Using the 139,135 identified cases, the average unstandardized case-weighted charge per case was \$80,677. The applicant then standardized the charges. The applicant did not remove charges for the current treatment because, as discussed above, ZINPLAVA™ will be used concomitantly with SOC antibacterial treatments for the treatment of CDI as an additive, or adjunctive treatment option, to reduce the recurrence of CDI infection. The applicant then applied the 2-year inflation factor of 1.098446 from the FY 2017 IPPS/LTCH PPS final rule (81 FR 57286) to inflate the charges from FY 2015 to FY 2017. The applicant noted that the anticipated price for ZINPLAVA™ has yet to be determined; therefore, no charges for ZINPLAVA™ were added in the analysis. Based on the FY 2017 IPPS/LTCH PPS Table 10 thresholds, the average case-weighted threshold amount was \$56,871. The inflated average case-weighted standardized charge per case was \$78,929. Because the inflated average case-weighted standardized charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion. The applicant noted that the inflated average case-weighted standardized charge per case exceeds the average case-weighted threshold amount without the average per patient cost of the technology. As such, the applicant anticipated that the inclusion of the cost of ZINPLAVA™, at any price point, will further increase charges above the average case-weighted threshold amount. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19879), we invited public comments on whether ZINPLAVA™ meets the cost criterion.

Comment: The applicant submitted comments reiterating its cost analysis

results. Specifically, the applicant stated that as indicated in the FY 2015 MedPAR data analysis summarized above, the average case-weighted standardized charge per case exceeded the average case-weighted threshold amount. As noted in the proposed rule, at the time the applicant submitted its application, the applicant indicated that the price of ZINPLAVA™ had not yet been determined. However, because the inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount without the average per-patient cost of the technology, the applicant contended that the inclusion of the cost of ZINPLAVA™, at any price point, would further increase charges above the average case-weighted threshold amount.

The applicant noted, in supplemental information submitted to CMS, the wholesale acquisition cost (WAC) of ZINPLAVA™ (which is supplied as a 1000 mg/40 mL (25 mg/mL) solution in a single-dose vial) is \$3,800 per vial. The recommended dosage of ZINPLAVA™ is a single 10 mg/kg dose administered as an IV infusion based on patient body weight. Because each vial contains 1,000 mg of ZINPLAVA™, a single vial provides the complete recommended dose for a single patient who weighs 100 kg or less.

As noted in the applicant's supplemental submission, to estimate the anticipated average charge submitted by hospitals for ZINPLAVA™, the applicant assumed that hospitals will mark up the cost for ZINPLAVA™ by 200 percent. A 200 percent mark-up of the \$3,800 WAC results in a total charge of \$7,600 for ZINPLAVA™. The applicant added the anticipated charge for ZINPLAVA™ of \$7,600 to the previously determined inflated average case-weighted standardized charge per case of \$78,929. This resulted in a revised inflated average case-weighted standardized charge per case of \$86,529, which still exceeds the average case-weighted threshold amount of \$56,871.

Response: After consideration of the comments we received, we agree that ZINPLAVA™ meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that the addition of ZINPLAVA™ to SOC antibacterial drug treatment reduces CDI recurrence because it provides passive immunity against Toxin B resulting from persistent or newly acquired *C-diff* spores.

The applicant conducted two Phase III studies, MODIFY I and MODIFY II. The primary endpoint of the studies was

recurrent CDI within 12 weeks after completion of treatment with ZINPLAVA™. The first study design initially included actoxumab, an antitoxin A monoclonal antibody treatment arm that was later discontinued due to a high failure rate and increase in mortality compared to other treatment arms.³ Clinical data on ZINPLAVA™ is provided exclusively from the FDA briefing document available on the FDA Web site at: <http://www.fda.gov/AdvisoryCommittees/CommitteesMeetingMaterials/Drugs/Anti-InfectiveDrugsAdvisoryCommittee>. Information is also provided in the package insert by the manufacturer, Merck & Company, Inc. The FDA briefing provided data on the safety and efficacy of ZINPLAVA™. The FDA considered sustained clinical responses defined as clinical cure of the initial CDI episode and the absence of CDI recurrence as an appropriate endpoint to assess the efficacy of ZINPLAVA™ in the prevention of CDI recurrences.

In MODIFY I trial, the clinical cure rate of the presenting CDI episode was lower in the ZINPLAVA™ arm as compared to the placebo arm, whereas in MODIFY II trial the clinical cure rate was lower in the placebo arm as compared to the ZINPLAVA™ arm. Additional analyses showed that, by 3 weeks post study drug infusion, the clinical cure rates of the presenting CDI episode were similar between treatment arms.

In MODIFY I, the rate of sustained clinical response was numerically in favor of ZINPLAVA™ (60.1 percent) in comparison to placebo (55.2 percent) with an adjusted difference and 95 percent CI of 4.8 percent (– 2.1 percent; 11.7 percent). In MODIFY II, the proportion of subjects with sustained clinical response in the ZINPLAVA™ arm (66.8 percent) was also higher than in the placebo arm (52.1 percent) with an adjusted difference of 14.6 percent and 95 percent CI (7.8 percent; 21.4 percent). The treatment did not significantly decrease mortality. Recurrence rates, including CDI-related hospital readmission rates, reportedly were between 10 and 25 percent. No clinically meaningful differences in the exposure of bezlotoxumab were found between patients 65 years of age and older and patients under 65 years of age.

In the Phase III trials, the safety profile of ZINPLAVA™ was similar overall to that of placebo. However, heart failure was reported more commonly in the two Phase III clinical

trials of ZINPLAVA™-treated patients compared to placebo-treated patients. These adverse reactions occurred primarily in patients with underlying congestive heart failure (CHF). In patients with a history of CHF, 12.7 percent (15/118) of ZINPLAVA™-treated patients and 4.8 percent (5/104) of placebo-treated patients had the serious adverse reaction of heart failure during the 12-week study period. In addition, in patients with a history of CHF, there were more deaths in ZINPLAVA™-treated patients (19.5 percent (23/118)) than in placebo-treated patients (12.5 percent (13/104)) during the 12-week study period. We stated in the proposed rule that we were concerned regarding the safety of ZINPLAVA™ in patients diagnosed with CHF. In regards to safety, data from the MODIFY I and MODIFY II studies suggest few adverse events associated with ZINPLAVA™, with no significant differences in the number of serious adverse events, deaths or discontinuations of study drug that occurred between the ZINPLAVA™ and the placebo groups. However, both the ZINPLAVA™ and the ZINPLAVA™ plus actoxumab treatment groups experienced more episodes of cardiac failure (defined as acute or chronic cardiac failure) then compared to the placebo group (2.2 percent versus 1 percent). We stated in the proposed rule that we were unsure if the cardiac failure reported in the studies may be the result of a higher number of baseline patients with heart failure in the treatment arms or the result of an adverse effect to ZINPLAVA™. Therefore, we stated that we were concerned with regard to the adverse event of cardiac failure of ZINPLAVA™.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19880), we invited public comments on whether ZINPLAVA™ meets the substantial clinical improvement criterion. We noted that we did not receive any written public comments in response to the New Technology Town Hall meeting notice regarding the application of ZINPLAVA™ for new technology add-on payments.

Comment: The applicant submitted comments regarding the substantial clinical improvement criterion. The applicant reiterated that the addition of ZINPLAVA™ to standard of care antibacterial drug treatment reduces the risk of CDI recurrence in adult patients who are at high risk for CDI recurrence because it provides passive immunity against Toxin B resulting from persistent or newly acquired *C. difficile* spores. The applicant noted CMS'

³ Wilcox MH et al. Bezlotoxumab for Prevention of Recurrent Clostridium difficile Infection. *N Engl J Med*. 2017 Jan 26;376(4):305–317.

concern, as described in the proposed rule, regarding the reported adverse event of cardiac failure with ZINPLAVA™. The applicant provided additional information concerning serious adverse events (SAEs) observed in the Phase III trials, and also included a series of analyses performed in the 41 subjects with an SAE of cardiac failure, as well as a discussion of analyses performed in a subset of patients with a baseline history of CHF.

The applicant noted that SAEs were collected for the full 12-week follow-up period in the both Phase III trials (P001 + P002). Amongst the 2344 Phase III trial subjects, 29.8 percent of subjects experienced an SAE during the 12-week follow-up period. According to the applicant, the proportion of subjects with a SAE was lower in the active treatment groups compared with placebo (bezlotoxumab, 29.4 percent; actoxumab + bezlotoxumab, 27.3 percent; and placebo, 32.7 percent). The most frequently reported SAEs across all treatment groups were CDI (4.7 percent), pneumonia (2.0 percent), sepsis (1.8 percent), cardiac failure (1.7 percent), diarrhea (1.6 percent), and urinary tract infection (1.5 percent). A higher percentage of subjects in the active treatment groups reported SAEs of cardiac failure compared with placebo (bezlotoxumab, 2.2 percent; actoxumab + bezlotoxumab, 2.2 percent; and placebo, 0.9 percent), whereas a higher percentage of subjects reported SAEs of CDI, pneumonia, and sepsis in the placebo group compared with the bezlotoxumab and actoxumab + bezlotoxumab groups. The incidence for other frequently reported SAEs was similar across groups. SAEs generally reflected the underlying comorbidities and advanced age of the subjects enrolled.

The applicant also further characterized the observed numerical imbalance of subjects experiencing cardiac failure SAEs in bezlotoxumab-containing versus placebo treatment groups, by performing a series of analyses in the 41 subjects with an SAE of cardiac failure. The applicant noted the baseline characteristics of the 41 subjects who experienced an SAE of cardiac failure. As compared with the All patients as treated (APaT) population for the integrated Phase III trials (P001 + P002) dataset, the 41 subjects were older, almost all were inpatients at the time of enrollment, had a higher incidence of comorbid conditions (as evidenced by Charlson Comorbidity Index and Horn's Index), and a higher incidence of severe CDI. Across the treatment groups, nearly 90 percent had a medical history of

including at least one cardiac condition and approximately 70 percent had a history of cardiac failure and/or cardiomyopathy. Therefore, the applicant believed that any assessment of the safety profile of this morbidly ill patient population must be interpreted with caution.

The applicant provided an analysis of the safety profile of the 41 subjects with cardiac failure SAEs with respect to timing to cardiac failure SAE and death. In the placebo group, 5 of 7 subjects experienced an SAE of cardiac failure before Week 4, while in the bezlotoxumab and actoxumab + bezlotoxumab groups, the majority of such events occurred after Week 4. None of the cardiac failure SAEs was deemed drug related by the investigator. Among subjects with a cardiac failure SAE, a higher proportion of subjects in the placebo group than in the bezlotoxumab group died before Week 4. The applicant noted that the events were often associated with concurrent conditions such as infection and/or worsening CDI that are known to exacerbate CHF, thereby further supporting the assessments that these events were not drug related. Overall, according to the applicant, these findings do not support a clear association between cardiac failure and bezlotoxumab, especially recognizing the severe baseline morbidity of the subjects and the lack of a temporal association of the event and any associated death.

The applicant reiterated that heart failure is listed in the warnings and precautions section of the prescribing information for ZINPLAVA™ to describe the higher incidence of heart failure reported in the two Phase III trials in subjects who received ZINPLAVA™ compared with those who received placebo, primarily in patients with underlying CHF. The warnings and precautions section of the ZINPLAVA™ label states, in part, that in patients with a history of CHF, ZINPLAVA™ “should be reserved for use when the benefit outweighs the risk.” Although the overall safety profile of ZINPLAVA™ was found to be acceptable, the FDA considered that this information was clinically relevant. Furthermore, the applicant stated that ZINPLAVA™ has also recently been authorized for use by the European Medicines Agency (EMA) and that there is no heart failure warning in the EU prescribing information.

Response: We appreciate the additional information and analysis provided by the applicant in response to our concerns regarding the adverse event of cardiac failure. We are satisfied

that the warnings and precautions section of the drug's label clearly state that “ZINPLAVA™ should be reserved for use when the benefit outweighs the risk” for patients with a history of congestive heart failure (CHF). We agree that ZINPLAVA™ represents a substantial clinical improvement over existing technologies because, based on the studies provided by the applicant, it reduces CDI recurrence by providing passive immunity against Toxin B resulting from persistent or newly acquired *C-diff* spores. After consideration of the public comments we received, we have determined that ZINPLAVA™ meets all of the criteria for approval of new technology add-on payments. Therefore, we are approving new technology add-on payments for ZINPLAVA™ for FY 2018. Cases involving ZINPLAVA™ that are eligible for new technology add-on payments will be identified by ICD-10-PCS procedure codes XW033A3 and XW043A3.

In its application, the applicant estimated that the average Medicare beneficiary would require a dosage of 10 mg/kg administered as an IV infusion over 60 minutes as a single dose. According to the applicant, the WAC for one dose is \$3,800. Under 42 CFR 412.88(a)(2), we limit new technology add-on payments to the lesser of 50 percent of the average cost of the technology or 50 percent of the costs in excess of the MS-DRG payment for the case. As a result, the maximum new technology add-on payment amount for a case involving the use of ZINPLAVA™ is \$1,900 for FY 2018. In keeping with the current ZINPLAVA™ label, CMS expects ZINPLAVA™ will be prescribed for adult patients who are receiving antibacterial drug treatment for a diagnosis of CDI who are at high risk for CDI recurrence, and after consideration of its current warnings and precautions section which indicates for patients with a history of CHF, ZINPLAVA™ should be reserved for use when the benefit outweighs the risk.

b. EDWARDS INTUITY Elite™ Valve System (INTUITY) and LivaNova Perceval Valve (Perceval)

Two manufacturers, Edwards Lifesciences and LivaNova, submitted applications for new technology add-on payments for FY 2018 for the INTUITY Elite™ Valve System (INTUITY) and the Perceval Valve (Perceval), respectively. Both of these technologies are prosthetic aortic valves inserted using surgical aortic valve replacement (AVR). We note that, while Edwards Lifesciences submitted an application for new technology add-on payments for

FY 2017 for the INTUITY valve, FDA approval was not received by July 1, 2016, and, therefore, the device was not eligible for consideration for new technology add-on payments for FY 2017.

Aortic valvular disease is relatively common, primarily manifested by aortic stenosis. Most aortic stenosis is due to calcification of the valve, either on a normal tri-leaflet valve or on a congenitally bicuspid valve. The resistance to outflow of blood is progressive over time, and as the size of the aortic orifice narrows, the heart must generate increasingly elevated pressures to maintain blood flow. Symptoms such as angina, heart failure, and syncope eventually develop, and portend a very serious prognosis. There is no effective medical therapy for aortic stenosis, so the diseased valve must be replaced or, less commonly, repaired.

The INTUITY valve incorporates the expansion feature of a catheter implanted valve, but is designed to be placed during cardiac surgery. The manufacturer explained that the INTUITY valve requires fewer stitches to hold the device in place because of the balloon expanded design and, therefore, can be inserted more quickly than a standard valve, and also facilitates minimally invasive cardiac surgery; that is, use of a smaller incision to allow faster recovery. The manufacturer of the INTUITY valve indicated that the device is comprised of: (1) A bovine pericardial aortic bioprosthetic valve; (2) a balloon expandable stainless steel frame; and (3) a textured sealing cloth. The manufacturer of the Perceval valve indicated that the Perceval valve device is comprised of: (1) Sizers used to determine the correct size of the prosthesis; (2) a dual holder used for positioning and deployment (available in two models, one for sternal approaches and one for MIS); (3) a “smart clip” to assist during assembly of the valve on the dual holder to prevent release during positioning; (4) a dual collapse used to evenly reduce the diameter of the prosthesis allowing it to mount onto the holder prior to implantation; (5) a dual collapse base used to allow proper positioning; and (6) a postdilation catheter used for in situ dilation of the prosthesis after implantation (available in two models, one for sternal approaches and one for MIS). According to both applicants, the INTUITY valve and the Perceval valve are the first sutureless, rapid deployment aortic valves that can be used for the treatment of patients who are candidates for surgical AVR. The applicants indicated that the two new

device innovations facilitate MIS approaches through: (1) The device rapid deployment mechanisms; and (2) the design of the prosthetic valve that allows for markedly fewer to no sutures to securely fasten the prosthetic valve to the aortic orifice. The applicants explained that both of these aspects of their devices are credited with the reduction of operating time.

As noted, according to both applicants, the INTUITY valve and the Perceval valve are the first sutureless, rapid deployment aortic valves that can be used for the treatment of patients who are candidates for surgical AVR. Because potential cases representing patients who are eligible for treatment using the INTUITY and the Perceval aortic valve devices would group to the same MS-DRGs, and we believe that these devices are intended to treat the same or similar disease in the same or similar patient population, and are purposed to achieve the same therapeutic outcome using the same or similar mechanism of action, we believe these two devices are substantially similar to each other and that it is appropriate to evaluate both technologies as one application for new technology add-on payments under the IPPS.

With respect to the newness criterion, the INTUITY valve received FDA approval on August 12, 2016, and was commercially available on the U.S. market on August 19, 2016. The Perceval valve received FDA approval on January 8, 2016, and was commercially available on the U.S. market on February 29, 2016. We believe that, in accordance with our policy, it is appropriate to use the earliest market availability date submitted as the beginning of the newness period. Therefore, we stated in the proposed rule that based on our policy, with regard to both devices, if the technologies are approved for new technology add-on payments, we believe that the beginning of the newness period would be February 29, 2016. In addition, both applicants indicated that ICD-10-PCS code X2RF032 (Replacement of Aortic Valve using Zooplastic Tissue, Rapid Deployment Technique, Open Approach, New Technology Group 2) would identify procedures involving the use of the devices when surgically implanted.

We previously stated that, because we believe these two devices are substantially similar to each other, we believe it is appropriate to evaluate both technologies as one application for new technology add-on payment under the IPPS. The applicants submitted separate

cost and clinical data, and we reviewed and discuss each set of data separately. However, we stated in the proposed rule that we intend to make one determination regarding new technology add-on payments that will apply to both devices. We believe that this is consistent with our policy statements in the past regarding substantial similarity. Specifically, we have noted that approval of new technology add-on payments would extend to all technologies that are substantially similar (66 FR 46915), and we believe that continuing our current practice of extending new technology add-on payments without a further application from the manufacturer of the competing product, or a specific finding on cost and clinical improvement if we make a finding of substantial similarity among two products is the better policy because we avoid—

- Creating manufacturer-specific codes for substantially similar products;
- Requiring different manufacturers of substantially similar products to submit separate new technology applications;
- Having to compare the merits of competing technologies on the basis of substantial clinical improvement; and
- Bestowing an advantage to the first applicant representing a particular new technology to receive approval (70 FR 47351).

We explained in the proposed rule that if these substantially similar technologies were submitted for review in different (and subsequent) years, rather than the same year, we would evaluate and make a determination on the first application and apply that same determination to the second application. However, because the technologies have been submitted for review in the same year, we believe that it is appropriate to consider both sets of cost data and clinical data in making a determination and we do not believe that it is possible to choose one set of data over another set of data in an objective manner.

As stated above, we believe that the INTUITY valve and the Perceval valve are substantially similar to each other for purposes of analyzing these two applications as one application. As we stated in the proposed rule, we also need to determine whether the INTUITY valve and the Perceval valve are substantially similar to existing technologies prior to their approval by the FDA and their release on the market. As discussed earlier, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be

considered “new” for purposes of new technology add-on payments.

With respect to the first criterion, whether a product uses the same or a similar mechanism of action to achieve a therapeutic outcome, the applicant for the INTUITY valve asserted that its unique design, which utilizes features that were not previously included in conventional aortic valves, constitutes a new mechanism of action. The deployment mechanism allows for rapid deployment. The expandable frame can reshape the native valve’s orifice, creating a larger and more efficiently shaped effective orifice area. In addition, the expandable skirt allows for structural differentiation upon fixation of the valve requiring 3 permanent, guiding sutures rather than the 12 to 18 permanent sutures used to fasten standard prosthetic aortic valves. The applicant for the Perceval valve described the Perceval valve’s mechanism of action as including: (a) No permanent sutures; (b) a dedicated delivery system that increases the surgeon’s visibility; (c) an enabler of minimally invasive approach; (d) a complexity reduction and reproducibility of the procedure; and (e) a unique device assembly and delivery systems.

With respect to the second and third criteria, whether a product is assigned to the same or a different MS-DRG and whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, the applicant for the INTUITY valve indicated that the technology is used in the treatment of the same patient population and potential cases representing patients that may be eligible for treatment using the INTUITY valve would be assigned to the same MS-DRGs as cases involving the use of other prosthetic aortic valves (that is, MS-DRGs 216 (Cardiac Valve & Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC), 217 (Cardiac Valve & Other Major Cardiothoracic Procedures with Cardiac Catheterization with CC), 218 (Cardiac Valve & Other Major Cardiothoracic Procedures with Cardiac Catheterization without CC/MCC), 219 (Cardiac Valve & Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC), 220 (Cardiac Valve & Other Major Cardiothoracic Procedures without Cardiac Catheterization with CC), and 221 (Cardiac Valve & Other Major Cardiothoracic Procedures without Cardiac Catheterization without CC/MCC).

The applicant for the Perceval valve also indicated that the Perceval valve device is used in the treatment of the

same patient population and potential cases representing patients that may be eligible for treatment using the technology would be assigned to the same MS-DRGs (MS-DRGs 216 through 221) as cases involving the use of other prosthetic aortic valves.

We stated in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19881) that after considering the materials included with both applications, we remained concerned as to whether the mechanism of action described by the applicants represents an improvement to an existing surgical technique and technology or a new technology. While the INTUITY and Perceval valves address some of the challenges posed by implantation of existing valves, including improving the visibility of the orifice and the physiological function of the valves, we stated that we did not believe that their mechanisms of action are fundamentally different from that of other aortic valves. As one of the applicants stated in its application, the goal of the prosthetic aortic valve is to mimic the native valve that it has replaced via the incorporation of three leaflets that open and close in response to pressure gradients developed during the cardiac cycle. We stated that we believe that the INTUITY and Perceval valves are the same or similar to other prosthetic aortic valves used to treat the same or similar diagnoses.

In the proposed rule, we invited public comments on whether the mechanism of action of the sutureless, rapid deployment of the INTUITY and Perceval valves differs from the mechanism of action of standard AVR valves and whether the technologies meet the newness criterion.

Comment: The applicant for the INTUITY valve, as well as several physicians that have performed surgeries implanting the INTUITY, stated that the mechanism of action differs from that of standard aortic valves because of the expeditious implantation, rapid deployment, and improved hemodynamics. The applicant also emphasized innovative aspects about the INTUITY that were described in its application, such as the flexible delivery system, the ability to reshape the native valve’s orifice, and the balloon expandable stented frame and subannular skirt. The applicant emphasized that minimally invasive aortic valve replacement has not been widely adopted because of greater technical challenge and longer cross-clamp times, but that the INTUITY facilitates minimally invasive surgery by addressing both of these challenges.

One commenter, who also manufactures heart valves, indicated

that it shared CMS’ concern about whether the mechanism of action constitutes a new technology. This commenter indicated that prosthetic aortic valves fall into two categories: Traditional, open surgical and minimally invasive, and that differences in design of the valves are intended to address challenges in surgical valve replacement, including surgical technique, reduction in complications, improvement in hemodynamics, or resistance to calcification. The commenter stated that all prosthetic aortic valves are substantially similar to each other. The commenter described the steps involved in placing surgical valves, and indicated that the applicants’ devices introduce a new technique for securing a surgically implanted bioprosthetic heart valve to the annulus and surrounding structures, but that the mechanism of action is unchanged. The commenter also noted that rapid deployment surgical aortic valves were introduced into clinical practice in 1963.

Response: We thank the commenters for the details and input on whether INTUITY and Perceval meet the newness criterion. While we appreciate the additional information provided by the commenter that did not believe these valves represented a new technology, we believe that based on comments from the manufacturer and physicians who have used the INTUITY device, the mechanism of action for the INTUITY and Perceval is different from other aortic valves. Specifically, as the manufacturer and other physicians emphasized in their comments, the technical features of the valve provide the ability to improve clinical function beyond the opening and closing of the valve leaflets and allow it to perform more efficiently than a standard valve. Thus, as these commenters noted, a prosthetic aortic valve inserted using surgical AVR with its insertion process improves the physiologic function of the outflow track of the new valve. After further review of the information provided by the applicant and consideration of the public comments we received, we believe that INTUITY and Perceval meet the newness criterion. Therefore, we consider the technology to be “new” as of February 29, 2016, when the Perceval valve became commercially available.

As we stated above, each applicant submitted separate analyses regarding the cost criterion for each of their devices, and both applicants maintained that their device meets the cost criterion. We summarize each analysis below.

With regard to the cost criterion, the INTUITY valve's applicant researched the FY 2015 MedPAR claims data file to identify cases representing patients who may be potential recipients of treatment using the INTUITY valve. The applicant

identified claims that reported an ICD-9-CM diagnosis code of 424.1 (Aortic valve disorder), in combination with an ICD-9-CM procedure code of 35.21 (Replacement of aortic valve with tissue) or 35.22 (Open and other

replacement of aortic valve). The applicant also identified cases with or without a coronary artery bypass graft (CABG) using the ICD-9-CM procedure codes in the table below.

ICD-9-CM code	Code description
36.10	Aortocoronary bypass for heart revascularization, not otherwise specified
36.11	(Aorto)coronary bypass of one coronary artery.
36.12	(Aorto)coronary bypass of two coronary arteries.
36.13	(Aorto)coronary bypass of three coronary arteries.
36.14	(Aorto)coronary bypass of four or more coronary arteries.
36.15	Single internal mammary-coronary artery bypass.
36.16	Double internal mammary-coronary artery bypass.
36.17	Abdominal-coronary artery bypass.

The applicant identified a total of 25,173 cases that mapped to MS-DRGs 216 through 221. Of these cases, the applicant identified 10,251 CABG cases and 14,922 non-CABG cases. According to the applicant, patients that undergo a procedure without need of a concomitant CABG are more likely to receive treatment with the INTUITY valve than patients in need of a concomitant CABG. Therefore, the applicant weighted the non-CABG cases at 90 percent of total cases and the CABG cases at 10 percent of total cases under each of the six MS-DRGs. The final case count is a weighted average of 14,455 cases.

The applicant calculated an average unstandardized charge per case of \$192,506 for all cases. The applicant then removed 100 percent of the charges for pacemakers, investigational devices, and other implants that would not be required for patients receiving treatment using the INTUITY valve. The applicant standardized the charges and then applied an inflation factor of 1.098446, which is the 2-year inflation factor in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57286), to update the charges from FY 2015 to FY 2017. The applicant calculated the average expected charge for the INTUITY valve based on the current list price of the device. Although the applicant submitted data related to the cost of the INTUITY valve, the applicant noted that the cost of the device is proprietary information. To add charges for the device, the applicant assumed a hospital mark-up of approximately 300 percent, based on the current average CCR for implantable devices (0.331) as reported in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56876). Based on the FY 2017 IPPS/LTCH PPS Table 10 thresholds, the average case-weighted threshold amount was \$170,321. The applicant computed an inflated average case-weighted standardized charge per case of

\$194,291, which is \$23,970 above the average case-weighted threshold amount. Because the inflated average case-weighted standardized charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19882), we thanked the applicant for the analysis above. However, we indicated that we would like more information from the applicant regarding how it decided upon which cases to include in the sensitivity analysis, as well as further details about how and on what basis the applicant weighted CABG and non-CABG cases. We invited public comments on whether the INTUITY valve meets the cost criterion. We summarize the public comment we received from the applicant regarding its cost analysis later in this section.

With regard to the cost criterion in reference to the Perceval valve, the applicant conducted the following analysis. The applicant examined FY 2015 MedPAR claims data that included cases reporting an ICD-9 procedure code of 35.21 or 35.22, in combination with diagnosis code: 424.1. Noting that MS-DRGs 216 through 221 contained 97 percent of these cases, the applicant limited its analysis to these 6 MS-DRGs. The applicant identified 25,193 cases across these MS-DRGs, resulting in an average case-weighted unstandardized charge per case of \$173,477. The applicant then standardized charges using FY 2015 standardization factors and applied an inflation factor of 1.089846 from the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25271). The applicant indicated that the technology meets the cost criterion by applying the inflation factor from the proposed rule and, therefore, would meet the cost criterion by applying the higher inflation factor from the final rule.

Included in the average case-weighted standardized charge per case were charges for the current valve prosthesis. Therefore, the applicant removed all charges associated with revenue center 0278, and calculated the adjusted average case-weighted standardized charge per case by subtracting these charges from the standardized charge per case. The applicant then added the charge for the new technology by taking the anticipated hospital cost of the new technology and dividing it by the national average implantable devices CCR of 0.331. The applicant then added the charge for the new technology to the inflated average case-weighted standardized charges per case to arrive at the final inflated average case-weighted standardized charge per case, which was then case-weighted based on the distribution of cases within the six MS-DRGs. This resulted in an inflated average case-weighted standardized charge per case of \$206,109. Using the FY 2017 IPPS Table 10 thresholds, the average case-weighted threshold amount was \$173,477. Because the inflated average case-weighted standardized charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19882), we invited public comments on whether the Perceval technology meets the cost criterion. We did not receive any public comments concerning the costs for the Perceval technology.

Comment: The applicant for the INTUITY valve stated that it based its initial sensitivity analysis on 14,455 cases that reflected the weighted mix of CABG and non-CABG cases, as the findings in European trials indicated that INTUITY was predominantly performed on patients who did not have a concomitant CABG during their inpatient stay. The applicant stated that

because the INTUITY is intended for use in all surgical aortic valve replacement procedures, regardless of whether the patient also receives CABG, it reran the cost threshold analysis including all 25,173 target cases in the FY 2015 MedPAR with an ICD-9-CM diagnosis code of 424.1 (Aortic valve disorder), in combination with an ICD-9-CM procedure code of 35.21 (Replacement of aortic valve with tissue) or 35.22 (Open and other replacement of aortic valve) that mapped to MS-DRGs 216 through 221. The applicant presented a summary table, which indicated that the case weighted threshold was \$173,463, the final inflated case weighted standardized charge per case was \$206,329, and the difference is \$32,866.

Response: We appreciate the applicant's submission of this additional information. Based on review of the sensitivity analysis included in the original application and subsequent analysis included in the INTUITY applicant's public comment, as well as the cost analyses set forth in both applicants' original applications as set forth above, we have determined that both the INTUITY and the Perceval valve meet the cost criterion.

With regard to substantial clinical improvement for the INTUITY valve, the applicant asserted that several aspects of the valve system represent a substantial clinical improvement over existing technologies. The applicant believed that the flexible deployment arm allows improved surgical access and visualization, making the surgery less challenging for the surgeon, improving the likelihood that the surgeon can use a minimally invasive approach. According to the applicant, the assembly of the device only allows the correct valve size to be fitted, which ensures that the valve does not slip or migrate, which prevents paravalvular leaks and patient prosthetic mismatch. The applicant indicated that the device improves clinical outcomes for patients undergoing minimally invasive AVR and full-sternotomy AVR. The applicant stated that the rapid deployment technology enables reduced operative time, specifically cross-clamp time, thereby reducing the period of myocardial ischemia. In addition, the applicant indicated that the device offers a reduction in operative time for full-sternotomy AVR. The applicant noted that clinical results document significant patient outcome and utilization improvements, including improved patient satisfaction, faster return to normal activity, decreased post-operative pain, reduced mortality and decreased complications, including

need for reoperation due to bleeding, reduced recovery time, reduced length of stay (both ICU and overall), more access to minimally invasive surgery, and improved hemodynamics.

The INTUITY valve has been tested clinically in several trials. In the TRITON trial (Kocher et al., 2013⁴), 287 patients diagnosed with aortic stenosis underwent surgery in 1 of 6 European centers. The first 149 patients received the first generation Model 8300A valve, and the next 138 patients received the second generation Model 8300AB. The average age of the patients was 75.7 years. Early, 30-day mortality was 1.7 percent (5/287), the post-op valve gradient was low, and 75 percent of the patients improved functionally. A total of 4 valves were explanted in the final 30 days due to bleeding, and 3 were explanted later for paravalvular leak, endocarditis, and aortic root aneurysms. Follow-up extended to 3 years (mean 1.8 years).

Implantation of the INTUITY valve using minimally invasive surgery was compared with conventional aortic valve replacement via full sternotomy in the CADENCE-MIS randomized trial (Borger et al., 2015⁵) of 100 patients treated in 1 of 5 centers in Germany. The authors found no significant difference in 30-day mortality, the need for pacemaker implantation, significant paravalvular regurgitation, and quality of life scores at 3 months. Aortic cross-clamp time was significantly reduced from 54.0 to 41.3 minutes ($p < 0.0001$), and cardiopulmonary bypass time was reduced from 74.4 to 68.8 minutes ($p = 0.21$). Early clinical outcomes were similar: No significant differences in mortality, reoperation, or other clinical outcomes. The aortic valve gradient was significantly lower in the MIS group: 8.5 versus 10.3 mmHg.

The TRANSFORM trial (Barnhart et al. 2017⁶) was a single-arm, non-randomized, multicenter trial, in which 839 patients underwent rapid deployment AVR surgery. The average

age of the patients was 73.5 years. The mean cross-clamp time and cardiopulmonary bypass times for full sternotomy were 49.3 ± 26.9 min and 69.2 ± 34.7 min, respectively, and for MIS, 63.1 ± 25.4 min and 84.6 ± 33.5 min, respectively. The authors compared these times to STS database comparators: For full sternotomy, 76.3 minutes and 104.2 minutes, respectively, and for MIS, 82.9 minutes and 111.4 minutes, respectively. All cause early mortality was 0.8 percent, mean EOA at 1 year was 1.7 cm^2 ; mean gradient, 10.3 mmHg; and moderate and severe PVL, 1.2 percent and 0.4 percent, respectively. The authors indicated that the INTUITY valve “. . . may lead to a relative reduction in aortic cross-clamp time and cardiopulmonary bypass time” and “may confer benefits to patients, such as decreased mortality and morbidity.” The authors noted the possibility of potential bias resulting from the level of experience of the study surgeons relative to typical cardiac surgeons. In addition, long-term follow-up is not available, and study comparators from the Society of Thoracic Surgeons (STS) database were not matched.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25057), after reviewing the studies provided by the applicant with its application for FY 2017, we expressed some specific concerns. We indicated that we were concerned that the INTUITY valve does not have sufficient advantages over alternative surgically implanted valves to constitute a substantial clinical improvement. We noted that, while some of the studies included with the application demonstrate reduced aortic cross-clamp time, conventional aortic valve replacement was used in the comparison group. Therefore, it is unclear whether the reduced aortic cross-clamp time is associated with the use of the INTUITY valve or as a result of the MIS surgery in general.

In response to these concerns, the INTUITY valve's applicant stated that the INTUITY valve is associated with significant clinical benefits outside of the benefits achieved by use of an MIS approach. The applicant referenced the sub-study of the TRANSFORM trial, which compared the MISAVR with the INTUITY valve to MISAVR with a conventional valve, stating that the results indicated reduced cross-clamp time and other benefits that are not simply a function of the MIS approach. The applicant also referenced trials that indicated that the INTUITY valve had excellent hemodynamic performance

(Haverich et al.,⁷ Borger et al.,⁸ Barnhart et al.,⁹) one of which found a significant improvement in functional status (Haverich et al.).

After considering the studies provided by the INTUITY valve applicant, in the proposed rule, we stated that we were concerned about the possibility of potential bias resulting from the level of experience of the study surgeons relative to typical cardiac surgeons, as well as the lack of long-term follow-up in these studies.

Comment: The applicant stated that there are three key points to support the improved clinical performance of the INTUITY. First, there is a sufficient body of evidence across multiple clinical studies demonstrating improved clinical and hemodynamic performance versus traditionally implanted surgical valves. Second, these improvements are not simply a result of a minimally invasive surgical approach. Third, collectively, these points validate the premise that the technical features of the INTUITY are the primary contributor of the improved clinical outcomes, and that non-INTUITY procedures done with a minimally invasive surgical approach generally have longer cross-clamp and operative times. Physicians that have implanted the INTUITY valve also indicated that the INTUITY valve reduces cardiopulmonary bypass time and cross-clamp time, both of which have been shown to reduce complications.

The applicant also stated that its studies included surgeons with varied degrees of experience, and that over 62 physicians participated in the US INTUITY trials, which reduces the impact of surgeon bias and allows for greater generalizability of results. The applicant stated that while no study is free of bias, the INTUITY has been shown to have consistent results in both clinical trials and the real-world setting. The applicant further supplemented its application with recently published 5-year follow-up data (Laufer et al.,

2017),¹⁰ which found sustained benefits, including effective orifice area (EOA) improvements, low pressure gradients, and reductions in left ventricular mass, as well as excellent survival rates.

A manufacturer that also manufactures heart valves stated that the studies cited by the INTUITY applicant have potential bias resulting from the level of experience of the study surgeons relative to typical cardiac surgeons, as well as a lack of long-term follow-up. This commenter noted that, in the CADENCE-MIS trial, key outcome measures did not differ statistically significantly at 3 months between the randomized arms of the study, but that the rate of pacemaker implants was higher in the INTUITY group. This commenter noted that while transaortic valve gradients are reported as significantly lower, the study population was small, and that the comparator devices are not all representative of best in class gradients. This commenter also pointed to the high rate of pacemaker implants in the TRANSFORM trial, and mentioned a recent manuscript that reported that early pacemaker implantation after aortic valve replacement was associated with an increased risk of death.¹¹

Response: While we appreciate the concerns raised by one commenter regarding the studies that examined the INTUITY valve, we believe the manufacturer addresses our concerns.

With regard to substantial clinical improvement for the Perceval valve, the applicant submitted several studies examining the Perceval valve. The following discussion summarizes some of these studies.

Pollari and colleagues¹² (2014) utilized a propensity score analysis to examine 82 matched pairs as part of a larger trial that included 566 patients treated with bioprosthetic aortic valve replacement, 166 of which received treatment using the Perceval sutureless valve and 400 of which received treatment using a stented valve. Aortic cross-clamp, cardiopulmonary bypass, and operation times were significantly shorter in the group that received treatment using the Perceval sutureless valve. The Perceval sutureless group also had shorter ICU stays, hospital

stays, and intubation times, and lower incidence of postoperative atrial fibrillation and respiratory insufficiency. The authors noted that, despite the promising preliminary results, longer follow-up is warranted before drawing definite conclusions.

In a nonrandomized trial of 100 patients in a German hospital, Santarpino and colleagues¹³ (2013) found that procedures completed using the Perceval valve were associated with significantly shorter cross-clamp and cardiopulmonary bypass times (40 ± 13.8 and 69 ± 19.1 versus 66 ± 20.4 and 105 ± 34.8) relative to conventional stented bioprosthetic valves, as well as less frequent use of blood transfusions, shorter ICU stays and shorter use of intubation. In contrast, Gilmanov and colleagues¹⁴ (2013) found that a MIS approach resulted in improved outcomes, albeit longer aortic cross-clamp times. A meta-analysis by Hurley and colleagues¹⁵ (2015) found reduced cross-clamp and cardiopulmonary bypass times, but found a significantly higher permanent pacemaker rate with the use of Perceval sutureless valves.

A study conducted by Dalen and colleagues¹⁶ (2015) used propensity score matching to examine early post-operative outcomes and 2-year survival between 171 pairs of patients who underwent ministernotomy using the Perceval device or a full sternotomy with stented prosthesis. There were no differences in 30-day mortality or 2-year survival between the groups. The aortic cross-clamp time and cardiopulmonary bypass time were shorter, and there were fewer blood transfusions in the group that received treatment using the Perceval device. However, this group was also at higher risk for post-operative permanent pacemaker implantation.

We stated in the proposed rule that, after reviewing the publications submitted by the applicant, we are concerned that the lack of randomization and blinded investigators may have influenced the outcomes in many of the studies provided. For example, in the discussion following

Santarpino et al.'s 2013 study, one of the participants suggested that medical decision-making regarding ventilation times, ICU times, and blood transfusions may be affected by the knowledge of investigators as to which valve the patient received treatment using. Also, as indicated above with respect to the INTUITY valve, the experience of the surgeons in these studies may be confounding factors that may have influenced the length of surgical procedures and/or surgical outcomes.

Comment: One manufacturer that produces heart valves stated that the evidence for the Perceval device suffers from lack of randomization and blinding of investigators. This commenter cited a brief by the Health Technology Assessment Information Services of ECRI summarizing the most recent evidence about the LivaNova Perceval valve. The brief cited a range of values for clinical outcomes, suggesting the importance in variation in technique. This commenter also compiled a table of gradients for aortic heart valves, including those of the applicants, and stated that the gradients are comparable to conventional surgical devices but are not best-in-class.

Response: While we acknowledge the concerns raised by one commenter regarding the Perceval valve, we recognize that studies in general may have some limitations. We also note that the studies submitted by the manufacturer indicate that the Perceval valve is associated with fewer blood transfusions and significantly shorter aortic cross-clamp, cardiopulmonary bypass, and operation times. The Perceval sutureless group also had shorter ICU stays, hospital stays, and intubation times, and lower incidence of postoperative atrial fibrillation and respiratory insufficiency.

In the proposed rule, we invited public comments on whether rapid deployment valves, specifically the INTUITY and Perceval valves, meet the substantial clinical improvement criterion. We noted that we did not receive any written public comments regarding the INTUITY and Perceval valves in response to the New Technology Town Hall meeting notice.

We agree with the manufacturers that the INTUITY and Perceval valves represent a substantial clinical improvement for the following reasons: The rapid deployment technology enables reduced operative time for minimally invasive AVR and full-sternotomy AVR. Additionally, the device improves cross-clamp time, thereby reducing the period of myocardial ischemia. The improved patient outcomes were also reflected in

improved patient satisfaction, faster return to normal activity, decreased postoperative pain, reduced mortality and decreased complications, including need for reoperation due to bleeding, reduced recovery time, reduced length of stay (both ICU and overall), and improved hemodynamics. In addition, the newly published 5-year data further support the substantial clinical improvement of this technology.

For the reasons described above and after consideration of the public comments we received, we have determined that the INTUITY and Perceval valve meet all of the criteria for approval of new technology add-on payments for FY 2018. Each of the applicants submitted cost information for its valve. The manufacturer of the INTUITY valve stated that the cost of the valve is \$12,500. The applicant projected that 1,750 cases will involve the use of INTUITY in FY 2018. The manufacturer of the Perceval valve stated that the cost of the valve is \$11,500. The applicant projected that 679 cases will involve the use of the Perceval valve in FY 2018.

New technology add-on payments for cases involving these technologies will be based on the weighted average cost of the two valves described by the ICD-10-PCS procedure code X2RF032 (Replacement of Aortic Valve using Zooplastic Tissue, Rapid Deployment Technique, Open Approach, New Technology Group 2). Because ICD-10 codes are not manufacturer specific, we cannot set one new technology add-on payment amount for INTUITY and a different new technology add-on payment amount for the Perceval valve; both technologies will be captured by using the same ICD-10-PCS procedure code. As such, we believe that the use of a weighted average of the cost of the standard valves based on the projected number of cases involving each technology to determine the maximum new technology add-on payment would be most appropriate. To compute the weighted cost average, we summed the total number of projected cases for each of the applicants, which equaled 2,429 cases (1,750 plus 679). We then divided the number of projected cases for each of the applicants by the total number of cases, which resulted in the following case-weighted percentages: 72 percent for the INTUITY and 28 percent for the Perceval valve. We then multiplied the cost per case for the manufacturer specific valve by the case-weighted percentage ($0.72 * \$12,500 = \$9,005.76$ for INTUITY and $0.28 * \$11,500 = \$3,214.70$ for the Perceval valve). This resulted in a case-weighted average cost of \$12,220.46 for the valves. Under

§ 412.88(a)(2), we limit new technology add-on payments to the lesser of 50 percent of the average cost of the device or 50 percent of the costs in excess of the MS-DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the INTUITY or Perceval valves is \$6,110.23 for FY 2018.

c. Ustekinumab (Stelara®)

Janssen Biotech submitted an application for new technology add-on payments for the Stelara® induction therapy for FY 2018. Stelara® received FDA approval as an intravenous (IV) infusion treatment of Crohn's disease (CD) on September 23, 2016, which added a new indication for the use of Stelara® and route of administration for this monoclonal antibody. IV infusion of Stelara® is indicated for the treatment of adult patients (18 years and older) diagnosed with moderately to severely active CD who have: (1) Failed or were intolerant to treatment using immunomodulators or corticosteroids, but never failed a tumor necrosis factor (TNF) blocker; or (2) failed or were intolerant to treatment using one or more TNF blockers. Stelara® for IV infusion has only one purpose, induction therapy. Stelara® must be administered intravenously by a health care professional in either an inpatient hospital setting or an outpatient hospital setting.

Stelara® for IV infusion is packaged in single 130mg vials. Induction therapy consists of a single IV infusion dose using the following weight-based dosing regimen: patients weighing less than (<) 55kg are administered 260mg of Stelara® (2 vials); patients weighing more than (>) 55kg, but less than (<) 85kg are administered 390mg of Stelara® (3 vials); and patients weighing more than (>) 85kg are administered 520mg of Stelara® (4 vials). An average dose of Stelara® administered through IV infusion is 390mg (3 vials). Maintenance doses of Stelara® are administered at 90mg, subcutaneously, at 8-week intervals and may occur in the outpatient hospital setting.

CD is an inflammatory bowel disease of unknown etiology, characterized by transmural inflammation of the gastrointestinal (GI) tract. Symptoms of CD may include fatigue, prolonged diarrhea with or without bleeding, abdominal pain, weight loss and fever. CD can affect any part of the GI tract including the mouth, esophagus, stomach, small intestine, and large intestine.

Conventional pharmacologic treatments of CD include antibiotics, mesalamines, corticosteroids,

immunomodulators, tumor necrosis alpha (TNF α) inhibitors, and anti-integrin agents. Surgery may be necessary for some patients diagnosed with CD in which conventional therapies have failed. The applicant asserted that use of Stelara[®] offers an alternative to conventional pharmacologic treatments, and has been shown to be successful in the treatment of patients who have failed treatment using the conventional agents currently being used for a diagnosis of CD, including TNF α inhibitors.

Although the precise cause of CD is unknown, the environment, genetics, and the patient's immune system are thought to play a role in this form of inflammatory bowel disease (IBD). Conventional pharmacologic therapy is directed against many different inflammatory mediators that produce inflammation and ultimately lead to gastrointestinal damage. The applicant asserted that it is of paramount importance to have a variety of pharmacologic agents that can address the proper inflammatory mediator for a particular patient. The applicant also asserted that, while the currently available anti-inflammatory agents used in the treatment of a diagnosis of CD are excellent medications, these agents do not successfully treat all patients diagnosed with CD, nor do they reliably sustain disease remission once a response has been achieved. The applicant believed that the use of Stelara[®] offers an alternative to currently available treatment options.

With regard to the newness criterion, Stelara[®] is not a newly formulated drug. Stelara[®], administered subcutaneously, received FDA approval in 2009 (September 25, 2009) for the treatment of moderate to severe plaque psoriasis in adults. Its IV use for the treatment of patients diagnosed with CD was approved by the FDA in 2016 (September 23, 2016). With regard to the new use of an existing technology, in the September 1, 2001 final rule (66 FR 46915), we stated that if the new use of an existing technology was for treating patients not expected to be assigned to the same MS-DRG as the patients receiving the existing technology, it may be considered for approval, but it must also meet the cost and substantial clinical improvement criteria in order to qualify for the new technology add-on payment. We do not believe that potential cases representing patients that may be eligible for treatment with the new use of the Stelara[®] for IV treatment of a diagnosis of CD would be assigned to the same MS-DRGs as cases treated using the prior indications.

As discussed above, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered "new" for purposes of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or a similar mechanism of action to achieve a therapeutic outcome, we stated in the proposed rule that we were concerned that Stelara[®]'s mechanism of action does not appear to differ from the mechanism of action of other monoclonal antibodies, which also target unique gastrointestinal-selective cytokines. The applicant believed that the Stelara[®] uses a different mechanism of action than other medications currently available for the treatment of patients diagnosed with CD. However, we stated that we believe that the mechanism of action for the new use of the Stelara[®] may be similar to the mechanism of action of other cytokine-selective monoclonal antibodies that disrupt cytokine mediated signals crucial to the inflammatory process in patients diagnosed with CD.

The applicant stated that the Stelara[®] is a human IgG1 monoclonal antibody that binds with specificity to the p40 protein subunit, which is common to both the interleukin-12 (IL-12) and interleukin (IL-23) cytokines. IL-12 and IL-23 are naturally occurring cytokines that are involved in inflammatory and immune responses, such as natural killer cell activation and CD4+ T-cell differentiation and activation. In *in vitro* models, the Stelara[®] was shown to disrupt IL-12 and IL-23 mediated signaling and cytokine cascades by blocking the interaction of these cytokines with a shared cell-surface receptor chain, IL-12R β 1. The cytokines IL-12 and IL-23 have been implicated as important contributors to chronic inflammation. According to the applicant, IV induction therapy quickly achieves optimal blood levels of Stelara[®] so that blockade of IL-12 and IL-23 is most effective. This level of blockade is not achieved with subcutaneous administration.

The applicant further stated that other available CD anti-inflammatory or immune modulator therapies do not target the IL-12/IL-23p40 substrate. Rather, these therapies may target other integrin pairs such as the alpha4- beta7 integrins. Therefore, the applicant believed that the Stelara[®] drug is not substantially similar to any other approved drug for the treatment of moderately to severely active CD. As previously noted, the applicant asserted that, while the currently available

agents are excellent medications, these agents do not successfully treat all patients diagnosed with CD, nor do these agents reliably sustain remission once a clinical response has been achieved. According to the applicant, the new use of the Stelara[®] offers an alternative to currently available treatment options, and has been shown to be successful in the treatment of patients who have failed treatment with the conventional agents currently being used for a diagnosis of CD, including TNF blockers. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19885), we stated that we are concerned that the Stelara[®]'s mechanism of action is similar to that of other immune system suppressors used in the treatment of patients diagnosed with moderately to severely active CD because other cytokine-selective monoclonal antibodies also disrupt cytokine mediated signals crucial to the inflammatory process in patients diagnosed with CD.

With respect to the second criterion, whether a product is assigned to the same or a different MS-DRG, the applicant maintained that MS-DRGs 386, 387, and 385 (Inflammatory Bowel Disease with CC, without CC/MCC, and with MCC, respectively) and MS-DRGs 330, 329 and 331 (Major Small and Large Bowel Procedures with CC, without CC/MCC, and with MCC, respectively) are used to identify cases representing patients who may potentially be eligible for treatment using the Stelara[®]. The applicant researched claims data from the FY 2015 MedPAR file and found 10,344 cases. About 85 percent of potentially eligible cases mapped to MS-DRGs for inflammatory bowel disease and most of the remainder of cases mapped to MS-DRGs for bowel surgery. In the proposed rule, we stated that we believe that potential cases involving Stelara[®] induction therapy may be assigned to the same MS-DRGs as cases representing patients who have been treated using currently available treatment options.

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, according to the applicant, currently available pharmacologic treatments include antibiotics, mesalamines, corticosteroids, immunomodulators, tumor necrosis alfa (TNF α) inhibitors and anti-integrins. The applicant stated that the new use of the Stelara[®] for IV infusion is indicated for the treatment of adults (18 years and older) diagnosed with moderately to severely active CD

who have: (1) Failed or were intolerant to treatment with immunomodulators or corticosteroids, but never failed treatment using a TNF blocker; or (2) failed or were intolerant to treatment with one or more TNF blockers. The applicant asserted that Stelara® for induction therapy is not substantially similar to other treatment options because it does not involve the treatment of the same or similar type of patient population. Patients who are eligible for treatment using the Stelara® induction therapy have failed other CD treatment modalities. The applicant believed that the subset of primary and secondary nonresponder patients to TNF inhibitor treatments is a patient population unresponsive to, or ineligible for, currently available treatments for diagnoses of moderate to severe CD. Based on the indications for the use of Stelara®, there is a class of patients who failed, or were intolerant to, treatment using immunomodulators or corticosteroids, but never failed treatment using a TNF blocker. The applicant indicated that, for those patients who never failed treatment with a TNF blocker, this class of patients can be recognized as two separate patient populations: One population of patients who have never received treatment using a TNF blocker, or the other population of patients who have received and responded to treatment using a TNF blocker. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19885), we stated that we believe that, if the new use of the Stelara® has the same mechanism of action as other immune system suppressors such as TNF blockers, the patient population that did not receive treatment using a TNF blocker may not be a new patient population because those patients may be able to receive treatment using, and would successfully respond to treatment using, a TNF blocker. Moreover, if the mechanism of action is the same as other immune system suppressors, we stated that we believe that the new use of the Stelara® may be targeted at a new patient population in some circumstances and instances, but we are concerned that it may not be targeted at a new patient population in all circumstances and instances.

In the proposed rule, we invited public comments on whether the Stelara® meets the newness criterion.

Comment: Several commenters stated that Stelara® has a different mechanism of action than other immune system suppressors. The applicant also submitted comments acknowledging that CMS accurately noted that other monoclonal antibodies targeting unique gastrointestinal-selective cytokines are

currently marketed for the treatment of CD. The applicant noted that a critical differentiator is that Stelara® targets the IL-12 and IL-23 regulatory cytokines while other monoclonal antibodies used to treat Crohn's disease are either TNF inhibitors or anti-integrin monoclonal antibodies. The applicant stated that, as a result, Stelara® has a different mechanism of action for reducing the inflammatory response in CD than other monoclonal antibodies used to treat the disease. Furthermore, the applicant stated that while many patients respond to TNF inhibition, 20 to 25 percent of them will not respond, regardless of the TNF inhibitor employed or the dose provided. By targeting the IL-12 and IL-23 regulatory cytokines that may be responsible for the inflammation producing the patient's symptoms, the applicant stated that Stelara® has a different mechanism of action designed to treat patients that failed other Crohn's disease treatments. The applicant believed that this distinction makes Stelara® new and different for treating some patients with Crohn's disease. The applicant provided comments reflecting that clinicians have learned that different patients with Crohn's disease require different types of cytokine inhibition to target the inflammatory process *in each particular patient*. The applicant believed that this is an example of personalized medicine—choosing the right biologic for the right patient at the right time. Therefore, according to the applicant, Stelara®'s mechanism of action provides a treatment option for patients with CD where others have been unsuccessful.

Response: We appreciate the comments we received from the applicant on whether or not Stelara® meets the newness criterion.

After consideration of the public comments we received, we believe that Stelara® has a unique mechanism of action because it is unique from other immune system suppressors in that it targets the IL-12 and IL-23 regulatory cytokines. Therefore, Stelara® meets the newness criterion for new technology add-on payments.

With regard to the cost criterion, the applicant conducted the following analysis to demonstrate that Stelara® meets the cost criterion. The applicant searched claims from the FY 2015 MedPAR file for cases with a principal ICD-9-CM diagnosis of 555.x (Regional Enteritis), which are cases of a diagnosis of Crohn's Disease that may be eligible for treatment using Stelara®.

The applicant identified 10,344 cases that mapped to 35 MS-DRGs. Approximately 85 percent of cases mapped to the following Inflammatory

Bowel MS-DRGs: MS-DRGs 385 (Inflammatory Bowel Disease with MCC), 386 (Inflammatory Bowel Disease with CC), and 387 (Inflammatory Bowel Disease without CC/MCC). Similarly, 11 percent of the cases mapped to the following MS-DRGs for bowel surgery: MS-DRGs 329 (Major Small and Large Bowel Procedures with MCC), 330 (Major Small and Large Bowel Procedures with CC), and 331 (Major Small and Large Bowel Procedures without CC/MCC). The remaining cases (4 percent) represented all other digestive system disorders.

Using the 10,344 identified cases, the average unstandardized case-weighted charge per case was \$39,935. The applicant then standardized the charges. The applicant did not remove charges for the current treatment because as discussed above Stelara® is indicated for use in patients who fail other treatments. The applicant then applied the 2-year inflation factor of 1.098446 from the FY 2017 IPPS/LTCH PPS final rule (81 FR 57286) to inflate the charges from FY 2015 to FY 2017. The applicant then added charges for the Stelara® technology. Specifically, the applicant assumed that hospitals would mark up Stelara® IV to the same extent that they currently mark-up Stelara® SC (J3357, ustekinumab, 1 mg). The applicant used the actual hospital mark-up based on charges in the CY 2017 OPPS/ASC proposed rule file (OPPS claims incurred and paid in CY 2015). Based on the FY 2017 IPPS/LTCH PPS Table 10 thresholds, the average case-weighted threshold amount was \$55,023. The inflated average case-weighted standardized charge per case was \$69,826. Because the inflated average case-weighted standardized charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19886), we invited public comments on whether Stelara® meets the cost criterion.

Comment: The applicant submitted public comments reiterating its cost analysis results. According to the applicant, the inflated average case-weighted standardized charge per case exceeds the average case-weighted threshold amount. The applicant maintained that the technology meets the cost criterion.

Response: After consideration of the public comments we received, we agree that Stelara® meets the cost criterion.

With regard to the third criterion, whether a technology represents a substantial clinical improvement over existing technologies, according to the

applicant, the new use of the Stelara® has been shown to produce clinical response and remission in patients diagnosed with moderate to severe CD who have failed treatment using conventional therapies, including antibiotics, mesalamine, corticosteroids, immunomodulators, and TNFα inhibitors. Stelara® has been commercially available on the U.S. market for the treatment of patients diagnosed with psoriasis (PsO) since 2009 and the treatment of patients diagnosed with psoriatic arthritis (PsA) since 2013, and the applicant has maintained a safety registry, which enrolled over 12,000 patients since 2007. According to the applicant, the drug has been extremely well-tolerated, and the safety profile in patients diagnosed with CD has been consistent with that experienced in cases representing patients diagnosed with PsO and PsA.

The applicant presented the results of three pivotal trials involving over 1,300 patients diagnosed with moderate to severe CD. All three trials utilized a multicenter, double-blind, placebo controlled study design. There were two single-dose IV induction trials, which included patients who had failed treatment using one or more TNFα inhibitors (UNITI-1) (N = 741), and patients who had failed treatment using corticosteroids and/or immunomodulators (UNITI-2) (N = 628). Responders to the single IV induction dose were then eligible to be enrolled in a maintenance trial (IM-UNITI) (N = 397), which began 8 weeks after administration of the single IV induction dose. IM-UNITI patients were given subcutaneous Stelara® and were treated for 44 weeks. Over half of the patients treated with 90 mg of Stelara® every 12 weeks were able to achieve remission; a highly significant response compared to placebo, according to the applicant. The results of these trials have been published by the *New England Journal of Medicine* and the applicant provided the published studies.¹⁷ The published study supported the applicant's assertion that Stelara® single IV dose induces response and remission in patients diagnosed with moderately to severely active CD that is refractory to either TNF antagonists or conventional therapy. Of the patients in the IM-UNITI trial receiving subcutaneous Stelara® at 8 weeks or 12 weeks, 53.1 percent and 48 percent, respectively, were in remission

at week 44 as compared with 35.9 percent of those patients receiving treatment using placebo.

The applicant submitted published results of a multicenter, double-blind, placebo controlled Phase III study of Stelara®.¹⁸ In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19886), we indicated that we were concerned that the study did not effectively establish the need for Stelara® induction therapy. Also, the median age of patients in the study was 37 years, and we stated that we were concerned that the study did not include a significant amount of older patients.

We also indicated that we were concerned that we do not have enough information to determine that the new use of the Stelara® is a substantial clinical improvement over existing technologies for the treatment of moderate to severe CD. We noted that the UNITI-1, UNITI-2, and IMUNITI trials were completed to evaluate efficacy and safety of Stelara®, not superiority of Stelara® to current conventional therapy. Our concerns were based on a lack of head-to-head trials comparing IV induction and maintenance Stelara® therapy with conventional therapy in patients diagnosed with moderate to severe CD that are also primary and secondary nonresponders to treatment using TNF alpha inhibitor¹⁹ therapy. We recognized the subset of primary and secondary nonresponder patients to TNF inhibitor treatments as a patient population unresponsive to, or ineligible for, currently available treatments for diagnoses of moderate to severe CD. However, we stated that we believe that this primary and secondary TNF alpha inhibitor non-responder patient population represents patients that experience a gap in treatment for diagnoses of moderate to severe CD. Specifically, we recognized the nonresponder patient population as described by Simon et al.²⁰ as those patients who are TNF inhibitor immunogenicity failures, pharmacokinetic failures, and/or pharmacodynamics failures. We also noted the supplement data in Feagan et al.'s publication²¹ summarized the primary and secondary nonresponders in UNITI-1. However, we stated that we

were not clear how the inclusion of the TNF alpha inhibitor intolerant patients with primary and secondary TNF alpha inhibitor failure patients impacts the final comparison of the placebo and treatment arms. In addition, we noted that, in the UNITI-1, UNITI-2, and IMUNITI studies, all treatment arms were allowed to continue conventional treatments for diagnoses of CD throughout the study. We stated that we were concerned that it is difficult to determine whether the new use of the Stelara® represents a substantial clinical improvement over existing technologies with the concomitant use of other conventional CD medications throughout the duration of the UNITI-1, UNITI-2, and IMUNITI studies.

Also, as mentioned earlier, based on the indications for the use of the Stelara®, there is a class of patients who failed, or were intolerant to, treatment with immunomodulators or corticosteroids, but never failed treatment using a TNF blocker. According to the applicant, for those patients who never failed treatment using a TNF blocker, this patient population can be recognized as two separate patient populations: One patient population representing patients who never received treatment using a TNF blocker; or the other patient population representing patients who received and responded to treatment using a TNF blocker. In the patient population that did not receive treatment using a TNF blocker, we stated that we were unsure if the new use of the Stelara® represents a substantial clinical improvement because it is possible that some patients will have a positive response to treatment using a TNF blocker and will not respond successfully to treatment using Stelara®, or some patients may have a positive response to both treatment using a TNF blocker and using Stelara®, or some patients may not respond to treatment using a TNF blocker, but will have a positive response to treatment using Stelara®.

In the proposed rule, we invited public comments on whether the Stelara® meets the substantial clinical improvement criterion. We noted that we did not receive any written public comments in response to the New Technology Town Hall meeting notice regarding the application of Stelara® for new technology add-on payments.

Comment: The applicant submitted public comments addressing CMS' concerns. The applicant stated that the first dose of any therapy may be considered induction therapy. The applicant reiterated the results of its early trials which demonstrated that

¹⁷ Feagan, W.J., et al. (2016) Ustekinumab as Induction and Maintenance Therapy for Crohn' Disease. *The New England Journal of Medicine*. 2016 Nov 17; 374(20):1946-60.

¹⁸ Ibid.

¹⁹ Ibid.

²⁰ Simon E.G., et al., (2016) Ustekinumab for the treatment of Crohn's disease: can it find its niche? *Therapeutic Advances in Gastroenterology*. 2016 Jan; 9(1):26-36.

²¹ Feagan, W.J., et al. (2016) Ustekinumab as Induction and Maintenance Therapy for Crohn' Disease. *The New England Journal of Medicine*. 2016 Nov 17; 374(20):1946-60.

intravenous induction therapy was superior to subcutaneous administration and that higher intravenous doses appeared to be more efficacious than lower subcutaneous doses. The applicant noted that IBD experts are generally in agreement that higher doses of biologics are required at the outset to induce remission, while lower and less frequent doses may be adequate to maintain remission in a maintenance setting.

The applicant also submitted comments addressing CMS' concerns with regards to the lack of head-to-head clinical trials comparing IV induction and maintenance Stelara® therapy with conventional therapy in patients diagnosed with moderate to severe CD that are also primary and secondary nonresponders to treatment using TNF alpha inhibitor therapy. The applicant stated that the UNITI trials were, in fact, head-to-head trials—the placebo group was receiving active treatment and was not truly a placebo group. Those patients continued the conventional therapies they were taking prior to study entry. The applicant noted that the UNITI induction trials covered the breadth of CD patients and that the UNITI-2 population had failed either corticosteroids and/or immunomodulators—these drugs are both recognized as standard conventional therapy for CD according to the applicant. The UNITI-1 population had failed at least one TNF inhibitor; in fact, approximately 50 percent had failed greater than one. This patient population, according to the applicant, is considered to be the most difficult group to treat in that they had, in most cases, already failed not only non-biologic therapy with corticosteroids and/or immunomodulators, but TNF inhibitors as well. The applicant summarized that the trials should be considered head-to-head comparing Stelara® to conventional therapies.

Response: We appreciate the comments submitted by the applicant in response to our concerns. After consideration of the public comments we received, which clarify the placebo group as having received conventional therapies and, therefore, the clinical trials did compare Stelara® to existing therapies, we believe Stelara® meets the substantial clinical improvement criterion because, according to the studies provided by the applicant, Stelara® produced a clinical response and remission in patients with moderate to severe Crohn's Disease who have failed conventional therapies, including antibiotics, mesalamines, corticosteroids, immunomodulators,

and TNFα inhibitors as outlined in their label. Specifically, Stelara® targets cytokines IL-12 and IL-23 which are responsible for inflammation in CD, offering a treatment option, otherwise not available, for a specific patient population. Stelara® provides a treatment option for this difficult-to-treat patient population.

We have determined that Stelara® meets all of the criteria for approval of new technology add-on payments. Therefore, we are approving new technology add-on payments for Stelara® for FY 2018. We expect that Stelara® will be administered for the treatment of adult patients (18 years and older) diagnosed with moderately to severely active CD who have: (1) Failed or were intolerant to treatment using immunomodulators or corticosteroids, but never failed a tumor necrosis factor (TNF) blocker; or (2) failed or were intolerant to treatment using one or more TNF blockers. Cases involving Stelara® that are eligible for new technology add-on payments will be identified by ICD-10-PCS procedure code XW033F3 (Introduction of other New Technology therapeutic substance into peripheral vein, percutaneous approach, New Technology Group 3). In its application, the applicant estimated that the average dose of Stelara® administered through IV infusion is 390 mg which would require 3 vials of Stelara IV at a hospital acquisition cost of \$1,600 per vial (for a total of \$4,800). Under 42 CFR 412.88(a)(2), we limit new technology add-on payments to the lesser of 50 percent of the average cost of the technology or 50 percent of the costs in excess of the MS-DRG payment for the case. As a result, the maximum new technology add-on payment amount for a case involving the use of STELARA™ is \$2,400 for FY 2018.

III. Changes to the Hospital Wage Index for Acute Care Hospitals

A. Background

1. Legislative Authority

Section 1886(d)(3)(E) of the Act requires that, as part of the methodology for determining prospective payments to hospitals, the Secretary adjust the standardized amounts for area differences in hospital wage levels by a factor (established by the Secretary) reflecting the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level. We currently define hospital labor market areas based on the delineations of statistical areas established by the Office of Management and Budget (OMB). A discussion of the FY 2018 hospital wage

index based on the statistical areas appears under section III.A.2. of the preamble of this final rule.

Section 1886(d)(3)(E) of the Act requires the Secretary to update the wage index annually and to base the update on a survey of wages and wage-related costs of short-term, acute care hospitals. (CMS collects these data on the Medicare cost report, CMS Form 2552-10, Worksheet S-3, Parts II, III, and IV. The OMB control number for approved collection of this information is 0938-0050.) This provision also requires that any updates or adjustments to the wage index be made in a manner that ensures that aggregate payments to hospitals are not affected by the change in the wage index. The adjustment for FY 2018 is discussed in section II.B. of the Addendum to this final rule.

As discussed in section III.I. of the preamble of this final rule, we also take into account the geographic reclassification of hospitals in accordance with sections 1886(d)(8)(B) and 1886(d)(10) of the Act when calculating IPPS payment amounts. Under section 1886(d)(8)(D) of the Act, the Secretary is required to adjust the standardized amounts so as to ensure that aggregate payments under the IPPS after implementation of the provisions of sections 1886(d)(8)(B), 1886(d)(8)(C), and 1886(d)(10) of the Act are equal to the aggregate prospective payments that would have been made absent these provisions. The budget neutrality adjustment for FY 2018 is discussed in section II.A.4.b. of the Addendum to this final rule.

Section 1886(d)(3)(E) of the Act also provides for the collection of data every 3 years on the occupational mix of employees for short-term, acute care hospitals participating in the Medicare program, in order to construct an occupational mix adjustment to the wage index. A discussion of the occupational mix adjustment that we are applying to the FY 2018 wage index appears under sections III.E.3. and F. of the preamble of this final rule.

2. Core-Based Statistical Areas (CBSAs) for the FY 2018 Hospital Wage Index

The wage index is calculated and assigned to hospitals on the basis of the labor market area in which the hospital is located. Under section 1886(d)(3)(E) of the Act, beginning with FY 2005, we delineate hospital labor market areas based on OMB-established Core-Based Statistical Areas (CBSAs). The current statistical areas (which were implemented beginning with FY 2015) are based on revised OMB delineations issued on February 28, 2013, in OMB Bulletin No. 13-01. OMB Bulletin No.

13–01 established revised delineations for Metropolitan Statistical Areas, Micropolitan Statistical Areas, and Combined Statistical Areas in the United States and Puerto Rico based on the 2010 Census, and provided guidance on the use of the delineations of these statistical areas using standards published on June 28, 2010 in the **Federal Register** (75 FR 37246 through 37252). We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 49951 through 49963) for a full discussion of our implementation of the OMB labor market area delineations beginning with the FY 2015 wage index.

Generally, OMB issues major revisions to statistical areas every 10 years, based on the results of the decennial census. However, OMB occasionally issues minor updates and revisions to statistical areas in the years between the decennial censuses through OMB Bulletins. On July 15, 2015, OMB issued OMB Bulletin No. 15–01, which provides updates to and supersedes OMB Bulletin No. 13–01 that was issued on February 28, 2013. The attachment to OMB Bulletin No. 15–01 provides detailed information on the update to statistical areas since February 28, 2013. The updates provided in OMB Bulletin No. 15–01 are based on the application of the 2010 Standards for Delineating Metropolitan and Micropolitan Statistical Areas to Census Bureau population estimates for July 1, 2012 and July 1, 2013. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56913), we adopted the updates set forth in OMB Bulletin No. 15–01 effective October 1, 2016, beginning with the FY 2017 wage index. For a complete discussion of the adoption of the updates set forth in OMB Bulletin No. 15–01, we refer readers to the FY 2017 IPPS/LTCH PPS final rule.

For FY 2018, we are continuing to use the OMB delineations that we adopted beginning with FY 2015 to calculate the area wage indexes, with updates as reflected in OMB Bulletin No. 15–01 specified in the FY 2017 IPPS/LTCH PPS final rule.

3. Codes for Constituent Counties in CBSAs

CBSAs are made up of one or more constituent counties. Each CBSA and constituent county has its own unique identifying codes. There are two different lists of codes associated with counties: Social Security Administration (SSA) codes and Federal Information Processing Standard (FIPS) codes. Historically, CMS has listed and used SSA and FIPS county codes to identify and crosswalk counties to CBSA codes for purposes of the hospital

wage index. We have learned that SSA county codes are no longer being maintained and updated. However, the FIPS codes continue to be maintained by the U.S. Census Bureau. The Census Bureau's most current statistical area information is derived from ongoing census data received since 2010; the most recent data are from 2015. For the purposes of crosswalking counties to CBSAs, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19898 through 19899), we proposed to discontinue the use of SSA county codes and begin using only the FIPS county codes.

The Census Bureau maintains a complete list of changes to counties or county equivalent entities on the Web site at: <https://www.census.gov/geo/reference/county-changes.html>. In our proposed transition to using only FIPS codes for counties for the hospital wage index, we proposed to update the FIPS codes used for crosswalking counties to CBSAs for the hospital wage index to incorporate changes to the counties or county equivalent entities included in the Census Bureau's most recent list. Based on information included in the Census Bureau's Web site, since 2010, the Census Bureau has made the following updates to the FIPS codes for counties or county equivalent entities:

- Petersburg Borough, AK (FIPS State County Code 02–195), CBSA 02, was created from part of former Petersburg Census Area (02–195) and part of Hoonah-Angoon Census Area (02–105). The CBSA code remains 02.
- The name of La Salle Parish, LA (FIPS State County Code 22–059), CBSA 14, is now LaSalle Parish, LA (FIPS State County Code 22–059). The CBSA code remains as 14.
- The name of Shannon County, SD (FIPS State County Code 46–113), CBSA 43, is now Oglala Lakota County, SD (FIPS State County Code 46–102). The CBSA code remains as 43.

We believe that it is important to use the latest counties or county equivalent entities in order to properly crosswalk hospitals from a county to a CBSA for purposes of the hospital wage index used under the IPPS. In addition, we believe that using the latest FIPS codes will allow us to maintain a more accurate and up-to-date payment system that reflects the reality of population shifts and labor market conditions. Therefore, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19898 through 19899), we proposed to implement these FIPS code updates, effective October 1, 2017, beginning with the FY 2018 wage indexes. We proposed to use these update changes to calculate area wage indexes in a manner that is generally consistent with the

CBSA-based methodologies finalized in the FY 2005 IPPS final rule and the FY 2015 IPPS/LTCH PPS final rule. We note that while the county update changes listed earlier changed the county names, the CBSAs to which these counties map did not change from the prior counties. Therefore, there is no impact or change to hospitals in these counties; they continue to be considered rural for the hospital wage index under these changes. We invited public comments on our proposals.

We did not receive any public comments on our proposals. Therefore, for the reasons discussed earlier, we are finalizing our proposal, without modification, to discontinue the use of the SSA county codes and begin using only the FIPS county codes for purposes of crosswalking counties to CBSAs. In addition, we are finalizing our proposal, without modification, to implement the latest FIPS code updates, as discussed earlier, effective October 1, 2017, beginning with the FY 2018 wage indexes. As we proposed, we will use these update changes to calculate the wage indexes in a manner that is generally consistent with the CBSA-based methodologies finalized in the FY 2005 IPPS final rule and the FY 2015 IPPS/LTCH PPS final rule. For FY 2018, Tables 2 and 3 associated with this final rule and the County to CBSA Crosswalk File and Urban CBSAs and Constituent Counties for Acute Care Hospitals File posted on the CMS Web site reflect these county changes.

B. Worksheet S–3 Wage Data for the FY 2018 Wage Index

The FY 2018 wage index values are based on the data collected from the Medicare cost reports submitted by hospitals for cost reporting periods beginning in FY 2014 (the FY 2017 wage indexes were based on data from cost reporting periods beginning during FY 2013).

1. Included Categories of Costs

The FY 2018 wage index includes all of the following categories of data associated with costs paid under the IPPS (as well as outpatient costs):

- Salaries and hours from short-term, acute care hospitals (including paid lunch hours and hours associated with military leave and jury duty);
- Home office costs and hours;
- Certain contract labor costs and hours, which include direct patient care, certain top management, pharmacy, laboratory, and nonteaching physician Part A services, and certain contract indirect patient care services (as discussed in the FY 2008 final rule

with comment period (72 FR 47315 through 47317)); and

- Wage-related costs, including pension costs (based on policies adopted in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51586 through 51590)) and other deferred compensation costs.

2. Excluded Categories of Costs

Consistent with the wage index methodology for FY 2017, the wage index for FY 2018 also excludes the direct and overhead salaries and hours for services not subject to IPPS payment, such as skilled nursing facility (SNF) services, home health services, costs related to GME (teaching physicians and residents) and certified registered nurse anesthetists (CRNAs), and other subprovider components that are not paid under the IPPS. The FY 2018 wage index also excludes the salaries, hours, and wage-related costs of hospital-based rural health clinics (RHCs), and Federally qualified health centers (FQHCs) because Medicare pays for these costs outside of the IPPS (68 FR 45395). In addition, salaries, hours, and wage-related costs of CAHs are excluded from the wage index for the reasons explained in the FY 2004 IPPS final rule (68 FR 45397 through 45398).

3. Use of Wage Index Data by Suppliers and Providers Other Than Acute Care Hospitals Under the IPPS

Data collected for the IPPS wage index also are currently used to calculate wage indexes applicable to suppliers and other providers, such as SNFs, home health agencies (HHAs), ambulatory surgical centers (ASCs), and hospices. In addition, they are used for prospective payments to IRFs, IPFs, and LTCHs, and for hospital outpatient services. We note that, in the IPPS rules, we do not address comments pertaining to the wage indexes of any supplier or provider except IPPS providers and LTCHs. Such comments should be made in response to separate proposed rules for those suppliers and providers.

C. Verification of Worksheet S-3 Wage Data

The wage data for the FY 2018 wage index were obtained from Worksheet S-3, Parts II and III of the Medicare cost report (Form CMS-2552-10) for cost reporting periods beginning on or after October 1, 2013, and before October 1, 2014. For wage index purposes, we refer to cost reports during this period as the “FY 2014 cost report,” the “FY 2014 wage data,” or the “FY 2014 data.” Instructions for completing the wage index sections of Worksheet S-3 are included in the Provider Reimbursement Manual (PRM), Part 2

(Pub.15-2), Chapter 40, Sections 4005.2 through 4005.4. The data file used to construct the FY 2018 wage index includes FY 2014 data submitted to us as of June 14, 2017. As in past years, we performed an extensive review of the wage data, mostly through the use of edits designed to identify aberrant data.

We asked our MACs to revise or verify data elements that result in specific edit failures. For the proposed FY 2018 wage index, we identified and excluded 51 providers with aberrant data that should not be included in the wage index, although we stated in the FY 2018 IPPS/LTCH PPS proposed rule that if data elements for some of these providers are corrected, we intend to include data from those providers in the final FY 2018 wage index (82 FR 19899). We note that of the 51 hospitals that we excluded from the proposed wage index, some hospitals had data that we did not expect to change or improve (for example, among the reasons these providers were excluded are: They are low Medicare utilization providers; they closed and failed edits for reasonableness; or they have extremely high or low average hourly wages that are atypical for their CBSAs). We also adjusted certain aberrant data and included these data in the proposed wage index. For example, in situations where a hospital did not have documentable salaries, wages, and hours for housekeeping and dietary services, we imputed estimates, in accordance with policies established in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49965 through 49967). We instructed MACs to complete their data verification of questionable data elements and to transmit any changes to the wage data no later than March 24, 2017. In addition, as a result of the April and May appeals processes, and posting of the April 28, 2017 PUF, we have made additional revisions to the FY 2018 wage data, as described further below. The revised data are reflected in this FY 2018 IPPS/LTCH PPS final rule.

In constructing the proposed FY 2018 wage index, we included the wage data for facilities that were IPPS hospitals in FY 2014, inclusive of those facilities that have since terminated their participation in the program as hospitals, as long as those data did not fail any of our edits for reasonableness. We believed that including the wage data for these hospitals is, in general, appropriate to reflect the economic conditions in the various labor market areas during the relevant past period and to ensure that the current wage index represents the labor market area's current wages as compared to the national average of wages. However, we

excluded the wage data for CAHs as discussed in the FY 2004 IPPS final rule (68 FR 45397 through 45398). For the proposed rule, we removed 7 hospitals that converted to CAH status on or after January 22, 2016, the cut-off date for CAH exclusion from the FY 2017 wage index, and through and including January 23, 2017, the cut-off date for CAH exclusion from the FY 2018 wage index. After excluding CAHs and hospitals with aberrant data, we calculated the proposed wage index using the Worksheet S-3, Parts II and III wage data of 3,325 hospitals.

Since the development of the FY 2018 proposed wage index, as a result of further review by the MACs and the April and May appeals processes, we received improved data for 15 hospitals and are including the wage data of these 15 hospitals in the final wage index. However, during our review of the wage data in preparation of the April 28, 2017 PUF, we identified and deleted the data of 2 additional hospitals whose data we determined to be aberrant (unusually low average hourly wages) relative to their CBSAs, and there was insufficient documentation provided to explain their wage data. Finally, we learned that in the proposed wage index, we inadvertently deleted the data of one hospital when we should have deleted the data of a different hospital. We have corrected this error, although because we were including one hospital while deleting another, there was no effect on the number of hospitals in the wage index. With regard to CAHs, we have since learned of 2 additional hospitals that converted to CAH status on or after January 22, 2016, the cut-off date for CAH exclusion from the FY 2017 wage index, and through and including January 23, 2017, the cut-off date for CAH exclusion from the FY 2018 wage index. Accordingly, we have removed 9 hospitals that converted to CAH status from the FY 2018 wage index. The final FY 2018 wage index is based on the wage index of 3,336 hospitals ($3,325 + 15 - 2 - 1 + 1 - 2 = 3,336$).

For the final FY 2018 wage index, we allotted the wages and hours data for a multicampus hospital among the different labor market areas where its campuses are located in the same manner that we allotted such hospitals' data in the FY 2017 wage index (81 FR 56915). Table 2, which contains the final FY 2018 wage index associated with this final rule (available via the Internet on the CMS Web site), includes separate wage data for the campuses of 9 multicampus hospitals.

D. Method for Computing the FY 2018 Unadjusted Wage Index

1. Methodology for FY 2018

The method used to compute the FY 2018 wage index without an occupational mix adjustment follows the same methodology that we used to compute the wage indexes without an occupational mix adjustment since FY 2012 (76 FR 51591 through 51593).

Comment: One commenter requested that CMS consider developing a process for determining a wage index that would reward hospitals that invest in the workforce and raise the wages of the lowest paid workers, rather than relying primarily on the average hourly wages of the labor market area as a whole.

Response: Section 1886(d)(3)(E) of the Act requires the Secretary to adjust for area differences in hospital wage levels by a factor reflecting the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level. The statute does not direct the Secretary to develop a wage index that rewards hospitals for workforce investment or other labor initiatives.

Comment: One commenter requested that CMS establish a floor wage index for providers in Puerto Rico that is not lower than the ratio of Puerto Rico nonhealth care wages to U.S. nonhealth care wages, using data from the Occupational Employment Statistics (OES) of the U.S. Bureau of Labor Statistics (BLS).

Response: We appreciate this comment. However, we consider it to be outside the scope of the FY 2018 IPPS/LTCH PPS proposed rule. Therefore, we are not responding to this comment at this time.

As discussed in the FY 2012 IPPS/LTCH PPS final rule, in “Step 5,” for each hospital, we adjust the total salaries plus wage-related costs to a common period to determine total adjusted salaries plus wage-related costs. To make the wage adjustment, we estimate the percentage change in the employment cost index (ECI) for compensation for each 30-day increment from October 14, 2013, through April 15, 2015, for private industry hospital workers from the BLS’ *Compensation and Working Conditions*. We have consistently used the ECI as the data source for our wages and salaries and other price proxies in the IPPS market basket, and we did not propose any changes to the usage of the ECI for FY 2018. The factors used to adjust the hospital’s data were based on the midpoint of the cost reporting period, as indicated in the following table.

MIDPOINT OF COST REPORTING PERIOD

After	Before	Adjustment factor
10/14/2013	11/15/2013	1.02310
11/14/2013	12/15/2013	1.02155
12/14/2013	01/15/2014	1.02004
01/14/2014	02/15/2014	1.01866
02/14/2014	03/15/2014	1.01740
03/14/2014	04/15/2014	1.01615
04/14/2014	05/15/2014	1.01482
05/14/2014	06/15/2014	1.01339
06/14/2014	07/15/2014	1.01193
07/14/2014	08/15/2014	1.01048
08/14/2014	09/15/2014	1.00905
09/14/2014	10/15/2014	1.00761
10/14/2014	11/15/2014	1.00614
11/14/2014	12/15/2014	1.00463
12/14/2014	01/15/2015	1.00309
01/14/2015	02/15/2015	1.00155
02/14/2015	03/15/2015	1.00000
03/14/2015	04/15/2015	0.99845

For example, the midpoint of a cost reporting period beginning January 1, 2014, and ending December 31, 2014, is June 30, 2014. An adjustment factor of 1.01193 would be applied to the wages of a hospital with such a cost reporting period. Using the data as previously described, the FY 2018 national average hourly wage (unadjusted for occupational mix) is \$42.1027.

Previously, we also would provide a Puerto Rico overall average hourly wage. As discussed in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56915), prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. As a result, we calculated a Puerto Rico-specific wage index that was applied to the labor share of the Puerto Rico-specific standardized amount. Section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. As we stated in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56915 through 56916), because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount as of January 1, 2016, under section 1886(d)(9)(E) of the Act, as amended by section 601 of the Consolidated Appropriations Act, 2016, there is no longer a need to calculate a Puerto Rico-specific average hourly wage and wage index. Hospitals in Puerto Rico are now paid 100 percent of the national

standardized amount and, therefore, are subject to the national average hourly wage (unadjusted for occupational mix) (which is \$42.1027 for this FY 2018 final rule) and the national wage index, which is applied to the national labor share of the national standardized amount. Therefore, for FY 2018, we did not propose a Puerto Rico-specific overall average hourly wage or wage index.

2. Clarification of Other Wage Related Costs in the Wage Index

Section 1886(d)(3)(E) of the Act requires the Secretary to update the wage index based on a survey of hospitals’ costs that are attributable to wages and wage-related costs. In the September 1, 1994 IPPS final rule (59 FR 45356), we developed a list of “core” wage-related costs that hospitals may report on Worksheet S–3, Part II of the Medicare hospital cost report in order to include those costs in the wage index. Core wage-related costs include categories of retirement cost, plan administrative costs, health and insurance costs, taxes, and other specified costs such as tuition reimbursement. In addition to these categories of core wage-related costs, we allow hospitals to report wage-related costs other than those on the core list if the other wage-related costs meet certain criteria. The criteria for including other wage-related costs in the wage index are discussed in the September 1, 1994 IPPS final rule (59 FR 45357) and also are listed in the Provider Reimbursement Manual (PRM), Part II, Chapter 40, Sections 4005.2 through 4005.4, Line 18 of the Medicare cost report (Form CMS–2552–10, OMB control number 0938–0050). Specifically, “other” wage-related costs are allowable for the wage index if the cost for employees whose services are paid under the IPPS exceeds 1 percent of the total adjusted salaries net of excluded area salaries, is a fringe benefit as defined by the IRS and has been reported to the IRS (as income to the employees or contractors), is not being furnished for the convenience of the provider, and is not listed on Worksheet S–3, Part IV.

We note that other wage-related costs are not to include benefits already included in Line 1 salaries on Worksheet S–3, Part II (refer to the cost report instructions for Worksheet S–3, Part II, Line 18, which state, “‘Other’ wage-related costs do not include wage-related costs reported on line 1 of this worksheet.”). We also note that the 1-percent test is conducted by dividing each individual category of the other wage-related cost (that is, the

numerator) by the sum of the following lines on the Medicare hospital cost report (Form CMS-2552-10): Worksheet S-3, Part II, Lines 11, 12, 13, and 14, Column 4, and Worksheet S-3, Part III, Line 3, Column 4 (that is, the denominator). The other wage-related costs associated with contract labor and home office/related organization personnel are included in the numerator because these other wage-related costs are allowed in the wage index (in addition to other wage-related costs for direct employees), assuming the requirements for inclusion in the wage index are met. For example, if a hospital is trying to include a parking garage as an other-wage related cost that is reported on the W-2 or 1099 form, when running the 1-percent test, include in the numerator all the parking garage other wage-related cost for direct salary employees, contracted employees, and home office employees and divide by the sum of Worksheet S-3, Part II, Lines 11, 12, 13, and 14, Column 4, and Worksheet S-3, Part III, Line 3, Column 4. For the category of parking other wage-related costs, the 1-percent test would be run only one time, inclusive of other wage-related costs for employee salaries, contracted employees, and home office employees. We intend to clarify the hospital cost report instructions to reflect that contract labor and home office/related organization salaries should be added to the subtotal of salaries on Worksheet S-3, Part III, Line 3, Column 4 (Line 3 is the difference of net salaries minus excluded area salaries) for purposes of performing the 1-percent test. If a hospital has more than one other wage-related cost, the 1-percent test must be conducted separately for each other wage-related cost (for example, parking and cafeteria separately; do not sum all the different types of other wage-related costs together and then run the 1-percent test). If the 1-percent test is met for a particular type of other wage-related costs, and the other criteria listed earlier are met as well, the other wage-related cost may be reported on Worksheet S-3, Part II, Line 18 of the hospital cost report.

We originally allowed for the inclusion of wage-related costs other than those on the core list because we were concerned that individual hospitals might incur unusually large wage-related costs that are not reflected on the core list but that may represent a significant wage-related cost. However, as we discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19900 through 19902), we are reconsidering allowing other wage-

related costs to be included in the wage index because recent internal reviews of the FY 2018 wage data show that only a small minority of hospitals are reporting other wage-related costs that meet the 1-percent test described earlier. In the calculation of the proposed FY 2018 wage index, for each hospital reporting other wage-related costs on Line 18 of Worksheet S-3, we performed the 1-percent test. We then made internal edits removing other wage-related costs on Line 18 where hospitals reported data that failed to meet the mathematical requirement that other wage-related costs must exceed 1 percent of total adjusted salaries net of excluded area salaries. After this review, only approximately 80 hospitals of approximately 3,320 hospitals had other wage-related costs on Line 18 meeting the 1-percent test. We believe that such a limited number of hospitals nationally reporting and meeting the 1-percent test may indicate that other wage-related costs might not constitute an appropriate part of a relative measure of wage costs in a particular labor market area, a longstanding tenet of the wage index. In other words, while other wage-related costs may represent costs that may have an impact on an individual hospital's average hourly wage, we do not believe that costs reported by only a very small minority of hospitals accurately reflect the economic conditions of the labor market areas in which those hospitals are located. Therefore, it is possible that inclusion of other wage-related costs in the wage index in such a limited manner may distort the average hourly wage of a particular labor market area so that its wage index does not accurately represent that labor market area's current wages relative to national wages.

Furthermore, the open-ended nature of the types of other wage-related costs that may be included on Line 18 of Worksheet S-3, in contrast to the concrete list of core wage-related costs, may hinder consistent and proper reporting of fringe benefits. Our internal review indicates widely divergent types of costs that hospitals are reporting as other wage-related costs on Line 18. We are concerned that inconsistent reporting of other wage-related costs on Line 18 further compromises the accuracy of the wage index as a representation of the relative average hourly wage for each labor market area. Our intent in creating a core list of wage-related costs in the September 1, 1994 IPPS final rule was to promote consistent reporting of fringe benefits, and we are increasingly concerned that inconsistent reporting of wage-related

costs on Line 18 of Worksheet S-3 undermines this effort. Specifically, we expressed in the September 1, 1994 IPPS final rule that, since we began including fringe benefits in the wage index, we have been concerned with the inconsistent reporting of fringe benefits, whether because of a lack of provider proficiency in identifying fringe benefit costs or varying interpretations across fiscal intermediaries of the definition for fringe benefits in PRM-I, Section 2144.1 (59 FR 45356).

We believe that the limited and inconsistent use of Line 18 of Worksheet S-3 for reporting wage-related costs other than the core list might indicate that including other wage-related costs in the wage index compromises the accuracy of the wage index as a relative measure of wages in a given labor market area. Therefore, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19901), we sought public comments on whether we should, in future rulemaking, propose to only include the wage-related costs on the core list in the calculation of the wage index and not to include any other wage-related costs in the calculation of the wage index.

Meanwhile, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19901 through 19902), we clarified that, under our current policy, an other wage-related cost (which we define as the value of a benefit) must be a fringe benefit as described by the IRS (refer to IRS Publication 15-B) and must be reported to the IRS on employees' or contractors' W-2 or 1099 forms as taxable income in order to be considered an other wage-related cost on Line 18 of Worksheet S-3 and for the wage index. That is, other wage-related costs that are not reported to the IRS on employees' or contractors' W-2 or 1099 forms as taxable income, *even if not required to be reported to the IRS according to IRS requirements*, will not be included in the wage index. This is consistent with current cost report instructions for Line 18 of Worksheet S-3, Part II of the Medicare cost report, Form 2552-10, which state that, to be considered an allowable other wage-related cost, the cost "has been reported to the IRS." We will apply this policy to the process for calculating the wage index for FY 2019, including the FY 2019 desk reviews beginning in September 2017.

As we stated in the FY 2018 proposed rule, we believe this clarification is necessary because some hospitals have incorrectly interpreted prior manual and existing preamble language to mean that a cost could be considered an other wage-related cost if the provider's reporting (or not reporting) of the cost

was in accordance with IRS requirements, rather than if the cost was actually reported on an employee's or contractor's W-2 or 1099 form as taxable income. We believe that such an interpretation of our policy would require an analysis of whether the reporting or not reporting of the cost to the IRS was done properly in accordance with IRS regulations and guidance in order to allow the cost as an other wage-related cost. We believe that the determinations regarding the proper or improper reporting of certain other wage-related costs to the IRS for the purpose of inclusion in the Medicare wage index are impractical for CMS and the MACs because we do not have the expertise and fluency in IRS regulations and tax law sufficient to perform such technical reviews of hospital wage-related costs. In contrast, our current policy of including an amount as an other wage-related cost for wage index purposes only if the amount was actually reported to the IRS on employees' or contractors' W-2 or 1099 forms as taxable income is a straightforward policy that we believe provides clarity to all involved parties. The brightline test of allowing an other wage-related cost to be included in the wage index only if it has been reported on an employee's or contractor's W-2 or 1099 form as taxable income helps ensure consistent treatment of other wage-related costs for all hospitals. Considering the variety of types of costs that may be included on Line 18 of Worksheet S-3 of the cost report for other wage-related costs (assuming the 1-percent test is met and other criteria are met), we believe that a straightforward policy that is simple for hospitals and CMS to apply is particularly important.

In addition, we believe the policy we are clarifying that an other wage-related cost can be included in the wage index only if it was reported to the IRS as taxable income on the employee's or contractor's W-2 or 1099, is consistent with CMS' longstanding position that a fringe benefit is not furnished for the convenience of the employer or otherwise excludable from income as a fringe benefit (such as a working condition fringe) and that inappropriate types of costs may not be included in the wage index. In response to a comment when we finalized the criteria for other wage-related costs in the September 1, 1994 IPPS final rule (59 FR 45359), we stated that "items such as the unrecovered cost of employee meals, tuition reimbursement, and auto allowances will only be allowed as a wage-related cost for purposes of the

wage index if properly reported to the IRS on an employee's W-2 form as a fringe benefit." (We note that the September 1, 1994 IPPS final rule does not mention the 1099 form for contractors, as contract labor was not allowed at that time in the wage index. Consistent with our treatment of costs for contract labor similar to that of employees for the wage index, we are clarifying that the requirement that a cost be reported to the IRS to be allowed as a wage-related cost for the wage index also applies to contract labor, which must be reported on the contractor's 1099 to be allowed as a wage-related cost for the wage index.) We believe that requiring other wage-related costs to be reported on employees' or contractors' W-2 or 1099 forms to be allowable for Line 18 of Worksheet S-3 of the Medicare cost report is consistent with the requirement that the cost is not being furnished for the convenience of the employer. A cost reported on an employee's or contractor's W-2 or 1099 form as taxable income is clearly a wage-related cost that is provided solely for the benefit of the employee. We believe that the requirement that other wage-related costs be a benefit to the employee also guarantees that administrative costs such as overhead and capitalized costs are excluded from other wage-related costs in the wage index.

Therefore, for the reasons discussed above, as we discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19901 through 19902), we are clarifying that a cost must be a fringe benefit as described by the IRS and must be reported to the IRS on employees' or contractors' W-2 or 1099 forms as taxable income in order to be considered an other wage-related cost on Line 18 of Worksheet S-3 and for the wage index. In addition, as discussed earlier, in the proposed rule, we requested public comments on whether we should consider in future rulemaking removing other wage-related costs from the wage index.

Because some hospitals have incorrectly interpreted prior manual and existing preamble language, as stated earlier, in the proposed rule we restated the criteria from the September 1, 1994 IPPS final rule (59 FR 45357) for allowing other wage-related costs for the wage index, with clarifications. The criteria follow below, and as stated in the proposed rule, we intend to update the manual with these clarifications: *Other Wage-Related Costs.* A hospital may be able to report a wage-related cost (defined as the value of the benefit) that

does not appear on the core list if it meets all of the following criteria:

- The wage-related cost is provided at a significant financial cost to the employer. To meet this test, the individual wage-related cost must be greater than 1 percent of total salaries after the direct excluded salaries are removed (the sum of Worksheet S-3, Part II, Lines 11, 12, 13, 14, column 4, and Worksheet S-3, Part III, Line 3, Column 4).

- The wage-related cost is a fringe benefit as described by the IRS and is reported to the IRS on an employee's or contractor's W-2 or 1099 form as taxable income.

- The wage-related cost is not furnished for the convenience of the provider or otherwise excludable from income as a fringe benefit (such as a working condition fringe).

We note that those wage-related costs reported as salaries on Line 1 (for example, loan forgiveness and sick pay accruals) should not be included as other wage-related costs on Line 18.

Comment: One commenter fully supported CMS proposing in future rulemaking to only include the wage-related costs on the core list in the calculation of the wage index and not to include any other wage-related costs in the calculation of the wage index. The commenter reiterated CMS' observation that only a small minority of hospitals benefit from the reporting of other wage-related costs, emphasizing that the inclusion of other wage-related costs in the wage index in such a limited manner distorts the average hourly wage of a particular labor market area so that its wage index does not accurately represent that labor market area's current wages relative to national wages. Several commenters did not oppose CMS proposing in future rulemaking to only include wage-related costs on the core list but requested that CMS first consider convening stakeholders for additional input prior to the removal of the item. Similarly, one commenter requested that CMS be as transparent as possible and provide complete information on the impact on the wage index for all areas of the country in future rulemaking if CMS proposes to exclude other wage-related costs from the wage index calculation.

Response: We appreciate the commenter's support for our proposing in future rulemaking to consider only including the wage-related costs on the core list in the calculation of the wage index and not to include any other wage-related costs in the calculation of the wage index. In response to the commenters who requested that CMS first consider convening stakeholders

for additional input prior to the removal of other wage-related costs (on Line 18 of Worksheet S-3) from the wage index, we are reassuring the commenters that we would engage in notice-and-comment rulemaking in order to solicit stakeholder input before removing Line 18 of Worksheet S-3 from the wage index calculation. Similarly, we endeavor to be as transparent as possible and, if appropriate, may consider providing information on the impact on the wage index for all areas of the country in future rulemaking if we propose to exclude other wage-related costs from the wage index calculation.

Comment: Two commenters applauded CMS' goals of achieving a more equitable and accurate wage index, but suggested that CMS address the inadequacies in the current reporting requirements for noncore other wage-related costs rather than consider eliminating Line 18 of Worksheet S-3 of the Medicare cost report from the wage index. These commenters asserted that all hospitals have noncore benefits. However, the commenters added, the limited guidance and "significant threshold limitations" in the current instructions prevent hospitals from capturing these noncore benefits. Furthermore, the commenters maintained that benefits are rapidly evolving into more nontraditional structures and, therefore, a mechanism to capture these evolving benefits is necessary for CMS to ensure an equitable survey. The commenters submitted several suggestions to ensure open and transparent reporting of other wage-related costs and to remove the onus from CMS and the MAC to make determinations regarding the acceptability of other wage-related costs. The commenters believed that clear and consistent reporting guidelines create an equitable playing field for all providers and stated that addressing the inadequacies in the current reporting requirements for Line 18 is prudent. However, the commenters suggested an approach different than CMS' clarifications of current policy to more accurately identify and capture other wage-related costs.

Response: We appreciate the feedback from commenters in favor of our improving the current reporting requirements for noncore other wage-related costs rather than considering eliminating Line 18 of Worksheet S-3 from the wage index calculation. We are not eliminating Line 18 from the wage index calculation at this time. Rather, in line with the commenters' recommendation, we are clarifying the requirements for Line 18 in this final

rule to facilitate consistent and accurate reporting of other wage-related costs for the wage index. We share the commenters' interests in reporting guidelines that are clear, consistent, and equitable. The commenters' specific suggestions and our responses follow below:

Comment: Commenters suggested that CMS, with input from providers, define a specific list of noncore benefits commonly shared by a large number of providers for inclusion in the wage index, such as employee parking and transit costs, uniform costs, and meal allowances. The commenters suggested that CMS approach the identification of noncore benefits with the same specificity as it does with core benefits in order to ensure an equitable wage index, more easily address tax issues, and allow more direct application of the employer convenience test.

Response: We appreciate the commenters' suggestion and agree that defined lists of allowable costs are generally helpful to support consistent and equitable reporting. In fact, our intent in creating a core list of wage-related costs in the September 1, 1994 IPPS final rule was to promote "more equitable and consistent reporting of wage-related costs for all hospitals" (59 FR 45356). When developing the list of core wage-related costs, we stated that one or more of the following criteria must be met to be considered a core wage-related cost: The wage-related cost is provided at a significant financial cost to the employer; the wage-related cost is of a type and nature that would generally be offered as a fringe benefit by most employers; the perceived value of this wage-related cost is of such importance that it would influence an individual's employment decisions; and the wage-related cost is a mandatory requirement under Federal or State law (for example FICA, Federal and State unemployment, among others) (59 FR 45356).

If there are noncore benefits that are of a type and nature that would generally be offered as a fringe benefit by most employers, as the commenters suggested, we believe that perhaps these costs should be added to the core list rather than defined separately as a list of other wage-related costs. In future rulemaking, we may consider this suggestion in the form of seeking hospitals' input on expanding the core list of wage-related costs to include common wage-related costs (such as parking) that are currently considered other wage-related costs.

Comment: Commenters suggested that the taxable or nontaxable nature of the benefit should not be a determinant for

inclusion as a noncore benefit. In the commenters' opinion, CMS made too broad a connection between taxable reporting and the employer convenience test; specifically, many employee benefits are not taxable due to dollar threshold exclusions and public policy considerations by Congress and the IRS. Furthermore, the commenters pointed out that evolving tax law could cause volatility in the wage index because what is considered a taxable benefit one year may not be taxable in the next year.

Rather, the commenters suggested that, in order for other wage-related costs to be included in the wage index, CMS require other wage-related costs to be reported to the IRS on the W-2, regardless of whether the benefit is taxable or not (the W-2 allows for reporting of both taxable and nontaxable benefits), and that CMS could then include other wage-related costs in the wage index as long as those costs, whether taxable or nontaxable, are reported on the W-2. The commenters maintained that it should not be the responsibility of CMS or the MACs to prove that the benefit has been handled appropriately for tax purposes, and this requirement to include all taxable and nontaxable costs on the W-2 in order to have those costs included in the wage index would ensure that the benefit has been handled correctly for tax purposes.

Response: In the proposed rule (82 FR 19902), we stated that requiring other wage-related costs to be reported on employees' or contractors' W-2 or 1099 forms to be allowable for Line 18 is consistent with the requirement that the cost is not being furnished for the convenience of the employer because, typically, a cost that is for the convenience of the employer is not taxable as income to the employee. This is not to say that all costs that are a benefit to the employee are taxable. Indeed, in our clarification of the criteria for allowing a cost as an other wage-related costs on Line 18 in the wage index, we specifically stated that "The wage-related cost is not furnished for the convenience of the provider or otherwise excludable from income as a fringe benefit (such as a working condition fringe)" (emphasis added). That is, we recognize that being furnished for the convenience of the provider is only one of many reasons that a cost may be excludable from income as a fringe benefit.

While we understand that many employee benefits are not taxable due to dollar threshold exclusions and public policy considerations by Congress and the IRS, and thereby excluded from Line 18, we continue to believe that a brightline test is necessary for consistent

treatment of other wage-related costs for all hospitals. Taken with the commenter's suggestion that CMS allow taxable and nontaxable other wage-related costs (assuming other criteria are met) as long as the costs are reported on W-2s or 1099s, we understand that the commenter is suggesting a different brightline test: That the cost be listed on the W-2, regardless of whether the cost is taxable or tax-exempt. We continue to believe that our clarification in the proposed rule is a more straightforward policy than the commenter's suggestion for two reasons. First, not all employers report nontaxable costs on an employee's W-2, nor are they required to do so. Therefore, to allow nontaxable costs so long as those costs are on an employee's W-2 would create an uneven playing field with inconsistent treatment of nontaxable costs. Second, a taxable benefit is typically income-related and a benefit to the employee. While we understand that there may be benefits to the employee that are tax-exempt due to a variety of public policy considerations, we believe that costs should be taxable in order to be incorporated as part of the wage index because the wage index is a relative measure of salaries and wages.

