint, varnish, lacquer, graffiti, surface protectants, or other coating from wood, metal, or other types of furniture, doors, radiators, or cabinets. Furniture stripping can be conducted separately or as a part of furniture refinishing. EPA has defined commercial furniture stripping as furniture stripping conducted in a commercial facility performed by an

individual, government entity, or company for which an individual, government entity, or company receives remuneration or other form of payment.

As described in the methylene chloride risk assessment, to carry out furniture stripping, or to remove paint, lacquer, varnish, or other coatings from wood or metal furniture (or similar items such as doors, radiators, and cabinets), chemical paint and coating removal products may be applied to the furniture by either dipping the furniture in an open tank containing the chemicals, brushing or spraying the product onto the furniture surface, or manually applying the chemical product with a brush, rag, or aerosol spray. Larger furniture refinishing facilities conducting furniture stripping may pump the chemical product through a brush. The application method depends on the size and structure of the furniture as well as the capabilities of the facility (Ref. 2). Some firms may use alternative methods of paint and coating removal, such as sanding or heat/thermal guns, but EPA's information to date indicates that paint and coating removal on furniture is primarily conducted with chemical removers (Refs. 22, 27, 31, 66 and 27).

The area where furniture refinishing workers conducting furniture stripping apply paint and coating removal chemicals typically has a sloped surface to allow for collection and recycling of unused chemical product. Larger facilities use a flow tray to apply the paint and coating removal product or chemical to parts. The flow tray is a sloped, shallow tank with a drain at the lower end. Some facilities may use a dip tank to immerse whole pieces or parts of furniture in the chemical product (Refs. 2 and 22).

After a worker applies the chemical product or immerses the piece of furniture in it, the paint and coating remover is left to soak, or "dwell," on the furniture surface to soften the paint, coating, or varnish. Once soaking is complete, a worker manually scrapes or brushes the unwanted coating from the furniture surface. The worker then transfers the furniture to a washing area where they wash the waste chemical and paint or coating sludge from the furniture. Workers can wash the treated furniture with low-pressure washing operations or high-pressure water jets or high-pressure wands. Wash water may contain oxalic acid to brighten the wood surface. Wash water is collected and either recycled or disposed of as waste. After washing, the worker transfers the furniture to a drying area where it is allowed to dry before being transferred

to other refinishing processes (e.g., sanding, painting, reupholstery) (Ref. 2).

Based on industry research and discussions with stakeholders, EPA is aware that most commercial furniture refinishing firms primarily use chemical methods for paint and coating removal, and that methylene chloride or methylene chloride-based products are the types of chemical paint removers primarily and, in some firms, exclusively, used. Some commercial furniture refinishers, including some small businesses participating in the SBAR process, have said that although they make limited use of acetone for some types of furniture, they have not found any workable substitutes for methylene chloride as a primary paint and coating removal method (Refs. 22 and 27). More information on the potential use of substitutes for furniture refinishing is provided in Unit XI.E.

B. Risks Associated With Furniture Refinishing

The methylene chloride risk assessment and additional supplemental analyses identified acute and chronic risks from inhalation of methylene chloride during paint and coating removal by consumers, commercial users, and bystanders in residences or workplaces (individuals not using the paint and coating remover but nearby a user) (Refs. 2, 19, 20, and 38). This includes an assessment of the risks from methylene chloride when used in commercial furniture refinishing. EPA estimates that, annually, there are approximately 15,000 workers at 4,900 commercial refinishing operations conducting paint and coating removal with methylene chloride (Ref. 4).

1. Exposures assessed to methylene chloride during commercial furniture refinishing and immersion stripping. Exposures assessed for workers in commercial furniture refinishing include acute and chronic exposures to methylene chloride for paint and coating removal, as described in the methylene chloride risk assessment (Ref. 2). The exposure pathways of interest included dermal contact and inhalation, but, due to limitations described in the risk assessment, the assessment was based only on the inhalation route of exposure. Different exposure scenarios were evaluated for workers, occupational bystanders, consumers, and residential bystanders (Ref. 2). Not included in the assessment but important to note are bystanders in commercial refinishing operations that are located in workshops or other parts of residences; here, the bystanders may include not only workers but also children and occupants of the home.

In addition to estimating likely exposures under current use patterns, for both commercial and consumer users, EPA assessed a number of exposure scenarios associated with risk reduction options in order to identify variations in methylene chloride exposure during paint and coating removal. All variations in the scenarios were applied to industry-specific exposure inputs and evaluated with exposure parameters that were modified to reflect either a reasonable worst-case scenario (also called the baseline) or a scenario in which exposures were moderated by several factors (also called the central tendency scenario). The risk reduction options varied between scenarios and included engineering controls and use of personal protective equipment (PPE), as well as combinations of these options (Ref. 19).

- Under the PPE risk reduction option exposure scenarios, EPA evaluated respirators with APF 10 to 10,000 for acute and chronic risks, including cancer risks.

- For the engineering controls risk reduction option exposure scenarios, EPA evaluated using local exhaust ventilation (LEV) to improve ventilation near the activity of workers in furniture refinishing operations, with an assumed 90% reduction in exposure levels.

Overall, EPA evaluated several distinct exposure scenarios for paint and coating removal with methylene chloride for commercial furniture refinishing. Additionally, EPA evaluated several distinct exposure scenarios for miscellaneous paint and coating removal conducted by immersion of the object in vats or tanks of methylene chloride (dip methods), since this has been reported as a method of paint and coating removal during furniture refinishing (Refs. 19 and 27).

The results of these evaluations of exposure scenarios demonstrate that the scenarios meeting all relevant health benchmarks for all scenarios of methylene chloride in paint and coating removal in commercial furniture refinishing requires: (1) A respiratory protection program using a supplied-air respirator with APF of 1,000 or 10,000, depending on type of method used for applying methylene chloride or workplace characteristics, such as the size of the facility; (2) reducing exposures with LEV that can achieve 90% efficiency in air flow plus worker respiratory protection with APF 1,000; or (3) elimination of exposure to methylene chloride by using an alternative method of paint and coating removal (Ref. 19). Although non-cancer risks and cancer risks were estimated using separate measures, exposure

reduction that is protective against non-cancer risks from methylene chloride is also protective against cancer risks.

2. *Risks assessed from methylene chloride during commercial furniture refinishing and immersion methods.* Exposure to methylene chloride is associated with death, neurotoxicity, liver toxicity, and cancer in humans and animals. To estimate non-cancer risks for acute and chronic exposures, the methylene chloride risk assessment used MOEs. Exposure scenarios with MOEs below the benchmark MOE have risks of concern, as explained in detail in the methylene chloride risk assessment. For acute and chronic exposure scenarios, the benchmark MOE is 10 (Ref. 2). The benchmark MOE identifies a risk of concern for a given endpoint; it is obtained by multiplying the total uncertainty factors associated with each health endpoint's point of departure. For more information on uncertainty factors, see Unit IV.B.

The acute inhalation risk assessment used central nervous system effects to evaluate the acute risks for occupational, consumer, and bystander exposure during paint and coating removal with methylene chloride. A risk of concern was identified if the MOE estimate was less than the benchmark MOE of 10 (Ref. 2).

EPA assessed acute risks for central nervous system effects from inhalation for workers using methylene chloride for commercial furniture refinishing and for immersion methods of paint and coating removal for various objects, including furniture. Acute risks were estimated in this sector, even in the presence of respirators with APF 10 or APF 25. MOEs for acute risks in commercial furniture refinishing ranged from a central tendency of 0.08 to 0.035, with a high end of 0.0063 (workplaces engaged in paint and coating removal using immersion methods). In general, these workplaces are estimated to present exposure levels between 125 times to greater than 1,500 times more than those that are expected to produce no risks of concern. Not only workers, but also occupational bystanders, or workers engaged in tasks other than paint and coating removal, would be at acute risk for central nervous system effects.

EPA also assessed risks of chronic exposure to workers using methylene chloride for commercial furniture refinishing. The methylene chloride risk assessment used liver toxicity as the critical endpoint for chronic exposure. The selected exposure scenarios represented inhalation exposures with a range of conservative assumptions. As described earlier, the assumptions were

then varied, such as use of PPE (supplied-air or other respirator) and duration of time spent in contact with the product (days and years). EPA assessed risks for liver toxicity (with effects that include vacuolation and fatty liver) for occupational and bystander exposure scenarios of paint and coating removal with methylene chloride.

Workers and occupational bystanders in this industry were estimated to be at risk of non-cancer liver toxicity as a result of chronic exposure to methylene chloride during paint and coating removal under typical exposure scenarios. When workers' exposures were estimated at facilities repeatedly reporting moderate or high methylene chloride air concentration levels, EPA estimated that there were risks of concern for these workers, even for scenarios evaluated with workers wearing respiratory protection with APF 50. Among all of the occupational scenarios, the greatest risk of concern is for workers engaging in long-term use of the product (*i.e.*, 250 days/year for 40 years) with no respiratory protection. For those workers, MOEs for chronic exposures were 0.025, or reflective of risks 400 times greater than the benchmark. Even for workers assumed to have lower exposure, MOEs did not reach 10. In most workplaces engaged in commercial furniture refinishing, MOEs for chronic exposure ranged from a central tendency of 0.60 to 0.3. Additionally, in EPA's risk assessment scenarios, which are not necessarily reflective of industry-wide work practices, for workers and bystanders assumed to have the lowest exposure (respirator APF 50, limited exposure duration, and moderate air concentration), MOEs for chronic exposure were 5, or one-half of the benchmark (Ref. 2).

For commercial users and bystanders, EPA also assessed cancer risks as a result of chronic exposure to methylene chloride in paint and coating removal in commercial furniture refinishing. Methylene chloride is a likely human carcinogen; cancer risks determine the incremental increased probability of an individual in an exposed population developing cancer over a lifetime following exposure to the chemical under specified use scenarios. Common cancer benchmarks used by EPA and other regulatory agencies are an increased cancer risk of one in one million or one in ten thousand (*i.e.*, 1×10^{-6} or 1×10^{-4}). Estimates of cancer risk should be interpreted as the incremental increased probability of an individual in an exposed population developing cancer over a lifetime as a

result of exposure to the potential carcinogen (*i.e.*, incremental or excess individual lifetime cancer risk) (Ref. 2).

In the methylene chloride risk assessment, when exposure for workers and occupational bystanders was estimated in facilities conducting commercial furniture refinishing, EPA identified excess cancer risks if these workers and bystanders were exposed to paint and coating removal with methylene chloride for 250 days per year for 40 years with no respiratory protection. Cancer risks ranged from 2 in 10,000 to 8 in 10,000, with a maximum of 5 in 1,000 (workplaces using immersion methods) (Ref. 2).

For commercial users and occupational bystanders in commercial furniture refinishing, acute and chronic risks were assessed based on the typical occupational exposure parameters, which may include several hours per day of exposure over several years of work. For these reasons, any risk mitigation measures must address not only acute risks, but also chronic risks, including both cancer and non-cancer effects. For these reasons, the most sensitive endpoint for risk mitigation must be considered, whether it derives from acute or chronic exposure.

3. *Impacts of the exposures.* As discussed for other commercial uses in Unit VI.E., exposure to methylene chloride in paint and coating removal, when conducted in commercial furniture refinishing and for other purposes, is associated with a range of adverse health effects, which include impacts on the nervous system, liver, respiratory system, kidneys, and reproductive systems. In some instances, these effects may appear relatively mild, such as dizziness, which occurs early in exposure and at low exposure levels. However, with increasing levels of exposure or increasing duration, these effects can take the form of generally irreversible health effects such as cognitive impairment, sensory impairment, coma, heart failure, liver toxicity, brain cancer, liver cancer, non-Hodgkin lymphoma, and multiple myeloma.

Acute exposure to methylene chloride during paint and coating removal can be fatal; since 1980, at least seven workers have died while using methylene chloride for commercial furniture refinishing. Data from OSHA indicate that the circumstances of death vary. For example, some workers collapse while conducting paint and coating removal over or near dip tanks, frequently falling into the tanks and subsequently dying. This was the case in 1985 in Pennsylvania, 1986 in Colorado, 1990 in Connecticut, and

2000 in Pennsylvania (Ref. 7). The worker in Connecticut earlier complained that the vapors were making him dizzy, and shortly after slumped into the dip tank and died; the worker in 2000 in Pennsylvania was found face-down in the dip tank next to the shutters from which he was attempting to remove paint (Ref. 7). Other workers in commercial furniture refinishing facilities lose consciousness at their workplace, but die sometime later, such as a worker in 1991 in Colorado, and in 1999 in Tennessee (Ref. 68).

These are likely not the only deaths in commercial furniture refinishing due to methylene chloride; as discussed in Unit VI.E., many deaths due to methylene chloride have not been recorded due to a lack of reporting to the OSHA incident database by self-employed individuals and the likelihood that deaths due to methylene chloride exposures are misattributed to heart disease, since the pathology is similar (Ref. 33).

In addition to fatalities, methylene chloride exposure during commercial wood refinishing has caused acute effects, such as the 1996 case of a cabinet manufacturer employee who experienced chronic headaches found to be due to methylene chloride exposure when the doors at his facility were closed in the winter months (Ref. 69).

In most commercial furniture refinishing facilities using methylene chloride for paint and coating removal, worker and occupational bystander exposure concentrations are orders of magnitude above what would be necessary to achieve the benchmark MOE of 10 for acute and chronic non-cancer effects. For acute health effects such as nervous system impacts, EPA estimated an MOE of 0.08 for workers in commercial furniture refinishing. For chronic non-cancer health effects such as liver toxicity, workers in this industry have an MOE of 0.6 to 0.3 (Ref. 2). For a description of MOEs and their use in risk assessment, see Unit IV.B.

In each case, workers in commercial furniture refinishing using methylene chloride for paint and coating removal are exposed at a level that is generally 125 to 1,500 times higher than what EPA has found to be a level that would not present acute or chronic non-cancer risks of concern. These risks of concern are for effects such as death, multiple adverse chronic health effects, and the subsequent lifetime impacts from these effects. Additionally, individuals occupationally exposed to methylene chloride in paint and coating removal may also be impacted by an increased risk for several types of cancer. The

cancer risks to workers in commercial furniture refinishing using methylene chloride for paint and coating removal range from 8 cases in 10,000 people to 5 cases in 1,000 people (workplaces using immersion methods) (Ref. 2).

EPA's risk estimates are corroborated by research conducted independently investigating working conditions at commercial furniture refinishing and OSHA enforcement of their methylene chloride standard. In 1990, as a result of several cases of methylene chloride poisoning during paint and coating removal in commercial furniture refinishing in Colorado, occupational medicine specialists from the University of Colorado surveyed the 21 small shops in the Denver area engaged in commercial furniture refinishing. These researchers found that of the 21 shops, no workers wore respirators at all in seven shops, and in 14 facilities, workers occasionally wore half-face respirators with organic vapor cartridges (which do not provide respiratory or eye protection from methylene chloride). In ten of the 21 shops, workers experienced acute nervous system effects, such as dizziness or nausea while working to remove coatings from furniture. The researchers concluded that "current safety practices in small-scale furniture-stripping shops may be inadequate to keep methylene chloride exposure levels in compliance with latest recommendations, and serious or fatal overexposure can occur" (Ref. 70).

When considering the benefits of preventing exposure to methylene chloride in paint and coating removal in commercial furniture refinishing, EPA considered the type of effect, the severity of the effect, the duration of the effect, and costs and other impacts of the health endpoint. The health endpoints associated with exposure to methylene chloride are serious. Unit VI.E. presents a detailed discussion of the impacts of the most significant acute, chronic non-cancer, and cancer effects associated with methylene chloride exposure during paint and coating removal, including the severity of the effect, the manifestation of the effect, and how the effect impacts a person during their lifetime. These effects include nervous system effects resulting from acute exposures, such as sensory impairment, incapacitation (loss of consciousness), and death; and effects resulting from chronic, occupational exposures including liver toxicity and liver cancer, hematopoietic cancers, brain cancer, lung cancer, reproductive effects, and kidney toxicity.

There are increased risks of death, nervous system effects, and liver, lung, brain, reproductive, and kidney effects

for the approximately 15,000 workers in 4,900 commercial facilities or companies that use methylene chloride for paint and coating removal during commercial furniture refinishing each year (Ref. 4).

C. Approaches That Could Reduce the Risks of Methylene Chloride Used in Furniture Refinishing to Benchmark Levels

Although EPA is not proposing to regulate the use of methylene chloride in paint and coating removal for commercial furniture refinishing, EPA has identified potential requirements for methylene chloride in paint and coating removal for commercial furniture refinishing that could reduce exposures so that the risks presented would no longer be unreasonable. EPA is providing advanced notice of these potential approaches and is seeking comment on them.

1. *Prohibition on manufacturing, processing, distribution, and use of methylene chloride in commercial furniture refinishing.* Similar to the approach proposed for regulation of methylene chloride in other commercial paint and coating removal (see Unit V.), EPA has identified a prohibition on manufacturing, processing, distribution, and use of methylene chloride in commercial furniture refinishing as an option for reducing risks in this industry to benchmark levels, under TSCA sections 6(a)(2) and 6(a)(5). This approach could also require manufacturers, processors, and distributors to provide downstream notification of the prohibitions under TSCA section 6(a)(3), and could require recordkeeping relevant to these prohibitions under TSCA section 6(a)(4).

Under this approach, exposures to methylene chloride during paint and coating removal in commercial furniture refinishing would be completely eliminated. As a result, not only non-cancer risks, but also cancer risks would be eliminated.

2. *Requiring a respiratory protection program, including PPE, air monitoring, and either a supplied-air respirator of APF 1,000 or 10,000 or an air exposure limit of 1 part per million (ppm) achieved through engineering controls or ventilation, in commercial facilities for furniture refinishing using methylene chloride for paint and coating removal under TSCA section 6(a)(5).* Another regulatory approach that EPA has considered for the use of methylene chloride for paint and coating removal in commercial furniture refinishing would be to require risk reduction through an occupational respiratory

protection program, which would include air monitoring, medical monitoring, and respiratory protection through use of a supplied-air respirator with an APF of 1,000 or 10,000, depending on the methods used for paint and coating removal with methylene chloride and other workplace characteristics, with a performance-based option of meeting an air concentration level of 1 ppm as an exposure limit for methylene chloride.

A full-face (or helmet/hood) self-contained breathing apparatus (SCBA) when used in the pressure demand mode or other positive pressure mode has an APF of 10,000. EPA's analysis found that use of a SCBA with an APF of 10,000 would, in all scenarios evaluated, control the methylene chloride exposure to levels that allow for meeting the benchmarks for non-cancer and cancer risks. In some commercial furniture refinishing facilities using methylene chloride for paint and coating removal, workers with a supplied-air respirator with an APF of 1,000 would experience reduced exposures to methylene chloride such that their risks would be reduced to benchmark levels (Ref. 19). It is important to note that current OSHA requirements for dermal and eye protection when using methylene chloride in any way would be maintained under this approach, in addition to other requirements for work practices, training, and hazard communication put forth in OSHA's Methylene Chloride Standard (29 CFR 1910.1052).

EPA seeks comment on whether commercial furniture refinishing operations have these types of respiratory protection programs in place, any experiences in complying with the current OSHA methylene chloride standard, methods of reducing costs associated with these programs, and recommended approaches for small businesses considering a respiratory protection program that would include supplied-air respirators.

EPA also considered requiring a combination of local exhaust ventilation and respirators with APF of 1,000 or 50, with a performance-based option of an air exposure limit of 1 ppm as an eight-hour TWA. When properly executed, this option would reduce risks to the health benchmarks for workers and bystanders (Refs. 19 and 38). However, while this option has the benefit of incorporating engineering controls and the use of respirators with a lower APF, the limitations to successful implementation of the use of supplied-air respirators in the workplace discussed previously are still present.

Further, this option would also require the use of prescriptive and expensive engineering controls to ensure that the exposures are below the benchmark cancer risks (Ref. 19). In an examination of the impacts of its methylene chloride standard, OSHA in 2010 found that furniture refinishing facilities in particular have not installed ventilation systems that would lower worker exposures to methylene chloride (Ref. 68). OSHA's assessment found that this is largely due the fact that most of these facilities are part of small businesses, and they tend to be less able to have sufficient capital to purchase the ventilation systems. Additionally, this type of ventilation requires make-up air systems, which have an additional cost and which, in cold climates, would need to heat the air and thus increase energy costs (Ref. 68).

Even if these engineering controls were installed, research conducted by the National Institutes of Occupational Safety and Health (NIOSH), as well as independent researchers, has indicated that ventilation alone is generally not able to reduce methylene chloride exposures below 25 ppm (Refs. 68 and 71), and there is no indication that a level close to 1 ppm (an acceptable exposure limit) could be reached.

3. *Approaches that do not mitigate the risks of methylene chloride in commercial furniture refinishing to benchmark levels.* As described in Units IV.B. and IV.C., EPA evaluated dozens of distinct exposure scenarios across consumer and commercial uses of methylene chloride for paint and coating removal, including in commercial furniture refinishing. The results of EPA's evaluation indicate that regulatory approaches for occupational exposures in commercial furniture refinishing such as reducing the concentration of methylene chloride in products used for paint and coating removal and using local exhaust ventilation to improve ventilation, in the absence of PPE, could not achieve the target MOE benchmarks for non-cancer endpoints for acute and chronic exposures and standard cancer risk benchmarks for chronic exposures (Refs. 26 and 29). The results also demonstrate that all risk reduction options meeting the benchmark MOEs and cancer benchmarks for methylene chloride in paint and coating removal in commercial furniture refinishing require the use of a supplied-air respirator, whether used alone or in conjunction with additional levels of protection. Therefore, EPA found that setting a maximum concentration of methylene chloride in products under section 6(a)(2) could not reduce exposures so

that risks from paint and coating removal with methylene chloride in commercial furniture refinishing would be reduced to benchmark levels. Options found not to meet the risk benchmarks are documented in EPA's supplemental technical reports on methylene chloride in paint and coating removal (Refs. 19, 20, 21, and 38).

D. Costs of EPA's Potential Approach for Regulation

EPA is at this time seeking additional information to inform its consideration of the reasonably ascertainable economic consequences of an action that would address the risks of commercial furniture refinishing so that they are no longer unreasonable, as required under TSCA section 6(c)(2)(A)(iv). This section presents the information EPA currently has and identifies the information that EPA is seeking. While the costs of potential risk management actions are not a legally permissible basis for EPA to reassess its proposed unreasonable risk determination, see TSCA section 6(b)(4)(A), costs are relevant to deciding among alternative risk management approaches that reduce risk so that a chemical substance no longer presents unreasonable risk and in establishing compliance dates for a risk management approach that is ultimately selected.

1. Information available to EPA.

Based on industry research and information provided by stakeholders, including during informal discussions and more formally from small entity representatives participating in the SBAR process (described in more detail in Unit XXIII.), EPA has learned that there may not be any substitute chemicals or alternative practices frequently in use for paint and coating removal in commercial furniture refinishing other than chemical paint and coating removal with methylene chloride (Refs. 22 and 27).

Primary chemical substitutes for methylene chloride in commercial paint and coating removal more generally include products formulated with benzyl alcohol; dibasic esters; acetone, toluene, and methanol (ATM); and caustic chemicals. These substitute chemicals, their hazards, and their environmental impacts are described in more detail in Unit VI.E. EPA has learned that these chemicals are generally not suitable for paint and coating removal in furniture refinishing since they either are ineffective at removing particular coatings frequently found on furniture (such as varnish, lacquer, or older paint formulations in multiple layers); are formulated to include large amounts of water and thus

incompatible with wood objects that can become saturated and damaged (as is the case with many products containing benzyl alcohol); or are chemically incompatible with wood and can result in damage or raising the grain on the object (as is the case with caustic paint and coating removal products) (Refs. 22 and 27). Products that may be chemically compatible with wood substrates or the paints, varnishes, or lacquers to be removed were described by stakeholders as requiring too long a dwell time to be efficacious for their business and thus are not used (Refs. 22 and 27). Other than two commercial furniture refinishers who remove paints and coatings on some solid wood objects with either immersion in 100% acetone or an acetone-toluene-methanol blend, no commercial wood finishing firms reported using substitute chemicals routinely for paint and coating removal, and none felt they were able to completely eliminate use of methylene chloride, despite being aware of the worker health and environmental impacts (Refs. 22 and 27).

In addition to substitute chemical products, EPA has identified non-chemical methods for commercial paint and coating removal that can be used more generally as alternatives to methylene chloride. Frequently-used alternative methods to chemical paint and coating removal include thermal removal, sanding, hydroblasting, abrasive blasting, and laser removal (Refs. 22 and 27). These methods are already frequently in use in various industries for paint and coating removal (Refs. 22, 27, and 31); they and their acute and chronic hazards to workers are described in more detail in Unit VI.E.

For commercial furniture refinishing, EPA has learned that all firms engage in varying amounts of mechanical or hand-sanding but do not consider it a primary method of paint and coating removal (Refs. 22 and 27). Additionally, despite the hand scraping or brushing that is required to remove waste paint from furniture and other objects for which methylene chloride has been used to remove paint or coatings, most stakeholders described sanding as too time consuming or labor intensive to use routinely as a primary method of paint and coating removal. Additionally, though many other commercial sectors have adopted various soft media blasting techniques for delicate substrates, such as using soda blasting on fiberglass vehicle parts, EPA has not found this to be a practice used in commercial furniture refinishing (Refs. 22 and 27).

EPA is seeking additional information to inform its consideration of the impacts on commercial furniture refinishing if use of methylene chloride as a paint and coating remover were prohibited or restricted.

2. Information sought. To aid in identifying the economic impacts on commercial furniture refinishers of any potential prohibition or restriction on methylene chloride for paint and coating removal, EPA is seeking the following information related to the approach that would prohibit the use of methylene chloride for paint and coating removal in furniture refinishing:

- What percent of business for firms in this sector is paint and coating removal, versus furniture repair, reupholstery, or other furniture refinishing functions?
- How likely is it that firms in this sector would close if methylene chloride were prohibited from use in paint and coating removal in this sector?
- What would the impact be on this sector if all firms were prohibited from using methylene chloride for paint and coating removal, and thus any changes in work processes or dwell time would be universally experienced?
- Have firms had any success with substitute chemicals or alternative methods of paint and coating removal? If not, which aspects of the chemical or method renders the substitute or alternative ineffective?

Related to the approach that would require a respiratory protection program, including either a supplied-air respirator with either APF 1,000 or APF 10,000, or engineering controls or ventilation to reach an exposure limit of 1 ppm:

- What is the current experience of firms in this sector with supplied-air respirators and/or engineering controls?
- What is the current experience of firms in this sector with ventilation systems, makeup-air systems, and other engineering controls?
- What types of exposures do workers in firms in these sectors currently experience?

EPA has found that commercial furniture refinishing primarily uses methylene chloride for paint and coating removal and that no current chemical substitutes are seen as useful alternatives. However, in recent decades, substitute products have been developed for other types of paint and coating removal, and it is possible that new substitute chemicals or products could be developed to address the special coatings or substrates involved in commercial furniture refinishing. Several formulators and research organizations are exploring possibilities

for efficacious and cost-effective substitute chemicals.

Additionally, outside of the United States, commercial furniture refinishers have adopted methods that are alternatives to chemical paint and coating removal. For example, most paint and coating removal in Sweden is conducted by thermal methods, such as heat guns or heat lamps, including for commercial furniture refinishing (Ref. 72). In Denmark, firms engaging in commercial furniture refinishing are reported to use large microwave furnaces, which can hold large pieces of furniture (Ref. 73).

These alternative methods and the research into substitute chemicals indicate that it is now and in the future may increasingly be possible to remove paint and coatings from furniture without methylene chloride. If that were the case, EPA would be able to more straightforwardly identify the costs and impacts of any proposed regulation of methylene chloride for paint and coating removal in commercial furniture refinishing. EPA is seeking additional information on the use and development of substitute chemicals and alternative methods that would be useful in commercial paint and coating removal on furniture, including information on:

- What are the current considerations when selecting a paint and coating removal chemical for furniture refinishing or refinishing of other wood objects or surfaces?
- What are the current considerations when selecting a paint and coating removal method for furniture refinishing or refinishing of other wood objects or surfaces?
- Are there substitute chemicals or alternative methods in use beyond what EPA has identified in this notice?
- Are any new paint and coating removal product formulations or chemistries under development?
- Are any new paint and coating removal methods in development for furniture refinishing, or refinishing of other wood objects or surfaces?

E. Public Engagement To Identify Impacts and Alternatives

To learn more about paint and coating removal in furniture refinishing, foreseeable impacts of any proposed regulations, and alternatives to methylene chloride, EPA plans to hold a series of stakeholder meetings. These meetings will focus on current practices related to methylene chloride for paint and coating removal in commercial furniture refinishing; any substitute chemicals or alternative methods currently in use or under development;

and current and best practices related to respiratory protection programs and exposure reduction.

EPA will announce dates and locations of these meetings in a future notice in the **Federal Register** as well as on EPA's Web site. EPA will provide some of these meetings electronically by Webinar to maximize public participation.

F. Next Steps

EPA views this section as an Advanced Notice of Proposed Rulemaking, and intends to issue a Notice of Proposed Rulemaking following the series of stakeholder meetings and further analysis on the cost impacts of regulatory action on this industry. Following that proposal and public comment period, EPA intends to finalize together the regulations proposed and the future proposal related methylene chloride in commercial furniture refinishing.

XII. Overview of NMP and Uses Subject to This Proposed Rule

A. What chemical is included in the proposed rule?

This proposed rule would apply to N-methylpyrrolidone (Chemical Abstract Services Registry Number (CASRN) 872-50-4) when used in paint and coating removal.

B. What are the uses of NMP and how can people be exposed?

NMP is a solvent used in a variety of industrial, commercial and consumer use applications, including (Ref. 3):

- Petrochemical processing, acetylene recovery from cracked gas, extraction of aromatics and butadiene, gas purification, lube oil extraction;
- Plastics engineering, as a reaction medium for the production of high-temperature polymers such as polyethersulfones, polyamideimides and polyaramids;
- Use in coatings, as a solvent for acrylic and epoxy resins, polyurethane paints, waterborne paints or finishes, printing inks, synthesis/diluent of wire enamels, coalescing agent;
- Production of agricultural chemicals: Solvent and/or co-solvent for liquid formulations;
- Electronics cleaning: Cleaning agent for silicon wafers, photoresist stripper, auxiliary in printed circuit board technology; and
- Industrial and domestic cleaning, including as a component in degreasers and paint removers.

According to the 2012 CDR information, approximately 180 million pounds of NMP were produced or imported into the U.S. that year (Ref. 3).

Individuals, including workers, consumers, and the general population are exposed to NMP from industrial/commercial and consumer sources, in different settings such as homes and workplaces, and through multiple routes (inhalation, dermal, and vapor-through-skin).

According to data in the 2014 TRI, 386 facilities reported releases or transfers of NMP and the top 100 facilities disposed of or released a total of 10.2 million pounds of NMP (Ref. 6).

The use assessed by EPA that is the subject of this proposal, NMP in paint and coating removal, represents about 9% of total use of NMP (Ref. 3). Paint and coating removal is the application of a chemical or use of another method to remove, loosen, or deteriorate any paint, varnish, lacquer, graffiti, surface protectants, or other coating from a substrate. Substrates can include objects, vehicles, architectural features, or structures. This use is discussed in detail in Unit XVI.A.

Although the TSCA Work Plan Chemical risk assessment for NMP focused on the chemical's use in paint and coating removal, EPA announced in December 2016 its designation of NMP as one of the ten chemical substances that will undergo risk evaluation pursuant to TSCA section 6(b)(2)(A) (81 FR 91927). The Agency is proceeding with this proposed rule addressing NMP in paint and coating removal in accordance with TSCA section 26(l) and asks for comment on its decision to pursue risk management for specific conditions of use of NMP while preparing to conduct a risk evaluation of remaining NMP conditions of use under TSCA section 6(b).

C. What are the potential health effects of NMP?

NMP is a developmental toxicant (Ref. 3). A broad set of relevant studies including animal bioassays in rats, mice, and rabbits show that maternal NMP exposure is associated with dose-dependent adverse developmental impacts on the fetus (including body weight reductions and fetal death). Developmental toxicity is the most sensitive endpoint. Other adverse impacts resulting from NMP exposure include effects on maternal body weight; alterations in blood cell counts; liver, kidney, splenic, thymus, and testicular effects; and neurotoxicity.

Nearly every study that evaluated developmental toxicity of NMP exposure identified some type of adverse effect depending on the route of exposure and the internal dose achieved. Moreover, a review of effect levels reveals that these effects are

observed within a comparable dose range when administered doses are converted to internal doses for a series of gestational exposure studies in rats. The NOAELs for these comparable developmental studies typically ranged from 100 to 200 mg/kg/day for oral exposure, 237 mg/kg/day for dermal exposure, and 479 to 612 mg/m³ for inhalation exposure. EPA applied a physiologically-based pharmacokinetic model to derive internal doses for these exposure scenarios to compare across routes and aggregate exposures. Specifically, EPA identified a number of biologically relevant, consistent, and sensitive effects, representing a continuum of reproductive and developmental effects for consideration in assessing human health risks, including decreased fetal and postnatal body weight, delayed ossification, skeletal malformations, and increased fetal and postnatal mortality. EPA identified a point of departure for decreased fetal body weight based on the average blood concentration of 411 mg/L. Studies have shown acute effects of NMP exposure to include fetal mortality and indications of fetal resorptions in rodents and a point of departure based on maximum blood concentration of 216 mg/L. Fetal and postnatal mortality have also been observed in oral and dermal studies (Ref. 3).

Chronic effects of NMP exposure include fetal body weight decreases. These effects were consistent among multiple studies with different dosing regimens and across exposure routes. Reduced fetal body weight is a sensitive endpoint that is considered a marker for fetal growth restriction, which is often assumed to be representative of chronic exposures. Decreases in fetal and postnatal body weights occur at similar dose levels (Ref. 3).

There is one case report of the fetus of a pregnant woman dying in utero at week 31 of pregnancy. The worker was exposed throughout pregnancy to NMP by inhalation and dermal exposure, but the exposure levels were unknown. The worker's tasks involved other chemicals, including acetone and methanol. During week 16 of the pregnancy, the worker cleaned up a spill of NMP using latex gloves that dissolved in the NMP. She was ill for the next 4 days and experienced malaise, headache, nausea and vomiting. While this study provides some evidence that NMP may be fetotoxic, the lack of quantitative exposure data precluded its use in the TSCA Work Plan Chemical Risk Assessment for NMP (Ref. 3).

Chronic effects of NMP exposure include systemic effects following

maternal exposure, which include body weight reductions, alterations in clinical chemistry and blood cell counts, liver and kidney toxicity, neurotoxicity and thymic atrophy, with highly variable dose levels where no observed adverse effects occurred (Ref. 3).

An additional effect of chronic NMP exposure is reproductive toxicity, though these findings are significantly less frequent or consistent than the occurrence of developmental effects. When observed, reproductive effects were variable in occurrence and dose effect range. Several rat studies identified some type of testicular effect, including testicular lesions, atrophy or smaller testes. Similarly, a small number of rat studies noted some effects related to developmental neurotoxicity in postnatal development and behavior following maternal exposure (Ref. 3).

In addition to developmental toxicity, exposure to NMP presents other acute and chronic toxicity concerns. Acute effects include skin, eye, and possible respiratory irritation. Human volunteer chamber studies revealed some discomfort during exposure. Prolonged exposures to neat (*i.e.*, pure) NMP increases the permeability of the skin (Ref. 3).

D. What are the environmental impacts of NMP?

Section 6(c) of TSCA requires that EPA state the effects of NMP on the environment and the magnitude of the exposure of the environment to NMP. The proposed unreasonable risk determination, however, is based solely on risks to human health since these risks are the most serious consequence of use of NMP and are sufficient to support this proposed action.

1. *Environmental effects and impacts.* Ecotoxicity studies for NMP have been conducted in fish, aquatic invertebrates, aquatic plants and birds. There were no acceptable studies identified for sediment or soil dwelling organisms. Based on available data in the NMP risk assessment, EPA concluded that NMP has low acute and chronic toxicity to aquatic organisms (including plants) and birds (Ref. 3). Based on NMP's low persistence, low bioaccumulation, and low hazard for environmental toxicity, the magnitude of potential environmental impacts on ecological receptors are judged to be low for the environmental releases associated with the use of NMP in paint and coating removal.

2. *What is the global warming potential of NMP?* Global warming potential (GWP) measures the potency of a greenhouse gas over a specific period of time, relative to carbon

dioxide, which has a GWP of 1 regardless of the time period used. No GWP has been developed for NMP because of its very short atmospheric lifetime. Based on its very short half-life, its GWP is expected to be very low (Ref. 3).

3. *What is the ozone depletion potential of NMP?* NMP is not an ozone-depleting substance and is listed as acceptable under the Significant New Alternatives Policy (SNAP) program for degreasing and aerosols (Ref. 9).

4. *Is NMP a volatile organic compound (VOC)?* NMP is not a VOC as defined at 40 CFR 51.100(c). A VOC is any compound of carbon, excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate, which participates in atmospheric photochemical reactions.

5. *Does NMP persist in the environment and bioaccumulate?* NMP is not persistent or bioaccumulative. Biodegradation studies have consistently shown NMP to be readily biodegradable. Based on its vapor pressure, NMP released to the atmosphere is expected to exist solely in the vapor-phase. Vapor-phase NMP is degraded in air by reaction with photochemically-produced hydroxyl radicals. The half-life of this reaction is approximately 5.8 hours, assuming a hydroxyl radical concentration of 1.5×10^6 hydroxyl radicals/cm³ air over a 12-hr day. NMP in the atmosphere can be expected to dissolve into water droplets, where it will be removed by condensation or further reactions with hydroxyl radicals (Ref. 3).

When released to water, NMP is not expected to adsorb to suspended solids or sediment in the water column based upon its K_{oc} value. Based on its low soil organic carbon partitioning coefficient (log K_{oc} = 0.9), NMP is expected to possess high mobility in soil; releases of NMP to soil may volatilize from soil surfaces or migrate through soil and contaminate groundwater (Ref. 3).

EPA was not able to locate measured bioconcentration studies for NMP; however, the estimated bioaccumulation factor of 0.9 and estimated bioconcentration factor of 3.16 suggest that bioaccumulation and bioconcentration in aquatic organisms is low. Based on the available environmental fate data, NMP is expected to have low bioaccumulation potential and low persistence (Ref. 3).

XIII. Regulatory Actions Pertaining to NMP

This section summarizes current state, federal, and international regulations and restrictions on NMP, with a focus

on its use in paint and coating removal. None of these actions imposes requirements to the extent necessary so that NMP does not present the unreasonable risk described in this proposed rule.

A. Federal Actions Pertaining to NMP

While many of the statutes that EPA is charged with administering provide statutory authority to address specific sources and routes of NMP exposure, none of these can address the serious human health risks from NMP exposure that EPA is proposing to address under TSCA section 6(a).

- NMP is listed on the Toxics Release Inventory (TRI) and is therefore subject to reporting pursuant to Section 313 of the Emergency Planning and Community Right-to-Know Act (EPCRA) (Ref. 6).

- NMP is on The Clean Air Act (CAA) Section 111, Standards of Performance for New Stationary Sources of Air Pollutants—Equipment Leaks Chemical List (40 CFR 68.130)

- NMP is currently approved for use by EPA as a solvent and co-solvent inert ingredient in pesticide formulations for both food and non-food uses and is exempt from the requirements of a tolerance limit (Ref. 74).

In 2013, the Consumer Product Safety Commission issued a fact sheet warning the public about hazards of paint and coating removal products, including those containing NMP, and included recommendations for PPE when using products containing this chemical (Ref. 62).

B. State Actions Pertaining to NMP

Several states have taken actions to reduce or make the public aware of risks from NMP. California has set worker protection regulations that require workers to wear gloves when using NMP, and workplace to meet a permissible exposure limit of 1 ppm as an eight-hour time-weighted average (TWA) (Ref. 3). Additionally, NMP is listed as an informational candidate on California's Safer Consumer Products regulations candidate list of chemicals that exhibit a hazard trait and are on an authoritative list and is also listed on California's Proposition 65 list of chemicals known to cause cancer or birth defects or other reproductive harm (Ref. 3).

In Washington, NMP is listed as a chemical of high concern under the Children's Safe Product Act (Ref. 3). Minnesota classifies NMP as a chemical of high concern and several other states have placed NMP on similar chemical listings. Additional states have

recognized NMP as an air pollutant (Ref. 3).

C. International Actions Pertaining to NMP

NMP is currently on the candidate list of substances of very high concern for authorization in the European Union. In August 2013, the Dutch National Institute for Public Health and the Environment submitted a proposal for the restriction of NMP to the European Chemicals Agency under the Registration, Evaluation, Authorisation and Restriction regulation. The Risk Assessment Committee modified the restriction proposal and the combined opinion will be sent to the European Commission for final decision. The Risk Assessment Committee recommended using long-term exposure Derived No Effect Levels for pregnant workers (the most sensitive population) for both inhalation and dermal exposure (Ref. 3).

Other countries have also recognized the risks of NMP. When Canada conducted a categorization of the Domestic Substances List for its Chemicals Management Plan in 2006, NMP met Canada's human health categorization criteria. NMP has been the subject of a Tier II health risk assessment in Australia under that country's Inventory Multi-tiered Assessment and Prioritisation. It is currently subject to labeling and related requirements based on concern for skin, eye and respiratory irritation and for reproductive toxicity. These government assessments consider NMP to be of low environmental concern (Ref. 3). Australia concluded that further risk management is required and additional assessment (Tier III) is needed to determine if current exposure controls are adequate to protect workers and the public when NMP is used in domestic products (Ref. 3).

XIV. NMP Risk Assessment and Outreach

In 2013, EPA identified NMP in paint and coating removal as a priority for risk assessment under the TSCA Work Plan. This unit describes the development of the NMP risk assessment and supporting analysis and expert input on the uses that are the subject of this proposed rule. A more detailed discussion of the risks associated with NMP in paint and coating removal can be found in Units XVI.B.1. and XVI.D.

A. TSCA Work Plan for Chemical Assessments

Using the TSCA Work Plan chemical prioritization criteria, discussed in Unit IV.A., NMP ranked high for health hazards and exposure potential and was

included on the initial list of TSCA Work Plan chemicals for assessment. NMP appeared in the 2012 TSCA Work Plan for Chemical Assessments and in the 2014 update of the TSCA Work Plan for Chemical Assessments.

B. NMP Risk Assessment

EPA finalized a TSCA Work Plan Chemical Risk Assessment for NMP (NMP risk assessment) in 2015, following the 2013 peer review of the 2012 draft NMP risk assessment. All documents from the 2013 peer review of the draft NMP risk assessment are available in EPA Docket Number EPA-HQ-OPPT-2012-0725. The completed risk assessment is included in that docket.

The NMP risk assessment evaluated health risks to consumers, workers, and bystanders from dermal and inhalation exposures to NMP when used in paint and coating removal (Ref. 3). EPA assumes workers and consumers would be adults of both sexes 16 years and older, including pregnant women. EPA assumes bystanders in residential settings would be individuals of any age group (e.g., children, adults, and the elderly) nearby during product application. During scoping and problem formulation for the risk assessment, EPA focused on occupational and consumer paint and coating removal because of high NMP content in products and potential high exposure to workers and consumers. EPA selected these uses for the NMP risk assessment because they were expected to involve frequent or routine use of NMP in high concentrations and/or have high potential for human exposure (Ref. 3). However, this does not mean that EPA determined that other uses not included in the NMP risk assessment present low risk.

The NMP risk assessment characterized human health effects associated with paint removal with NMP. Based on the physical-chemical properties of NMP and the paint stripping use scenarios described in the assessment, EPA views dermal exposure as the predominant route of exposure to NMP during paint removal, including absorption of vapor-through-skin.

The NMP risk assessment identified developmental risks of concern following acute (short-term) and chronic (repeated) exposures for workers conducting paint removal with NMP. Specifically, these developmental effects include increased fetal resorptions (fetal death) from acute exposures and decreased fetal body weight from chronic exposures (Ref. 3). EPA identified acute risks of concern for consumers using NMP for paint and

coating removal in the more complete array of scenarios described in the supplemental analyses, which used the same modeling methods as the risk assessment (Refs. 75 and 76).

Margins of exposure (MOEs) were used in the risk assessment and supplemental analyses to estimate non-cancer risks for acute and chronic exposures. For an explanation of MOEs, see Unit IV.B. For NMP, EPA identified acute or chronic non-cancer risks of concern if the MOE estimates were less than the benchmark MOE of 30 (Ref. 3). The health endpoint used for the benchmark MOE for acute exposure to NMP is fetal death; the health endpoint used for the benchmark MOE for chronic exposure to NMP is decreased infant birth weight. These are the most sensitive adverse health effects from exposure to NMP.

The NMP risk assessment and supplemental analyses estimated acute risks of fetal death for consumers from the use of paint and coating removers containing NMP, and acute and chronic non-cancer risks of decreased infant birth weight for workers from the use of paint and coating removers containing NMP. Exposure scenarios with MOEs below the benchmark MOE present risks of concern. Typically, non-cancer adverse effects are more likely to result from exposure scenarios with MOEs multiple orders of magnitude below the benchmark MOE. For non-cancer effects, EPA estimated exposures that are significantly larger than the point of departure (Ref. 3). Specifically, the assessment identified risks of fetal death from acute exposures of:

- Four or fewer hours per day, when gloves were not used.
- Greater than 4 hours per day, and risks were not mitigated by personal protective equipment such as respirators or gloves.

The assessment identified risks of decreased infant birth weight from chronic (repeated) exposures of:

- Four or fewer hours per day, when gloves were not used.
- Greater than 4 hours per day, and risks were not mitigated by personal protective equipment such as respirators or gloves.
- Over the course of a work-week (5 days)

Given the risks identified in the NMP risk assessment, the agency undertook further analysis to consider whether that use of NMP in paint and coating removal poses an unreasonable risk.

C. Supplemental Analysis Consistent With the NMP Risk Assessment

Following the NMP risk assessment, EPA conducted supplemental analyses

to inform risk management and to expand on the consumer exposure scenarios. These analyses are consistent with the scope of the NMP risk assessment and were based on the peer-reviewed methodology used in the NMP risk assessment. They included identification of baseline and central tendency exposure scenarios, impacts of reduced NMP content in paint removers, addition of local exhaust ventilation (LEV), use of personally protective equipment (PPE), and methods of monitoring to ascertain workplace exposures. The results of EPA's analyses are available in this rulemaking docket (Refs. 37, 75, and 76). Prior to promulgation of the final rule, EPA will peer review the "Recommendation for an Existing Chemical Exposure Limit (ECEL) for Occupational Use of NMP and Workplace Air Monitoring Methods for NMP," "Respirator and Glove Specifications for Workers and Consumers Exposed to N-methylpyrrolidone (NMP) in Paint and Coating Removal and Estimated Fractions of Worker Population Vulnerable to the Acute Health Effect," and "Supplemental Consumer Exposure and Risk Estimation Technical Report for NMP in Paint and Coating Removal" (Refs. 37, 75, and 76).

D. Outreach

In addition to the consultations described in Unit XXIII., EPA initiated discussions with experts on and users of paint removers (Ref. 22). For more information on these discussions, see Unit IV.D.

XV. Regulatory Approach for NMP in Paint and Coating Removal

A. TSCA Section 6(a) Unreasonable Risk Analysis

Under TSCA section 6(a), if the Administrator determines that a chemical substance presents an unreasonable risk of injury to health or the environment, without consideration of costs or other non-risk factors, including an unreasonable risk to a potentially exposed or susceptible subpopulation identified as relevant to EPA's risk evaluation, under the conditions of use, EPA must by rule apply one or more requirements to the extent necessary so that the chemical substance no longer presents such risk.

The TSCA section 6(a) requirements can include one or more, or a combination of, the following actions:

- Prohibit or otherwise restrict the manufacturing, processing, or distribution in commerce of such substances (§ 6(a)(1)).

- Prohibit or otherwise restrict the manufacturing, processing, or distribution in commerce of such substances for particular uses or for uses in excess of a specified concentration (§ 6(a)(2)).

- Require minimum warning labels and instructions (§ 6(a)(3)).
- Require recordkeeping or testing (§ 6(a)(4)).
- Prohibit or regulate any manner or method of commercial use (§ 6(a)(5)).
- Prohibit or otherwise regulate any manner or method of disposal (§ 6(a)(6)).
- Direct manufacturers and processors to give notice of the determination to distributors and the public and replace or repurchase substances (§ 6(a)(7)).

EPA analyzed a wide range of regulatory options under section 6(a) for each use in order to select the proposed regulatory approach (Refs. 23 and 24). For each use, EPA considered whether a regulatory option (or combination of options) would address the unreasonable risk so that it no longer presents such risk. To do so, EPA initially analyzed whether the regulatory options could reduce risks to levels below those of concern, based on EPA's technical analysis of exposure scenarios.

After the technical analysis, which represents EPA's assessment of the potential for the regulatory options to achieve risk benchmarks based on analysis of exposure scenarios, EPA then considered how reliably the regulatory options would actually reach these benchmarks. For the purposes of this proposal, EPA found that an option addressed the risk so that it was no longer unreasonable if the option could achieve the benchmark MOE or cancer benchmark for the most sensitive endpoint. In considering whether a regulatory option would ensure the chemical no longer presents the unreasonable risk, EPA considered whether the option could be realistically implemented or whether there were practical limitations on how well the option would mitigate the risks in relation to the benchmarks, as well as whether the option's protectiveness was impacted by environmental justice or children's health concerns.

B. TSCA Section 6(c)(2) Considerations

As noted previously, TSCA section 6(c)(2) requires EPA to consider and publish a statement based on reasonably available information with respect to the:

- Health effects of the chemical substance or mixture (in this case, NMP) and the magnitude of human exposure to NMP;

- Environmental effects of NMP and the magnitude of exposure of the environment to NMP;

- Benefits of NMP for various uses;
- Reasonably ascertainable economic consequences of the rule, including: The likely effect of the rule on the national economy, small business, technological innovation, the environment, and public health; the costs and benefits of the proposed and final rule and of the one or more primary alternatives that EPA considered; and the cost-effectiveness of the proposed rule and of the one or more primary alternatives that EPA considered.

In addition, in selecting among prohibitions and other restrictions available under TSCA section 6(a), EPA must factor in, to the extent practicable, these considerations. Further, in deciding whether to prohibit or restrict in a manner that substantially prevents a specific condition of use of a chemical substance or mixture, and in setting an appropriate transition period for such action, EPA must also consider, to the extent practicable, whether technically and economically feasible alternatives that benefit health or the environment will be reasonably available as a substitute when the proposed prohibition or other restriction takes effect.

EPA's analysis of health effects and magnitude of exposure to NMP can be found in Units XIV.B., XVI.B. and XVI.C., which discuss the NMP risk assessment and EPA's regulatory assessment of the use of NMP in paint and coating removal. A discussion of the environmental effects of NMP is in Unit XII.D.

With respect to the costs and benefits of this proposal and the alternatives EPA considered, as well as the impacts on small businesses, the full analysis is presented in the Economic Analysis (Ref. 4). The regulatory options and consideration of TSCA section 6(c)(2) factors are discussed in more detail in Unit V for methylene chloride in paint and coating removal and in Unit XV. for NMP in paint and coating removal.

To the extent information was reasonably available, EPA considered the benefits realized from risk reductions (including monetized benefits, non-monetized quantified benefits, and qualitative benefits), offsets to benefits from countervailing risks (e.g., residual risk risks from chemical substitutions and alternative practices), the relative risk for environmental justice populations and children and other potentially exposed or susceptible subpopulations (as compared to the general population), the cost of regulatory requirements for

the various options, and the cost effectiveness of the proposed action and the one or more primary alternate regulatory options. A discussion of the benefits EPA considered can be found in Units XVI.C. and XVII.B. as well as in the Economic Analysis (Ref. 4).

EPA considered the estimated costs to regulated entities as well as the cost to administer and enforce the options. For example, an option that includes use of a respirator would include inspections to evaluate compliance with all elements of a respiratory protection program (Ref. 25). In understanding the burden, EPA took into account the reasonably available information about the functionality and performance efficacy of the regulatory options and the ability to implement the use of chemical substitutes or other alternatives. Reasonably available information included the existence of other Federal, state, or international regulatory requirements associated with each of the regulatory options as well as the commercial history for the options. A discussion of the costs EPA considered and a discussion of the cost-effectiveness of the proposal and the primary alternate regulatory options that EPA considered is in Units XVI.E. and XVII.A. In addition, a discussion of the impacts on small businesses is in Unit XXIII. and in the Initial Regulatory Flexibility Analysis and Report from the Small Business Advocacy Review Panel (Refs. 26 and 27).

With respect to the anticipated effects of this proposal on the national economy, EPA considered the number of businesses and workers that would be affected and the costs and benefits to those businesses and workers. In addition, EPA considered the employment impacts of this proposal, as discussed in the Economic Analysis (Ref. 4). EPA found that the direction of change in employment is uncertain, but EPA expects the short term and longer-term employment effects to be small.

The benefits of NMP in paint and coating removal are discussed in Unit XVI.A., along with the availability of alternatives. The dates that the proposed restrictions would take effect are discussed in Unit XX. The availability of alternatives to methylene chloride in paint and coating removal on those dates is discussed in Unit XVI.D.

Finally, with respect to this proposal's effect on technological innovation, EPA expects this action to spur innovation, not hinder it. An impending prohibition on this use of NMP is likely to increase demand for alternatives, which EPA expects would result in the development of new alternatives. See

section 9.3 in the Economic Analysis (Ref. 4).

C. Regulatory Options Receiving Limited Evaluation

EPA analyzed a wide range of regulatory options under TSCA section 6(a). There are a range of regulatory options under TSCA; only those pertaining to these risks were evaluated in detail. An overview of the regulatory options not evaluated in detail follows.

First, EPA reasoned that the TSCA section 6(a)(1) regulatory option to prohibit the manufacture, processing or distribution in commerce of NMP or limit the amount of NMP which may be manufactured, processed or distributed in commerce is not applicable because EPA is not proposing to ban or limit the manufacture, processing or distribution in commerce of NMP for uses other than paint and coating removal.

In addition, EPA reasoned that the TSCA section 6(a)(6) regulatory option to prohibit or otherwise regulate any manner or method of disposal of the chemical is not applicable since EPA did not assess risks associated with NMP disposal.

Another option EPA evaluated would be to only require warning labels and instructions on paint and coating removal products containing NMP, pursuant to section 6(a)(3) (Ref. 30). EPA reasoned that warning labels and instructions alone could not mitigate the risks as necessary so that NMP no longer presents an unreasonable risk (either to users in the general population or to users who are women of childbearing age). For a further discussion of why EPA believes that labeling alone will not effectively mitigate the unreasonable risks, see Unit V.C. EPA's general observations about labeling, described in that unit, are also applicable in the case of NMP. Specifically regarding NMP, effective personal protection resulting in risk reduction would require not only the appropriate donning and doffing of specialized gloves that are not easily available to consumers, but also identification of which type of glove is protective against particular formulations of paint and coating removal products containing NMP (Ref. 75). Any labeling aiming to reduce risks to consumer or commercial users of these products would need to sufficiently and clearly explain this, and would still leave the user with the problem of obtaining and properly using the appropriate gloves and (in the case of commercial users or consumers using the product for several days at a time) the appropriate respirator. With respect to consumer risks in particular, a label on a product that is easily available to

consumers, that directs the user to obtain and use safety equipment that is not easily available to consumers, is especially unlikely to be correctly followed.

A regulatory option receiving limited evaluation was a training and certification program for commercial paint and coating removers, similar to the certification process required under EPA's Lead Renovation, Repair, and Painting Rule (73 FR 21692, April 22, 2008). This option was recommended by the small entity representatives as part of the SBAR process (Ref. 27). EPA considered this option as an approach to reducing risks from NMP in paint and coating removal. However, unlike the process for training and certification of commercial workers required under the Lead Renovation, Repair, and Paint Rule, effective risk reduction from commercial use of NMP for paint and coating removal would require additional regulation of distributors of these products. When considering this approach, given the Agency's experience with the training and certification program under the Lead Renovation, Repair, and Paint Rule, EPA viewed the costs and challenges involved in regulating distributors and ensuring that only trained and certified commercial users are able to access these paint and coating removal products as a significant limitation for this approach. EPA seeks public comment on the feasibility of such a program and its potential to reduce risks of exposure to NMP for workers so that those risks are no longer unreasonable.

XVI. Regulatory Assessment of NMP in Paint and Coating Removal

This unit describes the current use of NMP in paint and coating removal, the unreasonable risks presented by this use, and how EPA identified which regulatory options reduce the risks so that they are no longer unreasonable.

A. NMP in Paint and Coating Removal

As described previously in Units I.A. and VI.B., paint and coating removal, also referred to as paint stripping, is the process of removing paint or other coatings from a surface of a substrate, such as an object or structure (Ref. 3). More information on specific techniques for paint removal in each industry and by consumers are in the NMP risk assessment and supplemental materials (Refs. 3, 75, and 76).

Chemical products for paint and coating removal are used across several industries as well as by consumers or hobbyists, and products intended for one type of use—such as aircraft renovation—have been used in other

situations, such as bathtub refinishing (Refs. 11, 32, and 33). There are no restrictions on using products intended for one specific type of paint removal project in a different setting. Additionally, consumers face no restrictions when using products intended for or marketed to professional users.

EPA has identified 64 different products for paint and coating removal that contain NMP, formulated by 21 different firms. This is approximately 59% of the total number of paint and coating removal products EPA identified (109 products) (Ref. 34). Though the number of workers and consumers exposed to NMP during paint and coating removal is uncertain, EPA has several estimates based on industry data. As described in Unit VI.B., commercial uses include automotive refinishing, furniture refinishing, art conservation and restoration, pleasure craft building and repair, aircraft paint removal, graffiti removal, bathtub refinishing, and renovations in residences or other buildings. As described in more detail in the Economic Analysis, EPA estimates that 30,300 workers annually are exposed to NMP during paint and coating removal activities (Ref. 4).

Consumer use of NMP in paint and coating removal is similar to commercial use, but occurs in consumer settings, such as homes, workshops, basements, garages, and outdoors. Paint and coating removal products containing NMP are the same as those used in many commercial settings, and the process consumers use is similar to commercial methods of brushing or spraying on the paint and coating removal product, allowing time to pass for the product to penetrate the coating, and then scraping the loosened coating from the surface.

When consumers interested in DIY paint and coating removal choose to use chemical paint removers (Ref. 77), they frequently receive advice to use products that contain NMP, without any reference to the risks presented by NMP or even solvents in general (Refs. 78 and 79). Manufacturers and retailers of paint and coating removal products containing NMP frequently sell them to consumers in small containers with marketing language or labeling that state they are biodegradable, 'plant-based', or contain 'no harsh fumes' and implies they are 'green' or 'safe' (Ref. 35). Products containing NMP are not required to be labeled with that information or any information about personal protection or risk reduction. These products are frequently sold at home improvement retailers or

automotive supply stores that sell products to consumers as well as professional users (Ref. 35). Additionally, due to the wide availability of products available on the Internet and through various additional suppliers that serve commercial and consumer customers, consumers are able to purchase a variety of paint and coating removal products containing NMP. EPA estimates that the majority of users of paint and coating removal products containing NMP are consumers, rather than occupational users. EPA estimates that approximately 732,000 consumers annually use paint removal products containing NMP (Ref. 4).

B. Analysis of Regulatory Options

In this section, EPA explains how it evaluated whether the regulatory options considered would address the unreasonable risks presented by the use of NMP in paint and coating removal. First, EPA characterizes the unreasonable risks associated with the current use of NMP in paint and coating removal. Then, EPA describes its initial analysis of which regulatory options have the potential to achieve non-cancer benchmarks. Lastly, this section evaluates how well those regulatory options would address the unreasonable risk in practice.

1. Risks associated with the current use. a. General impacts. The NMP risk assessment and additional supplemental analyses identified acute and chronic risks for consumers and commercial users of paint and coating removal products containing NMP following exposure through dermal contact, inhalation, and vapor-through-skin (Refs. 3, 75, and 76). EPA did not find risks for occupational or residential bystanders (individuals not using the paint and coating remover, but near someone who is). EPA estimates, having refined the numbers since the risk assessment that, annually, there are approximately 30,300 workers at 4,300 commercial operations conducting paint and coating removal with NMP, and approximately 732,000 consumers who use paint and coating removal products containing NMP each year (Ref. 4).

b. Impacts on minority and other populations. While all consumers and workers using paint and coating removal products containing NMP would benefit from risk reduction, some populations are currently at disproportionate risk for the health effects associated with NMP in paint and coating removal. These are the same populations at disproportionate risk for the health effects associated with methylene chloride in paint and coating

removal, and are described in Unit VI.C.1.b.

c. Impacts on children. EPA has concerns for effects on the developing fetus from acute and chronic worker and consumer maternal exposures to NMP. The risk estimates focus on the most susceptible life stages, which for NMP are women of childbearing age and their developing fetus. However, because women may not know that they are pregnant (Refs. 80 and 81) and short-term exposure to NMP may adversely impact fetal development during a single day or single week of exposure, the life stages of concern for risk assessment include all women of childbearing age (*i.e.*, women between the ages of 16 and 49 years) and the developing fetus. The impacts to children derive from the pre-natal or maternal exposure; these impacts include decreased fetal weight, decreased birth (post-natal) weight, and fetal death. Details on the impacts of these health effects are described in Unit XVI.C.

EPA assumed that consumer and commercial users would generally be adults of both sexes (16 years old and older, including women of childbearing age), although exposures by teenagers and even younger individuals may be possible in consumer settings. However, risk estimates focused on the most susceptible life stage, which are pregnant women and their developing fetus, because developmental toxicity is one of the most sensitive health effects associated with NMP exposure (Ref. 3).

d. Exposures for this use. Exposures assessed for this in the risk assessment and supplemental analyses use include acute and chronic (or repeat-dose) exposures by commercial workers and acute exposures by consumers engaging in paint and coating removal with NMP, as described in the NMP risk assessment and additional analyses (Refs. 3 and 76). The exposure pathways of interest included dermal contact, vapor-through-skin, and inhalation. Acute scenarios assumed one day, or up to eight hours, of exposure; chronic, or repeat-dose, scenarios assumed five days of exposure per week, or one work week, with up to eight hours per day of exposure (Refs. 3 and 76).

For exposures in commercial settings, EPA assessed exposure scenarios under which the worker was presumed to work on either an indoor project (such as work by professional contractors, furniture stripping and other settings) or an outdoor or semi-enclosed space (such as graffiti removal on the exterior of a building, outdoor escalator, or elevator).

In the NMP risk assessment, EPA developed six occupational user

exposure scenarios for assessment. The following factors were considered in developing the exposure scenarios (Ref. 3):

- The weight fraction of NMP in the paint and coating removal product;
- Skin surface area of the worker in contact with the paint removal product; and
- Duration of contact (in hours) with the paint removal product.

Within each of the six workplace scenarios, EPA evaluated five permutations, by modifying the parameters of the scenario to include different combinations of personal protective equipment (PPE). These permutations were (1) respirator with assigned protection factor (APF) of 10, and gloves; (2) respirator APF 10 only; (3) gloves only; (4) neither respirator nor gloves; and (5) not directly using the product (nearby worker) (Ref. 3).

EPA used air concentration data and estimates found in literature sources to serve as inhalation exposure concentration inputs to the physiologically-based pharmacokinetic modeling for occupational exposures to NMP. This modeling was used to derive internal dose estimates for acute and chronic occupational exposures, and predicted absorption of liquid or vapor by the individual in the scenario when using the paint and coating removal product containing NMP (Ref. 3).

For consumer exposures, EPA assessed exposure scenarios under which the individual was presumed to work on one of several types of paint and coating removal projects (table and chairs, chest of drawers, or bathtub), with inputs reflecting that consumers do not reliably use personal protective equipment (effective gloves) or have access to engineering controls (e.g., ventilation fan). In each scenario, the consumer would be exposed via inhalation, dermal contact, and vapor-through-skin (Ref. 3).

EPA developed seven consumer exposure scenarios for the assessment. Similar to the worker exposure assessment, the following factors were considered in developing the exposure scenarios (Ref. 3):

- The type of application (*i.e.*, brush-on or spray-on), weight fraction of NMP in the paint and coating removal product, application rate by the user, surface area of object from which the paint or coating was being removed, and emission rate of the chemical, which can affect the amount of NMP that ultimately is released to the indoor environment;
- The location where the product is applied, which relates to exposure

factors such as the room volume and its air exchange rate with outdoor air;

- The house volume and air exchange rate, for reasons similar to those for the product use location; and
- Precautionary behaviors such as opening windows in the application room, the user leaving the application room during the wait period, related changes to the air exchange rates, and the proximity of the user to the source of NMP emissions.

In the absence of representative air monitoring data for consumers using paint and coating removal products containing NMP, EPA used the Multi-Chamber Concentration and Exposure Model to estimate consumer inhalation exposure concentrations. The predicted air concentrations from the exposure modeling for users and non-users were inputs to the physiologically-based pharmacokinetic modeling software and used to define consumers' moment-by-moment air concentration inhaled and in contact with unobstructed skin. The parameters and data sources for the model are described in the NMP risk assessment (Ref. 3).

EPA's estimates of the exposures individuals experienced during the acute and chronic scenarios of commercial or consumer use of paint and coating removal products containing NMP were used to assess the risks of these uses of NMP. The full exposure estimates and risk findings are described in the NMP risk assessment; risk findings are also summarized in Unit XVI.B.1.a.

In addition to estimating likely exposures under current use patterns, for both commercial and consumer users, EPA assessed a number of exposure scenarios associated with risk reduction options in order to identify variations in NMP exposure. All variations in the scenarios were evaluated with exposure parameters that were modified to reflect either a reasonable worst-case scenario (also called the baseline) or a scenario in which exposures were moderated by several factors (also called the central tendency scenario). The risk reduction options that were varied between scenarios included material substitution, duration of use, engineering controls, and use of PPE, as well as combinations of these options (Refs. 37, 75, and 76), as follows:

- The material substitution scenarios involved reducing the concentration of NMP in the paint and coating removal product, with concentrations varying from 5, 10, 25, 30, 35, 40, 62.5 and 100% by weight in the product.
- The duration of use scenarios involved, for consumers, variations in

the type of activity during which paint removal would be conducted (for example, 7 hours of exposure to NMP when removing paint from a table and 8 chairs; 0.5 hours of exposure to NMP when removing paint from a coffee table). For commercial users, duration of exposure to NMP in paint and coating removers was assessed as job time during a work day (1 to 8 hours).

- Under the PPE risk reduction option exposure scenarios, EPA evaluated consumers wearing specialized gloves, and workers wearing specialized gloves and/or respirators with APF 10.

- For the engineering controls risk reduction option exposure scenarios, EPA evaluated using LEV to improve ventilation near the activity of workers in furniture refinishing operations, with an assumed 90% reduction in exposure levels.

Additionally, EPA evaluated combinations of the options. For consumers, this included material substitution, duration of exposure, and PPE; for workers, this included material substitution, duration of exposure, PPE, and LEV. Engineering controls are not assumed to be practical for consumers as a method of exposure reduction. Overall, EPA evaluated dozens of distinct exposure scenarios for both consumer and commercial paint and coating removal with NMP.

e. Specific risks for this use. The assessment of acute risks used developmental toxicity data to evaluate the acute risks for paint and coating removal with NMP. EPA based its assessment of acute risks on the endpoint most protective of health (*i.e.*, fetal death (Ref. 3)), representing the most sensitive human life stage (*i.e.*, women of childbearing age (greater than 16 years) and the fetus). Because fetal effects were selected as key endpoints, risks were calculated for pregnant women and women of childbearing age who may become pregnant. As described in the risk assessment, exposures that do not result in risks of concern for these particular lifestages are also found to be protective of children and adult males. A risk of concern was identified if the MOE estimate was less than the benchmark MOE of 30 (Ref. 3).

In the risk assessment and supplemental analyses, EPA evaluated risks for fetal death from dermal contact, inhalation, and vapor-through-skin for all consumer, occupational, and bystander exposure scenarios of paint and coating removal with NMP. No risks were identified for occupational or residential bystanders. Acute risks of fetal death were identified for the

consumer and commercial users of NMP for paint and coating removal in several, although not all, scenarios. To identify what, if any, risks may be present for consumers in different scenarios, EPA conducted additional analyses consistent with the risk assessment to provide an expanded understanding of consumer exposures (Ref. 76). Additionally, it appears that consumers could engage in patterns of use comparable to worker exposures that present risk; for example, any consumers engaging in paint and coating removal with NMP for longer than four hours in one day could be subject to the acute occupational risks identified (Ref. 3).

For commercial users, the occupational scenarios in which acute risks were identified included four hours of paint removal in one day with no gloves, with or without a respirator, indoors or outdoors, assuming mid-range of the exposure parameters described earlier, such as concentration of NMP in the product (MOEs range from 12 to 15); and four hours of paint removal in one day with or without a respirator and gloves, indoors or outdoors, assuming the higher exposure parameters described earlier (MOEs range from 0.7 to 11.8) (Ref. 3). These risks are present whether the worker is indoors or outdoors, and may be present even in the presence of PPE or ventilation, depending on the duration of use and the concentration of NMP in the product. Therefore, EPA's proposed determination is that acute NMP exposures during paint and coating removal present unreasonable risks.

EPA also assessed risks of chronic exposure to NMP by commercial users, with a short-term chronic exposure that can be defined as a repeat-dose scenario in which the individual is exposed over the course of a work week, rather than over a lifetime. This chronic assessment used decreased fetal body weight as the critical endpoint. EPA assessed risks for decreased birth weight for occupational and bystander exposure scenarios of paint and coating removal with NMP. In the risk assessment, a risk of concern was identified if the MOE estimate was less than the benchmark MOE of 30 for decreased birth weight (Ref. 3).

Risk of decreased birth weight was identified for commercial users of NMP for paint and coating removal in several scenarios, including four hours of paint removal during each day in a work week without gloves, with or without a respirator, indoors or outdoors, assuming the mid-range of the exposure parameters described earlier, such as concentration of NMP in the product (MOEs range from 5.4 to 6.1); and eight

hours of paint removal during each day in a work week, with or without a respirator or gloves, indoors or outdoors, assuming the higher exposure parameters described earlier (MOEs range from 0.1 to 3.2) (Ref. 3). Though no risks were identified for occupational bystanders, for workers, these risks are present whether the worker is indoors or outdoors, and may be present even if PPE or ventilation is used, depending on the duration of use and the concentration of NMP in the product (Ref. 3). In some scenarios, this equates to estimated exposures that are more than 10 times greater than those that would produce the benchmark MOE for this endpoint, which assesses risks for fetal death and decreased birth weight. Therefore, EPA's proposed determination is that chronic NMP exposures during paint and coating removal also present unreasonable risks.

The SBAR Panel convened in support of this action heard from several SERs who expressed concerns about the underlying NMP risk assessment (Ref. 27). Many of the concerns expressed by these SERs were already expressed in the public comments and the peer review comments on the NMP risk assessment. The Summary of External Peer Review and Public Comments and Disposition document in the risk assessment docket (EPA-HQ-OPPT-2012-0725) explains how EPA responded to the comments received.

2. Initial analysis of potential regulatory options. Having determined that the risks from NMP in paint and coating removal were unreasonable, EPA evaluated how regulatory options under section 6(a) might reduce the risks so that they are no longer unreasonable.

The results of EPA's assessment of consumer uses, exposures, and risks indicate that regulatory options for consumer uses such as reducing the concentration of NMP in a product or advising the use of specialized gloves or respirators individually could not achieve the target MOE benchmarks for acute exposures (Ref. 76). Similarly, the results of EPA's evaluation indicate that regulatory options for occupational exposures such as reducing the concentration of NMP in products used for paint and coating removal and using local exhaust ventilation to improve ventilation, in the absence of PPE, could not achieve the target MOE benchmarks for non-cancer endpoints for acute and chronic exposures (Refs. 37 and 75). The results also demonstrate that all risk reduction options meeting the benchmark MOEs for NMP in paint and coating removal require the use of specialized gloves, whether used alone

or in conjunction with additional levels of respiratory protection such as a respirator of APF 10 or the use of an air exposure limit, even when the concentration of NMP in a product was limited to 25 percent. Therefore, EPA found setting a maximum concentration of NMP in products under TSCA section 6(a)(2) alone would not reduce exposures to levels at which risks would be at or below the risk benchmarks. Further, EPA's analysis found that even with specialized gloves and a respirator, workers would be at risk of NMP exposure if they used products with more than 25 percent NMP. Additional exposure level estimates for various scenarios are available in the supplemental analyses, which also document options that did not meet the risk benchmarks and which do not, for purposes of this proposal, address the identified unreasonable risks (Refs. 37, 75, and 76).

3. Assessment of whether regulatory options address the identified unreasonable risks to the extent necessary so that NMP in paint and coating removal no longer presents such risk. As discussed earlier, EPA considered a number of regulatory options under TSCA section 6(a) for NMP in paint and coating removal, which are reflected in EPA's supporting analysis (Ref. 30). In assessing these options, EPA considered a wide range of exposure scenarios (Refs. 75 and 76). These include both baseline and risk reduction scenarios involving varying factors such as concentration of NMP in paint and coating removal products, LEV use, respirator and glove use, and duration of use. As part of this analysis, EPA considered the impacts of regulatory options on consumer users and commercial users separately. However, EPA is proposing to address the use of NMP in paint and coating removal as a whole rather than as separate consumer and commercial uses. As described earlier in Unit XVI.A., paint and coating removal products containing NMP frequently are available in the same distribution channels to consumers and professional users. Products are marketed for a variety of projects, and cannot be straightforwardly restricted to a single type of project or user.

The Agency examined two main alternative approaches to addressing the unreasonable risk from NMP in paint and coating removal under current conditions of use by consumers and commercial users. These two approaches are the supply chain approach (and its two primary variations) and the reformulation, labeling, and PPE approach. These

regulatory alternatives are the options that have the potential to address the unreasonable risks presented by NMP when used for paint and coating removal by consumers, commercial users, or for both. The two options and their variations are described below.

(a) The first co-proposed approach (option 1) is a supply-chain approach, which would include prohibiting the manufacturing, processing, and distribution in commerce of NMP for paint and coating removal under TSCA section 6(a)(2) except for certain uses critical to national security; prohibiting the commercial use of NMP in paint and coating removal under TSCA section 6(a)(5) except for certain uses critical to national security; requiring that all paint and coating removers containing NMP be distributed in containers with volumes no less than 5 gallons under TSCA section 6(a)(2); requiring downstream notification when distributing NMP for other uses under TSCA section 6(a)(3); and limited recordkeeping under TSCA section 6(a)(4);

(b) Variations on such a supply-chain approach, such as just prohibiting the manufacturing, processing, and distribution in commerce of NMP for paint and coating removal under TSCA section 6(a)(2) for consumer and commercial use or just prohibiting the commercial use of NMP for paint and coating removal under TSCA section 6(a)(5);

(c) Additional variations on such a supply-chain approach, such as prohibiting the manufacturing, processing, and distribution in commerce of NMP for paint and coating removal under TSCA section 6(a)(2) for consumer and commercial use and requiring downstream notification (e.g., via SDS) when distributing NMP for other uses under TSCA section 6(a)(3); and

(d) The second co-proposed approach (option 2), a reformulation, PPE, and labeling approach, which would require (1) product reformulation to limit the concentration of NMP in paint and coating removal products under section 6(a)(2); (2) testing of product formulations to identify specialized gloves that provide protection for users and relevant recordkeeping under section 6(a)(4); (3) relabeling of products intended for consumer use to provide additional information to consumers under section 6(a)(3); (4) an occupational dermal and respiratory protection program for commercial use of NMP in paint and coating removal, including a requirement for hazard communication, specialized gloves and an air exposure limit or respirator under

section 6(a)(5); (5) a prohibition on use of NMP above a concentration of 35 percent for commercial paint and coating removal under 6(a)(5); (6) downstream notification when distributing NMP for other uses under TSCA section 6(a)(3); and (7) limited recordkeeping under TSCA section 6(a)(4). Under this co-proposed approach, EPA is not proposing an exemption for coating removal uses identified as critical to national security because paint and coating removal products containing NMP would continue to be available for these national security uses under this option, even without establishing a national security exemption.

A discussion of the regulatory options that could reach the risk benchmarks for consumer use, commercial use, or both is in this unit, along with EPA's evaluation of how well those regulatory options would address the unreasonable risks EPA has identified. EPA requests comment on the two co-proposed regulatory options addressing the use of NMP in paint and coating removal, particularly with regard to the advantages and disadvantages of the different approaches, their potential associated benefits, and whether such approaches would be consistent with EPA's obligation under TSCA to address risks identified as unreasonable.

a. First co-proposed approach: Supply-chain (option 1). The proposed regulatory approach for NMP in consumer and commercial paint and coating removal would prohibit the manufacturing, processing, and distribution in commerce of NMP for consumer and commercial paint and coating removal under TSCA section 6(a)(2), except for certain uses critical to national security; would prohibit the commercial use of NMP for paint and coating removal under TSCA section 6(a)(5), except for certain uses critical to national security; would require any remaining paint and coating removal products containing NMP to be distributed in containers with a volume no less than 5 gallons, under TSCA section 6(a)(2); would require manufacturers, processors, and distributors of NMP to provide downstream notification of the prohibitions under TSCA section 6(a)(3), and would require recordkeeping relevant to these prohibitions under TSCA section 6(a)(4).

As discussed earlier, a risk of concern was identified if the MOE estimate was less than the benchmark MOE of 30. As described in Unit XVI.B.1., the baseline risks for workers and consumers from paint and coating removal with NMP

were identified as ranging from two to 10 times below the benchmark MOEs of 30 for fetal death (the acute health impact) or low birth weight (the chronic health impact). Under this proposed option, exposures to NMP during paint and coating removal would be eliminated for consumers and workers. As a result, acute and chronic risks would be eliminated.

The first co-proposed approach would ensure that workers and consumers from the general population (as well as workers and consumers who are women of childbearing age) are no longer exposed to unreasonable risks from NMP exposure during paint and coating removal. Prohibiting the manufacturing, processing and distribution in commerce of NMP for paint and coating removal would minimize the overall availability of NMP for paint and coating removal. Importantly, this proposed regulation is protective of consumer users. EPA cannot regulate consumer use under TSCA section 6(a)(5). The prohibition of the commercial use of NMP for paint and coating removal would reduce commercial demand for NMP paint and coating removal products, reduce the likelihood that other types of products formulated with NMP would be used for paint and coating removal, and significantly reduce the potential for consumer use of commercial paint and coating removal products containing NMP. Workers would not be exposed to NMP for paint and coating removal, except for those uses that are proposed to be exempt because they are critical to national security. The risk to consumers would be minimized because commercial paint and coating removal products containing NMP would not be available outside of those directly supplied to DOD for uses identified as critical to national security.

The downstream notification of these restrictions ensures that processors and distributors are aware of the manufacturing, processing, distribution in commerce and use restrictions for NMP in paint and coating removal, and enhances the likelihood that the risks associated with this use of NMP are addressed throughout the supply chain. Downstream notification also streamlines compliance and enhances enforcement, since compliance is improved when rules are clearly and simply communicated (Ref. 39). This integrated supply chain proposed approach completely mitigates the risk to consumers and workers from NMP in paint and coating removal.

b. Options that are variations of elements of the co-proposed supply-chain approach (option 2). One

variation of the proposed approach would be to prohibit manufacture, processing, and distribution in commerce of NMP for consumer and commercial paint removal for the uses proposed for regulation this without the prohibition on commercial use of NMP for paint and coating removal and without the downstream notification of any prohibitions. Without the accompanying prohibition on commercial use and downstream notification that is included in the proposed supply chain approach, this option would leave open the likelihood that commercial and consumer users could obtain NMP (which would continue to be available for other uses, such as degreasing or solvent purposes) and use it for paint and coating removal.

Without downstream notification, unsophisticated purchasers in particular are likely to be unfamiliar with the prohibitions regarding this use and mistakenly use NMP for paint and coating removal, thereby exposing themselves and bystanders to unreasonable risks. Thus, under these variations, EPA anticipates that many users would not actually realize the risk benchmarks. Therefore, these variations fail to protect against the unreasonable risks. EPA requests comment on its consideration of and conclusions regarding this option.

Another regulatory option that EPA considered was to prohibit only the commercial use of NMP for paint and coating removal. This approach would reduce risks for commercial settings, but it would not reduce risks to consumers so that they are no longer unreasonable. By prohibiting use in the commercial sector alone, without a prohibition on the manufacture, processing, and distribution in commerce of paint and coating removal products containing NMP for consumer and commercial use, this approach would not address consumer risks as distributors of paint and coating removal products containing NMP could continue to distribute to consumers NMP marked as a paint and coating remover, including products labeled and marketed as "professional strength" or "commercial grade" products. Since it is foreseeable that consumers would continue to purchase products labeled and marketed in this fashion, consumers would continue to be exposed far above the health benchmarks and would not be protected from the unreasonable risks posed by NMP. EPA requests comment on its consideration of and conclusions regarding this option.

c. Prohibit the manufacturing, processing, and distribution in commerce of NMP for consumer paint

and coating removal under TSCA section 6(a)(2) or prohibit the manufacturing, processing, and distribution in commerce of NMP for consumer paint and coating removal under TSCA section 6(a)(2) and require downstream notification when distributing NMP for other uses under TSCA section 6(a)(3). EPA considered prohibiting the manufacturing, processing, and distribution in commerce of NMP only for consumer paint and coating removal, including an option with a requirement for downstream notification of such prohibition. If such a prohibition were effective, this option would mitigate the risks to consumers from NMP in paint and coating removal. However, consumers can easily obtain products labeled for commercial use. Indeed, for many consumers, identifying a product as being for commercial use may imply greater efficacy. Coupled with the fact that many products identified as commercial or professional are readily obtainable in a variety of venues (e.g., the Internet, general retailers, and specialty stores, such as automotive stores), EPA does not find that this option would protect consumers. In addition, this option alone would not address the risks to workers from NMP in paint and coating removal. EPA requests comment on its consideration of and conclusions regarding this option.

d. Second co-proposed approach: Reformulation, labeling, and PPE approach. EPA is co-proposing two regulatory options for NMP. The second co-proposed option would involve product reformulation, glove testing, labeling, and worker protection. This approach has the potential to reduce the risks presented by NMP during paint and coating removal. EPA currently believes this potential is greater for workers than for consumers. potential is greater for workers than for consumers. EPA is considering this co-proposed regulatory option, and may adopt it in the final rule; the Agency therefore solicits comment on the option, as described below.

i. Description of second co-proposed approach. The second co-proposed approach for NMP in commercial and consumer paint and coating removal requires actions from commercial users and product formulators. Under this approach, under section 6(a)(5), commercial users of NMP for paint and coating removal would be required to establish a worker protection program for dermal and respiratory protection, including hazard communication, training, and requirements that workers wear clothing covering most of the

body, i.e., impervious long pants and shirts with long sleeves, use gloves specified by product formulators (described under formulator requirements below) and a respirator with APF 10, with an alternative air exposure limit of 5 ppm achieved through engineering controls or ventilation. Also under this approach, formulators of products for either commercial or consumer use would be required to (1) Reformulate products such that paint and coating removal products containing NMP do not exceed a maximum of 35 percent NMP by weight in product formulations under section 6(a)(2) (except for product formulations destined to be used by DOD or its contractors performing work only for DOD projects identified in Unit XVIII.); (2) Test gloves for the product formulations being processed and distributed in commerce to identify specialized gloves that provide protection for users under section 6(a)(4); (3) Label products with information for consumers about reducing risks when using the products, including identifying which specialized gloves provide protection against their specific formulation; and (4) Provide information for commercial users about reducing risks when using the product, via product labels, SDS, and other methods of hazard communication. Variations of more than 1% in any component of a paint and coating removal product containing NMP would be considered a separate formulation.

Specifically, for labeling targeted to consumers under section 6(a)(3) formulators would be required to provide the following information to consumers on product labels: A warning that irreversible health effects such as fetal death may occur as a result of using the product; instructions to not use the product without a new (i.e., replaced each time the product is used) pair of the formulation-specific gloves identified on the label; instructions to either use the product outdoors or to adequately ventilate the workspace by opening windows and adding fans; instructions to not spray-apply the product; instructions to wear clothing that covers exposed skin; and instructions to use a respirator of APF 10, such as a NIOSH-certified air-purifying elastomeric half-mask respirator equipped with N100, R100, or P100 filters. The labeling requirement would also include appropriate placement and font size for the label information.

EPA requests comments on the components of this co-proposal, particularly on the maximum percent concentration that would be permitted

in paint and coating removal products containing NMP. EPA notes that the air exposure limit described earlier correlates with the concentration of NMP in the product, and would necessarily change with any corresponding change in NMP concentration (Ref. 37). EPA's calculations for the estimated exposures from products at various concentrations is in Ref. 75.

EPA also requests comment on the scientific and technical support used for development of the 5 ppm air exposure limit (Ref. 37) for NMP and the feasibility of implementing and enforcing this performance-based approach. Additionally, EPA is requesting comment on the cost to achieve reduced exposures in the workplace or to transition to alternative chemicals or technologies. EPA is requesting comment on whether this alternate option of allowing industrial use at specified exposure levels and with appropriate personal protective equipment should be adopted. Specifically, EPA seeks information on whether this alternative approach would incentivize industry to eliminate NMP use in paint and coating removal wherever technically feasible while minimizing disruptive impacts to those processes where technically feasible substitutes are currently unavailable. EPA also requests comment on whether there should be a phase-in period, *e.g.*, 3 years for formulators to develop the new formulations of products containing NMP at 35 percent. This would also allow users to make the transition. EPA also requests comment on whether the 35% limit on the concentration of NMP in the formulation is appropriate; whether EPA should specify a higher, lower or no limit; and why. Finally, EPA requests comment on the specific regulatory requirements for glove testing and for personal protective equipment programs. EPA has identified two ASTM International standards that are pertinent to glove testing, ASTM F739, "Standard Test Method for Permeation of Liquids and Gases through Protective Clothing Materials under Conditions of Continuous Contact," and ASTM F1194-99, "Standard Guide for Documenting the Results of Chemical Permeation Testing of Materials Used in Protective Clothing Materials." EPA requests comment on whether these standards should govern the mandatory glove testing, or whether there are other standards or requirements that should be imposed. In addition, EPA is proposing to require employers whose employees are exposed to NMP in paint

and coating removal products to develop and institute personal protective equipment programs. These programs must be in writing, specific to the affected workplace, and include provisions relating to the proper selection, use, and maintenance of equipment. EPA requests comment on whether the proposed requirements for personal protective equipment programs are appropriate and complete, whether less burdensome requirements would similarly allow risk to be reduced so that it is no longer unreasonable, or whether EPA should cross reference the OSHA regulations on personal protective equipment, specifically 29 CFR 1910.132-134 and 29 CFR 1910.138.

ii. Risk reduction of second co-proposed approach. Reducing risks to workers so that they would not be unreasonable requires a combination of a concentration limitation and worker protection programs that include PPE and hazard communication because concentration limits or a worker protection program alone would not be sufficient to reduce the risks to workers so that they are no longer unreasonable. For this reason, the second co-proposal aims to reduce the risks to workers by placing requirements on product formulators and commercial users.

Reducing exposure to NMP requires consideration of routes of exposure as well as user behaviors, such as wearing appropriate PPE (*i.e.*, specialized gloves that are effective for the specific formulation used, impervious clothing and a respirator). The dermal route is the primary contributor to exposures from NMP; however, vapor deposition and subsequent absorption through skin and inhalation are also important exposure pathways that must be considered in determining a person's exposure to NMP. Even when wearing specialized gloves, dermal absorption of NMP from the vapor phase typically contributes significantly to human exposure. EPA's calculations for dermal exposure are based on a person having up to 25 percent of exposed skin surface (*e.g.*, arms, head and neck), providing significant exposure to NMP even with impervious glove use (Ref. 3). Thus, the use of impervious long pants and shirts is needed to minimize the area of exposed skin and thus reduce the risk associated with using NMP for paint and coating removal. To address the exposures to NMP use in paint and coating removal via dermal exposure from both direct contact and vapor deposition, and via inhalation exposure, the following combination is required: Specialized gloves that are effective for the specific formulation used; a

respirator with an APF of 10; and impervious clothing covering the body. This combination, as part of a worker protection program, will reduce occupational exposures so that the benchmark MOE is exceeded, provided that the concentration of NMP in the formulations used in paint and coating removals does not exceed 35 percent (Ref. 75). Therefore, EPA believes that any remaining occupational risks would not be unreasonable.

Specialized gloves are an important component of reducing exposure and, thus, must be effective. The presence of co-solvents in the paint and coating removal product containing NMP can result in inadvertent exposure to NMP. Most paint and coating removal products containing NMP contain co-solvents (Ref. 34). Gloves proven to resist permeation or breakthrough from pure NMP have been shown to experience degradation and permeation with these co-solvents especially those that are small-molecule, volatile solvents. For this reason, it is not possible to know which type of glove provides adequate protection from products containing NMP with any co-solvents without testing the formulation of each product for glove breakthrough and permeation. When working with formulated products, the chemical component with the shortest breakthrough time must be considered when selecting the appropriate glove type for protection against chemical hazards unless glove-specific test data are available (Ref. 82). Risks may not be reduced if the appropriate gloves are not identified through testing.

Consumers could have access to NMP formulations identical to those available to commercial users. This co-proposed approach would attempt to address the unreasonable risk to consumers through the combination of labeling and product reformulation. The product reformulation would be as discussed previously. If consumers using NMP formulations which did not exceed 35% of NMP were to consistently follow *all* the warnings on the label (specifically, if the consumer were to use a new pair of the formulation-specific gloves identified on the label each time the product is used; and were to adequately ventilate the workspace; and not spray-apply the product; and if they were to wear clothing that covers exposed skin; and properly fit and use a respirator of APF 10, such as a NIOSH-certified air-purifying elastomeric half-mask respirator equipped with N100, R100, or P100 filters) then the consumer exposures to NMP would be expected to result in MOEs that approach the benchmark MOE of 30 (Ref. 76).

Under real-world conditions, EPA expects that not all consumers will adequately follow the label to reduce risk to a level above the benchmark MOE. The Agency is requesting comment on whether incomplete adherence to the label might still suffice to reduce risks presented by NMP in paint and coating removal so that those risks are no longer unreasonable. EPA also requests comment on whether the voluntary nature of consumer use and the information provided on the label that would allow consumers to avoid risk below the benchmark MOE if label directions were followed should be a factor in determining whether any remaining risk associated with this exposure scenario is unreasonable, and if so, how.

EPA is also requesting comment on how labels may be constructed to effectively communicate risk and instructions on how to use the product, such as information on label content, placement of information, pictures, and font size and color; how to construct a label to effectively communicate and improve the user's understanding of risk and protective measures. EPA requests that this be supported by data demonstrating the effectiveness of a label approach, particularly as it pertains to susceptible sub-populations or individuals with limited English proficiency or low literacy in any language.

EPA requests comment on the efficacy of this co-proposed option, including on individual components.

iii. Concerns regarding second co-proposed approach. EPA has identified several concerns regarding this co-proposed option related to risk reduction for commercial users and for consumers. For commercial users, many of these concerns relate to the use of PPE. Although respirators in conjunction with the use of appropriate formulation-tested gloves could reduce exposures to levels that are protective of acute and chronic risks, respirators are not EPA's preferred approach to decrease exposures. Not all workers may be able to wear respirators, even those with a lower APF. For a discussion of the use of respirators and the associated respiratory protection program, see Unit VI.C. Given equipment costs and the costs of establishing a worker protection program, which involves training, respirator fit testing and the establishment of a medical monitoring program, EPA anticipates that most companies would choose to switch to substitutes instead of adopting a program for this type of PPE to continue using NMP in paint and coating removal. As recommended by the SBAR

panel, EPA is requesting comment on and information about workplace experience with worker protection programs and air monitoring for NMP (Ref. 27). Specifically, EPA seeks comment on whether companies would opt to substitute an alternate chemical or process instead of implementing a worker protection program for PPE. Additionally, EPA is requesting comment on the cost to achieve reduced exposures in the workplace or to transition to alternative chemicals or technologies.

Under this approach, risks to consumers are only addressed to the extent that consumers understand and follow the required label information. While the Agency expects that some number of consumers who read the labels of paint and coating removal products containing NMP would understand this information and take appropriate steps to reduce their risks based on label information, as noted in Unit V.C., studies have shown that consumers do not consistently pay attention to labels for hazardous substances; consumers, particularly those with lower literacy levels, often do not understand label information; consumers often base a decision to follow label information on previous experience and perceptions of risk; even if consumers have noticed, read, understood, and believed the information on a hazardous chemical product label, they may not be motivated to follow the label information, instructions, or warnings; and consumers have varying behavioral responses to warning labels.

Even for those consumers who understand and follow the label, EPA expects some number will not follow the label instructions precisely or may be unable to readily locate the specialized gloves or the respirator indicated on the label (Ref. 28). Further, it is unlikely that consumers would have the fit of their respirator tested, which is important part of the proper use, and thus effectiveness, of a respirator, or that they would wear a new pair of specialized gloves for each use of the product containing NMP. EPA emphasizes that product labels are not equivalent to worker protection programs in which risks are reduced through, among other things, training programs, requirements that include proper testing and use of respirators, and requirements to use specialized gloves each time the product is used.

EPA is unable to determine how many consumers would read and take *all* appropriate action based on label information, and to what extent they could effectively carry out those actions

such that their exposure would be reduced.

As under the first co-proposed approach, manufacturers, processors, and distributors would be required to provide downstream notification of these requirements under TSCA section 6(a)(3), and limited recordkeeping would be required under TSCA section 6(a)(4).

C. Adverse Health Effects and Related Impacts That Would Be Prevented by the Proposed Options

EPA is co-proposing these options to prevent exposure to NMP from paint and coating removal and thus prevent the risks of adverse effects and associated impacts. As discussed in Unit XII.C., the range of adverse health effects from NMP includes developmental toxicity resulting in decreased birth weight or fetal death, kidney toxicity, liver toxicity, immunotoxicity, and reproductive toxicity (Ref. 3). These health effects associated with exposure to NMP are serious and can have impacts throughout a lifetime. The following is a discussion of the impacts of significant acute and chronic non-cancer effects associated with NMP exposure during paint and coating removal, including the severity of the effect, the manifestation of the effect, and how the effect impacts a person during their lifetime.

1. Developmental effects—acute exposures. The NMP risk assessment identified developmental effects as the most sensitive endpoint for acute exposure to NMP. Specifically, this assessment identified fetal death as the critical effect of acute exposures over the course of a day. Fetal death or fetal mortality includes miscarriage, spontaneous abortion, or stillbirth, depending on when in the pregnancy it occurs. Fetal death may result from a single maternal exposure to NMP at a developmentally critical period (Ref. 3). There are increased risks of fetal death for pregnant women who use NMP for paint and coating removal as consumers. EPA estimates that 732,000 consumers use NMP for paint and coating removal each year; of them, approximately 38,000 are estimated to be pregnant women. EPA estimates that approximately 11,300 of these pregnant women are estimated to experience acute exposure to NMP at levels that would result in an MOE below the benchmark of 30. Additionally, there are increased risks of fetal death for a subset of pregnant women among the approximately 8,800 female workers in 4,300 commercial facilities or companies that use NMP for paint and

coating removal. Of these female workers, approximately 500 are estimated to be pregnant, and, of them, approximately 160 are estimated to have acute exposure to NMP at levels that would result in an MOE below the benchmark of 30 for fetal death (Ref. 4). The basis for these calculations are shown in section 5.2.1 of the Economic Analysis (Ref. 4).

Researchers aiming to improve early childhood health outcomes have identified the most sensitive time in a pregnancy as the first few weeks following conception, before a woman may be aware she is pregnant. In the context of maternal welfare and risk reduction, “women often delay assessing and improving their health until after confirmation of pregnancy, putting their baby at risk during the critical early developmental stages” (Ref. 81). Approximately 35% of pregnancies in the United States are unplanned (Ref. 83); consequently, many women who are pregnant may not have taken or be prepared to take steps to reduce risks to the developing fetus during early stages of pregnancy. Maternal exposure to NMP in paint and coating removal may occur before a woman realizes she is pregnant. As such, even if she is aware of the risks of exposure to NMP, she may not take steps to reduce risks of fetal death.

Even if they are aware of their pregnancy, women may not wish to disclose this fact to their employers; although legal protections are in place, many women “feel they may lose their job, may not be considered for a promotion, or may have a promotion taken away if they announce they are pregnant” (Ref. 81). Similarly, the American College of Occupational and Environmental Medicine has found that “while it is illegal for an employer to terminate a worker because of pregnancy, such fears may not be groundless for some workers” (Ref. 83). Consequently, pregnant women may attempt to “minimize their pregnancy” (Ref. 81) and may not be vocal in their workplace about reducing risks to their pregnancy. This could increase chances of exposure to chemicals such as NMP that present a risk of fetal death.

Exposure to NMP in paint and coating removal during a single day (over 8 hours) was found to present risks of fetal death (Ref. 3). The impacts of fetal death, including miscarriage or stillbirth, include emotional impacts on the woman experiencing the death of a fetus, and also present significant emotional impacts for partners and spouses.

Emotional impacts and other mental health effects of miscarriage or stillbirth

can include depression, anxiety, grief, and guilt. Mental health research has consistently identified both miscarriage (defined as fetal death occurring before the 20th week of gestation) and stillbirth (defined as fetal death occurring after the 20th week of gestation) as a significant emotional burden that can persist for more than a year and sometimes up to three years following the event of fetal death (Ref. 84). Compared with their peers, women who have experienced fetal death “exhibit significantly elevated levels of depression and anxiety in the weeks and months following the loss, compared with samples of pregnant, community or postpartum women” (Ref. 85). Psychologists see miscarriage and stillbirth as “an unanticipated, often physically as well as psychologically traumatic event representing the death of a future child and disruption of reproductive plans. Physiologically, it marks the end of a pregnancy, and psychologically it may produce doubts about procreative competence” (Ref. 86). Other descriptions of fetal death similarly characterize it as “a significant psychosocial stressor that results in a high level of dysphoria and grief” (Ref. 87). Consequently, women who experience the death of a fetus are at increased risk for depression, anxiety, and other psychiatric disorders (Ref. 86).

Major depressive disorder has been identified in between 10% to 50% of women after a miscarriage, depending on the measures used (Refs. 88 and 89). According to the National Institutes of Mental Health, persistent depressive disorder is a depressed mood that lasts for at least two years. Symptoms can include difficulty concentrating, sleep pattern disruptions, appetite or weight change, thoughts of suicide or suicide attempts, loss of interest in hobbies or activities, decreased energy, and aches, headaches, or digestive problems without a clear physical cause and that do not ease even with treatment (Ref. 90). Depression can affect an individual’s physical health and their ability to work. Additionally, depression in one family member can also result in increased instance of illness or morbidity in other family members (Ref. 91). Treatment can require several types of attempted pharmaceutical or psychological therapies, and, in the case of depression following fetal death, can persist for years (Ref. 89).

Depression is not the only emotional impact of fetal death; many women also experience intense and persistent anxiety. Researchers have found that “a significant percentage of women

experience elevated levels of anxiety after a miscarriage up until about 6 months post-miscarriage, and they are at increased risk for obsessive-compulsive and posttraumatic stress disorder” (Ref. 89).

In addition to depression and anxiety, a primary component of the emotional burdens presented by fetal death is guilt. As one researcher explained, women search for answers to what they perceive as an inexplicable trauma: “They will spend enormous amounts of emotional energy trying to explain why it happened . . . They often blame themselves, even when it is inaccurate, to help make sense of it. Women may torment themselves with guilt and blame, rewriting the story, so to speak: ‘If I hadn’t gone to the grocery store’ or ‘If I didn’t stay up so late.’ It’s a way of coping with the loss” (Ref. 92).

Related to these emotional impacts, one study found that “the mean annual suicide rate within one year after miscarriage was significantly higher (18.1 per 100,000) than the suicide rates both for women who gave birth (5.9) and for women in the general population (11.3) in Finland between 1987 and 1994” (Ref. 86).

Women experiencing miscarriages or stillbirths are not the only individuals affected by fetal death. Researchers have also documented the ways in which the woman’s partners are affected by the loss (Ref. 86). Recent research has found that male partners experience more grief over miscarriages than previously assumed (Ref. 92) and that in 25% of the cases studied, the intensity of fathers’ grief exceeded that of the mothers’ (Ref. 93).

Additional burdens from fetal death can be felt throughout the affected family, including by subsequent children, since the depression, anxiety, and guilt initiated by fetal death may persist during and after any subsequent successful pregnancy (Ref. 92). As a result, future pregnancies and children can be adversely affected by fetal death during the mother’s previous pregnancies due to persistent psychological impacts leading to maternal stress or depression that can last up to three years (Refs. 94 and 85). As a result of this stress or depression, complications during subsequent pregnancies can occur. Maternal anxiety or depression during pregnancy is associated with pre-term birth, decreased birth weight, and impacts on fetal brain development as a result of abnormal uterine blood flow and increased maternal cortisol levels (Ref. 94). Maternal anxiety and depression, including that initiated by fetal death during a previous pregnancy, is also

associated with a higher risk of maternal postpartum depression (Ref. 85), which can lead to poor infant care, and infant cognitive delay (Ref. 94). For some children born to women who previously experienced the death of a fetus, there may be disorganized or insecure maternal attachment or bonding (Ref. 95), and maternal perinatal mood symptoms that may alter a child's emotional or health outcomes (Refs. 85 and 86). For example, available data indicate that "12-month-old infants born following prenatal loss were reported to show higher rates of disorganized attachment patterns to their mothers than children born into families without a loss history. Thus, even if there is no persistence of mood disturbance into the postnatal period, there may still be adverse effects of a previous prenatal loss on the parent-child relationship and child outcomes" (Ref. 85). Similarly, maternal postpartum depression or anxiety has been found to have "deleterious effects on maternal-child attachment, child behavior, and cognitive and neuroendocrine outcomes that persist into adolescence" (Ref. 85). In this way, a single instance of fetal death may result in years of emotional impacts for the mother and may potentially affect the health and well-being of future children. In addition to depression and anxiety, emotional impacts can take the form of grief, envy, or isolation.

Similarly, a woman's attitude towards a pregnancy does not necessarily correlate with the emotional impact resulting from fetal death. Although ambivalence toward pregnancy was associated with different emotional impacts (greater association with depressive symptoms, rather than grief), they were found to be as intense as in women who were not ambivalent about their pregnancy (Ref. 86).

As a result, fetal death at any stage of a pregnancy, even when experienced by a woman who is ambivalent about that pregnancy, may result in intense emotional impacts and psychological morbidities, for both the mother and other family members; these impacts can include depression and anxiety and, in many cases, could persist and potentially impact future pregnancies and children.

Additionally, it is important to note that fetal death can present health risks to the woman; in some cases, maternal death can result. From 1981 to 1991, the Centers for Disease Control and Prevention (CDC) recorded 62 cases of maternal mortality following spontaneous abortion at or before 20 weeks of fetal gestational age (an overall case fatality rate of 0.7 per 100,000

spontaneous abortions) (Ref. 96). Leading causes of maternal mortality during these incidents of fetal death were infection, hemorrhage, or embolism (Ref. 96). The CDC has noted that this case fatality rate is likely the result of underreporting, and that "the true number of deaths related to pregnancy might increase from 30% to 150% with active surveillance" (Ref. 97).

Even when the effects of fetal death are less severe, a miscarriage or stillbirth can have considerable adverse consequences on an individual, family, or community. Commercial and consumer users of NMP in paint and coating removal are at risk of fetal death from typical use of products containing NMP; although EPA is unable to quantify the precise number or frequency of fetal deaths that may occur as a result of exposure to NMP during paint and coating removal, reducing the risks of exposure would benefit women, their families, and the public at large by reducing risks of fetal death in a population of approximately 12,000 pregnant individuals (consumers and workers) likely to experience acute exposures that present risks of fetal death. Details on how EPA estimated the number of individuals is in section 5.2.1 of the Economic Analysis (Ref. 4).

2. Developmental effects—chronic exposures. The NMP risk assessment identified developmental effects as the most sensitive endpoint for chronic exposure to NMP. Specifically, the assessment selected decreased birth weight as the critical effect resulting from repeated exposures to women of child-bearing age. It is not known if there is a window of exposure that may pose greater risks to the fetus; therefore, any repeated exposure to NMP could increase risks to the fetus for developmental effects.

Rather than accumulating over a lifetime, risks were found for workers exposed to NMP during paint and coating removal over the course of a workweek, or five days. Even when maternal exposure ceased, the decreased fetal body weight was found to be a persistent adverse effect (Ref. 3); consequently, a relatively brief period of maternal repeated exposure to NMP in typical paint and coating removal can cause fetal weight decreases, resulting in life-long impacts. There are increased risks of decreased fetal weight for the subset of pregnant women among the approximately 8,800 female workers in 4,300 commercial facilities or companies that use NMP for paint and coating removal. EPA estimates that there are approximately 500 pregnant women working in these commercial

facilities (Ref. 4). A subset of these 500 pregnant would have chronic exposure to NMP at levels that would result in an MOE below the benchmark of 30 for decreased fetal weight (Ref. 3).

Decreased fetal weight can lead to reduced or low birth weight, which can have lifelong effects on a person and their family. Most cases of reduced or low birth weight are pre-term or premature birth; as a result, until recently, health impacts of reduced or low birth weight have been difficult to separate from the effects due to premature birth or gestational age. However, epidemiological, social, and medical research in the past several decades has isolated several health effects of reduced or low birth weight separate from gestational age at birth. Full-term babies may be born at low or reduced birth weights as a result of fetal growth restriction; these infants are usually referred to as small for gestational age, and "may have low birth weight because something slowed or stopped their growth in the womb" (Ref. 98). Low birth weight is typically defined as birth weight of less than 5.5 pounds, or 2,500 grams. Very low birth weight is typically defined as less than 1,500 grams (Ref. 99).

Low birth weight can have significant impacts on childhood development and the incidence of future diseases (Ref. 100); reduced birth weight can cause serious health problems for some children (Ref. 98), as well as long-term impacts on their lives as adults (Ref. 101).

Health impacts of low or reduced birth weight can begin at birth. According to the CDC, low birth weight infants may be more at risk for many health problems as neonates (Ref. 99); other medical authorities report that health impacts for infants with low birth weight include low oxygen levels at birth, inability to maintain body temperature; difficulty feeding and gaining weight; infection; breathing problems such as respiratory distress syndrome; neurologic problems, such as intraventricular hemorrhage (bleeding inside the brain); gastrointestinal problems such as necrotizing enterocolitis (a serious disease of the intestine), and a greater risk of Sudden Infant Death Syndrome (Ref. 102). These effects and health impacts have clear implications for the infant's future health and survival, and can cause emotional stress and anguish for families of the infant.

Effects of reduced or low birth weight can persist beyond infancy. It can affect growth: Low birth weight has been found to be "a major risk factor for children's physical growth in the early

years and there is no evidence of catch-up by age 2" (Ref. 103). In populations that may already be at risk for poor health outcomes, children with reduced birth weight or who were small for gestational age continued to be significantly smaller in all measures (height, weight, and head circumference) than their normal birth weight counterparts at age 3 (Refs. 104 and 105), and generally smaller between ages 4 through 7 (although the differences were small) (Ref. 104).

A child's size is not the only potential effect of reduced or low birth weight. Many studies have identified increased risk of cognitive, behavioral, and neurological problems in children and adolescents who had low birth weight or who were small for gestational age (Refs. 106 and 107). A large cohort study that followed infants born at full term with reduced birth weight (small for gestational age) found that "children of both genders who were born [small for gestational age] are at higher risk of learning difficulties" (Ref. 106), with girls with the lowest birth weight experiencing an increased risk of attention problems (Ref. 106).

Other studies have confirmed the impact of reduced or low birth weight on academic success in childhood; researchers note that compared to their normal birth weight siblings, low birth weight children are less likely to be in excellent or very good health in childhood. They also score significantly lower on reading, passage comprehension, and math achievement tests. Low birth-weight children are roughly one-third more likely to drop out of high school relative to other children (Ref. 100).

After childhood, the health, social, and financial impacts of reduced or low birth weight can continue. In many cases, an individual's size may continue to be affected. The difference in growth during adolescence and early adulthood varies by sex. Female adults who were very low birth weight infants tend to be the same size as their peers of average birth weight by age 20, while male adults "remain significantly shorter and lighter than controls" (Ref. 109). However, this may have its own risks: "Since catch-up growth may be associated with metabolic and cardiovascular risk later in life, these findings may have implications for the future adult health of [very low birth weight] survivors" (Ref. 109).

In terms of health effects, low birth weight can continue to have significant negative effects on adults. Researchers have found that low birth weight increases the probability of being in fair or poor health as an adult. Specifically,

"low birth weight children are nearly twice as likely as their normal birth-weight siblings to be in problematic health by ages 37–52 (23% versus 12%) (Ref. 100). Specific risks associated with low birth weight (separate from pre-term birth or gestational age) include increased risk of renal disease (Ref. 110); increased risk of asthma, diabetes, stroke, heart attack, or heart disease by age 50 (compared to average weight siblings) (Ref. 100); and increased risk of clinically verified hyperkinetic disorder, including attention deficit hyperactivity disorder (Ref. 111). Adults who were low birth weight babies may be more likely to have certain health issues such as diabetes, heart disease, high blood pressure, metabolic syndrome, and obesity (Ref. 98).

Additionally, there are financial implications for adults who were low birth weight; low birth weight has been found to lower labor force participation and labor market earnings over an individual's lifetime (Ref. 100). Specifically, "low birth weight is linked to a 10% reduction in hourly wages from ages 18–26, compared to the wages of normal birth-weight siblings, but a 22% reduction in wages from ages 37–52. Low birth-weight children, relative to their normal birth-weight siblings, work 7.4% fewer hours in adulthood" (Ref. 100).

Decreased fetal weight and low birth weight are strongly associated with a number of adverse health effects in adults. The Barker Hypothesis (Ref. 112) was among the first to identify a pattern between neonatal health and cardiovascular disease. Subsequent research in laboratory animals and in human epidemiological studies confirmed this pattern and extended the observations to include the relationship between delayed fetal growth, low birth weight and metabolic syndrome, which encompasses a host of adverse outcomes, such as hypertension, insulin resistance, obesity and type 2 diabetes mellitus (Refs. 113, 114, and 115). Diseases such as cardiovascular disease, hypertension, obesity and diabetes mellitus have a tremendous impact on public health. For example, according to the CDC, heart disease remains the nation's leading cause of death (Ref. 116). In addition to causing premature mortality, the monetary costs of cardiovascular disease were estimated at \$209.3 billion in direct costs and \$142.5 billion in indirect costs, for a total of \$351.8 billion (Ref. 116). A number of health disparities are associated with cardiovascular disease. Cardiovascular disease causes more deaths in women than men, and in black Americans, compared to white (Ref. 116). Years of

potential life lost before age 75 from heart disease is nearly double for Black or African Americans relative to White, Non-Hispanic Americans (Ref. 116).

Several of these health effects associated with reduced fetal growth and low birth weight fall within the definition of metabolic syndrome, which is generally defined as the presence of 3 or more of the following: Abdominal obesity (waist circumference ≥ 88 cm in women or ≥ 102 cm in men); low HDL cholesterol (< 50 mg/dL in women or < 40 mg/dL in men); elevated triglycerides (≥ 150 mg/dL); elevated fasting blood glucose (≥ 100 mg/dL or use of oral hypoglycemic medication or insulin or both); or elevated blood pressure (at least 1 of the following: Systolic ≥ 130 mmHg, diastolic ≥ 85 mmHg, or use of antihypertensive medication). Epidemiological studies indicate a strong, consistent association between low birth weight and metabolic syndrome (Ref. 113). The symptoms associated with metabolic syndrome are in turn associated with increased risk of cardiovascular disease and diabetes (Ref. 117).

Collectively, the sign, symptoms and diseases associated with delayed fetal growth and small birth weight present an enormous burden on public health. The extent that the development of adult disease is rooted in reductions in fetal and neonatal growth could limit the success of adult lifestyle changes in modifying these effects. Therefore, prevention must be focused on assuring fetal and neonatal health and preventing adverse impacts on growth rates.

Researchers highlight the fact that low birth weight can occur in every demographic group, and that even though most babies with low birth weight have normal outcomes, as a whole, infants with low birth weight "generally have higher rates of subnormal growth, illnesses, and neurodevelopmental problems. These problems increase as the child's birth weight decreases" (Ref. 118). Additionally, by using sibling comparisons and cohort studies, the effects of low birth weight have been found to persist even when accounting for "the independent effects of birth order, mother's age at birth, birth year cohort, race/ethnicity, family structure, parental income, and parental fertility timing" (Ref. 100).

Though most research has focused on infants with low or very low birth weight, it is important to note that children with reduced, but clinically normal, birth weights (2,500 to 2,999 grams) are also at increased risk from the health, academic, social, and financial effects described.

In this way, reduced or low birth weight resulting from maternal exposure to NMP during paint and coating removal can have serious and life-long impacts on individuals and their families, including their future family members. Even when birth weight is not reduced to the clinical definition of low, the decrease in fetal weight can have significant impacts. Additionally, it is important to note that the impacts of low birth weight go beyond affected individuals and their families; reduced and low birth weight “results in substantial costs to the health sector and imposes a significant burden on society as a whole” (Ref. 101).

3. Body weight reductions—chronic exposures. While the impact of decreased body weights in adult animals may be minimal, decreased body weight gain in pregnant females, in particular, may contribute to negative developmental outcomes as well as impacts on adult health (Refs. 119 and 120).

4. Kidney toxicity—chronic exposures. There are increased health risks for liver toxicity for many of the approximately 30,300 workers in 4,300 commercial facilities or companies that use NMP for paint and coating removal (Ref. 4). Exposure to NMP can cause kidney damage. This damage may result in signs and symptoms of acute kidney failure that include; decreased urine output, although occasionally urine output remains normal; fluid retention, causing swelling in the legs, ankles or feet; drowsiness; shortness of breath; fatigue; confusion; nausea; seizures or coma in severe cases; and chest pain or pressure. Sometimes acute kidney failure causes no signs or symptoms and is detected through lab tests done for another reason.

Kidney toxicity means the kidney has suffered damage that can result in a person being unable to rid their body of excess urine and wastes. In extreme cases where the kidney is impaired over a long period of time, the kidney could be damaged to the point that it no longer functions. When a kidney no longer functions, a person needs dialysis and ideally a kidney transplant. In some cases, a non-functioning kidney can result in death. Kidney dialysis and kidney transplantation are expensive and incur long-term health costs if kidney function fails (Ref. 56).

The monetary cost of kidney toxicity varies depending on the severity of the damage to the kidney. In less severe cases, doctor visits may be limited and hospital stays unnecessary. In more severe cases, a person may need serious medical interventions, such as dialysis or a kidney transplant if a donor is

available, which can result in high medical expenses due to numerous hospital and doctor visits for regular dialysis and surgery if a transplant occurs. The costs for hemodialysis, as charged by hospitals, can be upwards of \$100,000 per month (Ref. 57).

Depending on the severity of the kidney damage, kidney disease can impact a person's ability to work and live a normal life, which in turn takes a mental and emotional toll on the patient. In less severe cases, the impact on a person's quality of life may be limited while in instances where kidney damage is severe, a person's quality of life and ability to work would be affected. While neither the precise reduction in individual risk of developing kidney toxicity from reducing exposure to NMP during paint or coating removal or the total number of cases avoided can be estimated, these costs must still be considered because they can significantly impact those exposed to NMP.

5. Liver toxicity—chronic exposures. There are increased health risks for liver toxicity for many of the approximately 30,300 workers in 4,300 commercial facilities or companies that use NMP for paint and coating removal (Ref. 4).

Some form of liver disease impacts at least 30 million people, or 1 in 10 Americans. Included in this number is at least 20% of those with NAFLD. NAFLD tends to impact people who are overweight/obese or have diabetes. However, an estimated 25% do not have any risk factors. The danger of NAFLD is that it can cause the liver to swell, which may result in cirrhosis over time and could even lead to liver cancer or failure (Ref. 42). The most common known causes to this disease burden are attributable to alcoholism and viral infections, such as hepatitis A, B, and C. These known environmental risk factors of hepatitis infection may result in increased susceptibility of individuals exposed to organic chemicals such as NMP.

Additional medical and emotional costs are associated with liver toxicity following chronic exposure to NMP in paint and coating removal, although these costs cannot be quantified. These costs include medical visits and medication costs. In some cases, the ability to work can be affected, which in turn impacts the ability to get proper medical care. Liver toxicity can lead to jaundice, weakness, fatigue, weight loss, nausea, vomiting, abdominal pain, impaired metabolism, and liver disease.

Depending upon the severity of the jaundice, treatments can range significantly. Simple treatment may involve avoiding exposure to NMP and

other solvents; however, this may impact an individual's ability to continue to work. In severe cases, liver toxicity can lead to liver failure, which can result in the need for a liver transplant. Even if a donor is available, liver transplantation is expensive (with an estimated cost of \$575,000) and there are countervailing risks for this type of treatment (Ref. 44). The mental and emotional toll on an individual and their family as they try to identify the cause of sickness and possibly experience an inability to work, as well as the potential monetary cost of medical treatment required to regain health, are significant.

6. Reproductive toxicity. There are increased risks for these reproductive effects for many of the approximately 30,300 workers in 4,300 commercial facilities or companies that use NMP for paint and coating removal (Ref. 4). Similar to effects discussed previously, while neither the precise reduction in individual risk of developing this disorder from reducing exposure to NMP or the total number of cases avoided can be estimated, EPA still considers their impact.

7. Disproportionate impacts on environmental justice communities. An additional factor that cannot be monetized is the disproportionate impact on environmental justice communities. As described in Units VI.C.1.b. and XVI.B.1.b, Hispanic and foreign-born workers, who may have limited English proficiency, are disproportionately over-represented in construction trades (Ref. 4), in which NMP is used for paint and coating removal. Because they are disproportionately over-represented in this industry, these populations are disproportionately exposed to NMP during paint and coating removal, and are disproportionately at risk to the range of adverse health effects described here.

D. Availability of Alternatives

For almost every situation in which NMP is used to remove paints or coatings, EPA is aware of a cost-effective, economically feasible chemical substitutes or alternative methods. The exception is for critical corrosion-sensitive components of military aviation and vessels, for which EPA proposes are critical for national security, and for which EPA proposes an exemption, described in more detail in Unit XVIII.

EPA considered chemical substitutes and alternative methods consistent with the requirements of TSCA Section 6(c)(2)(C) and as similarly recommended by the SBAR panel (Ref.

27). A full industry profile characterizing manufacturers, processors, and end users of NMP for paint and coating removal and a use and substitutes analysis are included in section 2 and 3 of EPA's economic assessment. (Ref. 4). As described below, EPA proposes that alternatives are technologically and economically feasible, reasonably available, and present fewer hazards to human health than NMP in paint and coating removal. EPA requests comment on whether its conclusion that substitutes for NMP are available and technically and economically feasible is accurate and whether its consideration of alternatives was sufficient to satisfy the requirements of TSCA section 6(c)(2)(C).

Research into the efficacy of chemical substitutes has identified products currently available for commercial and consumer users of NMP for paint and coating removal, for a variety of coatings on numerous substrates (Refs. 58 and 59). Additionally, in most commercial sectors, NMP is not in widespread use; most sectors use substitute chemicals or methods, either due to financial considerations, problems with the efficacy of products containing NMP, or concern for worker or individual health and safety (Ref. 22). This was emphasized by a small business that manufactures such products (Ref. 22).

Many producers of paint and coating removal products containing NMP also produce paint and coating removal products with substitute chemicals (Ref. 4). This was emphasized by small businesses participating in the SBAR process (Ref. 27). Thus, there is already precedent for producers reformulating products to meet demand from commercial or individual customers.

Based on the frequent use of substitute chemicals or alternative methods for paint and coating removal in all industries discussed here, and the formulation and distribution of substitute chemicals for paint and coating removal by all formulators of products containing NMP (Ref. 4), EPA found that economically feasible alternatives to NMP are reasonably available for all paint and coating removal uses. Primary chemical substitutes for NMP in paint and coating removal include products formulated with benzyl alcohol; dibasic esters; acetone, toluene, and methanol (ATM); and caustic chemicals. EPA evaluated these products for efficacy, toxicity, relative hazards compared to NMP, and other hazards that might be introduced by use of these products (such as environmental toxicity, increased global warming potential, and increased flammability or other hazards to users).

EPA's analysis compared the hazard and exposure characteristics of the chemical paint and coating removal chemicals and products presumed to be already in use to NMP, to aid in ascertaining the impact on users of moving to alternative products. EPA used authoritative sources to characterize efficacy, hazard endpoints and identify effect and no effect levels. Relative exposure potential was assessed based on physical chemical parameters and concentrations in formulations, and exposure potential was considered to be similar to NMP within an order of magnitude. Product composition was based on publicly available Safety Data Sheets for products advertised for paint and coating removal (Ref. 36).

Products based on benzyl alcohol formulations have been identified as efficacious paint and coating removers in various industry sectors (Refs. 22 and 27). Consumer products containing benzyl alcohol are available for sale (Refs. 22, 27, 35, 58, 59, and 61). Regarding differential hazards between benzyl alcohol and NMP, there are fewer hazard concerns compared to NMP-based products, and the benzyl alcohol NOAELs are higher than for NMP, suggesting lower toxicity (Ref. 34). Regarding differential exposures between benzyl alcohol and NMP, the relative inhalation and dermal exposure potentials are similar to NMP (Ref. 34). Taken together, benzyl alcohol-based paint removers are expected to result in lower risks, primarily due to lower toxicity.

Dibasic ester products can include dimethyl succinate, dimethyl glutarate and dimethyl adipate. Many NMP products contain dibasic esters, and given the efficacy of these products users of these products would not experience much inconvenience if switched to substitute products that contain solely formulations based on dibasic esters, without NMP (Ref. 34). Regarding differential hazards between dibasic esters and NMP, in general, the hazards associated with dibasic esters are less severe and occur at concentrations suggesting lower toxicity (Ref. 34). Regarding differential exposures between dibasic esters and NMP, the relative inhalation exposure potential is similar to NMP. The relative dermal exposure potential for dibasic esters is lower, but similar to, NMP (Ref. 34). Taken together, dibasic ester-based paint removers are expected to result in lower risks, primarily due to lower toxicity.

ATM products contain acetone, toluene, and methanol. Products containing these chemicals may remove

coatings very quickly, but may not be effective on every type of coating (Ref. 27). ATM-based products are composed of chemicals that exhibit a range of hazard characteristics. Taken together, the components of ATM-based formulations have comparable hazard concerns to NMP. Regarding differential exposures between ATM and NMP, the relative inhalation exposure potentials for acetone, toluene and methanol are higher than NMP. The relative dermal exposure potentials for acetone, toluene and methanol are lower, but similar to, NMP (Ref. 34).

Products with caustic chemicals typically include calcium hydroxide or magnesium hydroxide. In many uses, they can be an effective product, particularly when multiple coatings are being removed from a substrate. In contrast to NMP-based products, there are no developmental or other repeat dose endpoints of concern associated with caustic products (Ref. 34). Caustic products pose acute concerns due to their physical chemical properties and can cause chemical burns (Ref. 34). The risks associated with caustic-based products are acute, and may be mitigated by appropriate and familiar protective equipment. The risks associated with NMP-based products are both acute and long term (Ref. 3).

In summary, when methylene chloride is excluded from consideration, the most likely chemical substitutes for NMP in paint and coating removal do not pose a risk of acute or chronic developmental effects, generally have lower or similar exposure potential than NMP, and when acute risks are present, as in the case of caustic chemicals, those risks are self-limiting by the nature of the adverse effects. The chemical formulations that seem to present some risks of concern contain toluene and methanol; however, risks from these chemicals can be mitigated by the user more easily than risks presented by NMP. Overall, exclusive use of substitute chemical products for paint and coating removal instead of NMP would remove the risks of chronic effects and acute developmental effects without introducing additional substantial risks to human health.

In addition to examining toxicity to humans, EPA reviewed available data on the chemicals in the baseline and alternative products for aquatic toxicity, persistence and bioaccumulation, as a basis for examining potential environmental toxicity. Only one chemical evaluated may have significant impacts on aquatic toxicity, with concern for environmental persistence and/or bioaccumulation. This chemical is contained in NMP-based paint

removal products and thus is not considered further.

EPA is also mindful of the risks that may be introduced by substitute chemicals or methods that increase global warming, and has examined the global warming potential of the chemical components of likely chemical substitutes for NMP in paint and coating removal. NMP does not present concerns for global warming and has a global warming potential (GWP) of 0 (Ref. 3). Similarly, the GWP values of likely substitute chemicals in paint and coating removal are: 0 GWP (benzyl alcohol, ATM) or not assessed (caustics, dibasic esters) (Ref. 24). As such, EPA has not identified any increased risk of global warming that would be introduced by use of chemical products as substitutes for NMP in paint and coating removal.

In addition to human and environmental toxicity, other hazards associated with chemical methods for paint and coating removal are risks of fire due to flammability of the chemical product, and poisoning or acute injury. Risks of fire are serious when using solvents such as paint and coating removal chemicals. Even among products that fall within the same general product composition category, there is meaningful variability in the specific formulations of paint remover products, and thus in their flammability. Furthermore, it is impracticable for EPA to predict the specific product formulations for which use will increase as a result of prohibitions on NMP in paint and coating removal. It is therefore impracticable for EPA to forecast whether the flammability of popular paint and coating removers would generally increase or decrease as a result of the proposed rule.

In addition to using substitute chemical products, EPA has identified non-chemical methods for paint and coating removal that can be used as alternatives to NMP. These methods are already frequently in use in various industries or by consumers for paint and coating removal, and are described in more detail in Unit VI.E.

EPA recognizes that all methods of paint and coating removal can present some hazards. Most of these alternative methods are already in frequent use, including by consumers and workers who currently use NMP or other chemicals for some paint and coating removal. The risks associated with each of these methods, while serious, are generally acute, related to injury, and can be mitigated through readily available and easy-to-implement standard safety practices; in contrast,

the acute risks presented by NMP, such as fetal death, require specialized gloves and are not the type of hazard frequently encountered when using household products.

E. Impacts of the Proposed and Alternative Regulatory Options

1. First co-proposed approach: Supply-chain approach. The costs of the first co-proposed approach are estimated to include product reformulation costs, downstream notification costs, recordkeeping costs, and Agency costs. The costs of paint and coating removal product reformulations are estimated to be approximately \$7,000 to \$14,000 per year (annualized at 3% over 20 years) and \$9,000 to \$19,000 (annualized at 7% over 20 years). The cost for reformulation includes a variety of factors such as identifying the appropriate substitute chemical for NMP in the formulation, assessing the efficacy of the new formulation and determining shelf life. The costs to users of paint and coating removers containing NMP are (–\$1,477,000) to \$27,617,000 at a discount rate of 3% and (–\$1,231,000) to \$27,638,000 at a discount rate of 7% (Ref. 4). The costs of downstream notification and recordkeeping on an annualized basis over 20 years are \$100 and \$100 using 3% and 7% discount rates respectively (Ref. 4). Agency costs for enforcement are estimated to be approximately \$114,401 and \$111,718 annualized over 20 years at 3% and 7%, respectively. The total cost of the proposed approach for paint and coating removers containing NMP is estimated to be (–\$1,484,000) to \$27,624,000 and (–\$1,251,000) to \$27,668,000 annualized over 20 years at 3% and 7%, respectively (Ref. 4).

2. Second co-proposed approach: Reformulation, labeling, and PPE approach. Reformulation costs are estimated to have less of an impact than those associated with adoption of worker protection programs. Given equipment costs and the requirements associated with establishing a dermal and respiratory protection program which involves training, purchase of specialized gloves, respirator fit testing and the establishment and maintenance of a medical monitoring program, EPA anticipates that companies would choose to switch to substitute chemicals instead of adopting a program for PPE, including with a performance-based option of meeting an air concentration level of 5 ppm as an exposure limit for NMP in paint and coating removal, when these products have a maximum concentration of 35% NMP by weight.

The estimated annualized costs to commercial and consumer users of switching to this type of dermal and respiratory protection program are \$47,076,900 to \$56,130,900 at 3% and \$47,245,900 to \$56,383,900 at 7% over 20 years. In addition, there would be higher EPA administration and enforcement costs under the second co-proposed approach than there would be with an enforcement program under the first co-proposed approach. Finally, this option requires that formulators of paint and coating removal products containing NMP identify which gloves are non-penetrable by NMP if used for an eight-hour shift; this requires that the formulators or processors conduct testing, which can have costs of \$15,786 per product (Refs. 4 and 127).

3. Options that exclude downstream notification. For those options that exclude downstream notification, the options are less effective and more to challenging to implement. The downstream notification (e.g., via SDS) provides additional information on the prohibitions under the proposed option for processors and distributors of NMP or products containing NMP other than paint and coating removers, and provides an efficient way for those entities to recognize themselves as affected by the regulation, which contributes to a more effective regulation (Ref. 63). In this way, the downstream notification component of the supply chain approach contributes to the use no longer presenting an unreasonable risk because it streamlines and aids in compliance and implementation (Ref. 64).

F. Summary

EPA is co-proposing these two options because the Agency believes both deserve consideration by commenters. The first co-proposed approach is necessary so that NMP in paint and coating removal no longer presents an unreasonable risk to the general population or to women of childbearing age. It is more cost effective than other regulatory options EPA identified as potentially reducing risks so that they are no longer unreasonable, because the proposed option achieves the benefits of reducing the unreasonable risks so they are no longer unreasonable for a lower cost than the second co-proposed approach. For more information, see Section 6 in the Economic Analysis (Ref. 4). As stated previously in this notice, the first co-proposed approach includes:

- Prohibiting manufacturing (including import), processing, and distribution in commerce of NMP for use in consumer and commercial paint

and coating removal, except for specified uses critical to national security;

- Prohibiting commercial use of NMP for paint and coating removal, except for specified uses critical to national security;

- Requiring that any products containing NMP intended or used for paint and coating removal be distributed in containers with a volume no less than 5 gallons;

- Requiring downstream notification of the prohibition on manufacturing (including import), processing, and distribution of NMP for the prohibited uses; and

- Requiring limited recordkeeping.

Technically and economically feasible alternatives to NMP for paint and coating removal are reasonably available. The supply chain approach ensures protection of consumers from the unreasonable risk by precluding the off-label purchase of commercial products by consumers.

The first co-proposed approach is relatively easy to enforce because key requirements are directly placed on a small number of suppliers and because the supply chain approach minimizes to the greatest extent the potential for NMP products to be intentionally or unintentionally misdirected into the prohibited uses. Enforcement under the other options would be much more difficult since the key requirements are directly placed on the large number of product users. As described in a recent article on designing more effective rules and permits, “the government can implement rules more effectively and efficiently when the universes of regulated sources are smaller and better-defined. This is because, other factors being equal, governments can more easily identify, monitor, and enforce against fewer, rather than more, entities” (Ref. 63). Under other options, enforcement activities must target firms that might perform the activity where a use of NMP is restricted or prohibited. Identifying which establishments might use paint and coating removers is difficult because paint and coating removal is not strictly specific to any industry (Ref. 4).

The second co-proposed approach would allow the continued use of NMP in commercial and consumer paint and coating removal at up to 35 percent NMP by weight, except for exempt critical national security uses which can be at any concentration, provided that commercial users of NMP for paint and coating removal establish a worker protection program for dermal and respiratory protection.

In addition, the co-proposed approach would require formulators of products for either commercial or consumer uses other than critical national security uses to: Reformulate products such that paint and coating products containing NMP do not exceed a maximum of 35 percent NMP by weight in product formulations; test gloves for the product formulations being processed and distributed in commerce to identify specialized gloves that provide protection for users; label products with information for consumers and provide information for commercial users about reducing risks when using the product. This approach would effectively reduce risk for workers. EPA is requesting comment on whether this co-proposed approach would be effective at reducing risks for consumers so that the risks are no longer unreasonable.

XVII. Costs and Monetized Benefits of the NMP Component of the Proposed Rule, the Alternatives EPA Considered, and Comparison of Costs and Benefits

EPA proposes that the identified risks from NMP in paint and coating removal are unreasonable. Apart from that proposed determination, EPA has evaluated the potential costs and benefits of the two co-proposed approach and their variations.

A. Costs of the First Co-Proposed Approach

The details of the costs of the first co-proposed approach for NMP in commercial and consumer paint and coating removal are discussed in Unit I.E. and in the Economic Analysis (Ref. 4). Under the first co-proposed option, costs to users of paint and coating removal products containing NMP are (–\$1,477,000) to \$27,617,000 at a discount rate of 3% and (–\$1,231,000) to \$27,638,000 at a discount rate of 7%. Costs of paint and coating removal product reformulations are estimated to be approximately \$7,000 to \$14,000 per year (annualized at 3% over 20 years) and \$9,000 to \$19,000 (annualized at 7% over 20 years). Costs of downstream notification and recordkeeping on an annualized basis over 20 years are \$100 and \$100 using 3% and 7% discount rates respectively. Agency costs for enforcement are estimated to be approximately \$114,401 to \$111,718 annualized over 20 years at 3% and 7%, respectively (Ref. 4). Under the first proposed approach, total costs of the proposed rule relevant to NMP in paint and coating removal are estimated to be (–\$1,484,000) to \$27,624,000 and (–\$1,251,000) to \$27,668,000 annualized over 20 years at 3% and 7% respectively (Ref. 4).

EPA also found that a use prohibition alone without downstream notification requirements would not address the unreasonable risks. EPA estimated the costs of this option to be \$5,164,000 to \$30,702,000 annualized over 20 years at 3% and \$5,409,000 to \$30,839,000 annualized over 20 years at 7% (Ref. 4).

B. Benefits of the First Co-Proposed Approach

As described in Unit XVII.B., there are no monetizable benefits from mitigating the risks from NMP in consumer and commercial paint and coating removal. Although the alternatives considered are unlikely to result in the same health benefits as the first co-proposed option, EPA was unable to quantify the differences.

C. Comparison of Benefits and Costs of the First Co-Proposed Approach

Based on the costs and benefits EPA can estimate, the monetized subset of benefits for preventing the risks resulting from NMP in consumer and commercial paint and coating removal do not outweigh the estimated monetary costs. However, EPA believes that the balance of costs and benefits of the proposed regulation of NMP cannot be fairly described without considering the additional, substantial, non-monetized benefits of mitigating the non-cancer adverse effects. As discussed previously, the multitude of potential adverse effects associated with NMP in paint and coating removal can profoundly impact an individual's quality of life. Some of the adverse effects associated with NMP exposure can be immediately experienced and can affect a person from childhood throughout a lifetime (e.g., low birth weight and associated impacts). Other adverse effects (e.g., adult immunotoxicity, kidney and liver failure, or fetal death) can have impacts that are experienced for a shorter portion of life, but are nevertheless significant in nature.

While the benefits associated with avoiding the health effects associated with NMP exposure during paint and coating removal cannot be monetized or quantitatively estimated, the qualitative discussion highlights how some of these effects may be as severe as more traditionally monetizable effects and thus just as life-altering; therefore the benefits of avoiding these effects are substantial. These effects include not only medical costs but also personal costs such as emotional and mental stress that are impossible to accurately measure. Considering only monetized benefits would significantly underestimate the benefits of avoiding

NMP-induced adverse outcomes on a person's quality of life.

Thus, considering costs and the benefits that cannot be quantified and subsequently monetized (developmental effects, fetal death, adult body weight reductions, kidney toxicity, liver toxicity, and immunotoxicity), including benefits related to the severity of the effects and the impacts on a person throughout a lifetime in terms of medical costs, effects on earning power and personal costs, emotional and psychological costs, and the disproportionate impacts on Hispanic communities and individuals with limited English proficiency, the benefits of preventing exposure to NMP in paint and coating removal by an estimated 732,000 consumers and an estimated 30,300 commercial workers outweigh the costs.

D. Impacts on the National Economy, Small Businesses, Technological Innovation, the Environment, and Public Health of the First Co-Proposed Approach

As described in Unit V.B. and in the Economic Analysis, EPA considered the anticipated effects of this proposal on the national economy. While the impacts of this rule as a whole are described in Unit XXIII.C. and the impacts of the NMP component of this proposal are described in more detail in Unit XVII.A. and in Section 9.3 of the Economic Analysis (Ref. 4), EPA does not anticipate these impacts having an effect on the overall national economy. EPA anticipates that a majority of small businesses will have cost impacts of less than one percent of the annual revenue, and the majority of small business bathtub refinishing facilities and professional contractors will have cost impacts greater than one percent of annual revenue.

The first co-proposed approach is anticipated to drive technological innovation by formulators of paint and coating removal products containing NMP, as they continue to develop substitute products, and refine such products already available. It is also anticipated to drive technological innovation by formulators of chemical paint and coating removal products with different chemistries as well as manufacturers and retailers of alternative methods of paint and coating removal, particularly those with interest in appealing to the consumer uses. See section 9.3 in the Economic Analysis (Ref. 4).

The first co-proposed approach is anticipated to have a positive impact on public health, as described in Unit XVI.C. There is not anticipated to be a

significant impact on the environment, for the reasons described in Unit XII.D.

E. Costs of the Second Co-Proposed Approach

The details of the costs of the second co-proposed approach for NMP in commercial and consumer paint and coating removal are discussed in Unit I.E. and in the supplement to the Economic Analysis (Ref. 127).

Under the second co-proposed option, costs to users of paint and coating removal products containing NMP are \$47,076,900 to \$56,130,900 (annualized at 3% over 20 years) and \$47,245,900 to \$56,383,900 (annualized at 7% over 20 years). Costs of paint and coating removal product reformulations are estimated to be approximately \$15,100 to \$21,100 per year (annualized at 3% over 20 years) and \$20,100 to \$28,100 (annualized at 7% over 20 years). Agency costs for enforcement are estimated to be approximately \$1,024,144 and \$998,711 annualized over 20 years at 3% and 7% respectively. Under the second proposed approach, total costs of the proposed rule relevant to NMP in paint and coating removal are estimated to be \$47,098,000 to \$56,146,000 and \$47,274,000 to \$56,404,000 annualized over 20 years at 3% and 7% respectively (Ref. 127).

F. Benefits of the Second Co-Proposed Approach

As described in Unit XVII.B., there are no monetizable benefits from mitigating the risks from NMP in consumer and commercial paint and coating removal. Although the second co-proposed option is unlikely to result in the same health benefits as the first co-proposed option, EPA was unable to quantify the differences.

G. Comparison of Benefits and Costs of the Second Co-Proposed Approach

Based on the costs and benefits EPA can estimate, the monetized subset of benefits for preventing the risks resulting from NMP in consumer and commercial paint and coating removal do not outweigh the estimated monetary costs. However, EPA believes that the balance of costs and benefits of the proposed regulation of NMP cannot be fairly described without considering the additional, substantial, non-monetized benefits of mitigating the non-cancer adverse effects. As discussed previously, the multitude of potential adverse effects associated with NMP in paint and coating removal can profoundly impact an individual's quality of life. Considering only monetized benefits would significantly

underestimate the benefits of avoiding NMP-induced adverse outcomes on a person's quality of life.

H. Impacts on the National Economy, Small Businesses, Technological Innovation, the Environment, and Public Health of the Second Co-Proposed Approach

As described in Unit V.B. and in the Economic Analysis, EPA considered the anticipated effects of this proposal on the national economy. While the impacts of this rule as a whole are described in Unit XXIII.C. and the impacts of the NMP component of this proposal are described in more detail in Unit XVII.A. and in the supplement to the Economic Analysis (Ref. 127), EPA does not anticipate these impacts having an effect on the overall national economy.

The second co-proposed approach is anticipated to drive technological innovation by formulators of paint and coating removal products containing NMP, as they continue to develop substitute products, and refine such products already available. It is also anticipated to drive technological innovation by formulators of chemical paint and coating removal products with different chemistries as well as manufacturers and retailers of alternative methods of paint and coating removal, particularly those with interest in appealing to the consumer uses. See the supplement to the Economic Analysis (Ref. 127).

The second co-proposed approach is anticipated to have a positive impact on public health, as described in Unit XVI.C. There is not anticipated to be a significant impact on the environment, for the reasons described in Unit XII.D.

XVIII. Uses of NMP for Paint and Coating Removal Critical for National Security

As part of interagency collaboration with the Department of Defense (DOD) on this proposed rule, EPA is aware that there are specific military uses for which NMP is essential for paint and coating removal and for which there are no technically feasible alternatives currently available. The military readiness of DOD's warfighting capability is paramount to ensuring national security, which includes ensuring the maintenance and preservation of DOD's warfighting assets. DOD has identified mission-critical uses for NMP for ensuring military aviation and vessel readiness. These mission-critical items require the use of NMP for the removal of coatings from mission-critical corrosion-sensitive components on military aviation and

vessels, including safety-critical components made of specialty metallic, nonmetallic, and composite materials. As described in this section, EPA proposes to exempt these uses from the regulations proposed on NMP in paint and coating removal. This exemption is proposed for an initial ten-year period from the publication date of a final rule. EPA will engage with DOD to identify any potential extension that may need to be granted, by further rulemaking, after those ten years.

DOD continues and will continue to pursue potential substitutes for NMP in paint and coating removal. However, for mission-critical corrosion-sensitive components on military aviation and vessels, including safety-critical components, DOD has found that currently available substitute chemicals for paint and coating removal have one or more technical limitations. These are the same technical limitations described in Unit VIII., which outlines the proposed exemption for methylene chloride for similar uses critical to national security.

Under TSCA section 6(g)(1)(B), EPA may grant an exemption from a requirement of a TSCA section 6(a) rule for a specific condition of use of a chemical substance or mixture if compliance with the requirement would significantly disrupt the national economy, national security, or critical infrastructure. Based on discussions and information provided by DOD, EPA has analyzed the need for the exemption and concurs with DOD that compliance with the proposed regulations on the use of NMP in paint and coating removal would significantly impact national security. DOD has demonstrated that the reduced mission availability of aircraft and vessels for military missions or, in the worst case, the loss of individual military aircraft and vessels, are potential impacts to military readiness that could result from the proposed prohibition of NMP in paint and coating removal. Due to the importance of these military systems for national security, EPA has determined that these uses of NMP for removal of specialized coatings from military aviation and vessel mission-critical corrosion-sensitive components, including safety-critical components, is critical for national security and the safety of personnel and assets. EPA includes in this exemption corrosion-sensitive military aviation and vessel mission-critical components such as landing gear, gear boxes, turbine engine parts, and other military aircraft and vessel components composed of metallic materials (specifically high-strength steel, aluminum, titanium, and

magnesium) and composite materials that not only require their coatings be removed for inspection and maintenance but also would be so negatively affected by the use of technically incompatible, substitute paint removal chemicals or methods that the safe performance of the vessel or aircraft could be compromised.

EPA proposes to grant this exemption for a period of ten years from the date of promulgation of a final rule, with a potential for extension, by further rulemaking, after review by EPA in consultation with DOD. The conditions for this exemption would be: (1) The use of NMP at any concentration for coating removal by DOD or its contractors performing this work only for DOD projects is limited to the mission-critical corrosion-sensitive components on military aviation and vessels, including safety-critical components; (2) this paint and coating removal must be conducted at DOD installations, or at Federal industrial facilities, or at DOD contractor facilities performing this work only for DOD projects.

This exemption granted under TSCA(6)(g)(1)(B) does not impact or lessen any requirements for compliance with other statutes under which the use, disposal, or emissions of NMP is regulated.

As described in Unit XVI.B.3., under the proposed approach, any paint and coating removal products containing NMP would be required to be distributed in containers with a volume no less than 5 gallons, as part of the exemption for uses identified as critical for national security. Allowing selective use for national security purposes does not disrupt the efficacy of the supply chain approach described in Unit XVI.B.3.

In addition to the exemption described in this unit, EPA will consider granting additional time-limited exemptions, under the authority of TSCA section 6(g). Details of EPA's request for comment on such exemption are described in Unit VIII.

XIX. Overview of Uncertainties for NMP in Paint and Coating Removal

A discussion of the uncertainties associated with this proposed rule can be found in the NMP risk assessment (Ref. 3) and in the additional analyses for NMP in commercial and consumer paint and coating removal (Refs. 75 and 76). A summary of these uncertainties follows.

EPA used a number of assumptions in the NMP risk assessment and supporting analysis to develop estimates for occupational and consumer exposure scenarios and to develop the

hazard/dose-response and risk characterization. EPA recognizes that the uncertainties may underestimate or overestimate actual risks. These uncertainties include the likelihood that exposures to NMP vary from one paint and coating removal project to the next. EPA attempted to quantify this uncertainty by evaluating multiple scenarios to establish a range of releases and exposures. In estimating the risk from NMP in paint and coating removal, there are uncertainties in the number of workers and consumers exposed to NMP and in the model inputs and algorithms used to estimate exposures.

In addition to the uncertainties in the risks, there are uncertainties in the cost and benefits. The uncertainties in the benefits are most pronounced in estimating the benefits from preventing the entirety of the adverse effects (described in Unit XIV.C.) because these non-cancer benefits generally cannot be monetized due to the lack of concentration response functions in humans leading to the ability to estimate the number of population-level non-cancer cases and limitations in established economic methodologies. Additional uncertainties in benefit calculations arose from EPA's use of a forecast from an industry expert to estimate the categories of alternatives that users might choose to adopt and the potential risks for adverse health effects that the alternatives may pose. While there are no products or methods that have comparable developmental or similar risks, these substitute products and alternative methods do present hazards. Without information on what alternative methods or chemicals users of NMP for paint and coating removal are likely to switch to, and estimates of the exposures for those alternatives, EPA is unable to quantitatively estimate any change in non-cancer risks due to use of substitute chemicals or alternative methods instead of using NMP for commercial or consumer paint and coating removal.

In addition to these uncertainties related to benefits, there are uncertainties related to the cost estimates. As noted earlier, there is uncertainty in EPA's estimates of which chemical substitutes or alternative methods users may adopt instead of NMP for paint and coating removal, which in turn produces uncertainty as to the cost of those substitutes or methods. EPA has estimated the cost of substitute chemicals, but is not able to fully characterize or quantify the total costs to all sectors for using substitute chemicals or alternative products. In addition, under certain assumptions EPA's economic analysis estimates that

some users of NMP for paint and coating removal will see a cost savings when switching to substitutes. Standard economic theory suggests that financially rational companies would choose technologies that maximize profits so that regulatory outcomes would not typically result in a cost savings for the regulated facilities. There could be several reasons that cost savings might occur in the real world. Potential reasons include lack of complete information or barriers to obtaining information on the cost savings associated with alternatives as well as investment barriers or higher interest rates faced by firms. Additionally, there may be costs associated with these alternatives that are not adequately accounted for in the analysis. To evaluate the effect of this uncertainty, EPA has included a sensitivity analysis that sets the cost savings to zero for these compliance alternatives (Ref. 4 at Section 7). EPA also recognizes that these firms might experience positive costs of compliance rather than zero costs, so that the actual total costs could be higher than those in the sensitivity analysis. However, EPA has no current basis to estimate these potentially higher costs, since the available data appear to show that there are lower cost substitutes available. EPA requests comments on these assumptions.

Additionally, there are uncertainties due to in the estimates of the number of affected commercial and consumer users, and for numbers of processors and distributors of NMP-containing products not prohibited by the proposed rule who are required to provide downstream notification and/or maintain records.

EPA will consider additional information received during the public comment period. This includes scientific publications and other input submitted to EPA during the comment period.

XX. Major Provisions and Enforcement of the Proposed Rule for NMP in Paint and Coating Removal

This proposal relies on general provisions in the proposed Part 751, Subpart A, which can be found at 81 FR 91592 (December 16, 2016).

A. Prohibitions and Requirements

Under the first co-proposed approach, the rule, when final, would (1) prohibit the manufacturing, processing, and distribution in commerce of NMP for consumer and commercial paint and coating removal, exempting uses defined as critical for national security (see Unit XVIII.); (2) prohibit the

commercial use of NMP for paint and coating removal, exempting for uses defined as critical for national security; (3) require any paint and coating removal products containing NMP to be distributed in containers with a volume no less than 5 gallons; (4) require that any commercial use of NMP for paint and coating removal for uses critical to national security include specific worker protections; (5) require manufacturers, processors, and distributors of NMP and all products containing NMP, excluding retailers, to provide downstream notification of the prohibitions; (6) and require recordkeeping relevant to these prohibitions. The prohibition on manufacturing, processing, and distributing in commerce of NMP for all consumer paint and coating removal would take effect 180 days after publication of a final rule. Similarly, the prohibition on manufacturing, processing, and distributing in commerce of NMP for any paint and coating removal for uses other than those exempted as critical for national security in volumes less than 5-gallon containers would take effect 180 days after publication of a final rule. The prohibition on commercial use of NMP for paint and coating removal except for the exempted critical national security uses would take effect 270 days after publication of a final rule. These are reasonable transition periods because, as noted in Unit XVI.D. and by the small businesses participating in the SBAR process, many formulators of paint and coating removers containing NMP also manufacture products for this use that do not contain NMP (Ref. 27). In addition, alternative paint removal products exist at comparable expense for users to purchase. Six months from publication of the final rule is sufficient time to allow for existing stocks to move through the market place and to allow manufacturers, processors and distributors and users to plan for and implement product substitution strategies.

Under the second co-proposed approach, formulators of paint and coating removal products for either commercial or consumer use would be required to: (1) Ensure that their paint and coating removal products containing NMP do not exceed a maximum of 35 percent NMP by weight in product formulations exempting products used for critical national security uses (see Unit XVIII.); (2) Test gloves for the product formulations being processed and distributed in commerce for other than exempt critical national security uses to identify

specialized gloves that provide protection for users and keep records relevant to these tests; (3) Label products with information for consumers about the risks presented by products that contain NMP and how to reduce these risks when using the products, including identifying which specialized gloves provide protection against the specific formulation; and (4) Provide information for commercial users about reducing risks when using the product, via product labels, SDS, and other methods of hazard communication. Variations of more than 1% in any component of a paint and coating removal product containing NMP would be considered a separate formulation.

Under this co-proposal, commercial users of NMP for paint and coating removal other than exempt critical national security uses would be prohibited from using paint and coating removal products or formulations that contain more than 35 percent by weight of NMP. They would also be required to establish a worker protection program for dermal and respiratory protection, including hazard communication, training, and requirements that workers wear clothing covering most of the body, *i.e.*, impervious long pants and shirts with long sleeves, use gloves specified by product formulators (described under formulator requirements below) and a respirator with APF 10, with an alternative air exposure limit of 5 ppm achieved through engineering controls or ventilation.

B. Downstream Notification

EPA has authority under TSCA section 6 of TSCA to require that a substance or mixture or any article containing such substance or mixture be marked with or accompanied by clear and adequate minimum warnings and instructions with respect to its use, distribution in commerce, or disposal or with respect to any combination of such activities. Many manufacturers and processors of NMP are likely to manufacture or process NMP or products containing NMP for other uses that would not be regulated under this proposed rule. Other companies may be strictly engaged in distribution in commerce of NMP, without any manufacturing or processing activities, to customers for uses that are not regulated. Under both co-proposed approaches, EPA is proposing a requirement for downstream notification by manufacturers, processors, and distributors of NMP for any use to ensure compliance with the prohibition on manufacture, processing,

distribution in commerce, and commercial use of NMP for the uses proposed for regulation. Downstream notification is necessary for effective enforcement of the rule because it provides a record, in writing, of notification on use restrictions throughout the supply chain, likely via modifications to the Safety Data Sheet. Downstream notification also increases awareness of restrictions on the use of NMP for paint and coating removal, which is likely to decrease unintentional uses of NMP by these entities. Downstream notification represents minimal burden and is necessary for effective enforcement of the rule. The estimated cost of downstream notification on an annualized basis over 20 years is \$100 and \$100 using 3% and 7% discount rates respectively (Ref. 4).

The effective date of the requirement for this notification would be 45 days after publication of the final rule. This is a reasonable transition period because regulated entities would only need to provide additional information on their SDS, which are routinely produced and updated.

C. Enforcement

Section 15 of TSCA makes it unlawful to fail or refuse to comply with any provision of a rule promulgated under TSCA section 6. Therefore, any failure to comply with this proposed rule when it becomes effective would be a violation of section 15 of TSCA. In addition, section 15 of TSCA makes it unlawful for any person to: (1) Fail or refuse to establish and maintain records as required by this rule; (2) fail or refuse to permit access to or copying of records, as required by TSCA; or (3) fail or refuse to permit entry or inspection as required by section 11 of TSCA.

Violators may be subject to both civil and criminal liability. Under the penalty provision of section 16 of TSCA, any person who violates section 15 could be subject to a civil penalty for each violation. Each day of operation in violation of this proposed rule when it becomes effective could constitute a separate violation. Knowing or willful violations of this proposed rule when it becomes effective could lead to the imposition of criminal penalties for each day of violation and imprisonment. In addition, other remedies are available to EPA under TSCA.

Individuals, as well as corporations, could be subject to enforcement actions. Sections 15 and 16 of TSCA apply to "any person" who violates various provisions of TSCA. EPA may, at its discretion, proceed against individuals as well as companies. In particular, EPA

may proceed against individuals who report false information or cause it to be reported.

XXI. Analysis for Methylene Chloride and NMP in Paint and Coating Removal under TSCA Section 9 and Section 26(h) Considerations

A. TSCA Section 9(a) Analysis

Section 9(a) of TSCA provides that, if the Administrator determines in her discretion that an unreasonable risk may be prevented or reduced to a sufficient extent by an action taken under a Federal law not administered by EPA, the Administrator must submit a report to the agency administering that other law that describes the risk and the activities that present such risk. If the other agency responds by declaring that the activities described do not present an unreasonable risk or if that agency initiates action under its own law to protect against the risk within the timeframes specified by TSCA section 9(a), EPA is precluded from acting against the risk under sections 6(a) or 7 of TSCA.

TSCA section 9(d) instructs the Administrator to consult and coordinate TSCA activities with other Federal agencies for the purpose of achieving the maximum enforcement of TSCA while imposing the least burden of duplicative requirements. For this proposed rule, EPA has consulted with OSHA and with CPSC. Both CPSC and OSHA have provided letters documenting this consultation (Refs. 121 and 122).

CPSC protects the public from unreasonable risks of injury or death associated with the use of consumer products under the agency's jurisdiction. Though CPSC has provided guidance to consumers when using products containing NMP, there are no CPSC regulations regarding NMP in paint and coating removal. CPSC currently requires that household products that can expose consumers to methylene chloride vapors must bear appropriate warning labels (52 FR 34698, September 14, 1987). In a letter regarding EPA's proposed rulemaking, CPSC stated that "Some paint removers are distributed for sale to, and use by, consumers and thus would likely fall within CPSC's jurisdiction. However, because TSCA gives EPA the ability to reach both occupational and consumer uses, we recognize that EPA may address risks associated with these chemicals in a more cohesive and coordinated manner given that CPSC lacks authority to address occupational hazards" (Ref. 121).

OSHA assures safe and healthful working conditions for working men and women by setting and enforcing standards and by providing training, outreach, education and assistance. OSHA's methylene chloride standard, 29 CFR 1910.1052, was issued in 1997 and applies to general industry, construction, and shipyard employment. It sets the PEL for airborne methylene chloride to an eight-hour TWA of 25 parts per ppm. OSHA has not set a standard for NMP. OSHA recently published a Request for Information on approaches to updating PELs and other strategies to managing chemicals in the workplace (79 FR 61384, October 10, 2014). OSHA's current regulatory agenda does not include revision to the methylene chloride PEL, establishment of a PEL for NMP, or other regulations addressing the risks EPA has identified when methylene chloride or NMP are used in paint and coating removal (Ref. 122).

This proposed rule addresses risk from exposure to methylene chloride and NMP during paint and coating removal in both workplace and consumer settings. With the exception of TSCA, there is no Federal law that provides authority to prevent or sufficiently reduce these cross-cutting exposures. No other Federal regulatory authority, when considering the exposures to the populations and within the situations in its purview, can evaluate and address the totality of the risk that EPA is addressing in this proposal and the prior proposal on TCE uses (Ref. 1). For example, OSHA may set exposure limits for workers but its authority is limited to the workplace and does not extend to consumer uses of hazardous chemicals. Further, OSHA does not have direct authority over state and local employees, and it has no authority at all over the working conditions of state and local employees in states that have no OSHA-approved State Plan under 29 U.S.C. 667. Other Federal regulatory authorities, such as CPSC, have the authority to only regulate pieces of the risks posed by methylene chloride and NMP, such as when used in consumer products.

Moreover, recent amendments to TSCA, Public Law 114-182, alter both the manner of identifying unreasonable risk under TSCA and EPA's authority to address unreasonable risk under TSCA, such that risk management under TSCA is increasingly distinct from analogous provisions of the Consumer Product Safety Act (CPSA), the Federal Hazardous Substances Act (FHSA), or the OSH Act. These changes to TSCA reduce the likelihood that an action under the CPSA, FHSA, or the OSH Act

would reduce the risk of methylene chloride and NMP in paint and coating removal so that the risks are no longer unreasonable under TSCA. Whereas (in a TSCA section 6 rule) an unreasonable risk determination sets the objective of the rule in a manner that excludes cost considerations, 15 U.S.C. 2605(a)(b)(4)(A), subject to time-limited conditional exemptions for critical chemical uses and the like, 15 U.S.C. 2605(g), a consumer product safety rule under the CPSA must include a finding that “the benefits expected from the rule bear a reasonable relationship to its costs.” 15 U.S.C. 2058(f)(3)(E). Additionally, recent amendments to TSCA reflect Congressional intent to “delete the paralyzing ‘least burdensome’ requirement,” 162 Cong. Rec. S3517 (June 7, 2016). However, a consumer product safety rule under the CPSA must impose “the least burdensome requirement which prevents or adequately reduces the risk of injury for which the rule is being promulgated.” 15 U.S.C. 2058(f)(3)(F). Analogous requirements, also at variance with recent revisions to TSCA, affect the availability of action under the FHSA relative to action under TSCA. 15 U.S.C. 1262. Gaps also exist between OSHA’s authority to set workplace standards under the OSH Act and EPA’s amended obligations to sufficiently address chemical risks under TSCA. To set PELs for chemical exposure, OSHA must first establish that the new standards are economically feasible and technologically feasible. 79 FR 61387 (2014). But under TSCA, EPA’s substantive burden under TSCA section 6(a) is to demonstrate that, as regulated, the chemical substance no longer presents an unreasonable risk, with unreasonable risk being determined without consideration of cost or other non-risk factors.