Furthermore, we agree with the commenters' assertion that it should not be the responsibility of CMS or the MACs to prove that the benefit has been handled appropriately for tax purposes. Indeed, it is for that reason that we clarified our current policy of allowing an amount as an other wage-related cost for wage index purposes only if the amount was actually reported to the IRS on employees' or contractors' W-2 or 1099 forms as taxable income. We stated in the proposed rule (82 FR 19901 through 19902) that other wage-related costs that are not reported to the IRS on employees' or contractors' W-2 or 1099 forms as taxable income, *even if not required to be reported to the IRS according to IRS requirements*, will not be included in the wage index. We explained that determinations regarding the proper or improper reporting of certain other wage-related costs to the IRS for the purpose of inclusion in the Medicare wage index are impractical for CMS and the MACs because we do not have the expertise and fluency in IRS regulations and tax law sufficient to perform such technical reviews of hospital wage-related costs.

Comment: Commenters suggested that CMS change the 1-percent test to a test in aggregate for the items on their recommended noncore list. For benefits not specifically listed by CMS as noncore, the commenters suggested that CMS continue using the current

methodology, which requires each individual benefit to meet the 1-percent test.

Response: We appreciate the commenters' suggestion. However, as we stated earlier, if there are noncore benefits that are of a type and nature that would generally be offered as a fringe benefit by most employers, we believe that perhaps these costs should be added to the core list rather than defined separately as a list of other wage-related costs. In future rulemaking, we may consider this suggestion in the form of seeking hospitals' input on expanding the core list of wage-related costs to include common wage-related costs (such as parking) that are currently considered other wage-related costs.

We continue to believe that it is appropriate for the 1-percent test to be performed on individual, rather than aggregate, other wage-related costs. In response to a public comment, in the September 1, 1994 IPPS final rule (59 FR 45358), we stated that "[t]he provision to include wage-related costs other than those reflected on the core list is intended to recognize only those limited circumstances where a hospital incurs any additional wage-related cost items that truly represent a significant financial burden to the hospital, but that also meet the current definition of a fringe benefit cost. We believe the 1-percent threshold is an appropriate measure of significance, and that the exclusion of any cost representing less than 1 percent of total salaries would not significantly affect the hospital's overall average hourly wage. We consider the 1-percent test critical in ensuring that providers only include other wage-related costs that contribute significantly to their wage costs and that are not accounted for in the core list." We continue to believe that the 1-percent test performed on individual costs ensures that the wage-related cost is provided at a significant financial cost to the employer.

Furthermore, we believe that allowing the 1-percent test to be performed on aggregate other wage-related costs (even on a limited list of other wage-related costs, as the commenter suggests) would lead to inequitable treatment of other wage-related costs. Hospitals with an other wage-related cost comprising an identical percentage of total adjusted salaries net of excluded area salaries could be treated differently, depending on the presence or absence of additional other wage-related costs to collectively "pass" the 1-percent test. For example, parking costs totaling .08 percent of total salaries for one hospital could be allowed (assuming the other criteria

were met) if the hospital also has additional noncore wage-related costs that combine to exceed 1 percent, while another hospital with parking costs totaling the identical .08 percentage of total salaries could have those costs disallowed in absence of additional noncore wage-related costs to add to the parking costs to exceed 1 percent of salaries.

We appreciate all of the comments submitted on this issue. We will take these comments into consideration in determining whether to propose in future rulemaking to remove other wage-related costs from the wage index calculation. Meanwhile, as discussed earlier and in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19900 through 19902), we are again clarifying that a cost must be a fringe benefit as described by the IRS and must be reported to the IRS on employees' or contractors' W-2 or 1099 forms as taxable income in order to be considered an other wage-related cost on Line 18 of Worksheet S-3 and for the wage index.

E. Occupational Mix Adjustment to the FY 2018 Wage Index

As stated earlier, section 1886(d)(3)(E) of the Act provides for the collection of data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program, in order to construct an occupational mix adjustment to the wage index, for application beginning October 1, 2004 (the FY 2005 wage index). The purpose of the occupational mix adjustment is to control for the effect of hospitals' employment choices on the wage index. For example, hospitals may choose to employ different combinations of registered nurses, licensed practical nurses, nursing aides, and medical assistants for the purpose of providing nursing care to their patients. The varying labor costs associated with these choices reflect hospital management decisions rather than geographic differences in the costs of labor.

1. Use of 2013 Occupational Mix Survey for the FY 2018 Wage Index

Section 304(c) of the Consolidated Appropriations Act, 2001 (Pub. L. 106-554) amended section 1886(d)(3)(E) of the Act to require CMS to collect data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program. We collected data in 2013 to compute the occupational mix adjustment for the FY 2016, FY 2017, and FY 2018 wage indexes. A new

measurement of occupational mix is required for FY 2019.

The 2013 survey included the same data elements and definitions as the previous 2010 survey and provided for the collection of hospital-specific wages and hours data for nursing employees for calendar year 2013 (that is, payroll periods ending between January 1, 2013 and December 31, 2013). We published the 2013 survey in the **Federal Register** on February 28, 2013 (78 FR 13679 through 13680). This survey was approved by OMB on May 14, 2013, and is available on the CMS Web site at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/Medicare-Wage-Index-Occupational-Mix-Survey2013.html>. The 2013 Occupational Mix Survey Hospital Reporting Form CMS-10079 for the Wage Index Beginning FY 2016 (in Excel format) is available on the CMS Web site at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/Medicare-Wage-Index-Occupational-Mix-Survey2013.html>. Hospitals were required to submit their completed 2013 surveys to their MACs by July 1, 2014. The preliminary, unaudited 2013 survey data were posted on the CMS Web site on July 11, 2014. As with the Worksheet S-3, Parts II and III cost report wage data, we asked our MACs to revise or verify data elements in hospitals' occupational mix surveys that result in certain edit failures.

2. Use of the 2016 Medicare Wage Index Occupational Mix Survey for the FY 2019 Wage Index

As stated earlier, a new measurement of occupational mix is required for FY 2019. The FY 2019 occupational mix adjustment will be based on a new calendar year (CY) 2016 survey. The CY 2016 survey (CMS Form CMS-10079) received OMB approval on September 27, 2016. The final CY 2016 Occupational Mix Survey Hospital Reporting Form is available on the CMS Web site at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/2016-Occupational-Mix-Survey-Hospital-Reporting-Form-CMS-10079-for-the-Wage-Index-Beginning-FY-2019.html>. Hospitals were required to submit their completed 2016 surveys to their MACs by July 3, 2017. The preliminary, unaudited CY 2016 survey data were posted on the CMS Web site on July 12, 2017. As with the Worksheet S-3, Parts II and III cost report wage data, as part of the FY 2019 desk review process, the MACs will

revise or verify data elements in hospitals' occupational mix surveys that result in certain edit failures.

3. Calculation of the Occupational Mix Adjustment for FY 2018

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19903), for FY 2018, we proposed to calculate the occupational mix adjustment factor using the same methodology that we have used since the FY 2012 wage index (76 FR 51582 through 51586) and to apply the occupational mix adjustment to 100 percent of the FY 2018 wage index. Because the statute requires that the Secretary measure the earnings and paid hours of employment by occupational category not less than once every 3 years, all hospitals that are subject to payments under the IPPS, or any hospital that would be subject to the IPPS if not granted a waiver, must complete the occupational mix survey, unless the hospital has no associated cost report wage data that are included in the FY 2018 wage index. For the proposed FY 2018 wage index, we used the Worksheet S-3, Parts II and III wage data of 3,325 hospitals, and we used the occupational mix surveys of 3,128 hospitals for which we also have Worksheet S-3 wage data, which represented a "response" rate of 94 percent (3,128/3,325). For the proposed FY 2018 wage index, we applied proxy data for noncompliant hospitals, new hospitals, or hospitals that submitted erroneous or aberrant data in the same manner that we applied proxy data for such hospitals in the FY 2012 wage index occupational mix adjustment (76 FR 51586).

Comment: One commenter stated that all hospitals should be obligated to submit the occupational mix survey because failure to complete the survey jeopardizes the accuracy of the wage index. The commenter suggested that a penalty be instituted for nonsubmitters. This commenter also requested that, pending CMS' analysis of the Commuting Based Wage Index and given the Institute of Medicine's study on geographic variation in hospital wage costs, CMS eliminate the occupational mix survey and the significant reporting burden it creates.

Response: We appreciate the commenter's concern about the accuracy of the wage index. We have continually requested that all hospitals complete and submit the occupational mix surveys. We did not establish a penalty for hospitals that did not submit the 2013 surveys. However, we are continuing to consider for future rulemaking various options for ensuring full compliance with future

occupational mix surveys. Regarding the commenter's request that CMS eliminate the occupational mix survey, this survey is necessary to meet the provisions of section 1886(d)(3)(E) of the Act, which requires us to measure the earnings and paid hours of employment by occupational category.

After consideration of the public comments we received, for FY 2018, we are adopting as final our proposal to calculate the occupational mix adjustment factor using the same methodology that we have used since the FY 2012 wage index. For the final FY 2018 wage index, we are using the Worksheet S-3, Parts II and III wage data of 3,336 hospitals, and we are using the occupational mix surveys of 3,138 hospitals for which we also have Worksheet S-3 wage data, which represents a "response rate" of 94 percent (3,138/3,336). We note that, in the proposed rule (82 FR 19903), we stated that we used the occupational mix survey of 3,128 hospitals. The reason for the increase in the number of hospitals from 3,128 to 3,138 is that 10 hospitals that had been deleted from the proposed rule wage index and that are now included in the final rule wage index had acceptable occupational mix surveys to use for the final rule. Therefore, we have included the occupational mix surveys of these 10 additional hospitals to calculate the wage index for this final rule. For the final FY 2018 wage index, we applied proxy data for noncompliant hospitals, new hospitals, or hospitals that submitted erroneous or aberrant data in the same manner that we applied proxy data for such hospitals in the FY 2012 wage index occupational mix adjustment (76 FR 51586). As a result of applying this methodology, the FY 2018 occupational mix adjusted national average hourly wage is \$42.0564.

F. Analysis and Implementation of the Occupational Mix Adjustment and the FY 2018 Occupational Mix Adjusted Wage Index

As discussed in section III.E. of the preamble of this final rule, for FY 2018, we are applying the occupational mix adjustment to 100 percent of the FY 2018 wage index. We calculated the occupational mix adjustment using data from the 2013 occupational mix survey data, using the methodology described in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51582 through 51586). Using the occupational mix survey data and applying the occupational mix adjustment to 100 percent of the FY 2018 wage index results in a national average hourly wage of \$42.0564.

The FY 2018 national average hourly wages for each occupational mix nursing subcategory as calculated in Step 2 of the occupational mix calculation are as follows:

Occupational mix nursing subcategory	Average hourly wage
National RN	\$38.86637039
National LPN and Surgical Technician	22.73227683
National Nurse Aide, Orderly, and Attendant	15.95002569
National Medical Assistant ...	17.96799473
National Nurse Category	32.856948

The national average hourly wage for the entire nurse category as computed in Step 5 of the occupational mix calculation is \$32.856948. Hospitals with a nurse category average hourly wage (as calculated in Step 4) of greater than the national nurse category average hourly wage receive an occupational mix adjustment factor (as calculated in Step 6) of less than 1.0. Hospitals with a nurse category average hourly wage (as calculated in Step 4) of less than the national nurse category average hourly wage receive an occupational mix adjustment factor (as calculated in Step 6) of greater than 1.0.

Based on the 2013 occupational mix survey data, we determined (in Step 7 of the occupational mix calculation) that the national percentage of hospital employees in the nurse category is 42.6 percent, and the national percentage of hospital employees in the all other occupations category is 57.4 percent. At the CBSA level, the percentage of hospital employees in the nurse category ranged from a low of 25.7 percent in one CBSA to a high of 73.5 percent in another CBSA.

We compared the FY 2018 occupational mix adjusted wage indexes for each CBSA to the unadjusted wage indexes for each CBSA. As a result of applying the occupational mix adjustment to the wage data, the final wage index values for 222 (54.4 percent) urban areas and 23 (48.9 percent) rural areas will increase. The final wage index values for 110 (27.0 percent) urban areas will increase by greater than or equal to 1 percent but less than 5 percent, and the final wage index values for 6 (1.5 percent) urban areas will increase by 5 percent or more. The final wage index values for 10 (21.3 percent) rural areas will increase by greater than or equal to 1 percent but less than 5 percent, and no rural areas' final wage index values will increase by 5 percent or more. However, the final wage index values for 184 (45.1 percent) urban areas and 24 (51.1 percent) rural areas will decrease. The final wage index values

for 85 (20.8 percent) urban areas will decrease by greater than or equal to 1 percent but less than 5 percent, and no urban areas' final wage index value will decrease by 5 percent or more. The final wage index values of 8 (17.0 percent) rural areas will decrease by greater than or equal to 1 percent and less than 5 percent, and no rural areas' final wage index values will decrease by 5 percent or more. The largest final positive impacts will be 17.4 percent for an urban area and 2.9 percent for a rural area. The largest final negative impacts will be 4.9 percent for an urban area and 2.4 percent for a rural area. Two urban areas' final wage index, but no rural area wage indexes, will remain unchanged by application of the occupational mix adjustment. These results indicate that a larger percentage of urban areas (54.4 percent) will benefit from the occupational mix adjustment than will rural areas (48.9 percent).

G. Application of the Rural, Imputed, and Frontier Floors

1. Rural Floor

Section 4410(a) of Public Law 105–33 provides that, for discharges on or after October 1, 1997, the area wage index applicable to any hospital that is located in an urban area of a State may not be less than the area wage index applicable to hospitals located in rural areas in that State. This provision is referred to as the “rural floor.” Section 3141 of Public Law 111–148 also requires that a national budget neutrality adjustment be applied in implementing the rural floor. Based on the FY 2018 wage index associated with this final rule (which is available via the Internet on the CMS Web site), we estimate that 366 hospitals will receive an increase in their FY 2018 wage index due to the application of the rural floor.

2. Expiration of the Imputed Floor Policy

In the FY 2005 IPPS final rule (69 FR 49109 through 49111), we adopted the “imputed floor” policy as a temporary 3-year regulatory measure to address concerns from hospitals in all-urban States that have argued that they are disadvantaged by the absence of rural hospitals to set a wage index floor for those States. Since its initial implementation, we have extended the imputed floor policy seven times, the last of which was adopted in the FY 2017 IPPS/LTCH PPS final rule and is set to expire on September 30, 2017. (We refer readers to further discussions of the imputed floor in the FY 2014, FY 2015, FY 2016, and FY 2017 IPPS/LTCH PPS final rules (78 FR 50589 through

50590, 79 FR 49969 through 49970, 80 FR 49497 through 49498, and 81 FR 56921 through 56922, respectively) and to the regulations at 42 CFR 412.64(h)(4).) Currently, there are three all-urban States—Delaware, New Jersey, and Rhode Island—with a range of wage indexes assigned to hospitals in these States, including through reclassification or redesignation. (We refer readers to discussions of geographic reclassifications and redesignations in section III.I. of the preamble of this final rule.) In computing the imputed floor for an all-urban State under the original methodology, which was established beginning in FY 2005, we calculated the ratio of the lowest-to-highest CBSA wage index for each all-urban State as well as the average of the ratios of lowest-to-highest CBSA wage indexes of those all-urban States. We then compared the State's own ratio to the average ratio for all-urban States and whichever is higher is multiplied by the highest CBSA wage index value in the State—the product of which established the imputed floor for the State. As of FY 2012, there were only two all-urban States—New Jersey and Rhode Island—and only New Jersey benefitted under this methodology. Under the previous OMB labor market area delineations, Rhode Island had only one CBSA (Providence-New Bedford-Fall River, RI-MA) and New Jersey had 10 CBSAs. Therefore, under the original methodology, Rhode Island's own ratio equaled 1.0, and its imputed floor was equal to its original CBSA wage index value. However, because the average ratio of New Jersey and Rhode Island was higher than New Jersey's own ratio, this methodology provided a benefit for New Jersey, but not for Rhode Island.

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53368 through 53369), we retained the imputed floor calculated under the original methodology as discussed above, and established an alternative methodology for computing the imputed floor wage index to address the concern that the original imputed floor methodology guaranteed a benefit for one all-urban State with multiple wage indexes (New Jersey) but could not benefit the other all-urban State (Rhode Island). The alternative methodology for calculating the imputed floor was established using data from the application of the rural floor policy for FY 2013. Under the alternative methodology, we first determined the average percentage difference between the post-reclassified, pre-floor area wage index and the post-reclassified, rural floor wage index (without rural floor

budget neutrality applied) for all CBSAs receiving the rural floor. (Table 4D associated with the FY 2013 IPPS/LTCH PPS final rule (which is available via the Internet on the CMS Web site) included the CBSAs receiving a State's rural floor wage index.) The lowest post-reclassified wage index assigned to a hospital in an all-urban State having a range of such values then is increased by this factor, the result of which establishes the State's alternative imputed floor. We amended § 412.64(h)(4) of the regulations to add new paragraphs to incorporate the finalized alternative methodology, and to make reference and date changes. In summary, for the FY 2013 wage index, we did not make any changes to the original imputed floor methodology at § 412.64(h)(4) and, therefore, made no changes to the New Jersey imputed floor computation for FY 2013. Instead, for FY 2013, we adopted a second, alternative methodology for use in cases where an all-urban State has a range of wage indexes assigned to its hospitals, but the State cannot benefit under the original methodology.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50589 through 50590), we extended the imputed floor policy (both the original methodology and the alternative methodology) for 1 additional year, through September 30, 2014, while we continued to explore potential wage index reforms.

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 49969 through 49970), for FY 2015, we adopted a policy to extend the imputed floor policy (both the original methodology and alternative methodology) for another year, through September 30, 2015, as we continued to explore potential wage index reforms. In that final rule, we revised the regulations at § 412.64(h)(4) and (h)(4)(vi) to reflect the 1-year extension of the imputed floor. As discussed in section III.B. of the preamble of that FY 2015 final rule, we adopted the new OMB labor market area delineations beginning in FY 2015. Under the new OMB delineations, Delaware became an all-urban State, along with New Jersey and Rhode Island. Under the new OMB delineations, Delaware has three CBSAs, New Jersey has seven CBSAs, and Rhode Island continues to have only one CBSA (Providence-Warwick, RI-MA). We refer readers to a detailed discussion of our adoption of the new OMB labor market area delineations in section III.B. of the preamble of the FY 2015 IPPS/LTCH PPS final rule. Therefore, under the adopted new OMB delineations discussed in section III.B. of the preamble of the FY 2015 IPPS/LTCH PPS final rule, Delaware became

an all-urban State and was subject to an imputed floor as well for FY 2015.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49497 through 49498), for FY 2016, we extended the imputed floor policy (under both the original methodology and the alternative methodology) for 1 additional year, through September 30, 2016. In that final rule, we revised the regulations at § 412.64(h)(4) and (h)(4)(vi) to reflect this additional 1-year extension. Similarly, in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56921 through 56922), for FY 2017, we extended the imputed floor policy (under both the original methodology and the alternative methodology) for 1 additional year, through September 30, 2017. In that final rule, we revised the regulations at § 412.64(h)(4) and (h)(4)(vi) to reflect this additional 1-year extension.

The imputed floor is set to expire effective October 1, 2017, and in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19905), we did not propose to extend the imputed floor policy. In the FY 2005 IPPS final rule (69 FR 49110), we adopted the imputed floor policy for all-urban States under the authority of section 1886(d)(3)(E) of the Act, which gives the Secretary broad authority to adjust the proportion (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs of the DRG prospective payment rates for area differences in hospital wage levels by a factor (established by the Secretary). However, we have expressed reservations about establishment of an imputed floor, considering that the imputed rural floor methodology creates a disadvantage in the application of the wage index to hospitals in States with rural hospitals but no urban hospitals receiving the rural floor (72 FR 24786 and 72 FR 47322). As we discussed in the FY 2008 IPPS final rule (72 FR 47322), the application of the rural and imputed floors requires transfer of payments from hospitals in States with rural hospitals but where the rural floor is not applied to hospitals in States where the rural or imputed floor is applied. For this reason, in the FY 2018 IPPS/LTCH PPS proposed rule, we proposed not to apply an imputed floor to wage index calculations and payments for hospitals in all-urban States for FY 2018 and subsequent years. That is, we proposed that hospitals in New Jersey, Delaware, and Rhode Island (and in any other all-urban State) would receive a wage index that is calculated without applying an imputed floor for FY 2018 and subsequent years. Therefore, under our

proposal, only States containing both rural areas and hospitals located in such areas (including any hospital reclassified as rural under the provisions of § 412.103 of the regulations) would benefit from the rural floor, in accordance with section 4410 of Public Law 105–33. In addition, we proposed to no longer include the imputed floor as a factor in the national budget neutrality adjustment. Therefore, the proposed wage index and impact tables associated with the FY 2018 IPPS/LTCH PPS proposed rule (which are available via the Internet on the CMS Web site) did not reflect the imputed floor policy, and there was no proposed national budget neutrality adjustment for the imputed floor for FY 2018. We invited public comments on our proposal not to extend the imputed floor for FY 2018 and subsequent years.

We are presenting below summaries of the public comments we received and our responses.

Comment: Several commenters supported CMS' proposal to allow the imputed floor policy to expire. One commenter stated that the imputed floor policy only benefited two States at the expense of other States due to national budget neutrality. Another commenter stated the imputed floor policy should only apply when required by statute.

Response: We appreciate the positions of commenters that support the proposal not to extend the imputed floor. In the FY 2005 IPPS final rule (69 FR 49110), we adopted the imputed floor policy for all-urban States under the authority of section 1886(d)(3)(E) of the Act, which gives the Secretary broad authority to adjust the proportion (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs, of the DRG prospective payment rates for area differences in hospital wage levels by a factor (established by the Secretary). Therefore, we believe that we have the discretion to adopt a policy that would adjust wage indexes in the stated manner. We adopted the imputed floor policy to address concerns from hospitals in all-urban States and subsequently extended it through notice-and-comment rulemaking. While we understand the commenters' concerns that the application of the imputed floors requires transfer of payments from hospitals in States with rural hospitals but where the rural floor is not applied to hospitals in States where the rural or imputed floor is applied, we also received many comments expressing concern about discontinuing the imputed floor (as further discussed below). As explained further below, we have decided to

temporarily extend the imputed floor for 1 year while we continue to consider the comments we received and assess whether to continue or discontinue the imputed floor policy for the long term.

Comment: Several commenters disagreed with the proposal to allow the imputed floor to expire, and stated that CMS should maintain the status quo and continue to extend the imputed floor in 1-year increments until the entirety of Medicare wage index reform is complete. The commenters stated that, by eliminating the imputed floor wage index, CMS is alleviating only a fraction of the combined payment transfer from the application of the rural and imputed floors. The commenters pointed out that, combined, hospitals in the three all-urban States (New Jersey, Rhode Island, and Delaware) accounted for less than 10 percent of the 397 hospitals nationally that received either the rural or imputed floor last year. The commenters conveyed that CMS indicated in the FY 2014 and FY 2015 IPPS/LTCH PPS final rules, both of which extended the imputed floor for an additional year, that CMS would continue to explore potential wage index reform, and that, as of the FY 2018 IPPS/LTCH PPS proposed rule, such reform has not occurred.

Multiple commenters indicated that eliminating the imputed floor would create the same uneven playing field that existed prior to 2005, in response to which CMS initially established the policy. The commenters stated that the anomaly originally cited by CMS (that is, that hospitals in all-urban States with predominant labor market areas do not have any type of protection, or “floor,” from declines in their wage index) would exist again if the imputed floor policy were discontinued.

One commenter indicated that the imputed floor is an equitable measure established by CMS which provides relief to hospitals in all-urban States. The commenter stated that this longstanding policy has reduced volatility and increased the equitability of the wage index system. The commenter believed that CMS should not remove the imputed floor from all-urban States. Regarding CMS’ concern with the payment impact of the existing imputed floor policy on States with rural hospitals that do not have urban hospitals that benefit from a rural floor, the commenter believed this should be reviewed as part of a comprehensive Medicare wage index reform. The commenter suggested that CMS consider all recommended changes to the imputed floor as part of wage index reform, and that the public have a chance to provide input to CMS prior to

finalizing any decisions regarding elimination of the imputed rural floor. The commenter further suggested that if there is a decision made to eliminate the imputed rural floor, the decision should include a 2-year notification period to allow impacted hospitals appropriate planning time. The commenter stated that CMS has extended such advance notice, including changes concerning the wage index, for this purpose in the past.

Several commenters stated they would like to make the imputed floor wage index provision permanent in the FY 2018 IPPS/LTCH PPS final rule. The commenters pointed out that CMS has upheld the imputed floor for the past 12 years as a valuable method of maintaining equitable wage index protections for all-urban States, consistent with those that exist for States with rural areas. The commenters referenced CMS’ explanation from the FY 2005 IPPS final rule (69 FR 49110) for adopting the imputed floor, such as: “because there is no ‘floor’ to protect those hospitals not located in the predominant labor market area from facing continued declines in their wage index, it becomes increasingly difficult for those hospitals to continue to compete for labor.” The commenters stated it is imperative that the imputed floor policy be made permanent to ensure that its State’s hospitals are not artificially disadvantaged simply because of geography and population.

In addition, the commenters stated that there are many Medicare payment programs that redirect scarce Medicare funding to a class of unique hospitals. Not all States have hospitals that benefit from these programs. For example, the commenters stated that CMS makes payments to CAHs at a rate of 101 percent of their cost. The commenters noted that some States do not have any hospitals that qualify as a CAH and do not benefit from this program. The commenters further stated that while CAHs are paid outside the IPPS program, the dollars continue to come from a finite Medicare trust fund. The commenters believed that this represents a transfer of payments from hospitals in States without any CAHs, such as all-urban States, into States with CAHs, similar to the transfer of payments CMS cites as its rationale to discontinue the imputed floor. The commenters indicated that there is precedent for CMS to restore, in the final rule, policies or provisions that were scheduled for elimination or discontinuation in the proposed rule. The commenters pointed out that, in the FY 2012 IPPS/LTCH PPS proposed rule, CMS stated that the imputed floor

would expire on September 30, 2011. However, in the final rule, CMS announced that the imputed floor provision was extended for 2 additional years, through FY 2013 (September 30, 2013).

One commenter supported the alternative methodology for calculating the imputed rural floor in Rhode Island. According to the commenter, the methodology has been used since FY 2013 and has been key for the State’s hospitals and maintaining access to care for residents of Rhode Island. The commenter stated that the alternative methodology for calculating the imputed floor appropriately addresses a hospital wage index reclassification system that does not reflect Rhode Island’s characteristics. The commenter further expressed that the alternative methodology for calculating the imputed rural floor protects its hospitals from falling to some of the lowest reimbursement rates in the country, at the same time while competing with some of the most highly reimbursed urban hospitals. The commenter referenced FY 2013, where a majority of hospitals in Rhode Island reported operating losses and a cumulative operating margin of negative 2.0 percent. The commenter pointed out that since implementing the alternative methodology for calculating the imputed floor, there has been improvement in the overall fiscal condition of Rhode Island’s health care system. According to the commenter, the alternative methodology provided nearly \$29 million to hospitals in Rhode Island last year. The commenter was concerned that any discontinuation of this policy would be devastating for a State still facing challenging economic conditions.

Response: While the commenters raised concerns that, if the imputed floor were discontinued, hospitals in all-urban States would again be disadvantaged by the absence of rural hospitals to set a wage index floor for those States, as well as concerns about the fiscal impacts of discontinuing the rural floor, we also have expressed concerns about continuing the imputed floor policy. As we discussed in the FY 2008 IPPS/LTCH PPS final rule (72 FR 47322), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51593), and the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19905), the application of the rural and imputed floors requires transfer of payments from hospitals in States with rural hospitals but where the rural floor is not applied to hospitals in States where the rural or imputed floor is applied. While the three all-urban States may count for a fraction of all States that

received the rural and imputed floor last year, the imputed rural floor methodology still creates a disadvantage in the application of the wage index to hospitals in States with rural hospitals but no urban hospitals receiving the rural floor. As discussed below, given the many comments we received both in support of and against our proposal to discontinue the imputed floor, we believe it would be appropriate to temporarily extend the imputed floor for an additional year, while we continue to consider these comments and further assess the effects of this policy and whether to continue or discontinue the policy for the long term.

In response to the comment suggesting that we maintain the status quo and continue to extend the imputed floor until wage index reform is complete, we note that section 3137(b) of the Affordable Care Act required the Secretary to submit to Congress a report that includes a plan to reform the Medicare wage index applied under the IPPS. We submitted the report to Congress on April 11, 2012, and have posted the report and other information regarding wage index reform on the CMS Web site at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Reform.html>. While in past years we have stated that we continue to explore wage index reforms while extending the imputed floor in increments (for example, 78 FR 50589 through 50590 and 79 FR 49969 through 49970), we note that it has already been many years since our Report to Congress was issued with no new legislation from Congress to comprehensively reform the wage index. Therefore, we do not agree with the commenter that the imputed floor should continue until such time as comprehensive wage index reform may be implemented.

In addition, we note that the imputed floor was originally authorized for only 3 years. In the FY 2005 IPPS final rule (69 FR 49110), we indicated that during the 3 years that the policy is in effect, we would determine whether to make additional changes to the policy or eliminate it. Given that we had indicated in the FY 2005 IPPS final rule that the provision was set to expire after 3 years, and that we have temporarily extended the provision in increments for several subsequent years due to the reasons discussed earlier, we believe that hospitals in all-urban States should not rely on the policy to continue permanently or until wage index reform is implemented. Furthermore, because the policy has been temporarily extended in increments for several years, we believe that hospitals have

had ample notice that the policy could ultimately expire, and thus should not rely on a notification period as requested by the commenter. However, we would provide the public a chance to provide input to CMS through the rulemaking process prior to finalizing any decisions regarding elimination of the imputed rural floor.

Finally, regarding the comparison made by commenters between the CAH payment methodology and the imputed floor methodology with respect to the transfer of payments, we disagree with this comparison. Because there is no national budget neutrality requirement relating to CAH payments (as there is with the imputed floor methodology), there is no transfer of payments from hospitals in States without any CAHs to hospitals in States with CAHs, similar to that which exists as a result of the application of the imputed floor. Under sections 1814(l) and 1834(g) of the Act, payments made to CAHs for inpatient and outpatient services are generally based on 101 percent of the reasonable costs of the CAH in providing such services. Reasonable cost is defined in section 1861(v)(1)(A) of the Act and determined in accordance with the regulations under 42 CFR part 413.

Comment: One commenter stated that, in more recent years, the rural floor wage index adjustment has been a cause for concern nationally because urban hospitals in certain States have had their wage indexes set equal to the highest wage index of any rural hospital in their respective State. As a result, the commenter pointed out, hospitals in such States draw Medicare money away from hospitals in other States. The commenter reemphasized its previous recommendations, which were also included in the MedPAC's 2007 Report to Congress, that Congress repeal the existing hospital wage index. The commenter appeared to be requesting support for legislation which would include: Removing the more than 900 individual hospital reclassifications, and other exceptions that occur each year, which are either stipulated in law or implemented through regulation, and also giving the Secretary authority to establish a new wage index system, using compensation data from all employees, together with hospital industry-specific occupational weights, and adjusting at the county level to smooth large differences between counties; and a transition period to mitigate large changes in wage index values. The commenter indicated that the system it proposed is similar to recommendations made by the Institute of Medicine and that its sets of recommendations would eliminate the

need for the system of geographic reclassification and exceptions that is currently in place.

Response: We thank the commenter for its comments and its recommendations regarding modifications to the hospital wage index. However, we note that we do not have authority to repeal or revise the existing wage index statutory provisions, including the rural floor statutory provisions at section 4410(b) of the BBA and section 3141 of the Affordable Care Act.

Comment: One commenter opposed the continued application of the nationwide rural floor budget neutrality adjustment as described in the proposed rule. The commenter recognized that the impetus for the policy is a Federal statute, not regulation. The commenter discussed section 3141 of the Affordable Care Act which established a policy of national budget neutrality for the application of the rural and imputed floors to the Medicare wage index. The commenter conveyed that, coupled with the orchestrated conversion of a single facility in Massachusetts—Nantucket Cottage Hospital—from a CAH to an IPPS hospital, section 3141 of the Affordable Care Act allows hospitals to unfairly manipulate the Medicare payment system and reward hospitals in Massachusetts and a few other States at the expense of most other hospitals across the nation. The commenter stated that the adverse consequences of nationwide rural floor budget neutrality have been recognized and commented upon by CMS, MedPAC, and many others over the past several years. Until this policy is corrected, the commenter stated that the Medicare wage index system cannot possibly accomplish its objective of ensuring that payments for the wage component of labor accurately reflect actual wage costs.

Other commenters stated “that the current application of the rural floor is broken” and referenced how a single hospital can shift such a large amount of payments and have it paid for by many other States in the nation. The commenters explained that section 4410 of the BBA established a rural floor. The commenters noted that, by careful selection of specific hospitals converting from CAHs to hospitals paid under the IPPS, States could game the system and exploit this provision, shifting millions of dollars into that State. These commenters stated that the most notable example of such gaming is a hospital located on Nantucket Island off the coast of Massachusetts. This single hospital sets the wage index for all hospitals in Massachusetts. The commenters stated that, according to

rural floor impact statements provided by CMS in the annual IPPS final rule from FY 2012 through FY 2017, this one hospital will bring a projected \$1.3 billion into the commonwealth of Massachusetts. The commenter pointed out that the inequity of this provision recently was highlighted in a March 2017 Office of Inspector General (OIG) report showing how a single hospital overreported dollars and underreported hours, driving up the average hourly wage. According to the commenter, the OIG estimated that this error resulted in more than \$133 million in Medicare overpayments to be paid to Massachusetts hospitals. The commenters “urged CMS to establish a national wage index ceiling (for example, 1.33) that can be used to increase the national wage index floor to a reasonable level (for example, .874)”. In addition, the commenters opposed the application of a nationwide rural floor budget neutrality adjustment and requested that CMS overturn section 3141 of the Affordable Care Act and restore integrity to the hospital wage index system.

Response: We thank the commenters for their comments and suggestions. Because there is no national wage index floor, we are not clear what the commenter meant with respect to its request to establish a national wage index ceiling that can be used to increase the national wage index floor to a reasonable level. Therefore, we are unable to respond to this suggestion made by the commenter. As we stated earlier, section 4410 of the BBA requires the application of the rural floor and section 3141 of the Affordable Care Act requires a uniform, national budget neutrality adjustment for the rural floor. We do not have authority to repeal or revise these laws.

Comment: One commenter suggested that CMS use its authority to establish a temporary wage index floor for Puerto Rico in the interest of preventing a decrease in Medicare payments due to Puerto Rico’s lower than national average wages.

Response: We appreciate the suggestions provided by the commenter regarding a temporary wage index floor for Puerto Rico. However, this comment is outside the scope of the proposed rule.

We appreciate the positions of commenters that both supported and opposed the proposal to allow the imputed floor policy to expire. After consideration of public comments we received, we believe extending the imputed floor policy for 1 more year through FY 2018 is appropriate while we continue to consider the many

comments we received and whether to continue or discontinue the imputed floor for the long term. Therefore, we are extending the imputed floor policy under both the original methodology and the alternative methodology for an additional year, through September 30, 2018, and will address this issue again in our FY 2019 rulemaking. We also are revising the regulations at §§ 412.64(h)(4) and (h)(4)(vi) to reflect the 1-year extension of the imputed floor, through September 30, 2018.

The wage index and impact tables associated with this FY 2018 IPPS/LTCH PPS final rule (which are available on the Internet via the CMS Web site) reflect the continued application of the imputed floor policy at § 412.64(h)(4) and a national budget neutrality adjustment for the imputed floor for FY 2018. There are 17 hospitals in New Jersey that will receive an increase in their FY 2018 wage index due to the continued application of the imputed floor policy under the original methodology, and 10 hospitals in Rhode Island and 6 hospitals in Delaware that will benefit under the alternative methodology.

3. State Frontier Floor for FY 2018

Section 10324 of Public Law 111–148 requires that hospitals in frontier States cannot be assigned a wage index of less than 1.0000. (We refer readers to the regulations at 42 CFR 412.64(m) and to a discussion of the implementation of this provision in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50160 through 50161).) In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19905), we did not propose any changes to the frontier floor policy for FY 2018. We stated in the proposed rule that 52 hospitals would receive the frontier floor value of 1.0000 for their FY 2018 wage index. These hospitals are located in Montana, Nevada, North Dakota, South Dakota, and Wyoming.

We did not receive any public comments on the application of the State frontier floor for 2018. In this final rule, 49 hospitals will receive the frontier floor value of 1.0000 for their FY 2018 wage index. These hospitals are located in Montana, Nevada, North Dakota, South Dakota, and Wyoming.

The areas affected by the final rural and frontier floor policies for the FY 2018 wage index are identified in Table 2 associated with this final rule, which is available via the Internet on the CMS Web site.

H. FY 2018 Wage Index Tables

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49498 and 49807 through 49808), we finalized a proposal to

streamline and consolidate the wage index tables associated with the IPPS proposed and final rules for FY 2016 and subsequent fiscal years. Prior to FY 2016, the wage index tables had consisted of 12 tables (Tables 2, 3A, 3B, 4A, 4B, 4C, 4D, 4E, 4F, 4J, 9A, and 9C) that were made available via the Internet on the CMS Web site. Effective beginning FY 2016, with the exception of Table 4E, we streamlined and consolidated 11 tables (Tables 2, 3A, 3B, 4A, 4B, 4C, 4D, 4F, 4J, 9A, and 9C) into 2 tables (Tables 2 and 3). We refer readers to section VI. of the Addendum to this final rule for a discussion of the final wage index tables for FY 2018.

I. Revisions to the Wage Index Based on Hospital Redesignations and Reclassifications

1. General Policies and Effects of Reclassification and Redesignation

Under section 1886(d)(10) of the Act, the Medicare Geographic Classification Review Board (MGCRB) considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. Hospitals must apply to the MGCRB to reclassify not later than 13 months prior to the start of the fiscal year for which reclassification is sought (usually by September 1). Generally, hospitals must be proximate to the labor market area to which they are seeking reclassification and must demonstrate characteristics similar to hospitals located in that area. The MGCRB issues its decisions by the end of February for reclassifications that become effective for the following fiscal year (beginning October 1). The regulations applicable to reclassifications by the MGCRB are located in 42 CFR 412.230 through 412.280. (We refer readers to a discussion in the FY 2002 IPPS final rule (66 FR 39874 and 39875) regarding how the MGCRB defines mileage for purposes of the proximity requirements.) The general policies for reclassifications and redesignations and the policies for the effects of hospitals’ reclassifications and redesignations on the wage index are discussed in the FY 2012 IPPS/LTCH PPS final rule for the FY 2012 final wage index (76 FR 51595 and 51596). In addition, in the FY 2012 IPPS/LTCH PPS final rule, we discussed the effects on the wage index of urban hospitals reclassifying to rural areas under 42 CFR 412.103. Hospitals that are geographically located in States without any rural areas are ineligible to apply for rural reclassification in accordance with the provisions of 42 CFR 412.103.

On April 21, 2016, we published an interim final rule with comment period

(IFC) in the **Federal Register** (81 FR 23428 through 23438) that included provisions amending our regulations to allow hospitals nationwide to have simultaneous § 412.103 and MGCRB reclassifications. For reclassifications effective beginning FY 2018, a hospital may acquire rural status under § 412.103 and subsequently apply for a reclassification under the MGCRB using distance and average hourly wage criteria designated for rural hospitals. In addition, we provided that a hospital that has an active MGCRB reclassification and is then approved for redesignation under § 412.103 will not lose its MGCRB reclassification; such a hospital receives a reclassified urban wage index during the years of its active MGCRB reclassification and is still considered rural under section 1886(d) of the Act and for other purposes.

We discussed that when there is both a § 412.103 redesignation and an MGCRB reclassification, the MGCRB reclassification controls for wage index calculation and payment purposes. We exclude hospitals with § 412.103 redesignations from the calculation of the reclassified rural wage index if they also have an active MGCRB reclassification to another area. That is, if an application for urban reclassification through the MGCRB is approved, and is not withdrawn or terminated by the hospital within the established timelines, we consider the hospital's geographic CBSA and the urban CBSA to which the hospital is reclassified under the MGCRB for the wage index calculation. We refer readers to the April 21, 2016 IFC (81 FR 23428 through 23438) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 56922 through 56930) for a full discussion of the effect of simultaneous reclassifications under both the § 412.103 and the MGCRB processes on wage index calculations.

2. MGCRB Reclassification and Redesignation Issues for FY 2018

a. FY 2018 Reclassification Requirements and Approvals

As previously stated, under section 1886(d)(10) of the Act, the MGCRB considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. The specific procedures and rules that apply to the geographic reclassification process are outlined in regulations under 42 CFR 412.230 through 412.280.

At the time this final rule was constructed, the MGCRB had completed its review of FY 2018 reclassification requests. Based on such reviews, there are 374 hospitals approved for wage

index reclassifications by the MGCRB starting in FY 2018. Because MGCRB wage index reclassifications are effective for 3 years, for FY 2018, hospitals reclassified beginning in FY 2016 or FY 2017 are eligible to continue to be reclassified to a particular labor market area based on such prior reclassifications for the remainder of their 3-year period. There were 245 hospitals approved for wage index reclassifications in FY 2016 that will continue for FY 2018, and 246 hospitals approved for wage index reclassifications in FY 2017 that will continue for FY 2018. Of all the hospitals approved for reclassification for FY 2016, FY 2017, and FY 2018, based upon the review at the time of this final rule, 865 hospitals are in a MGCRB reclassification status for FY 2018.

Under the regulations at 42 CFR 412.273, hospitals that have been reclassified by the MGCRB are permitted to withdraw their applications if the request for withdrawal is received by the MGCRB within 45 days of the publication of CMS' annual notice of proposed rulemaking concerning changes to the inpatient hospital prospective payment system and proposed payment rates for the fiscal year for which the application has been filed. (We note that in section III.I.4. of the preamble of this final rule, we did not finalize our proposal to revise the above described regulation text to specify that written notice to the MGCRB must be provided within 45 days from the date of public display of the proposed rule at the Office of the Federal Register.) For information about withdrawing, terminating, or canceling a previous withdrawal or termination of a 3-year reclassification for wage index purposes, we refer readers to § 412.273, as well as the FY 2002 IPPS final rule (66 FR 39887 through 39888) and the FY 2003 IPPS final rule (67 FR 50065 through 50066). Additional discussion on withdrawals and terminations, and clarifications regarding reinstating reclassifications and "fallback" reclassifications were included in the FY 2008 IPPS final rule (72 FR 47333).

Changes to the wage index that result from withdrawals of requests for reclassification, terminations, wage index corrections, appeals, and the Administrator's review process for FY 2018 are incorporated into the wage index values published in this FY 2018 IPPS/LTCH PPS final rule. These changes affect not only the wage index value for specific geographic areas, but also the wage index value that redesignated/reclassified hospitals receive; that is, whether they receive the

wage index that includes the data for both the hospitals already in the area and the redesignated/reclassified hospitals. Further, the wage index value for the area from which the hospitals are redesignated/reclassified may be affected.

Comment: MedPAC and other commenters stated that the increasing number of wage index reclassifications, along with other wage index exceptions, raises questions regarding whether the current wage index is equitably adjusting payments for local input costs of providing patient care. One commenter stated that the increasing number of hospitals that reclassify is a "clear indication of the broken system" that needs to be replaced; another commenter requested general wage index reform. MedPAC reiterated that recommendations included in the Commission's 2007 Report to Congress and similar recommendations made by the Institute of Medicine would eliminate the need for the system of geographic reclassification and exceptions that is currently in place. Specifically, MedPAC recommended that the Congress repeal the existing hospital wage index, remove the more than 900 individual hospital reclassifications and other exceptions that occur each year, and give the Secretary the authority to establish a new wage index system.

Response: We understand the commenters' concerns regarding the high volume of MGCRB reclassifications. We appreciate MedPAC's recommendation to repeal the current wage index statute. However, repealing the wage index statute would require legislative action by Congress. Specifically, section 1886(d)(3)(E) of the Act requires that, as part of the methodology for determining prospective payments to hospitals, the Secretary must adjust the standardized amounts for area differences in hospital wage levels by a factor (established by the Secretary) reflecting the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level. We also appreciate the other commenters' requests for wage index reform. We will take the requests into consideration and may address this issue again in future rulemaking.

Applications for FY 2019 reclassifications are due to the MGCRB by September 1, 2017 (the first working day of September 2017). We note that this is also the deadline for canceling a previous wage index reclassification, withdrawal, or termination under 42 CFR 412.273(d). Applications and other information about MGCRB

reclassifications may be obtained, beginning in mid-July 2017, via the Internet on the CMS Web site at: <https://www.cms.gov/Regulations-and-Guidance/Review-Boards/MGCRB/index.html>, or by calling the MGCRB at (410) 786-1174. The mailing address of the MGCRB is: 2520 Lord Baltimore Drive, Suite L, Baltimore, MD 21244-2670.

Under previous regulations at 42 CFR 412.256(a)(1), applications for reclassification were required to be mailed or delivered to the MGCRB, with a copy to CMS, and were not allowed to be submitted through the facsimile (FAX) process or by other electronic means. Because we believed this previous policy was outdated and overly restrictive and to promote ease of application for FY 2018 and subsequent years, in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56928), we revised this policy to require applications and supporting documentation to be submitted via the method prescribed in instructions by the MGCRB, with an electronic copy to CMS. We revised § 412.256(a)(1) to specify that an application must be submitted to the MGCRB according to the method prescribed by the MGCRB, with an electronic copy of the application sent to CMS. We specified that CMS copies should be sent via email to wageindex@cms.hhs.gov.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56928), we reiterated that MGCRB application requirements will be published separately from the rulemaking process, and paper applications will likely still be required. The MGCRB makes all initial determinations for geographic reclassification requests, but CMS requests copies of all applications to assist in verifying a reclassification status during the wage index development process. We stated that we believed that requiring electronic versions would better aid CMS in this process, and would reduce the overall burden upon hospitals.

We did not receive any public comments on the requirements for applications for FY 2019 reclassifications.

b. Extension of PRA Information Collection Requirement Approval for MGCRB Applications

As stated earlier, under section 1886(d)(10) of the Act, the MGCRB considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. The specific procedures and rules that apply to the geographic reclassification process are outlined in the regulations under 42

CFR 412.230 through 412.280. The information collection requirements for the MGCRB procedures and criteria and supporting regulations in 42 CFR 412.256 subject to the Paperwork Reduction Act provisions were approved under OMB Control Number 0938-0573 and expired on February 28, 2017. As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19906 and 19907), an extension of the collection was required in time for applications due to the MGCRB by September 1, 2017 for FY 2019 reclassifications. A request for an extension of the information collection requirements for the MGCRB procedures and criteria and supporting regulations received approval by OMB on June 30, 2017, and can be accessed at: https://www.reginfo.gov/public/do/PRAViewICR?ref_nbr=201612-0938-023.

c. Deadline for Submittal of Documentation of Sole Community Hospital (SCH) and Rural Referral Center (RRC) Classification Status to the MGCRB

The regulations at 42 CFR 412.230(a)(3), consistent with section 1886(d)(10)(D)(i)(III) of the Act, set special rules for sole community hospitals (SCHs) and rural referral centers (RRCs) that are reclassifying under the MGCRB. Specifically, a hospital that is an RRC or an SCH, or both, does not have to demonstrate a close proximity to the area to which it seeks redesignation. If a hospital that is an RRC or an SCH, or both, qualifies for urban redesignation, it is redesignated to the urban area that is closest to the hospital. If the hospital is closer to another rural area than to any urban area, it may seek redesignation to either the closest rural or the closest urban area.

In addition, section 1886(d)(10)(D)(iii) of the Act, as implemented in the regulations at § 412.230(d)(3)(i), provides an exception to certain wage comparison criteria for RRCs and former RRCs reclassifying under the MGCRB. Under § 412.230(d)(3)(i), if a hospital was ever an RRC, it does not have to demonstrate that it meets the average hourly wage criterion at § 412.230(d)(1)(iii), which would require that the hospital's average hourly wage be at least 106 percent for rural hospitals and at least 108 percent for urban hospitals of the average hourly wage of all other hospitals in the area in which the hospital is located. Rather, as codified at § 412.230(d)(3)(ii), consistent with our authority under section 1886(d)(10)(D)(i) of the Act, if a hospital was ever an RRC, it is required to meet only the criterion for rural hospitals at

§ 412.230(d)(1)(iv), which requires that the hospital's average hourly wage is equal to at least 82 percent of the average hourly wage of hospitals in the area to which it seeks redesignation. The regulations at § 412.96 set forth the criteria that a hospital must meet in order to qualify as an RRC.

For a hospital to use the special rules at § 412.230(a)(3) for SCHs and RRCs, the existing regulation at § 412.230(a)(3) requires that the hospital be an active SCH or an RRC as of the date of the MGCRB's review. In addition, for a hospital to use the RRC exceptions at § 412.230(d)(3), a hospital must either be an RRC at the time of the MGCRB's review or have previously been classified as an RRC in the past. In other words, under the existing regulations, if a hospital is approved by CMS as an SCH or an RRC but the approval is not yet effective at the time of the MGCRB's review, the hospital's status as an SCH or an RRC would not be considered in the MGCRB's decision, unless the hospital was a former RRC, in which case it would be able to use the RRC exceptions at § 412.230(d)(3).

The MGCRB currently accepts supporting documentation of SCH and RRC classification (including, but not limited to, the CMS approval letter) up until the date of MGCRB's review, which varies annually. A hospital may apply at any time for classification as an SCH, and the classification is effective 30 days after the date of CMS' written notification of approval, in accordance with § 412.92. Considering that the MGCRB usually meets in early February, hospitals typically seek to obtain SCH approval letters no later than early January (30 days prior to the date of MGCRB review) for the SCH status to be effective as of the date of the MGCRB's review. However, consistent with section 1886(d)(5)(C)(i) of the Act, a hospital must submit its application for RRC status during the quarter before the first quarter of the hospital's cost reporting period, to be effective at the beginning of the next cost reporting period. The existing regulation at § 412.230(a)(3), combined with the statutory timeframe for RRC classification, require that a hospital's cost reporting period as an RRC begin on or before the date of the MGCRB's review in order to be considered an RRC by the MGCRB for purposes of the special rules under § 412.230(a)(3). Similarly, in order to use the RRC exceptions under § 412.230(d)(3), a hospital's RRC status must be effective on the date of the MGCRB's review, or (unlike § 412.230(a)(3)) the hospital must have had RRC status in the past. For example, a hospital with a cost

reporting period beginning in March would obtain RRC approval, in accordance with the statutory timeframe, during the December through February quarter (potentially before the MGCRB's decision), but would not be considered an RRC by the MGCRB because the approval would not be effective until the next cost reporting period begins in March, after the MGCRB's decision (unless, for purposes of § 412.230(d)(3), the hospital had previously been classified as an RRC in the past).

As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19907 through 19908), the current practice of accepting documentation of SCH and RRC approvals up until the date of MGCRB review does not ensure adequate time for the MGCRB to include SCH and RRC approvals in its review. We noted in the proposed rule that many hospitals now obtain SCH or RRC status based on a § 412.103 reclassification in order to reclassify using the special rules and exceptions under the MGCRB following the April 21, 2016 IFC (81 FR 23428), which revised the regulations to allow hospitals nationwide to reclassify based on acquired rural status. We stated in the proposed rule that we believe the additional volume of SCH and RRC approvals submitted to the MGCRB increases the need for an earlier deadline for documentation of SCH and RRC classifications to be submitted to the MGCRB for purposes of the special rules at § 412.230(a)(3) and the exception for RRCs at § 412.230(d)(3). In addition, because the date of the MGCRB's review varies annually, we stated in the proposed rule that we believe hospitals would benefit from the certainty of a set date by which documentation of RRC or SCH status must be submitted in order to have that status considered by the MGCRB under § 412.230(a)(3) and § 412.230(d)(3).

Therefore, to ensure sufficient time for the MGCRB to include SCH and RRC status approvals in its review and increase clarity for hospitals, while allowing as much time and flexibility as possible for hospitals applying for RRC status to be considered RRCs by the MGCRB, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19907 through 19908), we proposed to revise the regulations at § 412.230(a)(3) and § 412.230(d)(3). We proposed to revise the regulations at § 412.230(a)(3) in two ways. First, we proposed to establish a deadline of the first business day after January 1 for hospitals to submit to the MGCRB documentation of SCH or RRC status approval (the CMS approval letter) in order to take advantage of the

special rules under § 412.230(a)(3) when reclassifying under the MGCRB. We stated that we believe that this date of the first business day after January 1 would provide sufficient time for the MGCRB to consider documentation of SCH or RRC status approval in its review, without negatively affecting hospitals seeking to obtain SCH or RRC status, as explained below. Second, we proposed to revise § 412.230(a)(3) to require hospitals to submit documentation of SCH or RRC status approval (the CMS approval letter) by the deadline above, rather than to have SCH or RRC classification that is effective as of the date of MGCRB review, in order to use the special rules for SCHs and RRCs under § 412.230(a)(3). Likewise, we proposed to revise the regulations at § 412.230(d)(3) so that a hospital qualifies for these RRC exceptions if it was ever *approved* as a RRC. In other words, the exceptions at § 412.230(d)(3) would continue to apply to hospitals that were ever classified as RRCs, but consistent with our authority under section 1886(d)(10)(D)(i) of the Act to publish guidelines to be utilized by the MGCRB, we proposed to also extend these exceptions to hospitals that were ever approved as RRCs. Similar to § 412.230(a)(3), we also proposed to establish a deadline of the first business day after January 1 for hospitals to submit documentation of RRC status approval (the CMS approval letter) in order to take advantage of the exception under § 412.230(d)(3) when reclassifying under the MGCRB. We stated in the proposed rule that these proposed revisions would more appropriately allow the MGCRB to prepare for its review and would allow hospitals obtaining SCH or RRC status approval as late as the first business day after January 1 to have these classifications considered by the MGCRB under § 412.230(a)(3) and (d)(3), irrespective of the effective date of these classifications. We stated that these proposals would not substantially affect hospitals seeking SCH classification for purposes of reclassifying under the MGCRB because a hospital must obtain SCH status approval by early January under the existing regulation in order to have that classification effective 30 days later by the time the Board usually meets in early February. For hospitals seeking RRC classification for purposes of reclassifying under the MGCRB, however, the proposed deadline of no later than the first business day after January 1, in concert with our proposal to accept documentation of approval

(the CMS approval letter) instead of requiring the hospital to be an active RRC at the time of the MGCRB review in order to take advantage of the special rules and exceptions under § 412.230(a)(3) and (d)(3), is beneficial. We stated that the proposed revisions to the regulations at § 412.230(a)(3) and (d)(3) would accommodate more hospitals with various cost reporting year ends by allowing hospitals with cost reporting periods beginning soon after the MGCRB's decision to have RRC status approvals included in the MGCRB's review. Under the proposals, the MGCRB would consider an RRC status approval obtained as late as the first business day after January 1 instead of requiring the RRC classification to be effective by the time the Board meets, which has been in February in past years. For example, under our proposal, a hospital with a cost reporting period beginning as late as March, which could apply for RRC status approval in accordance with the statutory timeframe starting in December, would be considered an RRC by the MGCRB if it submits documentation of approval of RRC status no later than the first business day after January 1, even though the approval would not be effective until after the MGCRB's decision.

For the reasons discussed earlier, consistent with our authority under section 1886(d)(10)(D)(i) of the Act to publish guidelines to be utilized by the MGCRB, we proposed to revise the regulations at § 412.230(a)(3) to specify that, to be redesignated under the special rules in that paragraph, the hospital must submit documentation of the approval of SCH or RRC status to the MGCRB no later than the first business day after January 1. In addition, we proposed conforming revisions to paragraphs (a)(3)(i) and (ii) of § 412.230 to reflect that these paragraphs apply to hospitals with SCH and RRC approval as specified above (and not only effective status). Specifically, we proposed to revise § 412.230(a)(3)(i) to specify that a hospital that is approved as an RRC or SCH, or both, does not have to demonstrate a close proximity to the area to which it seeks redesignation; and to revise § 412.230(a)(3)(ii) to specify that this paragraph applies if a hospital that is approved as an RRC or SCH, or both, qualifies for urban redesignation. We note that we proposed additional revisions to § 412.230(a)(3)(ii) as discussed in section III.I.2.d. of the preamble of the proposed rule and this final rule.

In addition, for the reasons discussed above, consistent with our authority under section 1886(d)(10)(D)(i) of the

Act to publish guidelines to be utilized by the MGCRB, we proposed to revise the regulations at § 412.230(d)(3). Specifically, we proposed to add introductory language to § 412.230(d)(3) to specify that for the exceptions in this paragraph to apply, the hospital must submit documentation of the approval of RRC status (current or past) to the MGCRB no later than the first business day after January 1. In addition, we proposed to revise § 412.230(d)(3)(i) to specify that if a hospital was ever approved as an RRC, it does not have to demonstrate that it meets the average hourly wage criterion set forth in § 412.230(d)(1)(iii); and to revise § 412.230(d)(3)(ii) to specify that if a hospital was ever approved as an RRC, it is required to meet only the criterion that applies to rural hospitals under § 412.230(d)(1)(iv), regardless of its actual location in an urban or rural area.

We invited public comments on these proposals.

Comment: One commenter did not disagree with the establishment of a deadline for submitting documentation of SCH and RRC status to the MGCRB because the commenter believed that the proposed deadline will provide clarity to hospitals, the MGCRB, and CMS in this process and will ensure adequate time for the MGCRB to include SCH and RRC approvals in its review. However, the commenter urged CMS to also establish a deadline of 30 days from receipt of request for SCH or RRC status for CMS to respond. The commenter pointed out that while the regulations specify effective dates for SCH and RRC status, the regulations do not set a timeframe by which CMS must rule on an SCH or RRC request. Therefore, the commenter stated, a hospital may face uncertainty that CMS will respond to its request for SCH or RRC status by the first business day in January, in time to submit to the MGCRB. According to the commenter, absent a defined timeframe within which CMS must respond to hospitals' requests for SCH and RRC status, hospitals face a disadvantage in complying with the deadline of the first business day in January for submitting documentation of SCH and RRC status to the MGCRB.

Response: We appreciate the commenter's support for our effort to provide clarity to all parties. The commenter is correct that the regulations do not set a timeframe by which CMS must rule on an SCH or RRC request. However, under section 1886(d)(5)(C)(i) of the Act, CMS must make a final determination on a request for RRC status within 60 days after the date the request was submitted. We agree with the commenter that,

depending on the timeframe within which SCH and RRC status approvals are issued, hospitals may face a disadvantage in complying with the proposed deadline to submit SCH and RRC documentation to the MGCRB. Thus, we believe that further consideration is needed regarding the appropriate timeframe for such approvals to avoid the disadvantage cited by the commenter. Accordingly, for FY 2018, we are *not* finalizing the proposed deadline of the first business day after January 1 for hospitals to submit documentation of SCH and RRC status to the MGCRB. We may revisit the deadline for submitting documentation to the MGCRB in future rulemaking to give us the opportunity to further consider the timeframe for CMS to respond to applications for SCH and RRC status.

However, we believe that the proposal to require that a hospital must be approved for SCH or RRC status, rather than have active RRC or SCH status, in order to use the special rules for SCHs and RRCs and exceptions for RRCs under §§ 412.230(a)(3) and (d)(3), remains beneficial for hospitals. While we are still concerned with providing the MGCRB sufficient time to include SCH and RRC status approval in its review, we believe finalizing our proposal to require that a hospital be approved for SCH or RRC status, rather than have active RRC or SCH status, in order to use the special rules for SCHs and RRCs and exceptions for RRCs under §§ 412.230(a)(3) and (d)(3) is appropriate because it provides flexibility and accommodates more hospitals. Therefore, as discussed further below, we are finalizing our proposed changes to the regulations to specify that a hospital must be approved as an SCH or RRC at the date of the MGCRB's review, irrespective of effective date of SCH or RRC status. While documentation of SCH and RRC status approval may include the CMS approval letter, we are clarifying that other documents could also serve this purpose as determined by the MGCRB, and that documentation in addition to the CMS approval letter may be required. Questions about acceptable supporting documentation should be directed to the MGCRB at 410-786-1174.

After consideration of the public comment we received, for the reasons discussed earlier, we are not finalizing our proposed revisions to the regulations at §§ 412.230(a)(3) and (d)(3) to establish a deadline of the first business day after January 1 for hospitals to submit documentation of SCH and RRC status approval to the

MGCRB. However, consistent with our authority under section 1886(d)(10)(D)(i) to publish guidelines to be used by the MGCRB, for the reasons discussed earlier and in the FY 2018 IPPS/LTCH PPS proposed rule, we are finalizing our proposal that a hospital must be approved for SCH or RRC status, rather than have active SCH or RRC status in order to use the special rules for SCHs and RRCs and exceptions for RRCs under §§ 412.230(a)(3) and (d)(3). Specifically, we are revising the regulation at § 412.230(a)(3) to specify that, to be redesignated under the special rules in this paragraph, a hospital must be approved as an SCH or RRC as of the date of the MGCRB's review. In addition, we are finalizing, without modification, our proposed revisions to paragraphs (a)(3)(i) and (ii) of § 412.230 to reflect that these paragraphs apply to hospitals with SCH and RRC approval (and not only effective status). Specifically, we are revising § 412.230(a)(3)(i) to specify that a hospital that is approved as an RRC or SCH, or both, does not have to demonstrate a close proximity to the area to which it seeks redesignation; and revising § 412.230(a)(3)(ii) to specify that this paragraph applies if a hospital that is approved as an RRC or SCH, or both, qualifies for urban redesignation. (We note that we are making additional revisions to § 412.230(a)(3)(ii) as discussed in section III.I.2.d. of the preamble of this final rule).

In addition, for the reasons discussed earlier, while we are not finalizing our proposed introductory language at § 412.230(d)(3), we are finalizing our proposed revisions to paragraphs (d)(3)(i) and (ii) of § 412.230, without modification, to reflect that these paragraphs apply to hospitals with RRC approval (and not only effective status). Specifically, we are revising § 412.230(d)(3)(i) to specify that if a hospital was ever approved as an RRC, it does not have to demonstrate that it meets the average hourly wage criterion set forth in § 412.230(d)(1)(iii); and revising § 412.230(d)(3)(ii) to specify that if a hospital was ever approved as an RRC, it is required to meet only the criterion that applies to rural hospitals under § 412.230(d)(1)(iv), regardless of its actual location in an urban or rural area.

d. Clarification of Special Rules for SCHs and RRCs Reclassifying to Geographic Home Area

Following issuance of the April 21, 2016 IFC (81 FR 23428), hospitals may simultaneously be redesignated as rural under § 412.103 and reclassified under the MGCRB. An urban hospital seeking

benefits of rural status, such as rural payments for disproportionate share hospitals (DSH) and eligibility for the 340B Drug Pricing Program administered by HRSA, without the associated rural wage index may be redesignated as rural under § 412.103 (if it meets the applicable requirements) and also reclassify under the MGCRB to an urban area (again, if it meets the applicable requirements). As discussed earlier and in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56922 through 56927), a hospital with simultaneous § 412.103 redesignation and MGCRB reclassification receives the wage index of the CBSA to which it is reclassified under the MGCRB while still maintaining § 412.103 reclassified rural status for other purposes.

Hospitals that are redesignated under § 412.103 may seek MGCRB reclassification to their geographic home area. Such hospitals automatically meet the criteria for proximity, but must still demonstrate that they meet the wage comparison requirements using the criteria for rural hospitals at § 412.230(d). Specifically, a hospital with a § 412.103 redesignation seeking reclassification under the MGCRB must demonstrate that its average hourly wage is at least 106 percent of the average hourly wage of all other hospitals in the area in which the hospital is located in accordance with § 412.230(d)(1)(iii), and the hospital's average hourly wage is equal to at least 82 percent of the average hourly wage of hospitals in the area to which it seeks redesignation, in accordance with § 412.230(d)(1)(iv). In this case, both the area in which the hospital is located and the area to which it seeks redesignation are the geographic home area. If a hospital with a § 412.103 rural redesignation also has SCH or RRC status based on its acquired rural status, the hospital may use the exception at § 412.230(d)(3) for RRCs seeking reclassification under the MGCRB and the special reclassification rules at § 412.230(a)(3) for SCHs and RRCs. Specifically, under § 412.230(d)(3)(ii), an RRC or former RRC must only demonstrate that its average hourly wage is equal to at least 82 percent of the average hourly wage of hospitals in the area to which it seeks redesignation. In other words, a hospital with RRC status based on a § 412.103 rural redesignation that is seeking additional reclassification under the MGCRB to its geographic home area must only demonstrate that its average hourly wage is equal to at least 82 percent of the average hourly wage of hospitals in its geographic home area. The proximity

requirement is waived under § 412.230(a)(3) for SCHs and RRCs, and SCHs and RRCs are redesignated to the urban area that is closest to the hospital (or if the hospital is closer to another rural area than to any urban area, it may seek redesignation to either the closest rural area or the closest urban area).

As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19908 through 19909), the existing regulation at § 412.230(a)(3)(ii) states that if an SCH or RRC qualifies for urban redesignation, it is redesignated to the urban area that is closest to the hospital. As currently worded, we believe it is unclear how this provision would apply to a hospital with a § 412.103 rural redesignation and SCH or RRC status. If the urban area that is closest to the hospital is interpreted to mean the hospital's geographic home area, a hospital with a § 412.103 rural redesignation and SCH or RRC status would not be able to reclassify to any closest area outside of the hospital's geographic home area, but would only be allowed to reclassify to the geographic home area. Alternatively, if the urban area that is closest to the hospital is interpreted to mean the closest urban area to the hospital's geographic home area, the hospital would seem to be precluded from reclassifying under the MGCRB to its geographic home area. In other words, under the existing language of this regulation, the urban area that is closest to the hospital can either be interpreted to mean the hospital's geographic home area, or the closest area outside of the hospital's geographic home area.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19909), we stated that we believe it would be appropriate to revise § 412.230(a)(3)(ii) to clarify that it allows for redesignation to either the hospital's geographic home area or to the closest area outside of the hospital's geographic home area. Prior to the April 21, 2016 interim final rule with comment period (IFC) (81 FR 23428), it was not possible for a hospital with § 412.103 rural redesignation to seek reclassification to its geographic home area or to the closest area outside its geographic home area under the MGCRB because dual reclassification under § 412.103 and under the MGCRB was not permitted. However, the IFC allowed dual § 412.103 and MGCRB reclassifications, so a hospital may now reclassify to a rural area under § 412.103 and then reclassify back to its geographic home area or another area under the MGCRB for wage index purposes (if it meets all criteria). Thus, depending on the circumstances, a hospital may seek to reclassify to either

its geographic home area or the closest area outside of its geographic home area.

Therefore, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19909), we proposed to revise the regulations at § 412.230(a)(3)(ii) to clarify that a hospital with a § 412.103 rural redesignation and SCH or RRC approval may reclassify under the MGCRB to its geographic home area or to the closest area outside of its geographic home area. Specifically, we proposed to revise § 412.230(a)(3)(ii) to state that if a hospital that is approved as an RRC or an SCH, or both, qualifies for urban redesignation, it is redesignated to the urban area that is closest to the hospital or to the hospital's geographic home area. If the hospital is closer to another rural area than to any urban area, it may seek redesignation to either the closest rural or the closest urban area.

Comment: Two commenters supported the clarification in the proposed rule and stated that it provides clarity with respect to SCHs and RRCs with § 412.103 rural redesignation applying for MGCRB reclassification based on special access rules. In addition, the commenters stated that the proposed regulatory revision is consistent with the regulations, past administrative decisions, and CMS' policy of allowing a hospital with § 412.103 rural redesignation to reclassify under the MGCRB.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, for the reasons discussed earlier and in the FY 2018 IPPS/LTCH PPS proposed rule, we are finalizing, without modification, our proposed revision of § 412.230(a)(3)(ii) to clarify that a hospital with a § 412.103 rural redesignation and SCH or RRC approval may reclassify under the MGCRB to its geographic home area or to the closest area outside of its geographic home area.

3. Redesignations Under Section 1886(d)(8)(B) of the Act

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600), we adopted the policy that, beginning with FY 2012, an eligible hospital that waives its Lugar status in order to receive the out-migration adjustment has effectively waived its deemed urban status and, thus, is rural for all purposes under the IPPS effective for the fiscal year in which the hospital receives the out-migration adjustment. In addition, we adopted a minor procedural change that would allow a Lugar hospital that qualifies for and accepts the out-migration adjustment (through written notification to CMS within 45 days from

the publication of the proposed rule) to waive its urban status for the full 3-year period for which its out-migration adjustment is effective. (We note that, in section III.I.4. of the preamble of this final rule, we finalized a policy revision to require a Lugar hospital that qualifies for and accepts the out-migration adjustment, or that no longer wishes to accept the out-migration adjustment and instead elects to return to its deemed urban status, to notify CMS within 45 days from the date of public display of the proposed rule at the Office of the Federal Register.) By doing so, such a Lugar hospital would no longer be required during the second and third years of eligibility for the out-migration adjustment to advise us annually that it prefers to continue being treated as rural and receive the out-migration adjustment. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56930), we again clarified that such a request to waive Lugar status, received within 45 days of the publication of the proposed rule, is valid for the full 3-year period for which the hospital's out-migration adjustment is effective. We further clarified that if a hospital wishes to reinstate its urban status for any fiscal year within this 3-year period, it must send a request to CMS within 45 days of publication of the proposed rule for that particular fiscal year. We indicated that such reinstatement requests may be sent electronically to wageindex@cms.hhs.gov. We wish to further clarify that both requests to waive and to reinstate "Lugar" status may be sent to this mailbox. To ensure proper accounting, we request hospitals to include their CCN, and either "waive Lugar" or "reinstate Lugar", in the subject line of these requests. As noted earlier, and discussed further in section III.I.4. of this final rule, we are finalizing our proposal to revise these notification timeframes, effective October 1, 2017, to 45 days from the date of public display of the annual proposed rule.

We did not receive any public comments on this subject area in the proposed rule.

4. Changes to the 45-Day Notification Rules

Certain Medicare regulations specify that hospitals have 45 days from the publication of the annual proposed rule for the hospital inpatient prospective payment system to inform CMS or the MGCRB of certain requested reclassification/redesignation and out-migration adjustment changes relating to the development of the hospital wage index. Specifically, 42 CFR 412.64(i)(3)(iii), which provides for adjusting the wage index to account for

commuting patterns of hospital workers, and 42 CFR 412.211(f)(3)(iii), which provides for the same adjustment for hospitals in Puerto Rico, state that a hospital may waive the application of this wage index adjustment by notifying CMS in writing within 45 days after the publication of the annual notice of proposed rulemaking for the hospital inpatient prospective payment system. The regulations at § 412.273(c) concerning withdrawing an MGCRB application, terminating an approved 3-year reclassification, or canceling a previous withdrawal or termination, also state (specifically § 412.273(c)(1)(ii) and (2)) that a request for withdrawal or termination must be received by the MGCRB within 45 days of publication of CMS' annual notice of proposed rulemaking concerning changes to the inpatient hospital prospective payment system and proposed payment rates. Similarly, the policy outlined in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600) allows a Lugar hospital that qualifies for and accepts the out-migration adjustment, or that no longer wishes to accept the out-migration adjustment and instead elects to return to its deemed urban status to notify CMS within 45 days from the publication of the proposed rule.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19910), we proposed to revise the above described regulation text and policies as follows to specify that written notification to CMS or the MGCRB (as applicable) must be provided within 45 days from the date of public display of the annual proposed rule for the hospital inpatient prospective payment system at the Office of the Federal Register. We stated that we believe that the public has access to the necessary information from the date of public display of the proposed rule at the Office of the Federal Register and on its Web site in order to make the decisions at issue. Specifically, we proposed to revise the regulations at § 412.64(i)(3)(iii) and § 412.211(f)(3)(iii) to provide that a hospital may waive the application of the wage index adjustment by notifying CMS within 45 days of the date of public display of the annual notice of proposed rulemaking for the hospital inpatient prospective payment system at the Office of the Federal Register. In addition, we proposed to revise the regulations at § 412.273(c)(1)(ii) and (c)(2) to provide that a request for withdrawal or termination of an MGCRB reclassification must be received by the MGCRB within 45 days of the date of public display at the Office of the Federal Register of the annual notice of

proposed rulemaking concerning changes to the inpatient hospital prospective payment system and proposed payment rates for the fiscal year for which the application has been filed (in the case of a withdrawal under § 412.273(c)(1)(ii)), or for the fiscal year for which the termination is to apply (under § 412.273(c)(2)). We also proposed to revise our policy outlined in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600) (as described above) to require a Lugar hospital that qualifies for and accepts the out-migration adjustment, or that no longer wishes to accept the out-migration adjustment and instead elects to return to its deemed urban status to notify CMS within 45 days from the date of public display of the IPPS proposed rule at the Office of the Federal Register. We invited public comments on these proposals.

We did not receive any public comments on the proposed revisions to § 412.64(i)(3)(iii) or § 412.211(f)(3)(iii) with regard to the time period for hospitals to notify CMS of decisions about the out-migration adjustment, or with regard to the proposed revision to the policy outlined in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600) concerning the time period for notifications by Lugar hospitals regarding acceptance or nonacceptance of the out-migration adjustment. However, we did receive public comments on our proposed revisions to § 412.273(c)(1)(ii) and (c)(2) regarding the time period to request withdrawal or termination of an MGCRB reclassification. These comments are summarized below.

Comment: Several commenters disagreed with the proposal to change the 45-day notification requirement for MGCRB withdrawals and terminations. They stated that 45 days from the date of public display at the Office of the Federal Register would not give hospitals adequate time to review the applicable data. The commenters pointed out that the proposal would decrease the time period for providers to act by approximately 14 days, which they claimed would "unnecessarily disadvantage" hospitals in making the most beneficial reclassification determinations for their wage index. In addition, a few commenters presented scenarios whereby the proposal may require hospitals to submit withdrawal or termination requests to the MGCRB prior to the Administrator's decisions on MGCRB appeals. The commenters recommended that CMS maintain its existing policy of 45 days after the proposed rule is issued in the **Federal Register** for hospitals to request

withdrawal and termination of MGCRB reclassifications. One commenter suggested that CMS also allow for an extension of the current deadline to ensure providers have at least 15 days from the issuance of a CMS Administrator decision to make withdrawal and termination requests.

Response: While the commenters are correct that requiring hospitals to submit withdrawal or termination requests to the MGCRB within 45 days from the date of public display, rather than the date the proposed rule is issued in the **Federal Register**, reduces the time for hospitals to make such determinations, we do not agree that hospitals generally would have inadequate time to review the applicable data. As discussed in the proposed rule (82 FR 19910), we believe that the public has access to the necessary information from the date of public display of the proposed rule at the Office of the Federal Register and on its Web site in order to make the decisions at issue under our proposals. However, while we believe that hospitals generally would have adequate time to make reclassification determinations under the proposal, we acknowledge that hospitals may be disadvantaged if the Administrator's decision on a hospital's appeal of an MGCRB decision has not been issued prior to the proposed deadline for submitting withdrawal or termination requests to the MGCRB. Specifically, the regulations at §§ 412.278(a) and (b)(1) provide that a hospital may request the Administrator to review the MGCRB decision, and that such request must be received by the Administrator within 15 days after the date the MGCRB issues its decision. Under § 412.278(f)(2)(i), the Administrator issues a decision not later than 90 days following receipt of the party's request for review (except that the Administrator may, in his or her discretion, for good cause shown, toll such 90 days). Considering the usual dates of the MGCRB's decisions (generally early February) and of the public display of the IPPS proposed rule, the maximum amount of time for an Administrator's decision to be issued may potentially extend beyond the proposed deadline of 45 days from the date of public display. Therefore, in order to further consider whether our proposed revisions to § 412.273(c) may require hospitals to submit withdrawal or termination requests to the MGCRB before the Administrator's decision on an appeal is issued, we are not finalizing at this time our proposed change to the 45-day notification rule at § 412.273(c)(1)(ii) and (c)(2) for

requesting withdrawals and terminations of MGCRB reclassifications. However, after consideration of these comments, we are revising our regulations at §§ 412.273(c)(1)(ii) and (c)(2) to ensure that our current policy under those regulations is clear. Specifically, we are revising §§ 412.273(c)(1)(ii) and (c)(2) to clarify that, under these regulations, a hospital's request to withdraw or terminate an MGCRB reclassification must be received by the MGCRB within 45 days of the date the annual notice of proposed rulemaking is issued in the **Federal Register**. We believe that these revisions will provide for greater clarification regarding how these provisions are applied. We note that we are not providing for an extension of the current deadline as one commenter suggested to allow providers to have at least 15 days from the issuance of a CMS Administrator decision to withdraw or terminate an MGCRB reclassification because we do not believe that an extension is necessary under the current deadline under §§ 412.273(c)(1)(ii) and (c)(2). Under the current deadline, a hospital can plan its withdrawal or termination decisions for both potential alternatives of the Administrator's decision on its appeal, and then act immediately within the current 45-day timeframe as soon as the Administrator's decision either to affirm or reverse the MGCRB's decision is issued.

Comment: One commenter stated that CMS' policy that hospitals must request to withdraw or terminate MGCRB reclassifications within 45 days of the proposed rule is problematic because a hospital could terminate a reclassification based on information in the proposed rule and, with the publication of the final rule, discover that its original reclassified status was more desirable. The commenter stated that hospitals cannot make informed decisions concerning their reclassification status based on values in a proposed rule that are likely to change and, therefore, recommended that CMS revise its existing policy to permit hospitals to withdraw or terminate their reclassification status within 45 days after the publication of the final rule.

Response: We maintain that information provided in the proposed rule constitutes the best available data to assist hospitals in making reclassification decisions. In addition, section 1886(d)(8)(D) of the Act requires the Secretary to adjust the standardized amounts to ensure that aggregate payments under the IPPS after implementation of the provisions of certain sections of the Act, including

section 1886(d)(10) of the Act for geographic reclassifications by the MGCRB, are equal to the aggregate prospective payments that would have been made absent these provisions. If hospitals were to withdraw or terminate reclassification statuses after the final rule, as the commenter suggested CMS permit, any resulting changes in the wage index would not have been taken into account when calculating the IPPS standardized amounts in the final rule in accordance with the statutory budget neutrality requirement. Therefore, the values published in the final rule represent the final wage index values reflective of reclassification decisions.

While we are not finalizing, for the reasons discussed earlier, the proposed changes to § 412.273(c)(1)(ii) and (c)(2) concerning the time period for requesting withdrawals and terminations of MGCRB reclassifications, we are finalizing, without modification, our proposed changes to § 412.64(i)(3)(iii) and § 412.211(f)(3)(iii) regarding the 45-day requirement for notifying CMS of decisions to waive application of the out-migration adjustment, and our proposed change to the policy outlined in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600) concerning the time period for notifications by Lugar hospitals regarding acceptance or nonacceptance of the out-migration adjustment. Unlike MGCRB decisions under § 412.278, out-migration adjustment and Lugar status decisions are not subject to Administrator's review. Therefore, hospitals deciding to waive the out-migration adjustment under § 412.64(i)(3)(iii) or § 412.211(f)(3)(iii) or Lugar hospitals deciding to accept or decline the out-migration adjustment would not experience the same potential disadvantage from implementation of the proposed revisions to the 45-day notification rules. For decisions regarding the out-migration adjustment and Lugar status, we continue to believe that the public has access to the necessary information from the date of public display of the proposed rule at the Office of the Federal Register and on its Web site in order to make decisions. Therefore, we believe that it is appropriate to finalize without modification our proposed changes to § 412.64(i)(3)(iii) and § 412.211(f)(3)(iii) and our proposed change to the policy outlined in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600) as discussed earlier.

In addition, as a courtesy, we will post on the CMS Web site at <https://www.cms.gov/Medicare/Medicare-Fee->

for-Service-Payment/AcuteInpatient PPS/wageindex.html the calendar closing dates of the 45-day notification deadlines for waiving the out-migration adjustment, for Lugar hospitals to notify CMS regarding acceptance or nonacceptance of the out-migration adjustment, and for requesting withdrawal or termination of an MGCRB reclassification. We note that the MGCRB is independent of CMS and that the deadline for withdrawals and terminations of MGCRB reclassifications posted on CMS' Web site will be posted as a courtesy only. The MGCRB makes the final decision regarding the date of the deadline and whether a request for withdrawal or termination is timely. The public should confirm the deadline for withdrawals and terminations of MGCRB reclassifications with the MGCRB.

After consideration of the public comments we received, for the reasons discussed earlier and in the FY 2018 IPPS/LTCH PPS proposed rule, we are finalizing, without modification, the proposed changes to the regulations at § 412.64(i)(3)(iii) and § 412.211(f)(3)(iii) to provide that hospitals may waive the application of the out-migration wage index adjustment within 45 days of the date of public display of the annual notice of proposed rulemaking for the hospital inpatient prospective payment system at the Office of the Federal Register. We also are finalizing, without modification, the proposed changes to the policy outlined in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600), so that a Lugar hospital that qualifies for and accepts the out-migration adjustment, or that no longer wishes to accept the out-migration adjustment and instead elects to return to its deemed urban status, must notify CMS within 45 days from the date of public display of the IPPS proposed rule at the Office of the Federal Register. For the reasons discussed earlier, we are *not* finalizing, as proposed, the changes to the regulations at § 412.273(c)(1)(ii) and (c)(2) concerning the timeframe for submitting a request to the MGCRB to withdraw or terminate an MGCRB reclassification. Rather, we are revising the regulations at § 412.273(c)(1)(ii) and § 412.273(c)(2) to clarify our current policy under these regulations that a request for withdrawal or termination of an MGCRB reclassification must be received by the MGCRB within 45 days of the date the annual notice of proposed rulemaking is issued in the **Federal Register**. Accordingly, a request for withdrawal or termination of an MGCRB reclassification must still be received by the MGCRB within 45 days

of issuance in the **Federal Register** of CMS' annual notice of proposed rulemaking concerning changes to the inpatient hospital prospective payment system and proposed payment rates. Finally, as discussed earlier, as a courtesy (and independent of the MGCRB), we will begin posting on the CMS Web site the annual calendar dates of the 45-day notification deadlines for (1) hospitals to notify CMS that they are waiving the out-migration adjustment; (2) Lugar hospitals to notify CMS that they qualify for and accept the out-migration adjustment or no longer wish to accept the outmigration adjustment and elect instead to return to deemed urban status; and (3) hospitals to request from the MGCRB withdrawal or termination of an MGCRB reclassification.

J. Out-Migration Adjustment Based on Commuting Patterns of Hospital Employees

In accordance with section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, beginning with FY 2005, we established a process to make adjustments to the hospital wage index based on commuting patterns of hospital employees (the “out-migration” adjustment). The process, outlined in the FY 2005 IPPS final rule (69 FR 49061), provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county but work in a different county (or counties) with a higher wage index. Section 1886(d)(13)(B) of the Act requires the Secretary to use data the Secretary determines to be appropriate to establish the qualifying counties. When the provision of section 1886(d)(13) of the Act was implemented for the FY 2005 wage index, we analyzed commuting data compiled by the U.S. Census Bureau that were derived from a special tabulation of the 2000 Census journey-to-work data for all industries (CMS extracted data applicable to hospitals). These data were compiled from responses to the “long-form” survey, which the Census Bureau used at the time and which contained questions on where residents in each county worked (69 FR 49062). However, the 2010 Census was “short form” only; information on where residents in each county worked was not collected as part of the 2010 Census. The Census Bureau worked with CMS to provide an alternative dataset based on the latest available data on where residents in each county worked in 2010, for use in developing a new out-migration

adjustment based on new commuting patterns developed from the 2010 Census data beginning with FY 2016. To determine the out-migration adjustments and applicable counties for FY 2016, we analyzed commuting data compiled by the Census Bureau that were derived from a custom tabulation of the American Community Survey (ACS), an official Census Bureau survey, utilizing 2008 through 2012 (5-Year) Microdata. The data were compiled from responses to the ACS questions regarding the county where workers reside and the county to which workers commute. As we discussed in the FY 2016 and FY 2017 IPPS/LTCH PPS final rules (80 FR 49501 and 81 FR 56930, respectively), the same policies, procedures, and computation that were used for the FY 2012 out-migration adjustment were applicable for FY 2016 and FY 2017, and in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19910), we proposed to use them again for FY 2018. We have applied the same policies, procedures, and computations since FY 2012, and we believe they continue to be appropriate for FY 2018. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49500 through 49502) for a full explanation of the revised data source.

For FY 2018, until such time that CMS finalizes out-migration adjustments based on the next Census, the out-migration adjustment continues to be based on the data derived from the custom tabulation of the ACS utilizing 2008 through 2012 (5-Year) Microdata. For FY 2018, we did not propose any changes to the methodology or data source that we used for FY 2016 (81 FR 25071). (We refer readers to a full discussion of the out-migration adjustment, including rules on deeming hospitals reclassified under section 1886(d)(8) or section 1886(d)(10) of the Act to have waived the out-migration adjustment, in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51601 through 51602).) We did not receive any public comments regarding the FY 2018 out-migration adjustment. Thus, for the reasons discussed earlier and in the FY 2018 IPPS/LTCH PPS proposed rule, we are finalizing, without modification, our proposed policies, procedures, methodology, and computation for the out-migration adjustment. Table 2 associated with this final rule (which is available via the Internet on the CMS Web site) includes the final out-migration adjustments for the FY 2018 wage index.

K. Reclassification From Urban to Rural Under Section 1886(d)(8)(E) of the Act, Implemented at 42 CFR 412.103

Under section 1886(d)(8)(E) of the Act, a qualifying prospective payment hospital located in an urban area may apply for rural status for payment purposes separate from reclassification through the MGCRB. Specifically, section 1886(d)(8)(E) of the Act provides that, not later than 60 days after the receipt of an application (in a form and manner determined by the Secretary) from a subsection (d) hospital that satisfies certain criteria, the Secretary shall treat the hospital as being located in the rural area (as defined in paragraph (2)(D)) of the State in which the hospital is located. We refer readers to the regulations at 42 CFR 412.103 for the general criteria and application requirements for a subsection (d) hospital to reclassify from urban to rural status in accordance with section 1886(d)(8)(E) of the Act. The FY 2012 IPPS/LTCH PPS final rule (76 FR 51595 through 51596) includes our policies regarding the effect of wage data from reclassified or redesignated hospitals.

Hospitals must meet the criteria to be reclassified from urban to rural status under § 412.103, as well as fulfill the requirements for the application process. There may be one or more reasons that a hospital applies for the urban to rural reclassification, and the timeframe that a hospital submits an application is often dependent on those reason(s). Because the wage index is part of the methodology for determining the prospective payments to hospitals for each fiscal year, we believe there should be a definitive timeframe within which a hospital should apply for rural status in order for the reclassification to be reflected in the next Federal fiscal year's wage data used for setting payment rates.

Therefore, after notice of proposed rulemaking and consideration of public comments, in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56931 through 56932), we revised § 412.103(b) by adding paragraph (6) to specify that, in order for a hospital to be treated as rural in the wage index and budget neutrality calculations under §§ 412.64(e)(1)(ii), (e)(2), (e)(4), and (h) for payment rates for the next Federal fiscal year, the hospital's filing date must be no later than 70 days prior to the second Monday in June of the current Federal fiscal year and the application must be approved by the CMS Regional Office in accordance with the requirements of § 412.103. We refer readers to the FY 2017 IPPS/LTCH PPS final rule for a full discussion of this policy. We clarified

that the lock-in date does not affect the timing of payment changes occurring at the hospital-specific level as a result of reclassification from urban to rural under § 412.103. This lock-in date also does not change the current regulation that allows hospitals that qualify under § 412.103(a) to request, at any time during a cost reporting period, to reclassify from urban to rural. A hospital's rural status and claims payment reflecting its rural status continue to be effective on the filing date of its reclassification application, which is the date the CMS Regional Office receives the application, in accordance with § 412.103(d). The hospital's IPPS claims will be paid reflecting its rural status on the filing date (the effective date) of the reclassification, regardless of when the hospital applies.

Comment: One commenter suggested that CMS' current policy that the effective date of an urban to rural reclassification under § 412.103 is the date the application is received by CMS be revised to allow flexibility for a later date. Specifically, the commenter requested that CMS allow hospitals to ask for an effective date anytime from the date the application is received until up to 60 days after the receipt of the application, to help hospitals that experience a short-term reduction in payment from obtaining rural status before becoming eligible for increased payment at a later time. The commenter stated that amending the regulation in this way would accommodate the various reasons why hospitals request rural status and will be more consistent with the statutory language at section 1886(d)(8)(E) of the Act which provides that the Secretary shall treat a hospital as rural "not later than 60 days after the receipt of an application."

Response: We did not propose any such revisions to the policy at § 412.103 in the FY 2018 IPPS/LTCH PPS proposed rule, but instead explained and clarified our existing policy. We appreciate the comments and may consider the commenter's request in future rulemaking.

L. Clarification of Application Deadline for Rural Referral Center (RRC) Classification

Section 1886(d)(5)(C)(i) of the Act, implemented at 42 CFR 412.96, provides for the classification and special treatment of rural referral centers (RRCs). The regulations at § 412.96 set forth the criteria that a hospital must meet in order to qualify as an RRC. Under § 412.96(b)(1)(ii), a hospital may qualify as an RRC if it is located in a rural area and has 275 or

more beds during its most recently completed cost reporting period. The hospital also can obtain RRC status by showing that at least 50 percent of its Medicare patients are referred from other hospitals or from physicians not on the staff of the hospital, and at least 60 percent of the hospital's Medicare patients live more than 25 miles from the hospital, and at least 60 percent of all the services that the hospital furnishes to Medicare beneficiaries are furnished to beneficiaries who live more than 25 miles from the hospital (§ 412.96(b)(2)), or by showing that the hospital meets the alternative criteria at § 412.96(c). We refer readers to 42 CFR 412.96 for a full description of the criteria for classification as an RRC.

Consistent with section 1886(d)(5)(C)(i) of the Act, the hospital must submit its application for RRC status during the last quarter of the hospital's cost reporting period, to be effective with the beginning of the next cost reporting period. Specifically, section 1886(d)(5)(C)(i) of the Act provides that an appeal allowed under this paragraph must be submitted to the Secretary (in such form and manner as the Secretary may prescribe) during the quarter before the first quarter of the hospital's cost reporting period (or, in the case of a cost reporting period beginning during October 1984, during the first quarter of that period), and the Secretary must make a final determination with respect to such appeal within 60 days after the date the appeal was submitted. Any payment adjustments necessitated by a reclassification based upon the appeal will be effective at the beginning of such cost reporting period. Therefore, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19911), we clarified that applications for RRC status must be submitted during this timeframe. That is, applications for RRC status must be submitted during the last quarter of the cost reporting period before the first quarter of a hospital's cost reporting year. If approved, the RRC status is effective with the beginning of the hospital's cost reporting period occurring after the last quarter of the cost reporting period in which the hospital submits an application.

We also clarified in the proposed rule that, while RRC applications must be submitted only within the timeframe described above, applications for urban-to-rural reclassification under § 412.103 may be submitted at any time for the hospital to be approved for rural reclassification. This includes hospitals seeking rural reclassification under § 412.103(a)(3), which states that a hospital meets criteria for urban-to-rural

reclassification if the hospital would qualify as a RRC as set forth in § 412.96, or as an SCH as set forth in § 412.92, if the hospital were located in a rural area. A hospital seeking RRC status based on a rural reclassification under § 412.103, including § 412.103(a)(3), must still submit an application for RRC status during the last quarter of its cost reporting year before the next cost reporting period in accordance with section 1886(d)(5)(C)(i) of the Act. While the § 412.103 rural redesignation would be effective as of the date of filing the application, in accordance with § 412.103(d), the RRC status would be effective beginning with the hospital's cost reporting period occurring after the last quarter of the cost reporting period in which the hospital submits an application. Because a hospital may only apply for RRC status during the last quarter of its cost reporting year in accordance with section 1886(d)(5)(C)(i) of the Act, hospitals seeking RRC status, in order to reclassify through the MGCRB using the special rules for SCHs and RRCs at § 412.230(a)(3) and the exceptions at § 412.230(d)(3) for RRCs, may be disadvantaged due to their cost reporting year end. As discussed in section III.I.2. of the preamble of the proposed rule, we proposed to revise the regulations at § 412.230(a)(3) and (d)(3) to allow hospitals to submit documentation of the approval of SCH or RRC status (as applicable) to the MGCRB no later than the first business day after January 1. We stated in the proposed rule that we believe our proposal to accept documentation of approval of RRC classification, instead of requiring that the hospital be classified as a RRC at the time of Board review, would accommodate more hospitals with various cost reporting period endings. We refer readers to section III.I.2. of the preamble of the proposed rule for further discussion of this proposal. We note that, as discussed in section III.I.2. of the preamble of this final rule, while we are finalizing our proposal that a hospital must be approved for SCH or RRC status, rather than have active SCH or RRC status, in order to use the special rules for SCHs and RRCs and the exceptions for RRCs under § 412.230(a)(3) and (d)(3), we are not finalizing our proposal to establish a deadline of the first business day after January 1 for hospitals to submit documentation of SCH and RRC status approval to the MGCRB.

Comment: One commenter agreed that the specific timing is required by the statutory language, but argued that CMS is applying a "restrictive interpretation" of the RRC application timing

requirements so that there is not a level playing field based solely on cost report year-ends. The commenter suggested an interpretation of the statute that it believes could allow hospitals seeking to obtain RRC status for the purposes of an MGCRB application to be considered RRCs even outside of the statutory timeframe. Specifically, the commenter pointed to section 1886(d)(10)(D)(iii) of the Act, which states that, in the case of a hospital that has ever been classified by the Secretary as rural referral center, the MGCRB may not reject the application on the basis of any comparison between the average hourly wage of the hospital and the average hourly wage of hospitals in the area in which it is located. According to the commenter, CMS' determination that a hospital meets the rural redesignation requirements under § 412.103(a)(3) (that is, the hospital would qualify as an RRC if it were located in a rural area) could be considered sufficient classification to trigger the exemption from the home area wage test and application of the special access rules.

Response: As discussed earlier, and as noted by the commenter, the timeframe for applying for RRC status is set forth in the statute. We recognize that certain hospitals may be disadvantaged due to their cost reporting year end, and for that reason we proposed, and are finalizing (as discussed in section III.I.2. of the preamble of this final rule) revisions to the regulations at § 412.230(a)(3) and (d)(3) to reflect that these paragraphs apply to hospitals with RRC approval (and not only effective status).

We do not agree with the commenter that CMS' determination under § 412.103(a)(3) that a hospital would qualify for RRC status if the hospital were located in a rural area (which is one condition under which a hospital can qualify for § 412.103 rural redesignation) is considered RRC classification. In fact, hospitals may obtain rural reclassification under § 412.103(a)(3), but not subsequently obtain RRC status. Therefore, we do not believe that such a determination under § 412.103(a)(3) is sufficient to satisfy the requirements at section 1886(d)(10)(D)(iii) of the Act.

M. Process for Requests for Wage Index Data Corrections

1. Process for Hospitals To Request Wage Index Data Corrections

The preliminary, unaudited Worksheet S-3 wage data files for the proposed FY 2018 wage index were made available on May 16, 2016, and the preliminary CY 2013 occupational

mix data files on May 16, 2016, through the Internet on the CMS Web site at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2018-Wage-Index-Home-Page.html>.

On January 30, 2017, we posted a public use file (PUF) at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2018-Wage-Index-Home-Page.html> containing FY 2018 wage index data available as of January 29, 2017. This PUF contains a tab with the Worksheet S-3 wage data (which includes Worksheet S-3, Parts II and III wage data from cost reporting periods beginning on or after October 1, 2013 through September 30, 2014; that is, FY 2014 wage data), a tab with the occupational mix data (which includes data from the CY 2013 occupational mix survey, Form CMS-10079), a tab containing the Worksheet S-3 wage data of hospitals deleted from the January 30, 2017 wage data PUF, and a tab containing the CY 2013 occupational mix data (if any) of the hospitals deleted from the January 30, 2017 wage data PUF. In a memorandum dated January 27, 2017, we instructed all MACs to inform the IPPS hospitals that they service of the availability of the January 30, 2017 wage index data PUFs, and the process and timeframe for requesting revisions in accordance with the FY 2018 Wage Index Timetable.

In the interest of meeting the data needs of the public, beginning with the proposed FY 2009 wage index, we post an additional PUF on our Web site that reflects the actual data that are used in computing the proposed wage index. The release of this file does not alter the current wage index process or schedule. We notify the hospital community of the availability of these data as we do with the current public use wage data files through our Hospital Open Door Forum. We encourage hospitals to sign up for automatic notifications of information about hospital issues and about the dates of the Hospital Open Door Forums at the CMS Web site at: <http://www.cms.gov/Outreach-and-Education/Outreach/OpenDoorForums/index.html>.

In a memorandum dated May 16, 2016, we instructed all MACs to inform the IPPS hospitals that they service of the availability of the wage index data files and the process and timeframe for requesting revisions. We also instructed the MACs to advise hospitals that these data were also made available directly through their representative hospital organizations.

If a hospital wished to request a change to its data as shown in the May

16, 2016 wage data files and the May 16, 2016 occupational mix data files, the hospital had to submit corrections along with complete, detailed supporting documentation to its MAC by September 2, 2016. Hospitals were notified of this deadline and of all other deadlines and requirements, including the requirement to review and verify their data as posted in the preliminary wage index data files on the Internet, through the letters sent to them by their MACs.

November 4, 2016 was the date by which MACs notified State hospital associations regarding hospitals that failed to respond to issues raised during the desk reviews. The MACs notified the hospitals by mid-January 2017 of any changes to the wage index data as a result of the desk reviews and the resolution of the hospitals' revision requests. The MACs also submitted the revised data to CMS by January 20, 2017. CMS published the wage index PUFs that included hospitals' revised wage index data on January 30, 2017. Hospitals had until February 17, 2017, to submit requests to the MACs for reconsideration of adjustments made by the MACs as a result of the desk review, and to correct errors due to CMS' or the MAC's mishandling of the wage index data. Hospitals also were required to submit sufficient documentation to support their requests.

After reviewing requested changes submitted by hospitals, MACs were required to transmit to CMS any additional revisions resulting from the hospitals' reconsideration requests by March 24, 2017. Under our current policy, the deadline for a hospital to request CMS intervention in cases where a hospital disagreed with a MAC's policy interpretation was April 5, 2017. As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19912), beginning next year (that is, April 2018 for wage data revisions for the FY 2019 wage index), we proposed to require that a hospital that seeks to challenge the MAC's handling of wage data on any basis (including a policy, factual, or any other dispute) must request CMS to intervene by the date in April that is specified as the deadline for hospitals to appeal MAC determinations and request CMS' intervention in cases where the hospital disagrees with the MAC's determination (the wage index timetable would be updated to reflect the specified date). We note that, as we did for the FY 2017 wage index, for the FY 2018 wage index, in accordance with the FY 2018 wage index timeline posted on the CMS Web site at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2018-Wage-Index-Home-Page.html>, the April appeals have to be sent via mail and email. We refer readers to the wage index timeline for complete details.

We did not receive any public comments regarding our proposal discussed above. Therefore, we are finalizing our proposal, without modification, to require that, beginning next year (that is, April 2018 for wage data revisions for the FY 2019 wage index), a hospital that seeks to challenge the MAC's handling of wage data on any basis (including a policy, factual, or any other dispute) must request CMS to intervene by the date in April that is specified as the deadline for hospitals to appeal MAC determinations and request CMS' intervention in cases where the hospital disagrees with the MAC's determination (as we stated above and in the proposed rule, the wage index timetable will be updated to reflect the specified date).

Hospitals were given the opportunity to examine Table 2, which was listed in section VI. of the Addendum to the proposed rule and available via the Internet on the CMS Web site at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2018-Wage-Index-Home-Page.html>. Table 2 associated with the proposed rule contained each hospital's proposed adjusted average hourly wage used to construct the wage index values for the past 3 years, including the FY 2014 data used to construct the proposed FY 2018 wage index. We noted in the proposed rule (82 FR 19912) that the proposed hospital average hourly wages shown in Table 2 only reflect changes made to a hospital's data that were transmitted to CMS by early February 2017.

We posted the final wage index data PUFs on April 28, 2017 on the Internet at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2018-Wage-Index-Home-Page.html>. The April 2017 PUFs were made available solely for the limited purpose of identifying any potential errors made by CMS or the MAC in the entry of the final wage index data that resulted from the correction process previously described (revisions submitted to CMS by the MACs by March 24, 2017).

After the release of the April 2017 wage index data PUFs, changes to the wage and occupational mix data could only be made in those very limited situations involving an error by the MAC or CMS that the hospital could not have known about before its review of

the final wage index data files.

Specifically, neither the MAC nor CMS will approve the following types of requests:

- Requests for wage index data corrections that were submitted too late to be included in the data transmitted to CMS by the MACs on or before March 24, 2017.

- Requests for correction of errors that were not, but could have been, identified during the hospital's review of the January 30, 2017 wage index PUFs.

- Requests to revisit factual determinations or policy interpretations made by the MAC or CMS during the wage index data correction process.

If, after reviewing the April 2017 final wage index data PUFs, a hospital believed that its wage or occupational mix data were incorrect due to a MAC or CMS error in the entry or tabulation of the final data, the hospital was given the opportunity to notify both its MAC and CMS regarding why the hospital believed an error exists and provide all supporting information, including relevant dates (for example, when it first became aware of the error). The hospital was required to send its request to CMS and to the MAC no later than May 30, 2017. Similar to the April appeals, beginning with the FY 2015 wage index, in accordance with the FY 2018 wage index timeline posted on the CMS Web site at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2018-Wage-Index-Home-Page.html>, the May appeals were required to be sent via mail and email to CMS and the MACs. We refer readers to the wage index timeline for complete details.

Verified corrections to the wage index data received timely by CMS and the MACs (that is, by May 30, 2017) were incorporated into the final FY 2018 wage index in this FY 2018 IPPS/LTCH PPS final rule, which is effective October 1, 2017.

We created the processes previously described to resolve all substantive wage index data correction disputes before we finalize the wage and occupational mix data for the FY 2018 payment rates. Accordingly, hospitals that did not meet the procedural deadlines set forth above will not be afforded a later opportunity to submit wage index data corrections or to dispute the MAC's decision with respect to requested changes. Specifically, our policy is that hospitals that do not meet the procedural deadlines set forth earlier (requiring requests to MACs by the specified date in February and, where such requests are unsuccessful,

requests for intervention by CMS by the specified date in April) will not be permitted to challenge later, before the PRRB, the failure of CMS to make a requested data revision. We refer readers also to the FY 2000 IPPS final rule (64 FR 41513) for a discussion of the parameters for appeals to the PRRB for wage index data corrections.

Again, we believe the wage index data correction process described earlier provides hospitals with sufficient opportunity to bring errors in their wage and occupational mix data to the MAC's attention. Moreover, because hospitals had access to the final wage index data PUFs by late April 2017, they had the opportunity to detect any data entry or tabulation errors made by the MAC or CMS before the development and publication of the final FY 2018 wage index by August 2017, and the implementation of the FY 2018 wage index on October 1, 2017. Given these processes, the wage index implemented on October 1 should be accurate. Nevertheless, in the event that errors are identified by hospitals and brought to our attention after May 30, 2017, we retain the right to make midyear changes to the wage index under very limited circumstances.

Specifically, in accordance with 42 CFR 412.64(k)(1) of our regulations, we make midyear corrections to the wage index for an area only if a hospital can show that: (1) The MAC or CMS made an error in tabulating its data; and (2) the requesting hospital could not have known about the error or did not have an opportunity to correct the error, before the beginning of the fiscal year. For purposes of this provision, "before the beginning of the fiscal year" means by the May deadline for making corrections to the wage data for the following fiscal year's wage index (for example, May 30, 2017 for the FY 2018 wage index). This provision is not available to a hospital seeking to revise another hospital's data that may be affecting the requesting hospital's wage index for the labor market area. As indicated earlier, because CMS makes the wage index data available to hospitals on the CMS Web site prior to publishing both the proposed and final IPPS rules, and the MACs notify hospitals directly of any wage index data changes after completing their desk reviews, we do not expect that midyear corrections will be necessary. However, under our current policy, if the correction of a data error changes the wage index value for an area, the revised wage index value will be effective prospectively from the date the correction is made.