TSCA is the only regulatory authority able to prevent or reduce risks of methylene chloride or NMP exposure to a sufficient extent across the range of uses and exposures of concern. In addition, these risks can be addressed in a more coordinated, efficient and effective manner under TSCA than under two or more different laws implemented by different agencies. Furthermore, there are key differences between the newly amended finding requirements of TSCA and those of the OSH Act, CPSA, and the FHSA. For these reasons, in her discretion, the Administrator does not determine that unreasonable risks from the use of methylene chloride and NMP in paint and coating removal may be prevented or reduced to a sufficient extent by an

action taken under a Federal law not administered by EPA. However, EPA is requesting public comment on this issue (*i.e.*, the sufficiency of an action taken under a Federal law not administered by EPA).

B. TSCA Section 9(b) Analysis

If EPA determines that actions under other Federal laws administered in whole or in part by EPA could eliminate or sufficiently reduce an unreasonable risk, section 9(b) of TSCA instructs EPA to use these other authorities unless the Administrator determines in the Administrator’s discretion that it is in the public interest to protect against such risk under TSCA. In making such a public interest finding, TSCA section 9(b)(2) states: “the Administrator shall consider, based on information reasonably available to the Administrator, all relevant aspects of the risk . . . and a comparison of the estimated costs and efficiencies of the action to be taken under this title and an action to be taken under such other law to protect against such risk.”

Although several EPA statutes have been used to limit methylene chloride or NMP exposure (Units III.A. and XII.A.), regulations under these EPA statutes have limitations because they largely regulate releases to the environment, rather than direct human exposure. SDWA only applies to drinking water. CAA does not apply directly to worker exposures or consumer settings where methylene chloride or NMP are used. Under RCRA, methylene chloride that is discarded may be considered a hazardous waste and subject to requirements designed to reduce exposure from the disposal of methylene chloride to air, land and water. RCRA does not address exposures during use of products containing methylene chloride or NMP. Only TSCA provides EPA the authority to regulate the manufacture (including import), processing, and distribution in commerce, and use of chemicals substances.

For these reasons, the Administrator does not determine that unreasonable risks from the use of methylene chloride and NMP in paint and coating removal could be eliminated or reduced to a sufficient extent by actions taken under other Federal laws administered in whole or in part by EPA.

C. Section 26(h) Considerations

EPA has used scientific information, technical procedures, measures, methods, protocols, methodologies, and models consistent with the best available science. For example, EPA based its proposed determination of

unreasonable risk presented by the use of methylene chloride and NMP in paint and coating removal on the completed risk assessments, which each followed a peer review and public comment process, as well as using best available science and methods (Refs. 2 and 3). Supplemental analyses were performed to better characterize the exposed populations and estimate the effects of various control options. These supplemental analyses were consistent with the methods and models used in the risk assessment. These analyses were developed for the purpose of supporting a future regulatory determination: To determine either that particular risks are not unreasonable or that those are risks are unreasonable. They were also developed to support risk reduction by regulation under section 6 of TSCA, to the extent risks were determined to be unreasonable. It is reasonable and consistent to consider these supplemental analyses in this rulemaking for such relevant purposes.

The extent to which the various information, procedures, measures, methods, protocols, methodologies or models, as applicable, used in EPA’s decision have been subject to independent verification or peer review is adequate to justify their use, collectively, in the record for this rule. Additional information on the peer review and public comment process, such as the peer review plan, the peer review report, and the Agency’s response to comments, can be found on EPA’s Assessments for TSCA Work Plan Chemicals Web page at <https://www.epa.gov/assessing-and-managing-chemicals-under-tasca/assessments-tasca-work-plan-chemicals>.

XXIII. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at <http://www2.epa.gov/laws-regulations/laws-and-executive-orders>.

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is an economically significant regulatory action that was submitted to the Office of Management and Budget (OMB) for review under Executive Order 12866 and Executive Order 13563 (76 FR 3821, January 21, 2011). Any changes made in response to OMB recommendations have been documented in the docket. EPA prepared an economic analysis of the potential costs and benefits associated with this action, which is available in the docket and summarized in Units I.E., VII.B., and XVII.B. (Refs. 4 and 127).

B. Paperwork Reduction Act (PRA)

The information collection requirements in this proposed rule have been submitted for approval to the Office of Management and Budget (OMB) under the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.* The Information Collection Request (ICR) document prepared by the EPA has been assigned the EPA ICR number 2556.01. You can find a copy of the ICR in the docket for this proposed rule (Ref. 123), and it is briefly summarized here.

Under the proposed approach for methylene chloride and both co-proposed approaches for NMP, the information collection activities required under the proposed rule include a downstream notification requirement and a recordkeeping requirement. The downstream notification would require companies that ship methylene chloride or NMP to notify companies downstream in the supply chain of the prohibitions of methylene chloride or NMP in the proposed rule. The proposed rule does

not require the regulated entities to submit information to EPA. The proposed rule also does not require confidential or sensitive information to be submitted to EPA or downstream companies. The recordkeeping requirement mandates companies that ship methylene chloride or NMP to retain certain information at the company headquarters for three years from the date of shipment. These information collection activities are necessary in order to enhance the prohibitions under the proposed rule by ensuring awareness of the prohibitions throughout the methylene chloride or NMP supply chain, and to provide EPA with information upon inspection of companies downstream who purchased methylene chloride or NMP. EPA believes that these information collection activities would not significantly impact the regulated entities.

Under the second co-proposed approach for NMP, processors of paint and coating removal products containing NMP must test gloves for permeability for each formulation they process. One type of gloves may not be appropriate for all NMP paint remover formulations because the permeability of the product will vary based on the other solvents and chemicals used in the formulation. The testing requirements for glove permeability and the labeling requirements mandate that processors paint removers containing perform glove permeability testing on each paint remover product containing NMP and update their current product labels to contain warnings and instructions for consumers on how to reduce exposures to NMP. Without the reporting requirements, processors of these products might not provide information about the specific types of protective gloves to users. Requiring that labels of paint and coating removal products containing NMP include information about which specific types of gloves provide dermal protection from the specific product formulation provides information that is essential for knowing how to reduce exposures while carrying out paint and coating removal with NMP. Requiring additional warnings and instructions to consumers provides information about the risks presented by the product and how those risks can be reduced. EPA believes that these information collection activities would not significantly impact the regulated entities.

Respondents/Affected Entities: Methylene chloride and NMP manufacturers, processors, and distributors; commercial users of NMP for paint and coating removal.

Respondent's Obligation to Respond: Respondents are not obligated to respond or report to EPA.

Estimated Number of Respondents for the Proposed Approach for Methylene Chloride and the First Co-Proposed Approach for NMP: 327.

Estimated Total Number of Potential Respondents for the Proposed Approach for Methylene Chloride and the Second Co-Proposed Approach for NMP: 327

Frequency of Response: On occasion to third parties as needed.

Total Estimated Burden for the Proposed Approach for Methylene Chloride and the First Co-Proposed Approach for NMP: 163.5

Estimated Total Annual Burden for the Proposed Approach for Methylene Chloride and the Second Co-Proposed Approach for NMP: 1,084 hours.

Total Estimated Cost for the Proposed Approach for Methylene Chloride and the First Co-Proposed Approach for NMP: \$7,904 (per year).

Estimated Total Annual Costs for the Proposed Approach for Methylene Chloride and the Second Co-Proposed Approach for NMP: \$924,890 (per year).

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9.

Submit your comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden to EPA using the docket identified at the beginning of this proposed rule. You may also send your ICR-related comments to OMB's Office of Information and Regulatory Affairs via email to oira_submission@omb.eop.gov, Attention: Desk Officer for the EPA. Since OMB is required to make a decision concerning the ICR between 30 and 60 days after receipt, OMB must receive comments no later than February 21, 2017. The EPA will respond to any ICR-related comments in the final rule.

C. Regulatory Flexibility Act (RFA)

Pursuant to section 603 of the RFA, 5 U.S.C. 601 *et seq.*, EPA prepared an initial regulatory flexibility analysis (IRFA) (Ref. 26) that examines the impact of the proposed rule on small entities along with regulatory alternatives that could minimize that impact. The complete IRFA is available for review in the docket and is summarized here.

1. Need for the rule. Under TSCA section 6(a) (15 U.S.C. 2605(a)), if EPA

determines that a chemical substance presents an unreasonable risk of injury to health or the environment, without consideration of costs or other non-risk factors, including an unreasonable risk to a potentially exposed or susceptible subpopulation identified as relevant to the risk evaluation, under the conditions of use, EPA must by rule apply one or more requirements to the extent necessary so that the chemical substance or mixture no longer presents such risk. Based on EPA's risk assessments of methylene chloride (Ref. 2) and NMP (Ref. 3), EPA proposes a determination that the use of methylene chloride and NMP in paint and coating removal presents an unreasonable risk of injury to human health. The provisions of this proposal are necessary to address the risk so that it is no longer unreasonable.

2. *Objectives and legal basis.* In part, the legal basis for this proposal is TSCA section 6(a), which provides authority for the Administrator to apply requirements to the extent necessary so that a chemical substance or mixture no longer presents an unreasonable risk of injury to health or the environment. Additional legal basis for the proposal is found at TSCA section 26(l)(4). With respect to chemical substances such as methylene chloride and NMP (which are listed in the 2014 update to the TSCA Work Plan for Chemical Assessments and for which completed risk assessments were published prior to the date of enactment of the Frank R. Lautenberg Chemical Safety for the 21st Century Act) TSCA section 26(l)(4) expressly authorizes EPA to issue rules under TSCA section 6(a) that are consistent with the scope of the completed risk assessment and consistent with the other applicable requirements of TSCA section 6.

3. *Small entities covered by this proposal.* EPA estimates that the proposal would affect approximately 10,300 small entities. The majority of these entities are commercial users of methylene chloride or NMP in paint and coating removal in a variety of occupational settings such as bathtub refinishing, graffiti removal, autobody repair, and residential renovations. This also includes a small number of formulators of paint and coating removal products that contain methylene chloride and NMP, for commercial or consumer uses (Refs. 4, 26, and 127).

4. *Compliance requirements and the professional skills needed.* For methylene chloride, EPA is proposing under TSCA section 6 to prohibit the manufacture (including import), processing, and distribution in

commerce of methylene chloride for all consumer and many types or uses of commercial paint and coating removal, as described in the proposed rule. EPA is also proposing under TSCA section 6 to prohibit the use of methylene chloride for commercial paint and coating removal in these several specified sectors. Additionally, EPA is proposing to require that any paint or coating removal products containing methylene chloride that continue to be distributed be packaged in volumes no less than 55-gallon containers, except for formulations produced specifically for DOD. EPA is also proposing to require manufacturers (including importers), processors, and distributors, except for retailers, of methylene chloride for any use to provide downstream notification of these requirements and prohibitions throughout the supply chain; and to require limited recordkeeping. More details on this supply chain approach are in Unit VI.C.3.

For NMP, EPA is co-proposing two approaches. Under the first co-proposed approach, EPA is proposing to prohibit the manufacture (including import), processing, and distribution in commerce of NMP for all consumer and commercial paint and coating removal, exempting uses identified in the proposed rule as critical to national security; and to prohibit the commercial use of NMP for paint and coating removal, exempting uses identified as critical to national security. EPA is proposing to require that any paint or coating removal products containing NMP that continue to be distributed be packaged in no less than 5-gallon containers. EPA is also proposing to require manufacturers (including importers), processors, and distributors, except for retailers, of NMP for any use to provide downstream notification of these prohibitions throughout the supply chain; and to require limited recordkeeping. For the second co-proposed approach for NMP, commercial users would be required to implement and maintain a detailed program for worker protection, including dermal and respiratory protection. Additionally, product processors would be required to carry out testing to identify gloves that are protective against each product formulation, labeling product with that information, and provide additional information on the label to consumers regarding risks of using the product and instructions on how to reduce those risks. As in the first co-proposal, EPA is also proposing to require manufacturers (including importers), processors, and

distributors, except for retailers, of NMP for any use to provide downstream notification of these prohibitions throughout the supply chain; and to require limited recordkeeping. More details on these two co-proposals are in Unit XVI.B.3.

Under the proposed approach for methylene chloride and first co-proposed approach for NMP, complying with the prohibitions, the downstream notification, and the recordkeeping requirements involve no special skills. However, implementing the use of substitute chemicals or alternative paint and coating removal processes may involve special skills or expertise in the sector in which the paint and coating removal is conducted.

For the second co-proposed approach for NMP, commercial users would be required to implement and maintain a detailed program for worker protection, which would involve special skills or expertise in industrial hygiene. Similarly, product processors would be required to carry out testing to identify gloves that are protective against each product formulation, could involve special skills or expertise. Labeling products to comply with new requirements would not involve special skill, particularly since EPA proposes to identify specific information for labels of paint and coating removal products containing NMP. As in the first co-proposal for NMP, the downstream notification and the recordkeeping requirements require no special skills.

5. *Other Federal regulations.* Other Federal regulations that affect the use of methylene chloride or NMP in paint and coating removal are discussed in Units III.A. and XIII.A. While many of the statutes that EPA and other agencies are charged with administering provide statutory authority to address specific sources and routes of methylene chloride exposure, none of these can address the serious human health risks from methylene chloride exposure that EPA is proposing to address under TSCA section 6(a). Regarding methylene chloride, because the methylene chloride NESHAPs were developed only to regulate emissions from certain types of paint and coating removal operations, not to address worker or consumer exposures, they are not duplicative with this proposal. Similarly, regulations addressing methylene chloride disposal or water contamination do not address worker or consumer exposures when conducting paint and coating removal. This proposed rule does not conflict with the NESHAP (or regulations addressing methylene chloride disposal or water contamination): it neither prohibits any action required by such

rules, nor requires any action prohibited by such rules.

OSHA's methylene chloride standard, 29 CFR 1910.1052, was issued in 1997 and applies to general industry, construction, and shipyard employment. This proposal does not duplicate OSHA's methylene chloride standard. Nor does the proposed rule conflict with the OSHA standard: it would not prohibit actions required to meet OSHA's methylene chloride standard and it would not require actions in violation OSHA's methylene chloride standard.

CPSC requires that consumer products that contain methylene chloride be labeled with a statement regarding the cancer risks presented by inhalation of methylene chloride fumes. This proposal does not impose requirements that would duplicate or conflict with CPSC's labeling requirements for methylene chloride.

Regarding NMP, there are no OSHA or CPSC regulations. EPA's proposal is not duplicative of other Federal rules nor does it conflict with other Federal rules.

6. *Regulatory alternatives considered.*

As described in Units V.C., VI.C., XV.C., and XVI.B., EPA considered a wide variety of risk reduction options. The Economic Analysis (Ref. 4) examined several alternative analytical options. However, most of the alternatives did not address the risks presented by methylene chloride and NMP in paint and coating removal as necessary so that they would no longer be unreasonable, either to the general population or (in the case of NMP) to women of childbearing age.

The primary alternative considered by EPA for methylene chloride in paint and coating removal was to allow the commercial use of methylene chloride in paint and coating removal and require a respiratory protection program, including PPE, air monitoring, and either a supplied-air respirator of APF 1,000 or 10,000 or an air exposure limit achieved through engineering controls or ventilation in commercial facilities where methylene chloride is used for paint and coating removal. Depending on air concentrations and proximity to the paint and coating removal, other employees in the area would also need to wear respiratory protection equipment. While this option would address the risks presented by methylene chloride in paint and coating removal, so that they would no longer be unreasonable, the Economic Analysis indicates that this option is more expensive than switching to a substitute chemical or alternative paint and coating removal method (Ref. 4). However, as recommended by the SBAR

panel, EPA is seeking comment on and additional information about air monitoring and the use of supplied-air respirators in firms conducting paint and coating removal with methylene chloride (Ref. 27).

EPA is co-proposing two approaches to address risks presented by NMP in commercial and consumer paint and coating removal. Those approaches are described above. EPA considers both of these approaches to be primary regulatory alternatives.

As required by section 609(b) of the RFA, EPA also convened a SBAR Panel to obtain advice and recommendations from small entity representatives that potentially would be subject to the rule's requirements. The SBAR Panel evaluated the assembled materials and small-entity comments on issues related to elements of an IRFA. A copy of the full SBAR Panel Report (Ref. 27) is available in the rulemaking docket.

The Panel recommended that EPA seek additional information in five specific areas: Exposure information, regulatory options, alternatives, cost information, and risk assessment. Specifically, the Panel recommendations were: (1) Exposure information: EPA should request workplace monitoring information during the comment period for worker exposure levels from companies for methylene chloride and NMP in paint and coating removal. EPA should request additional information regarding the frequency of use currently of PPE, and consider that information when weighing alternative options in the proposed rulemaking for methylene chloride and NMP in paint and coating removal. (2) Regulatory options: EPA should consider and seek public comments on enhanced labeling requirements for consumer paint removal products containing methylene chloride or NMP to reduce exposure to methylene chloride and NMP. EPA should consider and seek public comments on a control option such as a certification program similar to the Lead Renovation, Repair and Painting program with increased training and education for commercial users of paint removers. EPA should delay any proposed regulatory action on methylene chloride for the commercial furniture refinishing industry while it gathers additional information to characterize the impacts on this industry of restrictions on use of methylene chloride in paint and coating removal. EPA should request comment on current practices in the furniture refinishing industry on limiting exposure to methylene chloride used in paint and coating removal. EPA should

request comment on the feasibility of methylene chloride only being sold in 30–55-gallon drums. EPA should address the proposed regulatory actions as distinctly as possible in the one proposed rulemaking addressing both methylene chloride and NMP in paint and coating removal. (3) Alternatives: EPA should ensure that its analysis of the available alternatives to methylene chloride and NMP in paint and coating removal comply with the requirements of TSCA section 6(c)(2)(C) and include consideration, to the extent legally permissible and practicable, of whether technically and economically feasible alternatives that benefit health or the environment, compared to the use being prohibited or restricted, will be reasonably available as a substitute when the proposed requirements would take effect. Specifically, EPA should evaluate the feasibility of using alternatives, including the cost, relative safety, and other barriers; and take into consideration the current and future planned regulation of compounds the agency has listed as alternatives. (4) Cost information: EPA should request additional information on the cost to achieve reduced exposures in the workplace or to transition to alternative chemicals or technologies. (5) Risk assessments: EPA should recognize the concerns that the SERs had on the risk assessments by referring readers to the risk assessments and the Agency's Summary of External Peer Review and Public Comments and Disposition document for each risk assessment, which addresses those concerns, in the preamble of the proposed rulemaking.

Throughout this preamble, EPA has requested information with respect to these and other topics.

D. Unfunded Mandates Reform Act (UMRA)

This action does not contain an unfunded mandate of \$100 million or more as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The requirements of this action would primarily affect manufacturers, processors, and distributors of methylene chloride or NMP. The total estimated annualized cost of the proposed rule under the first co-proposed approach for NMP is \$4,185,000 to \$23,423,000 and \$4,550,000 to \$23,472,000 annualized over 20 years at 3% and 7%, respectively (Ref. 4). The total estimated annualized cost of the proposed rule under the second co-proposed approach for NMP is \$114,196,000 to \$125,893,000 and \$114,658,000 to \$125,438,000 annualized over 20 years

at 3% and 7%, respectively (Ref. 127), which does not exceed the inflation-adjusted unfunded mandate threshold of \$154 million.

E. Executive Order 13132: Federalism

The EPA has concluded that this action has federalism implications, as specified in Executive Order 13132 (64 FR 43255, August 10, 1999), because regulation under TSCA section 6(a) may preempt state law. EPA provides the following federalism summary impact statement. The Agency consulted with state and local officials early in the process of developing the proposed action to permit them to have meaningful and timely input into its development. EPA invited the following national organizations representing state and local elected officials to a meeting on May 13, 2015, in Washington DC: National Governors Association; National Conference of State Legislatures, Council of State Governments, National League of Cities, U.S. Conference of Mayors, National Association of Counties, International City/County Management Association, National Association of Towns and Townships, County Executives of America, and Environmental Council of States. A summary of the meeting with these organizations, including the views that they expressed, is available in the docket (Ref. 124). Although EPA provided these organizations an opportunity to provide follow-up comments in writing, EPA received no written follow-up.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications, as specified in Executive Order 13175 (65 FR 67249, November 9, 2000). This rulemaking would not have substantial direct effects on tribal government because methylene chloride or NMP are not manufactured, processed, or distributed in commerce by tribes. Tribes do not regulate methylene chloride or NMP, and this rulemaking would not impose substantial direct compliance costs on tribal governments. Thus, EO 13175 does not apply to this action. EPA nevertheless consulted with tribal officials during the development of this action, consistent with the EPA Policy on Consultation and Coordination with Indian Tribes.

EPA met with tribal officials in a national informational webinar held on May 12, 2015 concerning the prospective regulation of methylene chloride and NMP in paint and coating removal under TSCA section 6, and in

another teleconference with tribal officials on May 27, 2015 (Ref. 125). EPA also met with the National Tribal Toxics Council (NTTC) in Washington, DC and via teleconference on April 22, 2015 (Ref. 125). In those meetings, EPA provided background information on the proposed rule and a summary of issues EPA explored. These officials expressed support for EPA regulation to reduce the risks presented by methylene chloride and NMP in paint and coating removal.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This action is subject to Executive Order 13045 because it is an economically significant regulatory action as defined by Executive Order 12866, and the EPA believes that the environmental health or safety risk addressed by this action has a disproportionate effect on children, specifically on the developing fetus. Accordingly, we have evaluated the environmental health or safety effects of methylene chloride and NMP in paint and coating removal on children. This action's health and risk assessment of exposure by children to methylene chloride and NMP in paint and coating removal are contained in Units I.F., VI.C.1.c., and XVI.B.1.c. of this preamble. Supporting information on methylene chloride and NMP exposures and the health effects of methylene chloride or NMP exposure by children is available in the Toxicological Review of Methylene Chloride (Ref. 5), the NMP risk assessment (Ref. 3), and the methylene chloride risk assessment (Ref. 2).

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution in Commerce, or Use

This proposed rule is not subject to Executive Order 13211 (66 FR 28355, May 22, 2001), because this action is not expected to affect energy supply, distribution in commerce, or use. This rulemaking is intended to protect against risks from methylene chloride and NMP in paint and coating removal, and does not affect the use of oil, coal, or electricity.

I. National Technology Transfer and Advancement Act (NTTAA)

This proposed rulemaking does not involve technical standards, and is therefore not subject to considerations under NTTAA section 12(d), 15 U.S.C. 272 note. However, under one of the co-proposals for NMP discussed in Unit XVI, EPA is proposing to require

processors of paint and coating removal products that contain NMP to identify, through testing, gloves that provide an impervious barrier to dermal exposure during normal and expected duration and conditions of exposure. EPA has identified two potentially-applicable voluntary consensus standards for this process: ASTM International Standard F739, "Standard Test Method for Permeation of Liquids and Gases through Protective Clothing Materials under Conditions of Continuous Contact," and ASTM International F1194-99, "Standard Guide for Documenting the Results of Chemical Permeation Testing of Materials Used in Protective Clothing Materials." EPA is not proposing specific provisions for conducting and documenting glove testing, nor is EPA proposing to incorporate these voluntary consensus standards by reference. EPA requests comment on whether the regulation should include additional requirements on glove testing for processors and, if so, how that should be accomplished.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

Executive Order 12898 (59 FR 7629, February 16, 1994) establishes federal executive policy on environmental justice. Its main provision directs federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse health or environmental effects of their programs, policies and activities on minority populations and low-income populations in the U.S. Units VI.C.1.b., VI.D.10., XVI.B.1.b., and XVI.C.6. of this preamble address public health impacts from methylene chloride and NMP in paint and coating removal. This proposed rule would address the current disproportionate risk to Hispanic workers (of all races) and foreign-born workers in the construction trades, where these two populations are overrepresented compared to the general U.S. adult population (Ref. 4). Though this proposed rule would eliminate risks of exposure to NMP and methylene chloride when used in paint and coating removal in the construction trades, because workers in these two populations currently are overrepresented in this trade, these populations would disproportionately benefit from this risk reduction. The EPA places particular emphasis on the public health and environmental conditions affecting minority populations, low-income populations,

and indigenous peoples. In recognizing that these populations frequently bear a disproportionate burden of environmental harms and risks, EPA works to protect them from adverse public health and environmental effects (Ref. 126).

List of Subjects in 40 CFR Part 751

Environmental protection, Chemicals, Export notification, Hazardous substances, Import certification, Recordkeeping.

Dated: January 12, 2017.

Gina McCarthy,
Administrator.

Therefore, 40 CFR part 751, as proposed to be added at 81 FR 91592 (December 16, 2016), is proposed to be further amended as follows:

PART 751—REGULATION OF CERTAIN CHEMICAL SUBSTANCES AND MIXTURES UNDER SECTION 6 OF THE TOXIC SUBSTANCES CONTROL ACT

- 1. The authority citation for part 751 is revised to read as follows:

Authority: 15 U.S.C. 2605, 15 U.S.C. 2625(l)(4).

- 2. Add Subpart B to read as follows:

Subpart B—Methylene Chloride

Sec.

751.101 General.

751.103 Definitions.

751.105 Consumer Paint and Coating Removal.

751.107 Commercial Paint and Coating Removal in Specified Industries or for Specified Uses.

751.109 Downstream Notification.

751.111 Recordkeeping.

Subpart B—Methylene Chloride

§ 751.101 General.

This subpart sets certain restrictions on the manufacture (including import), processing, distribution in commerce, and uses of methylene chloride (CASRN 75–09–2) to prevent unreasonable risks to health associated with human exposure to methylene chloride for the specified uses.

§ 751.103 Definitions.

The definitions in subpart A of this part apply to this subpart unless otherwise specified in this section. In addition, the following definitions apply:

Commercial furniture stripping means furniture stripping conducted in a commercial facility performed by an individual, government entity, or company for which an individual, government entity, or company receives remuneration or other form of payment.

Commercial paint and coating removal means paint and coating removal performed by an individual, government entity, or company, for which an individual, government entity, or company receives remuneration or other form of payment.

Critical corrosion-sensitive components of military aviation and vessels means parts that directly enable or support warfighting assets of the Department of Defense (DOD) and include “safety critical items” identified by DOD in accordance with DOD policies and requirements for ensuring safety and performance. These include corrosion-sensitive aviation and vessel safety-critical components such as landing gear, gear boxes, turbine engine parts, and other military aircraft and vessel components composed of metallic materials (specifically high-strength steel, aluminum, titanium, and magnesium) and composite materials that not only require their coatings be removed for inspection and maintenance but also would be so negatively affected by the use of paint removal chemicals or methods other than methylene chloride that the safety of the system could be compromised.

Distribute in commerce has the same meaning as in section 3 of the Act, except that the term does not include retailers for purposes of § 751.109 and § 751.111.

Furniture stripping means paint and coating removal from furniture and includes application of a chemical or use of another method to remove, loosen, or deteriorate any paint, varnish, lacquer, graffiti, surface protectants, or other coating from wood, metal, or other types of furniture, doors, radiators, or cabinets. Furniture stripping includes paint and coating removal from furniture that occurs separately from or as part of furniture refinishing.

Paint and coating removal means application of a chemical or use of another method to remove, loosen, or deteriorate any paint, varnish, lacquer, graffiti, surface protectants, or other coating from a substrate, including objects, vehicles, architectural features, or structures.

Retailer means a person or business who distributes in commerce a chemical substance, mixture, or article to consumer end users.

§ 751.105 Consumer Paint and Coating Removal.

After [date 180 calendar days after the date of publication of the final rule], all persons are prohibited from manufacturing, processing, and distributing in commerce methylene

chloride for consumer paint and coating removal.

§ 751.107 Commercial Paint and Coating Removal in Specified Industries or for Specified Uses.

(a) After [date 180 calendar days after the date of publication of the final rule], all persons are prohibited from manufacturing, processing, and distributing in commerce methylene chloride for commercial paint and coating removal except for commercial furniture stripping or for paint and coating removal from critical corrosion-sensitive components of military aviation and vessels as defined in § 751.103. After [date 10 years after the date of publication of the final rule], all persons are prohibited from manufacturing, processing, and distributing in commerce methylene chloride for paint and coating removal from critical corrosion-sensitive components of military aviation and vessels.

(b) After [date 180 calendar days after the date of publication of the final rule], all persons are prohibited from distributing in commerce methylene chloride for paint and coating removal in containers with a volume less than 55 gallons except for formulations specifically manufactured for the Department of Defense, which may be distributed in commerce in containers with a volume no less than 5 gallons.

(c) After [date 270 calendar days after the date of publication of the final rule], all persons are prohibited from commercial use of methylene chloride for paint and coating removal except for commercial furniture stripping or for paint and coating removal from critical corrosion-sensitive components of military aviation and vessels as defined in § 751.103. After [date 10 years after the date of publication of the final rule], all persons are prohibited from commercial use of methylene chloride for paint and coating removal from critical corrosion-sensitive components of military aviation and vessels.

(d) Any paint and coating removal from critical corrosion-sensitive components of military aviation and vessels must be conducted under the following restrictions:

(1) All paint and coating removal from critical corrosion-sensitive components of military aviation and vessels using methylene chloride must be conducted at DOD installations, or at deployed locations under the control of DOD organizations, or at locations of DOD contractors performing coating removal work from corrosion-sensitive components of military aviation and vessels for DOD.

§ 751.109 Downstream Notification.

Each person who manufactures, processes, or distributes in commerce methylene chloride for any use after [date 45 calendar days after the date of publication of the final rule] must, prior to or concurrent with the shipment, notify companies to whom methylene chloride is shipped, in writing, of the restrictions described in this subpart.

§ 751.111 Recordkeeping.

(a) Each person who manufactures, processes, or distributes in commerce any methylene chloride after [date 45 calendar days after the date of publication of final rule] must retain in one location at the headquarters of the company documentation showing:

- (1) The name, address, contact, and telephone number of companies to whom methylene chloride was shipped;
- (2) A copy of the notification provided under § 751.109; and
- (3) The amount of methylene chloride shipped.

(b) The documentation in (a) must be retained for 3 years from the date of shipment.

■ 3. Add Subpart C as follows:**Subpart C—N-Methylpyrrolidone.**

Sec.

751.201 General.

751.203 Definitions. [option 1]

751.205 Manufacture, processing, and distribution of NMP for consumer paint and coating removal.

751.207 Manufacture, Processing, and Distribution of NMP for Commercial Paint and Coating Removal

751.209 Downstream Notification.

751.211 Recordkeeping. [option 2]

751.205 Paint and Coating Removal for Specified Uses.

751.209 Downstream Notification.

751.211 Recordkeeping.

Subpart C—N-Methylpyrrolidone**§ 751.201 General.**

This subpart sets certain restrictions on the manufacture (including import), processing, distribution in commerce, and uses of N-methylpyrrolidone (NMP) (CASRN 872–50–4) to prevent unreasonable risks to health associated with human exposure to NMP for the specified uses.

§ 751.203 Definitions.

The definitions in subpart A of this part apply to this subpart unless otherwise specified in this section. In addition, the following definitions apply:

Commercial paint and coating removal means paint and coating removal performed by an individual, government entity, or company, for which an individual, government entity,

or company receives remuneration or other form of payment.

Critical corrosion-sensitive components of military aviation and vessels means parts that directly enable or support warfighting assets of the Department of Defense (DOD) and include “safety critical items” identified by DOD in accordance with DOD policies and requirements for ensuring safety and performance. These include corrosion-sensitive aviation and vessel safety-critical components such as landing gear, gear boxes, turbine engine parts, and other military aircraft and vessel components composed of metallic materials (specifically high-strength steel, aluminum, titanium, and magnesium) and composite materials that not only require their coatings be removed for inspection and maintenance but also would be so negatively affected by the use of paint removal chemicals or methods other than NMP that the safety of the system could be compromised.

Distribute in commerce has the same meaning as in section 3 of the Act, except that the term does not include retailers for purposes of § 751.209 and § 751.211.

Formulation is a mixture of active and other ingredients.

Paint and coating removal means application of a chemical or other method to remove, loosen, or deteriorate any paint, varnish, lacquer, graffiti, surface protectants, or other coatings from a substrate, including objects, vehicles, architectural features, or structures.

Retailer means a person or business who distributes in commerce a chemical substance, mixture, or article to consumer end users.

[OPTION 1 PROPOSED REGULATORY TEXT FOR §§ 751.205, 751.207, 751.209, and 751.211: Co-Proposal 1: NMP—Banning the Manufacture, Processing, Distribution, and Use Except for a Critical Use Exemption]

§ 751.205 Manufacture, Processing, and Distribution of NMP for Consumer Paint and Coating Removal.

After [date 180 calendar days after the date of publication of the final rule], all persons are prohibited from manufacturing, processing, and distributing in commerce NMP for consumer paint and coating removal.

§ 751.207 Manufacture, Processing, and Distribution of NMP for Commercial Paint and Coating Removal.

(a) After [date 180 calendar days after the date of publication of the final rule], all persons are prohibited from manufacturing, processing, and distributing in commerce NMP for

commercial paint and coating removal except for paint and coating removal from critical corrosion-sensitive components of military aviation and vessels as defined in § 751.203. After [date 10 years after the date of publication of the final rule], all persons are prohibited from manufacturing, processing, and distributing in commerce NMP for paint and coating removal from critical corrosion-sensitive components of military aviation and vessels.

(b) After [date 180 calendar days after the date of publication of the final rule], all persons are prohibited from distributing in commerce NMP for paint and coating removal in containers with a volume less than 55 gallons except for formulations specifically manufactured for the Department of Defense, which may be distributed in commerce in containers with a volume no less than 5 gallons.

(c) After [date 270 calendar days after the date of publication of the final rule], all persons are prohibited from commercial use of NMP for paint and coating removal except for paint and coating removal from critical corrosion-sensitive components of military aviation and vessels as defined in § 751.203. After [date 10 years after the date of publication of the final rule], all persons are prohibited from commercial use of NMP for paint and coating removal from critical corrosion-sensitive components of military aviation and vessels.

(d) Any paint and coating removal from critical corrosion-sensitive components of military aviation and vessels must be conducted under the following restrictions:

(1) All paint and coating removal from critical corrosion-sensitive components of military aviation and vessels using NMP must be conducted at DOD installations; DOD owned, contractor operated locations; or contractor owned, contractor operated locations performing paint and coating removal from critical corrosion-sensitive components of military aviation and vessels for DOD.

(2) [Reserved].

§ 751.209 Downstream notification.

Each person who manufactures, processes, or distributes in commerce NMP for any use after [date 45 calendar days after the date of publication of the final rule] must, prior to or concurrent with the shipment, notify companies to whom NMP is shipped, in writing, of the restrictions described in this subpart.

§ 751.211 Recordkeeping.

(a) Each person who manufactures, processes, or distributes in commerce any NMP after [date 45 calendar days after the date of publication of final rule] must retain in one location at the headquarters of the company documentation showing:

(1) The name, address, contact, and telephone number of companies to whom NMP was shipped;

(2) A copy of the notification provided under § 751.209; and

(3) The amount of NMP shipped.

(b) The documentation in (a) must be retained for 3 years from the date of shipment.

[OPTION 2 PROPOSED REGULATORY TEXT FOR §§ 751.205, 751.209, and 751.211: Co-Proposal 2: NMP—Continued Use with Requirements for Product Reformulation, Labeling, and PPE]

§ 751.205 Paint and Coating Removal for Specified Uses.

(a) *Processors.* (1) Formulations of NMP for paint and coating removal that contain more than 35 percent by weight of NMP must not be manufactured, processed, or distributed in commerce after [date 180 calendar days after the date of publication of the final rule], except for product formulations destined to be used by DOD or contractors performing work only on DOD projects for paint and coating removal from critical corrosion-sensitive components of military aviation and vessels as defined in § 751.203 and subsection (b)(1).

(2) Conduct glove testing for each separate formulation of NMP, with a variation of more than 1 percent in any component of a paint and coating removal product containing NMP considered a separate formulation.

(i) The processor must be able to demonstrate that the gloves provide an impervious barrier to prevent dermal exposure during normal and expected duration and conditions of exposure.

(ii) The processor must subject the gloves to the expected conditions of exposure, including the likely combinations of chemical substances to which the gloves may be exposed in the work area.

(3) Provide a label securely attached to each NMP paint and coating removal product and not in the form of a booklet or other pull off type labeling. Label information must be prominently displayed and in an easily readable font size. Each separate NMP paint and coating removal product must be labeled with the following information:

(i) A notice that 40 CFR 751.205 requires commercial users of NMP paint and coating removal products to

establish an occupational dermal and respiratory protection program, including the use of specialized gloves and an air exposure limit or respirator.

(ii) A warning to consumers that fetal death and other irreversible health effects may occur as a result of using the NMP product;

(iii) An identification of the formulation-specific gloves that will provide protection from the NMP product and a direction to use a new pair of those gloves for each time the NMP product is used;

(iv) A direction for consumers to either use the product outdoors or adequately ventilate the workspace by opening windows and adding fans;

(v) A warning for consumers to not apply the product as a spray;

(vi) A direction to wear clothing that covers exposed skin;

(vii) A direction to use a respirator with an Assigned Protection Factor (APF) of 10. Refer to § 751.205(c)(3)(ii) for respirators having an APF of 10 or greater;

(b) *Commercial users.* Each person or company engaged in any commercial NMP paint and coating removal activities [date 180 calendar days after the date of publication of the final rule] is prohibited from using paint and coating removal products or formulations that contain more than 35 percent by weight of NMP and must institute a worker protection program that includes the requirements of § 751.205(c) and (e) except for product formulations destined to be used for paint and coating removal from critical corrosion-sensitive components of military aviation and vessels as defined in § 751.203. After [date 10 years after the date of publication of the final rule], all persons are prohibited from using paint and coating removal products or formulations that contain more than 35 percent by weight of NMP and must institute a worker protection program that includes the requirements of § 751.205(c) and (e).

(1) Any paint and coating removal from critical corrosion-sensitive components of military aviation and vessels must be conducted under the following restrictions:

(i) All paint and coating removal from critical corrosion-sensitive components of military aviation and vessels using NMP must be conducted at DOD installations; or at government owned, contractor operated locations; or at contractor owned and contractor operated locations performing paint and coating removal from critical corrosion-sensitive components of military aviation and vessels for DOD.

(ii) [Reserved].

(2) [Reserved].

(c) *Personal protective equipment (PPE).*

(1) *General.* (i) Protective equipment that is of safe design and construction for the work to be performed must be provided, used, and maintained in a sanitary, reliable, and undamaged condition. The employer must select PPE that properly fits each affected employee and communicate PPE selections to each affected employee.

(ii) *Training.* The employer must provide training to each employee required to use PPE.

(A) Each affected employee must be trained to know at least the following:

(1) When PPE is necessary.

(2) What PPE is necessary.

(3) How to properly don, doff, adjust, and wear PPE.

(4) The limitations of the PPE.

(5) The proper care, maintenance, useful life and disposal of the PPE.

(B) Each affected employee must demonstrate an understanding of these elements and the ability to use PPE properly before being allowed to perform work requiring the use of PPE.

(C) Retraining is required when previous training is rendered obsolete, whether due to changes in the workplace or the type of PPE, or when the employer has reason to believe that a previously-trained employee does not have the understanding and skill required by this subparagraph.

(2) *Dermal protective equipment.* (i) *General.* Each person who is reasonably likely to be dermally exposed in the work area to an NMP paint and coating removal product through direct handling of the substance or through contact with equipment or materials on which the substance may exist, or because the substance becomes airborne must be provided with, and required to wear, personal protective equipment that provides a barrier to prevent dermal exposure to the substance in the specific work area where it is selected for use.

(ii) *Specific dermal protective equipment.* The required dermal protective equipment includes, but is not limited to, the following items:

(A) Formulation-specific gloves as indicated on the NMP paint and coating removal product label. A new pair must be supplied and worn each time the NMP product is used.

(B) Impervious clothing covering the exposed areas of the body (e.g. long pants, long shirt).

(iii) *Demonstration of imperviousness.* The employer must demonstrate that each item of chemical protective clothing selected provides an impervious barrier to prevent dermal exposure during normal and expected

duration and conditions of exposure within the work area by any one or a combination of the following:

(A) Testing the material used to make the chemical protective clothing and the construction of the clothing to establish that the protective clothing will be impervious for the expected duration and conditions of exposure. The testing must subject the chemical protective clothing to the expected conditions of exposure, including the likely combinations of chemical substances to which the clothing may be exposed in the work area.

(B) Evaluating the specifications from the manufacturer or supplier of the chemical protective clothing, or of the material used in construction of the clothing, to establish that the chemical protective clothing will be impervious to the chemical substance alone and in likely combination with other chemical substances in the work area.

(3) *Respiratory protection.* (i) *General.* Each person who is reasonably likely to be exposed in the workplace to the use of NMP in paint and coating removal products must be provided with and is required to wear, at a minimum, a NIOSH-certified respirator with an APF of 10. All respirators must be issued, used, and maintained in accordance with an appropriate written respiratory protection program that is specific to the workplace and that includes the following:

(A) Procedures for selecting respirators for use in the workplace.

(B) Medical evaluations of employees required to use respirators.

(C) Fit testing procedures.

(D) Procedures for proper use of respirators.

(E) Procedures and schedules for cleaning, disinfecting, storing, inspecting, repairing, discarding, and otherwise maintaining respirators.

(F) Procedures to ensure adequate air quality, quantity, and flow of breathing air for atmosphere-supplying respirators.

(G) Procedures for regularly evaluating the effectiveness of the program.

(H) Recordkeeping.

(ii) *Authorized respirators.* The following NIOSH-certified respirators meet the minimum requirements of this section:

(A) Any NIOSH-certified air-purifying elastomeric half-mask respirator equipped with N100 (if oil aerosols absent), R100, or P100 filters;

(B) Any appropriate NIOSH-certified N100 (if oil aerosols absent), R100, or P100 filtering facepiece respirator;

(C) Any NIOSH-certified air-purifying full facepiece respirator equipped with

N100 (if oil aerosols absent), R100, or P100 filters. A full facepiece air-purifying respirator, although it has a higher APF of 50, is required to provide full face protection because the PMN substance presents significant exposure concern for mucous membranes, eyes, or skin;

(D) Any NIOSH-certified negative pressure (demand) supplied-air respirator equipped with a half-mask; or

(E) Any NIOSH-certified negative pressure (demand) self-contained breathing apparatus (SCBA) equipped with a half mask.

(d) *Alternative to respirator requirement.* Commercial users of NMP products for paint and coating removal may use an existing chemical exposure limit (ECEL) as a means of controlling inhalation exposures whenever practicable rather than respirators.

(1) *Existing Chemical Exposure Limit (ECEL).* The employer must ensure that no person is exposed to an airborne concentration of NMP in excess of 20 mg/m³ (the ECEL) as an 8-hour time-weighted average (TWA) without using a respirator. For non-8-hour work-shifts, the ECEL for that work-shift (ECEL_n) must be determined by the following equation: $ECEL_n = ECEL \times (8/n) \times [(24-n)/16]$, where *n* = the number of hours in the actual work-shift.

(2) *Verification of method validity.* An independent accredited reference laboratory must verify the validity of the analytical method for NMP in paint and coating removal products. The sampling and analytical method, and all exposure monitoring data relied on by the employer, must be accurate to within 25% at a 95% confidence level for concentrations of NMP ranging from one half the ECEL to twice the ECEL.

(3) *Exposure monitoring.* The employer must collect samples that are representative of the potential exposure of each person who is reasonably likely to be exposed to airborne concentrations of NMP.

(i) *Initial monitoring.* Before the employer may deviate from the respirator requirements in subsection (d) of this section, the employer must conduct initial exposure monitoring to accurately determine the airborne concentration of NMP for each exposure group in which persons are reasonably likely to be exposed.

(ii) *Results.* (A) Employees whose exposures are represented by initial monitoring results below the ECEL need not wear the respirators required in subsection (d) of this section.

(B) Employees whose exposures are represented by initial monitoring results above the ECEL must continue to wear the respirators required in subsection

(d) of this section until such time as two monitoring results below the ECEL, sampled at least 24 hours apart, are obtained.

(C) Within 15 days of the date exposure monitoring results are received, the employer must provide the results to each person whose exposure is represented by the monitoring. If the result is above the ECEL, the employer must also provide the employee with information on the actions the employer will take to reduce employee exposures to the ECEL or below.

(iii) *Periodic monitoring.* The employer must repeat exposure monitoring:

(A) Every 6 months for those employees whose initial monitoring results are between 0.5 ECEL and the ECEL, until such time as 2 results below 0.5 ECEL, from samples collected at least 24 hours apart, are obtained,

(B) Every 3 months for those employees whose initial monitoring results are at or above the ECEL. If 2 results below the ECEL, from samples collected at least 24 hours apart, are obtained, then frequency may be reduced to every 6 months. If 2 results below 0.5 ECEL, from samples collected at least 24 hours apart, are obtained, then exposure monitoring under this subsection need not be repeated unless there is a process, equipment, environment, or personnel change.

(C) At any time when process, equipment, environment, or personnel changes may reasonably cause new or additional exposures to NMP.

(e) *Hazard communication program.*

Each employer that performs commercial NMP paint and coating removal activities must develop and implement a written hazard communication program for the substance in each workplace. The written program will, at a minimum, describe how the requirements of this section for labels, SDSs, other forms of warning material, and employee information and training will be satisfied. The employer must make the written hazard communication program available, upon request, to all employees, contractor employees, and their designated representatives. The employer may rely on an existing hazard communication program that satisfies the requirements of this paragraph.

(1) *General.* The written program must include the following:

(i) A list of each NMP paint and coating removal product present in the work area. The list must be maintained in the work area and must use the identity provided on the appropriate

SDS. The list may be compiled for the workplace or for individual work areas.

(ii) The methods the employer will use to inform contractors of the presence of NMP paint and coating removal products in the employer's workplace and of the provisions of this part applicable to the NMP products if employees of the contractor work in the employer's workplace and are reasonably likely to be exposed to the NMP products while in the employer's workplace.

(2) *Employee information and training.* Each employer must ensure that employees are provided with information and training on NMP paint and coating removal products. This information and training must be provided at the time of each employee's initial assignment to using an NMP paint and coating removal product.

(i) Information provided to employees under this paragraph must include:

(A) The requirements of this section.

(B) The location and availability of the written hazard communication program.

(ii) Training provided to employees must include:

(A) The potential human health hazards of the NMP paint and coating removal products as specified on the label.

(B) The measures employees can take to protect themselves from the NMP paint and coating removal products, including specific procedures the employer has implemented to protect employees from exposure to the substance, including appropriate work practices, emergency procedures, personal protective equipment, engineering controls, and other measures to control worker exposure.

(3) *Existing hazard communication program.* The employer need not take additional actions if existing programs and procedures satisfy the requirements of this section.

§ 751.209 Downstream notification.

Each person who manufactures, processes, or distributes in commerce NMP for any use after *[date 45 calendar days after the date of publication of the*

final rule] must, prior to or concurrent with the shipment, notify companies to whom NMP is shipped, in writing, of the restrictions described in this subpart.

§ 751.211 Recordkeeping.

(a) Each person who manufactures, processes, or distributes in commerce any NMP after *[date 45 calendar days after the date of publication of final rule]* must retain in one location at the headquarters of the company documentation showing:

(1) The name, address, contact, and telephone number of companies to whom NMP was shipped;

(2) A copy of the notification provided under § 751.209; and

(3) The amount of NMP shipped.

(b) The documentation in (a) must be retained for 3 years from the date of shipment.

Department of Transportation

14 CFR Part 399

Transparency of Airline Ancillary Service Fees; Proposed Rule

DEPARTMENT OF TRANSPORTATION**Office of the Secretary****14 CFR Part 399**

[Docket No. DOT-OST-2017-0007]

RIN 2105-AE56

Transparency of Airline Ancillary Service Fees**AGENCY:** Office of the Secretary (OST), Department of Transportation (DOT).**ACTION:** Supplemental Notice of Proposed Rulemaking (SNPRM).

SUMMARY: This SNPRM proposes to require air carriers, foreign air carriers, and ticket agents to clearly disclose to consumers at all points of sale customer-specific fee information, or itinerary-specific information if a customer elects not to provide customer-specific information, for a first checked bag, a second checked bag, and one carry-on bag wherever fare and schedule information is provided to consumers. This SNPRM further proposes to require each covered carrier to provide useable, current, and accurate (but not transactable) baggage fee information to all ticket agents that receive and distribute the carrier's fare and schedule information, including Global Distribution Systems and metasearch entities. On covered carrier and ticket agent Web sites, the SNPRM would require the baggage fee information to be disclosed at the first point in a search process where a fare is listed in connection with a specific flight itinerary, adjacent to the fare. The SNPRM would permit carriers and ticket agents to allow customers to opt-out of receiving the baggage fee information when using their Web sites.

DATES: Comments must be received by March 20, 2017. Comments received after this date will be considered to the extent practicable.

ADDRESSES: You may file comments identified by the docket number DOT-OST-2017-0007 by any of the following methods:

- **Federal eRulemaking Portal:** Go to <http://www.regulations.gov> and follow the online instructions for submitting comments.
- **Mail:** Docket Management Facility, U.S. Department of Transportation, 1200 New Jersey Ave. SE., Room W12-140, Washington, DC 20590-0001.
- **Hand Delivery or Courier:** The Docket Management Facility is located on the West Building, Ground Floor, of the U.S. Department of Transportation, 1200 New Jersey Ave. SE., Room W12-140, between 9 a.m.

and 5 p.m., Monday through Friday, except Federal holidays.

- **Fax:** 202-493-2251.

Instructions: You must include the agency name and the Docket Number DOT-OST-2017-0007 or the Regulatory Identification Number (RIN) for the rulemaking at the beginning of your comment. All comments received will be posted without change to <http://www.regulations.gov>, including any personal information provided.

Privacy Act: Anyone is able to search the electronic form of all comments received in any of our dockets by the name of the individual submitting the comment (or signing the comment if submitted on behalf of an association, a business, a labor union, etc.). You may review DOT's complete Privacy Act statement in the **Federal Register** published on April 11, 2000 (65 FR 19477-78), or you may visit <http://DocketsInfo.dot.gov>.

Docket: For access to the docket to read background documents or comments received, go to <http://www.regulations.gov> or to the street address listed above. Follow the online instructions for accessing the docket.

FOR FURTHER INFORMATION CONTACT:

Kimberly Graber or Blane A. Workie, Office of the Assistant General Counsel for Aviation Enforcement and Proceedings, U.S. Department of Transportation, 1200 New Jersey Ave. SE., Washington, DC 20590, 202-366-9342 (phone), kimberly.graber@dot.gov or blane.workie@dot.gov (email).

SUPPLEMENTARY INFORMATION:**Background**

The Notice of Proposed Rulemaking, titled Transparency of Airline Ancillary Service Fees and Other Consumer Protection Issues, Docket No. DOT-OST-2014-0056, 79 FR 29970, May 23, 2014 (Consumer Protection NPRM), contained a number of proposals to enhance consumer protections, including a proposal to require the disclosure of certain airline ancillary service fees. This proposed disclosure requirement was one of the more controversial provisions of the rulemaking and generated significant comments from consumers, airlines, ticket agents and other interested parties. In light of the comments on this issue, the Department is issuing this SNPRM, which focuses solely on the issue of transparency of certain ancillary service fees. The other issues in the 2014 NPRM are being addressed separately. See RIN 2105-AE11, Enhancing Airline Passenger Protections III; and RIN 2105-AE57, Enhancing Airline Passenger Protections IV.

In this SNPRM, the Department proposes to require disclosure at all points of sale of the customer-specific fees for first and second checked bag and carry-on bag but does not propose to require disclosure of the fee for advance seat assignment. In addition, the Department proposes to require carriers to provide certain baggage fee information to ticket agents so that both carriers and ticket agents would be able to provide customer-specific baggage fee information to consumers. We invite all interested parties to comment on the proposals set forth in this notice. Our final action will be based on comments and supporting evidence from the public filed in this docket, and on our own analysis and regulatory evaluation.

A. Need for Rulemaking and Legal Authority

The NPRM: In the NPRM, the Department described the problem identified by consumers and consumer advocacy groups of the lack of transparency of ancillary service fees in air transportation pricing. That is, not being able to determine the true cost of travel due to the lack of information regarding certain ancillary service fees. This lack of transparency of fees for unbundled services (*i.e.*, services that historically had been included in the air fare but for which many carriers now charge a separate fee is particularly notable when consumers are attempting to purchase air transportation through a ticket agent rather than directly from the carrier but it occurs at both ticket agent and airline outlets. Corporate travel agents have also complained about the lack of access to ancillary service fee information.

Online travel agencies (OTAs), metasearch sites, "traditional" travel agencies, and travel management companies generally obtain most of their information regarding air transportation options indirectly through Global Distribution Systems (GDSs). GDSs essentially facilitate the purchase of tickets between airlines and consumers through third parties but do not have complete information regarding ancillary service fees. As a result, when researching air transportation options and making decisions on whether to purchase air transportation, consumers continue to have difficulty determining the total cost of travel because the fees for basic ancillary services are not available through all sales channels. Consumers also experience difficulty on carrier Web sites because fees are provided on lengthy static lists, and many ancillary service fees are listed as a range, so consumers do not necessarily know the

specific fees that apply to their travel when purchasing air transportation. With respect to baggage, the existing disclosure requirements mandate specific information if a carrier or a ticket agent has a Web site accessible for ticket purchases by the general public in the United States, but passengers must frequently review lengthy and complex charts to determine the exact baggage fees that apply to their air transportation particularly for interline or international itineraries.

The Department's goal is to protect consumers from hidden and deceptive fees and enable them to determine the true cost of travel in an effective manner when they price shop for air transportation. The problem of hidden fees has been brought to our attention by consumer complaints, comments on the second Enhancing Airline Passenger Protections rulemaking, and comments to the docket for the Advisory Committee for Aviation Consumer Protection. We also note that members of Congress representing constituents have expressed support for full, more specific, disclosure of ancillary service fees.

In the 2014 NPRM, we provided an overview of the airline distribution system based on information gathered from representatives of carriers, GDSs, consumer advocacy organizations, and trade associations, as well as other interested entities, including third-party technology developers. We noted that approximately 50% of tickets are sold by airlines directly to consumers, and the remainder is sold through ticket agents. Further, in the United States, three GDSs (Sabre, Travelport and Amadeus) control the distribution of the airline product for the ticket agent channel and most airlines use the GDSs to distribute their products to ticket agents, including corporate travel agents that sell the higher revenue tickets. The NPRM noted that airlines state they have made some efforts to reduce their reliance on GDSs and transition to direct connections between airline reservation systems and ticket agent systems but contractual arrangements make that difficult. As stated in the NPRM, carriers and carrier associations have expressed concern that a Department requirement to distribute information through a GDS would reinforce the existing distribution patterns and stifle innovation. Some stakeholders have alleged that if existing distribution patterns are reinforced, carriers will no longer have sufficient incentive to invest in new distribution technologies, which might ultimately provide more information to the benefit of consumers. In connection with new

distribution technologies, the 2014 NPRM also mentioned that the International Air Transport Association (IATA) applied to the Department of Transportation for approval of its agreement establishing the framework for the IATA New Distribution Capability (NDC). That application was pending at the time of NPRM publication but has since been approved. NDC is essentially an XML-based technical standard for use in airline distribution, including direct connect services, that has been developed by IATA in cooperation with air transportation stakeholders. The goal appears to be to change how airlines sell their products today by using the enhanced platform to quickly generate dynamic, personalized offers. For more information, see docket DOT-OST-2013-0048. The NDC standard is available to any party and has been implemented by some entities since the 2014 NPRM was published.

Our discussion in the 2014 NPRM explained that although airlines generally distribute fare, schedule, and availability information through GDSs, they generally do not distribute ancillary service fee information in the same manner. The NPRM also outlined some of the technological and competitive concerns raised by air transportation industry stakeholders. We also noted that in contrast to airlines, GDSs assert that any transition to direct connect services will succeed or fail based on whether the services meet the needs of travel agencies and the consumers they serve, regardless of existing contracts. As noted in the NPRM, GDSs disputed the position that there is no need for a Department requirement, stating that airlines and ticket agents have not been able to come to agreements that would allow airlines to provide ancillary service fee information to ticket agents so they could in turn provide such information to consumers.

The 2014 NPRM explained that our decision to initiate a rulemaking regarding distribution of ancillary service fee information rested on the conclusion that consumers are continuing to have difficulty finding ancillary service fee information, which limits consumers' ability to determine the true cost of travel. We also recognized in the NPRM that carriers and GDSs state they share our goal of transparency of ancillary service fee information. In the NPRM we made clear that the Department is working to find the most beneficial disclosure rule for consumers while avoiding any adverse impact on innovations in the air transportation marketplace, contract

negotiations between carriers and their distribution partners, or a carrier's ability to set prices for its services in response to its own commercial strategy and market forces. As the NPRM stated, consumers need to be protected from hidden and deceptive fees that prevent them from effectively price shopping—that is, determining while shopping and before purchasing, the total costs of air transportation. The NPRM explained that failing to disclose basic ancillary service fees in an accurate and up-to-date manner before a consumer purchases air transportation is an unfair and deceptive practice. We identified a number of questions regarding the need for rulemaking on which we requested comment, including questions regarding the difficulty consumers have finding fee information, what fee information consumers wanted to have prior to purchase, and whether either of the Department's proposals would make fees easier to find. We also explained the alternatives that we had considered.

Comments: Consumer comments in this rulemaking overwhelmingly supported Department action on disclosure of ancillary service fees. Over 600 consumers commented on transparency issues generally, which for many consumers encompasses disclosure of ancillary service fees as well as the full airfare, including taxes and fees. Over 450 consumers clearly supported additional requirements relating to disclosure of ancillary service fees while fewer than ten commented in opposition to additional disclosure requirements. Consumer advocacy groups Travelers United and National Consumers League also commented in support of the need for a rulemaking, stating that airlines publish what are in effect partial prices and that the full cost of travel is masked at the initial purchase and only revealed in a secondary buying process. Consumers Union and the U.S. Public Interest Research Group (U.S. PIRG) also supported Department action in this area, stating that the Department should require disclosure at every point of sale, early in the purchasing process. They went on to state that too many U.S. carriers have made ancillary service fee information difficult or impossible to obtain until close to or at the point of actual purchase or, in some channels, not available at all. FlyersRights also supported the rulemaking on disclosure of ancillary service fees, stating that unbundling is rapidly making price shopping difficult to impossible for consumers. It further stated that baggage fee information often is buried on a carrier's Web site and can be confusing

and complex. To illustrate its point, FlyersRights identified one legacy carrier that charges up to nine different fees for baggage depending on weight, size, and number of bags.

Open Allies, which described itself as a coalition of more than 400 independent distributors and sellers of air travel, corporate travel departments, travel trade associations and consumer organizations, commented in favor of Department action in this area. According to Open Allies, the rule is needed because ancillary service fees are not accessible and that identifying total travel cost is complex, confusing, and needlessly time consuming. According to Open Allies, the market is not reacting quickly or completely enough to address the issue. Open Allies pointed to a survey it conducted of over 1,000 adults in the United States, indicating that 55 percent of respondents said that they were surprised by additional fees after purchasing a ticket; 88 percent said that Department action is important; 81 percent believe that current airline practices are “unfair and deceptive;” and 47 percent said that it was hard to search and find the lowest price for travel.

Open Allies argued that the Department should not rely on competition because fees are still hidden, despite existing Department requirements, which results in consumers making sub-optimal purchasing decisions. Open Allies relied on consumer comments in the docket, saying that they show that consumers feel deceived and confused and do not understand the true, full cost of travel. According to Open Allies, consumers generally give two key reasons for supporting increased disclosure of ancillary service fees: (1) It would allow them to compare prices across various airlines; and (2) it would prevent airlines from surprising them with fees after they have purchased their airfare. Open Allies commented that there are many benefits to enhanced disclosure of price information such as ancillary service fees, including that it lowers prices, enhances competition, and promotes informed buyers. According to Open Allies, airlines lack a commercial incentive to provide ancillary service fee information to the “neutral” travel agency channel because airlines have an interest in not allowing ticket agents to show the full cost of travel at the shopping stage because if travel appears less expensive, consumers will be more likely to complete a purchase. Open Allies further pointed out that an airline is unlikely to voluntarily display ancillary

service fees on a travel agent display because it would make the airline’s fares appear more expensive when compared to the fares of other airlines that do not disclose ancillary service fee information.

In support of its position, Open Allies cited a 2010 GAO Report and a follow-on 2014 report, describing the problem of ancillary service fee disclosure as a continuing problem. Open Allies pointed out that while some individual airlines and individual GDSs have announced agreements regarding distribution of certain ancillary service fees, those agreements are generally limited to premium seating on some of the individual airline’s flights and do not provide all ticket agents access to that information. Therefore, consumers are still unable to discover all basic ancillary service fees when searching for flights. According to Open Allies, the Department has substantial evidence to support its rulemaking as well as ample authority under § 41712 (unfair or deceptive practices). Open Allies compared the Department’s authority to that of the FTC and stated that analogous FTC precedent on unfair or deceptive practices establishes that the Department has the legal authority to proceed with this rulemaking.

The three GDSs—Amadeus, Sabre, and Travelport—all supported the rulemaking, stating that consumers that use ticket agents to shop for air transportation do not have access to all ancillary service fee information. According to Sabre, for consumers to “know the full price of travel before they are locked into a purchase” the Department must act. The GDSs also stated that airlines will not share ancillary service fee information with ticket agents, except on a limited basis, unless the Department requires the information to be shared. Travelport stated that airlines are motivated to increase revenues by driving consumer costs up through “obfuscation of the true cost of flying.” Amadeus points to airline opposition to disclosure requirements, particularly opposition by U.S. airlines, as evidence that the market will not resolve the problem. Travel Technology Association (Travel Tech), a trade association for major OTAs, GDSs, and some entities operating metasearch engines focused on travel, also stated that a problem remains for consumers trying to uncover charges for additional services and stated that consumers must search to discover the true cost of their air travel.

Several travel agents and travel agent associations also stated there is a need for Department action in this area. The American Society of Travel Agents

(ASTA) joined in the comments of Open Allies and stated that the Department’s proposals do not go far enough to address widespread confusion among consumers. A number of travel agents submitted comments stating that their customers could not calculate the true cost of airfare with certainty and that the travel agents themselves could not provide a quote with certainty because of the complexity of and variation in ancillary service fees charged from airline to airline. Those travel agents supported mandating that airlines disclose the costs of bag fees and seat assignments. The United States Tour Operators Association (USTOA) opposed being subject to disclosure regulations but commented that consumers have expressed strong support for early disclosure of information on ancillary service fees. USTOA pointed to a survey that shows that 45 percent of respondents reported difficulty in budgeting for air travel due to the proliferation of fees and difficulty in determining the costs of flying. Survey respondents also indicated that total cost of travel is very important to purchasing decisions. Corporate travel agents also commented that they were concerned about disclosure. Global Business Travel Association stated that there is a need for disclosure requirements because despite investing resources, acquiring technologies, and changing travel policies, its members are still facing challenges finding basic ancillary fee information for baggage and seat assignments. Business Travel Coalition (BTC) commented in support of requiring disclosure of fees, stating that airlines are “masking the all-in price of air travel.”

Computer and Communications Industry Association (CCIA), advocating for metasearch entities, commented in favor of Department action to make sure consumers have the information needed to determine the full cost of travel. TripAdvisor and Skyscanner, which both operate flight search tools, also commented in favor of Department action requiring airlines to disclose ancillary service fee information to ensure transparency for the benefit of consumers. Of airline commenters, only Southwest supported the Department requiring greater fee disclosure, noting that consumers will “be better able to arrive at the true cost of air transportation.” Finally, several commenters, including ASTA, BTC, FlyersRights, and Travel Tech also noted that airlines are not subject to State and local consumer protection laws due to Federal preemption, and

therefore, only the Department can take action to protect consumers in this area.

The Department also received many comments that opposed any further requirement pertaining to disclosure of ancillary service fees as specific charges. A4A (Airlines for America, the trade association of the larger U.S. airlines) argued that there is no need for any proposal regarding ancillary service fee information because the industry has already provided that information in response to existing Department regulatory requirements and market pressure and no consumer harm is occurring. A4A further argued that the Department does not have the authority to require airlines to disclose certain ancillary service fees in displays of fare search results because the failure to provide that information at the time fare information is presented to consumers does not amount to an unfair or deceptive practice. A4A also pointed out that on some occasions when discussing the ancillary service fee disclosure issue, the Department has described it in terms of the ability of consumers to engage in comparison shopping. A4A argued that the Department does not have regulatory authority to dictate the terms of carrier distribution or ancillary service fee disclosure to enhance comparison shopping.

In addition to stating there is no need for any ancillary service fee proposals, A4A opposed any ancillary service fee disclosure requirement on competitive grounds, alleging that the rulemaking would effectively require airline distribution through GDSs, which would put airlines at a competitive disadvantage. According to A4A, the Department recognized the powerful market position of GDSs in a 2004 rulemaking¹ and still determined not to regulate those entities. A4A stated that GDSs still have significant market power and to be competitive most airlines have to distribute fare information through all three GDSs; meanwhile, GDSs prevent their client ticket agents from directly connecting to an airline. A4A stated that in contrast to fares, carriers are not dependent on GDSs for distribution of ancillary service information and this places airlines in a better position to negotiate with GDSs, to the benefit of consumers. For example, according to A4A, GDSs agreed to develop new distribution technologies as part of negotiations over ancillary services. A4A stated that the proposed regulation would strengthen

the negotiating position of GDSs at the expense of the airlines if adopted.

Meanwhile, according to airline associations, the market is working. A4A commented that existing Department regulations combined with market forces have led to “enhanced fee disclosure practices,” and that carriers want to sell ancillary services, especially to business travelers who constitute a large segment of their repeat customers and revenue producers. A4A went on to explain that carriers are already incentivized to distribute information about ancillary products and fees and to facilitate the sale of ancillary services through multiple channels, including travel agencies, if they can do so on commercially reasonable terms. According to A4A, carriers and GDSs have already developed the ability (using the ATPCO filing system) to disclose information such as first and second checked bag fees to travel agents. A4A further noted that some airlines have made it possible for some agents to purchase certain ancillary services for consumers and some GDSs have developed mechanisms for ticket agents to buy services directly from carrier Web sites. A4A also pointed to tools on carrier Web sites that allow consumers to obtain customer-specific information through an airline Web site after providing information from the purchased ticket, and third-party Web sites that provide ancillary service fee information as the “beneficial result of the existing environment.” A4A also criticized Open Allies’ reliance on survey results, stating that the survey was flawed for a number of methodological reasons and “it should not be relied upon to arrive at conclusions concerning perceptions and attitudes about ancillary services held by people who fly on commercial airlines in the United States.” According to A4A, GDSs are trying to obtain the commercial benefit of access to ancillary service fee information through regulation instead of through negotiations, even though negotiated agreements are possible. A4A also stated that GDSs have made concessions on pricing and technology through commercial agreements. A4A concluded that regulation will result in higher GDS fees which will in turn be passed on to consumers through higher ticket prices, to the detriment of the public.

In supplemental comments, A4A stated that the three GDSs engaged in pilot projects to “begin adapting to” the NDC initiative and many airlines have invested in technology solutions. In addition, a variety of technology service companies are building solutions in the area. According to A4A, these

marketplace developments prove that regulation is unneeded. A4A provided a number of examples of agreements between airlines and GDSs that it says show that carriers are sharing ancillary service fee information with GDSs. A4A went on to say that it is more and more common for carriers to sell bundled fares on their own sites, which A4A stated often results in discounts and is a consumer-friendly method of display. A4A further stated that mandating disclosures on the first page that displays fares interferes with airline efforts to differentiate their products and compete on service and price, as well as “squandering” the investment made by carriers on bundled pricing initiatives and technology to display those prices. A4A concluded in its supplemental comments that marketplace solutions that compel all parties to negotiate and use the most efficient data-sharing and latest technology will lead to time savings for consumers.

IATA commented that the market has fundamentally changed since the Department first considered requiring carriers to disclose ancillary service fees and consumers now have “more than ample” access to information about ancillary services and fees prior to making purchase decisions. According to IATA, there is no lack of information about ancillary service fees causing harm to consumers. Further the Department has not demonstrated there is any unfair or deceptive practice that will be prevented by further regulating the disclosure of ancillary service fees, therefore, they argued, the Department does not have the authority to regulate in this area.

IATA further argued that marketplace solutions are already making any rulemaking regarding ancillary service fees unnecessary as the rapid changes in distribution are working to the benefit of consumers and any Departmental intervention in this rapidly changing market will interfere and result in suboptimal solutions. IATA argued that airline Web sites already offer comprehensive and accurate information about ancillary services and fees. IATA acknowledged that airlines provide fee information as a range of fees in a static format but stated that this is not evidence of fraud or deception, merely “evidence of the complexity of capturing the wide variety of factors that are considered when dynamically setting the price for a specific ancillary service for a specific customer.” IATA went on to state that carriers are coming to agreements to provide ancillary service fee information to GDSs for distribution directly to agents rather

¹Dep’t of Transp., Computer Reservation System (CRS) Regulations, Final Rule, 69 FR 976, 996 (Jan. 7, 2004) (“CRS Rulemaking”)

than through outdated fare filing systems. IATA also stated that the adoption of the NDC standard will provide transparency and efficiency. According to IATA, the Department should not intervene in distribution and should rely on the market to resolve any disclosure issues. Air Transport Association of Canada also opposed the Department rulemaking regarding disclosure of ancillary service fees, stating that the market is addressing the issue and the Department does not have the legal authority to intervene in the deregulated airline industry and dictate how airlines distribute their products and services.

Several airlines also commented in opposition to the rulemaking. American Airlines joined in the comments of A4A and further stated that the Department's proposals do not address specific instances of demonstrated harm to consumers that cannot reasonably be avoided and the rulemaking is "beyond the recognized limits of the Department's regulatory powers." American alleged that the Department based its reasoning on a need for comparison shopping, which American said is an unreasonable and inadequate basis for rulemaking. Frontier Airlines opposed any disclosure requirements, stating it "believes that competitive market forces and the Department's existing regulations are more than adequate to inform and protect consumers." JetBlue also endorsed the comments of both A4A and IATA and stated that the Department should rely on market forces. According to JetBlue, the Department assumes a problem regarding consumers not knowing the true cost of travel and the NPRM does not provide a foundation for that assumption. United also endorsed the comments of A4A and stated that the market is already addressing many of the Department's concerns so the Department should refrain from issuing regulations regarding ancillary service fee disclosure. United further stated that the Department does not have evidence that supports the need for the proposed rulemaking. Spirit Airlines similarly opposed any rulemaking on disclosure of ancillary service fees, stating that it is not necessary and not in the public interest. According to Spirit, the Department should defer to the market place which is rapidly developing and "progressively improving reasonable consumers' ability to determine the total cost of their travel before purchase."

Several foreign air carriers endorsed IATA's comments and opposed any Department regulation of disclosure of ancillary service fees. Aerovías de México, S.A. de C.V., (Aeromexico) and

Air Transat endorsed the comments submitted by IATA regarding disclosure of ancillary service fees, and stated that the market is already addressing the issues raised by the Department. Further, any intervention by the Department will likely have a negative impact on consumers. In comments filed on behalf of the Avianca carrier group, Avianca endorsed IATA's comments, stating that the marketplace already is addressing the Department's concerns regarding disclosure of ancillary service fees, and any regulatory intervention likely will have a negative impact on both consumers and carriers. Air New Zealand supported the comments of IATA and stated that the current disclosure requirements are adequate to protect the consumer. Compañía Panameña de Aviación, S.A. (Copa Airlines) opposed Department rules regarding ancillary service fee disclosure, stating such rules may have "unintended adverse consequences that would significantly diminish any such benefits by making its implementation financially and technologically cumbersome for carriers." Qatar Airways (Qatar) also endorsed the comments of IATA and added that the market is working. Qatar went on to state that Department intervention will have a negative impact on consumers. Scandinavian Airlines System also endorsed IATA's comments and stated the rulemaking will have a negative impact on consumers. Virgin Atlantic Airways (Virgin Atlantic) commented that the market is evolving to meet customer preferences and the Department's current fee disclosure requirements are adequate. Further, requiring carriers to provide ancillary service fee information to ticket agents deprives carriers of their right to decide how to market their ancillary services and to distribute such information in a way that is most cost-effective for them.

The Arab Air Carriers Organization (AACO) commented that market developments since the Department began to address ancillary services in rulemakings have resulted in market action that is heading towards developing a data transmission standard that would make the flow of information between the airlines and agents more efficient. AACO went on to state that the Department should not specify how airlines display information. AACO also stated that a requirement to distribute through the GDSs would have a negative effect on future innovation in the distribution and display of ancillary services and fees as well as give GDSs the upper hand in contract negotiations with airlines.

AAA, a leisure travel agent trade organization, commented that it supports transparency but specific mandates in this area may be premature at this time. AAA stated it was concerned about stifling innovation and wanted airlines to work with GDSs on agreements to distribute full ancillary fee information. Momondo Group, an online travel media and technology company that operates a flight search tool, commented that it supports transparency as its primary objective. However, it stated that it would be extremely costly to provide accurate information and avoid consumer confusion. It recommended that the Department conduct a more detailed examination of the problem before implementing a regulation that will impact a variety of entities, including operators of metasearch engines.

DOT Response: The sheer number, length, and variety of comments on this issue, as well as the strongly held positions on all sides, illustrate the presence of a problem and the complexity of addressing it. Airlines and their associations stated that the Department has not demonstrated the harm to consumers that the Department's rulemaking is intended to address. For example, in support of its position that information is available and the market is providing solutions, A4A observed that some airline Web sites provide an option for consumers to identify themselves to determine fees for some ancillary services and potentially receive special offers *after* they have already purchased a ticket. Meanwhile, IATA noted that "experienced travelers" know that airlines charge bag fees and advance seat assignment fees and also know how to navigate multiple Web sites to obtain this information and that the Department should not impose costly regulations to benefit the relatively few travelers that care about this information but do not know how to locate it. In late-filed comments, Travel Tech noted that some airlines have begun to provide some information on ancillary services to ticket agents, but the progress has been far from universal.

For the average consumer looking for the total cost of travel, he or she must frequently review a complex chart to determine his or her baggage fees particularly for interline itineraries and guess what an assigned seat fee might cost. We disagree with airlines and airline associations that these facts do not reflect consumer harm as we believe the additional time spent searching to find the total cost of travel and the additional funds spent on air transportation that might have been

avoided if the consumer had been able to determine the true cost of travel up front are the harms suffered by consumers when basic ancillary service fees are not adequately disclosed.

The Department agrees with commenters that supported a need for rulemaking to allow consumers to have complete access to certain basic ancillary service fees in a manner that permits them to quickly and effectively determine their true cost of travel, although as explained further below, the Department has changed its view on what constitutes a basic ancillary service. Further, until all airlines and ticket agents are required to display certain basic ancillary service fees, and carriers are required to transmit fees for basic ancillary services to ticket agents, there is a strong incentive for carriers to obfuscate those fees. That is because if all competing carriers do not make similar disclosures, any airline that disclosed the cost of ancillary services, such as baggage fees, would appear to charge more for air transportation than the airlines that did not clearly provide fee information for those ancillary services. Therefore, even carriers that believe it is appropriate and consumer-friendly to provide the information in a clear fashion have a strong marketplace disincentive to disclose the cost of ancillary services. The Department notes that even the comments by airlines and airline associations that argued that the market is resolving the issue described the changes as ongoing and recognized that it will take time for airlines and ticket agents to come to agreement and implement new methods of disclosure. Although airline associations point to the number of agreements being reached between airlines and GDSs regarding GDS access to bundled fare packages that include an advance seat assignment, those agreements are bilateral agreements addressing limited services, primarily enhanced seating options, in limited markets and are not widely available to the general public.

Meanwhile, airlines are capable of disclosing some ancillary service fees in search results on their own Web site search result displays today, yet choose not to do so. The Department is not persuaded by airline arguments that the complexity of factors considered when setting fees is a sufficient justification for leaving it to the airlines to decide how much disclosure to provide regarding basic ancillary service fees. To the contrary, any argument that fees are difficult to explain or quantify militates for greater disclosure requirements of fees for basic ancillary services intrinsic to air transportation. The mere fact that

airlines are unbundling fares and have implemented ancillary service fee policies that even the airlines acknowledge are complex justifies efforts by the Department to ensure that consumers are able to discern the true cost of travel that includes basic ancillary service fees. Moreover, the existence of complex fee calculations that take into account a variety of factors does not explain why airlines do not provide better disclosure of baggage fee information that they already provide as a specific amount on a static list. Although there are complexities involved in displaying baggage fees, the comments demonstrate there is no technical impediment to displaying baggage fees with search results on carrier Web sites, yet that information is still not displayed.

In support of its argument that the Department has not demonstrated a problem that it has authority to regulate, A4A provided two examples (from the NPRM and a docket record of an A4A meeting with Department staff)² in which the Department referred to consumers' ability to "comparison shop" as well as a reference in the NPRM to allowing consumers to "price shop" and a reference to complaints by business travel representatives regarding the difficulty of advising "clients on the best and most cost effective flights." According to A4A, it is not within the Department's authority to require further disclosure of fees because we are taking the action to ensure consumers have the opportunity to comparison shop, which is not sufficient justification for the action. We acknowledge that the Department has at times used terms such as "comparison shopping" in connection with ancillary service fee disclosure. However, we disagree that the rationale of our proposed rule is to enhance consumers' ability to comparison shop. The Department's view is that consumers should be able to determine if the price provided is the total cost they will incur, whether purchasing through an airline or a ticket agent outlet, and our rulemaking is based on addressing that issue. The Department's position, as set forth in both the NPRM and the responses to A4A's questions, is that the proposals on ancillary service fees address the concerns regarding ensuring that consumers are aware of the total cost of travel.³ The Department's concern addressed by this rulemaking is

that if airlines and ticket agents do not provide reasonable disclosure of ancillary service fees intrinsic to air transportation at the point that consumers are researching the total cost of travel and making a purchasing decision then consumers are not able to make an informed decision based on the true cost of air transportation. Although the disclosures mandated in the previous rulemaking improved consumer access to airline ancillary service fee information by requiring those fees to be displayed somewhere, airlines continue to disclose fees in a static format in complex charts that can be confusing to consumers. Further, in connection with complex itineraries, interline tickets, and even some code-share flights, consumers are still reporting confusion regarding the total cost of baggage fees. There is a close connection between comparison shopping to determine the best value and knowing the total or true cost of travel because consumers must know the total cost of travel to shop effectively for the best price. However, the concern we are proposing to address is whether consumers are able to ascertain the total cost of air transportation without confusion before they make a purchase, whether the consumer engages in comparison shopping or not. In this SNPRM, we are seeking comments on a requirement that specific ancillary service fee information be provided to consumers at the same time fare information is provided to help them determine the true cost of travel prior to purchase.

B. The Definition of Basic Ancillary Service Fees

The NPRM: The NPRM set forth the Department's view that certain basic services are intrinsic to air transportation and that carriers used to include them in the cost of air transportation before the advent of unbundled fares. We further noted that the cost of those services is important to consumers when they choose among air transportation options. The NPRM identified basic ancillary services as the first and second checked bag, one carry-on item and advance seat selection. The NPRM requested comment on whether the Department's list of basic ancillary services should be expanded. We also asked whether current disclosure requirements are sufficient and whether there is any need to adopt additional fee disclosure requirements for basic ancillary services.

Comments: The comments reflected a diversity of views on this issue. Most consumer comments generally favored more transparency regarding fees and

² See DOT-OST-2014-0056-0624, Summary of Proceedings, DOT Meeting with Airlines for America (A4A) (posted September 15, 2014).

³ NPRM at 29975 and DOT Meeting with A4A, page 4, question 9.

some identify categories of fee information about which they would like more information—and they would like it early in the process of selecting a fare. In addition to consumer comments stating they want more information about all the fees airlines charge, a few comments identified specific fees. The fees consumer commenters most commonly identified were baggage, seat assignments, and change or cancellation fees, and a few mentioned advance boarding fees. The comments of consumer advocacy organizations Consumers Union, U.S. PIRG, Travelers United, and NCL expressed support for greater disclosure of all ancillary service fees, going beyond the baggage and seat assignment fees specified in the NPRM. Travelers United and NCL contended that the Department should require airlines to release airfares and all ancillary fee data for any entity to use as it wishes. BTC stated that boarding fees and change or cancellation fees should be included, as well as bundles that include a basic ancillary service. Similarly, BCD Travel USA LLC (BCD), a corporate travel management company, also commented that advance boarding fees and bundles that include a basic ancillary service should be included. In addition to specified baggage and seat assignment fees, Travel Tech and Open Allies both commented that advance boarding, change, and cancellation fees are “basic” and further stated that any ancillary service “package” that includes a basic ancillary service should be disclosed. Open Allies stated that these services are all critical to booking decisions. Sabre agreed with the Open Allies comment on this issue. Amadeus also stated the Department should expand the definition to include boarding fees and change and cancellation fees as well as bundles that include basic ancillary services. TripAdvisor stated that limiting the list of fees that must be disclosed to “basic” fees is a mistake because carriers may unbundle some other “essential” service and absent another lengthy Department rulemaking, the information would not be disclosed to consumers. Southwest commented on baggage fees, stating that they are unique because transporting passenger baggage is intrinsic to air transportation.

On the other hand, several commenters opposed defining basic ancillary services as intrinsic to air transportation or including seat assignment fees as a basic ancillary service. USTOA commented that the Department should not include a requirement that seat assignment fees be

disclosed in an itinerary specific manner because sellers of package tours may not have access to seat assignments at the time the package is sold or, since seats are inventory-controlled, the cost is likely to change before a consumer is able to purchase them on an airline Web site. Spirit asserted that any advance seat assignment fee disclosure should be eliminated because all airlines provide a seat with the cost of air transportation so disclosing an advance seat assignment fee at the beginning of a booking process may induce someone to purchase it when there is no need to do so. A4A, AACO, and United commented that advance seat assignments have not been traditionally provided to consumers as part of the price of air transportation. Comments by A4A and United noted that fare purchases guarantee a seat in a particular cabin, such as first class or economy, but not a particular seat number. In addition, historically seats often were not assigned until 30 days before a flight or at the gate on the day of flight. A4A and United further noted that Southwest does not provide seat assignments at all.

ATPCO and Farelogix did not comment on whether baggage or seat assignment fees are intrinsic to air transportation, but rather on the difficulty of disclosing the information. ATPCO stated that it can already support the proposed requirement to disclose first and second checked bag fees, which is also supported by A4A's comments indicating that airlines have provided itinerary-specific checked baggage fees to ATPCO for distribution to other industry participants. ATPCO also stated that the industry is working to address disclosure of carry-on baggage and seat assignment fees. However, given the complex pricing structure for seats, and the variation in carry-on baggage allowances depending on the aircraft, disclosure of this information is a complex undertaking that will take significant time to achieve. Farelogix stated that the industry is working towards distribution of seat assignment fees but that due to dynamic pricing of seats, and the need to determine availability at the time the price is displayed, it is not currently practicable to display dynamic seat assignment fees at the shopping stage. According to Farelogix, a requirement by the Department to provide seat assignment fees at the shopping stage would effectively force industry participants to provide static fees. Such a requirement would redirect industry efforts to implementing a static system rather than continuing to work toward modernizing distribution systems and

ultimately would not be in the interests of consumers.

DOT Response: We take note of the comments focused on technical issues and stating that due to technological limitations, the Department should not require disclosure of such fees. However, we note that many of the comments pointed to the progress in technology and in commercial agreements. That progress is allowing GDSs to provide advance seat assignment information to ticket agents and allowing ticket agents that sell to consumers to provide that information to consumers and transact those fees. It appears from the comments that the ability to display dynamic seat assignment fees and sell such services is progressing rapidly and with sufficient implementation time, such fees could be disclosed. In addition, we are unpersuaded by the argument that seat assignment fees are dynamic and therefore should not be considered a basic ancillary service fee. The dynamic and changing nature of seat assignment fees tends to support a requirement that such fees be not only disclosed but transactable. However, we are convinced by carrier arguments that advance seat assignments were not universally provided to consumers as part of the price of air transportation even before the unbundling of fares. As noted by A4A and United, fare purchases always did and still do guarantee a seat in a particular cabin, such as first class or economy, but not a particular seat number. In addition, we acknowledge seats often were not assigned until a few weeks before the flight or even on the day of flight. Now, in an era of unbundled fares, some carriers offer few advance seat assignments for free but those carriers assign a seat without charge on or close to the day of travel. In addition, at least one U.S. carrier, Southwest, does not provide seat assignments at all. Meanwhile, we note that it would be a violation of the full fare rule and an unfair and deceptive practice if a carrier required a consumer to pay an additional fee beyond airfare to obtain any seat at all. Carriers must provide a seat in the class of service that was sold to the consumer regardless of whether a seat is assigned in advance or not. Accordingly, we have tentatively concluded that advance seat assignments should not be considered intrinsic to air transportation. In addition, although we appreciate that advance boarding options and related fees are important to many consumers that would like to purchase that service, it is not a service that historically has

been included in the cost of air transportation.

Turning to change and cancellation fees, we are aware that such fees are important information and in fact are significant restrictions that must be disclosed to consumers because it would be an unfair and deceptive practice not to disclose such fees. Further, carriers are required to provide direct notice with the ticket (14 CFR 253.7) of terms such as restrictions on refunds, and information regarding cancellation fees in their customer service commitments. We encourage carriers to make change and cancellation fee information as transparent and clear to consumers as possible. We also solicit comment on whether the Department should require airlines and ticket agents, prior to an online transaction being completed, to provide consumers a link to the airline Web sites where the change and cancellation information is available or if an agent prefers to its own site that displays airlines' change and cancellation information. However, we are not convinced that change and cancellation fees are a cost that is intrinsic to air transportation and must be disclosed at the same point that itinerary information is disclosed. Like seat assignments, many consumers avail themselves of air transportation without making changes or canceling reservations.

Regarding bundled fares that include the fees that the Department initially considered basic ancillary service fees (e.g., advance seat assignment or certain baggage fees), our position is that consumers need to be able to ascertain the true cost of travel including basic ancillary service fees so to the extent that a carrier wanted to provide a bundled fare in addition to an unbundled fare and basic ancillary service fees, a carrier would be free to do so. However, if the carrier is disclosing basic ancillary service fees at the same point fare information is disclosed, then under this proposal additional options such as bundled fares are not something a carrier would have to disclose to ensure the consumer was aware of the true cost of travel.

With regard to baggage fees, the comments did not offer any reason to change our view that a carry-on bag and first and second checked bag were traditionally included in the cost of transportation. We remain of the view that a carry-on bag and first and second checked bag are intrinsic to air transportation and it is reasonable to require carriers and ticket agents to disclose those baggage fees to consumers at the same point that fare

and schedule information is disclosed. Therefore our revised proposal in this SNPRM includes a requirement that carriers disclose to ticket agents the fees for one carry-on item and a first and second checked bag. The proposal would also require ticket agents and carriers to provide those fees to consumers whenever fare and schedule information is provided as described in Section F below. We seek comment on the revised proposal.

Although we have tentatively concluded that only certain baggage fees should be included in our disclosure requirement, we note that some members of Congress have expressed the view that in addition to baggage fees, advance seat assignment fees, change and cancellation fees, priority boarding fees, and ticket fees should all be disclosed where fares are displayed. See, for example, HR 636 (as passed in the Senate in April 2016). In the event future similar legislation is enacted to require the Department to address whether advance seat assignment fees, change and cancellation fees, priority boarding fees, and ticket fees should all be disclosed where fares are displayed, we seek comment on such a disclosure requirement. What are possible benefits to consumers from a requirement to disclose baggage fees, advance seat assignment fees, change and cancellation fees, priority boarding fees, and ticket fees along with fares? What are the costs and potential challenges to implementing such a requirement? Comments that are most useful provide information regarding the reasons why additional disclosures should be required or should not be required. In addition, comments describing specific costs and benefits would be helpful.

C. Disclosure by Carriers to Ticket Agents of Fees for Basic Ancillary Services

The NPRM: The NPRM put forth two co-proposals. Under both proposals, each carrier would have been required to distribute its basic ancillary service fee information to certain ticket agents that the carrier permits to distribute its fare, schedule, and availability information. Under the first proposal, option A, carriers would have been required to distribute the information to all ticket agents, including GDSs, that the carrier provides fare, schedule, and availability information for distribution. Under the second proposal, option B, carriers would not have been required to distribute ancillary service fee information to GDSs or other intermediaries that do not sell the carrier's tickets directly to consumers. The option B proposal included an

assumption that GDSs and similar intermediaries would not be subject to any direct consumer notification requirements. This means that, in addition to GDSs and similar business-to-business intermediaries, entities that operate flight search tools but do not transact sales to consumers would not have been subject to direct consumer notification requirements. Neither proposal required carriers to distribute ancillary service fee information to any GDS or other ticket agent to whom the carrier does not choose to distribute its fare, schedule, and availability information. In connection with transactability, neither of the proposals required transactability (the ability for ticket agents to sell/transact an airline ancillary service to consumers). The options proposed merely required carriers to provide "usable, current and accurate" information on fees for basic ancillary services to all ticket agents so this information may be disclosed to consumers wherever fare, schedule, and availability information is provided.

Under both of the proposals, U.S. and foreign air carriers would have been required to distribute to certain ticket agents the standard fees for basic ancillary services. However, carriers would not have been required to provide information to ticket agents about individual customers, such as their frequent flyer status, though these factors may impact the fee for an ancillary service. Under both proposals, specific charges, not a range of fees, would have to have been disclosed to consumers for basic ancillary service fees. Neither of the Department's alternative proposals dictated the method that carriers must use to distribute the information, rather, the NPRM cautioned that carriers would have to be mindful that whatever distribution method is used would have to provide usable, accurate, and current information so the information would be accessible in real-time. Further, ticket agents would have had to work in good faith with carriers to come to agreement on the method used to transmit the ancillary service fee information.

Comments: In response to the NPRM, many commenters suggested that the Department go further than either option A or option B in terms of disclosure by carriers to ticket agents. For example, Open Allies, Travelers United, NCL, CCIA, TripAdvisor, and Skyscanner recommended that the Department require airlines to share all flight content information with any interested entity. According to CCIA, that would provide consumers with accurate ancillary fee information in the most direct manner with the least

regulatory cost. TripAdvisor commented that the Department should require airlines to make all flight-specific information, including fares and fees, available to all information providers, because open exchange of information is the best way to protect consumers. Skyscanner also argued that transparency for consumers can only be achieved if the Department requires airlines to disclose fee information to all entities involved in the travel booking process, including metasearch sites. TripAdvisor further commented that if the Department chooses from the proposed options, it should adopt option A, requiring disclosure of basic ancillary service fees to all entities with which the carrier shares fare information, as that is the practical and efficient way for ticket agents to receive and display the fee information and comply with Department requirements. Meanwhile, to the extent the Department adopts one of the two proposed options, Travelers United and NCL supported option A. According to Travelers United and NCL, option B is not feasible because the existing air travel distribution system relies on GDSs, the current marketplace would be extremely limited by exclusion of GDSs, and there is no alternative distribution network currently in place.

Open Allies also supported option A. According to Open Allies, option B, which would not require distribution to GDSs, discriminates against ticket agents and is not a good solution. Open Allies stated that agents and airlines need GDS involvement for the potential benefits of the regulation to be put into place in a workable manner and that including GDSs is the lowest cost, most efficient way of achieving the Department's disclosure goal. The organization also argued that there is no valid reason to exclude intermediaries from disclosure requirements when to do so will make fee dissemination more challenging and costly.

Travel Tech also commented in support of option A, stating that it is the only option that will achieve the Department's goals. According to Travel Tech, 90 percent of ARC-approved ticket agents use GDSs and, although that may change over time, as a practical matter, many ticket agents currently rely on GDSs for data today. It is an efficient way for ticket agents to receive fee information, is currently in use for many charges that airlines already impose, and will facilitate display of the information. According to Travel Tech, option B raises a "nightmare" prospect for many travel agents, including OTAs, of not being able to rely on their established data source. Travel Tech

noted the Department's desire to minimize government interference and encourage innovation but stated that not requiring disclosure to GDSs will be a disservice to consumers. Travel Tech stated that it is not a new concept and analogizes to existing Department requirements, such as the requirement that carriers provide GDSs code-share and change-of-gauge information when providing flight information to GDSs. Travel Tech went on to state that GDSs are technically capable of displaying ancillary services and fees as carriers want them displayed. Meanwhile, carriers can continue to develop alternative distribution arrangements for future use while allowing ticket agents to provide the disclosure to consumers as contemplated by the Department.

Sabre, in support of option A, stated that its services make sharing price information accurate and efficient as well as cost effective for ticket agents. Sabre further stated that if travel agents that rely on GDSs were forced to use an alternative, they would incur costs that would ultimately be passed on to consumers. Travelport commented in support of option A, noting the Department's statement that 50 percent of tickets are sold via a travel agent and virtually all of those agents rely on a GDS as an efficient data conduit. Amadeus offered similar reasons in support of option A, noting that ticket agents already rely on GDSs as an efficient source of data. Amadeus also pointed out that many travel agents are small businesses that rely on GDSs for airline data and if data were not provided through GDSs, they would not have a financially feasible way to obtain and distribute the information. Such agencies could not afford or manage the technical complexity of, for example, direct connects with multiple airlines, to obtain and disclose ancillary service fee information.

ASTA and several travel agents also commented that GDSs have the technology to allow travel agents to book ancillary services. ASTA also noted that travel agents rely on GDSs for a variety of business functions in addition to booking, and accordingly ASTA stated that option A, excluding GDSs, would harm travel agents. ASTA also stated that option B does not provide sufficient protection for consumers. Therefore, according to ASTA, the Department should not adopt either option A or B and instead should require transactability.

Corporate travel agents American Express Global Business Travel, Carlson Wagonlit Travel (CWT), and BCD supported option A. CWT commented that ticket agents cannot provide

ancillary service fee information unless the information is first provided by carriers to ticket agents via GDSs; otherwise, ticket agents would be required to obtain the information from each carrier. BCD commented that ticket agents must have access to information about ancillary services through GDSs, the "normal and customary distribution channels" that are time-tested and functional. Without the requirement that GDSs have the information, BCD stated it will incur material costs in obtaining the ancillary service information from every airline and will not be able to ensure it has accurate and complete information. Travelers United and NCL supported option A as the best of the options proposed. BTC supported option A, commenting that there is no usable, workable mechanism for airlines to distribute ancillary service fee information to tens of thousands of individual travel agents, most of whom already rely on GDSs. Skyscanner noted that if the Department chooses option B over option A, consumers who conduct searches on metasearch Web sites that do not sell the ticket will not receive the same ancillary fee information that is disclosed on traditional travel agent or carrier Web sites.

A4A opposed the disclosure requirement on the grounds that it will place airlines at a disadvantage to GDSs in contract negotiations and also opposed it on technology grounds. A4A argued that GDSs have historically been in a stronger negotiating position than airlines and that GDSs were only willing to develop new technologies for accessing and distributing airline fare and flight information because the GDSs did not have contract provisions requiring airlines to provide ancillary services information. The ancillary services information, in addition to motivating GDS investments in technology, enabled airlines to negotiate lower GDSs booking fees. According to A4A, GDS concessions on pricing and technology resulted because airlines did not have the obligation to provide the ancillary service fee information to GDSs, and if the Department requires airlines to provide such information, it will restore GDSs to a stronger negotiating position over airlines. A4A stated this will be the case whether the Department adopts option A, expressly requiring airlines to provide the information to GDSs, or option B, requiring airlines to give the information to GDSs as a practical matter. A4A also objected to the proposal on the grounds that distribution channels would all have to offer the same functionality and not

every channel has the more developed functionality needed to distribute dynamic fees. The effect would be to impose a system of static fees, according to A4A. AACO also commented that a requirement to distribute ancillary service fee information through GDSs would essentially require carriers to distribute static fees to ticket agents instead of the dynamic fees currently available on carrier Web sites. This would force airlines to use static fees on their Web sites for the sake of consistency and would limit innovation and could lead to higher charges for consumers. IATA also opposed the disclosure requirement, arguing that the changing marketplace is making information more readily available to consumers because airlines are motivated to disclose the information and consumers are used to unbundled fares and know how to search and find such information. IATA stated that airline Web sites offer consumers and ticket agents comprehensive and accurate ancillary service fee information. However, according to IATA, a Department rule mandating disclosure will harm consumers, because it could shift current marketplace momentum from implementing new internet-based technologies that offer dynamic solutions back to inferior solutions offered on legacy infrastructure.

Most airline comments objected to any ancillary service fee disclosure requirement, with several indicating that any Department involvement would unduly influence contract negotiations and distribution innovations. In contrast to ticket agents and their representatives, some carriers stated that any requirement to distribute fees will effectively require them to distribute to GDSs, which would unfairly disadvantage them in negotiations with GDSs as well as lock them into a distribution model that relies on static fees, which will create obstacles to innovation. However, some commented that to the extent that the Department adopts one of the proposals, some carriers supported Option B, requiring disclosure of ancillary service fee information to ticket agents that sell transportation only, excluding GDSs and other intermediaries. For example, Delta stated that the Department should refrain from any regulation of airline distribution channels, but option B would have less impact on negotiations between carriers and GDSs. United commented that option B would better allow for development of alternative systems for airlines to provide information directly to travel agents.

United also notes that ATPCO (relied on by GDSs) does not have the technological capability to process constantly changing ancillary service prices, which makes this issue more complex than addressing baggage fees. Like AACO, Delta and United seem to indicate that a requirement to distribute ancillary service fee information through GDSs would essentially require carriers to distribute static fees to ticket agents.

China Eastern stated that option B would present fewer technical and development hurdles. Spirit commented that option B is less intrusive and that a requirement to distribute ancillary service fee information to all travel intermediaries as described in option A may cause Spirit to withdraw from one or more GDSs altogether due to increased distribution costs. Insel, a Caribbean carrier, commented that consumers must be informed of the total cost associated with their travel; however, requiring disclosure through GDSs would increase airlines' costs, and those costs would likely be passed on to consumers. Virgin Atlantic is concerned about the burden of ensuring ticket agents that have Virgin Atlantic's fare, schedule, and availability information also have ancillary service fee information and stated that if a carrier has shared information with ATPCO or a direct connect, that should be sufficient.

DOT Response: We have carefully considered the comments regarding whether to require carriers to distribute ancillary service fee information to all ticket agents that a carrier provides with its fare, schedule, and availability information, including GDSs, or only to require carriers to distribute the information to those ticket agents that sell its tickets. We recognize that both options potentially impact relationships among commercial entities and we do not take Department involvement in carrier distribution channels lightly. We recognize that airlines have concerns that being required to provide certain ancillary fee information to GDSs will put airlines at a disadvantage when negotiating contract terms with GDSs. We also understand that airlines have concerns about being required to rely on GDS infrastructure and GDS ability to market dynamic fees as carriers do on their own Web sites. However, airline complaints about the technical deficits of GDSs appear to be focused on dynamic fees. Airlines already rely on the GDSs to distribute baggage fee information and carriers do not provide a strong argument against using GDSs to distribute this information. Meanwhile, ATPCO notes that there are some

technical issues to be worked out to distribute information on fees for carry-on items but ATPCO is already working with certain carriers and ticket agents, including GDSs, to distribute and even transact checked bag fees. Further, the proposals in the 2014 NPRM reflect our view that basic ancillary fee information should be shared with all consumers at all outlets. IATA acknowledges that more work needs to be done by the industry in that area. We agree with the comments of Skyscanner that our consumer protection goals would be undermined if we did not require disclosure to intermediaries in arranging for air transportation, such as metasearch entities that operate flight search tools, as those entities would not necessarily have basic ancillary service fee information to provide to consumers. Regarding the ability of GDSs to distribute the information, all three GDSs serving the U.S. market assert they have the technical ability to distribute baggage fee information. In addition, we find persuasive some ticket agent comments that they rely on receiving information through the GDS channel, that alternative distribution methods would be practically disruptive and technically difficult if not impossible to implement, and would cause them to incur significant costs. We recognize that with either option some time would be needed to develop the process for disclosure, particularly in connection with carry-on bags, as ATPCO noted. The proposed implementation period is discussed below in section G.

In connection with the requirement that the distribution method used would have to provide usable, accurate, and current ancillary service fee information so the information would be accessible in real-time, some entities comment that the 2014 NPRM does not define with sufficient specificity what constitutes usable, accurate, and current. Farelogix commented that distribution through GDSs would effectively halt or limit dynamic pricing because according to Farelogix, GDSs are only able to provide static pricing. However, the comments opposing use of GDSs to transmit fee information were focused on the technical limitations of GDSs in the area of dynamic fees (which GDSs dispute); there were no comments indicating that any entity thought that baggage fee information transmitted through GDSs would not be usable, accurate, and current. A4A's comment indicates that the fee information for checked baggage is already available in the GDS systems via ATPCO filings. We note that the proposed requirement to provide

information to GDSs only applies if the carrier is using the GDSs to distribute its fare, and schedule information. We do not believe such a requirement would be unduly burdensome on carriers as it appears that the primary objection of carriers from a technical standpoint relates to limited availability services subject to dynamic pricing, such as seat assignment fees, and seat assignment fee information is no longer included in the proposed requirement. In response to some comments that by imposing disclosure requirements on checked baggage fees the Department would be effectively prohibiting carriers from offering discounts through dynamic pricing, we disagree. Carriers are free under Department rules to offer discounts, whether through dynamic pricing or other methods, if the pricing is properly disclosed.⁴ Further, some carriers are already working with GDSs to offer premium seats, so we are not convinced that they could not do the same with baggage fees. The remaining objection, being placed in a disadvantageous position in contract discussions, would be addressed by a prohibition on unilateral contract provisions related to distribution, as discussed more fully below.

After carefully considering all of the comments submitted, the Department has decided to propose requiring carriers to provide information on fees for one carry-on item and first and second checked bag to all ticket agents to which it provides fare and schedule information, including GDSs and other intermediaries in the air transportation marketplace. This option provides for wide distribution with the least disruption to existing business models and the shortest implementation time. We acknowledge that almost any distribution and disclosure requirement will involve Department intervention into business and contractual arrangements. However, the Department is counter-balancing these concerns by including in its proposal a prohibition on unilateral cost increases by GDSs on airlines as discussed in Section E. When the proposed requirement to provide information to GDSs is considered in conjunction with the Department's proposed restriction on certain contract provisions, we believe the Department's

regulatory involvement in business arrangements is minimal and justifiable.

We note that in this SNPRM we are proposing to require carriers to provide certain ancillary service fee information to all ticket agents to which it provides fare and schedule information. This would ensure consumers receive key baggage fee information at the same time that they are identifying flight options so that they have enough information to determine the true cost of travel. We believe that furnishing availability information to ticket agents should not be a determining factor in whether the agent receives the ancillary service fee information in question. Requiring carriers to provide required ancillary service fee information to all ticket agents to which they provide fare and schedule information should ensure that all relevant ticket agents are provided with the ancillary service fee information without imposing an overly broad requirement. We seek comment on the substance of the proposal and whether the description of ticket agents that should receive basic ancillary service fee information is sufficiently broad.

D. Transactability

The NPRM: In the NPRM, the Department requested comment on the issue of requiring that basic ancillary services be made transactable (*i.e.*, to require that airlines permit online travel agencies to sell these ancillary services). The Department recognized that transactability is a very important business issue for both carriers and ticket agents and noted that we want to avoid causing a negative impact on innovation or unnecessarily intruding into business and commercial arrangements. We further noted that carriers and stakeholders have assured the Department that they share our goal of transparency and assume that the various stakeholders would negotiate regarding the ability of ticket agents to sell a carrier's ancillary services and the price at which those services would be sold. However, we left open the possibility of requiring transactability and requested comments on the issue.

Comments: Consumer advocacy organizations' comments generally favored transactability. Consumers Union and U.S. PIRG stated that ancillary services should be transactable through ticket agents or, at a minimum, customer-specific quotes with ancillary service fees should be provided and guaranteed to be available once the ticket has been purchased. Travelers United and NCL commented that the Department should not concern itself with how the data is used but rather

should require airlines to release all ancillary service data and let market innovations determine how it is provided to consumers. Open Allies commented that the Department should require airlines to provide basic ancillary service fee information to ticket agents in a format that allows ticket agents not only to disclose the information to consumers but also to sell the services.

Open Allies stated it believes that the lack of transactability is unlikely to be resolved by carriers absent a rule. The organization commented that ticket agents should be able to sell services because consumers support transactability. It pointed to a survey it conducted which showed 72 percent of survey respondents believe transparency includes transactability. Open Allies also noted that requiring transactability would save time and be more efficient for consumers. If transactability is not required, it contended, consumers will have to go to airline Web sites to find and purchase a service found on a ticket agent Web site and, unless fees are unchangeable, the service may no longer be available, or available at the quoted price, at that time. According to Open Allies, airlines are the only entities that "disaggregate" pricing and as a consequence the Department should regulate "pricing transparency" which is only possible with transactability. Open Allies disagreed with the carrier position that GDSs have greater bargaining power than airlines in contract negotiations, noting the reduced GDS fees airlines have negotiated since GDS deregulation. Open Allies also said the decreased number of legacy carriers in the United States has increased airline negotiating power. The organization argued that transactability is necessary because, if the Department relied on requiring the carriers to lock in prices for ancillary services at the time consumers purchased tickets, it would be difficult to enforce and costly and time consuming to develop systems that would enable fees to be locked for individual consumers. Meanwhile, consumers would still face the inconvenience of having to go to airline sites to purchase the ancillary service, which would increase their transaction costs.

Several travel agents filed similar comments favoring transactability, stating that disclosure alone is not sufficient. According to those travel agents, add-on fees are complex and change from airline to airline, preventing travel agents from providing completely accurate quotes to customers. Although requiring

⁴ In response to A4A's comment that the requirement to distribute static baggage fees through GDSs to comply with previous rule has prevented airlines from offering dynamic baggage fee pricing, we note that is the result of airline pricing decisions and GDS contract restrictions and not a Department requirement. Airlines are free to offer static or dynamic fees under Department rules, as long as the prices are properly disclosed.

disclosure of the cost of bags and seat assignments would help, according to these commenters, consumers would still be surprised because the price of services may go up before they buy them. They also stated that GDSs have the ability to provide transactability and airlines would benefit from increased sales of ancillary services, creating a “win-win” for the entire value chain. ASTA commented that the only option the Department should consider is transactability. According to ASTA, airlines, U.S. airlines in particular, have proven unresponsive to market influences to sell ancillary services through ticket agents and without requiring transactability. ASTA asserted that the Department will effectively be forcing agents to send customers to a competitor if it does not require transactability.

Travel Tech commented in support of transactability, stating that the existing GDS infrastructure already permits transaction of various airline service fees, such as baggage, in some cases, and also allows seat assignments for certain carriers’ inventory. According to Travel Tech, the only question is whether airlines will allow ticket agents to transact the services once the airline makes the information available through GDSs. Travel Tech also commented that consumers should be able to purchase ancillary services at their preferred outlet to avoid the increased search and transaction costs of not having ancillary services available for purchase through ticket agents.

Amadeus, Sabre and Travelport also commented that consumers using ticket agent outlets experience increased transaction time without transactability. They stated that they are ready to implement transactability and point to their own technological developments and existing agreements with carriers on distribution of ancillary services. Sabre provided information regarding 23 carriers for which it both displays and transacts at least one ancillary service. Travelport stated ancillary services can be transacted using older technology but that it has introduced a new platform to allow airlines to differentiate their products from competing airlines. Amadeus stated that requiring transactability is the only way the Department can meet the goal of transparency. Amadeus commented that disclosure without transactability will confuse consumers. Amadeus stated that it already has a product that will enable transactability and that 58 airlines are already using this product, but concludes that the Department cannot rely on the market to move towards transactability because the

factors that have inhibited widespread implementation are still present, particularly in the case of U.S. airlines.

Orbitz stated it is a member of Travel Tech and commented to elaborate on Travel Tech’s comments. Orbitz stated that if the Department imposes disclosure requirements on ticket agents without transactability, consumers will only be more confused. Orbitz pointed to the static nature of some fees and dynamic nature of others, which will increase the confusion. Meanwhile, according to Orbitz, the Department should not assume that airlines will negotiate to allow ticket agents to transact ancillary services. The outcome of the rule may be that ticket agents that compete with airlines and offer consumers choices that they might not otherwise have been aware of, are left with an inferior product and asymmetrical disclosure requirements that disadvantage ticket agents and lead to consumer harm.

Corporate travel agents also supported transactability. BCD commented that the Department should require transactability through GDSs and if the information is not transactable, corporate travel agents should not be required to disclose those ancillary service fees. BCD stated customers will be frustrated if it is not able to book the services that it has just disclosed to its customers. BCD also stated its customers depend on having all of the costs of travel tracked through its systems so if it cannot book all services the customer wants, its travel cost data will not be accurate. CWT commented that to provide consumer benefit, the Department must require that ancillary services be transactable through GDSs or agents will be unduly burdened and the existing distribution system will be undermined. BTC commented that for consumers transparency and transactability are “interlocked” and without transactability, the booking process for consumers and travel agents involves multiple steps and is more confusing and time consuming as a result. BTC also commented on the risk of increased costs or lost opportunities to purchase certain ancillary services if they are not purchased at the time the ticket is purchased. International Airline Passengers Association also commented in favor of transactability and supported BTC’s comments.

A4A opposed transactability, reiterating its view that there is no consumer harm to address. A4A also identifies practical considerations, including that some carriers do not allow for payment of baggage fees at time of ticketing even when travel is purchased directly from the carrier and

many consumers do not know at time of ticketing whether or how many bags the consumer will want transported. Several carrier comments reflect agreement with the Department’s tentative decision not to require transactability, including those of Delta and United. Frontier also opposed transactability, stating that it would increase airline costs which would in turn be passed on to consumers. Virgin Atlantic opposed a transactability requirement because it would undermine carrier ability to control its distribution scope and costs and essentially mandates the commercial relationship between a carrier and its agents solely to the benefit of agents.

DOT Response: We have carefully considered all of the comments supporting and opposing transactability. We note that the Department has already prohibited post-purchase price increases on transporting baggage. The Department’s Enforcement Office has also indicated that it intends to pursue enforcement action against carriers that increase fees for baggage not provided with the ticket but traditionally included in the price of the ticket (*i.e.*, carry-on bag, 1st and 2nd checked bag). Therefore, the Department’s existing rule regarding baggage fee price increases has already addressed the concern that ticket agents will provide consumers information on baggage fees that will be inaccurate or the price will increase before the consumer has the opportunity to purchase baggage transportation services. Regarding seat assignment fees, since the Department has tentatively concluded that advance seat assignments are not truly intrinsic to air transportation, and consequently determined not to propose a requirement that ticket agents disclose fees for seat assignments, consumers will not be presented with seat assignment options that they cannot purchase immediately. This means consumers will not be confused by being presented a seat assignment that they cannot obtain, or risk being unable to purchase their chosen option at the advertised price.

We recognize that requiring airlines to make both baggage and seat assignments transactable services through ticket agents would potentially increase consumer satisfaction and decrease transaction costs of time spent on shopping and booking when using ticket agent Web sites to book travel. We are also aware of the importance of transactability as a business matter to ticket agents that must provide the services consumers want and expect or risk losing business. We recognize that comments by some stakeholders,

including ticket agents and consumer advocacy groups, indicate that airlines are not motivated to enter into agreements to allow transactability. In addition, we recognize that many consumers do not purchase baggage transportation at the same time they purchase travel, so there may be limited incentive for either ticket agents or carriers to negotiate agreements on transactability in this area. However, we are encouraged by the progress reported to date by both carriers and ticket agents in reaching some agreements that permit ticket agents to sell select carrier ancillary services. We also note that both ticket agents and airlines have stated that airlines have a strong incentive to make airline ancillary services more widely available to consumers in order to sell more of those services. Accordingly, we believe that carriers and ticket agents may be able to reach agreements to transact various ancillary services if there is sufficient benefit to all commercial entities in the transaction. We also recognize that corporate travel agents have additional concerns specific to their business model regarding customer frustration with a travel agent's inability to transact certain services as well as business concerns regarding tracking costs for corporate travel clients. However, we feel the benefits of having the information available for consumers outweighs any frustration caused by the inability to purchase through a ticket agent, particularly since the only fees that must be disclosed under the current rulemaking are baggage fees, which are not permitted to be increased. Regarding tracking the costs of travel for business purposes, the same problem exists if a consumer does not decide to check a bag until the date of travel and pays at the airport. At least under the disclosure requirement, corporate travel agents can include the amount of bag fees that potentially may be incurred in a travel record for purposes of record keeping. Ultimately we believe there are even greater incentives for both carriers and ticket agents to come to agreements regarding transacting ancillary services in the corporate travel arena than in connection with leisure travel.

Finally, in connection with technical issues related to transactability, we note that some stakeholders alleged that a requirement to distribute ancillary service fees through GDSs would essentially require carriers to distribute static fees to ticket agents instead of the dynamic fees currently available on carrier Web sites. ATPCO's comments support that view to some extent based on its description of the current

capability for entities to transact checked bag fees using ATPCO codes and the complexity of carry on and seat assignment fees, which would require more development by ATPCO. However, we also note that GDSs comment that they have been developing technology solutions and the technology already exists for ancillary services to be transactable through GDSs. Meanwhile, although carriers object to undue intrusion into their businesses, they also point to agreements carriers have reached on transacting ancillary services to support the position that the market is solving the disclosure problem. This leads us to conclude that technical obstacles to transactability are not insurmountable and would not require disclosure of only static baggage fees. Meanwhile, we remain of the view that the Department should limit its intervention concerning commercial negotiations in this area at this time and continue to rely on market forces to a large extent. Therefore, we are proposing a revised disclosure option that we believe offers the maximum consumer disclosure benefit while stopping short of requiring transactability. At this time, the Department is relying on competition and market forces but will continue to monitor the issue. If the Department identifies evidence of consumer harm resulting from a lack of transactability and a market failure preventing resolution of the problem, we will revisit the issue in a future rulemaking. At this time, however, we are not proposing a transactability requirement.

E. Contract Provisions Among Carriers, GDSs, and Other Ticket Agents

The NPRM: In the NPRM, we noted that if we adopted a provision requiring carriers to disclose ancillary service fee information to ticket agents and ticket agents to disclose it to consumers, it would be unlawful to provide fare information that did not include the fees for basic ancillary services. Accordingly, we stated that to the extent that carriers have existing contractual relationships with ticket agents acting as intermediaries, such as GDSs, to distribute fare information, those ticket agents acting as intermediaries would be prohibited from imposing charges for the distribution of required ancillary service fee information. We also noted that we would expect GDSs to work in good faith with carriers and other ticket agents that are able to agree on alternative distribution methods that do not include the GDSs to allow integration of information obtained through other sources and information obtained through GDSs.

Comments: Travel Tech commented that the ban on GDSs charging additional fees should only apply to existing contracts and that the language of the rule should be changed to clarify this. Travel Tech also argued that if a requirement for carriers to provide basic ancillary fee information only to ticket agents that sell a carrier's tickets directly to consumers is adopted, it should be changed to make it clear that the contract limitation only applies to those ticket agents. Travel Tech also argued that carriers should be required to provide the same fees for ancillary services that carriers display on their own sites and not higher service fees, otherwise ticket agents would effectively be prohibited from negotiating with carriers regarding the ancillary service fees the ticket agent must disclose and ticket agents that display fees to consumers would be limited in the fees they could display to consumers. Amadeus commented that the Department should clarify that the prohibition against imposing additional charges on carriers for distributing ancillary service fee information expires at the termination of an existing contract. Amadeus also argued that, during the existing contract period, the carrier should provide the same fee information to the GDSs that is available on the carrier's Web site. In contrast, Travelport opposed the contractual provision and stated it is confusing and that the Department should not interfere with contractual negotiations.

Open Allies commented that it is acceptable to ban the imposition of additional charges on carriers, but only for the length of the existing contract. Open Allies also argued that carriers should be required to provide the same fees for ancillary services, not higher fees, to ticket agents during the term of the existing contracts. ASTA opposed the contract provision, stating that it is outside the scope of Department authority. It also asserted that, as the provision is drafted, it is unclear about which ticket agents are covered. According to ASTA, most travel agents receive airline flight information through GDSs and their contracts with airlines are through the Airlines Reporting Corporation (ARC) and can be unilaterally amended by the airlines but not travel agents. Further, as a practical matter, travel agents are not in a position to unilaterally impose charges on airlines. ASTA commented that it would be inappropriate for the Department to prohibit travel agents from imposing charges on consumers, but it appears the Department meant to only cover ticket agents acting as

intermediaries and prevent charges to carriers. However, according to ASTA, that is not clear from the proposed rule text. AACO commented that even if the Department prohibited GDSs from imposing an explicit fee in connection with the requirement to disclose certain ancillary service fee information, GDSs could still introduce adjustments in other service charges to compensate for the requirement.

DOT Response: The Department has considered the comments regarding a contract provision prohibiting ticket agent intermediaries from imposing additional charges on carriers in connection with distributing ancillary service fee information along with fare information. We recognize that some ticket agents oppose any Department involvement in contractual arrangements between private entities, and we are similarly reluctant to insert the Department into such arrangements. However, since the Department is proposing to impose a new legal requirement on carriers and the ticket agents that distribute carrier fares and certain ancillary service fees, we believe it is appropriate to put in place a short term restriction on unilateral changes to contract arrangements.

We recognize that distribution of ancillary service fees has been very controversial, in particular in GDS dealings with carriers, and in order to prevent business disputes from interfering with the implementation of a new Department requirement we have determined it is appropriate to implement a regulation with limited scope that covers only existing contracts that were negotiated based on a different regulatory background. The proposed restriction is only intended to cover contract provisions regarding charges imposed on airlines by ticket agent intermediaries for distributing certain ancillary fee information that the rule requires to be distributed along with fare information. The proposed restriction would only impact contracts for their current term at the time a final rule is issued in order to reflect the changed regulatory environment; future negotiations will enable all parties to negotiate based on the regulatory changes.

We believe that in practice the proposed disclosure requirement will not require significant investment in new technology by GDSs since GDSs already have a significant amount of baggage information through ATPCO filings. Accordingly, we would expect GDSs to work with carriers in good faith and not attempt to circumvent the restriction on additional charges by adding charges in other areas to evade

the restriction. To the extent that a GDS engaged in such tactics, the Department would consider it a violation of the provision preventing such charges. The restriction only limits unilateral imposition of new charges on airlines by intermediary ticket agents. It is not intended to prevent good faith negotiations to revise existing contracts or to carry over to any new contracts negotiated after issuance of this final rule. We agree with some commenters that the rule text should be clarified to make clear it covers only existing contracts and have made the appropriate changes in the proposed rule text. We have also revised the proposed rule text in connection with ASTA's comment that the provision could be read to apply to travel agents that do not receive information directly from carriers. We do not intend for the proposed restriction to cover such contracts.

In connection with comments that carriers should be required to provide the same fees for ancillary services that carriers display on their own sites and not higher service fees, we have decided not to propose such a restriction. It is not the Department's position that the same ancillary service fees must be charged at all outlets, merely that consumers should be informed of the basic ancillary service fees so they can determine the true cost of air transportation and make an informed decision before making a purchase. Therefore, we tentatively believe it is appropriate to leave it to carriers and ticket agents to determine the ancillary service fees that will be charged through ticket agents. Although we recognize that this means a carrier would not be prohibited from implementing different fees for baggage, depending on the outlet from which the consumer chooses to purchase air transportation, as a practical matter, we believe it would be challenging for carriers to implement varying charges in the current technological environment. Therefore, under the proposed provision, carriers and ticket agents will have the opportunity to come to agreement on this issue as new contracts are negotiated and new commercial and technological arrangements are put in place.

F. Customer-Specific or Itinerary-Specific Fee Information

The NPRM: The NPRM recognized that requiring carriers to disclose basic ancillary service fee information to ticket agents is not helpful to consumers if it is not displayed to them. Further, to address the issue of consumer difficulty in finding basic ancillary

service fee information, the information must be displayed by both carriers and ticket agents in specific amounts, not a range of fees. The NPRM proposed to require carriers to provide customer-specific information if a consumer provides identifying information and itinerary-specific information if identifying information is not provided. The NPRM further proposed to require ticket agents to provide itinerary-specific information. In the NPRM, we stated that "customer-specific" refers to variations in fees that depend on, for example, the passenger type (e.g., military), frequent flyer status, method of payment, geography, travel dates, cabin (e.g., first class, economy), ticketed fare (e.g., full fare ticket -Y class). By contrast, "itinerary-specific" fee information does not include variations in fees that depend on the attributes of the passengers such as the passenger type (e.g., military), frequent flyer status, or method of payment. For itinerary-specific information, the NPRM proposed that both carriers and ticket agents would be required to take into account variations in fees that are related to the itinerary such as travel dates, geography, ticketed fare and cabin.

In addition to providing itinerary-specific fees for a first checked bag, a second checked bag, a carry-on bag and an advance seat assignment, when displaying itinerary-specific information, the NPRM stated that ticket agents would also be required to clearly and prominently disclose that these fees may be reduced or waived based on the passenger's frequent flyer status, method of payment or other characteristic. In either case, whether customer or itinerary-specific fee information is displayed, both airlines and ticket agents that have Web sites marketed towards U.S. consumers would have to disclose, or at a minimum display by a link or rollover, the fees for these basic ancillary services on the first page on which a fare is displayed in response to a search for a specific flight itinerary.

During the comment period, an important clarification was made regarding the NPRM. A4A pointed out that the NPRM stated "Carriers would, of course, be required to provide ticket agents the fee rules for particular passenger types (e.g. military, frequent flyers, or credit card holders)" Notice at 29977. A4A observed that this is customer-specific information that ticket agents would not need to meet the requirement to provide "itinerary specific" fee information. In response to the A4A inquiry, Department staff confirmed that the NPRM statement was

an error.⁵ Nevertheless, as the NPRM stated, ticket agents may come to agreements with airlines that would enable the ticket agent to provide customer-specific ancillary service fee information.

Comments: We received extensive comments supporting greater disclosure. Of consumers favoring greater disclosure, several also comment in favor of a standardized display of some kind, whether a table or other format. In connection with innovative alternatives and solutions not considered, Travelers United and NCL commented that better display of information is needed but do not argue for or against the display requirements proposed, supporting instead a requirement that all data be made available so market innovation can improve how the information is provided to consumers. Open Allies supported greater disclosure of ancillary service fees and stated that the Department should require airlines to provide ticket agents information to provide customer-specific, transactable, quotes. Open Allies argued that if the Department does not require carriers to provide enough information for ticket agents to display customer-specific quotes, consumers will not have enough information in the ticket agent channel and may choose flight options that are more costly than the option they would have chosen if the ticket agent displayed more information. Travel Tech supported a disclosure requirement that is the same for carriers and ticket agents and stated the Department should require carriers to provide customer-specific quotes so that carriers and ticket agents are on equal footing. Amadeus generally supported the proposed display requirements for itinerary-specific fees and stated that the Department should also require carriers to provide customer-specific fee information to ticket agents so that ticket agents may provide customer-specific fee quotes when the ticket agent has sufficient information about the passenger. Amadeus argued that the Department should ensure that consumers dealing with the indirect ticket agent channel have access to the same ancillary fee data that is available from the airline channel.

Southwest Airlines also supported a requirement to disclose ancillary service fees, stating that consumers are not necessarily able to determine the true cost of their own travel because they do not know how much bag fees will be for a particular flight option and as a result

sometimes choose flights that they otherwise would not have chosen. Southwest also stated that requiring display of baggage fees will put downward pressure on those fees. Global Business Travel Association commented in favor of the proposed disclosure requirements, commenting that the Department should require both airlines and ticket agents to display certain ancillary service fees on the first page of search results.

However, many commenters opposed proposed display requirements which would result in carriers providing customer-specific information to consumers that identified their customer category while ticket agents would only be required to provide itinerary-specific information. ASTA pointed out that if the Department adopts display requirements as proposed in the NPRM, carriers would be subject to different disclosure requirements to the extent that a consumer provides identity information to a carrier, which according to ASTA discriminates against and disadvantages ticket agents and defeats the stated regulatory intent. Orbitz also opposed proposed display requirements, stating that providing more information at the start of the booking process will overwhelm and confuse consumers. Further, according to BCD, display requirements will impose additional compliance costs on travel management companies like BCD without providing an opportunity to recoup those costs by offering enhanced services, and those costs will be passed on to BCD clients. CWT also argued that the Department should consider the differences between corporate and leisure travelers and stated that only those fees that can be booked in advance should have to be disclosed, and they should also be transactable or the requirement undermines the distribution system. Instead, CWT supported leaving the existing disclosure requirements unchanged.

Many airlines and airline associations also opposed new display requirements. A4A commented that the proposal is not needed as the Department has already implemented fee disclosure requirements, including requirements for disclosures on carrier and ticket agent Web sites and in e-ticket confirmations. A4A argued that the Department should rely on market pressures to encourage carriers to provide any further disclosures to consumers regarding ancillary service fee information. According to A4A, there is no evidence of consumer injury to support additional display requirements, and the consumer

comments and complaints regarding fees that the Department relies on are not specific enough to justify new display rules. In addition, A4A stated that a requirement that airlines and ticket agents provide itinerary-specific display results that are not based on the identity of the customer will provide inaccurate information to consumers that may be eligible for ancillary service fee discounts based on factors such as frequent flyer membership or method of payment. Air New Zealand and Copa commented on the increased costs that airlines will incur to ensure that ticket agents have additional and correct information to provide to consumers.

Google, Inc. (Google), Hipmunk, Inc. (Hipmunk), Kayak Software Corporation (Kayak), Skyscanner Limited (Skyscanner), Travelzoo, Inc. (Travelzoo), and TripAdvisor LLC (TripAdvisor), referring to themselves as the "Metasearch Providers," filed joint comments summarizing their "consensus views on the nature of the services they provide and the Department's jurisdiction." The Metasearch Providers argued that they have a different role from other ticket agents and should not be subject to display requirements because it is unnecessary and could hamper a consumer's search and discourage overall innovation. The Metasearch Providers stated that display of baggage and seat assignment fees is not necessarily useful to consumers that are just exploring travel options. They also stated that disclosure requirements would impose significant costs for programming and may discourage entities operating flight search tools from displaying prices at all. CCIA commented that display requirements should not apply to entities operating metasearch tools because those entities have strong incentives to provide their users with accurate information and a requirement to show particular information for every flight search would dampen innovation in the flight search exploration process. According to CCIA, the Department should require airlines to provide dynamic ancillary fee data without imposing any "rigid" display requirements, particularly on metasearch entities. Finally, both TripAdvisor and Skyscanner argued that requirements to disclose information to consumers should not apply to them and instead it should be left to the metasearch entities to determine the best method of disclosure to consumers.

DOT Response: After reviewing the comments and considering the options, the Department has determined that it would be more transparent and better serve consumers to have a uniform,

⁵ See DOT-OST-2014-0056-0624, Summary of Proceedings, DOT Meeting with Airlines for America (A4A) (posted September 15, 2014).

more specific, display requirement for consumers. Currently, the burden is on the consumer to research the airline's fees and policies to try to determine which baggage fees may apply to the consumer's air travel. However, we think it is reasonable for consumers to be able to obtain fee information that applies to specific categories of customers. We do not want to interfere with business agreements or impose additional complexity on airlines and ticket agents by requiring airlines to provide personal information regarding their customers to ticket agents. Therefore, we have not proposed to require carriers or ticket agents to provide information that is specific to individuals. Instead, this SNPRM would propose to require carriers to provide the fees for specific categories of customers to ticket agents. It would also require carriers and ticket agents to modify their Web pages to allow consumers the option to indicate any factors that may impact the fees that the consumer might pay to transport baggage. As some of the comments suggested, we agree that it should be optional for consumers to provide the information. Some consumers might prefer to search for flight options without providing that information. Other consumers might be searching for multiple passengers, each of whom might fall into a different customer category, in which case the consumer might need to search flight options more than once to determine what baggage fees applied to each passenger's air travel. However, we believe consumers should have those options rather than having only the option to review multiple static lists to try to determine which baggage fees apply. In the Department's view, the burden of identifying specific baggage fees more appropriately falls on the carrier and ticket agent rather than the consumer. Accordingly, we believe consumers should have the option to provide information to obtain more specific fee information if the consumer chooses to do so.

We seek comment on whether the proposal in this SNPRM covers the appropriate categories of consumers that may be eligible for specialized baggage fees and should be included in the proposal. In the 2014 NPRM, we identified the following categories: Military, credit card holders (method of payment), and frequent flyer members. We have included those same categories in this SNPRM. We seek comment on whether those categories of consumers are sufficient to provide most consumers with specific baggage fee

information. In the alternative, should the Department include any additional customer categories in the requirement? We also seek comment on whether the Department should include in the requirement a general obligation to disclose that baggage fees may be reduced or waived based on other consumer characteristics to be specified by the carrier. In other words, if there are additional categories of consumers that may be eligible for specialized baggage fees on a particular airline but it is not a general category across airlines and is not identified in this rulemaking, should the airline be required to provide additional notice to consumers?

Regarding method of payment, we are aware that there are many credit cards that may provide consumers with the benefit of free or reduced baggage fees. Should we identify specific credit cards that must be included in the list of options that consumers may select or simply require that all carrier-affiliated cards offering baggage fee benefits be included as options for consumers?

Regarding frequent flyer programs, we recognize that there is variation in each carrier's program, for example, different levels of membership with different benefits depending on the consumer's status. Should we specify the levels of membership and status for which information must be provided or is it sufficient to state that each carrier should identify the levels of membership and provide relevant benefit information for all levels of membership (*i.e.*, information on benefits pertaining to baggage fees) to all ticket agents?

In addition, there are also carrier-alliance programs that confer their own benefits. Should we require airlines to provide information regarding carrier-alliance programs as well? If so, would it be necessary for each carrier to identify the levels of membership and provide relevant benefit information for all levels of membership (*i.e.*, information on benefits pertaining to baggage fees) to all ticket agents?

G. Web Site and Mobile Application Displays; Consumer Opt-Out; and Implementation Period

The NPRM: The 2014 NPRM made clear that to comply with the proposed ancillary service fee disclosure requirement, airlines and agents would have to modify their Web sites to display the basic ancillary service fees adjacent to the fare information on the first page that displays a requested itinerary with fare. The NPRM asked for comment about several aspects of the proposed disclosure options, including

whether ancillary service fee information should be displayed only upon a consumer's request or always provided on the first page of search results and whether disclosure of basic ancillary service fee information should be required on limited availability sites, such as corporate travel Web sites. Both proposals would have required that carriers and ticket agents that have Web sites marketed towards U.S. consumers must disclose, or at a minimum display by a link or rollover, the fees for basic ancillary services on the first page on which a fare is displayed in response to a search for a specific flight itinerary. The NPRM made clear that to comply with the proposed disclosure requirement, airlines and agents would have to modify their Web sites to display these basic ancillary service fees adjacent to the fare information on the first page that displays a requested itinerary with fare. The NPRM also sought comment on whether the Department should require carriers and agents to provide information on standard fees for baggage or require a variety of baggage fees to be displayed, and if a variety of fees for each service, how such fees should be arranged in displays. We also asked for information on the technological feasibility and cost of requiring this information to be displayed. Finally, the NPRM also requested comment on whether we should leave the existing requirements on baggage disclosure in place instead of adopting either of the proposals. We also encouraged interested parties to provide comments regarding any innovative alternatives or solutions that the Department may not have considered but that would address the lack of disclosure of ancillary service fees in all sales channels.

Comments: We received extensive comments in connection with these issues. In addition to consumer comments generally supporting greater disclosure, some consumers comment in support of specific display requirements, including over 20 supporting display of fees on the first page displaying fares and six supporting display later in the search process but before purchase. Several consumers also commented in favor of a standardized display of some kind, whether a table or other format. Consumer advocacy groups Consumers Union and U.S. PIRG supported a requirement to display ancillary service fee information automatically alongside the fares on the first page of search results displayed to consumers. They further commented that to the extent all ancillary service fee information is provided (*i.e.*, beyond

baggage fees) and this would crowd the page, then a link should be provided along with clear and conspicuous notice that other fees may apply. In connection with innovative alternatives and solutions not considered, Travelers United and NCL commented that better display of information is needed but they do not argue for or against the display requirements proposed, supporting instead a requirement that all data be made available so market innovation can improve how the information is provided to consumers. In connection with how ancillary service fee information should be displayed, Open Allies urged the Department to allow carriers and ticket agents flexibility in how information is disclosed and expresses concern that too much information on a screen will make it hard for consumers to comprehend. Open Allies supported the proposal to permit the use of links or rollovers provided that a prominent notice adjacent to the advertised fare makes clear that ancillary service fees are disclosed via a link or rollover. Regarding an opt-out option, Open Allies stated it “doubts that most consumers would select the opt-out option,” but agreed providing that flexibility makes sense. Travel Tech supported a disclosure requirement that is the same for carriers and ticket agents. In connection with how the information is displayed, Travel Tech urged the Department to allow flexibility, including the use of links or roll-overs. It also urged the Department to extend that flexibility to mobile displays. Regarding opt-out, Travel Tech supported allowing the option of an opt-out that is not pre-selected and includes notice that ancillary service fees may apply. According to Amadeus, display of ancillary service fee information does not need to be provided on the first screen, it only needs to be provided before a booking decision is made.

Orbitz opposed proposed display requirements, stating that providing more information at the start of the booking process will overwhelm and confuse consumers. Orbitz also commented that any display standard adopted will quickly become obsolete or hinder innovation as technology changes. Orbitz also opposed imposing display requirements on mobile platforms as it would be difficult to implement and would impair the user experience. In connection with corporate travel sites, Orbitz opposed any display requirements, noting that display content is typically negotiated by the businesses involved. BCD also opposed display requirements on

corporate travel agent sites, arguing that if it is not able to transact ancillary service fees, it should not be required to display such fees. According to BCD, display requirements will impose additional compliance costs on BCD without providing an opportunity to recoup those costs by offering enhanced services and those costs will be passed on to BCD clients. CWT also argued that the Department should consider the differences between corporate and leisure travelers and stated that only those fees that can be booked in advance should have to be disclosed and they should also be transactable or the requirement undermines the distribution system. In connection with Section 399.85, CWT commented that it should not be changed.

A4A argued that the proposed disclosure requirement will cause sub-optimal displays, providing fee information that consumers may not be interested in and taking up screen space that could be used to provide additional flight options or other information. A4A noted that the fee information might vary for every segment of the itinerary and argues that the sheer volume of information displayed is likely to overwhelm rather than assist consumers. A4A also stated that the proposed display requirements are contrary to the current carrier trend to offer bundled pricing and differentiated seat products and limit carriers’ ability to provide such offerings. In addition, A4A stated that a requirement that airlines and ticket agents provide itinerary-specific display results that are not based on the identity of the customer will provide inaccurate information to consumers that may be eligible for ancillary service fee discounts based on factors such as frequent flyer membership or method of payment. Regarding searches for multiple passengers, A4A stated the search results displayed might not reflect the discounts available to some members of the group. A4A also noted that if more information must be displayed, search results will likely take longer to display due to increased processing time.

Regarding mobile applications, A4A commented that the problem of displacing information such as additional flight options on Web sites is particularly acute on mobile devices “because first-screen space is limited and valuable,” therefore the Department should not expand the display rules to mobile applications. Delta also opposed display requirements stating that it would have a negative impact on speed and performance of reservations systems and would be costly and time

consuming to implement. United opposed a requirement to display basic ancillary service fees at the first point in a search process where a fare is listed, stating that it will waste time for consumers because search results will be slowed by additional processing time for the information, then consumers must review additional information they are not interested in or click on links or pop-ups to see the information. Meanwhile, fewer flight options will be displayed on each screen. United also argued that search results may display inaccurate information depending on whether the consumer is conducting an anonymous search but is entitled to reduced fees, or a consumer is searching for multiple passengers, and similar concerns.

CCIA also commented that display of ancillary service fee information could result in screen clutter, which would be frustrating to users and that the proposed display requirements “are not adequately designed to work on a mobile platform” and may impede the consumer experience. TripAdvisor also commented that the Department should exempt mobile displays from display requirements or tailor requirements to a range of display sizes. Skyscanner commented that display of a large volume of information is unfeasible on a mobile device so, if implemented, displays would become less useful to users of mobile sites or mobile applications. Displays would be slower and include fewer options in a more cluttered presentation. USTOA opposed the proposed display requirements, stating that they will limit development of new business models, and questions how tour operators that sell bundled packages that may include airfare would comply with disclosure requirements.

DOT Response

Disclosure and Display Requirements

We recognize that the comments reflect legitimate concerns about the fact that if more information must be displayed, more screen space is consumed and search results will likely take longer to display due to increased processing time. However, we also note that many of the comments on this issue focused on the amount of screen space and increased processing time required for the display of seat assignment fees, which are generally dynamically priced and therefore would require additional processing time. As noted earlier, we have decided not to include disclosure of seat assignment fees in this proposal. Regarding baggage fees, although displaying such fees may also require some additional processing time and

will use some additional screen space, it is a cost that carriers have chosen to state separately from airfare and is information that consumers and consumer advocates have repeatedly stated that consumers need in order to determine the true cost of travel.

Nevertheless, we agree it is important to make the information as easy to provide and as useful to consumers as possible. Accordingly, we request comment on whether we should permit the baggage fee information to be displayed by links or roll-overs on all displays or on certain mobile displays.

Regarding the comment by A4A and others that the fee information might vary for every segment of the itinerary and the volume of information displayed is likely to overwhelm rather than assist consumers, this concern does not apply to baggage fees since carriers must apply the baggage allowances and fees that apply at the beginning of a passenger's itinerary throughout his or her entire itinerary pursuant to 14 CFR 399.87.⁶

Some comments expressed concern that the Department's proposed display requirements are contrary to the current carrier trend to offer bundled pricing and customized pricing. The Department's consumer protection rules in this area are intended to protect consumers from being surprised by unexpected fees and to allow them to discern the true cost of air transportation before making a purchase. To the extent carriers or ticket agents choose to offer bundled fares that include baggage in addition to, or instead of, offering fares that do not include baggage fees, they would not be prohibited from doing so. Under this proposal the display of such fares would only be required to make clear that there is no additional baggage fee associated with that fare if that is the case.

Regarding air-tour packages, we recognize that air transportation may be purchased in bulk by the seller of the tour package and the carrier may be unknown at the time of purchase which may make it difficult to provide specific baggage fee information. Accordingly, we have tentatively concluded not to require ticket agent sellers of air-tour packages to provide disclosure of specific baggage fees in certain circumstances. Specifically, if air transportation is arranged at a later date and specific airline and baggage fee

information is not known at the time of booking, ticket agents would not be required to display the baggage fee. However, when displaying such air-tour package prices, such ticket agent displays would be required to prominently disclose that baggage fees may apply if that is the case. In addition, ticket agents would be required to disclose in online displays and oral communications that baggage fees may apply and that those fees may be reduced or waived based on the passenger's frequent flyer status, method of payment or other consumer characteristic. This exception would not apply to air carriers or foreign air carriers selling air-tour packages. We request comment on whether this exception for certain air-tour packages adequately addresses concerns of air-tour package sellers. We also request comment on whether such an exception adequately protects consumers.

Opt-Out

Regarding the concern that consumers may not be interested in baggage fee information being displayed and it may take up screen space that could be used to provide additional flight options or other information, we recognize there may be reasons that consumers wish to opt-out of display of baggage fees, for example if the consumer will be traveling without checked baggage. We agree that it is reasonable to provide entities the flexibility to provide such an option. Most of the comments on this issue agreed that it was reasonable to provide an opt-out option. In addition, if an entity anticipates that there will be a significant impact on the speed of search results or particular display options the entity provides, the option to provide an opt-out for baggage fees would address those concerns by providing carriers and ticket agents the option to provide consumers what may be a faster or more streamlined display of search results, if consumers choose such displays. We anticipate that basic baggage fee information will be useful to many, if not most, consumers, and that they will often choose displays that include such information. However, by providing an opt-out option for baggage fee information, entities that display flight information would still have the flexibility to provide search results without that information if the consumer chooses a display option that does not include it. Accordingly, our proposal would permit carriers and ticket agents to provide various opt-out options. Opt-out options could include the choice to opt-out of seeing all baggage fee information that would otherwise be required to be displayed

(first and second checked bag and carry-on bag) or to opt-out of seeing some of those fees. For example, a consumer might choose to see fees for carry-on and first checked bag, but not second checked bag. Another option might be that a consumer could choose to see only carry-on bag. A third option could be to see first and second checked bag fees but not the carry-on bag fee. The opt-out options that may be provided would be up to the carrier or ticket agent and no opt-out would be required under the proposal.

We seek comment on whether providing the flexibility to furnish a variety of opt-out options addresses some of the concerns of carriers and ticket agents regarding increased processing times and screen clutter. We also seek comment on whether providing opt-out options would adequately protect consumers.

Display of Search Results on Mobile Displays

In connection with applicability to mobile applications (apps) and mobile Web sites, several commenters state that the Department should consider more limited requirements for mobile outlets because implementation of new rules in the mobile environment is technically more difficult and detailed disclosures may be difficult to incorporate and display, particularly considering the screen size of some mobile devices. We recognize some of the inherent limitations of displays designed for mobile outlets. Comments suggesting more limited disclosure requirements for mobile outlets focused on the complexity of potential disclosure requirements. The limitation of disclosure requirements to certain baggage fees will reduce the amount of screen space used for additional disclosures.

In addition, some commenters stated concern that there would be technical difficulty in implementing increased disclosure requirements and increased processing time; however, we note that similar concerns apply to non-mobile internet displays. However, we have determined that the consumer benefit to having basic ancillary service fee information outweighs the potentially increased processing times. As some commenters noted, consumers in increasing numbers are using apps to book travel. Therefore, we believe it is important that the same consumer protections apply to apps as to other outlets directed to consumers. Accordingly, we have tentatively concluded that the disclosure requirements should be the same on apps as on Web sites or mobile Web

⁶ We note that carriers always have the option of waiving a baggage fee or offering a lower baggage fee than advertised for any segment of an itinerary. As the Department's Office of Aviation Enforcement and Proceedings has stated regarding Section 399.87, it does not prevent a carrier from charging a lower fee as a courtesy. [Cite is FAQ 50]

sites. We request comment on whether allowing disclosure via links or pop-ups would simplify the disclosure process and reduce technical issues and speed processing times for mobile outlets.

We also note that the FTC has provided guidance regarding internet disclosures (See .com Disclosures: How to Make Effective Disclosures in Digital Advertising, available at <https://www.ftc.gov/system/files/documents/plain-language/bus41-dot-com-disclosures-information-about-online-advertising.pdf>). The FTC's guidance notes that using hyperlinks, rollovers, or pop-ups for price and certain other disclosures may be less effective. Consistent with DOT's position in this SNPRM, the guide states that "consumers should not have to click on hyperlinks to understand the full amount they will pay." The guide therefore suggests that fee or cost information should be disclosed adjacent to the price claim, unless the information is very complex. Similarly, the guide notes that rollovers or mouseovers "may not work on mobile devices that have no cursor to hover over a link." Finally, the guide cautions that pop-ups may be blocked by software or otherwise ignored by consumers.

Accordingly, we request that commenters provide any consumer research or data that indicates whether hyperlinked or other disclosures not adjacent to the fare on a mobile site would or would not be effective.

Implementation Period

In connection with the time to implement rule, the Department is tentatively of the view that a six month implementation period to display consumer-specific fee information for a first checked bag, a second checked bag and a carry-on bag to consumers whenever fare and schedule information is provided would be appropriate and should provide enough time for both carriers and ticket agents to update Web sites and apps. We recognize that in order to make technical changes and accommodate new information, individual ticket agents will need to know in detail how the information will be distributed from carriers to the ticket agent and have the information from carriers well before the display deadline. We anticipate carriers will work in good faith with ticket agents, including GDSs and other ticket agent intermediaries, to ensure that the distribution method and details are worked out well in advance of the display deadline. In this regard, we have tentatively concluded that carriers should ensure ticket agents have the

information no later than three months before the display deadline. We note many of the comments state that a lengthy implementation period will be necessary to implement any disclosure requirement and some suggested several years. However, many of the reasons presented for the multi-year implementation period had to do with the complexity of disclosing multiple dynamic fees. Since the Department is limiting the requirement to disclosure of one carry-on item and a first and second checked bag, the Department believes a six month implementation period is appropriate.

We request comment on whether this proposed implementation period is too lengthy or too short. If the proposed implementation period is either too lengthy or too short, how long of an implementation period would be appropriate?

H. Revised Baggage Fee Disclosure Requirements and 14 CFR 399.85(b) and (c)

This proposed rule, if adopted, would require carriers and ticket agents to provide customer-specific baggage fee information for one carry-on item and a first and second checked bag if they provide fare information. We are tentatively of the view that there would no longer be a need for a requirement that airlines and ticket agents provide a general statement on the first screen on which the agent or carrier offers a fare quotation for a specific itinerary that additional airline fees for baggage may. We are proposing in this SNPRM to remove the requirement under 14 CFR 399.85(b) that displays of fare quotations must include a statement that fees for baggage may apply and where consumers can see these baggage fees. The requirement to provide the more general statement that baggage fees may apply would be limited to certain ticket agent displays related to air tour packages that are unable to provide customer-specific baggage fee information.

In addition to eliminating rule text under 14 CFR 399.85(b), we are considering eliminating the requirement in 14 CFR 399.85(c) regarding disclosure of bag fee information on e-ticket confirmations as it may be of limited use.

We seek comment on whether eliminating 14 CFR 399.85(b) would be appropriate if the proposed requirement to display customer-specific baggage fee information is adopted. We also seek comment on whether we should consider keeping the existing requirement 14 CFR 399.85(b) with revisions to reflect the proposed

changes. If the 14 CFR 399.85(b) disclosure requirement should be kept but modified, what changes would be appropriate?

Regarding 14 CFR 399.85(c), we request comment on whether the proposed revision would be appropriate and adequately inform consumers of the applicable baggage fees if the proposed requirement to display more specific baggage fee information is adopted. If not, what changes or additions would better ensure that consumers are provided with the specific baggage fee information that will be required if the proposal is adopted?

Regulatory Analyses and Notices

A. Executive Order 12866 (Regulatory Planning and Review) and DOT Regulatory Policies and Procedures

This action has been determined to be significant under Executive Order 12866 and the Department of Transportation's Regulatory Policies and Procedures. It has been reviewed by the Office of Management and Budget under that Executive Order. This section contains a summary of costs and benefits associated with this SNPRM. More detail on the economic impact of this proposed rule can be found in the Regulatory Impact Analysis (RIA), which is available in the docket. Due to the lack of key pieces of data, the Department was unable to quantify the costs and the benefits of the rule proposed in this SNPRM.

Under this SNPRM, the Department is proposing that all ticket agents and airlines that provide fare and schedule information to consumers while doing business in the United States be required to provide fee information to consumers for first and second checked bag, and one carry-on item adjacent to the fare. The information would include the necessary fee information to allow the display of these fees as either the standard fees charged by the carriers, or, at the consumer's choice, as the customer-specific charge if the consumer elects to provide his or her customer category information including, but not limited to, military/veteran status, frequently flier category, and method of payment. Airlines can potentially establish a large number of customer-specific factors that impact the fee that a consumer would pay for a carry-on and first and second checked bag. We solicit comment on whether the Department should limit the categories that have to be displayed on a ticket agent's Web site to the most commonly used categories. If the Department adopts such a limitation, how should

the most commonly used categories be determined?

Carriers would be required to transmit this baggage fee information to all ticket agents to which they provide fare and schedule information, including GDSs and other intermediaries in the air transportation marketplace. Ticket agents and carriers would be required to be compliant with the rule within six months of its final publication date.

Ticket agents would be allowed to design the presentation of these fees as best suits them as long as they are available at the time when fares are first presented. This fee information must be customer-specific, *i.e.* specific to the individual and his/her any unique circumstances, unless the passenger opts out.

Costs of the SNPRM

1. Direct Costs to Carriers

Carriers would incur costs related to preparing and transmitting ancillary service fee information to OTAs and GDSs. These costs would include the one-time set up costs to develop internal systems/processes to distribute the baggage fee information. These set-up costs would include upfront planning time to develop procedures to collect and distribute the necessary data, as well as any potential IT and software development costs to transmit data which is not already being transmitted to GDSs and ticket agents via ATPCO or NDC.

Carriers would also incur some incremental ongoing costs to manage and transmit data relating to any changes in baggage fees defined as basic ancillary service fees by this rulemaking. Carriers might also incur some additional costs for system updates to any new IT systems or programs incorporated for the purposes of complying with this rule. For this analysis, only the ongoing costs which would not have occurred except for the rulemaking are considered.

Carriers can present the information in a format of their choosing, including allowing consumers to opt out of viewing the information, or choosing only some of it, if that is their preference. The Department is requesting further comments on this specific issue with this SNPRM.

Multiple commenters to the 2014 NPRM provided information on likely costs to carriers of the proposed requirement for basic ancillary service fee information, though most of these costs comments were directed at the possible inclusions of requiring transactability for these fees as well as their display (*i.e.*, that consumers would

be able to pay for these ancillary services on the OTAs and GDSs), an alternative which was considered by the Department but not adopted for this SNPRM.

One mainline carrier (Delta) commented that the proposed rule as described in the NPRM would require the redesign of carrier distribution systems to provide ancillary fees at the first point of search. Delta estimates it would take 12 months and cost \$1 million redesign its systems.

An economic consultant (who submitted comments with the carrier trade association, A4A) argued that the costs to carriers to comply with the requirement for greater transparency as proposed in the NPRM would cost more than \$3 million in the first year, and \$7.2 million over 10 years. This commenter also argued that carriers would incur significant additional ongoing costs for managing estimates of the process of “development and debugging programs and procedures that the carriers will have to create to report ancillary fee information.” The commenter noted that carriers typically employ one full time employee to monitor and debug the baggage fee information reporting to ATPCO. He also noted that carriers spend approximately \$1 million to “establish each link to a GDS”.

ATPCO also commented that the costs to carriers of compliance with the requirement as proposed in the NPRM could be quite high, noting that ATPCO’s efforts alone to comply with the simpler baggage fee information requirements of the 2011 consumer rule cost over \$1 million.

The Department believes that the estimates from commenters to the 2014 NPRM overstate the likely costs to carriers of this SNPRM for several reasons. While reviewing these comments, the Department noted that much of the comments were directed to the challenges and additional costs of transferring information for advance seat assignment, which is dynamic information, changing frequently as carriers manage their loads. The cost for the transmittal of real-time advance seat assignment information to ticket agents would thus be significantly more than the transmittal of baggage fee information, which changes much less frequently. Additionally, the Department notes that several carriers are already in agreement to start providing that information to GDSs; and some carriers are moving to IATA’s NDC which will allow for easier customization of flight and pricing options to consumers and at a lower cost to carriers (once they have

incorporated NDC into their systems). And while the Department agrees that there will be ongoing costs to maintain and transmit data required by the rule, the Department does not believe that the SNPRM, if adopted as proposed, would generate the need for an additional full-time staff equivalent for each carrier, on average, to monitor and debug ancillary fee data shared with travel agents, given the current pace of technological improvements in all reporting systems, the pace at which carriers are adopting NDC, and the staff resources already committed to monitoring data transmittals.

Given the existing questions and comments to the 2014 NPRM, the Department does not believe that it has enough information to confidently quantify the total cost to carriers of complying with the proposed rule. The Department believes that the costs of compliance are likely to be less than \$1 million per carrier, but is nevertheless seeking additional information on the likely costs to carriers of the requirement as specified in this SNPRM.

2. Direct Costs to Ticket Agents

Ticket agents would incur costs related to accepting ancillary service fee information from GDSs and carriers and posting that information on their Web site engines, and of communicating the additional fee information to consumers during reservation phone calls. The most significant cost to ticket agents is likely to be the one-time cost to reprogram their Web site search engines to provide the necessary baggage information.

Larger ticket agents and OTAs are likely to have in-house capability to reprogram their Web sites accordingly, but small tickets agents probably will not. As the US Tour Operators Association (USTOA) noted in its comment to the 2014 NPRM, many tour operators are unlikely to have in-house web programmers and would likely need to hire consultants and contractors to bring their Web sites into compliance.

Ticket agents that market and sell online to consumers already have systems in place to receive flight and cost information from carriers and GDSs, but it is unclear whether these systems have the capacity to receive and process all the necessary information to comply with the proposed rule. Several commenters to the NPRM argued that the RIA for the 2014 NPRM underestimates the costs to ticket agents to update their systems to comply with the rule. The Department is seeking comments on this specific issue with this SNPRM.

At least three commenters noted that there could be significant ongoing compliance costs for ticket agents and tour operators to provide baggage fee information as per the proposed requirement, primarily in terms of longer times during reservation phone calls. The Department acknowledges that there may be additional time at the beginning of a call as ticket agents discuss baggage fees earlier in the reservation process but notes that such earlier discussion of baggage fees may also limit the likelihood of increased call time at the end of the call as some consumers are surprised by additional baggage fees and may revisit their flight searches.

Ticket agents would also incur some ongoing costs to refresh the required baggage fee information when it changes. The Department does not expect that these costs would be significant, since the systems to transmit the data are already in place and the programming to display the required baggage fee has already occurred. In addition, these fees need only be updated when changed.

We believe that the cost impacts of the proposal in this SNPRM would differ significantly from the costs which would have been incurred under the 2014 NPRM, since the current proposed rule no longer includes advance seat assignment in the basic ancillary service fees to be covered. Thus, the Department is seeking additional information on the potential costs of this SNPRM on ticket agents.

3. Other Cost Issues—Additional Costs to GDSs and/or ATPCO

It is unclear if GDSs would incur additional costs to process the information required by this SNPRM. For this analysis, the relevant incremental costs to the GDSs would be those costs of efforts/improvements which they would otherwise not have incurred, but for this rulemaking. Costs for efforts of GDSs to collect and transmit the needed baggage fee information to ticket agents that were already planned or which would occur in the future for reasons other than this rule (such as responding to market forces) are not considered to be due to the rule. According to some of the comments received, GDSs are already improving the capacity of their systems to manage more ancillary service fee information.

Comments to 2014 NPRM regarding costs to GDSs to comply with it were somewhat inconsistent. At least two comments (one for from a carrier and another carrier trade association supported study) claimed that GDSs

would incur significant costs. Yet one GDS (Sabre) commented that it already has the capability to comply with the requirements proposed in the 2014 NPRM (although it noted that ticket agents do not already have the needed systems in place). The Department thus expects that this SNPRM, if adopted as proposed, would not have significant costs to GDSs.

ATPCO could also potentially incur additional costs to process the required information, due solely to this rulemaking, although this is also very uncertain. In its comments to the NPRM, ATPCO stated that it already has the capacity to meet the proposed 2014 NPRM requirements. The Department also expects that the SNPRM would not entail significant costs for ATPCO.

Costs to Consumers of Additional Time Waiting for Search Results

Several commenters to the 2014 NPRM, including A4A, Delta, and IATA, argued that the Department's analysis should take into account potential costs to consumers from additional time spent waiting for the research results to load, given additional processing time required to display more ancillary fees. These commenters specifically cited the likely increased time needed to access real time information for up-to-date seat assignment fee information. A study prepared for A4A by Dr. Daniel L. Rubinfeld estimated the additional wait times to consumers would cost approximately \$805 million per year, based on the assumption that the proposed rule would add approximately 20–40 seconds to each itinerary search (drawn from a survey by A4A of its members). Elsewhere in its submittal, A4A estimates that the additional processing time for the proposed ancillary service fee information would cost approximately \$139 million a year from an estimated loss of 5.5 million hours per year for online ticket agents alone.

The Department notes that most of the costs relating to additional processing times and added wait times for consumers raised by commenters focus on the additional time and cost for transmitting advance seat assignment information, which, as noted above, is dynamic and thus more complicated and expensive to keep up-to-date. Since the SNPRM does not include advance seat assignment, the needed time to process and display the required fee information should be much less than what was estimated by commenters in response to the 2014 NPRM.

Additionally, to provide more flexibility to ticket agents, this SNPRM

would permit ticket agents to provide consumers the opportunity to opt-out of receiving the baggage fee information for carry-on and first and second checked baggage, if so desired. If ticket agents do choose to incorporate such an opt-out feature, additional time for processing and displaying information on baggage fees which the consumer does not want to see should be significantly reduced. The cost of waiting for baggage fee information, which the consumer does want to see, should be off-set by the value to the consumer of getting that information (hence the choice made to receive it). The Department acknowledges that some portion of consumers may misjudge/underestimate the amount of time it would take to receive all the baggage information, especially in the beginning period after implementation and that, therefore, there will be some additional wait time and costs to consumers but that this cost will decrease over time.

Since the SNPRM does not include seat assignment fees in the basic ancillary fee data that must be communicated, the Department believes that there would not be significant additional wait time for consumers. Nevertheless, the Department is seeking additional comment on this issue.

Benefits of the SNPRM

1. Time Saving Benefits to Consumers

Both consumers who purchase directly from carrier Web sites and those who use travel agents would benefit. A significant number of leisure travelers book online via online travel agencies, use metasearch engines, or even use their businesses travel management company. But since OTA Web sites do not currently have customer category-specific bag fees, these consumers must check multiple airline Web sites in order to get an accurate estimate of the flight costs including the fees for basic ancillary services related to carry-on and first and second checked bags. While information on baggage fees is already required to be available from travel agents, it is often available through links, which requires significant time and effort from the consumer to determine the actual fee that must be paid. The consumer must click the link or links to get the baggage information for the itinerary being considered and recalculate their cost. Not all consumers purchasing tickets via an OTA would experience a time savings, as not all consumers are concerned with baggage fees. For some consumers the additional cost for baggage will not factor into their choice of a flight, and as such these consumers

wouldn't search for baggage fees and thus would not benefit from the requirements proposed in this SNPRM. Additionally, in some markets there is only one (or perhaps two) carriers that offer flights at the preferred time or at a fare which the consumer would consider; these consumers also would not benefit. But the Department believes that many consumers seek out at least some baggage information, which would result in the time savings for those individuals.