In the FY 2006 IPPS final rule (70 FR 47385 through 47387 and 47485), we revised 42 CFR 412.64(k)(2) to specify that, effective on October 1, 2005, that is, beginning with the FY 2006 wage index, a change to the wage index can be made retroactive to the beginning of the Federal fiscal year only when CMS determines all of the following: (1) The MAC or CMS made an error in tabulating data used for the wage index calculation; (2) the hospital knew about the error and requested that the MAC and CMS correct the error using the established process and within the established schedule for requesting corrections to the wage index data, before the beginning of the fiscal year for the applicable IPPS update (that is, by the May 30, 2017 deadline for the FY 2018 wage index); and (3) CMS agreed before October 1 that the MAC or CMS made an error in tabulating the hospital's wage index data and the wage index should be corrected.

In those circumstances where a hospital requested a correction to its wage index data before CMS calculated the final wage index (that is, by the May 30, 2017 deadline for the FY 2018 wage index), and CMS acknowledges that the error in the hospital's wage index data was caused by CMS' or the MAC's mishandling of the data, we believe that the hospital should not be penalized by our delay in publishing or implementing the correction. As with our current policy, we indicated that the provision is not available to a hospital seeking to revise another hospital's data. In addition, the provision cannot be used to correct prior years' wage index data; and it can only be used for the current Federal fiscal year. In situations where our policies would allow midyear corrections other than those specified in 42 CFR 412.64(k)(2)(ii), we continue to believe that it is appropriate to make prospective-only corrections to the wage index.

We note that, as with prospective changes to the wage index, the final retroactive correction will be made irrespective of whether the change increases or decreases a hospital's payment rate. In addition, we note that the policy of retroactive adjustment will still apply in those instances where a final judicial decision reverses a CMS denial of a hospital's wage index data revision request.

2. Process for Data Corrections by CMS After the January Public Use File (PUF)

The process set forth with the wage index timeline discussed in section III.M.1. of the preamble of this final rule allows hospitals to request corrections to their wage index data within

prescribed timeframes. In addition to hospitals' opportunity to request corrections of wage index data errors or MACs' mishandling of data, CMS has the authority under section 1886(d)(3)(E) of the Act to make corrections to hospital wage index and occupational mix data in order to ensure the accuracy of the wage index. As we explained in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49490 through 49491) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 56914), section 1886(d)(3)(E) of the Act requires the Secretary to adjust the proportion of hospitals' costs attributable to wages and wage-related costs for area differences reflecting the relative hospital wage level in the geographic areas of the hospital compared to the national average hospital wage level. As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19913 through 19915), we believe that, under section 1886(d)(3)(E) of the Act, we have discretion to make corrections to hospitals' data to help ensure that the costs attributable to wages and wage-related costs in fact accurately reflect the relative hospital wage level in the hospitals' geographic areas.

We have an established multistep, 15-month process for the review and correction of the hospital wage data that is used to create the IPPS wage index for the upcoming fiscal year. Since the origin of the IPPS, the wage index has been subject to its own annual review process, first by the MACs, and then by CMS. As a standard practice, after each annual desk review, CMS reviews the results of the MACs' desk reviews and focuses on items flagged during the desk review, requiring that, if necessary, hospitals provide additional documentation, adjustments, or corrections to the data. This ongoing communication with hospitals about their wage data may result in the discovery by CMS of additional items that were reported incorrectly or other data errors, even after the posting of the January PUF, and throughout the remainder of the wage index development process. In addition, the fact that CMS analyzes the data from a regional and even national level, unlike the review performed by the MACs that review a limited subset of hospitals, can facilitate additional editing of the data that may not be readily apparent to the MACs. In these occasional instances, an error may be of sufficient magnitude that the wage index of an entire CBSA is affected. Accordingly, CMS uses its authority to ensure that the wage index accurately reflects the relative hospital wage level in the geographic area of the

hospital compared to the national average hospital wage level, by continuing to make corrections to hospital wage data upon discovering incorrect wage data, distinct from instances in which hospitals request data revisions.

We note that CMS corrects errors to hospital wage data as appropriate, regardless of whether that correction will raise or lower a hospital's average hourly wage. For example, as discussed in section III.D.2. of the preamble of the proposed rule (82 FR 19900 through 19902), in the calculation of the proposed FY 2018 wage index, upon discovering that hospitals reported other wage-related costs on Line 18 of Worksheet S-3, despite those other wage-related costs failing to meet the requirement that other wage related costs must exceed 1 percent of total adjusted salaries net of excluded area salaries, CMS made internal edits to remove those other wage-related costs from Line 18. Conversely, if CMS discovers after conclusion of the desk review, for example, that a MAC inadvertently failed to incorporate positive adjustments resulting from a prior year's wage index appeal to a hospital's wage related costs such as pension, CMS would correct that data error and the hospital's average hourly wage would likely increase as a result.

While we maintain CMS' authority to conduct additional review and make resulting corrections at any time during the wage index development process, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19914), we proposed a process for hospitals to request further review of a correction made by CMS starting with the FY 2019 wage index. In order to allow opportunity for input from hospitals concerning corrections made by CMS after the posting of the January PUF, we proposed a process similar to the existing process in which hospitals may request corrections to wage index data displayed in the January PUF. We stated in the proposed rule that instances where CMS makes a correction to a hospital's data after the January PUF based on a different understanding than the hospital about certain reported costs, for example, could potentially be resolved using this proposed process before the final wage index is calculated. We stated that we believe this proposed process and timeline (as described below) would bring additional transparency to instances where CMS makes data corrections after the January PUF, and would provide opportunities for hospitals to request further review of CMS changes in time for the most

accurate data to be reflected in the final wage index calculations.

Effective beginning with the FY 2019 wage index development cycle, we proposed to use existing appeal deadlines (in place for hospitals to appeal determinations made by the MAC during the desk review process) for hospitals to dispute corrections made by CMS after posting of the January PUF that do not arise from a hospital request for a wage data revision. Starting with the April appeal deadline, hospitals would use the soonest approaching appeal deadline to dispute any adjustments made by CMS. However, if a hospital was notified of an adjustment within 14 days of an appeal deadline, the hospital would have until the next appeal deadline to dispute any adjustments. We believe this would give hospitals sufficient time to prepare an appeal of adjustments made by CMS after the January PUF. Specifically, for any adjustments made by CMS between the date the January PUF is posted and at least 14 calendar days before the April appeals deadline, we proposed that hospitals would have until the April appeals deadline (which, for example, is April 5 in the FY 2018 Wage Index Timetable) to dispute the adjustments. For any adjustments made by CMS between 13 calendar days before the April appeals deadline and 14 calendar days before the May appeals deadline, we proposed that hospitals would have until the May appeals deadline (which, for example, is May 30 in the FY 2018 Wage Index Timetable) to dispute the adjustments. In cases where hospitals disagree with CMS adjustments of which they were notified 13 calendar days before the May appeals deadline or later, the hospitals could appeal to the PRRB with no need for further review by CMS before such appeal.

We are using dates from the FY 2018 Wage Index Timetable in the following example which was included in the proposed rule at 82 FR 19914 (we reiterate that this appeals process would be effective beginning with the FY 2019 wage index cycle, but for illustrative purposes, we are using dates from the FY 2018 Wage Index Timetable, the most recently published wage index timetable): A hospital that is notified by the MAC or CMS of an adjustment to its wage data after the release of the January 30, 2017 PUF could use the April 5, 2017 appeals deadline to dispute the adjustment. If the hospital is notified of an adjustment by CMS or the MAC to its wage data after March 22, 2017 (that is, less than 14 days prior to the April 5 appeals deadline), it could use the May 30, 2017 appeals deadline

to dispute the adjustment. If the hospital is first notified about the adjustment after May 16, 2017 (that is, less than 14 days prior to the May 30 deadline), and disagrees with the adjustment, the hospital could appeal directly to the PRRB.

As with the existing process for requesting wage data corrections, we proposed that a hospital disputing an adjustment made by CMS after the posting of the January PUF would be required to request a correction by the first applicable deadline. For example, using the FY 2018 Wage Index Timetable for illustrative purposes only, if a hospital was notified on March 20 of an adjustment to its data by CMS and did not appeal by April 5, the hospital would not be able to appeal by May 30 or bring the case before the PRRB. That is, hospitals that do not meet the procedural deadlines set forth earlier would not be afforded a later opportunity to submit wage index data corrections or to dispute CMS' decision with respect to requested changes. As with the existing process for hospitals to request wage data corrections, our policy is that hospitals that do not meet the procedural deadlines set forth earlier would not be permitted to challenge later, before the PRRB, the failure of CMS to make a requested data revision.

In summary, under the statute, CMS has discretion to make corrections and revisions to hospitals' wage data throughout the multistep wage index development process, and we proposed a pathway for hospitals to request additional review of corrections to their wage data made by CMS. Beginning with the development of the FY 2019 wage index, we proposed a process whereby CMS could continue to correct data after the posting of the January PUF, while allowing hospitals to appeal changes made by CMS using existing deadlines from the process for hospitals to request wage data corrections. As with the existing process, a hospital would be required to appeal by the first applicable deadline, if relevant, to maintain the right to appeal to the PRRB to dispute a correction to its wage data made by CMS.

We invited public comments on our proposals.

Comment: Several commenters stated that CMS is proposing to limit the time a provider has to dispute an adjustment once the January PUF is posted. The commenters stated that, currently, hospitals have 1 month to request corrections for errors in the April 28 PUF. They maintained that the reduced timelines will require hospitals to review the posted PUF immediately to

ensure that the data are correct and take any necessary action to correct. The commenters also noted that CMS has taken a more active role in recent years in performing additional data analysis that results in follow-up questions or requests to hospitals for supporting data, which require time for hospitals to develop a response. One commenter stated that, by reducing time, CMS will be placing an administrative hardship on hospitals while they attempt to respond to detailed audit requests. Some of the commenters were “deeply concerned” that the short timeline CMS proposed to respond to detailed requests will not allow for comprehensive analysis and a thorough response. One commenter specifically requested that the dispute process be expanded to 28 days prior to the appeal deadline, instead of the proposed 14 days, to give hospitals enough time to collect data and respond in a timely manner.

Response: We believe that the commenters misunderstood our proposal as a change to the current process for hospitals to request wage data corrections, rather than an additional process for disputing corrections made by CMS after the January PUF that do not arise from a hospital’s request for wage data revisions. Under our proposal, hospitals would still have approximately 1 month to request corrections for errors in the April 28 PUF, in accordance with the wage index timetable. Our proposal would create an additional process for hospitals to appeal adjustments or corrections made by CMS or the MAC after the normal desk review timeframe that do not arise from a hospital’s request for wage data revisions. Therefore, we do not agree that this proposal requires hospitals to review the posted PUF any earlier than hospitals would do so under the current policy, or that it constitutes administrative hardship. Furthermore, we believe that, rather than limiting hospitals, our proposal would provide additional transparency and opportunities for hospitals to request further review of CMS changes made after the January PUF where there is currently no such established process.

Regarding the concerns that the proposed timeline is too short and the suggestion that CMS expand the 14-day timeline to 28 days, we continue to believe that our proposed timeline would give hospitals sufficient time to prepare an appeal of adjustments made by CMS after the January PUF. We believe that a hospital that was notified of an adjustment at least 2 weeks before the upcoming deadline has enough time to prepare an appeal by the upcoming

deadline. Specifically, starting with the April appeal deadline, hospitals would use the soonest approaching appeal deadline to dispute any adjustments made by CMS. However, if a hospital was notified of an adjustment within 14 days of an appeal deadline, the hospital would have until the next appeal deadline to dispute any adjustments.

Comment: One commenter did not state a position on the proposal but expressed the following concerns: First, that CMS should add the particulars of this appeal process to the existing FY 2019 Wage Index Timeline that is published and made available online each year by CMS; second, that most adjustments to the wage data made by CMS on a routine basis be performed much earlier in the process than these April and May appeal deadlines, so that the proposed appeal process would be reserved for “rare and unusual circumstances requiring CMS’ intervention and adjustment to the data.” Specifically, this commenter stated that it would oppose a policy that gives CMS the latitude to indiscriminately make adjustments to the hospital wage data this late in the process where that adjustment was known of far ahead of time and/or could have easily been made earlier in the process.

Response: We appreciate the commenter’s concerns and suggestions. In response to the commenter’s first suggestion, we intend to add the particulars of this appeal process to the existing Wage Index Timeline that is published and made available online each year by CMS. Second, while we maintain CMS’ authority under section 1886(d)(3)(E) of the Act to make corrections to hospitals’ data to help ensure the accuracy of the wage index, we note that routine adjustments to the wage data that are known of far ahead of time and/or could easily be made earlier in the process will continue to be performed earlier in the process than these April and May appeal deadlines.

After consideration of the public comments we received, for the reasons discussed earlier and in the FY 2018 IPPS/LTCH PPS proposed rule, we are finalizing, without modification, our proposed process for hospitals to dispute data corrections made by CMS after the January PUF that do not arise from a hospital’s request for wage data revisions. Effective beginning with the FY 2019 wage index development cycle, we will use existing appeal deadlines (in place for hospitals to appeal determinations made by the MAC during the desk review process) for hospitals to dispute corrections made by CMS after posting of the January PUF

that do not arise from a hospital request for a wage data revisions. Starting with the April appeal deadline, hospitals must use the soonest approaching appeal deadline to dispute any adjustments made by CMS. However, if a hospital is notified of an adjustment within 14 days of an appeal deadline, the hospital has until the next appeal deadline to dispute any adjustments, as discussed earlier. As with the existing process for requesting wage data corrections, a hospital disputing an adjustment made by CMS after the posting of the January PUF will be required to request a correction by the first applicable deadline. For example, using the FY 2018 Wage Index Timetable for illustrative purposes only, if a hospital was notified on March 20 of an adjustment to its data by CMS and did not appeal by April 5, the hospital would not be able to appeal by May 30 or bring the case before the PRRB. That is, hospitals that do not meet the procedural deadlines set forth above will not be afforded a later opportunity to submit wage index data corrections or to dispute CMS’ decision with respect to requested changes. Our policy is that hospitals that do not meet the procedural deadlines set forth earlier will not be permitted to challenge later, before the PRRB, the failure of CMS to make a requested data revision.

N. Labor-Market Share for the FY 2018 Wage Index

Section 1886(d)(3)(E) of the Act directs the Secretary to adjust the proportion of the national prospective payment system base payment rates that are attributable to wages and wage-related costs by a factor that reflects the relative differences in labor costs among geographic areas. It also directs the Secretary to estimate from time to time the proportion of hospital costs that are labor-related and to adjust the proportion (as estimated by the Secretary from time to time) of hospitals’ costs which are attributable to wages and wage-related costs of the DRG prospective payment rates. We refer to the portion of hospital costs attributable to wages and wage-related costs as the labor-related share. The labor-related share of the prospective payment rate is adjusted by an index of relative labor costs, which is referred to as the wage index.

Section 403 of Public Law 108–173 amended section 1886(d)(3)(E) of the Act to provide that the Secretary must employ 62 percent as the labor-related share unless this would result in lower payments to a hospital than would otherwise be made. However, this provision of Public Law 108–173 did

not change the legal requirement that the Secretary estimate from time to time the proportion of hospitals' costs that are attributable to wages and wage-related costs. Thus, hospitals receive payment based on either a 62-percent labor-related share, or the labor-related share estimated from time to time by the Secretary, depending on which labor-related share resulted in a higher payment.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50596 through 50607), we rebased and revised the hospital market basket. We established a FY 2010-based IPPS hospital market basket to replace the FY 2006-based IPPS hospital market basket, effective October 1, 2013. In that final rule, we presented our analysis and conclusions regarding the frequency and methodology for updating the labor-related share for FY 2014. Using the FY 2010-based IPPS market basket, we finalized a labor-related share for FY 2014, FY 2015, FY 2016, and FY 2017 of 69.6 percent. In addition, in FY 2014, we implemented this rebased and revised labor-related share in a budget neutral manner (78 FR 51016). However, consistent with section 1886(d)(3)(E) of the Act, we did not take into account the additional payments that would be made as a result of hospitals with a wage index less than or equal to 1.0000 being paid using a labor-related share lower than the labor-related share of hospitals with a wage index greater than 1.0000.

For FY 2018, as described in section IV. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19916 through 19929), we proposed to rebase and revise the IPPS market basket reflecting 2014 data. We also proposed to recalculate the labor-related share for discharges occurring on or after October 1, 2017 using the proposed 2014-based IPPS market basket. As discussed in Appendix A of the proposed rule, we proposed this rebased and revised labor-related share in a budget neutral manner. However, consistent with section 1886(d)(3)(E) of the Act, we did not take into account the additional payments that would be made as a result of hospitals with a wage index less than or equal to 1.0000 being paid using a labor-related share lower than the labor-related share of hospitals with a wage index greater than 1.0000. We refer readers to section IV. of the preamble of this final rule and Appendix A for our finalized policies for the 2014-based IPPS market basket.

The labor-related share is used to determine the proportion of the national IPPS base payment rate to which the area wage index is applied. We include a cost category in the labor-related share

if the costs are labor intensive and vary with the local labor market. As described in section IV. of the preamble of the proposed rule, we proposed to include in the labor-related share the national average proportion of operating costs that are attributable to Wages and Salaries, Employee Benefits, Professional Fees: Labor-Related, Administrative and Facilities Support Services, Installation, Maintenance, and Repair Services, and All Other: Labor-Related Services as measured in the proposed 2014-based IPPS market basket. Therefore, for FY 2018, we proposed to use a labor-related share of 68.3 percent for discharges occurring on or after October 1, 2017.

We refer readers to section IV.B.3. of the preamble of this final rule for a discussion of our recalculation of the labor-related share for discharges occurring on or after October 1, 2017 using the 2014-based IPPS market basket.

Prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. As a result, we applied the Puerto Rico-specific labor-related share percentage and nonlabor-related share percentage to the Puerto Rico-specific standardized amount. Section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount as of January 1, 2016, under section 1886(d)(9)(E) of the Act as amended by section 601 of the Consolidated Appropriations Act, 2016, there is no longer a need for us to calculate a Puerto Rico-specific labor-related share percentage and nonlabor-related share percentage for application to the Puerto Rico-specific standardized amount. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the national labor-related share and nonlabor-related share percentages that are applied to the national standardized amount. Accordingly, for FY 2018, we did not propose a Puerto Rico-specific labor-related share percentage or a nonlabor-related share percentage in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19915).

Comment: Commenters suggested that CMS consider an approach that will mitigate significant decreases in inpatient payments to hospitals as a result of the proposed decrease in the labor-related share for FY 2018.

Response: As noted earlier, section 1886(d)(3)(E) of the Act directs the Secretary to adjust the proportion of the national prospective payment system base payment rates that are attributable to wages and wage-related costs by a factor that reflects the relative differences in labor costs among geographic areas. It also directs the Secretary to estimate from time to time the proportion of hospital costs that are labor-related and to adjust the proportion (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs of the DRG prospective payment rates. In section IV.B.3. of the preamble of this final rule, we discuss our recalculation of the labor-related share for discharges occurring on or after October 1, 2017, using the 2014-based IPPS market basket. We believe that the labor-related share calculated for FY 2018 accurately and appropriately reflects the proportion of hospitals' costs that are attributable to wages and wage-related costs. Therefore, we do not believe it is necessary or appropriate to mitigate the effects of the labor-related share percentage finalized in this rule.

After consideration of the public comments we received, for the reasons discussed in section IV.B.3. of the preamble of this final rule and in the FY 2018 IPPS/LTCH PPS proposed rule, we are finalizing our proposal to use a labor-related share of 68.3 percent for discharges occurring on or after October 1, 2017, for all hospitals (including Puerto Rico hospitals) whose wage indexes are greater than 1.0000.

Tables 1A and 1B, which are published in section VI. of the Addendum to this FY 2018 IPPS/LTCH PPS final rule and available via the Internet on the CMS Web site, reflect the national labor-related share, which is also applicable to Puerto Rico hospitals. For FY 2018, for all IPPS hospitals (including Puerto Rico hospitals) whose wage indexes are less than or equal to 1.0000, we are applying the wage index to a labor-related share of 62 percent of the national standardized amount. For all hospitals (including Puerto Rico hospitals) whose wage indexes are greater than 1.0000, for FY 2018, we are applying the wage index to a labor-related share of 68.3 percent of the national standardized amount.

IV. Rebasing and Revising of the Hospital Market Baskets for Acute Care Hospitals

A. Background

Effective for cost reporting periods beginning on or after July 1, 1979, we developed and adopted a hospital input price index (that is, the hospital market basket for operating costs). Although “market basket” technically describes the mix of goods and services used in providing hospital care, this term is also commonly used to denote the input price index (that is, cost category weights and price proxies combined) derived from that market basket. Accordingly, the term “market basket” as used in this document refers to the hospital input price index.

The percentage change in the market basket reflects the average change in the price of goods and services hospitals purchase in order to provide inpatient care. We first used the market basket to adjust hospital cost limits by an amount that reflected the average increase in the prices of the goods and services used to provide hospital inpatient care. This approach linked the increase in the cost limits to the efficient utilization of resources.

Since the inception of the IPPS, the projected change in the hospital market basket has been the integral component of the update factor by which the prospective payment rates are updated every year. An explanation of the hospital market basket used to develop the prospective payment rates was published in the **Federal Register** on September 1, 1983 (48 FR 39764). We also refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50596) in which we discussed the most recent previous rebasing of the hospital input price index.

The hospital market basket is a fixed-weight, Laspeyres-type price index. A Laspeyres-type price index measures the change in price, over time, of the same mix of goods and services purchased in the base period. Any changes in the quantity or mix of goods and services (that is, intensity) purchased over time are not measured.

The index itself is constructed in three steps, which are discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19916 through 19929) and in this final rule. First, a base period is selected (in the proposed rule, we proposed to use 2014 as the base period) and total base period expenditures are estimated for a set of mutually exclusive and exhaustive spending categories, with the proportion of total costs that each category represents being calculated. These proportions are called “cost

weights” or “expenditure weights.” Second, each expenditure category is matched to an appropriate price or wage variable, referred to as a “price proxy.” In almost every instance, these price proxies are derived from publicly available statistical series that are published on a consistent schedule (preferably at least on a quarterly basis). Finally, the expenditure weight for each cost category is multiplied by the level of its respective price proxy. The sum of these products (that is, the expenditure weights multiplied by their price index levels) for all cost categories yields the composite index level of the market basket in a given period. Repeating this step for other periods produces a series of market basket levels over time. Dividing an index level for a given period by an index level for an earlier period produces a rate of growth in the input price index over that timeframe.

As noted above, the market basket is described as a fixed-weight index because it represents the change in price over time of a constant mix (quantity and intensity) of goods and services needed to provide hospital services. The effects on total expenditures resulting from changes in the mix of goods and services purchased subsequent to the base period are not measured. For example, a hospital hiring more nurses to accommodate the needs of patients would increase the volume of goods and services purchased by the hospital, but would not be factored into the price change measured by a fixed-weight hospital market basket. Only when the index is rebased would changes in the quantity and intensity be captured, with those changes being reflected in the cost weights. Therefore, we rebase the market basket periodically so that the cost weights reflect recent changes in the mix of goods and services that hospitals purchase (hospital inputs) to furnish inpatient care between base periods.

We last rebased the hospital market basket cost weights effective for FY 2014 (78 FR 50596), with FY 2010 data used as the base period for the construction of the market basket cost weights. For the FY 2018 IPPS/LTCH PPS proposed rule, we proposed to rebase the cost structure for the IPPS hospital index from FY 2010 to 2014, as discussed in the proposed rule (82 FR 19916 through 19929) and below in this final rule.

B. Rebasing and Revising the IPPS Market Basket

The terms “rebasing” and “revising,” while often used interchangeably, actually denote different activities. “Rebasing” means moving the base year for the structure of costs of an input

price index (for example, in the proposed rule, we proposed to shift the base year cost structure for the IPPS hospital index from FY 2010 to 2014). We note that we proposed to no longer refer to the market basket as a “FY 2014-based” market basket and instead referred to the proposed market basket as simply “2014-based”. We proposed this change in naming convention for the market basket because the base year cost weight data for the proposed market basket does not reflect only fiscal year data. For example, the proposed 2014-based IPPS market basket uses Medicare cost report data and other government data that reflect 2014 fiscal year, 2014 calendar year, and 2014 State fiscal year expenses to determine the base year cost weights. Given that it is based on a mix of classifications of 2014 data, we proposed to refer to the market basket as “2014-based” instead of “FY 2014-based” or “CY 2014-based”.

“Revising” means changing data sources or price proxies used in the input price index. As published in the FY 2006 IPPS final rule (70 FR 47387), in accordance with section 404 of Public Law 108–173, CMS determined a new frequency for rebasing the hospital market basket. We established a rebasing frequency of every 4 years and, therefore, for the FY 2018 IPPS update, we proposed to rebase and revise the IPPS market basket from FY 2010 to 2014. We invited public comments on our proposed methodology. A summary of the public comments we received and our responses are included below under the appropriate subject area.

1. Development of Cost Categories and Weights

a. Use of Medicare Cost Report Data

The major source of expenditure data for developing the proposed hospital market basket cost weights is the 2014 Medicare cost reports. These 2014 Medicare cost reports are for cost reporting periods beginning on and after October 1, 2013 and before October 1, 2014. We note that while these dates appear to reflect fiscal year data, in order to be classified as a “2014 cost report,” a hospital’s cost reporting period must begin between these dates. For example, we found that of the 2014 Medicare cost reports for IPPS hospitals, approximately 40 percent of the reports had a begin date on January 1, 2014, approximately 30 percent had a begin date on July 1, 2014, and approximately 18 percent had a begin date on October 1, 2013. For this reason, we are defining the base year of the market basket as “2014-based” instead of “FY 2014-

based". We proposed to use 2014 as the base year because we believe that the 2014 Medicare cost reports represent the most recent, complete set of Medicare cost report data available to develop cost weights for IPPS hospitals at the time of rulemaking. As was done in previous rebasings, these cost reports are from IPPS hospitals only (hospitals excluded from the IPPS and CAHs are not included) and are based on IPPS Medicare-allowable operating costs. IPPS Medicare-allowable operating costs are costs that are eligible to be paid under the IPPS. For example, the IPPS market basket excludes home health agency (HHA) costs as these costs would be paid under the HHA PPS and, therefore, these costs are not IPPS Medicare-allowable costs.

We proposed to derive costs for eight major expenditures or cost categories for the 2014-based IPPS market basket from the CMS Medicare cost reports (Form 2552-10, OMB Control Number 0938-0050): Wages and Salaries, Employee Benefits, Contract Labor, Pharmaceuticals, Professional Liability Insurance (Malpractice), Blood and Blood Products, Home Office Contract Labor, and a residual "All Other" category. The residual "All Other" category reflects all remaining costs that are not captured in the other seven cost categories. We proposed that, for the 2014-based IPPS market basket, we obtain costs for one additional major cost category from the Medicare cost reports compared to the FY 2010-based IPPS market basket—Home Office Contract Labor Costs. We describe below the detailed methodology for obtaining costs for each of the seven cost categories directly determined from the Medicare cost reports. We received one specific comment on the detailed methodology of the major cost weights, specifically for the Home Office Contract Labor cost weight. We address this comment below.

(1) Wages and Salaries Costs

To derive wages and salaries costs for the Medicare allowable cost centers, we proposed to first calculate total unadjusted wages and salaries costs as reported on Worksheet S-3, part II. We then proposed to remove the wages and salaries attributable to non-Medicare allowable cost centers (that is, excluded areas) as well as a portion of overhead wages and salaries attributable to these excluded areas. Specifically, wages and salaries costs were equal to total wages and salaries as reported on Worksheet S-3, Part II, Column 4, Line 1, less excluded area wages and salaries (reported on Worksheet S-3, Part II, Column 4, Lines 3 and 5 through 10)

and less overhead wages and salaries attributable to the excluded areas.

Overhead wages and salaries are attributable to the entire IPPS facility. Therefore, we proposed to only include the proportion attributable to the Medicare allowable cost centers. We proposed to estimate the proportion of overhead wages and salaries that are not attributable to Medicare allowable costs centers (that is, excluded areas) by multiplying the ratio of excluded area wages and salaries (as defined earlier) to total wages and salaries (Worksheet S-3, part II, Column 4, Line 1) by total overhead wages and salaries (Worksheet A, Column 1, Lines 4 through 18). A similar methodology was used to derive wages and salaries costs in the FY 2010-based IPPS market basket.

(2) Employee Benefits Costs

We proposed to derive employee benefits costs using a similar methodology as the wages and salaries costs; that is, reflecting employee benefits costs attributable to the Medicare allowable cost centers. First, we calculated total unadjusted employee benefits costs as the sum of Worksheet S-3, Part II, Column 4, Lines 17, 18, 20, and 22. We then excluded those employee benefits attributable to the overhead wages and salaries for the non-Medicare allowable cost centers (that is, excluded areas). Employee benefits attributable to the non-Medicare allowable cost centers were derived by multiplying the ratio of total employee benefits (equal to the sum of Worksheet S-3, Part II, Column 4, Lines 17 through 25) to total wages and salaries (Worksheet S-3, Part II, Column 4, Line 1) by excluded overhead wages and salaries (as derived above for wages and salaries costs). A similar methodology was used in the FY 2010-based IPPS market basket.

(3) Contract Labor Costs

Contract labor costs are primarily associated with direct patient care services. Contract labor costs for services such as accounting, billing, and legal are estimated using other government data sources as described below. We proposed to derive contract labor costs for the 2014-based IPPS market basket as the sum of Worksheet S-3, Part II, Column 4, Lines 11, 13 and 15. A similar methodology was used in the FY 2010-based IPPS market basket.

(4) Professional Liability Insurance Costs

We proposed that professional liability insurance (PLI) costs (often referred to as malpractice costs) be equal to premiums, paid losses, and self-

insurance costs reported on Worksheet S-2, Part I, Columns 1 through 3, Line 118.01. A similar methodology was used for the FY 2010-based IPPS market basket.

(5) Pharmaceuticals Costs

We proposed to calculate pharmaceuticals costs using nonsalary costs reported for the Pharmacy cost center (Worksheet A, Column 2, Line 15) and Drugs Charged to Patients cost center (Worksheet A, Column 2, Line 73) less estimated employee benefits attributable to these two cost centers. We proposed to estimate these employee benefits costs by multiplying the ratio of total employee benefits (equal to the sum of Worksheet S-3, Part II, Column 4, Lines 17 through 25) to total wages and salaries (Worksheet S-3, Part II, Column 4, Line 1) by total wages and salaries costs for the Pharmacy and Drugs Charged to Patients cost centers (equal to the sum of Worksheet A, Column 1, Lines 15 and 73). A similar methodology was used for the FY 2010-based IPPS market basket.

(6) Blood and Blood Products Costs

We proposed to calculate blood and blood products costs using nonsalary costs reported for the Whole Blood & Packed Red Blood Cells cost center (Worksheet A, Column 2, Line 62) and the Blood Storing, Processing, & Transfusing cost center (Worksheet A, Column 2, Line 63) less estimated employee benefits attributable to these two cost centers. We estimated these employee benefits costs by multiplying the ratio of total employee benefits (equal to the sum of Worksheet S-3, Part II, Column 4, Lines 17 through 25) to total wages and salaries (Worksheet S3, Part II, Column 4, Line 1) by total wages and salaries for the Whole Blood & Packed Red Blood Cells and Blood Storing, Processing, & Transfusing cost centers (equal to the sum of Worksheet A, Column 1, Lines 62 and 63). A similar methodology was used for the FY 2010-based IPPS market basket.

(7) Home Office Contract Labor Costs

We proposed to determine home office contract labor costs using data reported on Worksheet S-3, Part II, Column 4, line 14. Specifically, we proposed to determine the Medicare allowable portion of these costs by multiplying them by the ratio of total Medicare allowable operating costs (as defined in section IV.B.1.b. of the preamble to the proposed rule and in section IV.B.1.b. of the preamble of this final rule) to total operating costs (calculated as Worksheet B, Part I, Column 26, Line 202, less Worksheet B,

Part I, Column 0, Lines 1 through 3). Home office contract labor costs in the FY 2010-based IPPS market basket were calculated using the U.S. Census Bureau's Bureau of Economic Analysis (BEA) Benchmark Input-Output (I-O) data, as described in section IV.B.1.c. of the preamble to the proposed rule and in section IV.B.1.c. of the preamble of this final rule.

Comment: One commenter stated that the data reported on Worksheet S-3, Part II, Column 4, Line 14 is not specific to home office costs but can include costs to other related organizations. The commenter recommended that if the intent is to only capture home office costs, CMS use a different data source. However, if the intent is to capture home office and other related organization costs, the commenter recommended that the label applied to the major cost category be altered to reflect the actual cost being utilized (for example, Home Office/Related Party Contract Labor Costs).

Response: We agree with the commenter's suggestion to alter the label for this cost category. The instructions for the Medicare cost report (CMS form 2552-10) in the CMS Provider Reimbursement Manual, Part 2 state that the costs included on this line represent salaries and wage-related costs paid to personnel who are affiliated with a home office and/or related organization, who provide services to the hospital, and whose salaries are not included on Worksheet A, Column 1 (CMS Pub. 15-2, Section 4005.2). According to the CMS Provider Reimbursement Manual, Part 1, an organization is defined as being related to the provider when the provider to a significant extent is associated or affiliated with, or has control of, or is controlled by, the organization furnishing the services, facilities, or supplies (CMS Pub 15-1, Section 1002.1).

As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19923), the costs included in this proposed category for the 2014-based IPPS market basket were previously obtained from the BEA Benchmark I-O data using the costs from the NAICS 55 sector (Management of Companies or Enterprises). The definition of the NAICS 55 sector from the BLS Web site is: (1) Establishments that hold the securities of (or other equity interests in) companies and enterprises for the

purpose of owning a controlling interest or influencing management decisions or (2) establishments (except government establishments) that administer, oversee, and manage establishments of the company or enterprise and that normally undertake the strategic or organizational planning and decision-making role of the company or enterprise. Establishments that administer, oversee, and manage may hold the securities of the company or enterprise. (<https://www.bls.gov/iag/tgs/iag55.htm>).

As was done for the FY 2010-based IPPS market basket when we used the Benchmark I-O data, to calculate home office contract labor costs using the Medicare cost reports, our intent is to capture both home office and related organization compensation costs. Our proposed methodology of using the Medicare cost report data meets our intention and reflects the most current data on these expenses. We appreciate the commenter's suggestion and will incorporate this suggestion by finalizing the cost category label to be "Home Office/Related Organization Contract Labor" so it is more consistent with the scope of costs included in this category.

b. Final Major Cost Category Computation

After we derived costs for the seven major cost categories for each provider using the Medicare cost report data as previously described, we proposed to address data outliers using the following steps. First, we divided the costs for each of the seven categories by total Medicare allowable operating costs calculated for the provider to obtain cost weights for each PPS hospital. We proposed that total Medicare allowable operating costs were equal to noncapital costs (Worksheet B, part I, Column 26 less Worksheet B, part II, Column 26) that are attributable to the Medicare allowable cost centers of the hospital. Medicare allowable cost centers were defined as Lines 30 through 35, 50, 51, 53 through 60, 62 through 76, 90, 91, 92.01 and 93.

For all of the major cost weights except the Home Office Contract Labor cost weight, we then removed those providers whose derived cost weights fall in the top and bottom 5 percent of provider-specific cost weights to ensure the removal of outliers. After the outliers were removed, we summed the costs for each category across all remaining providers. We then divided

this by the sum of total Medicare allowable operating costs across all remaining providers to obtain a cost weight for the proposed 2014-based IPPS market basket for the given category.

We note that, in the FY 2018 IPPS/LTCH PPS proposed rule, we mistakenly referenced that we used the same trimming methodology for the Home Office Contract Labor cost weight that we used for the other major cost weights (a top and bottom 5 percent trimming methodology).

For the Home Office Contract Labor cost weight, we applied a 1-percent top-only trimming methodology. This allowed all providers' Medicare allowable costs to be included, even if their home office contract labor costs were zero. We believe, as the Medicare cost report data (Worksheet S-2, Part 1, Line 140) indicate, that not all IPPS hospitals have a home office. IPPS hospitals without a home office can incur these expenses directly by having their own staff, for which the costs would be included in the Wages and Salaries and Employee Benefits cost weights. Alternatively, IPPS hospitals without a home office could also purchase related services from external contractors for which these expenses would be captured in the residual "All-Other" cost weight. We believe this 1-percent top-only trimming methodology is appropriate as it addresses outliers while allowing providers with zero Home Office Contract Labor costs to be included in the Home Office Contract Labor cost weight calculation. If we applied both the top and bottom 5 percent trimming methodology, we would exclude providers who have zero Home Office Contract Labor costs. Finally, we proposed to calculate the residual "All Other" cost weight that reflects all remaining costs that are not captured in the seven cost categories listed.

Table IV-01 in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19918) shows the major cost categories and their respective cost weights as derived from the Medicare cost reports for the proposed rule. Table IV-01 below provides these same major cost categories and respective cost weights, with the change made to the Home Office Contract Labor Cost category name as discussed earlier in our response to public comments.

TABLE IV-01—MAJOR COST CATEGORIES AS DERIVED FROM THE MEDICARE COST REPORTS

Major cost categories	FY 2010	Proposed and final 2014
Wages and Salaries	45.8	42.1
Employee Benefits	12.7	12.0
Contract Labor	1.8	1.8
Professional Liability Insurance (Malpractice)	1.3	1.2
Pharmaceuticals	5.4	5.9
Blood and Blood Products	1.1	0.8
Home Office/Related Organization Contract Labor*	-	4.2
"All Other" Residual	31.9	32.0

*Home Office/Related Organization Contract Labor costs were included in the "All Other" residual cost weight of the FY 2010-based IPPS market basket.

From FY 2010 to 2014, the Wages and Salaries and Employee Benefits cost weights as calculated directly from the Medicare cost reports decreased by approximately 3.7 and 0.7 percentage points, respectively, while the Contract Labor cost weight was unchanged. The decrease in the Wages and Salaries cost weight occurred among most cost centers and in aggregate for the General Service (overhead), Inpatient Routine Service, Ancillary Service, and Outpatient Service cost centers.

Comment: One commenter expressed concerns that several of the updated payment rates based on the proposed market basket do not accurately account for the realities facing hospitals and health systems. For example, the commenter believed the proposed market basket cost weights for certain categories are too low. Specifically, the weight for employee benefits that decreased from 12.7 percent to 12.0 percent, and the weight for pharmaceuticals that increased from 5.4 percent to 5.9 percent. The commenter further stated that hospitals, similar to other employers, are experiencing significant increases in costs for providing health care to their employees. The commenter claimed that, in 2017 alone, employer-sponsored premiums increased by 3 percent nationally. The commenter further cited a study conducted for the American Hospital Association and the Federation of American Hospitals, which found that between FY 2013 and FY 2015, average annual inpatient drug spending at community hospitals increased by 23.4 percent and average spending per admission increased 38.7 percent. The commenter stated that Virginia hospitals saw a 9.6-percent increase in spending on pharmaceuticals between 2014 and 2015 and a 41-percent increase in the last 6 years. The commenter further stated that it is important that CMS ensures any rebasing of the market basket adequately accounts for these increased costs.

Response: As stated in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19916), the market basket is described as a fixed-weight index because it represents the change in price over time of a constant mix (quantity and intensity) of goods and services needed to provide hospital services. The effects on total expenditures resulting from changes in the mix of goods and services purchased subsequent to the base period are not measured. Only when the index is rebased and updated cost weights determined would changes in the quantity and intensity be captured. Therefore, we rebase the market basket periodically so that the cost weights reflect recent changes in the mix of goods and services that hospitals purchase (hospital inputs) to furnish inpatient care between base periods.

We used a similar methodology for calculating the Employee Benefits and Pharmaceuticals cost weights as we used to derive the FY 2010-based IPPS market basket. These data are obtained directly from the Medicare cost reports completed by IPPS hospitals. In addition, in the FY 2018 IPPS/LTCH PPS proposed rule, we provided the specific fields from the Medicare cost report that we were proposing to use to calculate the cost weights. We did not receive any technical public comments on these specific methodologies we proposed.

The change in the cost weight of a specific category from the current index (FY 2010) to the rebased index (2014) is a function of the growth rate of those specific expenses relative to other components of the market basket. For pharmaceuticals, costs increased faster than other components of the market basket between FY 2010 and 2014, which is why the Pharmaceuticals cost weight increased from 5.4 to 5.9 percent. As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19917), the Pharmaceuticals cost weight does not include compensation costs associated with hospital pharmacy

employees; rather, these costs are included in the compensation cost weight. The increase in pharmaceutical costs over this period reflects changes in both the price of prescription drugs, proxied by the Producer Price Index for Prescription Drugs, as well the quantity and intensity of prescriptions.

We note that, for the FY 2018 IPPS market basket update, pharmaceuticals price growth contributes approximately 0.4 percentage point to the FY 2018 IPPS market basket update of 2.7 percent, or nearly 15 percent of the update. This large contribution (relative to the base year cost weight) reflects not only a projected FY 2018 prescription drug price increase that is approximately 80 percent faster than the weighted average price associated with the other remaining market basket cost categories, but also that over the FY 2014 to FY 2017 time period, the pharmaceuticals prices are projected to increase over 25 percent compared to the price increases of the other market basket categories combined at approximately 5 percent. Thus, we believe that the market basket is adequately reflecting the recent trends in prescription drug price growth.

For employee benefits, costs increased over the FY 2010 to FY 2014 period but at a slower rate than other components of the market basket, which resulted in a slight decrease in the proposed Employee Benefits cost weight from 12.7 to 12.0 percent. The changes in employee benefit costs over this period reflect not only the price changes associated with employee benefits, which are proxied by the Employment Cost Index for All Civilian Workers in Hospitals, but also any changes in the mix of workers. For FY 2018, the price change in the benefits component for the ECI for hospital workers is projected to be 2.6 percent.

After consideration of public comments we received, in this final rule, we are finalizing our calculation of the major cost weights of the 2014-based IPPS market basket as proposed. As

discussed above, we are making one revision to change the label of the proposed “Home Office Contract Labor” category to “Home Office/Related Organization Contract Labor”. However, there is no effect on the calculation of the major cost weight for this category or in how it is apportioned between Professional Fees: Labor-Related and Professional Fees: Nonlabor Related as described in detail in section IV.B.3 of the preamble of this final rule.

As we did for the FY 2010-based IPPS market basket (78 FR 50597), we proposed to allocate contract labor costs to the Wages and Salaries and Employee

Benefits cost weights based on their relative proportions for employed labor under the assumption that contract labor costs are comprised of both wages and salaries and employee benefits. The contract labor allocation proportion for wages and salaries was equal to the Wages and Salaries cost weight as a percent of the sum of the Wages and Salaries cost weight and the Employee Benefits cost weight. Using the 2014 Medicare cost report data, this percentage was 78 percent. Therefore, we proposed to allocate approximately 78 percent of the Contract Labor cost weight to the Wages and Salaries cost

weight and 22 percent to the Employee Benefits cost weight. The FY 2010-based IPPS market basket also allocated 78 percent of the Contract Labor cost weight to the Wages and Salaries cost weight.

Table IV–02 in the proposed rule (82 FR 19918) shows the Wages and Salaries and Employee Benefits cost weights after contract labor allocation for the FY 2010-based IPPS market basket and the proposed 2014-based IPPS market basket. This table is also included below to reflect the final 2014-based IPPS market basket.

TABLE IV–02—WAGES AND SALARIES AND EMPLOYEE BENEFITS COST WEIGHTS AFTER CONTRACT LABOR ALLOCATION

Major cost categories	FY 2010-based IPPS market basket	Proposed and final 2014-based IPPS market basket
Wages and Salaries	47.2	43.4
Employee Benefits	13.1	12.4

We did not receive any specific public comments regarding the allocation of the Contract Labor cost weight to the Wages and Salaries and Employee Benefits cost weights. In this final rule, we are finalizing our methodology of allocating the Contract Labor cost weight as we proposed.

c. Derivation of the Detailed Cost Weights

To further divide the “All Other” residual cost weight estimated from the 2014 Medicare cost report data into more detailed cost categories, we proposed to use the 2007 Benchmark I–O “Use Tables/Before Redefinitions/Purchaser Value” for NAICS 622000, Hospitals, published by the BEA. These data are publicly available at the following Web site: http://www.bea.gov/industry/io_annual.htm. The BEA Benchmark I–O data are generally scheduled for publication every 5 years on a lagged basis, with the most recent data available for 2007. The 2007 Benchmark I–O data are derived from the 2007 Economic Census and are the building blocks for BEA’s economic accounts. Therefore, they represent the most comprehensive and complete set of data on the economic processes or mechanisms by which output is produced and distributed.²² BEA also produces Annual I–O estimates. However, while based on a similar methodology, these estimates reflect less comprehensive and less detailed data

sources and are subject to revision when benchmark data become available. Instead of using the less detailed Annual I–O data, we proposed to inflate the detailed 2007 Benchmark I–O data forward to 2014 by applying the annual price changes from the respective price proxies to the appropriate market basket cost categories that are obtained from the 2007 Benchmark I–O data. In our calculations for the proposed rule, we repeated this practice for each year.

We then calculated the cost shares that each cost category represents of the 2007 data inflated to 2014. These resulting 2014 cost shares were applied to the “All Other” residual cost weight to obtain the detailed cost weights for the proposed 2014-based IPPS market basket. For example, the cost for Food: Direct Purchases represented 7.3 percent of the sum of the “All Other” 2007 Benchmark I–O Hospital Expenditures inflated to 2014. Therefore, the Food: Direct Purchases cost weight represented 7.3 percent of the proposed 2014-based IPPS market basket’s “All Other” cost category (32.0 percent), yielding a Food: Direct Purchases proposed cost weight of 2.3 percent in the proposed 2014-based IPPS market basket (0.073×32.0 percent = 2.3 percent). For the FY 2010-based IPPS market basket (78 FR 50597), we used the same methodology utilizing the 2002 Benchmark I–O data (aged to FY 2010).

Using this methodology, we proposed to derive 18 detailed cost categories from the proposed 2014-based IPPS

market basket residual cost weight (32.0 percent). These categories were: (1) Fuel: Oil and Gas; (2) Electricity; (3) Water and Sewerage; (4) Food: Direct Purchases; (5) Food: Contract Services; (6) Chemicals; (7) Medical Instruments; (8) Rubber and Plastics; (9) Paper and Printing Products; (10) Miscellaneous Products; (11) Professional Fees: Labor-Related; (12) Administrative and Facilities Support Services; (13) Installation, Maintenance, and Repair Services; (14) All Other: Labor-Related Services; (15) Professional Fees: Nonlabor-Related; (16) Financial Services; (17) Telephone Services; and (18) All Other: Nonlabor-Related Services.

Similar to the 2013-based LTCH market basket, the proposed 2014-based IPPS market basket does not include separate cost categories for Apparel, Machinery and Equipment, and Postage. Due to the small weights associated with these detailed categories and relatively stable price growth in the applicable price proxy, we believed that consolidating these smaller cost category weights with other cost categories in the proposed market basket that experience similar price increases eliminates unnecessary complexity to the market basket without having a material impact on the total market basket increase. Therefore, we proposed to include Apparel and Machinery and Equipment in the Miscellaneous Products cost category and Postage in the All-Other: Nonlabor-Related Services cost category. We note that the

²² http://www.bea.gov/papers/pdf/IOmanual_092906.pdf.

machinery and equipment expenses are for equipment that is paid for in a given year and not depreciated over the asset's useful life. Depreciation expenses for movable equipment are reflected in the proposed 2014-based Capital Input Price Index (described in section IV.D. of the preamble of this final rule). For the proposed 2014-based IPPS market basket, we also proposed to include a separate cost category for Installation, Maintenance, and Repair Services in order to proxy these costs by a price index that better reflects the price changes of labor associated with maintenance-related services.

We did not receive any specific public comments on the derivation of the detailed cost weights. In this final rule, we are finalizing our methodology for deriving the detailed cost weights as we proposed.

2. Selection of Proposed Price Proxies

After computing the proposed 2014 cost weights for the IPPS market basket, it was necessary to select appropriate wage and price proxies to reflect the rate of price change for each expenditure category. With the exception of the proxy for professional liability insurance (PLI), all the proxies we proposed are based on Bureau of Labor Statistics (BLS) data and are grouped into one of the following BLS categories:

- **Producer Price Indexes—Producer Price Indexes (PPIs)** measure price changes for goods sold in markets other than the retail market. PPIs are preferable price proxies for goods and services that hospitals purchase as inputs because PPIs better reflect the actual price changes encountered by hospitals. For example, we proposed to use a PPI for prescription drugs, rather than the Consumer Price Index (CPI) for prescription drugs, because hospitals generally purchase drugs directly from a wholesaler. The PPIs that we proposed to use measure price changes at the final stage of production.

- **Consumer Price Indexes—Consumer Price Indexes (CPIs)** measure change in the prices of final goods and services bought by the typical consumer. Because they may not represent the price faced by a producer, we proposed to use CPIs only if an appropriate PPI is not available, or if the expenditures are more like those faced by retail consumers in general rather than by purchasers of goods at the wholesale level. For example, the CPI for food purchased away from home was proposed to be used as a proxy for contracted food services.

- **Employment Cost Indexes—Employment Cost Indexes (ECIs)** measure the rate of change in employee

wage rates and employer costs for employee benefits per hour worked. These indexes are fixed-weight indexes and strictly measure the change in wage rates and employee benefits per hour. Appropriately, they are not affected by shifts in employment mix.

We evaluated the price proxies using the criteria of reliability, timeliness, availability, and relevance. Reliability indicates that the index is based on valid statistical methods and has low sampling variability. Timeliness implies that the proxy is published regularly, preferably at least once a quarter. Availability means that the proxy is publicly available. Finally, relevance means that the proxy is applicable and representative of the cost category weight to which it is applied. We stated in the proposed rule that we believe the proposed PPIs, CPIs, and ECIs selected meet these criteria.

a. Price Proxies for Each Cost Category

Below we present a detailed explanation of the price proxies that we proposed for each cost category weight and a statement of our finalized policies. We note that many of the proxies that we proposed to use for the 2014-based IPPS market basket are the same as those used for the FY 2010-based IPPS market basket.

(1) Wages and Salaries

We proposed to use the ECI for Wages and Salaries for All Civilian Workers in Hospitals (BLS series code CIU1026220000000I) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(2) Employee Benefits

We proposed to use the ECI for Total Benefits for All Civilian Workers in Hospitals to measure the price growth of this cost category. This ECI is calculated using the ECI for Total Compensation for All Civilian Workers in Hospitals (BLS series code CIU1016220000000I) and the relative importance of wages and salaries within total compensation. This is the same price proxy used in the FY 2010-based IPPS market basket.

(3) Fuel: Oil and Gas

We proposed to change the proxy used for the Fuel: Oil and Gas cost category. The FY 2010-based IPPS market basket uses the PPI Industry for Petroleum Refineries (BLS series code PCU32411–32411–) to proxy these expenses.

For the proposed 2014-based IPPS market basket, we proposed to use a blend of the PPI Industry for Petroleum Refineries (BLS series code PCU32411–

32411–) and the PPI Commodity for Natural Gas (BLS series code WPU0531). Our analysis of the BEA 2007 Benchmark I–O data (use table before redefinitions, purchaser's value for NAICS 622000 [Hospitals]) shows that petroleum refineries expenses account for approximately 70 percent and Natural Gas expenses account for approximately 30 percent of the Fuel: Oil and Gas expenses. Therefore, we proposed a blended proxy of 70 percent of the PPI Industry for Petroleum Refineries (BLS series code PCU32411–32411–) and 30 percent of the PPI Commodity for Natural Gas (BLS series code WPU0531). We stated in the proposed rule that we believe that these two price proxies are the most technically appropriate indices available to measure the price growth of the Fuel: Oil and Gas cost category in the proposed 2014-based IPPS market basket.

(4) Electricity

We proposed to use the PPI Commodity for Commercial Electric Power (BLS series code WPU0542) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(5) Water and Sewerage

We proposed to use the CPI for Water and Sewerage Maintenance (All Urban Consumers) (BLS series code CUUR0000SEHG01) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(6) Professional Liability Insurance

We proposed to proxy price changes in hospital professional liability insurance premiums (PLI) using percentage changes as estimated by the CMS Hospital Professional Liability Index. To generate these estimates, we collected commercial insurance premiums for a fixed level of coverage while holding nonprice factors constant (such as a change in the level of coverage). This is the same price proxy used in the FY 2010-based IPPS market basket.

(7) Pharmaceuticals

We proposed to use the PPI Commodity for Pharmaceuticals for Human Use, Prescription (BLS series code WPUS107003) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(8) Food: Direct Purchases

We proposed to use the PPI Commodity for Processed Foods and Feeds (BLS series code WPU02) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(9) Food: Contract Services

We proposed to use the CPI for Food Away From Home (All Urban Consumers) (BLS series code CUUR0000SEFV) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(10) Chemicals

We proposed to continue to use a four-part blended index composed of the PPI Industry for Industrial Gas Manufacturing (BLS series code PCU325120325120P), the PPI Industry for Other Basic Inorganic Chemical Manufacturing (BLS series code PCU32518–32518–), the PPI Industry for Other Basic Organic Chemical Manufacturing (BLS series code PCU32519–32519–), and the PPI Industry for Soap and Cleaning Compound Manufacturing (BLS series code PCU32561–32561–). We proposed to update the blended weights using 2007 Benchmark I–O data, which we also proposed to use for the proposed

2014-based IPPS market basket. The FY 2010-based IPPS market basket included the same blended chemical price proxy, but used the 2002 Benchmark I–O data to determine the weights of the blended chemical price index. The 2007 Benchmark I–O data have a higher weight for organic chemical products and a lower weight for the other chemical products compared to the 2002 Benchmark I–O data.

Table IV–03 in the proposed rule (82 FR 19920) shows the proposed weights for each of the four PPIs used to create the blended index compared to those used for the FY 2010-based IPPS market basket. This table is also included below and reflects the final 2014-based IPPS weights.

TABLE IV–03—BLENDED CHEMICAL WEIGHTS

Name	FY 2010-based IPPS weights (%)	Proposed and final 2014-Based IPPS weights (%)	NAICS
PPI for Industrial Gas Manufacturing	35	32	325120
PPI for Other Basic Inorganic Chemical Manufacturing	25	17	325180
PPI for Other Basic Organic Chemical Manufacturing	30	45	325190
PPI for Soap and Cleaning Compound Manufacturing	10	6	325610

(11) Blood and Blood Products

We proposed to use the PPI Industry for Blood and Organ Banks (BLS series code PCU621991621991) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(12) Medical Instruments

We proposed to use a blended price proxy for the Medical Instruments cost category. The 2007 Benchmark Input-Output data show an approximate 50/50 split between Surgical and Medical Instruments and Medical and Surgical Appliances and Supplies for this cost category. Therefore, we proposed a blend composed of 50 percent of the PPI Commodity for Surgical and Medical Instruments (BLS series code WPU1562) and 50 percent of the PPI Commodity for Medical and Surgical Appliances and Supplies (BLS series code WPU1563). The FY 2010-based IPPS market basket used the single, higher level PPI Commodity for Medical, Surgical, and Personal Aid Devices (BLS series code WPU156). We stated in the proposed rule that we believe that the proposed price proxy better reflects the mix of expenses for this cost category as obtained from the 2007 Benchmark I–O data.

(13) Rubber and Plastics

We proposed to use the PPI Commodity for Rubber and Plastic Products (BLS series code WPU07) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(14) Paper and Printing Products

We proposed to use the PPI Commodity for Converted Paper and Paperboard Products (BLS series code WPU0915) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(15) Miscellaneous Products

We proposed to use the PPI Commodity for Finished Goods Less Food and Energy (BLS series code WPUFD4131) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(16) Professional Fees: Labor-Related

We proposed to use the ECI for Total Compensation for Private Industry Workers in Professional and Related (BLS series code CIU2010000120000I) to measure the price growth of this category. It includes occupations such as legal, accounting, and engineering services. This is the same price proxy

used in the FY 2010-based IPPS market basket.

(17) Administrative and Facilities Support Services

We proposed to use the ECI for Total Compensation for Private Industry Workers in Office and Administrative Support (BLS series code CIU2010000220000I) to measure the price growth of this category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(18) Installation, Maintenance, and Repair Services

We proposed to use the ECI for Total Compensation for All Civilian Workers in Installation, Maintenance, and Repair (BLS series code CIU1010000430000I) to measure the price growth of this new cost category. Previously these costs were included in the All Other: Labor-Related Services category and were proxied by the ECI for Total Compensation for Private Industry Workers in Service Occupations (BLS series code CIU2010000300000I). We believe that this index better reflects the price changes of labor associated with maintenance-related services and its incorporation represents a technical improvement to the market basket.

(19) All Other: Labor-Related Services

We proposed to use the ECI for Total Compensation for Private Industry Workers in Service Occupations (BLS series code CIU2010000300000I) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(20) Professional Fees: Nonlabor-Related

We proposed to use the ECI for Total Compensation for Private Industry Workers in Professional and Related (BLS series code CIU2010000120000I) to measure the price growth of this category. This is the same price proxy that we proposed to use for the Professional Fees: Labor-Related cost category and the same price proxy used in the FY 2010-based IPPS market basket.

(21) Financial Services

We proposed to use the ECI for Total Compensation for Private Industry

Workers in Financial Activities (BLS series code CIU201520A000000I) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(22) Telephone Services

We proposed to use the CPI for Telephone Services (BLS series code CUUR0000SEED) to measure the price growth of this cost category. This is the same price proxy used in the FY 2010-based IPPS market basket.

(23) All Other: Nonlabor-Related Services

We proposed to use the CPI for All Items Less Food and Energy (BLS series code CUUR0000SA0L1E) to measure the price growth of this cost category. We believe that using the CPI for All Items Less Food and Energy avoids double counting of changes in food and energy prices as they are already captured elsewhere in the market basket. This is

the same price proxy used in the FY 2010-based IPPS market basket. We did not receive any specific public comments on the price proxies we proposed to use for the 2014-based IPPS market basket. In this final rule, we are finalizing the use of these price proxies as we proposed.

After consideration of the public comments we received, we are finalizing the 2014-based IPPS market basket as proposed.

Table IV–04 in the proposed rule (82 FR 19921) set forth the proposed 2014-based IPPS market basket, including the cost categories and their respective weights and price proxies. For comparison purposes, the corresponding FY 2010-based IPPS market basket cost weights also were listed. This table is also included below and reflects the final 2014-based IPPS market basket.

TABLE IV–04—PROPOSED AND FINAL 2014-BASED IPPS MARKET BASKET COST CATEGORIES, COST WEIGHTS, AND PRICE PROXIES COMPARED TO FY 2010-BASED IPPS MARKET BASKET COST WEIGHTS

Cost categories	FY 2010-based IPPS market basket cost weights	Proposed and final 2014-based IPPS market basket cost weights	Proposed and final 2014-based IPPS market basket price proxies
1. Compensation	60.3	55.8	
A. Wages and Salaries ¹	47.2	43.4	ECI for Wages and Salaries for All Civilian Workers in Hospitals.
B. Employee Benefits ¹	13.1	12.4	ECI for Total Benefits for All Civilian Workers in Hospitals.
2. Utilities	2.2	2.5	
A. Fuel: Oil and Gas	0.4	1.3	Blend of PPIs for Petroleum Refineries and Natural Gas.
B. Electricity	1.7	1.0	PPI Commodity for Commercial Electric Power.
C. Water and Sewerage	0.1	0.1	CPI for Water and Sewerage Maintenance (All Urban Consumers).
3. Professional Liability Insurance	1.3	1.2	CMS Hospital Professional Liability Insurance Premium Index.
4. All Other	36.1	40.5	
A. All Other Products	19.5	17.4	
(1) Pharmaceuticals	5.4	5.9	PPI Commodity for Pharmaceuticals for Human Use, Prescription.
(2) Food: Direct Purchases	4.2	2.3	PPI Commodity for Processed Foods and Feeds.
(3) Food: Contract Services	0.6	1.3	CPI for Food Away From Home (All Urban Consumers).
(4) Chemicals	1.5	0.9	Blend of Chemical PPIs.
(5) Blood and Blood Products	1.1	0.8	PPI Industry for Blood and Organ Banks.
(6) Medical Instruments	2.6	2.9	Blend of PPI for Surgical and Medical Instruments and PPI for Medical and Surgical Appliances and Supplies.
(7) Rubber and Plastics	1.6	0.8	PPI Commodity for Rubber and Plastic Products.
(8) Paper and Printing Products	1.5	1.5	PPI Commodity for Converted Paper and Paperboard Products.
(9) Miscellaneous Products ²	1.0	1.1	PPI Commodity for Finished Goods less Food and Energy.
B. Labor-Related Services	9.2	12.5	
(1) Professional Fees: Labor-Related	5.5	6.8	ECI for Total Compensation for Private Industry Workers in Professional and Related.
(2) Administrative and Facilities Support Services	0.6	1.0	ECI for Total Compensation for Private Industry Workers in Office and Administrative Support.

TABLE IV-04—PROPOSED AND FINAL 2014-BASED IPPS MARKET BASKET COST CATEGORIES, COST WEIGHTS, AND PRICE PROXIES COMPARED TO FY 2010-BASED IPPS MARKET BASKET COST WEIGHTS—Continued

Cost categories	FY 2010-based IPPS market basket cost weights	Proposed and final 2014-based IPPS market basket cost weights	Proposed and final 2014-based IPPS market basket price proxies
(3) Installation, Maintenance and Repair Services.		2.4	ECI for Total Compensation for Civilian Workers in Installation, Maintenance, and Repair.
(4) All Other: Labor-Related Services	3.1	2.3	ECI for Total Compensation for Private Industry Workers in Service Occupations.
C. Nonlabor-Related Services	7.4	10.7	
(1) Professional Fees: Nonlabor-Related	3.7	5.1	ECI for Total Compensation for Private Industry Workers in Professional and Related.
(2) Financial Services	1.2	3.0	ECI for Total Compensation for Private Industry Workers in Financial Activities.
(3) Telephone Services	0.6	0.8	CPI for Telephone Services.
(4) All Other: Nonlabor-Related Services ³	1.9	1.7	CPI for All Items less Food and Energy.
Total	100.0	100.0	

Note: The cost weights are calculated using three decimal places. For presentational purposes, we are displaying one decimal and therefore, the detail may not add to the total due to rounding.

¹ Contract labor is distributed to wages and salaries and employee benefits based on the share of total compensation that each category represents.

² The FY 2010-based IPPS market basket Miscellaneous Products cost category also includes Apparel and Machinery and Equipment cost categories. These costs were not broken out separately in the 2014-based IPPS market basket.

³ The FY 2010-based IPPS market basket All Other: Nonlabor-Related Services cost category also includes the Postage cost category. These costs were not broken out separately in the 2014-based IPPS market basket.

Table IV-05 in the proposed rule (82 FR 19922) compares both the historical and forecasted percent changes in the FY 2010-based IPPS market basket and the proposed 2014-based IPPS market

basket. The percent changes in the proposed rule were based on IHS Global Inc.'s (IGI's) fourth quarter 2016 forecast with historical data through third quarter 2016. The forecasted growth

rates provided in Table IV-05 below are based on IGI's more recent second quarter 2017 forecast with historical data through first quarter 2017.

TABLE IV-05—FY 2010-BASED AND PROPOSED AND FINAL 2014-BASED IPPS HOSPITAL OPERATING INDEX PERCENT CHANGE, FY 2013 THROUGH FY 2020

Fiscal year (FY)	FY 2010-based IPPS market basket percent change	Proposed and final 2014-based IPPS market basket percent change
Historical data:		
FY 2013	2.0	2.0
FY 2014	1.8	1.8
FY 2015	1.8	1.6
FY 2016	1.8	1.8
Average FYs 2013–2016	1.9	1.8
Forecast:		
FY 2017	2.6	2.7
FY 2018	2.7	2.7
FY 2019	2.9	2.9
FY 2020	3.0	3.1
Average FYs 2017–2020	2.8	2.9

Source: IHS Global Inc., 2nd Quarter 2017 forecast.

The percent change in the proposed and final 2014-based IPPS market basket is, on average, 0.1 percentage point lower than the FY 2010-based IPPS market basket over the FY 2013 to FY 2016 historical time period and on average 0.1 percentage point higher over the FY 2017 to FY 2020 forecasted time period. The difference in the average growth rates is mostly a result of the

lower compensation cost weight and the revised price proxy for the Fuel, Oil and Gasoline cost category. As stated in section IV.B.2. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule (and in section IV.B.2.a. of the preamble of this final rule), for the 2014-based IPPS market basket, we proposed to revise the price proxy for the Fuel: Oil and Gas cost category to be a blend of

the PPI Industry for Petroleum Refineries (BLS series code PCU32411–32411–) and the PPI Commodity for Natural Gas (BLS series code WPU0531). The FY 2010-based IPPS market basket used only the PPI Industry for Petroleum Refineries.

3. Labor-Related Share

Under section 1886(d)(3)(E) of the Act, the Secretary estimates from time to time the proportion of payments that are labor-related. Section 1886(d)(3)(E) of the Act states that the Secretary shall adjust the proportion, (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs, of the DRG prospective payment rates. We refer to the proportion of hospitals' costs that are attributable to wages and wage-related costs as the "labor-related share."

The labor-related share is used to determine the proportion of the national PPS base payment rate to which the area wage index is applied. We include a cost category in the labor-related share if the costs are *labor intensive* and *vary with the local labor market*. For the FY 2018 IPPS/LTCH PPS proposed rule, we proposed (82 FR 19923) to include in the labor-related share the national average proportion of operating costs that are attributable to the following cost categories in the proposed 2014-based IPPS market basket: Wages and Salaries, Employee Benefits, Professional Fees: Labor-Related, Administrative and Facilities Support Services, Installation, Maintenance, and Repair Services, and All Other: Labor-Related Services. As noted in section IV.B.1.c. of the preamble of the proposed rule, for the proposed 2014-based IPPS market basket, we proposed the creation of a separate cost category for Installation, Maintenance, and Repair Services. These expenses were previously included in the All Other: Labor-Related Services cost category in the FY 2010-based IPPS market basket, along with other services, including, but not limited to, janitorial, waste management, security, and dry cleaning/laundry services. Because these services tend to be labor-intensive and are mostly performed at the facility (and, therefore, unlikely to be purchased in the national market), we continue to believe that they meet our definition of labor-related services.

Similar to the FY 2010-based IPPS market basket, we proposed that the Professional Fees: Labor-Related cost category includes expenses associated with advertising and a proportion of legal services, accounting and auditing, engineering, management consulting, and management of companies and enterprises expenses. As was done in the FY 2010-based IPPS market basket rebasing, we proposed to determine the proportion of legal, accounting and auditing, engineering, and management consulting services that meet our

definition of labor-related services based on a survey of hospitals conducted by CMS in 2008. We notified the public of our intent to conduct this survey on December 9, 2005 (70 FR 73250) and did not receive any public comments in response to the notice (71 FR 8588).

A discussion of the composition of the survey and poststratification can be found in the FY 2010 IPPS/LTCH PPS final rule (74 FR 43850 through 43856). Based on the weighted results of the survey, we determined that hospitals purchase, on average, the following portions of contracted professional services outside of their local labor market:

- 34 percent of accounting and auditing services;
- 30 percent of engineering services;
- 33 percent of legal services; and
- 42 percent of management consulting services.

We proposed to apply each of these percentages to its respective Benchmark I–O cost category underlying the professional fees cost category. This is the methodology that we used to separate the FY 2010-based IPPS market basket professional fees cost category into Professional Fees: Labor-Related and Professional Fees: Nonlabor-Related cost categories. We proposed to use the same methodology and survey results to separate the professional fees costs for the proposed 2014-based IPPS market basket into Professional Fees: Labor-Related and Professional Fees: Nonlabor-Related cost categories. We stated that we believe these survey results are appropriate to use for the 2014-based IPPS market basket as they empirically determine the proportion of contracted professional services purchased by the industry that is attributable to local firms and the proportion that is purchased from national firms.

In the proposed 2014-based IPPS market basket, nonmedical professional fees that were subject to allocation based on these survey results represent 4.9 percent of total operating costs (and are limited to those fees related to Accounting & Auditing, Legal, Engineering, and Management Consulting services). Based on our survey results, we proposed to apportion 3.1 percentage points of the 4.9 percentage point figure into the Professional Fees: Labor-Related share cost category and designate the remaining 1.8 percentage point into the Professional Fees: Nonlabor-Related cost category.

Comment: Several commenters expressed concern about the methodology CMS proposed to use to remove a portion of professional fees

from the labor-related share. Several commenters believed the Professional Fees Survey that was gathered in 2008 is outdated. Some of those commenters stated that it is inappropriate to use data gathered in 2008 to adjust payments made in 2018. In addition, one commenter stated that the survey was outdated because hospitals have reduced staff since 2008 and rely more on consulting services for obtaining needed personnel expertise. A few commenters stated that if CMS' intention is to update the labor-related share to account for recent changes, it should also update these survey data.

A few commenters reiterated how, in previous comments, they stated that they did not believe the survey could be statistically representative because it was based on 108 hospitals. The commenters also stated that CMS failed to share data on the characteristics of the hospitals that responded to the survey, selection bias, or survey methodology. The commenters urged CMS not to use the results of this survey to estimate the proportion of professional fees that are labor-related. Several commenters urged CMS to continue to investigate alternative methodologies for determining the proportion that is labor-related before implementing any changes.

Response: We first utilized the Professional Fees Survey in the FY 2006-based IPPS market basket finalized in the FY 2010 IPPS/LTCH PPS final rule (74 FR 43843). In response to our proposal to use this Professional Fees Survey in the FY 2010 IPPS/LTCH PPS proposed rule, commenters had similar requests for additional information on the survey, specifically requesting the characteristics of the hospitals that responded, possible selection bias, and survey methodology. For the FY 2010 IPPS/LTCH PPS final rule (74 FR 43853), we provided additional information on the Professional Fees Survey methodology, sample selection, and methodology for deriving the final weights. The FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19923) made note of this information and provided the **Federal Register** reference for the FY 2010 IPPS/LTCH PPS final rule (74 FR 43850 through 43856). Therefore, we disagree with the commenters' claim that we failed to share characteristics of the hospitals that responded to the survey, selection bias, and survey methodology.

With respect to the comment that the survey is outdated because hospitals have reduced staff since 2008 and rely more on consulting services for obtaining needed personnel expertise, the Professional Fees Survey is not used

to determine the level of hospital staffing relative to contract staffing. As stated above, the Medicare cost report data show that over the FY 2010 to FY 2014 time period, the Wages and Salaries and Employee Benefit cost weights decreased while the Labor-related services cost weight increased. This supports the commenter's claim that hospitals have reduced staff and are relying more on consulting services, and is reflected in the hospital market basket. The Professional Fees Survey is only used to determine the proportion of Professional Fees costs that are purchased within a hospital's local labor market, a proportion that we believe is unlikely to change significantly over time.

With respect to the commenters' concern regarding alternative methodologies, we are not aware of any other currently available data source regarding the proportion of Professional Fees that are labor-related. Therefore, the only possible alternatives to the current methods would be to assume that 100 percent of the accounting and auditing services, engineering services, legal services, and management consulting services are purchased in the national market or assume that 100 percent are purchased in the local labor market. Neither of these approaches seems reasonable, given that the 2008 Professional Fees Survey results in the assumption that 63 percent of those services are purchased locally (in aggregate) and the remaining 37 percent are purchased nationally. As stated in the FY 2018 IPPS/LTCH PPS proposed rule, we continue to believe the survey results are appropriate to use for the 2014-based IPPS market basket as they empirically determine the proportion of contracted professional services purchased by the industry that is attributable to local firms and the proportion that is purchased from national firms. We will continue to explore options for updating the Professional Fees Survey to reflect more recent data for incorporation into future market basket rebasing and labor-related share determinations. If conducted, we encourage providers to respond to the survey, which would be announced in the **Federal Register** as done previously. After consideration of the public comments we received, we are finalizing the use of the Professional Fees Survey as proposed.

In addition to the professional services listed earlier, we also proposed to classify a proportion of the home office/related organization contract labor expenses (as this cost category has been relabeled, as discussed earlier in section IV.B.1.a. of the preamble of this

final rule, and is referred to throughout this discussion) into the Professional Fees: Labor-Related cost category as was done in the previous rebasing. For the FY 2010-based IPPS market basket, we obtained home office/related organization contract labor expenses from the Benchmark I–O data for the NAICS 55 industry (Management of Companies and Enterprises). As stated in section IV.B.1.a. of the preamble to the FY 2018 IPPS/LTCH PPS proposed rule, for the 2014-based IPPS market basket, we proposed to obtain these data from the Medicare cost reports. We believe that many of the home office/related organization contract labor expenses are labor-intensive and vary with the local labor market. However, data indicate that not all IPPS hospitals with home offices have home offices located in their local labor market. Therefore, we proposed to include in the labor-related share only a proportion of the home office/related organization contract labor expenses based on the methodology described below.

For the FY 2010-based IPPS market basket, we used data primarily from the Medicare cost reports and a CMS database of Home Office Medicare Records (HOMER) (a database that provides city and state information (addresses) for home offices). We determined the proportion of costs that should be allocated to the labor-related share based on the percent of hospital home office/related organization contract labor compensation as reported in Worksheet S–3, Part II. Using this methodology, we determined that 62 percent of hospitals' home office/related organization contract labor compensation costs were for home offices located in their respective local labor markets (defined as the same Metropolitan Statistical Area (MSA)). Therefore, we classified 62 percent of these costs into the Professional Fees: Labor-Related Services cost category and the remaining 38 percent into the Professional Fees: Nonlabor-Related Services cost category for the FY 2010-based IPPS market basket. For a detailed discussion of this analysis, we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50601).

For the proposed 2014-based IPPS market basket, we conducted a similar analysis of home office data. For consistency, we believe that it is important for our analysis on home office data to be conducted on the same IPPS hospitals used to derive the proposed 2014-based IPPS market basket cost weights. The Medicare cost report requires a hospital to report information regarding their home office provider. Approximately 64 percent of

IPPS hospitals reported some type of home office information on their Medicare cost report for 2014 (for example, city, State, and zip code). Using the data reported on the Medicare cost report, we compared the location of the hospital with the location of the hospital's home office. We then proposed to determine the proportion of costs that should be allocated to the labor-related share based on the percent of total hospital home office/related organization contract labor compensation costs (as reported in Worksheet S–3, Part II) for those hospitals that had home offices located in their respective local labor markets—defined as being in the same MSA. We determined a hospital's and home office's MSAs using their zip code information from the Medicare cost report. Using this methodology, we determined that 60 percent of hospitals' home office/related organization contract labor compensation costs were for home offices located in their respective local labor markets. Therefore, we proposed to allocate 60 percent of home office expenses to the labor-related share.

In the proposed 2014-based IPPS market basket, home office/related organization contract labor expenses that were subject to allocation based on the home office allocation methodology represent 4.2 percent of total operating costs. Based on the results of the home office analysis discussed earlier, we proposed to apportion 2.5 percentage points of the 4.2 percentage points figure into the Professional Fees: Labor-Related cost category and designate the remaining 1.7 percentage points into the Professional Fees: Nonlabor-Related cost category. In summary, based on the two allocations mentioned earlier, we apportioned 5.6 percentage points of the professional fees and home office/related organization contract labor cost weights into the Professional Fees: Labor-Related cost category. This amount was added to the portion of professional fees that we already identified as labor-related using the I–O data such as contracted advertising and marketing costs (approximately 1.2 percentage point of total operating costs) resulting in a Professional Fees: Labor-Related cost weight of 6.8 percent.

The FY 2018 IPPS/LTCH PPS proposed rule included Table IV–06 (82 FR 19924), which compared the proposed 2014-based labor-related share and the FY 2010-based labor-related share. As discussed in section IV.B.1.b. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule, the Wages and Salaries and Employee Benefits cost weights reflect contract labor costs. This

table is also included below and reflects the final 2014-based labor-related share.

TABLE IV-06—COMPARISON OF THE FY 2010-BASED LABOR-RELATED SHARE AND THE PROPOSED AND FINAL 2014-BASED LABOR-RELATED SHARE

	FY 2010-based IPPS market basket cost weights	Proposed and final 2014-based IPPS market basket cost weights
Wages and Salaries	47.2	43.4
Employee Benefits	13.1	12.4
Professional Fees: Labor-Related	5.5	6.8
Administrative and Facilities Support Services	0.6	1.0
Installation, Maintenance, and Repair Services ¹		2.4
All Other: Labor-Related Services	3.1	2.3
Total Labor-Related Share	69.6	68.3

Note: Detail may not add to total due to rounding.

¹ Installation, Maintenance, and Repair Services costs were previously included in the All Other: Labor-Related Services cost category of the FY 2010-based IPPS market basket.

Using the cost category weights from the proposed 2014-based IPPS market basket, we calculated a labor-related share of 68.3 percent, approximately 1.3 percentage points lower than the current labor-related share of 69.6 percent. Therefore, we proposed to use a labor-related share of 68.3 percent for discharges occurring on or after October 1, 2017. We continue to believe, as we have stated in the past, that these operating cost categories are related to, influenced by, or vary with the local markets. Therefore, our definition of the labor-related share continues to be consistent with section 1886(d)(3) of the Act. We note that section 403 of Public Law 108–173 amended sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act to provide that the Secretary must employ 62 percent as the labor-related share unless 62 percent would result in lower payments to a hospital than would otherwise be made.

Comment: Several commenters stated that they were unable to replicate or verify the proposed labor-related share. One commenter stated that it is unclear how we determined that a reduction to the labor-related share from 69.6 percent to 68.3 percent was warranted since we did not release the base calculations. Several commenters further stated that not having access to this information severely limited their ability to comment sufficiently on this issue. The commenters requested that CMS provide all information necessary to replicate the agency's calculation of the labor-related share, including, but not limited to, greater clarity of data sources used; case counts at different points, such as number of providers after trimming; provider level data illustrating what information was used

in the calculation; and the kinds of checks CMS made during calculations to assess and ensure accuracy. The commenters requested that this information be provided in advance of publication of the final rule.

Response: We disagree with the commenters' claim that we did not provide sufficiently detailed information regarding our calculations of the labor-related share. As stated in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19923), the labor-related share is derived using the cost weights of the proposed 2014-based IPPS market basket. The FY 2018 IPPS/LTCH PPS proposed rule included a detailed description of the data sources and methodology used to derive all of the market basket cost weights.

Specifically, section IV.B.1.a. of the preamble of the proposed rule (82 FR 19916) provided the detailed Medicare cost report methodology used to calculate the major cost weights of the proposed 2014-based IPPS market basket (including the specific Medicare cost report worksheets and trimming methodologies). Section IV.B.1.c. of the preamble of the proposed rule (82 FR 19918) provided the specific methodology and data source used to derive the remaining detailed cost weights. Section IV.B.3. of the preamble of proposed rule (82 FR 19923) provided information regarding how the Professional Fees cost category was divided between Labor-related and Nonlabor-related services. The data sources used to produce the market basket cost weights are publicly available. In addition, contact information for CMS staff was provided in the proposed rule to provide the opportunity to ask any specific questions regarding the methodology.

We note that we provided a similar detailed description of the methodologies used to derive the 2012-based IPF and 2012-based IRF market baskets in the FY 2016 IPF PPS proposed rule and the FY 2016 IRF PPS proposed rule, respectively. In those instances, stakeholders were able to use the detailed description in the proposed rules to closely replicate the proposed cost weights and suggest methodological changes that were considered during final rulemaking.

Therefore, for the reasons stated earlier, we believe that there was sufficient detail provided in the FY 2018 IPPS/LTCH PPS proposed rule to describe the proposed methodology for deriving the market basket cost weights and labor-related share.

Comment: Several commenters opposed the decrease in the labor-related share from 69.6 percent to 68.3 percent, stating that reducing the labor-related share further undervalues the very real differences in hospital-specific costs. These commenters stated that such a change to the labor-related share would specifically harm hospitals in higher-cost urban areas that already experience some of the highest labor costs in the country. Furthermore, they stated that they opposed reducing the sensitivity of the prospective payment system to the different circumstances of individual hospitals through the introduction of an approach that would foster the development of a reimbursement system that trends toward the mean despite unquestionable differences in hospital costs. The commenters urged CMS to withdraw the proposal to reduce the labor-related share for FY 2018.

Response: We disagree with the commenters' rationale for the request to

withdraw the proposal to reduce the labor-related share. The methodology used to derive the proposed labor-related share of 68.3 percent based on the proposed 2014-based market basket is the same methodology used to determine the current labor-related share of 69.6 percent using the FY 2010-based IPPS market basket. The decrease in the labor-related share of 1.3 percentage points stems from a decrease in the Wages and Salaries and Employee Benefit cost weights (which were derived from the Medicare cost reports), as discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19918), accounting for a decrease of 4.5 percentage points. This is partially offset by an increase in the Labor-related services cost weight, accounting for an increase of 3.2 percentage points. As stated in the FY 2018 IPPS/LTCH PPS proposed rule, the decrease in the Wages and Salaries cost weight from FY 2010 to FY 2014 occurred across most cost centers and in aggregate for the General Service (overhead), Inpatient Routine Service, Ancillary Service, and Outpatient Service cost centers.

Furthermore, the other components of the IPPS (including, but not limited to, MS-DRG, wage index, disproportionate share hospital adjustment, and indirect medical education adjustment) account for variations in costs among individual hospitals. After consideration of the public comments we received, we are finalizing our methodology for calculating the labor-related share of 68.3 percent using the 2014-based IPPS market basket cost weights.

C. Market Basket for Certain Hospitals Presently Excluded From the IPPS

In the FY 2010 IPPS/RV 2010 LTCH PPS final rule (74 FR 43857), we adopted the use of the FY 2006-based IPPS operating market basket percentage increase to update the target amounts for children's hospitals, PPS-excluded cancer hospitals and religious nonmedical health care institutions (RNHCIs). Children's hospitals and PPS-excluded cancer hospitals and RNHCIs are still reimbursed solely under the reasonable cost-based system, subject to the rate-of-increase limits. Under these limits, an annual target amount (expressed in terms of the inpatient operating cost per discharge) is set for each hospital based on the hospital's own historical cost experience trended forward by the applicable rate-of-increase percentages.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50603), under the broad authority in sections 1886(b)(3)(A) and (B), 1886(b)(3)(E), and 1871 of the Act and section 4454 of the BBA, consistent

with our use of the IPPS operating market basket percentage increase to update target amounts, we adopted the use of the FY 2010-based IPPS operating market basket percentage increase to update the target amounts for children's hospitals, PPS-excluded cancer hospitals, and RNHCIs that are paid on the basis of reasonable cost subject to the rate-of-increase limits under § 413.40. In addition, as discussed in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50156 through 50157), consistent with §§ 412.23(g), 413.40(a)(2)(ii)(A), and 413.40(c)(3)(viii), we also have used the percentage increase in the FY 2010-based IPPS operating market basket to update the target amounts for short-term acute care hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa). These hospitals also are paid on the basis of reasonable cost, subject to the rate-of-increase limits under § 413.40.

Due to the small number of children's and cancer hospitals and RNHCIs and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico and because these facilities provide limited Medicare cost report data, we are unable to create a separate market basket specifically for these facilities. Due to the limited cost report data available, we stated that we believe that the proposed 2014-based IPPS operating market basket most closely represents the cost structure of children's hospitals, PPS-excluded cancer hospitals, RNHCIs, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico. We believe this is appropriate as the IPPS operating market basket would reflect the input price growth for providing inpatient hospital services (similar to the services provided by the above excluded facilities) based on the specific mix of goods and services required. Therefore, we proposed to use the 2014-based IPPS market basket percentage increase to update the target amounts for children's hospitals, PPS-excluded cancer hospitals, RNHCIs, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico that are paid on the basis of reasonable cost subject to the rate-of-increase limits under § 413.40. We stated that we believe it is the best available measure of the average increase in the prices of the goods and services purchased by children's hospitals, the cancer hospitals, RNHCIs, and hospitals located outside the 50

States, the District of Columbia, and Puerto Rico in order to provide care.

We did not receive any public comments on our proposal. Therefore, we are adopting the use of the 2014-based IPPS market basket percentage increase to update the target amounts for children's hospitals, PPS-excluded cancer hospitals, RNHCIs, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico that are paid on the basis of reasonable cost.

D. Rebasing and Revising the Capital Input Price Index (CIPI)

The CIPI was originally described in the FY 1993 IPPS final rule (57 FR 40016). There have been subsequent discussions of the CIPI presented in the IPPS proposed and final rules. The FY 2014 IPPS/LTCH PPS final rule (78 FR 50603 through 50607) described the most recent rebasing and revision of the CIPI to a FY 2010 base year, which reflected the capital cost structure of IPPS hospitals available at that time.

For the FY 2018 IPPS update, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19925 through 19929), we proposed to rebase and revise the CIPI to a 2014 base year to reflect a more current structure of capital costs for IPPS hospitals. This proposed 2014-based CIPI was derived using 2014 cost reports for IPPS hospitals, which includes providers whose cost reporting period began on or after October 1, 2013, and prior to September 30, 2014. While we proposed and finalized the title of the current CIPI in the FY 2014 IPPS/LTCH proposed and final rules as "FY 2010-based CIPI", for the proposed CIPI, we proposed to simply refer to the proposed CIPI as "2014-based CIPI" (dropping the reference to FY). As discussed in section IV.B. of the preamble of the proposed rule, for the 2014-based IPPS operating market basket, we proposed this change in naming convention for the market basket because the base year cost weight data for the proposed market basket do not reflect only fiscal year data. Similarly, the proposed 2014-based CIPI uses Medicare cost report data and other government data that reflect 2014 fiscal year, 2014 calendar year, and 2014 State fiscal year expenses to determine the base year cost weights and vintage weights. Given that it is based on a mix of classifications of 2014 data, we proposed to refer to the CIPI as "2014-based" instead of "FY 2014-based" or "CY 2014-based". However, the methods and data used to derive each of these CIPI are similar. As with the FY 2010-based index, we proposed to develop two sets of weights to derive

the proposed 2014-based CIPI. The first set of weights identifies the proportion of hospital capital expenditures attributable to each expenditure category, while the second set of weights is a set of relative vintage weights for depreciation and interest. The set of vintage weights is used to identify the proportion of capital expenditures within a cost category that is attributable to each year over the useful life of the capital assets in that category. A more thorough discussion of vintage weights is provided later in this section.

Using 2014 Medicare cost reports, we were able to group capital costs into the following categories: Depreciation, Interest, Lease, and Other. For each of these categories, we proposed to determine what proportion of total capital costs the category represents using the data reported by IPPS hospitals on Worksheet A-7, which is the same methodology used for the FY 2010-based CIPI. As shown in the left column of Table IV-07 in the proposed rule (82 FR 19926), in 2014, depreciation expenses accounted for 66.4 percent of total capital costs, interest expenses accounted for 16.3

percent, leasing expenses accounted for 11.8 percent, and other capital expenses accounted for 5.5 percent. This table is also listed below.

We also proposed to allocate lease costs across each of the remaining capital cost categories as was done in the FY 2010-based CIPI. This resulted in three primary capital cost categories in the proposed 2014-based CIPI: Depreciation, Interest, and Other. Lease costs are unique in that they are not broken out as a separate cost category in the proposed 2014-based CIPI. Rather, we proposed to proportionally distribute leasing costs among the cost categories of Depreciation, Interest, and Other, reflecting the assumption that the underlying cost structure of leases is similar to that of capital costs in general. As was done for the FY 2010-based CIPI, we proposed to assume that 10 percent of the lease costs as a proportion of total capital costs represents overhead and to assign those costs to the Other capital cost category accordingly. Therefore, we assumed that approximately 1.2 percent (11.8 percent x 0.1) of total capital costs represent lease costs attributable to overhead, and we proposed to add this 1.2 percent to the 5.5 percent Other cost

category weight. We then proposed to distribute the remaining lease costs (10.6 percent, or 11.8 percent – 1.2 percent) proportionally across the three cost categories (Depreciation, Interest, and Other) based on the proportion that these categories comprise of the sum of the Depreciation, Interest, and Other cost categories (excluding lease expenses). For example, the Other cost category represented 6.3 percent of all three cost categories (Depreciation, Interest, and Other) prior to any lease expenses being allocated. This 6.3 percent is applied to the 10.6 percent of remaining lease expenses so that another 0.7 percent of lease expenses as a percent of total capital costs is allocated to the Other cost category. Therefore, the resulting proposed Other cost weight is 7.4 percent (5.5 percent + 1.2 percent + 0.7 percent). This is the same methodology used for the FY 2010-based CIPI. The resulting cost weights of the proposed allocation of lease expenses were shown in the right column of Table IV-07 in the proposed rule (82 FR 19926). This table is also included below and reflects the final allocation of lease expenses.

TABLE IV-07—PROPOSED AND FINAL ALLOCATION OF LEASE EXPENSES FOR THE PROPOSED AND FINAL 2014-BASED CIPI

Cost categories	Proposed and final cost shares obtained from medicare cost reports (percent of total capital costs)	Proposed and final cost shares after allocation of lease expenses (percent of total capital costs)
Depreciation	66.4	74.4
Interest	16.3	18.2
Lease	11.8	
Other	5.5	7.4

Finally, we proposed to further divide the Depreciation and Interest cost categories. We proposed to separate the Depreciation cost category into the following two categories: (1) Building and Fixed Equipment and (2) Movable Equipment. We also proposed to separate the Interest cost category into the following two categories: (1) Government/Nonprofit; and (2) For-profit.

To disaggregate the depreciation cost weight, we needed to determine the percent of total depreciation costs for IPPS hospitals (after the allocation of lease costs) that are attributable to building and fixed equipment, which we hereafter refer to as the “fixed percentage.” Based on Worksheet A-7

data from the 2014 IPPS Medicare cost reports, we have determined that depreciation costs for building and fixed equipment account for approximately 49 percent of total depreciation costs, while depreciation costs for movable equipment account for approximately 51 percent of total depreciation costs. As was done for the FY 2010-based CIPI, we proposed to apply this fixed percentage to the depreciation cost weight (after leasing costs are included) to derive a Depreciation cost weight attributable to Building and Fixed Equipment and a Depreciation cost weight attributable to Movable Equipment.

To disaggregate the interest cost weight, we needed to determine the

percent of total interest costs for IPPS hospitals that are attributable to government and nonprofit facilities, which we hereafter refer to as the “nonprofit percentage,” because interest price pressures tend to differ between nonprofit and for-profit facilities. We proposed to use interest costs data from Worksheet A-7 of the 2014 Medicare cost reports for IPPS hospitals, which is the same methodology used for the FY 2010-based CIPI. The nonprofit percentage determined using this method is 86 percent. Table IV-08 in the proposed rule (82 FR 19927) provides a comparison of the FY 2010-based CIPI cost weights and the proposed 2014-based CIPI cost weights. This table is also included below and

reflects the final 2014-based CIPI cost weights.

After the capital cost category weights were computed, it was necessary to select appropriate price proxies to reflect the rate-of-increase for each expenditure category. We proposed to apply the same price proxies as were used in the FY 2010-based CIPI, which are listed below and provided in Table IV–08 in the proposed rule. We also proposed to continue to vintage weight the capital price proxies for Depreciation and Interest to capture the long-term consumption of capital. This vintage weighting method is the same method that was used for the FY 2010-based CIPI and is described below.

We proposed to continue to proxy the Depreciation—Building and Fixed Equipment cost category by the BEA Chained Price Index for Private Fixed Investment in Structures, Nonresidential, Hospitals and Special

Care (BEA Table 5.4.4. Price Indexes for Private Fixed Investment in Structures by Type). As stated in the FY 2010 IPPS/LTCH PPS final rule (74 FR 43860), for the FY 2006-based CIPI we finalized the use of this index to measure the price growth of this cost category. This BEA index is intended to capture prices for construction of facilities such as hospitals, nursing homes, hospices, and rehabilitation centers. For the Depreciation—Movable Equipment cost category, we proposed to continue to measure the price growth using the PPI Commodity for Machinery and Equipment (BLS series code WPU11). This price index reflects price inflation associated with a variety of machinery and equipment that would be utilized by hospitals including but not limited to communication equipment, computers, and medical equipment. For the Nonprofit Interest and For-profit Interest cost categories,

we proposed to continue to measure the price growth using the average yield on domestic municipal bonds (Bond Buyer 20-bond index) and the average yield on Moody's Aaa bonds (Federal Reserve), respectively. As stated above, we proposed two proxies because interest price pressures tend to differ between nonprofit and for-profit facilities.

For the Other capital cost category (including insurances, taxes, and other capital-related costs), we proposed to continue to measure the price growth using the CPI for Rent of Primary Residence (All Urban Consumers) (BLS series code CUUS0000SEHA), which would reflect the price growth of these costs. We believe that these price proxies continue to be the most appropriate proxies for IPPS capital costs that meet our selection criteria of relevance, timeliness, availability, and reliability.

TABLE IV–08—PROPOSED AND FINAL 2014-BASED CIPI COST WEIGHTS AND PRICE PROXIES WITH FY 2010-BASED CIPI COST WEIGHTS INCLUDED FOR COMPARISON

Cost categories	FY 2010 cost weights	Proposed and final 2014 cost weights	Proposed and final price proxy
Total	100.0	100.0	
Depreciation	74.0	74.4	
Building and Fixed Equipment	36.2	36.7	BEA's Chained Price Index for Private Fixed Investment in Structures, Nonresidential, Hospitals and Special Care.
Movable Equipment	37.9	37.7	PPI Commodity for Machinery and Equipment.
Interest	19.2	18.2	
Government/Nonprofit	17.1	15.7	Average Yield on Domestic Municipal Bonds (Bond Buyer 20-Bond Index).
For-Profit	2.1	2.5	Average Yield on Moody's Aaa Bonds.
Other	6.8	7.4	CPI for Rent of Primary Residence.

Note: The cost weights are calculated using three decimal places. For presentational purposes, we are displaying one decimal and therefore, the detail may not add to the total due to rounding.

Because capital is acquired and paid for over time, capital expenses in any given year are determined by both past and present purchases of physical and financial capital. We stated in the proposed rule that the proposed vintage-weighted 2014-based CIPI is intended to capture the long-term consumption of capital, using vintage weights for depreciation (physical capital) and interest (financial capital). These vintage weights reflect the proportion of capital purchases attributable to each year of the expected life of building and fixed equipment, movable equipment, and interest. We proposed to use vintage weights to compute vintage-weighted price changes associated with depreciation and interest expenses.

Vintage weights are an integral part of the CIPI. Capital costs are inherently complicated and are determined by complex capital purchasing decisions,

over time, based on such factors as interest rates and debt financing. In addition, capital is depreciated over time instead of being consumed in the same period it is purchased. By accounting for the vintage nature of capital, we are able to provide an accurate and stable annual measure of price changes. Annual nonvintage price changes for capital are unstable due to the volatility of interest rate changes and, therefore, do not reflect the actual annual price changes for IPPS capital costs. The CIPI reflects the underlying stability of the capital acquisition process.

To calculate the vintage weights for depreciation and interest expenses, we first needed a time series of capital purchases for building and fixed equipment and movable equipment. We found no single source that provides an appropriate time series of capital

purchases by hospitals for all of the above components of capital purchases. The early Medicare cost reports did not have sufficient capital data to meet this need. Data we obtained from the American Hospital Association (AHA) did not include annual capital purchases. However, we were able to obtain data on total expenses back to 1963 from the AHA. Consequently, we proposed to use data from the AHA Panel Survey and the AHA Annual Survey to obtain a time series of total expenses for hospitals. We then proposed to use data from the AHA Panel Survey supplemented with the ratio of depreciation to total hospital expenses obtained from the Medicare cost reports to derive a trend of annual depreciation expenses for 1963 through 2014. We proposed to separate these depreciation expenses into annual amounts of building and fixed

equipment depreciation and movable equipment depreciation as determined earlier. From these annual depreciation amounts, we derived annual end-of-year book values for building and fixed equipment and movable equipment using the expected life for each type of asset category. We used the AHA data and similar methodology to derive the FY 2010-based IPPS capital market basket (78 FR 50604).

To continue to calculate the vintage weights for depreciation and interest expenses, we also needed to account for the expected lives for building and fixed equipment, movable equipment, and interest for the proposed 2014-based CIPI. We proposed to calculate the expected lives using Medicare cost report data. The expected life of any asset can be determined by dividing the value of the asset (excluding fully depreciated assets) by its current year depreciation amount. This calculation yields the estimated expected life of an asset if the rates of depreciation were to continue at current year levels, assuming straight-line depreciation. Using this proposed method, we determined the average expected life of building and fixed equipment to be equal to 27 years, and the average expected life of movable equipment to be equal to 12 years. For the expected life of interest, we believe that vintage weights for interest should represent the average expected life of building and fixed equipment because, based on previous research described in the FY 1997 IPPS final rule (61 FR 46198), the

expected life of hospital debt instruments and the expected life of buildings and fixed equipment are similar. We note that the FY 2010-based CIPI was based on an expected average life of building and fixed equipment of 26 years and an expected average life of movable equipment of 12 years. Multiplying these expected lives by the annual depreciation amounts results in annual year-end asset costs for building and fixed equipment and movable equipment. We then calculated a time series, beginning in 1964, of annual capital purchases by subtracting the previous year's asset costs from the current year's asset costs.

For the building and fixed equipment and movable equipment vintage weights, we proposed to use the real annual capital-related purchase amounts for each asset type to capture the actual amount of the physical acquisition, net of the effect of price inflation.

These real annual capital-related purchase amounts are produced by deflating the nominal annual purchase amount by the associated price proxy as described in the proposed rule, and this final rule. For the interest vintage weights, we proposed to use the total nominal annual capital-related purchase amounts to capture the value of the debt instrument (including, but not limited to, mortgages and bonds). Using these capital purchases time series specific to each asset type, we proposed to calculate the vintage weights for

building and fixed equipment, for movable equipment, and for interest.

The vintage weights for each asset type are deemed to represent the average purchase pattern of the asset over its expected life (in the case of building and fixed equipment and interest, 27 years, and in the case of movable equipment, 12 years). For each asset type, we proposed to use the time series of annual capital purchases amounts available from 2014 back to 1964. These data allow us to derive twenty-five 27-year periods of capital purchases for building and fixed equipment and interest, and forty 12-year periods of capital purchases for movable equipment. For each 27-year period for building and fixed equipment and interest, or 12-year period for movable equipment, we proposed to calculate annual vintage weights by dividing the capital-related purchase amount in any given year by the total amount of purchases over the entire 27-year or 12-year period. This calculation was done for each year in the 27-year or 12-year period and for each of the periods for which we have data. We then calculated the average vintage weight for a given year of the expected life by taking the average of these vintage weights across the multiple periods of data.

The vintage weights for the proposed 2014-based CIPI and the FY 2010-based CIPI were presented in Table IV–09 in the proposed rule (82 FR 19928). This table is also included below and reflects the final 2014-based CIPI.

TABLE IV–09—PROPOSED AND FINAL 2014–BASED CIPI AND FY 2010–BASED CIPI VINTAGE WEIGHTS

Year ¹	Building and fixed equipment		Movable equipment		Interest	
	Proposed and final 2014-based 27 years	FY 2010-based 26 years	Proposed and final 2014-based 12 years	FY 2010-based 12 years	Proposed and final 2014-based 27 years	FY 2010-based 26 years

Total	1.000	1.000	1.000	1.000	1.000	1.000

Note: Numbers may not add to total due to rounding.

¹ Vintage weight in the last year (for example, year 27 for the 2014-based CIPI) is applied to the most recent data point and prior vintage weights are applied going back in time. For example, year 27 vintage weight would be applied to the 2018q3 fixed price proxy level, year 26 vintage weight would be applied to the 2017q3 fixed price proxy level, and so forth.

The process of creating vintage-weighted price proxies requires applying the vintage weights to the price proxy index where the last applied vintage weight in Table IV–09 is applied to the most recent data point. We have provided on the CMS Web site an example of how the vintage weighting price proxies are calculated, using example vintage weights and example price indices. The example can be found under the following CMS Web site link: <http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/>

MedicareProgramRatesStats/MarketBasketResearch.html in the zip file titled “Weight Calculations as described in the IPPS FY 2010 Proposed Rule.”

Comment: A few commenters supported the proposal to rebase the CIPI.

Response: We appreciate the commenters’ support.

We did not receive any detailed public comments on our methodology for deriving the proposed 2014-based CIPI. After consideration of the public comments we received, in this final

rule, we are finalizing the 2014-based CIPI as proposed.

Table IV–10 in the proposed rule (82 FR 19929) compares both the historical and forecasted percent changes in the FY 2010-based CIPI and the proposed 2014-based CIPI. The percent changes in the proposed rule were based on IGI’s fourth quarter 2016 forecast with historical data through third quarter 2016. The forecasted growth rates provided in Table IV–10 below are based on IGI’s more recent second quarter 2017 forecast with historical data through first quarter 2017.

TABLE IV–10—COMPARISON OF FY 2010-BASED AND PROPOSED AND FINAL 2014-BASED CAPITAL INPUT PRICE INDEX, PERCENT CHANGE, FY 2013 THROUGH FY 2020

Fiscal year	CIPI, FY 2010-based	Proposed and final CIPI, 2014-based
Historical Data:		
FY 2013	1.1	1.0
FY 2014	1.2	1.2
FY 2015	1.2	1.1
FY 2016	1.1	1.0
Average FYs 2013–2016	1.2	1.1
Forecast:		
FY 2017	1.2	1.1
FY 2018	1.4	1.3
FY 2019	1.4	1.4
FY 2020	1.5	1.5
Average FYs 2017–2020	1.4	1.3

Source: IHS Global Inc., 2nd quarter 2017 forecast.

IGI forecasts a 1.3 percent increase in the proposed and final 2014-based CIPI for FY 2018, as shown in Table IV–10. The underlying vintage-weighted price increases for depreciation (including building and fixed equipment and movable equipment) and interest

(including government/nonprofit and for-profit) based on the proposed 2014-based CIPI were included in Table IV–11 of the proposed rule (82 FR 19929). Again, the percent changes in the proposed rule were based on IGI’s fourth quarter 2016 forecast with

historical data through third quarter 2016. The forecasted growth rates provided in Table IV–11 below are based on IGI’s more recent second quarter 2017 forecast with historical data through first quarter 2017.

TABLE IV—11—PROPOSED AND FINAL 2014-BASED CAPITAL INPUT PRICE INDEX PERCENT CHANGES, TOTAL AND DEPRECIATION AND INTEREST COMPONENTS—FYs 2013 THROUGH 2020

Fiscal year	Total	Depreciation	Interest
Historical Data:			
FY 2013	1.0	1.7	–2.5
FY 2014	1.2	1.8	–1.8
FY 2015	1.1	1.8	–2.7
FY 2016	1.0	1.7	–3.0
Forecast:			
FY 2017	1.1	1.6	–2.2
FY 2018	1.3	1.6	–1.3
FY 2019	1.4	1.6	–0.5
FY 2020	1.5	1.6	–0.1

Source: IHS Global Inc. 2nd quarter 2017 forecast.

Rebasing the CIPI from FY 2010 to 2014 decreased the percent change in the forecasted update for FY 2018 by 0.1 percentage point, from 1.4 percent to 1.3 percent, as shown in Table IV–10. The lower FY 2018 update is primarily due to a change in the vintage weights for the proposed and final 2014-based CIPI, which includes updating the asset purchase data through 2014 and changing the building and fixed equipment and interest asset lives from 26 years to 27 years. This lower update is only partially offset by the change in the base year weights, which produce a faster increase due to more weight being given to the Depreciation cost category and less weight being given to the Interest cost category. As shown in Table IV–11 in the proposed rule (82 FR 19929) and this final rule, for FY 2018, vintage-weighted price growth is projected to be positive for the Depreciation cost category and negative for the Interest cost category.