Meanwhile, a little more than a fourth of airline passengers purchase tickets directly from carrier Web sites (PhoCusWright estimates this figure at 23%).⁷ While these consumers have the most direct access to ancillary service fees, many carrier Web sites also do not include basic ancillary service fees when first quoting an itinerary fare. Thus, some consumers must access multiple Web pages to reach the information they need to calculate a cost to them which includes posted fare plus the fees for carry-on and first and second checked bags. Since the SNPRM would require that basic ancillary service fee information be consolidated in one place on carrier fare displays, some portion of consumers purchasing tickets on carrier Web sites would spend less time searching for the desired fee information.

Not all consumers purchasing from carrier Web sites would benefit. Consumers who purchase from a carrier Web site are more likely as a group to be aware of the carrier's baggage fees and policies. Many of these consumers are going directly to the carrier Web site because that carrier is one of the few or the only one to offer flights at the desired time and to the desired destination, or because the consumer is a member of the carrier's affinity program. Nevertheless, some portion of those consumers who purchase tickets on a carrier Web site do check to see what the baggage fees would be for their desired itinerary, and these consumers would save time under this SNPRM.

Together, the time savings may be quite significant. The Department does not yet have the information to confidently estimate the value of this benefit so it is seeking additional comment on it.

2. Better Informed Consumer Purchasing Decisions

The increased transparency in ancillary service fee information would also lead to some portion of consumers making more informed purchasing

choices: (1) Those who learn of the baggage fees for a flight they intend to purchase but do so near the end of the purchasing process, and (2) those who remain unaware of the baggage fee information until after they make a purchase. Both of these consumer groups may end up making purchasing decisions they otherwise would not have made had they been aware of the associated baggage fees when first reviewing search results.

Research has shown that when consumers first see a price which is lower than the final price they must pay (whether due to delayed display of taxes, fees, shipping and handling, etc.) they often end up paying more than if the first price they see is the final, total price (including taxes, fees, and/or shipping and handling). Studies and experiments have demonstrated that partitioned pricing (the separating of a price into its components) and the timing for when different pieces of pricing information (such as taxes) are revealed in a purchasing situation can lead to increases in consumer demand.⁸

If revealing full prices later in the purchasing process leads to more purchases than if the full price had been seen immediately, (at least some) consumers are purchasing at a price higher than they otherwise would have. These "sub-optimal" choices lead to what economists call a "dead-weight loss."

In other research conducted in market situations in which one group of consumers knows more about products and/or prices than others, some economists have proposed a "tourists and natives" framework, in which consumers are divided into two groups—those with access to more information about lower prices/better quality (the natives) and those with very limited information who will often pay more (the tourists). (Some researchers have called these two groups "savvy" and "unsavvy" travelers.) This framework has two price-equilibriums; the "tourist" one is higher than the one

for "natives." With respect to this SNPRM, one could consider the consumers who are well informed regarding fees for ancillary services (*i.e.* aware of itinerary-specific baggage fees) in contrast to other travelers (perhaps those who rarely travel) who are not aware of variance in carry-on and checked baggage fees. The result is that the latter group would end up, on average, paying more.

While both of these theoretical constructs are useful in understanding how and why some consumers may be making sub-optimal air travel purchasing decisions, the Department does not have enough information to quantify or monetize this benefit.

3. Benefits to Businesses Employees That Travel

Many businesses are also concerned with the ancillary fees associated with baggage. Travel can be a significant expense for many companies and ancillary service fees can substantially increase trip costs.

Many business travelers book flights via travel management companies that seek the best flight at the best price for the traveler, given his or her parameters. But much of the information needed to ensure that each traveler gets the best full price taking into account base fare, mileage club memberships, specific credit cards used and any other potential discounts are not often readily available. Travel managers have complained that not all baggage fee information needed to ensure that business travel is booked according to company policy is readily accessible and readily incorporated into internal reservation tracking or accounting programs. The information must be manually entered, often based on receipts or information provided by the travelers themselves. Thus, many businesses either pay more than they needed to for a particular flight or must have employees spend time seeking out the appropriate fee information in order to make the best choice. The increased effort results in higher company travel costs.

These costs associated with searching for baggage fee information have been identified repeatedly to the Department by travel management company representatives and raised at meetings of the Advisory Committee for Aviation Consumer Protection. In addition, several commenters, including trade associations, a GDS and at least one advocacy group, noted that benefits to business travelers of this requirement could be significant.

While there is much interest in the industry on the impact of unbundling

⁷ PhoCusWright (2011) "U.S. Online Travel Overview."

⁸ Deborah Shenck, "Exploiting the Salience Biases in Designing Taxes," (*New York University Law and Economics Working Papers*, Paper 233, 2010) has an informative and extensive review of past work in this area. See also Morwitz, Vicki, Greenleaf, Eric, Shalev, Edith and Johnson, Eric J., *The Price Does Not Include Additional Taxes, Fees, and Surcharges: A Review of Research on Partitioned Pricing* (February 26, 2009). Available at SSRN: <http://ssrn.com/abstract=1350004>. Note, though that some studies have found that partitioned pricing can also lead to negative brand recognition and may hurt sales in the future, if the fees are perceived to be excessive and within the seller's ability to control. This differs somewhat from the situation here, since the separate portions of the price are taxes imposed by state, local and federal governments (as opposed to shipping fees, etc.).

and ancillary service fees on the costs of business travel, the Department did not find adequate data on this impact to estimate the benefits of this requirement for these business travelers, but notes that they may be significant for some entities.

4. Benefits to Ticket Agents

While there is concern about the added costs of this provision to ticket agents in terms of additional programming expenditures and staff time to communicate the added baggage fee information, there is also the possibility that ticket agents may experience some benefits of the SNPRM. At least one commenter raised the point that ticket agents would be able to access ancillary service fee information more quickly in response to consumer requests, and could conclude some transactions with consumers more quickly. The Department agrees that ticket agents may benefit from the rule in this manner but is unable to estimate by how much.

B. Regulatory Flexibility Act

The Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) requires an agency to review regulations to assess their impact on small entities unless the agency determines that a rule is not expected to have a significant economic impact on a substantial number of small entities. The rule proposed in this SNPRM would have some impact on a significant number of small entities, as discussed in the Initial Regulatory Flexibility Analysis.

For purposes of rules promulgated by the Department regarding aviation economic and consumer matters, an airline is a small entity for purposes of the Regulatory Flexibility Act if it provides air transportation only with aircraft having 60 or fewer seats and no more than 18,000 pounds payload capacity.⁹ The Small Business Administration (SBA) size standard for small business for both travel agents and tour operators is \$20.5 million in average annual receipts (SBA does not have a size standard for ticket agents as defined by the Department; travel agents and tour operators are the most applicable categories for which such data was found).

A significant number of small entities would be impacted by this SNPRM. Due to the relative lack of key pieces of data, the Department was unable to quantify the costs of the proposed rule to small (or large) entities, but notes that some

small entities may incur substantial costs. The primary costs of the rule arise from programming, data management and other related costs to carriers and ticket agents to transmit or display the required baggage information. The Department is seeking additional information on the potential costs and benefits of the requirements proposed in the SNPRM.

C. Executive Order 13132 (Federalism)

This SNPRM has been analyzed in accordance with the principles and criteria contained in Executive Order 13132 ("Federalism"). The notice does not contain any provision that (1) has substantial direct effects on the States, the relationship between the national government and the States, or the distribution of power and responsibilities among the various levels of government; (2) imposes substantial direct compliance costs on State and local governments; or (3) preempts State law. States are already preempted from regulating in this area by the Airline Deregulation Act, 49 U.S.C. 41713. Therefore, the consultation and funding requirements of Executive Order 13132 do not apply.

D. Executive Order 13084

This SNPRM has been analyzed in accordance with the principles and criteria contained in Executive Order 13084 ("Consultation and Coordination with Indian Tribal Governments"). The SNPRM would not significantly or uniquely affect the communities of the Indian tribal governments or impose substantial direct compliance costs on them, the funding and consultation requirements of Executive Order 13084 do not apply.

E. Paperwork Reduction Act

The Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501 *et seq.*) requires that the Department consider the impact of paperwork and other information collection burdens imposed on the public and, under the provisions of PRA section 3507(d), obtain approval from the Office of Management and Budget (OMB) for each collection of information it conducts, sponsors, or requires through regulations. DOT has determined that the proposals included in this SNPRM would impose new information collection requirements on the affected entities. Accordingly, we are seeking comment on the impact of the requirements proposed in this SNPRM.

The first collection of information proposed here is a requirement that air carriers and foreign air carriers provide useable, current, and accurate fee

information for a first checked bag, a second checked bag, and one carry-on bag to all ticket agents that receive and distribute the air carrier's or foreign carrier's fare and schedule information. The second information collection is a requirement that air carriers, foreign air carriers, and ticket agents that provide an air carrier's or foreign carrier's fare and schedule information to consumers in the United States receive the information from carriers and disclose the air carrier's or foreign air carrier's fees for a first checked bag, a second checked bag, and one carry-on bag.

For each of these information collections, the title, a description of the respondents, and an estimate of the annual recordkeeping and periodic reporting burden are set forth below:

1. Requirement that air carriers and foreign air carriers provide certain baggage fee information to all ticket agents that receive and distribute the carrier's fare and schedule information.

Respondents: Air carriers and foreign air carriers that provide fare and schedule information to ticket agents and charge baggage fees for a carry-on bag, first checked bag, or second checked bag. We estimate that approximately 206 carriers will be impacted by this requirement.

Estimated Annual Burden on Respondents: Approximately 8 hours per respondent. Note that 8 hours is the basis used for computing the costs of providing baggage fee information, but since airlines already share this information with each other to facilitate code-share and interline ticketing, it likely overestimates the actual amount of additional time that most carriers will have to spend to meet the requirement.

Estimated Total Annual Burden: 1,648 hours for all respondents.

Frequency: Once information is provided, new or additional information only needs to be provided when baggage fee information changes; varies by airline but for most carriers is infrequent and will likely be less than annually.

2. Requirement that air carriers, foreign air carriers, and ticket agents that provide carrier fare and schedule information to consumers in the United States disclose carrier's fees for a first checked bag, a second checked bag, and one carry-on bag.

Respondents: Air carriers, foreign air carriers, and ticket agents that provide carrier fare and schedule information to consumers in the United States. We estimate that as many as 206 air carriers and foreign air carriers and as many as 600 ticket agents may be impacted by this requirement.

Our estimate is based on the following information and assumptions: Ticket

⁹ See 14 CFR Chapter 11. Note that the Small Business Administration definition of small carriers is not used.

agents includes online travel agencies (OTAs), brick-and-mortar travel agencies, corporate travel agencies, and tour operators that market airline tickets. As described in the Regulatory Impact Analysis accompanying this SNPRM, there may be approximately 9,500 travel agencies and over 2,500 tour operators in the United States, although not all of those entities market air transportation online to consumers in the United States. In addition, most ticket agents rely on GDSs to create online fare and schedule displays. GDSs and entities that create or develop and maintain their own online fare and schedule displays, such as many of the impacted airlines and the largest travel agents, will incur some planning, development, and programming costs to reprogram their systems to provide online displays of fare and schedule information that includes baggage fee information on their Web sites. Therefore we estimate that about five percent of United States ticket agents, including GDSs and large travel agencies, or as many as 600 ticket agents, will be impacted by this requirement. Many smaller carriers also rely on GDSs to create online fare and schedule displays so our estimate of 206 impacted carriers may be overstated.

Estimated Annual Burden on Respondents: Approximately 80 hours per respondent. Our estimate is based on the following information and assumptions: The primary costs to respondents for the disclosure requirement would arise from programming, data management, Web site modification and other related costs to carriers and ticket agents to display the required baggage information. Revising Web site displays in this manner would likely be similar to the revisions that carriers and ticket agents needed to make to their Web sites to comply with the requirement to include all taxes and fees in fare displays in connection with the Enhanced Airline Passenger Protections II rulemaking. Our estimate of those costs was 80 hours per respondent as discussed in the Regulatory Impact Analysis prepared in connection with the Enhanced Airline Passenger Protections II rulemaking (2011) (see page 59, <https://www.regulations.gov/document?D=DOT-OST-2010-0140-2046>).

Estimated Total Annual Burden: Approximately 64,480 hours for all respondents (based on an assumption of 16,480 hours for carriers and 48,000 hours for ticket agents).

Frequency: Once information is incorporated into Web site displays, the

displays would not need to be revised. It would likely be a one-time cost.

F. Unfunded Mandates Reform Act

The Department has determined that the requirements of Title II of the Unfunded Mandates Reform Act of 1995 do not apply to this SNPRM.

G. National Environmental Policy Act

The Department has analyzed the environmental impacts of this SNPRM pursuant to the National Environmental Policy Act of 1969 (NEPA) (42 U.S.C. 4321 *et seq.*) and has determined that it is categorically excluded pursuant to DOT Order 5610.1C, Procedures for Considering Environmental Impacts (44 FR 56420, Oct. 1, 1979). Categorical exclusions are actions identified in an agency's NEPA implementing procedures that do not normally have a significant impact on the environment and therefore do not require either an environmental assessment (EA) or environmental impact statement (EIS). See 40 CFR 1508.4. In analyzing the applicability of a categorical exclusion, the agency must also consider whether extraordinary circumstances are present that would warrant the preparation of an EA or EIS. *Id.* Paragraph 3.c.6.i of DOT Order 5610.1C categorically excludes “[a]ctions relating to consumer protection, including regulations.” The purpose of this rulemaking is to enhance protections for air travelers and to improve the air travel environment. The Department does not anticipate any environmental impacts, and there are no extraordinary circumstances present in connection with this rulemaking.

Issued this 9th day of January 2017 in Washington, DC.

Anthony R. Foxx,

Secretary of Transportation.

Administrative practice and procedure, Air carriers, Air rates and fares, Air taxis, Consumer protection, and Small businesses.

PART 399—[AMENDED]

■ 1. The authority citation for part 399 is revised to read as follows:

Authority: 49 U.S.C. 40101 *et seq.*

■ 2. Section 399.85 is amended by removing paragraph (b).

§ 399.85 Notice of baggage fees and other fees.

* * * * *

(b) Removed.

* * * * *

■ 3. A new section 399.90 is added to read as follows:

§ 399.90 Transparency in airline pricing, including ancillary service fees.

(a) The purpose of this section is to ensure that air carriers, foreign air carriers and ticket agents doing business in the United States clearly disclose to consumers at all points of sale the fees for a first checked bag, a second checked bag, and one carry-on bag wherever fare and schedule information is provided to consumers that may be purchasing or considering purchasing air transportation. Nothing in this section should be read to require that these ancillary services must be transactable (e.g., purchasable online or at other points of sale).

(b) Each air carrier and foreign air carrier shall provide useable, current, and accurate information for fees for a first checked bag, a second checked bag, and one carry-on bag to all ticket agents that receive and distribute the air carrier's or foreign carrier's fare and schedule information. The information should be sufficient to allow ticket agents to express fees as itinerary-specific or customer-specific charges. “Customer-specific” refers to variations in fees that depend on, for example, the passenger type (e.g., military), frequent flyer status, method of payment, geography, travel dates, cabin (e.g., first class, economy), ticketed fare (e.g., full fare ticket—Y class), etc.

(c) Each air carrier, foreign air carrier or ticket agent that provides an air carrier's or foreign carrier's fare and schedule information to consumers in the United States must disclose the air carrier's or foreign air carrier's fees for a first checked bag, a second checked bag, and one carry-on bag.

(i) The fee information disclosed to a consumer for these ancillary services must be expressed as customer-specific charges as provided in subpart (b) if the consumer elects to provide his or her customer category information to the carrier or ticket agent, such as frequent flyer type, payment method, or military status.

(ii) If the consumer conducting a search does not opt out of receiving baggage fee information but elects not to provide his or her customer category information to the carrier or ticket agent, and conducts an “anonymous” search, the fee information disclosed to consumers for these ancillary services must be expressed as itinerary-specific charges. “Itinerary-specific” refers to variations in fees that depend on, for example, geography, travel dates, cabin (e.g., first class, economy), and ticketed fare class (e.g., full fare ticket—Y class).

(iii) This provision does not apply to air-tour packages advertised or sold online by ticket agents if the air transportation component is not finalized and the carrier providing air transportation is not known at the time of booking. However, the agent must clearly and prominently disclose on the first screen in which the agent or carrier offers a fare quotation for a specific itinerary selected by a consumer that additional airline fees for baggage may apply and where consumers can see these baggage fees unless no baggage fees will apply. An agent may refer consumers to carrier Web sites where specific baggage fee information may be obtained or to its own site if it displays carriers' baggage fees. In online displays and oral communications, prior to purchase, each ticket agent must disclose that baggage fees may apply if that is the case and that those fees may be reduced or waived based on the passenger's frequent flyer status, method of payment or other consumer characteristic.

(d) If a U.S. or foreign air carrier or ticket agent has a Web site marketed to U.S. consumers where it advertises or sells air transportation, the carrier and ticket agent must disclose the fees for a

first checked bag, a second checked bag and one carry-on bag as specified in paragraph (c) at the first point in a search process where a fare is listed in connection with a specific flight itinerary, adjacent to the fare. When providing customer-specific fee information, if more than one baggage fee may be responsive to the search parameters, *e.g.*, fee for a particular frequent flyer status and fee for a particular method of payment, the lowest cost option must be identified and displayed. Carriers and ticket agents may permit a consumer to opt out of being provided search results with the fees for a first checked bag, a second checked bag or one carry-on bag, or any single baggage fee (*e.g.*, second checked bag) or any combination of baggage fees (*e.g.*, carry-on and second checked bag) but the opt-out option must not be pre-selected and must make clear which fee or fees will not be displayed.

(e) In any oral communication with a prospective consumer and in any telephone calls placed from the United States, an air carrier, foreign air carrier or ticket agent must inform a consumer, upon request, of the fees for a first checked bag, a second checked bag and

one carry-on bag as specified in paragraph (c).

(f) Ticket agents with an existing contractual agreement at the time this rule becomes effective with an air carrier or foreign air carrier to act as an intermediary for the distribution of that carrier's fare and schedule information to other ticket agents shall not charge separate or additional fees for the distribution of the ancillary service fee information described in paragraph (b). Nothing in this paragraph should be read as invalidating any provision in an existing contract among these parties with respect to compensation.

(g) It is an unfair and deceptive practice in violation of 49 U.S.C. 41712 for an air carrier or foreign air carrier to fail to provide the fees for a first checked bag, a second checked bag and one carry-on bag as described in paragraph (b) to those ticket agents to which the carrier provides its fare and schedule information or for a U.S. carrier, foreign carrier, or ticket agent to fail to provide the fees for a first checked bag, a second checked bag and one carry-on bag to consumers as described in paragraph (c) and (d).

Environmental Protection Agency

40 CFR Part 702

Procedures for Chemical Risk Evaluation Under the Amended Toxic
Substances Control Act; Proposed Rule

ENVIRONMENTAL PROTECTION AGENCY**40 CFR Part 702**

[EPA-HQ-OPPT-2016-0654; FRL-9957-75]

RIN 2070-AK20

Procedures for Chemical Risk Evaluation Under the Amended Toxic Substances Control Act**AGENCY:** Environmental Protection Agency (EPA).**ACTION:** Proposed rule.

SUMMARY: As required under section 6(b)(4) of the Toxic Substances Control Act (TSCA), EPA is proposing to establish a process for conducting risk evaluations to determine whether a chemical substance presents an unreasonable risk of injury to health or the environment, without consideration of costs or other non-risk factors, including an unreasonable risk to a potentially exposed or susceptible subpopulation, under the conditions of use. Risk evaluation is the second step, after Prioritization, in a new process of existing chemical substance review and management established under recent amendments to TSCA. This proposed rule identifies the steps of a risk evaluation process including scope, hazard assessment, exposure assessment, risk characterization, and finally a risk determination. EPA is proposing that this process be used for the first ten chemical substances to be evaluated from the 2014 update of the TSCA Work Plan for Chemical Assessments, chemical substances designated as High-Priority Substances during the prioritization process, and those chemical substances for which EPA has initiated a risk evaluation in response to manufacturer requests. The proposed rule also includes the required "form and criteria" applicable to such manufacturer requests.

DATES: Comments must be received on or before March 20, 2017.

ADDRESSES: Submit your comments, identified by docket identification (ID) number EPA-HQ-OPPT-2016-0654, by one of the following methods:

- **Federal eRulemaking Portal:** <http://www.regulations.gov>. Follow the online instructions for submitting comments. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute.

- **Mail:** Document Control Office (7407M), Office of Pollution Prevention and Toxics (OPPT), Environmental

Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460-0001.

- **Hand Delivery:** To make special arrangements for hand delivery or delivery of boxed information, please follow the instructions at <http://www.epa.gov/dockets/contacts.html>.

Additional instructions on commenting or visiting the docket, along with more information about dockets generally, is available at <http://www.epa.gov/dockets>.

For technical information contact: Susanna W. Blair, Immediate Office, Office of Pollution Prevention and Toxics, Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460-0001; telephone number: (202) 564-4371; email address: blair.susanna@epa.gov.

For general information contact: The TSCA-Hotline, ABVI-Goodwill, 422 South Clinton Ave., Rochester, NY 14620; telephone number: (202) 554-1404; email address: TSCA-Hotline@epa.gov.

SUPPLEMENTARY INFORMATION:**I. Executive Summary***A. Does this action apply to me?*

EPA is primarily proposing to establish requirements on the Agency. However this proposal also includes the process and requirements that manufacturers (including importers) would be required to follow when they request an Agency-conducted risk evaluation on a particular chemical substance. This action may, therefore, be of interest to entities that are manufacturing or importing, or may manufacture or import a chemical substance regulated under TSCA (e.g., entities identified under North American Industrial Classification System (NAICS) codes 325 and 324110). Since other entities may also be interested, the Agency has not attempted to describe all the specific entities and corresponding NAICS codes for entities that may be interested in or affected by this action.

B. What action is the agency taking?

EPA is proposing to establish the process by which the Agency would conduct risk evaluations on chemical substances under TSCA. The proposal identifies the necessary components of a risk evaluation, including a scope (composed of a conceptual model and an analysis plan), a hazard assessment, an exposure assessment, a risk characterization, and a risk determination. The proposed rule would also establish the process by which manufacturers (including

importers) would request an Agency-conducted risk evaluation, and the criteria by which the EPA would evaluate such requests.

C. What is the agency's authority for taking this action?

EPA is proposing this rule pursuant to the authority in TSCA section 6(b)(4), as amended (15 U.S.C. 2605(b)). See also the discussion in Units II.A. and B.

D. What are the estimated incremental impacts of this action?

Although this proposal focuses on the process and activities that apply to EPA, it also proposes the process and requirements that manufacturers (including importers) would be required to follow when they request an Agency-conducted risk evaluation on a particular chemical substance. Since these requirements qualify as an information collection under the Paperwork Reduction Act (PRA), 44 U.S.C. 3501 *et seq.*, EPA has prepared an Information Collection Request (ICR) to estimate the potential burden and costs associated with the proposed requirements for submitting a request for an Agency-conducted risk evaluation on a particular chemical substance. The ICR, which is available in the docket, is discussed in Unit VI.B. and is briefly summarized here. (Ref. 1).

The total estimated annual burden is 960.3 hours and \$69,353, which is based on an estimated per request burden of 96.03 hours.

E. What should I consider as I prepare my comments for EPA?

1. Submitting CBI. Do not submit this information to EPA through regulations.gov or email. Clearly mark the part or all of the information that you claim to be CBI. For CBI information in a disk or CD-ROM that you mail to EPA, mark the outside of the disk or CD-ROM as CBI and then identify electronically within the disk or CD-ROM the specific information that is claimed as CBI. In addition to one complete version of the comment that includes information claimed as CBI, a copy of the comment that does not contain the information claimed as CBI must be submitted for inclusion in the public docket. Information so marked will not be disclosed except in accordance with procedures set forth in 40 CFR part 2.

2. Tips for preparing your comments. When preparing and submitting your comments, see the commenting tips at <http://www.epa.gov/dockets>.

II. Background

A. Recent Amendments to TSCA

On June 22, 2016, the President signed into law the “Frank R. Lautenberg Chemical Safety for the 21st Century Act,” which imposed sweeping reforms to TSCA. The bill received broad bipartisan support in the U.S. House of Representatives and Senate, and its passage was heralded as the most significant update to an environmental law in over 20 years. The amendments give EPA improved authority to take actions to protect people and the environment from the effects of dangerous chemical substances. Additional information on the new law is available on EPA’s Web site at: <https://www.epa.gov/assessing-and-managing-chemicals-under-tscA/frank-r-lautenberg-chemical-safety-21st-century-act>.

When TSCA was originally enacted in 1976, it established an EPA-administered health and safety review process for new chemical substances prior to allowing their entry into the marketplace. However, tens of thousands of chemical substances in existence at that time were “grandfathered in” with no requirement for EPA to ever evaluate their risks to health or the environment. The absence of a review requirement or deadlines for action, coupled with a burdensome statutory standard for taking risk management action on existing chemical substances, resulted in very few chemical substances ever being assessed for safety by EPA, and even fewer subject to restrictions to address identified risks.

One of the key features of the new law is the requirement that EPA now systematically prioritize and assess existing chemicals, and manage identified risks. Through a combination of new authorities, a risk-based safety standard, deadlines for action, and minimum throughput requirements, TSCA effectively creates a “pipeline” by which EPA will conduct existing chemicals review and management. This new pipeline—from prioritization to risk evaluation to risk management (when warranted)—is intended to drive steady forward progress on the backlog of existing chemical substances left largely unaddressed by the original law. Risk evaluation is the second step of this process, after prioritization, which is being addressed in a separate rulemaking.

B. Statutory Requirements for Risk Evaluation

TSCA section 6(b)(4) requires EPA to establish, by rule, a process to conduct

risk evaluations. Specifically, EPA is directed to use this process to “determine whether a chemical substance presents an unreasonable risk of injury to health or the environment, without consideration of costs or other non-risk factors, including an unreasonable risk to a potentially exposed or susceptible subpopulation identified as relevant to the risk evaluation by the Administrator under the conditions of use.” (15 U.S.C. 2605(b)(4)(A)). TSCA sections 6(b)(4)(A) through (H) enumerate the deadlines and minimum requirements applicable to this process, including provisions that direct which chemical substances must undergo evaluation, the development of criteria for manufacturer-requested evaluations, the minimum components of an Agency risk evaluation, and the timelines for public comment and ultimate completion of the risk evaluation.

1. *Chemical substances to undergo risk evaluation.* TSCA section 6(b) identifies the chemical substances that are subject to this process; these are: (1) Ten chemical substances the Agency is required to identify from the 2014 update to the TSCA Work Plan within the first 180 calendar days after the signing of TSCA (15 U.S.C. 2605(b)(2)); (2) the chemical substances determined as High-Priority Substances through the prioritization process that is being proposed in a separate rulemaking; and (3) requested chemicals submitted by manufacturers that have met the criteria for EPA to conduct a risk evaluation as outlined by this rule. Assuming a sufficient number of requests that have met the criteria outlined in this proposed rule are received, subsection (E) specifies that the number of manufacturer-requested evaluations be 25 to 50 percent of the number of “High Priority” risk evaluations ongoing at any one time. Since the number of manufacturer-requested evaluations is expressed as a percentage of the number of High-Priority Substance evaluations, not as a percentage of the total, the number of manufacturer-requested evaluations will likely comprise between 1/5 and 1/3 of the number of total ongoing evaluations, assuming a sufficient number of compliant requests are received. Any manufacturer requested chemical substances on the 2014 update of the TSCA Work Plan (Ref. 2) are exempt from the percentage limitations.

2. *Manufacturer-requested risk evaluations.* TSCA section 6(b)(4)(C) directs EPA to establish the “form and manner” and “criteria” that govern manufacturer requests that a substance that they manufacture undergo an EPA

conducted risk evaluation. EPA has broad discretion to establish these criteria, but relatively less discretion over whether to grant requests that comply with EPA’s criteria. EPA must grant any request that complies with EPA’s criteria, until the statutory minimum of 25 percent has been met. Assuming EPA receives requests in excess of this threshold, EPA interprets this provision to grant EPA discretion to determine whether to grant further requests, up to the maximum 50 percent level. In such circumstances, the EPA is directed to give preference to manufacturer requests for which the EPA determines that restrictions imposed by one or more states have the potential to significantly impact interstate commerce, or health or the environment. 15 U.S.C. 2605(b)(4)(E)(iii). As discussed elsewhere in this preamble, EPA is also proposing to give preference to requests where EPA estimates there may be relatively high exposure(s) and/or hazard(s) under one or more conditions of use.

3. *Components of a risk evaluation.* The statute identifies the minimum components EPA must include in all chemical substance risk evaluations. For each risk evaluation, EPA must publish a document that outlines the scope of the risk evaluation that will be conducted, and that includes the hazards, exposures, conditions of use, and the potentially exposed or susceptible subpopulations the EPA expects to consider. 15 U.S.C. 2605(b)(4)(D). The statute provides that the scope of the risk evaluation must be published no later than six months after the initiation of the risk evaluation.

Each risk evaluation must also: (1) “integrate and assess available information on hazards and exposure for the conditions of use of the chemical substance, including information on specific risks of injury to health or the environment and information on potentially exposed or susceptible subpopulations;” (2) “describe whether aggregate or sentinel exposures were considered and the basis for that consideration;” (3) “take into account, where relevant, the likely duration, intensity, frequency, and number of exposures under the conditions of use;” (4) “describe the weight of scientific evidence for the identified hazards and exposure.” 15 U.S.C.

2605(b)(4)(F)(i),(iii)–(v). The risk evaluation must not consider costs or other non-risk factors. 15 U.S.C. 2605(b)(4)(F)(ii).

Many stakeholders have expressed concern as to how EPA will apply “weight of scientific evidence” under

the amended TSCA. EPA is providing, for the purposes of background, a description of how the Agency has consistently interpreted and applied that concept. EPA is not proposing to modify this process as part of this rule. Nor is EPA proposing to codify it; this process has and will continue to evolve with changing scientific methods and innovation. Codifying a specific definition can inhibit the flexibility of the Agency to quickly adopt and implement changing science.

The phrase weight-of-evidence (WoE) is used by EPA and other scientific bodies to describe the strength of the scientific inferences that can be drawn from a given body of evidence, specifically referring to how studies are selected, the quality of the studies evaluated, and how findings are assessed and integrated. Weight-of-evidence is a complex issue and as stated by the National Academies this is “because scientific evidence used in WOE evaluations varies greatly among chemicals and other hazardous agents in type, quantity, and quality, it is not possible to describe the WoE evaluation in other than relatively general terms. It is thus not unexpected that WoE judgements in particular cases can vary among experts and that consensus is sometimes difficult to achieve” (NAS, 2009) (Ref. 3). The following is a brief description of how WoE is used at EPA, serving as an example of successful application of WOE in making the scientific determinations.

EPA utilizes the WoE approach in existing programs including IRIS and the Endocrine Disruptor Screening Program among others, and in the classification of carcinogens. In the 1999 Guidelines for Carcinogen Risk Assessment (Ref. 4) EPA refers to the WoE approach as “. . . a collective evaluation of all pertinent information so that the full impact of biological plausibility and coherence is adequately considered (Ref. 5). The Endocrine Disruptor Screening and Testing Advisory Committee (EDSTAC) referred to the WoE approach as “. . . a process by which trained professionals judge the strengths and weaknesses of a collection of information to render an overall conclusion that may not be evident from consideration of the individual data” (Ref. 6).

WoE is the process for characterizing the extent to which the available data support a hypothesis that an agent causes a particular effect (Ref. 4 and 5). This process involves a number of steps starting with assembling the relevant data, evaluating that data for quality and relevance, followed by an integration of the different lines of evidence to

support conclusions concerning a property of the substance. WoE is not a simple tallying of the number of positive and negative studies, but rather it relies on professional judgment. The significant issues, strengths, and limitations of the data and the uncertainties that deserve serious consideration are presented, and the major points of interpretation are highlighted.

This WoE analysis is conducted on a case-by-case basis by first assembling and assessing the individual lines of evidence and then performing an integrated analysis of those lines of evidence. All data considered in the WoE analysis need to be documented and scientifically acceptable. A WoE analysis typically begins with a careful evaluation of each individual study. The process of evaluating the individual lines of evidence includes assembling the data, evaluating that data against current acceptance and quality criteria, and presenting the conclusions regarding the results for each study. The reviews of the available studies need to be transparent about what studies were considered or not, and how the quality of a study was judged.

After assembling and assessing the individual lines of data, an integrated analysis is performed. This means the results from all scientifically relevant published or publically available peer-reviewed studies, which are of sufficient quality and reliability, are evaluated across studies and endpoints into an overall assessment. In general, the WoE analysis examines multiple lines of evidence considering a number of factors, including for example the nature of the effects within and across studies, including number, type, and severity/magnitude of effects and strengths and limitations of the information.

A summary WoE narrative or characterization generally accompanies the detailed analysis of the individual studies and the integrative analysis of the multiple lines of evidence. Inclusion of a WoE narrative is common in WoE assessments and judgments (Ref. 4 and 7). The narrative/characterization is intended to be transparent and allow the reader to clearly understand the reasoning behind the conclusions. The narrative will generally explain the selection of the studies or effects used as the main lines of evidence and relevant basis for conclusions. The overall strength of the evidence supporting a conclusion from the WoE evaluation needs to be described.

The National Toxicology Program of the National Institute of Environmental Health Sciences has developed a tool

called “systematic review” to assist in WoE evaluations particularly for hazard identification (<https://ntp.niehs.nih.gov/pubhealth/hat/noms/index-2.html>).

This tool uses a defined set of processes to identify, select, critically assess, and synthesize evidence to arrive at a hazard conclusion for a chemical. It is designed to enhance transparency and informs scientific judgments. The evidence synthesis step involves considering factors that decrease confidence in the body of evidence for a particular health endpoint (e.g. risk of bias, inconsistencies across studies, imprecision) as well as factors that increase confidence (e.g. magnitude of the effect, residual confounding, consistency). By evaluating study design (e.g., consistent with study guidelines issued by OECD, and test guidelines issued by the Office of Chemical Safety and Pollution Prevention), and study quality (e.g., studies that comply with Good Laboratory Practices (GLP) like those applicable generally (<https://www.federalregister.gov/documents/2016/08/24/2016-19875/good-laboratory-practice-for-nonclinical-laboratory-studies>) and those issued by EPA for studies submitted under TSCA and FIFRA (<https://www.epa.gov/compliance/good-laboratory-practices-standards-compliance-monitoring-program>)), and integrating negative data (and consideration of the quality of those data), the confidence in hazard conclusions can be increased.

The NIEHS systematic review tool is one example of a documented systematic review approach. EPA believes the proposed risk evaluation process generally reflects the use of systematic review approaches that are appropriate for the types and quantity of information used in a chemical risk evaluation. EPA requests comment on this view. EPA is also requesting comment on the need for regulatory text requiring the use of specific elements of a systematic review approach for hazard identification, including the appropriateness of specific elements that might be included and/or concerns about codifying such an approach.

4. Timeframe. TSCA requires that the risk evaluation process last no longer than three years with a possible six-month extension. 15 U.S.C. 2605(b)(4)(G).

5. Opportunities for public participation. The statute requires that the Agency allow for at least one 30 day public comment period on the draft risk evaluation, prior to publishing a final risk evaluation. 15 U.S.C. 2605(b)(4)(H).

6. Metals and metal compounds. When evaluating metals or metal compounds, EPA must “use” the March

2007 Framework for Metals Risk Assessment of the Office of the Science Advisor (Ref. 8) or a successor document that addresses metals risk assessment and is peer-reviewed by the Science Advisory Board.

7. *Other statutory requirements.* TSCA imposes new requirements on EPA in a number of different areas that EPA is not proposing to incorporate or otherwise address in this proposed rule. For example, amendments to TSCA section 4 require EPA to “. . . reduce and replace, to the extent practicable, [. . .] the use of vertebrate animals in the testing of chemical substances . . .” and to develop a strategic plan to promote such alternative test methods. 15 U.S.C. 2603(h). Likewise, TSCA section 26 requires, to the extent that EPA makes a decision based on science under TSCA sections 4, 5, or 6, that EPA uses certain scientific standards and bases those decisions on the weight of the scientific evidence. 15 U.S.C. 2625(h) and (i). While these requirements are relevant to the risk evaluation of chemical substances, EPA is not obliged to repeat them in this proposed rule. As statutory requirements, they apply to EPA’s decisions under TSCA section 6. Moreover, in contrast to TSCA section 6, Congress has not directed EPA to implement these other requirements “by rule;” it is well-established that where Congress has declined to require rulemaking, the implementing agency has complete discretion to determine the appropriate method by which to implement those provisions.

C. EPA Risk Assessment

Since EPA’s inception, human health and ecological risk assessment has informed decisions made to protect humans and the environment. Risk assessments performed by the Agency inform a broad range of regulatory decisions, and, over time, the scientific approaches and methods employed for these risk assessments have evolved. In developing and refining risk assessment processes, frameworks, and guidance documents, EPA has incorporated recommendations from expert technical panels, internal and external peer reviews, and a number of influential reports from the National Academy of Sciences (NAS) National Research Council (NRC) including Risk Assessment in the Federal Government (1983) (Ref. 9), Science and Judgement in Risk Assessment. (1994) (Ref. 10), Understanding Risk: Informing Decisions in a Democratic Society (1996) (Ref. 11), Toxicity Testing in the 21st Century: A Vision and a Strategy (2007) (Ref. 12), Phthalates and

Cumulative Risk Assessment: The Tasks Ahead (2008) (Ref. 8), and Science and Decisions: Advancing Risk Assessment (2009) (Ref. 3). Specifically, the NAS NRC Science and Decisions Report (Ref. 3) recommended that EPA focus on the important roles of scoping or problem formulation so that a risk assessment will serve a specific and documented purpose. An additional recommendation encouraged EPA to develop risk assessments that are well-tailored to the problems and decisions at hand so that they can inform the decision-making process in the most meaningful way. EPA has evaluated, and will continue to evaluate chemical risks in a manner that is best suited for the particular chemical substance, including its manufacture, processing, formulation, uses, and disposal, and the evaluations may vary as necessary to best characterize potential risks related to the chemical substance under review.

As stated, TSCA requires EPA to evaluate risk to relevant potentially exposed or susceptible subpopulations identified by EPA as relevant to the risk evaluation under the conditions of use. 15 U.S.C. 2605(b)(4)(A). Although this was added as a component of the newly amended law, this will not be a new consideration for the Agency; for example, see EPA’s Policy on Evaluating Health Risks to Children (1995) (Ref. 14). The Agency has evaluated the risk of chemical substances to all sectors of the population, with particular attention to workers, indigenous peoples, pregnant women, children, infants, the elderly, environmental justice communities, and fence-line communities, among others. The Agency utilizes a number of existing guidance documents (including but not limited to Ref. 15, 16, 17, 18, and 19) to evaluate risk at various life stages, and will use and refine these processes to protect the most vulnerable.

1. *Differences between previous EPA risk assessments under TSCA and proposed new risk evaluations.* In this proposed rule, EPA does not propose a new method of risk evaluation, but builds upon existing and proven methodologies for evaluating risk. Also as required by the statute, the rule includes opportunities for public participation, statutory deadlines, necessary components of a risk evaluation, and methods for manufacturer requested risk evaluation. Above and beyond the statute, the proposed rule provides an additional opportunity for public participation, added detail as to components of the scope, hazard and exposure assessments, risk characterization, and increases transparency in the risk

evaluation process. EPA requests comment on whether and how the proposed rule could provide additional transparency, public accountability, opportunities for public participation, or incorporation of statutory deadlines.

There are several key differences between previous chemical risk assessments conducted under TSCA and the new risk evaluation process mandated by TSCA amendments and established under these proposed regulations. These differences include considerations of conditions of use, timelines, and determination of unreasonable risk, and are discussed in more detail under those topics in this unit. This proposed rule and procedures described herein apply to risk evaluations conducted under TSCA, and do not apply to risk evaluations conducted by EPA pursuant to other statutes or programs.

2. *Conditions of use.* Prior to the amended TSCA, EPA was free to and did conduct risk assessments on selected uses of chemical substances. In contrast, EPA interprets the amended TSCA as requiring that risk evaluations encompass all manufacture, processing, distribution in commerce, use, and disposal activities that constitute the conditions of use within the meaning of TSCA section 3. That is to say, a risk evaluation must encompass all known, intended, and reasonably foreseen activities associated with the subject chemical substance. This issue has been the subject of considerable discussion since the enactment of the new law, and EPA acknowledges that different readings of the law may be possible. For example, TSCA section 6(b)(4)(D) requires EPA to identify the conditions of use that the Agency expects to consider in a risk evaluation, suggesting that EPA does not need to consider all conditions of use.

Overall, the statutory text and purpose are best effectuated through a more encompassing reading. TSCA section 6(b)(4)(A) specifies that a risk evaluation must determine whether “a chemical substance” presents an unreasonable risk of injury to health or the environment “under the conditions of use.” The evaluation is on the chemical substance—not individual conditions of use—and it must be based on “the conditions of use.” In this context, EPA believes the word “the” is best interpreted as calling for evaluation that considers all conditions of use. First, if EPA were free to base its determination of whether a chemical substance, as a whole, presents an unreasonable risk or injury (as the statute requires) on merely a subset of individual uses, it could, for example,

determine that a chemical substance with 10 known uses does not present an unreasonable risk of injury based on an evaluation of a single one of those uses, with no further obligation to evaluate the remaining uses within the three-year statutory deadline. This is a strained reading of the commands to determine whether the chemical substance presents an unreasonable risk, under the conditions of use, and to complete that evaluation “for a chemical substance” within three years of initiation. See 15 U.S.C (b)(4)(G)(i).

Second, a major objective of the new law is to require EPA to systematically evaluate existing chemical substances to determine whether or not they present unreasonable risk, and, if necessary, regulate them based on the results of the evaluation. Given the large number of existing chemical substances, it would not be feasible to complete risk evaluations on any significant number of them if EPA were to continually need to re-evaluate chemical substances based on different subset of uses. Rather the law’s purposes will be best fulfilled by judging in a comprehensive way whether a chemical substance, under the known, intended, and reasonably foreseen uses and other activities, presents an unreasonable risk; ensuring through regulation that it does not present an unreasonable risk, if necessary; and then presumptively being done with that chemical substance (pending re-prioritization for some unforeseen reason). Finally, EPA notes that, if the law is read as allowing EPA to select particular conditions of use, it provides no criteria for EPA to apply in making such a selection.

Given these considerations, the instruction in TSCA section 6(b)(4)(D) for the Agency to identify the conditions of use it expects to consider in a risk evaluation is best read as directing the Agency to identify the uses and other activities that it has determined constitute the conditions of use, not as a license to choose among conditions of use.

Concerns have been raised about EPA’s ability to meet the statutory risk evaluation deadlines if all conditions of use must be considered. Concerns have also been raised about ensuring that EPA can act promptly to address any unreasonable risks identified for particular conditions of use. EPA acknowledges that this will be challenging but based on the procedures outlined in this proposal, expects it will be manageable. First, a use or other activity constitutes a condition of use under the definition only if EPA determines that it does. EPA has authority to exercise judgment in

making its determination of whether a condition of use is known, intended, or reasonably foreseen. Moreover, in this proposed rule EPA proposes to “lock down” the conditions of use included in a risk evaluation at the time of scoping, by providing opportunity for comment on the scoping document and specifying that any objections to the draft scope document are waived if not raised during this process. It will not be practicable to meet the statutory deadlines if stakeholders are free to identify additional conditions of use later in the process—for example, on the proposed risk determination.

As explained elsewhere in this preamble, EPA also generally intends to initiate risk evaluation on a chemical substance only when EPA determines that sufficient reasonably available information exists to complete the evaluation, and when it has already identified all of the conditions of use. As also explained elsewhere in this preamble, under certain circumstances EPA may expedite an evaluation for a particular condition of use to move more rapidly to risk management under TSCA section 6(a).

Finally, the proposed rule provides that EPA will rely on a combination of information, accepted science policies (e.g., defaults and uncertainty factors), models and screening methodologies in conducting risk evaluations, with considerations of evolving science and technology. It further provides that the balance of information, science policy decisions, models, and screening methodologies used in risk evaluation will be informed by the deadlines specified in TSCA section 6(b)(4)(G) for completing such evaluations, and by the extent to which the generation of additional information is warranted by the reduction in uncertainty that the information would afford in determining whether a chemical substance presents an unreasonable risk of injury to health or the environment.

In this regard, EPA is also proposing to require that the components of its risk evaluations will be “fit for purpose.” All conditions of use will not warrant the same level of evaluation, and EPA expects it may be able to reach conclusions without extensive or quantitative evaluations of risk. For example, lower-volume or less dispersive uses might receive less quantitative, data-driven evaluations than uses with more extensive or complicated exposure patterns. Consistent with EPA’s current practice in conducting risk assessments, technically sound risk determinations can be made, consistent with the best available science, through a

combination of different types of information and other approaches.

In sum, Congress intended to create obligations that EPA can actually meet, and EPA intends to conduct risk evaluations in a way that is manageable given the statutory deadlines.

3. Timelines and guidance regarding assessing risks of existing chemical substances. Prior to the amended TSCA, EPA was not required to evaluate or manage the risk of the thousands of existing chemical substances grandfathered in under the 1976 Act. As discussed previously, the amended TSCA affirmatively requires EPA to evaluate existing chemical substances more quickly, instructs EPA on how many of these chemical substances the Agency must evaluate at any given time, and places time limits on when these evaluations must be completed. 15 U.S.C. 2605(b)(2)–(4).

4. Determination of unreasonable risk. Under TSCA section 6(b) (15 U.S.C. 2605(b)(4)(B)), EPA must establish a risk evaluation process to determine whether a chemical substance presents an unreasonable risk of injury to health or the environment. Prior to the passage of the amended TSCA, chemical substance risk assessments did not include a determination of unreasonable risk. This step was reserved for risk management rulemaking. The amended statute now requires that a risk evaluation include a risk assessment as well as the EPA’s determination of unreasonable risk, and, most significantly, requires that this determination be independent of cost or other non-risk factors. 15 U.S.C. 2506(b)(4)(A) and (F)(iii).

In general, EPA may weigh a variety of factors in determining unreasonable risk. These factors include, but are not limited to, characterization of cancer and non-cancer risks (including margins of exposure for non-cancer risks), the population exposed (including any susceptible populations), the severity of hazard (the nature of the hazard), the irreversibility of hazard, uncertainties, and estimates of cumulative exposure. Because of the case-by-case nature of each of these factors EPA has purposely not proposed a definition of unreasonable risk in this rule. However, EPA is specifically requesting comments on whether EPA should define unreasonable risk in the final rule. If so, acknowledging that the statute precludes consideration of costs and other non-risk factors at this step, what factors should EPA consider in making such a determination?

5. Manufacturer-requested evaluations and draft risk evaluations by interested persons. The newly

amended TSCA requires that a portion of ongoing risk evaluations be conducted on chemical substances requested by manufacturers “in a form and manner and using criteria” EPA prescribes by rule. 15 U.S.C. 2605(b)(4)(C)(ii),(E)(i). The statute also requires EPA to develop guidance (which will be forthcoming) to assist interested persons in submitting draft risk evaluations, and requires EPA to consider such submitted drafts. 15 U.S.C. 2625(l)(5).

D. Stakeholder Feedback

On August 9, 2016, EPA held a one-day public meeting to obtain public comment and feedback regarding the development and implementation of the risk evaluation rule. The meeting began with an explanation of how the Agency currently conducts risk assessments (see https://www.epa.gov/sites/production/files/2016-08/documents/risk_evaluation_9_august_2016.pdf). The remainder of the day was reserved for public comment. Each commenter was provided four minutes to comment and there was a total of 47 oral comments on the risk evaluation rule. Additionally, EPA opened a docket for submission of written comments and received 57 comments, many of which were from the same commenters at the public meeting. These comments, and a transcript of the meeting are accessible in the meeting’s docket, identified by Docket ID No. EPA–HQ–OPPT–2016–0399, which is available online at <https://www.regulations.gov/>.

The commenters included industry, environmental groups, academics, private citizens, trade associations, and health care interest groups and representatives. The comments were very informative for both rule development and risk evaluation implementation. While not all of the comments are captured here, there were a number of themes that emerged. Overall, there was a general expression of support for the new law and EPA’s inclusive approach to implementation. Many of the commenters agreed the rule has the potential to increase transparency in EPA’s chemical substance risk evaluation process. Many urged the Agency to work towards this goal, while creating an open scientific dialogue.

Questions arose about how the Agency will determine “unreasonable risk” and implement TSCA section 26 requirements including “best available science” and “weight of scientific evidence.” Some suggested that EPA should codify in this rule the meaning of these terms along with other details of the risk evaluation process. Due to

changes in the law, manufacturers are now able to submit their own draft risk evaluations. Commenters noted that if these submitted evaluations are to be equivalent as Agency draft risk evaluations, having specific criteria, such as specific types of exposure and hazard information would ensure the Agency and the manufacturers were held to the same standard. Stakeholders also suggested that holding a public comment period for the draft risk evaluation scope would increase the transparency of each risk evaluation early in the process and allow the public to comment on any data gaps or discrepancies.

Other stakeholders urged the Agency to reserve specific scientific processes regarding hazard and exposure information for Agency guidance and discretion, suggesting the rule should address only the process and procedure. This approach would allow the Agency to be flexible and adapt to the changing science of risk evaluation and the science that informs risk evaluation.

A number of commenters spoke about the statute’s requirement that the Agency determine the specific risk to “potentially exposed or susceptible subpopulation[s]”. Although the law defines this term to include “infants, children, pregnant women, workers, or the elderly,” many encouraged the Agency to consider expanding the definition to include for example: environmental justice communities, Arctic communities, American Indian communities, communities with little access to preventative health-care, subsistence fishers, and fence-line communities. There were a number of stakeholders who encouraged the Agency to work with the Occupational Safety & Health Administration (OSHA), the National Institute for Occupational Safety and Health (NIOSH), and the Consumer Product Safety Commission (CPSC), among other federal agencies, to better protect against occupational and consumer exposures. Also regarding exposure, stakeholders encouraged the examination of cumulative and low dose exposures in risk evaluations, which are not specifically mentioned in the new statute.

A number of commenters emphasized the need for EPA to maximize transparency throughout the evaluation process. The EPA received a number of comments about the science used to inform individual risk evaluations, including the types of data, models, policy assumptions (e.g., default factors) and computational approaches. A number of commenters argued that a lack of data does not equate to a lack of risk. Stakeholders encouraged the

Agency to engage with industry to obtain hazard and exposure data and to utilize the new order authority allowed under the law (TSCA section 4). Commenters suggested an increased use of EPA’s Office of Research and Development (ORD) and internationally accepted data, models, and products. A number of stakeholders expressed their support for the new provision in the law that requires the Agency to reduce and replace vertebrate testing (TSCA section 4(h)) in obtaining chemical substance hazard and exposure data.

EPA considered all of these comments in the development of this proposed rule, and welcomes additional feedback from stakeholders on the proposed process and requirements presented in this document.

III. The Proposed Rule

A. Policy Objectives

The risk evaluation process under TSCA is ultimately how EPA will determine whether a chemical substance presents an unreasonable risk of injury to health or the environment. The overall objective of this action is to propose to codify the process by which the Agency evaluates risk from chemical substances for purposes of TSCA section 6. In this proposed rule, the Agency details those components of TSCA risk evaluation and key factors that EPA deems are necessary to consider in each risk evaluation to ensure that the public has a full understanding of how risk evaluations will be conducted. However, EPA is not proposing to establish highly detailed provisions that will address every eventuality or possible consideration that might arise. Due to the rapid advancement of the science of risk evaluation and the science and technology that inform risk evaluation, this proposed rule seeks to balance the need for the risk evaluation procedures to be transparent, without unduly restricting the specific science that will be used to conduct the evaluations, allowing the Agency flexibility to adapt and keep current with changing science as it conducts TSCA evaluations into the future.

B. Interagency Collaboration

EPA recognizes that other Federal agencies may be able to provide important use, exposure and hazard information that is likely to be relevant to a risk evaluation of chemical substances. EPA is committed to interagency engagement and dialogue throughout its risk evaluation process, including data sharing, information requests, and consultation regarding specific chemicals of interest. As such,

EPA has reached out to other agencies, inviting them to join the agency in an open and collaborative dialogue. EPA intends to continue and expand its interagency collaboration efforts for chemicals management and risk evaluations under TSCA.

To coordinate with other agencies on TSCA implementation generally, EPA intends to continue to use—and expand where appropriate—existing interagency groups, such as the OMNE (OSHA–MSHA–NIOSH–NIEHS–EPA) Committee and the National Science and Technology Council (NSTC)’s Committee on Environment, Natural Resources, and Sustainability’s new Toxicity Assessment Committee. EPA is also committed to interagency engagement at the working level on individual chemical evaluations.

To ensure that such collaboration can occur in a timely manner when needed, EPA intends to initiate interagency consultation through the existing mechanisms early in the process, and document these measures in the scope document. However, EPA is concerned that imposing a single, pre-determined consultation step might lead to an overly bureaucratic process that could limit or complicate ongoing collaboration efforts, and so is not proposing to codify any particular process in this regulation.

C. Scope of Evaluations

TSCA requires risk evaluations to determine whether or not a chemical substance presents an unreasonable risk of injury to health or the environment under the conditions of use, with conditions of use being defined as “the circumstances, as determined by the EPA, under which a chemical substance is intended, known, or reasonably foreseen to be manufactured, processed, distributed in commerce, used, or disposed of.” 15 U.S.C. 2602(4).

Although some of the commenters during the public meeting suggested that EPA could evaluate a specific use of a chemical substance, EPA is not choosing to adopt such an interpretation, for the reasons explained previously. Also, EPA recognizes that under certain circumstances it may be necessary to expedite an evaluation for a particular condition of use to move more rapidly to risk management under TSCA section 6(a) (15 U.S.C. 2605(a)): this could include a situation in which a single use presented an unreasonable risk of injury for the population as a whole or for a susceptible subpopulation (e.g., one use results in risks that EPA would determine unreasonable regardless of the risk posed by other uses). However, in any

case where EPA would find it necessary to pursue a risk evaluation in phases, the Agency will still complete the full risk evaluation on all identified conditions of use within the statutory 3-year deadline. Therefore, relying on this discretion, EPA is proposing to explicitly recognize its authority to complete risk evaluations in phases, and to manage unreasonable risks as they are identified through those phases under TSCA section 6(a) in the regulation.

D. Definitions

TSCA defines a number of key terms necessary for interpretation of the new law. The definitions within the law apply to this proposed rule. EPA has also included some additional definitions in the proposed rule for further clarification; these are noted and defined later in this document. The law requires EPA to evaluate risk to “potentially exposed or susceptible subpopulation[s],” and although the law elaborates on this phrase, EPA is proposing to expand the definition for TSCA purposes. TSCA states that “the term ‘potentially exposed or susceptible subpopulation’ means a group of individuals within the general population identified by the EPA who, due to either greater susceptibility or greater exposure, may be at greater risk than the general population of adverse health effects from exposure to a chemical substance or mixture, such as infants, children, pregnant women, workers, or the elderly.” 15 U.S.C. 2602(12). EPA is proposing to incorporate the phrase “including but not limited to” before the specific subpopulations identified in the statutory definition, to further clarify that EPA may identify additional subpopulations, where warranted. As suggested by the statute, EPA is also proposing to include specific authorization for EPA to consider both intrinsic (e.g., life stage, reproductive status, age, gender, genetic traits) and acquired (e.g., pre-existing disease, geography, socioeconomic, cultural, workplace) factors when identifying this population.

TSCA section 26(k) (15 U.S.C. 2625(k)) states that in carrying out risk evaluations, EPA shall consider information that is “reasonably available,” but the statute does not further define this phrase. EPA is proposing a definition for “reasonably available” to mean existing information that EPA possesses, or can reasonably obtain and synthesize for use in risk evaluations, considering the deadlines for completing the evaluation. Generally speaking, EPA does not consider information that has not yet been

generated, as reasonably available, because it will typically not be feasible for EPA to require significant chemical testing and receive and assess those test results during the three to three and a half year window allotted for risk evaluation. Accordingly, EPA intends to generally ensure that sufficient information to complete a risk evaluation exists and is available to the Agency prior to initiating the evaluation (indeed, prior to initiating prioritization). EPA also generally intends to use its authority under TSCA to require the development of new information, as necessary, prior to risk prioritization.

TSCA requires EPA, as a part of the risk evaluation, to document whether the Agency has considered aggregate or sentinel exposure, and the basis for that decision. 15 U.S.C. 2605(b)(4)(F)(ii). These terms are not defined in the law, so EPA has proposed a definition for aggregate exposure that is consistent with current Agency policies and practices. “Aggregate exposure” means the combined exposures to an individual from a single chemical substance across multiple routes and across multiple pathways (Ref. 20). “Sentinel” means the exposure(s) of greatest significance, which may be the maximum exposure to an individual, population (or subpopulation), or the environment to the chemical substance of interest (or any combination thereof). Although sentinel exposure is not a novel way of characterizing exposure, this is a new term for EPA.

Other terms defined in the proposed rule are designed to provide clarity regarding the science that will be used to conduct an evaluation. “Pathways” of exposure refers to the mode through which one is exposed to a chemical substance, including but not limited to: food, water, soil, and air (Ref. 20). “Routes” of exposure refer to the particular manner which a chemical substance may contact the body, including absorption via ingestion, inhalation, or dermally (Ref. 20). The statute requires EPA to consider “the extent to which the variability and uncertainty . . . are evaluated and characterized.” 15 U.S.C. 2625(h). EPA is adopting definitions for both “variability” and “uncertainty” from existing Agency guidance. “Uncertainty” means the imperfect knowledge or lack of precise knowledge either for specific values of interest or in the description of a system (Ref. 21). “Variability” means the inherent natural variation, diversity, and heterogeneity across time and/or space or among individuals within a population (Ref. 21).

E. Timing of Risk Evaluations

As indicated, the statute requires EPA to complete risk evaluations within three years, with the possibility of a six month extension beyond the three year timeframe. This proposed rule simply adopts these timeframes without modification or elaboration. EPA acknowledges this is a relatively short timeframe, and, as discussed elsewhere in this preamble, is proposing to adopt other procedures that will allow the Agency to meet these deadlines.

F. Chemical Substances for Risk Evaluation

As identified previously, chemical substances that will undergo risk evaluation can be put into three groups: (1) The first ten chemical substances the Agency is required to identify within the first 180 calendar days of enacting the amendments to TSCA (15 U.S.C. 2605(b)(2)); (2) the chemical substances determined as High-Priority Substances through the prioritization process proposed in a separate rulemaking; and (3) requested chemical substances submitted by manufacturers that meet the criteria for EPA to conduct an Agency risk evaluation.

G. Process for Manufacturer Requested Risk Evaluations

TSCA allows a manufacturer or group of manufacturers to submit requests for Agency conducted risk evaluations for chemical substances that they manufacture. EPA is proposing the necessary components of the request in the proposed regulatory text. EPA is proposing to require that manufacturers demonstrate in their request that there is sufficient, reasonably available information for the Agency to conduct a risk evaluation on the chemical substance under the conditions of use. EPA must complete any manufacturer-requested risk evaluation that it determines meets the criteria within the statutory three years. Unlike those chemical substances that have come through the prioritization process, manufacturer-requested chemical substances have not undergone initial risk screening and therefore EPA will not assign such chemicals a high- or low-priority designation. The purpose of the requirements proposed as the necessary components of the request, is to allow the Agency to determine whether sufficient information is “reasonably available” for EPA to complete a risk evaluation of the requested chemical under the conditions of use, as that term is defined under TSCA section 3.

EPA is proposing to require a manufacturer to submit a list (e.g., citations) of the reasonably available information on hazard and exposure for all the conditions of use. EPA is not requesting manufacturers submit copies of the cited information. Manufacturers must include a commitment to provide EPA any referenced data if they are not publicly available, and must certify that the information submitted is accurate and complete. EPA will not accept a manufacturer request where any of the relevant data is not in the possession of the requestor but is with another entity.

Consistent with TSCA section 6(b)(4)(E)(iii), EPA will prioritize requests where there is evidence that restrictions imposed by one or more States have the potential to have a significant impact on interstate commerce or health or the environment, and is therefore proposing to allow (but not require) manufacturers to include any evidence to support such a finding. Following this required initial prioritization, EPA is proposing to further prioritize chemical substances for risk evaluation based on initial estimates of exposure(s) and/or hazard(s) under one or more conditions of use or any other factor that EPA determines may be relevant. In general, EPA plans to prioritize those chemical substances where there is evidence of relatively high risk over those with less evidence of risk.

Instructions for submitting CBI are also included in the proposed rule. EPA believes that TSCA section 14(c)(3) is best read as requiring upfront substantiation of non-exempt CBI claims. In addition, EPA believes the obligation to review all non-exempt chemical identification claims and 25 percent of all other non-exempt claims will be best effectuated by requiring substantiation at the time of submission.

Chemical substances that EPA has prioritized through the prioritization process (proposed in a separate rulemaking), are subject to two separate public comment periods prior to the completion of the prioritization process. EPA expects that these comment periods will ensure that EPA has the necessary information to evaluate the chemical substances, including information on all conditions of use. Consequently, in order to ensure that chemical substances subject to manufacturer requests undergo risk evaluation only if the available information is comparable to what EPA will identify or generate through the measures identified in the proposed prioritization framework rule, EPA is proposing opportunities to collect additional information from the public.

Upon receipt of the request, EPA is proposing to verify that the request is facially valid, i.e., that information has been submitted that is consistent with the regulatory requirements. EPA is proposing that within 30 business days of a receiving a facially valid request, EPA will submit for publication an announcement of the receipt of the request in the **Federal Register**, open a docket for the request, and provide no less than a 30 calendar day comment period, to allow the public to identify and/or submit any reasonably available information regarding hazard, exposure, potentially exposed population(s) and subpopulation(s), and conditions of use that may help inform a risk evaluation, including identifying information gaps. The requesting manufacturer may also submit any additional material during this time.

Within 9 months after the end of the comment period, EPA will review the request along with any additional information received during the comment period to determine whether the request meets the regulatory criteria and will notify the manufacturer(s) accordingly. This time will allow EPA to develop the equivalent of a conceptual model to describe actual or predicted relationships between the chemical substance and the receptors, either human or environmental, with consideration of potential hazards throughout the life cycle of the chemical substance—from manufacturing, processing, distribution in commerce, storage, use, or disposal. If EPA determines that the request is compliant (i.e., it has the required information necessary for conducting a risk evaluation), EPA will begin the risk evaluation process consistent with TSCA section 6(b)(4)(E)(i). If the request is found insufficient EPA will identify the information that would be necessary to conduct the risk evaluation in its notification to the manufacturer. The manufacturer will have 60 calendar days from receipt of EPA’s determination to submit the additional information. EPA will consider the request withdrawn if the manufacturer(s) fails to submit the additional information identified. The process for conducting the risk evaluation will otherwise be identical to the process for those chemical substance identified as a High-Priority Substance through the Prioritization Process, which is addressed in a separate proposed rule.

H. Risk Evaluation General Provisions

1. *Agency guidance.* EPA has a number of existing guidance documents that inform Agency risk assessment.

EPA has been using risk assessments to characterize the nature and magnitude of health risks to humans and ecological receptors from chemical contaminants and other stressors that may be present in the environment since its inception. Over the years, EPA has worked with the scientific community and other stakeholders to develop a variety of guidance, guidelines, methods and models for use in conducting different kinds of assessments. A compendium of existing Agency guidance related to risk assessments is maintained at <https://www.epa.gov/risk/risk-assessment-guidelines>. A compendium of guidance, databases and models used for assessing pesticide risks is available at <https://www.epa.gov/pesticide-science-and-assessing-pesticide-risks>, and information about available predictive models and tools for assessing chemicals under TSCA can be found at <https://www.epa.gov/tsc-screening-tools>. Each of these Web sites identify and link to a number of written guidance documents, tools and models. Rather than starting anew, EPA intends to take advantage of existing guidance, tools and models that are relevant and available for use in conducting a risk evaluation under this program.

Since the law requires the development of additional “policies, procedures, and guidance the Administrator determines are necessary” to carry out the process in TSCA (15 U.S.C. 2625(l)). EPA may also develop additional guidance(s) for risk evaluation in the future.

2. Categories of chemical substances. TSCA provides EPA with authority to take action on categories of chemical substances: groups of chemical substances which are, for example, similar in molecular structure, in physical, chemical, or biological properties, in use, or in mode of entrance into the human body or into the environment. Although the proposed rule most often references “chemical substances,” EPA is also proposing to include a clear statement in the regulation that nothing in the proposed rule shall be construed as a limitation on EPA’s authority to take action with respect to categories of chemical substances, and that, where appropriate, EPA can prioritize and evaluate categories of chemical substances.

3. Information and information sources. As discussed, the timeframe for completing risk evaluation is compressed. For those chemical substances chosen by EPA to undergo the risk evaluation process, EPA expects to only initiate the process when EPA has determined that most of the

information necessary to complete the evaluation is reasonably available, which in most cases means the information already exists. As appropriate, however, EPA will exercise its TSCA information collection, testing, and subpoena authorities, including those under TSCA sections 4, 8, and 11(c) to develop the information needed for a risk evaluation. Pursuant to TSCA section 8(e), the law requires that any person who manufactures, processes, or distributes in commerce a chemical substance or mixture and who obtains information which supports the conclusion that this substance presents a substantial risk of injury to health or the environment, shall immediately inform the Agency.

To conduct a risk evaluation, EPA will rely on a combination of information, models, screening methods, and accepted science policies, which include defaults, reasonable estimates, and uncertainty factors, in addition to considering information generated from evolving science and technology. EPA expects to obtain scientific advice from the Science Advisory Committee on Chemicals, which the Agency is required to develop and convene under TSCA section 26(o). In compliance with the statute, EPA will work to reduce and replace, to the extent practicable, the use of vertebrate animals in testing chemical substances as outlined in TSCA section 4(h).

I. Risk Evaluation Steps

1. Scope. The first step of a risk evaluation is the development of the scope. In compliance with the statute, the scope will identify the conditions of use, hazards, exposures, and any potentially exposed or susceptible subpopulations that the EPA expects to consider. EPA is also proposing to include additional information in the scoping document, including any models, screening methods, and any accepted science policies expected to be used during the risk evaluation. EPA is further proposing to include a conceptual model that will describe the actual or predicted relationships between the chemical substance and the receptors, either human or environmental, with consideration of potential hazards throughout the life cycle of the chemical substance—from manufacturing, processing, distribution in commerce, storage, use, to release or disposal. Also included will be an analysis plan, which will identify the approaches and methods EPA plans to use to assess exposure, effects, and risk, including associated uncertainty and variability, as well as a strategy for

approaching science policy decisions (e.g., defaults or uncertainty factors).

The announced availability of the final scope will be published in the **Federal Register** within six months of the initiation of the risk evaluation. Although not required under the statute, EPA has proposed to provide a draft scope for a 45 calendar day public comment period during this six month period. EPA welcomes all public participation, but specifically encourages commenters to provide information they believe might be missing or may further inform the risk evaluation. That said, EPA expects to use the comment periods during the prioritization process to reduce the likelihood of significant comments on the draft scope. Consequently, the proposed rule makes clear that all comments that could be raised on information and approaches presented in the scope must be presented during this comment period. Any issues related to scope not raised in comments at this time cannot form the basis for an objection or challenge in a future administrative or judicial proceeding. This is a well-established principle of administrative law and practice, see, e.g., *Nuclear Energy Institute v. EPA*, 373 F.3d 1251, 1290–1291 (D.C. Cir. 2004), and the need for such a provision is reinforced by the statutory deadlines under which EPA must operate for completing TSCA risk evaluations. Note that EPA is not proposing to preclude parties from raising newly discovered information, or from raising issues that could not have been fairly raised during this comment period. Rather, EPA seeks merely to prevent parties from delaying the risk evaluation by withholding information or by providing it piecemeal.

2. Hazard assessment. In compliance with TSCA section 6(b)(4)(F), EPA is proposing that a hazard assessment be conducted on each chemical substance or category. A hazard assessment identifies the types of adverse health or environmental effects that can be caused by exposure to some agent in question, and to characterize the quality and weight of evidence supporting this identification. Hazard Identification is the process of determining whether exposure to a stressor can cause an increase in the incidence of specific adverse health or environmental effects (e.g., cancer, developmental toxicity).

This hazard assessment may include, but may not be limited to, evaluation of the potential toxicity of the chemical substance with respect to cancer, mutation, reproductive, developmental, respiratory, immune, metabolic, and cardiovascular impacts, and

neurological impairments. The assessment will evaluate effects at life stage(s) most appropriate for a receptor target. The hazard assessment will consider the dose or concentration and resulting effect or response. Potential information sources that may support the health assessment include but are not limited to: Human epidemiological studies; *in vivo* and/or *in vitro* laboratory studies; mechanistic or kinetic studies in a variety of test systems, including but not limited to toxicokinetics and toxicodynamics, computational toxicology; data from structure-activity relationships, high-throughput assays, genomic response assays, and ecological field data. Specifically, for human health hazards, the assessment will consider all potentially exposed or susceptible subpopulation(s) identified in the scope and use appropriate combination, if available, of population-based epidemiological studies, information related to geographic location of susceptible subpopulations, models representing health effects to the population, and any other relevant, scientifically valid information or methodology. In an environmental hazard assessment, the relationship between the chemical substance and the occurrence of an ecological response will be evaluated using field or laboratory data, modeling strategies, and species extrapolations.

Where possible, a hazard assessment also will include a dose-response assessment. A dose-response relationship describes how the likelihood and severity of adverse health effects (the responses) are related to the amount and condition of exposure to an agent (the dose provided). The same principles generally apply for studies where the exposure is to a concentration of the agent (*e.g.*, airborne concentrations applied in inhalation exposure studies or water or other media concentrations for ecological exposure studies), and the resulting information is referred to as the concentration-response.

3. Exposure assessment. Pursuant to TSCA section 6(b)(4)(F), EPA, where relevant, will take into account the likely duration, intensity, frequency, and number of exposures under the conditions of use in an exposure assessment. An exposure assessment includes some discussion of the size, nature, and types of individuals or populations exposed to the agent, as well as discussion of the uncertainties in this information. Exposure can be measured directly, but more commonly is estimated indirectly through consideration of measured

concentrations in the environment, consideration of models of chemical transport and fate in the environment, and estimates of human intake or environmental exposure over time.

Using reasonably available information, exposures will be estimated (usually quantitatively) for the identified conditions of use. For human health exposure, the assessment would consider all potentially exposed or susceptible subpopulation(s) identified in the scope and utilize any combination, as available, of population-based epidemiological studies, information related to geographic location of susceptible subpopulations, models representing exposures to the population, measurements in human tissues or relevant environmental or exposure media, and any other relevant, scientifically valid information or methodology. In an environmental health exposure assessment, the interaction of the chemical substance with any ecological characteristics identified in the scope will be characterized and evaluated.

4. Risk characterization. TSCA requires that a risk evaluation “integrate and assess available information on hazards and exposures”. (15 U.S.C 2605(b)(4)(F)). A risk characterization conveys the risk assessor’s judgment as to the nature and presence or absence of risks, along with information about how the risk was assessed, where assumptions and uncertainties still exist, and where policy choices will need to be made. Risk characterization takes place for both human health risk assessments and ecological risk assessments.

In practice, each component of the risk assessment (*e.g.* hazard assessment, dose-response assessment, exposure assessment) has an individual characterization written to carry forward the key findings, assumptions, limitations, and uncertainties. The set of these individual characterizations provide the information basis to write an integrative risk characterization analysis. The final, overall risk characterization thus consists of the individual component characterizations plus an integrative analysis.

Each risk evaluation will quantitatively and/or qualitatively estimate and characterize risk for the identified populations and ecological characteristics under the conditions of use. The risk characterization will also describe whether aggregate or sentinel exposures were considered and provide the evidence and information to support the consideration.

In the risk characterization, EPA will further carry out the obligations under TSCA section 26(h) (15 U.S.C 2625(h)); for example, by assessing uncertainty and variability in each step of the risk evaluation, discussing considerations of data quality such as the reliability, relevance and whether the methods utilized were reasonable and consistent, explaining any assumptions used, and discussing information generated from independent peer review. EPA also may exercise its discretion to include a discussion of any alternative interpretation of results generated from the risk evaluation. For environmental evaluations specifically, EPA plans to include a discussion of the nature and magnitude of the effects, the spatial and temporal patterns of the effects, implications at the individual, species, and community level, and the likelihood of recovery subsequent to exposure to the chemical substance.

5. Peer review. For each risk evaluations conducted on chemicals identified pursuant to TSCA section 6(b)(4)(A), EPA will conduct peer reviews using the guidance provided in executive branch peer review directives included in the Office of Management and Budget Final Information Quality Bulletin for Peer Review (OMB Bulletin) (Ref. 22) and the guidance set forth in the EPA Peer Review Handbook (2015) (Ref. 23) or its updates.

The goal of the peer review process is to obtain independent review from experts who have not contributed to its development. According to EPA’s peer review policy, peer review of all scientific and technical information that is intended to inform or support Agency decisions is encouraged and expected. Both the EPA Peer Review Handbook and the OMB Bulletin provide standards for when and how to conduct peer review on science documents. The documents do not contemplate that peer review is necessary for every document or risk assessment, but is expected to occur for those documents that have either:

- Influential scientific information: scientific information that the Agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions, or
- Highly influential scientific assessment: a subset of influential scientific information that could have a potential impact of more than \$500 million in any year on either the public or private sector or is novel, controversial, or precedent-setting, or has significant interagency interest.

The EPA Peer Review Handbook, first released in 1998 and last updated in

2015, has also been instrumental in providing guidance on the methods for conducting peer review at the Agency for the past two decades. According to the Handbook the peer review approach can consist of internal or external reviewers and can range from a letter review, an *ad hoc* expert panel review, review of a journal manuscript by a referred scientific journal, review by an established Federal Advisory Committee (FAC), review by an Agency-appointed special board or commission, or review by the National Academy of Science. Given that this guidance reflects longstanding and well-accepted EPA practices on peer review, and given the public's familiarity with it, the Agency is proposing to continue to rely on that established guidance, rather than attempt to modify it or create some new methodology in this rulemaking. As discussed earlier in this proposal, EPA will identify aspects of the analysis on which peer review will be conducted, and the planned methodologies, as part of the draft scoping document that will undergo public comment for each chemical substance that undergoes risk evaluation. These may include novel models or analyses that warrant an in-depth peer review. In addition to any targeted peer review of specific aspects of the analysis, the entire risk assessment will also undergo peer review, as it is important for peer reviewers to consider how the various underlying analyses fit together to produce an integrated risk characterization which will form the basis of an unreasonable risk determination.

The peer review will address aspects of the science underlying the assessment, including, but not limited to hazard assessment, assessment of dose-response, exposure assessment, and risk characterization. Please note, however, EPA will not seek review of any determination as to whether the risks are "unreasonable", which is an Agency policy judgement. The purpose of peer review is for independent review of the science underlying the risk assessment, not to evaluate EPA's policy judgments. TSCA expressly reserves to the Agency the final determination of whether risk posed by a chemical substance is "unreasonable." 15 U.S.C. 2605(i). EPA nevertheless will include its unreasonable risk judgment as part of the risk evaluation that is subject to public review and comment.

6. Unreasonable risk determination. The final step of a risk evaluation is for the EPA to determine whether the chemical substance presents an unreasonable risk of injury to health or the environment. The EPA may find that

the substance does not present an unreasonable risk of injury to health or the environment under the conditions of use. This will be issued by order, published in the **Federal Register**, and considered to be a final EPA action. Alternatively, the EPA may determine that the substance does present an unreasonable risk under one or more conditions of use, in which case EPA must, pursuant to TSCA section 6(a) (15 U.S.C. 2605(a)), impose requirements to the extent necessary so that the substance no longer presents such risk.

EPA will announce in the **Federal Register** the availability of and solicit public comment on the draft risk evaluation, including the unreasonable risk determination. All comments that could be raised on components of the draft risk evaluation must be presented during this comment period. Any issues not raised during this time will be considered to have been waived, and may not form the basis for an objection or challenge in any subsequent administrative or judicial proceeding.

7. Additional publically available information. Pursuant to TSCA section 26(j), EPA will make available: (1) All notices, determinations, findings, consent agreements, and orders; (2) any information required to be provided by the EPA under 15 U.S.C. 2603; (3) a nontechnical summary of the risk evaluation; (4) a list of the studies with the results of the studies, considered in carrying out each risk evaluation; and (5) the final peer review report, including the response to peer review comments.

8. Reassessment of unreasonable risk determination. EPA may reassess a final unreasonable risk determination of a chemical substance at any time based on information available to the Agency.

IV. Request for Comments

While EPA is seeking public comment on all aspects of this proposed rule, there are areas where the Agency specifically requesting public input.

1. Redefining scientific terms. EPA received a number of stakeholder comments regarding EPA's approach to defining a number of important terms within this rule. These terms include "best available science", "weight-of-the-evidence", "sufficiency of information", "unreasonable risk", and "reasonably available information" among others. Many of the terms used in the proposed rule are not novel concepts and are already in use and the meaning of which is discussed extensively in existing Agency guidance. For example, extensive descriptions for the phrases "best available science", "weight-of-the-evidence", and "sufficiency of

information" can be found in EPA's Risk Characterization Handbook (Ref. 24), and in other existing Agency guidance.

EPA believes further defining these and other terms in the proposed rule is unnecessary and ultimately problematic. These terms have and will continue to evolve with changing scientific methods and innovation. Codifying specific definitions for these phrases in this rule may inhibit the flexibility of the Agency to quickly adapt and implement changing science. The Agency intends to use existing guidance definitions and will update definitions and guidance as necessary.

However, the Agency welcomes public comments regarding the pros and cons of codifying these or other definitions and/or approaches for these or any other terms. EPA encourages commenters to suggest alternative definitions the Agency should consider for codification in this procedural rule. Please explain your views as clearly as possible, providing specific examples to illustrate your concerns and suggest alternate wording, where applicable. EPA is specifically requesting comments on whether EPA should define unreasonable risk in the final rule. If so, acknowledging that the statute precludes consideration of costs and other non-risk factors at this step, what factors should EPA consider in making such a determination.

2. Margin of exposure. EPA currently uses a margin-of-exposure (MOE) approach in risk characterization of TSCA risk assessments. Please comment on the strengths and weaknesses of the MOE approach. Are there other approaches (e.g. use of hazard indices, use of probabilistic risk assessment) that might better suit the TSCA Risk Evaluation Program? Are there other approaches that provide quantifiable non-cancer risks?

3. Systematic Review. While EPA has included a systematic review approach in the past, and intends to continue to do so, please comment on the need for regulatory text prescribing a specific systematic review approach for hazard identification, including the appropriateness of elements that might be included or concerns about codifying an approach.