V. Other Decisions and Changes to the IPPS for Operating System

A. Changes to MS–DRGs Subject To Postacute Care Transfer Policy and MS–DRG Special Payments Policies (§ 412.4)

1. Background

Existing regulations at 42 CFR 412.4(a) define discharges under the IPPS as situations in which a patient is formally released from an acute care hospital or dies in the hospital. Section 412.4(b) defines acute care transfers, and § 412.4(c) defines postacute care transfers. Our policy set forth in § 412.4(f) provides that when a patient is transferred and his or her length of stay is less than the geometric mean length of stay for the MS–DRG to which the case is assigned, the transferring hospital is generally paid based on a graduated per diem rate for each day of stay, not to exceed the full MS–DRG payment that would have been made if

the patient had been discharged without being transferred.

The per diem rate paid to a transferring hospital is calculated by dividing the full MS–DRG payment by the geometric mean length of stay for the MS–DRG. Based on an analysis that showed that the first day of hospitalization is the most expensive (60 FR 45804), our policy generally provides for payment that is twice the per diem amount for the first day, with each subsequent day paid at the per diem amount up to the full MS–DRG payment (§ 412.4(f)(1)). Transfer cases also are eligible for outlier payments. In general, the outlier threshold for transfer cases, as described in § 412.80(b), is equal to the fixed-loss outlier threshold for nontransfer cases (adjusted for geographic variations in costs), divided by the geometric mean length of stay for the MS–DRG, and multiplied by the length of stay for the case, plus 1 day.

We established the criteria set forth in § 412.4(d) for determining which DRGs qualify for postacute care transfer payments in the FY 2006 IPPS final rule (70 FR 47419 through 47420). The determination of whether a DRG is subject to the postacute care transfer policy was initially based on the Medicare Version 23.0 GROUPE (FY 2006) and data from the FY 2004 MedPAR file. However, if a DRG did not exist in Version 23.0 or a DRG included in Version 23.0 is revised, we use the current version of the Medicare GROUPE and the most recent complete year of MedPAR data to determine if the DRG is subject to the postacute care transfer policy. Specifically, if the MS–DRG's total number of discharges to postacute care equals or exceeds the 55th percentile for all MS–DRGs and the proportion of short-stay discharges to postacute care to total discharges in the MS–DRG exceeds the 55th percentile for all MS–DRGs, CMS will apply the postacute care transfer policy to that MS–DRG and to any other MS–DRG that

shares the same base MS–DRG. The statute directs us to identify MS–DRGs based on a high volume of discharges to postacute care facilities and a disproportionate use of postacute care services. As discussed in the FY 2006 IPPS final rule (70 FR 47416), we determined that the 55th percentile is an appropriate level at which to establish these thresholds. In that same final rule (70 FR 47419), we stated that we will not revise the list of DRGs subject to the postacute care transfer policy annually unless we are making a change to a specific MS–DRG.

To account for MS–DRGs subject to the postacute care policy that exhibit exceptionally higher shares of costs very early in the hospital stay, § 412.4(f) also includes a special payment methodology. For these MS–DRGs, hospitals receive 50 percent of the full MS–DRG payment, plus the single per diem payment, for the first day of the stay, as well as a per diem payment for subsequent days (up to the full MS–DRG payment (§ 412.4(f)(6))). For an MS–DRG to qualify for the special payment methodology, the geometric mean length of stay must be greater than 4 days, and the average charges of 1-day discharge cases in the MS–DRG must be at least 50 percent of the average charges for all cases within the MS–DRG. MS–DRGs that are part of an MS–DRG severity level group will qualify under the MS–DRG special payment methodology policy if any one of the MS–DRGs that share that same base MS–DRG qualifies (§ 412.4(f)(6)).

2. Changes for FY 2018

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19929 through 19931), based on our annual review of MS–DRGs, we identified three MS–DRGs that we proposed to be included on the list of MS–DRGs subject to the special payment transfer policy. As we discussed in section II.F. of the preamble of that proposed rule, in

response to public comments and based on our analysis of FY 2016 MedPAR claims data, we proposed to make changes to MS-DRGs, effective for FY 2018.

As discussed in the preamble of the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19850), we proposed to delete MS-DRGs 984, 985, and 986 (Prostatic O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC and without CC/MCC, respectively) and reassign the procedure codes currently assigned to these three MS-DRGs to MS-DRGs 987, 988, and 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC and without CC/MCC, respectively).

In light of the proposed changes to the MS-DRGs for FY 2018, according to the

regulations under § 412.4(d), we evaluated proposed revised MS-DRGs 987, 988, and 989 (which would contain the proposed reassigned procedures from MS-DRGs 984, 985, and 986) against the general postacute care transfer policy criteria using the FY 2016 MedPAR data. If an MS-DRG qualified for the postacute care transfer policy, we also evaluated that MS-DRG under the special payment methodology criteria according to regulations at § 412.4(f)(6). We continue to believe it is appropriate to reassess MS-DRGs when proposing reassignment of procedure or diagnosis codes that would result in material changes to an MS-DRG. MS-DRGs 987, 988, and 989 are currently subject to the postacute care transfer

policy. We stated in the proposed rule that as a result of our review, the proposed revised MS-DRGs 987, 988, and 989 continue to qualify to be included on the list of MS-DRGs that are subject to the postacute care transfer policy. We did not propose to change the postacute care transfer policy status for MS-DRGs 987, 988, and 989.

As discussed in section II.F.14.b. of the preamble of this FY 2018 IPPS/LTCH PPS final rule, we are finalizing the proposed revisions to these MS-DRGs. Using the March 2017 update of the FY 2016 MedPAR file, we developed the following chart which sets forth the most recent analysis of the postacute care transfer policy criteria completed for this final rule.

LIST OF REVISED MS-DRGs SUBJECT TO REVIEW OF POSTACUTE CARE TRANSFER POLICY STATUS FOR FY 2018

Revised MS-DRG	MS-DRG title	Total cases	Postacute care transfers (55th percentile: 1,418)	Short-stay postacute care transfers	Percent of short-stay postacute care transfers to all cases (55th percentile: 7.80629%)	Postacute care transfer policy status
987	Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC.	8,485	4,395	1,117	13.16441	Yes.
988	Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with CC.	8,876	3,774	817	9.20460	Yes.
989	Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis without MCC/CC.	2,364	* 568	53	* 2.24196	Yes. **

* Indicates a current postacute care transfer policy criterion that the MS-DRG did not meet.

** As described in the policy at 42 CFR 412.4(d)(3)(ii)(D), MS-DRGs that share the same base MS-DRG will all qualify under the postacute care transfer policy if any one of the MS-DRGs that share that same base MS-DRG qualifies.

As we discussed in the proposed rule, we also determined that proposed revised MS-DRGs 987, 988, and 989 would meet the criteria for the MS-DRG special payment methodology. MS-DRGs 987, 988, and 989 are not currently listed as being subject to the special payment policy. Therefore, we proposed that these three proposed revised MS-DRGs would be subject to the MS-DRG special payment methodology, effective FY 2018.

We did not receive any public comments on this proposal. Therefore, we are finalizing the proposed changes to the special payment policy status of MS-DRGs 987, 988, and 989. We note that, in a chart in the proposed rule (82 FR 19931), we erroneously listed the geometric mean length of stay for MS-DRG 988 as 8.6 days. The figure should have been 4.4 days (which, for this final rule, is revised to 4.3 days as a result of the most recent data analysis). Regardless, because the revised

geometric mean length of stay is also greater than 4 days, MS-DRG 988 qualifies for special payment policy status, and as described in the policy at 42 CFR 412.4(d)(6)(iv), MS-DRGs 987 and 989 also qualify, consistent with our proposal. Using the March 2017 update of the FY 2016 MedPAR file, we developed the following chart which set forth the most recent data analysis of the special payment methodology criteria completed for this final rule.

LIST OF REVISED MS-DRGs SUBJECT TO REVIEW OF SPECIAL PAYMENT POLICY STATUS FOR FY 2018

Revised MS-DRG	MS-DRG title	Geometric mean length of stay	Average charges of 1-day discharges	50 percent of average charges for all cases within MS-DRG	Special payment policy status
987	Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC.	7.9	\$33,424	\$52,050	Yes*.
988	Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with CC.	4.3	34,443	28,404	Yes.

LIST OF REVISED MS-DRGS SUBJECT TO REVIEW OF SPECIAL PAYMENT POLICY STATUS FOR FY 2018—Continued

Revised MS-DRG	MS-DRG title	Geometric mean length of stay	Average charges of 1-day discharges	50 percent of average charges for all cases within MS-DRG	Special payment policy status
989	Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis without MCC/CC.	2.2	0	0	Yes.*

* As described in the policy at 42 CFR 412.4(d)(6)(iv), MS-DRGs that share the same base MS-DRG will all qualify under the MS-DRG special payment policy if any one of the MS-DRGs that share that same base MS-DRG qualifies.

The finalized special payment policy status of these three MS-DRGs is reflected in Table 5 associated with this final rule, which is listed in section VI. of the Addendum to this final rule and available via the Internet on the CMS Web site.

B. Changes in the Inpatient Hospital Update for FY 2018 (§ 412.64(d))

1. FY 2018 Inpatient Hospital Update

In accordance with section 1886(b)(3)(B)(i) of the Act, each year we update the national standardized amount for inpatient hospital operating costs by a factor called the “applicable percentage increase.” As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19931 through 19933), for FY 2018, we are setting the applicable percentage increase by applying the adjustments listed in this section in the same sequence as we did for FY 2017. Specifically, consistent with section 1886(b)(3)(B) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, we are setting the applicable percentage increase by applying the following adjustments in the following sequence. The applicable percentage increase under the IPPS is equal to the rate-of-increase in the hospital market basket for IPPS hospitals in all areas, subject to—

(a) A reduction of one-quarter of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals that fail to submit quality information under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act;

(b) A reduction of three-quarters of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals not considered to be meaningful EHR users in accordance with section 1886(b)(3)(B)(ix) of the Act;

(c) An adjustment based on changes in economy-wide productivity (the

multifactor productivity (MFP) adjustment); and

(d) An additional reduction of 0.75 percentage point as required by section 1886(b)(3)(B)(xii) of the Act.

Sections 1886(b)(3)(B)(xi) and (b)(3)(B)(xii) of the Act, as added by section 3401(a) of the Affordable Care Act, state that application of the MFP adjustment and the additional FY 2018 adjustment of 0.75 percentage point may result in the applicable percentage increase being less than zero.

We note that, in compliance with section 404 of the MMA, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19916 through 19923), we proposed to replace the FY 2010-based IPPS operating market basket with the rebased and revised 2014-based IPPS operating market basket for FY 2018. We proposed to base the proposed FY 2018 market basket update used to determine the applicable percentage increase for the IPPS on IHS Global Inc.’s (IGI’s) fourth quarter 2016 forecast of the proposed 2014-based IPPS market basket rate-of-increase with historical data through third quarter 2016, which was estimated to be 2.9 percent. We proposed that if more recent data subsequently became available (for example, a more recent estimate of the market basket and the MFP adjustment), we would use such data, if appropriate, to determine the FY 2018 market basket update and the MFP adjustment in this final rule. We received public comments regarding the rebasing and revising of the IPPS operating market basket and refer readers to section IV.B. of this final rule for a complete discussion on the rebasing and revising of the market basket. In section IV.B., we are finalizing our proposals without modification and, therefore, are using the finalized rebased and revised 2014-based IPPS market basket rate-of-increase for FY 2018.

Based on the most recent data available for this FY 2018 IPPS/LTCH PPS final rule (that is, IGI’s second quarter 2017 forecast of the 2014-based IPPS market basket rate-of-increase with historical data through first quarter 2017), we estimate that the FY 2018

market basket update used to determine the applicable percentage increase for the IPPS is 2.7 percent.

For FY 2018, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act (hereafter referred to as a hospital that submits quality data) and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act (hereafter referred to as a hospital that is a meaningful EHR user), there are four possible applicable percentage increases that can be applied to the standardized amount as specified in the table that appears later in this section.

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51689 through 51692), we finalized our methodology for calculating and applying the MFP adjustment. As we explained in that rule, section 1886(b)(3)(B)(xi)(II) of the Act, as added by section 3401(a) of the Affordable Care Act, defines this productivity adjustment as equal to the 10-year moving average of changes in annual economy-wide, private nonfarm business MFP (as projected by the Secretary for the 10-year period ending with the applicable fiscal year, calendar year, cost reporting period, or other annual period). The Bureau of Labor Statistics (BLS) publishes the official measure of private nonfarm business MFP. We refer readers to the BLS Web site at <http://www.bls.gov/mfp> for the BLS historical published MFP data. MFP is derived by subtracting the contribution of labor and capital input growth from output growth. The projections of the components of MFP are currently produced by IGI, a nationally recognized economic forecasting firm with which CMS contracts to forecast the components of the market baskets and MFP. As we discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49509), beginning with the FY 2016 rulemaking cycle, the MFP adjustment is calculated using the revised series developed by IGI to proxy the aggregate capital inputs. Specifically, in order to generate a forecast of MFP, IGI forecasts BLS aggregate capital inputs using a

regression model. A complete description of the MFP projection methodology is available on the CMS Web site at: <http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/MedicareProgramRatesStats/MarketBasketResearch.html>. As discussed in the FY 2016 IPPS/LTCH PPS final rule, if IGI makes changes to the MFP methodology, we will announce them on our Web site rather than in the annual rulemaking.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19932), for FY 2018, we proposed an MFP adjustment

of 0.4 percentage point. Similar to the market basket update, for the proposed rule, we used IGI's fourth quarter 2016 forecast of the MFP adjustment to compute the proposed MFP adjustment. As noted previously, we proposed that if more recent data subsequently become available, we would use such data, if appropriate, to determine the FY 2018 market basket update and the MFP adjustment for the final rule. Based on the most recent data available for this final rule, we have determined an MFP adjustment of 0.6 percentage point for FY 2018.

We did not receive any public comments on our proposal to use the most recent available data to determine the final market basket update and the MFP adjustment. Therefore, for this final rule, we are finalizing a market basket update of 2.7 percent and an MFP adjustment of 0.6 percentage point based on the most recent available data.

Based on the most recent data available for this final rule, as described previously, we have determined four applicable percentage increases to the standardized amount for FY 2018, as specified in the following table:

FY 2018 APPLICABLE PERCENTAGE INCREASES FOR THE IPPS

FY 2018	Hospital submitted quality data and is a meaningful EHR user	Hospital submitted quality data and is not a meaningful EHR user	Hospital did not submit quality data and is a meaningful EHR user	Hospital did not submit quality data and is not a meaningful EHR user
Market Basket Rate-of-Increase	2.7	2.7	2.7	2.7
Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0.0	0.0	-0.675	-0.675
Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0.0	-2.025	0.0	-2.025
MFP Adjustment under Section 1886(b)(3)(B)(xi) of the Act	-0.6	-0.6	-0.6	-0.6
Statutory Adjustment under Section 1886(b)(3)(B)(xii) of the Act	-0.75	-0.75	-0.75	-0.75
Applicable Percentage Increase Applied to Standardized Amount	1.35	-0.675	0.675	-1.35

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19932), we proposed to revise the existing regulations at 42 CFR 412.64(d) to reflect the current law for the FY 2018 update. Specifically, in accordance with section 1886(b)(3)(B) of the Act, we proposed to revise paragraph (vii) of § 412.64(d)(1) to include the applicable percentage increase to the FY 2018 operating standardized amount as the percentage increase in the market basket index, subject to the reductions specified under § 412.64(d)(2) for a hospital that does not submit quality data and § 412.64(d)(3) for a hospital that is not a meaningful EHR user, less an MFP adjustment and less an additional reduction of 0.75 percentage point.

We did not receive any public comments on our proposed changes to the regulations at § 412.64(d)(1)(vii) and, therefore, are finalizing these proposed changes without modification in this final rule.

Section 1886(b)(3)(B)(iv) of the Act provides that the applicable percentage increase to the hospital-specific rates for SCHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS). Therefore,

the update to the hospital-specific rates for SCHs also is subject to section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act.

As discussed in section V.H. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule and in this final rule, section 205 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10, enacted on April 16, 2015) extended the MDH program (which, under previous law, was to be in effect for discharges on or before March 31, 2015 only) for discharges occurring on or after April 1, 2015, through FY 2017 (that is, for discharges occurring on or before September 30, 2017). Therefore, under current law, the MDH program will expire at the end of FY 2017.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19932), for FY 2018, we proposed updates to the hospital-specific rates applicable to SCHs based on IGI's fourth quarter 2016 forecast of the proposed 2014-based IPPS market basket update with historical data through third quarter 2016. Similarly, we used IGI's fourth quarter 2016 forecast of the MFP adjustment. We proposed that if more recent data subsequently became available (for example, a more recent

estimate of the market basket increase and the MFP adjustment), we would use such data, if appropriate, to determine the update in the final rule.

We did not receive any public comments with regard to our proposal. Therefore, we are finalizing the proposal to determine the update to the hospital-specific rates for SCHs in this final rule using the most recent data available.

For this final rule, based on the most recent available data, we are finalizing the following updates to the hospital-specific rates applicable to SCHs (using IGI's second quarter 2017 forecast of the 2014-based IPPS market basket update and the MFP adjustment): An update of 1.35 percent for a hospital that submits quality data and is a meaningful EHR user; an update of 0.675 percent for a hospital that fails to submit quality data and is a meaningful EHR user; an update of -0.675 percent for a hospital that submits quality data and is not a meaningful EHR user; and an update of -1.35 percent for a hospital that fails to submit quality data and is not a meaningful EHR user.

2. FY 2018 Puerto Rico Hospital Update

As discussed in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56937 through 56938), prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national

standardized amount and 25 percent of the Puerto Rico-specific standardized amount. Section 601 of Public Law 114–113 amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount.

Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount under the amendments to section 1886(d)(9)(E) of the Act, there is no longer a need for us to determine an update to the Puerto Rico standardized amount. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the same update to the national standardized amount discussed under section V.B.1. of the preamble of this final rule. Accordingly, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19932 through 19933), for FY 2018, we proposed an applicable percentage increase of 1.75 percent to the standardized amount for hospitals located in Puerto Rico. We did not receive any public comments on our proposal. Based on the most recent available data, we are finalizing an applicable percentage increase of 1.35 percent to the standardized amount for hospitals located in Puerto Rico.

We note that section 1886(b)(3)(B)(viii) of the Act, which specifies the adjustment to the applicable percentage increase for “subsection (d)” hospitals that do not submit quality data under the rules established by the Secretary, is not applicable to hospitals located in Puerto Rico.

In addition, section 602 of Public Law 114–113 amended section 1886(n)(6)(B) of the Act to specify that Puerto Rico hospitals are eligible for incentive payments for the meaningful use of certified EHR technology, effective beginning FY 2016, and also to apply the adjustments to the applicable percentage increase under section 1886(b)(3)(B)(ix) of the Act to Puerto Rico hospitals that are not meaningful EHR users, effective FY 2022. Accordingly, because the provisions of section 1886(b)(3)(B)(ix) of the Act are not applicable to hospitals located in Puerto Rico until FY 2022, the adjustments under this provision are not applicable for FY 2018.

C. Change to Volume Decrease Adjustment for Sole Community Hospitals (SCHs) and Medicare-Dependent, Small Rural Hospitals (MDHs) (§§ 412.92 and 412.108)

1. Background

Sections 1886(d)(5)(D) and (d)(5)(G) of the Act provide special payment protections under the IPPS to sole community hospitals (SCHs) and Medicare-dependent, small rural hospitals (MDHs), respectively. Section 1886(d)(5)(D)(iii) of the Act defines an SCH in part as a hospital that the Secretary determines is located more than 35 road miles from another hospital or that, by reason of factors such as isolated location, weather conditions, travel conditions, or absence of other like hospitals (as determined by the Secretary), is the sole source of inpatient hospital services reasonably available to Medicare beneficiaries. The regulations at 42 CFR 412.92 set forth the criteria that a hospital must meet to be classified as a SCH. For more information on SCHs, we refer readers to the FY 2009 IPPS/LTCH PPS final rule (74 FR 43894 through 43897).

Section 1886(d)(5)(G)(iv) of the Act defines an MDH as a hospital that is located in a rural area, has not more than 100 beds, is not an SCH, and has a high percentage of Medicare discharges (that is, not less than 60 percent of its inpatient days or discharges during the cost reporting period beginning in FY 1987 or two of the three most recently audited cost reporting periods for which the Secretary has a settled cost report were attributable to inpatients entitled to benefits under Part A). The regulations at 42 CFR 412.108 set forth the criteria that a hospital must meet to be classified as an MDH. The MDH program is not authorized by statute beyond September 30, 2017. Therefore, beginning October 1, 2017, all hospitals that previously qualified for MDH status under section 1886(d)(5)(G) of the Act will no longer have MDH status and will be paid based on the IPPS Federal rate. For additional information on the MDH program and the payment methodology, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51683 through 51684).

2. Changes to the Volume Decrease Adjustment Calculation Methodology for SCHs

Section 1886(d)(5)(D)(ii) and section 1886(d)(5)(G)(iii) of the Act require that the Secretary adjust the payments made to an SCH and MDH, respectively, as may be necessary to fully compensate the hospital for the fixed costs it incurs

in providing inpatient hospital services, including the reasonable cost of maintaining necessary core staff and services, when it experiences a decrease of more than 5 percent in its total number of inpatient discharges due to circumstances beyond its control. These adjustments are known as “volume decrease adjustments.”

The regulations governing volume decrease adjustments are found at 42 CFR 412.92(e) for SCHs and § 412.108(d) for MDHs. As noted earlier, the MDH program is set to expire as of October 1, 2017. As such, we proposed that if the MDH program ends up being extended by law, similar to how it was extended by section 205 of the MACRA (Pub. L. 114–10) and prior legislation, the proposed changes to the volume decrease adjustment methodology and the proposed amendment to § 412.92(e)(3) for SCHs would also be made to the parallel requirements for MDHs under § 412.108(d)(3).

To qualify for a volume decrease adjustment, the SCH must: (a) Submit documentation demonstrating the size of the decrease in discharges and the resulting effect on per discharge costs; and (b) show that the decrease is due to circumstances beyond the hospital’s control. If an SCH demonstrates to the MAC’s satisfaction that it has suffered a qualifying decrease in total inpatient discharges, the MAC determines the appropriate amount, if any, due to the SCH as an adjustment.

As we have noted in Section 2810.1 of the Provider Reimbursement Manual, Part 1 (PRM–1) and in adjudications rendered by the PRRB and the CMS Administrator, under the current methodology, the MAC determines a volume decrease adjustment amount not to exceed a cap calculated as the difference between the lesser of (1) the hospital’s current year’s Medicare inpatient operating costs or (2) its prior year’s Medicare inpatient operating costs multiplied by the appropriate IPPS update factor, and the hospital’s total MS–DRG revenue for inpatient operating costs (including outlier payments, DSH payments, and IME payments). In determining the volume decrease adjustment amount, the MAC considers the individual hospital’s needs and circumstances, including the reasonable cost of maintaining necessary core staff and services in view of minimum staffing requirements imposed by State agencies; the hospital’s fixed costs (including whether any semi-fixed costs are to be considered fixed) other than those costs paid on a reasonable cost basis; and the length of time the hospital has experienced a decrease in utilization.

We have set forth interpretive guidance regarding volume decrease adjustments in the preambles to various rules and in Section 2810.1 of the PRM–1. The adjustment also has been the subject of a series of adjudications, rendered by the PRRB and the CMS Administrator. For example, we refer readers to *Greenwood County Hospital Eureka, Kansas, v. Blue Cross Blue Shield Association/Blue Cross Blue Shield of Kansas*, 2006 WL 3050893 (PRRB August 29, 2006); *Unity Healthcare Muscatine, Iowa v. Blue Cross Blue Shield Association/Wisconsin Physicians Service*, 2014 WL 5450066 (CMS Administrator September 4, 2014); *Lakes Regional Healthcare Spirit Lake, Iowa v. Blue Cross Blue Shield Association/Wisconsin Physicians Service*, 2014 WL 5450078 (CMS Administrator September 4, 2014); *Fairbanks Memorial Hospital v. Wisconsin Physician Services/BlueCross BlueShield Association*, 2015 WL 5852432 (CMS Administrator, August 5, 2015); *St. Anthony Regional Hospital v. Wisconsin Physicians Service*, 2016 WL 7744992 (CMS Administrator October 3, 2016); and *Trinity Regional Medical Center v. Wisconsin Physician Services*, 2017 WL 2403399 (CMS Administrator February 9, 2017). In those adjudications, the PRRB and the CMS Administrator have recognized that: (1) The volume decrease adjustment is intended to compensate qualifying SCHs for their fixed costs only, and that variable costs are to be excluded from the adjustment; and (2) an SCH's volume decrease adjustment should be reduced to reflect the compensation of fixed costs that has already been made through MS–DRG payments.

However, some hospitals have recently expressed concerns regarding the exact calculations that the MACs use when determining the volume decrease adjustment. The issue also has been addressed in some recent decisions of the PRRB. As the above referenced Administrator decisions illustrate and explain, under the current calculation methodology, the MACs calculate the volume decrease adjustment by subtracting the entirety of the hospital's total MS–DRG revenue for inpatient operating costs, including outlier payments and IME and DSH payments in the cost reporting period in which the volume decrease occurred, from fixed costs in the cost reporting period in which the volume decrease occurred, minus any adjustment for excess staff. If the result of that calculation is greater than zero and less than the cap, the hospital receives that amount in a lump-sum payment. If the result of that

calculation is zero or less than zero, the hospital does not receive a volume decrease payment adjustment.

Under the IPPS, MS–DRG payments are not based on an individual hospital's actual costs in a given cost reporting period. However, the main issue raised by the PRRB and individual hospitals is that, under the current calculation methodology, if the hospital's total MS–DRG revenue for treating Medicare beneficiaries for which it incurs inpatient operating costs (consisting of fixed, semi-fixed, and variable costs) exceeds the hospital's fixed costs, the calculation by the MACs results in no volume decrease adjustment for the hospital. In some recent decisions, the PRRB has indicated that it believes it would be more appropriate for the MACs to adjust the hospital's total MS–DRG revenue from Medicare by looking at the ratio of a hospital's fixed costs to its total costs (as determined by the MAC) and applying that ratio as a proxy for the share of the hospital's MS–DRG payments that it assumes are attributable (or allocable) to fixed costs, and then comparing that estimate of the fixed portion of MS–DRG payments to the hospital's fixed costs. In this way, the calculation would compare estimated Medicare revenue for fixed costs to the hospital's fixed costs when determining the volume decrease adjustment.

We continue to believe that our current approach in calculating volume decrease adjustments is reasonable and consistent with the statute. The relevant statutory provisions, at sections 1886(d)(5)(D)(ii) and 1886(d)(5)(G)(iii) of the Act, are silent about and thus delegate to the Secretary the responsibility of determining which costs are to be deemed “fixed” and what level of adjustment to IPPS payments may be necessary to ensure that total Medicare payments have fully compensated an SCH or MDH for its “fixed costs.” These provisions suggest that the volume decrease adjustment amount should be reduced (or eliminated as the case may be) to the extent that some or all of an SCH's or MDH's fixed costs have already been compensated through other Medicare subsection (d) payments. The Secretary's current approach is also consistent with the regulations and the PRM–1. Like the statute, the relevant regulations do not address variable costs, and the regulations and the PRM–1 (along with the Secretary's preambles to issued rules (48 FR 39781 through 39782 and 55 FR 15156) and adjudications) all make it clear that the volume decrease adjustment is intended

to compensate qualifying SCHs and MDHs for their fixed costs, not for their variable costs, and that variable costs are to be excluded from the volume decrease adjustment calculation. Nevertheless, we understand why hospitals might take the view that CMS should make an effort, in some way, to ascertain whether a portion of MS–DRG payments can be allocated or attributed to fixed costs in order to fulfill the statutory mandate to “fully compensate” a qualifying SCH for its fixed costs.

Accordingly, after considering these views, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19933), we proposed to prospectively change how the MACs calculate the volume decrease adjustments and require that the MACs compare estimated Medicare revenue for fixed costs to the hospital's fixed costs to remove any conceivable possibility that a hospital that qualifies for the volume decrease adjustment could ever be less than fully compensated for fixed costs as a result of the application of the adjustment. We proposed that, in order to estimate the fixed portion of the Medicare revenue, the MACs would apply the ratio of the hospital's fixed costs to total costs in the cost reporting period when it experienced the volume decrease to the hospital's total Medicare revenue in that same cost reporting period. We proposed to revise the regulations at 42 CFR 412.92(e)(3) to reflect our proposed change in the MAC's calculation of the volume decrease adjustment that would apply prospectively to cost reporting periods beginning on or after October 1, 2017, and to reflect that the language requiring that the volume decrease adjustment amount not exceed the difference between the hospital's Medicare inpatient operating costs and the hospital's total DRG revenue for inpatient operating costs would only apply to cost reporting periods beginning before October 1, 2017, but not to subsequent cost reporting periods. Under the proposed methodology, if a hospital's total MS–DRG payment is less than its total Medicare inpatient operating costs, the sum of any resulting volume decrease adjustment payment and its MS–DRG payment would never exceed its total Medicare inpatient operating costs due to the fact that the fixed cost percentage is applied to the MS–DRG payment in calculating the volume decrease adjustment amount. By taking the ratio derived from the subset of fixed costs to total costs and applying that same ratio to the MS–DRG payment, we ensure that the sum of a hospital's IPPS payment

and its volume decrease adjustment payment would never exceed its total Medicare inpatient operating costs, thus negating the need for a cap calculation. Thus, the proposed methodology would render the current volume decrease adjustment cap calculation obsolete. Conversely, if a hospital's total MS-DRG payment is greater than its total Medicare inpatient operating costs, calculating a volume decrease adjustment using the proposed methodology would result in a negative payment amount, which would yield a volume decrease adjustment payment of zero. Finally, if a hospital's total MS-DRG payment is equal to its total Medicare inpatient operating costs, calculating a volume decrease adjustment using the proposed methodology would also yield a volume decrease adjustment payment of zero. Furthermore, we believe that because a hospital could not foresee a decrease in its volume from one year to the next and would therefore not plan for a volume decrease adjustment, the volume decrease adjustment payment should therefore not be limited to a cap that is based on the previous year's costs. For these reasons, we proposed to remove the cap calculation from the volume decrease adjustment calculation methodology in future periods. We believe that this new approach to calculating the volume decrease adjustment, like the current methodology, is reasonable and consistent with the statute.

We proposed that these proposed changes in the MAC's calculation of the volume decrease adjustment would be prospective, effective for cost reporting periods beginning on or after October 1, 2017. We indicated in the proposed rule that if these proposed changes are adopted, we also intended to update Section 2810.1 of the PRM-1 to reflect the changes in the calculation of the volume decrease adjustment by the MAC. For volume decrease adjustments for earlier cost reporting periods, we stated that the current calculation methodology would continue. In addition, we stated that we were not proposing to change any part of the methodology, criteria, rules, or presumptions we consider and apply in determining whether to classify a given cost as fixed, semi-fixed, or variable for purposes of the volume decrease adjustment.

In the proposed rule, we presented the following example to illustrate the calculation of the volume decrease adjustment by the MAC under our proposed change. We note that, as presented in our proposed rule, the example may have implied that under

the proposed methodology, the MACs would apply the ratio of the hospital's Medicare fixed costs to total Medicare costs, rather than "the ratio of the hospital's fixed costs to total costs in the cost reporting period when it experienced the volume decrease to the hospital's total Medicare revenue in that same cost reporting period," as stated elsewhere in the preamble (82 FR 19934). We have modified the example below to address this inconsistency and to clarify our intent by including additional details to more clearly illustrate how Medicare fixed costs and the fixed MS-DRG revenue are calculated and used in the calculation, including to reflect that this same ratio, that is, the hospital's fixed inpatient costs to total inpatient costs, is applied to total Medicare costs to arrive at fixed Medicare costs, as under the current methodology.

Example: In its cost reporting period beginning October 1, 2017, Hospital A has total Medicare inpatient operating costs equaling \$1,600,000 and total MS-DRG revenue (including outlier payments, IME and DSH) of \$1,400,000. The MAC determines that the hospital qualifies for a volume decrease adjustment for this cost reporting period. The MAC classifies \$2,720,000 of Hospital A's total (Medicare and non-Medicare) costs as fixed and \$480,000 as variable. Hospital A's fixed cost ratio is therefore $.85 = \$2,720,000 / (\$2,720,000 + \$480,000) = \$2,720,000 / \$3,200,000$. The MAC applies this ratio to the (1) total MS-DRG revenue of \$1,400,000 to estimate the hospital's fixed MS-DRG revenue to be \$1,190,000 and (2) total Medicare inpatient operating costs to estimate the hospital's fixed Medicare costs to be \$1,360,000. The volume decrease adjustment payment is then calculated by comparing the fixed MS-DRG revenue of \$1,190,000 to the Medicare fixed costs of \$1,360,000, resulting in a volume decrease adjustment payment of \$170,000 (\$1,360,000 minus \$1,190,000).

Under the current methodology used by the MACs, Hospital A would receive no volume decrease adjustment payment because its total MS-DRG revenue from Medicare of \$1,400,000 exceeded the hospital's Medicare fixed costs of \$1,360,000. Furthermore, under the current methodology, but not under our proposed methodology, it is possible that a hospital would still receive no volume decrease adjustment payment even if its Medicare fixed costs exceeded its total MS-DRG revenue if those fixed costs exceeded the previous year's costs updated for inflation.

We also proposed changes to an adjustment that might be made to a

hospital's staffing costs in calculating the volume decrease adjustment. The statute and regulations and the PRM-1 imply, and we have expressly indicated in prior rulemaking, most recently in the FY 2006 rulemaking, our belief that not all staff costs can necessarily be considered fixed costs (71 FR 48056 through 48060). Therefore, we currently require a hospital, when applying for a volume decrease adjustment, to demonstrate that it appropriately adjusted the number of staff in inpatient areas of the hospital based on the decrease in the number of inpatient days but not beyond minimum levels as required by State or local laws. If a hospital does not appropriately adjust its number of staff, the cost of maintaining those staff members is deducted from the total volume decrease adjustment payment. In reviewing the volume decrease adjustment calculation, we have also weighed the administrative burden on the hospital of making this demonstration to CMS, as compared to an assumption that it is likely that a hospital would, in its normal course of business, adjust its staffing levels as revenue declines. In the absence of evidence to contrary, we believe that a hospital would adjust its staffing levels as revenue declines rather than maintain those staffing levels for the sole purpose of potentially having those staffing costs eventually reflected in a Medicare volume decrease adjustment payment that the hospital may or may not qualify for when it files its cost report. Therefore, we proposed to modify the volume decrease adjustment process to no longer require that a hospital explicitly demonstrate that it appropriately adjusted the number of staff in inpatient areas of the hospital based on the decrease in the number of inpatient days and to no longer require the MAC to adjust the volume decrease adjustment payment amount for excess staffing. We proposed that these changes would be effective for cost reporting periods beginning on or after October 1, 2017.

Comment: Commenters supported CMS' proposed changes to the volume decrease adjustment methodology to (1) apply the ratio of the hospital's fixed costs to total costs in the cost reporting period when it experienced the volume decrease to the hospital's total Medicare revenue in that same cost reporting period; (2) remove the cap calculation from the volume decrease adjustment calculation methodology in future periods; (3) no longer require that a hospital explicitly demonstrate that it appropriately adjusted the number of

staff in inpatient areas of the hospital based on the decrease in the number of inpatient days; and (4) no longer require the MAC to adjust the volume decrease adjustment payment amount for excess staffing. However, commenters suggested that CMS apply these proposals retrospectively with a gamut of suggestions as to the specific types of volume decrease adjustment determinations for which to apply the proposed methodology: Pending volume decrease adjustment determinations; volume decrease adjustment determinations currently under appeal; unsettled cost reports; volume decrease adjustment determinations that are still within the PRRB appeal timeline; volume decrease adjustment determinations for which the MAC has issued a recoupment demand; volume decrease adjustment determinations for all open cost reports, regardless of whether an appeal was made; and all open cost reports, including those for which a volume decrease adjustment was not requested.

Some commenters asserted that what CMS outlined in the proposed rule as its “current methodology” was not, in fact, the current methodology being applied consistently across the board and that applying that methodology to pending volume decrease adjustment cases would amount to retroactive rulemaking. The commenters added that the proposed methodology, or the “proxy methodology,” is not, in fact, new because it has been referenced in PRRB decisions and has been used by some MACs at times. Other commenters stated that critical funding to hospitals for pending volume decrease adjustment determinations should not be at risk due to a lack of standardization across CMS and MAC decisions.

Response: We appreciate the commenters’ support of our proposed changes to the volume decrease adjustment methodology. We disagree with the commenters’ assertion that the methodology that we outlined as our “current methodology” is not current but a new methodology that we are introducing as “current.” While there may have been inconsistencies in volume decrease adjustment determinations made by some MACs, inconsistent MAC determinations and PRRB decisions that are subsequently reversed by the Administrator do not establish agency policy nor bind the agency. Furthermore, our current methodology has been upheld by the PRRB in *Greenwood County Hospital Eureka, Kansas, v. Blue Cross Blue Shield Association/Blue Cross Blue Shield of Kansas*, 2006 WL 3050893 (PRRB, August 29, 2006) and clearly

outlined in the Administrator’s decisions in *Unity Healthcare Muscatine, Iowa v. Blue Cross Blue Shield Association/Wisconsin Physicians Service*, 2014 WL 5450066 (CMS Administrator September 4, 2014); *Lakes Regional Healthcare Spirit Lake, Iowa v. Blue Cross Blue Shield Association/Wisconsin Physicians Service*, 2014 WL 5450078 (CMS Administrator September 4, 2014); *Fairbanks Memorial Hospital v. Wisconsin Physician Services/BlueCross BlueShield Association*, 2015 WL 5852432 (CMS Administrator, August 5, 2015); *St. Anthony Regional Hospital v. Wisconsin Physicians Service*, 2016 WL 7744992 (CMS Administrator October 3, 2016); and *Trinity Regional Medical Center v. Wisconsin Physician Services*, 2017 WL 2403399 (CMS Administrator February 9, 2017), to name a few. For these reasons, we disagree with the commenters that our current policy was not the established policy, and we believe that applying this policy does not constitute retroactive rulemaking. Indeed, some of these same commenters are currently awaiting a court decision in a pending appeal in which they challenged the exact methodology which they claim in their comments is not “current policy” but a redefined “new policy.”

We also do not agree that we should apply our proposed methodology retroactively. The IPPS is a prospective system and, absent legislation, a judicial decision, or other compelling considerations to the contrary, we generally make changes to IPPS regulations effective prospectively based on the date of discharge or the start of a cost reporting period within a certain Federal fiscal year. We believe following our usual approach and applying the new methodology for cost reporting periods beginning on or after October 1, 2017 would allow for the most equitable application of this methodology among all IPPS providers seeking to qualify for volume decrease adjustments. For these reasons, we are finalizing that our proposed changes to the volume decrease adjustment methodology will apply prospectively for cost reporting periods beginning on or after October 1, 2017.

Comment: One commenter suggested that, because CMS did not issue updated core staffing factors for FY 2012 or later, the proposed change to no longer require a hospital to explicitly demonstrate that it appropriately adjusted the number of staff in inpatient areas of the hospital based on the decrease in the number of inpatient days and to no longer require the MAC to adjust the volume decrease

adjustment payment amount for excess staffing be effective for cost reporting periods beginning on or after October 1, 2011.

Response: We appreciate the commenter’s support of our effort to streamline the volume decrease adjustment determination process by eliminating the core staffing adjustment. However, we disagree with the suggestion to apply this change retroactively. As noted earlier, the IPPS is a prospective system and we generally make changes effectively prospectively. The absence of updated core staffing data does not undermine the policy that we expressly indicated in prior rulemaking. Therefore, we do not see any compelling reason to apply this change retrospectively.

Comment: Some commenters addressed areas of volume decrease adjustment policy for which we did not propose any changes. These included waiving the requirement for hospitals to demonstrate that the decrease in discharges was beyond the hospital’s control; to no longer require the removal of variable costs and calculate the volume decrease adjustment by subtracting the MS-DRG payment from total inpatient costs; shortening the timeline in which MACs need to make volume decrease adjustment determinations; and stopping MACs from rejecting requests for volume decrease adjustments before an NPR is issued.

Response: We appreciate the commenters’ concerns. However, because we did not make any proposals related to these specific policy areas and we consider these comments to be out of the scope of the proposed rule, we are not addressing them in this final rule.

After consideration of the public comments we received, we are finalizing our policies as proposed, with one modification to our proposed amendment to § 412.92(e)(3) to reflect these policies. We are finalizing our proposal to prospectively require that the MACs compare Medicare revenue allocable to fixed costs from the cost reporting period in which the hospital experienced the volume decrease to the hospital’s fixed costs from that same cost reporting period when calculating a volume decrease adjustment and that the cap will no longer be applied to the volume decrease adjustment calculation methodology. We proposed to revise the regulations at § 412.92(e)(3) to reflect these changes. However, our proposed regulatory text did not precisely capture the new calculation methodology that we described in the preamble to the proposed rule, and which we are now finalizing, in one respect. Specifically,

the preamble to the proposed rule stated that, under the proposed change in the MAC's calculation of the volume decrease adjustment, "in order to estimate the fixed portion of the Medicare revenue, the MACs would apply *the ratio of the hospital's fixed costs to total costs* in the cost reporting period when it experienced the volume decrease to the hospital's total Medicare revenue in that same cost reporting period" (82 FR 19934). By contrast, the proposed regulatory text in the proposed rule stated that the ratio to be applied by the MAC would be "the ratio of the hospital's fixed Medicare inpatient operating costs to its total Medicare inpatient operating costs" (82 FR 20161). Therefore, consistent with the proposed policy which we are now finalizing, we are deleting the two instances of the words "Medicare" that appear in the clause quoted in the preceding sentence. Accordingly, as finalized, the second sentence of § 412.92(e)(3) specifies that, effective for cost reporting periods beginning on or after October 1, 2017, the MAC determines a lump sum adjustment amount equal to the difference between the hospital's fixed Medicare inpatient operating costs and the hospital's total MS-DRG revenue based on MS-DRG-adjusted prospective payment rates for inpatient operating costs (including outlier payments for inpatient operating costs determined under subpart F of Part 412 and additional payments made for inpatient operating costs for hospitals that serve a disproportionate share of low-income patients as determined under § 412.106 and for indirect medical education costs as determined under § 412.105) multiplied by the ratio of the hospital's fixed inpatient operating costs to its total inpatient operating costs. We also are finalizing our proposal to prospectively modify the volume decrease adjustment process to no longer require that a hospital explicitly demonstrate that it appropriately adjusted the number of staff in inpatient areas of the hospital based on the decrease in the number of inpatient days and to no longer require the MAC to adjust the volume decrease adjustment payment amount for excess staffing. These changes will be effective for cost reporting periods beginning on or after October 1, 2017. As we noted earlier, we proposed that if the MDH program ends up being extended by law, similar to how it was extended by section 205 of the MACRA (Pub. L. 114-10) and prior legislation, these changes to the volume decrease adjustment methodology and the amendment to § 412.92(e)(3) for SCHs would also be

made to the parallel requirements for MDHs under § 412.108(d)(3). To that end, we are modifying the regulations at § 412.108(d)(3) by modifying the introductory paragraph to cross-reference the requirements found at § 412.92(e)(3). This will allow for consistency in the regulations governing volume decrease adjustments should the MDH program be extended.

D. Rural Referral Centers (RRCs) Annual Updates to Case-Mix Index and Discharge Criteria (§ 412.96)

Under the authority of section 1886(d)(5)(C)(i) of the Act, the regulations at § 412.96 set forth the criteria that a hospital must meet in order to qualify under the IPPS as a rural referral center (RRC). RRCs receive some special treatment under both the DSH payment adjustment and the criteria for geographic reclassification.

Section 402 of Public Law 108-173 raised the DSH payment adjustment for RRCs such that they are not subject to the 12-percent cap on DSH payments that is applicable to other rural hospitals. RRCs also are not subject to the proximity criteria when applying for geographic reclassification. In addition, they do not have to meet the requirement that a hospital's average hourly wage must exceed, by a certain percentage, the average hourly wage of the labor market area in which the hospital is located.

Section 4202(b) of Public Law 105-33 states, in part, that any hospital classified as an RRC by the Secretary for FY 1991 shall be classified as such an RRC for FY 1998 and each subsequent fiscal year. In the August 29, 1997 IPPS final rule with comment period (62 FR 45999), we reinstated RRC status for all hospitals that lost that status due to triennial review or MGCRB reclassification. However, we did not reinstate the status of hospitals that lost RRC status because they were now urban for all purposes because of the OMB designation of their geographic area as urban. Subsequently, in the August 1, 2000 IPPS final rule (65 FR 47089), we indicated that we were revisiting that decision. Specifically, we stated that we would permit hospitals that previously qualified as an RRC and lost their status due to OMB redesignation of the county in which they are located from rural to urban, to be reinstated as an RRC. Otherwise, a hospital seeking RRC status must satisfy all of the other applicable criteria. We use the definitions of "urban" and "rural" specified in Subpart D of 42 CFR part 412. One of the criteria under which a hospital may qualify as an RRC is to have 275 or more beds available for

use (§ 412.96(b)(1)(ii)). A rural hospital that does not meet the bed size requirement can qualify as an RRC if the hospital meets two mandatory prerequisites (a minimum case-mix index (CMI) and a minimum number of discharges), and at least one of three optional criteria (relating to specialty composition of medical staff, source of inpatients, or referral volume). (We refer readers to § 412.96(c)(1) through (c)(5) and the September 30, 1988 **Federal Register** (53 FR 38513) for additional discussion.) With respect to the two mandatory prerequisites, a hospital may be classified as an RRC if—

- The hospital's CMI is at least equal to the lower of the median CMI for urban hospitals in its census region, excluding hospitals with approved teaching programs, or the median CMI for all urban hospitals nationally; and
- The hospital's number of discharges is at least 5,000 per year, or, if fewer, the median number of discharges for urban hospitals in the census region in which the hospital is located. The number of discharges criterion for an osteopathic hospital is at least 3,000 discharges per year, as specified in section 1886(d)(5)(C)(i) of the Act.

1. Case-Mix Index (CMI)

Section 412.96(c)(1) provides that CMS establish updated national and regional CMI values in each year's annual notice of prospective payment rates for purposes of determining RRC status. The methodology we used to determine the national and regional CMI values is set forth in the regulations at § 412.96(c)(1)(ii). The national median CMI value for FY 2018 is based on the CMI values of all urban hospitals nationwide, and the regional median CMI values for FY 2018 are based on the CMI values of all urban hospitals within each census region, excluding those hospitals with approved teaching programs (that is, those hospitals that train residents in an approved GME program as provided in § 413.75). These values are based on discharges occurring during FY 2016 (October 1, 2015 through September 30, 2016), and include bills posted to CMS' records through March 2016.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19936), we proposed that, in addition to meeting other criteria, if rural hospitals with fewer than 275 beds are to qualify for initial RRC status for cost reporting periods beginning on or after October 1, 2017, they must have a CMI value for FY 2016 that is at least—

- 1.6635 (national—all urban); or
- The median CMI value (not transfer-adjusted) for urban hospitals

(excluding hospitals with approved teaching programs as identified in § 413.75) calculated by CMS for the census region in which the hospital is located.

The proposed median CMI values by region were set forth in the proposed rule (82 FR 19936). We stated in the proposed rule that we intended to update these proposed CMI values in the FY 2018 final rule to reflect the updated FY 2016 MedPAR file, which

will contain data from additional bills received through March 2017. We did not receive any public comments on our proposal. Based on the latest available data (FY 2016 bills received through March 2017), in addition to meeting other criteria, if rural hospitals with fewer than 275 beds are to qualify for initial RRC status for cost reporting periods beginning on or after October 1, 2017, they must have a CMI value for FY 2016 that is at least—

- 1.6638 (national—all urban); or
- The median CMI value (not transfer-adjusted) for urban hospitals (excluding hospitals with approved teaching programs as identified in § 413.75) calculated by CMS for the census region in which the hospital is located.

The final CMI values by region are set forth in the table below:

Region	Case-mix index value
1. New England (CT, ME, MA, NH, RI, VT)	1.4192
2. Middle Atlantic (PA, NJ, NY)	1.5133
3. South Atlantic (DE, DC, FL, GA, MD, NC, SC, VA, WV)	1.5405
4. East North Central (IL, IN, MI, OH, WI)	1.5896
5. East South Central (AL, KY, MS, TN)	1.5086
6. West North Central (IA, KS, MN, MO, NE, ND, SD)	1.6344
7. West South Central (AR, LA, OK, TX)	1.6950
8. Mountain (AZ, CO, ID, MT, NV, NM, UT, WY)	1.7580
9. Pacific (AK, CA, HI, OR, WA)	1.6473

A hospital seeking to qualify as an RRC should obtain its hospital-specific CMI value (not transfer-adjusted) from its MAC. Data are available on the Provider Statistical and Reimbursement (PS&R) System. In keeping with our policy on discharges, the CMI values are computed based on all Medicare patient discharges subject to the IPPS MS-DRG-based payment.

2. Discharges

Section 412.96(c)(2)(i) provides that CMS set forth the national and regional numbers of discharges criteria in each year's annual notice of prospective payment rates for purposes of determining RRC status. As specified in section 1886(d)(5)(C)(ii) of the Act, the national standard is set at 5,000

discharges. In the FY 2018 IPPS/LTCH PPS proposed rule, for FY 2018, we proposed to update the regional standards based on discharges for urban hospitals' cost reporting periods that began during FY 2015 (that is, October 1, 2014 through September 30, 2015), which were the latest cost report data available at the time this proposed rule was developed. Therefore, we proposed that, in addition to meeting other criteria, a hospital, if it is to qualify for initial RRC status for cost reporting periods beginning on or after October 1, 2017, must have, as the number of discharges for its cost reporting period that began during FY 2015, at least—

- 5,000 (3,000 for an osteopathic hospital); or

• The median number of discharges for urban hospitals in the census region in which the hospital is located. (We refer readers to the table set forth in the FY 2018 IPPS/LTCH PPS proposed rule at 82 FR 19936.) In the proposed rule, we stated that we intended to update these numbers in the FY 2018 final rule based on the latest available cost report data.

We did not receive any public comments on our proposal.

Based on the latest discharge data available at this time, that is, for cost reporting periods that began during FY 2015, the final median number of discharges for urban hospitals by census region are set forth in the following table.

Region	Number of discharges
1. New England (CT, ME, MA, NH, RI, VT)	8,080
2. Middle Atlantic (PA, NJ, NY)	9,988
3. South Atlantic (DE, DC, FL, GA, MD, NC, SC, VA, WV)	10,552
4. East North Central (IL, IN, MI, OH, WI)	8,181
5. East South Central (AL, KY, MS, TN)	8,647
6. West North Central (IA, KS, MN, MO, NE, ND, SD)	7,709
7. West South Central (AR, LA, OK, TX)	5,325
8. Mountain (AZ, CO, ID, MT, NV, NM, UT, WY)	8,735
9. Pacific (AK, CA, HI, OR, WA)	9,101

We note that the median number of discharges for hospitals in each census region is greater than the national standard of 5,000 discharges. Therefore, under this final rule, 5,000 discharges is the minimum criterion for all hospitals, except for osteopathic hospitals for

which the minimum criterion is 3,000 discharges.

E. Payment Adjustment for Low-Volume Hospitals (§ 412.101)

1. Expiration of Temporary Changes to Low-Volume Hospital Payment Policy

Under section 1886(d)(12) of the Act, as amended, most recently by section 204 of the Medicare Access and CHIP

Reauthorization Act of 2015 (MACRA), Public Law 114–10, the temporary changes in the low-volume hospital payment policy originally provided by the Affordable Care Act and extended through subsequent legislation are effective through FY 2017. Beginning with FY 2018, the preexisting low-volume hospital payment adjustment and qualifying criteria, as implemented in FY 2005 and discussed later in this section, will resume. We discuss the payment policies for FY 2018 in section V.E.3. of the preamble of this final rule.

2. Background

Section 1886(d)(12) of the Act, as added by section 406(a) of Public Law 108–173, provides for a payment adjustment to account for the higher costs per discharge for low-volume hospitals under the IPPS, effective beginning FY 2005. Sections 3125 and 10314 of the Affordable Care Act amended section 1886(d)(12) of the Act by modifying the definition of a low-volume hospital and the methodology for calculating the payment adjustment for low-volume hospitals, effective only for discharges occurring during FYs 2011 and 2012. Specifically, the provisions of the Affordable Care Act amended the qualifying criteria for low-volume hospitals to specify, for FYs 2011 and 2012, that a hospital qualifies as a low-volume hospital if it is more than 15 road miles from another subsection (d) hospital and has less than 1,600 discharges of individuals entitled to, or enrolled for, benefits under Medicare Part A during the fiscal year. In addition, the statute, as amended by the Affordable Care Act, provides that the low-volume hospital payment adjustment (that is, the percentage increase) is determined using a continuous linear sliding scale ranging from 25 percent for low-volume hospitals with 200 or fewer discharges of individuals entitled to, or enrolled for, benefits under Medicare Part A in the fiscal year to 0 percent for low-volume hospitals with greater than 1,600 discharges of such individuals in the fiscal year. The temporary changes to the low-volume hospital qualifying criteria and the payment adjustment originally provided by the Affordable Care Act were extended by subsequent legislation, most recently through FY 2017 by section 204 of the MACRA. (We refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 56941 through 59943) for a detailed summary of the applicable legislation.) Under current law, beginning with FY 2018, the preexisting low-volume hospital qualifying criteria and payment adjustment, as implemented in FY 2005

and described in this section, will resume. The regulations implementing the low-volume hospital adjustment provided by section 1886(d)(12) of the Act are located at 42 CFR 412.101.

The additional payment adjustment to a low-volume hospital provided for under section 1886(d)(12) of the Act is in addition to any payment calculated under this section. Therefore, the additional payment adjustment is based on the per discharge amount paid to the qualifying hospital under section 1886 of the Act. In other words, the low-volume add-on payment amount is based on total per discharge payments made under section 1886 of the Act, including capital, DSH, IME, and outliers. For hospitals paid based on the hospital-specific rate, the low-volume add-on payment amount is based on either the Federal rate or the hospital-specific rate, whichever results in a greater operating IPPS payment.

Section 1886(d)(12)(C)(i) of the Act defines a low-volume hospital, for fiscal years other than FYs 2011 through 2017, as a subsection (d) hospital (as defined in paragraph (1)(B)) that the Secretary determines is located more than 25 road miles from another subsection (d) hospital and that has less than 800 discharges during the fiscal year. Section 1886(d)(12)(C)(ii) of the Act further stipulates that the term “discharge” means an inpatient acute care discharge of an individual, regardless of whether the individual is entitled to benefits under Medicare Part A. Therefore, for fiscal years other than FYs 2011 through 2017, the term “discharge” refers to total discharges, regardless of payer (that is, not only Medicare discharges). Furthermore, section 1886(d)(12)(B) of the Act requires, for discharges occurring in FYs 2005 through 2010 and FY 2018 and subsequent years, that the Secretary determine an applicable percentage increase for these low-volume hospitals based on the “empirical relationship” between the standardized cost-per-case for such hospitals and the total number of discharges of such hospitals and the amount of the additional incremental costs (if any) that are associated with such number of discharges. The statute thus mandates that the Secretary develop an empirically justifiable adjustment based on the relationship between costs and discharges for these low-volume hospitals. Section 1886(d)(12)(B)(iii) of the Act limits the applicable percentage increase adjustment to no more than 25 percent.

Based on an analysis we conducted for the FY 2005 IPPS final rule (69 FR 49099 through 49102), a 25-percent low-volume adjustment to all qualifying

hospitals with less than 200 discharges was found to be most consistent with the statutory requirement to provide relief to low-volume hospitals where there is empirical evidence that higher incremental costs are associated with low numbers of total discharges. In the FY 2006 IPPS final rule (70 FR 47432 through 47434), we stated that multivariate analyses supported the existing low-volume adjustment implemented in FY 2005.

3. Payment Adjustment for FY 2018 and Subsequent Fiscal Years

In accordance with section 1886(d)(12) of the Act, beginning with FY 2018, the low-volume hospital definition and payment adjustment methodology will revert back to the statutory requirements that were in effect prior to the amendments made by the Affordable Care Act and extended by subsequent legislation. Therefore, effective for FY 2018 and subsequent years, in order to qualify as a low-volume hospital, a subsection (d) hospital must be more than 25 road miles from another subsection (d) hospital and have less than 200 discharges (that is, less than 200 discharges total, including both Medicare and non-Medicare discharges) during the fiscal year. As discussed earlier, the statute specifies that a low-volume hospital must have less than 800 discharges during the fiscal year. However, as required by section 1886(d)(12)(B)(i) of the Act and as discussed earlier, the Secretary has developed an empirically justifiable payment adjustment based on the relationship, for IPPS hospitals with less than 800 discharges, between the additional incremental costs (if any) that are associated with a particular number of discharges. Based on an analysis we conducted for the FY 2005 IPPS final rule (69 FR 49099 through 49102), a 25-percent low-volume adjustment to all qualifying hospitals with less than 200 discharges was found to be most consistent with the statutory requirement to provide relief for low-volume hospitals where there is empirical evidence that higher incremental costs are associated with low numbers of total discharges. (Under the policy we established in that same final rule, hospitals with between 200 and 799 discharges do not receive a low-volume hospital adjustment.)

As described earlier, for FYs 2005 through 2010 and FY 2018 and subsequent years, the discharge determination is made based on the hospital's number of total discharges, that is, Medicare and non-Medicare discharges. The hospital's most recently

submitted cost report is used to determine if the hospital meets the discharge criterion to receive the low-volume payment adjustment in the current year (§ 412.101(b)(2)(i)). We use cost report data to determine if a hospital meets the discharge criterion because this is the best available data source that includes information on both Medicare and non-Medicare discharges. We note that, for FYs 2011 through 2017, we used the most recently available MedPAR data to determine the hospital's Medicare discharges because only Medicare discharges were used to determine if a hospital met the discharge criterion for those years.

For FY 2018 and for subsequent fiscal years, in addition to a discharge criterion, the eligibility for the low-volume payment adjustment is also dependent upon the hospital meeting the mileage criterion specified at § 412.101(b)(2)(i). Specifically, to meet the mileage criterion to qualify for the low-volume payment adjustment for FY 2018 and subsequent fiscal years, a hospital must be located more than 25 road miles from the nearest subsection (d) hospital. We define, at § 412.101(a), the term "road miles" to mean "miles" as defined at § 412.92(c)(1) (75 FR 50238 through 50275 and 50414).

In the FY 2011 IPPS/LTCH PPS final rule (75 FR 50238 through 50275 and 50414) and subsequent rulemaking, most recently in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56942 through 56943), we discussed the process for requesting and obtaining the low-volume hospital payment adjustment. In order to qualify for the low-volume hospital payment adjustment, a hospital must provide to its MAC sufficient evidence to document that it meets the discharge and distance requirements. The MAC will determine, based on the most recent data available, if the hospital qualifies as a low-volume hospital, so that the hospital will know in advance whether or not it will receive a payment adjustment. The MAC and CMS may review available data, in addition to the data the hospital submits with its request for low-volume hospital status, in order to determine whether or not the hospital meets the qualifying criteria.

In order to receive a low-volume hospital payment adjustment under § 412.101, a hospital must notify and provide documentation to its MAC that it meets the mileage criterion. The use of a Web-based mapping tool as part of documenting that the hospital meets the mileage criterion for low-volume hospitals is acceptable. The MAC will determine if the information submitted by the hospital, such as the name and

street address of the nearest hospitals, location on a map, and distance (in road miles, as defined in the regulations at § 412.101(a)) from the hospital requesting low-volume hospital status, is sufficient to document that it meets the mileage criterion. If not, the MAC will follow up with the hospital to obtain additional necessary information to determine whether or not the hospital meets the low-volume mileage criterion. In addition, the MAC will refer to the hospital's most recently submitted cost report to determine whether or not the hospital meets the discharge criterion. A hospital should refer to its most recently submitted cost report for total discharges (Medicare and non-Medicare) in order to decide whether or not to apply for low-volume hospital status for a particular fiscal year. A hospital must continue to meet the qualifying criteria at § 412.101(b)(2)(i) as a low-volume hospital (that is, the discharge criterion and the mileage criterion) in order to receive the payment adjustment in that year; that is, low-volume hospital status is not based on a "one-time" qualification (75 FR 50238 through 50275).

As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19938), in order to be a low-volume hospital in FY 2018 and subsequent fiscal years, in accordance with our previously established procedure, a hospital must make a written request for low-volume hospital status that is received by its MAC by September 1 immediately preceding the start of the Federal fiscal year for which the hospital is applying for low-volume hospital status in order for the 25-percent, low-volume, add-on payment adjustment to be applied to payments for its discharges for the fiscal year beginning on or after October 1 immediately following the request (that is, the start of the Federal fiscal year). For a hospital whose request for low-volume hospital status is received after September 1, if the MAC determines the hospital meets the criteria to qualify as a low-volume hospital, the MAC will apply the 25-percent, low-volume, add-on payment adjustment to determine payment for the hospital's discharges for the fiscal year, effective prospectively within 30 days of the date of the MAC's low-volume status determination.

Specifically, for FY 2018, a hospital must make a written request for low-volume hospital status that is received by its MAC no later than September 1, 2017, in order for the 25-percent, low-volume, add-on payment adjustment to be applied to payments for its discharges beginning on or after October 1, 2017 (through September 30, 2018). Under this procedure, a hospital that

qualified for the low-volume hospital payment adjustment for FY 2017 may continue to receive a low-volume hospital payment adjustment for FY 2018 without reapplying if it meets both the discharge criterion and the mileage criterion applicable for FY 2018. As in previous years, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19938), we proposed that such a hospital must send written verification that is received by its MAC no later than September 1, 2017, stating that it meets the mileage criterion applicable for FY 2018. For FY 2018, we further proposed that this written verification must also state, based upon the most recently submitted cost report, that the hospital meets the discharge criterion applicable for FY 2018 (that is, less than 200 discharges total, including both Medicare and non-Medicare discharges). If a hospital's request for low-volume hospital status for FY 2018 is received after September 1, 2017, and if the MAC determines the hospital meets the criteria to qualify as a low-volume hospital, the MAC will apply the 25-percent, low-volume, add-on payment adjustment to determine the payment for the hospital's FY 2018 discharges, effective prospectively within 30 days of the date of the MAC's low-volume hospital status determination. We noted that this process mirrors our established application process but is updated to ensure that providers currently receiving the low-volume hospital payment adjustment verify that they meet both the mileage criterion and the discharge criterion applicable for FY 2018 to continue receiving the adjustment for FY 2018. For additional information on our established application process for the low-volume hospital payment adjustment, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 56942 through 56943).

Comment: A few commenters expressed concern about the financial impact of the expiration of the temporary changes to the low-volume hospital payment adjustment provided for by the Affordable Care Act and extended through subsequent legislation (most recently the MACRA). Some commenters supported legislative action that would make permanent these changes to the low-volume hospital payment adjustment. Other commenters requested that CMS use the existing statutory authority to make the low-volume adjustment to qualifying hospitals that have less than 800 total discharges rather than only to qualifying hospitals that have less than 200 total discharges. These commenters did not provide any data analysis in support of

their comments to expand the low-volume hospital adjustment to qualifying hospitals that have less than 800 total discharges.

One commenter questioned whether CMS would be making any claims processing or cost report changes in light of the expiration of the temporary changes to the low-volume hospital payment adjustment.

Response: As noted earlier in the preamble of this final rule and as discussed in response to public comments in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53408 through 53409) and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50612 through 50613), to implement the original low-volume hospital payment adjustment provision, and as mandated by statute, we developed an empirically justified adjustment based on the relationship between costs and total discharges of hospitals with less than 800 total (Medicare and non-Medicare) discharges. Specifically, we performed several regression analyses to evaluate the relationship between hospitals' costs per case and discharges, and found that an adjustment for hospitals with less than 200 total discharges is most consistent with the statutory requirement to provide for additional payments to low-volume hospitals where there is empirical evidence that higher incremental costs are associated with lower numbers of discharges (69 FR 49101 through 49102). Based on these analyses, we established a low-volume hospital policy under which qualifying hospitals with less than 200 total discharges receive a payment adjustment of an additional 25 percent. (Section 1886(d)(12)(B)(iii) of the Act limits the applicable percentage increase adjustment to no more than 25 percent.) In the future, we may reevaluate the low-volume hospital adjustment policy; that is, the definition of a low-volume hospital and the payment adjustment. However, because we are not aware of any analysis or empirical evidence that would support expanding the originally established a low-volume hospital adjustment policy, we did not make any proposals regarding the low-volume hospital payment adjustment for FY 2018 and are not making any changes to the low-volume hospital payment adjustment policy in this final rule.

Therefore, the low-volume hospital definition and payment adjustment methodology will revert back to the policy established under statutory requirements that were in effect prior to the amendments made by the Affordable Care Act and extended through

subsequent legislation (most recently the MACRA).

With regard to the comment regarding revisions to claims processing or the cost report, any such changes will be addressed through subregulatory guidance or other avenues, as appropriate.

After consideration of the public comments we received, we are finalizing our proposals as described above, without modification.

As described earlier, for FYs 2005 through 2010 and FY 2018 and subsequent fiscal years, the discharge determination will be made based on the hospital's number of total discharges; that is, Medicare and non-Medicare discharges. The hospital's most recently submitted cost report is used to determine if the hospital meets the discharge criterion to receive the low-volume hospital payment adjustment in the current year (§ 412.101(b)(2)(i)). We use cost report data to determine if a hospital meets the discharge criterion because this is the best available data source that includes information on both Medicare and non-Medicare discharges. As we noted in the proposed rule, for FYs 2011 through 2017, we used the most recently available MedPAR data to determine the hospital's Medicare discharges because only Medicare discharges were used to determine if a hospital met the discharge criterion for those years. In addition to a discharge criterion, the eligibility for the low-volume hospital payment adjustment also will be dependent upon the hospital meeting the mileage criterion specified at § 412.101(b)(2)(i). Specifically, to meet the mileage criterion to qualify for the low-volume hospital payment adjustment for FY 2018 and subsequent fiscal years, a hospital must be located more than 25 road miles from the nearest subsection (d) hospital.

For FY 2018, as discussed in the proposed rule, we will continue to use the established process for requesting and obtaining the low-volume hospital payment adjustment. That is, in order to receive a low-volume hospital payment adjustment under § 412.101, a hospital must notify and provide documentation to its MAC that it meets the discharge and distance requirements. The MAC will determine, based on the most recent data available, if the hospital qualifies as a low-volume hospital, so that the hospital will know in advance whether or not it will receive a payment adjustment. The MAC and CMS may review available data, in addition to the data the hospital submits with its request for low-volume hospital status, in order to determine whether or not the

hospital meets the qualifying criteria. (For additional details on our established process for the low-volume hospital payment adjustment, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 56942 through 56943).)

Consistent with our previously established procedure, for FY 2018, a hospital must make a written request for low-volume hospital status that is received by its MAC no later than September 1, 2017, in order for the 25-percent low-volume hospital payment adjustment to be applied to payments for its discharges beginning on or after October 1, 2017 (through September 30, 2018). Under this procedure, a hospital that qualified for the low-volume hospital payment adjustment for FY 2017 may continue to receive a low-volume hospital payment adjustment for FY 2018 without reapplying if it meets both the discharge criterion and the mileage criterion applicable for FY 2018. As in previous years, such a hospital must send written verification that is received by its MAC no later than September 1, 2017, stating that it meets the mileage criterion applicable for FY 2018. In addition, for such a hospital, this written verification must also state, based upon the most recently submitted cost report, that the hospital meets the discharge criterion applicable for FY 2018 (that is, less than 200 discharges total, including both Medicare and non-Medicare discharges). If a hospital's request for low-volume hospital status for FY 2018 is received after September 1, 2017, and if the MAC determines the hospital meets the criteria to qualify as a low-volume hospital, the MAC will apply the 25-percent low-volume hospital payment adjustment to determine the payment for the hospital's FY 2018 discharges, effective prospectively within 30 days of the date of the MAC's low-volume hospital status determination.

In the FY 2016 IPPS interim final rule with comment period (80 FR 49594 through 49597 and 49767), we made conforming changes to the regulations at 42 CFR 412.101 to reflect the extension of the changes to the qualifying criteria and the payment adjustment methodology for low-volume hospitals through FY 2017 in accordance with section 204 of the MACRA. Under these revisions, beginning with FY 2018, consistent with current law, the low-volume hospital qualifying criteria and payment adjustment methodology will return to the criteria and methodology that were in effect prior to the amendments made by the Affordable Care Act (that is, the low-volume hospital payment policy in effect for FYs 2005 through 2010). Therefore, no

further revisions to the policy or to the regulations at § 412.101 are required to conform them to the statutory requirement that the low-volume hospital policy in effect prior to the Affordable Care Act will again be in effect for FY 2018 and subsequent years.

As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19938), for this reason, we did not propose specific amendments to the regulations at § 412.101 to reflect the expiration of the temporary changes to the low-volume hospital payment adjustment policy originally provided for by the Affordable Care Act, but we proposed that if these temporary changes to the low-volume hospital payment policy were to be extended by law, similar to extensions provided most recently through FY 2017 by MACRA, we would make conforming changes to the regulations at § 412.101(b) through (d), as appropriate, to reflect any such extension. Because, as of the time of the development of this final rule, these temporary changes to the low-volume hospital payment policy have not been extended by law, we are not making any such conforming changes. As noted previously, any changes to the cost report will be addressed through subregulatory guidance or other avenues, as appropriate.

4. Parallel Low-Volume Hospital Payment Adjustment Regarding Hospitals Operated by the Indian Health Services (IHS) or a Tribe

As previously stated, section 1886(d)(12)(C) of the Act and our regulations at 42 CFR 412.101(b)(2) require that, in order to qualify for the low-volume hospital payment adjustment, a hospital must be located more than a specified number of miles from the nearest subsection (d) hospital (referred to as the mileage criterion). Section 1886(d)(1)(B) of the Act defines a “subsection (d) hospital” as a hospital located in one of the 50 States or District of Columbia, other than the specified excluded types of hospitals. As stated in prior rulemaking (for example, 79 FR 50153 (August 22, 2014), 78 FR 61194 and 61196 (October 3, 2013), 78 FR 50710 (August 19, 2013), 78 FR 27623 (May 10, 2013), 77 FR 53397 (August 31, 2012), 77 FR 27965 (May 11, 2012), 75 FR 50307 (August 16, 2010)), CMS considers IHS and Tribal hospitals to be subsection (d) hospitals. However, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19939), we stated that, given the unique nature of IHS and Tribal hospitals and the populations they serve, as discussed below, we believe it would be appropriate to provide additional flexibility in determining

eligibility for the low-volume hospital payment adjustment for IHS and Tribal hospitals and non-IHS hospitals that are located less than the specified mileage from one another. Specifically, we proposed that, for an IHS or Tribal hospital, only its proximity to other IHS or Tribal hospitals would be used to determine if the mileage criterion is met. Similarly, for a non-IHS hospital, only its proximity to other non-IHS hospitals would be used to determine if the mileage criterion is met.

Except for emergencies and a few other limited special cases, those individuals who are not members of a federally recognized Tribe are not eligible for treatment at IHS or Tribal hospitals. Therefore, such a hospital is not a valid option for the general Medicare population, including local residents who are not members of a federally recognized Tribe or not otherwise eligible for IHS services. Therefore, we stated that we believe it would be appropriate to not consider IHS and Tribal hospitals when evaluating whether a non-IHS hospital meets the mileage criterion.

Likewise, we stated that we believe it would be appropriate to not consider non-IHS hospitals when evaluating whether an IHS or Tribal hospital meets the mileage criterion. The principal mission of the IHS is the provision of health care to American Indians and Alaska Natives throughout the United States. In carrying out that mission, IHS operates under two primary authorizing statutes. The first statute, the Snyder Act, authorizes IHS to expend such moneys as Congress may determine from time to time appropriate for the conservation of the health of American Indians or Alaska Natives. We refer readers to 25 U.S.C. 13 (providing that the Bureau of Indian Affairs (BIA) will expend funds as appropriated for, among other things, the conservation of health of American Indians and Alaska Natives); and 42 U.S.C. 2001(a) (transferring the responsibility for American Indian and Alaska Native health care from BIA to HHS). The second statute, the Indian Health Care Improvement Act (IHCIA), established IHS as an agency within the Public Health Service of HHS and provides authority for numerous programs to address particular health initiatives for American Indians and Alaska Natives, such as alcohol and substance abuse and diabetes (25 U.S.C. 1601 *et seq.*).

IHS and Tribal hospitals are charged with addressing the health of American Indians and Alaska Natives and are uniquely situated to provide services to this population. For this reason, we stated that we believe it would be

appropriate to not consider the non-IHS hospitals when evaluating whether an IHS or Tribal hospital meets the mileage criterion.

Because IHS and Tribal hospitals are subsection (d) hospitals, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19339), we proposed to use our authority under section 1886(d)(5)(I)(i) of the Act to provide an adjustment equal to the applicable low-volume adjustment provided for under section 1886(d)(12) of the Act for an IHS or Tribal hospital whose sole disqualifier for the low-volume hospital adjustment is its proximity to a non-IHS hospital, and for a non-IHS hospital whose sole disqualifier is its proximity to an IHS or Tribal hospital. Such an adjustment would provide that, practically speaking, an IHS or Tribal hospital would be able to receive a low-volume hospital adjustment based on its distance to the nearest IHS or Tribal hospital, and a non-IHS hospital would be able to qualify to receive a low-volume hospital adjustment based on its distance to the nearest non-IHS hospital. We believe it is appropriate to apply this authority here, given the unique characteristics of IHS and Tribal hospitals, as discussed above. To implement this proposed adjustment, we proposed to revise 42 CFR 412.101 by adding paragraph (e) to provide that, for discharges occurring in FY 2018 and subsequent years, only the distance between IHS or Tribal hospitals would be considered when assessing whether an IHS or Tribal hospital meets the mileage criterion under § 412.101(b)(2). Similarly, only the distance between non-IHS hospitals would be considered when assessing whether a non-IHS hospital meets the mileage criterion under § 412.101(b)(2).

Comment: Commenters supported the proposed parallel adjustment so that, for discharges occurring in FY 2018 and subsequent years, only the distance between IHS or Tribal hospitals would be considered when assessing whether an IHS or Tribal hospital meets the mileage criterion under § 412.101(b)(2), and similarly, only the distance between non-IHS hospitals would be considered when assessing whether a non-IHS hospital meets the mileage criterion under § 412.101(b)(2). Several commenters urged CMS to apply this proposal retroactively as, according to some commenters, they did not believe CMS has always considered IHS and Tribal hospitals to be subsection (d) hospitals for purposes of the low-volume payment adjustment, while other commenters believed that IHS and Tribal hospitals are not “like” hospitals. Some commenters asked CMS to state in

its final rule that the proposed addition of paragraph (e) to § 412.101 is a codification and clarification of existing policy regarding dissimilar hospitals, and that under that policy it is proper to approve a low-volume hospital adjustment to a hospital despite its proximity to an IHS or Tribal hospital. In general, commenters pointed to one or more of the following reasons in support of their assertion that the proposed rule is a codification and clarification of existing policy rather than a new policy: (1) Published CMS and MAC guidance that commenters claim has provided for a “like hospital” standard since the implementation of the adjustment (for example, Transmittal 1347, Change Request 8627 (February 14, 2014)); (2) a hospital that is within 15 miles of an IHS hospital and also has sole community hospital status indicates that such hospitals and IHS facilities are not “like hospitals”; (3) assertions that some MACs had, at times for some cost reporting periods (or portions thereof), allowed non-IHS hospitals whose sole disqualifier was proximity to an IHS or Tribal hospital to receive a low-volume hospital adjustment; and (4) two Departmental Appeals Board decisions for cases which involved CAH designation not eligibility for a low-volume hospital adjustment (*Cibola General Hospital*, DAB No. 2387 (2011) and *La Paz Regional Hospital*, DAB CR 2883 (2013)), that commenters asserted found that “IHS facilities should be disregarded in determining a hospital’s eligibility for Medicare program classifications that are based on proximity to other Medicare hospitals.”

Response: We appreciate the commenters’ support of our proposal. Because we have consistently considered IHS and Tribal hospitals to be subsection (d) hospitals, as noted in the preambles of the above cited rules, we believe it is inappropriate to apply this parallel adjustment retroactively. While CMS may have in certain instances used terms such as “like” in place of “subsection (d)” when issuing subregulatory guidance for the low-volume hospital adjustment and there may have been inconsistencies in low-volume hospital adjustment determinations made by some contractors, these factors do not establish agency policy or bind the agency. Indeed, CMS’ regulations at § 412.101(b)(2) clearly refer to the proximity to the nearest subsection (d) hospital, consistent with section 1886(d)(12)(C)(i) of the Act, but neither the statutory nor the regulatory provisions that govern the low-volume

hospital adjustment refer to a “like” hospital standard. The SCH regulations at § 412.92(a), by comparison, expressly refer to proximity to a “like” hospital (as defined at § 412.92(c)(2)), consistent with section 1886(d)(5)(D)(iii) of the Act.

Moreover, the DAB decisions cited by the commenters concerned the certification of a hospital for CAH status, not the requirements for determining proximity to a subsection (d) hospital for purposes of the low-volume hospital payment adjustment. To the extent that these decisions could be interpreted to mean that the DAB has held that IHS hospitals may not, by implication, be subsection (d) hospitals, we reiterate that CMS has a longstanding policy of considering IHS and Tribal hospitals to be subsection (d) hospitals (as noted in the preambles to the rules cited above). As a result, we believe that it is necessary to amend the regulation governing the low-volume hospital payment adjustment in order to provide flexibility in determining eligibility for the adjustment. Therefore, after consideration of the public comments we received, we are finalizing this proposal, including our proposed revisions to 42 CFR 412.101, without modification.

F. Indirect Medical Education (IME) Payment Adjustment Factor for FY 2018 (§ 412.105)

Under the IPPS, an additional payment amount is made to hospitals with residents in an approved graduate medical education (GME) program in order to reflect the higher indirect patient care costs of teaching hospitals relative to nonteaching hospitals. The payment amount is determined by use of a statutorily specified adjustment factor. The regulations regarding the calculation of this additional payment, known as the IME adjustment, are located at § 412.105. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51680) for a full discussion of the IME adjustment and IME adjustment factor. Section 1886(d)(5)(B)(ii)(XII) of the Act provides that, for discharges occurring during FY 2008 and fiscal years thereafter, the IME formula multiplier is 1.35. Accordingly, in the FY 2018 IPPS/LTH PPS proposed rule (82 FR 19940), we stated that, for discharges occurring during FY 2018, the formula multiplier is 1.35. We estimate that application of this formula multiplier for the FY 2018 IME adjustment will result in an increase in IPPS payment of 5.5 percent for every approximately 10 percent increase in the hospital’s resident-to-bed ratio.

Comment: One commenter stated that it appreciated that the resident-to-bed ratio is statutorily required for purposes of calculating the IME adjustment. The commenter requested that, in order to respond to physician shortages, policymakers provide additional funding to train future physicians and urged CMS to consider additional funding that would supplement the current IME adjustment factor.

Response: We appreciate the commenter’s comment. As noted above, the IME adjustment factor is statutory and the calculation of the IME payment is also specified in statute. Accordingly, for discharges occurring during FY 2018, the formula multiplier is 1.35.

G. Payment Adjustment for Medicare Disproportionate Share Hospitals (DSHs) for FY 2018 (§ 412.106)

1. General Discussion

Section 1886(d)(5)(F) of the Act provides for additional Medicare payments to subsection (d) hospitals that serve a significantly disproportionate number of low-income patients. The Act specifies two methods by which a hospital may qualify for the Medicare disproportionate share hospital (DSH) adjustment. Under the first method, hospitals that are located in an urban area and have 100 or more beds may receive a Medicare DSH payment adjustment if the hospital can demonstrate that, during its cost reporting period, more than 30 percent of its net inpatient care revenues are derived from State and local government payments for care furnished to needy patients with low incomes. This method is commonly referred to as the “Pickle method.” The second method for qualifying for the DSH payment adjustment, which is the most common, is based on a complex statutory formula under which the DSH payment adjustment is based on the hospital’s geographic designation, the number of beds in the hospital, and the level of the hospital’s disproportionate patient percentage (DPP). A hospital’s DPP is the sum of two fractions: the “Medicare fraction” and the “Medicaid fraction.” The Medicare fraction (also known as the “SSI fraction” or “SSI ratio”) is computed by dividing the number of the hospital’s inpatient days that are furnished to patients who were entitled to both Medicare Part A and Supplemental Security Income (SSI) benefits by the hospital’s total number of patient days furnished to patients entitled to benefits under Medicare Part A. The Medicaid fraction is computed by dividing the hospital’s number of inpatient days furnished to patients

who, for such days, were eligible for Medicaid, but were not entitled to benefits under Medicare Part A, by the hospital's total number of inpatient days in the same period.

Because the DSH payment adjustment is part of the IPPS, the statutory references to "days" in section 1886(d)(5)(F) of the Act have been interpreted to apply only to hospital acute care inpatient days. Regulations located at § 412.106 govern the Medicare DSH payment adjustment and specify how the DPP is calculated as well as how beds and patient days are counted in determining the Medicare DSH payment adjustment. Under § 412.106(a)(1)(i), the number of beds for the Medicare DSH payment adjustment is determined in accordance with bed counting rules for the IME adjustment under § 412.105(b).

Section 3133 of the Patient Protection and Affordable Care Act, as amended by section 10316 of the same Act and section 1104 of the Health Care and Education Reconciliation Act (Pub. L. 111–152), added a section 1886(r) to the Act that modifies the methodology for computing the Medicare DSH payment adjustment. (For purposes of this final rule, we refer to these provisions collectively as section 3133 of the Affordable Care Act.) Beginning with discharges in FY 2014, hospitals that qualify for Medicare DSH payments under section 1886(d)(5)(F) of the Act receive 25 percent of the amount they previously would have received under the statutory formula for Medicare DSH payments. This provision applies equally to hospitals that qualify for DSH payments under section 1886(d)(5)(F)(i)(I) of the Act and those hospitals that qualify under the Pickle method under section 1886(d)(5)(F)(i)(II) of the Act.

The remaining amount, equal to an estimate of 75 percent of what otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals who are uninsured, is available to make additional payments to each hospital that qualifies for Medicare DSH payments and that has uncompensated care. The payments to each hospital for a fiscal year are based on the hospital's amount of uncompensated care for a given time period relative to the total amount of uncompensated care for that same time period reported by all hospitals that receive Medicare DSH payments for that fiscal year.

As provided by section 3133 of the Affordable Care Act, section 1886(r) of the Act requires that, for FY 2014 and each subsequent fiscal year, a subsection (d) hospital that would

otherwise receive DSH payments made under section 1886(d)(5)(F) of the Act receives two separately calculated payments. Specifically, section 1886(r)(1) of the Act provides that the Secretary shall pay to such subsection (d) hospital (including a Pickle hospital) 25 percent of the amount the hospital would have received under section 1886(d)(5)(F) of the Act for DSH payments, which represents the empirically justified amount for such payment, as determined by the MedPAC in its March 2007 Report to Congress. We refer to this payment as the "empirically justified Medicare DSH payment."

In addition to this empirically justified Medicare DSH payment, section 1886(r)(2) of the Act provides that, for FY 2014 and each subsequent fiscal year, the Secretary shall pay to such subsection (d) hospital an additional amount equal to the product of three factors. The first factor is the difference between the aggregate amount of payments that would be made to subsection (d) hospitals under section 1886(d)(5)(F) of the Act if subsection (r) did not apply and the aggregate amount of payments that are made to subsection (d) hospitals under section 1886(r)(1) of the Act for such fiscal year. Therefore, this factor amounts to 75 percent of the payments that would otherwise be made under section 1886(d)(5)(F) of the Act.

The second factor is, for FYs 2014 through 2017, 1 minus the percent change in the percent of individuals under the age of 65 who are uninsured, determined by comparing the percent of such individuals who were uninsured in 2013, the last year before coverage expansion under the Affordable Care Act (as calculated by the Secretary based on the most recent estimates available from the Director of the Congressional Budget Office before a vote in either House on the Health Care and Education Reconciliation Act of 2010 that, if determined in the affirmative, would clear such Act for enrollment), and the percent of individuals who were uninsured in the most recent period for which data are available (as so calculated) minus 0.1 percentage point for FY 2014, and minus 0.2 percentage point for FYs 2015 through 2017. For FYs 2014 through 2017, the baseline for the estimate of the change in uninsurance is fixed by the most recent estimate of the Congressional Budget Office before the final vote on the Health Care and Education Reconciliation Act of 2010, which is contained in a March 20, 2010 letter from the Director of the Congressional Budget Office to the

Speaker of the House. (The March 20, 2010 letter is available for viewing on the following Web site: <https://www.cbo.gov/sites/default/files/111th-congress-2009-2010/costestimate/amendreconprop.pdf>.)

For FY 2018 and subsequent fiscal years, the second factor is 1 minus the percent change in the percent of individuals who are uninsured, as determined by comparing the percent of individuals who were uninsured in 2013 (as estimated by the Secretary, based on data from the Census Bureau or other sources the Secretary determines appropriate, and certified by the Chief Actuary of CMS), and the percent of individuals who were uninsured in the most recent period for which data are available (as so estimated and certified), minus 0.2 percentage point for FYs 2018 and 2019.

The third factor is a percent that, for each subsection (d) hospital, represents the quotient of the amount of uncompensated care for such hospital for a period selected by the Secretary (as estimated by the Secretary, based on appropriate data), including the use of alternative data where the Secretary determines that alternative data are available which are a better proxy for the costs of subsection (d) hospitals for treating the uninsured, and the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under section 1886(r) of the Act. Therefore, this third factor represents a hospital's uncompensated care amount for a given time period relative to the uncompensated care amount for that same time period for all hospitals that receive Medicare DSH payments in the applicable fiscal year, expressed as a percent.

For each hospital, the product of these three factors represents its additional payment for uncompensated care for the applicable fiscal year. We refer to the additional payment determined by these factors as the "uncompensated care payment."

Section 1886(r) of the Act applies to FY 2014 and each subsequent fiscal year. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50620 through 50647) and the FY 2014 IPPS interim final rule with comment period (78 FR 61191 through 61197), we set forth our policies for implementing the required changes to the Medicare DSH payment methodology made by section 3133 of the Affordable Care Act for FY 2014. In those rules, we noted that, because section 1886(r) of the Act modifies the payment required under section 1886(d)(5)(F) of the Act, it affects only the DSH payment under the operating IPPS. It does not revise or replace the

capital IPPS DSH payment provided under the regulations at 42 CFR part 412, subpart M, which were established through the exercise of the Secretary's discretion in implementing the capital IPPS under section 1886(g)(1)(A) of the Act.

Finally, section 1886(r)(3) of the Act provides that there shall be no administrative or judicial review under section 1869, section 1878, or otherwise of any estimate of the Secretary for purposes of determining the factors described in section 1886(r)(2) of the Act or of any period selected by the Secretary for the purpose of determining those factors. Therefore, there is no administrative or judicial review of the estimates developed for purposes of applying the three factors used to determine uncompensated care payments, or the periods selected in order to develop such estimates.

2. Eligibility for Empirically Justified Medicare DSH Payments and Uncompensated Care Payments

As indicated earlier, the payment methodology under section 3133 of the Affordable Care Act applies to "subsection (d) hospitals" that would otherwise receive a DSH payment made under section 1886(d)(5)(F) of the Act. Therefore, hospitals must receive empirically justified Medicare DSH payments in a fiscal year in order to receive an additional Medicare uncompensated care payment for that year. Specifically, section 1886(r)(2) of the Act states that, in addition to the payment made to a subsection (d) hospital under section 1886(r)(1) of the Act, the Secretary shall pay to such subsection (d) hospitals an additional amount. Because section 1886(r)(1) of the Act refers to empirically justified Medicare DSH payments, the additional payment under section 1886(r)(2) of the Act is limited to hospitals that receive empirically justified Medicare DSH payments in accordance with section 1886(r)(1) of the Act for the applicable fiscal year.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50622) and the FY 2014 IPPS interim final rule with comment period (78 FR 61193), we provided that hospitals that are not eligible to receive empirically justified Medicare DSH payments in a fiscal year will not receive uncompensated care payments for that year. We also specified that we would make a determination concerning eligibility for interim uncompensated care payments based on each hospital's estimated DSH status for the applicable fiscal year (using the most recent data that are available). We indicated that our final determination on the hospital's

eligibility for uncompensated care payments will be based on the hospital's actual DSH status at cost report settlement for that payment year.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50622) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50006), we specified our policies for several specific classes of hospitals within the scope of section 1886(r) of the Act. We refer readers to those two final rules for a detailed discussion of our policies. In summary, we specified the following:

- *Subsection (d) Puerto Rico hospitals* that are eligible for DSH payments also are eligible to receive empirically justified Medicare DSH payments and uncompensated care payments under the new payment methodology (78 FR 50623 and 79 FR 50006).

- *Maryland hospitals* are not eligible to receive empirically justified Medicare DSH payments and uncompensated care payments under the payment methodology of section 1886(r) of the Act because they are not paid under the IPPS. As discussed in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50007), effective January 1, 2014, the State of Maryland elected to no longer have Medicare pay Maryland hospitals in accordance with section 1814(b)(3) of the Act and entered into an agreement with CMS that Maryland hospitals will be paid under the Maryland All-Payer Model. However, under the Maryland All-Payer Model, Maryland hospitals still are not paid under the IPPS. Therefore, they remain ineligible to receive empirically justified Medicare DSH payments or uncompensated care payments under section 1886(r) of the Act.

- *SCHs that are paid under their hospital-specific rate* are not eligible for Medicare DSH payments. SCHs that are paid under the IPPS Federal rate receive interim payments based on what we estimate and project their DSH status to be prior to the beginning of the Federal fiscal year (based on the best available data at that time) subject to settlement through the cost report, and if they receive interim empirically justified Medicare DSH payments in a fiscal year, they also will receive interim uncompensated care payments for that fiscal year on a per discharge basis, subject as well to settlement through the cost report. Final eligibility determinations will be made at the end of the cost reporting period at settlement, and both interim empirically justified Medicare DSH payments and uncompensated care payments will be adjusted accordingly (78 FR 50624 and 79 FR 50007).

- *MDHs* are paid based on the IPPS Federal rate or, if higher, the IPPS Federal rate plus 75 percent of the amount by which the Federal rate is exceeded by the updated hospital-specific rate from certain specified base years (76 FR 51684). The IPPS Federal rate used in the MDH payment methodology is the same IPPS Federal rate that is used in the SCH payment methodology. Section 205 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA), Public Law 114–10, enacted April 16, 2015, extended the MDH program for discharges on or after April 1, 2015, through September 30, 2017. Because MDHs are paid based on the IPPS Federal rate, for FY 2017, MDHs continue to be eligible to receive empirically justified Medicare DSH payments and uncompensated care payments if their DPP is at least 15 percent. We apply the same process to determine MDHs' eligibility for empirically justified Medicare DSH and uncompensated care payments, as we do for all other IPPS hospitals, through September 30, 2017. We note that there has not been legislation at the time of development of this final rule that would extend the MDH program beyond September 30, 2017. However, if the MDH program were to be extended beyond its current expiration date, similar to how it was extended under MACRA, MDHs would continue to be paid based on the IPPS Federal rate or, if higher, the IPPS Federal rate plus 75 percent of the amount by which the Federal rate is exceeded by the updated hospital-specific rate from certain specified base years. Accordingly, if the MDH program were to be extended beyond its current expiration date of September 30, 2017, we would continue to make a determination concerning eligibility for interim uncompensated care payments based on each hospital's estimated DSH status for the applicable fiscal year (using the most recent data that are available). Our final determination on the hospital's eligibility for uncompensated care payments would be based on the hospital's actual DSH status at cost report settlement for that payment year. In addition, as we do for all IPPS hospitals, we would calculate a numerator for Factor 3 for all MDHs, regardless of whether they are projected to be eligible for Medicare DSH payments during the fiscal year, but the denominator for Factor 3 would be based on the uncompensated care data from the hospitals that we have projected to be eligible for Medicare DSH payments during the fiscal year.

These policies for MDHs would only apply in FY 2018 if the MDH program is extended by statute, beyond its current expiration date of September 30, 2017.

- *IPPS hospitals that have elected to participate in the Bundled Payments for Care Improvement initiative and IPPS hospitals that are participating in the mandatory Comprehensive Care for Joint Replacement Model, the Episode Payment Models, or the Cardiac Rehabilitation Incentive Payment Model* continue to be paid under the IPPS (77 FR 53342) and, therefore, are eligible to receive empirically justified Medicare DSH payments and uncompensated care payments (78 FR 50625 and 79 FR 50008).

- *Hospitals Participating in the Rural Community Hospital Demonstration Program* are not eligible to receive empirically justified Medicare DSH payments and uncompensated care payments under section 1886(r) of the Act because they are not paid under the IPPS (78 FR 50625 and 79 FR 50008). The Rural Community Hospital Demonstration Program was originally authorized for a 5-year period by section 410A of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) (Pub. L. 108–173), and extended for another 5-year period by sections 3123 and 10313 of the Affordable Care Act (Pub. L. 114–255). The period of performance for this 5-year extension period ended December 31, 2016. Section 15003 of the 21st Century Cures Act (Pub. L. 114–255), enacted December 13, 2016, again amended section 410A of Public Law 108–173 to require a 10-year extension period (in place of the 5-year extension required by the Affordable Care Act), to begin on the date immediately following the last day of the initial 5-year period. Section 15003 also requires that, no later than 120 days after enactment of Public Law 114–255, the Secretary issue a solicitation to select additional hospitals to participate in the demonstration program for the second 5 years of the 10-year extension period so long as the maximum number of 30 hospitals stipulated by the Affordable Care Act is not exceeded. (We refer readers to section V.L. of the preamble of this final rule for a full discussion of the provisions of section 15003 of Public Law 114–255 and our implementation of this provision.) As of the time of development of this final rule, the entire set of hospitals that will participate in the second 5 years of the extension period is unknown. However, we intend to apply a similar payment methodology during the remainder of the extension period. As a result, we

expect that hospitals participating in the demonstration will not receive empirically justified DSH payments, and that they will be excluded from receiving interim and final uncompensated care payments for FY 2018 and subsequent fiscal years for the duration of the second 5 years of the extension period.

3. Empirically Justified Medicare DSH Payments

As we have discussed earlier, section 1886(r)(1) of the Act requires the Secretary to pay 25 percent of the amount of the Medicare DSH payment that would otherwise be made under section 1886(d)(5)(F) of the Act to a subsection (d) hospital. Because section 1886(r)(1) of the Act merely requires the program to pay a designated percentage of these payments, without revising the criteria governing eligibility for DSH payments or the underlying payment methodology, we stated in the FY 2014 IPPS/LTCH PPS final rule that we did not believe that it was necessary to develop any new operational mechanisms for making such payments. Therefore, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50626), we implemented this provision by advising MACs to simply adjust the interim claim payments to the requisite 25 percent of what would have otherwise been paid. We also made corresponding changes to the hospital cost report so that these empirically justified Medicare DSH payments can be settled at the appropriate level at the time of cost report settlement. We provided more detailed operational instructions and cost report instructions following issuance of the FY 2014 IPPS/LTCH PPS final rule that are available on the CMS Web site at: <http://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2014-Transmittals-Items/R5P240.html>.

4. Uncompensated Care Payments

As we discussed earlier, section 1886(r)(2) of the Act provides that, for each eligible hospital in FY 2014 and subsequent years, the uncompensated care payment is the product of three factors. These three factors represent our estimate of 75 percent of the amount of Medicare DSH payments that would otherwise have been paid, an adjustment to this amount for the percent change in the national rate of uninsurance compared to the rate of uninsurance in 2013, and each eligible hospital's estimated uncompensated care amount relative to the estimated uncompensated care amount for all eligible hospitals. Below we discuss the data sources and methodologies for

computing each of these factors, our final policies for FYs 2014 through 2017, and our proposed and final policies for FY 2018.

a. Calculation of Factor 1 for FY 2018

Section 1886(r)(2)(A) of the Act establishes Factor 1 in the calculation of the uncompensated care payment. Section 1886(r)(2)(A) of the Act states that this factor is equal to the difference between (1) the aggregate amount of payments that would be made to subsection (d) hospitals under section 1886(d)(5)(F) of the Act if section 1886(r) of the Act did not apply for such fiscal year (as estimated by the Secretary); and (2) the aggregate amount of payments that are made to subsection (d) hospitals under section 1886(r)(1) of the Act for such fiscal year (as so estimated). Therefore, section 1886(r)(2)(A)(i) of the Act represents the estimated Medicare DSH payments that would have been made under section 1886(d)(5)(F) of the Act if section 1886(r) of the Act did not apply for such fiscal year. Under a prospective payment system, we would not know the precise aggregate Medicare DSH payment amount that would be paid for a Federal fiscal year until cost report settlement for all IPPS hospitals is completed, which occurs several years after the end of the Federal fiscal year. Therefore, section 1886(r)(2)(A)(i) of the Act provides authority to estimate this amount, by specifying that, for each fiscal year to which the provision applies, such amount is to be estimated by the Secretary. Similarly, section 1886(r)(2)(A)(ii) of the Act represents the estimated empirically justified Medicare DSH payments to be made in a fiscal year, as prescribed under section 1886(r)(1) of the Act. Again, section 1886(r)(2)(A)(ii) of the Act provides authority to estimate this amount.

Therefore, Factor 1 is the difference between our estimates of: (1) The amount that would have been paid in Medicare DSH payments for the fiscal year, in the absence of the new payment provision; and (2) the amount of empirically justified Medicare DSH payments that are made for the fiscal year, which takes into account the requirement to pay 25 percent of what would have otherwise been paid under section 1886(d)(5)(F) of the Act. In other words, this factor represents our estimate of 75 percent (100 percent minus 25 percent) of our estimate of Medicare DSH payments that would otherwise be made, in the absence of section 1886(r) of the Act, for the fiscal year.

As we did for FY 2017, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR

19943), in order to determine Factor 1 in the uncompensated care payment formula for FY 2018, we proposed to continue the policy established in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50628 through 50630) and in the FY 2014 IPPS interim final rule with comment period (78 FR 61194) of determining Factor 1 by developing estimates of both the aggregate amount of Medicare DSH payments that would be made in the absence of section 1886(r)(1) of the Act and the aggregate amount of empirically justified Medicare DSH payments to hospitals under 1886(r)(1) of the Act. These estimates will not be revised or updated after we know the final Medicare DSH payments for FY 2018.

Therefore, in order to determine the two elements of proposed Factor 1 for FY 2018 (Medicare DSH payments *prior* to the application of section 1886(r)(1) of the Act, and empirically justified Medicare DSH payments *after* application of section 1886(r)(1) of the Act), for the proposed rule, we used the most recently available projections of Medicare DSH payments for the fiscal year, as calculated by CMS' Office of the Actuary using the most recently filed Medicare hospital cost report with Medicare DSH payment information and the most recent Medicare DSH patient percentages and Medicare DSH payment adjustments provided in the IPPS Impact File.

For purposes of calculating proposed Factor 1 and modeling the impact of the FY 2018 IPPS/LTCH PPS proposed rule, we used the Office of the Actuary's January 2017 Medicare DSH estimates, which were based on data from the December 2016 update of the Medicare Hospital Cost Report Information System (HCRIS) and the FY 2017 IPPS/LTCH PPS final rule IPPS Impact file, published in conjunction with the publication of the FY 2017 IPPS/LTCH PPS final rule. Because SCHs that are projected to be paid under their hospital-specific rate are excluded from the application of section 1886(r) of the Act, these hospitals also were excluded from the January 2017 Medicare DSH estimates. Furthermore, because section 1886(r) of the Act specifies that the uncompensated care payment is in addition to the empirically justified Medicare DSH payment (25 percent of DSH payments that would be made without regard to section 1886(r) of the Act), Maryland hospitals participating in the Maryland All-Payer Model that do not receive DSH payments were also excluded from the Office of the Actuary's January 2017 Medicare DSH estimates. Hospitals that had been participating in the Rural Community

Hospital Demonstration Program through December 31, 2016 were included in these estimates. (As discussed earlier, the Affordable Care Act authorized a 5-year extension period for the demonstration, which ended December 31, 2016.) The demonstration was extended for an additional 5 years by section 15003 of Public Law 114–255. Although the hospitals that will participate in the second 5 years of the extension period had not been determined at the time of development of the proposed rule, we stated that we intend to apply a similar payment methodology during the second 5 years of the extension period as for the earlier periods of the demonstration. Therefore, hospitals participating in the demonstration would not be eligible to receive DSH payments. We stated in the proposed rule that if the hospitals participating in the second 5 years of the extension period are known prior to the development of the Medicare DSH estimates for the FY 2018 final rule, these hospitals would be excluded from the Office of the Actuary's final Medicare DSH estimates for FY 2018.

For the proposed rule, using the data sources discussed earlier, the Office of the Actuary used the most recently submitted Medicare cost report data to identify Medicare DSH payments and the most recent Medicare DSH payment adjustments provided in the IPPS Impact File, and applied inflation updates and assumptions for future changes in utilization and case-mix to estimate Medicare DSH payments for the upcoming fiscal year. The January 2017 Office of the Actuary estimate for Medicare DSH payments for FY 2017, without regard to the application of section 1886(r)(1) of the Act, was approximately \$16,003 billion. This estimate excluded Maryland hospitals participating in the Maryland All-Payer Model and SCHs paid under their hospital-specific payment rate. Therefore, based on the January 2017 estimate, the estimate for empirically justified Medicare DSH payments for FY 2017, with the application of section 1886(r)(1) of the Act, was approximately \$4,001 billion (or 25 percent of the total amount of estimated Medicare DSH payments for FY 2018). Under § 412.106(g)(1)(i) of the regulations, Factor 1 is the difference between these two estimates of the Office of the Actuary. Therefore, in the proposed rule, we proposed that Factor 1 for FY 2018 was \$12,001,915,095.04, which is equal to 75 percent of the total amount of estimated Medicare DSH payments for FY 2017 (\$16,002,553,460.05 minus

\$4,000,638,365.01). We invited public comments on our proposed calculation of Factor 1 for FY 2018.

Comment: A number of commenters requested greater transparency in the methodology used by CMS and the OACT to estimate aggregate DSH payments that would have been paid absent implementation of the Affordable Care Act, particularly with respect to the calculation of estimated DSH payments for purposes of determining Factor 1. The commenters believed that CMS has not adequately explained its methodology in calculating DSH payments and urged CMS to clarify the methodology and provide additional information on the factor assumptions used to make these projections. One commenter noted that providing a table explaining the factors applied for FYs 2015–2018 to estimate Medicare DSH expenditures using a 2014 baseline is not sufficient, given that CMS does not provide more detail on the completion factor used to adjust the FY 2015 and FY 2016 claims data used for the “Discharges” column. The commenter stated that this lack of information severely limited the public's ability to comment on the projections and estimates for Factor 1. Commenters also requested that this information be provided in advance of the publication of the FY 2018 IPPS/LTCH PPS final rule and in future proposed rules each year.

The majority of comments on Factor 1 related to the “Other” and “Discharges” factors that are used to estimate Medicare DSH expenditures. Some commenters stated that there is variability in the factors and requested full disclosure of the methodology and the various components used to estimate the catch-all “Other” column. A number of commenters noted that, other than the statements in the proposed rule, CMS provided no further explanation for the specific items that make up the “Other” column or the value of each component. Specifically, one commenter expressed concern that the annual growth rate due to “other” factors projected by CMS increased from 4.9 percent in FY 2015 to 6.9 percent in FY 2017, while it decreased by 1 percent in FY 2018. Commenters requested that CMS provide a breakdown of the factors influencing these changes and their impact on FY 2018 DSH estimates to allow providers to understand and verify these projections, as well as to make meaningful comments, if warranted.

Many commenters also asked CMS to explain how Medicaid expansion is accounted for in the “Other” column used to determine the Factor 1 estimate.

A few commenters stated that the effect of Medicaid expansion on the agency's projection of the amount of traditional DSH payments that would have been paid in FY 2014, absent of the Affordable Care Act, has varied erratically in the agency's successive rulemakings for FYs 2015 through 2018. Another commenter noted that the most recent Congressional Budget Office report showed a 32-percent increase in Medicaid/CHIP enrollment as a result of Medicaid expansion, and expected that this increase in enrollment would result in a substantial increase in DSH payments that is not reflected in OACT's DSH estimate for Factor 1.

Commenters objected to CMS' statement from prior rulemaking that "the increase due to Medicaid expansion is not as large as commenters contended due to the actuarial assumption that the new enrollees are healthier than the average Medicaid recipient, and, therefore, use fewer hospital services." Some commenters asserted that there is no solid evidentiary basis for the assumption that new Medicaid enrollees are healthier, and requested that CMS reconsider and discontinue use of this assumption. In addition, the commenters argued that CMS should by now have accurate information regarding States that have expanded Medicaid, and that CMS should utilize the available enrollment and/or utilization information from Medicaid expansion programs either to support or refute the assumption that the Medicaid expansion population is healthier than the average Medicaid recipient. Many commenters also stated that the level of Medicaid expansion included in the calculation of Factor 1, including the adjustments made to Factor 1 to account for the estimated Medicaid expansion in FY 2018, is unclear. The commenters requested that CMS resolve the inconsistency with the decrease in the uninsured rate from 14 percent in 2013 to 8.15 percent in 2018 due to Medicaid expansion, and fully account for the increase in Medicaid participation in the Factor 1 calculation.

Response: We thank the commenters for their input. As in previous years, we would like to clarify that Factor 1 is not estimated in isolation. The Factor 1 estimates for proposed rules are generally consistent with the economic assumptions and actuarial analysis used to develop the President's Budget estimates under current law, and the Factor 1 estimates for the final rule are generally consistent with those used for the Midsession Review of the President's Budget. For additional information on the development of the

President's Budget, we refer readers to the Office of Management and Budget Web site at: <https://www.whitehouse.gov/omb/budget>. For additional information on the specific economic assumptions used in the Midsession Review of the President's FY 2018 Budget, we refer readers to the "Midsession Review of the President's FY 2018 Budget" available on the Office of Management and Budget Web site at: <https://www.whitehouse.gov/omb/budget>. For a general overview of the principal steps involved in projecting future inpatient costs and utilization, we refer readers to the "2017 Annual Report of the Boards of Trustees of the Federal Hospital Insurance and Federal Supplementary Medical Insurance Trust Funds" available on the CMS Web site at: <https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/ReportsTrustFunds/index.html?redirect=/reportstrustfunds/> under "Downloads." For the OACT's memorandum describing its methodology and estimates, we refer readers to "OACT Memorandum on DSH Factor 1 for FY 2018" available on the CMS Web site at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html> under "Downloads".

As we did in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56950), later in this section, we provide additional information regarding the data sources, methods, and assumptions employed by the actuaries in determining the OACT's updated estimate of Factor 1 for FY 2018. We believe that this discussion addresses the methodological concerns raised by commenters regarding the various assumptions used in the estimate, including the "Other" and "Discharges" assumptions and also provides additional information regarding how we address the Medicaid and CHIP expansion. However, we note that, with regard to the commenters' questions and concerns regarding the use of completion factors to adjust preliminary data, the OACT assumed a discharge completion factor of 99 percent for FY 2015 and 98 percent for FY 2016. Similarly, the OACT assumed that case-mix for these years was stabilized at the time of the estimate and no additional completion factor adjustment was needed. These assumptions are consistent with historical patterns of completion factors that have been determined for discharge and case-mix numbers.

Regarding the commenters' assertion that Medicaid expansion is not adequately accounted for in the "Other" column and that there is no evidentiary

basis for the assumption that the newly covered Medicaid expansion population is healthier than the average Medicaid recipient, we note that, based on data from the Midsession Review of the President's Budget, the OACT assumed per capita spending for Medicaid beneficiaries who enrolled due to the expansion to be 50 percent of the average per capita spending of a pre-expansion Medicaid beneficiary due to the better health of these beneficiaries. This assumption is consistent with recent internal estimates of Medicaid per capita spending pre-expansion and post-expansion.

Comment: In addition to requesting that the methodology and assumptions used for Factor 1 be made public before the publication of the final rule and with the proposed rule each subsequent year, commenters requested that CMS furnish interested parties with advance opportunity to comment on new calculations based on the more recent data that CMS intends ultimately to use for the final rule. One commenter believed that CMS' rulemaking is flawed because different data and calculations are used in the final rule than were used for purposes of the proposed rule, without any opportunity for the hospitals to comment. This commenter requested that CMS make clear that it will use different or updated data to determine payments for uncompensated care in the final rule. The commenter believed that the proposal to determine the amount of hospitals' uncompensated care payments based on data first released with the final rule and on which hospitals will have no meaningful opportunity to comment violates notice-and-comment rulemaking requirements. As discussed earlier, several commenters noted the variability in the values of the "Other" column as well as in the factor applied to account for Medicaid expansion; one of the commenters called on CMS to explain why these values were allowed to change from one rulemaking to the next when the agency has otherwise taken the position that the estimates used to determine uncompensated care payments should be fixed when made and not be reconciled with data that become available later.

Response: We believe that stakeholders had notice and a full opportunity to comment on the methodology that would be used to determine uncompensated care payments, including the data sources that would be used. As a result, commenters had a full opportunity to raise any concerns regarding the appropriateness of the data generally, even if the actual data were not yet

available, consistent with the requirements for notice-and-comment rulemaking under the Administrative Procedure Act. With respect to concerns about the variability of the factors used to estimate Factor 1, we note that, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50630), using the discretion afforded in the statute to estimate the aggregate amount of DSH payments that would be made in the absence of section 1886(r) of the Act, we finalized a policy of defining the methodology for calculating Factor 1 using the OACT's biannual Medicare DSH payment projections, which are typically available around February of each year (based on data from December of the previous year) as part of the President's Budget, and around July (based on data from June) as part of the Midsession Review of the President's Budget.

Comment: One commenter requested that, in light of its concerns about the data sources and methods used to estimate Factor 1, CMS adopt a process to reconcile data for Factor 1. Commenters noted their concern that the DSH payment estimates for FY 2014 through FY 2017, as displayed in the table for factors applied to update the Medicare DSH baseline in the FY 2018 proposed rule, compared to original projections from the respective payment year from the FY 2014 through FY 2017 final rules, show that Factor 1 would have been higher, in retrospect, over that period of time. In other words, commenters noted how, based on the more recent data used in the FY 2018 proposed rule, the Factor 1 estimates are higher compared to the data available at the time of the past final rules.

Response: We continue to believe that applying our best estimates prospectively is most conducive to administrative efficiency, finality, and predictability in payments (78 FR 50628; 79 FR 50010; 80 FR 49518; and 81 FR 56949). We believe that, in affording the Secretary the discretion to estimate the amount of these payments and by including a prohibition against administrative and judicial review of those estimates in section 1886(r)(3) of

the Act, Congress recognized the importance of finality and predictability in payments. As a result, we do not agree with the commenter that we should establish a process for reconciling our estimate of Factor 1. However, we note that, in reviewing the OACT's prior estimates for DSH payments compared to more updated estimates and/or actual experience, from FY 2005 to FY 2017, the original estimates have been higher than either the more updated estimates and/or actual experience for 8 of the 14 years and lower than actual experience in only 6 years.

After consideration of the public comments received, we are finalizing our proposed methodology for calculating Factor 1 for FY 2018. We discuss the resulting Factor 1 amount for FY 2018 below.

To determine Factor 1 and to model the impact of this provision for FY 2018, we used the Office of the Actuary's June 2017 Medicare DSH estimates based on data from the March 2017 update of the cost report data for FY 2014 included in the HCRIS and the Impact File published in conjunction with the publication of the FY 2017 IPPS/LTCH PPS final rule. Because SCHs that are projected to be paid under their hospital-specific rate are excluded from the application of section 1886(r) of the Act, these hospitals also were excluded from the June 2017 Medicare DSH estimates. Furthermore, because Maryland hospitals participating in the Maryland All-Payer Model do not receive DSH payments, these hospitals also are excluded from the Office of the Actuary's Medicare DSH estimates. At the time of development of this final rule, the set of hospitals participating in the Rural Community Hospital Demonstration program is still unknown. As a result, it was not possible for these hospitals to be excluded from the Office of the Actuary's Medicare DSH estimates. However, we expect that hospitals participating in the demonstration will not receive empirically justified DSH payments, and that they will be

excluded from receiving interim and final uncompensated care payments for FY 2018 and subsequent fiscal years for the duration of the second 5 years of the extension period.

For this final rule, using the data sources discussed above, the Office of the Actuary used the most recently submitted Medicare cost report data for FY 2014 to identify Medicare DSH payments and the most recent Medicare DSH payment adjustments provided in the Impact File published in conjunction with the publication of the FY 2017 IPPS/LTCH PPS final rule and applied update factors and assumptions for future changes in utilization and case-mix to estimate Medicare DSH payments for the upcoming fiscal year. The June 2017 Office of the Actuary estimate for Medicare DSH payments for FY 2018, without regard to the application of section 1886(r)(1) of the Act, was approximately \$15.533 billion. This estimate excluded Maryland hospitals participating in the Maryland All-Payer Model and SCHs paid under their hospital-specific payment rate. Therefore, based on the June 2017 estimate, the estimate for empirically justified Medicare DSH payments for FY 2018, with the application of section 1886(r)(1) of the Act, is approximately \$3.888 billion (or 25 percent of the total amount of estimated Medicare DSH payments for FY 2018). Under § 412.106(g)(1)(i) of the regulations, Factor 1 is the difference between these two estimates of the Office of the Actuary. Therefore, in this final rule, Factor 1 for FY 2018 is \$11,664,704,643.27, which is equal to 75 percent of the total amount of estimated Medicare DSH payments for FY 2018 (\$15,552,939,524.36 minus \$3,888,234,881.09).

The Office of the Actuary's final estimates for FY 2018 began with a baseline of \$12.395 billion in Medicare DSH expenditures for FY 2014. The following table shows the factors applied to update this baseline through the current estimate for FY 2018:

FACTORS APPLIED FOR FY 2015 THROUGH FY 2018 TO ESTIMATE MEDICARE DSH EXPENDITURES USING 2014 BASELINE

FY	Update	Discharges	Case-mix	Other	Total	Estimated DSH payment (in billions) *
2015	1.014	1.0068	1.005	1.0496	1.0769	\$13.348
2016	1.009	0.9742	1.027	1.0685	1.0787	14.398
2017	1.0015	0.9952	1.005	1.0535	1.0553	15.194
2018	1.018088	1.0070	1.005	0.9935	1.0236	15.533

* Rounded.

In this table, the “Discharges” column shows the increase in the number of Medicare fee-for-service (FFS) inpatient hospital discharges. The figures for FY 2015 and FY 2016 are based on Medicare claims data that have been adjusted by a completion factor. The discharge figure for FY 2017 is based on preliminary data for 2017. The discharge figure for FY 2018 is an assumption based on recent trends recovering back to the long-term trend and assumptions related to how many beneficiaries will be enrolled in Medicare Advantage (MA) plans. The case-mix column shows the increase in case-mix for IPPS hospitals. The case-mix figures for FY 2015 and FY 2016 are based on actual data adjusted by a completion factor. The FY 2017 increase is based on preliminary data.

The FY 2018 increase is based on the recommendation of the 2010–2011 Medicare Technical Review Panel. The

“Other” column shows the increase in other factors that contribute to the Medicare DSH estimates. These factors include the difference between the total inpatient hospital discharges and the IPPS discharges, and various adjustments to the payment rates that have been included over the years but are not reflected in the other columns (such as the change in rates for the 2-midnight stay policy). In addition, the “Other” column includes a factor for the Medicaid expansion due to the Affordable Care Act. The factor for Medicaid expansion was developed using public information and statements for each State regarding its intent to implement the expansion. Based on this information, it is assumed that 50 percent of all individuals who were potentially newly eligible Medicaid enrollees in 2016 resided in States that had elected to expand Medicaid

eligibility and, for 2017 and thereafter, that 55 percent of such individuals would reside in expansion States. In the future, these assumptions may change based on actual participation by States. For a discussion of general issues regarding Medicaid projections, we refer readers to the 2016 Actuarial Report on the Financial Outlook for Medicaid (<https://www.cms.gov/Research-Statistics-Data-and-Systems/Research/ActuarialStudies/Downloads/MedicaidReport2016.pdf>). We note that, in developing their estimates of the effect of Medicaid expansion on Medicare DSH expenditures, our actuaries have assumed that the new Medicaid enrollees are healthier than the average Medicaid recipient and, therefore, use fewer hospital services.

The table below shows the factors that are included in the “Update” column of the above table:

FY	Market basket percentage	Affordable Care Act payment reductions	Multifactor productivity adjustment	Documentation and coding	Total update percentage
2015	2.9	–0.2	–0.5	–0.8	1.4
2016	2.4	–0.2	–0.5	–0.8	0.9
2017	2.7	–0.75	–0.3	–1.5	0.15
2018	2.7	–0.75	–0.6	0.4588	1.8088

Note: All numbers are based on Midsession Review of FY 2018 President’s Budget projections.

b. Calculation of Factor 2 for FY 2018

(1) Background

Section 1886(r)(2)(B) of the Act establishes Factor 2 in the calculation of the uncompensated care payment. Specifically, section 1886(r)(2)(B)(i) of the Act provides that, for each of FYs 2014, 2015, 2016, and 2017, a factor equal to 1 minus the percent change in the percent of individuals under the age of 65 who are uninsured, as determined by comparing the percent of such individuals (1) who were uninsured in 2013, the last year before coverage expansion under the Affordable Care Act (as calculated by the Secretary based on the most recent estimates available from the Director of the Congressional Budget Office before a vote in either House on the Health Care and Education Reconciliation Act of 2010 that, if determined in the affirmative, would clear such Act for enrollment); and (2) who are uninsured in the most recent period for which data are available (as so calculated), minus 0.1 percentage point for FY 2014 and minus 0.2 percentage point for each of FYs 2015, 2016, and 2017.

Section 1886(r)(2)(B)(i)(I) of the Act further indicates that the percent of individuals under 65 without insurance in 2013 must be the percent of such individuals who were uninsured in 2013, the last year before coverage expansion under the Affordable Care Act (as calculated by the Secretary based on the most recent estimates available from the Director of the Congressional Budget Office before a vote in either House on the Health Care and Education Reconciliation Act of 2010 that, if determined in the affirmative, would clear such Act for enrollment). The Health Care and Education Reconciliation Act (Pub. L. 111–152) was enacted on March 30, 2010. It was passed in the House of Representatives on March 21, 2010, and by the Senate on March 25, 2010. Because the House of Representatives was the first House to vote on the Health Care and Education Reconciliation Act of 2010 on March 21, 2010, we have determined that the most recent estimate available from the Director of the Congressional Budget Office “before a vote in either House on the Health Care and Education Reconciliation Act of 2010 . . .” (emphasis added)

appeared in a March 20, 2010 letter from the director of the CBO to the Speaker of the House. Therefore, we believe that only the estimates in this March 20, 2010 letter meet the statutory requirement under section 1886(r)(2)(B)(i)(I) of the Act. (To view the March 20, 2010 letter, we refer readers to the Web site at: <https://www.cbo.gov/sites/default/files/111th-congress-2009-2010/costestimate/amendconprop.pdf>.)

In its March 20, 2010 letter to the Speaker of the House of Representatives, the CBO provided two estimates of the “post-policy uninsured population.” The first estimate is of the “Insured Share of the Nonelderly Population Including All Residents” (82 percent) and the second estimate is of the “Insured Share of the Nonelderly Population Excluding Unauthorized Immigrants” (83 percent). In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50631), we used the first estimate that includes all residents, including unauthorized immigrants. We stated that we believe this estimate is most consistent with the statute, which requires us to measure “the percent of individuals under the age of 65 who are

uninsured” and provides no exclusions except for individuals over the age of 65. In addition, we stated that we believe that this estimate more fully reflects the levels of uninsurance in the United States that influence uncompensated care for hospitals than the estimate that reflects only legal residents. The March 20, 2010 CBO letter reports these figures as the estimated percentage of individuals with insurance. However, because section 1886(r)(2)(B)(i) of the Act requires that we compare the percent of individuals who are uninsured in the most recent period for which data are available with the percent of individuals who were uninsured in 2013, in the FY 2014 IPPS/LTCH PPS final rule, we used the CBO insurance rate figure and subtracted that amount from 100 percent (that is, the total population without regard to insurance status) to estimate the 2013 baseline percent of individuals without insurance. Therefore, for FYs 2014 through 2017, our estimate of the uninsurance percentage for 2013 was 18 percent.

Section 1886(r)(2)(B)(i) of the Act requires that we compare the baseline uninsurance rate to the percent of such individuals who are uninsured in the most recent period for which data are available (as so calculated). In the FY 2014, FY 2015, FY 2016, and FY 2017 IPPS/LTCH PPS final rules (78 FR 50634, 79 FR 50014, 80 FR 49522, and 81 FR 56952, respectively), we used the same data source, CBO estimates, to calculate this percent of individuals without insurance. In response to public comments, we also agreed that we should normalize the CBO estimates, which are based on the calendar year, for the Federal fiscal years for which each calculation of Factor 2 is made (78 FR 50633). Therefore, for the FY 2017 IPPS/LTCH PPS final rule (81 FR 56952), we used the most recently available estimate of the uninsurance rate, which was based on the CBO’s March 2016 estimates of the effects of the Affordable Care Act on health insurance coverage (which are available at <https://www.cbo.gov/sites/default/files/114th-congress-2015-2016/reports/51385-HealthInsuranceBaseline.pdf>). The CBO’s March 2016 estimate of individuals under the age of 65 with insurance in CY 2016 was 90 percent. Therefore, the CBO’s most recent estimate of the rate of uninsurance in CY 2016 was 10 percent (that is, 100 percent minus 90 percent). The CBO’s March 2016 estimate of individuals under the age of 65 with insurance in CY 2017 was also 90 percent. Therefore, the CBO’s most recent estimate of the

rate of uninsurance in CY 2017 available for the FY 2017 final rule was also 10 percent (that is, 100 percent minus 90 percent).

The calculation of the final Factor 2 for FY 2017, employing a weighted average of the CBO projections for CY 2016 and CY 2017, was as follows:

- CY 2016 rate of insurance coverage (March 2016 CBO estimate): 90 percent.
- CY 2017 rate of insurance coverage (March 2016 CBO estimate): 90 percent.
- FY 2016 rate of insurance coverage: (90 percent * .25) + (90 percent * .75) = 90 percent.
- Percent of individuals without insurance for 2013 (March 2010 CBO estimate): 18 percent.
- Percent of individuals without insurance for FY 2017 (weighted average): 10 percent.

$$1 - \left| \frac{(0.10 - 0.18)}{0.18} \right| = 1 - 0.4444 = 0.5556 \text{ (55.56 percent)}$$

$$0.5556 \text{ (55.56 percent)} - .002 \text{ (0.2 percentage points for FY 2017 under section 1886(r)(2)(B)(i) of the Act)} = 0.5536 \text{ or } 55.36 \text{ percent}$$

$$0.5536 = \text{Factor 2}$$

Therefore, the final Factor 2 for FY 2017 was 55.36 percent.

The FY 2017 final uncompensated care amount was: \$10,797,476,782.62 × 0.5536 = \$5,977,483,146.86.

FY 2017 Uncompensated Care Total Available ...	\$5,977,483,146.86

(2) Methodology for Calculation of Factor 2 for FY 2018

Section 1886(r)(2)(B)(ii) of the Act permits the use of a data source other than the CBO estimates to determine the percent change in the rate of uninsurance beginning in FY 2018. In addition, for FY 2018 and subsequent years, the statute does not require that the estimate of the percent of individuals who are uninsured be limited to individuals who are under 65. Specifically, the statute states that, for FY 2018 and subsequent fiscal years, the second factor is 1 minus the percent change in the percent of individuals who are uninsured, as determined by comparing the percent of individuals who were uninsured in 2013 (as estimated by the Secretary, based on data from the Census Bureau or other sources the Secretary determines appropriate, and certified by the Chief Actuary of CMS) and the percent of individuals who were uninsured in the most recent period for which data are available (as so estimated and certified), minus 0.2 percentage point for FYs 2018 and 2019. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56952), we indicated that we planned to address

changes to the methodology for determining Factor 2 and the viability of potential alternative data sources in the FY 2018 IPPS/LTCH PPS proposed rule.

As we discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19945), in our analysis of a potential data source for the rate of uninsurance for purposes of computing Factor 2 in FY 2018, we considered the following: (a) The extent to which the source accounted for the full U.S. population; (b) the extent to which the source comprehensively accounted for both public and private health insurance coverage in deriving its estimates of the number of uninsured; (c) the extent to which the source utilized data from the Census Bureau; (d) the timeliness of the estimates; (e) the continuity of the estimates over time; (f) the accuracy of the estimates; and (g) the availability of projections (including the availability of projections using an established estimation methodology that would allow for calculation of the rate of uninsurance for the applicable Federal fiscal year). As we explained in the proposed rule, these considerations are consistent with the statutory requirement that this estimate be based on data from the Census Bureau or other sources the Secretary determines appropriate and help to ensure the data source will provide reasonable estimates for the rate of uninsurance that are available in conjunction with the IPPS rulemaking cycle.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19946 and 19947), we explained that we have determined that the source that, on balance, best meets all of these considerations is the uninsured estimates produced by CMS’ Office of the Actuary (OACT) as part of the development of the National Health Expenditure Accounts (NHEA). The NHEA represents the government’s official estimates of economic activity (spending) within the health sector. The information contained in the NHEA has been used to study numerous topics related to the health care sector, including, but not limited to, changes in the amount and cost of health services purchased and the payers or programs that provide or purchase these services; the economic causal factors at work in the health sector; the impact of policy changes, including major health reform; and comparisons to other countries’ health spending. Of relevance to the determination of Factor 2 is that the comprehensive and integrated structure of the NHEA creates an ideal tool for evaluating changes to the health care system, such as the mix of the insured and uninsured because this mix is integral to the well-established NHEA

methodology. Below we describe some aspects of the methodology used to develop the NHEA that we believe are particularly relevant in estimating the percent change in the rate of uninsurance for FY 2018. A full description of the methodology used to develop the NHEA is available on the CMS Web site at: <https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/Downloads/DSM-15.pdf>.

The NHEA estimates of U.S. population reflect the Census Bureau's definition of the resident-based population, which includes all people who usually reside in the 50 States or the District of Columbia, but excludes residents living in Puerto Rico and areas under U.S. sovereignty, members of the U.S. Armed Forces overseas, and U.S. citizens whose usual place of residence is outside of the United States, plus a small (typically less than 0.2 percent of population) adjustment to reflect Census undercounts. In past years, the estimates for Factor 2 were made using the CBO's uninsured population estimates for the under 65 population. For FY 2018 and subsequent years, the statute does not restrict the estimate to the measurement of the percent of individuals under the age of 65 who are uninsured. Accordingly, as we explained in the proposed rule, we believe it is appropriate to use an estimate that reflects the rate of uninsurance in the United States across all age groups. In addition, we continue to believe that a resident-based population estimate more fully reflects the levels of uninsurance in the United States that influence uncompensated care for hospitals than an estimate that reflects only legal residents. The NHEA estimates of uninsurance are for the total U.S. population (all ages) and not by specific age cohort, such as the population under the age of 65.

The NHEA includes comprehensive enrollment estimates for total private health insurance (PHI) (including direct and employer-sponsored plans), Medicare, Medicaid, the Children's Health Insurance Program (CHIP), and other public programs, and estimates of the number of individuals who are uninsured. Estimates of total PHI enrollment are available for 1960 through 2015, estimates of Medicaid, Medicare, and CHIP enrollment are available for the length of the respective programs, and all other estimates (including the more detailed estimates of direct-purchased and employer-sponsored insurance) are available for 1987 through 2015. The NHEA data are publicly available on the CMS Web site

at: <https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/index.html>. In order to compute Factor 2, the first metric that is needed is the proportion of the total U.S. population that was uninsured in 2013. In developing the estimates for the NHEA, OACT's methodology included using the number of uninsured individuals for 1987 through 2009 based on the enhanced Current Population Survey (CPS) from the State Health Access Data Assistance Center (SHADAC). The CPS, sponsored jointly by the U.S. Census Bureau and the U.S. Bureau of Labor Statistics (BLS), is the primary source of labor force statistics for the population of the United States. (We refer readers to the Web site at: <http://www.census.gov/programs-surveys/cps.html>.) The enhanced CPS, available from SHADAC (available at <http://datacenter.shadac.org>) accounts for changes in the CPS methodology over time. OACT further adjusts the enhanced CPS for an estimated undercount of Medicaid enrollees (a population that is often not fully captured in surveys that include Medicaid enrollees due to a perceived stigma associated with being enrolled in the Medicaid program or confusion about the source of their health insurance).

To estimate the number of uninsured individuals for 2010 through 2014, OACT extrapolates from the 2009 CPS data using data from the National Health Interview Survey (NHIS). The NHIS is one of the major data collection programs of the National Center for Health Statistics (NCHS), which is part of the Centers for Disease Control and Prevention (CDC). The U.S. Census Bureau is the data collection agent for the NHIS.

The NHIS results have been instrumental over the years in providing data to track health status, health care access, and progress toward achieving national health objectives. For further information regarding the NHIS, we refer readers to the CDC Web site at: <https://www.cdc.gov/nchs/nhis/index.htm>. For 2015, the estimate of the rate of uninsurance in the NHEA matches with the estimate from the NHIS.

The next metrics needed to compute Factor 2 are projections of the rate of uninsurance in both calendar years 2017 and 2018. On an annual basis, the OACT projects enrollment and spending trends for the coming 10-year period. Those projections (currently for years 2016 through 2025) use the latest NHEA historical data, which presently run

through 2015. The NHEA projection methodology accounts for expected changes in enrollment across all of the categories of insurance coverage previously listed. The sources for projected growth rates in enrollment for Medicare, Medicaid, and CHIP include the latest Medicare Trustees Report, the Medicaid Actuarial Report, or other updated estimates as produced by the OACT. Projected rates of growth in enrollment for private health insurance and the uninsured are based largely on OACT's econometric models, which rely on the set of macroeconomic assumptions underlying the latest Medicare Trustees Report. Greater detail can be found in OACT's report titled "Projections of National Health Expenditure: Methodology and Model Specification," which is available on the CMS Web site at: <https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/Downloads/ProjectionsMethodology.pdf>. As discussed in the proposed rule, the use of data from the NHEA to estimate the rate of uninsurance is consistent with the statute and meets the criteria we have identified for determining the appropriate data source. Section 1886(r)(2)(B)(ii) of the Act instructs the Secretary to estimate the rate of uninsurance for purposes of Factor 2 based on data from the Census Bureau or other sources the Secretary determines appropriate. The NHEA utilizes data from the Census Bureau; the estimates are available in time for the IPPS rulemaking cycle; the estimates are produced by OACT on an annual basis and are expected to continue to be produced for the foreseeable future; and projections are available for calendar year time periods that span the upcoming fiscal year. Timeliness and continuity are important considerations because of our need to be able to update this estimate annually. Accuracy is also a very important consideration and, all things being equal, we would choose the most accurate data source that sufficiently meets our other criteria.

Using these data sources and the methodologies described above, OACT estimates that the uninsured rate for the historical, baseline year of 2013 was 14 percent and for CYs 2017 and 2018 is 8.3 percent and 8.1 percent, respectively. As required by section 1886(r)(2)(B)(ii) of the Act, the Chief Actuary of CMS has certified these estimates. As with the CBO estimates on which we based Factor 2 in prior fiscal years, the NHEA estimates are for a calendar year. In the rulemaking for FY 2014, many commenters noted that the

uncompensated care payments are made on fiscal year and not a calendar year basis and requested that CMS normalize the CBO estimate to reflect a fiscal year basis. Specifically, commenters requested that CMS calculate a weighted average of the CBO estimate for October through December 2013 and the CBO estimate for January through September 2014 when determining Factor 2 for FY 2014. We agreed with the commenters that normalizing the estimate to cover FY 2014 rather than CY 2014 would more accurately reflect the rate of uninsurance that hospitals would experience during the FY 2014 payment year. Accordingly, we estimated the rate of uninsurance for FY 2014 by calculating a weighted average of the CBO estimates for CY 2013 and CY 2014 (78 FR 50633). We have continued this weighted average approach in each fiscal year since FY 2014.

We continue to believe that, in order to estimate the rate of uninsurance during a fiscal year more accurately, Factor 2 should reflect the estimated rate of uninsurance that hospitals will experience during the fiscal year, rather than the rate of uninsurance during only one of the calendar years that the fiscal year spans. However, we have concerns about the future potential for the uninsured rate to vary nonuniformly in the 2 calendar years that the fiscal year spans (for example, due to changes in the economy or changes in legislation). Nevertheless, for FY 2018, because OACT's current estimates of the percent of individuals without insurance in CY 2017 and CY 2018 are relatively close, we stated in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19947) that we do not believe this is a significant policy issue, and we proposed to continue with the weighted average approach used in past fiscal years in order to estimate the rate of uninsurance for FY 2018.

The calculation of the proposed Factor 2 for FY 2018 using a weighted average of OACT's projections for CY 2017 and CY 2018 was as follows:

- Percent of individuals without insurance for CY 2013: 14 percent.
- Percent of individuals without insurance for CY 2017: 8.3 percent.
- Percent of individuals without insurance for CY 2018: 8.1 percent.
- Percent of individuals without insurance for FY 2018 (0.25 times 0.083) + (0.75 times 0.081): 8.15 percent

$$1 - \left| \frac{(0.0815 - 0.14)}{0.14} \right| = 1 - 0.4179 = 0.5821 \text{ (58.21 percent)}$$

$$1 - \left| \frac{(0.0815 - 0.14)}{0.14} \right| = 1 - 0.4179 = 0.5821 \text{ (58.21 percent)}$$

$$0.5821 \text{ (58.21 percent)} - .002 \text{ (0.2 percentage points for FY 2018)}$$

under section 1886(r)(2)(B)(ii) of the Act) = 0.5801 or 58.01 percent
0.5801 = Factor 2

Therefore, the proposed Factor 2 for FY 2018 was 58.01 percent.

The proposed FY 2018 uncompensated care amount was:
\$12,001,915,095.04 × 0.5801 =
\$6,962,310,946.63.

Proposed FY 2018 Un-compensated Care Total Available	\$6,962,310,946.63

We invited public comments on our proposed methodology for calculation of Factor 2 for FY 2018.

Comment: Several commenters supported the proposal to use the uninsured estimates produced by CMS' OACT as part of the development of the NHEA in estimating the percent change in the rate of uninsurance for FY 2018. Some of these commenters stated that, in their view, the estimates produced by OACT are timely, complete, and more accurately capture the change in the number of uninsured individuals than CBO's historical estimate of the rate of uninsurance in 2013. A few commenters noted that the data source adds greater transparency to the process as the NHEA estimates are publicly available, while other commenters urged CMS to ensure that all data are provided with complete transparency of the type of data and data collection methods that are used. One commenter requested further explanation for our assumption regarding underreporting of Medicaid coverage in the survey data and the corresponding adjustment to our estimate of the rate of uninsurance, and then contended that this assumption was applied inconsistently between Factors 1 and 2.

Commenters supported the proposed methodology for determining Factor 2 because they believed it provides a more accurate comparison when evaluating changes in the uninsured population since 2013, noting that the amount available to make uncompensated care payments in FY 2017 was lower using CBO estimates than if the NHEA data had been used. A number of commenters asked CMS to retrospectively apply the NHEA estimates when measuring the effect of changes in Medicare DSH policy across time periods prior to FY 2018. Some of these commenters recognized that CMS does not have the authority to retroactively change estimates from prior years, but suggested that CMS consider this point in its analysis of payment changes occurring from the proposal to move from the use of low-

income patient days to Worksheet S-10 data to estimate uncompensated care.

Several commenters requested that CMS use the most recent estimates available and update them in a timely manner. The commenters also requested that CMS account for any legislative or policy changes that may have an effect on the uninsurance rate during FY 2018.

Several commenters expressed concern about the sustainability of continued reductions to aggregate uncompensated care payments due to the application of Factor 2. The commenters noted that, as insurance coverage increases, the aggregate amount available for uncompensated care payments will decline and thus reduce the amount of payments to be made.

Response: We appreciate the commenters' support for our proposal to begin using the uninsured estimates produced by OACT in the computation of Factor 2 for FY 2018. Section 1886(r)(2)(B)(ii) of the Act permits us to use a data source other than CBO estimates to determine the percent change in the rate of uninsurance beginning in FY 2018. We believe that the NHEA data, on balance, best meet all of our considerations to ensure that the data source meets the statutory requirement that the estimate be based on data from the Census Bureau or other sources the Secretary determines appropriate and will provide reasonable estimates of the rate of uninsurance that are available in conjunction with the IPPS rulemaking cycle. In the FY 2018 IPPS/LTCH PPS proposed rule, we provided additional information regarding the data sources, methods, and assumptions employed by the actuaries in determining the OACT's updated estimate of Factor 2 for FY 2018. We believe that this discussion addresses the concerns raised by commenters regarding the various assumptions used in the estimate. Regarding the assumption of undercount for Medicaid enrollees in surveys, we refer readers to research by Michael Davern, et al. as cited by the NHEA's Methodology Paper available on the CMS Web site at: <https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/Downloads/DSM-15.pdf>. With respect to the commenters' request to retrospectively apply the NHEA estimates when measuring the effect of changes in Medicare DSH policy, section 1886(r)(2)(B)(ii) of the Act states that, for FY 2018 and subsequent fiscal years, Factor 2 is determined by comparing the percent of individuals who were uninsured in 2013, as

estimated by the Secretary, based on data from the Census Bureau or other sources the Secretary determines appropriate, and certified by the Chief Actuary of CMS, and the percent of individuals who were uninsured in the most recent period for which data are available, as so estimated and certified. Because the statute specifies the use of these estimates only for FY 2018 and subsequent years, and section 1886(r)(2)(B)(i) of the Act expressly requires the use of CBO estimates for prior fiscal years, we do not believe that we have authority to use the NHEA data to retroactively recalculate uninsurance rates for previous years.

In response to the commenters who requested that we update the estimates and account for any legislative or policy changes that may affect the uninsurance rate in FY 2018, in the FY 2018 IPPS/LTCH PPS proposed rule, we indicated that we considered timeliness and accuracy when selecting the NHEA as the appropriate data on which to base our estimates of the rate of uninsurance. Furthermore, we continue to believe that applying our best estimate of the change in the rate of uninsurance for a fiscal year prospectively would be most conducive to administrative efficiency, finality, and predictability in payments.

Finally, in response to concerns about the decrease in the amount available to make uncompensated care payments, we believe that the intent of the statute is to reduce the amount available to make uncompensated care payments to reflect the decline in the number of uninsured individuals and the expected corresponding decrease in the amount of uncompensated care.

After consideration of the public comments we received, we are finalizing the proposed calculation of Factor 2 for this FY 2018 IPPS/LTCH PPS final rule. The estimates of the percent of uninsured individuals have been certified by the Chief Actuary of CMS as discussed in the proposed rule. The final calculation using a weighted average of OACT's projections for CY 2017 and CY 2018 is as follows:

- Percent of individuals without insurance for CY 2013: 14 percent.
- Percent of individuals without insurance for CY 2017: 8.3 percent.
- Percent of individuals without insurance for CY 2018: 8.1 percent.
- Percent of individuals without insurance for FY 2018 (0.25 times 0.083) + (0.75 times 0.081): 8.15 percent

$$1 - \left| \frac{(0.0815 - 0.14)}{0.14} \right| = 1 - 0.4179 = 0.5821 \text{ (58.21 percent)}$$

$$0.5821 \text{ (58.21 percent)} - .002 \text{ (0.2 percentage points for FY 2018 under section 1886(r)(2)(B)(ii) of the Act)} = 0.5801$$

0.5801 = Factor 2

Therefore, the final Factor 2 for FY 2018 is 58.01 percent.

The FY 2018 final uncompensated care amount is: \$11,664,704,643.27 × 0.5801 = \$6,766,695,163.56.

FY 2018 Uncompensated Care Total Available ...	\$6,766,695,163.56

c. Calculation of Factor 3 for FY 2018

(1) Background

Section 1886(r)(2)(C) of the Act defines Factor 3 in the calculation of the uncompensated care payment. As we have discussed earlier, section 1886(r)(2)(C) of the Act states that Factor 3 is equal to the percent, for each subsection (d) hospital, that represents the quotient of (1) the amount of uncompensated care for such hospital for a period selected by the Secretary (as estimated by the Secretary, based on appropriate data (including, in the case where the Secretary determines alternative data are available that are a better proxy for the costs of subsection (d) hospitals for treating the uninsured, the use of such alternative data)); and (2) the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under section 1886(r) of the Act for such period (as so estimated, based on such data).

Therefore, Factor 3 is a hospital-specific value that expresses the proportion of the estimated uncompensated care amount for each subsection (d) hospital and each subsection (d) Puerto Rico hospital with the potential to receive Medicare DSH payments relative to the estimated uncompensated care amount for all hospitals estimated to receive Medicare DSH payments in the fiscal year for which the uncompensated care payment is to be made. Factor 3 is applied to the product of Factor 1 and Factor 2 to determine the amount of the uncompensated care payment that each eligible hospital will receive for FY 2014 and subsequent fiscal years. In order to implement the statutory requirements for this factor of the uncompensated care payment formula, it was necessary to determine: (1) The definition of uncompensated care or, in other words, the specific items that are to be included in the numerator (that is, the estimated uncompensated care amount for an individual hospital) and the denominator (that is, the estimated uncompensated care amount for all hospitals estimated to receive Medicare DSH payments in the applicable fiscal year); (2) the data source(s) for the estimated uncompensated care amount;

and (3) the timing and manner of computing the quotient for each hospital estimated to receive Medicare DSH payments. The statute instructs the Secretary to estimate the amounts of uncompensated care for a period based on appropriate data. In addition, we note that the statute permits the Secretary to use alternative data in the case where the Secretary determines that such alternative data are available that are a better proxy for the costs of subsection (d) hospitals for treating individuals who are uninsured.

In the course of considering how to determine Factor 3 during the rulemaking process for FY 2014, we considered defining the amount of uncompensated care for a hospital as the uncompensated care costs of each hospital and determined that Worksheet S-10 of the Medicare cost report potentially provides the most complete data regarding uncompensated care costs for Medicare hospitals. However, because of concerns regarding variations in the data reported on Worksheet S-10 and the completeness of these data, we did not propose to use data from Worksheet S-10 to determine Factor 3 for FY 2014, the first year this provision was in effect, or for FY 2015, 2016, or 2017. When we first discussed using Worksheet S-10 to allocate hospitals' shares of uncompensated care costs in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50638), we explained why we believed that it was premature to use uncompensated care costs reported on Worksheet S-10 for FY 2014.

Specifically, at that time, the most recent available cost reports would have been from FYs 2010 and 2011, which were submitted on or after May 1, 2010, when the new Worksheet S-10 went into effect. We believed that concerns about the standardization and completeness of the Worksheet S-10 data could be more acute for data collected in the first year of the Worksheet's use (78 FR 50635). In addition, we believed that it would be most appropriate to use data elements that have been historically publicly available, subject to audit, and used for payment purposes (or that the public understands will be used for payment purposes) to determine the amount of uncompensated care for purposes of Factor 3 (78 FR 50635). At the time we issued the FY 2014 IPPS/LTCH PPS final rule, we did not believe that the available data regarding uncompensated care from Worksheet S-10 met these criteria and, therefore, we believed they were not reliable enough to use for determining FY 2014 uncompensated care payments. Accordingly, for FY

2014, we concluded that utilization of insured low-income patients would be a better proxy for the costs of hospitals in treating the uninsured. For FYs 2015, 2016, and 2017, the cost reports used for calculating uncompensated care payments (that is, FYs 2011, 2012, and 2013) were also submitted prior to the time that hospitals were on notice that Worksheet S-10 could be the data source for calculating uncompensated care payments. Therefore, we believed it was also appropriate to use proxy data to calculate Factor 3 for these years.

We stated in the preamble of the FY 2017 IPPS/LTCH PPS proposed rule that we believed that, for FY 2018, many of the above concerns would no longer be relevant. That is, hospitals were on notice as of FY 2014 that Worksheet S-10 could eventually become the data source for CMS to calculate uncompensated care payments. Furthermore, hospitals' cost reports from FY 2014 had been publicly available for some time, and CMS had analyses of Worksheet S-10 conducted both internally and by stakeholders demonstrating that Worksheet S-10 accuracy had improved over time. Specifically, as discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25090), MedPAC has provided analyses that found that current Worksheet S-10 data are a better proxy for predicting audited uncompensated care costs than Medicaid/Medicare SSI days, and that the data on Worksheet S-10 would improve over time as the data are actually used to make payments. CMS has also undertaken an extensive analysis of the Worksheet S-10 data, benchmarking it against the data on uncompensated care costs reported to the Internal Revenue Service (IRS) on Form 990 by not-for-profit hospitals. (This analysis, performed by Dobson DaVanzo & Associates, LLC, under contract to CMS, was included in a report entitled "Improvements to Medicare Disproportionate Share Hospital (DSH) Payments Report: Benchmarking S-10 Data Using IRS Form 990 Data and Worksheet S-10 Trend Analyses," which is available on the CMS Web site at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html> under the Downloads section.) The analysis determined a strong and converging correlation between the amounts for Factor 3 derived using the IRS Form 990 and Worksheet S-10 data, suggesting that Worksheet S-10 uncompensated care data are becoming more stable over time. As we discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR

19947 through 19948), given these results and in light of the fact that hospitals have been on notice since the FY 2014 rulemaking that CMS intended eventually to use Worksheet S-10 as the data source for calculating uncompensated care payments, we believed it would be appropriate to propose to begin incorporating Worksheet S-10 data for purposes of calculating Factor 3 starting in FY 2018. In section IV.F.4.d. of the preamble of the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25090 through 25094), we proposed a methodology and timeline for incorporating Worksheet S-10 data in the calculation of Factor 3 beginning in FY 2018 and invited public comments on that proposal.

While some commenters, including MedPAC, were supportive of the proposal, many other commenters expressed concerns about a perceived lack of clarity in the Worksheet S-10 instructions and their belief in the necessity of a strict audit mechanism to capture aberrant uncompensated care costs reported on Worksheet S-10. Many commenters also cited the report from Dobson DaVanzo, which concluded that hospitals are doing a better job of reporting their uncompensated care data on Worksheet S-10 than they did a few years ago. However, these commenters disagreed with CMS about the significance of this observation. One commenter stated that even if it is true in the aggregate that hospitals are reporting data more accurately on Worksheet S-10, the zero-sum nature of the calculation of uncompensated care payments is such that the remaining inaccuracy and lack of uniformity in the data reported can have a very large impact on hospitals. The commenter asserted that if hospitals, for whatever reason, over-report their uncompensated care, they benefit financially from doing so, while those that do not aggressively report suffer financial harm. The commenter concluded that, for this reason, the possibility that some hospitals are generally "doing better" with reporting data is not good enough. All hospitals must do better, and until they do, the commenter believed that data from Worksheet S-10 are not accurate enough for public policymaking purposes. Other commenters asserted that the Dobson/DaVanzo study did not illustrate or even evaluate whether data from Worksheet S-10 are a reasonable proxy for the costs hospitals incur in providing care to the uninsured. These commenters pointed to their own analyses, which indicated that the most notable aberrations in Worksheet S-10 data reporting occur

among public hospitals, which do not file a Form 990 and are therefore missing from the Dobson/DaVanzo analysis.

On balance, after considering all of the comments, we elected not to finalize our proposal to begin to incorporate Worksheet S-10 into the calculation of Factor 3 for FY 2018 in the FY 2017 IPPS/LTCH PPS final rule. We stated that we were postponing the decision regarding when to begin incorporating data from Worksheet S-10 and proceeding with certain additional quality control and data improvement measures to the Worksheet S-10 instructions as commenters had requested. We indicated that we would consider further whether the current Worksheet S-10 data or a proxy should be used to calculate Factor 3 for FY 2018 and subsequent fiscal years. We also expressed our intention to explore whether there is an appropriate proxy for uncompensated care that could be used to calculate Factor 3 until we determine that data from the revised Worksheet S-10 can be used for this purpose. We stated that we would undertake notice-and-comment rulemaking to address the issue of the appropriate data to use to determine Factor 3 for FY 2018 and subsequent years.

(2) Data Sources for FY 2018

Since the publication of the FY 2017 final rule and as part of our ongoing quality control and data improvement measures for Worksheet S-10, we have updated the benchmarking analysis described in the report "Improvements to Medicare Disproportionate Share Hospital (DSH) Payments Report: Benchmarking S-10 Data Using IRS Form 990 Data and Worksheet S-10 Trend Analyses" posted with the FY 2017 IPPS/LTCH PPS proposed rule. A copy of the updated analysis was made available in conjunction with the FY 2018 IPPS/LTCH PPS proposed rule on the CMS Web site at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Downloads/FY2018-NPRM-Update-of-Benchmarking-S-10-Data.pdf>. As discussed in the FY 2017 IPPS/LTCH PPS proposed rule, the purpose of the benchmarking analysis was to determine if Worksheet S-10 uncompensated care data are becoming more stable over time (81 FR 25090). In the report issued in conjunction with the FY 2017 rulemaking, we conducted an analysis of 2010, 2011, and 2012 Worksheet S-10 data and IRS Form 990 data from the same years. Using IRS Form 990 data for tax years 2010, 2011, and 2012 (the latest available years at

that time) as a benchmark, we compared key variables derived from Worksheet S-10 and IRS Form 990 data, such as charity care and bad debt. The analysis was completed using data from hospitals that had completed both Worksheet S-10 and IRS Form 990 across all study years, yielding a sample of 788 not-for-profit hospitals (representing 668 unique Taxpayer Identification Numbers). Because Factor 3 is used to determine the Medicare uncompensated care payment amount for each hospital, we calculated the amounts for Factor 3 for the matched hospitals using charity care and bad debt, and compared the Factor 3 distributions calculated using data from IRS Form 990 and Worksheet S-10. Key findings indicated that the amounts for Factor 3 derived using the IRS Form 990 and Worksheet S-10 data were highly correlated. In addition, the correlation coefficient between the amounts for Factor 3 calculated from the IRS Form 990 and Worksheet S-10 had increased over time, from 0.71 in 2010 to 0.77 in 2011 and 0.80 in 2012, demonstrating an increasing convergence between the data sources.

As we discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19949), in the updated analysis performed for the FY 2018 rulemaking, we again compared Worksheet S-10 and IRS Form 990 data and assessed the correlation in Factor 3s derived from each of the data sources. We conducted an analysis of 2011, 2012, and 2013 Worksheet S-10 data and IRS Form 990 data from the same years. (The previous analysis used data from 2010 to 2012.) Using IRS Form 990 data for tax years 2011, 2012, and 2013 (again, the latest available years) as a benchmark, we utilized the same methodology as was used in the previous analysis, which yielded a sample of 1,061 not-for-profit hospitals (representing 918 unique Taxpayer Identification Numbers) and found that the amounts for Factor 3 derived using the IRS Form 990 and Worksheet S-10 data continue to be highly correlated and that, within the larger sample in the updated analysis, this correlation continues to increase over time, from 0.80 in 2011 to 0.85 in 2013. (The highest correlation found in the earlier analysis performed for the FY 2017 rulemaking was 0.80.)

The fact that this most recent analysis, which was performed after the issuance of the FY 2017 IPPS/LTCH PPS final rule, continues to demonstrate a high correlation between the amounts for Factor 3 derived using the IRS Form 990 data and the Worksheet S-10 data and that this correlation continues to increase over time leads us to believe that we

have reached a tipping point with respect to the use of the Worksheet S-10 data. Specifically, we can no longer conclude that alternative data are available for FY 2014 that are a better proxy for the costs of subsection (d) hospitals for treating individuals who are uninsured than the data on uncompensated care costs reported on the Worksheet S-10. However, we stated in the proposed rule that we continue to believe that it is appropriate to use low-income insured days as a proxy for uncompensated care costs for years prior to FY 2014. Hospitals did not have notice that the Worksheet S-10 data from these years might be used for purposes of computing uncompensated care payments and, as a result, may not have fully appreciated the importance of reporting their uncompensated care costs as completely and accurately as possible.

We found further evidence for this tipping point when we examined changes to the FY 2014 Worksheet S-10 data submitted by hospitals since the publication of the FY 2017 IPPS/LTCH PPS final rule. In the FY 2017 IPPS/LTCH PPS final rule, as part of our ongoing quality control and data improvement measures for the Worksheet S-10, we referred readers to Change Request 9648, Transmittal 1681, titled “The Supplemental Security Income (SSI)/Medicare Beneficiary Data for Fiscal Year 2014 for Inpatient Prospective Payment System (IPPS) Hospitals, Inpatient Rehabilitation Facilities (IRFs), and Long Term Care Hospitals (LTCH),” issued on July 15, 2016 (available at: <https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/Downloads/R1681OTN.pdf>). In this transmittal, as part of the process for ensuring complete submission of Worksheet S-10 by all eligible DSH hospitals, we instructed MACs to accept amended Worksheets S-10 for FY 2014 cost reports submitted by hospitals (or initial submissions of Worksheet S-10 if none had been submitted previously) and to upload them to the Health Care Provider Cost Report Information System (HCRIS) in a timely manner. The transmittal stated that, for revisions to be considered, hospitals were required to submit their amended FY 2014 cost report containing the revised Worksheet S-10 (or a completed Worksheet S-10 if no data were included on the previously submitted cost report) to the MAC no later than September 30, 2016.

As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19949), we examined hospitals’ FY 2014 cost reports to see if the Worksheet S-10 data on those cost reports have changed

as a result of the opportunity for hospitals to submit revised Worksheet S-10 data for FY 2014. Specifically, we compared hospitals’ FY 2014 Worksheet S-10 data as they existed in the first quarter of CY 2016 with data from the fourth quarter of CY 2016. We found that the FY 2014 Worksheet S-10 data had changed over that time period for approximately one quarter of hospitals that receive uncompensated care payments. As we discussed in the proposed rule, the fact that the Worksheet S-10 data changed for such a significant number of hospitals following a review of the cost report data they originally submitted and that the revised Worksheet S-10 information is available to be used in determining uncompensated care costs contributes to our belief that we can no longer conclude that alternative data are available that are a better proxy than the Worksheet S-10 data for the costs of subsection (d) hospitals for treating individuals who are uninsured.

Commenters have also provided equity arguments with respect to the relationship between uncompensated care payments and the expansion of Medicaid in certain States under the authority provided by the Affordable Care Act. The commenters have made a twofold argument. First, they have argued that hospitals in States that did not expand Medicaid treat a higher number of uninsured patients compared to hospitals in States that did expand Medicaid and, as a result, provide more uncompensated care. However, since the implementation of the new DSH payment methodology under section 3133 of the Affordable Care Act in FY 2014, these hospitals have experienced reductions in the payments for uncompensated care due to the national decline in the uninsured rate driven in large part by Medicaid expansions in other States. Second, they have argued that hospitals in nonexpansion States will be penalized a second time when Medicaid utilization is used as part of the basis for determining Factor 3 because their Medicaid utilization has not grown as much relative to hospitals in expansion States. Although CMS has not yet used data affected by Medicaid expansion when determining Factor 3, commenters are concerned that they will be penalized in future calculations when these data are used.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50639), we recognized that, in using Medicaid days as part of the proxy for uncompensated care, it would be possible for hospitals in States that choose to expand Medicaid to receive higher uncompensated care payments because they may have more Medicaid

patient days than hospitals in a State that does not choose to expand Medicaid. Because the earliest Medicaid expansions under the Affordable Care Act began in 2014, the 2011, 2012, and 2013 Medicaid days data used to determine Factor 3 for FY 2017 are the most recent available data on Medicaid utilization that do not reflect the effects of these Medicaid expansions.

Accordingly, if we were to use only low-income insured days to estimate uncompensated care in FY 2018, we would need to hold the time period of these data constant and use data on Medicaid days from 2011, 2012, and 2013 in order to avoid the risk of any redistributive effects arising from the decision to expand Medicaid in certain States. As a result, we would be using older data that may provide a less accurate proxy for the level of uncompensated care being furnished by hospitals in FY 2018, contributing to our growing concerns regarding the continued use of low-income insured days as a proxy for uncompensated care costs in FY 2018.

In the proposed rule, we also noted that when weighing the new information that has become available to us regarding the Worksheet S-10 and the low-income days proxy since the FY 2018 rulemaking, we are not considering these developments in isolation, but rather in the context of the information that we previously considered as part of our discussions of the Worksheet S-10 data in prior rulemaking. Part of this background is provided by the 2007 MedPAC analysis of data from the Government Accountability Office (GAO) and the American Hospital Association (AHA), which suggests that Medicaid days and low income Medicare days are not a good proxy for uncompensated care costs (80 FR 49525). Additional analyses performed by MedPAC showed that the correlation between audited uncompensated care data from 2009 and the data from the FY 2011 Worksheet S-10 was over 0.80, as compared to a correlation of approximately 0.50 between the audited uncompensated care data and 2011 Medicare SSI and Medicaid days. Based on this analysis, MedPAC concluded that use of Worksheet S-10 data was already better than using Medicare SSI and Medicaid days as a proxy for uncompensated care costs, and that the data on Worksheet S-10 would improve over time as the data are actually used to make payments (81 FR 25090). Furthermore, MedPAC in the past has raised concerns about the low-income days proxy we have used historically because it is an inpatient

measure and much of the uncompensated care provided by certain hospitals, including rural hospitals, occurs in the emergency room or other outpatient areas. In its comments on the FY 2017 IPPS/LTCH PPS proposed rule, MedPAC again recommended that we start using the Worksheet S-10 data with a phase-in (81 FR 56962).

In summary, as we stated in the FY 2018 IPPS/LTCH PPS proposed rule, when weighing the new information that has become available to us since the FY 2017 rulemaking in conjunction with the information regarding Worksheet S-10 data and the low-income days proxy that we have analyzed as part of our consideration of this issue in prior rulemaking, we can no longer conclude that alternative data to the Worksheet S-10 are available for FY 2014 that are a better proxy for the costs of subsection (d) hospitals for treating individuals who are uninsured.

Comment: Many commenters expressed disapproval that CMS “backtracked” on its decision in the FY 2017 IPPS/LTCH PPS final rule to postpone incorporating data from Worksheet S-10 into the calculation of Factor 3 and voiced their confusion and surprise over the apparent change in policy. These commenters noted that CMS’ position in the FY 2017 IPPS/LTCH PPS final rule was that additional time was needed to make certain modifications and clarifications to the cost report instructions for Worksheet S-10, as well as to explore suggestions made by commenters in previous years for ensuring the consistent submission of Worksheet S-10 by hospitals when filing their cost reports (such as software edits to flag negative, unusual, or missing data or a missing Worksheet S-10). They added that CMS stated that this postponement also allowed time for hospitals to more accurately complete and submit the form. The commenters observed that CMS’ stated intent in the FY 2017 IPPS/LTCH PPS final rule was to begin to incorporate Worksheet S-10 data into the computation of Factor 3 once these additional measures to ensure data quality and completeness are in place, and no later than FY 2021, yet CMS had reversed this decision by proposing to use Worksheet S-10 data from FY 2014 in the calculation of Factor 3 for FY 2018 in the FY 2018 IPPS/LTCH PPS proposed rule.

Response: We appreciate the comments regarding our proposal to begin using data from Worksheet S-10 in the calculation of Factor 3 in FY 2018. As stated in the FY 2018 IPPS/LTCH PPS proposed rule and explained in greater detail below, when weighing

the new information that has become available to us since the FY 2017 rulemaking, in conjunction with the information regarding Worksheet S-10 data and the low-income days proxy that we have analyzed as part of our consideration of this issue in prior rulemaking, we can no longer conclude that alternative data to the Worksheet S-10 are available for FY 2014 that are a better proxy for the costs of subsection (d) hospitals for treating individuals who are uninsured.

Comment: Several commenters approved of CMS’ proposal to begin using data from Worksheet S-10 in the calculation of Factor 3 prior to FY 2021. MedPAC stated that using Worksheet S-10 data, in conjunction with select auditing of cost reports, will lead to better estimates of uncompensated care costs than the continued use of the current proxy of Medicaid and SSI days. Other commenters echoed MedPAC’s statement, noting that the metrics from Worksheet S-10 appear to provide a better assessment of a hospital’s uncompensated care costs than the current proxy data, which assess only low-income insured days and distribute the bulk of Medicare DSH payments based on the amount of inpatient care a hospital delivers to Medicaid patients and recipients of SSI payments. One commenter cited the December 2016 article in *Health Affairs* (Stensland, *et al.*), which estimated that Medicare payments on average are reduced by \$20 for every additional uninsured patient a hospital treats, to support the argument that the distribution of uncompensated care payments according to a hospital’s proportion of low-income insured days results in payments that are poorly correlated with a hospital’s true uncompensated care burden. The commenter asserted that uncompensated care payments should compensate hospitals based on their delivery of care to the uninsured rather than based on a proxy that is poorly correlated with the costs of treating the uninsured.

As in previous years, commenters also believed that the proposed methodology for FY 2018 brings parity and equity across the States, regardless of their decision to expand Medicaid. Commenters stated that implementation of the proposal to use data from Worksheet S-10 will create more balance between Medicaid expansion and nonexpansion States, especially because hospitals in nonexpansion States are “at a significant disadvantage” under the current proxy methodology. The commenters noted that, under the current methodology used to calculate Factor 3, hospitals in

nonexpansion States bear a greater uncompensated care burden, yet are effectively penalized in Medicare DSH allocations twice: First, because they incur a reduction in the total amount available to be distributed as uncompensated care payments based on the national decline in the uninsured rate that largely reflects the experience of expansion States; and second, because their Medicaid utilization rates remain relatively flat compared to the increasing rates of hospitals in expansion States, resulting in lower uncompensated care payments. These commenters believed that FY 2018 is an appropriate time to transition to Worksheet S-10, as CMS proposed, using an average of 2 years of Medicaid and SSI days data in conjunction with 1 year of Worksheet S-10 data that eliminates the use of the low-income insured days proxy for FY 2014 when many States expanded Medicaid. Furthermore, as proposed, the amount available for uncompensated care payments would increase by approximately \$1 billion in FY 2018, which helps mitigate the financial impact of transitioning to Worksheet S-10 data for hospitals treating higher numbers of Medicaid and SSI patients and fewer uninsured patients.

In response to arguments that further refinement of Worksheet S-10 is needed, one commenter pointed to separate evaluations performed by MedPAC and the consulting firm Dobson DaVanzo, which both found a high degree of correlation between data reported on Worksheet S-10 and audited uncompensated care data, as evidence that the information currently reported on Worksheet S-10 is satisfactory for purposes of allocating uncompensated care payments. The commenter argued that while CMS should continue to refine the instructions for Worksheet S-10, the transition from the proxy of low-income insured days to Worksheet S-10 as a method of allocating uncompensated care payments will never take place if CMS postpones the transition until the Worksheet S-10 data are perfect. The commenter stated that, despite years of refinements, Medicare has yet to achieve perfection in the Medicare cost report data; nevertheless, there are various examples throughout the Medicare inpatient PPS in which payments are made based on the best available information from the Medicare cost report. This commenter was troubled that CMS had delayed the implementation of Worksheet S-10 until no later than FY 2021 in the FY 2017 IPPS/LTCH PPS final rule, and

encouraged CMS to finalize its proposal to begin incorporating Worksheet S-10 data in the calculation of Factor 3 for FY 2018.

Response: We appreciate the support for our proposal to begin to incorporate Worksheet S-10 data into the computation of Factor 3 for FY 2018. We agree with the commenters that FY 2018 is an appropriate time to begin using Worksheet S-10 data in the calculation of Factor 3 due to a confluence of factors, including evidence that the Worksheet S-10 data are improving over time and concerns that the proxy data for FY 2014 and subsequent years will reflect the effects of Medicaid expansion. As we stated in the FY 2018 IPPS/LTCH PPS proposed rule, we can no longer conclude that alternative data to the Worksheet S-10 are available for FY 2014 that are a better proxy for the costs of subsection (d) hospitals for treating individuals who are uninsured. We also acknowledge that the approximately \$800 million increase in the total amount available to make uncompensated care payments will help to mitigate the impact of this change on hospitals that serve a large number of Medicaid and SSI patients and fewer uninsured patients.

Comment: Many commenters opposed the use of Worksheet S-10 to compute Factor 3 and allocate uncompensated care costs beginning in FY 2018. Most of these commenters maintained their position from previous years that, while Worksheet S-10 has the potential to serve as a more exact measure of hospital uncompensated care costs, the data reported are not presently a reliable and accurate reflection of these uncompensated care costs. These commenters disagree with CMS that the agency has reached a “tipping point” and shared observations that they believe refute each of the factors cited in the FY 2018 IPPS/LTCH PPS proposed rule as a reason to begin using Worksheet S-10 data. Overall, commenters stated that the rationale provided by CMS for transitioning to the use of data from Worksheet S-10—that the accuracy of the data has improved over time—was not sufficient to justify the transition.

With respect to the Dobson DaVanzo report, which showed a strong correlation between Factor 3 values derived from data reported on IRS 990 Schedule H and Worksheet S-10, several commenters noted limitations that they believe should be taken into consideration when using these findings to support the use of Worksheet S-10 data. Commenters noted that a simple correlation between two data sources

that have not been reviewed for accuracy does not support the statistical validity of the uncompensated care data reported on Worksheet S-10.

Furthermore, commenters noted that because the data from IRS 990 do not include for-profit and government hospitals, the sample used in the analysis is not representative of the universe of hospitals receiving Medicare DSH payments and therefore presents biased results. One commenter observed that the analysis overrepresents certain States and underrepresents other States. Another commenter noted some specific line items that illustrate inconsistencies between the IRS 990 data and the S-10 data. For example, the commenter stated that in tax year 2011, the IRS 990 Schedule H changed such that bad debt expense is no longer reported at cost, and filing organizations were no longer instructed to multiply bad debt expense by their CCR, a change that is not reflected in the Worksheet S-10 instructions and which the Dobson analysis does not take into consideration.

Commenters continued to express concerns about the lack of accurate and consistent data being reported on Worksheet S-10, primarily due to what they perceive as a lack of clear and concise line level instructions. Commenters pointed out that, in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56963), CMS agreed to institute certain additional quality control and data improvement measures prior to moving forward with incorporating Worksheet S-10 data into the calculation of Factor 3. However, the commenters pointed out that, aside from a brief window in 2016 for hospitals to submit corrected data on their FY 2014 Worksheet S-10 by September 30, 2016, and the issuance of revised instructions (Transmittal 10) in November 2016 that are applicable to cost reports beginning on or after October 1, 2016, no additional quality control and data improvement measures have been implemented. Furthermore, commenters asserted that the clarifications and guidance with respect to the instructions for Worksheet S-10 issued by CMS are not sufficient to ensure consistent submission of uncompensated care data, and that the 25 percent of hospitals that either resubmitted their FY 2014 Worksheet S-10 or provided a missing FY 2014 Worksheet S-10 do not present significant evidence that the problems with Worksheet S-10 reporting have been resolved. One commenter took issue with CMS’ statement in the proposed rule that it does not anticipate making any further modifications to the

instructions for completing Worksheet S-10 at this time, and asserted that hospitals should have the benefit of a final rule and instructions that can be referenced in completing Worksheet S-10 data for future cost reports, ensuring accuracy, consistency and completeness.

Because many commenters were concerned that unclear reporting instructions on Worksheet S-10 would result in inconsistent and inaccurate reporting of data, commenters requested that, after more precise instructions are provided, CMS apply a strict auditing process for information reported on the Worksheet S-10 before it is used to determine uncompensated care costs. The commenters believed that simply tying information reported on Worksheet S-10 to payment and requiring its regular use will not improve the accuracy of the data. In addition, commenters requested that CMS ensure that its contractors administer an auditing process consistently and make the instructions for such an audit public. To support their claim that auditing is needed, many commenters shared observations regarding anomalies they identified in data from Worksheet S-10 and associated concerns. A number of commenters shared their own analyses that looked at the small proportion of hospitals receiving a large share of uncompensated care payments, and the proportion of hospitals that reported aberrant data relating to uncompensated care costs. The commenters stated that the aberrant numbers reported by some hospitals illustrate some combination of misinterpretation of Worksheet S-10 instructions, lack of clarity of those instructions, and possible attempts by providers to maximize their Medicare DSH dollars.

MedPAC also commented that a hospital's charges may have errors that could result in overstating uncompensated care costs. To limit the effect of aberrant charges, MedPAC suggested that CMS could screen out Worksheet S-10 data where there were high levels of reported uncompensated care relative to total operating costs reported on the cost report (for example, 50 percent of operating costs). MedPAC expected that very few hospitals would report uncompensated care costs in excess of this threshold. For hospitals that did exceed this threshold, MedPAC suggested using 2015 Worksheet S-10 data if they were available. If the hospital insisted that the 2014 data were correct, MedPAC suggested that CMS require the hospital to provide support for the 2014 data. If the hospital did not provide audited financial statements

supporting the uncompensated care reported, MedPAC suggested that the reported uncompensated care could be reduced down to a threshold of 50 percent of operating costs. Other commenters also discussed examining the ratio of the reported uncompensated care to total operating costs to identify aberrant data. They provided additional ratio examples such as uncompensated care costs relative to total revenue, operating budget, Worksheet C total costs, or Worksheet C total charges. Some commenters suggested that CMS adopt an empirically derived upper threshold for the ratio of uncompensated care costs to operating costs, and then prioritize those hospitals that exceeded the threshold for audit purposes. One commenter's example of an empirically derived threshold was 3 standard deviations from the mean for the ratio of uncompensated care costs to total operating costs.

The majority of the commenters who opposed the use of Worksheet S-10 in FY 2018 stated that the low-income insured days proxy is more accurate than Worksheet S-10 in its current form. They suggested that CMS should continue to use this proxy on a temporary basis to distribute uncompensated care payments until the data from Worksheet S-10 are more reliable, or CMS should consider using a methodology that utilizes a permanent blend of data from Worksheet S-10 and low-income insured days. Some commenters believed that the proposed methodology for calculating Factor 3 in FY 2018, which excludes Medicaid shortfalls from the calculation of uncompensated care costs, could lead to a huge inequity, as there would be a substantial redistribution of Medicare DSH payments from Medicaid expansion States to non-expansion States. While one commenter referred to CMS' potential legal concern about continuing to use low-income insured days as a proxy for uncompensated care for FY 2014 and subsequent years, several commenters and their outside counsel concluded that CMS has the authority to "fashion an 'appropriate' calculation using proxy data as it has already been doing for three years, adjusted proxy data or blended data."

Commenters stated that using uncompensated care data from Worksheet S-10 for computing uncompensated care payments would be highly redistributive, with many hospitals experiencing significant swings in their payments. Commenters noted that using data from Worksheet S-10 to calculate Factor 3, as opposed to using the current low-income insured days proxy, has serious implications for

entire States. Many commenters noted that the States that would lose uncompensated care dollars are States that have expanded their Medicaid programs, as the current proxy captures Medicaid days and the Worksheet S-10 does not. One analysis showed that the Worksheet S-10 data would be highly redistributive to the extent that 10 percent of hospitals would receive 77 percent of total gains in uncompensated care payments among all hospitals, while other hospitals would experience significant losses. One commenter indicated that the losses it anticipates if the proposal to incorporate data from the Worksheet S-10 in FY 2018 is finalized will not only hamper its system's ability to provide care through different service lines, but will also affect its ability to participate in different types of value-based purchasing programs. Another commenter noted that the cuts CMS outlines also are far more redistributive than had been intended when the Affordable Care Act was enacted in 2010 prior to the Supreme Court ruling that rendered Medicaid expansion optional.

Response: We thank the commenters for their input. In previous rulemaking cycles, commenters, both in favor of and opposed to use of a proxy for calculation of Factor 3, requested that CMS provide a timeline and implementation process for when and how the Worksheet S-10 data would be used for determining uncompensated care costs (for example, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49524)). We note that we have been receiving such requests since the rulemaking for the FY 2014 IPPS/LTCH PPS final rule, and that hospitals have been on notice since FY 2014 that Worksheet S-10 could eventually become the data source for computing Factor 3. With this in mind, and based on the growing evidence that Worksheet S-10 is improving over time, we proposed to begin incorporating Worksheet S-10 data from FY 2014 cost reports into the calculation of Factor 3 for FY 2018.

We understand the commenters' concerns about the limitations of the IRS 990 correlation analysis and the shortcomings of using the study findings to support assertions about the validity of the Worksheet S-10 data. Notwithstanding those limitations, a few commenters supported the findings and the use of Worksheet S-10 in FY 2018. Although we acknowledge that the analysis was limited to not-for-profit hospitals, we believe it is relevant to our assessment of the overall quality of the data reported on Worksheet S-10.

Because many not-for-profit hospitals are eligible for empirically justified Medicare DSH payments and, therefore, uncompensated care payments, we believe they represent a suitable standard of comparison. Furthermore, as stated in the proposed rule, we did not make the decision to propose to begin Worksheet S-10 implementation in FY 2018 based on the correlation analysis alone. MedPAC also submitted an analysis that corroborated the results of the Dobson DaVanzo report, showing a high level of correlation between audited uncompensated care data and uncompensated care costs reported on Worksheet S-10 and a lower correlation between the audited uncompensated care data and Medicaid and SSI days.

After considering the comments submitted by MedPAC and others regarding the potential for aberrant data to be reported on the Worksheet S-10, we agree that using the ratio of uncompensated care costs to total operating costs to identify potentially aberrant data when determining the Factor 3 amounts for FY 2018 has merit. We acknowledge that it is not possible to determine a perfect threshold for when this ratio reflects potentially aberrant data. However, after a review of the comments received, we do not believe that it is appropriate to have no threshold, nor do we believe that it is appropriate to delay beginning to incorporate the Worksheet S-10 data in the calculation of Factor 3 in pursuit of a perfect threshold. It is relatively straightforward to identify the extreme end of the spectrum of possible threshold values: it does not appear to us to be reasonable for a hospital to have uncompensated care costs that exceed all of its operating expenses (that is, a threshold of 100 percent or more). Using the data currently available to us, we have attempted to determine the most appropriate threshold above which it would be reasonable to believe that aberrant uncompensated care data may have been reported. While we do not want to include aberrant data in the determination of Factor 3, we also do not want to inappropriately reduce FY 2018 uncompensated care payments to a hospital with a legitimately high ratio. Weighing all of these considerations, we believe it is appropriate to adopt MedPAC's suggestion that uncompensated care costs in excess of half a hospital's total operating expenses may be potentially aberrant. In the rare situations where a hospital has a FY 2014 ratio in excess of 50 percent, we also agree with MedPAC and other commenters that it would be appropriate to utilize 2015 data in some

manner to address the potentially aberrant 2014 Worksheet S-10 data. As we have previously indicated, we do not believe it would be appropriate to use Worksheet S-10 data from years prior to FY 2014 in the determination of Factor 3. Therefore, the most widely available Worksheet S-10 data available to us if a hospital exceeds the threshold for its FY 2014 Worksheet S-10 data are the FY 2015 Worksheet S-10 data. We believe that when a hospital has reported uncompensated care costs in excess of 50 percent of operating costs, the issue is most likely its FY 2014 uncompensated care costs and not its FY 2014 total operating expenses. Accordingly, we will determine the ratio of FY 2015 uncompensated care costs to FY 2015 total operating expenses from the hospital's FY 2015 cost report and apply that ratio to the FY 2014 total operating expenses from the hospital's FY 2014 cost report to determine an adjusted amount of uncompensated care costs for FY 2014. Under this approach, if a hospital has a consistently high ratio across the 2 years, we are less likely to inappropriately reduce its uncompensated care payments.

However, if a hospital has a much lower ratio in FY 2015, we believe it is reasonable to believe that the data reported for FY 2014 were aberrant. Specifically, after considering the public comments received, for hospitals where the ratio of uncompensated care costs relative to total operating costs for the hospital's 2014 cost report (as reported on Worksheet G, Part 3, Line 4) exceeds 50 percent, we will determine the ratio of uncompensated care costs relative to total operating costs from the hospital's 2015 cost report (as of March 2017) and apply that ratio to the hospital's total operating costs from the 2014 cost report to determine an adjusted amount of uncompensated care costs for FY 2014. We will then substitute this amount for the FY 2014 Worksheet S-10 data when determining Factor 3 for FY 2018. We believe this approach, which affects the data from three hospitals, balances our desire to exclude potentially aberrant data from a small number of hospitals in the determination of Factor 3 with our concern regarding inappropriately reducing FY 2018 uncompensated care payments to a hospital that may have a legitimately high ratio. As discussed elsewhere in this section, we are developing audit protocols for the Worksheet S-10 data for use in future rulemaking. We will consider in future rulemaking whether continued use of this adjustment or an alternative

adjustment is necessary for subsequent years.

We appreciate the commenters' concerns relating to the instructions for Worksheet S-10. In November 2016, we issued Transmittal 10, which clarified and revised the instructions for the Worksheet S-10, including the instructions regarding the reporting of charity care charges. Transmittal 10 is available for download on the CMS Web site at: <https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2016-Transmittals-Items/R10P240.html>. In Transmittal 10, we clarified that hospitals may include discounts given to uninsured patients who meet the hospital's charity care criteria in effect for that cost reporting period. This clarification applied to cost reporting periods beginning prior to October 1, 2016, as well as cost reporting periods beginning on or after October 1, 2016. As a result, nothing prohibits a hospital from considering a patient's insurance status as a criterion in its charity care policy. A hospital determines its own financial criteria as part of its charity care policy. The instructions for the Worksheet S-10 set forth that hospitals may include discounts given to uninsured patients, including patients with coverage from an entity that does not have a contractual relationship with the provider, who meet the hospital's charity care criteria in effect for that cost reporting period. In addition, we revised the instructions for the Worksheet S-10 for cost reporting periods beginning on or after October 1, 2016, to provide that charity care charges must be determined in accordance with the hospital's charity care criteria/policy and written off in the cost reporting period, regardless of the date of service. We will continue to work with our stakeholders to address their concerns regarding the reporting of uncompensated care through provider education and refinement of the instructions to the Worksheet S-10.

We also understand the commenters' concerns regarding the effects on hospitals' payments of moving from calculating Factor 3 using a proxy based on low-income days to the use of uncompensated care data from Worksheet S-10. As discussed in prior rulemaking, in using Medicaid and Medicare SSI days as a proxy for uncompensated care, we recognize that it would be possible for hospitals in States that choose to expand Medicaid to receive higher uncompensated care payments because they may have more Medicaid patient days than hospitals in a State that does not choose to expand Medicaid. We believe that the

redistribution of payments from hospitals that serve a greater number of Medicaid patients to hospitals that serve more uninsured patients is consistent with the intent of the Affordable Care Act. However, as described below, we have proposed a methodology that would help to stabilize payments and protect hospitals from undue fluctuations by gradually incorporating Worksheet S-10 data into the calculation of Factor 3. In addition, the approximately \$800 million increase in the amount available to be distributed as uncompensated care payments will also help to offset some of the redistributive effects of moving to Worksheet S-10 in FY 2018.

Regarding some commenters' recommendation that we continue to use low-income insured days to calculate Factor 3, either on their own or in a permanent blend with Worksheet S-10 data, we note that the earliest Medicaid expansions under the Affordable Care Act began in 2014. Therefore, in order to insulate the calculation of Factor 3 from the effects of Medicaid expansion, Medicaid days must be drawn from cost reporting periods prior to FY 2014. This prohibits the use of low-income insured days on a permanent basis, as the data will become too old to ensure accuracy. However, the methodology of using 3 years of data to estimate uncompensated care that we first adopted for FY 2017 and that we again proposed for FY 2018 would help to protect hospitals from undue payment fluctuations by using a blend of low-income insured days data and Worksheet S-10 data on a temporary basis.

When all of these factors are taken into consideration, we maintain that we can no longer conclude that alternative data to the Worksheet S-10 are available for FY 2014 that are a better proxy for the costs of subsection (d) hospitals for treating individuals who are uninsured. We believe that continued use of Worksheet S-10 will improve the accuracy and consistency of the reported data, especially in light of our concerted efforts to allow hospitals to review and resubmit their Worksheet S-10 data for past years and the use of select audit protocols to trim aberrant uncompensated care costs and replace them with more reasonable amounts.

Comment: Many commenters, whether supporting or opposing the eventual use of Worksheet S-10, believed that it was premature to use its data in the calculation of Factor 3 for FY 2018. The commenters noted that, given that data elements used for the distribution of uncompensated care payments must be "historically publicly

available, subject to audit, and used for payment purposes," CMS has not met its own criteria for using Worksheet S-10 data to determine the distribution of uncompensated care payments. They stated that this is particularly troublesome because CMS has stated that it does not anticipate completing desk audits of data from Worksheet S-10 until FY 2020.

Most commenters recommended that CMS delay the use of data from Worksheet S-10 for at least 1 year, and up to 3 years, or until CMS has put processes in place to ensure consistent submissions by all hospitals as discussed in the FY 2017 IPPS/LTCH PPS final rule. Specifically, the majority of commenters stated that before Worksheet S-10 data are used, CMS must improve and clarify the instructions for Worksheet S-10 to ensure consistent reporting, and also implement audits of the data from Worksheet S-10.

One commenter suggested that these audits be conducted outside of the regular cost report audit for FY 2014 cost reports to ensure consistency with the Worksheet S-10's cost reporting instructions. The commenter also indicated that CMS may need to develop separate audit protocols for different cost reporting periods, as there are differences between the Worksheet S-10 instructions for cost reporting periods beginning before October 1, 2016 and those beginning on or after that date. The commenter urged CMS to make proposed audit instructions to the MACs available in advance and to gather additional stakeholder input before finalizing an audit approach, and noted that making the instructions available in advance would help the agency to identify issues that need additional refinement. Several commenters suggested that the data be audited in a rigorous manner, similar to wage index data. One commenter provided a list of metrics for CMS to consider including in a guide for MACs for their audits of the Worksheet S-10 data. Several other commenters disagreed with CMS' decision not to share the audit criteria with hospitals, and asked that CMS also release the audit criteria for charity care and non-Medicare bad debt. Similarly, commenters asked that before data from Worksheet S-10 are used, CMS implement additional steps to eliminate outliers, including data that represent unreasonable uncompensated care costs. However, the commenters also noted that CMS must allow hospitals a way to appeal any adjustments made to their data, and that CMS needs to allow a grace period similar to the Medicaid

DSH audits before the results of the audit have financial consequences.

Many commenters who urged CMS to delay the use of data from Worksheet S-10 also provided recommendations for CMS to address during the intervening time. Commenters requested that, before Worksheet S-10 data are put to use, CMS further educate hospitals about how to complete the Worksheet S-10 accurately and consistently and allow them to correct their data retroactively. This would include providing hospitals the opportunity to amend previously submitted worksheets for FY 2014 and FY 2015. The commenters emphasized the importance of providing this opportunity because the previous September 30, 2016 deadline for amending 2014 cost reports meant that the revised instructions for the Worksheet S-10 published in November 2016 could not be used because the deadline for resubmission had already passed. In addition, commenters recommended that CMS convene a stakeholder technical advisory group to make Worksheet S-10 data recommendations.

Response: We acknowledge the concerns raised by commenters regarding the use of data from Worksheet S-10 in the calculation of Factor 3 for FY 2018. However, as we stated in the FY 2018 IPPS/LTCH PPS proposed rule, when weighing the new information that has become available to us since the FY 2017 rulemaking in conjunction with the information regarding Worksheet S-10 data and the low-income days proxy that we have analyzed as part of our consideration of this issue in prior rulemaking, we can no longer conclude that alternative data to the Worksheet S-10 are available for FY 2014 that are a better proxy for the costs of subsection (d) hospitals for treating individuals who are uninsured. We also note that, as part of our ongoing quality control and data improvement measures to continue to improve the Worksheet S-10 data over time, we have revised the cost report instructions and are currently developing an audit process. With respect to the cost reporting instructions, on November 18, 2016, we issued Transmittal 10 which updated the instructions for Form 2552-10. Specifically, we updated the instructions in Section 4012 of Chapter 40 of the Provider Reimbursement Manual, Part II. The instructions clarify the reporting of charity care charges. Transmittal 10 is available for download on the CMS Web site at: <https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2016-Transmittals-Items/R10P240.html>.

With respect to the audit process, in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56964), we stated that we intended to provide standardized instructions to the MACs to guide them in determining when and how often a hospital's Worksheet S-10 should be reviewed. We indicated that we would not make the MACs' review protocol public, as all CMS desk review and audit protocols are confidential and are for CMS and MAC use only. The instructions for the MACs are still under development and will be provided to the MACs as soon as possible and in advance of any audit. We refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 56964) for a complete discussion concerning the issues that we are considering in developing the instructions that will be provided to the MACs.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19955), we stated our belief that cost reports beginning in FY 2017 will be the first cost reports for which the Worksheet S-10 data will be subject to a desk review. In addition, due to the overwhelming feedback from commenters emphasizing the importance of audits in ensuring the accuracy and consistency of the Worksheet S-10 data, we expect cost reports beginning in FY 2014, FY 2015, and FY 2016 to be subject to further scrutiny after submission.

We will continue to work with our stakeholders to address their concerns through provider education and further refinement of the instructions to the Worksheet S-10 as appropriate.

In reference to allowing hospitals to amend or submit new data for Worksheet S-10 for FYs 2014 and 2015, we note that, as discussed in the FY 2017 IPPS/LTCH PPS final rule, hospitals were given the opportunity to revise and resubmit their data for FY 2014. For revisions to be considered, hospitals were required to submit their amended FY 2014 cost report containing the revised Worksheet S-10 (or a completed Worksheet S-10 if no data were included on the previously submitted cost report) to the MAC no later than September 30, 2016. Although commenters asserted that the September 30, 2016 deadline for amending 2014 cost reports meant that the revised instructions for Worksheet S-10 published in November 2016 could not be used because the deadline had already passed, the changes to the instructions for Worksheet S-10 did not apply to FY 2014 cost reports as they were limited to cost reporting periods beginning on or after October 1, 2016. However, we note that the clarification that only the charges of uninsured

patients who do not meet the hospital's charity care criteria for a full or partial discount must be excluded from charity care could affect hospitals who provided discounts to uninsured patients who met the hospital's charity care policy in FY 2014. Accordingly, we are allowing hospitals another opportunity to resubmit data for FY 2014 Worksheets S-10, and they may include these charges if they were previously omitted. For revisions to be considered, hospitals must submit their amended FY 2014 cost report containing the revised Worksheet S-10 (or a completed Worksheet S-10 if no data were included on the previously submitted cost report) to the MAC no later than September 30, 2017. We note that these revised data will not be used to calculate Factor 3 for FY 2018, but will be available for use in future years if we propose and finalize a methodology for determining Factor 3 that uses FY 2014 Worksheet S-10 data.

We will provide hospitals with a similar opportunity for FY 2015 cost reports. We refer readers to Change Request 10026, Transmittal 1863, titled "The Supplemental Security Income (SSI)/Medicare Beneficiary Data for Fiscal Year 2015 for Inpatient Prospective Payment System (IPPS) Hospitals, Inpatient Rehabilitation Facilities (IRFs), and Long Term Care Hospitals (LTCH)," issued on June 30, 2017 (available at <https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2017-Transmittals-Items/R1863OTN.html>). In this transmittal, as a step in the process of ensuring complete submission of Worksheet S-10 by all DSH-eligible hospitals, we instruct MACs to accept amended Worksheets S-10 of FY 2015 cost reports submitted by hospitals (or initial submissions of Worksheet S-10 if none have been submitted previously) and to upload them to the Health Care Provider Cost Report Information System (HCRIS) in a timely manner. The transmittal states that, for revisions to be considered, hospitals must submit their amended FY 2015 cost report containing the revised Worksheet S-10 (or a completed Worksheet S-10 if no data were included on the previously submitted cost report) to the MAC no later than September 30, 2017.

After consideration of the public comments received, we are finalizing our proposal to begin incorporating Worksheet S-10 into the calculation of Factor 3 beginning in FY 2018. We discuss below our proposed methodology for how we would begin to incorporate Worksheet S-10 data into the calculation of Factor 3 of the

uncompensated care payment methodology.

(3) Time Period for Calculating Factor 3 for FY 2018, Including Methodology for Incorporating Worksheet S-10 Data

Section 1886(r)(2)(C) of the Act not only governs the selection of the data to be used in calculating Factor 3, but also allows the Secretary the discretion to determine the time periods from which we will derive the data to estimate the numerator and the denominator of the Factor 3 quotient. Specifically, section 1886(r)(2)(C)(i) of the Act defines the numerator of the quotient as the amount of uncompensated care for such hospital *for a period selected by the Secretary*. Section 1886(r)(2)(C)(ii) of the Act defines the denominator as the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under section 1886(r) of the Act *for such period*. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50638), we adopted a process of making interim payments with final cost report settlement for both the empirically justified Medicare DSH payments and the uncompensated care payments required by section 3133 of the Affordable Care Act. Consistent with that process, we also determined the time period from which to calculate the numerator and denominator of the Factor 3 quotient in a way that would be consistent with making interim and final payments. Specifically, we must have Factor 3 values available for hospitals that we estimate will qualify for Medicare DSH payments and for those hospitals that we do not estimate will qualify for Medicare DSH payments but that may ultimately qualify for Medicare DSH payments at the time of cost report settlement.

In the FY 2017 IPPS/LTCH PPS final rule, in order to mitigate undue fluctuations in the amount of uncompensated care payments to hospitals from year to year and smooth over anomalies between cost reporting periods, we finalized a policy of calculating a hospital's share of uncompensated care based on an average of data derived from three cost reporting periods instead of one cost reporting period. As explained in the preamble to the FY 2017 IPPS/LTCH PPS final rule (81 FR 56957 through 56959), instead of determining Factor 3 using Medicaid days from a single cost reporting period and the most recent available data on Medicare SSI utilization, as we did in FY 2014, FY 2015, and FY 2016, we used Medicaid days from *three* cost reporting periods (FYs 2011, 2012, and 2013) and SSI days from the *three* most recent available years of SSI utilization

data (FYs 2012, 2013, and 2014) to compute Factor 3 for FY 2017. We continued to extract Medicaid days data from the most recent update of HCRIS, which for FY 2017 was the March 2016 update. Furthermore, instead of determining a single Factor 3 as we have done since the first year of the uncompensated care payment in FY 2014, we calculated an individual Factor 3 for each of the three cost reporting periods, which we then averaged by the number of cost reporting years with data to compute the final Factor 3 for a hospital. Under this policy, if a hospital had merged, we would combine data from both hospitals for the cost reporting periods in which the merger was not reflected in the surviving hospital's cost report data to compute Factor 3 for the surviving hospital.

Moreover, to further reduce undue fluctuations in a hospital's uncompensated care payments, if a hospital filed multiple cost reports beginning in the same fiscal year, we combined data from the multiple cost reports so that a hospital could have a Factor 3 calculated using more than one cost report within a cost reporting period. We codified these changes for FY 2017 by amending the regulations at § 412.106(g)(1)(iii)(C).

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19951), we proposed to continue to use the methodology finalized in FY 2017 and to compute Factor 3 for FY 2018 using an average of data from three cost reporting periods instead of one cost reporting period. Consistent with the methodology used to calculate Factor 3 for FY 2017, we proposed to advance the time period of the data used in the calculation of Factor 3 forward by 1 year and use data from FY 2012, FY 2013, and FY 2014 cost reports. For the reasons we described earlier, we explained our belief that it would not be appropriate to use Worksheet S-10 data for periods prior to FY 2014. Rather, for cost reporting periods prior to FY 2014, we indicated that we believe it would be appropriate to continue to use low-income insured days. Accordingly, with a time period that includes 3 cost reporting years consisting of FY 2014, FY 2013, and FY 2012, we proposed to use Worksheet S-10 data for the FY 2014 cost reporting period and the low-income insured days proxy data for the two earlier cost reporting periods. In order to perform this calculation, we will draw three sets of data (2 years of Medicaid utilization data and 1 year of Worksheet S-10 data) from the most recent available HCRIS extract, which was the December 2016 update of

HCRIS for the FY 2018 IPPS/LTCH PPS proposed rule and is the March 2017 update of HCRIS for this final rule. Accordingly, for FY 2018, in addition to the Worksheet S-10 data for FY 2014, we proposed to use Medicaid days from FY 2012 and FY 2013 cost reports and FY 2014 and FY 2015 SSI ratios. We also proposed to continue to use FY 2012 cost report data submitted to CMS by IHS and Tribal hospitals to determine Medicaid days for those hospitals. (Cost report data from IHS and Tribal hospitals are included in HCRIS beginning in FY 2013, and are no longer submitted separately.) We also proposed to continue the policies that were finalized in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50020) to address several specific issues concerning the process and data to be employed in determining Factor 3 in the case of hospital mergers as well as the policies finalized in the FY 2017 IPPS/LTCH PPS final rule concerning multiple cost reports beginning in the same fiscal year (81 FR 56957).

We stated in the proposed rule that we believe this approach, if we were to propose to continue it for FY 2019 and FY 2020, would have the effect of transitioning the incorporation of data from Worksheet S-10 into the calculation of Factor 3. Starting with 1 year of Worksheet S-10 data in FY 2018, an additional year of Worksheet S-10 data would be incorporated into the calculation of Factor 3 in FY 2019, and the use of low-income insured days would be phased out by FY 2020.

In addition, in the proposed rule we acknowledged the concerns regarding IHS/Tribal hospitals and subsection (d) Puerto Rico hospitals that some commenters expressed in response to the FY 2017 proposal to begin using Worksheet S-10 data to determine Factor 3 in FY 2018. According to some of these commenters, the use of data from Worksheet S-10 to calculate uncompensated care may jeopardize all of the IHS/Tribal hospitals' uncompensated care payments due to their unique funding structure. With respect to Puerto Rico, other commenters asserted that the use of Worksheet S-10 data may not be appropriate, given the historical treatment of subsection (d) Puerto Rico hospitals under the statutory provisions governing payments under Medicaid and Medicare Part A and its impact on the reporting of uncompensated care payments by these hospitals. After consideration of the concerns, we indicated that we believe the uncompensated care data reported by Puerto Rico and IHS/Tribal hospitals needs to be further examined and

should not be used for FY 2018. For the reasons described earlier related to the impact of the Medicaid expansion beginning in FY 2014, we also stated that we do not believe it would be appropriate to calculate a Factor 3 for these hospitals using FY 2014 low-income insured days. Because we do not believe it is appropriate to use the FY 2014 uncompensated care data for these hospitals and we also do not believe it is appropriate to use the FY 2014 low-income insured days, we stated that we believe the best proxy for the costs of Puerto Rico and IHS/Tribal hospitals for treating the uninsured is the low income-insured days data for FY 2012 and FY 2013. Accordingly, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19951), we proposed for these hospitals that when we compute the individual Factor 3s for each of the three cost reporting periods that are used to determine Factor 3, rather than computing a Factor 3 using Worksheet S-10 data from the hospital's FY 2014 cost report, we would substitute the Factor 3 calculated using the hospital's FY 2013 low-income insured days. That is, in order to determine the Factor 3 for FY 2018, we would calculate an average of three individual Factor 3s using the Factor 3 calculated using FY 2013 cost report data twice and the Factor 3 calculated using FY 2012 cost report data once. We indicated that we believe it is appropriate to double-weight the Factor 3 calculated using FY 2013 data as it reflects the most recent available information regarding the hospital's low-income insured days before any expansion of Medicaid. We also noted that, as we were not making any proposals with respect to the calculation of Factor 3 for FY 2019 in the FY 2018 IPPS/LTCH PPS proposed rule, we would reexamine the use of the Worksheet S-10 data for Puerto Rico and IHS/Tribal hospitals as part of the FY 2019 rulemaking. In addition, we proposed to continue to use a proxy for SSI days consisting of 14 percent of a hospital's Medicaid days for Puerto Rico hospitals, as finalized in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56953 through 56956).

Therefore, for FY 2018, we proposed to compute Factor 3 for each hospital by—

- *Step 1:* Calculating Factor 3 using the low-income insured days proxy based on FY 2012 cost report data and the FY 2014 SSI ratio;
- *Step 2:* Calculating Factor 3 using the insured low-income days proxy based on FY 2013 cost report data and the FY 2015 SSI ratio;
- *Step 3:* Calculating Factor 3 based on the FY 2014 Worksheet S-10 data (or

using the Factor 3 calculated in Step 2 for Puerto Rico and IHS/Tribal hospitals); and

- *Step 4:* Averaging the Factor 3 values from Steps 1, 2, and 3; that is, adding the Factor 3 values from FY 2012, FY 2013, and FY 2014 for each hospital, and dividing that amount by the number of cost reporting periods with data to compute an average Factor 3.

We invited public comments on our proposed methodology for calculating Factor 3 for FY 2018. We also noted that if this proposed methodology was adopted for FY 2018, we would expect to propose to use a similar methodology for calculating Factor 3 for subsequent years, meaning that for FY 2019 we would expect to incorporate data from the FY 2015 Worksheet S–10 into the methodology and drop the FY 2012 low-income insured day proxy data. However, we did not make any proposals with respect to the calculation of Factor 3 for FY 2019 in the FY 2018 IPPS/LTCH PPS proposed rule.

Comment: While many commenters supported CMS' proposal to use a 3-year average to calculate Factor 3 for FY 2018, some commenters also provided suggestions for modified or alternative methodologies to calculate Factor 3 in FY 2018 and beyond. Many of these commenters opposed the use of Worksheet S–10 data beginning in FY 2018 and recommended a delay of at least 1 year to allow for further refinement of the Worksheet S–10 instructions and audit protocols to identify and remove aberrant uncompensated care costs. Several commenters requested that, instead of adding Factor 3 values from FY 2012, FY 2013, and FY 2014 for each hospital, and dividing that amount by the number of cost reporting periods with data, CMS continue to use the same data that was used to calculate uncompensated care payments in FY 2017 (Medicaid days from FYs 2011, 2012, and 2013 cost reports and SSI days from FY 2012, FY 2013, and FY 2014 SSI ratios) for purposes of calculating uncompensated care payments to hospitals in FY 2018. The commenters noted that using these data during a 1-year delay in incorporating Worksheet S–10 data would avoid including post-Medicaid expansion data for FY 2014 in the Factor 3 calculation.

Many commenters asked that CMS implement a stop-loss policy to protect hospitals that lose more than 5 to 10 percent in DSH payments in any given year as a result of transitioning to use of Worksheet S–10 data. These commenters suggested that this stop-loss should extend beyond the

transition to help hospitals with decreasing uncompensated care payments adjust to their new payment levels. However, other commenters noted that a permanent stop-loss would not be warranted, given that a 3-year phase-in is an appropriate way to temporarily reduce the impact of new provisions.

One commenter recommended that any measure of uncompensated care should account for the different sources of uncompensated care burden hospitals incur as they treat low income patients in a changing coverage landscape. The commenter suggested that CMS use a permanent hybrid methodology that includes both a hospital's low-income insured days and uncompensated care costs from Worksheet S–10 to calculate its Factor 3. This commenter recommended that instead of transitioning entirely to Worksheet S–10 data (presumably in FY 2020), CMS use a weighted average of low-income insured days and uncompensated care costs from Worksheet S–10, with low-income insured days weighted 25 percent and Worksheet S–10 data weighted 75 percent.

Another commenter suggested an alternative 5-year phase-in, beginning in FY 2019. This commenter recommended that the weight accorded to data from Worksheet S–10 from FY 2014 be limited in the first year to 10 percent, with the remaining 90 percent determined using data on low-income insured days for FYs 2012 and 2013. In the second year, the commenter suggested that 2 years of data from Worksheet S–10 (FY 2014 and FY 2015) would be averaged and would equal 20 percent, with the remaining 80 percent weight accorded to the data on low-income insured days from FYs 2012 and 2013. In the third year, the commenter suggested that Worksheet S–10 data from FYs 2016 and 2017 would be averaged and weighted at 40 percent, with 60 percent weight accorded to the data on low income insured days. The commenter added that the phase-in process would continue in Year 4, FY 2022, with the use of averaged FY 2017 and FY 2018 Worksheet S–10 data with 80 percent weight, the remainder accorded to the data on low-income insured days. According to the commenter, Year 5 of the phase-in would utilize Worksheet S–10 as the sole data source, with an average of audited data from FYs 2017 through 2019.

While many commenters expressed approval of the proposed 3-year phase-in approach to using data from Worksheet S–10, there were other varying opinions expressed regarding

the length of the phase-in period. Many commenters agreed with the proposed 3-year phase-in following a period of delay, as outlined above. However, other commenters encouraged CMS to expedite the transition to Worksheet S–10 data with potentially no phase-in. Commenters who recommended no phase-in noted that Worksheet S–10 uses the most accurate information available on uncompensated care costs, and while it is not perfect, no cost report schedule or other source of information provided by individual hospitals will ever achieve perfection. Conversely, other commenters requested that CMS consider a longer phase-in period. These commenters recommended a minimum 5-year transition period to gradually phase-in the use of Worksheet S–10 data once the data have been audited. According to the commenters, this longer phase-in would mitigate the effect on hospitals of the redistribution in uncompensated care payments resulting from the inclusion of data from the Worksheet S–10.

One commenter did not agree with the use of a 3-year average in the computation of Factor 3 because it would result in the use of dated information and is not a reasonable solution to solve data anomalies. This commenter requested that CMS use both Medicaid and Medicare SSI days from the most recent available full year of cost report data to compute Factor 3 for FY 2018. However, most commenters supported the use of 3 years of data in the calculation of Factor 3 in FY 2018, regardless of whether they supported a 1-year delay prior to implementing the use of Worksheet S–10 data or the implementation of the use of Worksheet S–10 data in FY 2018, as proposed.

Response: We appreciate the commenters' support for the use of a 3-year average in the calculation of Factor 3 for FY 2018. We also appreciate the comments regarding alternative timelines for incorporating Worksheet S–10 data into the calculation of Factor 3 and alternative methods for computing proxies for uncompensated care costs. As we stated in the FY 2018 IPPS/LTCH PPS proposed rule, when weighing the new information that has become available to us since the FY 2017 rulemaking in conjunction with the information regarding Worksheet S–10 data and the low-income days proxy that we have analyzed as part of our consideration of this issue in prior rulemaking, we can no longer conclude that alternative data to the Worksheet S–10 are available for FY 2014 that are a better proxy for the costs of subsection (d) hospitals for treating individuals

who are uninsured. For these reasons, we believe that it is appropriate to begin to incorporate the Worksheet S-10 data in the calculation of Factor 3 starting in FY 2018. We note that the proposals in the FY 2018 IPPS/LTCH PPS proposed rule were limited to FY 2018, and that we did not make any proposals with respect to the data that would be used to calculate Factor 3 for subsequent years. As a result, it would be premature for CMS to establish policies for future years in this final rule. We will consider the commenters' suggestions for further incorporating Worksheet S-10 into the calculation of Factor 3, or computing proxies for uncompensated care costs using a blend of Worksheet S-10 data, low-income insured days, or other data sources, in future rulemaking.

With respect to the stop-loss policy that one commenter suggested, we believe that the use of 3 years of data instead of 1 year of data already provides assurance that hospitals' uncompensated care payments will remain reasonably stable and predictable, and would not be subject to unpredictable swings and anomalies in a hospital's low-income insured days or reported uncompensated care costs. As a result, because there is already a mechanism for smoothing the transition from the use of low-income insured days to the use of Worksheet S-10 data in place, we do not believe a stop-loss policy is necessary at this time.

Comment: One commenter requested that CMS consider using a proxy for Puerto Rico hospitals' SSI days in computing the empirically justified DSH payment amount, or 25 percent of the amount that would have been paid for Medicare DSH prior to implementation of section 3133 of the Affordable Care Act.

Response: In the FY 2018 IPPS/LTCH PPS proposed rule, we did not propose any changes to the methodology used to calculate empirically justified Medicare DSH payments. Therefore, we consider this comment to be outside the scope of the proposed rule. However, we note that while section 1886(r)(2)(C)(i) of the Act allows for the use of alternative data as a proxy to determine the costs of subsection (d) hospitals for treating the uninsured for purposes of determining uncompensated care payments, section 1886(r)(1) of the Act requires the Secretary to pay an empirically justified DSH payment that is equal to 25 percent of the amount of the Medicare DSH payment that would otherwise be made under section 1886(d)(5)(F) of the Act to a subsection (d) hospital for the fiscal year. Because section 1886(d)(5)(F)(vi) of the Act, which prescribes the disproportionate patient percentage

used to determine empirically justified Medicare DSH payments, specifically calls for the use of SSI days in the Medicare fraction and does not allow the use of alternative data, we do not believe there is any legal basis for CMS to use a proxy for Puerto Rico hospitals' SSI days in the calculation of the empirically justified Medicare DSH payment under section 1886(r)(1) of the Act.

Comment: Several commenters supported the proposal to use 14 percent of Medicaid days as a proxy for Medicare SSI days when determining Factor 3 for Puerto Rico hospitals. These commenters stated that they appreciated the attention and effort by CMS to develop a fair and appropriate method to estimate SSI days for Puerto Rico hospitals, as the SSI program is statutorily unavailable to U.S. citizens residing in the Territories.

One commenter recommended that CMS examine data to evaluate future proxy alternatives for Puerto Rico hospitals, such as using data for Medicare beneficiaries with Medicaid eligibility (dual eligible beneficiaries). The commenter proposed that CMS initiate a plan to work with hospitals in Puerto Rico to formally review and define cost report data for recent years in relation to the documentation of hospital inpatient days for dual eligible beneficiaries. As a second step, the commenter recommended that CMS allow hospitals in Puerto Rico to resubmit the pertinent worksheets of the cost reports for past years, to appropriately document the inpatient days for dual-eligible beneficiaries.

Response: We appreciate the support for our continued use of 14 percent of a Puerto Rico hospital's Medicaid days as a proxy for SSI days. Because we are continuing to use insured low-income patient days as a proxy for uncompensated care as part of the Factor 3 calculation in FY 2018 and residents of Puerto Rico are not eligible for SSI benefits, we believe it is important to create a proxy for SSI days for Puerto Rico hospitals.

Regarding the comment recommending that we use inpatient days for Medicare beneficiaries receiving Medicaid as this proxy, we have examined this concept and have been unable to identify a systematic source for these data for Puerto Rico hospitals. Specifically, we note that inpatient utilization for Medicare beneficiaries entitled to Medicaid is not reported by hospitals on the Medicare cost report, either within or outside Puerto Rico. We expect to further address issues related to estimating the amount of uncompensated care for

hospitals in Puerto Rico as part of the FY 2019 rulemaking.

Comment: A few commenters expressed concern that the use of data from Worksheet S-10 to calculate uncompensated care costs does not take into account the IHS's unique funding structure and therefore may jeopardize all uncompensated care payments for IHS hospitals. The commenters stated that, due to their unique funding structure, Indian Health Care Providers (IHCPs) do not have uncompensated care costs under Worksheet S-10. They indicated that because funding for the costs of patient care is provided through congressional appropriations, all care is considered compensated, even though appropriations fund only approximately 59 percent of the health care needs for American Indians/Alaska Natives. The commenters also stated that many Tribes and Tribal organizations invest non-Federal resources in their health care programs to furnish care that could easily be classified as uncompensated care because IHCPs may not charge beneficiaries to receive care and, thus, may not have the accounting methods to track these costs. As a result, the commenters stated that IHCP hospitals are currently unable to report charity care and non-Medicare bad debt consistent with the proposed definition of uncompensated care in the proposed rule. Therefore, the commenters requested that CMS consult with IHS and Tribal stakeholders to estimate the amount of uncompensated care furnished in IHCP hospitals. The commenters also stated that the opportunity to submit comments on the rulemaking process is not considered meaningful consultation in accordance with Executive Order 13175 or the CMS Tribal consultation policy approved December 5, 2015, and that additional Tribal consultation is necessary.