4. Manufacturer Requests. EPA anticipates that some chemical substances prioritized for risk evaluation have been manufactured by persons who possess unpublished information that could impact the chemical's risk determination. For chemical substances prioritized for risk evaluation, the Agency generally expects to exercise, as needed, among

other authorities, its information-gathering authority pursuant to 15 U.S.C. 2607(a) and 2607(d), likely very early in the process. EPA is specifically requesting comment on approaches to utilizing its information gathering authorities to assure that EPA has the most complete information to make its risk determination. For example, one option might be to incorporate its 15 U.S.C. 2607(a) and 2607(d) authority into the "Information and information sources" section of this rule to allow EPA to require, by notice in the **Federal Register**, manufacturers with information subject to 15 U.S.C. 2607(a)(2) and 2607(d) to submit that information to EPA for use in a risk evaluation. EPA is requesting comment on this option and on any more effective alternative methods to exercise this authority within the rule to assure the completeness of the information relevant to the risk evaluation.

The Agency also anticipates the possibility that one manufacturer requests a risk evaluation but other manufacturers of the same chemical who have not joined in the request also possess relevant unpublished information. For manufacturer requests for risk evaluation, the burden is on the requester to include or reference all information that is necessary for EPA to conduct a risk evaluation. Although EPA could use its data collection authority to access information, including unpublished studies, held by entities other than the requestor, the Agency intends to deny requests for risk evaluation if the requester does not have access to the information necessary for risk evaluation.

5. *Peer Review.* As discussed in both the OMB Bulletin and the EPA Peer Review Handbook, there are specific exemption criteria for information that does not necessitate peer review, even if it might be considered to be influential or highly influential. A number of specific circumstances where peer review is not necessary are discussed in section 3.3 of the EPA Peer Review Handbook. Examples of these circumstances include information involving a health or safety issue where the Agency determines that the dissemination is time-sensitive or if an application of an adequately peer-reviewed work product does not depart significantly from its scientific or technical approach. In addition, EPA expects that there will be individual circumstances where a chemical substance is found to not present an unreasonable risk or that findings are similar or the same as other jurisdictions (states or countries) that have reached similar conclusions based

on the same information, such that the Agency could determine that peer review is not necessary for that chemical risk evaluation.

EPA expects that many of the risk evaluations conducted under TSCA will necessitate peer review. In cases in which a chemical substance is determined to present an unreasonable risk, the Agency must promptly move to manage the risk, a circumstance that would typically qualify the assessment as "influential scientific information" under current guidance and practice. The Agency also expects that some risk evaluations would also be highly influential scientific assessments, *e.g.*, contain novel, controversial, or precedent-setting science with significant interagency interest. EPA also expects that peer review will be warranted in many cases where the Agency determines a chemical substance does not present an unreasonable risk. Aspects of the evaluation may qualify as influential scientific information or highly influential scientific assessment, and thus warrant peer review. Other circumstances where the Agency may determine that peer review is warranted could include circumstances where there are existing private sector standards suggesting concern for a given chemical substance, where existing state assessments differ from the EPA evaluation, or where the public has expressed general concern about the chemical substances effects.

As required under the amended TSCA, chemical substances must be prioritized as either low or high. Those categorized as high are subject to a risk evaluation, and those determined to be low are not. The bar for prioritizing a chemical as a low priority as required under the amended TSCA is fairly high. As such, EPA expects that, as an increasing number of chemical risk evaluations are completed, those chemical substances that present risk to human health or the environment will be managed accordingly, leaving an increasing number of chemicals that do not present an unreasonable risk. The Agency questions whether all future risk evaluations warrant peer review.

EPA is specifically requesting public comment on whether there are circumstances where conducting peer review may not be warranted. What circumstances might qualify, and whether the regulatory text should be adjusted to require EPA to make a case by case determination of whether and to what extent, consistent with the EPA Peer Review Handbook, peer review is warranted for the chemical substance undergoing a risk evaluation. In all

cases, the rule would require that this determination, and any peer review activities that are conducted, be documented for each chemical evaluation, starting with the scope document.

6. *Reliance on existing guidance and procedures for conducting risk evaluations.* As discussed in Unit III.G.1., EPA intends to take advantage of existing guidance, tools and models that are relevant and available for use in conducting a risk evaluation under this program. Since each risk evaluation is based on the specific circumstances surrounding the chemical being assessed, EPA has not attempted to codify any specific guidance, method or model. EPA believes that this is necessary to ensure that there is flexibility to address potentially unique circumstances on a chemical basis. EPA is interested in your comments about this approach, and where there is any existing guidance that may be of particular interest for consideration in conducting these risk evaluations. Additionally, EPA asks if the current guidance documents are sufficient and whether there are additional guidance documents that should be relevant but may not be on the lists available on EPA's Web site (<https://www.epa.gov/risk/risk-assessment-guidelines>). Finally, should EPA consider requiring that a list of appropriate guidance documents be included on a case-by-case basis as part of the scoping document that undergoes public review and comment.

7. *Interagency collaboration.* As discussed in Unit III.B., EPA is committed to ensuring there is interagency engagement and dialogue throughout its risk evaluation process, and has chosen not to limit the potential interagency collaboration by proposing to codify any particular process. EPA is concerned that imposing a single, pre-determined consultation step might lead to an overly bureaucratic process that could limit or complicate ongoing collaboration efforts, and so is not proposing to codify any particular process in this regulation. However, EPA is requesting specific public comment on whether codifying this collaboration at a specific point in the regulation is necessary.

24. Risk Characterization Handbook. Science Policy Council Handbook: Risk Characterization, EPA 100-B-00-002, Washington, DC December 2000. <https://www.epa.gov/risk/risk-characterization-handbook>.

VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at <http://www2.epa.gov/laws-regulations/laws-and-executive-orders>.

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is a significant regulatory action that was submitted to the Office of Management and Budget (OMB) for review under Executive Orders 12866 (58 FR 51735, October 4, 1993) and 13563 (76 FR 3821, January 21, 2011). Any changes made in response to OMB recommendations have been documented in the docket.

B. Paperwork Reduction Act (PRA)

The information collection activities associated with this proposed rule have been submitted to OMB for review and approval under the PRA, 44 U.S.C. 3501 *et seq.* Specifically, EPA has prepared an ICR to estimate the potential burden and costs associated with the proposed requirements for submitting a request for an Agency-conducted risk evaluation on a particular chemical substance. The ICR, which is available in the docket, has been assigned the EPA ICR number 2559.01. You can find a copy of the ICR in the docket for this proposed rule (Ref. 1), and it is briefly summarized here.

Respondents/affected entities: Manufacturers (including importers).

Respondent's obligation to respond: Optional, *i.e.*, needed only if they are requesting an EPA-conducted risk evaluation for a particular chemical substance.

Estimated number of respondents: 10.

Frequency of response: On occasion.

Total estimated annual burden: 960.3 hours. Burden is defined in 5 CFR 1320.3(b).

Total estimated annual cost: \$69,353 for burden hours. There are no M&O costs.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9.

Submit your comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden to EPA using the docket identified at the beginning of this proposed rule. You may also send your ICR-related comments to OMB's Office of

Information and Regulatory Affairs via email to oira_submission@omb.eop.gov, Attention: Desk Officer for the EPA. Since OMB is required to make a decision concerning the ICR between 30 and 60 calendar days after receipt, OMB must receive comments no later than February 21, 2017. Any ICR-related comments will be addressed with the final rule.

C. Regulatory Flexibility Act (RFA)

EPA certifies under section 605(b) of the RFA, 5 U.S.C. 601 *et seq.*, that this action will not have a significant economic impact on a substantial number of small entities. Although this proposed rule primarily addresses internal EPA procedures and activities associated with conducting risk evaluations for chemical substances as required by TSCA, EPA is also proposing the process and content requirements for a manufacturer (including importer) to request that EPA conduct a risk evaluation on a particular chemical substance. EPA has determined that the process and content requirements proposed will have minimal impact on an entity, regardless of size, because there is no mandate for them to make such a request, and the information they must provide should they decide to make such a request, which involves basic information about the chemical substance and the manufacturer's reasons for requesting the EPA-conducted risk evaluation on that chemical substance, should be readily available to the manufacturer. Estimated potential burden and costs are presented in the ICR (Ref. 1).

D. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local or tribal governments or the private sector.

E. Executive Order 13132: Federalism

This action does not have federalism implications as specified in Executive Order 13132 (64 FR 43255, August 10, 1999). It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive

Order 13175 (65 FR 67249, November 9, 2000). It will not have substantial direct effects on one or more Indian tribes, on the relationship between the Federal Government and Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes. Thus, Executive Order 13175 does not apply to this action.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

The EPA interprets Executive Order 13045 (62 FR 19885, April 23, 1997) as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of “covered regulatory action” in section 2–202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not a “significant energy action” as defined in Executive Order 13211 (66 FR 28355, May 22, 2001), because it is not likely to have a significant adverse effect on the supply, distribution or use of energy.

I. National Technology Transfer and Advancement Act (NTTAA)

This action does not involve any technical standards, and is therefore not subject to considerations under NTTAA section 12(d), 15 U.S.C. 272 note.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

This action does not establish an environmental health or safety standard, and is therefore not subject to environmental justice considerations under Executive Order 12898 (59 FR 7629, February 16, 1994). This is procedural rule that will not affect the level of protection provided to human health or the environment.

List of Subjects in 40 CFR Part 702

Environmental protection, Chemicals, Chemical Substance, Hazardous substances, Health and safety, Risk Evaluation.

Dated: January 12, 2017,

Gina McCarthy,
Administrator.

Therefore, it is proposed that 40 CFR chapter I, subchapter R, be amended as follows:

PART 702—GENERAL PRACTICES AND PROCEDURES

■ 1. The authority citation for part 702 is revised to read as follows:

Authority: 15 U.S.C. 2605 and 2619.

■ 2. Add subpart B to part 702 to read as follows:

Subpart B—Procedures for Chemical Substance Risk Evaluations

Sec.

- 702.31 General provisions.
- 702.33 Definitions.
- 702.35 Chemical substances designated for risk evaluation.
- 702.37 Submission of manufacturer requests for risk evaluations.
- 702.39 Evaluation requirements.
- 702.41 Risk characterization and peer review procedures.
- 702.43 Unreasonable risk determination.
- 702.45 Risk Evaluation timeframes and actions.
- 702.47 Publicly available information.

§ 702.31 General provisions.

(a) *Purpose.* This subpart establishes the EPA process for conducting a risk evaluation to determine whether a chemical substance presents an unreasonable risk of injury to health or the environment as required under TSCA section 6(b)(4)(B) (15 U.S.C. 2605(b)(4)(B)).

(b) *Scope.* These regulations establish the general procedures, key definitions, and timelines EPA will use in a risk evaluation conducted pursuant to TSCA section 6(b) (15 U.S.C. 2605(b)).

(c) *Applicability.* The requirements of this part apply to all chemical substance risk evaluations initiated pursuant to TSCA section 6(b) (15 U.S.C. 2605(b)).

(d) *Enforcement.* Submission to EPA of inaccurate, incomplete, or misleading information by a manufacturer pursuant to a risk evaluation conducted pursuant to 15 U.S.C. 2605(b)(4)(B) is a prohibited act under 15 U.S.C. 2614, subject to penalties under 15 U.S.C. 2615 and Title 18 of the U.S. Code.

§ 702.33 Definitions.

All definitions in TSCA apply to this subpart. In addition the following definitions apply:

Act means the Toxic Substances Control Act, as amended (15 U.S.C. 2601 *et seq.*).

Aggregate exposure means the combined exposures to an individual

from a single chemical substance across multiple routes and across multiple pathways.

EPA means the U.S. Environmental Protection Agency.

Pathways means the mode through which one is exposed to a chemical substance, including but not limited to: Food, water, soil, and air.

Potentially exposed or susceptible subpopulation means a group of individuals within the general population identified by the Agency who, due to either greater susceptibility or greater exposure, may be at greater risk than the general population of adverse health effects from exposure to a chemical substance or mixture, including but not limited to, infants, children, pregnant women, workers, or the elderly. EPA may identify a susceptible subpopulation in an individual risk evaluation upon consideration of various intrinsic (e.g., life stage, reproductive status, age, gender, genetic traits) or acquired (e.g., pre-existing disease, geography, workplace) characteristics that may affect exposure or modify the risk of illness or disease.

Reasonably available information means existing information that EPA possesses or can reasonably obtain and synthesize for use in risk evaluations, considering the deadlines specified in TSCA section 6(b)(4)(G) for completing such evaluation.

Routes means the particular manner which a chemical substance may contact the body, including absorption via ingestion, inhalation, or dermally (integument).

Sentinel exposure means the exposure(s) of greatest significance, which may be the plausible maximum exposure to an individual, population (or subpopulation), or the environment to the chemical substance of interest (or any combination thereof).

Uncertainty means the imperfect knowledge or lack of precise knowledge either for specific values of interest or in the description of a system.

Variability means the inherent natural variation, diversity, and heterogeneity across time and/or space or among individuals within a population.

§ 702.35 Chemical substances designated for risk evaluation.

(a) *Chemical Substances Undergoing Risk Evaluation.* A risk evaluation for a chemical substance designated by the Agency as a High-Priority Substance pursuant to the prioritization process described in subpart A, identified under 15 U.S.C. 2605(b)(2)(A), or initiated at the request of a manufacturer or manufacturers under 40 CFR 702.37,

will be conducted in accordance with this part, except that risk evaluations that are initiated prior to the effective date of this rule will be conducted in accordance with this part to the maximum extent practicable.

(b) *Percentage Requirements.* The Agency will ensure that, of the number of chemical substances that undergo risk evaluation under 15 U.S.C. 2605(b)(4)(C)(i), the number of chemical substances undergoing risk evaluation under 15 U.S.C. 2605(b)(4)(C)(ii) is not less than 25%, if sufficient requests that comply with 40 CFR 702.37 are made by manufacturers, and not more than 50%.

(c) *Manufacturer Requests for Work Plan Chemical Substances.* Manufacturer requests for risk evaluations, described in 40 CFR 702.35(a), for chemical substances that are drawn from the 2014 update of the TSCA Work Plan for Chemical Assessments or its relevant and applicable successor document will be granted at the discretion of the Agency. Such evaluations are not subject to the percentage requirements in 40 CFR 702.35(b).

§ 702.37 Submission of manufacturer requests for risk evaluations.

(a) *General Provision.* Any request for EPA to conduct a risk evaluation on a chemical substance pursuant to this part must comply with all the procedures and criteria in this section to be eligible to be granted by EPA. A request will meet EPA's criteria if the request includes or references all the information that is necessary for EPA to conduct a risk evaluation addressing all the circumstances that constitute conditions of use of the chemical substance within the meaning of TSCA section 3 (i.e., all circumstances under which the chemical substance is intended, known, or reasonably foreseen to be manufactured, processed, distributed in commerce, used, or disposed of).

(b) *Method for Submission.* One or more manufacturers of a chemical substance can request that EPA conduct a risk evaluation on the chemical substance by providing all the following information:

(1) Name, mailing address, and contact information of the entity (or entities) submitting the request. If more than one manufacturer submits the request, all individual manufacturers must provide their contact information.

(2) Full information on the chemical identity of the chemical substance that is the subject of the request. At a minimum, this includes, all known names of the chemical substance, including common or trades names,

chemical identity, CAS number, and molecular structure of the chemical substance.

(3) A complete list of the reasonably available information that is consistent with the standards in TSCA section 26(h) and that is relevant to whether the chemical substance presents an unreasonable risk of injury to health or the environment. The list must be accompanied by an explanation as to why such information is adequate to permit EPA to complete a risk evaluation addressing all the circumstances that constitute conditions of use of the chemical substance within the meaning of TSCA section 3 (i.e., all circumstances under which the chemical substance is intended, known, or reasonably foreseen to be manufactured, processed, distributed in commerce, used, or disposed of). The request need not include copies of the information; citations are sufficient. The request must include or reference all reasonably available information on the health and environment hazard(s) of the chemical substance, health and environmental exposure(s), and exposed population(s). At a minimum this must include information relevant to the following:

(i) The chemical substance's hazard and exposure potential;

(ii) The chemical substance's persistence and bioaccumulation;

(iii) Potentially exposed or susceptible subpopulations they believe to be relevant and that EPA should evaluate in the risk evaluation;

(iv) Whether there is any storage of the chemical substance near significant sources of drinking water;

(v) The chemical substance's conditions of use or significant changes in conditions of use;

(vi) The chemical substance's production volume or significant changes in production volume; and

(vii) Any other information relevant to the risks potentially presented by the chemical substance.

(4) The request must include a commitment to provide to EPA any referenced information upon request. In addition, if the manufacturer previously conducted its own risk assessment of the chemical substance, or possesses or can reasonably obtain any other pre-existing risk assessment, the request must include a commitment to provide such assessments to EPA upon request.

(5) A signed certification that all information contained in the request is accurate and complete, as follows:

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision and the information contained therein, to the best of

my knowledge is, true, accurate, and complete and I have not withheld any relevant information. I am aware there are significant penalties for submitting incomplete, false and/or misleading information, including the possibility of fine and imprisonment for knowing violations.

(c) *Optional Elements.* A manufacturer may provide evidence to demonstrate that restrictions imposed by one or more States have the potential to have a significant impact on interstate commerce or health or the environment, and that as a consequence the request is entitled to preference pursuant to 15 U.S.C. 2605(b)(4)(E)(iii).

(d) *Confidential Business Information.* (1) Persons submitting a request under this subpart are subject to EPA confidentiality regulations at 40 CFR part 2, subpart B.

(2) In submitting a claim of confidentiality, a person must certify the truth of the following statements concerning all information claimed as confidential:

I hereby certify to the best of my knowledge and belief that all information entered on this form is complete and accurate. I further certify that, pursuant to 15 U.S.C. 2613(c), for all claims for confidentiality made with this submission, all information submitted to substantiate such claims is true and correct, and that it is true and correct that

(i) My company has taken reasonable measures to protect the confidentiality of the information;

(ii) I have determined that the information is not required to be disclosed or otherwise made available to the public under any other Federal law;

(iii) I have a reasonable basis to conclude that disclosure of the information is likely to cause substantial harm to the competitive position of my company; and

(iv) I have a reasonable basis to believe that the information is not readily discoverable through reverse engineering.

(3) Each claim of confidentiality, other than a claim pertaining to information described in TSCA section 14(c)(2), must be accompanied by a substantiation in accordance with 40 CFR 2.204(e)(4).

(4) Manufacturers must supply a structurally descriptive generic name where specific chemical identity is claimed as CBI.

(5) Any knowing and willful misrepresentation is subject to criminal penalty pursuant to 18 U.S.C. 1001.

(e) *EPA Process for Evaluating Manufacturer Requests.* (1) *Review for completeness.* Upon receipt of the request, EPA will verify that the request is facially valid, *i.e.*, that information has been submitted that is consistent with the requirements in 40 CFR 702.37(b) through (d). EPA will inform

the submitting manufacturer(s) if EPA has determined that the request is incomplete and cannot be processed. Complete requests will be processed as described in this subpart.

(2) *Public notice and comment.* Within 30 business days of receiving a request that EPA has determined to be valid under paragraph (e)(1) of this section, EPA will submit for publication the receipt of the request in the **Federal Register**, open a docket for that request and provide no less than a 30 calendar day public comment period, during which time the public may submit comments and information relevant to whether the chemical substance presents an unreasonable risk of injury to health or the environment under the conditions of use. In particular, comments identifying any information gaps in the request (*e.g.*, any conditions of use not identified in the request).

(3) *Supplementation of original request.* (i) At any time prior to the end of the comment period, manufacturer(s) may supplement the original request with any new information it receives/obtains.

(ii) At any point prior to the completion of a risk evaluation conducted on a chemical substance at the request of a manufacturer(s), manufacturer(s) are required to supplement the original request upon receipt of information that meets the criteria in 15 U.S.C. 2607(e) and 40 CFR 702.37, or other information that has the potential to change EPA's evaluation of the risk of the chemical substance. Such information must be submitted within 30 calendar days of discovery.

(4) *EPA determination.* Within 9 months of the end of the comment period provided in paragraph (e)(2) of this section, EPA will review the request along with any additional information received during the comment period to determine whether the request meets the criteria and requirements of 40 CFR 702.37. EPA will notify the submitting manufacturer(s) of its determination.

(i) *Request is lacking required information.* (A) The manufacturer(s) have 60 calendar days from receipt of EPA's determination to submit any additional information identified as lacking in the notification.

(B) Failure to submit the additional information will be considered to be a withdrawal of the request to initiate a risk evaluation on the named chemical substance.

(C) Notwithstanding any such withdrawal, manufacturer(s) may submit a subsequent request on the same chemical substance.

(ii) *Compliant request.* EPA will initiate a risk evaluation for all requests

for non-TSCA Work Plan Chemicals that meet the criteria in this subpart, until EPA determines that the number of manufacturer-requested chemical substances undergoing risk evaluation is equal to 25% of the High-Priority Substances identified in subpart A as undergoing risk evaluation. Once that level has been reached, EPA will initiate one new manufacturer-requested risk evaluation for each manufacturer-requested risk evaluation completed, as needed to ensure that the number of manufacturer-requested risk evaluations is equal to at least 25% of the High-Priority substances risk evaluation.

(5) *Preferences.* In conformance with 40 CFR 702.35(c), in evaluating requests for TSCA Work Plan Chemicals and requests for non-TSCA Work Plan chemicals in excess of the 25% threshold in paragraph (e)(4)(ii) of this section, EPA will give preference to requests for risk evaluations on chemical substances:

(i) That demonstrate that restrictions imposed by one or more States have the potential to have a significant impact on interstate commerce, health or the environment.

(ii) EPA will also give preference to requests where EPA has determined there are relatively high estimates of hazard and/or exposure for the chemical substance.

(iii) Any other factor EPA determines to be relevant.

(6) *Conditions of use considered.* EPA will conduct the risk evaluation on all of the conditions of use of a chemical substance undergoing risk evaluation at the request of a manufacturer, as determined through the scoping process outlined in 40 CFR 702.39(c).

(7) *No preferential treatment.* EPA will not expedite or otherwise provide special treatment to a risk evaluation conducted as a result of a manufacturer request.

(f) *Fees.* Manufacturers must pay fees to support risk evaluations under 15 U.S.C. 2605(b)(4)(C)(ii).

§ 702.39 Evaluation Requirements and Peer Review Procedures.

(a) *Considerations.* (1) Each risk evaluation will include the following components: a Scope, including a Conceptual Model and an Analysis Plan; a Hazard Assessment; an Exposure Assessment; a Risk Characterization; and a Risk Determination.

(2) Existing EPA guidance, where available and relevant, will be used in conducting the risk evaluation. In addition, other scientifically relevant methods or guidance may be used in a risk evaluation.

(3) Where appropriate, a risk evaluation may be conducted on a category of chemical substances. EPA will determine whether to conduct an evaluation on a category of chemical substances, and the composition of the category based on the considerations listed in 15 U.S.C. 2625(c). In addition to the factors specifically enumerated in that provision, EPA may consider the hazards and exposures associated with the category of chemical substances, and the populations likely to be exposed.

(4) EPA will ensure that all supporting analyses and components of the risk evaluation are suitable for their intended purpose, and well-tailored to the problems and decision at hand, in order to inform the development of a technically sound determination as to whether a chemical substance presents an unreasonable risk of injury to health or the environment, based on the weight of the scientific evidence.

(5) The extent to which EPA will refine its evaluations for particular conditions of use in any risk evaluation will vary as necessary to determine whether a chemical substance presents an unreasonable risk of injury to health or the environment. To the extent a determination as to the level of risk presented by a condition of use can be made, for example, by the use of accepted science policies (e.g., defaults assumptions or uncertainty factors), and models or screening methodologies, EPA may determine that no further information or analysis is needed to complete its risk evaluation of the use(s).

(6) EPA may conduct a risk evaluation on a chemical substance in phases to allow the Agency to proceed with risk management on particular conditions of use. For example, EPA may determine that a chemical substance presents an unreasonable risk of injury to health or the environment under one or more conditions of use, and address such unreasonable risk through rulemaking under TSCA section 6(a), while other conditions of use remain under evaluation. In all cases in which EPA conducts its risk evaluations in phases, EPA will nevertheless complete a full risk evaluation of the chemical substance for all of the conditions of use identified through the scoping process in 40 CFR 702.39(c) within the time frame in 40 CFR 702.43(d).

(7) In evaluating chemical substances that are metals or metal compounds, EPA will use the *Framework for Metals Assessment of the Office of the Science Advisor, Risk Assessment Forum* dated March 2007, or a successor document that addresses metal risk assessment

and is peer reviewed by the Science Advisory Board.

(b) *Information and information sources.* (1) EPA will base each risk evaluation on reasonably available information.

(2) EPA generally expects to initiate a risk evaluation for a chemical substance only when EPA believes that all or most of the information necessary to perform the risk evaluation already exists and is reasonably available. EPA expects to use its authorities under the Act, and other information gathering authorities, when necessary to generate the information needed to perform a risk evaluation for a chemical substance before initiating the risk evaluation for such substance. EPA will use such authorities on a case-by-case basis during the performance of a risk evaluation to obtain or generate information as needed to ensure that EPA has adequate, reasonably available information to perform the evaluation.

(3) Among other sources of information, the Agency will consider information and advice provided by the Science Advisory Committee on Chemicals established pursuant to 15 U.S.C. 2625.

(4) In conducting risk evaluations, EPA will rely on an appropriate combination of information, accepted science policies (e.g., defaults and uncertainty factors), models and screening methodologies. The balance of information, accepted science policies models, and screening methodologies used in risk evaluation will be informed by the deadlines specified in TSCA section 6(b)(4)(G) for completing such evaluations. It will also be informed by consideration of the extent to which additional information would reduce the uncertainty in determining whether a chemical substance presents an unreasonable risk of injury to health or the environment.

(5) Where appropriate, to the extent practicable, and scientifically justified, EPA will use information generated without the use of testing on vertebrates in performing risk evaluation.

(c) *Scope of the risk evaluation.* EPA will determine the scope of the risk evaluation to be conducted for each chemical substance based on all of the following:

(1) EPA will identify those uses that constitute the conditions of use that will be assessed during the risk evaluation. Those uses shall be all circumstances under which the Agency determines that the chemical substance is intended, known, or reasonably foreseen to be manufactured, processed, distributed in commerce, used, or disposed of.

(2) When determining the scope, EPA will identify the exposed individuals

and populations, including any potentially exposed or susceptible subpopulations as identified by the Agency that EPA plans to evaluate; the ecological characteristics that EPA plans to evaluate; and the hazards to health and the environment that EPA plans to evaluate.

(3) The combination of reasonably available information, accepted science policies (e.g., defaults and uncertainty factors), models, and screening methodologies that EPA plans to use in the risk evaluation will be documented.

(4) *Conceptual model.* (i) The scope documents will include a Conceptual Model that describes actual or predicted relationships between the chemical substance and human and environmental receptors.

(ii) The Conceptual Model will identify human and ecological health endpoints the EPA plans to evaluate for the exposure scenarios EPA plans to evaluate.

(iii) Conceptual Model development will consider the life cycle of the chemical substance, including manufacture, processing, distribution in commerce, storage, use, and disposal.

(5) *Analysis plan.* (i) The scope documents will include an analysis plan that identifies the approaches, methods, and/or metrics that the EPA plans to use to assess exposures, effects, and risk, including associated uncertainty and variability for each risk evaluation. The analysis plan will also identify the strategy for using information, accepted science policies, models, and screening methodologies.

(ii) Hypotheses about the relationships described in the conceptual model will be described. The relative strengths of (any) competing hypotheses will be evaluated to determine the appropriate risk assessment approaches.

(6) *Developing the Scope.* (i) *Draft scope.* For each risk evaluation to be conducted EPA will publish a document in the **Federal Register** that specifies the draft scope of the risk evaluation the Agency plans to conduct. The document will address the elements in paragraphs (c)(1) through (5) of this section.

(ii) *Timeframes.* EPA generally expects to publish the draft scope no later than 3 months from the initiation of the risk evaluation process for the chemical substance, and to allow a period of 30 calendar days during which interested persons may submit comment on EPA's draft risk evaluation scope. EPA will open a docket to facilitate receipt of public comments.

(iii) *Public comments.* All comments that could be raised on the matters addressed and issues presented in the

published risk evaluation scope document must be presented during this comment period. Any issues not raised at this time will be considered to have been waived, and may not form the basis for an objection or challenge in any subsequent administrative or judicial proceeding.

(iv) *Final scope.* (A) The Agency will, no later than 6 months after the initiation of a risk evaluation, publish a document in the **Federal Register** that specifies the final scope of the risk evaluation the Agency plans to conduct. The document shall address the elements in paragraphs (c)(1) through (5) of this section.

(B) For a chemical substance designated as a High-Priority Substance under 40 CFR part 702 subpart A, EPA will not publish the final scope of the risk evaluation until at least 12 months have elapsed from the initiation of the prioritization process for the chemical substance.

(d) *Hazard assessment.* (1) The hazard information relevant to the chemical substance will be evaluated using endpoints identified in the final scope document published pursuant to paragraph (c)(6)(iv) of this section, for the identified exposure scenarios, including any identified potentially exposed or susceptible subpopulation(s).

(2) The hazard assessment process will identify the types of hazards to health or the environment posed by the chemical substance. This process includes the identification, evaluation, and synthesis of information to describe the potential health effects of the chemical substance.

(3) Based on the final scope document published pursuant to paragraph (c)(6)(iv) of this section, potential human and environmental hazard endpoints will be evaluated, including, as appropriate; acute, subchronic, and chronic effects during various stages of reproduction or life stage.

(4) The relationship between the dose of the chemical substance and the occurrence of human and environmental health effects or outcomes will be evaluated.

(5) Studies evaluated may include, but would not be limited to: Human epidemiological studies, in vivo and/or in vitro laboratory studies, mechanistic or kinetic studies in a variety of test systems, including but not limited to toxicokinetics and toxicodynamics, computational toxicology, data from structure-activity relationships, high-throughput assays, genomic response assays, and ecological field data.

(6) Hazard identification will include an evaluation of the strengths and

limitations of the reasonably available information.

(7) *Human health hazard assessment.* The hazard assessment will consider all potentially exposed and susceptible subpopulation(s) determined to be relevant, as identified in the final scope document published pursuant to paragraph (c)(6)(iv) of this section. Reasonably available information used to characterize risk to susceptible subpopulation(s) may include, but may not be limited to:

(i) Population-based epidemiology studies that identify risk factors and susceptible subpopulations;

(ii) Information related to geographic location of subpopulations;

(iii) Models that represent health effects of relevant subpopulations; and

(iv) Any other relevant, scientifically valid information, methodology, or extrapolation.

(8) *Environmental health hazard assessment.* The relationship between the chemical substance and the occurrence of an ecological hazard elicited will be evaluated using reasonably available information including but not limited to: Field or laboratory measurements, modeling strategies, extrapolations or incident data.

(e) *Exposure assessment.* (1) Where relevant, the likely duration, intensity, frequency, and number of exposures under the conditions of use will be considered.

(2) For the conditions of use, exposures will be evaluated using reasonably available information.

(3) Chemical-specific factors including, but not limited to: Physical-chemical properties and environmental fate parameters will be examined.

(4) *Human health exposure assessment.* The exposure assessment will consider all potentially exposed and susceptible subpopulation(s) determined to be relevant, as identified in the final scope document published pursuant to paragraph (c)(6)(iv) of this section. Reasonably available information used to characterize exposure to susceptible subpopulation(s) may include:

(i) Population-based epidemiology studies that identify risk factors and susceptible subpopulations;

(ii) Information related to geographic location of subpopulations;

(iii) Models that represent exposure or health effects of relevant subpopulations; and

(iv) Any other relevant, scientifically valid information or methodology.

(5) *Environmental health exposure assessment.* (i) The environmental health exposure assessment will

characterize and evaluate the interaction of the chemical substance with the ecological characteristics identified in the final scope document published pursuant to paragraph (c)(6)(iv) of this section.

(ii) Exposures considered will include individuals as well as communities, depending on the chemical substance and the ecological characteristic involved.

§ 702.41 Risk characterization and peer review procedures.

(a) Risk Characterization

Considerations. EPA will: (1) Integrate the hazard and exposure assessments into quantitative and/or qualitative estimates of risk for the identified populations (including any potentially exposed or susceptible subpopulation(s) identified in the final scope document published pursuant to 40 CFR 703.39(c)(6)(iv) and ecological characteristics for the conditions of use; and

(2) Describe whether aggregate or sentinel exposures under the conditions of use were considered and the basis for that consideration.

(b) The Risk Characterization will summarize, as applicable, the considerations addressed throughout the evaluation components, in carrying out the obligations under 15 U.S.C. 2625(h). This summary will include, as appropriate, a discussion of:

(1) *Considerations regarding uncertainty and variability.* Information about uncertainty and variability in each step of the risk evaluation (e.g., use of default assumptions, scenarios, choice of models and information used for quantitative analysis) will be integrated into an overall characterization and/or analysis of the impact of the uncertainty and variability on estimated risks. EPA may describe the uncertainty using a qualitative assessment of the overall strength and limitations of the data used in the assessment.

(2) *Considerations of data quality.* A discussion of issues associated with data quality (e.g., reliability, relevance, and whether methods employed to generate the information are reasonable for and consistent with the intended use of the information), as well as assumptions used, will be included to the extent necessary. EPA also expects to include a discussion of the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models used in the risk evaluation.

(3) *Considerations of alternative interpretations.* If appropriate and

relevant, a discussion of alternative interpretations of the data and analyses will be included.

(4) *Considerations for environmental risk evaluations.* For environmental risk evaluations, it may be necessary to discuss the nature and magnitude of the effects, the spatial and temporal patterns of the effects, implications at the individual, species, and community level, and the likelihood of recovery subsequent to exposure to the chemical substance.

(c) *Peer Review.* The EPA Peer Review Handbook (2015), the Office of Management and Budget Final Information Quality Bulletin for Peer Review (OMB Bulletin), or other available, relevant and applicable methods consistent with 15 U.S.C. 2625, will serve as the guidance for peer review activities. Peer review will be conducted on the risk evaluations for the chemical substances identified pursuant to 15 U.S.C. 2605(b)(4)(A).

§ 702.43 Unreasonable risk determination.

The EPA will determine whether the chemical substance presents an unreasonable risk of injury to health or the environment under the conditions of use as identified in the final scope document published pursuant to 40 CFR 702.39(c)(6)(iv).

§ 702.45 Risk evaluation timeframes and actions.

(a) *Draft risk evaluation timeframe.* The EPA will publish a draft risk

evaluation in the **Federal Register** and provide no less than a 30-day comment period, during which time the public may submit comment on EPA's draft risk evaluation.

(1) EPA will open a docket to facilitate receipt of public comment.

(2) All comments that could be raised on the matters addressed and issues presented in the draft risk evaluation must be presented during this comment period. Any issues not raised at this time will be considered to have been waived, and may not form the basis for an objection or challenge in any subsequent administrative or judicial proceeding.

(b) *Final risk evaluation.* (1) EPA will complete a risk evaluation for the chemical substance as soon as practicable, but not later than 3 years after the date on which the Agency initiates the risk evaluation.

(2) The Agency may extend the deadline for a risk evaluation for not more than 6 months.

(3) EPA will publish the final risk evaluation in the **Federal Register**.

(c) *Final determination of unreasonable risk.* Upon determination by the EPA that a chemical substance does present an unreasonable risk of injury to health or the environment, the Agency will initiate action as required pursuant to 15 U.S.C. 2605(a).

(d) *Final determination of no unreasonable risk.* A determination by the EPA that the chemical substance

does not present an unreasonable risk of injury to health or the environment will be issued by order and considered to be a final EPA action, effective on the date of issuance of the order.

(c) *Reassessment.* EPA may reassess an unreasonable risk determination based on a review of available information.

§ 702.47 Publicly available information.

For each risk evaluation, EPA will maintain a public docket at <http://www.regulations.gov> to provide public access to the following information, as applicable for that risk evaluation:

(1) The draft scope, final scope, draft risk evaluation, and final risk evaluation;

(2) All notices, determinations, findings, consent agreements, and orders;

(3) Any information required to be provided to the Agency under 15 U.S.C. 2603;

(4) A nontechnical summary of the risk evaluation;

(5) A list of the studies, with the results of the studies, considered in carrying out each risk evaluation;

(6) The final peer review report, including the response to peer review comments; and

(7) Response documents to the public comments on the draft risk evaluation.

Transfers of Certain Property by U.S. Persons to Partnerships With
Related Foreign Partners; Final and Temporary Rules

DEPARTMENT OF THE TREASURY**Internal Revenue Service****26 CFR Part 1**

[TD 9814]

RIN 1545-BM95

Transfers of Certain Property by U.S. Persons to Partnerships With Related Foreign Partners**AGENCY:** Internal Revenue Service (IRS), Treasury.**ACTION:** Final and temporary regulations.

SUMMARY: This document contains temporary regulations that address transfers of appreciated property by United States persons (U.S. persons) to partnerships with foreign partners related to the transferor. The regulations override the rules providing for nonrecognition of gain on a contribution of property to a partnership in exchange for an interest in the partnership under section 721(a) of the Internal Revenue Code (Code) pursuant to section 721(c) unless the partnership adopts the remedial method and certain other requirements are satisfied. The document also contains regulations under sections 197, 704, and 6038B that apply to certain transfers described in section 721. The regulations affect U.S. partners in domestic or foreign partnerships. The text of the temporary regulations also serves as the text of the proposed regulations set forth in the notice of proposed rulemaking on this subject in the Proposed Rules section of this issue of the **Federal Register**. The final regulations revise and add cross-references to coordinate the application of the temporary regulations.

DATES: *Effective Date:* These regulations are effective on January 18, 2017.*Applicability Dates:* For dates of applicability, see §§ 1.197-2T(l)(5)(i), 1.704-1T(f), 1.704-3T(g)(1), 1.721(c)-1T(e), 1.721(c)-2T(e), 1.721(c)-3T(e), 1.721(c)-4T(d), 1.721(c)-5T(g), 1.721(c)-6T(g), and 1.6038B-2T(j)(4)(i).**FOR FURTHER INFORMATION CONTACT:** Concerning the temporary regulations, Ryan A. Bowen, (202) 317-6937; concerning submissions of comments or requests for a public hearing, Regina Johnson, (202) 317-6901 (not toll-free numbers).**SUPPLEMENTARY INFORMATION:****Paperwork Reduction Act**

The collection of information contained in the regulations is listed with the Office of Management and Budget under control numbers 1545-

1668 and 1545-0123 in accordance with the Paperwork Reduction Act of 1995 (44 U.S.C. 3507(d)). Comments on the collection of information should be sent to the Office of Management and Budget, Attn: Desk Officer for the Department of the Treasury, Office of Information and Regulatory Affairs, Washington, DC 20503, with copies to the Internal Revenue Service, Attn: IRS Reports Clearance Officer, SE:W:CAR:MP:T:T:SP, Washington, DC 20224. Comments on the collection of information should be received February 21, 2017.

The collections of information are in §§ 1.721(c)-6T and 1.6038B-2T. The collections of information are mandatory. The likely respondents are domestic corporations. Burdens associated with these requirements will be reflected in the burden for Form 1065, U.S. Return of Partnership Income, and Form 8865, Return of U.S. Persons With Respect to Certain Foreign Partnerships. Estimates for completing these forms can be located in the form instructions.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a valid control number.

Background**I. Statutory Background**

Until they were repealed as part of the Taxpayer Relief Act of 1997 (the 1997 Act), Public Law 105-34 (111 Stat. 788), section 1131, sections 1491 through 1494 imposed an excise tax on certain transfers of appreciated property by a U.S. person to a foreign partnership, which generally was 35 percent of the amount of gain inherent in the property. Congress believed that the imposition of enhanced information reporting obligations (including sections 6038, 6038B, and 6046A) with respect to foreign partnerships would eliminate the need for sections 1491 through 1494. Staff of the Joint Committee on Taxation, General Explanation of Tax Legislation Enacted in 1997, Part Two: Taxpayer Relief Act of 1997 (H.R. 2014) (JCS-23-97) (Dec. 17, 1997), at 314-315.

Notwithstanding these enhanced information reporting requirements, the 1997 Act granted the Secretary regulatory authority in section 721(c) to override the application of the nonrecognition provision of section 721(a) to gain realized on the transfer of property to a partnership (domestic or foreign) if the gain, when recognized, would be includible in the gross income of a person other than a U.S. person. In the 1997 Act, Congress also enacted

section 367(d)(3), which provides the Secretary regulatory authority to apply the rules of section 367(d)(2) to transfers of intangible property to partnerships in circumstances consistent with the purposes of section 367(d). Regulations have never been issued pursuant to section 721(c) or section 367(d)(3).

Congress enacted section 367 (and its predecessor) in order to prevent U.S. persons from avoiding U.S. tax by transferring appreciated property to foreign corporations using nonrecognition transactions. Staff of the Joint Committee on Taxation, General Explanation of the Revenue Provisions of the Deficit Reduction Act of 1984 (H.R. 4170, 98th Congress; Pub. L. 98-369) (JCS-41-84) (Dec. 31, 1984), at 427. The outbound transfer of intangible property raises additional issues that Congress also sought to address. Specifically, section 367(d) was enacted to prevent U.S. persons from transferring intangibles offshore in order to achieve deferral of U.S. tax on the profits generated by the intangibles. H.R. Rep. No. 98-432, 98th Cong., 2d Sess., at 1311-15 (1984). Under section 367(d), a U.S. person that transfers intangible property (within the meaning of section 936(h)(3)(B)) to a foreign corporation in an exchange described in section 351 or section 361 is treated as having sold such property in exchange for payments that are contingent upon the productivity, use, or disposition of such property, and receiving amounts that reasonably reflect the amounts that would have been received annually in the form of such payments over the useful life of the property, or, in the case of a disposition following the transfer (whether direct or indirect), at the time of the disposition. Section 367(d)(2)(A). The amounts taken into account must be commensurate with the income attributable to the intangible property. *Id.*

Section 721(a) provides a general rule that no gain or loss is recognized to a partnership or to any of its partners in the case of a contribution of property to the partnership in exchange for an interest in the partnership. Because section 367 applies only to the transfer of property to a foreign corporation, absent regulations under section 721(c) or section 367(d)(3), a U.S. person generally does not recognize gain on the contribution of appreciated property to a partnership with foreign partners.

Section 704(c)(1)(A) requires partnerships to allocate income, gain, loss, and deduction with respect to property contributed by a partner to the partnership so as to take into account any variation between the adjusted tax

basis of the property and its fair market value at the time of contribution.

II. Regulatory Background

Section 1.704–3(a)(1) provides that the purpose of section 704(c) is to prevent the shifting of tax consequences among partners with respect to pre-contribution gain or loss (forward section 704(c) layer). In addition, partnerships may, but are not required to, revalue partnership property pursuant to § 1.704–1(b)(2)(iv)(f) or (s) upon the occurrence of enumerated events, such as the entry of a new partner by contribution, giving rise to a reverse section 704(c) layer. Section 1.704–3(a)(6)(i) provides that the principles of § 1.704–3 apply to allocations with respect to these reverse section 704(c) layers (reverse section 704(c) allocations).

Section 704(c) allocations must be made using any reasonable method consistent with the purpose of section 704(c). Section 1.704–3(a)(1). Section 1.704–3 describes three methods of making section 704(c) allocations that are generally reasonable, including the remedial allocation method. *Id.* Under the remedial allocation method, a partnership may eliminate distortions caused by the ceiling rule (as described in § 1.704–3(b)(1)) by making remedial allocations of income, gain, loss, or deduction to the noncontributing partners equal to the full amount of the limitation caused by the ceiling rule, and offsetting those allocations with remedial allocations of income, gain, loss, or deduction to the contributing partner. See § 1.704–3(d)(1); see also T.D. 8585 (59 FR 66724). Under § 1.704–3(a)(10), an allocation method (or combination of methods) is not reasonable if the contribution of property (or event that results in reverse section 704(c) allocations) and the corresponding allocation of tax items with respect to the property are made with a view to shifting the tax consequences of built-in gain or loss among the partners in a manner that substantially reduces the present value of the partners' aggregate tax liability. However, § 1.704–3(d)(5)(ii) provides that, in exercising its authority under § 1.704–3(a)(10), the IRS will not require a partnership to use the remedial allocation method.

III. Reasons for Exercising Regulatory Authority

The Treasury Department and the IRS are aware that certain taxpayers purport to be able to contribute, consistently with sections 704(b), 704(c), and 482, property to a partnership that allocates the income or gain from the contributed

property to related foreign partners that are not subject to U.S. tax. Many of these taxpayers choose a section 704(c) method other than the remedial method or use valuation techniques that are inconsistent with the arm's length standard. In 1997, Congress recognized that taxpayers might use a partnership to shift gain to a foreign person and consequently enacted sections 721(c) and 367(d)(3). Based on the experience of the IRS with the taxpayer positions described above, the Treasury Department and the IRS have determined that it is appropriate to exercise the regulatory authority granted in section 721(c) to override the application of section 721(a) to gain realized on the transfer of property to a partnership (domestic or foreign) in certain circumstances in which the gain, when recognized, ultimately would be includible in the gross income of a foreign person. Although Congress also provided specific authority in section 367(d)(3) to address transfers of intangible property to partnerships, the Treasury Department and the IRS have concluded that acting pursuant to section 721(c) is more appropriate because the transactions at issue are not limited to transfers of intangible property.

IV. Notice 2015–54

On August 6, 2015, the Department of the Treasury (Treasury Department) and the IRS issued Notice 2015–54, 2015–34 I.R.B. 210 (the notice), which describes regulations to be issued under section 721(c) that would ensure that, when a U.S. person transfers certain property to a partnership that has foreign partners related to the U.S. person, income or gain attributable to the appreciation in the property at the time of the contribution will be taken into account by the transferor either immediately or over time. Comments were received on the notice and will be included in the administrative record for the notice of proposed rulemaking on this subject in the Proposed Rules section of this issue of the **Federal Register** (REG–127203–15). The Treasury Department and the IRS have considered all the submitted comments. The significant comments are discussed in the Explanation of Provisions section of this preamble.

The notice states that future regulations generally will override the application of section 721(a) to gain realized on the transfer of property to a partnership (domestic or foreign) in certain circumstances in which the gain, when recognized, ultimately would be includible in the gross income of a related foreign person. The notice further states that future regulations will

allow for the continued application of section 721(a) to transfers to partnerships with related foreign partners when certain requirements intended to protect the U.S. tax base are satisfied. The notice described these requirements, in addition to others, as the “gain deferral method.”

The requirements of the gain deferral method described in the notice are that (i) the section 721(c) partnership adopts the remedial allocation method for built-in gain with respect to all section 721(c) property contributed to the partnership pursuant to the same plan by the U.S. transferor and all U.S. transferors that are related persons; (ii) the section 721(c) partnership makes consistent allocations of all section 704(b) items with respect to an item of section 721(c) property (the consistent allocation method); (iii) certain reporting requirements are satisfied; (iv) the U.S. transferor recognizes any remaining built-in gain with respect to section 721(c) property upon an acceleration event; and (v) the gain deferral method is adopted for all section 721(c) property subsequently contributed to the section 721(c) partnership by the U.S. transferor and all other U.S. transferors that are related persons until the earlier of two dates: the date that no built-in gain remains with respect to any section 721(c) property to which the gain deferral method first applied, or the date that is 60 months after the date of the initial contribution of section 721(c) property to which the gain deferral method first applied (unified application requirement). See Part III of the Explanations of Provisions section of this preamble for the definitions of “section 721(c) partnership,” “section 721(c) property,” “U.S. transferor” and other commonly used terms.

The notice generally provides that the regulations will define an acceleration event as any transaction that either (i) would reduce the amount of remaining built-in gain that a U.S. transferor would recognize under the gain deferral method if the transaction had not occurred, or (ii) could defer the recognition of the built-in gain. The notice also describes several situations that the regulations will not treat as acceleration events.

The notice states that the regulations will apply to transactions involving tiered partnerships in a manner that is consistent with the purpose of the regulations. As examples, the notice provides that the regulations will treat a contribution of section 721(c) property by a partnership (in which a U.S. transferor is a direct or indirect partner) to a lower-tier partnership, or a

contribution by a U.S. transferor of an interest in a partnership that owns section 721(c) property to an upper-tier partnership, as though the U.S. transferor contributed its share of the section 721(c) property directly.

The notice provides that the regulations described therein will apply to contributions occurring on or after August 6, 2015, and to contributions occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701-3 that is filed on or after August 6, 2015, and that is effective on or before August 6, 2015. The notice provides, however, that the reporting requirements will not apply to taxable years that end before the date of publication of regulations described in the notice.

The notice also announced the intent to issue regulations under sections 482 and 6662 to ensure the appropriate valuation of controlled transactions involving partnerships. These regulations are not contained in this Treasury decision and will appear in future regulations. Section 482 continues to apply to controlled transactions (within the meaning of § 1.482-1(i)(8)) that are also subject to these regulations. An adjustment pursuant to section 482 does not prevent the application of these regulations.

Explanation of Provisions

I. Comments Regarding Statutory Authority for Regulations

Comments questioned whether the regulations described in the notice are within the scope of the grant of authority in section 721(c). Specifically, comments asserted that pre-contribution gain could not be taxed under section 721(c) until it is recognized in a sale or exchange by the partnership. The Treasury Department and the IRS disagree with these comments for several reasons.

First, as explained in the notice, Congress added the broad grant of regulatory authority in section 721(c) in the 1997 Act to address transactions in which property is contributed to partnerships in order to inappropriately shift gain offshore as a replacement for the repealed excise tax on transfers to foreign partnerships in sections 1491 through 1494.

Second, section 721(c) provides authority to tax the gain when the property is contributed if the gain “will be includible” in a foreign person’s income; it is not a rule (like section 704(c)(1)(B)) that requires the “wait-and-see” approach suggested by the comments. The comments fail to

acknowledge that neither the traditional method nor the traditional method with curative allocations will necessarily ensure that a contributing partner will bear all the tax consequences of pre-contribution gain. A contributing partner exchanges a share of the property it contributes for a share of the property the other partners contribute. Economically, a contribution is a current value-for-value exchange. The purpose of section 704(c) is to prevent the shifting of tax consequences among partners with respect to pre-contribution built-in gain or loss in contributed property. The regulations under section 704(c) provide three generally reasonable methods under which partnerships may allocate items with respect to contributed property so as to take into account the tax consequences of pre-contribution gain or loss—the traditional method, the traditional method with curative allocations, and the remedial allocation method. None of the methods are mandatory, and taxpayers may choose any of them (or another reasonable method) on a property-by-property and section 704(c) layer-by-layer basis. In the case of a contribution of depreciable or amortizable property with pre-contribution gain, under all three methods, book cost recovery deductions reduce the pre-contribution gain in the property (the gain that must be allocated back to the contributor) over the course of the recovery period for the property. Under the traditional method, tax cost recovery deductions (which are based on tax basis in the property) are, to the extent available, allocated first to the noncontributing partner up to its allocated book cost recovery deductions. If the noncontributing partner’s book cost recovery deductions exceed its tax cost recovery deductions, the noncontributing partner will be overtaxed on its investment in the partnership property. The traditional method does not make up for shortfalls in available tax deductions, and if the partnership uses the traditional method with curative allocations, those shortfalls are cured only if there are other tax items available with which to cure. Because book cost recovery deductions reduce the built-in gain in the property regardless of whether the noncontributing partner has received all of the tax cost recovery deductions to which it is economically entitled or whether the contributing partner has received taxable income (or fewer tax deductions) commensurate with the pre-contribution gain in its property, neither the traditional method nor the traditional method with curative

allocations prevents a shift of the tax consequences of pre-contribution gain to the noncontributing partner when tax basis or other tax items are insufficient to reflect the economics of the noncontributing partner. When this shift occurs, the contributing partner generally will not bear the tax consequences of the pre-contribution gain until, at the earliest, its partnership interest is liquidated or sold. In this way, the contribution of property to a partnership applying either of these two methods can result in a tax-advantaged exchange with respect to the contributing partner. When the noncontributing partner is foreign, this situation is the appropriate target for the temporary regulations.

Finally, the regulations under section 704(c) give wide latitude to taxpayers regarding how and when partners may choose to recognize pre-contribution gain. Subject to anti-abuse rules, taxpayers are allowed to adopt the traditional method and the traditional method with curative allocations despite those methods’ inability to prevent a shift of the tax consequences of pre-contribution gain in all cases. This latitude raises more concern in the case of related partners, one or more of whom are foreign, given their likely overall alignment of tax interests, which would not necessarily exist among unrelated partners. As explained in Part II of the Background section of this preamble, the remedial allocation method is the only method that reliably and consistently ensures that the tax consequences of pre-contribution gain from contributed property are properly borne by the contributing partner. This feature of the remedial method is particularly relevant to the Congressional concerns about the erosion of the U.S. tax base that led to the enactment of section 721(c), and thus the remedial method is the method that is most appropriate for appreciated property that is contributed to a partnership controlled by the U.S. transferor and one or more related foreign partners. For these reasons, the Treasury Department and the IRS have determined that these regulations are within the scope of the grant of authority in section 721(c).

II. Overview of the Temporary Regulations

The temporary regulations adopt the rules that were described in the notice, with certain modifications, in part, in response to comments received.

Section 1.721(c)-1T provides definitions and rules of general application for purposes of all sections of the temporary regulations. Section

1.721(c)–2T provides the general operative rules that override section 721(a) nonrecognition upon a contribution of section 721(c) property to a partnership. Section 1.721(c)–3T describes the gain deferral method, which, if adopted, avoids the immediate recognition of gain upon a contribution of section 721(c) property. Section 1.721(c)–4T provides rules regarding events that accelerate the recognition of gain that previously was deferred under the gain deferral method. Section 1.721(c)–5T identifies exceptions to the acceleration events provided in § 1.721(c)–4T, the result of which, generally, is that the gain deferral method either ends (termination events) or continues to apply without immediate gain recognition (successor events) or continues to apply with partial gain recognition (partial acceleration events). Section 1.721(c)–6T provides procedural and reporting requirements. Section 1.721(c)–7T provides examples illustrating the application of the temporary regulations.

III. General Scope of the Temporary Regulations

The temporary regulations apply on a property-by-property basis. Accordingly, as discussed in Paragraph b of Part VI of the Explanations of Provisions section of this preamble, the temporary regulations do not include the unified application requirement announced in the notice.

The temporary regulations apply to all contributions, actual or deemed, of property to a partnership, including, for example, a contribution of property that occurs as a result of (i) a partnership merger, consolidation, or division in the assets-over form, (ii) a change in entity classification that occurs pursuant to § 301.7701–3, or (iii) a transaction described in Rev. Rul. 99–5, 1999–1 C.B. 434 (change from a disregarded entity to a partnership). However, in response to a comment, the temporary regulations provide that a contribution in a technical termination of a partnership described in section 708(b)(1)(B) (technical termination) will not, by itself, cause a partnership to become a section 721(c) partnership subject to the temporary regulations. For further discussion, see Part IV of the Explanation of Provisions section of this preamble. However, the temporary regulations do apply to a technical termination of a section 721(c) partnership applying the gain deferral method. In this regard, see Part V and Paragraph c of Part VIII of the Explanation of Provisions section of this preamble, concerning the general rule of

gain recognition and successor events, respectively.

The temporary regulations provide that a mere change in identity, form, or place of organization of a partnership or a recapitalization of a partnership will not cause the partnership to become a section 721(c) partnership. See § 1.721(c)–1T(c).

Finally, as announced in the notice, the temporary regulations contain rules for transactions involving tiered partnerships, as well as a general anti-abuse rule (see § 1.721(c)–1T(d)) that applies for purposes of all sections of the temporary regulations.

IV. Definitions: Section 721(c) Partnership, Section 721(c) Property, U.S. Transferor, and Other Terms

The notice states that future regulations would provide that a partnership is a section 721(c) partnership if a U.S. transferor contributes section 721(c) property to the partnership, and, after the contribution and any transactions related to the contribution, (i) a related foreign person is a direct or indirect partner, and (ii) the U.S. transferor and related persons own (directly or indirectly) more than 50 percent of the interests in partnership capital, profits, deductions, or losses.

A comment requested that the definition of section 721(c) partnership be revised to exclude partnerships when the interests held by related foreign persons are small and an unrelated third-party with a material adverse tax position to the U.S. transferor holds a meaningful interest in the partnership. According to the comment, these two factors would sufficiently mitigate the potential for the abuse that the notice is intended to address. While these factors may reduce the ability of a U.S. transferor to shift gain or income outside the United States, the Treasury Department and the IRS have concluded that these factors alone are insufficient to prevent the erosion of the U.S. tax base that section 721(c) was enacted to address. In particular, the Treasury Department and the IRS are concerned that even a small ownership interest held by a related foreign person may be used for a meaningful shift of gain or income outside the United States. Furthermore, the Treasury Department and the IRS have determined that such a rule would necessitate additional rules to address small interests that later become large either in absolute or relative terms. In this regard, the Treasury Department and the IRS have determined that both a general anti-abuse rule and a more targeted rule that would require periodic retesting of the

size of a related foreign person's interest would be difficult to administer.

Accordingly, this comment has not been adopted. The Treasury Department and the IRS, however, acknowledge that the higher the overall level of related ownership in the partnership, the more likely the arrangement among the partners will reflect tax considerations. After considering this comment and other comments that requested a higher level of related-party ownership in the definition of a section 721(c) partnership, the temporary regulations increase the threshold from a “more than 50 percent” test to an “80 percent or more” test (ownership requirement). See § 1.721(c)–1T(b)(14)(i) for the general definition of a section 721(c) partnership. The temporary regulations also provide rules that deem certain controlled partnerships in a tiered-partnership structure to be section 721(c) partnerships in order to apply the gain deferral method. See § 1.721(c)–1T(b)(14)(ii).

The temporary regulations define section 721(c) property as property, other than excluded property, with built-in gain that is contributed to a partnership by a U.S. transferor. See § 1.721(c)–1T(b)(15)(i) for the general definition of section 721(c) property. The notice incorporated the requirement that a U.S. transferor make the contribution in the definition of a section 721(c) partnership rather than in the definition of section 721(c) property. This adjustment to the definitions is intended to be a non-substantive change. The temporary regulations provide that if a U.S. transferor is treated as contributing its share of an item of property, the entire item of property is section 721(c) property. In addition, the temporary regulations provide rules that deem certain property of a tiered partnership to be section 721(c) property. See § 1.721(c)–1T(b)(15)(ii). When an interest in a partnership is contributed, the partnership interest, if it is not excluded property, is the section 721(c) property.

The temporary regulations define excluded property as (i) a cash equivalent; (ii) a security within the meaning of section 475(c)(2), without regard to section 475(c)(4); (iii) an item of tangible property with built-in gain that does not exceed \$20,000 or with an adjusted tax basis in excess of book value (built-in loss); and (iv) an interest in a partnership that holds (directly, or indirectly through interests in one or more partnerships that are not excluded property under this clause (iv)) property of which 90 percent or more of the value consists of property described in clauses (i) through (iii) (partnership interest

exclusion). See § 1.721(c)–1T(b)(6). The notice announced the first three categories of excluded property. However, the temporary regulations include tangible property with a built-in loss in the third exclusion so that such property is excluded property for purposes of the partnership interest exclusion. The Treasury Department and the IRS determined that it was appropriate to add the partnership interest exclusion so that the temporary regulations do not apply to transfers of partnership interests when only a small portion of the partnership's property is section 721(c) property. If a partnership interest fails the 90-percent threshold test for the partnership interest exclusion and does not qualify under the second exclusion for securities, the interest is section 721(c) property.

Comments recommended that property that gives rise to income effectively connected with a U.S. trade or business (ECI property) be excluded from the definition of section 721(c) property, because the income will be subject to U.S. tax even if it is allocated to a related foreign person. The Treasury Department and the IRS agree with the reasoning behind this comment, and have determined that the temporary regulations should also address the situation when the property ceases to be ECI property and still has built-in gain. Accordingly, the temporary regulations continue to include ECI property in the definition of section 721(c) property but modify the application of the gain deferral method to ECI property, as discussed in Paragraph c of Part VI of the Explanation of Provisions section of this preamble.

Another comment similarly suggested that the definition of section 721(c) property exclude property the gain on which would be subject to U.S. tax under subpart F of the Code. The Treasury Department and IRS have declined to adopt such a rule, which would depend on a “wait and see” approach and would import the recognition rules of subpart F, including an earnings and profits requirement, rather than the more direct approach of section 721(c).

The temporary regulations define built-in gain with respect to an item of property contributed to a partnership as the excess of the book value of the property over the partnership's adjusted tax basis in the property upon the contribution, determined without regard to the application of the gain recognition rule of § 1.721(c)–2T(b). See § 1.721(c)–1T(b)(2). The temporary regulations clarify the definition provided in the notice in two respects. First, the notice states that built-in gain

would be determined with respect to the contributing partner's adjusted tax basis in the property at the time of the contribution, whereas the temporary regulations provide that built-in gain is determined with respect to the partnership's adjusted tax basis in the property. The revision was made in order to more precisely describe the amount of gain that may be shifted to a related foreign partner. Second, the temporary regulations clarify that built-in gain is determined without regard to the application of the gain recognition rule under § 1.721(c)–2T(b).

The temporary regulations include a new term, “remaining built-in gain.” Section 1.721(c)–1T(b)(13)(i) generally defines remaining built-in gain, with respect to an item of section 721(c) property that is subject to the gain deferral method, as the built-in gain, reduced by decreases in the difference between the property's book value and adjusted tax basis. However, subsequent increases or decreases to the property's book value due to a revaluation other than a revaluation required under these temporary regulations for tiered partnerships are not taken into account in determining remaining built-in gain. The temporary regulations provide rules for determining remaining built-in gain in the case of tiered partnerships. See § 1.721(c)–1T(b)(13)(ii).

Consistent with the notice, § 1.721(c)–1T(b)(18)(i) of the temporary regulations generally defines a U.S. transferor as a U.S. person (within the meaning of section 7701(a)(30)) other than a domestic partnership. The temporary regulations also provide a rule that deems certain tiered partnerships to be a U.S. transferor solely for purposes of applying the consistent allocation method. See § 1.721(c)–1T(b)(18)(ii).

Finally, the temporary regulations, consistent with the notice, define (i) a related person as a person that is related (within the meaning of section 267(b) or section 707(b)(1)) to a U.S. transferor; (ii) a related foreign person as a person that is a related person (other than a partnership) that is not a U.S. person; and (iii) a direct or indirect partner as a person (other than a partnership) that owns an interest in a partnership directly or indirectly through one or more partnerships. See § 1.721(c)–1T(b)(12), (b)(11), and (b)(5), respectively.

V. General Rule of Gain Recognition Upon a Contribution of Section 721(c) Property to a Section 721(c) Partnership

Section 1.721(c)–2T provides the general operative rules that override section 721(a) nonrecognition of gain upon a contribution of section 721(c)

property to a partnership. Section 1.721(c)–2T(b) provides the general rule that nonrecognition under section 721(a) will not apply to gain realized upon a contribution of section 721(c) property to a section 721(c) partnership. In contrast to the regulations described in the notice, § 1.721(c)–2T(b) provides that this general rule does not apply—and therefore that nonrecognition under section 721(a) continues to apply—to a direct contribution of section 721(c) property by an “unrelated” U.S. transferor (in other words, a U.S. transferor that does not, together with related persons with respect to it, satisfy the ownership requirement). The carve-out is consistent with the intent of the temporary regulations to address the shifting of income among related persons. Because this carve-out for an unrelated U.S. transferor is limited to direct contributions of section 721(c) property, it does not apply to a contribution that occurs pursuant to the partnership look-through rule in § 1.721(c)–2T(d)(1) (as discussed elsewhere in this Part V).

Section 1.721(c)–2T(c) provides a de minimis exception to the general rule. The temporary regulations modify the de minimis exception described in the notice—which focused on contributions made by a U.S. transferor (and all related U.S. transferors) during the U.S. transferor's taxable year—to focus instead on contributions during the partnership's taxable year, in order to align the rule with the reporting required under § 1.721(c)–6T. Under the de minimis exception in the temporary regulations, contributions of section 721(c) property will not be subject to immediate gain recognition if the sum of all built-in gain for all section 721(c) property contributed to a section 721(c) partnership during the partnership's taxable year does not exceed \$1 million.

Section 1.721(c)–2T(d)(1) provides a look-through rule for identifying a section 721(c) partnership when an upper-tier partnership in which a U.S. transferor is a direct or indirect partner contributes property to a lower-tier partnership. For purposes of determining if the lower-tier partnership is a section 721(c) partnership, the U.S. transferor will be treated as contributing to the lower-tier partnership its share of the property actually contributed by the upper-tier partnership to the lower-tier partnership. If the lower-tier partnership is a section 721(c) partnership, absent application of the gain deferral method by the lower-tier partnership to the entire property and by the upper-tier partnership to the partnership interest in the lower-tier partnership, the upper-tier partnership will recognize the entire

built-in gain in the section 721(c) property under the general gain recognition rule, because the entire property will be section 721(c) property (see the general definition of section 721(c) property in § 1.721(c)-1T(b)(15)(i)).

Section 1.721(c)-2T(d)(2) provides that the partnership look-through rule will not apply to a deemed contribution by an “old” partnership to a “new” partnership that occurs as a result of a technical termination of the old partnership. Thus, a technical termination will not cause a non-section 721(c) partnership, in which a U.S. transferor is a direct or indirect partner, to become a section 721(c) partnership subject to these temporary regulations. If, however, a partnership is a section 721(c) partnership subject to the temporary regulations immediately before its technical termination, the technical termination would be a successor event (rather than an acceleration event) only if the new partnership continues the gain deferral method with respect to the section 721(c) property that was subject to the gain deferral method in the terminated partnership. In this regard, see § 1.721(c)-5T(c)(4) (defining a successor event to include certain technical terminations).

VI. Gain Deferral Method

a. In General

Section 1.721(c)-3T describes the gain deferral method, which generally must be applied in order to avoid the immediate recognition of gain upon a contribution of section 721(c) property to a section 721(c) partnership. Section 1.721(c)-3T(b) provides the five general requirements for applying the gain deferral method to an item of section 721(c) property: (i) The section 721(c) partnership adopts the remedial allocation method and allocates section 704(b) items of income, gain, loss, and deduction with respect to the section 721(c) property in a manner that satisfies the consistent allocation method; (ii) the U.S. transferor recognizes gain equal to the remaining built-in gain with respect to the section 721(c) property upon an acceleration event, or an amount of gain equal to a portion of the remaining built-in gain upon a partial acceleration event or certain transfers to foreign corporations described in section 367; (iii) procedural and reporting requirements are satisfied; (iv) the U.S. transferor extends the period of limitations on assessment of tax (as discussed in Part X of the Explanation of Provisions section of this preamble); and (v) the rules for tiered

partnerships are satisfied if either the section 721(c) property is an interest in a partnership or the section 721(c) property is described in the partnership look-through rule in § 1.721(c)-2T(d)(1).

b. Application of the Gain Deferral Method on a Property-by-Property Basis

Comments questioned the necessity for the unified application requirement announced in the notice. The unified application requirement was intended to prevent taxpayers from disaggregating the contribution of separate but related business property and choosing to recognize gain upon contribution for some property and to apply the gain deferral method for other property, in an attempt to minimize the reported cumulative value for all contributed property or to minimize the reported value of property for which the gain deferral method was not adopted. This concern arises, in part, because the IRS may not be able to make an adjustment for the correct amount of gain with respect to property that is not subject to the gain deferral method due to the expiration of the period of limitations on the assessment of tax. While the Treasury Department and the IRS continue to be concerned that taxpayers will attempt to disaggregate related business property in order to undervalue their contributions, the temporary regulations adopt a more targeted approach to address these comments. Accordingly, the temporary regulations do not include the unified application requirement and instead apply on a property-by-property basis.

As described in the notice, in order to apply the gain deferral method with respect to a contribution of section 721(c) property to a section 721(c) partnership, the temporary regulations require the U.S. transferor to extend the period of limitations on assessment of tax on all items related to the property with respect to which the gain deferral method applies through the close of the eighth full taxable year following the contribution. To address the concerns that motivated the uniform application requirement, the temporary regulations require a U.S. transferor to extend the period of limitations on assessment of tax on the gain recognized under the general rule with respect to any section 721(c) property that is contributed to the partnership for which the gain deferral method will not be applied through the close of the fifth full taxable year following the contribution of such property, if the property is contributed within five full taxable years after a gain deferral contribution, defined in § 1.721(c)-1T(b)(7) as a contribution of section 721(c) property to a section

721(c) partnership with respect to which the gain is deferred under the gain deferral method. See §§ 1.721(c)-3T(b)(4) and 1.721(c)-6T(b)(5)(iii), discussed in Part X of the Explanation of Provisions section of this preamble. Additionally, it should be noted that § 1.482-1T(f)(2)(i)(B) provides that separate transactions must be aggregated for purposes of determining the arm's length pricing of such transactions under section 482, including for purposes of an analysis under multiple provisions of the Code or regulations, if the transactions are so interrelated that an aggregate analysis provides the most reliable measure of the arm's length result.

c. Application of the Gain Deferral Method to ECI Property

As discussed in Part IV of the Explanation of Provisions section of this preamble, the temporary regulations do not adopt the comment recommending that ECI property be excluded from the definition of section 721(c) property. Instead, the temporary regulations continue to provide that a contribution of section 721(c) property that is ECI property is subject to immediate gain recognition if the gain deferral method is not applied. However, in response to the comment, the temporary regulations modify the gain deferral method such that ECI property is not subject to the remedial allocation method or the consistent allocation method. This special exception for ECI property applies for as long as, beginning on the date of the contribution and ending when there is no remaining built-in gain with respect to the property, all distributive shares of income and gain with respect to the property for all direct and indirect partners that are related foreign persons will be subject to taxation as effectively connected with a trade or business within the United States (under section 871 or 882), and neither the section 721(c) partnership nor a direct or indirect partner that is a related foreign person claims benefits under an income tax treaty that would exempt the income or gain from tax or reduce the rate of taxation to which the income or gain is subject. See § 1.721(c)-3T(b)(1)(ii).

All the other requirements of the gain deferral method apply with respect to ECI property. Thus, a U.S. transferor must recognize gain upon an acceleration event with respect to ECI property, including when property ceases to be ECI property, and satisfy the procedural and reporting requirements with respect to ECI property. See § 1.721(c)-6T(b)(2)(iii), (b)(3)(vii), and (c)(1).

A comment also requested an exclusion for property subject to tax under section 897 (relating to U.S. real property interests) from the definition of section 721(c) property. The temporary regulations do not adopt this comment because the special rules for ECI property appropriately address the concerns expressed regarding U.S. real property interests.

d. Application of the Gain Deferral Method to Anti-Churning Property

Comments requested guidance on how the requirement to use the remedial allocation method interacts with the section 197 anti-churning rules. In general, section 197(f)(9) prohibits the amortization of goodwill and going concern value that was nonamortizable before the enactment of section 197 (section 197(f)(9) intangible property), and that prohibition continues if the property is transferred to a related person. Under § 1.197-2(h)(12)(vii)(B), when section 197(f)(9) intangible property is contributed to a partnership, a noncontributing partner generally may receive remedial allocations of amortization with respect to the property. A noncontributing partner that is related to the contributing partner, however, may not receive such remedial allocations.

One comment requested that a U.S. transferor not be required to include remedial income with respect to section 197(f)(9) intangible property when the gain deferral method is being applied. The temporary regulations do not adopt this comment. The Treasury Department and the IRS are concerned that providing favorable treatment for section 721(c) property belonging to a particular class would incentivize taxpayers to attribute excessive value to that class of property while simultaneously undervaluing related but separate section 721(c) property that remains subject to all of the requirements of the gain deferral method. This concern is especially pronounced in the case of section 197(f)(9) intangible property, which is often difficult to value separately from other identifiable intangible property. In this regard, see the preamble of the notice of proposed rulemaking (REG-139483-13) containing proposed regulations under section 367, published in the **Federal Register** on September 16, 2015 (80 FR 55568). See also the preamble to T.D. 9803, which finalized those proposed regulations, published in the **Federal Register** on December 16, 2016 (81 FR 91012).

Another comment recommended that regulations implementing the gain deferral method require the partnership

to amortize the section 197(f)(9) intangible and allocate remedial items of amortization to a related foreign partner and corresponding remedial items of income to the contributing partner. The Treasury Department and the IRS have determined that changing § 1.197-2(h)(12)(vii)(B) to permit remedial allocations of amortization to related partners, or distinguishing between domestic and related foreign partners, would be contrary to section 197(f)(9) and therefore do not adopt this comment. In lieu of providing that remedial allocations may be made to a related partner, the temporary regulations provide a special non-amortizable tax basis adjustment to the property. This special adjustment is made solely with respect to the related partner. The Treasury Department and the IRS have determined that allowing this tax basis adjustment is consistent with the policy of the section 197 anti-churning rules.

More specifically, the temporary regulations revise the remedial allocation method in § 1.704-3(d) as to related partners when a section 721(c) partnership is applying the gain deferral method with respect to section 197(f)(9) intangible property. The revised rule requires the partnership to amortize the portion of the partnership's book value in the section 197(f)(9) intangible property that exceeds its adjusted tax basis in the property. Accordingly, the allocation of book amortization to a noncontributing partner will result in a ceiling rule limitation to the extent of this allocation of book amortization. If a noncontributing partner is a related person with respect to the U.S. transferor, the temporary regulations provide that, solely with respect to the related noncontributing partner, the partnership must increase the adjusted tax basis of the property by the amount of the difference between the book allocation of the item to the related person and the tax allocation of the same item to the related person and allocate remedial income in the same amount to the U.S. transferor. See § 1.704-3T(d)(5)(iii)(C).

The rules governing the tax consequences of the special tax basis adjustment are modeled on § 1.743-1 and proposed regulations under section 704(c)(1)(C) that are contained in a notice of proposed rulemaking (REG-144468-05) published in the **Federal Register** (79 FR 3042) on January 16, 2014. The adjustment to the tax basis of section 197(f)(9) intangible property will be recovered by the related partner only upon a sale or exchange of the property by the partnership. Generally, a transfer by the noncontributing related partner

of all or a portion of its interest in the partnership will eliminate the tax basis adjustment attributable to the interest such that the transferee will not succeed to the tax basis adjustment. However, if the interest is transferred in a substituted basis transaction, the transferee will succeed to the transferor's tax basis adjustment and the adjustment will be taken into account in computing and allocating any adjustment to the basis of the section 197(f)(9) intangible property under sections 743(b) and 755. These rules must be applied together with the general rules under section 197 and subchapter K of the Code. In resolving any uncertainty that arises in the implementation of these rules, it would be reasonable for taxpayers to apply principles similar to those contained in § 1.743-1, the proposed regulations under section 704(c)(1)(C), and any Code sections or regulations that reference those rules.

The Treasury Department and the IRS request comments on the following issues, and on any other issues relevant to a section 721(c) partnership's application of the remedial allocation method to section 197(f)(9) intangible property: (i) The application of the method to members of a consolidated group; (ii) the treatment of a tax basis adjustment when the adjusted section 197(f)(9) intangible property is transferred (a) in a like-kind exchange described in section 1031, (b) to a lower-tier partnership, (c) in a transaction described in section 351, (d) in a technical termination, or (e) in an installment sale; (iii) the treatment of a tax basis adjustment when the section 197(f)(9) intangible property is distributed to the related person for whom the adjustment was made or to another partner in a current or liquidating distribution; and (iv) any rules that are necessary to ensure that the tax basis adjustment does not become amortizable in contravention of the anti-churning rules.

e. Consistent Allocation Method

1. In General

Section 1.721(c)-3T(c)(1) describes the consistent allocation method, which, like the gain deferral method, applies on a property-by-property basis. The consistent allocation method requires a section 721(c) partnership to allocate the same percentage of each book item of income, gain, deduction, and loss "with respect to the section 721(c) property" to the U.S. transferor. Comments questioned the necessity of the requirement to apply the consistent allocation method. Some comments

asserted that the requirement is unnecessary because the built-in gain in section 721(c) property will be preserved in the difference between the book and tax capital accounts of a U.S. transferor. The Treasury Department and the IRS have determined that remedial allocations alone are insufficient to ensure that built-in gain with respect to section 721(c) property will be subject to U.S. tax. The consistent allocation method is intended to prevent a U.S. transferor from rendering the remedial allocation method ineffective by, for example, having the partnership allocate a higher percentage share of book depreciation to the U.S. transferor (which would reduce the U.S. transferor's remedial income inclusion) than the U.S. transferor's percentage share of income or gain with respect to the property, which would result in shifting the gain (and taxable income) to related foreign persons that are direct or indirect partners in the partnership. Therefore the temporary regulations do not adopt this comment. The temporary regulations provide rules (discussed in Paragraph e.2 of this Part VI) to determine the amount of income, gain, deduction, and loss that is considered to be "with respect to section 721(c) property" under the gain deferral method.

According to another comment, the consistent allocation method is both over-inclusive, in that situations in which a U.S. transferor is allocated greater income than its share of deductions would violate the rule, and under-inclusive, because deductions allocated to a U.S. transferor that do not arise from section 721(c) property are beyond the scope of the rule. This comment proposed an alternative anti-abuse rule that would require that a minimum cumulative amount of income be allocated to a U.S. transferor. The Treasury Department and the IRS have concluded that the rule described in the comment would be difficult to administer. However, in response to comments, the temporary regulations provide exceptions (discussed in Paragraph e.3 of this Part VI) to the consistent allocation method for certain regulatory allocations and the allocations of creditable foreign tax expenditures.

2. Determining Book Items With Respect to Section 721(c) Property

The notice did not describe how partnership items are determined to be "with respect to section 721(c) property." The temporary regulations provide guidance for making this determination based on principles that will be familiar to many taxpayers.

i. Book Items of Income and Gain

Section 1.721(c)-3T(c)(2) provides the rule for determining the extent to which partnership items of book income and gain are considered to be "with respect to" particular section 721(c) property for purposes of applying the consistent allocation method on a property-by-property basis. This rule provides that a section 721(c) partnership must attribute book income and gain to each property in a consistent manner using any reasonable method that takes into account all the facts and circumstances. The temporary regulations provide that all items of book income and gain attributable to each property will comprise a single class of gross income for purposes of determining the extent to which partnership items of deduction or loss are allocated and apportioned with respect to the section 721(c) property.

ii. Book Items of Deduction and Loss

Section 1.721(c)-3T(c)(3) provides the rules for determining the extent to which partnership items of book deduction and loss are considered to be "with respect to" particular section 721(c) property for purposes of applying the consistent allocation method. A section 721(c) partnership must use the principles of §§ 1.861-8 and 1.861-8T to allocate and apportion all of its items of deduction, except for interest expense and research and experimental expenditures (R&E), and loss to the class of gross income with respect to each section 721(c) property. The section 721(c) partnership may allocate and apportion its interest expense and R&E using any reasonable method, including, but not limited to, the methods described in §§ 1.861-9 and 1.861-9T (interest expense) and § 1.861-17 (R&E).