Response: We appreciate these comments and acknowledge that the use of data from Worksheet S-10 to calculate uncompensated care costs does not take into account the unique funding structure of IHS hospitals and therefore using these data to determine Factor 3 may have an unintended impact on the uncompensated care payments to these hospitals. Through consultation and communication with IHS and Tribal hospitals, including an All Tribes' Call on May 22, 2017, to discuss the FY 2018 IPPS/LTCH PPS proposed rule, we have confirmed that it would not be appropriate to use FY 2014 uncompensated care cost data from Worksheet S-10 to calculate Factor 3 for IHS and Tribal hospitals.

In the FY 2018 IPPS/LTCH PPS proposed rule, we proposed for IHS

hospitals that when we compute the individual Factor 3s for each of the three cost reporting periods that are used to determine Factor 3, rather than computing a Factor 3 using Worksheet S-10 data from the hospital's FY 2014 cost report, we would substitute the Factor 3 calculated using the hospital's FY 2013 low-income insured days. That is, in order to determine the Factor 3 for FY 2018, we would calculate an average of three individual Factor 3s using the Factor 3 calculated using FY 2013 cost report data twice and the Factor 3 calculated using FY 2012 cost report data once. We believe it is appropriate to double-weight the Factor 3 calculated using FY 2013 data as it reflects the most recent available information regarding the hospital's low-income insured days before any expansion of Medicaid. We note that we did not make any proposals with respect to the calculation of Factor 3 for FY 2019 in the FY 2018 proposed rule. We will reexamine the use of the Worksheet S-10 data for IHS/Tribal hospitals as part of the FY 2019 rulemaking.

Comment: Many commenters asked CMS to change, rescind, or otherwise edit methodologies with respect to all-inclusive rate providers, which several commenters called "inappropriate" and "erroneous." Several commenters suggested a separate audit protocol to address the unique circumstances of all-inclusive billers, and to ensure that their uncompensated care is accurately captured. They observed that because all-inclusive rate providers do not use charges, the CCR on the Worksheet S-10 would be inaccurate. One commenter suggested the use of an audit protocol akin to the one that is used to audit charity care reported by CAHs for purposes of the meaningful use program.

One suggestion to ameliorate the issues regarding all-inclusive rate providers was to add a line to the Worksheet S-10 that asks hospitals "Are you an all-inclusive biller?" that would provide an alternative methodology for those hospitals to calculate their CCRs. Another suggestion was to allow all-inclusive rate providers to submit their own CCRs, so they could explain or correct their data prior to CMS substitution of the hospital-reported CCR with the statewide average. A third suggestion was to use the uncompensated care costs as reported by all-inclusive rate providers on Line 30 of Worksheet S-10 (as opposed to converting charges to costs using the CCR reported on Line 1 of Worksheet S-10 or a statewide average CCR as CMS proposed) or to use low-income days as a proxy for uncompensated care when

calculating Factor 3 either for all all-inclusive rate providers or for public all-inclusive rate providers.

Response: We appreciate the concerns and suggestions raised by commenters with respect to the CCRs that will be used in determining the uncompensated care costs of all-inclusive rate providers. Given the unique charge structure of all-inclusive rate providers, we have determined that it would not be appropriate to use FY 2014 uncompensated care cost data from Worksheet S-10 to calculate Factor 3 for these hospitals, and we will instead use an alternate methodology that is consistent with the methodology that we proposed for IHS/Tribal hospitals and Puerto Rico hospitals, which also experience special circumstances that could potentially affect the validity of their Worksheet S-10 data. We note that we did not make any proposals with respect to the calculation of Factor 3 for FY 2019 or subsequent years in the FY 2018 proposed rule; we will reexamine the use of the Worksheet S-10 data for all-inclusive rate providers as part of the FY 2019 rulemaking.

After consideration of the public comments we received, we are finalizing our proposal to incorporate 1 year of Worksheet S-10 data into the calculation of Factor 3 in FY 2018 in conjunction with data on low-income insured days for FYs 2012 and 2013. We will continue to use data from three cost reports, which will gradually incorporate data from Worksheet S-10 into the calculation of Factor 3.

We also are finalizing our proposal not to incorporate Worksheet S-10 data for Puerto Rico hospitals and IHS and Tribal hospitals, but will double-weight the 2013 Factor 3 calculated for these hospitals. In addition, we will not use Worksheet S-10 data for all-inclusive rate providers, but will also double-weight the 2013 Factor 3 calculated for these hospitals. We believe that the uncompensated care data reported by Puerto Rico hospitals, IHS/Tribal hospitals, and all-inclusive rate providers on Worksheet S-10 need to be further examined and should not be used in determining Factor 3 for FY 2018. Because we do not believe it is appropriate to use the FY 2014 uncompensated care data for these hospitals and we also do not believe it is appropriate to use the FY 2014 low-income insured days due to the effects of Medicaid expansion, we believe that the best proxy for the costs of Puerto Rico hospitals, IHS/Tribal hospitals, and all-inclusive rate providers for treating the uninsured is the low-income insured days data for FY 2012 and FY 2013.

In addition, we are finalizing the proposed amendment to the regulation at § 412.106(g)(1)(iii)(C) to reflect the data that will be used to calculate Factor 3 for FY 2018. We have made a minor modification to the proposed text of the regulation in order to clarify that data on uncompensated care costs will not be used to determine Factor 3 for Puerto Rico hospitals, IHS and Tribal hospitals, and all-inclusive rate providers.

For new hospitals that do not have data for any of the three cost reporting periods used in the Factor 3 calculation, we will continue to apply the new hospital policy finalized in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50643). That is, the hospital will not receive either interim empirically justified Medicare DSH payments or interim uncompensated care payments. However, if the hospital is later determined to be eligible to receive empirically justified Medicare DSH payments based on its FY 2018 cost report, the hospital will also receive an uncompensated care payment calculated using a Factor 3, where the numerator is the uncompensated care costs reported on Worksheet S-10 of the hospital's FY 2018 cost report, and the denominator is the sum of uncompensated care costs reported on Worksheet S-10 of all DSH eligible hospitals' FY 2014 cost reports as prospectively determined during rulemaking. We note that, given the selected time period of the data used to calculate Factor 3, any hospitals with a CCN established after October 1, 2014 will be considered new and subject to this policy.

As we have done for each proposed and final rule beginning in FY 2014, in conjunction with this final rule, we will publish on the CMS Web site a table listing Factor 3 for all hospitals that we estimate will receive empirically justified Medicare DSH payments in FY 2018 (that is, those hospitals that will receive interim uncompensated care payments during the fiscal year), and for the remaining subsection (d) hospitals and subsection (d) Puerto Rico hospitals that have the potential of receiving a Medicare DSH payment in the event that they receive an empirically justified Medicare DSH payment for the fiscal year as determined at cost report settlement.

In conjunction with the proposed rule, we published a supplemental data file containing a list of the mergers that we were aware of and the computed uncompensated care payment for each merged hospital. Hospitals had 60 days from the date of public display of the FY 2018 IPPS/LTCH PPS proposed rule to review the table and supplemental data

file published on the CMS Web site and to notify CMS in writing of any inaccuracies. We stated in the proposed rule that we would address these comments as appropriate in the table and the supplemental data file that we publish on the CMS Web site in conjunction with the publication of this FY 2018 IPPS/LTCH PPS final rule. Hospitals will have until August 31, 2017, to review and submit comments on the accuracy of the table and supplemental data file published in conjunction with this final rule. Comments may be submitted to the CMS inbox at Section3133DSH@cms.hhs.gov through August 31, 2017, and any changes to Factor 3 will be posted on the CMS Web site prior to October 1, 2017.

Comment: Some commenters provided specific information regarding merger situations involving their hospitals and requested that CMS consider these mergers in determining Factor 3 for FY 2018 payments. A few commenters also pointed out that specific data for the calculation of Factor 3, such as Medicaid days, were incorrect due to missing cost report data in the HCRIS extract for the applicable year. In addition, a few commenters noted inaccuracies in the FY 2018 Proposed Rule Supplemental Data File, which, in some cases, had not been updated to reflect the most recent FY 2014 cost report filed in accordance with CMS Transmittal 1681. CMS Transmittal 1681 instructed MACs to accept amended Worksheets S–10 for FY 2014 cost reports submitted by hospitals (or initial submissions of Worksheet S–10 if none had been submitted previously) and to upload them to the Health Care Provider Cost Report Information System (HCRIS) in a timely manner if received no later than September 30, 2016.

Response: We thank the commenters for their input. We have updated our list of mergers based on information submitted by the MACs as of June 2017. In addition, we have reviewed the commenters' submissions of mergers not previously identified in the proposed rule and have updated our list accordingly. We also have reviewed the commenters' submissions regarding missing or incorrect Worksheet S–10 data from FY 2014 cost reports in the FY 2018 Proposed Rule Supplemental Data File and included those data that were submitted timely and inadvertently excluded from the March 2017 HCRIS extract due to MAC or CMS error. We will continue to pay diligent attention to data inaccuracies and work internally and with our contractors to resolve these issues in a timely manner.

(4) Methodological Considerations for Calculating Factor 3

• **Annualizing short cost reports.** As we explained in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56957 through 56959) and in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19953), we believe that for hospitals that file multiple cost reports beginning in the same year, combining the data from these cost reports has the benefit of supplementing the data of hospitals that filed cost reports that are less than 12 months, such that the basis of their uncompensated care payments and those of hospitals that filed full-year 12-month cost reports would be more equitable. In response to our original proposal in the FY 2017 IPPS/LTCH PPS proposed rule to combine data from multiple cost reports, many hospitals stated that while they were appreciative of CMS' efforts to provide a more equitable playing field for hospitals that filed short cost reports, they believed that expanding the time period of the data used to calculate Factor 3 as well as combining data across multiple cost reports would not remedy the fact that some hospitals are still disadvantaged by having less than 36 months of data in their Factor 3 calculation (81 FR 56959). Other commenters opposed the use of multiple cost reporting periods if it would result in a hospital having more than 12 months of data in the Factor 3 calculation for a year, and recommended that CMS prorate the data to a 12-month period. Similarly, other commenters recommended that CMS annualize cost report data for any cost reporting period that is less than 12 months. In the FY 2017 IPPS/LTCH PPS final rule, we acknowledged that, although we had not made any proposal in the FY 2017 IPPS/LTCH PPS proposed rule to annualize the cost reports used to calculate Factor 3, the situations presented by commenters, including both long and short cost reporting periods, pose unique challenges in the context of estimating Factor 3. We stated that we intended to consider the issue further and might address the issue in future rulemaking.

For the FY 2018 IPPS/LTCH PPS proposed rule, taking into consideration the feedback from hospitals that have been disadvantaged in the Factor 3 calculation due to cost reports that do not span a full year, we proposed to annualize Medicaid data if a hospital's cost report does not equal 12 months of data. We did not propose to annualize SSI days because we do not obtain these data from hospital cost reports in HCRIS. Rather, we obtain these data from the latest available SSI ratios

posted on the Medicare DSH homepage (<https://www.cms.gov/medicare/medicare-fee-for-service-payment/AcuteInpatientPPS/dsh.html>), which are aggregated at the hospital level and do not have the information needed to determine if the data should be annualized.

Under this proposal, if the time between the start date of a hospital's cost reporting year and the end date of its cost reporting year is less than 12 months, we proposed that we would annualize the Medicaid days so that the hospital has 12 months of data included in its Factor 3 calculation. Conversely, if the time between the aforementioned start date and the end date is *greater* than 12 months, we would annualize the Medicaid days to achieve 12 months of Medicaid days data. If a hospital files more than one cost report beginning in the same fiscal year, we would first combine the data across the multiple cost reports before determining the difference between the start date and the end date to see if annualization is needed.

To annualize the Medicaid days for a long or short cost reporting year, we proposed that we would divide the length of a full year (365 or 366 calendar days, as applicable) by the length of the cost reporting year (the number of calendar days in the cost reporting year) and then multiply the quotient by the number of Medicaid days in the cost reporting year.

For instance, a cost reporting year that is 285 calendar days long with 1,200 Medicaid days would be annualized as follows: $(365/285) * 1,200 = 1,537$ days.

A cost reporting year that is 385 calendar days long with 1,200 Medicaid days would be annualized using the same formula: $(365/385) * 1,200 = 1,137$ days.

Likewise, because long and short cost reporting periods pose the same challenges in the context of estimating Factor 3 using hospital uncompensated care costs, we proposed to annualize the uncompensated care cost data reported on Worksheet S–10 for cost reports that do not equal 12 months of data, by dividing the length of a full year (365 or 366 calendar days, as applicable) by the length of the cost reporting year (number of calendar days in the cost reporting year) and then multiplying the quotient by the total reported uncompensated care costs for the cost reporting year.

For instance, a cost reporting year that is 285 calendar days long reporting \$10,500,000 in uncompensated care costs would be annualized as follows: $(365/285) * \$10,500,000 = \$13,447,368$.

A cost reporting year that is 385 calendar days long reporting \$10,500,000 in uncompensated care costs would be annualized using the same formula: $(365/385) * \$10,500,000 = \$9,954,545$.

If a hospital files more than one cost report beginning in the same fiscal year, we proposed that we would first combine the data across the multiple cost reports before determining the length of the cost reporting year to see if annualization is needed.

We invited public comment on our proposal to annualize the cost reports used to calculate Factor 3 for FY 2018. In addition, as noted earlier, our proposal to continue calculating a hospital's share of uncompensated care payments using a time period that includes 3 cost reporting years was also designed to mitigate undue fluctuations in the amount of uncompensated care payments to hospitals from year to year and smooth over anomalies between cost reporting periods. Given that our proposal to annualize the cost reports used to calculate Factor 3 for FY 2018 would also mitigate fluctuations in the amount of uncompensated care payments from year to year, we also sought public comment on the degree to which the use of three cost reporting years would still be necessary if we were to adopt our proposal to annualize the cost reports used to calculate Factor 3, or if instead the use of a single cost reporting year or two cost reporting years would be appropriate. In order to facilitate public comments, we indicated that we intend to post on our Web site a data file containing information similar to the information provided in section I.H.5., "Effects of the Proposed Changes to Medicare DSH and Uncompensated Care Payments for FY 2018" of Appendix A of the proposed rule. However, instead of reflecting our proposed approach of calculating Factor 3 using a time period that includes 3 cost reporting years, it would reflect an alternative approach of calculating Factor 3 using only the most recent year (FY 2014) of our proposed 3-year average. In all other respects, the calculation of Factor 3 would remain the same.

Comment: Many commenters supported CMS' proposal to annualize cost reports that do not reflect 12 months of data (short and long periods). One commenter specifically supported the proposal to annualize Medicare SSI days for the Factor 3 calculation, while another commenter supported the proposal to combine data from multiple cost reports beginning in the same fiscal year before annualization.

Response: We appreciate the support for the proposal to annualize cost reports that do not meet the 12-month threshold. However, we reiterate that the proposal did not apply to Medicare SSI days as these data are not obtained directly from cost reports in HCRIS (unlike Medicaid days and uncompensated care cost data), but rather from a file posted on the CMS Web site: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html>, where the data are aggregated at the hospital level and without the information to determine if annualization is needed. Therefore, we are unable to annualize Medicare SSI days as we proposed for Medicaid days from Worksheet S-2 and uncompensated care cost data from Worksheet S-10 of the Medicare cost report.

After consideration of the comments we received, we are finalizing our proposal to annualize cost reports that do not have 12 months of data. As stated in the FY 2018 IPPS/LTCH PPS proposed rule, if the time between the start date of a hospital's cost reporting year and the end date of its cost reporting year is less than 12 months, we will annualize the Medicaid days so that the hospital has 12 months of data included in its Factor 3 calculation. Conversely, if the time between the aforementioned start date and the end date is *greater* than 12 months, we will annualize the Medicaid days to achieve 12 months of Medicaid days data. If a hospital files more than one cost report beginning in the same fiscal year, we will first combine the data across the multiple cost reports before determining the difference between the start date and the end date to see if annualization is needed.

• **Scaling Factor.** Under the methodology adopted in the FY 2017 IPPS/LTCH PPS final rule and as we proposed to apply in FY 2018, if a hospital does not have data for one or more of the three cost reporting periods, we would compute Factor 3 for the periods available and average those. In other words, we would divide the sum of the individual Factor 3s by the number of cost reporting periods with data so as not to disadvantage hospitals that are missing data for one or more cost reporting periods. Following the publication of the FY 2017 IPPS/LTCH PPS final rule, several hospitals noted that this aspect of the methodology resulted in the Factor 3 values of DSH eligible hospitals in Table 18 and the Medicare DSH Supplemental Data File adding up to slightly greater than one, which resulted in total uncompensated

care payments somewhat exceeding the estimate published in the FY 2017 final rule. Specifically, for hospitals that have fewer than 3 cost reporting years with data, dividing the individual Factor 3s by the number of cost reporting years with data (that is, 2 cost reporting years or 1 cost reporting year) results in a higher average Factor 3 than if the individual Factor 3s were divided by the number of cost reporting years, regardless of whether or not there is data (that is, 3 cost reporting years). For example, a hospital with no data for FY 2011 and a Factor 3 of 0.000051762 for FY 2012 and 0.000049852 for FY 2013 will have an average Factor 3 of 0.000050807 if divided by 2 but an average Factor 3 of only 0.000033871 if divided by 3. After reviewing the data in Table 18 and the Medicare DSH Supplemental Data File, which were published in conjunction with the FY 2017 IPPS/LTCH PPS final rule, we concluded that the hospitals' observations are correct and that an adjustment is needed so that total uncompensated care payments do not exceed the estimated amount available to make uncompensated care payments as discussed in section V.G.4.b of the preamble of this final rule.

Accordingly, to address the effects of averaging Factor 3s calculated for three separate fiscal years, we proposed to apply a scaling factor to the Factor 3 values of all DSH eligible hospitals so that total uncompensated care payments are consistent with the estimated amount available to make uncompensated care payments for FY 2018. We proposed to first compute Factor 3 and the uncompensated care payments for all hospitals that we anticipate qualifying for Medicare DSH payments in FY 2018. We proposed to then divide 1 (the *expected* sum of all eligible hospitals' Factor 3 values) by the *actual* sum of all eligible hospitals' Factor 3 values and multiply the quotient by each hospital's total uncompensated care payment to obtain scaled uncompensated care payment amounts whose sum is consistent with the estimate of the total amount available to make uncompensated care payments. The hospital-specific uncompensated care amount would then be divided by a 3-year claims average to obtain the amount of the interim uncompensated care payment the hospital will receive for each claim. As an illustration of the calculation of the scaling factor, applying this proposal to the FY 2017 uncompensated care payments would have resulted in a scaling factor of 0.9992 (1/1.0008). We noted that the FY 2017 uncompensated

care payments as calculated for the FY 2017 IPPS final rule exceeded the estimated amount by approximately \$5 million due to the lack of a scaling factor.

We invited public comments on our proposal to apply a scaling factor to all DSH eligible hospitals' Factor 3 values for FY 2018.

Comment: One commenter supported applying a scaling factor to Factor 3 and noted that it would prevent artificial inflation of a hospital's amount of uncompensated care in the absence of 3 years of cost report data.

Response: We appreciate the commenter's support for the proposed scaling factor.

After consideration of the comments we received, we are finalizing our proposal to implement a scaling factor to all DSH eligible hospitals' Factor 3 values for FY 2018.

(5) Methodological Considerations for Incorporating Worksheet S–10 Data

• *Definition of uncompensated care.* In the FY 2014 IPPS/LTCH PPS rulemaking, we considered three potential definitions of uncompensated care: Charity care; charity care + bad debt; and charity care + bad debt + Medicaid shortfalls. As we explained in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50634), we considered proposing to define the amount of uncompensated care for a hospital as the uncompensated care costs of that hospital and considered potential data sources for those costs. We examined the literature on uncompensated care and the concepts of uncompensated care used in various public and private programs, and considered input from stakeholders and public comments in various forums, including the national provider call that we held in January 2013. Our review of the information from these sources indicated that there is some variation in how different States, provider organizations, and Federal programs define “uncompensated care.” However, a common theme of almost all these definitions is that they include both “charity care” and “bad debt” as components of “uncompensated care.” Therefore, a definition that incorporates the most commonly used factors within uncompensated care as reported by stakeholders would include charity care costs and bad debt costs. Worksheet S–10 employs the definition of charity care plus non-Medicare bad debt.

Specifically:

Cost of Charity Care (Line 23)
+ Cost of non-Medicare bad debt
expense (Line 29)

Cost of non-Medicare uncompensated care (Line 30)

Where:

- Cost of charity care = Cost of initial obligation of patients approved for charity care (line 21) minus partial payment by patients approved for charity care (line 22).
- Cost of non-Medicare bad debt expense = Cost to charge ratio (line 1) times non-Medicare and nonreimbursable bad debt expense (line 28).

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25092), we proposed to adopt a definition of uncompensated care costs that included charity care and non-Medicare bad debt. We explained that we believe there are compelling arguments for excluding Medicaid shortfalls from the definition of uncompensated care, including the fact that several government agencies and key stakeholders do not consider Medicaid shortfalls in their definition of uncompensated care and that excluding Medicaid shortfalls from the uncompensated care definition allows Medicare uncompensated care payments to target hospitals that have a disproportionate share of uncompensated care for patients with no insurance coverage. Although we did not finalize the proposed definition of uncompensated care costs as part of the FY 2017 rulemaking, we continue to believe a definition of uncompensated care that incorporates the most commonly used factors within uncompensated care as reported by stakeholders would include charity care costs and non-Medicare bad debt costs, which correlates to Line 30 of Worksheet S–10. Therefore, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19954), we again proposed that, for purposes of calculating Factor 3 and uncompensated care costs beginning in FY 2018, “uncompensated care” would be defined as the amount on line 30 of Worksheet S–10, which is the cost of charity care (Line 23) and the cost of non-Medicare bad debt (Line 29). We invited public comments on this proposal.

Comment: Several commenters supported the proposed definition of uncompensated care as charity care plus non-Medicare bad debt. However, a common concern expressed by these commenters, as well as those commenters who disagreed with the proposed definition, was the inclusion of Medicaid shortfalls in the definition of uncompensated care as captured by Worksheet S–10. Commenters stated that excluding Medicaid shortfalls from the definition of uncompensated care severely penalizes hospitals that care for a large number of Medicaid patients

because, while uninsured costs have declined as people have gained coverage through Medicaid, hospitals continue to lose money on Medicaid patients as the Medicaid payment rates are often below the cost of providing health care services. The commenters also stated that including Medicaid losses in the definition of uncompensated care would align with the Medicaid DSH program and the IRS method of calculating the community benefit provided by nonprofit hospitals. Some commenters also requested that shortfalls from CHIP and State and local indigent care programs be included in uncompensated care costs along with charity care and non-Medicare bad debt.

Other commenters supported the exclusion of Medicaid shortfalls from the definition of uncompensated care. One of these commenters pointed out that the current use of low-income insured days as a proxy for uncompensated care already penalizes hospitals in nonexpansion States as their Medicaid ratio is lower than hospitals in expansion States. The commenter believed that including Medicaid shortfalls in the definition of uncompensated care would exacerbate this impact. In addition, the commenter supported the exclusion of Medicaid shortfalls from the definition of uncompensated care because it believed that Medicaid programs vary by State, making the data on shortfalls less reliable. Commenters added that excluding Medicaid unreimbursed costs from non-Medicare uncompensated care will result in a more equitable distribution of uncompensated care payments. Another commenter believed that continuing to exclude Medicaid shortfalls from Factor 3 calculations will improve the accuracy and consistency of the data reported on Worksheet S–10. In addition, commenters noted that computing losses on Medicaid patients is operationally problematic because it is unclear how much Medicaid shortfalls are left after the Medicare DSH payment is made. That is, commenters noted that Medicare DSH payments may already be covering the Medicaid shortfalls.

In addition to comments about the Medicaid shortfalls, commenters observed that States differ in how they define uncompensated care costs, and that not all costs incurred by hospitals in treating the uninsured are categorized as charity care and bad debt, such as in the case of discounts to the uninsured who are unable to pay or unwilling to provide means-tested information. Specifically, commenters pointed out that Worksheet S–10 does not capture all of the information relevant to the

purposes of section 3133 of the Affordable Care Act. To this end, one commenter noticed definitional discrepancies in Worksheet S–10 that failed to recognize the requirement under section 3133 of the Affordable Care Act that the amount of uncompensated care costs of subsection (d) hospitals reflect the costs of treating the uninsured, which should include costs incurred through non-means tested uninsured discount programs. Commenters expressed concern for the disregard of uninsured discounts, which, according to them, results in uncompensated care being undercounted.

Several commenters stated that the uncompensated care definition should be expanded to include discounts to the uninsured and underinsured as well as those who self-pay. According to one commenter, such discounts should include “self-pay imposed charge discounts,” “state mandated self-pay charge discounts,” and “means tested” charge discounts. The same commenter stated that, despite CMS’ concerns that adding self-pay discounts into uncompensated care may result in situations where payments exceed costs, overall self-pay patient payments are immaterial in the aggregate and would not be a significant factor in such a calculation.

Some commenters also argued that adopting a policy that excludes discounts would inappropriately penalize hospitals that offer uninsured discounts and disincentivize hospitals from offering this financial help to the uninsured. To this end, commenters noted that Worksheet S–10 does not adequately reflect discounts to the uninsured and expressed concern that hospitals that attempt to collect on a full debt with no discount receive the same or a higher uncompensated care total as hospitals that do provide discounts. Specifically, one commenter noted that the current policy for uninsured discounts is irrational because it gives special treatment to those hospitals unwilling to discount care for the uninsured. Another commenter argued that discounts offered to the uninsured are costs that hospitals incur in providing care for such patients; therefore, regardless of whether they are called “discounts” or some other term, they should be incorporated in the definition of uncompensated care in Worksheet S–10. One commenter also noted that it applies discounts according to its charity patients’ liability, which includes both coinsurance and deductible for covered services, and the costs of services provided but not covered by the

patient’s insurance, stating that this practice is “industry standard” as well as allowable under IRS Form 990. Echoing calls from others, the commenter suggested that CMS revise the definitions for uncompensated care to reflect the entirety of costs to hospitals for providing charity care, including uninsured discounts.

In contrast to the support for the inclusion of discounts to the uninsured in the definition of uncompensated care, one commenter believed that expansion of the definition of uncompensated care to include discounts to the uninsured is flawed because these discounts are nonlegitimate “costs” for community health reporting. The commenter stated that hospitals in its State have a long history of discounts to the uninsured through an Attorney General’s agreement, and that the State tends to have a higher-than-normal adoption rate of high-deductible health plans. Therefore, the commenter has come to this conclusion regarding these discounts based on its own significant experience.

Response: In general, we will attempt to address commenters’ concerns in future cost report clarifications to ensure that Worksheet S–10 is an appropriate instrument to collect the information necessary to implement section 3133 of the Affordable Care Act. With regard to the comments regarding Medicaid shortfalls, we recognize commenters’ concerns but continue to believe there are other compelling arguments for excluding Medicaid shortfalls from the definition of uncompensated care, including the fact that several key stakeholders do not consider Medicaid shortfalls in their definition of uncompensated care, and that it is most consistent with section 3133 of the Affordable Care Act for Medicare uncompensated care payments to target hospitals that incur a disproportionate share of uncompensated care for patients with no insurance coverage. Conceptual issues aside, we note that even if we were to adjust the definition of uncompensated care to include Medicaid shortfalls, this would not be a feasible option at this time due to computational limitations. Specifically, computing such losses is operationally problematic because Medicaid pays hospitals a single DSH payment that in part covers the hospital’s costs in providing care to the uninsured and in part covers estimates of the Medicaid “shortfalls.” Therefore, it is not clear how CMS would determine how much of the “shortfalls” is left after the Medicaid DSH payment is made. In addition, in some States, hospitals

return a portion of their Medicaid revenues to the State via provider taxes, making the computation of “shortfalls” even more complex. Accordingly, we continue to believe it is appropriate to apply a definition of uncompensated care costs that includes charity care and non-Medicare bad debt for FY 2018.

With regard to the comments that States differ in how they define uncompensated care costs, and that hospitals’ costs of treating the uninsured are not always categorized as charity care and bad debt, such as in the case of discounts to the uninsured who are unable to pay or unwilling to provide income information, we believe the commenters are referring to the Worksheet S–10 instructions for Line 20, which state, in part, “Do not include charges for either uninsured patients given discounts without meeting the hospital’s charity care criteria or patients given courtesy discounts.” We believe that hospitals have the discretion to design their charity care policies as appropriate, and may include discounts offered to uninsured patients as “charity care.” However, we will also further consider the concern raised by the commenter as to whether CMS’ current instructions are inadvertently creating a disincentive to offer such discounts, and we may consider revisions to the instructions on Line 20 of Worksheet S–10 to further clarify when patient discounts would be considered charity care versus bad debt.

Comment: Many commenters expressed concerns relating to, and provided suggestions for, calculating charity care and bad debt as captured on Worksheet S–10:

- Commenters expressed confusion about what is identified as an indigent care program, and when charity care and Medicaid noncovered charges are components of charity care, pointing out that there are several areas of confusion and areas that might encourage individual interpretation. In addition, commenters believed that government providers are misreporting data related to charity care by including all charges for their indigent care/general relief patient populations as charity care while not accounting for offsetting payments. The commenters expressed their view that services furnished under these programs are not uncompensated, but are funded through State and local tax assessments. Therefore, the commenters requested that CMS require that patient charges cannot be included in the cost of charity care unless the related services are not covered by an indigent care program. More generally, commenters stated that hospitals have difficulty in identifying where to report

nonpatient-specific payments that are received to offset charity care and bad debt.

- Commenters raised a similar concern about Line 20 of Worksheet S–10 regarding a possible discrepancy between considering noncovered charges for Medicaid patients as eligible for charity care, but not allowing noncovered charges for patients that have some commercial coverage to be considered charity care. In particular, according to commenters, the current methodology used to calculate the cost of charity care for insured patients is incorrect because it asks hospitals to apply a CCR to deductibles and coinsurance in order to arrive at the cost, which will significantly understate the cost of charity care because coinsurance and deductibles are typically a function of the payment rate rather than the hospital's charges for the service. To this end, one commenter noted that waived deductibles and coinsurance for charity care insured patients would always be expected to be less than, and only a fraction of, full charges for charity care for uninsured patients. Commenters suggested that CMS develop a separate CCR applicable to deductible and coinsurance amounts to calculate the cost of charity care.

- One commenter requested that instructions for the Worksheet S–10 ensure that the dollar amount reported for Line 22, Column 2 represents payments from both patients and insurers for specific patient accounts that were granted charity care during the cost reporting period.

- A few commenters stated that any further revision to the instructions for Line 20 of Worksheet S–10 should reference a hospital's "financial assistance policy" for consistency with the terminology used in the regulations implementing section 501(r) of the Internal Revenue Code, which require hospitals to establish financial assistance policies and to reduce charges for services furnished to individuals who qualify for assistance under those policies. In addition, commenters suggested that CMS clarify that Federal law does not mandate eligibility criteria for a hospital's financial assistance policy.

- Commenters stated that hospitals report charity care amounts for patients that qualify for partial charity inconsistently, and requested that CMS clarify how amounts should be reported for patients that qualify for partial charity care, including both uninsured individuals as well as patients with financial responsibility after their insurance pays. In addition, one commenter asked CMS to provide

guidance that protects facilities that expanded their tiered partial charity care programs in order to cover more individuals falling within a broader income scale.

- Many commenters believed that the definition of bad debt is unclear and that the methodology CMS uses to arrive at the cost of bad debt significantly understates the uncompensated care expense that hospitals incur as a result of uncollectable amounts. Commenters also asked for clarification on whether or not non-Medicare bad debt claimed on Line 26 of Worksheet S–10 should be netted of recoveries received during the cost report period.

- Commenters also expressed concern in regard to patients who have some form of insurance but are not able to meet their cost sharing responsibility, in particular coinsurance and deductibles. These commenters believed that applying the hospital's CCR to the amount on Line 26 of Worksheet S–10 understates the costs associated with deductibles and coinsurance for insured patients written off as bad debt. The commenters recommended that CMS revise Worksheet S–10 to require separate reporting for bad debt written off for the uninsured and for those who are insured but cannot afford their cost sharing, similar to the instructions for Line 20.

- Several commenters observed that the current Worksheet S–10 methodology may provide an incentive to hospitals to overstate charity care, compromising the fidelity of the information collected.

- One commenter stated that bad debt and charity care should be considered reductions to expected hospital payment and thus should not be treated as hospital charges and adjusted by the CCR.

- One commenter believed that charity care and bad debt are not valid measures of a hospital's uncompensated care burden, as charity care may be offset with direct taxes, appropriations, and/or uncompensated care payments.

Response: We intend to consider the various issues raised by the commenters that directly relate to reporting of charity care and bad debt costs on Worksheet S–10 as we continue to review Worksheet S–10. We will continue to work with our stakeholders to address their concerns through provider education and further refinement of the instructions to the Worksheet S–10 as appropriate. We also clarify that the bad debt claimed on Line 26 of Worksheet S–10 must be net of bad debt recoveries received during the cost report period.

- *Trims to apply to CCRs on Line 1 of Worksheet S–10.* As we noted in the FY 2017 IPPS/LTCH PPS proposed and final rules (81 FR 25093 and 81 FR 56971), commenters have suggested that uncompensated care costs reported on Worksheet S–10 should be audited due to extremely high values consistently reported by some hospitals. In response to these comments, we reviewed the Worksheet S–10 data and identified approximately 10 to 20 hospitals that have anomalous uncompensated care costs. We note that many of these hospitals are public hospitals, which can have charging practices that are distinct from other hospital types. We believe that, just as we apply trims to hospitals' CCRs to eliminate anomalies when calculating outlier payments for extraordinarily high cost cases (§ 412.84(h)(3)(ii)), it is appropriate to apply statistical trims to the CCRs on Worksheet S–10, Line 1 that are considered anomalies. Specifically, § 412.84(h)(3)(ii) states that the Medicare contractor may use a statewide CCR for hospitals whose operating or capital CCR is in excess of 3 standard deviations above the corresponding national geometric mean (that is, the CCR "ceiling"). This mean is recalculated annually by CMS and published in the proposed and final IPPS rules each year. To control for data anomalies, in the FY 2017 rulemaking, we considered approaches that would trim hospitals' CCRs to ensure reasonable CCRs are used to convert charges to costs for purposes of determining uncompensated care costs.

After considering the comments received in response to the FY 2017 IPPS/LTCH PPS proposed rule, which were discussed in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56971 through 56973), in the FY 2018 IPPS/LTH PPS proposed rule (82 FR 19954 and 19955), for FY 2018, we proposed the following alternative methodology for trimming CCRs:

Step 1: Remove Maryland hospitals. In addition, we will remove all-inclusive rate providers, as they have charge structures that differ from other IPPS hospitals, and providers that did not report a CCR on Worksheet S–10, Line 1, and assign them the statewide average CCR in step 5 below.

Step 2: For hospitals with multiple cost reports included in the 2014 HCRIS data, (a) combine the amounts from Worksheet C, Part I, Line 202, Column 3 from each cost report to calculate total costs, (b) combine the amounts from Worksheet C, Part I, Line 202, Column 8 from each cost report to calculate total charges, and (c) divide the total costs by

the total charges to arrive at a recalculated CCR.

Step 3: Calculate a CCR “ceiling” using the CCRs reported on Worksheet S–10, Line 1, from all IPPS hospitals that were not removed in Step 1 (including non-DSH eligible hospitals), or the recalculated CCR described in Step 2. The ceiling is calculated as 3 standard deviations above the national geometric mean CCR. This approach is consistent with our calculation of the CCR ceiling used for high-cost outliers. Remove all hospitals that exceed the ceiling so that these aberrant CCRs do not skew the calculation of the statewide average CCR. Based on the information currently available to us during the development of this final rule, this trim would remove 9 hospitals that have CCRs above the calculated ceiling of 0.932.

Step 4: Using the CCRs for the remaining hospitals in Step 3, determine the urban and rural statewide average CCRs using Line 1 of Worksheet S–10 for hospitals within each State (including non-DSH eligible hospitals), weighted by the sum of total inpatient discharges and outpatient visits from Worksheet S–3, Part I, Line 14, Column 14.

Step 5: Assign the appropriate statewide average CCR (urban or rural) calculated in Step 4 to all hospitals with a CCR greater than 3 standard deviations above the corresponding national geometric mean (that is, the CCR “ceiling”), as well as to providers that did not report a CCR on Worksheet S–10, Line 1. The statewide average CCR would therefore be applied to 27 hospitals, of which 18 did not report a CCR on Worksheet S–10, Line 1 and 9 had a CCR that exceeded the calculated ceiling of 0.932. (We note that the number of hospitals that are assigned the statewide average CCR has changed significantly from the estimates included in the proposed rule due to our decision not to incorporate Worksheet S–10 data into the calculation of Factor 3 for all-inclusive rate providers, as discussed above.)

After applying the applicable trims to a hospital’s CCR as appropriate, we proposed to calculate a hospital’s uncompensated care costs as being equal to Line 30, which is the sum of Line 23 and Line 29, as follows:

Hospital Uncompensated Care Costs = Line 30 (Line 23 + Line 29), which is equal to—

[(Line 1 CCR (as adjusted, if applicable) × charity care line 20) – (Payments received for charity care Line 22)]

+

[(Line 1 CCR (as adjusted, if applicable) × Non-Medicare and non-reimbursable Bad Debt Line 28)].

We invited public comments on our proposed trim methodology for FY 2018.

Comment: Many commenters expressed concern that the proposed trim methodology would improve neither the accuracy nor consistency of uncompensated care data. The commenters recommended that CMS further review the trim methodology or delay its application until an audit of the Worksheet S–10 is complete.

Several commenters suggested that high-cost outliers be entirely removed to avoid skewing the data instead of setting their CCRs as the statewide average. The commenters contended that automatically setting CCRs to the statewide average would be “inappropriate,” especially when performed without opportunities for explanation. One commenter stated that hospitals that have been identified as potential outliers should have the opportunity to explain their data and correct errors before the trim methodology is applied, which would facilitate data validity.

A few commenters requested that the trimming methodology should not be finalized until an audit of the data has been conducted, and that hospitals with extremely high CCRs should be audited and an appropriate CCR determined instead of applying an arbitrary trim to a statewide average. One commenter suggested that CMS develop a separate audit protocol for all-inclusive billers before application of the trimming methodology. Another commenter believed that it would be inappropriate to assume that reported amounts are incorrect and thus change State averages or other DSH calculations, especially without an auditing process in place. Others identified “anomalies” in data that would not be addressed by the proposed trims, such as a hospital with uncompensated care that equaled to four times total hospital charges. Another commenter requested that instead of applying the statewide average CCR, CMS instruct MACs to use 2015 Worksheet S–10 data if the 2014 data were incomplete or unusually high.

As noted above, several commenters expressed concern over the proposed trim methodology because hospitals that are considered “all-inclusive rate providers” are not required to complete Worksheet C, Part I, which is used for reporting the CCR on Line 1 of the Worksheet S–10. Commenters noted that, as a result, the proposed trim methodology inappropriately modifies

their uncompensated care costs, and that a high CCR could be accurate if the hospital’s charges are close to costs, as is usually the case for all-inclusive rate hospitals. One commenter suggested that, instead of applying a trim, CMS evaluate CCRs on cost reports to identify misreported, erroneous values and not penalize hospitals that are accurately reporting information under a CMS-sanctioned methodology.

Response: We appreciate the additional information provided by the commenters related to applying trims to the CCRs. We intend to further explore which trims are appropriate to apply to the CCRs on Line 1 of Worksheet S–10, including whether it is appropriate to apply a unique trim to certain subsets of hospitals, such as all-inclusive rate providers. We note that all-inclusive rate providers have the ability to compute and enter their appropriate CCR on Worksheet S–10, Line 1, by answering Yes to the question on Worksheet S–2, Part I, Line 115, and not have it computed using information from Worksheet C, Part I. We will give more consideration to the utilization of statewide averages in substituting outlier CCRs, and in future rulemaking, we intend to consider other approaches that would ensure validity of the trim methodology and not penalize hospitals that use alternative methods of cost apportionment. However, as we previously discussed, because all-inclusive rate providers have charge structures that differ from other IPPS hospitals, we will not use data from the Worksheet S–10 to determine Factor 3 for these hospitals for FY 2018. Instead, we will determine Factor 3 for these hospitals using an average of three individual Factor 3s, using the Factor 3 calculated using low-income insured days for FY 2013 twice and the Factor 3 calculated using low-income insured days for FY 2012 once.

Comment: Many commenters requested that the cost of graduate medical education (GME) be included within the CCR calculation to account for the costs associated with the training of interns and residents. One commenter stated that hospitals charges are based on “all costs” acquired in the provision of medical services, which would “naturally” include GME. The commenter indicated that exclusion of costs associated with GME would result in inaccurate reporting of costs and lower CCRs.

Several commenters observed that GME is included in the denominator but not the numerator of the Worksheet S–10 CCR and that this discrepancy should be rectified. One commenter observed that this inconsistency occurs

because Line 1 uses data from Worksheet C, Column 3 (“costs,” which do not include GME) and Worksheet C, Column 8 (“charges,” which do include GME). The commenter recommended using the “costs” definition from Worksheet B, Column 24, Line 118 to reconcile the discrepancy. One commenter noted that inclusion of GME costs in the numerator would ensure “fairness” in the calculation. Another commenter stated that modification of the calculation to include GME costs within the CCR should occur on Line 1 of the Worksheet S–10.

Response: As we have stated previously in response to this issue, we believe that the purpose of uncompensated care payments is to provide additional payment to hospitals for treating the uninsured, not for the costs incurred in training residents. In addition, because the CCR on Line 1 of Worksheet S–10 is pulled from Worksheet C, Part I, and is also used in other IPPS ratesetting contexts (such as high-cost outliers and the calculation of the MS–DRG relative weights) from which it is appropriate to exclude GME because GME is paid separately from the IPPS, we hesitate to adjust the CCRs in the narrower context of calculating uncompensated care costs. Therefore, we continue to believe that it is not appropriate to modify the calculation of the CCR on Line 1 of Worksheet S–10 to include GME costs in the numerator.

After consideration of the comments we received, we are finalizing our proposal to apply statistical trims to the CCRs on Worksheet S–10, Line 1 that are considered anomalies using the methodology outlined earlier, but are not applying the statewide average to all-inclusive rate providers as described earlier.

- *Cost report revisions and Worksheet S–10 audits.* While not directly relevant to our proposal to use FY 2014 Worksheet S–10 data beginning in FY 2018, in the proposed rule, we noted that, as part of our ongoing quality control and data improvement measures to continue to improve the Worksheet S–10 data over time, we have made revisions to the cost report instructions and developed an audit process.

With respect to the cost reporting instructions, on November 18, 2016, we issued Transmittal 10 which updated the instructions for Form 2552–10. Specifically, we updated the instructions in Section 4012 of Chapter 40 of the Provider Reimbursement Manual, Part II. The instructions clarify the reporting of charges for charity care. Transmittal 10 is available for download at the CMS Web site at: <https://www.cms.gov/Regulations-and->

[Guidance/Guidance/Transmittals/2016-Transmittals-Items/R10P240.html](https://www.cms.gov/Regulations-and-).

With respect to the audit process, in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56964), we stated that we intended to provide standardized instructions to the MACs to guide them in determining when and how often a hospital’s Worksheet S–10 should be reviewed. We indicated that we would not make the MACs’ review protocol public, as all CMS desk review and audit protocols are confidential and are for CMS and MAC use only. The instructions for the MACs are still under development and will be provided to the MACs as soon as possible. We refer readers to the FY 2017 IPPS/LTCH PPS final rule for a complete discussion concerning the issues that we are considering in developing the instructions that will be provided to the MACs. We note that, in addition to our stated belief in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19955) that cost reports beginning in FY 2017 will be the first cost reports for which the Worksheet S–10 data will be subject to a desk review, we expect cost reports beginning in FY 2014, FY 2015, and FY 2016, to be subject to further scrutiny after submission. We will continue to work with our stakeholders to address their concerns through provider education and further refinement of the instructions to the Worksheet S–10, as appropriate.

Comment: Many commenters expressed concern about confusing or unclear instructions in the Worksheet S–10, especially with regard to the definition of “uncompensated care.” The commenters expressed a general concern toward “inconsistent reporting” and “inadequate and unreliable data” abounded as a result of current Worksheet S–10 instructions. One commenter requested that CMS clarify the definition of “uncompensated care” specifically within the general instructions of the Worksheet S–10. Another commenter observed that issues with flawed data may be the result of inconsistent reporting that could be ameliorated by clarification of the Worksheet S–10 instructions, such as on Lines 20 and 21.

Several commenters expressed concern that, despite the clarifications discussed in the FY 2017 IPPS/LTCH PPS final rule, MACs lacked “guidance, instruction, and training” for the “uniform and even application” of the reporting requirements for the Worksheet S–10. One commenter recommended that CMS provide additional guidance and documentation to MACs and instruct them to accept amended and/or corrected cost reports.

Another commenter expressed discontent that CMS allowed hospitals to amend data from FY 2014 in late FY 2016 but provided “no education,” guidance, or other “insight” that may have facilitated accurate and/or consistent hospital reporting. Many commenters provided a broad range of detailed suggestions related to reporting requirements for specific lines of Worksheet S–10. Commenters suggested the following general modifications to the manner in which uncompensated care costs are captured on Worksheet S–10:

- Commenters observed that the instructions for Worksheet S–10 are inconsistent with generally accepted accounting principles (GAAP) and differ from the accounting practices of the majority of hospitals. Therefore, the commenters requested that CMS amend the cost reporting instructions to require hospitals to report amounts based on GAAP. One commenter believed that using GAAP would make every hospital be under the same rules. Commenters also suggested that the Worksheet S–10 instructions be amended to require hospitals to report the same bad debt and charity care amounts they report on their financial statements, which are GAAP appropriate. In particular, one commenter asked that CMS clarify whether the 35 percent residual of Medicare bad debts recorded as bad debt expense should be included in the determination of uncompensated care costs (currently, based on GAAP, a hospital will record 100 percent of the unpaid Medicare deductible and coinsurance as bad debt; however, only 65 percent is reimbursed by Medicare).

- Commenters noted that because Worksheet S–10 data is derived from data reported on the Medicare cost report, charges and payments for physician services are currently excluded. However, the commenters stated that hospitals provide physician services to patients with little or no access to private physicians. They noted that safety-net hospitals in low-income communities particularly provide these services. As a result, several commenters argued the Worksheet S–10 should include uncompensated care costs related to employed physician services.

- Commenters requested clarification of whether charity care charges should be reported for inpatient hospital services, outpatient hospital services, or both. The commenters requested the ability to report these charges on separate lines and to apply separate CCRs to these separate sets of costs. One commenter noted that because “aggregate outpatient CCRs are usually

higher than aggregate inpatient CCRs, application of an overall CCR to uncompensated care charges will generally underestimate UC costs.”

- Commenters noted that the instructions for Line 26 include Medicare bad debts for services provided beyond the inpatient and outpatient setting, and interpreted this to mean that hospitals should include non-Medicare bad debts for services provided in the following settings for which expenses are included on the hospital cost report: Skilled nursing beds (both swing beds and distinct part facilities); distinct part inpatient rehabilitation units; distinct part LTCHs; distinct part psychiatric units; dialysis centers; CMHCs; RHCs; and FQHCs. The commenters asked CMS to confirm in the final rule that this interpretation is correct. Similarly, commenters requested that CMS define any additional distinct part units or services that are not listed in the instructions for Line 26 but should be included in that line when reporting non-Medicare bad debt.

- Commenters advised requiring Medicaid DSH payments and Medicaid supplemental payment information to be reported on separate lines, and to offset all of these payments against Medicaid costs reported on Worksheet S–10. In addition, according to one commenter, the current Worksheet S–10 provides an incomplete picture of Medicaid shortfall and should be revised to allow hospitals to deduct intergovernmental transfers, certified public expenditures, and provider taxes from their Medicaid revenues. Specifically, some commenters also requested separate reporting of a number of such payments, including direct payments to hospitals, Medicaid DSH, and supplementary payments including upper payment limits, intergovernmental transfers, certified government expenditures, provider taxes, other government payments, and payments for local or state indigent care.

- One commenter suggested that CMS integrate payer mix into Worksheet S–10, as providers with a substantial commercial payer mix often have operating margins that help offset uncompensated care costs. The commenter recommended that CMS examine methods to adjust the uncompensated care amount for payer mix.

- One commenter noted that CCRs in Worksheet S–10 are reported with Reasonable Compensation Equivalency (RCE) limits applied. The commenter cited the discussion in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50161), which states that RCE limits

have no effect on IPPS provider payments. Therefore, the commenter believed that if the CCR in Worksheet S–10 is used, IPPS hospitals’ payments would be affected by RCE limits, and RCE disallowances should therefore be removed from the CCR on Line 1 of Worksheet S–10.

- Commenters observed that CCRs for “parts of hospitals” such as facility-based skilled nursing facilities and inpatient rehabilitation facilities are very different from the CCRs for acute care hospitals paid under the IPPS. The commenters questioned the appropriateness of including parts of hospitals in the CCR in Worksheet S–10. In particular, one commenter noted that the initial instructions on the Worksheet S–10 ask hospitals to report costs “incurred by the hospital for providing inpatient and outpatient hospital services.” However, later instructions for Line 20 ask hospitals to report gross charity care costs for the “entire facility,” which could lead to IPPS and OPSS payments to parts of the hospital that should not have been covered, such as skilled nursing facilities and rehabilitation facilities. The commenter recommended that CMS either use consistent language or list the subparts of hospitals that should be included.

Response: Some of the commenters express concerns and raise questions that have not been raised before, while others have been raised in previous rulemaking. We believe that a number of these questions and concerns are addressed by the updated instructions for the Worksheet S–10 that were issued in November 2016, which clarify the reporting of charges for charity care. We will continue to work with our stakeholders to address their concerns through provider education and further refinement of the instructions to the Worksheet S–10, as appropriate.

With regard to the comments asking for clarification of which inpatient and outpatient services should be included in the uncompensated care costs reported on the Worksheet S–10, we note that the cost report instructions at Section 4012 of CMS Pub. 15–2, state: “Worksheet S–10—Hospital Uncompensated and Indigent Care Data—Section 112(b) of the Balanced Budget Refinement Act (BBRA) requires that short-term acute care hospitals (§ 1886(d) of the Act) submit cost reports containing data on the cost incurred by the hospital for providing *inpatient and outpatient hospital services for which the hospital is not compensated*” (emphasis added). In a similar vein, the CCR used on Worksheet S–10, Line 1 is from Worksheet C, Part I, Line 202. This CCR

reflects costs and charges of all hospital inpatient departments and outpatient department and clinics. Thus, Worksheet S–10 is designed to capture uncompensated care costs associated with the hospital under all of the hospital’s Medicare provider agreements, including provider-based facilities. However, Worksheet S–10 is not intended to capture uncompensated care costs related to physician services. We note that at various points on Worksheet S–10, the instructions state, “Include payments for all covered services except *physician or other professional services*” (emphasis added).

Finally, with regard to the comment that the CCRs on Worksheet S–10 are reported with the RCE limits applied, we believe the commenter is mistaken. Line 1 of Worksheet S–10 instructs hospitals to compute the CCR by dividing the costs from Worksheet C, Part I, Line 202, Column 3, by the charges on Worksheet C, Part I, Line 202, Column 8. The RCE limits are applied in Column 4, not in Column 3; thus, the RCE limits do not affect the CCR on Line 1 of Worksheet S–10.

H. Medicare-Dependent, Small Rural Hospital (MDH) Program (§ 412.108)

1. Background for the MDH Program

Section 1886(d)(5)(G) of the Act provides special payment protections, under the IPPS, to a Medicare-dependent, small rural hospital (MDH). (For additional information on the MDH program and the payment methodology, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51683 through 51684).) As discussed in section V.B.1. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule and this final rule, the MDH program provisions at section 1886(d)(5)(G) of the Act will expire at the end of FY 2017. Beginning with discharges occurring on or after October 1, 2017, all hospitals that previously qualified for MDH status will be paid based on the Federal rate.

Since the extension of the MDH program through FY 2012 provided by section 3124 of the Affordable Care Act, the MDH program had been extended by subsequent legislation as follows: Section 606 of the ATRA (Pub. L. 112–240) extended the MDH program through FY 2013 (that is, for discharges occurring before October 1, 2013). Section 1106 of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67) extended the MDH program through the first half of FY 2014 (that is, for discharges occurring before April 1, 2014). Section 106 of the PAMA (Pub. L. 113–93) extended the MDH program

through the first half of FY 2015 (that is, for discharges occurring before April 1, 2015). Section 205 of the MACRA (Pub. L. 114–10) extended the MDH program through FY 2017 (that is, for discharges occurring before October 1, 2017). For additional information on the extensions of the MDH program after FY 2012, we refer readers to the following **Federal Register** documents: The FY 2013 IPPS/LTCH PPS final rule (77 FR 53404 through 53405 and 53413 through 53414); the FY 2013 IPPS notice (78 FR 14689); the FY 2014 IPPS/LTCH PPS final rule (78 FR 50647 through 50649); the FY 2014 interim final rule with comment period (79 FR 15025 through 15027); the FY 2014 notice (79 FR 34446 through 34449); the FY 2015 IPPS/LTCH PPS final rule (79 FR 50022 through 50024); the August 2015 interim final rule with comment period (80 FR 49596); and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57054 through 57057).

b. Expiration of the MDH Program

Because section 205 of the MACRA extended the MDH program through FY 2017 only, beginning October 1, 2017, the MDH program will no longer be in effect. Because the MDH program is not authorized by statute beyond September 30, 2017, beginning October 1, 2017, all hospitals that previously qualified for MDH status under section 1886(d)(5)(G) of the Act will no longer have MDH status and will be paid based on the IPPS Federal rate.

When the MDH program was set to expire at the end of FY 2012, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53404 through 53405), we revised our sole community hospital (SCH) policies to allow MDHs to apply for SCH status in advance of the expiration of the MDH program and be paid as such under certain conditions. We codified these changes in the regulations at §§ 412.92(b)(2)(i) and (b)(2)(v). Specifically, the existing regulations at §§ 412.92(b)(2)(i) and (b)(2)(v) allow for an effective date of an approval of SCH status that is the day following the expiration date of the MDH program. We note that these same conditions apply to MDHs that intend to apply for SCH status with the expiration of the MDH program on September 30, 2017. Therefore, in order for an MDH to receive SCH status effective October 1, 2017, the MDH must apply for SCH status at least 30 days before the expiration of the MDH program; that is, the MDH must apply for SCH status by September 1, 2017. The MDH also must request that, if approved as an SCH, the SCH status be effective with the expiration of the MDH program; that is,

the MDH must request that the SCH status, if approved, be effective October 1, 2017, immediately after its MDH status expires with the expiration of the MDH program on September 30, 2017. We emphasize that an MDH that applies for SCH status in anticipation of the expiration of the MDH program would not qualify for the October 1, 2017 effective date for SCH status if it does not apply by the September 1, 2017 deadline. If the MDH does not apply by the September 1, 2017 deadline, the hospital would instead be subject to the usual effective date for SCH classification; that is, 30 days after the date of CMS' written notification of approval as specified at § 412.92(b)(2)(i).

We note that the regulations governing the MDH program are found at § 412.108 and the MDH program is also cited in the general payment rules in the regulations at § 412.90. As stated earlier, under current law, the MDH program will expire at the end of FY 2017, which is already reflected in § 412.108. As such, we did not propose to make specific amendments to the regulations at § 412.108 to reflect the expiration of the MDH program. However, it has come to our attention that, with the various extensions of the MDH program as noted earlier, we neglected to make conforming changes to the regulation text at § 412.90. Therefore, we proposed to revise the general payment rules under § 412.90 to reflect the expiration of the MDH program. We did not receive any public comments on our proposed conforming changes to the regulation text at § 412.90 and are finalizing these changes as proposed. However, we also proposed that if the MDH program were to be extended by law, similar to how it was extended through legislation set forth above, including most recently through FY 2017, by the MACRA (Pub. L. 114–10), we would make conforming changes to the regulations governing the MDH program at § 412.108(a)(1) and (c)(2)(iii) and the general payment rules at § 412.90(j) to reflect such an extension of the MDH program. We stated that these conforming changes would only be made if the MDH program were to be extended by statute beyond September 30, 2017. As of the time of the development of this final rule, there has been no change in law to extend the MDH program beyond FY 2017. Therefore, in this final rule, we are not making any additional changes to the regulations governing the MDH program at § 412.108, and, as stated above, the revisions we are finalizing to the general payment rules under § 412.90 reflect the current expiration of

the MDH program on September 30, 2017.

Comment: Several commenters indicated that hospitals in their States would experience payment decreases as a result of the expiration of the MDH program. One commenter urged CMS to work with Congress to permanently extend the MDH program. Another commenter indicated that it would continue supporting congressional efforts to protect the MDH program.

Response: We appreciate the commenters' concerns about the expiration of the MDH program. However, CMS does not have the authority under current law to continue the MDH program beyond the September 30, 2017 statutory expiration date. These comments are similar to comments we received previously, prior to the statutory extensions of the MDH program for FYs 2013 and 2014 provided by subsequent legislation, and discussed in both the FY 2013 IPPS/LTCH PPS final rule (77 FR 53413 through 53414) and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50647 through 50649). Therefore, under current law, beginning October 1, 2017, all hospitals that previously qualified for MDH status will no longer have MDH status.

I. Hospital Readmissions Reduction Program: Updates and Changes (§§ 412.150 Through 412.154)

1. Statutory Basis for the Hospital Readmissions Reduction Program

Section 3025 of the Patient Protection and Affordable Care Act, as amended by section 10309 of the Patient Protection and Affordable Care Act, added section 1886(q) to the Act, which establishes the "Hospital Readmissions Reduction Program" effective for discharges from "applicable hospitals" beginning on or after October 1, 2012. Under the Hospital Readmissions Reduction Program, payments to applicable hospitals may be reduced to account for certain excess readmissions. We refer readers to section IV.E.1. of the FY 2016 IPPS/LTCH PPS final rule (80 FR 49530 through 49531) for a detailed discussion and additional information on the statutory history of the Hospital Readmissions Reduction Program.

On December 13, 2016, the 21st Century Cures Act (Pub. L. 114–255) was enacted. Section 15002 of Public Law 114–255 added subparagraphs (D) and (E) to section 1886(q)(3) of the Act. These subparagraphs direct the Secretary to assign hospitals to peer groups, develop a methodology that allows for separate comparisons for hospitals within these groups, and

allows for changes in the risk adjustment methodology. Section 15002 of Public Law 114–255 also directs MedPAC to conduct a review of overall hospital readmissions and whether such readmissions are related to any changes in outpatient and emergency services furnished. A report on the study is required to be submitted in the MedPAC's Report to Congress no later than June 2018.

Section 1886(q)(3)(D) of the Act directs the Secretary to develop a transitional methodology that accounts for the percentage of full-benefit dual-eligible patients treated by a hospital to determine a hospital's payment adjustment factor. Section 1886(q)(3)(D)(i) of the Act sets forth the requirement that the Secretary assign hospitals to groups and apply a methodology "that allows for separate comparison of hospitals within each such group." This applies to discharges that occur during and after FY 2019 and before the application of section 1886(q)(3)(E)(i) of the Act, which allows the Secretary to take into account the recommendations in the reports required by the IMPACT Act (Pub. L. 113–185) related to risk adjustment and social risk factors. The first of two reports required in the IMPACT Act was released in December 2016 (available at: <https://aspe.hhs.gov/system/files/pdf/253971/ASPESESRTCfull.pdf>), and the second report is required to be completed by October 2019.

The hospital groups in section 1886(q)(3)(D)(ii) of the Act are described as being based on their overall proportion of the inpatients who are entitled to, or enrolled for, benefits under Medicare Part A and who are full-benefit dual-eligible individuals (as defined in section 1935(c)(6) of the Act). The Secretary is further required to consult with MedPAC when defining groups and may consider analysis done by MedPAC in preparation for its June 2013 report submitted to Congress. Section 1886(q)(3)(D)(iii) of the Act prevents the imposition of additional reporting requirements in order to carry out subparagraph (D). Section 1886(q)(3)(D)(iv) of the Act requires that the estimated total amount of reductions in payments using the methodology should equal the estimated total amount of reductions in payments if subparagraph (D) did not apply.

Section 1886(q)(3)(E) of the Act outlines the considerations the Secretary may take into account with respect to the risk adjustment methodology. Section 1886(q)(3)(E)(i) of the Act allows the Secretary to take into account studies conducted and recommendations made by the Secretary

under section 2(d)(1) of the IMPACT Act in the application of risk adjustment methodologies. This does not preclude the consideration of the use of groupings of hospitals. The Secretary is also allowed under section 1886(q)(3)(E)(ii) of the Act to consider the use of "V" or other ICD-related codes for removal of a readmission with respect to discharges occurring after FY 2018. Section 1886(q)(3)(E)(iii) of the Act outlines the considerations the Secretary may make in the removal of certain readmissions. For discharges occurring after FY 2018, the Secretary may consider the removal as a readmission of an admission that is classified within one or more of the following: Transplants; end-stage renal disease; burns, trauma; psychosis; or substance abuse.

2. Regulatory Background

We refer readers to the following past final rules for detailed discussions of the regulatory background and descriptions of the current policies for the Hospital Readmissions Reduction Program: The FY 2012 IPPS/LTCH PPS final rule (76 FR 51660 through 51676); the FY 2013 IPPS/LTCH PPS final rule (77 FR 53374 through 53401); the FY 2014 IPPS/LTCH PPS final rule (78 FR 50649 through 50676); the FY 2015 IPPS/LTCH PPS final rule (79 FR 50024 through 50048); the FY 2016 IPPS/LTCH PPS final rule (80 FR 49530 through 49543); and the FY 2017 IPPS/LTCH PPS final rule (81 FR 56973 through 56979). These policies describe the general framework for the implementation of the Hospital Readmissions Reduction Program, including: (1) The selection of and measures for the applicable conditions; (2) the calculation of the excess readmission ratio, which is used, in part, to calculate the readmissions adjustment factor; (3) the current calculation of the hospital readmission payment adjustment factor, specifically addressing the base operating DRG payment amount, aggregate payments for excess readmissions, and aggregate payments for all discharges; (4) the opportunity for hospitals to review and submit corrections using a process similar to what is currently used for posting results on *Hospital Compare*; (5) the adoption of an extraordinary circumstances exception policy to address hospitals that experience a disaster or other extraordinary circumstance; (6) the clarification that the public reporting of excess readmission ratios will be posted on an annual basis to the *Hospital Compare* Web site as soon as is feasible following the preview period; and (7) the

specification that the definition of "applicable hospital" does not include hospitals and hospital units excluded from the IPPS, such as LTCHs, cancer hospitals, children's hospitals, IRFs, IPFs, CAHs, and hospitals in Puerto Rico.

We also have codified certain requirements of the Hospital Readmissions Reduction Program at 42 CFR 412.152 through 412.154.

CMS strives to put patients first, ensuring that they are empowered to make decisions about their own healthcare along with their clinicians, using information from data-driven insights that are increasingly aligned with meaningful quality measures. We support technology that reduces burden and allows clinicians to focus on providing high-quality health care for their patients. We also support innovative approaches to improve quality, accessibility, and affordability of care while paying particular attention to improving clinicians' and beneficiaries' experience when interacting with CMS programs. We believe the Hospital Readmissions Reduction Program in combination with other efforts across the Department of Health and Human Services encourages hospitals to improve health care quality and value, while giving patients and providers the tools and information needed to make the best decisions for them. We recognize that the Hospital Readmissions Reduction Program represents a key component of the way that we bring quality measurement and improvement together with payment, we have taken efforts to review existing policies to identify how to move the program forward in the least burdensome manner possible while continuing to encourage improvement in the quality of care provided to patients.

3. Maintenance of Technical Specifications for Quality Measures

We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50039) for a discussion of the maintenance of technical specifications for quality measures for the Hospital Readmissions Reduction Program. Technical specifications of the readmission measures are provided on our Web site in the Measure Methodology Reports at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>. Additional resources about the Hospital Readmissions Reduction Program and measure technical specifications are on the QualityNet Web site on the Resources page at: <http://>

www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228772412995.

4. Policies for the Hospital Readmissions Reduction Program

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19957 through 19967), we proposed the following policies for the Hospital Readmissions Reduction Program: (1) The applicable time period for FY 2018; (2) the calculation of aggregate payments for excess readmissions for FY 2018; (3) changes to the payment adjustment factor in accordance with section 15002 of Public Law 114–255 for FY 2019; and (4) updates to the Extraordinary Circumstance Exception policy beginning in FY 2018 as related to extraordinary circumstances that occur on or after October 1, 2017. These proposals are described in more detail below.

5. Applicable Period for FY 2018

Under section 1886(q)(5)(D) of the Act, the Secretary has the authority to specify the applicable period with respect to a fiscal year under the Hospital Readmissions Reduction Program. In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51671), we finalized our policy to use 3 years of claims data to calculate the readmission measures. In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53675), we codified the definition of “applicable period” in the regulations at 42 CFR 412.152 as the 3-year period from which data is collected in order to calculate excess readmissions ratios and adjustments for the fiscal year, which includes aggregate payments for excess readmissions and aggregate payments for all discharges used in the calculation of the payment adjustment.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56974 through 56975), for FY 2017, consistent with the definition specified at § 412.152, we established an “applicable period” for the Hospital Readmissions Reduction Program to be the 3-year period from July 1, 2012 through June 30, 2015. In other words, the excess readmissions ratios and the payment adjustment (including aggregate payments for excess readmissions and aggregate payments for all discharges) for FY 2017 are calculated using data from the 3-year time period of July 1, 2012 through June 30, 2015.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19957), for FY 2018, consistent with the definition specified at § 412.152, we proposed that the “applicable period” for the Hospital

Readmissions Reduction Program would be the 3-year period from July 1, 2013 through June 30, 2016. In other words, we proposed that the excess readmissions ratios and the payment adjustment (including aggregate payments for excess readmissions and aggregate payments for all discharges) for FY 2018 would be calculated using data from the 3-year time period of July 1, 2013 through June 30, 2016. We invited public comment on this proposal.

Comment: Many commenters expressed concern about the proposed Hospital Readmissions Reduction Program performance period for FY 2018 because it combines data collected under both ICD–9 and ICD–10. Commenters requested that CMS provide further empirical analysis in the final rule to show that measure reliability and validity are not compromised by using two different coding systems and ensure that the ICD–10 versions of the measures in the Hospital Readmissions Reduction Program are endorsed by the National Quality Forum (NQF). One commenter also recommended that CMS analyze performance differences resulting from the transition to ICD–10 for all the measures used in all its public reporting and pay-for-performance programs to determine if there are any unintended biases and measure performance changes because of the change. One commenter disagreed with the use of the three-year performance period for FY 2018 because commenter believes it is too long and combines data from ICD–9 and ICD–10. The commenter suggested that a one-year performance period would be more appropriate.

Response: The readmission measures in the Hospital Readmissions Reduction Program all completed “maintenance of endorsement,” a periodic evaluation of measures to assess impact and potential unintended consequences, in December 2016 and are NQF-endorsed. The NQF requires developers to submit all ICD–9 and ICD–10 diagnosis and procedure codes used to define the measure cohorts. We identified all ICD–10 codes that corresponded with ICD–9 codes used in the measure cohort definitions using the General Equivalence Mappings tool (GEMs). The ICD–10 codes identified using GEMs were reviewed by measure and clinical experts and made public as a part of the maintenance of endorsement process. However, because the ICD–10 code system was implemented in October 2015, there were insufficient claims coded with ICD–10 to provide any testing results to NQF during the endorsement maintenance process. We

will submit testing results in claims data coded with ICD–10 in future cycles of NQF endorsement maintenance.

In addition to identifying ICD–10 codes used to define the measures’ cohorts using the GEMs tool and completing a review of those codes by clinical and measure experts, we also examined the frequency of the use of these codes in the first 6-months of ICD–10 coded claims for Medicare fee-for-service (FFS) patients who were 65 years and older. As a part of calculating measure results that will be made public in July 2017, we completed extensive testing of measure specifications and of measure performance. For the most recent measurement period from July 2013 through June 2016, there are 9 months, from October 2015 through June 2016, of ICD–10 coded claims. Results of some of this testing is described in the publicly available 2017 Annual Updates and Specifications reports for all readmission measures, including a description of the ICD–10 measure specifications, a description of measure cohort sizes, the number of acute care hospitals included in the measure, risk-standardized readmission rates in the national sample, risk variable frequencies and risk model coefficients, as well as overall model performance for each year and for the 3-year measurement period with the combined ICD–9 and ICD–10 codes. The results of these analyses demonstrate stability in the measure cohort, in the number of hospitals included in the measure, in the performance of the measure risk model, and in trends of modest reductions in risk-standardized readmission rates across the country.

We have decided to continue to use a three-year measurement period rather than a one-year measurement period despite the implementation of ICD–10. We use a 3-year measurement period because some small and rural hospitals do not have at least 25 admissions for Medicare FFS patients who are 65 years and older for each of the measure conditions in a single year or even over the course of two years. The three-year period allows us to include the maximum possible number of hospitals in public reporting.

In addition, we have examined the average change in risk-standardized readmission rates at the hospital-level and the distribution of changes in rates for all readmission measures comparing the results of the 2015, 2016, and 2017 reporting periods. We found that differences in average hospital-level performance comparing the 2016 performance year, which included only ICD–9 claims, and the 2017 performance year, which included 9 months of ICD–

10 claims, were similar to differences in performance observed between the 2015 and 2016 performance years. We are currently evaluating and considering the feasibility of publicly releasing these analyses. We believe the results show that our conversion process is maintaining a high level of accuracy.

After consideration of the public comments we received, we are finalizing as proposed, without modification, the applicable period of the 3-year time period of July 1, 2013 through June 30, 2016 to calculate readmission payment adjustment factor for FY 2018 under the Hospital Readmissions Reduction Program.

6. Calculation of Aggregate Payments for Excess Readmissions for FY 2018

Section 1886(q)(3)(B) of the Act specifies the ratio used to calculate the adjustment factor under the Hospital Readmissions Reduction Program. It states that the ratio is equal to 1 minus the ratio of—(i) the aggregate payments for excess readmissions and (ii) the aggregate payments for all discharges. For a detailed discussion on the methodology for the calculation of aggregate payments for excess readmissions, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53387 through 53397). We also have codified the definition of “aggregate payments for excess readmissions” and “aggregate payments for all discharges,” as well as a current methodology for calculating the numerator of the ratio (aggregate payments for excess readmissions) and the denominator of the ratio (aggregate payments for all discharges) at 42 CFR 412.152 through 412.154.

The Hospital Readmissions Reduction Program currently includes the following six applicable conditions: Acute myocardial infarction (AMI); heart failure (HF); pneumonia (PN); total hip arthroplasty/total knee arthroplasty (THA/TKA); chronic obstructive pulmonary disease (COPD); and Coronary Artery Bypass Graft (CABG) Surgery.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56975 through 56977), we adopted the methodology to include CABG in the calculation of the readmissions payment adjustment for FY 2017. Specifically, we discussed how the addition of CABG applicable conditions would be included in the calculation of the aggregate payments for excess readmissions (the numerator of the readmissions payment adjustment). We note that this policy did not alter our established methodology for calculating aggregate

payments for all discharges (that is, the denominator of the ratio).

When calculating the numerator (aggregate payments for excess readmissions), we determine the base operating DRG payments for the applicable period. To determine the base operating DRG payment amount for an individual hospital for such applicable period for such condition, we use Medicare inpatient claims from the MedPAR file with discharge dates that are within the same applicable period to calculate the excess readmissions ratio. We use MedPAR claims data as our data source for determining aggregate payments for excess readmissions and aggregate payments for all discharges, as this data source is consistent with the claims data source used in IPPS rulemaking to determine IPPS rates.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19957 through 19959), for FY 2018, we proposed to use MedPAR claims with discharge dates that are on or after July 1, 2013, and no later than June 30, 2016, consistent with our historical use of a 3-year applicable period. Under our established methodology, we use the update of the MedPAR file for each Federal fiscal year, which is updated 6 months after the end of each Federal fiscal year within the applicable period, as our data source (that is, the March updates of the respective Federal fiscal year MedPAR files) for the final rules.

In the proposed rule, for FY 2018, we proposed to determine aggregate payments for excess readmissions and aggregate payments for all discharges using data from MedPAR claims with discharge dates that are on or after July 1, 2013, and no later than June 30, 2016. However, we noted that, for the purpose of modeling the proposed FY 2018 readmissions payment adjustment factors for the proposed rule, we used excess readmissions ratios for applicable hospitals from the FY 2017 Hospital Readmissions Reduction Program applicable period. For the FY 2018 IPPS/LTCH PPS final rule, applicable hospitals will have had the opportunity to review and correct data from the proposed FY 2018 applicable period of July 1, 2013 to June 30, 2016, before they are made public under our policy regarding the preview and reporting of hospital-specific information, which we discussed in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53374 through 53401).

In the proposed rule, for FY 2018, we proposed to use MedPAR data from July 1, 2013 through June 30, 2016. Specifically, for the proposed rule, we used the following MedPAR files:

- March 2014 update of the FY 2013 MedPAR file to identify claims within FY 2013 with discharge dates that are on or after July 1, 2013;
- March 2015 update of the FY 2014 MedPAR file to identify claims within FY 2014;
- March 2016 update of the FY 2015 MedPAR file to identify claims within FY 2015;
- December 2016 update of the FY 2016 MedPAR file to identify claims within FY 2016 with discharge dates no later than June 30, 2016.

For the final rule, we proposed to use the same MedPAR files as listed above for claims within FY 2013, FY 2014 and FY 2015, and for claims within FY 2016, we proposed to use the March 2017 update of the FY 2016 MedPAR file.

For a discussion of how we identified the applicable conditions to calculate the aggregate payments for excess readmissions for FY 2017, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 56975 through 56977).

Under our current methodology, in identifying the applicable conditions to calculate the aggregate payments for excess readmissions, we apply the same exclusions to the claims in the MedPAR file as are applied in the measure methodology for each of the applicable conditions. In the proposed rule, for FY 2018, we proposed to continue to apply the same exclusions to the claims in the MedPAR file as we applied for FY 2017 for the AMI, HF, PN, THA/TKA, CABG and COPD applicable conditions. We refer readers to the FY 2016 IPPS/LTCH PPS and FY 2017 IPPS/LTCH PPS final rules (80 FR 49539; 81 FR 56976) for a list of these exclusions. Updates to these exclusions will be posted on the QualityNet Web site at: <http://www.QualityNet.org> > Hospital-Inpatient > Claims-Based Measures > Readmission Measures > Measure Methodology.

Furthermore, under our current methodology we only identify Medicare FFS claims that meet the criteria described above for each applicable condition to calculate the aggregate payments for excess readmissions (that is, claims paid for under Medicare Part C or Medicare Advantage, are not included in this calculation). This policy is consistent with the methodology to calculate excess readmissions ratios based solely on admissions and readmissions for Medicare FFS patients. Therefore, consistent with our established methodology, for FY 2018, we proposed to continue to exclude admissions for patients enrolled in Medicare Advantage as identified in the Medicare Enrollment Database.

Under our existing policy, we identify eligible hospitalizations and readmissions of Medicare patients discharged from an applicable hospital having a principal diagnosis for the measured condition in an applicable period (76 FR 51669). As described above, the proposed 3-year applicable period for FY 2018 of July 1, 2013 through June 30, 2016 includes discharges occurring in four Federal FYs (FY 2013, FY 2014, FY 2015, and FY 2016). Diagnoses and procedure codes for discharges occurring prior to October 1, 2015 were reported under the ICD-9-CM code set. Effective with discharges occurring on or after October 1, 2015 (FY 2016), diagnoses and procedure codes are reported under the ICD-10-CM and ICD-10-PCS code sets. Thus, for the proposed FY 2018 applicable period, the discharge diagnoses for each applicable condition would be based on a list of specific ICD-9-CM or ICD-10-CM and ICD-10-PCS code sets, as applicable, for that condition.

In the proposed rule, to identify the discharges for each applicable condition for FY 2018 to calculate the aggregate payments for excess readmissions for an individual hospital, we proposed to identify each applicable condition, using, for FY 2013, FY 2014 and FY 2015, the appropriate ICD-9-CM codes, and for FY 2016, the appropriate ICD-10-CM and ICD-10-PCS code sets. This proposal is consistent with our established policy for identifying the discharges for each applicable condition to calculate the aggregate payments for excess readmissions (76 FR 51673 through 51676). The ICD-9-CM codes for the AMI, HF, PN, THA/TKA, COPD, and CABG applicable conditions can be found on the QualityNet Web site at: <http://www.QualityNet.org> > Hospital-Inpatient > Claims-Based Measures > Readmission Measures > Measure Methodology. For a complete list of the ICD-9-CM codes we proposed to use to identify the applicable conditions, we refer readers to the following tables of the measure methodology reports on the QualityNet Web site:

- 2016 Measure Updates: AMI, HF, Pneumonia, COPD, Stroke Readmission (*AMI-Version 8.0, HF-Version 8.0, Pneumonia-Version 8.0, COPD-Version 4.0, and Stroke-Version 4.0: 2016 Condition-Specific Readmission Measures Updates and Specifications Report*)—

- ++ Table D.1.1—ICD-9-CM Codes for AMI Cohort (page 79).

- ++ Table D.2.1—ICD-9-CM Codes for COPD Cohort (page 83).

- ++ Table D.3.1—ICD-9-CM Codes for Inclusion in HF Cohort (page 89).

- ++ Table D.4.1—ICD-9-CM Codes for Pneumonia Cohort (page 94).

- 2016 Measure Updates: THA/TKA and CABG Readmission (*THA and/or TKA-Version 4.0, CABG-Version 2.0: 2016 Procedure-Specific Readmission Measures Updates and Specifications Report*)—

- ++ Table D.1.1—ICD-9-CM Codes Used to Identify Eligible CABG Procedures (page 49).

- ++ Table D.2.1—ICD-9-CM Codes Used to Identify Eligible THA/TKA Procedures (page 58).

The ICD-10-CM codes for the AMI, HF, PN, THA/TKA, COPD, and CABG applicable conditions for the period from October 1, 2015 to June 30, 2016 can be found on the QualityNet Web site at: <http://www.QualityNet.org> > Hospital-Inpatient > Claims-Based Measures > Readmission Measures > Measure Methodology. For a complete list of the ICD-10-CM codes we are proposing to use to identify the applicable conditions, we refer readers to the following tables of the measure methodology reports on the QualityNet Web site:

- 2017 Measure Updates: AMI, HF, Pneumonia, COPD, Stroke Readmission (*AMI-Version 10.0, HF-Version 10.0, Pneumonia-Version 10.0, COPD-Version 6.0, and Stroke-Version 6.0: 2017 Condition-Specific Readmission Measures Updates and Specifications Report*)—

- ++ Table D.1.1—ICD-10-CM Codes for AMI Cohort (page 77).

- ++ Table D.2.1—ICD-10-CM Codes for COPD Cohort (page 81).

- ++ Table D.3.1—ICD-10-CM Codes for Inclusion in HF Cohort (page 87).

- ++ Table D.4.1—ICD-9-CM Codes for Pneumonia Cohort (page 93).

- 2016 Measure Updates: THA/TKA and CABG Readmission (*THA and/or TKA-Version 6.0, CABG-Version 4.0: 2017 Procedure-Specific Readmission Measures Updates and Specifications Report*)—

- ++ Table D.1.1—ICD-10-CM Codes Used to Identify Eligible CABG Procedures (page 49).

- ++ Table D.2.1—ICD-10-CM Codes Used to Identify Eligible THA/TKA Procedures (page 63).

In summary, for FY 2018, we proposed to calculate aggregate payments for excess readmissions, using MedPAR claims from July 1, 2013 through June 30, 2016, to identify applicable conditions based on the same ICD-9-CM codes or ICD-10-CM and ICD-10-PCS code sets, as applicable, used to identify the conditions for the readmissions measures, and to apply the proposed exclusions for the types of admissions (as previously discussed).

We did not propose any changes to our existing methodology for calculating “aggregate payments for excess readmissions” for each hospital (the numerator of the ratio). Specifically, to calculate aggregate payments for excess readmissions for each hospital, we proposed to calculate the base operating DRG payment amounts for all claims in the 3-year applicable period for each applicable condition (AMI, HF, PN, COPD, THA/TKA, and CABG) based on the claims we have identified as described above. Once we have calculated the base operating DRG amounts for all the claims for the six applicable conditions, we proposed to sum the base operating DRG payments amounts by each condition, resulting in six summed amounts, one amount for each of the six applicable conditions. We proposed to then multiply the amount for each condition by the respective excess readmissions ratio minus 1 when that excess readmissions ratio is greater than 1, which indicates that a hospital has performed, with respect to readmissions for that applicable condition, worse than the average hospital with similar patients. Each product in this computation represents the payments for excess readmissions for that condition. We proposed to then sum the resulting products which represent a hospital’s proposed “aggregate payments for excess readmissions” (the numerator of the ratio). Because this calculation is performed separately for each of the six conditions, a hospital’s excess readmissions ratio must be less than or equal to 1 on each measure to avoid CMS’ determination that there were payments made by CMS for excess readmissions (resulting in a payment reduction under the Hospital Readmissions Reduction Program). In other words, in order to avoid a payment reduction a hospital’s excess readmissions ratio must be less than or equal to 1 on each measure. We note that we did not propose any changes to our existing methodology to calculate “aggregate payments for all discharges” (the denominator of the ratio).

Section 1886(q)(3)(A) of the Act defines the “adjustment factor” for an applicable hospital for a fiscal year as equal to the greater of: (i) The ratio described in subparagraph (B) for the hospital for the applicable period (as defined in paragraph (5)(D)) for such fiscal year; or (ii) the floor adjustment factor specified in subparagraph (C).

Section 1886(q)(3)(B) of the Act, in turn, describes the ratio used to calculate the adjustment factor. Specifically, it states that the ratio is equal to 1 minus the ratio of—(i) the

aggregate payments for excess readmissions and (ii) the aggregate payments for all discharges. The calculation of this ratio is codified at § 412.154(c)(1) of the regulations and the floor adjustment factor is codified at § 412.154(c)(2) of the regulations. Section 1886(q)(3)(C) of the Act specifies the floor adjustment factor at 0.97 for FY 2015 and subsequent fiscal years.

Consistent with section 1886(q)(3) of the Act, codified at § 412.154(c)(2), for FY 2018, the adjustment factor is either the greater of the ratio or the floor adjustment factor of 0.97. Under our established policy, the ratio is rounded to the fourth decimal place. In other words, for FY 2018, a hospital subject to the Hospital Readmissions Reduction Program would have an adjustment factor that is between 1.0 (no reduction) and 0.9700 (greatest possible reduction).

We did not receive public comments related to this proposal. Therefore, we are finalizing as proposed, without modification, the calculation of aggregate payments for excess readmissions for FY 2018.

7. Background and Current Payment Adjustment Methodology

a. Background

As described above, section 1886(q)(3)(D) of the Act requires the Secretary to group hospitals and apply a methodology that allows for separate comparisons of hospitals within groups in determining a hospital's adjustment factor for payments applied to discharges beginning in FY 2019.

b. Current Payment Adjustment Methodology

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53374 through 53401), we finalized policies that relate to the portions of section 1886(q) of the Act that at that time addressed the calculation of the hospital readmissions payment adjustment factor. Section 1886(q)(3)(A) of the Act defines the "adjustment factor" for an applicable hospital for a fiscal year as equal to the greater of: (i) The ratio described in subparagraph (B) for the hospital for the applicable period (as defined in paragraph (5)(D)) for such fiscal year; or (ii) the floor adjustment factor specified in subparagraph (C). Section 1886(q)(3)(B) of the Act, in turn, describes the ratio used to calculate the adjustment factor. Specifically, it states that the ratio is equal to 1 minus the ratio of—(i) the aggregate payments for excess readmissions and (ii) the aggregate payments for all discharges.

Consistent with section 1886(q)(3)(C) of the Act, codified at § 412.154(c)(2),

for FY 2015 and subsequent years, the adjustment factor is either the greater of the ratio or the floor adjustment factor of 0.9700. In other words, a hospital subject to the Hospital Readmissions Reduction Program will have an adjustment factor that is between 1.0000 (no reduction) and 0.9700 (greatest possible reduction). Under our established policy, the ratio is rounded to the fourth decimal place.

8. Provisions for the Payment Adjustment Methodology for FY 2019: Methodology for Calculating the Proportion of Dual-Eligible Patients

a. Background

As described above, section 1886(q)(3)(D) of the Act requires the Secretary to group hospitals and apply a methodology that allows for separate comparisons of hospitals within groups in determining a hospital's adjustment factor for payments of discharges beginning in FY 2019. Furthermore, section 1886(q)(3)(D)(ii) of the Act directs the Secretary to define groups of hospitals, based on their overall proportion, of the inpatients who are entitled to, or enrolled for, benefits under part A, and who are full-benefit dual-eligible individuals (as defined in section 1935(c)(6) of the Act).²³ Under these statutory requirements, hospitals are grouped based on the proportion or ratio of full-benefit dual-eligible patients (numerator) to the hospital's Medicare inpatient stays (denominator). The Act specifies that in defining groups, the Secretary shall consult the MedPAC and may consider the analysis done by MedPAC in preparing the portion of its report submitted to Congress in June 2013 relating to readmissions.

b. Data Sources Used To Determine Dual Eligibility

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19960), we proposed to identify full-benefit dual status (numerator) using dual eligibility status data, where the original data source is the State Medicare Modernization Act (MMA) file of dual eligibility, which States submit to CMS monthly. The State MMA file is considered the most current and most

accurate source of data for identifying dual-eligible beneficiaries since it is also used for operational purposes related to the administration of Part D benefits. Under our proposal, an individual would be counted as a full-benefit dual patient if the beneficiary was identified as full-benefit dual status in the State MMA files for the month he/she was discharged from the hospital.

We invited public comment on this proposal.

Comment: Many commenters supported the preferred approach of using the State Medicare Modernization Act (MMA) files as the source to identify full-benefit dual-eligible individuals, noting this approach adheres to the statutory requirement and does not impose any additional reporting burden on providers.

Response: We thank commenters for their support and agree with commenters.

Comment: A few commenters expressed support for comparing hospitals based on their proportion of patients who are dual-eligible patients. One commenter believed that this approach helps hospitals that have a disproportionate number of dual-eligible patients and specifically cited safety net hospitals as key beneficiaries.

Response: We thank commenters for their support and agree with commenters. We proposed to finalize approaches to implement policy options that change the payment formula to reduce the financial burden on safety-net hospitals without disproportionately increasing the penalty for non-safety-net hospitals to address stakeholder concerns and meet the implementation requirement of Public Law 114–255, which included grouping hospitals based on their proportion of dual-eligible beneficiaries.

Comment: A few commenters expressed concern with using the proportion of dual-eligible beneficiaries because it is an inappropriate mechanism for determining socioeconomic status. One commenter cautioned that dual-eligible peer groups exclude several at-risk and socioeconomically stressed patients that are not part of the data set. One commenter suggested that CMS should use the community distress index for the community where a hospital is located or a patient resides. One commenter expressed concern that dual eligibility was insufficient to identify socio-demographic risk. Another commenter suggested that CMS consider whether it should continue to use dual-eligibility as the adjustment variable, and whether to move from the current peer grouping approach to one that

²³ Section 1935(c)(6)(A) of the Act defines "full-benefit dual-eligible individual" as, "for a State for a month, an individual who—(i) has coverage for the month for covered part D drugs under a prescription drug plan under part D of title XVIII, or under an MA–PD plan under part C of such title; and (ii) is determined eligible by the State for medical assistance for full benefits under this title for such month under section 1902(a)(10)(A) or 1902(a)(10)(C) [of the Act], by reason of section 1902(f) [of the Act], or under any other category of eligibility for medical assistance for full benefits under this title, as determined by the Secretary."

incorporates one or more socioeconomic variables into the readmission measures risk-adjustment models of the Hospital Readmissions Reduction Program measures (that is, direct risk adjustment of the readmission measures). One commenter cautioned CMS against stating on *Hospital Compare* that dual eligibility denotes poverty.

Response: We thank commenters for their input and agree that we should be cautious in not stating on *Hospital Compare* that dual-eligibility denotes poverty. While we agree that many socioeconomically stressed patients are not dual eligible and therefore not accounted for when stratifying hospitals based on dual proportion, Public Law 114–255 requires that we use the proportion of dual-eligible beneficiaries to stratify hospitals into peer groups for the purpose of determining payments. Section 15002 of Public Law 114–255 added subparagraphs (D) and (E) to section 1886(q)(3) of the Act, which directs the Secretary to assign hospitals to peer groups, develop a methodology that allows for separate comparisons for hospitals within these groups, and allows for changes in the risk adjustment methodology. Specifically, section 1886(q)(3)(D) of the Act directs the Secretary to develop a transitional methodology that accounts for the percentage of full-benefit dual-eligible patients treated by a hospital to determine a hospital's payment adjustment factor. Section 1886(q)(3)(D)(i) of the Act sets forth the requirement that the Secretary assign hospitals to groups and apply a methodology that allows for separate comparison of hospitals within each such group.

Section 1886(q)(3)(E)(i) of the Act does not preclude the inclusion of additional risk factors. We will continue to monitor the impact of accounting for dual-eligible beneficiaries in the Hospital Readmissions Reduction Program and assess the appropriateness and feasibility of future changes to include other variables or adjustments.

Comment: One commenter expressed concern over the impact of risk adjustment for non-safety net facilities, arguing that facilities should be rewarded for outreach to at-risk populations instead of penalized with risk adjustment which may not reflect their actual readmission rates or patient's risk for readmissions at the facility, and which has the potential to reduce transparency.

Response: As required by Public Law 114–255, we are stratifying hospitals based on dual-eligible proportion and modifying the payment adjustment factor formula to assess a hospital's

performance relative to other hospitals in its peer group. To clarify, we are not changing the measure methodology for calculating of the excess readmission ratios, rather we are stratifying hospitals based on the proportion of dual-eligible beneficiaries to set the threshold used to assess hospital performance. Because quality assessment is determined based on a hospital's performance relative to all other Hospital Readmissions Reduction Program eligible hospitals, and therefore allows for comparison between peer groups of hospitals, this approach is transparent. At the same time, by stratifying hospitals and determining the payment adjustment factors based on performance relative to the peer group median, we can reduce the penalty for safety-net hospitals, hence avoiding a reduction in the resources available to safety-net hospitals to provide high quality care for their at-risk patients. Because peer groups are based on proportion of dual-eligible patients served, the same would also be true for non-safety net facilities that do outreach to at-risk patients and thus have a higher proportion of dual-eligible patients than other non-safety net facilities.

We believe the proposed approach achieves both the goal of holding all hospitals to a high standard while also ensuring we are not disproportionately penalizing hospitals serving an at-risk population. Section 1886(q)(3)(E)(i) of the Act allows the Secretary to consider studies conducted and recommendations made by the Secretary under section 2(d)(1) of the IMPACT Act in the application of risk adjustment methodologies. We will continue to monitor the progress and findings of research the Assistant Secretary for Planning and Evaluation (ASPE) is conducting as part of its IMPACT Act study and the National Quality Forum's trial period and will consider their recommendations. We will continue to monitor the impact of accounting for dual-eligible patients in the Hospital Readmissions Reduction Program and evaluate if future changes to include other variables or adjustments are needed.

Comment: One commenter requested that CMS develop an adjustment for the variability in Medicaid eligibility across states for the calculations of the proportion of dual-eligible patients, citing its belief that the variation distorts the population measure of poverty that in fact may be representative of patients under treatment. The commenter also stated that Medicare Advantage data should only be included in the denominator if it is included in State reporting.

Another commenter expressed concern with using quintiles based on the proportion of Medicare FFS and Medicare Advantage patients that are full-benefit, dual-eligible patients because it does not consider differences in States' health care program eligibility and if a State has expanded Medicaid under the Patient Protection and Affordable Care Act.

Response: We acknowledge the commenter's concern about using the proportion of Medicare FFS and Medicare Advantage patients that are full-benefit, dual-eligible patients when there is variability in Medicaid eligibility across states. However, Public Law 114–255 requires hospitals be stratified based on the proportion of Medicare patients who are eligible for full-benefit Medicaid. Although Medicaid eligibility is defined on a State-by-State basis, it varies much less across States for the over 65 and people with disabilities populations, the population covered under Medicare.^{24 25} In addition, the Patient Protection and Affordable Care Act did not expand Medicaid eligibility to patients enrolled in Medicare Part A or Part B. Because the dual proportion is calculated among Medicare beneficiaries only, there is much less variability in dual proportion than if it was calculated as the percentage of all hospital patients who were eligible for Medicaid. We will continue to monitor the impact of changes to Medicaid eligibility for the Medicare population and evaluate if future changes to include other variables or adjustments are needed.

Comment: Commenters supported the inclusion of a socioeconomic adjustment in the readmissions reduction program but recommended that the Secretary expand the conditions excluded from the readmission measures used in the Hospital Readmissions Reduction Program. Commenters also asked CMS to continue to find ways to adjust for social risk factors that capture variation

²⁴ For over-65 and people with disabilities populations in 40 States plus the District of Columbia, Medicaid eligibility in the Medicare population is connected to receipt of SSI, which sets an income standard for eligibility at roughly 75 percent of the Federal Poverty Level (FPL). However, about one third of States set their eligibility levels at 100 percent FPL or higher. There are also ten States, known as 209(b) States, in which eligibility rules for dually eligible populations can be set lower than the SSI standards.

²⁵ United States Department of Health and Human Services Office of the Assistant Secretary for Planning and Evaluation. "Social Risk Factors and Performance Under Medicare's Value-Based Purchasing Programs: A Report Required by the Improving Medicare Post-Acute Care Transformation (IMPACT) Act of 2014". Washington, DC: December, 2016.

in the complexity of patients across hospitals.

Response: We thank the commenters for their input and plan to investigate the impact on the readmission measures and appropriateness of categorizing additional diagnoses as planned readmissions as directed by Public Law 114–255. We will also continue to monitor the work being done by the Assistant Secretary for Planning and Evaluation (ASPE) as part of its study required by the IMPACT Act. The first of two reports on the study was released in December of 2016 and the second report is required to be completed by October 2019. The study analyzed the effects of certain social risk factors in Medicare beneficiaries on quality measures and measures of resource use used in one or more of nine Medicare value-based purchasing programs. The report also included considerations for strategies to account for social risk factors in these programs. We will continue to consider the analyses and recommendations from this report.

Comment: Numerous commenters expressed concern that they were unable to comment on the proposals due to the lack of publicly available data. To evaluate proposals and confirm estimates, commenters requested that CMS publicly provide a summary file providing hospital-level data consistent with the data used by CMS to derive the results reported in the tables and Readmission Proposal Supplemental files for each of the alternative approaches providing the data necessary to duplicate the CMS estimates that are reported in the tables.

Commenters further requested that dual-eligible summary files be released publicly since they reside with the States. Commenters also requested that CMS release patient population lists, quarterly, to identify this population for improvement activities and to allow for replication. Commenters asked CMS to make more data available on the proposed payment adjustment methodology to ensure full transparency on the various aspects of the agency's determinations. In addition, commenters recommended that CMS prepare a dry-run using this year's data so that hospitals can familiarize themselves with the new methodology. Commenters also suggested that CMS include hospital peer group assignments in future proposed rules, allow for review and corrections and asked CMS to continually evaluate its adjustment approach, and to engage with the field on ensuring its adjustment approach keeps up with the science.

Response: We thank commenters for their input and we agree with the need

for transparency and providing stakeholders with data to confirm their dual proportion assignment. However, we also have a responsibility to safeguard patient information and comply with the federal regulations governing data. To ensure CMS upholds data security standards, we established the CMS Data Request Center through the Research Data Assistance Center (ResDAC) to review requests for data. To obtain the full MBSF data file a request can be submitted to ResDAC at: <https://www.resdac.org/cms-data/request/cms-data-request-center>. Such a request will be reviewed and approved based on ResDAC's established criteria. We are considering methods for publicly releasing this data. We are also considering different options to provide hospitals with early individualized feedback regarding their peer grouping and payment adjustment.

After consideration of the public comments we received, we are finalizing, without modification, our proposal that an individual would be counted as a full benefit dual-eligible patient if the beneficiary was identified as full-benefit dual status in the State MMA files for the month he/she was discharged from the hospital.

In the proposed rule, we considered two alternative definitions of total number of Medicare patients (denominator) that could be used to calculate each hospital's proportion of dual-eligible patients. We proposed to define the proportion of full-benefit dual-eligible beneficiaries as the proportion of dual-eligible patients among all Medicare FFS and Medicare Advantage stays. This is our preferred approach because using the proportion of dual-eligible patients calculated among all Medicare FFS and managed care patients more accurately represents the proportion of dual-eligible patients served by the hospital, particularly for hospitals in States with high managed care penetration rates. For example, Hospital A located in Arizona has a high managed care penetration rate. When stratified based on the proportion of dual-eligible patients, calculated among Medicare FFS and managed care patients, Hospital A was assigned to the top quintile of proportion of dual-eligible patients and its payment adjustment calculated based on its ERR relative to the threshold for the top quintile. When stratified based on the proportion of dual-eligible patients among only Medicare FFS patients, Hospital A was assigned to the second quintile and its payment adjustment calculated relative to the threshold of the second quintile. Its classification when managed care patients are

included more accurately identifies the social risk of the patients Hospital A serves, compared to its classification if only the FFS population is included.

However, because the Hospital Readmissions Reduction Program payment adjustment is only applied to Medicare FFS payments, and is based on excess readmissions among Medicare FFS patients only, we included an alternative to define the proportion of full-benefit dual-eligible beneficiaries as only Medicare FFS stays. Under both approaches, we proposed to use the MedPAR files, the same data source used to calculate the payment adjustment factors, to identify total hospital stays as this is the best available claims data that are readily publicly available. However, in developing our proposal, we also considered using other data sources such as the CMS integrated data repository (IDR), which may incorporate managed care claims more consistently to calculate total hospital stays, but it is currently not readily available to the public. We invited stakeholder input on the most appropriate data source to identify total hospital stays and whether such stays should include all Medicare FFS and Medicare Advantage stays or only Medicare FFS stays.

We invited public comment on our preferred proposals and alternative considerations.

Comment: Many commenters supported using both Medicare Advantage and Medicare FFS patients to determine the total number of Medicare stays as the denominator because it accurately represents the proportion of dual-eligible patients a hospital serves. One commenter recommended including Medicaid enrollees under 100 percent of federal poverty level in addition to dual-eligibility status to improve accuracy. One commenter requested that CMS should monitor for any unintended consequences among hospitals in states with high managed care penetration, compared with those that have low penetration, and modify the methodology to adjust for future growth in managed care.

Response: We thank commenters for their support and we will continue to monitor the impact of stratifying hospitals based on the proportion of full-benefit dual-eligible beneficiaries in the Hospital Readmissions Reduction Program and evaluate if future changes to include other variables or adjustments are needed.

Comment: Several commenters recommended stratifying hospitals based on the share of full-benefit Medicaid patients among Medicare FFS patients only and not all FFS and MA

patients. One commenter stated that the share of Medicare FFS patients that are full dual-eligible beneficiaries should be used because penalties will not apply to MA readmissions. Another commenter expressed concern that because penalties will not apply to MA readmissions, MA patients would distort the risk profiles of hospitals because their income characteristics may differ from FFS patients in certain hospitals.

Response: We thank the commenters for the input. In selecting a proposal, we considered calculating the proportion of dual-eligible patients (dual proportion) among Medicare FFS and managed care patients as well as Medicare FFS patients only. We agree that determining this proportion among Medicare FFS beneficiaries instead of all Medicare beneficiaries more accurately reflects the incidence of these factors among patients eligible for inclusion in the Hospital Readmissions Reduction Program measures. However, calculating the dual proportion among all Medicare FFS and managed care patients more accurately represents the dual status of the hospital, particularly for hospitals in States with high managed care penetration rates. This approach enables more accurate and complete risk profiles for hospitals. There is a strong relationship between dual proportion and penalties under both the current methodology and proposed approaches whether hospitals are stratified based on Medicare FFS patients only or based on both Medicare FFS and managed care patients. In general, this relationship is similarly positive; hospitals with higher dual proportions by either definition incur larger penalties on average. However, the relationship between the penalty share of payments and dual proportion among FFS and managed care patients exhibits a slightly stronger upward trend.

Comment: One commenter supported using both the Medicare Advantage and Medicare FFS patients identified through the CMS Integrated Data Repository (IDR) to determine the dual-eligible population, and supported calculating the dual proportion among both MA and FFS beneficiaries because it provides an accurate representation of a hospital's dual-eligible population.

Response: We thank the commenter for the support of calculating the dual proportion among both MA and FFS beneficiaries. Both the IDR and the Master Beneficiary Summary File (MBSF) are sourced from the State Medicare Modernization Act (MMA) file. Many commenters supported using data sourced from the State MMA file as it is considered the most current and

most accurate source of data for identifying dual-eligible beneficiaries since it is also used for operational purposes related to the administration of Part D benefits. We will assess the feasibility of different datasets with dual status information sourced from the State MMA files as part of implementation.

After consideration of the public comments we received, we are finalizing, without modification, our proposal to define the proportion of full benefit dual-eligible beneficiaries as the proportion of dual-eligible patients among all Medicare FFS and Medicare Advantage stays.

c. Data Period Used To Define Dual Eligibility

Consistent with the requirement of the statute, we proposed to group or stratify hospitals based on the proportion of full-benefit dual-eligible patients determined under the proposals discussed above and proposed to define the proportion of full-benefit dual-eligible beneficiaries as the number of dual-eligible patients discharged during the 3-year applicable period under the Hospital Readmissions Reduction Program. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19960), we considered two alternatives for the data period used to define dual eligibility, a 3-year period corresponding to the performance period, and a 1-year period, which would be calculated over the most recent year for which complete data is available.

While both data periods would include the most recently available data to define dual eligibility, our proposal to use a 3-year period accounts for the influence of social risk factors on the excess readmissions ratio (ERR) because the proportion of dual-eligible patients is measured over the full period when they influenced the likelihood of excess readmissions. However, the most recent 1-year period would capture the most recent population served by the hospital and may enable a more accurate stratification to calibrate the impact of payment adjustments to the proportion of dual-eligible patients that the hospital currently serves.

We invited public comment on our preferred proposal and alternative considerations.

Comment: Many commenters supported using the 3-year data period because it aligns the adjustment for the proportion of dual-eligible patients with the established measurement period. Commenters stated that using a 3-year period will guard against the effects of recent shifts in year-to-year patient population changes. One commenter

noted that both the 3-year data period and the 1-year data period provide similar information about the current patient population because both programs rely on data that will not be current at the time that payment penalty adjustment is applied.

Response: We thank commenters for their support and agree that the proposed 3-year data period is appropriate.

Comment: A few commenters supported the use of the 1-year data period. Commenters stated that a 1-year data period would provide the most recent population served by the hospitals and enable a more accurate stratification by proportion of dual-eligible patients for payment adjustments.

Response: While we understand commenters' support of using a 1-year data period, we agree with the many commenters who supported using the 3-year data period because it accounts for the influence of social risk factors on the excess readmission ratios (ERR) since the proportion of dual-eligible patients is measured over the full period when they influenced excess readmissions. We recognize that the 1-year data period may better represent a hospital's current patient population. However, the 3-year data period corresponds to the performance period; therefore, it more accurately reflects the influence of social risk factors on the ERRs and payment adjustments. We will continue to monitor the impact of accounting for dual-eligible patients in the Hospital Readmissions Reduction Program and evaluate if future changes to include other variables or other adjustments are needed.

After consideration of the public comments we received, we are finalizing the 3-year data period corresponding to the performance period as the data period used to define dual eligibility.

9. Provisions for the Payment Adjustment Methodology for FY 2019: Methodology for Assigning Hospitals to Peer Groups

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19960 through 19961), we considered three alternative methodologies for assigning hospitals to peer groups. For the reasons discussed below, our preferred approach is to stratify hospitals into quintiles (five peer groups). However, we also sought public comment on stratifying hospitals into two and 10 peer groups.

To understand the impact on payment adjustments of stratifying hospitals into different numbers of peer groups, we conducted an analysis that estimated

payment adjustments when stratifying hospitals into 2, 5 (quintiles), or 10 (deciles) peer groups. Two and 10 peer groups were considered to align with previous research conducted by MedPAC and ASPE that assessed impacts from stratifying hospitals into 2 or 10 groups. MedPAC's analysis stratified hospitals into 10 peer groups when setting the target rate used to compare hospital performance. ASPE's analysis stratified hospitals into 2 and 10 peer groups to calculate payment adjustments. Our analysis showed that using five peer groups allows for more precisely defined peer groups than is possible with a grouping of two, while ensuring that the number of hospitals is sufficient to represent a peer group, even for measures, like CABG, in which only a minority of hospitals are subject to a payment adjustment.

We note, as the number of groupings increase, hospitals became more similar within their peer groups with respect to proportion of dual-eligible patients in their patient population. Hence, payment adjustments are more closely related to the proportion of dual-eligible patients, and to the possible influence on the likelihood of readmission resulting from small variations in patient populations. We also observed that increasing the number of peer groups also increases the likelihood that hospitals with similar exposure to dual-eligible patients will be compared to different thresholds in the payment adjustment formula. Deciles cover a narrow range of dual-eligible patient proportions in each peer group; therefore, small differences in proportion are likely to result in differences in peer group assignment and corresponding comparison thresholds used in the payment adjustment formula. This problem is compounded by the small number of hospitals in deciles. When the number of hospitals is small, peer group thresholds or distributions and the resulting payment adjustments are less predictable.

Stratifying hospitals into two peer groups is a simpler method and reduces the likelihood that similar hospitals are assigned different payment adjustments. However, this approach yields peer groups with a more heterogeneous mix of hospitals assigned to each group and weakens the relationship between the payment adjustment and the hospital's patient population. When the impact on payments of different peer group definitions was tested using the various methods of incorporating stratification into the payment formula, we found a substantial reduction in penalties (measured as the share of payment

adjustments as a percentage of total payments) to safety-net hospitals, defined as hospitals in the highest quintile for disproportionate share hospital (DSH) patient percentage, from stratification into quintiles compared to stratification into two groups. Furthermore, our analysis found a similar impact on the share of total payments borne as payment adjustments by safety-net hospitals from stratifying hospitals into quintiles and deciles, suggesting that the benefit to safety-net hospitals from increasing the number of strata would be small. For example, using the preferred modified payment formula, proposed below, across the current set of six conditions, we found that for safety-net hospitals, payment adjustment as a proportion of total payments decreased from a baseline of 0.64 percent to 0.59 percent with two groups, 0.55 percent with quintiles and 0.54 percent with deciles.

Based on the analysis described above, we proposed to stratify hospitals into quintiles (five peer groups) because it creates peer groups that accurately reflect the relationship between the proportion of dual-eligible patients in the hospital's population without the disadvantage of establishing a larger number of peer groups.

We invited public comment on our preferred proposal and alternative considerations.

Comment: Many commenters supported using quintiles because it creates peer groups that more accurately reflect the relationship between the proportion of dual-eligible patients in the hospital's population, while mitigating the disadvantages of establishing a larger number of peer groups. One commenter, using its data, found that 2 groups did not adequately differentiate among hospitals and 10 groups resulted in too many nonmonotonic excess readmission ratios. However, commenters urged CMS to be mindful of unintended consequences and be open to future changes if issues do rise.

Response: We thank commenters for their support.

Comment: One commenter stated that, while using quintiles is reasonable, there was no compelling reason for having the groups all have the same number of hospitals in them. One commenter suggested that many hospitals with relatively low proportions of "duals" could be grouped together, with the peer-grouping done to create several smaller groups at the high end of the distribution. Some commenters agreed that neither 2 nor 10 peer groups are adequate. However, commenters

believed that the ideal number of groups could be improved. Commenters cited the use of continuous data, the introduction of additional covariates, and the use of statistical modeling as ways to produce a better method of grouping hospitals. One commenter also provided an example of a method it previously used to determine cut points (that is, performance thresholds or peer groupings).

Response: As the commenter noted, the upper part of the distribution is where the choice of peer groups has the greatest impact. This means the choice of the number of peer groups is most strongly influenced by hospitals with high dual proportions. Thus, the benefits of smaller peer groups among these hospitals were considered in establishing the number of peer groups. In our proposal, we considered how different numbers of peer groups influenced the yearly variation in peer group assignment. This is one of the reasons we proposed quintiles. The quintile-based approach is based on larger peer groups, thereby producing less arbitrary variation and yearly fluctuation in hospital assignments.

We considered many factors in developing peer groups to calculate payment adjustments for the Hospital Readmissions Reduction Program. These factors included: (1) The legislative requirements of Public Law 114–255, such as stratification by the proportion of dual-eligible beneficiaries in the patient census, budget neutrality, and the need for immediate implementation; (2) constructing peer groups that are consistent across six current measures and future additional measures, and are defined consistently over time; (3) the intent of the program to encourage efficient, high quality care; and (4) the impact of peer group definitions on the distribution of payments to hospital groups, such as safety-net or rural hospitals. The goodness of fit of the readmission measure models with hospitals' dual proportion is a contributory factor among these others factors. Preselecting peer groups of equal size and choosing the size that best meets these objectives is transparent and effective. In the future, more flexible methods for peer group formation may be considered for implementation. Any approach must be evaluated based on multiple criteria including those described above and proposed through the rulemaking process.

We need to consider both hospital performance on multiple measures and the program's impact on the distribution of payments. The most salient criterion for evaluating approaches is the impact

of stratification on the penalty share of payments in groups defined both by the stratifying variable and other relevant hospital characteristics. Preselecting peer groups of equal size and choosing the size that best meets these objectives is transparent and effective. Our use of cut-point evaluation techniques within the context described above helps to establish the relative benefit of choosing quintile or decile peer groups. In the future, a more flexible method for peer group formation may be developed and considered for implementation. However, this approach must still be evaluated based on multiple criteria, including those described above, and proposed through the rulemaking process.

Comment: One commenter discouraged the use of two peer groups because it does not adequately differentiate between hospitals' payer mixes and will continue to unfairly penalize urban safety net hospitals. The commenter noted the use of two peer groups would overgeneralize hospital SDS groupings.

Response: We agree with commenter that the use of two peer groups does not allow for meaningful comparison of hospitals.

Comment: One commenter recommended CMS use deciles rather than quintiles because hospitals in the highest decile of low-income shares tended to have higher readmissions than those in the eighth or ninth decile. Therefore, the commenter believed deciles would do a better job of acknowledging the challenges of the hospitals with the highest share of low-income patients.

Response: Our analyses found the relationship between hospital dual proportion decile and ERR is not consistent among the six readmission measures included in the Hospital Readmissions Reduction Program. However, the median ERR for the top decile is higher than that of the ninth decile for all six measures. When considering a final policy option, we assessed the strengths and weaknesses of both quintiles and deciles. While we agree that, compared to quintiles, stratification into deciles more completely accounts for the challenges faced by hospitals with the highest share of dually-eligible patients, both deciles and quintiles substantially reduce the share of penalties paid by safety-net hospitals (defined as the top DSH quintile), to a level below that paid by non-safety-net hospitals. The quintile-based approach is also based on

larger peer groups and produces less arbitrary variation in hospital assignments and penalty changes from year to year. Using deciles causes hospitals to face more uncertainty in the standard from year to year.

Comment: One commenter expressed concern that the individual penalty amount for hospitals may be increased in a way that disproportionately shifts to a small group of outlier providers, citing its own analysis of the proposed methodology for quintile assignment.

Response: When considering the different approaches for adjusting the payment factor formula, one of our goals was to avoid disproportionately increasing the penalty for any hospital. Compared to other approaches, the use of the peer group median as the threshold for payment adjustment calculation results in smaller changes for individual hospitals. Our analysis found the proportion of hospitals estimated to have an increased penalty under the proposed approach slightly exceeds the proportion with decreased penalties. Because Public Law 114–255 requires total Medicare savings under the stratified methodology be equivalent to total Medicare savings under the current methodology (that is, budget neutrality), the mean penalty increase for hospitals with an increased penalty will be smaller than the mean penalty decrease for hospitals with a decreased penalty. The largest penalty increase projected under the preferred approach compared to the current methodology is substantially less than projected by the commenter, perhaps due to differences in the peer groups formed by DSH and dual proportions. We will continue to monitor the impact of these program changes on hospital penalties, including their impact on individual hospitals and consider changes to mitigate undesirable effects.

Comment: One commenter recommended that the peer groups account for academic status, citing studies that have shown a strong correlation between provider academic status and readmissions rates. In addition, one commenter recommended hospital groupings per other features, with special consideration for designated safety net hospitals, Level 1 Trauma centers, hospitals affiliated with schools of medicine and nursing, hospitals with in-house neonatal and pediatric intensive care units, and hospitals with solid organ transplant programs that include liver transplantation.

Response: We thank commenters for their recommendations, and we will continue to monitor the impact of accounting for dual-eligible beneficiaries in the Hospital Readmissions Reduction Program and evaluate if future changes to include other variables or adjustments are needed.

Comment: One commenter supported the development of peer groups for the purposes of payment but disagreed with accounting for social risk factors for the purposes of calculating readmission rates for public reporting.

Response: We will take this commenter's input into consideration as we continue to assess the appropriateness and feasibility of publicly and/or confidentially reporting information related to certain social risk factors, such as a hospital's proportion of dual-eligible beneficiaries. Public Law 114–255 requires the development of peer groups based on the number of dual-eligible patients served by each hospital for the purposes of scoring performance. In addition, as we are required under 1886(q)(6)(A) of the Act, we will continue to report the readmission rate data on *Hospital Compare* as we always have.

After consideration of the public comments we received, we are finalizing our proposal to stratify hospitals into quintiles.

10. Provisions for the Payment Adjustment Methodology for FY 2019: Payment Adjustment Formula Calculation Methodology

a. Background

As described above, section 1886(q)(3)(D)(iv) of the Act requires the Secretary to design the methodology to implement this subparagraph so that the estimated total amount of Medicare savings under this subsection (stratified methodology) equals the estimated total amount of Medicare savings that would otherwise occur under this subsection (current methodology) if this subparagraph did not apply (that is, maintain budget neutrality).

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19961 through 19966), we analyzed several modifications of the payment adjustment formula to assess payment reductions based on a hospital's performance compared to performance of other hospitals in its peer group. The current readmissions payment adjustment can be written as

²⁶ "Payment" refers to the base operating DRG payment.

$$1 - \min\{.03, \sum_{dx} \frac{\text{Payment}(dx) * \max\{(\text{ERR}(dx) - 1.0000), 0\}}{\text{All payments}}\}^{26}$$

where dx is AMI, HF, pneumonia, COPD, THA/TKA or CABG. In our analyses, we modified the payment adjustment formula by replacing the current threshold ERR of 1.0000 with a peer group specific threshold.

In adopting a methodology for achieving budget neutrality, our priority is to adopt a simplified and well-known metric that allows us to be more transparent in our methodology and reduces the penalty on safety-net hospitals, while not disproportionality increasing the penalty to non-safety-net hospitals. In developing policy options to implement the budget neutrality requirement, we analyzed the following alternatives to evaluate the financial impacts:

- Using the median ERR for the hospital's peer group in place of 1.0000 in the payment adjustment formula and applying a uniform modifier to maintain budget neutrality;
- Using the mean ERR for the hospital's peer group in place of 1.0000

in the payment adjustment formula and applying a uniform modifier to maintain budget neutrality;

- Using the "budget neutralizing" ERR for each peer group in place of 1.0000 in the payment adjustment formula. The budget neutralizing ERR is defined as the ERR corresponding to the percentile (for example, 52nd) of the peer group distributions that would maintain budget neutrality for each peer group; and

- Using a standardized ERR for each individual hospital's ERR in place of the hospital's current calculated ERR and applying a uniform modifier to maintain budget neutrality. Each hospital's ERR is transformed to create a distribution of ERRs within each stratum with the same mean and standard deviation as the original mean and standard deviation across all hospitals.

b. Proposals

In the proposed rule, we discussed four alternative budget neutral methodologies for calculating the

payment adjustment factor. Our preferred approach is assessing performance compared to the peer group median ERR, rather than the current threshold of 1.0000, and scaling hospital payment adjustments by a neutrality modifier. However, we are seeking public comment on three additional approaches—using the mean ERR plus a neutrality modifier, a budget neutralizing ERR, and a standardized ERR plus a neutrality modifier.

(1) Median ERR Plus a Neutrality Modifier

As we stated in the proposed rule, our preferred approach is using the median ERR plus a neutrality modifier. We would use the median ERR for the hospital's peer group in place of 1.0000, which is the approximate mean and median of the baseline distribution, in the current payment adjustment formula. The payment adjustment formula would then be:

$$P = 1 - \min\{.03, \sum_{dx} \frac{NM_M * \text{Payment}(dx) * \max\{(\text{ERR}(dx) - \text{Median peer group ERR}(dx)), 0\}}{\text{All payments}}\}$$

The payment reduction (1 – P) resulting from use of the median ERR for the peer group is scaled by a neutrality modifier (NM_M) to achieve budget neutrality. To calculate the neutrality modifier, we estimate total Medicare savings across all hospitals under the current method and under the proposed stratified method, in the absence of a modifier. We then calculate a multiplicative factor that, when applied to each hospital's adjustment calculated using the stratified method, would equate total Medicare savings from that method to total Medicare savings under the current method. Total

Medicare savings and the neutrality modifier will be calculated using the same payment data. These data will consist of the most recently available full year of MedPAR data. For example, if the payment reduction for a hospital (1 – P) equals 0.00748 when using the median threshold, then under the median plus neutrality modifier method it would equal NM * 0.00748 = 0.9545 * 0.00748 = 0.00714, where the neutrality modifier was equal to 0.9545. Thus, the hospital's payment adjustment factor (P) would equal 0.9925 (1 – 0.00748) in the absence of the neutrality modifier, and 0.9929

(1 – 0.00714) when the modifier is added.

(2) Mean ERR Plus a Neutrality Modifier

We also analyzed the use of the mean ERR plus a neutrality modifier to calculate the readmissions adjustment factor. Just like the median ERR plus neutrality modifier approach mentioned above, the mean ERR for the hospital's peer group would be used in place of 1.0000 in the payment adjustment formula. The payment adjustment formula would then be:

$$P = 1 - \min\{.03, \sum_{dx} \frac{K_\mu * \text{Payment}(dx) * \max\{(\text{ERR}(dx) - \text{Mean peer group ERR}(dx)), 0\}}{\text{All payments}}\}$$

(3) Budget Neutralizing ERR

We also analyzed using a budget neutralizing ERR in which penalties are

assessed based on the difference between the hospital's ERR and the

budget neutralizing ERR. The payment adjustment formula would be:

$$P = 1 - \min\{.03, \sum_{dx} \frac{\text{Payment}(dx) * \max\{(\text{ERR}(dx) - \text{budget neutralizing ERR}(dx)), 0\}}{\text{All payments}}\}$$

(4) Standardized ERR Plus a Neutrality Modifier

We also analyzed using a standardized ERR in which penalties are assessed by determining the mean and

standard deviation of the ERRs across all hospitals. The payment adjustment formula would be calculated by dividing hospitals into strata based on a hospital's proportion of dual-eligible patients. The current ERRs would then

be transformed to create a new standardized distribution of ERRs within each stratum with the same mean and standard deviation as the original mean and standard deviation across all hospitals.

$$P = 1 - \min\{.03, \sum_{dx} \frac{NM_S * \text{Payment}(dx) * \max(S_B(dx) / S_p(dx) \{ERR(dx) + \mu_B(dx) - \mu_p(dx)\} - 1.0000, 0)}{\text{All payments}}\}$$

where $S_B(dx)$ and $\mu_B(dx)$ are the standard deviation and mean of the current ERR distribution for a condition (dx), and $S_p(dx)$ and $\mu_p(dx)$ are the standard deviation and mean of the peer group ERR distribution for that dx. The standardized ERRs has a mean of 1 and a standard deviation equal to the standard deviation of ERRs across all hospitals in the peer group for that condition. The standardized ERRs are compared to 1.0000 in the payment adjustment formula to determine excess readmissions. The payment reduction (1 - P) resulting from use of the standardized ERR is then scaled by a neutrality modifier (NM_S) to achieve budget neutrality.

c. Analysis

As mentioned above, in adopting a methodology for achieving budget neutrality, our priority is to adopt a simplified and well-known metric that allows us to be more transparent in our methodology and reduces the penalty on safety-net hospitals, while not disproportionality increasing the penalty to non-safety-net hospitals. To

assess the expected impact on hospital payment adjustments resulting from the changes to the formula, we simulated hospitals' readmission adjustment factors under different stratified thresholds. Readmissions adjustment factors were calculated using total base operating DRG payment amounts for each hospital as well as total base DRG payment amounts for each of the six measure cohorts (AMI, HF, pneumonia, COPD, CABG, THA/TKA) included in the FY 2018 program. We used DRG payment information for the period July 1, 2012 through June 30, 2015. Furthermore, to estimate the dollar amount of the penalty and the share of payments the penalty represents, we used total base operating DRG payments among Medicare FFS claims from the FY 2015 MedPAR data file.

All four methods support the agency's efforts to reduce the payment adjustment for safety-net hospitals. We proposed to use the median ERR plus a neutrality modifier because it creates a standard where a hospital's ERR is subject to payment reduction when a hospital's performance as measured by

the ERR is worse than that of half the other hospitals in its peer group. The median ERR plus neutrality modifier is preferred to the mean ERR plus neutrality modifier because the median represents a consistent standard (that is, 50th percentile) for the hospital's rank within its peer group, while the rank corresponding to the mean changes between years, cohorts and peer groups. The median ERR plus neutrality modifier substantially reduces the penalty as a share of total payments (from 0.64 percent to 0.55 percent with quintile peer groups) and penalty per discharge (from \$157 to \$135) for safety-net hospitals while not disproportionately increasing the payment reduction amount for non-safety-net hospitals (from 0.61 percent to 0.63 percent as share of total payments). The median ERR plus neutrality modifier is also preferred because it achieves more precise budget neutrality than the budget neutralizing ERR. Below we show the estimated total Medicare savings under the current and stratified methodology used to assess budget neutrality.

Method	Estimated total medicare savings	Difference between stratified and current methodology	Percentage difference between stratified and current methodology
Current methodology	\$532,948,318	N/A	N/A
Mean plus neutrality modifier (neutrality modifier=1.0135 when using quintiles)	532,949,006	688	<0.00
Median plus neutrality modifier (neutrality modifier=0.9546 when using quintiles)	532,946,272	(\$2,046)	<0.00
Budget neutralizing ERR	533,199,304	250,985	0.05
Standardized ERR plus neutrality modifier (neutrality modifier=0.9710 when using quintiles)	532,948,288	(\$30)	<0.00

Source: FY 2017 Hospital Readmissions Reduction Program Final Rule Results. Results are based on July 1, 2012, through June 30, 2015, discharges among subsection (d) and Maryland hospitals only. Although data from all subsection (d) and Maryland hospitals are used in calculations of each hospital's Excess Readmission Ratio (ERR), this table does not include results for Maryland hospitals. Hospital Characteristics are based on the FY 2017 final rule Impact File. Hospitals are stratified into quintiles based on the proportion of dual-eligible beneficiaries among Medicare FFS and managed care patients discharged between July 1, 2012, through June 30, 2015.

When we analyzed the other options, we found that the mean threshold permits a higher standard to be set if hospitals in the peer group have performance well above the midpoint but not far below, or a lower standard if hospitals are more likely to have very high rates. In our testing, the mean plus

modifier resulted in lower penalties for safety-net hospitals (0.52 percent as a share of total payments compared to 0.55 percent for the median plus modifier). However, our preferred approach of the median is based on the judgment that the standard reflected by the threshold should not be affected by

hospitals with unusually strong or weak performance in the peer group. Like the median, the budget neutralizing ERR threshold approach imposes a consistent rank-based standard across peer groups. However, this method is not preferred since it is more complex, less intuitive and results in greater

divergence between total payment adjustments under the stratified and current methodologies than approaches using a neutrality modifier (differing from the current methodology by approximately 0.05 percent of total payments when simulated with quintile peer groups). The median uses the original distribution of hospital ERR estimates, based on their relationship to a national standard, and represents the most precise possible measures of their performance under that standard. Using a standardized ERR within each peer group compares a hospital's performance to other hospitals in the peer group. In contrast, using the mean or median threshold adjusts penalties based on a hospital's relative performance within the peer group, but the performance indicator of the ERR retains the comparison to the mean performance of all hospitals across all peer groups. However, comparing the ERR to the mean or median for each peer group is a more straightforward methodology than re-standardizing ERRs. The median is preferred to the

standardized ERR because, as with the budget neutralizing ERR, the median is less complex and more intuitive. Using a less complex and well-known metric, will create a more transparent methodology since it will be easier for hospitals and other stakeholders to replicate the calculation of the median ERRs.

The impact of the proposed changes to the payment adjustment formula for the budget neutral considered methods, by peer group options, for safety-net and non-safety-net hospitals is shown in the table below. The table includes three penalty metrics: average payment reduction, total Medicare savings, and share of payment adjustments as a percentage of total payments. The average payment reduction shows the average reduction in Medicare DRG payments for safety-net and non-safety-net hospitals. The total Medicare savings column shows the total estimated penalties borne by safety-net and non-safety-net hospitals under each approach. Because the payment reduction is applied to hospitals' base

DRG payments, hospitals with more discharges will contribute a larger amount of Medicare savings to the group total of Medicare savings.

Furthermore, because there are fewer safety-net than non-safety-net hospitals, as safety-net is defined as hospitals in the top quintile of DSH patient percentage, the total Medicare savings for non-safety-net hospitals are inherently much larger than for safety-net hospitals. Therefore, to compare the financial impact of the program on hospitals in each group, we calculated the payment adjustment as a proportion of DRG payments. Using this metric allows comparison across the different methodologies where the total base operating DRG payments are different between different groups of hospitals and is a more accurate indication of the financial impact on the group. For example, under the current methodology, the payment adjustment as a proportion of all DRG payments among safety-net hospitals is 0.64 percent.

COMPARISON OF PENALTY METRICS BY THRESHOLD METHODS AND PEER GROUP OPTIONS FOR ALL HOSPITALS, SAFETY-NET, AND NON-SAFETY-NET HOSPITALS

Stratification approach and payment formula methodology	Average payment reduction (1 - P) ^a (%)	Total Medicare savings	Payment adjustment as a proportion of all DRG payments (%)
Current methodology:			
Safety-net hospitals	0.62	\$109,142,525	0.64
Non-safety-net hospitals	0.61	\$423,805,793	0.61
Approach 1: Two equal peer groups based on the proportion of dual-eligible beneficiaries			
Median plus neutrality modifier (neutrality modifier = 0.9558):			
Safety-net hospitals	0.56	100,205,115	0.59
Non-safety-net hospitals	0.61	432,741,958	0.62
Mean plus neutrality modifier (neutrality modifier = 1.0191):			
Safety-net hospitals	0.54	97,837,278	0.57
Non-safety-net hospitals	0.61	435,112,491	0.63
Budget neutralizing ERR:			
Safety-net hospitals	0.55	98,208,670	0.58
Non-safety-net hospitals	0.61	435,216,961	0.63
Standardized ERR plus neutrality modifier (neutrality modifier = 0.9796):			
Safety-net hospitals	0.55	98,468,430	0.58
Non-safety-net hospitals	0.61	434,478,852	0.63
Approach 2: Quintiles based on the proportion of dual-eligible beneficiaries			
Median plus neutrality modifier (neutrality modifier = 0.9546)			
Safety-net hospitals	0.52	93,878,536	0.55
Non-safety-net hospitals	0.62	439,067,736	0.63
Mean plus neutrality modifier (neutrality modifier = 1.0135)			
Safety-net hospitals	0.49	89,182,424	0.52
Non-safety-net hospitals	0.62	443,766,582	0.64
Budget neutralizing ERR			
Safety-net hospitals	0.49	88,510,157	0.52
Non-safety-net hospitals	0.62	444,689,147	0.64
Standardized ERR plus neutrality modifier (neutrality modifier = 0.9710)			
Safety-net hospitals	0.50	91,686,964	0.54
Non-safety-net hospitals	0.62	441,261,324	0.64

COMPARISON OF PENALTY METRICS BY THRESHOLD METHODS AND PEER GROUP OPTIONS FOR ALL HOSPITALS, SAFETY-NET, AND NON-SAFETY-NET HOSPITALS—Continued

Stratification approach and payment formula methodology	Average payment reduction (1 - P) ^a (%)	Total Medicare savings	Payment adjustment as a proportion of all DRG payments (%)
Approach 3: Deciles based on the proportion of dual-eligible beneficiaries			
Median plus neutrality modifier (neutrality modifier = 0.9555)			
Safety-net hospitals	0.51	91,881,047	0.54
Non-safety-net hospitals	0.62	441,068,999	0.64
Mean plus neutrality modifier (neutrality modifier = 1.0148)			
Safety-net hospitals	0.48	87,289,962	0.51

Budget neutralizing ERR			
Safety-net hospitals	0.47	86,671,374	0.51
Non-safety-net hospitals	0.62	446,299,280	0.64
Standardized ERR plus neutrality modifier (neutrality modifier = 0.9713)			
Safety-net hospitals	0.49	90,058,433	0.53
Non-safety-net hospitals	0.62	442,888,696	0.64

Notes: Results based on July 1, 2012 through June 30, 2015 discharges among subsection (d) and Maryland hospitals only. Although data from all subsection (d) and Maryland hospitals are used in calculations of each hospital's ERR, this table does not include results for Maryland hospitals. Hospitals are stratified based on the proportion of duals calculated among Medicare FFS and managed care patients for the FY 2017 performance period. Safety-net hospitals are defined as hospitals in the top quintile of DSH patient percentage. DSH patient percentage was calculated among all hospitals with a positive DSH value (including hospitals not eligible for DSH payments).

^a The payment reduction shows what percentage of DRG payments hospitals will lose as a result of the program. This is slightly different than the adjustment factor that CMS applies, which is 1 minus the number reported here (that is, ranges from 0.97 to 1).

^b Total Medicare savings is estimated by multiplying the payment reduction by total base operating DRG payments from July 1, 2014 through June 30, 2015.

^c The group share of payment adjustments as a percentage of all DRG payments is calculated as the sum of total Medicare savings for the group of hospitals (that is, safety-net hospitals or non-safety-net hospitals) divided by total base operating DRG payments from July 1, 2014 through June 30, 2015 for the group of hospitals.

Our analysis also assesses the impact of the proposed changes to the payment adjustment formula on additional groups of hospitals. Variation in the impact of the proposed changes by hospital characteristics on the share of payment adjustments as a percentage of all DRG payments for the FY 2019 Hospital Readmissions Reduction Program, is shown in the table below. The table is based on results when hospitals are stratified into quintiles based on the proportion of dual-eligible beneficiaries among Medicare FFS and managed care patients discharged between July 1, 2012, and June 30, 2015, our preferred approaches. The table shows the average share of payment

adjustments as a percentage of all DRG payments for each group of hospitals. The group average is calculated as the sum of penalties for all hospitals with that characteristic over the sum of all DRG payments for those hospitals between July 1, 2014 and June 30, 2015. For example, under the current methodology, the average share of payment adjustments as a percentage of all DRG payments for urban hospitals is 0.61 percent. This means that total penalties for all urban hospitals is 0.61 percent of total payments for urban hospitals (that is the ratio of total penalties to total DRG payments is 0.61 percent). This metric allows us to compare the financial impact of the

different methods for assessing penalties between hospitals with different number of beds even though larger hospitals tend to generate higher total Medicare savings because their payment reduction is applied to more DRG payments. Measuring the financial impact on hospitals as a proportion of total DRG payments allows us to account for differences in the amount of DRG payments for hospitals when comparing the financial impact of the program on different groups of hospitals, and allows comparison across the different methodologies between groups of hospitals with different numbers of eligible hospitals.

AVERAGE SHARE OF PAYMENT ADJUSTMENTS AS A PERCENTAGE OF ALL DRG PAYMENTS FOR CONSIDERED APPROACHES FOR THE HOSPITAL READMISSIONS REDUCTION PROGRAM, BY HOSPITAL CHARACTERISTIC

Hospital characteristics	Number of hospitals with characteristic	Current methodology (%)	Median plus neutrality modifier (neutrality modifier = 0.9546) (%)	Mean plus neutrality modifier (neutrality modifier = 1.0135) (%)	Budget neutralizing ERR (%)	Standardized ERR plus neutrality modifier (neutrality modifier = 0.9710) (%)
All Hospitals	3,096	0.62	0.62	0.62	0.62	0.62
Geographic Location:

Source: FY 2017 Hospital Readmissions Reduction Program Final Rule Results. Results are based on July 1, 2012, through June 30, 2015, discharges among subsection (d) and Maryland hospitals only. Although data from all subsection (d) and Maryland hospitals are used in calculations of each hospital's Excess Readmission Ratio (ERR), this table does not include results for Maryland hospitals. This table only includes results for hospitals who are eligible for a penalty under the program on the basis of having at least 25 eligible discharges for at least one measure. Hospital Characteristics are based on the FY 2017 final rule Impact File. There were 15 hospitals that did not have MCR percentages in the FY 2017 final rule Impact File. To calculate the payment adjustment as a proportion of total base operating DRG payments, this analysis used MedPAR data to calculate the total base operating DRG payments from July 1, 2014 through June 30, 2015. The group average share of payment adjustments as a percentage of all DRG payments is calculated as the sum of all Medicare savings for the group of hospitals divided by total base operating DRG payments for all hospitals in that group.

We invited public comment on our preferred proposal and alternative considerations.

Comment: Many commenters supported using the median ERR plus neutrality modifier because a homogenous group of hospitals are included in each peer group, the approach is simple and accurate, it is not skewed by extreme values, and provides a more robust threshold. However, one commenter argued that budget neutrality should be done at the national level rather than using a budget-neutralizing ERR at the peer group level.

Response: We thank commenters for their support. We agree that the peer group median ERR is a strong threshold. To clarify, the budget neutralizing ERR is not calculated only among hospitals in the peer group. The budget neutralizing ERR is the ERR corresponding to the percentile within each peer group's distribution of ERRs that will ensure budget neutrality across all applicable hospitals.

Comment: One commenter asked CMS to reconsider the budget neutrality requirement for the payment adjustment methodology because it disincentivizes the overall goal of the program.

Response: While we understand commenters' concerns, one of the requirements of Public Law 114–255 is to maintain budget neutrality. For this reason, we have proposed using the median ERR as the threshold and scaling payment adjustments by a neutrality modifier. Many commenters expressed support for using the median ERR plus neutrality modifier. We believe that adopting the median ERR plus neutrality modifier methodology meets our priority to adopt a simplified and well-known metric that allows us to be more transparent in our methodology and reduces the penalty on safety-net

hospitals. We will continue to monitor the impact of accounting for dual-eligible patients in the Hospital Readmissions Reduction Program and evaluate if future changes to include other variables or adjustments are needed.

Comment: One commenter noted that, to calculate the difference between each hospital's excess readmission ratio and the quintile average, CMS must divide the former by the latter and then subtract 1 rather than simply subtracting the latter from the former. The commenter also argued that it was essential that CMS modify the quintile medians to ensure monotonicity to adhere to the intent of the statute.

Response: We considered many factors in developing peer groups to calculate payment adjustments for the Hospital Readmissions Reduction Program in response to Public Law 114–255. These factors included: (1) The legislative requirements of Public Law 114–255 such as stratification by dual proportion, budget neutrality, and immediate implementation; (2) constructing peer groups that were consistent across six current measures and future additional measures, and were defined consistently over time; (3) the intent of the program to encourage efficient, high quality care; and (4) the impact of peer group definitions on the distribution of payments to hospital groups, such as safety-net or rural hospitals.

The modification to the formula recommended in the proposed rule, to use the peer group median to assess hospital performance, meets these objectives. The proposed approach transforms the distribution of excess readmission ratios by subtracting from it the difference between the median of the peer group and the overall median. The commenter's proposed alternative modification, of dividing the excess readmission ratio by the peer group median, is consistent with the formulation of the payment adjustment as the proportion by which the hospital's readmission rate exceeds a standard rate multiplied by the cost of admissions. However, we do not agree that the formula modification must be performed in this way to be consistent with the requirements of the legislation and our objectives. Though monotonicity is desirable, the proposed approach, preselecting peer groups of equal size and choosing the size that best meets the objectives above with an unmodified median, is transparent and effective.

Comment: One commenter recommended that CMS delay implementing the payment adjustment

methodology based on proportion of dual-eligible patients while better measures are developed.

Response: We thank the commenter for its recommendation. However, Public Law 114–255 requires the implementation of these changes to apply to discharges that occur during and after FY 2019. Public Law 114–255 added section 1886(q)(3)(D) to the Act, which directs the Secretary to develop a transitional methodology that accounts for the percentage of full-benefit dual-eligible patients treated by a hospital to determine a hospital's payment adjustment factor. Section 1886(q)(3)(D)(i) of the Act sets forth the requirement that the Secretary assign hospitals to groups and apply a methodology that allows for separate comparison of hospitals within each such group. This applies to discharges that occur during and after FY 2019, until and unless the system is revised under the authority of section 1886(q)(3)(E)(i) of the Act.

After consideration of the public comments we received, we are finalizing, without modification, our proposal to use the median ERR plus neutrality modifier.

11. Accounting for Social Risk Factors in the Hospital Readmissions Reduction Program

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19966 through 19967), we discussed the accounting for social risk factors in the Hospital Readmissions Reduction Program. Although the program has made steps to account for social risk factors in this year's rule, we understand that social risk factors such as income, education, race and ethnicity, employment, disability, community resources, and social support (certain factors of which are also sometimes referred to as socioeconomic status (SES) factors or socio-demographic status (SDS) factors) play a major role in health. One of our core objectives is to improve beneficiary outcomes, including reducing health disparities, and we want to ensure that all beneficiaries, including those with social risk factors, receive high quality care. In addition, we seek to ensure that the quality of care furnished by providers and suppliers is assessed as fairly as possible under our programs while ensuring that beneficiaries have adequate access to excellent care.

We have been reviewing reports prepared by the Office of the Assistant Secretary for Planning and Evaluation (ASPE)²⁷ and the National Academies

of Sciences, Engineering, and Medicine on the issue of accounting for social risk factors in CMS' quality measurement and payment programs, and considering options on how to address the issue in these programs. On December 21, 2016, ASPE submitted a report to Congress on a study it was required to conduct under section 2(d) of the Improving Medicare Post-Acute Care Transformation (IMPACT) Act of 2014. The study analyzed the effects of certain social risk factors in Medicare beneficiaries on quality measures and measures of resource use used in one or more of nine Medicare value-based purchasing programs, including the Hospital Readmissions Reduction Program.²⁸ The report also included considerations for strategies to account for social risk factors in these programs. In a January 10, 2017 report released by the National Academies of Sciences, Engineering, and Medicine, that body provided various potential methods for measuring and accounting for social risk factors, including stratified public reporting.²⁹

As noted in the FY 2017 IPPS/LTCH PPS final rule, the NQF undertook a 2-year trial period in which certain new measures, measures undergoing maintenance review, and measures endorsed with the condition that they enter the trial period were assessed to determine whether risk adjustment for selected social risk factors is appropriate for these measures. This trial entailed temporarily allowing inclusion of social risk factors in the risk-adjustment approach for these measures. We await the recommendations of the NQF trial on risk adjustment for quality measures.

As we continue to consider the analyses and recommendations from these reports and await the results of the NQF trial on risk adjustment for quality measures, we are continuing to work with stakeholders in this process. As we have previously indicated, we are concerned about holding providers to different standards for the outcomes of their patients with social risk factors because we do not want to mask potential disparities or minimize incentives to improve the outcomes for disadvantaged populations. Keeping this concern in mind, while we sought input on this topic previously, we continue to seek public comment on

under-medicare-value-based-purchasing-programs.

²⁸ <https://aspe.hhs.gov/pdf-report/report-congress-social-risk-factors-and-performance-under-medicare-value-based-purchasing-programs>.

²⁹ National Academies of Sciences, Engineering, and Medicine. 2017. Accounting for social risk factors in Medicare payment. Washington, DC: The National Academies Press.

²⁷ <https://aspe.hhs.gov/pdf-report/report-congress-social-risk-factors-and-performance>.

whether we should account for additional social risk factors in the Hospital Readmissions Reduction Program and, if so, what method or combination of methods, in addition to the method of stratification based on proportion of dual-eligible beneficiaries in the facility that we are finalizing in this rule, would be most appropriate for accounting for social risk factors. We believe that the path forward should incentivize improvements in health outcomes for disadvantaged populations while ensuring that beneficiaries have access to excellent care. Examples of methods include: Confidential reporting of stratified measure rates to providers; public reporting of stratified measure rates; risk adjustment of a particular measure as appropriate based on data and evidence; developing readmission measures or statistical approaches that are suitable for the reporting of performance on readmissions; providing financial incentives for achievement of low readmission rates for beneficiaries with social risk factors; and using a hospital-wide readmissions measure. While we consider whether and to what extent we currently have statutory authority to implement one or more of the above-described methods, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19966), we sought comments on whether any of these methods should be considered, and if so, which of these methods or combination of methods would best account for social risk factors in the Hospital Readmissions Reduction Program.

In addition, in the proposed rule, we sought public comment on which social risk factors might be most appropriate for stratifying measure scores and/or potential risk adjustment of a particular measure. Examples of social risk factors include, but are not limited to, dual eligibility/low-income subsidy, race and ethnicity, and geographic area of residence. We also sought comments on which of these factors, including current data sources where this information would be available, could be used alone or in combination, and whether other data should be collected to better capture the effects of social risk. We will take commenters' input into consideration as we continue to assess the appropriateness and feasibility of accounting for social risk factors in the Hospital Readmissions Reduction Program. We note that any such changes would be proposed through future notice-and-comment rulemaking.

We look forward to working with stakeholders as we consider the issue of accounting for social risk factors and reducing health disparities in CMS programs. Of note, implementing any of

the above methods would be taken into consideration in the context of how this and other CMS programs operate (for example, data submission methods, availability of data, statistical considerations relating to reliability of data calculations, among others); therefore, we also welcomed comment on operational considerations. CMS is committed to ensuring that its beneficiaries have access to and receive excellent care, and that the quality of care furnished by providers and suppliers is assessed fairly in CMS programs.

Comment: Numerous commenters supported adjusting for social risk factors and recommended that any methodology support equitable care delivery while not disproportionately penalizing certain hospitals. Commenters cited the importance of transparency in risk factors related to any risk adjustment methodology to meet both aims and discourages the use of unadjusted data in public reporting and pay-for-performance. Commenters agreed with CMS' approach to stratify hospitals into peer groups and recommended that CMS consider additional social risk factors in addition to the peer grouping requirements using dual-eligibility data required by Public Law 114–255. Commenters recommended that CMS closely examine the considerations provided by National Academy of Medicine (NAM) for risk adjustment, which recommend four domains of risk indicators: Income, education, and dual eligibility; race, ethnicity, language, and nativity; marital/partnership status and living alone; and neighborhood deprivation, urbanicity, and housing.

Commenters also recommended that CMS study the relationship between a hospital's readmission rates and the surrounding area's Health Professional Shortage Area (HPSA), Type II Diabetes, hypertension, arthritis, heart disease and depression to determine if these factors should be accounted for. Commenters also suggested focusing on: Continuing refinement of performance scoring and measurements to end any bias to major teaching providers; continuing development of appropriate peer groups; develop and apply appropriate socio-demographic status adjustments to all the quality risk programs; and ensuring efficiency in data reporting. Commenters requested that CMS lay out a longer-term effort for testing and refining additional variables when accounting for social risk factors due to the wide range of variables that impact a person's health outcomes. A few commenters suggested that CMS use census data on poverty rates and

education levels of patients in a hospital's service area, two key indicators of population health per Healthy People 2020, to adjust a hospital's measure score.

Some commenters recommended the use of confidential patient-reported data as self-reports offer a reasonably valid estimate of differences in utilization of health care between socioeconomic groups. Commenters requested that CMS consider providing hospitals with confidential reports of performance on accountability measures stratified by dual-eligible status or other nationally available data elements. Once hospitals have had sufficient opportunity to review and understand their performance on these stratified measures, CMS should work with stakeholders to publicly report this data in an appropriate fashion. Commenters further recommend the implementation of demonstration projects to encourage hospitals to collect data on social risk factors through their electronic health records (EHR).

Some commenters recommended that CMS start with standard patient admission information and use the information from NQF and other sources to gather additional data, provide appropriate metrics, risk models, and risk adjustment strategies. One commenter suggested that CMS should consider concurrently quality and disparities using a two-stage reimbursement strategy because it can mitigate unintended consequences while reducing disparities and improving quality.

A few commenters recommended that CMS not use social risk factors to adjust quality measures and recommended that CMS first evaluate and learn from the use of peer groups before additional adjustment to either the program or program measures. Commenters noted that adjusting for social risk factors does not address the underlying disparities that are often associated with poor health outcomes and would mask potential disparities or minimize incentives to improve the outcomes for disadvantaged populations.

Commenters expressed concern regarding the potential use of a hospital-wide readmission measure to account for social risk factors, citing the uncertainty that CMS has the legal authority to do so and government reports indicating that it would increase penalties for all hospitals and increase the disparity between safety-net and other hospitals. Commenters stated that if CMS incorporated the hospital-wide readmission measure in the Hospital Readmissions Reduction Program, it would need to remove the existing six

measures and do it in a budget-neutral manner.

One commenter believed that the readmission measures used in the Hospital Readmissions Reduction Program should be risk adjusted for social risk factors that are associated with higher readmission rates. The commenter recommended CMS undertake analysis that would directly measure those factors and make appropriate risk adjustments as part of the measure calculation.

Response: We thank commenters for the extensive responses to our request for public comments on whether we should account for social risk factors in the Hospital Readmissions Reduction Program, and if so, what method or combination of methods would be most appropriate for accounting for social risk factors. We recognize that social risk factors impact health, and one of our core objectives is to improve beneficiary outcomes including reducing health disparities. In addition, we seek to ensure that the quality of care furnished by providers and suppliers is assessed as fairly as possible under our programs while ensuring that beneficiaries receive high quality care. To this end, we have closely reviewed reports by the Office of the Assistant Secretary for Planning and Evaluation (ASPE) and the National Academies of Sciences, Engineering, and Medicine on the issue of accounting for social risk factors in CMS' value-based purchasing and quality reporting programs. We also await the recommendations of the recently concluded NQF trial on risk adjustment for quality measures. As we have previously stated, we are concerned about holding providers to different standards for the outcomes of their patients with social risk factors, because we do not want to mask potential disparities or minimize incentives to improve the outcomes for disadvantaged populations.

Commenters were generally supportive of how the Hospital Readmissions Reduction Program is adopting a methodology for accounting for dual-eligible patients. However, commenters also stated concerns such as the need to: Continue refinement of performance scoring and measurements to end any bias to major teaching providers; continue development of appropriate peer groups; and work to develop and apply appropriate socio-demographic status adjustments. Some recommendations, such as the use of a hospital-wide readmission measure, would require a statutory change. We will consider all suggestions as we continue to assess each measure and the

overall program. We intend to explore options including but not limited to measure stratification by social risk factors in a consistent manner across programs, informed by considerations of stratification methods described in section IX.A.13. of the preamble of this final rule. We thank commenters for this important feedback and will continue to consider options to account for social risk factors that would allow us to view disparities and potentially incentivize improvement in care for patients and beneficiaries. We will also consider providing feedback to providers on outcomes for individuals with social risk factors in confidential reports.

12. Extraordinary Circumstance Exception (ECE) Policy

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19967), we noted that many of our quality reporting and value-based purchasing programs share a common process for requesting an exception from program reporting due to an extraordinary circumstance not within a provider's control. The Hospital IQR, the Hospital OQR, the IPFQR, the Ambulatory Surgical Center Quality Reporting (ASCQR), and the PCHQR Programs, as well as the HAC Reduction Program, and the Hospital Readmissions Reduction Program, share common processes for ECE requests. In reviewing the policies for these programs, we recognized that there are five areas in which these programs have variance regarding ECE requests. These are: (1) Allowing the facilities or hospitals to submit a form signed by the facility's or hospital's CEO versus CEO or designated personnel; (2) requiring the form be submitted within 30 days following the date that the extraordinary circumstance occurred versus within 90 days following the date the extraordinary circumstance occurred; (3) inconsistency regarding specification of a timeline for us to provide our formal response notifying the facility or hospital of our decision; (4) inconsistency regarding specification of our authority to grant ECEs due to CMS data system issues; and (5) referring to the program as "extraordinary extensions/exemptions" versus as "extraordinary circumstances exceptions." We believe addressing these five areas, as appropriate, can improve administrative efficiencies for affected facilities or hospitals.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49542 through 49543), we adopted an ECE policy for the Hospital Readmissions Reduction Program beginning in FY 2016. This policy was similar to the ECE policy for the Hospital IQR Program, as finalized in

the FY 2012 IPPS/LTCH PPS final rule (76 FR 51651), modified in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50836) (designation of a non-CEO hospital contact), and further modified in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50277) (amended 42 CFR 412.140(c)(2) to refer to "extension or exemption" instead of the former "extension or waiver").

We proposed to update these policies by: (1) Allowing the facility to submit a form signed by the facility's CEO or designated personnel; (2) clarifying that we will strive to provide our formal response notifying the facility of our decision within 90 days of receipt of the facility's request; and (3) allowing CMS to have the authority to grant ECEs due to CMS data system issues which affect data submission. These proposed policies generally align with policies in the Hospital IQR Program (76 FR 51651 through 51652), (78 FR 50836 through 50837), and (81 FR 57181 through 57182), the Hospital OQR Program (77 FR 68489 and 81 FR 79795), as well as other quality reporting programs. We proposed that these policies would apply beginning in FY 2018 as related to extraordinary circumstances that occur on or after October 1, 2017.

We note that there may be circumstances in which it is not feasible for a facility's CEO to sign the ECE request form. In these circumstances, we believe that facilities affected by such circumstances should be able to submit ECE forms regardless of the CEO's availability to sign. This proposed change would allow hospitals to designate an appropriate, non-CEO, contact at its discretion. This individual would be responsible for the submission, and would be the one signing the form. Therefore, we proposed to accept ECE forms which have been signed by designated personnel.

We also believe that it is important for facilities to receive timely feedback regarding the status of ECE requests. We strive to complete our review of each ECE request as quickly as possible. However, we recognize that the number of requests we receive, and the complexity of the information provided impacts the actual timeframe to make ECE determinations. To improve transparency of our process, we believe it is appropriate to clarify that we will strive to complete our review of each request within 90 days of receipt.

Although we do not anticipate this situation will happen on a regular basis, there may be times where CMS experiences issues with its data systems that directly affects facilities' abilities to submit data. In these cases, we believe

it would be inequitable to require facilities to report. Therefore, we proposed to allow CMS to grant ECEs to facilities if we determine that a systemic problem with one of our data collection systems directly affected the ability of the facilities to submit data. If we make the determination to grant ECEs, we proposed to communicate this decision through routine communication channels.

We invited public comment on these proposed modifications to the Extraordinary Circumstance Exception policy.

Comment: Commenters supported the proposals to modify the extraordinary circumstances exceptions (ECE) policies to align across CMS quality reporting and value-based purchasing programs.

Response: We thank commenters for their support.

Comment: A few commenters noted that there currently is no ECE policy for the Indian Health Service or Tribally-operated programs, although tribal programs have requested an exception from CMS in previous fiscal years. Commenters requested an ECE specifically for IHS and tribal healthcare programs.

Response: We appreciate the commenters' concern. However, we note that section 1886(q)(5)(C) of the Act defines applicable hospitals and requires all subsection (d) hospitals to be included in the Hospital Readmissions Reduction Program. The ECE policy was not designed to allow a hospital to seek exclusion from the Hospital Readmissions Reduction on Program in its entirety, but to provide relief for a hospital whose ability to accurately collect quality measure data and/or to report those data in a timely manner has been negatively impacted as a direct result of experiencing a significant disaster or other extraordinary circumstance beyond the control of the hospital.

After consideration of the public comments we received, we are finalizing, without modification, our proposal to update our extraordinary circumstances exception policies to align with other quality reporting programs.

13. Timeline for Public Reporting of Excess Readmission Ratios on *Hospital Compare* for the FY 2018 Payment Determination

Section 1886(q)(6) of the Act requires the Secretary to make information available to the public regarding readmission rates of each subsection (d) hospital under the program, and states that such information shall be posted on the *Hospital Compare* Internet Web site

in an easily understandable format. Accordingly, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53401), we indicated that public reporting for excess readmission ratios could be available on the *Hospital Compare* Web site as early as mid-October. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56978 through 56979), we clarified that public reporting of excess readmission ratios will be posted on an annual basis to the *Hospital Compare* Web site as soon as is feasible following the review period. This may occur as early as October, but it could occur later for a particular year in order to streamline reporting and align with other hospital quality reporting and performance programs.

J. Hospital Value-Based Purchasing (VBP) Program: Policy Changes

1. Background

a. Statutory Background and Overview of Past Program Years

Section 1886(o) of the Act, as added by section 3001(a)(1) of the Affordable Care Act, requires the Secretary to establish a hospital value-based purchasing program (the Hospital VBP Program) under which value-based incentive payments are made in a fiscal year (FY) to hospitals that meet performance standards established for a performance period for such fiscal year. Both the performance standards and the performance period for a fiscal year are to be established by the Secretary.

For more of the statutory background and descriptions of our current policies for the Hospital VBP Program, we refer readers to the Hospital Inpatient VBP Program final rule (76 FR 26490 through 26547); the FY 2012 IPPS/LTCH PPS final rule (76 FR 51653 through 51660); the CY 2012 OPPS/ASC final rule with comment period (76 FR 74527 through 74547); the FY 2013 IPPS/LTCH PPS final rule (77 FR 53567 through 53614); the FY 2014 IPPS/LTCH PPS final rule (78 FR 50676 through 50707); the CY 2014 OPPS/ASC final rule (78 FR 75120 through 75121); the FY 2015 IPPS/LTCH PPS final rule (79 FR 50048 through 50087); the FY 2016 IPPS/LTCH PPS final rule with comment period (80 FR 49544 through 49570); the FY 2017 IPPS/LTCH PPS final rule (81 FR 56979 through 57011); and the CY 2017 OPPS/ASC final rule with comment period (81 FR 79855 through 79862).

We also have codified certain requirements for the Hospital VBP Program at 42 CFR 412.160 through 412.167.

b. FY 2018 Program Year Payment Details

Section 1886(o)(7)(B) of the Act instructs the Secretary to reduce the base operating DRG payment amount for a hospital for each discharge in a fiscal year by an applicable percent. Under section 1886(o)(7)(A) of the Act, the sum total of these reductions in a fiscal year must equal the total amount available for value-based incentive payments for all eligible hospitals for the fiscal year, as estimated by the Secretary. We finalized details on how we would implement these provisions in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53571 through 53573) and refer readers to that rule for further details. Under section 1886(o)(7)(C)(iv) of the Act, the applicable percent for the FY 2018 program year is 2.00 percent. Using the methodology we adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53571 through 53573), we estimate that the total amount available for value-based incentive payments for FY 2018 is approximately \$1.9 billion, based on the March 2017 update of the FY 2016 MedPAR file.

As finalized in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53573 through 53576), we will utilize a linear exchange function to translate this estimated amount available into a value-based incentive payment percentage for each hospital, based on its Total Performance Score (TPS). We will then calculate a value-based incentive payment adjustment factor that will be applied to the base operating DRG payment amount for each discharge occurring in FY 2018, on a per-claim basis. We published proxy value-based incentive payment adjustment factors in Table 16 associated with the FY 2018 IPPS/LTCH PPS proposed rule (which is available via the Internet on the CMS Web site). The proxy factors are based on the TPS from the FY 2017 program year.

These FY 2017 performance scores are the most recently available performance scores hospitals have been given the opportunity to review and correct. The updated slope of the linear exchange function used to calculate those proxy value-based incentive payment adjustment factors is 3.0693696034. This slope, along with the estimated amount available for value-based incentive payments has been updated based on the March 2017 update of the FY 2016 MedPAR file, and is published with this final rule in Table 16A (which is available via the Internet on the CMS Web site).

After hospitals have been given an opportunity to review and correct their

actual TPSs for FY 2018, we will add Table 16B (which will be available via the Internet on the CMS Web site) to display the actual value-based incentive payment adjustment factors, exchange function slope, and estimated amount available for the FY 2018 program year. We expect Table 16B will be posted on the CMS Web site in the fall of 2017.

We strive to put patients first, ensuring they are empowered to make decisions about their own healthcare along with their clinicians using information from data-driven insights that are increasingly aligned with meaningful quality measures. We support technology that reduces burden and allows clinicians to focus on providing high-quality healthcare for their patients. We also support innovative approaches to improve quality, accessibility, and affordability of care while paying particular attention to improving clinicians' and beneficiaries' experience when interacting with our programs. In combination with other efforts across the Department of Health and Human Services, we believe the Hospital VBP Program helps to incentivize hospitals to improve healthcare quality and value, while giving patients and providers the tools and information needed to make the best decisions for them. We recognize that the Hospital VBP Program represents a key component of the way that we bring quality measurement and improvement together with payment, we have taken efforts to review existing policies to identify how to move the program forward in the least burdensome manner possible while continuing to incentivize improvement in the quality of care provided to patients.

2. Accounting for Social Risk Factors in the Hospital VBP Program

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19968 through 19969), we discussed accounting for social risk factors in the Hospital VBP Program. We understand that social risk factors such as income, education, race and ethnicity, employment, disability, community resources, and social support (certain factors of which are also sometimes referred to as socioeconomic status (SES) factors or socio-demographic status (SDS) factors) play a major role in health. One of our core objectives is to improve beneficiary outcomes, including reducing health disparities, and we want to ensure that all beneficiaries, including those with social risk factors, receive high quality care. In addition, we seek to ensure that the quality of care furnished by providers and suppliers is assessed as

fairly as possible under our programs while ensuring that beneficiaries have adequate access to excellent care.

We have been reviewing reports prepared by the Office of the Assistant Secretary for Planning and Evaluation (ASPE)³⁰ and the National Academies of Sciences, Engineering, and Medicine on the issue of accounting for social risk factors in CMS' value-based purchasing and quality reporting programs, and considering options on how to address the issue in these programs. On December 21, 2016, ASPE submitted a Report to Congress on a study it was required to conduct under section 2(d) of the Improving Medicare Post Acute Care Transformation (IMPACT) Act of 2014. The study analyzed the effects of certain social risk factors in Medicare beneficiaries on quality measures and measures of resource use used in one or more of nine Medicare value-based purchasing programs, including the Hospital VBP Program.³¹ The report also included considerations for strategies to account for social risk factors in these programs. In a January 10, 2017 report released by the National Academies of Sciences, Engineering, and Medicine, that body provided various potential methods for measuring and accounting for social risk factors, including stratified public reporting.³²

In the ASPE report noted above, there is an analysis of and focus on the Medicare Spending Per Beneficiary (MSPB) measure, which was adopted by the Hospital VBP Program beginning with the FY 2015 program year.³³ We note that the MSPB measure is currently undergoing endorsement review for NQF, as part of the 2-year socioeconomic trial period described below.³⁴ ASPE's December 2016 Report to Congress did not include an analysis

³⁴ Medicare Spending Per Beneficiary (MSPB)—Hospital. See Section 2b.4.5 in National Quality Forum—Measure Testing. Accessed 2/21/17 from: <http://www.qualityforum.org/ProjectMeasures.aspx?projectId=83458>.

of the effect of social risk factors on hospital performance on any condition-specific payment measures that are currently adopted for the Hospital VBP Program beginning with the FY 2021 program year (Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI Payment) measure and Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Heart Failure (HF Payment) measure) (81 FR 56986 through 56990 and 81 FR 56990 through 56992, respectively). We look forward to ASPE's continued analyses in this area, such as the role of frailty and disability in explaining variation in hospital episode spending among Medicare beneficiaries.

As noted in the FY 2017 IPPS/LTCH PPS final rule, the NQF undertook a 2-year trial period in which certain new measures, measures undergoing maintenance review, and measures endorsed with the condition that they enter the trial period were assessed to determine whether risk adjustment for selected social risk factors is appropriate for these measures. This trial entailed temporarily allowing inclusion of social risk factors in the risk-adjustment approach for these measures. We await the recommendations of the NQF trial on risk adjustment for quality measures.

We note that the AMI Payment and HF Payment measures adopted in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56987 through 56990 and 81 FR 56990 through 56992, respectively), as well as the Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Pneumonia (PN Payment) measure (prior to the expansion of the measure cohort), recently underwent successful NQF re-endorsement following enrollment in the NQF's trial. Based on its review of these measures during the trial, the NQF re-endorsed these measures without modifications to their risk adjustment methodologies for social risk factors. We are finalizing our proposal to adopt the PN Payment measure beginning with the FY 2022 program year for the Hospital VBP Program (we refer readers to section V.J.4.a. of the preamble of this final rule), and we intend to submit the measure with the proposed expanded measure cohort for NQF review during the measure's next re-endorsement review.

As we continue to consider the analyses and recommendations from these reports and await the results of the NQF trial on risk adjustment for quality measures, we are continuing to work with stakeholders in this process. As we have previously communicated, we are

concerned about holding providers to different standards for the outcomes of their patients with social risk factors because we do not want to mask potential disparities or minimize incentives to improve the outcomes for disadvantaged populations. Keeping this concern in mind, while we sought input on this topic previously, we continue to seek public comment on whether we should account for social risk factors in the Hospital VBP Program, and if so, what method or combination of methods would be most appropriate for accounting for social risk factors. Examples of methods include: Adjustment of the payment adjustment methodology under the Hospital VBP Program; adjustment of provider performance scores (for instance, stratifying providers based on the proportion of their patients who are dual eligible); confidential reporting of stratified measure rates to providers; public reporting of stratified measure rates; risk adjustment of a particular measure as appropriate based on data and evidence; and redesigning payment incentives (for instance, rewarding improvement for providers caring for patients with social risk factors or incentivizing providers to achieve health equity).

We note that in section V.I.9. of the preamble of this final rule, we discuss considerations for stratifying hospitals into peer groups for purposes of assessing payment adjustments under the Hospital Readmissions Reduction Program, as required under the 21st Century Cures Act. We refer readers to that section for a detailed discussion of these alternatives; while this discussion and corresponding proposal are specific to the Hospital Readmissions Reduction Program, they reflect the level of analysis we would undertake when evaluating methods and combinations of methods for accounting for social risk factors in CMS' other value-based purchasing programs, such as the Hospital VBP Program. While we consider whether and to what extent we currently have statutory authority to implement one or more of the above-described methods, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19969), we sought comments on whether any of these methods should be considered, and if so, which of these methods or combination of methods would best account for social risk factors in the Hospital VBP Program.

In addition, in the proposed rule, we sought public comment on which social risk factors might be most appropriate for stratifying measure scores and/or potential risk adjustment of a particular measure. Examples of social risk factors

include, but are not limited to, dual eligibility/low-income subsidy, race and ethnicity, and geographic area of residence. We also sought comments on which of these factors, including current data sources where this information would be available, could be used alone or in combination, and whether other data should be collected to better capture the effects of social risk. We also welcomed comment on operational considerations. Of note, implementing any of the above methods would be taken into consideration in the context of how this and other CMS programs operate (for example, data submission methods, availability of data, statistical considerations relating to reliability of data calculations, among others).

We received extensive comments in response to our request for public comment on whether we should account for social risk factors in the Hospital VBP Program, and if so, what method or combination of methods would be most appropriate for accounting for social risk factors.

Comment: Commenters were generally supportive of accounting for social risk factors at the domain and measure level for the Hospital VBP Program in order to avoid penalizing hospitals for factors beyond their control or issues with the measures themselves. These commenters further stated that because social risk factors influence health outcomes, failure to appropriately risk-adjust for these factors in outcome measures could result in inadvertent penalties for hospitals who treat large populations of socially at-risk patients, and unintended consequences, such as reduced access to care for complex patients, due to provider concern that treating high-risk patients could negatively affect their performance rating. Commenters specifically recommended that CMS look to risk-adjust for socio-demographic and socioeconomic factors—such as income, education, race, payer type, patient travel distance, homelessness, and language proficiency—as well as functional status and frailty. However, commenters also stated concerns that changing Medicare payment policies to risk adjust or stratify measure rates for social risk factors would not address the underlying disparities that are often associated with poor health outcomes, would mask potential disparities or minimize incentives to improve the outcomes for disadvantaged populations, and may create perverse incentives for poor performers to continue with the status quo and for high performers to retreat from their

efforts to address disparities in high social risk factor populations.

Response: We appreciate all the comments and interest in this topic. As we have previously stated, we are concerned about holding providers to different standards for the outcomes of their patients with social risk factors, because we do not want to mask potential disparities or minimize incentives to improve outcomes for disadvantaged populations. We believe that the path forward should incentivize improvements in health outcomes for disadvantaged populations while ensuring that beneficiaries have access to excellent care. We intend to consider all suggestions as we continue to assess each measure and the overall program. We appreciate that some commenters recommended risk adjustment as a strategy to account for social risk factors, while others stated a concern that risk adjustment could minimize incentives and reduce efforts to address disparities for patients with social risk factors. We intend to conduct further analyses on the impact of strategies such as measure-level risk adjustment and stratifying performance scoring to account for social risk factors including the options suggested by commenters. In addition, we appreciate the recommendations from the commenters about consideration of specific social risk factor variables and will work to determine the feasibility of collecting these patient-level variables. As we consider the feasibility of collecting patient-level data and the impact of strategies to account for social risk factors through further analysis, we will continue to evaluate the reporting burden on providers. Future proposals would be made after further research and continued stakeholder engagement.

3. Retention and Removal of Quality Measures for the FY 2019 Program Year

a. Retention of Previously Adopted Hospital VBP Program Measures

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53592), we finalized a policy to retain measures from prior program years for each successive program year, unless otherwise proposed and finalized. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19970), we did not propose any changes to this policy.

b. Removal of the PSI 90 Measure

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56979 through 56981), we finalized our proposal to shorten the performance period for the current³⁵

³⁵ The "current" PSI 90 measure refers to the version of the PSI 90 measure previously finalized

PSI 90 measure for the FY 2018 program year due to concerns associated with combining measure performance data that use both ICD-9 and ICD-10 data in calculating performance scores under the measure. In that final rule, we explained our system requires an ICD-10 risk-adjusted version of the AHRQ PSI software³⁶ in order to calculate scores using ICD-10 codes, and AHRQ needs a full year of nationally representative ICD-10 coded data before it can complete development of risk-adjusted models based on a national reference population for this software. This means the AHRQ PSI software will not be available for us to calculate scores until late CY 2017. More importantly, we noted an ICD-10 version of the current PSI 90 measure is not being developed (81 FR 56980), nor will ICD-10 AHRQ PSI software be available to calculate performance scores for the FY 2019 program year (81 FR 56981). As a result, we will not be able to calculate performance scores for the current PSI 90 measure for the FY 2019 program year because these scores would include ICD-10 data. Based on these concerns, in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56981), we signaled our intent to propose to remove the current PSI 90 measure from the Hospital VBP Program beginning with the FY 2019 program year. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19970), we proposed to remove the current PSI 90 measure from the Hospital VBP Program beginning with the FY 2019 program year.

We invited public comment on this proposal. We also refer readers to section V.J.4.b. of the preamble of this final rule where we discuss our proposal to adopt the modified version of the PSI 90 measure for the Hospital VBP Program beginning with the FY 2023 program year.

Comment: The vast majority of commenters supported CMS' proposal to remove the PSI 90 measure from the Hospital VBP Program beginning with the FY 2019 program year.

Response: We thank the commenters for their support.

Comment: Two commenters supported the removal of PSI 90 from the Hospital VBP Program measure set, but recommended CMS remove the measure immediately and permanently, including the FY 2018 program year. A

few commenters noted the measure is unreliable and lacks appropriate exclusions based on patient social risk factors. One commenter stated that only 15 months of data will be available for the FY 2018 performance period, questioned the measure's reliability, and stated that the measure is flawed. Another commenter expressed concern that continued use of the current PSI 90 measure during the FY 2018 program year while the HAC Reduction Program implements the modified PSI 90 measure would create confusion and misalignment across the programs.

Response: While we understand commenters' concerns, we previously decided to retain the currently adopted version of the PSI 90 measure for the FY 2018 program year because we had the option to shorten the performance period so that performance standards can be calculated using the ICD-9 AHRQ PSI software (81 FR 56981). We also continue to believe that this measure meets the program goal of providing important information on hospital performance on patient safety and adverse events. In addition, the PSI 90 measure was developed using a scientifically rigorous process that involved the input of technical experts and stakeholders. Further, AHRQ has supported a series of validation studies, based on detailed abstraction of medical records, that have informed AHRQ's PSI development process, including making further refinements to indicators and working with others to improve coding practices. We refer commenters to the AHRQ PSI Development zip file and AHRQ Composite Measures Workgroup document available at: http://www.qualityindicators.ahrq.gov/modules/psi_resources.aspx. We therefore believe that the PSI 90 measure in its current form is reliable, valid, and appropriate to retain in the Hospital VBP Program for the FY 2018 program year because it encourages robust hospital attention to patient safety. We further believe that a 15-month performance period is sufficiently reliable, particularly in light of the case minimum of three cases for any of the underlying PSI 90 indicators as finalized in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53609). Because we believe the measure is sufficiently reliable with 15 months of data, we do not believe we need to suspend or remove the measure or extend the measure's performance period for the FY 2018 program year.

Comment: A few commenters did not support the removal of PSI 90, stating that retaining consistency in measures over time enables hospitals to focus on improvement and CMS should not

allow a 3-year lapse in public reporting of a critical safety measure. One commenter expressed particular concern that removing the current PSI 90 measure will result in a redistribution of the Safety domain score across the NHSN measures, which the commenter believed are of limited value because they allow hospitals to use different surveillance methods and have inadequate risk adjustment. Commenters therefore urged CMS to look more broadly for opportunities to accelerate the inclusion of the proposed Patient Safety and Adverse Events (Composite) measure into the Hospital VBP Program, such as suspending the current PSI 90 measure for one year and phasing in a 24-month performance period beginning in FY 2020, or continuing to include the current PSI 90 measure rather than waiting for the new measures to become available to ensure that surgical complications remain a key component of the Hospital VBP Program.

Response: We thank the commenters for their recommendations, but note that, as discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19970), we will be unable to calculate measure scores for the current PSI 90 measure in the FY 2019 program year because ICD-10 AHRQ PSI software for the currently adopted measure will not be available. This lack of measure calculation software also precludes us from suspending the measure for one year and re-instituting the measure in FY 2020 using only ICD-10 data, because we will not be able to calculate measure scores.

Furthermore, due to certain statutory requirements in the Hospital VBP Program, we are unable to adopt the proposed Patient Safety and Adverse Events (Composite) measure earlier than proposed. Section 1886(o)(2)(A) of the Act requires the Hospital VBP Program to select measures that have been specified for the Hospital IQR Program. In addition, section 1886(o)(2)(C)(i) of the Act requires the Hospital VBP Program to refrain from beginning the performance period for a new measure until data on the measure have been posted on *Hospital Compare* for at least one year. The Hospital IQR Program finalized adoption of the modified PSI 90 measure (also known as the Patient Safety and Adverse Events (Composite) measure) in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57133), and we are required to wait one full year after data has been posted before that measure's performance period may begin in the Hospital VBP Program. Because measure data for the Patient Safety and Adverse Events (Composite) measure has not

for use in the Hospital VBP Program in the FY 2013 IPPS/LTCH PPS final rule (78 FR 50694).

³⁶ The AHRQ PSI Software is the software used to calculate PSIs and the composite measure. More information is available at: http://www.qualityindicators.ahrq.gov/Downloads/Resources/Publications/2015/Empirical_Methods_2015.pdf.

been posted on *Hospital Compare*, we are unable to adopt the measure for the FY 2019 program year. However, as discussed the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19973 through 19974), we proposed to adopt the Patient Safety and Adverse Events (Composite) measure beginning with the FY 2023 program year, which was the soonest program year possible under the Hospital VBP Program's statutory authority.

After consideration of the public comments we received, we are finalizing our proposal to remove the current PSI 90 measure from the Hospital VBP Program beginning with the FY 2019 program year.

c. Summary of Previously Adopted Measures and Finalized Measure for Removal for the FY 2019 and FY 2020 Program Years

In summary, for the FY 2019 and FY 2020 program years, we have finalized the following measure set, which no longer includes the current PSI 90 measure, as we are finalizing our proposal to remove the measure from the Hospital VBP Program beginning with the FY 2019 program year:

PREVIOUSLY ADOPTED MEASURES AND FINALIZED MEASURE FOR REMOVAL FOR THE FY 2019 AND FY 2020 PROGRAM YEARS

Measure short name	Domain/measure name	NQF #
Person and Community Engagement Domain *		
HCAHPS	Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS)** (including Care Transition Measure)	0166 (0228)
Clinical Care Domain		
MORT-30-AMI	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (AMI) Hospitalization.	0230
MORT-30-HF	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Heart Failure (HF) Hospitalization.	0229
MORT-30-PN	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Pneumonia Hospitalization.	0468
THA/TKA	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	1550
Safety Domain		
CAUTI	National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure.	0138
CLABSI	National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure.	0139
Colon and Abdominal Hysterectomy SSI.	American College of Surgeons—Centers for Disease Control and Prevention (ACS—CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	0753
MRSA Bacteremia	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) Bacteremia Outcome Measure.	1716
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset <i>Clostridium difficile</i> Infection (CDI) Outcome Measure.	1717
PC-01	Elective Delivery	0469
Efficiency and Cost Reduction Domain		
MSPB	Payment-Standardized Medicare Spending Per Beneficiary (MSPB)	2158

* In section IV.H.3.b. of the preamble of the FY 2017 IPPS/LTCH PPS final rule (81 FR 56984), we renamed this domain from Patient- and Caregiver-Centered Experience of Care/Care Coordination domain to Person and Community Engagement domain beginning with the FY 2019 program year.

** In section XIX.B.3. of the preamble of the CY 2017 OPPI/ASC final rule with comment period (81 FR 79855 through 79862), we finalized the removal of the Pain Management dimension from the Hospital VBP Program beginning with the FY 2018 program year.

4. New Measures for the FY 2022 Program Year, FY 2023 Program Year, and Subsequent Years

We consider measures for adoption based on the statutory requirements, including specification under the Hospital IQR Program, posting dates on the *Hospital Compare* Web site, and our priorities for quality improvement as outlined in the current CMS Quality Strategy, available at: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityInitiativesGenInfo/>

CMS-Quality-Strategy.html. Due to the time necessary to adopt measures, we often adopt policies for the Hospital VBP Program well in advance of the program year for which they will be applicable.

a. New Measure for the FY 2022 Program Year and Subsequent Years: Hospital-Level, Risk-Standardized Payment Associated With a 30-Day Episode-of-Care for Pneumonia (PN Payment)

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19971 through 19973), we proposed a new measure for the FY 2022 program year and subsequent years:

Hospital-Level, Risk-Standardized Payment Associated With a 30-Day Episode-of-Care for Pneumonia (PN Payment).

(1) Measure Proposal

Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Pneumonia (PN Payment) is a measure assessing hospital risk-standardized payment associated with a 30-day episode-of-care for pneumonia. We adopted this measure in the Hospital IQR Program in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50227 through 50231), and we adopted an updated version of the measure, with an expanded cohort and modified risk-adjustment model, in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57125 through 57128). For purposes of describing this measure, the “cohort” is the set of hospitalizations, or “index admissions,” that meet all of the measure’s inclusion and exclusion criteria and, thus, are used to calculate the total payments Medicare makes on behalf of these Medicare beneficiaries for a 30-day episode-of-care. The cohort for the expanded version of the PN Payment measure includes Medicare FFS patients aged 65 or older with: (1) A principal hospital discharge diagnosis of pneumonia, including not only viral or bacterial pneumonia but also aspiration pneumonia; or (2) a principal discharge diagnosis of sepsis (but not severe sepsis) with a secondary diagnosis of pneumonia (including viral or bacterial pneumonia and aspiration pneumonia) coded as present on admission. The measure calculates payments for these patients over a 30-day episode-of-care, beginning with the index admission, using administrative claims data. In general, the measure uses the same approach to risk-adjustment as 30-day outcome measures previously adopted for the Hospital VBP Program, including the 30-day PN mortality measure, MORT–30–PN. Initial measure data collected under the Hospital IQR Program for the expanded PN Payment cohort and modified risk-adjustment model will be posted on *Hospital Compare* in July 2017, and the full measure specifications are available at: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

Promoting high-value care is an essential part of our mission to provide better health care for individuals, better health for populations, and lower costs for health care. Our aim is to encourage higher value care where there is the most opportunity for improvement, the greatest number of patients to benefit

from improvements, and the largest sample size to ensure reliability. Pneumonia is one of the leading causes of hospitalization for Americans aged 65 and over,³⁷ and pneumonia patients incur roughly \$10.2 billion in aggregate health care costs.³⁸ There is evidence of variation in payments at hospitals for pneumonia patients in the proposed PN Payment measure; median 30-day risk-standardized payment among Medicare FFS patients aged 65 or older hospitalized for pneumonia was \$15,988 and ranged from \$9,193 to \$26,546 for the July 2011 through June 2014 reporting period in the Hospital IQR Program.³⁹ This variation in payment suggests there is opportunity for improvement. We believe it is important to adopt the PN Payment measure for the Hospital VBP Program because variation in payment may reflect differences in care decision-making and resource utilization (for example, treatment, supplies, or services) for patients with pneumonia both during hospitalization and immediately post-discharge. The PN Payment measure specifically addresses the NQS priority and CMS Quality Strategy goal to make quality care more affordable.

We recognize high or low payments to hospitals are difficult to interpret in isolation. Some high payment hospitals may produce better clinical outcomes when compared with low payment hospitals, while other high payment hospitals may not produce better outcomes. For this reason, payment measure results viewed in isolation are not necessarily an indication of quality. However, by viewing such information along with quality measure results, consumers, payers, and providers would be able to better assess the value of care. In order to incentivize innovation that promotes high-quality care at high value, it is important to examine measures of payment and patient outcomes concurrently. The proposed PN Payment measure is intended to be paired with the MORT–30–PN measure

in the Hospital VBP Program,⁴⁰ thereby directly linking payment to quality by the alignment of comparable populations and risk-adjustment methodologies to facilitate the assessment of efficiency and value of care. We believe adopting the PN Payment measure will create stronger incentives for appropriately reducing practice pattern variation to achieve the aim of lowering the cost of care and creating better coordinated care for Medicare beneficiaries.

We proposed to adopt the PN Payment measure beginning with the FY 2022 program year. The PN Payment measure would be added to the Efficiency and Cost Reduction domain. The proposed measure fulfills all of the statutory requirements for the Hospital VBP Program based on our adoption of the measure in the Hospital IQR Program, and our anticipated posting of measure data for the refined PN Payment measure, with the expanded cohort and modified risk-adjustment model, on *Hospital Compare* beginning July 2017, which would be at least one year before the beginning of the proposed performance period of August 1, 2018. We refer readers to sections V.J.5.c.(3) through V.J.5.c.(5) of the preamble of this final rule where we discussed our proposed baseline periods and performance periods for this measure if adopted for the Hospital VBP Program.

The proposed PN Payment measure (MUC15–378) was reviewed by the MAP in December 2015 and did not receive support for adoption into the Hospital VBP Program.⁴¹ The result of the MAP vote was 31 percent support, 15 percent conditional support, and 54 percent do not support. The MAP’s decision of “do not support” for the proposed PN Payment measure was based on concerns that the measure may overlap with and thereby double count services that are already captured in the MSPB measure. In addition, some MAP members expressed a desire to have more experience with the measure in the Hospital IQR Program to understand

³⁷ Lindenauer PK, Lagu T, Shieh M, Pekow PS, Rothberg MB. Association of diagnostic coding with trends in hospitalizations and mortality of patients with pneumonia, 2003–2009. *JAMA*. 2012;307(13):1405–1413.

Agency for Healthcare Research and Quality, Rockville, MD. Available at: <http://www.hcup-us.ahrq.gov/reports/statbriefs/sb146.pdf>.

³⁹ 2016 Reevaluation and Re-Specifications Report of the Hospital-Level 30-Day Risk-Standardized Pneumonia Payment Measure. AMI, HF, PN Payment Updates (zip file). Available at: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

⁴⁰ The Hospital VBP Program first adopted the MORT–30–PN measure for the FY 2014 program year in the Hospital Inpatient Value-Based Purchasing Program final rule (76 FR 26497 through 26511). We subsequently expanded the measure cohort beginning with the FY 2021 program year in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56994 through 56996).

⁴¹ “2016 Spreadsheet of Final Recommendations to HHS and CMS” available at: <http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367> and “Process and Approach for MAP Pre-Rulemaking Deliberations” found at: http://www.qualityforum.org/Publications/2016/02/Process_and_Approach_for_MAP_Pre-Rulemaking_Deliberations.aspx.

whether there may be unintended consequences or a need to adjust for social risk factors. We note some MAP members expressed support for the proposed PN Payment measure and other condition-specific payment measures, expressing that the increased granularity provided by condition-specific payment measures will provide valuable feedback to hospitals for targeted improvement.

With respect to MAP stakeholder concerns that treatment- or condition-specific payment measures may overlap and double count services, we note that the proposed PN Payment measure addresses a topic of critical importance to quality improvement in the inpatient hospital setting. As discussed above, we selected the PN Payment measure because we believe it is appropriate to provide stronger incentives for hospitals to provide high-value and efficient care, especially for a high-volume condition such as pneumonia. We acknowledge that hospitals that do not perform well on the PN Payment measure may also perform poorly on the MSPB measure and potentially receive a lower incentive payment, depending upon their performance on other measures. However, because admissions for pneumonia make up only a part of all admissions included in the MSPB measure, a hospital's results on the MSPB measure may not be the same as their result on the PN Payment measure. In other words, a hospital's results for one measure are not deterministic of its results of the other, so we cannot state conclusively that if a hospital performs well (or poorly) on one measure, that they will also perform well (or poorly) on the second measure. Hospitals would perform differently on the MSPB and PN Payment measures because these measures evaluate performance on different metrics. For example, some hospitals with poorer results on the MSPB measure may have better results on the PN Payment measure allowing them to improve their overall score. In addition, the overlap between the MSPB and PN Payment measures may result in some hospitals receiving an increased benefit by performing well on both measures. Furthermore, if a hospital does not perform as well on the MSPB measure relative to other hospitals but performs very well with respect to its pneumonia patients on the proposed PN Payment measure, that hospital would have the opportunity to earn a higher score in the Efficiency and Cost Reduction domain.

Regarding MAP stakeholder concerns for the need to adjust for social risk factors, we note the proposed PN Payment measure already incorporates a

risk-adjustment methodology that accounts for age and comorbidities. We understand the important role social risk factors play in the care of patients, routinely monitor the impact of social risk factors on hospitals' results on our measures, and will continue to do so. In addition, as discussed in section V.J.3. of the preamble of this final rule, the original PN Payment measure using the previous measure cohort (Hospital-level, risk-standardized payment associated with a 30-day episode-of-care for pneumonia (NQF #2579)), as well as the AMI Payment and HF Payment measures adopted in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56987 through 56990 and 81 FR 56990 through 56992, respectively), which use the same measurement methodology as the proposed PN Payment measure, recently underwent successful NQF re-endorsement following enrollment in the NQF's trial. The NQF re-endorsed these measures without requesting modifications to their risk adjustment methodologies for adjustment by social risk factors. The proposed PN Payment measure includes an updated risk-adjustment model that accounts for patient comorbidities, and we intend to submit to NQF that risk adjustment model as part of the overall proposed PN Payment measure specifications during the next Cost and Resource Use project.

As noted above, some MAP members expressed support for the proposed PN Payment measure and other condition-specific payment measures, agreeing the increased granularity provided by condition-specific payment measures will provide valuable feedback to hospitals for targeted improvement. In addition, a NQF-commissioned white paper also supports the position that cost or payment measures should be interpreted in the context of quality measures and that measures which link cost and quality are the preferred method of assessing hospital efficiency.⁴² The PN Payment measure, which directly pairs with the MORT-30-PN measure in the Hospital VBP Program, follows this recommended approach. Based on our analysis of the issues surrounding condition-specific payment measures, we believe the benefits of adopting the PN Payment measure outweigh any potential risks; however, we also remain committed to monitoring for unintended consequences.

We invited public comment on this proposal.

Comment: A number of commenters supported the addition of the PN Payment measure. A few commenters supported adoption of the PN Payment measure because pneumonia is one of the leading causes of hospitalization for Americans aged 65 and over, and these hospitalizations result in high aggregate costs for patients. Two commenters expressed particular support for the measure's inclusion of patients with a principal diagnosis of aspiration pneumonia, or a principal diagnosis of sepsis with a secondary diagnosis of pneumonia, because including these patients addresses stakeholder concerns regarding variation in coding of pneumonia as a principal diagnosis in order to avoid patients being captured by the pneumonia episode of care measure. Two other commenters noted the measure's alignment with the National Quality Strategy, and that tracking of this measure will enable identification of outlier performers in managing pneumonia and thereby spur incorporation of evidence-based practices for monitoring and managing pneumonia patients. One commenter expressed support for CMS' intention to focus more strongly on cost as an element of value in the Hospital VBP Program.

Response: We thank the commenters for their support.

Comment: One commenter expressed support for CMS' goals in proposing to adopt the PN Payment measure, but urged CMS to carefully consider the risk adjustments used in this measure because not all pneumonia diagnoses are comparable and factors outside the control of hospitals, such as geographic location, can impact the disease. Another commenter strongly recommended that CMS not include the PN Payment measure in the Hospital VBP Program because the expansion of the PN Payment measure cohort to include patients with a principal discharge diagnosis of aspiration pneumonia or sepsis with a secondary diagnosis of pneumonia coded as present on admission could make hospitals that care for complex patients look worse unless there is appropriate risk adjustment for social risk factors.

Response: We appreciate the commenters' concerns that different types of pneumonia, such as community acquired pneumonia and aspiration pneumonia, have different causes and associated risks (for example, recurrent aspiration due to other comorbidities). While the pathological causes of aspiration pneumonia are slightly different from the causes of community acquired pneumonia, in routine clinical practice, evidence shows it can be very

⁴² Ryan AM, Tompkins CP. Efficiency and Value in Healthcare: Linking Cost and Quality Measures. Washington, DC: NQF; 2014.

challenging for physicians to differentiate aspiration syndromes, including pneumonitis and pneumonia, from other types of pneumonia included in the measure.^{43 44} This is reflected in the tremendous variation across hospitals in the use of aspiration pneumonia diagnosis codes. This variation suggests that hospitals are not consistently distinguishing between these conditions as distinct subtypes regardless of patients' comorbid conditions. Furthermore, we note that the treatment of patients hospitalized for pneumonia, aspiration pneumonia, or sepsis due to pneumonia is very similar and involves treatment with antibiotics, IV fluids, and symptom management.⁴⁵ In addition, although some patients with aspiration pneumonia, such as medically frail patients, have a higher predicted mortality risk (that is, are more complex), many of the associated comorbidities are captured in the PN Payment measure's risk-adjustment methodology.

With respect to geographic variation, the incidence of fungal and mycobacterial infections are strongly associated with a patient's area of residence, and these infections would be expected to have different outcomes than typical bacterial and viral pneumonias, including higher levels of spending. They also involve different treatments than those provided to patients with typical bacterial and viral pneumonia. These considerations justify their continued exclusion from the pneumonia outcome measures. Although similar arguments might be applied to the different bacterial pathogens included in the pneumonia measure, most treatment of pneumonia remains empiric, and it is unusual to identify a specific etiologic agent. For this reason, we do not believe that is appropriate to include the specific bacterial pathogen in risk-adjustment models.

The risk adjustment model adequately accounts for the varying severity and comorbidities of patients across the modified cohort; therefore, we believe that hospitals will not be unfairly penalized for treating sicker patients. Expanding the measure cohort ensures that the measure is clinically comprehensive. Moreover, the treatment

of patients hospitalized for pneumonia, aspiration pneumonia, or sepsis due to pneumonia is very similar and involves treatment with antibiotics, IV fluids, and symptom management. In addition, although some patients with aspiration pneumonia, such as medically frail patients, have a higher predicted mortality risk, many of the associated comorbidities are captured in the MORT-30-PN (updated cohort) measure's risk-adjustment methodology. Of note, due to the increased number of patients that are included in the expanded cohort, we reselected risk-adjustment variables to ensure that the measure does not bias hospital performance as well as accounts for the differences in risk among the subgroup of patients. For example, the risk model includes clinical history of stroke, as well as conditions associated with frailty, such as neuromuscular disease, and dementia. The full PN Payment measure specifications are available at: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

Comment: Many commenters did not support adoption of the PN Payment measure because it will overlap with the MSPB measure in the Efficiency and Cost Reduction domain. A large subset of these commenters did not support adoption of the PN Payment measure because the MAP did not support this measure for inclusion in the Hospital VBP Program, and stated their belief that CMS has not addressed the MAP's concerns of double-counting and overlap with services already captured by the MSPB measure, which could potentially penalize hospitals twice for the same episode. A number of commenters urged CMS to reconcile this overlap before adopting the PN Payment measure by removing episodes of pneumonia payment from the MSPB measure calculation. One commenter expressed concern that the overlap between the MSPB and proposed PN Payment measures may send mixed signals to hospitals about their resource use performance. One commenter also noted that it will be possible for hospitals to score well on the MSPB measure, but poorly on the condition-specific payment measures, even though the measures will capture many of the same services.

Response: While we acknowledge that there may be some overlap between the MSPB and condition-specific payment measures, including the PN Payment measure, we believe that the condition-specific measures are of critical importance to improving efficiency of care. We selected the PN Payment

measure for the Hospital VBP Program because pneumonia is one of the leading causes of hospitalization for Americans aged 65 and over,⁴⁶ and pneumonia patients incur roughly \$10 billion in aggregate health care costs.⁴⁷ Including condition-specific measures alongside the MSPB measure provides hospitals with actionable feedback that will better equip them to implement targeted improvements, in comparison to an overall payment measure alone. Moreover, these condition-specific measures will allow consumers, providers, and payers to make a more fully informed assessment of value of care.

As we noted in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19972), because admissions for pneumonia make up only a part of all admissions included in the MSPB measure, a hospital's results on the MSPB measure may not be the same as their result on the PN Payment measure, and hospitals would perform differently on the MSPB and PN Payment measures because these measures evaluate performance on different metrics. In other words, a hospital's results for one measure are not deterministic of its results of the other, so we cannot state conclusively that if a hospital performs well (or poorly) on one measure, that they will also perform well (or poorly) on the second measure. We believe that even if some services were double counted, hospitals that offer quality service and maintain better results on the MSPB and condition-specific payment measures relative to other hospitals in the Hospital VBP Program could receive an increased benefit by performing well on both quality measures and payment measures. Furthermore, because hospitals would have bigger financial incentives, they would strive to perform better, which would lead to better quality.

In addition, we note that the PN Payment measure already incorporates a risk-adjustment methodology that accounts for age and comorbidities, discussed in more detail below. We understand the important role social risk factors play in the care of patients, routinely monitor the impact of social

risk factors on hospitals' results on our measures, and will continue to do so.

Comment: A number of commenters did not support adoption of the PN Payment measure because the measure is not risk-adjusted to account for socio-demographic status factors. Some of these commenters expressed further concern that the measure is not risk-adjusted to account for socioeconomic status factors. One commenter stated that previous testing of the measure should have included additional social risk factors, such as community characteristics. One commenter stated that it is premature to adopt the PN Payment measure without the NQF SDS trial results. Another commenter acknowledged the PN Payment measure was reviewed as part of the NQF's SDS trial and NQF's evaluation indicated that SDS adjustment was not necessary, but recommended that CMS continue to examine the impact of socioeconomic factors on measure performance under the PN Payment measure and incorporate adjustments as needed. A third commenter encouraged CMS to continue to engage with stakeholders regarding the inclusion of social risk factors for the PN Payment measure, noting that specific risk factors often lead to worse outcomes, so providing care may cost more and make it more difficult for hospitals to achieve high performance on quality measures.

Response: We acknowledge commenters' concerns that the proposed PN Payment measure is not properly risk-adjusted and we understand the important role that socio-demographic status plays in the care of patients; however, we continue to believe the PN Payment measure's risk-adjustment methodology is appropriate and reliable. As we noted in the FY 2018 IPPS/LTCH PPS proposed rule, the proposed measure already incorporates a risk-adjustment methodology that accounts for age and comorbidities and we intend to submit to NQF that risk adjustment model as part of the overall proposed PN Payment measure specifications during the next Cost and Resource Use project. We also continue to have concerns about holding hospitals to different standards for the outcomes of their patients of diverse socio-demographic status because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations.

In addition, as discussed in section V.J.3. of the preamble of this final rule, the original PN Payment measure using the previous measure cohort (Hospital-level, risk-standardized payment associated with a 30-day episode-of-care for pneumonia (NQF #2579)), as well as

the AMI Payment and HF Payment measures adopted in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56987 through 56990 and 81 FR 56990 through 56992, respectively), which use the same measurement methodology as the proposed PN Payment measure, recently underwent successful NQF re-endorsement following enrollment in the NQF's trial. The NQF 2-year trial period allowed for the temporary inclusion of socio-demographic factors in the risk-adjustment approach for some performance measures. This trial period considered the analyses and interpretations as well as performance scores with and without socio-demographic factors in the risk-adjustment model. NQF's evaluation indicated that SDS adjustment was not necessary for this measure. We routinely monitor the impact of socio-demographic status on hospitals' results on our measures and, as noted in section V.J.2. of the preamble of this final rule where we discuss accounting for social risk factors in the Hospital VBP Program, we will conduct further research and continue engaging stakeholders as we assess the appropriateness of any specific strategies such as measure-level risk adjustment or stratified performance scoring.

We also thank commenters for their recommendation that we engage with stakeholders regarding risk adjustments for the PN Payment measure, and note we routinely solicit public comment on our payment measures and other measures under development. For current and future opportunities, we encourage the commenter to visit the CMS Quality Measures Public Comment page at: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/CallforPublicComment.html>. In addition, there are opportunities for stakeholders to serve on Technical Expert Panels and provide technical input to CMS and the measure contractors on the development, selection, and maintenance of measures. We refer the commenter to the following Web site for more information: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/TechnicalExpertPanels.html>.

Comment: Some commenters did not support the addition of condition-specific payment measures because the commenters believed the measures inappropriately assign costs to the hospitals. A few commenters noted that variations in Medicare payments are due primarily to readmission rates and post-acute care. One commenter further noted that post-acute care use varies due

to wide-ranging differences in local market availability of these services and patterns of care, which are not within the hospital's control. Two commenters recommended that CMS work with the hospital community to develop and implement efficiency metrics of spending that hospitals directly influence because the current and proposed condition-specific payment measures include physician spending and preferences, which are beyond the control of the hospital. One commenter recommended limiting inclusion of payments used in the calculation of the measures to only payment directly related to the condition-specific index admission, because the commenter believed this would be a more accurate proxy for factors within a hospital's control than all spending over a 30-day period.

Response: We continue to believe that hospitals that provide quality inpatient care and conduct appropriate discharge planning can work with providers and suppliers in coordinating efficient follow-up care. When examining variation in payments, consideration of the episode-of-care triggered by admissions is meaningful for several reasons. First, hospitalizations represent a brief period of a patient's illness that require ongoing management post discharge, and decisions made at the admitting hospital affect payments for care in the immediate post discharge period. Second, attributing payments for a continuous episode-of-care to admitting hospitals may reveal practice variations in the full care of the patient's illness that can result in increased payments. Third, a 30-day preset window provides a standard observation period by which to compare all hospitals. Lastly, we note the PN Payment measure is intended to be paired with the MORT-30-PN measure to capture payments for Medicare fee-for-service patients age 65 and older across all care settings, services, and supplies (that is, inpatient, outpatient, skilled nursing facility, home health, hospice, physician/clinical laboratory/ambulance services, durable medical equipment, prosthetics/orthotics, and supplies).

We thank commenters for the recommendations and note that we have developed, and will continue to develop, efficiency measures in consultation with clinical and measurement experts, key stakeholders (including the hospital and patient communities), and the public. We disagree with commenters that all payment measures should be limited to only payments directly related to the index admission because, as noted

above, we continue to believe that inclusion of payments on a broad range of services incentivizes quality care and care coordination. The intensity of services needed for patients after an inpatient stay may be the result of quality failures during the stay that led to poor clinical outcomes.

Comment: A few commenters did not support adoption of the proposed PN Payment measure due to concerns about the measure's validity and reliability. One commenter asserted that because not all hospitals will have sufficient volume to be scored on each condition-specific payment measure, the statistical reliability of those measures' scores will likely be lower than the MSPB measure and, as a result, provide a less useful picture of hospital performance. Another commenter recommended that CMS not adopt the PN Payment measure because the measure's population is too small to be stable, reliable, or meaningful for many smaller facilities. A third commenter cautioned against implementation of the PN Payment measure without conclusive evidence that the measure is clinically and statistically fair and meaningful. One commenter recommended that if CMS chooses to finalize the PN Payment measure, it use the years leading up to FY 2022 to ensure the validity of the measure and resolve MAP stakeholder concerns about incorporating social risk factors into the measure to improve quality of care while not unduly penalizing essential hospitals.

Response: We disagree with the commenter that hospitals will not be able to report statistically reliable information on the condition-specific payment measures because, as discussed in section V.J.7.c.(5) below, hospitals must report a minimum number of 25 cases to receive a payment measure score. We believe the case minimum will ensure that each hospital's payment measure rate is sufficiently reliable to generate a score that meaningfully distinguishes hospital performance on the measures. We also disagree with the commenter's assertion that the statistical reliability of the condition-specific payment measures is likely to be weaker than the MSPB measure. The statistical model that we use to calculate the payment measures allows for the inclusion of hospitals with relatively few cases by taking into account the uncertainty associated with sample size. In addition, we note the PN Payment measure uses longer baseline and performance periods than the MSPB measure (three years instead of a single year) in order to increase the measure's sample size and ensure sufficiently reliable measure results.

Comment: A number of commenters expressed concern that the PN Payment measure, without a linkage to a quality measure, is purely focused on payment for pneumonia episodes of care and therefore does not reflect appropriateness of care. A few commenters expressed concern that the PN Payment measure is not an indicator of value because it does not capture the quality of care provided and is not paired with measures that do so. Other commenters expressed concern about the inclusion of additional payment measures in the Hospital VBP Program and stated their belief that condition-specific payment measures themselves do not provide insight into where improvements need to be made in the delivery of care across the continuum of care. Three commenters further stated these measures do not give beneficiaries a sense of their financial obligation. A few commenters agreed with CMS' stated intent to interpret the condition-specific payment measures alongside corresponding quality measures, but asserted that adopting the payment and quality measures separately instead of directly linking the information from each measure will not provide an assessment of value. One commenter acknowledged CMS' intent to link the PN Payment and MORT-30-PN measures, but stated there are outcomes other than mortality relevant to understanding the quality and cost of care that pneumonia patients receive in the hospital.

Response: We disagree with the commenters who believed that the PN Payment measure, and condition-specific payment measures more generally, will not provide hospitals with actionable data for quality improvement efforts. By adopting condition-specific payment measures and viewing results alongside quality measure results, we believe that consumers, payers, and providers will be able to better assess the overall value of care provided at a hospital. We also believe that adopting condition-specific payment measures for the Hospital VBP Program that are directly paired with clinical outcome measures, aligned by comparable populations, performance periods, or risk-adjustment methodologies, helps move toward achievement of this goal. We also believe that adopting condition-specific payment measures (for example, the MORT-30-PN measure) will create stronger incentives for appropriately reducing practice pattern variation to achieve the aim of lowering the cost of care and creating better coordinated care for Medicare beneficiaries.

Comment: Two commenters expressed concern that the PN Payment measure's focus on reducing cost will not necessarily lead to or provide measurable proof of improved patient care and outcomes. One commenter expressed concern that focusing on cost-effectiveness will overshadow patients' needs during a care episode. One commenter expressed concern that measures focusing solely on the cost of care without consideration of overall quality create incentives for hospitals to cut costs without consideration of patients' unique needs. The commenter recommended that CMS work with hospitals and other stakeholders to ensure that existing and future episode-based measures align with the objectives of creating efficiency and economy in the Medicare program and to appropriately tailor measures in the Hospital VBP Program to support these objectives.

Response: We understand commenter's concern that condition-specific payment measures, viewed in isolation, may create an incentive for hospitals to focus on reducing costs without accounting for potential impacts on the quality of care provided. We also agree the PN Payment measure as a standalone measure is not designed to assess improvements in patient care or outcomes. However, we note that the Hospital VBP Program explicitly proposed to adopt the PN Payment measure for interpretation alongside the previously finalized MORT-30-PN measure, thereby linking the condition-specific payment measure with a measure of quality of care. We believe that adding the PN Payment measure, paired with the MORT-30-PN measure, will provide actionable feedback to hospitals on the overall value of their services to beneficiaries. In addition, we note that the Hospital VBP Program scoring methodology takes into account both quality and cost of care by weighting the quality domains at 75 percent of a hospital's TPS and the Efficiency and Cost Reduction domain at 25 percent of a hospital's TPS. We thank commenters for the recommendations and note that we have developed, and will continue to develop, efficiency measures in consultation with clinical and measurement experts, key stakeholders (including the hospital community), and the public.

Comment: A few commenters strongly recommended that CMS not include the PN Payment measure because hospital performance on the measure will not be publicly reported until after the public comment period for the FY 2018 IPPS/LTCH PPS proposed rule has ended.

Commenters noted that publicly reporting measures provides transparency on provider performance, allows hospitals to gain experience submitting data for the measure, and allows time to identify errors, unintended consequences, or other concerns with the measure methodology. One commenter asserted that stakeholders are unable to provide sufficient feedback on the PN Payment measure without access to publicly reported data on this measure. One commenter stated that all measures should be publicly reported under the Hospital IQR Program for one year before being considered for inclusion in the Hospital VBP Program.

Response: While we understand stakeholders' desire to see performance data from the PN Payment measure before deciding whether to adopt this measure for the Hospital VBP Program, we note that, as discussed in the FY 2018 IPPS/LTCH PPS proposed rule, the measure has undergone extensive testing and has been determined to be both reliable and valid. Furthermore, we note that the proposed adoption of this measure before its public reporting on *Hospital Compare* did not preclude hospitals from submitting questions and comments on the measure to CMS. Publicly reported PN Payment measure data became available on July 26, 2017, and we encourage hospitals, providers, patients, and other stakeholders to review these data. We further note the PN Payment measure is not proposed for implementation in the Hospital VBP Program until the FY 2022 program year with a performance period of August 1, 2018 through June 30, 2020; we believe the time period before implementation provides hospitals with sufficient time to become familiar with the measure's specifications and reporting requirements before performance on the PN Payment measure is reflected in hospitals' TPSs.

We further disagree that, absent publicly reported performance data, hospitals lack sufficient information to comment on the proposed adoption of the PN Payment measure. In proposing to adopt this measure, CMS provided a full description of the measure's specifications and its development history, explained how the proposal satisfied the requirements of the statute, and provided links to additional sources of in-depth information regarding the detailed specifications for this measure. In addition, performance data for the PN Payment measure using the original cohort has been publicly available for hospitals' review on *Hospital Compare* since July 2015. We therefore believe commenters had sufficient information

to use in reviewing the PN Payment measure, allowing them to comment meaningfully on its proposed adoption.

Comment: One commenter did not support CMS' proposal to adopt the PN Payment measure because the commenter believed CMS lacks a mechanism to provide claims data to hospitals in a timely manner for use in performance improvement activities under the condition-specific payment measure. The commenter further stated that risk-standardized measures are difficult to track using hospitals' internal data due to a lack of insight into care and payments provided outside of the hospital. Another commenter requested that CMS make the claims data for the measure available to hospitals on a more timely basis to allow hospitals to review the current spending per episode and make the necessary changes in improving processes.

Response: We acknowledge the commenter's concern that hospitals' internal data only include care provided at their hospital and the payments made on behalf of the patient for that care, whereas the PN Payment measure is designed to capture the full spectrum of care provided during and for 30 days following the index hospitalization. We therefore provide confidential, hospital-specific reports to each hospital on this and other claims-based outcome measures, which for the payment measures provides hospitals with additional information about care their patients received following discharge. The type of follow-up care patients receive is often influenced by the discharging hospital (for example, discharge to a skilled nursing facility or provision of home health care) which will then impact the cost of care for the 30 days captured by the measure.

We recognize that there is a delay in reporting the claims data because this measure reports hospitals' results on a yearly basis, but we believe using the available annual data would enable hospitals to improve their performance year-over-year. We note that we previously addressed this concern in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53380) in the context of the Hospital Readmissions Reduction Program. In addition, we note that the Hospital VBP Program uses a 90 day "run-out" period following the last date of discharge used in the performance period for purposes of calculating claims-based measure rates (77 FR 53579 through 53580). This "run-out" period balances our desire to provide hospitals with timely quality data for the purpose of quality improvement and the need to have as complete a data set as possible for

measure calculations. After we run the data and create the data extract for purposes of calculating the measure rate for a claims-based measure, it takes several months to incorporate other data needed to complete the rate calculation; generate and check the rate calculations; and program, populate, and deliver the confidential reports and accompanying data to hospitals. As a result, we cannot provide the PN Payment hospital-specific reports earlier than the spring following the end of the performance period.

Comment: One commenter recommended that instead of adding the PN Payment measure to the Hospital VBP Program now, CMS should first examine methods of pairing cost and payment measures so that they signal value to beneficiaries.

Response: We believe that adding the PN Payment measure now will provide actionable feedback to hospitals on the overall value of their services to pneumonia patients as both payment data and mortality data would be made available through the Hospital VBP Program. We note that we solicited comments on methods of accounting for value of care in the Hospital VBP Program scoring methodology in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25105 through 25106), and discussed comments received in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56993 through 56994). We are continuing to evaluate the feasibility of incorporating condition- or procedure-specific assessments of value in the Hospital VBP Program scoring methodology. We also note currently for public reporting purposes our *Hospital Compare* Web site shows individual hospital's results for the payment (AMI, HF, and PN Payment) measures and corresponding mortality measures together to assess the value of care.⁴⁸

Comment: One commenter recommended that CMS develop a plan for incorporating additional measures of efficiency and either focus on condition-specific payment measures or global efficiency measures, without overlapping.

Response: We thank the commenter for this recommendation, and will take this into consideration in future years of the program.

(2) Scoring Methodology for the PN Payment Measure

We proposed to calculate the PN Payment measure using the same methodology we use to score the MSPB measure and, as finalized in the FY

⁴⁸ <https://www.medicare.gov/hospitalcompare/Data/Value-of-care.html>.

2017 IPPS/LTCH PPS final rule (81 FR 56992 through 56993), the AMI Payment and HF Payment measures so that all measures in the Efficiency and Cost Reduction domain are scored in the same manner. We note for these measures that lower values represent better performance.

For achievement points, we proposed to calculate a spending ratio of PN spending for each hospital to the median PN spending across all hospitals during the performance period. We would then use each hospital's PN spending ratio to calculate between 0 and 10 achievement points. We proposed to set the achievement threshold at the median PN spending ratio across all hospitals during the performance period. Because lower values represent better performance under the proposed PN Payment measure, we proposed to set the benchmark at the mean of the lowest decile of the PN spending ratios during the performance period. Therefore, if a hospital's individual PN spending ratio falls above the achievement threshold, the hospital would score 0 achievement points on the measure. If a hospital's individual PN spending ratio falls at or below the benchmark, the hospital would score the maximum 10 achievement points on the measure. If a hospital's individual PN spending ratio falls at or below the achievement threshold but above the benchmark, the hospital would score between 1 and 9 points according to the following formula:

$$[9 * ((\text{achievement threshold} - \text{Hospital's performance period ratio}) / (\text{achievement threshold} - \text{benchmark}))] + 0.5$$

For improvement points, we proposed to calculate a spending ratio of PN spending for each hospital to the median PN spending across all hospitals during the performance period. We would then use each hospital's PN spending ratio to calculate between 0 and 9 improvement points by comparing each hospital's ratio to its own performance during the baseline period. Again, because lower values represent better performance under the proposed PN Payment measure, we proposed to set the benchmark as the mean of the lowest decile of PN spending ratios across all hospitals. Therefore, if a hospital's PN spending ratio is equal to or higher than its baseline period ratio, the hospital would score 0 improvement points on the measure. If a hospital's score on the measure during the performance period is less than its baseline period score but above the benchmark, the hospital

would receive a score of 0 to 9 according to the following formula:

$$[10 * ((\text{Hospital baseline period ratio} - \text{Hospital performance period ratio}) / (\text{Hospital baseline period ratio} - \text{benchmark}))] - 0.5$$

We note that if a hospital scores at or below the benchmark on the achievement scoring methodology, that hospital will receive the maximum 10 points for this measure. As a result, the hospital would not receive an improvement score for this measure.