3. Exceptions to the Consistent Allocation Method

In response to comments, the temporary regulations provide exceptions from the requirement to apply the consistent allocation method with respect to certain book items of a section 721(c) partnership.

i. Regulatory Allocations

The temporary regulations provide that a regulatory allocation (as defined in § 1.721(c)-1T(b)(10)) of book income, gain, deduction, or loss with respect to section 721(c) property that otherwise would fail to satisfy the requirements of the consistent allocation method nevertheless will, in certain cases, be deemed to satisfy the requirements. Specifically, a regulatory allocation is deemed to satisfy the requirements of the consistent allocation method if the

allocation is (i) an allocation of income or gain to the U.S. transferor (or a member of its consolidated group); or (ii) an allocation of deduction or loss to a partner other than the U.S. transferor (or a member of its consolidated group). In addition, if the allocation is not described in clause (i) or (ii) but the U.S. transferor receives less income or gain or more deductions or loss with respect to the section 721(c) property because of the regulatory allocation, the allocation is treated as described in § 1.721(c)-5T(d)(2) (generally requiring that a portion of remaining built-in gain be recognized, as discussed in Paragraph d.2 of Part VIII of the Explanation of Provisions section of this preamble). See § 1.721(c)-3T(c)(4)(i)(C). The Treasury Department and the IRS have determined that this special rule for regulatory allocations is appropriate because an allocation described in clause (i) or (ii) will not reduce the U.S. tax base and an allocation described in clause (iii) will result in the U.S. transferor recognizing gain that will offset the reduction in the U.S. tax base resulting from the regulatory allocation.

The temporary regulations provide that a regulatory allocation is (i) an allocation pursuant to a minimum gain chargeback, as defined in § 1.704-2(b)(2), (ii) a partner nonrecourse deduction, as determined in § 1.704-2(i)(2), (iii) an allocation pursuant to a partner minimum gain chargeback, as described in § 1.704-2(i)(4), (iv) an allocation pursuant to a qualified income offset, as defined in § 1.704-1(b)(2)(ii)(d), (v) an allocation with respect to the exercise of a noncompensatory option described in § 1.704-1(b)(2)(iv)(s), and (vi) an allocation of partnership level ordinary income or loss described in § 1.751-1(a)(3). The Treasury Department and the IRS have determined that relief is appropriate for these regulatory allocations because, in general, partners do not have discretion regarding their application and, when necessary, treating them as a partial acceleration event will result in the appropriate amount of gain being recognized for purposes of the gain deferral method. The Treasury Department and the IRS have determined that relief is not appropriate for a nonrecourse deduction, as defined in § 1.704-2(b)(1), because, unlike the other types of regulatory allocations, partners have significant discretion regarding the allocation of a nonrecourse deduction.

ii. Creditable Foreign Tax Expenditures

The temporary regulations provide that allocations of creditable foreign tax expenditures (as defined in § 1.704-

1(b)(4)(viii)(b)) (CFTEs) are not subject to the consistent allocation method. See § 1.721(c)-3T(c)(4)(ii). The regulations governing the allocation of CFTEs take into account section 704(c) income and gain and are not based strictly on the allocation of book items. As a result, it would be difficult to apply the consistent allocation method with respect to CFTEs.

VII. Acceleration Events

a. Overview

Section 1.721(c)-4T provides rules regarding acceleration events, which, like the gain deferral method, apply on a property-by-property basis. When an acceleration event occurs with respect to section 721(c) property, remaining built-in gain in the property must be recognized and the gain deferral method no longer applies. The temporary regulations provide exceptions to acceleration events that are discussed in Part VIII of the Explanation of Provisions section of this preamble.

b. Definition of an Acceleration Event

1. General Rules

Subject to the exceptions described in Part VIII of the Explanation of Provisions section of this preamble, § 1.721(c)-4T(b)(1) defines an acceleration event as any event that would reduce the amount of remaining built-in gain that a U.S. transferor would have recognized under the gain deferral method if the event had not occurred or that could defer the recognition of the remaining built-in gain. The temporary regulations clarify that an acceleration event includes the transfer of section 721(c) property via a contribution of the property itself or through a contribution of a partnership interest.

2. Failure To Comply With a Requirement of the Gain Deferral Method

The rules described in the notice would have provided that a failure to comply with one of the requirements of the gain deferral method with respect to any section 721(c) property would cause an acceleration event for all section 721(c) property. Comments requested that the Treasury Department and the IRS eliminate this provision. Because the temporary regulations provide that the gain deferral method is applied on a property-by-property basis (in lieu of containing the unified application requirement), the temporary regulations adopt this comment.

Under the temporary regulations, an acceleration event with respect to section 721(c) property occurs when any party fails to comply with a requirement

of the gain deferral method with respect to that property. See § 1.721(c)-4T(b)(2)(i). For example, if section 721(c) property is ECI property, an acceleration event occurs if a distributive share of income or gain from the property that is allocated to a direct or indirect partner that is a related foreign person is no longer subject to taxation as income effectively connected with a trade or business within the United States or if the section 721(c) partnership or a direct or indirect partner that is a related foreign person claims certain benefits under an income tax treaty with respect to the income (see § 1.721(c)-3T(b)(1)(ii)).

An acceleration event will not occur solely as a result of a failure to comply with a procedural or reporting requirement of the gain deferral method if that failure is not willful and relief is sought under the prescribed procedures. See §§ 1.721(c)-4T(b)(2)(ii) and 1.721(c)-6T(f).

3. Special Rule When Section 721(c) Property Is an Interest in a Partnership

When section 721(c) property is an interest in a partnership, the temporary regulations provide that an acceleration event will not occur because of a reduction in remaining built-in gain in the partnership interest as a result of allocations of book items of deduction and loss or tax items of income and gain by that partnership. See § 1.721(c)-4T(b)(3).

4. Deemed Acceleration Event

Under the temporary regulations, a U.S. transferor may affirmatively treat an acceleration event as having occurred with respect to section 721(c) property by recognizing the remaining built-in gain with respect to that property and satisfying the reporting required by § 1.721(c)-6T(b)(3)(iv). See § 1.721(c)-4T(b)(4).

c. Consequences of an Acceleration Event

Section 1.721(c)-4T(c) sets forth the consequences of an acceleration event. Specifically, the U.S. transferor must recognize gain in an amount equal to the remaining built-in gain that would have been allocated to the U.S. transferor if the section 721(c) partnership had sold the section 721(c) property immediately before the acceleration event for fair market value. Following the acceleration event, the section 721(c) property will no longer be subject to the gain deferral method.

The U.S. transferor generally must make correlative adjustments to its basis in its partnership interest. See § 1.721(c)-4T(c)(1). In addition, the

section 721(c) partnership will increase its basis in the section 721(c) property by the amount of gain recognized by the U.S. transferor. This basis increase is made immediately before the acceleration event. See § 1.721(c)-4T(c)(2). If the section 721(c) property remains in the partnership after the acceleration event, the increase in the basis of the section 721(c) property generally would be treated in the same manner as newly purchased property, including for purposes of determining the depreciation schedule if the property is depreciable property.

VIII. Acceleration Event Exceptions

a. In General

Section 1.721(c)-5T identifies the following categories of exceptions to acceleration events, which, like acceleration events, apply on a property-by-property basis: (i) Termination events, in which case, the gain deferral method ceases to apply to the section 721(c) property; (ii) successor events, in which case, the gain deferral method continues to apply to the section 721(c) property but with respect to a successor U.S. transferor or a successor section 721(c) partnership, as applicable; (iii) partial acceleration events, in which case, a U.S. transferor recognizes an amount of gain that is less than the full amount of remaining built-in gain in the section 721(c) property and the gain deferral method continues to apply; (iv) transfers described in section 367 of section 721(c) property to a foreign corporation, in which case, the gain deferral method ceases to apply and a U.S. transferor recognizes an amount of gain equal to the remaining built-in gain attributable to the portion of the section 721(c) property that is not subject to tax under section 367; and (v) fully taxable dispositions of a portion of an interest in a section 721(c) partnership, in which case, the gain deferral method continues to apply for the retained portion of the interest.

b. Termination Events

1. In General

Section 1.721(c)-5T(b) identifies the events that cause the gain deferral method to no longer apply. The Treasury Department and the IRS have determined that it is appropriate to terminate the application of the gain deferral method with respect to the affected section 721(c) property in these cases because the potential to shift gain or income to a related foreign person that is a direct or indirect partner in the section 721(c) partnership has been eliminated.

2. Transfers of Section 721(c) Property (Other Than a Partnership Interest) to a Domestic Corporation Described in Section 351

The temporary regulations provide that a termination event occurs if a section 721(c) partnership transfers section 721(c) property other than a partnership interest to a domestic corporation in a transaction to which section 351 applies. See § 1.721(c)–5T(b)(2).

3. Certain Incorporations of a Section 721(c) Partnership

A comment questioned whether the rules described in the notice would exempt from the definition of an acceleration event certain transactions after which the partnership ceases to exist, such as those described in Rev. Rul. 84–111, 1984–2 C.B. 88 (describing three methods for incorporating a partnership). See § 601.601(d)(2)(ii)(b). The temporary regulations provide that a termination event occurs upon an incorporation of a section 721(c) partnership into a domestic corporation by any method of incorporation other than a method involving an actual distribution of partnership property to the partners, followed by a contribution of that property to a corporation, provided that the section 721(c) partnership is liquidated as part of the incorporation transaction. See § 1.721(c)–5T(b)(3).

4. Certain Distributions of Section 721(c) Property

A comment questioned whether an acceleration event should occur as a result of a distribution of section 721(c) property to a partner other than a U.S. transferor outside of the seven-year period described in sections 704(c)(1)(B) and 737 (rules that address certain distributions of property within seven years of a contribution). While sections 704(c)(1)(B) and 737 also are intended to ensure that gain on contributed property is not inappropriately transferred to a partner other than the contributor, in the context of contributions to partnerships with related foreign partners, the Treasury Department and the IRS have determined that concerns about the erosion of the U.S. tax base remain as long as there is remaining built-in gain in the section 721(c) property. Accordingly, the Treasury Department and the IRS have determined that it is inappropriate to provide a termination event exception for all distributions of section 721(c) property after seven years.

The temporary regulations, however, provide that a termination event occurs

if a section 721(c) partnership distributes section 721(c) property to the U.S. transferor. A termination event will also occur if a section 721(c) partnership distributes section 721(c) property to a member of a U.S. transferor's consolidated group and the distribution occurs more than seven years after the contribution. See § 1.721(c)–5T(b)(4).

5. Section 721(c) Partnership Ceases to Have a Related Foreign Person Partner

In response to a comment, the temporary regulations generally provide that a termination event occurs when a section 721(c) partnership ceases to have any direct or indirect partners that are related foreign persons, provided there is no plan for a related foreign person to subsequently become a direct or indirect partner in the partnership (or a successor). See § 1.721(c)–5T(b)(5). The no-plan requirement applies independently of the general anti-abuse rule under § 1.721(c)–1T(d). An acceleration event, however, occurs upon a distribution of section 721(c) property in redemption of a related foreign person's interest in a section 721(c) partnership.

6. Fully Taxable Dispositions of Section 721(c) Property or of an Entire Interest in a Section 721(c) Partnership

The notice treated a taxable disposition of section 721(c) property by a section 721(c) partnership, or an indirect disposition of section 721(c) property through a taxable disposition of an interest in a section 721(c) partnership interest, as an acceleration event. The Treasury Department and the IRS have determined that it is appropriate instead to treat a fully taxable disposition of section 721(c) property or of an entire interest in a section 721(c) partnership as a termination event because other sections of the Code require gain to be recognized.

Accordingly, the temporary regulations provide that a termination event occurs if a section 721(c) partnership disposes of section 721(c) property in a transaction in which all gain or loss, if any, is recognized. See § 1.721(c)–5T(b)(6). In addition, a termination event occurs if either a U.S. transferor or a partnership in which a U.S. transferor is a direct or indirect partner disposes of an entire interest in a section 721(c) partnership that owns section 721(c) property in a transaction in which all gain or loss, if any, is recognized. This rule does not apply if a U.S. transferor is a member of a consolidated group and the interest in the section 721(c) partnership is transferred to another member in an

intercompany transaction (as defined in § 1.1502–13(b)(1)). See § 1.721(c)–5T(b)(7). See, however, Paragraph c.2 of this Part VIII, which describes the rule in § 1.721(c)–5T(c)(3) that provides that such a transaction may be a successor event.

c. Successor Events

1. In General

Section 1.721(c)–5T(c) identifies the successor events that allow for the continued application of the gain deferral method. In each of these cases, it is appropriate to continue application of the gain deferral method (rather than accelerate gain recognition), because its application can be preserved in the hands of a successor U.S. transferor or a successor section 721(c) partnership, as applicable. If, however, the successor does not continue the gain deferral method, the event is an acceleration event. If only a portion of an interest in a partnership is transferred in a successor event, the principles of § 1.704–3(a)(7) apply to determine the remaining built-in gain in section 721(c) property that is attributable to the portion of the interest that is transferred and the portion that is retained. See § 1.721(c)–5T(c)(1).

2. A Domestic Corporation Becomes a Successor U.S. Transferor

The temporary regulations provide that a successor event occurs if either a U.S. transferor or a partnership in which a U.S. transferor is a direct or indirect partner transfers (directly or indirectly through one or more partnerships) an interest in a section 721(c) partnership to a domestic corporation in a transaction to which section 351 or 381 applies, and the gain deferral method is continued by treating the transferee domestic corporation as the U.S. transferor. See § 1.721(c)–5T(c)(2).

In addition, a successor event occurs if a U.S. transferor that is a member of a consolidated group transfers (directly or indirectly through one or more partnerships) an interest in a section 721(c) partnership to another member in an intercompany transaction (as defined in § 1.1502–13(b)(1)), and the gain deferral method is continued by treating the transferee member as the U.S. transferor. See § 1.721(c)–5T(c)(3).

3. Technical Termination of a Section 721(c) Partnership

In response to comments, the temporary regulations provide that a successor event occurs if there is a technical termination of a section 721(c) partnership, and the gain deferral method is continued by treating the new

partnership as the section 721(c) partnership. See § 1.721(c)–5T(c)(4). Although a technical termination will cause the depreciation schedule to be reset with respect to any depreciable section 721(c) property of the terminated section 721(c) partnership, and thus defer the recognition of remaining built-in gain, the Treasury Department and the IRS have concluded that this should not cause an acceleration event. In this case, however, the general anti-abuse rule under § 1.721(c)–1T(d) may apply, depending on the facts relating to the technical termination.

4. A Partnership Becomes a Successor Section 721(c) Partnership

The temporary regulations provide two other categories of successor events that involve successor section 721(c) partnerships. In each case, section 721(c) property is directly or indirectly contributed to a successor section 721(c) partnership and the gain deferral method is applied down the chain of ownership with the result that the remaining built-in gain will continue to be subject to U.S. tax.

In the first category, a successor event occurs if (i) a section 721(c) partnership contributes section 721(c) property to a lower-tier partnership that is a controlled partnership; (ii) the gain deferral method is applied both with respect to the section 721(c) partnership's interest in the lower-tier partnership and with respect to the section 721(c) property in the hands of the lower-tier partnership; and (iii) the lower-tier partnership either is a section 721(c) partnership, or is a controlled partnership that fails the ownership requirement but is treated as a section 721(c) partnership. See § 1.721(c)–5T(c)(5)(i). In the case in which the lower-tier partnership is a controlled partnership but not a section 721(c) partnership, the Treasury Department and the IRS have determined that it is appropriate to allow the parties to continue to apply the gain deferral method to the section 721(c) property, rather than triggering an acceleration event, provided the parties treat the lower-tier partnership as a section 721(c) partnership for purposes of applying the gain deferral method.

In the second category, a successor event occurs if (i) either a U.S. transferor or a partnership in which a U.S. transferor is a direct or indirect partner contributes (directly or indirectly through one or more partnerships) an interest in a section 721(c) partnership to an upper-tier partnership that is a controlled partnership; (ii) the gain deferral method is continued with

respect to the section 721(c) property in the hands of the section 721(c) partnership; (iii) if the upper-tier partnership directly owns its interest in the section 721(c) partnership, the gain deferral method is applied with respect to the upper-tier partnership's interest in the section 721(c) partnership and the upper-tier partnership is, or is treated as, a section 721(c) partnership; and (iv) if the upper-tier partnership indirectly owns its interest in the section 721(c) partnership through one or more partnerships, the principles described in clause (iii) are applied with respect to the upper-tier partnership and each partnership through which the upper-tier partnership indirectly owns an interest in the section 721(c) partnership. See § 1.721(c)–5T(c)(5)(ii).

Both categories of successor events involve tiered partnerships. Therefore, pursuant to § 1.721(c)–3T(b)(5), the rules for tiered partnerships (described in § 1.721(c)–3T(d)) must be applied in order to satisfy the requirements to apply the gain deferral method as required under the rules described in the two preceding paragraphs.

To illustrate, consider the following simplified example: In year 1, USP, a domestic corporation, and CFC1, a wholly owned foreign subsidiary of USP, form PS1, a partnership, as equal partners. USP contributes section 721(c) property, asset A, a depreciable asset with a \$10 million built-in gain (fair market value of \$10 million and tax basis of zero) (USP contribution). PS1 is a section 721(c) partnership as a result of the USP contribution, and the gain deferral method is applied with respect to asset A. In year 2, PS1 and CFC1 form PS2, a partnership, as equal partners. PS1 contributes asset A to PS2 (PS1 contribution) when asset A has remaining built-in gain of \$8 million and a fair market value of \$12 million (the tax basis is still zero). PS2 is a section 721(c) partnership as a result of the PS1 contribution. The PS1 contribution will be a successor event with respect to asset A if PS2 applies the gain deferral method to asset A and PS1 applies the gain deferral method to its interest in PS2 as described in § 1.721(c)–5T(c)(5)(i). The remaining built-in gain in asset A in the hands of PS2 will be \$12 million (excess of book value of \$12 million over PS2's adjusted tax basis of \$0). If PS2 sells the property, PS2 will allocate \$12 million to PS1, and PS1 will allocate \$10 million of the gain to USP (\$8 million of which would be allocated under § 1.704–3(a)(9)).

On the other hand, the PS1 contribution will be an acceleration event (rather than a successor event) with respect to asset A if either PS1 or

PS2 does not apply the gain deferral method. In this case, USP will recognize \$8 million of gain, which is the amount of the remaining built-in gain that would have been allocated to USP if PS1 had sold asset A immediately before the PS1 contribution for fair market value, and PS1 will increase its tax basis in asset A from \$0 to \$8 million. See § 1.721(c)–4T(c). Furthermore, the PS1 contribution will be subject to the general gain recognition rule under § 1.721(c)–2T(b) because PS2 is a section 721(c) partnership and asset A is section 721(c) property. PS1's realized gain with respect to asset A that will not qualify for nonrecognition under section 721(a) is \$4 million (fair market value of \$12 million less adjusted tax basis of \$8 million) and PS1 will allocate half of that gain to USP.

d. Partial Acceleration Events

1. In General

Section 1.721(c)–5T(d) identifies the partial acceleration events, and, in each case, the amount of gain that a U.S. transferor must recognize. The basis adjustments in § 1.721(c)–4T(c) that must be made by a U.S. transferor and a section 721(c) partnership upon a “full” acceleration event also apply for a partial acceleration event, except in the case of a partial acceleration that occurs as a result of an adjustment under section 734 to section 721(c) property, as described in Paragraph d.3 of this Part VIII. If there is remaining built-in gain in the section 721(c) property immediately after the partial acceleration event, the gain deferral method must continue to apply following the partial acceleration event.

2. Regulatory Allocations

Section 1.721(c)–3T(c)(4)(i)(C) provides that a regulatory allocation that results in an over-allocation of book deduction or loss to a U.S. transferor or an under-allocation of book income or gain to a U.S. transferor will nevertheless be treated as satisfying the consistent allocation method if gain is recognized. See the discussion in Paragraph e.3.i of Part VI of the Explanation of Provisions section of this preamble. In order for such a regulatory allocation to be deemed to satisfy the consistent allocation method, the U.S. transferor must recognize an amount of gain equal to the amount of the allocation that, had the regulatory allocation not occurred, would have been allocated to the U.S. transferor in the case of income or gain, or would not have been allocated to the U.S. transferor in the case of deduction or

loss. See § 1.721(c)–5T(d)(2). However, the amount of gain recognized is limited to the amount of the remaining built-in gain that would have been allocated to the U.S. transferor upon a hypothetical sale by the section 721(c) partnership of that portion of the property immediately before the regulatory allocation is made for fair market value.

3. Distributions of Other Partnership Property to a Partner That Result in an Adjustment Under Section 734

The temporary regulations provide that a partial acceleration event occurs if there is a distribution of other property by a section 721(c) partnership that results in a positive basis adjustment to section 721(c) property under section 734. In these cases, the U.S. transferor must recognize an amount of gain equal to the positive basis adjustment to the section 721(c) property under section 734. However, the amount of gain recognized is limited to the amount of the remaining built-in gain that would have been allocated to the U.S. transferor upon a hypothetical sale by the section 721(c) partnership of that portion of the property immediately before the regulatory allocation is made for fair market value. Furthermore, if the property that triggered the section 734 adjustment was distributed to the U.S. transferor or a member of its consolidated group, the amount described in the preceding sentence is reduced (but not below zero) by the amount of gain recognized by the U.S. transferor (or the consolidated group member) under section 731(a). See § 1.721(c)–5T(d)(3). The amount of gain recognized as a result of the acceleration event is not reduced by any step-down to distributed property described by section 734(b)(1)(B). The partnership will not increase its basis under § 1.721(c)–4T(c)(2) for the gain recognized by the U.S. transferor.

e. Section 367 Transfers of Section 721(c) Property to a Foreign Corporation

Section 1.721(c)–5T(e) provides rules for certain direct and indirect transfers of section 721(c) property to a foreign corporation. These rules apply if a section 721(c) partnership transfers section 721(c) property, or if a U.S. transferor or a partnership in which a U.S. transferor is a direct or indirect partner transfers (directly or indirectly through one or more partnerships) an interest in a section 721(c) partnership, to a foreign corporation in a transaction described in section 367. In this case, the underlying section 721(c) property will no longer be subject to the gain deferral method. The Treasury Department and the IRS have

determined that this result is appropriate because to the extent any U.S. transferor is treated as transferring the section 721(c) property to the foreign corporation for purposes of section 367, the tax consequences will be determined under section 367. In this regard, see §§ 1.367(a)–1T(c)(3)(i) and (ii), 1.367(d)–1T(d)(1), and 1.367(e)–2(b)(1)(iii) (in general, providing an aggregate treatment of partnerships for purposes of applying the outbound transfer provisions under section 367). Furthermore, for the remaining portion of the property (which is the portion attributable to non-U.S. persons and therefore not subject to tax under section 367), the U.S. transferor must recognize an amount of gain equal to the remaining built-in gain that would have been allocated to the U.S. transferor upon a hypothetical sale by the section 721(c) partnership of that portion of the property immediately before the transfer for fair market value. The basis adjustments in § 1.721(c)–4T(c) that must be made by a U.S. transferor and a section 721(c) partnership upon a “full” acceleration event also apply in this case. If stock in the transferee foreign corporation is received by a section 721(c) partnership, the stock will not be subject to the gain deferral method.

f. Fully Taxable Dispositions of a Portion of an Interest in a Section 721(c) Partnership

Section 1.721(c)–5T(f) provides a special rule when there is a fully taxable disposition of a portion of an interest in a section 721(c) partnership. Specifically, if a U.S. transferor or a partnership in which a U.S. transferor is a direct or indirect partner disposes of (directly or indirectly through one or more partnerships) a portion of an interest in a section 721(c) partnership in a transaction in which all gain or loss, if any, is recognized, an acceleration event will not occur with respect to the portion of the interest transferred. The gain deferral method will continue to apply with respect to the section 721(c) property of the section 721(c) partnership. The principles of § 1.704–3(a)(7) will apply to determine the remaining built-in gain in section 721(c) property that is attributable to the portion of the interest in a section 721(c) partnership that is retained. This rule does not apply to an intercompany transaction (as defined in § 1.1502–13(b)(1)). See § 1.721–5T(c)(3). See also the discussion in Paragraph c.2 of this Part VIII.

IX. Tiered Partnerships Rules

a. Overview

This Part IX discusses the application of the gain deferral method to tiered partnerships. The temporary regulations employ two general principles in applying the gain deferral method to tiered partnerships. First, if the section 721(c) property is an interest in a partnership, the contribution of that partnership interest, and not the indirect contribution of the underlying property of the lower-tier partnership, to a section 721(c) partnership is subject to section 721(c), and the gain deferral method applies to the contribution of the interest. Second, the gain deferral method must also be adopted at all levels in the ownership chain.

These principles, however, raise various issues in applying the gain deferral method to tiered partnerships: (i) Not all partnerships in the ownership chain will necessarily be section 721(c) partnerships; (ii) when the book value of an interest in a partnership reflects appreciation in the property of the lower-tier partnership that has not yet been reflected in the book value of the property, there will be a discrepancy between the built-in gain in the partnership interest and the built-in gain in the underlying property; (iii) an upper-tier partnership's allocation of its distributive share of certain lower-tier partnership items must comply with § 1.704–3(a)(9) (concerning the application of section 704(c) to tiered partnerships) and with the consistent allocation method; and (iv) a partnership whose interest is section 721(c) property that is contributed to a section 721(c) partnership may have previously adopted a method other than the remedial allocation method with respect to its underlying section 704(c) property.

To address these issues, the temporary regulations specify requirements that must be satisfied, in addition to all the other requirements to apply the gain deferral method, in order for the gain deferral method to be applied to tiered partnerships. See § 1.721(c)–3T(b)(5) (the last requirement to apply the gain deferral method).

b. Additional Requirements for Applying the Gain Deferral Method

1. In General

For purposes of applying the gain deferral method, the temporary regulations address the conditions required to be satisfied by upper-tier partnerships and lower-tier partnerships involved in tiered-partnership transactions to ensure that the gain

deferral method is applied at all levels in the ownership chain and the allocation of partnership items up the chain correctly traces the built-in gain to the U.S. transferor. See § 1.721(c)–3T(d). In the base case in which a U.S. transferor directly contributes section 721(c) property to a section 721(c) partnership, the U.S. transferor will recognize gain under the general rule in these temporary regulations unless the gain deferral method is applied to the contribution. The same principle applies when section 721(c) property is indirectly (through an upper-tier partnership) contributed by a U.S. transferor to a section 721(c) partnership and the partnership look-through rule in § 1.721(c)–2T(d)(1) applies, in which case, the tiered-partnership rules in § 1.721(c)–3T(d)(2) apply to the transferor upper-tier partnership and all controlled partnerships above it in the ownership chain. In addition, when the section 721(c) property is an interest in a partnership, the tiered-partnership rules in § 1.721(c)–3T(d)(1) apply to the partnership whose interest is transferred and all controlled partnerships below it in the ownership chain. Therefore, when a partnership interest described in the preceding sentence is indirectly contributed by a U.S. transferor and the partnership look-through rule applies, the rules of both § 1.721(c)–3T(d)(1) and (2) apply.

2. Indirect Contribution of Section 721(c) Property

Section 1.721(c)–3T(d)(2) provides the additional requirements for applying the gain deferral method if the section 721(c) property is indirectly contributed by a U.S. transferor to a section 721(c) partnership and the partnership look-through rule applies. In particular, this rule applies if an upper-tier partnership in which a U.S. transferor is a direct or indirect partner contributes section 721(c) property to a lower-tier section 721(c) partnership. The upper-tier partnership need not be a section 721(c) partnership for the partnership look-through rule to apply, but, in order for the upper-tier partnership to avoid immediate gain recognition under the general gain recognition rule, the lower-tier section 721(c) partnership must apply the gain deferral method to the contributed property. This application of the gain deferral method has several additional requirements. First, the lower-tier section 721(c) partnership must treat the upper-tier partnership (which is not necessarily a section 721(c) partnership) as the U.S. transferor solely for purposes of applying the consistent allocation method. Second, the upper-tier partnership, if it is a

controlled partnership, must apply the gain deferral method to its interest in the lower-tier section 721(c) partnership. If the upper-tier partnership is not a section 721(c) partnership, it is deemed to be so, and the interest in the lower-tier section 721(c) partnership is deemed to be section 721(c) property. See § 1.721(c)–1T(b)(14)(ii) and (b)(15)(ii).

For the upper-tier partnership to apply the gain deferral method to the interest in the lower-tier partnership, § 1.704–3T(a)(13)(ii) provides that the upper-tier partnership must treat its distributive share of lower-tier partnership items of gain, loss, and amortization, depreciation, or other cost recovery deductions with respect to a lower-tier partnership's section 721(c) property as though they were items of gain, loss, and amortization, depreciation, or other cost recovery with respect to the upper-tier partnership's interest in the lower-tier partnership. Section 1.704–3T(a)(13)(ii) is intended to reach the same result as if an aggregate approach governed the application of § 1.704–3(a)(9) in the context of the gain deferral method. Section 1.704–3(a)(9) provides that if a partnership contributes section 704(c) property to a lower-tier partnership, or if a partner that receives a partnership interest in exchange for contributed property subsequently contributes the partnership interest to an upper-tier partnership, the upper-tier partnership must allocate its distributive share of lower-tier partnership items with respect to that section 704(c) property in a manner that takes into account the contributing partner's remaining built-in gain or loss. The Treasury Department and the IRS considered comments about aggregate treatment that were received on Notice 2009–70, 2009–34 I.R.B. 255, in developing the rule in § 1.704–3T(a)(13)(ii). This rule applies only to a tiered-partnership structure that has at least one section 721(c) partnership and to which the gain deferral method is applied. The Treasury Department and the IRS intend no inference regarding the application of § 1.704–3(a)(9) to partnerships not applying the gain deferral method.

If the U.S. transferor is an indirect partner in the upper-tier partnership through one or more partnerships, these requirements must be satisfied by each controlled partnership in the chain of ownership between the upper-tier partnership and the U.S. transferor.

3. Contribution of an Interest in a Partnership

Section 1.721(c)–3T(d)(1) provides the additional requirements for applying the

gain deferral method if the section 721(c) property that is contributed to a section 721(c) partnership is an interest in a lower-tier partnership. The lower-tier partnership need not be a section 721(c) partnership. First, the lower-tier partnership, if it is a controlled partnership with respect to a U.S. transferor, must revalue all of its property under § 1.704–1T(b)(2)(iv)(f)(6) if the revaluation would result in a new positive reverse section 704(c) layer in at least one property that is not excluded property (revaluation requirement). If the lower-tier partnership is not a section 721(c) partnership, it will be deemed to be so upon the revaluation. See § 1.721(c)–1T(b)(14)(ii).

The revaluation requirement ensures, to the greatest extent possible, that all appreciation in the underlying property of a lower-tier partnership that is reflected in the book value of the partnership interest in the lower-tier partnership is subject to the temporary regulations to the same extent that appreciation would be subject to the temporary regulations if the property of the lower-tier partnership (rather than the interest in the lower-tier partnership) were contributed.

Second, the lower-tier partnership must apply the gain deferral method with respect to each property (other than excluded property) for which there is a new positive reverse section 704(c) layer as a result of the revaluation. A property with a new positive reverse section 704(c) layer is deemed to be section 721(c) property, and the remaining built-in gain includes the new positive reverse section 704(c) layer. See § 1.721(c)–1T(b)(15)(ii) and (b)(13)(ii), respectively. Although § 1.721(c)–3T(b)(1)(i)(A) requires the application of the remedial allocation method to the remaining built-in gain, a lower-tier partnership may apply the gain deferral method by adopting the remedial allocation method only for the positive reverse section 704(c) layer if the partnership has previously adopted a section 704(c) method other than the remedial method for the property. Accordingly, the lower-tier partnership may continue to apply a different, historical section 704(c) method to forward section 704(c) layers or to pre-existing reverse section 704(c) layers, as applicable, and still satisfy the requirements of the gain deferral method. For further discussion of the revaluation requirement and the definition of a controlled partnership, see Paragraph c of this Part IX.

Third, the lower-tier partnership must treat a partner that is a partnership in which the U.S. transferor is a direct or

indirect partner as the U.S. transferor solely for purposes of applying the consistent allocation requirement. As a result, the lower-tier partnership must allocate its book items to the deemed U.S. transferor under the consistent allocation method. Regardless of the number of tiers of partnerships in the chain, the tiered-partnership rules are intended to cause the U.S. transferor that contributed (directly or indirectly) the lower-tier partnership interest to the section 721(c) partnership to be the person to recognize gain upon an acceleration event.

If the lower-tier partnership owns (directly or indirectly through one or more partnerships) one or more partnerships that are controlled partnerships with respect to the U.S. transferor, these three requirements must be satisfied by each controlled partnership.

c. Revaluation Requirement

In recognition of the possibility that a U.S. transferor may not be able to cause a lower-tier partnership to revalue its property when a partnership interest is contributed to an upper-tier partnership, the revaluation requirement is limited to those lower-tier partnerships that are controlled partnerships with respect to the U.S. transferor. Control is a facts-and-circumstances test, except that the U.S. transferor and related persons will be deemed to control a partnership in which those persons, in the aggregate, own (directly or indirectly through one or more partnerships) more than 50 percent of the interests in partnership capital or profits. See § 1.721(c)–1T(b)(4).

The definition of built-in gain in the notice excluded revaluation gain because a reverse section 704(c) layer with respect to property does not arise on the contribution of that property. However, a partnership that does not create and apply the remedial method to a positive reverse section 704(c) layer created on the contribution of a lower-tier partnership interest to an upper-tier partnership may shift the tax consequences of a portion of the built-in gain to a partner that is a related foreign person. The Treasury Department and the IRS believe that the description of the tiered-partnership rules contained in the notice notified taxpayers of an intention to promulgate a rule with the result reached by the temporary regulations.

The revaluation requirement described in the gain deferral method requires an expansion of permissible events for partnership revaluations under section 704(b). Accordingly, § 1.704–1T(b)(2)(iv)(f)(6) allows a

partnership to revalue its property if the revaluation is a condition for applying the gain deferral method. When multiple partnerships revalue their property, the revaluations occur in order from the lowest-tier partnership to the highest-tier partnership.

If a partnership revalues its property, § 1.704–3T(a)(13)(i) provides that the principles of § 1.704–3(a)(9) shall apply to any reverse section 704(c) allocations made as a result of the revaluation.

In developing the revaluation requirement and § 1.704–3T(a)(13)(i), the Treasury Department and the IRS considered comments received on revaluation rules in proposed regulations under section 751(b) that are contained in a notice of proposed rulemaking (REG–151416–06) published on November 3, 2014, in the **Federal Register** (79 FR 65151). See proposed §§ 1.704–1(b)(2)(iv)(f) and 1.704–3(a)(9).

X. Procedural and Reporting Requirements

To comply with the gain deferral method, the notice described regulations that would be issued requiring reporting of a gain deferral contribution and annual reporting with respect to the section 721(c) property to which the gain deferral method applies. The notice requested comments on whether the regulations should provide rules similar to those in the regulations under sections 367(a) and 6038B regarding failures to file gain recognition agreements or to satisfy other reporting obligations, including the standards for relief therein. See T.D. 9704 (79 FR 68763) (the 2014 GRA regulations). Comments were received expressing support for this approach.

a. Reporting and Procedural Requirements for the Year of the Gain Deferral Contribution

The temporary regulations implement the rules described in the notice in a manner consistent with the approach in the 2014 GRA regulations. For a U.S. transferor, the reporting requirements include, among other information, the information required to be filed under section 6038B. The temporary regulations also adopt procedural requirements in order to seek relief for a failure to meet the reporting requirements of the gain deferral method, which mirror the approach in the 2014 GRA regulations, including procedures relating to the manner by which a transferor can establish the lack of willfulness and that a failure was due to reasonable cause. See §§ 1.721(c)–6T(f) and 1.6038B–2T(h). The temporary regulations adopt these procedural requirements for all U.S. persons that

have a reporting obligation under section 6038B with respect to a transfer of property to a foreign partnership and that are seeking relief under the reasonable cause exception, not only for U.S. transferors described in the section 721(c) regulations. The reasonable cause procedure in the temporary regulations applies to all requests for reasonable cause relief (regardless of the date on which the contribution or the failure to file occurred) filed on or after January 18, 2017.

In addition to adopting the current requirements of § 1.6038B–2(c), the temporary regulations require reporting necessary to demonstrate compliance with the gain deferral method. In general, the temporary regulations require a U.S. transferor to report information on a statement included on (or attached to) the Form 8865, Schedule O, Transfer of Property to a Foreign Partnership. The Treasury Department and the IRS intend that the Schedule O will be revised to include the information required by the temporary regulations.

For purposes of the U.S. transferor's reporting requirements under § 1.721(c)–6T with respect to a gain deferral contribution to a domestic section 721(c) partnership, a domestic section 721(c) partnership will generally be treated as foreign under section 7701(a)(4) for reporting purposes. See §§ 1.721(c)–6T(b)(4) and 1.6038B–2T(a)(1)(iii). As a result, a U.S. transferor that contributes section 721(c) property to a domestic section 721(c) partnership in a gain deferral contribution must file a Form 8865, Return of U.S. Persons With Respect to Certain Foreign Partnerships (including Form 8865, Schedule O, Transfer of Property to a Foreign Partnership), with its return for the taxable year that includes the date of the gain deferral contribution.

Also as a requirement of the gain deferral method, the temporary regulations require that the U.S. transferor agree to extend the period of limitations on the assessment of tax for eight full taxable years with respect to the gain realized but not recognized on a gain deferral contribution, and for six full taxable years with respect to the U.S. transferor's distributive share of all items with respect to the section 721(c) property for the year of contribution and two subsequent years. See § 1.721(c)–6T(b)(5)(i) and (ii). The U.S. transferor also must agree to extend the period of limitations on the assessment of tax for five full taxable years with respect to the gain recognized on the contribution of section 721(c) property for which the gain deferral method is not applied if

the contribution is made within five partnership taxable years following a gain deferral contribution. See § 1.721(c)-6T(b)(5)(iii). All agreements to extend the period of limitations on assessment of tax are deemed consented to and signed by the Secretary for purposes of section 6501(c)(4). The Treasury Department and the IRS intend to issue a designated form for use in extending the period of limitations by consent, as described above. Until the time such form is issued, the required consent must be submitted as a statement attached to the U.S. Transferor's Form 8865, Schedule O. Once such form is issued, the U.S. transferor must use the designated form to submit the required consent. These agreements must be filed only in connection with contributions occurring on or after January 18, 2017.

If section 721(c) property that is subject to the gain deferral method is ECI property, the temporary regulations require the U.S. transferor to obtain from the section 721(c) partnership and each related foreign person that is a direct or indirect partner in the section 721(c) partnership a statement pursuant to which the partner and the partnership waive any claim under any income tax convention (whether or not currently in force at the time of the contribution) to an exemption from U.S. income tax or a reduced rate of U.S. income taxation on income derived from the use of the ECI property for the period in which there is remaining built-in gain. See § 1.721(c)-6T(c)(1).

The temporary regulations require the U.S. transferor also to provide information with respect to related foreign partners and certain section 721(c) partnerships under section 6038B and the gain deferral method. This requirement also applies in the case of a partnership in a tiered-partnership structure that applies the gain deferral method under § 1.721(c)-3T(d). See § 1.721(c)-6T(b)(2). The U.S. transferor must attach this information to its return.

If the section 721(c) partnership has a reporting obligation under section 6031, it also will be required to report certain information under the temporary regulations. See § 1.721(c)-6T(d). Although the temporary regulations require the partnership to submit certain information to the IRS and comply with other requirements relating to the application of the gain deferral method, a failure to do so will not constitute an acceleration event to the U.S. transferor. The Treasury Department and the IRS intend that the Form 1065, Schedule K-1, or their accompanying instructions will be revised to describe this required

information. Failure to include this information may result in imposition of a penalty. See sections 6721 and 6722.

b. Annual Reporting Requirements

The temporary regulations require the U.S. transferor to provide certain information on an annual basis with respect to section 721(c) property subject to the gain deferral method. See §§ 1.721(c)-6T(b)(3) and 1.6038B-2T(c)(9). This includes information about income from the section 721(c) property (book and remedial income) allocated to the U.S. transferor in the partnership taxable year that ends with, or within, the U.S. transferor's taxable year, a calculation of remaining built-in gain, and information about acceleration, termination, successor, and partial acceleration events. The U.S. transferor must also attach a Schedule K-1 (Form 8865), Partner's Share of Income, Deductions, Credits, etc., for all related foreign persons that are direct or indirect partners in the section 721(c) partnership (if the partnership does not have a filing obligation under section 6031) for the partnership taxable year that ends with, or within, the U.S. transferor's taxable year.

In the case of ECI property subject to the gain deferral method, the U.S. transferor must annually declare that, after exercising reasonable diligence, to the best of the U.S. transferor's knowledge and belief all the income from the property was income effectively connected with the conduct of a trade or business within the United States, and no benefits with respect to the ECI property were claimed under any income tax convention by related foreign persons that are direct or indirect partners in the section 721(c) partnership or by the section 721(c) partnership. This requirement eliminates the potential need for related foreign persons that are direct or indirect partners in the section 721(c) partnership and the partnership to submit to the U.S. transferor an annual waiver of treaty benefits.

The U.S. transferor must describe all acceleration, termination, successor, and partial acceleration events that occur with respect to the section 721(c) property during the partnership taxable year that ends with, or within, the U.S. transferor's taxable year. When there is a successor event, the U.S. transferor must identify the new partnership, lower-tier partnership, upper-tier partnership, or U.S. corporation (as applicable). If the section 721(c) partnership is a foreign partnership, the U.S. transferor must include the information described in § 1.6038-3(g) (contents of information returns

required of certain United States persons with respect to controlled foreign partnerships), if not already reported elsewhere, without regard to whether the section 721(c) partnership is a controlled foreign partnership or whether the U.S. transferor controlled the section 721(c) partnership. If the U.S. transferor is not a controlling fifty-percent partner (as defined in § 1.6038-3(a)), the U.S. transferor may comply with this requirement by providing only the information described in § 1.6038-3(g)(1). These requirements also apply to a U.S. transferor that is a successor, as described in Paragraph c.2 of Part VIII of the Explanation of Provisions section of this preamble.

If the section 721(c) partnership has a filing obligation under section 6031, the partnership must include the information required under § 1.721(c)-6T(b)(2) and (3) on the Schedule K-1 (Form 1065), Partner's Share of Income, Deductions, Credits, etc., of the U.S. transferor and all related foreign persons that are direct or indirect partners in the section 721(c) partnership. See § 1.721(c)-6T(d)(2).

XI. Effective/Applicability Dates

The applicability dates of the temporary regulations generally relate back to the issuance of the notice. Accordingly, in general, the temporary regulations apply to contributions occurring on or after August 6, 2015, and to contributions occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701-3 that is filed on or after August 6, 2015 (referred to in this preamble as the "general applicability date"). However, new rules, including any substantive changes to the rules described in the notice, apply to contributions occurring on or after January 18, 2017, or to contributions occurring before January 18, 2017, resulting from an entity classification election made under § 301.7701-3 that is filed on or after January 18, 2017. Taxpayers may, however, elect to apply those new rules and substantive changes to the rules described in the notice to a contribution occurring on or after the general applicability date. The election is made by reflecting the application of the relevant rule on a timely filed or amended return.

Special Analyses

Certain IRS regulations, including these, are exempt from the requirements of Executive Order 12866, as supplemented and reaffirmed by Executive Order 13563. Therefore, a regulatory impact assessment is not required. It is hereby certified that the

collection of information contained in this regulation will not have a significant economic impact on a substantial number of small entities. Accordingly, a regulatory flexibility analysis is not required. This certification is based on the fact that the temporary regulations include a \$1,000,000 de minimis exception for certain transfers, and tangible property with built-in gain that does not exceed \$20,000 is excluded from the regulations. In addition, the regulations only apply when a U.S. transferor contributes property to a partnership with a partner that is a related foreign person, and persons related to the U.S. transferor own more than 80 percent of the interests in the partnership. Accordingly, the Treasury Department and the IRS expect that these regulations primarily will affect large domestic corporations. Pursuant to section 7805(f) of the Code, these regulations have been submitted to the Chief Counsel for Advocacy of the Small Business Administration for comment on their impact on small business.

Drafting Information

The principal author of these regulations is Ryan A. Bowen of the Office of the Associate Chief Counsel (International). However, other personnel from the Treasury Department and the IRS participated in the development of the regulations.

List of Subjects in 26 CFR Part 1

Income taxes, Reporting and recordkeeping requirements.

Amendments to the Regulations

Accordingly, 26 CFR part 1 is amended as follows:

PART 1—INCOME TAXES

■ **Paragraph 1.** The authority citation for part 1 is amended by adding entries in numerical order to read in part as follows:

Authority: 26 U.S.C. 7805 * * *.

Section 1.197–2T also issued under 26 U.S.C. 197(g).

* * * * *

Section 1.721(c)–1T also issued under 26 U.S.C. 721(c).

Section 1.721(c)–2T also issued under 26 U.S.C. 721(c).

Section 1.721(c)–3T also issued under 26 U.S.C. 721(c).

Section 1.721(c)–4T also issued under 26 U.S.C. 721(c).

Section 1.721(c)–5T also issued under 26 U.S.C. 721(c).

Section 1.721(c)–6T also issued under 26 U.S.C. 721(c).

Section 1.721(c)–7T also issued under 26 U.S.C. 721(c).

* * * * *

Section 1.6038B–2T also issued under 26 U.S.C. 6038B.

* * * * *

■ **Par. 2.** Section 1.197–2 is amended by adding paragraphs (h)(12)(vii)(C) and (l)(5) to read as follows:

§ 1.197–2 Amortization of goodwill and certain other intangibles.

* * * * *

(h) * * *

(12) * * *

(vii) * * *

(C) [Reserved]. For further guidance, see § 1.197–2T(h)(12)(vii)(C).

* * * * *

(l) * * *

(5) [Reserved]. For further guidance, see § 1.197–2T(l)(5).

■ **Par 3.** Section 1.197–2T is added to read as follows:

§ 1.197–2T Amortization of goodwill and certain other intangibles.

(a) through (h)(12)(vii)(B) [Reserved]. For further guidance, see § 1.197–2(a) through (h)(12)(vii)(B).

(C) *Rules for section 721(c) partnerships.* See § 1.704–3T(d)(5)(iii) if there is a contribution of a section 197(f)(9) intangible to a section 721(c) partnership (as defined in § 1.721(c)–1T(b)(14)).

(viii) through (l)(4)(iii) [Reserved]. For further guidance, see § 1.197–2(h)(12)(viii) through (l)(4)(iii).

(5) *Rules for section 721(c) partnerships—(i) Applicability dates—(A) In general.* Except as provided in paragraph (l)(5)(i)(B) of this section, paragraph (h)(12)(vii)(C) of this section applies with respect to contributions occurring on or after January 18, 2017, and with respect to contributions occurring before January 18, 2017, resulting from an entity classification election made under § 301.7701–3 of this chapter that is filed on or after January 18, 2017.

(B) *Election to apply the provisions described in paragraph (l)(5)(i)(A) of this section retroactively.* Paragraph (h)(12)(vii)(C) of this section may, by election, be applied with respect to a contribution occurring on or after August 6, 2015, and to a contribution occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701–3 of this chapter that is filed on or after August 6, 2015. The election is made by applying paragraph (h)(12)(vii)(C) of this section on a timely filed original return (including extensions) or an amended return filed no later than six months after January 18, 2017.

(ii) *Expiration date.* Paragraph (h)(12)(vii)(C) of this section expires on January 17, 2020.

■ **Par. 4.** Section 1.704–1 is amended by adding paragraph (b)(2)(iv)(f)(6) following the undesignated paragraph at the end of paragraph (b)(2)(iv)(f)(5) and adding paragraph (f) to read as follows:

§ 1.704–1 Partner's distributive share.

* * * * *

(b) * * *

(2) * * *

(iv) * * *

(f) * * *

(6) [Reserved]. For further guidance, see § 1.704–1T(b)(2)(iv)(f)(6).

* * * * *

(f) [Reserved]. For further guidance, see § 1.704–1T(f).

■ **Par. 5.** Section 1.704–1T is amended by:

- 1. Revising paragraphs (b)(1)(iii) through (b)(2)(iv)(f)(5).
- 2. Adding paragraph (b)(2)(iv)(f)(6).
- 3. Revising paragraphs (b)(2)(iv)(g) through (b)(4)(viii)(a) introductory text.
- 4. Redesignating paragraph (f) as paragraph (g).
- 5. Adding a new paragraph (f).
- 6. Revising newly redesignated paragraph (g).

The additions and revisions read as follows:

§ 1.704–1T Partner's distributive share (temporary).

* * * * *

(b)(1)(iii) through (b)(2)(iv)(f)(5) [Reserved]. For further guidance, see § 1.704–1(b)(1)(iii) through (b)(2)(iv)(f)(5).

(6) Notwithstanding paragraph (b)(2)(iv)(f)(5) of this section, the revaluation is required under § 1.721(c)–3T(d)(1) as a condition of the application of the gain deferral method (as described in § 1.721(c)–3T(b)) and is pursuant to an event described in this paragraph (b)(2)(iv)(f)(6). If an interest in a partnership is contributed to a section 721(c) partnership (as defined in § 1.721(c)–1T(b)(14)), the partnership whose interest is contributed may revalue its property in accordance with this section. In this case, the revaluation by the partnership whose interest was contributed must occur immediately before the contribution. If a partnership that revalues its property pursuant to this paragraph owns an interest in another partnership, the partnership in which it owns an interest may also revalue its property in accordance with this section. When multiple partnerships revalue under this paragraph (b)(2)(iv)(f)(6), the revaluations occur in order from the lowest-tier partnership to the highest-tier partnership.

(b)(2)(iv)(g) through (b)(4)(viii)(a) introductory text [Reserved]. For further guidance, see § 1.704–1(b)(2)(iv)(g) through (b)(4)(viii)(a) introductory text.

* * * * *

(f) *Dates*—(1) *Applicability dates*—(i) *In general*. Except as provided in paragraph (f)(1)(ii) of this section, paragraph (b)(2)(iv)(f)(6) of this section applies with respect to contributions occurring on or after January 18, 2017, and with respect to contributions occurring before January 18, 2017, resulting from an entity classification election made under § 301.7701–3 of this chapter that is filed on or after January 18, 2017.

(ii) *Election to apply the provisions described in paragraph (f)(1)(i) of this section retroactively*. Paragraph (b)(2)(iv)(f)(6) of this section may, by election, be applied with respect to a contribution occurring on or after August 6, 2015, but before January 18, 2017, and with respect to a contribution occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701–3 of this chapter that is filed on or after August 6, 2015. The election is made by applying paragraph (b)(2)(iv)(f)(6) of this section on a timely filed original return (including extensions) or an amended return filed no later than six months after January 18, 2017.

(2) *Expiration date*. Paragraph (b)(2)(iv)(f)(6) of this section expires on January 17, 2020.

(g) *Expiration date*. The applicability of this section (other than paragraphs (b)(2)(iv)(f)(6) and (f) of this section) expires on February 4, 2019.

■ **Par. 6.** Section 1.704–3 is amended by adding paragraphs (a)(13), (d)(5)(iii), and (g) to read as follows:

§ 1.704–3 Contributed property.

(a) * * *

(13) [Reserved]. For further guidance, see § 1.704–3T(a)(13).

* * * * *

(d) * * *

(5) * * *

(iii) [Reserved]. For further guidance, see § 1.704–3T(d)(5)(iii).

* * * * *

(g) [Reserved]. For further guidance, see § 1.704–3T(g).

■ **Par. 7.** Section 1.704–3T is added to read as follows:

§ 1.704–3T Contributed property (temporary).

(a)(1) through (12) [Reserved]. For further guidance, see § 1.704–3(a)(1) through (12).

(13) *Rules for tiered section 721(c) partnerships*—(i) *Revaluations*. If a

partnership revalues its property pursuant to § 1.704–1T(b)(2)(iv)(f)(6) immediately before an interest in the partnership is contributed to another partnership, or if an upper-tier partnership owns an interest in a lower-tier partnership, and both the upper-tier partnership and the lower-tier partnership revalue partnership property pursuant to § 1.704–1T(b)(2)(iv)(f)(6), the principles of § 1.704–3(a)(9) will apply to any reverse section 704(c) allocations made as a result of the revaluation.

(ii) *Basis-derivative items*. If a lower-tier partnership that is a section 721(c) partnership applies the gain deferral method, then, for purposes of applying this section, the upper-tier partnership must treat its distributive share of lower-tier partnership items of gain, loss, amortization, depreciation, or other cost recovery with respect to the lower-tier partnership's section 721(c) property as though they were items of gain, loss, amortization, depreciation, or other cost recovery with respect to the upper-tier partnership's interest in the lower-tier partnership. For purposes of this paragraph (a)(13)(ii), gain deferral method is defined in § 1.721(c)–1T(b)(8), section 721(c) partnership is defined in § 1.721(c)–1T(b)(14), and section 721(c) property is defined in § 1.721(c)–1T(b)(15).

(b) through (d)(5)(ii) [Reserved]. For further guidance, see § 1.704–3(b) through (d)(5)(ii).

(iii) *Special rules for a section 721(c) partnership and anti-churning property*—(A) *In general*. Solely in the case of a gain deferral contribution of section 721(c) property that is a section 197(f)(9) intangible that was not an amortizable section 197 intangible in the hands of the contributor, the remedial allocation method is modified with respect to allocations to a related person to the U.S. transferor pursuant to paragraphs (d)(5)(iii)(B) through (F) of this section. For purposes of this paragraph (d)(5)(iii), gain deferral contribution is defined in § 1.721(c)–1T(b)(7), related person is defined in § 1.721(c)–1T(b)(12), section 721(c) partnership is defined in § 1.721(c)–1T(b)(14), section 721(c) property is defined in § 1.721(c)–1T(b)(15), and U.S. transferor is defined in § 1.721(c)–1T(b)(18). For an example applying the rules of this paragraph (d)(5)(iii), see § 1.721(c)–7T, *Example 6*.

(B) *Book basis recovery*. The section 721(c) partnership must amortize the portion of the partnership's book value in the section 197(f)(9) intangible that exceeds the adjusted basis in the property upon contribution using any recovery period and amortization

method available to the partnership as if the property had been newly purchased by the partnership from an unrelated party.

(C) *Effect of ceiling rule limitations*. If the ceiling rule causes the book allocation of the item of amortization of a section 197(f)(9) intangible under paragraph (d)(5)(iii)(B) of this section by a section 721(c) partnership to a related person with respect to the U.S. transferor to differ from the tax allocation of the same item to the related person (a ceiling rule limited related person), the partnership must not create a remedial item of deduction to allocate to the related person but instead must increase the adjusted basis of the section 197(f)(9) intangible by an amount equal to the difference solely with respect to that related person. The partnership simultaneously must create an offsetting remedial item in an amount identical to the increase in adjusted tax basis of the section 197(f)(9) intangible and allocate it to the contributing partner.

(D) *Effect of basis adjustment*—(1) *In general*. The basis adjustment described in paragraph (d)(5)(iii)(C) of this section constitutes an adjustment to the adjusted basis of a section 197(f)(9) intangible with respect to the ceiling rule limited related person only. No adjustment is made to the common basis of partnership property. Thus, for purposes of calculating gain and loss, the ceiling rule limited related person will have a special basis for that section 197(f)(9) intangible. The adjustment to the basis of partnership property under this section has no effect on the partnership's computation of any item under section 703.

(2) *Computation of a partner's distributive share of partnership items*. The partnership first computes its items of gain or loss at the partnership level under section 703. The partnership then allocates the partnership items among the partners, including the ceiling rule limited related person, in accordance with section 704, and adjusts the partners' capital accounts accordingly. The partnership then adjusts the ceiling rule limited related person's distributive share of the items of partnership gain or loss, in accordance with paragraph (d)(5)(iii)(D)(3) of this section, to reflect the effects of that person's basis adjustment under this section. These adjustments to that person's distributive shares must be reflected on Schedules K and K–1 of the partnership's return (Form 1065) (when otherwise required to be completed) and do not affect that person's capital account.

(3) *Effect of basis adjustment in determining items of income, gain, or*

loss. The amount of a ceiling rule limited related person's gain or loss from the sale or exchange of a section 197(f)(9) intangible in which that person has a tax basis adjustment is equal to that person's share of the partnership's gain or loss from the sale of the asset (including any remedial allocations under this paragraph (d) and § 1.704-3(d)), minus the amount of that person's tax basis adjustment for the section 197(f)(9) intangible.

(E) *Subsequent transfers*—(1) *In general.* Except as provided in paragraph (d)(5)(iii)(E)(2) of this section, if a ceiling rule limited related person transfers all or part of its partnership interest, the portion of the basis adjustment for a section 197(f)(9) intangible attributable to the interest transferred is eliminated. The transferor of the partnership interest remains the ceiling rule limited related person with respect to any remaining basis adjustment for the section 197(f)(9) intangible.

(2) *Special rules for substituted basis transactions.* Paragraph (d)(5)(iii)(E)(1) of this section does not apply to the extent a ceiling rule limited related person transfers its partnership interest in a transaction in which the transferee's basis in the partnership interest is determined in whole or in part by reference to the ceiling rule limited related person's basis in that interest. Instead, in such a case, the transferee succeeds to that portion of the transferor's basis adjustment for a section 197(f)(9) intangible attributable to the interest transferred. In such a case, the basis adjustment in a section 197(f)(9) intangible to which the transferee succeeds is taken into account for purposes of determining the transferee's share of the adjusted basis to the partnership of the partnership's property for purposes of §§ 1.743-1(b) and 1.755-1(b)(5). To the extent a transferee would be required to decrease the adjusted basis of a section 197(f)(9) intangible pursuant to §§ 1.743-1(b)(2) and 1.755-1(b)(5), the decrease first reduces the special basis adjustment described in paragraph (d)(5)(iii)(C) of this section, if any, to which the transferee succeeds.

(F) *Non-amortization of basis adjustment.* Neither the increase to the adjusted basis of a section 197(f)(9) intangible with respect to a ceiling rule limited related person nor the portion of the basis of any property that was determined by reference to such increase is subject to amortization, depreciation, or other cost recovery.

(d)(6) through (f) [Reserved]. For further guidance, see § 1.704-3(d)(6) through (f).

(g) *Certain rules for section 721(c) partnerships*—(1) *Applicability dates*—(i) *In general.* Notwithstanding § 1.704-3(f), except as provided in paragraph (g)(1)(ii) of this section, paragraphs (a)(13) and (d)(5)(iii) of this section apply with respect to contributions occurring on or after January 18, 2017, and with respect to contributions occurring before January 18, 2017, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed on or after January 18, 2017.

(ii) *Election to apply the provisions described in paragraph (g)(1)(i) of this section retroactively.* Paragraphs (a)(13) and (d)(5)(iii) of this section may, by election, be applied with respect to a contribution occurring on or after August 6, 2015, but before January 18, 2017, and with respect to a contribution occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed on or after August 6, 2015. The election is made by applying paragraph (a)(13) or paragraph (d)(5)(iii) of this section, as applicable, on a timely filed original return (including extensions) or an amended return filed no later than six months after January 18, 2017.

(2) *Expiration date.* The applicability of paragraphs (a)(13) and (d)(5)(iii) of this section expires on January 17, 2020.

■ **Par. 8.** Section 1.721(c)-1T is added to read as follows:

§ 1.721(c)-1T Overview, definitions, and rules of general application (temporary).

(a) *Overview*—(1) *In general.* This section and §§ 1.721(c)-2T through 1.721(c)-7T (collectively, the *section 721(c) regulations*) provide rules under section 721(c). This section provides definitions and rules of general application for purposes of the section 721(c) regulations. Section 1.721(c)-2T provides the general operative rules that override section 721(a) nonrecognition of gain upon a contribution of section 721(c) property to a section 721(c) partnership. Section 1.721(c)-3T describes the gain deferral method, which may be applied in order to avoid the immediate recognition of gain upon a contribution of section 721(c) property to a section 721(c) partnership. Section 1.721(c)-4T provides rules regarding acceleration events for purposes of applying the gain deferral method. Section 1.721(c)-5T identifies exceptions to the rules regarding acceleration events provided in § 1.721(c)-4T(b). Section 1.721(c)-6T provides procedural and reporting requirements. Section 1.721(c)-7T provides examples illustrating the

application of the section 721(c) regulations.

(2) *Scope.* Paragraph (b) of this section provides definitions. Paragraph (c) of this section describes the treatment of a change in form of a partnership. Paragraph (d) of this section provides an anti-abuse rule. Paragraph (e) of this section provides the dates of applicability, and paragraph (f) of this section provides the date of expiration.

(b) *Definitions.* The following definitions apply for purposes of the section 721(c) regulations. Unless otherwise indicated, the definitions apply on a property-by-property basis, as applicable.

(1) *Acceleration event.* An acceleration event has the meaning provided in § 1.721(c)-4T(b).

(2) *Built-in gain.* Built-in gain is, with respect to property contributed to a partnership, the excess of the book value of the property over the partnership's adjusted tax basis in the property upon the contribution, determined without regard to the application of § 1.721(c)-2T(b).

(3) *Consistent allocation method.* The consistent allocation method is the method described in § 1.721(c)-3T(c).

(4) *Controlled partnership.* A partnership is a controlled partnership with respect to a U.S. transferor if the U.S. transferor and related persons control the partnership. For this purpose, control is determined based on all the facts and circumstances, except that a partnership will be deemed to be controlled by a U.S. transferor and related persons if those persons, in the aggregate, own (directly or indirectly through one or more partnerships) more than 50 percent of the interests in the partnership capital or profits.

(5) *Direct or indirect partner.* A direct or indirect partner is a person (other than a partnership) that owns an interest in a partnership directly or indirectly through one or more partnerships.

(6) *Excluded property.* Excluded property is—

(i) A cash equivalent;

(ii) A security within the meaning of section 475(c)(2), without regard to section 475(c)(4);

(iii) Tangible property with a book value exceeding adjusted tax basis by no more than \$20,000 or with an adjusted tax basis in excess of book value; and

(iv) An interest in a partnership in which 90 percent or more of the property (as measured by value) held by the partnership (directly or indirectly through interests in one or more partnerships that are not excluded property) consists of property described in paragraphs (b)(6)(i) through (iii) of this section.

(7) *Gain deferral contribution.* A gain deferral contribution is a contribution of section 721(c) property to a section 721(c) partnership with respect to which the recognition of gain is deferred under the gain deferral method.

(8) *Gain deferral method.* The gain deferral method is the method described in § 1.721(c)-3T(b).

(9) *Partial acceleration event.* A partial acceleration event is an event described in § 1.721(c)-5T(d)(2) or (3).

(10) *Regulatory allocation.* A regulatory allocation is—

(i) An allocation pursuant to a minimum gain chargeback, as defined in § 1.704-2(b)(2);

(ii) A partner nonrecourse deduction, as determined in § 1.704-2(i)(2);

(iii) An allocation pursuant to a partner minimum gain chargeback, as described in § 1.704-2(i)(4);

(iv) An allocation pursuant to a qualified income offset, as defined in § 1.704-1(b)(2)(ii)(d);

(v) An allocation with respect to the exercise of a noncompensatory option described in § 1.704-1(b)(2)(iv)(s); and

(vi) An allocation of partnership level ordinary income or loss described in § 1.751-1(a)(3).

(11) *Related foreign person.* A related foreign person is, with respect to a U.S. transferor, a related person (other than a partnership) that is not a U.S. person.

(12) *Related person.* A related person is, with respect to a U.S. transferor, a person that is related (within the meaning of section 267(b) or 707(b)(1)) to the U.S. transferor.

(13) *Remaining built-in gain*—(i) *In general.* Remaining built-in gain is, with respect to section 721(c) property subject to the gain deferral method, the built-in gain reduced by decreases in the difference between the property's book value and adjusted tax basis, but, for this purpose, without taking into account increases or decreases to the property's book value pursuant to § 1.704-1(b)(2)(iv)(f) or (s).

(ii) *Special rule for tiered partnerships.* If section 721(c) property is described in § 1.721(c)-3T(d)(1)(ii), the remaining built-in gain includes the new positive reverse section 704(c) layer described in § 1.721(c)-3T(d)(1)(ii), reduced by decreases in the difference between the property's book value and adjusted tax basis, but, for this purpose, without taking into account increases or decreases to the property's book value pursuant to § 1.704-1(b)(2)(iv)(f) or (s) that are unrelated to the revaluation described in § 1.721(c)-3T(d)(1)(i).

(14) *Section 721(c) partnership*—(i) *In general.* A partnership (domestic or foreign) is a section 721(c) partnership if there is a contribution of section

721(c) property to the partnership and, after the contribution and all transactions related to the contribution—

(A) A related foreign person with respect to the U.S. transferor is a direct or indirect partner in the partnership; and

(B) The U.S. transferor and related persons own 80 percent or more of the interests in partnership capital, profits, deductions, or losses.

(ii) *Special rule for tiered partnerships.* A partnership described in § 1.721(c)-3T(d)(1) or (2) is deemed to be a section 721(c) partnership for purposes of the gain deferral method.

(15) *Section 721(c) property*—(i) *In general.* Section 721(c) property is property, other than excluded property, with built-in gain that is contributed to a partnership by a U.S. transferor, including pursuant to a contribution described in § 1.721(c)-2T(d) (partnership look-through rule). If the U.S. transferor is treated as contributing its share of property to a partnership pursuant to § 1.721(c)-2T(d), the entire property will be section 721(c) property.

(ii) *Special rule for tiered partnerships.* Property described in § 1.721(c)-3T(d)(1)(ii) and an interest in a partnership described in § 1.721(c)-3T(d)(2)(ii) is deemed to be section 721(c) property.

(16) *Successor event.* A successor event is an event described in § 1.721(c)-5T(c)(2), (3), (4), or (5).

(17) *Termination event.* A termination event is an event described in § 1.721(c)-5T(b)(2), (3), (4), (5), (6), or (7).

(18) *U.S. transferor*—(i) *In general.* A U.S. transferor is a United States person within the meaning of section 7701(a)(30) (a *U.S. person*), other than a domestic partnership.

(ii) *Special rule for tiered partnerships.* Solely for purposes of applying the consistent allocation method, a U.S. transferor includes a partnership that is treated as a U.S. transferor under § 1.721(c)-3T(d)(1)(iii) or (d)(2)(i).

(c) *Change in form of a partnership.* A mere change in identity, form, or place of organization of a partnership or a recapitalization of a partnership will not cause the partnership to become a section 721(c) partnership.

(d) *Anti-abuse rule.* If a U.S. transferor engages in a transaction (or series of transactions) or an arrangement with a principal purpose of avoiding the application of the section 721(c) regulations, the transaction (or series of transactions) or the arrangement may be recharacterized (including by aggregating or disregarding steps or

disregarding an intermediate entity) in accordance with its substance.

(e) *Applicability dates*—(1) *In general.* Except as provided in paragraphs (e)(2) and (3) of this section, this section applies to contributions occurring on or after August 6, 2015, and to contributions occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed on or after August 6, 2015.

(2) *Certain provisions.* Except as provided in paragraph (e)(3) of this section, paragraphs (b)(6)(iv) and (c) of this section apply to contributions occurring on or after January 18, 2017, and to contributions occurring before January 18, 2017, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed on or after January 18, 2017. Except as provided in paragraph (e)(3) of this section, paragraph (b)(14)(i)(B) of this section applies by replacing “80 percent or more” with “greater than 50 percent” with respect to contributions occurring on or after August 6, 2015, but before January 18, 2017, and with respect to contributions occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed on or after August 6, 2015, but before January 18, 2017.

(3) *Election to apply the provisions described in paragraph (e)(2) of this section retroactively.* Paragraphs (b)(6)(iv), (b)(14)(i)(B), and (c) of this section, without the modification described in paragraph (e)(2) of this section, may, by election, be applied to a contribution occurring on or after August 6, 2015, but before January 18, 2017, and to a contribution occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed on or after August 6, 2015. The election is made by applying paragraph (b)(6)(iv) or (c) as described in paragraph (b)(14)(i)(B) or (e)(2) of this section, without the modification described in paragraph (e)(2) of this section, as applicable, to the contribution on a timely filed original return (including extensions) or an amended return filed no later than six months after January 18, 2017.

(f) *Expiration date.* The applicability of this section expires on January 17, 2020.

■ **Par. 9.** Section 1.721(c)-2T is added to read as follows:

§ 1.721(c)–2T Recognition of gain on certain contributions of property to partnerships with related foreign partners (temporary).

(a) *Scope.* This section provides the general operative rules that override section 721(a) nonrecognition of gain upon a contribution of section 721(c) property to a section 721(c) partnership. Paragraph (b) of this section provides the general rule that nonrecognition of gain under section 721(a) does not apply to a contribution of section 721(c) property to a section 721(c) partnership. Paragraph (c) of this section provides a de minimis exception to the application of the general rule in paragraph (b) of this section. Paragraph (d) of this section provides rules for identifying a section 721(c) partnership when a partnership in which a U.S. transferor is a direct or indirect partner contributes property to another partnership. Paragraph (e) of this section provides the dates of applicability, and paragraph (f) of this section provides the date of expiration. For definitions that apply for purposes of this section, see § 1.721(c)–1T(b).

(b) *General rule for contributions of section 721(c) property.* Except as provided in this paragraph (b), paragraph (c) of this section, and § 1.721(c)–3T (describing the gain deferral method), nonrecognition under section 721(a) will not apply to gain realized by the contributing partner upon a contribution of section 721(c) property to a section 721(c) partnership. This paragraph (b) does not apply to a direct contribution by a U.S. transferor if the U.S. transferor and related persons with respect to the U.S. transferor do not own 80 percent or more of the interests in partnership capital, profits, deductions, or losses.

(c) *De minimis exception.* Paragraph (b) of this section will not apply with respect to contributions to a section 721(c) partnership during a taxable year of the section 721(c) partnership for which the sum of the built-in gain with respect to all section 721(c) property contributed in that taxable year does not exceed \$1 million. If, pursuant to the last sentence of paragraph (b) of this section, a direct contribution of property to the section 721(c) partnership by a U.S. transferor is not subject to paragraph (b) of this section, then such contribution is not taken into account for purposes of this paragraph (c).

(d) *Rules for identifying a section 721(c) partnership when a partnership contributes property to another partnership—(1) Partnership look-through rule.* If a U.S. transferor is a direct or indirect partner in a partnership (upper-tier partnership) and

the upper-tier partnership contributes all or a portion of its property to another partnership (lower-tier partnership), then, for purposes of determining if the lower-tier partnership is a section 721(c) partnership, the U.S. transferor is treated as contributing to the lower-tier partnership its share of the property actually contributed by the upper-tier partnership to the lower-tier partnership.

(2) *Exception for a technical termination of a partnership.* Paragraph (d)(1) of this section will not apply to a deemed contribution that occurs as a result of a termination of a partnership described in section 708(b)(1)(B) (technical termination). If a partnership is a section 721(c) partnership immediately before a technical termination, see § 1.721(c)–5T(c)(4) (which treats technical terminations as successor events in certain circumstances).

(e) *Applicability dates—(1) In general.* Except as provided in paragraphs (e)(2) and (3) of this section, this section applies to contributions occurring on or after August 6, 2015, and to contributions occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701–3 of this chapter that is filed on or after August 6, 2015.

(2) *Certain provisions.* Except as provided in paragraph (e)(3) of this section, the final sentence of paragraph (b) of this section, the final sentence of paragraph (c) of this section, and paragraph (d)(2) of this section apply to contributions occurring on or after January 18, 2017, and to contributions occurring before January 18, 2017, resulting from an entity classification election made under § 301.7701–3 of this chapter that is filed on or after January 18, 2017.

(3) *Election to apply the provisions described in paragraph (e)(2) of this section retroactively.* The final sentence of paragraph (b) of this section, the final sentence of paragraph (c) of this section, and paragraph (d)(2) of this section may, by election, be applied to a contribution occurring on or after August 6, 2015, but before January 18, 2017, and to a contribution occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701–3 of this chapter that is filed on or after August 6, 2015. The election is made by applying the final sentence of paragraph (b) of this section, the final sentence of paragraph (c) of this section, or paragraph (d)(2) of this section, as applicable, to the contribution on a timely filed original return (including extensions) or an amended return filed

no later than six months after January 18, 2017.

(f) *Expiration date.* The applicability of this section expires on January 17, 2020.

■ **Par. 10.** Section 1.721(c)–3T is added to read as follows:

§ 1.721(c)–3T Gain deferral method (temporary).

(a) *Scope.* This section describes the gain deferral method to avoid the immediate recognition of gain upon a contribution of section 721(c) property to a section 721(c) partnership. Paragraph (b) of this section provides the requirements of the gain deferral method, including the requirement to apply the consistent allocation method. Paragraph (c) of this section describes the consistent allocation method. Paragraph (d) of this section provides rules for tiered partnerships. Paragraph (e) of this section provides the dates of applicability, and paragraph (f) of this section provides the date of expiration. For definitions that apply for purposes of this section, see § 1.721(c)–1T(b).

(b) *Requirements of the gain deferral method.* A contribution of section 721(c) property to a section 721(c) partnership that would be subject to § 1.721(c)–2T(b) will not be subject to § 1.721(c)–2T(b) if the conditions in paragraphs (b)(1) through (5) of this section are satisfied with respect to that property.

(1) Either—

(i) Both—

(A) The section 721(c) partnership adopts the remedial allocation method described in § 1.704–3(d) with respect to the section 721(c) property; and

(B) The section 721(c) partnership applies the consistent allocation method provided in paragraph (c) of this section; or

(ii) For the period beginning on the date of the contribution of the section 721(c) property and ending on the date on which there is no remaining built-in gain with respect to that property, all distributive shares of income and gain with respect to the section 721(c) property for all direct and indirect partners that are related foreign persons with respect to the U.S. transferor will be subject to taxation as income effectively connected with a trade or business within the United States (under either section 871 or 882), and neither the section 721(c) partnership nor a related foreign person that is a direct or indirect partner in the section 721(c) partnership claims benefits under an income tax convention that would exempt the income or gain from tax or reduce the rate of taxation to which the income or gain is subject.

(2) Upon an acceleration event, the U.S. transferor recognizes an amount of gain equal to the remaining built-in gain with respect to the section 721(c) property or an amount of gain required to be recognized under § 1.721(c)-5T(d) or (e), as applicable.

(3) The procedural and reporting requirements provided in § 1.721(c)-6T(b) are satisfied.

(4) The U.S. transferor consents to extend the period of limitations on assessment of tax as required by § 1.721(c)-6T(b)(5).

(5) If the section 721(c) property is a partnership interest or property described in the partnership look-through rule provided in § 1.721(c)-2T(d), the applicable tiered-partnership rules provided in paragraph (d) of this section are applied.

(c) *Consistent allocation method*—(1) *In general.* For each taxable year of a section 721(c) partnership in which there is remaining built-in gain in the section 721(c) property, the section 721(c) partnership must allocate each book item of income, gain, deduction, and loss with respect to the section 721(c) property to the U.S. transferor in the same percentage. For exceptions to this general rule, see paragraph (c)(4) of this section.

(2) *Determining income or gain with respect to section 721(c) property.* For purposes of applying paragraph (c)(1) of this section, a section 721(c) partnership must attribute book income and gain to each item of section 721(c) property in a consistent manner using any reasonable method taking into account all the facts and circumstances. All items of book income and gain attributable to an item of section 721(c) property will comprise a single class of gross income for purposes of applying paragraph (c)(3) of this section.

(3) *Determining deduction or loss with respect to section 721(c) property.* For purposes of applying paragraph (c)(1) of this section, a section 721(c) partnership must use the principles of §§ 1.861-8 and 1.861-8T to allocate and apportion its items of deduction, except for interest expense and research and experimental expenditures, and loss to the class of gross income with respect to each item of section 721(c) property as determined in paragraph (c)(2) of this section. Accordingly, a deduction or loss will be considered to be definitely related and therefore allocable to a class of gross income with respect to particular section 721(c) property whether or not there is any item of gross income in that class that is received or accrued during the taxable year and whether or not the amount of deduction or loss exceeds the amount of gross

income in that class during the taxable year. If a deduction or loss is definitely related and therefore allocable to gross income attributable to more than one class of gross income of the section 721(c) partnership or if a deduction or loss is not definitely related to any class of gross income of the section 721(c) partnership, the section 721(c) partnership must apportion that deduction or loss among its classes of gross income using a reasonable method that reflects to a reasonably close extent the factual relationship between the deduction or loss and the classes of gross income. The section 721(c) partnership may allocate and apportion its interest expense and research and experimental expenditures under any reasonable method, including, but not limited to, the methods prescribed in §§ 1.861-9 and 1.861-9T (interest expense) and § 1.861-17 (research and experimental expenditures). For this purpose, the section 721(c) partnership must allocate and apportion its deductions and losses without regard to the partners' percentage interests in the partnership.

(4) *Exceptions to the consistent allocation method*—(i) *Regulatory allocations.* A regulatory allocation (as defined in § 1.721(c)-1T(b)(10)) of book income, gain, deduction, or loss with respect to section 721(c) property that otherwise would fail to satisfy paragraph (c)(1) of this section is nevertheless deemed to satisfy that paragraph if the allocation is—

(A) An allocation of income or gain to the U.S. transferor (or a member of its consolidated group as defined in § 1.1502-1(h));

(B) An allocation of deduction or loss to a partner other than the U.S. transferor (or a member of its consolidated group); or

(C) Treated as a partial acceleration event pursuant to § 1.721(c)-5T(d)(2).

(ii) *Allocation of creditable foreign tax expenditures.* An allocation of a creditable foreign tax expenditure (as defined in § 1.704-1(b)(4)(viii)(b)) is not subject to the consistent allocation method.

(d) *Tiered partnership rules.* This paragraph (d) provides the tiered partnership rules referred to in paragraph (b)(5) of this section.

(1) *Section 721(c) property is a partnership interest.* If the section 721(c) property that is contributed to a section 721(c) partnership is an interest in a partnership (lower-tier partnership), then the lower-tier partnership, if it is a controlled partnership with respect to the U.S. transferor, and each partnership in which an interest is owned (directly or indirectly through one or more

partnerships) by the lower-tier partnership and that is a controlled partnership with respect to the U.S. transferor, must satisfy the requirements of paragraphs (d)(1)(i), (ii), and (iii) of this section.

(i) The partnership must revalue all its property under § 1.704-1(b)(2)(iv)(f)(6) if the revaluation would result in a separate positive difference between book value and adjusted tax basis in at least one property that is not excluded property.

(ii) The partnership must apply the gain deferral method for each property (other than excluded property) for which there is a separate positive difference between book value and adjusted tax basis resulting from the revaluation described in paragraph (d)(1) of this section (*new positive reverse section 704(c) layer*). If the partnership has previously adopted a section 704(c) method other than the remedial allocation method for the property, the partnership satisfies the requirement of paragraph (b)(1)(i)(A) of this section by adopting the remedial allocation method for the new positive reverse section 704(c) layer.

(iii) The partnership must treat a partner that is a partnership in which the U.S. transferor is a direct or indirect partner as if it were the U.S. transferor with respect to the section 721(c) property solely for purposes of applying the consistent allocation method.

(2) *Section 721(c) property is indirectly contributed by a U.S. transferor under the partnership look-through rule.* If the U.S. transferor is a direct or indirect partner in the upper-tier partnership described in § 1.721(c)-2T(d)(1), and under § 1.721(c)-2T(d)(1), the U.S. transferor is treated as contributing the section 721(c) property (including an interest in a partnership described in paragraph (d)(1) of this section) to a section 721(c) partnership, then the requirements of paragraphs (d)(2)(i), (ii), and (iii) of this section must be satisfied.

(i) The section 721(c) partnership must treat the upper-tier partnership as the U.S. transferor of the section 721(c) property solely for purposes of applying the consistent allocation method;

(ii) The upper-tier partnership, if it is a controlled partnership with respect to the U.S. transferor, must apply the gain deferral method to its interest in the section 721(c) partnership; and

(iii) If the U.S. transferor is an indirect partner in the upper-tier partnership through one or more partnerships, the principles of paragraphs (d)(2)(i) and (ii) of this section must be applied with respect to those partnerships that are

controlled partnerships with respect to the U.S. transferor.

(e) *Applicability dates*—(1) *In general.* Except as provided in paragraphs (e)(2) and (3) of this section, this section applies to contributions occurring on or after August 6, 2015, and to contributions occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701–3 of this chapter that is filed on or after August 6, 2015.

(2) *Certain provisions.* Except as provided in paragraph (e)(3) of this section, paragraphs (b)(1)(ii), (c)(2) and (3), (c)(4)(i) and (ii), and (d)(1) and (2) of this section apply to contributions occurring on or after January 18, 2017, and to contributions occurring before January 18, 2017, resulting from an entity classification election made under § 301.7701–3 of this chapter that is filed on or after January 18, 2017.

(3) *Election to apply the provisions described in paragraph (e)(2) of this section retroactively.* Paragraphs (b)(1)(ii), (c)(2) and (3), (c)(4)(i) and (ii), and (d)(1) and (2) of this section may, by election, be applied to a contribution occurring on or after August 6, 2015, but before January 18, 2017, and to a contribution occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701–3 of this chapter that is filed on or after August 6, 2015. The election is made by applying paragraph (b)(1)(ii), (c)(2) and (3), (c)(4)(i) and (ii), and (d)(1) or (2) of this section, as applicable, to the contribution on a timely filed original return (including extensions) or an amended return filed no later than six months after January 18, 2017. In order to elect to apply paragraph (c)(2) or (3) of this section to a contribution described in this paragraph (e)(3), an election must also be made to apply paragraph (c)(3) or (2) of this section, respectively, to the contribution.

(4) *Transitional rules.* If a contribution is described in paragraph (e)(2) of this section and no election described in paragraph (e)(3) of this section is made to apply one or more of paragraphs (c)(2) and (3) and (c)(4)(i) and (ii) of this section, as applicable, to the contribution, then, for purposes of paragraph (c)(1) of this section, the section 721(c) partnership must attribute book income, gain, loss, and deduction to the section 721(c) property in a consistent manner under any reasonable method taking into account all the facts and circumstances. If a contribution is described in paragraph (e)(2) of this section and no election described in paragraph (e)(3) of this section is made to apply paragraph (d)(1) or (2) of this section, as

applicable, to the contribution, then, this section must be applied in a manner consistent with the purpose of the section 721(c) regulations. Thus, for example, if a U.S. transferor is a direct or indirect partner in a partnership and that partnership contributes section 721(c) property to a lower-tier partnership, or, if a U.S. transferor contributes an interest in a partnership that owns section 721(c) property to a lower-tier partnership, then paragraph (b) of this section applies as though the U.S. transferor contributed its share of the section 721(c) property directly.

(f) *Expiration date.* The applicability of this section expires on January 17, 2020.

■ **Par. 11.** Section 1.721(c)–4T is added to read as follows:

§ 1.721(c)–4T Acceleration events (temporary).

(a) *Scope.* This section provides rules regarding acceleration events for purposes of applying the gain deferral method. Paragraph (b) of this section defines an acceleration event. Paragraph (c) of this section provides the consequences of an acceleration event. Paragraph (d) of this section provides the dates of applicability, and paragraph (e) of this section provides the date of expiration. For definitions that apply for purposes of this section, see § 1.721(c)–1T(b).

(b) *Definition of an acceleration event*—(1) *General rules.* Except as provided in this paragraph (b) and § 1.721(c)–5T (acceleration event exceptions), an acceleration event with respect to section 721(c) property is any event that either would reduce the amount of remaining built-in gain that a U.S. transferor would recognize under the gain deferral method if the event had not occurred or could defer the recognition of the remaining built-in gain. An acceleration event includes a contribution of section 721(c) property to another partnership by a section 721(c) partnership and a contribution of an interest in a section 721(c) partnership to another partnership. This paragraph (b) applies on a property-by-property basis.

(2) *Failure to comply with a requirement of the gain deferral method*—(i) *General rule.* An acceleration event with respect to section 721(c) property occurs when any party fails to comply with a condition of the gain deferral method with respect to the section 721(c) property.

(ii) *Certain failures to comply with procedural and reporting requirements.* Notwithstanding paragraph (b)(2)(i) of this section, an acceleration event will not occur solely as a result of a failure

to comply with a requirement of § 1.721(c)–3T(b)(3) that is not willful. See §§ 1.721(c)–6T(f) and 1.6038B–2T(h)(3).

(3) *Lower-tier partnership allocations.* Notwithstanding paragraph (b)(1) of this section, an acceleration event will not occur because of a reduction in remaining built-in gain in an interest in a partnership that is section 721(c) property that occurs as a result of allocations of book items of deduction and loss, or tax items of income and gain.

(4) *Deemed acceleration event.* A U.S. transferor may treat an acceleration event as having occurred with respect to section 721(c) property by both recognizing gain in an amount equal to the remaining built-in gain that would have been allocated to the U.S. transferor if the section 721(c) partnership had sold the section 721(c) property immediately before the deemed acceleration event for fair market value and satisfying the reporting required by § 1.721(c)–6T(b)(3)(iv). In this case, see paragraph (c) of this section regarding basis adjustments.

(c) *Consequences of an acceleration event.* Paragraphs (c)(1) and (2) of this section provide the consequences of an acceleration event with respect to section 721(c) property, a partial acceleration event with respect to section 721(c) property to the extent provided in § 1.721(c)–5T(d)(1), and a transfer described in section 367 of section 721(c) property to the extent provided in § 1.721(c)–5T(e).

(1) *U.S. transferor.* The U.S. transferor must recognize gain in an amount equal to the remaining built-in gain that would have been allocated to the U.S. transferor if the section 721(c) partnership had sold the section 721(c) property immediately before the acceleration event for fair market value. The U.S. transferor will increase its basis in its partnership interest by the amount of gain recognized. If the U.S. transferor is an indirect partner in the section 721(c) partnership through one or more tiered partnerships, appropriate basis adjustments will be made to the interests in the tiered partnerships.

(2) *Section 721(c) partnership.* The section 721(c) partnership will increase its basis in the section 721(c) property by the amount of built-in gain recognized by the U.S. transferor under paragraph (c)(1) of this section. Any tax consequences of the acceleration event will be determined taking into account the increase in the partnership's adjusted tax basis in the section 721(c) property. If the section 721(c) property remains in the partnership after the

acceleration event, the increase in basis of the section 721(c) property may be recovered using any applicable recovery period and depreciation (or other cost recovery) method (including first-year conventions) available to the partnership for newly purchased property of the same type placed in service on the date of the acceleration event. The section 721(c) property will no longer be subject to the gain deferral method.

(d) *Applicability dates.* This section applies to contributions occurring on or after August 6, 2015, and to contributions occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed on or after August 6, 2015.

(e) *Expiration date.* The applicability of this section expires on January 17, 2020.

■ **Par. 12.** Section 1.721(c)-5T is added to read as follows:

§ 1.721(c)-5T Acceleration event exceptions (temporary).

(a) *Scope.* This section identifies exceptions to the acceleration events, which, like the rules regarding acceleration events provided in § 1.721(c)-4T(b), apply on a property-by-property basis. Paragraph (b) of this section identifies the events that terminate the requirement to apply the gain deferral method. Paragraph (c) of this section identifies the successor events that allow for the continued application of the gain deferral method. Paragraph (d) of this section identifies the partial acceleration events. Paragraph (e) of this section provides special rules for transfers of section 721(c) property to a foreign corporation described in section 367. Paragraph (f) of this section allows for the continued application of the gain deferral method if there is a fully taxable disposition of a portion of an interest in a partnership. Paragraph (g) of this section provides the dates of applicability, and paragraph (h) of this section provides the date of expiration. For definitions that apply for purposes of this section, see § 1.721(c)-1T(b).

(b) *Termination events*—(1) *In general.* Notwithstanding § 1.721(c)-4T(b)(1), a termination event with respect to section 721(c) property will not constitute an acceleration event. In these cases, the section 721(c) property will no longer be subject to the gain deferral method.

(2) *Transfers of section 721(c) property (other than a partnership interest) to a domestic corporation described in section 351.* A termination event occurs if a section 721(c)

partnership transfers section 721(c) property (other than an interest in a partnership) to a domestic corporation in a transaction to which section 351 applies.

(3) *Certain incorporations of a section 721(c) partnership.* A termination event occurs upon an incorporation of a section 721(c) partnership into a domestic corporation by any method of incorporation (other than a method involving an actual distribution of partnership property to the partners, followed by a contribution of that property to a corporation), provided that the section 721(c) partnership is liquidated as part of the incorporation transaction.

(4) *Certain distributions of section 721(c) property.* A termination event occurs if a section 721(c) partnership distributes section 721(c) property either to the U.S. transferor or, if the U.S. transferor is a member of a consolidated group (as defined in § 1.1502-1(h)) at the time of the distribution and the distribution occurs outside the seven-year period described in section 704(c)(1)(B), to a member of the consolidated group.

(5) *Partnership ceases to have a partner that is a related foreign person.* A termination event occurs when a section 721(c) partnership ceases to have any direct or indirect partners that are related foreign persons with respect to the U.S. transferor, provided there is no plan for a related foreign person to subsequently become a direct or indirect partner in the partnership (or a successor). This paragraph (b)(5) does not apply to a distribution of section 721(c) property in redemption of a related foreign person's interest in a section 721(c) partnership.

(6) *Fully taxable dispositions of section 721(c) property.* A termination event occurs if a section 721(c) partnership disposes of section 721(c) property in a transaction in which all gain or loss, if any, is recognized.

(7) *Fully taxable dispositions of an entire interest in a section 721(c) partnership.* A termination event occurs if a U.S. transferor or a partnership in which a U.S. transferor is a direct or indirect partner disposes of its entire interest in a section 721(c) partnership that owns the section 721(c) property in a transaction in which all gain or loss, if any, is recognized. This paragraph (b)(7) does not apply if a U.S. transferor is a member of a consolidated group (as defined in § 1.1502-1(h)) and the interest in the section 721(c) partnership is transferred in an intercompany transaction (as defined in § 1.1502-13(b)(1)).

(c) *Successor events*—(1) *In general.* Notwithstanding § 1.721(c)-4T(b)(1), a successor event with respect to section 721(c) property will not constitute an acceleration event. If only a portion of an interest in a partnership is transferred in a successor event described in this paragraph (c), the principles of § 1.704-3(a)(7) apply to determine the remaining built-in gain in section 721(c) property that is attributable to the portion of the interest that is transferred and the portion of the interest that is retained.

(2) *Transfers of an interest in a section 721(c) partnership by a U.S. transferor or upper-tier partnership to a domestic corporation in certain nonrecognition transactions.* A successor event occurs if a U.S. transferor or a partnership in which a U.S. transferor is a direct or indirect partner transfers (directly or indirectly through one or more partnerships) an interest in a section 721(c) partnership to a domestic corporation in a transaction to which section 351 or 381 applies, and the gain deferral method is continued by treating the transferee domestic corporation as the U.S. transferor for purposes of the section 721(c) regulations. If the transfer described in this paragraph (c)(2) also results in a termination under section 708(b)(1)(B) of the section 721(c) partnership, see paragraph (c)(4) of this section.

(3) *Transfers of an interest in a section 721(c) partnership in an intercompany transaction.* A successor event occurs if a U.S. transferor that is a member of a consolidated group (as defined in § 1.1502-1(h)) transfers (directly or indirectly through one or more partnerships) an interest in a section 721(c) partnership in an intercompany transaction (as defined in § 1.1502-13(b)(1)), and the gain deferral method is continued by treating the transferee member as the U.S. transferor for purposes of the section 721(c) regulations. If the transfer described in this paragraph (c)(3) also results in a termination under section 708(b)(1)(B) of the section 721(c) partnership, see paragraph (c)(4) of this section.

(4) *Termination under section 708(b)(1)(B) of a section 721(c) partnership.* A successor event occurs if there is a termination under section 708(b)(1)(B) of a section 721(c) partnership, and the gain deferral method is continued by treating the new partnership as the section 721(c) partnership for purposes of the section 721(c) regulations.

(5) *Transactions involving tiered partnerships*—(i) *Contributions of section 721(c) property to a lower-tier*

partnership. A successor event occurs if a section 721(c) partnership contributes the section 721(c) property to a partnership that is a controlled partnership with respect to the U.S. transferor (lower-tier section 721(c) partnership) and the requirements of paragraphs (c)(5)(i)(A), (B), and (C) of this section are satisfied.

(A) The lower-tier section 721(c) partnership is a section 721(c) partnership or is treated as a section 721(c) partnership.

(B) The gain deferral method is applied with respect to the section 721(c) property in the hands of the lower-tier section 721(c) partnership.

(C) The gain deferral method is applied with respect to the section 721(c) partnership's interest in the lower-tier section 721(c) partnership. See §§ 1.721(c)-3T(b)(5) and (d)(2).

(ii) *Contributions of an interest in a section 721(c) partnership to an upper-tier partnership.* A successor event occurs if a U.S. transferor or a partnership in which a U.S. transferor is a direct or indirect partner contributes (directly or indirectly through one or more partnerships) an interest in a section 721(c) partnership to a partnership that is a controlled partnership with respect to the U.S. transferor (upper-tier section 721(c) partnership) and the requirements of paragraphs (c)(5)(ii)(A), (B), (C), and (D) of this section are satisfied.

(A) The gain deferral method is continued with respect to the section 721(c) property in the hands of the section 721(c) partnership.

(B) The upper-tier section 721(c) partnership is, or is treated as, a section 721(c) partnership.

(C) If the upper-tier section 721(c) partnership directly owns its interest in the section 721(c) partnership, the gain deferral method is applied with respect to the upper-tier section 721(c) partnership's interest in the section 721(c) partnership. See § 1.721(c)-3T(b)(5) and (d)(1).

(D) If the upper-tier section 721(c) partnership indirectly owns its interest in the section 721(c) partnership through one or more partnerships, the principles of paragraphs (c)(5)(ii)(B) and (C) of this section are applied with respect to each partnership through which the upper-tier section 721(c) partnership indirectly owns an interest in the section 721(c) partnership.

(d) *Partial acceleration events*—(1) *In general.* Notwithstanding § 1.721(c)-4T, a partial acceleration event with respect to section 721(c) property does not constitute an acceleration event. In these cases, except as provided in paragraph (d)(3) of this section, the rules

in § 1.721(c)-4T(c) (concerning the consequences of an acceleration event) for making basis adjustments apply to the extent that the U.S. transferor is required to recognize gain under paragraph (d)(2) or (3) of this section. Furthermore, if there is remaining built-in gain with respect to the section 721(c) property after the application of this paragraph (d), the application of the gain deferral method with respect to the section 721(c) property must be continued in the same manner.

(2) *Regulatory allocations.* If a regulatory allocation is described in § 1.721(c)-3T(c)(4)(i) but not in § 1.721(c)-3T(c)(4)(i)(A) or (B), a partial acceleration event occurs with respect to section 721(c) property if the U.S. transferor recognizes an amount of gain (but not in excess of remaining built-in gain) equal to the amount of the allocation that, under the consistent allocation method, had the regulatory allocation not occurred, would have been allocated to the U.S. transferor in the case of income or gain, or would not have been allocated to the U.S. transferor in the case of deduction or loss.

(3) *Certain distributions of other partnership property to a partner that result in an adjustment under section 734.* A partial acceleration event occurs with respect to section 721(c) property if there is a distribution of other property by the section 721(c) partnership that results in a positive basis adjustment to the section 721(c) property under section 734. In these cases, the U.S. transferor must recognize an amount of gain (but not in excess of the remaining built-in gain) equal to the positive basis adjustment to the section 721(c) property under section 734, reduced (but not below zero) by the amount of gain recognized by the U.S. transferor (or a member of its consolidated group (as defined in § 1.1502-1(h))) under section 731(a). In these cases, the partnership will not increase its basis under § 1.721(c)-4T(c)(2) by the amount of gain recognized by the U.S. transferor.

(e) *Transfers described in section 367 of section 721(c) property to a foreign corporation.* If a section 721(c) partnership transfers section 721(c) property, or a U.S. transferor or a partnership in which a U.S. transferor is a direct or indirect partner transfers (directly or indirectly through one or more partnerships) all or a portion of an interest in a section 721(c) partnership that owns section 721(c) property, to a foreign corporation in a transaction described in section 367, then, the property will no longer be subject to the gain deferral method. To the extent any

U.S. transferor is treated as transferring the section 721(c) property to the foreign corporation for purposes of section 367, the tax consequences will be determined under section 367. In this regard, see §§ 1.367(a)-1T(c)(3)(i) and (ii), 1.367(d)-1T(d)(1), and 1.367(e)-2(b)(1)(iii) (providing for the aggregate treatment of partnerships). However, for the remaining portion of the property (if any), the U.S. transferor must recognize an amount of gain equal to the remaining built-in gain that would have been allocated to the U.S. transferor if the section 721(c) partnership had sold that portion of the section 721(c) property immediately before the transfer for fair market value. The stock in the transferee foreign corporation received will not be subject to the gain deferral method. The rules in § 1.721(c)-4T(c) (concerning the consequences of an acceleration event) for making basis adjustments will apply to the extent that the U.S. transferor recognizes gain under this paragraph (e).

(f) *Fully taxable dispositions of a portion of an interest in a partnership.* If a U.S. transferor or a partnership in which a U.S. transferor is a direct or indirect partner disposes of (directly or indirectly through one or more partnerships) a portion of an interest in a section 721(c) partnership in a transaction in which all gain or loss, if any, is recognized, an acceleration event will not occur with respect to the portion of the interest transferred. The gain deferral method will continue to apply with respect to the section 721(c) property of the section 721(c) partnership. The principles of § 1.704-3(a)(7) will apply to determine the remaining built-in gain in section 721(c) property that is attributable to the portion of the interest in a section 721(c) partnership that is retained. This paragraph (f) will not apply to an intercompany transaction (as defined in § 1.1502-13(b)(1)).

(g) *Applicability dates*—(1) *In general.* Except as provided in paragraph (g)(2) of this section, this section applies to contributions occurring on or after January 18, 2017, and to contributions occurring before January 18, 2017, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed on or after January 18, 2017.

(2) *Election to apply this section retroactively.* This section may, by election, be applied to a contribution occurring on or after August 6, 2015, but before January 18, 2017, and to a contribution occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed

on or after August 6, 2015. The election is made by applying this section to the contribution on a timely filed original return (including extensions) or an amended return filed no later than six months after January 18, 2017.

(h) *Expiration date.* The applicability of this section expires on January 17, 2020.

■ **Par. 13.** Section 1.721(c)–6T is added to read as follows:

§ 1.721(c)–6T Procedural and reporting requirements (temporary).

(a) *Scope.* This section provides procedural and reporting requirements that must be satisfied under § 1.721(c)–3T(b)(3) of the gain deferral method. Paragraph (b) of this section describes the procedural and reporting requirements of a U.S. transferor. Paragraph (c) of this section describes information required to be reported with respect to related foreign persons and partnerships. Paragraph (d) of this section describes the procedural and reporting requirements of a section 721(c) partnership with a section 6031 filing obligation. Paragraph (e) of this section provides the proper signatory for the information provided under this section. Paragraph (f) of this section provides relief for certain failures to comply that are not willful. Paragraph (g) of this section provides the dates of applicability, and paragraph (h) of this section provides the date of expiration. For definitions that apply for purposes of this section, see § 1.721(c)–1T(b).

(b) *Procedural and reporting requirements of a U.S. transferor—(1) In general.* This paragraph (b) describes the procedural and reporting requirements that a U.S. transferor (as defined § 1.721(c)–1T(b)(18)(i)) must satisfy in applying the gain deferral method. The information required under this paragraph (b) must be included with the U.S. transferor's timely filed return on (or attached to) the appropriate forms (including Form 8865, Schedule O, Transfer of Property to a Foreign Partnership), and must be submitted in the form and manner and to the extent prescribed by the form (and its accompanying instructions).

(2) *Reporting of a gain deferral contribution.* A U.S. transferor must report the following information with respect to a gain deferral contribution:

(i) A statement, titled “Statement of Application of the Gain Deferral Method under Section 721(c),” that contains the following information with respect to the section 721(c) property—

(A) A description of the property and recovery period (or periods) for the property;

(B) Whether the property is an intangible described in section 197(f)(9);

(C) A calculation of the built-in gain, the basis, and fair market value on the date of the contribution, including the amount of gain recognized by the U.S. transferor, if any, on the gain deferral contribution;

(D) The name, U.S. taxpayer identification number (if any), address, and country of organization (if any) of each direct or indirect partner in the section 721(c) partnership that is a related person with respect to the U.S. transferor, and a description of each partner's interest in capital and profits immediately after the gain deferral contribution; and

(E) When the section 721(c) property is a partnership interest, the information described in paragraphs (b)(2)(i)(A) through (D) of this section with respect to each property of a lower-tier partnership to which the gain deferral method is applied under § 1.721(c)–3T(d)(1);

(ii) A statement, titled “Consent to Extend the Time to Assess Tax Pursuant to the Gain Deferral Method under Section 721(c),” completed and executed in the manner prescribed in forms and instructions, extending the period of limitations on the assessment of tax as described in paragraph (b)(5) of this section;

(iii) A copy of the waiver of treaty benefits described in paragraphs (c)(1) of this section (if any);

(iv) Information relating to the section 721(c) partnership described in paragraph (c)(2) of this section (if any);

(v) With respect to any foreign partnership (or partnership treated as foreign under paragraph (b)(4) of this section) the information required under § 1.6038B–2(c)(1) through (7); and

(vi) The information required under paragraph (b)(3) of this section.

(3) *Annual reporting relating to gain deferral method.* A U.S. transferor must file an annual statement, titled “Annual Statement of Application of the Gain Deferral Method under Section 721(c),” for each gain deferral contribution. The information in the statement must be with respect to the partnership taxable year that ends with, or within, the taxable year of the U.S. transferor, beginning with the partnership's taxable year that includes the date of the gain deferral contribution and ending with the last taxable year in which the gain deferral method is applied to the section 721(c) property. The statement must contain the following information:

(i) The amount of book income, gain, deduction, and loss and tax items allocated to the U.S. transferor with respect to the section 721(c) property,

including a description of any regulatory allocations;

(ii) The proportion (expressed as a percentage) in which the book income, gain, deduction, and loss with respect to the section 721(c) property was allocated among the U.S. transferor and related persons that are partners in the section 721(c) partnership under the consistent allocation method;

(iii) The amount of remaining built-in gain at the beginning of the taxable year, the remedial income allocated to the U.S. transferor under the remedial allocation method, the amount of built-in gain taken into account by reason of an acceleration event or partial acceleration event (if any), the partnership's adjustment to its tax basis in the section 721(c) property, and the remaining built-in gain at the end of the taxable year;

(iv) A declaration stating whether an acceleration event or partial acceleration event occurred during the taxable year, the date of the event, and a description of the event (including a citation to the relevant paragraph of § 1.721(c)–5T(d) in the case of a partial acceleration event, and whether the acceleration event is described in § 1.721(c)–4T(b)(4);

(v) A description of a termination event or any successor event that occurred during the taxable year with a citation to the relevant paragraph of § 1.721(c)–5T(b) or (c), the date of the event, and, in the case of a successor event, the name, address, and U.S. taxpayer identification number (if any) of any successor partnership, lower-tier partnership, upper-tier partnership, or U.S. corporation (as applicable);

(vi) A description of all transfers of 721(c) property to a foreign corporation described in § 1.721–5T(e) that occurred during the taxable year, and for each transfer, the date of the transfer, the section 721(c) property transferred, and the name, address, and U.S. taxpayer identification number (if any) of the foreign transferee corporation;

(vii) With respect to section 721(c) property for which a waiver of treaty benefits was filed under paragraph (b)(2)(iii) of this section, a declaration that, after exercising reasonable diligence, to the best of the U.S. transferor's knowledge and belief, all income from the section 721(c) property allocated to the partners during the taxable year remained subject to taxation as income effectively connected with the conduct of a trade or business within the United States (under either section 871 or 882) for all direct or indirect partners that are related foreign persons with respect to the U.S. transferor (regardless of whether any

such partner was a partner at the time of the gain deferral contribution), and, that neither the partnership nor any such partner has made any claim under any income tax convention to an exemption from U.S. income tax or a reduced rate of U.S. income taxation on income derived from the use of the section 721(c) property;

(viii) A statement, titled "Consent to Extend the Time To Assess Tax Pursuant to the Gain Deferral Method under Section 721(c)," completed and executed as prescribed in forms and instructions, extending the period of limitations on the assessment of tax, in the case of a gain deferral contribution, as described in paragraph (b)(5)(ii) of this section, and, in the case of certain contributions on which gain is recognized, as described in paragraph (b)(5)(iii) of this section;

(ix) If the section 721(c) partnership is a partnership that does not have a filing obligation under section 6031, the information described in § 1.6038-3(g) (contents of information returns required of certain United States persons with respect to controlled foreign partnerships), if not already reported elsewhere, without regard to whether the section 721(c) partnership is a controlled foreign partnership within the meaning of section 6038. If the U.S. transferor is not a controlling fifty-percent partner (as defined in § 1.6038-3(a)), the U.S. transferor complies with the requirement of this paragraph (b)(3)(ix) by providing only the information described in § 1.6038-3(g)(1);

(x) A description of all section 721(c) property contributed by the U.S. transferor to the section 721(c) partnership (including pursuant to a contribution described in § 1.721(c)-2T(d)(1)) during the taxable year to which the gain deferral method is not applied; and

(xi) The information required in paragraphs (c)(2) and (3) of this section for related foreign persons that are direct or indirect partners in the section 721(c) partnership and the section 721(c) partnership itself (if any).

(4) *Domestic partnerships treated as foreign.* Solely for purposes of this section, a U.S. transferor must treat a domestic section 721(c) partnership as a foreign partnership if the partnership was formed on or after January 18, 2017. If the section 721(c) partnership has an information return filing obligation under section 6031, that requirement is not affected by the requirement of this paragraph (b)(4) that the U.S. transferor treat the partnership as a foreign partnership.

(5) *Extension of period of limitations on assessment of tax.* In order to comply with the gain deferral method, a U.S. transferor must extend the period of limitations on the assessment of tax:

(i) With respect to the gain realized but not recognized on a gain deferral contribution, through the close of the eighth full taxable year following the U.S. transferor's taxable year that includes the date of the gain deferral contribution;

(ii) With respect to all book and tax items with respect to the section 721(c) property allocated to the U.S. transferor in the partnership's taxable year that includes the date of the gain deferral contribution and the subsequent two years, through the close of the sixth full taxable year following such taxable year with which, or within which, the partnership's taxable year ends; and

(iii) With respect to the gain recognized on a contribution of section 721(c) property to a section 721(c) partnership for which the gain deferral method is not applied, if the contribution occurs within five partnership taxable years following a partnership taxable year that includes the date of a gain deferral contribution, through the close of the fifth full taxable year following the U.S. transferor's taxable year that includes the date of the contribution on which gain is recognized.

(c) *Information with respect to section 721(c) partnerships and related foreign persons—*(1) *Effectively connected income.* If the gain deferral method is applied with respect to a contribution of section 721(c) property that satisfies the condition in § 1.721(c)-3T(b)(1)(ii), the U.S. transferor must obtain a statement from the section 721(c) partnership and from each related foreign person that is a direct or indirect partner in the section 721(c) partnership, titled "Statement of Waiver of Treaty Benefits under § 1.721(c)-6T," pursuant to which the partner and the partnership waive any claim under any income tax convention (whether or not currently in force at the time of the contribution) to an exemption from U.S. income tax or a reduced rate of U.S. income taxation on income derived from the use of the section 721(c) property for the period during which the section 721(c) property is subject to the gain deferral method.

(2) *Partnerships in tiered-partnership structures applying the gain deferral method.* If the gain deferral method is applied as a result of a transaction described in § 1.721(c)-3T(d), the U.S. transferor must supply all information that a section 721(c) partnership would be required to report under paragraph

(b) of this section if the section 721(c) partnership were a U.S. transferor.

(3) *Schedules K-1 for related foreign partners.* If a section 721(c) partnership does not have a filing obligation under section 6031, the U.S. transferor must obtain a Schedule K-1 (Form 8865), Partner's Share of Income, Deduction, Credits, etc., for all related foreign persons that are direct or indirect partners in the section 721(c) partnership.

(d) *Reporting and procedural requirements of a section 721(c) partnership with a section 6031 filing obligation—*(1) *Waiver of treaty benefits.* A section 721(c) partnership with a return filing obligation under section 6031 must include its waiver of treaty benefits described in paragraph (c)(1) of this section with its tax return for the taxable year that includes the date of the gain deferral contribution.

(2) *Information on Schedule K-1.* A section 721(c) partnership with a return filing obligation under section 6031 must provide the relevant information necessary for the U.S. transferor to comply with the requirements in paragraphs (b)(2) and (3) of this section with the U.S. transferor's Schedule K-1 (Form 1065), Partner's Share of Income, Deductions, Credits, etc. The partnership must also attach to its Form 1065 a Schedule K-1 (Form 1065) for each partner that is a related foreign person with respect to the U.S. transferor.

(e) *Signatory.* The statements required in this section must be signed under penalties of perjury by an agent of the U.S. transferor, the related foreign person that is a direct or indirect partner in the section 721(c) partnership, or the section 721(c) partnership, as applicable, that is authorized to sign under a general or specific power of attorney, or by an appropriate party. For the U.S. transferor, an appropriate party is a person described in § 1.367(a)-8(e)(1). For a partnership with a section 6031 filing obligation, an appropriate party is any party authorized to sign Form 1065.

(f) *Relief for certain failures to file or failures to comply that are not willful—*(1) *In general.* This paragraph (f)(1) provides relief from the failure to comply with the procedural and reporting requirements of the gain deferral method prescribed by § 1.721(c)-3T(b)(3) and provided in paragraph (b) of this section if there is a failure to file or to include information required by this section (failure to comply). A failure to comply will be deemed not to have occurred for purposes of § 1.721(c)-3T(b)(3) if the U.S. transferor demonstrates that the

failure was not willful using the procedure provided in this paragraph (f). For this purpose, willful is to be interpreted consistent with the meaning of that term in the context of other civil penalties, which would include a failure due to gross negligence, reckless disregard, or willful neglect. Whether a failure to comply was willful will be determined by the Director of Field Operations, Cross Border Activities Practice Area of Large Business & International (or any successor to the roles and responsibilities of such position, as appropriate) (Director) based on all the facts and circumstances. The U.S. transferor must submit a request for relief and an explanation as provided in paragraph (f)(2) of this section. A U.S. transferor whose failure to comply is determined not to be willful under this paragraph will be subject to a penalty under section 6038B if it fails to satisfy the applicable reporting requirements under that section and does not demonstrate that the failure was due to reasonable cause and not willful neglect. See § 1.6038B-2(h). The determination of whether the failure to comply was willful under this section has no effect on any request for relief made under § 1.6038B-2(h).

(2) *Procedures for establishing that a failure to comply was not willful*—(i) *Time and manner of submission.* A U.S. transferor's statement that a failure to comply was not willful will be considered only if, promptly after the U.S. transferor becomes aware of the failure, an amended return is filed for the taxable year to which the failure relates that includes the information that should have been included with the original return for such taxable year or that otherwise complies with the rules of this section as well as a written statement explaining the reasons for the failure to comply. The U.S. transferor also must file, with the amended return, a Form 8865, Schedule O, and a statement (as described in paragraph (b)(5) of this section), completed and executed as prescribed in forms and instructions, consenting to extend the period of limitations on assessment of tax with respect to the gain realized but not recognized on the gain deferral contribution to the later of the close of the eighth full taxable year following the taxable year during which the contribution occurred (*date one*), or the close of the third full taxable year ending after the date on which the required information is provided to the Director (*date two*). However, the U.S. transferor is not required to file a Form 8865, Schedule O, with the amended

return if both *date one* is later than *date two* and a consent to extend the period of limitations on assessment of tax with respect to the gain realized but not recognized on the gain deferral contribution for the U.S. transferor's taxable year that includes the date of the contribution was previously submitted with a Form 8865, Schedule O. The amended return and either a Form 8865, Schedule O, or a copy of the previously filed Form 8865, Schedule O, as the case may be, must be filed with the Internal Revenue Service at the location where the U.S. transferor filed its original return. The U.S. transferor may submit a request for relief from the penalty under section 6038B as part of the same submission. See § 1.6038B-2T(h)(3).

(ii) *Notice requirement.* In addition to the requirements of paragraph (f)(2)(i) of this section, the U.S. transferor must comply with the notice requirements of this paragraph (f)(2)(ii). If any taxable year of the U.S. transferor is under examination when the amended return is filed, a copy of the amended return must be delivered to the Internal Revenue Service personnel conducting the examination. If no taxable year of the U.S. transferor is under examination when the amended return is filed, a copy of the amended return must be delivered to the Director.

(g) *Applicability dates*—(1) *In general.* Except as provided in paragraphs (g)(2) and (3) of this section, this section applies with respect to contributions occurring on or after January 18, 2017, and with respect to contributions occurring before January 18, 2017, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed on or after January 18, 2017.

(2) *Reporting relating to effectively connected income.* Paragraphs (b)(2)(iii), (b)(3)(vii), and (d)(1) of this section apply to a contribution occurring on or after August 6, 2015, and to a contribution occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed on or after August 6, 2015, and, in either case, provided § 1.721(c)-3T(b)(1)(ii) applies to the contribution. To the extent that a previously filed return did not comply with paragraph (b)(2)(iii), (b)(3)(vii), or (d)(1) of this section, an amended return complying with such paragraphs must be filed no later than six months after January 18, 2017.

(3) *Transition rules.* For transfers occurring on or after August 6, 2015, and for transfers occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed

on or after August 6, a U.S. transferor (or a domestic partnership in which a U.S. transferor is a direct or indirect partner) must fulfill any reporting requirements imposed under sections 6038, 6038B, and 6046A and the regulations thereunder with respect to the contribution of the section 721(c) property to the section 721(c) partnership.

(h) *Expiration date.* The applicability of this section expires on January 17, 2020.

■ **Par. 14.** Section 1.721(c)-7T is added to read as follows:

§ 1.721(c)-7T Examples (temporary).

(a) *Presumed facts.* For purposes of the examples in paragraph (b) of this section, assume that there are no other transactions that are related to the transactions described in the examples and that all partnership allocations have substantial economic effect under section 704(b). For definitions that apply for purposes of this section, see § 1.721(c)-1T(b). Except where otherwise indicated, the following facts are presumed—

(1) USP and USX are domestic corporations that each use a calendar taxable year. USX is not a related person with respect to USP.

(2) CFC1, CFC2, FX, and FY are foreign corporations.

(3) USP wholly owns CFC1 and CFC2. Neither FX nor FY is a related person with respect to USP or with respect to each other.

(4) PRS1, PRS2, and PRS3 are foreign entities classified as partnerships for U.S. tax purposes. A partnership interest in PRS1, PRS2, and PRS3 is not described in section 475(c)(2).

(5) A taxable year is referred to, for example, as year 1.

(6) A partner in a partnership has the same percentage interest in income, gain, loss, deduction, and capital of the partnership.

(7) No property is described in section 197(f)(9) in the hands of a contributing partner.

(8) No partnership is a controlled partnership solely under the facts and circumstances test in § 1.721(c)-1T(b)(4).

(b) *Examples.* The application of the rules stated in §§ 1.721(c)-1T through 1.721(c)-6T may be illustrated by the following examples:

Example 1. Determining if a partnership is a section 721(c) partnership. (i) *Facts.* In year 1, USP and CFC1 form PRS1 as equal partners. CFC1 contributes cash of \$1.5 million to PRS1, and USP contributes three properties to PRS1: A patent with a book value of \$1.2 million and an adjusted tax basis of zero, a security (within the meaning

of section 475(c)(2)) with a book value of \$100,000 and an adjusted tax basis of \$20,000, and a machine with a book value of \$200,000 and an adjusted tax basis of \$600,000.

(ii) *Results.* (A) Under § 1.721(c)–1T(b)(18)(i), USP is a U.S. transferor because USP is a U.S. person and not a domestic partnership. Under § 1.721(c)–1T(b)(2), the patent has built-in gain of \$1.2 million. The patent is not excluded property under § 1.721(c)–1T(b)(6). Therefore, under § 1.721(c)–1T(b)(15)(i), the patent is section 721(c) property because it is property, other than excluded property, with built-in gain that is contributed by a U.S. transferor, USP.

(B) Under § 1.721(c)–1T(b)(2), the security has built-in gain of \$80,000. Under § 1.721(c)–1T(b)(6)(ii), the security is excluded property because it is described in section 475(c)(2). Therefore, the security is not section 721(c) property.

(C) The tax basis of the machine exceeds its book value. Under § 1.721(c)–1T(b)(6)(iii), the machine is excluded property and therefore is not section 721(c) property.

(D) Under § 1.721(c)–1T(b)(12), CFC1 is a related person with respect to USP, and under § 1.721(c)–1T(b)(11), CFC1 is a related foreign person. Because USP and CFC1 collectively own at least 80 percent of the interests in the capital, profits, deductions, or losses of PRS1, under § 1.721(c)–1T(b)(14)(i), PRS1 is a section 721(c) partnership upon the contribution by USP of the patent.

(E) The de minimis exception described in § 1.721(c)–2T(c) does not apply to the contribution because during PRS1's year 1 the sum of the built-in gain with respect to all section 721(c) property contributed in year 1 to PRS1 is \$1.2 million, which exceeds the de minimis threshold of \$1 million. As a result, under § 1.721(c)–2T(b), section 721(a) does not apply to USP's contribution of the patent to PRS1, unless the requirements of the gain deferral method are satisfied.

Example 2. Determining if partnership interest is section 721(c) property. (i) *Facts.* In year 1, USP and FX form PRS2. USP contributes a security (within the meaning of section 475(c)(2)) with a book value of \$100,000 and an adjusted tax basis of \$20,000 and a building located in country X with a book value of \$30,000 and an adjusted tax basis of \$8,000 in exchange for a 40-percent interest. FX contributes a machine with a book value of \$195,000 and an adjusted tax basis of \$250,000 in exchange for a 60-percent interest.

(ii) *Results.* PRS2 is not a section 721(c) partnership because FX is not a related person with respect to USP, USP's contributions to PRS2 are not subject to § 1.721(c)–2T(b).

(iii) *Alternative facts and results.* (A) Assume the same facts as in paragraph (i) of this *Example 2*. In addition, USP and CFC1 form PRS1 as equal partners. CFC1 contributes cash of \$130,000 to PRS1, and USP contributes its 40-percent interest in PRS2.

(B) PRS2's property consists of a security and a machine that are excluded property, and a building with built-in gain in excess of \$20,000. Under § 1.721(c)–1T(b)(iv),

because more than 90 percent of the value of the property of PRS2 consists of excluded property described in § 1.721(c)–1T(b)(6)(i) through (iii) (the security and the machine), any interest in PRS2 is excluded property. Therefore, the 40-percent interest in PRS2 contributed by USP to PRS1 is not section 721(c) property. Accordingly, USP's contribution of its interest in PRS2 to PRS1 is not subject to § 1.721(c)–2T(b).

Example 3. Assets-over tiered partnerships.

(i) *Facts.* In year 1, USP and CFC1 form PRS1 as equal partners. USP contributes a patent with a book value of \$300 million and an adjusted tax basis of \$30 million (USP contribution). CFC1 contributes cash of \$300 million. Immediately thereafter, PRS1 contributes the patent to PRS2 in exchange for a two-thirds interest (PRS1 contribution), and CFC2 contributes cash of \$150 million in exchange for a one-third interest. The patent has a remaining recovery period of 5 years out of a total of 15 years. With respect to all contributions described in § 1.721(c)–2T(b), the de minimis exception does not apply, and the gain deferral method is applied. Thus, the partnership agreements of PRS1 and PRS2 provide that the partnership will make allocations under section 704(c) using the remedial allocation method under § 1.704–3(d).

(ii) *Results: USP contribution.* PRS1 is a section 721(c) partnership as a result of the USP contribution.

(iii) *Results: PRS1 contribution.* (A) For purposes of determining whether PRS2 is a section 721(c) partnership as a result of the PRS1 contribution, under § 1.721(c)–2T(d)(1), USP is treated as contributing to PRS2 its share of the patent that PRS1 actually contributes to PRS2. USP and CFC1 are each one-third indirect partners in PRS2. Taking into account the one-third interest in PRS2 directly owned by CFC2, USP, CFC1, and CFC2 collectively own at least 80 percent of the interests in PRS2. Thus, PRS2 is a section 721(c) partnership as a result of the PRS1 contribution.

(B) Under § 1.721(c)–2T(b), section 721(a) does not apply to PRS1's contribution of the patent to PRS2, unless the requirements of the gain deferral method are satisfied. Under § 1.721(c)–3T(b), the gain deferral method must be applied with respect to the patent. In addition, under § 1.721(c)–3T(d)(2), because PRS1 is a controlled partnership with respect to USP, the gain deferral method must be applied with respect to PRS1's interest in PRS2, and, solely for purposes of applying the consistent allocation method, PRS2 must treat PRS1 as the U.S. transferor. As stated in paragraph (i) of this *Example 3*, the gain deferral method is applied. PRS2 is a controlled partnership with respect to USP. Under § 1.721(c)–5T(c)(5)(i), the PRS1 contribution is a successor event with respect to the USP contribution.

(iv) *Results: Application of remedial allocation method.* (A) Under § 1.704–3(d)(2), in year 1, PRS2 has \$24 million of book amortization with respect to the patent (\$6 million (\$30 million of book value equal to adjusted tax basis divided by the 5-year remaining recovery period) plus \$18 million (\$270 million excess of book value over tax basis divided by the new 15-year recovery

period)). PRS2 has \$6 million of tax amortization. Under the PRS2 partnership agreement, PRS2 allocates \$8 million of book amortization to CFC2 and \$16 million of book amortization to PRS1. Because of the application of the ceiling rule, PRS2 allocates \$6 million of tax amortization to CFC2 and \$0 of tax amortization to PRS1. Because the ceiling rule would cause a disparity of \$2 million between CFC2's book and tax amortization, PRS2 must make a remedial allocation of \$2 million of tax amortization to CFC2 and an offsetting remedial allocation of \$2 million of taxable income to PRS1.

(B) PRS1's distributive share of each of PRS2's items with respect to the patent is \$16 million of book amortization, \$0 of tax amortization, and \$2 million of taxable income from the remedial allocation from PRS1. Under § 1.704–3(a)(9), PRS1 must allocate its distributive share of each of PRS2's items with respect to the patent in a manner that takes into account USP's remaining built-in gain in the patent. Therefore, PRS1 allocates \$2 million of taxable income to USP. Under § 1.704–3T(a)(13)(ii), PRS1 treats its distributive share of each of PRS2's items of amortization with respect to PRS2's patent as items of amortization with respect to PRS1's interest in PRS2. Under the PRS1 partnership agreement, PRS1 allocates \$8 million of book amortization and \$0 of tax amortization to CFC1, and \$8 million of book amortization and \$0 of tax amortization to USP. Because the ceiling rule would cause a disparity of \$8 million between CFC1's book and tax amortization, PRS1 must make a remedial allocation of \$8 million of tax amortization to CFC1. PRS1 must also make an offsetting remedial allocation of \$8 million of taxable income to USP. USP reports \$10 million of taxable income (\$2 million of remedial income from PRS2 and \$8 million of remedial income from PRS1).

Example 4. Section 721(c) partnership ceases to have a related foreign person as a partner. (i) *Facts.* In year 1, USP and CFC1 form PRS1. USP contributes a trademark with a built-in gain of \$5 million in exchange for a 60-percent interest, and CFC1 contributes other property in exchange for the remaining 40-percent interest. With respect to all contributions described in § 1.721(c)–2T(b), the de minimis exception does not apply, and the gain deferral method is applied. On day 1 of year 4, CFC1 sells its entire interest in PRS1 to FX. There is no plan for a related foreign person with respect to USP to subsequently become a partner in PRS1 (or a successor).

(ii) *Results.* (A) PRS1 is a section 721(c) partnership.

(B) With respect to year 4, under § 1.721(c)–5T(b)(5), the sale is a termination event because, as a result of CFC1's sale of its interest, PRS1 will no longer have a partner that is a related foreign person, and there is no plan for a related foreign person to subsequently become a partner in PRS1 (or a successor). Thus, under § 1.721(c)–5T(b)(1), the trademark is no longer subject to the gain deferral method.

Example 5. Transfer described in section 367 of section 721(c) property to a foreign corporation. (i) *Facts.* In year 1, USP, CFC1,

and USX form PRS1. USP contributes a patent with a built-in gain of \$5 million in exchange for a 60-percent interest, CFC1 contributes other property in exchange for a 30-percent interest, and USX contributes cash in exchange for a 10-percent interest. With respect to all contributions described in § 1.721(c)–2T(b), the de minimis exception does not apply, and the gain deferral method is applied. In year 3, when the patent has remaining built-in gain, PRS1 transfers the patent to FX in a transaction described in section 351.

(ii) *Results.* (A) PRS1 is a section 721(c) partnership.

(B) With respect to year 3, the transfer of the patent to FX is a transaction described in section 367(d). Therefore, under § 1.721(c)–5T(e), the patent is no longer subject to the gain deferral method. Under §§ 1.367(d)–1T(d)(1) and 1.367(a)–1T(c)(3)(i), for purposes of section 367(d), USP and USX are treated as transferring their proportionate share of the patent actually transferred by PRS1 to FX. Under § 1.721(c)–5T(e), to the extent USP and USX are treated as transferring the patent to FX, the tax consequences are determined under section 367(d) and the regulations thereunder. With respect to the remaining portion of the patent, which is attributable to CFC1, USP must recognize an amount of gain equal to the remaining built-in gain that would have been allocated to USP if PRS1 had sold that portion of the patent immediately before the transfer for fair market value. Under § 1.721(c)–4T(c)(1), USP must increase the basis in its partnership interest in PRS1 by the amount of gain recognized by USP and under § 1.721(c)–4T(c)(2), immediately before the transfer, PRS1 must increase its basis in the patent by the same amount. The stock in FX received by PRS1 is not subject to the gain deferral method.

Example 6. Limited remedial allocation method for anti-churning property with respect to related partners. (i) *Facts.* USP, CFC1, and FX form PRS1. On January 1 of year 1, USP contributes intellectual property (IP) with a book value of \$600 million and an adjusted tax basis of \$0 in exchange for a 60-percent interest. The IP is a section 197(f)(9) intangible (within the meaning of § 1.197–2(h)(1)(i)) that was not an amortizable section 197 intangible in USP's hands. CFC1 contributes cash of \$300 million in exchange for a 30-percent interest, and FX contributes cash of \$100 million in exchange for a 10-percent interest. The IP is section 721(c) property, and PRS1 is a section 721(c) partnership. The gain deferral method is applied. The partnership agreement provides that PRS1 will make allocations under section 704(c) with respect to the IP using the remedial allocation method under § 1.704–3T(d)(5)(iii). All of PRS1's allocations with respect to the IP satisfy the requirements of the gain deferral method. On January 1 of year 16, PRS1 sells the IP for cash of \$900 million to a person that is not a related person. During years 1 through 16, PRS1 earns no income other than gain from the sale of the IP in year 16, has no expenses or deductions other than from amortization of the IP, and makes no distributions.

(ii) *Results: Year 1.* Under § 1.704–3T(d)(5)(iii)(B), PRS1 must recover the excess

of the book value of the IP over its adjusted tax basis at the time of the contribution (\$600 million) using any recovery period and amortization method that would have been available to PRS1 if the property had been newly purchased property from an unrelated party. Thus, under section 197(a), PRS1 must amortize \$600 million of the IP's book value ratably over 15 years for book purposes, and PRS1 will have \$40 million of book amortization per year without any tax amortization. Under the partnership agreement, in year 1, PRS1 allocates book amortization of \$24 million to USP, \$12 million to CFC1, and \$4 million to FX. Because in year 1 the ceiling rule would cause a disparity between FX's allocations of book and tax amortization, PRS1 makes a remedial allocation of tax amortization of \$4 million to FX and an offsetting remedial allocation of \$4 million of taxable income to USP. In year 1, the ceiling rule would also cause a disparity between CFC1's allocations of book and tax amortization. However, § 1.197–2(h)(12)(vii)(B) precludes PRS1 from making a remedial allocation of tax amortization to CFC1. Instead, pursuant to § 1.704–3T(d)(5)(iii)(C), PRS1 increases the adjusted tax basis in the IP by \$12 million, and pursuant to § 1.704–3T(d)(5)(iii)(D), that basis adjustment is solely with respect to CFC1. Pursuant to § 1.704–3T(d)(5)(iii)(C), PRS1 also makes an offsetting remedial allocation of \$12 million of taxable income to USP.

(iii) *Results: Years 2–15.* At the end of year 15, PRS1 has book basis and adjusted tax basis of \$0 in the IP. PRS1 has amortized \$600 million for book purposes by allocating total book amortization deductions of \$360 million to USP, \$180 million to CFC1, and \$60 million to FX. For U.S. tax purposes, by the end of year 15, PRS1 has made remedial allocations of \$60 million of tax amortization to FX and increased the adjusted tax basis in the IP by \$180 million solely with respect to CFC1. PRS1 has also made total remedial allocations of \$240 million of taxable income to USP (attributable to \$60 million of remedial tax amortization to FX and \$180 million of tax basis adjustments with respect to CFC1). With respect to their partnership interests in PRS1, USP has a capital account and an adjusted tax basis of \$240 million, CFC1 has a capital account of \$120 million and an adjusted tax basis of \$300 million, and FX has a capital account and an adjusted tax basis of \$40 million.

(iv) *Results: Sale of property in year 16.* PRS1's sale of the IP for cash of \$900 million on January 1 of year 16 results in \$900 million of book and tax gain (\$900 million–\$0). PRS1 allocates the book and tax gain 60 percent to USP (\$540 million), 10 percent to FX (\$90 million), and 30 percent to CFC1 (\$270 million). However, under § 1.704–3T(d)(5)(iii)(D)(3), CFC1's tax gain is \$90 million, equal to its share of PRS1's gain (\$270 million), minus the amount of the tax basis adjustment (\$180 million). After the sale, PRS1's only property is cash of \$1.3 billion. With respect to their partnership interests in PRS1, USP has a capital account and an adjusted tax basis of \$780 million, CFC1 has a capital account and an adjusted tax basis of \$390 million, and FX has a

capital account and an adjusted tax basis of \$130 million.

■ **Par. 15.** Section 1.6038B–2 is amended by:

■ 1. Revising paragraphs (a)(1)(i) and (ii), (a)(3), (c)(6) and (c)(7)(v).

■ 2. Adding paragraphs (a)(1)(iii) and (c)(8) and (9).

■ 3. Revising paragraphs (h)(1) introductory text and (h)(3).

■ 4. Adding paragraphs (j)(4) and (5).

The revisions and additions read as follows.

§ 1.6038B–2 Reporting of certain transfers to foreign partnerships.

(a) * * *

(1) * * *

(i) Immediately after the transfer, the United States person owns, directly, indirectly, or by attribution, at least a 10-percent interest in the partnership, as defined in section 6038(e)(3)(C) and the regulations thereunder;

(ii) The value of the property transferred, when added to the value of any other property transferred in a section 721 contribution by such person (or any related person) to the partnership during the 12-month period ending on the date of the transfer, exceeds \$100,000; or

(iii) [Reserved]. For further guidance, see § 1.6038B–2T(a)(1)(iii).

* * * * *

(3) [Reserved]. For further guidance, see § 1.6038B–2T(a)(3).

* * * * *

(c) * * *

(6) A separate description of each item of contributed property that is appreciated property subject to the allocation rules of section 704(c) (except to the extent that the property is permitted to be aggregated in making allocations under section 704(c)), or is intangible property, including its estimated fair market value and adjusted basis;

(7) * * *

(v) Other property;

(8) [Reserved]. For further guidance, see § 1.6038B–2T(c)(8); and

(9) [Reserved]. For further guidance, see § 1.6038B–2T(c)(9).

* * * * *

(h) * * *

(1) *Consequences of a failure.* If a United States person is required to file a return under paragraph (a) of this section and fails to comply with the reporting requirements of section 6038B and this section, or § 1.721(c)–6T, then that person is subject to the following penalties:

* * * * *

(3) [Reserved]. For further guidance, see § 1.6038B–2T(h)(3).

* * * * *

(j) * * *

(4) through (5) [Reserved]. For further guidance, see § 1.6038B-2T(j)(4) through (5).

■ **Par. 16.** Section 1.6038B-2T is added to read as follows:

§ 1.6038B-2T Reporting of certain transfers to foreign partnerships (temporary).

(a) introductory text through (a)(1)(ii) [Reserved]. For further guidance, see § 1.6038B-2(a) introductory text through (a)(1)(ii).

(iii) The United States person is a U.S. transferor (as defined in § 1.721(c)-1T(b)(18)) that makes a gain deferral contribution and is required to report under § 1.721(c)-6T(b)(2). The reporting required under this paragraph (a) includes the annual reporting required by § 1.721(c)-6T(b)(3). For purposes of applying this paragraph (a)(1)(iii) to partnerships formed on or after January 18, 2017, a domestic partnership is treated as a foreign partnership pursuant to section 7701(a)(4).

(a)(2) [Reserved]. For further guidance, see § 1.6038B-2(a)(2).

(3) *Indirect transfer through a foreign partnership.* Solely for purposes of this section, if a foreign partnership transfers section 721(c) property (as defined in § 1.721(c)-1T(b)(15)) to another foreign partnership in a transfer described in § 1.721(c)-3T(d) (tiered-partnership rules), then the transferor foreign partnership's partners will be considered to have transferred a proportionate share of the property to the foreign partnership.

(a)(4) through (c)(7) [Reserved]. For further guidance, see § 1.6038B-2(a)(4) through (c)(7).

(8) With respect to reporting required under § 1.721(c)-6T(b)(2) and paragraph (a)(1)(iii) of this section with regard to a gain deferral contribution, the

information required by § 1.721(c)-6T(b)(2); and

(9) With respect to section 721(c) property for which a statement is required to be filed under § 1.721(c)-6T(b)(3) and paragraph (a)(1)(iii) of this section, the information required by § 1.721(c)-6T(b)(3).

(d) through (h)(2) [Reserved]. For further guidance, see § 1.6038B-2(d) through (h)(2).

(3) *Reasonable cause exception.* Under section 6038B(c)(2) and this section, the provisions of paragraph (h)(1) of this section will not apply if the United States person shows, in a timely manner, that a failure to comply was due to reasonable cause and not willful neglect. A United States person's statement that the failure to comply was due to reasonable cause and not willful neglect will be considered timely only if, promptly after the United States person becomes aware of the failure, an amended return is filed for the taxable year to which the failure relates that includes the information that should have been included with the original return for such taxable year or that otherwise complies with the rules of this section, and that includes a written statement explaining the reasons for the failure to comply. If any taxable year of the United States person is under examination when the amended return is filed, a copy of the amended return must be delivered to the Internal Revenue Service personnel conducting the examination when the amended return is filed. If no taxable year of the United States person is under examination when the amended return is filed, a copy of the amended return must be delivered to the Director of Field Operations, Cross Border Activities Practice Area of Large Business & International (or any successor to the roles and responsibilities of such position, as

appropriate) (Director). Whether a failure to comply was due to reasonable cause and not willful neglect will be determined by the Director under all the facts and circumstances.

(i) through (j)(3) [Reserved]. For further guidance, see § 1.6038B-2(i) through (j)(3).

(4) *Transfers of section 721(c) property—(i) Applicability dates.* Paragraph (c)(8) of this section applies to transfers occurring on or after August 6, 2015, and to transfers occurring before August 6, 2015, resulting from an entity classification election made under § 301.7701-3 of this chapter that is filed on or after August 6, 2015. Paragraphs (a)(1)(iii), (a)(3), and (c)(9) of this section apply to transfers occurring on or after January 18, 2017, and to transfers occurring before January 18, 2017, resulting from entity classification elections made under § 301.7701-3 of this chapter that are filed on or after January 18, 2017.

(ii) *Expiration date.* The applicability of paragraphs (a)(1)(iii), (a)(3), and (c)(8) and (9) of this section expires on January 17, 2020.

(5) *Reasonable cause exception—(i) Applicability date.* Paragraph (h)(3) of this section applies to all requests for relief for transfers of property to partnerships filed on or after February 21, 2017.

(ii) *Expiration date.* The applicability of paragraph (h)(3) of this section expires on January 17, 2020.

John Dalrymple,

Deputy Commissioner for Services and Enforcement.

Approved: January 10, 2017.

Mark J. Mazur,

Assistant Secretary of the Treasury (Tax Policy).

Title 3—

Proclamation 9568 of January 13, 2017

The President

Martin Luther King, Jr., Federal Holiday, 2017

By the President of the United States of America

A Proclamation

When the Reverend Dr. Martin Luther King, Jr., shared his dream with the world atop the steps of the Lincoln Memorial, he gave mighty voice to our founding ideals. Few could have imagined that nearly half a century later, his iconic profile would forever be memorialized in stone, standing tall and gazing outward, not far from where he stirred our collective conscience to action. In summoning a generation to recognize the universal threat of injustice anywhere, Dr. King's example has proven that those who love their country can change it.

A foot soldier for justice and a giant of the Civil Rights Movement, Dr. King lifted the quiet hopes of our Nation with the powers of his voice and pen. Whether behind his pulpit in Montgomery, at a podium on the National Mall, or from his jail cell in Birmingham, he beckoned us toward justice through non-violent resistance and oratory skill. Dr. King fought not merely for the absence of oppression but for the presence of opportunity. His soaring rhetoric impelled others to take up his cause, and with struggle and discipline, persistence and faith, those who joined him on his journey began to march. America was watching, and so they kept marching; America was listening, and so they kept sounding the call for justice. Because they kept moving forward with unwavering resistance, they changed not only laws but also hearts and minds. And as change rippled across the land, it began to strengthen over time, building on the progress realized on buses, in schools, and at lunch counters so that eventually, it would reverberate in the halls of government and be felt in the lives of people across our country.

Those who dismiss the magnitude of the progress that has been made dishonor the courage of all who marched and struggled to bring about this change—and those who suggest that the great task of extending our Nation's promise to every individual is somehow complete neglect the sacrifices that made it possible. Dr. King taught us that “The ultimate measure of a man is not where he stands in moments of convenience and comfort, but where he stands at times of challenge and controversy.” Although we do not face the same challenges that spurred the Civil Rights Movement, the fierce urgency of now—and the need for persistence, determination, and constant vigilance—is still required for us to meet the complex demands and defeat the injustices of our time. With the same iron will and hope in our hearts, it is our duty to secure economic opportunity, access to education, and equal treatment under the law for all. The arc of the moral universe may bend toward justice, but it only bends because of the strength and sacrifice of those who reject complacency and drive us forward.

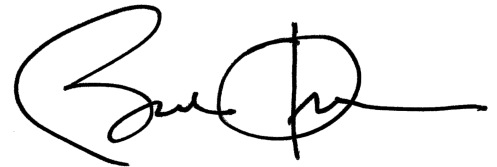

As we reflect on Dr. King's legacy, we celebrate a man and a movement that transformed our country, and we remember that our freedom is inextricably bound to the freedom of others. Given the causes he championed—from civil rights and international peace to job creation and economic justice—it is right that today we honor his work by serving others. Now more than ever, we must heed his teachings by embracing our convictions. We must live our values, strive for righteousness, and bring goodness to

others. And at a time when our politics are so sharply polarized and people are losing faith in our institutions, we must meet his call to stand in another person's shoes and see through their eyes. We must work to understand the pain of others, and we must assume the best in each other. Dr. King's life reminds us that unconditional love will have the final word—and that only love can drive out hate.

Only by drawing on the lessons of our past can we ensure the flame of justice continues to shine. By standing up for what we know to be right and speaking uncomfortable truths, we can align our reality closer with the ideal enshrined in our founding documents that all people are created equal. In remembering Dr. King, we also remember that change has always relied on the willingness of our people to keep marching forward. If we do, there is no mountaintop or promised land we cannot reach.

NOW, THEREFORE, I, BARACK OBAMA, President of the United States of America, by virtue of the authority vested in me by the Constitution and the laws of the United States, do hereby proclaim January 16, 2017, as the Martin Luther King, Jr., Federal Holiday. I encourage all Americans to observe this day with appropriate civic, community, and service projects in honor of Dr. King and to visit www.MLKDay.gov to find Martin Luther King, Jr., Day of Service projects across our country.

IN WITNESS WHEREOF, I have hereunto set my hand this thirteenth day of January, in the year of our Lord two thousand seventeen, and of the Independence of the United States of America the two hundred and forty-first.

Proclamation 9569 of January 13, 2017

Religious Freedom Day, 2017

By the President of the United States of America

A Proclamation

Believing that “Almighty God hath created the mind free,” Thomas Jefferson authored the Virginia Statute for Religious Freedom after our young Nation declared its independence. This idea of religious liberty later became a foundation for the First Amendment, which begins by stating that “Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof . . .” On Religious Freedom Day, we rededicate ourselves to defending these fundamental principles, pay tribute to the many ways women and men of different religious and non-religious backgrounds have shaped America’s narrative, and resolve to continue forging a future in which all people are able to practice their faiths freely or not practice at all.

Religious freedom is a principle based not on shared ancestry, culture, ethnicity, or faith but on a shared commitment to liberty—and it lies at the very heart of who we are as Americans. As a Nation, our strength comes from our diversity, and we must be unified in our commitment to protecting the freedoms of conscience and religious belief and the freedom to live our lives according to them. Religious freedom safeguards religion, allowing us to flourish as one of the most religious countries on Earth, but it also strengthens our Nation as a whole. Brave men and women of faith have challenged our conscience and brought us closer to our founding ideals, from the abolition of slavery to the expansion of civil rights and workers’ rights. And throughout our history, faith communities have helped uphold these values by joining in efforts to help those in need—rallying in the face of tragedy and providing care or shelter in times of disaster.

As they built this country, our Founders understood that religion helps strengthen our Nation when it is not an extension of the State. And because our Government does not sponsor a religion—nor pressure anyone to practice a particular faith or any faith at all—we have a culture that aims to ensure people of all backgrounds and beliefs can freely and proudly worship without fear or coercion. Yet in 2015, nearly 20 percent of hate crime victims in America were targeted because of religious bias. That is unacceptable—and as Americans, we have an obligation to do better.

If we are to defend religious freedom, we must remember that when any religious group is targeted, we all have a responsibility to speak up. At times when some try to divide us along religious lines, it is imperative that we recall the common humanity we share—and reject a politics that seeks to manipulate, prejudice, or bias, and that targets people because of religion. Part of being American means guarding against bigotry and speaking out on behalf of others, no matter their background or belief—whether they are wearing a hijab or a baseball cap, a yarmulke or a cowboy hat.

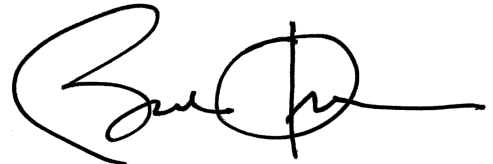

Today, we must also remember those outside the United States who are persecuted for their faith or beliefs, including those who have lost their lives in attacks on sacred places. Religious liberty is more than a cornerstone of American life—it is a universal and inalienable right—and as members of a global community, we must strive to ensure that all people can enjoy

that right in peace and security. That is why my Administration has worked with coalitions around the globe to end discrimination against religious minorities, protect vulnerable communities, and promote religious freedom for all. We have also worked to ensure that those who are persecuted for their religious beliefs can find safety and a new home in the United States and elsewhere.

America has changed a great deal since Thomas Jefferson first drafted the Virginia Statute for Religious Freedom, but religious liberty is a right we must never stop striving to uphold. Today, let us work to protect that precious right and ensure all people are able to go about their day in safety and with dignity—without living in fear of violence or intimidation—in our time and for generations to come.

NOW, THEREFORE, I, BARACK OBAMA, President of the United States of America, by virtue of the authority vested in me by the Constitution and the laws of the United States, do hereby proclaim January 16, 2017, as Religious Freedom Day. I call on all Americans to commemorate this day with events and activities that teach us about this critical foundation of our Nation's liberty, and that show us how we can protect it for future generations at home and around the world.

IN WITNESS WHEREOF, I have hereunto set my hand this thirteenth day of January, in the year of our Lord two thousand seventeen, and of the Independence of the United States of America the two hundred and forty-first.

A handwritten signature in black ink, appearing to be "Barack Obama", with a stylized circular flourish at the end.

Executive Order 13762 of January 13, 2017

Providing an Order of Succession Within the Department of Justice

By the authority vested in me as President by the Constitution and the laws of the United States of America, including the Federal Vacancies Reform Act of 1998, 5 U.S.C. 3345 *et seq.*, it is hereby ordered that:

Section 1. *Order of Succession.* Subject to the provisions of section 2 of this order, the following officers, in the order listed, shall act as and perform the functions and duties of the office of Attorney General, during any period in which the Attorney General, the Deputy Attorney General, the Associate Attorney General, and any officers designated by the Attorney General pursuant to 28 U.S.C. 508 to act as Attorney General have died, resigned, or otherwise become unable to perform the functions and duties of the office of Attorney General, until such time as at least one of the officers mentioned above is able to perform the functions and duties of that office:

- (a) United States Attorney for the District of Columbia;
- (b) United States Attorney for the Northern District of Illinois; and
- (c) United States Attorney for the Central District of California.

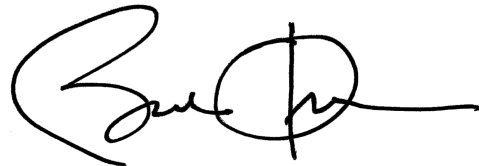

Sec. 2. *Exceptions.* (a) No individual who is serving in an office listed in section 1 of this order in an acting capacity, by virtue of so serving, shall act as Attorney General pursuant to this order.

(b) No individual listed in section 1 shall act as Attorney General unless that individual is otherwise eligible to so serve under the Federal Vacancies Reform Act of 1998.

(c) Notwithstanding the provisions of this order, the President retains discretion, to the extent permitted by law, to depart from this order in designating an acting Attorney General.

Sec. 3. Executive Order 13557 of November 4, 2010, is revoked.

Sec. 4. This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity, by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

Presidential Documents

Executive Order 13763 of January 13, 2017

Providing an Order of Succession Within the Environmental Protection Agency

By the authority vested in me as President by the Constitution and the laws of the United States of America, including the Federal Vacancies Reform Act of 1998, as amended, 5 U.S.C. 3345 *et seq.* (the “Act”), it is hereby ordered that:

Section 1. Order of Succession. Subject to the provisions of section 2 of this order, and to the limitations set forth in the Act, the following officials of the Environmental Protection Agency, in the order listed, shall act as and perform the functions and duties of the office of the Administrator of the Environmental Protection Agency (Administrator) during any period in which the Administrator and the Deputy Administrator of the Environmental Protection Agency have died, resigned, or become otherwise unable to perform the functions and duties of the office of Administrator:

- (a) General Counsel;
- (b) Assistant Administrator, Office of Solid Waste;
- (c) Assistant Administrator for Toxic Substances (also known as the Assistant Administrator for the Office of Chemical Safety and Pollution Prevention);
- (d) Assistant Administrator for the Office of Air and Radiation;
- (e) Assistant Administrator for the Office of Water;
- (f) Assistant Administrator for the Office of Enforcement and Compliance Assurance;
- (g) Chief Financial Officer;
- (h) Assistant Administrator for the Office of Research and Development;
- (i) Assistant Administrator for the Office of International and Tribal Affairs;
- (j) Assistant Administrator for the Office of Administration and Resources Management;
- (k) Assistant Administrator for the Office of Environmental Information;
- (l) Regional Administrator, Region VII;
- (m) Deputy Regional Administrator, Region II;
- (n) Principal Deputy General Counsel;
- (o) Principal Deputy Assistant Administrator for the Office of Enforcement and Compliance Assurance; and
- (p) Deputy Regional Administrator, Region V.

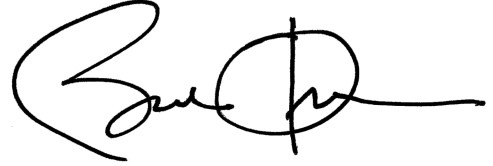

Sec. 2. Exceptions. (a) No individual who is serving in an office listed in section 1(a)–(p) of this order in an acting capacity shall, by virtue of so serving, act as Administrator pursuant to this order.

(b) No individual listed in section 1(a)–(p) of this order shall act as Administrator unless that individual is otherwise eligible to so serve under the Act.

(c) Notwithstanding the provisions of this order, the President retains discretion, to the extent permitted by law, to depart from this order in designating an acting Administrator.

Sec. 3. *Revocation.* Executive Order 13737 of August 12, 2016 (Providing an Order of Succession Within the Environmental Protection Agency), is hereby revoked.

Sec. 4. *Judicial Review.* This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

Memorandum of January 13, 2017

Continuing To Expand Opportunity for All Young People

Memorandum for the Heads of Executive Departments and Agencies

By the authority vested in me as President by the Constitution and the laws of the United States of America, I hereby direct the following:

Section 1. The Presidential Memorandum issued on February 27, 2014 (Creating and Expanding Ladders of Opportunity for Boys and Young Men of Color), is amended:

(a) in the preamble, by striking the phrase “My Brother’s Keeper initiative” and replacing it with “Task Force on Improving the Lives of Boys and Young Men of Color and Underserved Youth”;

(b) in the preamble, by striking the phrase “The initiative” and replacing it with “The Task Force”;

(c) in section 1, by striking the phrase “My Brother’s Keeper Task Force” throughout and replacing it with “Task Force on Improving the Lives of Boys and Young Men of Color and Underserved Youth”;

(d) in section 1(a), by striking everything that follows “In addition to the Chair, the Task Force shall consist of the following members:” in subsection (a) and inserting the following:

“(i) the Attorney General;

(ii) the Secretary of Agriculture;

(iii) the Secretary of Commerce;

(iv) the Secretary of Defense;

(v) the Secretary of Education;

(vi) the Secretary of Energy;

(vii) the Secretary of Health and Human Services;

(viii) the Secretary of Housing and Urban Development;

(ix) the Secretary of the Interior;

(x) the Secretary of Labor;

(xi) the Secretary of Transportation;

(xii) the Director of the Office of Management and Budget;

(xiii) the Chair of the Council of Economic Advisers;

(xiv) the Director of the Office of Personnel Management;

(xv) the Administrator of the Small Business Administration;

(xvi) the Chair of the Equal Employment Opportunity Commission;

(xvii) the Chief Executive Officer of the Corporation for National and Community Service;

(xviii) the Director of the National Science Foundation;

(xix) the Assistant to the President for Intergovernmental Affairs and Public Engagement;

(xx) the Director of the Domestic Policy Council;

(xxi) the Director of the National Economic Council;

(xxii) the Director of the Office of Science and Technology Policy; and
(xxiii) the heads of such other executive departments, agencies, and offices as the Chair may, from time to time, designate.”;

(e) in section 2(a)(i), by inserting “as appropriate” after “to be maintained by the Department of Education”;

(f) in section 2(a)(i), by inserting “and in consultation with the Office of Management and Budget, including the Office of the Chief Statistician of the United States, as appropriate” after “on an ongoing basis”;

(g) by adding, as section 2(f): “The Task Force shall also provide a status report to the President regarding the implementation of this memorandum at least once each calendar year. In addition, every 2 years, the Task Force shall review the recommendations from the 90-day report, determine whether updated recommendations should be sent to the President, and evaluate whether the set of critical indicators of life outcomes should be updated.”; and

(h) in section 2(v) and section 2(vii), by inserting “and underserved youth” after “boys and young men of color”.

Sec. 2. The Secretary of Education is authorized and directed to publish this memorandum in the *Federal Register*.

THE WHITE HOUSE,
Washington, January 13, 2017

Presidential Documents

Memorandum of January 13, 2017

Designation of Officers or Employees of the Office of Science and Technology Policy To Act as Director

Memorandum for the Director of the Office of Science and Technology Policy

By the authority vested in me as President by the Constitution and the laws of the United States of America, including the Federal Vacancies Reform Act of 1998, 5 U.S.C. 3345 *et seq.* (the “Act”), it is hereby ordered that:

Section 1. Order of Succession. Subject to the provisions of section 2 of this memorandum and the limitations set forth in the Act, the following officials of the Office of Science and Technology Policy (OSTP), in the order listed, shall act as and perform the functions and duties of the office of the Director of OSTP (Director), during any period in which the Director has died, resigned, or otherwise become unable to perform the functions and duties of the office of Director, until such time as the Director is able to perform the functions and duties of that office:

- (a) Associate Director (National Security and International Affairs);
- (b) Associate Director (Technology);
- (c) Associate Director (Science);
- (d) Associate Director (Environment and Energy);
- (e) Chief of Staff;
- (f) Deputy Chief of Staff and Assistant Director; and
- (g) General Counsel.

Sec. 2. Exceptions. (a) No individual who is serving in an office listed in section 1 in any acting capacity, by virtue of so serving, shall act as Director pursuant to this memorandum.

(b) No individual listed in section 1 shall act as Director unless that individual is otherwise eligible to so serve under the Act.

(c) Notwithstanding any provision of this memorandum, the President retains the discretion, to the extent permitted by law, to depart from this memorandum in designating an acting Director.

Sec. 3. Revocation. The President’s memorandum of August 5, 2009 (Designation of Officers of the Office of Science and Technology Policy to Act as Director), is hereby revoked.

Sec. 4. General Provisions. (a) Nothing in this memorandum shall be construed to impair or otherwise affect:

- (i) the authority granted by law to a department or agency, or the head thereof; or
- (ii) the functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This memorandum is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

(c) You are authorized and directed to publish this memorandum in the *Federal Register*.

A handwritten signature in black ink, appearing to be "Donald Trump", with a large circular flourish and a horizontal line extending to the right.

Memorandum of January 13, 2017

Providing an Order of Succession Within the Council on Environmental Quality

Memorandum for the Chairman of the Council on Environmental Quality

By the authority vested in me as President by the Constitution and the laws of the United States of America, including the Federal Vacancies Reform Act of 1998, 5 U.S.C. 3345 *et seq.* (the “Act”), it is hereby ordered that:

Section 1. Order of Succession. Subject to the provisions of section 2 of this memorandum and to the limitations set forth in the Act, the following officials of the Council on Environmental Quality, in the order listed, shall act as and perform the functions and duties of the office of the Chairman of the Council on Environmental Quality (Chairman), during any period in which the Chairman has died, resigned, or is otherwise unable to perform the functions and duties of that office:

- (a) Managing Director;
- (b) Chief of Staff;
- (c) General Counsel;
- (d) Associate Director for National Environmental Policy Act; and
- (e) Other Associate Directors in the order in which they have been appointed as such.

Sec. 2. Exceptions. (a) No individual who is serving in an office listed in section 1 of this memorandum in an acting capacity, by virtue of so serving, shall act as Chairman pursuant to this memorandum.

(b) No individual listed in section 1 of this memorandum shall act as Chairman unless that individual is otherwise eligible to so serve under the Act.

(c) Notwithstanding the provisions of this memorandum, the President retains discretion, to the extent permitted by law, to depart from this memorandum in designating an acting Chairman.

Sec. 3. Revocation. The Presidential Memorandum of March 13, 2015 (Providing an Order of Succession Within the Council on Environmental Quality), is hereby revoked.

Sec. 4. General Provisions. (a) Nothing in this memorandum shall be construed to impair or otherwise affect:

- (i) the authority granted by law to an agency, or the head thereof; or
- (ii) the functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This memorandum is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

(c) You are hereby authorized and directed to publish this memorandum in the *Federal Register*.

A handwritten signature in black ink, appearing to be "Donald Trump", with a large circular flourish and a vertical line through it.

Memorandum of January 13, 2017

Providing an Order of Succession Within the Federal Mediation and Conciliation Service

Memorandum for the Director of the Federal Mediation and Conciliation Service

By the authority vested in me as President by the Constitution and the laws of the United States of America, including the Federal Vacancies Reform Act of 1998, 5 U.S.C. 3345, *et seq.* (the “Act”), it is hereby ordered that:

Section 1. Order of Succession. Subject to the provisions of section 2 of this memorandum, and to the limitations set forth in the Act, the following officials of the Federal Mediation and Conciliation Service, in the order listed, shall act as and perform the functions and duties of the Office of the Director of the Federal Mediation and Conciliation Service (Director), during any period in which the Director has died, resigned, or otherwise become unable to perform the functions and duties of the Office of the Director:

- (a) Deputy Director, Field Operations;
- (b) Deputy Director; and
- (c) Manager, National Programs and Initiatives.

Sec. 2. Exemptions. (a) No individual who is serving in an office listed in section 1 of this memorandum in an acting capacity, by virtue of so serving, shall act as Director pursuant to this memorandum.

(b) No individual listed in section 1 of this memorandum shall act as Director unless that individual is otherwise eligible to so serve under the Act.

(c) Notwithstanding the provisions of this memorandum, the President retains discretion, to the extent permitted by law, to depart from this memorandum in designating an acting Director.

Sec. 3. General Provisions. (a) This memorandum is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

(b) You are authorized and directed to publish this memorandum in the *Federal Register*.

A handwritten signature in black ink, appearing to be "Donald Trump", with a large, stylized "D" and a circular flourish.

World Wide Web

Full text of the daily Federal Register, CFR and other publications is located at: www.fdsys.gov.

Federal Register information and research tools, including Public Inspection List, indexes, and Code of Federal Regulations are located at: www.ofr.gov.

E-mail

FEDREGTOC (Daily Federal Register Table of Contents Electronic Mailing List) is an open e-mail service that provides subscribers with a digital form of the Federal Register Table of Contents. The digital form of the Federal Register Table of Contents includes HTML and PDF links to the full text of each document.

To join or leave, go to <https://public.govdelivery.com/accounts/USGPOOFR/subscriber/new>, enter your email address, then follow the instructions to join, leave, or manage your subscription.

PENS (Public Law Electronic Notification Service) is an e-mail service that notifies subscribers of recently enacted laws.

To subscribe, go to <http://listserv.gsa.gov/archives/publaws-l.html> and select *Join or leave the list (or change settings)*; then follow the instructions.

FEDREGTOC and **PENS** are mailing lists only. We cannot respond to specific inquiries.

Reference questions. Send questions and comments about the Federal Register system to: fedreg.info@nara.gov

The Federal Register staff cannot interpret specific documents or regulations.

CFR Checklist. Effective January 1, 2009, the CFR Checklist no longer appears in the Federal Register. This information can be found online at <http://bookstore.gpo.gov/>.

LIST OF PUBLIC LAWS

Note: No public bills which have become law were received by the Office of the Federal Register for inclusion

in today's **List of Public Laws**.

Last List January 11, 2017

Public Laws Electronic Notification Service (PENS)

PENS is a free electronic mail notification service of newly

enacted public laws. To subscribe, go to <http://listserv.gsa.gov/archives/publaws-l.html>

Note: This service is strictly for E-mail notification of new laws. The text of laws is not available through this service. **PENS** cannot respond to specific inquiries sent to this address.