For more information about the proposed scoring methodology for the proposed PN Payment measure, we refer readers to section IV.B.3.b. of the preamble of the FY 2012 IPPS/LTCH PPS final rule (76 FR 51654 through 51656) where we discuss the MSPB measure's identical scoring methodology in detail.

We invited public comment on the proposed scoring methodology for the proposed PN Payment measure.

We did not receive any public comments specific to the proposed scoring methodology for the proposed PN Payment measure. After considering all of the comments received regarding the proposed adoption of the PN Payment measure in the Hospital VBP Program as discussed above, we are finalizing our proposal to adopt the PN Payment measure beginning with the FY 2022 program year as proposed.

b. New Measure for the FY 2023 Program Year and Subsequent Years: Patient Safety and Adverse Events (Composite) (NQF #0531)

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19973 through 19974), we proposed a new measure for the FY 2023 program year and subsequent years: Patient Safety and Adverse Events (Composite) (NQF #0531).

The current PSI 90 measure previously adopted for the Hospital VBP Program underwent NQF maintenance review and re-endorsement in 2015, leading to several substantive measure changes.⁴⁹ Due to statutory requirements in the Hospital VBP Program,⁵⁰ we were unable to adopt the

newly re-endorsed version of the PSI 90 measure in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56981), but stated our intent to propose to adopt the modified version of the PSI 90 measure in future rulemaking. In section V.J.3.b. of the preamble of this final rule, we discuss our proposal to remove the current PSI 90 measure from the Hospital VBP Program beginning with the FY 2019 program year due to the operational constraints associated with calculating measure scores for the current measure for FY 2019 and subsequent years. Because of the priority of improving patient safety and reducing adverse events during inpatient stays, and with substantive refinements made to the measure in response to feedback as further described below, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19973 through 19974), we proposed to adopt a modified version of the current PSI 90 measure, entitled Patient Safety and Adverse Events (Composite) (NQF #0531), for the Hospital VBP Program for the FY 2023 program year and subsequent years.

The Hospital IQR Program adopted this measure in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57128 through 57133),⁵¹ beginning with the FY 2018 payment determination, and we intend to publicly report initial measure data on the measure on *Hospital Compare* in the fall of 2017. The full measure specifications are available at: https://www.qualityindicators.ahrq.gov/Modules/PSI_TechSpec_ICD09_v60.aspx.

The Patient Safety and Adverse Events (Composite) measure is a weighted average of the reliability-adjusted, indirectly standardized, observed-to-expected ratios for the following 10 individual PSI component indicators:

- PSI 03 Pressure Ulcer Rate;
- PSI 06 Iatrogenic Pneumothorax Rate;
- PSI 08 In-Hospital Fall with Hip Fracture Rate;⁵²
- PSI 09 Perioperative Hemorrhage or Hematoma Rate; *

Second, section 1886(o)(2)(C)(i) of the Act requires the Hospital VBP Program to refrain from beginning the performance period for a new measure until data on the measure have been posted on *Hospital Compare* for at least one year. Finally, section 1886(o)(3)(C) of the Act requires that the Hospital VBP Program establish performance standards for each measure not later than 60 days prior to the beginning of the performance period.

⁵¹ We note that the HAC Reduction Program also adopted this measure in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57013 through 57030).

⁵² Previously titled "Postoperative Hip Fracture" prior to v6.0.

⁴⁹ National Quality Forum QPS Measure Description for "Patient Safety for Selected Indicators (modified version of PSI 90) (Composite Measure)" found at: <https://www.qualityforum.org/QPS/MeasureDetails.aspx?standardID=321&print=0&entityTypeID=3>; and PSI 90 Fact Sheet found at: http://www.qualityindicators.ahrq.gov/News/PSI90_Factsheet_FAQ_v2.pdf (we note that this fact sheet is written from an all-payer perspective, and is therefore not limited to the measure as used in the Medicare FFS population).

⁵⁰ First, section 1886(o)(2)(A) of the Act requires the Hospital VBP Program to select measures that have been specified for the Hospital IQR Program.

- PSI 10 Postoperative Acute Kidney Injury Requiring Dialysis Rate;⁵³
- PSI 11 Postoperative Respiratory Failure Rate;^{*}
 - PSI 12 Perioperative Pulmonary Embolism (PE) or Deep Vein Thrombosis (DVT) Rate;
 - PSI 13 Postoperative Sepsis Rate;
 - PSI 14 Postoperative Wound Dehiscence Rate; and
 - PSI 15 Unrecognized Abdominopelvic Accidental Puncture/Laceration Rate.^{54 55}

(* Denotes new component for the Patient Safety and Adverse Events (Composite) measure)

The Patient Safety and Adverse Events (Composite) measure no longer includes PSI 07 Central Venous Catheter-Related Blood Stream Infection Rate, because of potential overlap with the CLABSI measure (NQF #0139), which has been included in the Hospital VBP Program since the FY 2013 IPPS/LTCH PPS final rule (77 FR 53597 through 53598).

The measure is calculated using administrative claims data. Like the previously adopted PSI 90 measure, under the Patient Safety and Adverse Events (Composite) measure, the predicted value for each case is computed using a Generalized Estimating Equation hierarchical modeling approach that adjusts for demographic and clinical characteristics. The expected rate for each of the indicators is computed as the sum of the predicted value for each case divided by the number of cases for the unit of analysis of interest (that is, the hospital). The risk-adjusted rate for each of the indicators is computed using indirect standardization as the observed rate divided by the expected rate, multiplied by the reference population rate.⁵⁶

As stated above, the previously adopted eight-indicator version of the PSI 90 measure underwent an extended NQF maintenance re-endorsement in the 2014 NQF Patient Safety Committee. In its final report, the NQF Patient Safety Committee deferred their final decision for the PSI 90 measure until the following measure evaluation

cycle.⁵⁷ Following this report, AHRQ worked to address many of the NQF stakeholders' concerns about the PSI 90 measure, and subsequently completed NQF maintenance re-review and received re-endorsement on December 10, 2015. As a result of this process, the current PSI 90 measure's NQF maintenance re-endorsement led to several changes to the measure, specifically: A change to the measure name; the addition of three indicators; the removal of one indicator; the re-specification of two indicators; and a revision to the weighting of component indicators.⁵⁸ For more information on the proposed Patient Safety and Adverse Events (Composite) measure and component indicators, we refer readers to the AHRQ Quality Indicators Web site available at:

www.qualityindicators.ahrq.gov.

We continue to believe the PSI 90 measure is an important measure of patient safety, addressing the NQS priority and CMS Quality Strategy goal to make care safer, and that these modifications help broaden and strengthen the measure. We expect inclusion of the Patient Safety and Adverse Events (Composite) measure in the Hospital VBP Program will encourage improvement in patient safety over the long-term for all hospitals. Conditions such as perioperative hemorrhage, postoperative respiratory failure, pressure ulcers, and other complications or conditions that arise after a patient was admitted to the hospital for the treatment of another condition are often preventable, and cost Medicare and the private sector billions of dollars each year and take a significant toll on patients and families. In most cases, hospitals can prevent these conditions when they follow protocols, procedures, and evidence-based guidelines. We anticipate the Patient Safety and Adverse Events (Composite) measure will provide actionable information and specific direction for prevention of patient safety events, because hospitals can track and monitor individual PSI rates and develop targeted improvements to patient safety using this measure data.⁵⁹

We proposed to adopt the Patient Safety and Adverse Events (Composite) measure for the Hospital VBP Program beginning with the FY 2023 program year because we believe the measure would continue to create strong incentives for hospitals to ensure that patients are not harmed by the medical care they receive, which is a critical consideration in quality improvement. We also proposed that the measure would be added to the Safety domain, like the previously adopted PSI 90 measure that we proposed to remove in section V.J.3.b. of the preamble of the proposed rule. The Patient Safety and Adverse Events (Composite) measure fulfills all statutory requirements for the Hospital VBP Program based on our adoption of that measure in the Hospital IQR Program and the anticipated posting of measure data on *Hospital Compare* at least 1 year prior to the start of the proposed measure performance period. The Patient Safety and Adverse Events (Composite) measure (MUC15–604) was included on the “List of Measures Under Consideration for December 1, 2015”⁶⁰ and received support from the MAP, which noted the importance of safety measures for the Hospital VBP Program.⁶¹ Therefore, we proposed to add the Patient Safety and Adverse Events (Composite) measure to the Safety domain for the FY 2023 program year and subsequent years.

We invited public comment on this proposal.

Comment: A number of commenters supported CMS' proposal to adopt the Patient Safety and Adverse Events (Composite) measure because it was updated using the NQF maintenance re-endorsement process; the measure aligns with CMS' priority to improve patient safety and reduce adverse events during patient stays; and the measure is used in other programs and adopting it for the Hospital VBP Program would align quality measures across programs. Some commenters strongly supported adoption of the Patient Safety and Adverse Events (Composite) measure, but expressed concern that the Hospital VBP Program will lack a patient safety composite measure between the FY

2019 and FY 2023 program years. Commenter urged CMS to look for opportunities to advance use of this measure in the Hospital VBP Program prior to the FY 2023 program year, or look to include other available measures to ensure that surgical complications remain a key component of the Hospital VBP Program.

Response: We thank the commenters for their support. As discussed in section V.J.3.b. of the preamble of this final rule, above, we will be unable to calculate measure scores for the current PSI 90 measure in the FY 2019 program year or a subsequent year because ICD-10 AHRQ PSI software for the currently adopted measure will not be available. Furthermore, due to certain statutory requirements in the Hospital VBP Program, we are unable to adopt the proposed Patient Safety and Adverse Events (Composite) measure earlier than the FY 2023 program year. Section 1886(o)(2)(A) of the Act requires the Hospital VBP Program to select measures that have been specified for the Hospital IQR Program. In addition, section 1886(o)(2)(C)(i) of the Act requires the Hospital VBP Program to refrain from beginning the performance period for a new measure until data on the measure have been posted on *Hospital Compare* for at least one year. The Hospital IQR Program finalized adoption of the modified PSI 90 measure (also known as the Patient Safety and Adverse Events (Composite) measure) in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57133), and we are required to wait one full year after data has been posted before that measure's performance period may begin in the Hospital VBP Program. Because measure data for the Patient Safety and Adverse Events (Composite) measure has not been posted on *Hospital Compare*, and because AHRQ requires sufficient time to develop the ICD-10 AHRQ PSI software for a given year, we are unable to adopt the measure before the FY 2023 program year.

We agree with commenters that surgical complications remain a key concern to address within our quality programs, including the Hospital VBP Program, and note that the NHSN measures will continue in the Safety domain of the Hospital VBP Program. We note that information on hospital performance on the Patient Safety and Adverse Events (Composite) measure will be publicly available through the Hospital IQR Program beginning in the fall of 2017. In addition, the HAC Reduction Program, which is not subject to the same statutory requirements as the Hospital VBP Program, will use this measure beginning with the FY 2018

program year. We believe earlier inclusion of this measure in the HAC Reduction Program will help incentivize hospitals to reduce patient safety events until the measure can be implemented in the Hospital VBP Program.

Comment: Many commenters strongly recommended that CMS not include the Patient Safety and Adverse Events (Composite) measure because hospital performance on the measure will not be publicly reported until after the comment period has ended. A number of these commenters noted that publicly reporting measures: Provides transparency on provider performance; allows hospitals to gain experience submitting data and become familiar with the measure's refinements and use of ICD-10 codes; allows time to identify errors and unintended consequences; and informs CMS and the measure developer of any implementation concerns. Some commenters further asserted that all measures should be publicly reported under the Hospital IQR Program for one year before being considered for inclusion in the Hospital VBP Program. One commenter asserted that stakeholders are unable to provide sufficient feedback on the proposed Patient Safety and Adverse Events measure without access to publicly reported measure data from the Hospital IQR Program. For these reasons, commenters urged CMS to postpone finalizing this measure for the Hospital VBP Program until stakeholders have sufficient data to review this measure to determine the appropriateness of the Patient Safety and Adverse Events (Composite) measure in the Hospital VBP Program.

Response: While we understand stakeholders' desire to see performance data from the Patient Safety and Adverse Events (Composite) measure before commenting on whether this measure should be adopted for the Hospital VBP Program, we note that, as discussed in the FY 2018 IPPS/LTCH PPS proposed rule, the measure has undergone extensive testing and found to be both reliable and valid. Furthermore, we note that adoption of this measure before its public reporting on *Hospital Compare* does not preclude hospitals from submitting questions and comments on the measure to CMS. Publicly reported Patient Safety and Adverse Events (Composite) measure data will be available in the fall of 2017, and we encourage hospitals, providers, patients, and other stakeholders to review these data and contact CMS with any questions regarding their measure scores. We further note the Patient Safety and Adverse Events (Composite) measure is being finalized for

implementation in the Hospital VBP Program for the FY 2023 program year with a performance period of July 1, 2019 through June 30, 2021; we believe the time period before implementation provides hospitals with sufficient time to become familiar with the measure's specifications and reporting requirements before performance on the Patient Safety and Adverse Events (Composite) measure is reflected in hospitals' TPSs.

We further disagree that, absent publicly reported performance data, hospitals lack sufficient information to sufficiently comment on the proposed adoption of the Patient Safety and Adverse Events (Composite) measure. In proposing to adopt this measure, CMS provided a full description of the measure's specifications and its development history, explained the satisfaction of all statutorily-required actions, and provided links to additional sources of in-depth information regarding the detailed specifications for this measure. In addition, seven of the ten Patient Safety and Adverse Event (Composite) component indicators were also included in the previously adopted PSI 90 measure. We therefore believe commenters had ample information to use in reviewing the Patient Safety and Adverse Events (Composite) measure, allowing them to comment meaningfully on its proposed adoption.

Comment: A number of commenters did not support CMS' proposal to adopt the Patient Safety and Adverse Events (Composite) measure because the measure is subject to reliability and accuracy concerns; commenters believe the measure will not provide accurate, meaningful, actionable data on hospital safety performance; and commenters believe the measure is not sufficiently risk-adjusted for patient characteristics. Two commenters asserted that the proposed Patient Safety and Adverse Events (Composite) measure is flawed, stating that, according to the developer, the measure was not meant to be used in pay-for-performance programs. One commenter expressed concern regarding CMS' proposal to use a composite measure of patient safety, because the commenter believes composite measures limit the ability of a hospital to identify the specific component of the composite measure causing them to fall out of compliance. Another commenter believed it was likely that the PSI 90 measure will undergo additional updates before the FY 2023 program year, which would render this measure proposal outdated before the measure's implementation.

Response: We disagree with commenters that the Patient Safety and Adverse Events (Composite) measure has not demonstrated that it is an accurate, reliable, and valid indicator of quality and safety of care that is adequately risk-adjusted. Over the past decade, AHRQ has supported a series of validation studies based on detailed abstraction of medical records.⁶² These studies informed AHRQ's PSI development process, including further refinements to the indicators, working with others to improve coding practices, and retirement of a few indicators. Furthermore, many of these claims-based indicators have been endorsed by the NQF, which includes a review process that assesses reliability and validity.⁶³ We note that NQF endorsed the Patient Safety and Adverse Events (Composite) measure (NQF #0531), including the risk-adjustment methodology of the component indicators, as reliable and valid. Further, we believe this measure does provide actionable information and specific direction for prevention of patient safety events, because hospitals can track and monitor individual PSI rates and develop targeted improvements to improve patient safety. For further guidance on PSI monitoring and strategies for applying quality improvements to PSI data, we refer readers to the Toolkit for Using the AHRQ quality indicators available at: <http://www.ahrq.gov/professionals/systems/hospital/qitoolkit/index.html>.

While we do not anticipate any further updates to the Patient Safety and Adverse Events (Composite) measure at this time, we acknowledge that the measure may undergo additional updates in the future as part of measure maintenance. Depending on the nature of these updates and their applicability to the Hospital VBP Program's aims, we will determine how best to address them in future years of the program.

Comment: Several commenters did not support adoption of the Patient Safety and Adverse Events (Composite) measure because it is susceptible to surveillance bias; measures components that occur infrequently or may not be preventable through evidence-based

practices; lacks appropriate and necessary exclusions associated primarily with large academic centers; and is based on administrative claims data that does not fully reflect a patient's history, course of care, and clinical risk factors and therefore impacts the measure's ability to draw meaningful conclusions about hospital performance on safety issues. Some commenters also believe that it may disproportionately impact teaching hospitals because they tend to have robust infection control programs and are therefore more likely to identify patient safety events.

Response: While we acknowledge commenters' concerns, administrative claims data are valid for quality measurement and significantly less burdensome on hospitals for quality reporting. We note that there are previously conducted studies that validate the relationship between administrative claims data and medical records.⁶⁴ These studies demonstrate that administrative claims data can provide sufficient clinical information to assess patient safety. We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50091) for a further discussion of this issue in the context of the HAC Reduction Program.

We also acknowledge commenters' concern regarding the impact of surveillance bias, but note that there is little evidence that hospitals that may have a less robust surveillance program or underreport diagnoses for the PSI 90 indicators. Further, the measure exhibits a high degree of sensitivity (true positives, or the proportion of positives that are correctively identified as such) with respect to indicator diagnoses among hospitals. In addition, we note that many teaching hospitals do as well or better on the measure than non-teaching hospitals, and many of the patient safety indicator components are preventable through evidence-based practices. We have previously addressed commenters' concerns regarding the use of administrative claims, coding issues, and the impact on academic hospitals. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50684) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50064) for this discussion.

Comment: One commenter expressed particular concern about the vulnerability of PSI 12 (Perioperative PE or DVT Rate) to surveillance bias, because hospitals with more

sophisticated tools to identify and track venous thromboembolism (VTE) show higher rates of VTE and may therefore be penalized for doing a better job at detection. Commenter stated that performance on PSI 12 may reflect differences in VTE imaging use rather than differences in the quality of care, and the inclusion of PSI 12 in the Patient Safety and Adverse Events (Composite) measure could unfairly penalize hospitals with increased vigilance in VTE detection.

Response: CMS and AHRQ recognize the commenter's concerns about surveillance bias for PSI 12, and note this issue was addressed in the NQF Patient Safety Steering Committee in 2015. Several research teams have examined DVT and PE rates and surveillance bias.⁶⁵ However, studies have not specifically examined whether the observed rates reflect underdiagnosis of DVT or PE at low-testing hospitals, or the underlying true incidence of symptomatic DVT or PE, and there is no evidence currently available to support the hypothesis that increased vigilance in DVT or PE detection is desirable from the perspective of patients and their families. Thus, while we acknowledge commenter's concerns regarding surveillance bias, we believe the PSI 12 is an important component indicator of the Patient Safety and Adverse Events (Composite) measure because it encourages hospitals not only to prevent DVT or PE, but also to appropriately assess a patient's risk for DVT and PE to prevent over-diagnosis and underdiagnosis.

Comment: Several commenters expressed concern that the timing and operational difficulties associated with procuring the AHRQ software hospitals need in order to calculate their own scores makes it impossible for hospitals to use this measure for internal quality improvement activities. Two commenters recommended that CMS delay adoption of the Patient Safety and Adverse Events (Composite) measure until the measure and associated software have been developed and validated in order to provide hospitals time to acquire the AHRQ software required to assess hospital performance on an ongoing basis and inform intervention strategies.

Association between inpatient surveillance and venous thromboembolism rates after hospital discharge. *JAMA Surg*. 2015;150(6):520–527.

Response: We appreciate commenters' commitment to continuous monitoring of performance. We understand that it is imperative for hospitals to monitor performance in an ongoing manner, and we are working with AHRQ to have the risk-adjusted software available as soon as possible. For more information on the release plan for ICD-10 risk adjusted software, we refer commenters to the AHRQ Quality Indicators Software page available at: <http://www.qualityindicators.ahrq.gov/Software/Default.aspx>.

Comment: Two commenters did not support CMS' proposal to adopt the Patient Safety and Adverse Events (Composite) measure beginning with the FY 2023 program year because this measure has already been adopted for the HAC Reduction Program, and adopting this measure for Hospital VBP would result in double counting of measure scores across programs.

Response: While we acknowledge that there is some overlap in quality measures between the Hospital VBP Program and the HAC Reduction Program, we note that these measures cover topics of critical importance to quality improvement and patient safety in the inpatient hospital setting. We selected these quality measures because we believe that hospital acquired condition measures comprise some of the most critical patient safety areas. These measures track infections and adverse events that could cause significant health risks to Medicare beneficiaries, and we believe it is appropriate to provide incentives for hospitals to avoid them under more than one program.

We further stress that the HAC Reduction Program and the Hospital VBP Program are separate programs with different purposes and policy goals. The HAC Reduction Program reduces payments to hospitals for excess hospital acquired conditions to increase patient safety in hospitals. On the other hand, the Hospital VBP Program is an incentive program that redistributes a portion of the Medicare payments made to hospitals based on their performance on a variety of measures, including safety measures, in order to provide a more holistic assessment of hospitals' quality of care. Accordingly, we believe that the critical importance of these measures to patient safety warrants their inclusion in both programs. We will, in the future, continue to monitor the HAC Reduction Program and Hospital VBP Program and analyze the impact of our measures selection, including any unintended consequences with having a measure in more than one program, and

will revise the measure set in one or both programs if needed.

Comment: A few commenters did not support adoption of the Patient Safety and Adverse Events (Composite) measure because the first performance periods for the Patient Safety and Adverse Event (Composite) measure data that involve the use of ICD-10-CM data in the Hospital IQR Program did not end until June 30, 2017, and hospitals will see initial performance scores once CMS performs those calculations for FY 2019. Commenters noted the transition from ICD-9-CM to ICD-10-CM resulted in a number of issues with the previous PSI 90 measure, and therefore recommended CMS delay finalizing adoption of the measure in order to allow hospitals time to review their performance data and identify any issues with the Patient Safety and Adverse Events (Composite) measure's specifications.

Response: We thank the commenter for their recommendation, but note that one of the factors in our decision to delay the use of ICD-10 claims data for this measure in the Hospital IQR Program until the FY 2019 payment determination was to allow for the necessary time for AHRQ to create a risk-adjusted software version. While we are not aware that the transition to ICD-10-CM/PCS codes has currently caused inaccuracies in PSI reporting and evaluation, we are actively monitoring for any potential issues related to ICD-10 conversion. We note that all measure specifications for the Patient Safety and Adverse Events (Composite) measure have been translated to and updated for corresponding ICD-10 code specifications; these changes for ICD-10-CM/PCS conversion of AHRQ's patient safety indicators are available at: http://www.qualityindicators.ahrq.gov/FAQs_Support/FAQ_QI.aspx#.

We further note that AHRQ welcomes input from the user community on the AHRQ PSI ICD-10-CM/PCS software. Please provide suggestions and comments directly to: QISupport@ahrq.hhs.gov.

Comment: One commenter requested additional information about how performance for selected indicators under the Patient Safety and Adverse Events (Composite) measure will be assessed for conditions where a hospital's expected rate of a given safety event is less than 1.0. A second commenter strongly recommended CMS revisit the scoring methodology for the Patient Safety and Adverse Events (Composite) measure because hospitals that have been effective in driving down infection rates to below 1.0 are, in effect,

penalized by the measure not being scored, rather than being rewarded for their work.

Response: The Patient Safety and Adverse Events (Composite) measure does not use minimum criteria as described in commenters' comments; we therefore interpret commenters' reference to expected rates of safety events less than 1.0 to refer to the minimum precision criteria for the NHSN HAI measures, that is, at least one predicted infection for a reporting period for the measure result to be reported. We would note the Patient Safety and Adverse Events (Composite) measure requires that hospitals have a minimum of three eligible cases on any one underlying indicator during the baseline period in order to receive an improvement score and three eligible cases on any one underlying indicator during performance period in order to receive an improvement or achievement score. For the purposes of the Patient Safety and Adverse Events (Composite) measure, a case is "eligible" for a given indicator if it meets the criterion for inclusion in the indicator measure population. This minimum number of cases is based on AHRQ's methodology for scoring performance on the Patient Safety and Adverse Events (Composite) measure. Under this methodology, all hospitals that meet the case minimum will be scored based on their performance on this measure, and those that do not meet the case minimum will not receive a score for that component indicator. In addition, a hospital will be eligible to receive a score on the Patient Safety and Adverse Events (Composite) measure if they meet the case minimum criteria for at least one component indicator. We note that this case minimum applies to all hospitals, including those that experience zero numerator events during the performance period. Therefore, a hospital that meets the case minimum for a given component indicator but experiences zero numerator events will still receive a score on that component indicator.

Comment: Two commenters recommended that CMS consider replacing the current PSI 90 measure with objective, clinical outcome measures from the CDC's National Healthcare Safety Network.

Response: We thank the commenters for their recommendation, and we will take this into consideration in the future. We note that the Hospital VBP Program has adopted a number of NHSN-based measures in previous years, including the CLABSI, CAUTI, CDI, Colon and the Abdominal

Hysterectomy SSI, and MRSA Bacteremia measures.

Comment: A few commenters urged CMS to remove PSI 03 (Pressure Ulcer Rate) from the Patient Safety and Adverse Events (Composite) measure because pressure ulcers are complex and may not be appropriately captured under the composite measure. In the alternative, commenters recommended that CMS adopt the Percent of Residents or Patients with Pressure Ulcers that are New or Worsened (NQF #0678) measure for the Hospital VBP Program.

Response: We thank the commenters for their recommendation; however, we believe it is appropriate to use the PSI 03 indicator in the Patient Safety and Adverse Events (Composite) measure for the Hospital VBP Program because none of the measures previously adopted for the program capture pressure ulcer or injury data. The recommended measure, Percent of Residents or Patients with Pressure Ulcers that are New or Worsened (NQF #0678), is not currently specified for use in the acute, inpatient hospital setting of care.⁶⁶ In addition, this measure is also collected via chart abstraction, and we believe the additional reporting burden on hospitals for this measure currently outweighs the benefit of collecting this data in the inpatient hospital setting when the PSI 03 indicator in the Patient Safety and Adverse Events (Composite) measure is available for use and hospitals are familiar with this indicator. Furthermore, due to the statutory requirements of the Hospital VBP Program, we are unable to adopt the recommended measure at this time. However, if the same or similar measure that is specified for the acute, inpatient hospital setting becomes available, we will consider the measure for future program years.

After consideration of the public comments we received, we are finalizing our proposal to adopt the Patient Safety and Adverse Events (Composite) measure beginning with the FY 2023 program year.

5. Previously Adopted and Newly Finalized Baseline and Performance Periods

a. Background

Section 1886(o)(4) of the Act requires the Secretary to establish a performance period for the Hospital VBP Program that begins and ends prior to the beginning of such fiscal year. We refer

readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49561 through 49562) for the baseline and performance periods for the Clinical Care, Person and Community Engagement, Safety, and Efficiency and Cost Reduction domains that we have adopted for the FY 2018 program year. We refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 56998 through 57003) for additional baseline and performance periods that we have adopted for the FY 2018, FY 2019, FY 2020, FY 2021 and FY 2022 program years. Although in past rulemaking we have proposed and adopted a new baseline and performance period for each program year for each measure in each final rule, in the FY 2017 IPPS/LTCH PPS final rule, we finalized a schedule for all future baseline and performance periods.

b. Person and Community Engagement Domain

Since the FY 2015 program year, we have adopted a 12-month baseline period and 12-month performance period for measures in the Person and Community Engagement domain (previously referred to as the Patient- and Caregiver-Centered Experience of Care/Care Coordination domain) (77 FR 53598; 78 FR 50692; 79 FR 50072; 80 FR 49561). In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56998), we finalized our proposal to adopt a 12-month performance period for the Person and Community Engagement domain that runs on the calendar year two years prior to the applicable program year and a 12-month baseline period that runs on the calendar year four years prior to the applicable program year, for the FY 2019 program year and subsequent years.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19974 through 19775), we did not propose any changes to these policies.

c. Efficiency and Cost Reduction Domain

(1) MSPB Measure

Since the FY 2016 program year, we have adopted a 12-month baseline period and 12-month performance period for the MSPB measure in the Efficiency and Cost Reduction domain (78 FR 50692; 79 FR 50072; 80 FR 49562). In the FY 2017 IPPS/LTCH PPS final rule, we finalized our proposal to adopt a 12-month performance period for the MSPB measure that runs on the calendar year two years prior to the applicable program year and a 12-month baseline period that runs on the calendar year four years prior to the

applicable program year for the FY 2019 program year and subsequent years (81 FR 56998).

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19775), we did not propose any changes to these policies.

(2) AMI Payment and HF Payment Measures

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56999), we adopted a 24-month performance period and a 36-month baseline period for the AMI Payment and HF Payment measures for the FY 2021 program year. We did so in order to adopt the measures as early as feasible into the Hospital VBP Program, and stated our belief that using a 24-month performance period rather than a 36-month performance period for the first program year of these measures would still enable us to accurately assess the quality of care provided by hospitals and would not substantially change a hospital's performance on the measure (81 FR 56998 through 56999). In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19975), we did not propose any changes to the length of these performance or baseline periods for the FY 2021 program year.

In the FY 2017 IPPS/LTCH PPS final rule, we also adopted a 36-month performance period and 36-month baseline period for the AMI Payment and HF Payment measures for the FY 2022 program year (81 FR 57000). In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19975), we did not propose any changes to the length of these performance or baseline periods for the FY 2022 program year.

For the FY 2023 program year and subsequent years, we proposed it would be appropriate to use a 36-month performance period and 36-month baseline period for the AMI Payment and HF Payment measures as we have adopted for the FY 2022 program year. Therefore, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19975), for the FY 2023 program year and subsequent years, we proposed to adopt a 36-month performance period that runs from July 1st five years prior to the applicable fiscal program year to June 30th two years prior to the applicable fiscal program year. We also proposed to adopt a 36-month baseline period that runs from July 1, 10 years prior to the applicable fiscal program year, to June 30, 7 years prior to the applicable fiscal program year.

We invited public comment on these proposals.

Comment: One commenter supported CMS' proposal to adopt 36-month performance and baseline periods for the AMI and HF Payment measures.

⁶⁶ National Quality Forum. "0678: Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (Short-Stay)." Available at: <https://www.qualityforum.org/QPS/QPSTool.aspx> after searching "0678."

Response: We thank the commenter for their support.

Comment: Two commenters urged CMS to reevaluate the length of time between the baseline period, performance period, and payment implications of the AMI and HF Payment measures because commenters believed using a baseline period that begins 10 years prior to the program year would fail to provide relevant data to CMS on hospital performance.

Response: We use a three-year period of index admissions for the PN Payment measure in order to increase the number of cases per hospital used for measure calculation, which improves the precision of each hospital's measure rate. As a result, the baseline and performance periods cover a much longer period of time than used in other measures, and are further in time from the payment impacts for a given program year. Although this approach utilizes older data, it also identifies more variation in hospital performance and still allows for improvement from one year of reporting to the next. We decided to use the proposed timeframe because it balances the need for the most recent claims and sufficient time to process the claims data and calculate the measures to meet the program's timelines.

After consideration of the public comments we received, we are finalizing the baseline and performance periods for the AMI and HF Payment measures as proposed.

(3) PN Payment Measure in the FY 2022 Program Year

As discussed in section V.J.4.a. of the preamble of this final rule, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19971 through 19973), we proposed a new PN Payment measure for the FY 2022 program year and subsequent years. In order to adopt this measure as early as feasible into the Hospital VBP Program, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19975 through 19976), we proposed to adopt a 36-month baseline period and a 23-month performance period. We proposed to adopt a 23-month performance period because we anticipate that the refined measure will not be posted on *Hospital Compare* for one year until July 2017. Therefore, for the FY 2022 program year, we proposed to adopt a 23-month performance period that runs from August 1, 2018 to June 30, 2020 and a baseline period that runs from July 1, 2013 to June 30, 2016.

We believe that using a 23-month performance period for the proposed PN Payment measure, rather than a 36-month performance period, in the FY

2022 program year would accurately assess the quality of care provided by hospitals and would not substantially change hospitals' performance on the measure. To determine the viability of using a 23-month performance period to calculate the proposed PN Payment measure's scores, we compared the measure score reliability for a 24-month and 36-month performance period. We calculated the Intraclass Correlation Coefficient (ICC) to determine the extent to which assessment of a hospital using different but randomly selected subsets of patients produces similar measures of hospital performance.⁶⁷ We calculated the risk-standardized payment (RSP) using a random split-sample of a 36-month performance period (we used July 1, 2013 through June 30, 2016) and a random split-sample of a 24-month performance period (we used July 1, 2013 through June 30, 2015).

For both the 36-month and 24-month performance period, we obtained two RSPs for each hospital, using an entirely distinct set of patients from the same time period. If the RSPs for both the 36-month and 24-month performance periods agree, we can demonstrate that the measure assesses the quality of the hospital rather than the types of patients treated. To calculate agreement between these measure subsets, we calculated the ICC (2,1)⁶⁸ for both the 36-month and 24-month performance periods.

For the proposed PN Payment measure, there were 1,170,762 index admissions and 3,242 hospitals that met the minimum case threshold for reporting a measure result (at least 25 cases) in the 36-month performance period. There were 787,817 index admissions and 3,218 hospitals that met the minimum case threshold for reporting a measure result in the 24-month performance period.

For the 36-month performance period, the ICC for the two independent assessments of each hospital was 0.868. For the 24-month performance period, the ICC for the two independent assessments of each hospital was 0.834. Therefore, the data subsets showcase "substantial" agreement of hospital performance, and we can demonstrate that, even with a shortened performance period, the proposed PN Payment measure assesses the quality of care provided at a hospital rather than the

types of patients that these hospitals treat.⁶⁹

To assess whether using fewer than 36 months of data change the performance in the same hospital, we compared the percent change in a hospital's predicted/expected (P/E) ratio using 24 months of data. For hospitals that met the minimum case threshold in the 24-month performance period, the median percent change was 0.11 percent (with an interquartile range of -1.5 percent to 0.07 percent). These results suggest minimal difference in same-hospital performance when using a 24-month measurement period. Based on these analyses, we are confident that using a 23-month performance period will result in reliable measure scores because our analysis demonstrates strong reliability at 24 months and we believe the change in available data due to a one month difference in the performance period is insufficient to substantially impact the measure's reliability.

In summary, based on the analysis described above, we are confident that using a 23-month performance period, rather than 36-month performance period, for the initial performance period for this measure would accurately assess the quality of care provided by that hospital and would not substantially change the hospital's performance on that measure.

We invited public comment on these proposals.

Comment: One commenter requested that CMS consider reducing the performance period for the PN Payment measure from three years to one year.

Response: As noted above, our goal is to use a three-year period of index admissions for the PN Payment measure in order to increase the number of cases per hospital used for measure calculation, which improves the precision of each hospital's measure rate. Although this approach utilizes older data, it also identifies more variation in hospital performance and still allows for improvement from one year of reporting to the next.

Comment: One commenter recommended that, if CMS finalizes adoption of the PN Payment measure, CMS delay implementation of the measure until a 36-month performance period can be adopted for this measure because the commenter believes that having a performance period that is different from the performance period used for other condition-specific measures is confusing for providers and patients.

⁶⁷ Shrout P, Fleiss J. Intraclass Correlations: Uses in Assessing Rater Reliability. *Psychol. Bull.* Mar 1979;86(2):420-428.

⁶⁸ Shrout P, Fleiss J. Intraclass Correlations: Uses in Assessing Rater Reliability. *Psychol. Bull.* Mar 1979;86(2):420-428.

⁶⁹ Landis J, Joch G. The Measurement of Observer Agreement for Categorical Data. *Biometrics.* Mar 1997;33(1):159-174.

Response: We continue to believe that the 23-month performance period for the FY 2022 program year and 35-month performance period for the FY 2023 program year are sufficiently reliable to accurately assess the resource use by hospitals and would not substantially change hospitals' performance on the measure. We note that the PN Payment measure will only have an abbreviated performance period in the FY 2022 and FY 2023 program years, the first two years this measure is in the program, but we are adopting a 36-month performance period for the FY 2024 program year and subsequent years, as detailed in the next section below.

After consideration of the public comments we received, we are finalizing the baseline and performance periods for the PN Payment measure for the FY 2022 program year as proposed.

(4) PN Payment Measure in the FY 2023 Program Year

We have stated in past rules that we would strive to adopt 36-month performance periods and baseline periods when possible to accommodate the time needed to process measure data and to ensure that we collect enough measure data for reliable performance scoring for all mortality measures (78 FR 50074; 79 FR 50057; and 80 FR 49588). While we cannot adopt a 36-month performance period for the FY 2023 program year because we anticipate that the refined measure will not be posted on *Hospital Compare* for 1 year until July 2017, we could lengthen the PN Payment measure performance period from 23 months to 35 months. As demonstrated above, our analysis of the proposed PN Payment measure indicates that the measure would produce reliable measure scores using 24 months of data as well as 36 months of data. As such, we are confident they will also be reliable when calculated using 35 months of data for the performance period for the FY 2023 program year. Therefore, for the FY 2023 program year, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19776), we proposed to adopt a 35-month performance period that runs from August 1, 2018 to June 30, 2021 and a 36-month baseline period that runs from July 1, 2013 to June 30, 2016.

We invited public comment on these proposals. We did not receive public comments on the proposed baseline and performance periods for the PN Payment measure for the FY 2023 program year and subsequent years. We are finalizing the baseline and performance periods for the PN Payment measure for the FY 2023 program year as proposed.

(5) PN Payment Measure in the FY 2024 Program Year and Subsequent Years

For the FY 2024 program year and subsequent years, we believe it would be appropriate to use a 36-month performance period and 36-month baseline period for the PN Payment measure. Therefore, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19976), for the FY 2024 program year and subsequent years, we proposed to adopt a 36-month baseline period and a 36-month performance period for the proposed PN Payment measure. Specifically, we proposed to adopt a 36-month performance period that runs from July 1, 5 years prior to the applicable fiscal program year, to June 30, 2 years prior to the applicable fiscal program year and a 36-month baseline period that runs from July 1, 10 years prior to the applicable fiscal program year, to June 30, 7 years prior to the applicable fiscal program year.

We invited public comment on these proposals. We did not receive public comments on the proposed baseline and performance periods for the PN Payment measure for the FY 2024 program year and subsequent years. We are finalizing the baseline and performance periods for FY 2024 and subsequent years as proposed.

d. Safety Domain

(1) Previously Adopted Measures in the Safety Domain

Since the FY 2016 program year, we have adopted a 12-month baseline period and 12-month performance period for all measures in the Safety domain, with the exception of the PSI 90 measure (78 FR 50692; 79 FR 50071; 80 FR 49562). In the FY 2017 IPPS/LTCH PPS final rule, we finalized our proposal to adopt a performance period for all measures in the Safety domain—with the exception of the PSI 90 measure, as discussed in more detail below—that runs on the calendar year 2 years prior to the applicable program year and a baseline period that runs on the calendar year 4 years prior to the applicable program year for the FY 2019 program year and subsequent program years (81 FR 57000).

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19976), we did not propose any changes to these policies.

(2) Patient Safety and Adverse Events (Composite) Measure in the FY 2023 Program Year

As discussed above in section V.J.3.b. of the preamble of this final rule, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19970), we proposed to remove the currently adopted PSI 90 measure

beginning with the FY 2019 program year, and in section V.J.4.b. of the preamble of this final rule, we discuss our proposal to adopt the Patient Safety and Adverse Events (Composite) measure beginning with the FY 2023 program year. In order to adopt the Patient Safety and Adverse Events (Composite) measure as early as feasible into the Hospital VBP Program, we proposed to adopt a 21-month baseline period and 24-month performance period for the measure for the FY 2023 program year. Specifically, we proposed to adopt a performance period that runs from July 1, 2019 to June 30, 2021, and a baseline period that runs from October 1, 2015 to June 30, 2017. The 21-month baseline period would only apply to the FY 2023 program year and would only use ICD-10 data.

Prior to deciding to propose an abbreviated baseline period for the FY 2023 program year, we took several factors into consideration, including the recommendations of the measure steward, the feasibility of using a combination of ICD-9 and ICD-10 data without the availability of the appropriate measure software, minimizing provider burden, program implementation timelines, and the reliability of using a shortened baseline period. We believe using a 21-month baseline period for the Patient Safety and Adverse Events (Composite) measure for the FY 2023 program year best serves the need to provide important information on hospital patient safety and adverse events by allowing sufficient time to process the claims data and calculate measure scores, while minimizing the reporting burden and program disruption. We also believe that measure scores would continue to be reliable for the above proposed baseline period because the NQF, which re-endorsed the modified version of the measure that we proposed, found it to be reliable using 12 months of data.⁷⁰

We invited public comment on these proposals. We did not receive public comments on the proposed baseline and performance periods for the Patient Safety and Adverse Events (Composite) measure for the FY 2023 program year. We are finalizing the baseline and performance period as proposed.

(3) Patient Safety and Adverse Events (Composite) Measure in the FY 2024 Program Year and Subsequent Years

For the FY 2024 program year and subsequent years, in the FY 2018 IPPS/

⁷⁰ "Patient Safety 2015 Final Report" is available at: http://www.qualityforum.org/Publications/2016/02/Patient_Safety_2015_Final_Report.aspx.

LTCH PPS proposed rule (82 FR 19976), we proposed to lengthen the Patient Safety and Adverse Events (Composite) measure baseline period to 24 months and continue to adopt a 24-month performance period because we believe the measure is most reliable with a 24-month baseline period. For the FY 2024 program year, the baseline period would run from July 1, 2016 to June 30, 2018. Therefore, we proposed to adopt a performance period that runs from July 1, 4 years prior to the applicable fiscal program year, to June 0, 2 years prior to the applicable fiscal program year, and a baseline period that runs from July 1, 8 years prior to the applicable program year, to June 30, 6 years prior to the applicable program year.

We invited public comment on these proposals. We did not receive public comments on the proposed baseline and performance periods for the Patient Safety and Adverse Events (Composite) measure for the FY 2024 program year and subsequent years. We are finalizing the baseline and performance periods for the FY 2024 program year and subsequent years as proposed.

e. Clinical Care Domain

(1) Previously Adopted Measures in the Clinical Care Domain

For the FY 2019, FY 2020, and FY 2021 program years, we adopted a 36-month baseline period and 36-month performance period for measures in the Clinical Care domain (78 FR 50692 through 50694; 79 FR 50073; 80 FR 49563).⁷¹ In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57000), we finalized our proposal to adopt a 36-month performance period and 36-month baseline period for the FY 2022 program year for each of the previously finalized measures in the Clinical Care domain—that is, the MORT-30-AMI, MORT-30-HF, MORT-30-COPD, THA/TKA, and MORT-30-CABG measures.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19977), we proposed to adopt a 36-month performance period and 36-month baseline period for these measures for the FY 2023 program year and subsequent years.

Specifically, for the mortality measures (MORT-30-AMI, MORT-30-HF, MORT-30-COPD, and MORT-30-CABG), the performance period would run for 36 months from July 1, 5 years prior to the applicable fiscal program year, to June 30, 2 years prior to the applicable fiscal program year, and the baseline period would run for 36 months from July 1, 10 years prior to the applicable fiscal program year, to June 30, 7 years prior to the applicable fiscal program year. For the THA/TKA measure, the performance period would run for 36 months from April 1, 5 years prior to the applicable fiscal program year, to March 31, 2 years prior to the applicable fiscal program year, and the baseline period would run for 36 months from April 1, 10 years prior to the applicable fiscal program year, to March 31, 7 years prior to the applicable fiscal program year.

We invited public comment on these proposals. We did not receive any public comments on these proposals; we are finalizing our proposals to set the baseline and performance periods for the MORT-30-AMI, MORT-30-HF, MORT-30-COPD, THA/TKA, and MORT-30-CABG measures for FY 2023 program year and subsequent years as proposed.

(2) MORT-30-PN (Updated Cohort) Measure

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57001), we adopted a 22-month performance period for the MORT-30-PN (updated cohort) measure and a 36-month baseline period for the FY 2021 program year. In the

same final rule, we adopted a 34-month performance period and 36-month baseline period for the MORT-30-PN (updated cohort) measure for the FY 2022 program year. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19977), we did not propose any changes to the length of these performance or baseline periods for the FY 2021 and FY 2022 program years.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57001), we also stated our intent to lengthen the MORT-30-PN (updated cohort) measure performance period to a full 36-month performance period beginning in July, instead of September. Therefore, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19977), we proposed to adopt a 36-month performance period that would run from July 1, 5 years prior to the applicable fiscal program year, to June 30, 2 years prior to the applicable fiscal program year, and a 36-month baseline period that would run from July 1, 10 years prior to the applicable fiscal program year, to June 30, 7 years prior to the applicable fiscal program year for the MORT-30-PN (updated cohort) measure for the FY 2023 program year and subsequent years.

We invited public comment on these proposals. We did not receive any public comments on this proposal; we are finalizing our proposal to set the baseline and performance periods for the MORT-30-PN (updated cohort) measure for the FY 2023 program year and subsequent years as proposed.

f. Summary of Previously Adopted and Newly Finalized Baseline and Performance Periods for the FY 2019 Through FY 2023 Program Years

The tables below summarize the baseline and performance periods that we have previously adopted and are finalizing in this final rule.

PREVIOUSLY ADOPTED BASELINE AND PERFORMANCE PERIODS FOR THE FY 2019 PROGRAM YEAR

Domain	Baseline period	Performance period
Person and Community Engagement:		
• HCAHPS Survey	• January 1, 2015–December 31, 2015	• January 1, 2017–December 31, 2017.
Clinical Care:		
• Mortality (MORT-30-AMI, MORT-30-HF, MORT-30-PN).	• July 1, 2009–June 30, 2012	• July 1, 2014–June 30, 2017.
• THA/TKA	• July 1, 2010–June 30, 2013	• January 1, 2015–June 30, 2017.
Safety:*		
• PC-01 and NHSN measures (CAUTI, CLABSI, SSI, CDI, MRSA).	• January 1, 2015–December 31, 2015	• January 1, 2017–December 31, 2017.
Efficiency and Cost Reduction:		

⁷¹ The THA/TKA measure was added for the FY 2019 program year with a 36-month baseline period and a 24-month performance period (79 FR 50072),

but we have since adopted 36-month baseline and performance periods for the FY 2021 program year (80 FR 49563). We intend to continue having 36-

month baseline periods and 36-month performance periods in the future for all measures in the Clinical Care domain.

PREVIOUSLY ADOPTED BASELINE AND PERFORMANCE PERIODS FOR THE FY 2019 PROGRAM YEAR—Continued

Domain	Baseline period	Performance period
• MSPB	• January 1, 2015–December 31, 2015	• January 1, 2017–December 31, 2017.

* In section V.J.3.b. of the preamble of this final rule, we discuss our decision to finalize the removal of the current PSI 90 measure beginning with the FY 2019 program year. As a result, the previously finalized performance and baseline periods for this measure were not included in this table.

PREVIOUSLY ADOPTED BASELINE AND PERFORMANCE PERIODS FOR THE FY 2020 PROGRAM YEAR

Domain	Baseline period	Performance period
Person and Community Engagement: • HCAHPS Survey	• January 1, 2016–December 31, 2016.	• January 1, 2018–December 31, 2018.
Clinical Care: • Mortality (MORT–30–AMI, MORT–30–HF, MORT–30–PN). • THA/TKA	• July 1, 2010–June 30, 2013 • July 1, 2010–June 30, 2013	• July 1, 2015–June 30, 2018. • July 1, 2015–June 30, 2018.
Safety: * • PC–01 and NHSN measures (CAUTI, CLABSI, SSI, CDI, MRSA).	• January 1, 2016–December 31, 2016.	• January 1, 2018–December 31, 2018.
Efficiency and Cost Reduction: • MSPB	• January 1, 2016–December 31, 2016.	• January 1, 2018–December 31, 2018.

* In section V.J.3.b. of the preamble of this final rule, we discuss our decision to finalize the removal of the current PSI 90 measure beginning with the FY 2019 program year. As a result, the previously finalized performance and baseline periods for this measure were not included in this table.

PREVIOUSLY ADOPTED BASELINE AND PERFORMANCE PERIODS FOR THE FY 2021 PROGRAM YEAR

Domain	Baseline period	Performance period
Person and Community Engagement: • HCAHPS Survey.	• January 1, 2017–December 31, 2017	• January 1, 2019–December 31, 2019.

6. Performance Standards for the Hospital VBP Program

a. Background

Section 1886(o)(3)(A) of the Act requires the Secretary to establish performance standards for the measures selected under the Hospital VBP Program for a performance period for the applicable fiscal year. The performance standards must include levels of achievement and improvement, as required by section 1886(o)(3)(B) of the Act, and must be established no later than 60 days before the beginning of the performance period for the fiscal year involved, as required by section 1886(o)(3)(C) of the Act. We refer readers to the Hospital Inpatient VBP Program final rule (76 FR 26511 through 26513) for further discussion of achievement and improvement standards under the Hospital VBP Program.

In addition, when establishing the performance standards, section 1886(o)(3)(D) of the Act requires the Secretary to consider appropriate factors, such as: (1) Practical experience with the measures, including whether a

significant proportion of hospitals failed to meet the performance standard during previous performance periods; (2) historical performance standards; (3) improvement rates; and (4) the opportunity for continued improvement.

We refer readers to the FY 2013, FY 2014, and FY 2015 IPPS/LTCH PPS final rules (77 FR 53604 through 53605; 78 FR 50694 through 50698; and 79 FR 50077 through 50079, respectively) for a more detailed discussion of the general scoring methodology used in the Hospital VBP Program.

We note that the performance standards for the following measures are calculated with lower values representing better performance:

- The NHSN measures (the CLABSI, CAUTI, CDI, Colon and the Abdominal Hysterectomy SSI, and MRSA Bacteremia measures);
- The THA/TKA measure;
- The PC-01 measure;
- The MSPB measure;
- The HF, AMI, and PN Payment measures; and
- The Patient Safety and Adverse Events (Composite) measure.

This distinction is made in contrast to other measures for which higher values indicate better performance.⁷² As discussed further in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50684), the performance standards for the Colon and Abdominal Hysterectomy SSI measure are computed separately for each procedure stratum, and we first award achievement and improvement points to each stratum separately, then compute a weighted average of the points awarded to each stratum by predicted infections.

b. Previously Adopted and Newly Finalized Performance Standards for the FY 2020 Program Year

In accordance with our finalized methodology for calculating performance standards (discussed more fully in the Hospital Inpatient VBP Program final rule (76 FR 26511 through 26513)), in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19979 through 19980), we proposed to adopt additional

⁷² We note that the mortality measures in the Hospital VBP Program use survival rates rather than mortality rates; as a result, higher values indicate better performance on these measures.

performance standards for the FY 2020 program year. We noted that the numerical values for the performance standards displayed in the proposed rule represented estimates based on the most recently available data, and we stated our intention to update the numerical values in this FY 2018 IPPS/

LTCH PPS final rule. We noted further that the MSPB measure's performance standards are based on performance period data; therefore, we are unable to provide numerical equivalents for the standards at this time.

We invited public comment on the proposed performance standards. We did not receive any public comments on

the proposed performance standards for the FY 2020 program year. We are adopting the performance standards listed in the table below. These performance standards have been updated from the FY 2018 IPPS/LTCH PPS proposed rule and represent the most recently available data.

PREVIOUSLY ADOPTED AND NEWLY FINALIZED PERFORMANCE STANDARDS FOR THE FY 2020 PROGRAM YEAR: SAFETY, CLINICAL CARE, AND EFFICIENCY AND COST REDUCTION DOMAINS #

Measure short name	Achievement threshold	Benchmark
Safety Domain ♦		
CAUTI *†	0.828	0.000.
CLABSI *†	0.784	0.000.
CDI *†	0.852	0.091.
MRSA Bacteremia *†	0.815	0.000.
Colon and Abdominal Hysterectomy SSI *†	• 0.781	• 0.000.
	• 0.722	• 0.000.
PC-01 *	0.000000	0.000000.
Clinical Care Domain		
MORT-30-AMI ±	0.853715	0.875869.
MORT-30-HF ±	0.881090	0.906068.
MORT-30-PN ±	0.882266	0.909532.
THA/TKA *±	0.032229	0.023178.
Efficiency and Cost Reduction Domain		
MSPB *±	Median Medicare Spending Per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending Per Beneficiary ratios across all hospitals during the performance period.

In section V.J.3.b. of the preamble of this final rule, we are removing the current PSI 90 measure beginning with the FY 2019 program year. As a result, the previously finalized performance standards for this measure are not included in this table.

♦ The performance standards displayed in this table for the Safety domain measures are updated using four quarters of CY 2016 data in this final rule.

† In section III.F.2.e. of preamble of the FY 2016 IPPS/LTCH PPS final rule (80 FR 49554 through 49555), we finalized our proposal to use the CDC's new standard population data to calculate performance standards for the NHSN measures beginning with the FY 2019 program year. We refer readers to that final rule for additional information regarding the NHSN measures' standard population data. In addition, we note that a technical update was released for these measures for the FY 2019 program year in order to ensure that hospitals have the correct performance standards for the applicable performance period.

* Lower values represent better performance.

± Previously adopted performance standards.

In the CY 2017 OPPI/ASC final rule with comment period (81 FR 79857), we discussed how the removal of the Pain Management dimension of the HCAHPS Survey, beginning with the FY 2018 program year, affects the scoring of the Person and Community Engagement domain. The eight dimensions of the HCAHPS measure are calculated to generate the HCAHPS Base Score. For each of the eight dimensions, Achievement Points (0–10 points) and Improvement Points (0–9 points) are calculated, the larger of which is then summed across the eight dimensions to

create the HCAHPS Base Score (0–80 points). Each of the eight dimensions is of equal weight, thus the HCAHPS Base Score ranges from 0 to 80 points. HCAHPS Consistency Points are then calculated, which range from 0 to 20 points. The Consistency Points take into consideration the scores of all eight Person and Community Engagement dimensions; as noted above, the Pain Management dimension is not included in the scoring of this Domain. The final element of the scoring formula is the summation of the HCAHPS Base Score and the HCAHPS Consistency Points,

which results in the Person and Community Engagement Domain score that ranges from 0 to 100 points.

We invited public comment on the proposed performance standards for the eight HCAHPS survey dimensions. We did not receive any public comments on these proposed performance standards, and are adopting the performance standards listed in the table below. These HCAHPS survey dimension performance standards have been updated from the FY 2018 IPPS/LTCH PPS proposed rule and represent the most recently available data.

**NEWLY FINALIZED PERFORMANCE STANDARDS FOR THE FY 2020 PROGRAM YEAR: PERSON AND COMMUNITY
ENGAGEMENT DOMAIN *±**

HCAHPS survey dimension	Floor (percent)	Achievement threshold (percent)	Benchmark (percent)
Communication with Nurses	51.80	79.08	87.12
Communication with Doctors	50.67	80.41	88.44
Responsiveness of Hospital Staff	35.74	65.07	80.14
Communication about Medicines	26.16	63.30	73.86
Hospital Cleanliness & Quietness	41.92	65.72	79.42
Discharge Information	66.72	87.44	92.11
Care Transition	20.33	51.14	62.50
Overall Rating of Hospital	32.47	71.59	85.12

* We renamed this domain from Patient- and Caregiver-Centered Experience of Care/Care Coordination domain to Person and Community Engagement domain beginning with the FY 2019 program year, as discussed in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56984).

± The performance standards displayed in this table were calculated using four quarters of CY 2016 data in this final rule.

c. Previously Adopted Performance Standards for Certain Measures for the FY 2021 Program Year

As discussed above, we have adopted certain measures for the Clinical Care and Efficiency and Cost Reduction domains for future program years in order to ensure that we can adopt baseline and performance periods of sufficient length for performance

scoring purposes. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49567), we adopted performance standards for the FY 2021 program year for the Clinical Care domain measures (THA/TKA, MORT-30-HF, MORT-30-AMI, and MORT-30-COPD). In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57008), we adopted performance standards for the MORT-30-PN (updated cohort) measure (81 FR 57008) and the AMI

Payment and HF Payment measures for the FY 2021 program year. We note that the performance standards for the MSPB, AMI Payment, and HF Payment measures are based on performance period data; therefore, we are unable to provide numerical equivalents for the standards at this time. The previously adopted performance standards for these measures are set out in the table below.

PREVIOUSLY ADOPTED PERFORMANCE STANDARDS FOR THE FY 2021 PROGRAM YEAR

Measure short name	Achievement threshold	Benchmark
Clinical Care Domain		
MORT-30-AMI±	0.860355	0.879714.
MORT-30-HF±	0.883803	0.906144.
MORT-30-PN (updated cohort)*	0.836122	0.870506.
MORT-30-COPD±	0.923253	0.938664.
THA/TKA*±	0.031157	0.022418.
Efficiency and Cost Reduction Domain		
MSPB*±	Median Medicare Spending Per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending Per Beneficiary ratios across all hospitals during the performance period.
AMI Payment*±	Median Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.	Mean of the lowest decile Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.
HF Payment*±	Median Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.	Mean of the lowest decile Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.

± Previously adopted performance standards.

* Lower values represent better performance.

† After publication of the FY 2017 IPPS/LTCH PPS final rule, we determined there was a display error in the performance standards for this measure. We have since undertaken a technical update for these performance standards in order to ensure that hospitals have the correct performance standards for the applicable performance period. The corrected performance standards are displayed here.

d. Previously Adopted and Newly Finalized Performance Standards for Certain Measures for the FY 2022 Program Year

As discussed above, we have adopted certain measures for the Clinical Care and Efficiency and Cost Reduction domains for future program years in

order to ensure that we can adopt baseline and performance periods of sufficient length for performance scoring purposes. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57009), we adopted performance standards for the FY 2022 program year for the Clinical Care domain measures (THA/TKA, MORT-30-HF, MORT-30-AMI,

MORT-30-PN (updated cohort), MORT-30-COPD, and MORT-30-CABG) and the Efficiency and Cost Reduction domain measures (AMI Payment and HF Payment). In section V.J.4.a. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19971 through 19973), we proposed to add one measure, the PN Payment

measure, beginning with the FY 2022 program year. We note that the performance standards for the MSPB, AMI Payment, HF Payment, and PN Payment measures are based on performance period data; therefore, we are unable to provide numerical

equivalents for the standards at this time.

We invited public comment on the proposed performance standards for certain measures for the FY 2022 program year. We did not receive any public comments on the proposed PN Payment measure performance standards for the FY 2022 program year

and are adopting the performance standards listed in the table below. The previously adopted and newly finalized performance standards for these measures are set out in the table below.

The table below is up-to-date and represents the most recently available data.

PREVIOUSLY ADOPTED AND NEWLY FINALIZED PERFORMANCE STANDARDS FOR THE FY 2022 PROGRAM YEAR

Measure short name	Achievement threshold	Benchmark
Clinical Care Domain		
MORT-30-AMI [±]	0.861793	0.881305.
MORT-30-HF [±]	0.879869	0.903608.
MORT-30-PN (updated cohort) [±]	0.836122	0.870506.
MORT-30-COPD [±]	0.920058	0.936962.
MORT-30-CABG [±]	0.968210	0.979000.
THA/TKA ^{*±}	0.029833	0.021493.
Efficiency and Cost Reduction Domain		
MSPB ^{*±}	Median Medicare Spending Per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending Per Beneficiary ratios across all hospitals during the performance period.
AMI Payment ^{*±}	Median Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.	Mean of the lowest decile Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.
HF Payment ^{*±}	Median Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.	Mean of the lowest decile Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.
PN Payment ^{**}	Median Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.	Mean of the lowest decile Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.

[±] Previously adopted performance standards.

[†] After publication of the FY 2017 IPPS/LTCH PPS final rule, we determined there was a display error in the performance standards for this measure. Specifically, the Achievement Threshold and Benchmark values, while accurate, were presented in the wrong categories. We have corrected this issue in the table above, and the correct performance standards are displayed here.

^{*} Lower values represent better performance.

^{**} Scored the same as the MSPB, AMI Payment, and HF Payment measures, as discussed in section V.J.4.a.(2) of the preamble of this final rule.

e. Performance Standards for Certain Measures for the FY 2023 Program Year

As discussed above, we have adopted certain measures for the Clinical Care and Efficiency and Cost Reduction domains for future program years in order to ensure that we can adopt baseline and performance periods of sufficient length for performance scoring purposes. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19982 through 19983), we proposed the following performance standards for the FY 2023 program year for the Clinical Care domain measures (THA/TKA, MORT-30-AMI, MORT-30-HF, MORT-30-PN (updated cohort),

MORT-30-COPD, and MORT-30-CABG) and for the Efficiency and Cost Reduction domain measures (MSPB, AMI Payment, HF Payment, and the proposed PN Payment measure). Although we are finalizing our proposal to adopt the Patient Safety and Adverse Events (Composite) measure beginning with the FY 2023 program year, we do not currently have data available to calculate the performance standards; we therefore intend to propose the FY 2023 performance standards for this measure in next year's rulemaking. We note that the performance standards for the MSPB, AMI Payment, HF Payment, and PN Payment measures are based on

performance period data; therefore, we are unable to provide numerical equivalents for the standards at this time. These newly proposed performance standards for these measures are set out in the table below.

We invited public comment on the proposed performance standards for certain measures for the FY 2023 program year. We did not receive any public comments on the proposed performance standards for the FY 2023 program year, and are adopting the performance standards listed below. The table below is up-to-date and represents the most recently available data.

NEWLY FINALIZED PERFORMANCE STANDARDS FOR THE FY 2023 PROGRAM YEAR

Measure short name	Achievement threshold	Benchmark
Clinical Care Domain		
MORT-30-AMI	0.866548	0.885499.
MORT-30-HF	0.881939	0.906798.
MORT-30-PN (updated cohort)	0.840138	0.871741.
MORT-30-COPD	0.919769	0.936349.
MORT-30-CABG	0.968747	0.979620.
THA/TKA *	0.027428	0.019779.
Efficiency and Cost Reduction Domain		
MSPB *	Median Medicare Spending Per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending Per Beneficiary ratios across all hospitals during the performance period.
AMI Payment **	Median Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.	Mean of the lowest decile Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.
HF Payment **	Median Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.	Mean of the lowest decile Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.
PN Payment **	Median Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.	Mean of the lowest decile Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.

* Lower values represent better performance.

** Scored the same as the MSPB, AMI Payment, and HF Payment measures, as discussed in section V.J.4.a.(2) of the preamble of this final rule.

7. Scoring Methodology and Data Requirements for the FY 2019 Program Year and Subsequent Years

a. Domain Weighting for the FY 2020 Program Year and Subsequent Years for Hospitals That Receive a Score on All Domains

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49568 through 49570), we adopted equal weight of 25 percent for each of the four domains in the FY 2018 program year for hospitals that receive a score in all domains. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57009 through 57010), for the FY 2019 program year, we retained this domain weighting. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19983), we did not propose any changes to the domain weights for the FY 2018 and FY 2019 program years.

For the FY 2020 program year and subsequent years, we proposed to retain this same domain weighting for hospitals receiving a score on all four domains. The previously adopted domain weighting is summarized in the table below.

DOMAIN WEIGHTS FOR THE FY 2019 PROGRAM YEAR AND SUBSEQUENT YEARS FOR HOSPITALS RECEIVING A SCORE ON ALL DOMAINS

Domain	Weight (percent)
Safety	25
Clinical Care	25
Efficiency and Cost Reduction ...	25
Person and Community Engagement *	25

* We renamed this domain from Patient- and Caregiver-Centered Experience of Care/Care Coordination domain to Person and Community Engagement domain beginning with the FY 2019 program year, as discussed in section IV.H.3.b. of the FY 2017 IPPS/LTCH PPS final rule (81 FR 56984).

We invited public comment on this proposal.

Comment: A few commenters recommended that CMS remove the Efficiency and Cost Reduction domain from the Hospital VBP Program because commenters believe the domain is poorly defined and its only current measure, the MSPB measure, cannot be meaningfully interpreted. In the alternative, commenters recommended that CMS reduce the weighting of the Efficiency and Cost Reduction domain until the measures finalized for that domain are further defined and tested.

One commenter stated that the MSPB measure contains a substantial

proportion of expense which is outside the influence or control of the hospital, and is not risk adjusted for clinical or social factors, for market resources, or for patient preference and decision-making and is, therefore, not appropriate for inpatient care. In addition, the commenter stated that because Medicare has very few 30-day episode payments benchmarked, this domain may not reflect performance on Medicare populations. The commenter therefore recommended CMS reduce the weight of the Efficiency and Cost Reduction domain as a whole and should focus on the episode payments which are most reliably manageable and suitable for influence and improvement by actions taken in the inpatient setting.

Response: As we stated in the FY 2014 IPPS/LTCH PPS final rule (79 FR 50048 through 50087), we believe we have appropriately balanced our desire to provide strong incentives for hospitals to consider both the cost and the quality of the care that they provide to Medicare beneficiaries by weighting the Efficiency and Cost Reduction domain at 25 percent of the TPS while the quality-focused domains encompass 75 percent of the TPS. We note that section 1886(o)(2)(B)(ii) of the Act requires that the Hospital VBP Program include efficiency measures, including measures of Medicare spending per beneficiary. We continue to believe the

Efficiency and Cost Reduction domain merits a significant portion of the TPS in order to ensure that hospitals monitor the costs of the care they provide to Medicare beneficiaries during the inpatient hospitalization and are involved in the coordination of beneficiaries' care immediately prior to a hospitalization and post-discharge. We believe based on the current Hospital VBP Program measure set that the Efficiency and Cost Reduction domain is appropriately weighted, and despite not directly addressing patient outcomes, this domain encourages hospitals to assess cost in conjunction with quality of care. We also believe that hospitals can effect change through the measures in each of the four domains in the Hospital VBP Program.

After consideration of the public comments we received, we are finalizing our proposal to retain the equal weight of 25 percent for each of the four domains in the FY 2020 program year and subsequent years for hospitals that receive a score in all domains.

b. Domain Weighting for the FY 2019 Program Year and Subsequent Years for Hospitals Receiving Scores on Fewer Than Four Domains

For the FY 2017 program year and subsequent years, we adopted a policy that hospitals must receive domain scores on at least three of four quality domains in order to receive a TPS, and hospitals with sufficient data on only three domains will have their TPSs proportionately reweighted (79 FR 50084 through 50085). In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19983), we did not propose any changes to these domain weights for the FY 2019 program year or subsequent years.

For a hospital to receive a TPS for the FY 2019 program year and subsequent years:

- Hospitals must report a minimum number of 100 completed HCAHPS surveys for a hospital to receive a Person and Community Engagement domain score.
- Hospitals must receive a minimum of one measure score within the Efficiency and Cost Reduction domain.
- Hospitals must receive a minimum of two measure scores within the Clinical Care domain.
- Hospitals must receive a minimum of two measure scores within the Safety domain.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19983 through 19984), we proposed two changes to our domain scoring policies for the FY 2019 program year and subsequent years. We proposed to change the minimum

number of measures scores a hospital must receive to receive a score on the Safety domain from three measures to two measures. Second, we proposed that hospitals must receive a minimum of one measure score within the Efficiency and Cost Reduction domain to receive a domain score rather than requiring that hospitals meet the requirements to receive a MSPB measure score.

The proposed change to the Safety domain minimum number of measure scores was based on our proposal to remove the current PSI 90 measure from the Hospital VBP Program beginning with the FY 2019 program year. Based on our analyses, removing this measure but maintaining the requirement that a hospital receive three measure scores in order to receive a Safety domain score would have a significant impact on the number of hospitals eligible to receive a Safety domain score. Therefore, in order to include the greatest number of hospitals in the Hospital VBP Program possible while ensuring the need for TPSs to be sufficiently reliable, we proposed to reduce the minimum number of required measure scores within the Safety domain from three measures to two.

In addition, we note that we did not propose to reduce the number of measures a hospital must receive a score on in order to receive an Efficiency and Cost Reduction domain score. Under the current program requirements (79 FR 50086), a hospital must be eligible to receive a score on the MSPB measure in order to receive a score for this domain. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56987 through 56990 and 81 FR 56990 through 56992), we adopted two condition-specific payment measures, the AMI Payment and HF Payment measures, beginning with the FY 2021 program year, and as discussed in section V.J.4.a. of the preamble of this final rule in the FY 2018 IPPS/LTCH PPS proposed rule, we proposed to adopt one additional condition-specific payment measure, the PN Payment measure. We therefore proposed to require that hospitals must be eligible to receive a score on at least one measure within the Efficiency and Cost Reduction domain, rather than on the MSPB measure specifically, to reflect this expansion of the domain's measure set.

We believe these proposed changes reflect the evolution of the Hospital VBP Program measure set, and we continue to believe that these requirements appropriately balance our desire to enable as many hospitals as possible to participate in the Hospital VBP Program and the need for TPSs to be sufficiently

reliable to provide meaningful distinctions between hospitals' performance on quality measures.

We invited public comment on these proposals.

Comment: A few commenters supported CMS' proposal to reduce the number of measures for which a hospital must have a score to receive a Safety domain score from three measures to two.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing our proposals to: Reduce the number of measures for which a hospital must have a score to receive a Safety domain score from three measures to two; and that hospitals must be eligible to receive a score on at least one measure within the Efficiency and Cost Reduction domain as proposed.

c. Minimum Numbers of Cases for Hospital VBP Program Measures for the FY 2019 Program Year and Subsequent Years

(1) Background

Section 1886(o)(1)(C)(ii)(IV) of the Act requires the Secretary to exclude for the fiscal year hospitals that do not report a minimum number (as determined by the Secretary) of cases for the measures that apply to the hospital for the performance period for the fiscal year. Under section 1886(o)(1)(C)(iii) of the Act, in determining the minimum number of reported cases for a given measure, the Secretary must conduct an independent analysis of what minimum numbers would be appropriate. For additional discussion of the previously finalized minimum numbers of cases for measures under the Hospital VBP Program, we refer readers to the Hospital Inpatient VBP Program final rule (76 FR 26527 through 26531); the CY 2012 OPPS/ASC final rule (76 FR 74532 through 74534); the FY 2013 IPPS/LTCH PPS final rule (77 FR 53608 through 53609); the FY 2015 IPPS/LTCH PPS final rule (79 FR 50085); the FY 2016 IPPS/LTCH PPS final rule (80 FR 49570); and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57011).

(2) Person and Community Engagement Domain

In the Hospital Inpatient VBP Program final rule (76 FR 26527 through 26531), we adopted a minimum number of 100 completed HCAHPS Surveys for a hospital to receive a score on the HCAHPS measure.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19984), we did not propose any changes to this policy.

(3) Clinical Care Domain

In the CY 2012 OPPTS/ASC final rule with comment period (76 FR 74532 through 74534), we adopted a minimum number of 10 cases for the MORT-30-AMI, MORT-30-HF, and MORT-30-PN measures beginning with the FY 2014 program year. In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53608 through 53609), we adopted a new minimum number of 25 cases for the MORT-30-AMI, MORT-30-HF, and MORT-30-PN measures for the FY 2015 program year. We adopted the same 25-case minimum for the MORT-30-COPD measure in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49570), and for the MORT-30-CABG, MORT-30-PN (updated cohort), and THA/TKA measures in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57011).

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19984), we did not propose any changes to these policies.

(4) Safety Domain

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53608 through 53609), we adopted a minimum of one predicted infection for NHSN-based surveillance measures (that is, the CAUTI, CLABSI, CDI, MRSA, and SSI measures) based on CDC's minimum case criteria. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50085), we adopted this case minimum for the NHSN-based surveillance measures FY 2016 Hospital VBP Program and subsequent years. In the FY 2012 IPPS/LTCH PPS final rule (76 FR 26530), we adopted a minimum of 10 cases for the PC-01 measure.⁷³

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19984), beginning with the FY 2023 program year, we proposed that hospitals must report a minimum of three eligible cases on any one underlying indicator during the baseline period in order to receive an improvement score and three eligible cases on any one underlying indicator during performance period in order to receive an achievement score on the Patient Safety and Adverse Events (Composite) measure. For the purposes of the Patient Safety and Adverse Events (Composite) measure, a case is "eligible" for a given indicator if it meets the criterion for inclusion in the

indicator measure population. This minimum number of cases is based on AHRQ's methodology for scoring performance on the Patient Safety and Adverse Events (Composite) measure. We note that these proposed minimum data requirements for the Patient Safety and Adverse Events (Composite) measure are the same as those previously finalized for the current PSI 90 measure.

We invited public comment on our proposal regarding the minimum number of cases for the Patient Safety and Adverse Events (Composite) measure.

We did not receive any public comments on our proposal regarding the minimum number of cases for the Patient Safety and Adverse Events (Composite) measure, and are finalizing our proposal that hospitals must report a minimum of three eligible cases on any one underlying indicator during the baseline period in order to receive an improvement score and three eligible cases on any one underlying indicator during performance period in order to receive an achievement score on the Patient Safety and Adverse Events (Composite) measure.

(5) Efficiency and Cost Reduction Domain

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53609 through 53610), we adopted a minimum of 25 cases in order to receive a score for the MSPB measure. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50085 through 50086), we retained the same MSPB measure case minimum for the FY 2016 program year and subsequent years.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56987 through 56990 and 81 FR 56990 through 56992, respectively), we adopted the AMI Payment and HF Payment measures in the Efficiency and Cost Reduction domain for the FY 2021 program year and subsequent years. In section V.J.4.a. of the preamble of this final rule, we discuss our decision to adopt the PN Payment measure in the Efficiency and Cost Reduction domain for the FY 2022 program year and subsequent years. For these condition-specific payment measures (namely, the AMI Payment, HF Payment, and PN Payment measures), in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19984 through 19985), we proposed that hospitals must report a minimum number of 25 cases per measure in order to receive a measure score for the FY

2021 program year, FY 2022 program year, and subsequent years. We believe this minimum number of cases is appropriate because it balances our interest in allowing the maximum possible number of hospitals the opportunity to receive a score on the measure and maintaining sufficiently reliable scores. As we noted in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56992), we expect this case minimum will ensure that each hospital's payment measure rate is sufficiently reliable to generate a score that meaningfully distinguishes hospital performance on the measures. In addition, the statistical model that CMS uses to calculate the payment measures allows for the inclusion of hospitals with relatively few cases by taking into account the uncertainty associated with sample size.

We invited public comment on our proposal regarding the minimum number of cases for the AMI, HF, and PN Payment measures.

Comment: One commenter stated that requiring only 25 cases to calculate condition-specific payment measure scores for the AMI, HF, and PN Payment measures is insufficient for stable, reliable, and meaningful performance metrics.

Response: We disagree with the commenter that hospitals will not be able to report statistically reliable information on the PN Payment measure because we believe the case minimum will ensure that each hospital's payment measure rate is sufficiently reliable to generate a score that meaningfully distinguishes hospital performance on the measures. The statistical model that we use to calculate the payment measures allows for the inclusion of hospitals with relatively few cases by taking into account the uncertainty associated with sample size.

After consideration of the public comments we received, we are finalizing our proposal that hospitals must report a minimum number of 25 cases per measure in order to receive a measure score on the condition-specific payment measures as proposed.

(6) Summary of Previously Adopted and Newly Finalized Minimum Numbers of Cases for the FY 2019 Program Year and Subsequent Years

The previously adopted and newly finalized minimum numbers of cases for these measures are set forth in the table below.

⁷³ We note that the PC-01 measure was previously included in the Clinical Care—Process domain. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49553 through 49554), we re-categorized this measure as a Safety domain measure beginning with the FY 2018 program year.

PREVIOUSLY ADOPTED AND NEWLY FINALIZED MINIMUM CASE NUMBER REQUIREMENTS FOR THE FY 2019 PROGRAM YEAR AND SUBSEQUENT YEARS

Measure short name	Minimum number of cases
Person and Community Engagement Domain	
HCAHPS	Hospitals must report a minimum number of 100 completed HCAHPS surveys.
Clinical Care Domain	
MORT-30-AMI	Hospitals must report a minimum number of 25 cases.
MORT-30-HF	Hospitals must report a minimum number of 25 cases.
MORT-30-PN (updated cohort)	Hospitals must report a minimum number of 25 cases.
MORT-30-COPD	Hospitals must report a minimum number of 25 cases.
MORT-30-CABG	Hospitals must report a minimum number of 25 cases.
THA/TKA	Hospitals must report a minimum number of 25 cases.
Safety Domain	
CAUTI	Hospitals have a minimum of 1.000 predicted infections as calculated by the CDC.
CLABSI	Hospitals have a minimum of 1.000 predicted infections as calculated by the CDC.
Colon and Abdominal Hysterectomy SSI	Hospitals have a minimum of 1.000 predicted infections as calculated by the CDC.
MRSA Bacteremia	Hospitals have a minimum of 1.000 predicted infections as calculated by the CDC.
CDI	Hospitals have a minimum of 1.000 predicted infections as calculated by the CDC.
Patient Safety and Adverse Events (Composite) [#]	Hospitals must report a minimum of three eligible cases on any one underlying indicator.
PC-01	Hospitals must report a minimum of 10 cases.
Efficiency and Cost Reduction Domain	
MSPB	Hospitals must report a minimum number of 25 cases.
AMI Payment	Hospitals must report a minimum number of 25 cases.
HF Payment	Hospitals must report a minimum number of 25 cases.
PN Payment*	Hospitals must report a minimum number of 25 cases.

[#] In section V.J.3.b. of the preamble of this final rule, we are finalizing our proposal to remove the current PSI 90 measure beginning with the FY 2019 program year. In section V.J.4.b. of the preamble of this final rule, we are finalizing our proposal to adopt the Patient Safety and Adverse Events (Composite) measure beginning with the FY 2023 program year.

* In section V.J.4.a. of the preamble of this final rule, we are finalizing our proposal to adopt the PN Payment measure beginning with the FY 2022 program year.

d. Weighting Measures Within the Efficiency and Cost Reduction Domain

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51618 through 51627), we adopted the MSPB measure for the Hospital VBP Program beginning with the FY 2015 program year. MSPB is the only cost measure in the Hospital VBP Program through the FY 2020 program year; as a result, hospitals' Efficiency and Cost Reduction domain scores are currently based solely on their MSPB measure scores. In the FY 2017 IPPS/LTCH PPS final rule, we adopted two condition-specific cost measures, the AMI Payment and HF Payment measures, beginning with the FY 2021 program year (81 FR 56987 through 56990 and 81 FR 56990 through 56992, respectively). In addition, as discussed in section V.J.4.a. of the preamble of this final rule, we are finalizing our proposal to adopt an additional condition-specific cost measure, the PN Payment measure, beginning with the FY 2022 program year. Based on this evolution of the Hospital VBP Program measure set, we believe it is appropriate to address measure score weighting within the Efficiency and Cost Reduction domain.

In determining how to weight measures in the Efficiency and Cost Reduction domain, we took into consideration hospitals' experience with the measures and the measures' ability to incentivize greater coordination among hospitals, physicians, and providers of post-acute care services to optimize the value of care they provide to Medicare beneficiaries. Therefore, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19985 through 19986), we proposed to weight the measures within the Efficiency and Cost Reduction domain such that the MSPB measure comprises 50 percent of a hospital's domain score and the other condition-specific payment measures, weighed equally, comprise the remaining 50 percent of a hospital's domain score, beginning with the FY 2021 program year and for subsequent years. We further proposed that:

- If a hospital meets the case minimum to receive a score on the MSPB measure but does not meet the minimum number of cases for any other measures in the Efficiency and Cost Reduction domain, its domain score will be based solely on its MSPB score;

- If a hospital does not meet the case minimum to receive a score on the MSPB measure but meets the minimum number of cases for any other measure or measures within the Efficiency and Cost Reduction domain, its domain score will be based on its scores on the other payment measures, weighted equally (that is, the MSPB measure's weight will be redistributed equally among the Efficiency and Cost Reduction domain measures for which the hospital is eligible receive a score); and

- If a hospital meets the case minimum to receive a score on the MSPB measure and one or more other measures within the Efficiency and Cost Reduction domain, but not all measures within this domain, the hospital's MSPB measure score will comprise 50 percent of its domain score and the remaining 50 percent will be divided equally among the measures for which the hospital is eligible to receive a score.

Under our proposed weighting scheme, a hospital's MSPB measure score could constitute between 12.5 percent and 25 percent of the hospital's TPS. We believe the proposed weighting is appropriate because the MSPB

measure is an overall spending measure and is therefore more broadly applicable than the condition-specific payment measures. In addition, hospitals have the most familiarity with this measure because it has been in the program the longest. We also considered proposing to weight all measures within the Efficiency and Cost Reduction domain equally. However, we determined this weighting may not reflect the broader applicability of the MSPB measure and its importance in ensuring that hospitals monitor the overall costs of care they provide to a larger subset of Medicare beneficiaries during an inpatient hospitalization and are involved in the coordination of beneficiaries' care immediately prior to hospitalization and post-discharge.

We invited public comment on these proposals.

Comment: Some commenters supported CMS' proposal to reweight the Efficiency and Cost Reduction domain to reflect the adoption of additional condition-specific payment measures. One commenter specifically supported CMS' proposal to reweight the Efficiency and Cost Reduction domain because these measures encourage providers to consider the resource use implications of their hospital and specialist referral patterns.

Response: We thank the commenters for their support.

Comment: A few commenters recommended that CMS weight all measures within the Efficiency and Cost Reduction domain equally, because these commenters believe doing so would enable hospitals to more easily improve performance in this domain by targeting cost reduction for specific conditions. One commenter noted the other measure domains in the Hospital VBP Program weight all measures equally within a given domain, and therefore recommended that CMS weight all measures within the Efficiency and Cost Reduction domain equally.

Response: While we acknowledge the commenter's concerns regarding the disproportionate weighting of the MSPB measure, we believe the fundamental differences between this measure and condition-specific payment measures justify weighting the MSPB measure higher in the Efficiency and Cost Reduction domain. The MSPB measure is an overall spending measure that has been in the Hospital VBP Program for many years. In addition, we note this weighting allocation actually reduces the total weight of the MSPB measure in hospitals' TPSs from 25 percent to 12.5 percent, depending upon whether the hospital is eligible to receive a score on

one of the condition-specific payment measures.

Comment: Many commenters recommended that CMS not finalize its proposal to weight the MSPB measure at 50 percent of the Efficiency and Cost Reduction domain, noting that the measure double-counts payments captured in the condition-specific measures in the domain, the measure's comprehensiveness makes it difficult for hospitals to improve, and the recent ASPE report that noted deficiencies in the measure's current risk adjustment which may penalize providers for medical risk beyond the provider's control. Two commenters recommended that the MSPB measure should be removed from the program starting FY 2021, stating that reliance on condition-specific measures will ensure that payments are not double-counted and will make it easier for providers to implement targeted strategies to improve performance. At a minimum, commenters requested that the measure be equally weighted with the other episode of care payment measures.

Response: We thank the commenters for their recommendations. However, we note that section 1886(o)(2)(B)(ii) of the Act requires that the Hospital VBP Program "include efficiency measures, including measures of 'Medicare spending per beneficiary.'" While we agree the condition-specific payment measures will provide hospitals with important data on payments associated with an episode of care, we continue to believe the MSPB measure also provides hospitals with valuable information because this measure captures resource use data for a wide range of services provided in the inpatient hospital setting. We will continue to consider other future measures for the Efficiency and Cost Reduction domain, and encourage commenters to submit any fully developed measures for consideration for the Measures Under Consideration List as part of the pre-rulemaking process (details available at: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityMeasures/Pre-Rule-Making.html>).

Comment: One commenter stated that weighting the HF and PN Payment measures together at 50 percent of the Efficiency and Cost Reduction domain in the FY 2021 program year gives these measures a significantly disproportionate weight in the overall calculation compared to other measures.

Response: We interpret commenter's reference to PN Payment in the FY 2021 program year to mean the AMI Payment measure finalized for that year alongside the HF Payment measure. While we

recognize this proposed weighting results in the condition-specific payment measures represent between 12.5 percent and 6.25 percent, we believe this weight is appropriate for the condition-specific payment measures. The condition-specific payment measures, paired with their corresponding quality measures, are intended to serve as a larger assessment of value of care provided at a hospital. We therefore believe it is important to weight the measures in a manner that incentivizes hospitals to strive for continued improvement in this area.

Comment: One commenter recommended weighting the condition-specific payment measures at 20 percent of the Efficiency and Cost Reduction domain in order to mitigate the overlap between these measures and the MSPB measure, and to reduce the possibility of this overlap leading to mixed signals for hospitals regarding their resource use.

Response: We interpret commenter's recommendation to mean weighting the three condition-specific payment measures, combined, at 20 percent of the Efficiency and Cost Reduction domain, which represents 25 percent of a hospital's TPS. Assuming this position, under this recommendation, if a hospital were eligible to receive a score on all three condition-specific payment measures, these three measures would only represent five percent of the hospital's TPS. We believe weighting the condition-specific payments measures at 20 percent of the Efficiency and Cost Reduction domain does not afford the measures sufficient weight to drive an increased focus on the value of care provided at hospitals. However, we will continue to monitor the impact of weighting the measures within the Efficiency and Cost Reduction domain for unintended consequences.

After consideration of the public comments we received, we are finalizing our proposal to weight the measures within the Efficiency and Cost Reduction domain such that the MSPB measure comprises 50 percent of a hospital's domain score and the other condition-specific payment measures, weighed equally, comprise the remaining 50 percent of a hospital's domain score, beginning with the FY 2021 program year.

K. Changes to the Hospital-Acquired Condition (HAC) Reduction Program

1. Background

We refer readers to section V.I.1.a. of the FY 2014 IPPS/LTCH PPS final rule (78 FR 50707 through 50708) for a general overview of the HAC Reduction Program. For a detailed discussion of

the statutory basis of the HAC Reduction Program, we refer readers to section V.I.2. of the FY 2014 IPPS/LTCH PPS final rule (78 FR 50708 through 50709). For a further description of our previously finalized policies for the HAC Reduction Program, we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50707 through 50729), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50087 through 50104), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49570 through 49581), and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57011 through 57026). These policies describe the general framework for implementation of the HAC Reduction Program, including: (a) The relevant definitions applicable to the program; (b) the payment adjustment under the program; (c) the measure selection process and conditions for the program, including a risk-adjustment and scoring methodology; (d) performance scoring; (e) the process for making hospital-specific performance information available to the public, including the opportunity for a hospital to review the information and submit corrections; and (f) limitation of administrative and judicial review.

We also have codified certain requirements of the HAC Reduction Program at 42 CFR 412.170 through 412.172.

2. Implementation of the HAC Reduction Program for FY 2018

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717), we finalized the following Centers for Disease Control and Prevention (CDC) National Healthcare Safety Network (NHSN) measures for Domain 2 for use in the FY 2015 program and subsequent years: CLABSI, CAUTI, Colon and Abdominal Hysterectomy SSI, MRSA Bacteremia, and CDI. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57020), we finalized the use of the Patient Safety and Adverse Events Composite (PSI 90) measure for use in the FY 2018 program and subsequent years for Domain 1.

CMS strives to put patients first, ensuring they are empowered to make decisions about their own healthcare along with their clinicians using information from data-driven insights that are increasingly aligned with meaningful quality measures. We support technology that reduces burden and allows clinicians to focus on

providing high-quality healthcare for their patients. We also support innovative approaches to improve quality, accessibility, and affordability of care while paying particular attention to improving clinicians' and beneficiaries' experience when interacting with CMS programs. In combination with other efforts across the Department of Health and Human Services, we believe the HAC Reduction Program helps to encourage hospitals to improve healthcare quality and value, while giving patients and providers the tools and information needed to make the best decisions for themselves. We recognize that the HAC Reduction Program represents a key component of the way that we bring quality measurement and improvement together with payment, we have taken efforts to review existing policies to identify how to move the program forward in the least burdensome manner possible while continuing to promote improvement in the quality of care provided to patients. These previously finalized measures are shown in the table below.

HAC REDUCTION PROGRAM MEASURES FOR FY 2018

Short name	Measure name	NQF #
Domain 1		
PSI 90	Patient Safety and Adverse Events Composite	0531
Domain 2		
CAUTI	NHSN Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure	0138
CDI	NHSN Facility-wide Inpatient Hospital-onset <i>Clostridium difficile</i> Infection (CDI) Outcome Measure.	1717
CLABSI	NHSN Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure	0139
Colon and Abdominal Hysterectomy SSI.	American College of Surgeons—Centers for Disease Control and Prevention (ACS—CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	0753
MRSA Bacteremia	NHSN Facility-wide Inpatient Hospital-onset Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) Bacteremia Outcome Measure.	1716

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57022), we finalized a 15-month performance period from July 1, 2014 through September 30, 2015, for the Domain 1 measure (PSI 90 Patient Safety and Adverse Events Composite) and a 24-month performance period from January 1, 2015 through December 31, 2016 (CYs 2015 and 2016) for Domain 2 measures (CLABSI, CAUTI, Colon and Abdominal Hysterectomy SSI, MRSA Bacteremia, and CDI) for the FY 2018 HAC Reduction Program. We anticipate we will be able to provide hospitals with their confidential hospital-specific reports and discharge level information used in the calculation of their FY 2018 Total HAC

Score in late summer 2017 via the QualityNet Secure Portal.⁷⁴ In order to access their hospital-specific reports, hospitals must register for a QualityNet Secure Portal account.

We did not make any changes to the review and correction policies for FY 2017. Hospitals have a period of 30 days after the information is posted to the QualityNet Secure Portal to review and submit corrections for the calculation of their HAC Reduction Program measure scores, domain scores, and Total HAC Score for the fiscal year. As we have

noted on the QualityNet Web site,⁷⁵ the review and corrections process does not allow hospitals to submit additional corrections related to the underlying claims data for the PSI 90 Composite, or to add new claims to the data extract used to calculate the results. In addition, under the Hospital IQR Program, hospitals have an opportunity to submit, review, and correct the chart-abstracted information used to calculate the CLABSI, CAUTI, Surgical Site Infection (SSI), MRSA, and CDI healthcare-associated infection (HAI)

⁷⁴ Available at: <https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetBasic&cid=1228773343598>.

⁷⁵ Available at: <https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228774298609>.

measures. The HAC Reduction Program's review and corrections process does not allow hospitals to correct: (1) Reported number of HAIs, (2) Standardized Infection Ratios (SIRs), or (3) reported central-line days, urinary catheter days, surgical procedures performed, or patient days. For further information related to the review and correction process we refer readers to the 2014 IPPS/LTCH PPS final rule (78 FR 50725 through 50728).

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50726), we stated that the HAC Reduction Program would use the same process as the Hospital IQR Program for hospitals to review and correct data for chart-abstracted measures in Domain 2. Under this process, hospitals can review and correct data they submit on all Hospital IQR Program chart-abstracted measures, whether or not the measures were adopted as a measure for the HAC Reduction Program. In that rule, we stated that under the Hospital IQR Program, hospitals had an opportunity to submit, review, and correct any of the chart-abstracted information for the full 4½ months following the last discharge date in a calendar quarter. To align with the Hospital IQR Program, we are clarifying the language used for reporting requirements for chart-abstracted measures. We note that NHSN requires that data be submitted on a monthly basis and CDC strongly encourages healthcare facilities to enter each month's data within 30 days of the end of the month in which it is collected so it has the greatest impact on infection prevention activities.

However, for purposes of fulfilling CMS quality measurement reporting requirements, each facility's data must be entered into NHSN no later than 4½ months after the end of the reporting quarter. We further note that NHSN data are reported based on when the event occurred, as opposed to when the patient was discharged. For data submitted for SSIs, facilities should include SSIs that are associated with procedures that were performed during the reporting time period. We refer readers to CDC Web site for additional resources and data submission requirements, which can be found at: <https://www.cdc.gov/nhsn/cms/index.html>.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19986 through 19990), for the HAC Reduction Program, we: (1) Proposed to specify the dates of the time period used to calculate hospital performance for the FY 2020 HAC Reduction Program; (2) requested comment on additional measures for potential future adoption; (3) requested

comment on social risk factors; (4) requested comment on accounting for disability and medical complexity in the CDC NHSN measures in Domain 2; and (5) proposed to update the Extraordinary Circumstance Exception policy beginning in FY 2018 as related to extraordinary circumstances that occur on or after October 1, 2017. These proposals are described in more detail below.

3. Data Collection Time Periods for the FY 2020 HAC Reduction Program

Section 1886(p)(4) of the Act gives the Secretary the statutory authority to determine the "applicable period" during which data are collected for the HAC Reduction Program. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717), we finalized and codified at 42 CFR 412.170 that we would use a 24-month data collection period of performance data to calculate the Total HAC Score. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57020), we finalized a truncated data collection period for Domain 1, shorter than the previous 24-month data collection period for calculating the Total HAC Score for the FY 2018 and FY 2019 HAC Reduction Programs, to accommodate the transition to the ICD-10 classification system. We also changed the definition of "applicable period," in 42 CFR 412.170, to reflect this change.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19987), for the FY 2020 program, we proposed to return to a 24-month data collection period for the calculation of HAC Reduction Program measure results. We believe that using 24 months of data for both domains balances the needs of the program against the data-collection processes utilized by hospitals, and allows for sufficient time to process the claims data and calculate the measure results. The 24-month data collection period allows time to complete the complex calculation process for the measures, to perform comprehensive quality assurance to enhance the accuracy of measure results, and to disseminate confidential reports on hospital-level results to individual hospitals. For the Domain 1 measure (Patient Safety and Adverse Events Composite), we proposed to use the 24-month period from July 1, 2016 through June 30, 2018. The claims for all Medicare Fee-for-Service beneficiaries discharged during this period would be included in the calculations of measure results for Domain 1 for the FY 2020 program. For the CDC NHSN measures in Domain 2 (CLABSI, CAUTI, Colon and Abdominal Hysterectomy SSI, MRSA Bacteremia, and CDI), we

proposed to use data from CYs 2017 and 2018, that is January 1, 2017–December 31, 2018, for the FY 2020 program.

Comment: Some commenters supported returning to a 24-month data collection period for all measures. However, a few commenters recommended adoption of a 12-month data collection period. These commenters stated that a shorter performance would provide hospitals with more timely information to develop quality improvement initiatives.

Response: We thank commenters for their support and we understand that reliable data is a critical component of accurately assessing hospital performance. We believe the 24-month data collection period supports our continued goal to minimize provider burden and incentivize high-quality care. As we noted in the 2014 IPPS/LTCH PPS final rule (78 FR 50717), we adopted the 24-month data collection period based on recommendations from AHRQ, the measure developer. An analysis of the recalibrated PSIs show that most PSIs included in the PSI 90 composite have at least moderate reliability, on average, using a 24-month time period. We continue to believe that the 24-month data collection period provides hospitals and the public the most reliable data available.

After consideration of the public comments we received, we are finalizing the Fiscal Year 2020 data collection period as proposed.

4. Request for Comments on Additional Measures for Potential Future Adoption

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25123), we welcomed public comment and suggestions for additional HAC Reduction Program measures. We believe that our continued efforts to reduce HACs are vital to improving patients' quality of care and reducing complications and mortality, while simultaneously decreasing costs. The reduction of HACs is an important marker of quality of care and has a positive impact on both patient outcomes and cost of care. Our goal for the HAC Reduction Program is to heighten the awareness of HACs and reduce the number of incidences that occur.

As part of our ongoing efforts to evaluate and strengthen the HAC Reduction Program, we are conducting a review of patient safety measures to include in Domain 1. We seek to adopt outcomes-focused patient-safety measures with an emphasis on topic areas including, but not limited to: Falls with injury, adverse drug events (ADEs),

glycemic events and ventilator associated events (VAEs). NQF identified these as gap areas for the HAC Reduction Program.⁷⁶

We note that falls are frequent in the inpatient setting. An estimated 700,000 to 1 million inpatients fall each year in U.S. hospitals.⁷⁷ These falls can result in further health care complications for patients and add costs by increasing the need for expensive imaging, like head computed-tomography scans.⁷⁸ Risk assessment is the primary tool for preventing falls⁷⁹ and research has indicated that inpatient fall prevention programs with patient education components are effective in reducing fall rates.⁸⁰

ADEs are a frequent and preventable occurrence among hospital inpatients. They pose serious threats to patient safety and can result in prolonged hospitalization, increased morbidity and higher health care costs.⁸¹

Glycemic events, a common occurrence among inpatients, are associated with a greater risk of negative health outcomes.⁸² Many guidelines exist to support glycemic control in hospitalized patients. The most common guideline recommendations include documenting diabetes diagnoses, obtaining a hemoglobin A1C on admission, use of the “basal-bolus” method for insulin delivery, discontinuation of noninsulin agents for non-ICU patients with type 2 diabetes, and use of standardized order sets.⁸³

⁸³ Maynard, G., K. Kulasa, P. Ramos, D. Childers, B. Clay, M. Sebaskey, E. Fink, A. Field, M. Renvall, P.S. Juang, C. Choe, D. Pearson, B. Serences, and

Mechanically ventilated patients are at greater risk for VAEs, which can result in morbidity and death.⁸⁴ VAEs include ventilator associated pneumonia (VAP) and preventable adverse events, such as pulmonary edema and acute respiratory distress syndrome. VAP continues to rank among the most common HACs. Effective prevention strategies for VAP include early removal of invasive devices and strict infection control and prevention efforts to target these high-risk groups.⁸⁵

Our overarching purpose is to support the National Quality Strategy’s goals of better health care for individuals, better health for populations, and lower costs for health care.⁸⁶ To the extent practicable, HAC Reduction Program measures should be nationally endorsed by a multi-stakeholder organization. Measures should be aligned with best practices among other payers and the needs of the end users of the measures. Measures should consider widely accepted criteria established in medical literature.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19987 through 19988), we welcomed public comment and suggestions on these measure areas, as well as additional outcome-based patient-safety measures that will help achieve the program goals.

Comment: Many commenters recommended that CMS emphasize measures of patient safety by adopting outcomes-focused measures which include falls and injury, adverse drug effects, glycemic events, and ventilator associated events (VAEs). Commenters noted that future inclusion of these measures supports the National Quality Strategy three-part aim of better health for individuals, better health for populations, and lower costs for health.

Commenters also recommended that CMS concentrate on patient-focused measures that increase quality, reduce harm, and provide opportunities for payers and consumers to be prudent purchasers of clinical services. Specifically, commenters recommended that measures reflect clinical reality by

⁸⁶ About the National Quality Strategy, <https://www.aahrq.gov/workingforquality/about.htm#aims>.

accurately measuring the intended target, be usable by providers who can use the data to implement evidence-based practices to improve care, align with one another using standardized definitions, and represent only the most important health priorities.

Some commenters stated that measures should be integrated in interoperable EHRs, allowing for more comprehensive measurement and requiring no extra reporting effort. In addition, commenters recommended that CMS utilize measures that were fully tested and received NQF endorsement. Commenters believed that NQF endorsement was the most prominent standard which confirmed that measures reflected evidence-based care, were feasible to collect and report in a specific care setting, were clearly defined and usable, and met the highest standard of reliability and validity.

Commenters further requested that CMS avoid measure overlap with the Hospital VBP Program. Commenters requested that any new measure should also be included in the Hospital IQR Program and reported on *Hospital Compare* for one year and approved by the MAP before the measure is proposed.

Some commenters expressed concern that hospitals and other providers were required to report on hundreds of measures and recommended against the addition of any new measures. These commenters did not support the addition of VAE measures, noting a lack of data on VAEs’ responsiveness to quality improvement initiatives. These commenters also expressed concern with measures that focused on ADE and glycemic events unless appropriate clinical data could be efficiently collected and reliance on administrative data could be avoided.

One commenter believed it would be prudent to delay the adoption of such measures until more interventional studies were published to bolster the evidence base and better inform healthcare providers how best to reduce VAEs. This commenter noted that the number of published papers that delineate risk factors (for example, sedation, fluids, high tidal volumes, acid suppression) and effective ways to reduce VAEs (for example, spontaneous awakening trials, spontaneous breathing trials, conservative fluid management) were growing, but the subject is not mature at this point.

Some commenters believed that adding more HAI measures could serve to dilute the focus on improvement efforts. Commenters noted that when additional measures were added, facilities were not able to prioritize the

infection-related events that were most relevant to the population served and services provided in their facilities. Commenters requested that CMS: Commit to the minimum number of measures needed to evaluate healthcare quality, outcomes, and value; use measures that are naturally derived from the delivery of patient care; align with nationally endorsed, evidence-based measures; focus on measures that target the most vital aspects of care, are usable, tailored to the patient population, and that offer opportunities to directly and positively impact patient outcomes; and collaborate with key healthcare stakeholders, including patients, payers, regulators, and providers, to coordinate efforts.

One commenter recommended two NQF-endorsed measures of glycemic control, Glycemic Control—Hypoglycemia (NQF #2363) and Glycemic Control—Hyperglycemia (NQF #2362). This commenter noted that hypoglycemia and hyperglycemia occur frequently in the inpatient setting, have a negative impact on patient outcomes, and increase costs. This commenter encouraged CMS to consider adding these measures because: Studies have identified that the bundling of specific therapies is effective at preventing glycemic events; protocols to reduce the risk of glycemic events have been identified, documented, and are available for implementation by hospitals; and credible data are available to assess the rate of hypoglycemia and hyperglycemia among hospitalized patients.

Some commenters recommended that CMS consider the addition of a Medication Safety Domain (Domain 3). To construct this domain, commenters suggested two measures which address sources of medication errors and related adverse events: Medication Reconciliation: Unintentional Medication Discrepancies (NQF #2456) and the Computerized Provider Order Entry (CPOE) Evaluation Tool. Medication Reconciliation: Unintentional Medication Discrepancies (NQF #2456) measures the rate of unintentional medication discrepancies per patient and is currently in use in the MARQUIS Multi-Center Medication Reconciliation Quality Improvement Study funded by AHRQ. The measure calls for a licensed pharmacist to create a gold standard preadmission medication list (PAML) for a sample of twenty-five adult inpatients per quarter; the PAML is compared to the medication list at admission and to the medication list upon discharge. Hospitals report the number of unintentional medication discrepancies

identified between the PAML and the admission and discharge orders, resulting in a rate of unintentional medication discrepancies per patient. The Computerized Provider Order Entry (CPOE) Evaluation Tool, funded by AHRQ, is designed to test the ability of inpatient CPOE systems to alert prescribers to common, serious medication errors. In addition, the Tool is designed to help hospitals improve their use of clinical decision support to reduce adverse drug events and improve medication safety.

Noting a measures gap in maternity care, one commenter recommended the addition of two maternity safety measures: Cesarean Birth (PC-02) (NQF #0471), developed by The Joint Commission, and Unexpected Newborn Complications (NQF #0716), developed by the California Maternal Quality Care Collaborative. The commenter noted that cesarean births result in increased neonatal and maternal morbidities when compared to vaginal deliveries which, in turn, leads to increased cost of care. The Unexpected Newborn Complications measure was initially endorsed by NQF in 2011 and was recently revised to incorporate several improvements to the measure.

One commenter recommended that CMS adopt the Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (NQF #0678) measure. This commenter noted that pressure ulcers/injuries exact a significant clinical and financial toll; pressure ulcers result in pain, delayed recovery, prolonged hospital stays, increased risk of sepsis, and even death. The commenter also noted published international guidelines for the prevention and treatment of pressure ulcers/injuries that specify emerging therapies as part of pressure ulcer/injury prevention. The commenter further noted that CMS has implemented this measure in the LTCH QRP, and it had been vetted by the NQF.

Finally, the commenter stated their belief that using this measure would add consistency across sites of care and would advance the CMS goal of harmonizing key measures across the continuum of care.

One commenter requested that CMS put a process or system in place to account for patient safety among children. Another commenter recommended CMS explore a measure for the use of antipsychotics for patients with dementia.

Response: We appreciate the commenters' input. Improving patient safety is the primary objective of the HAC Reduction Program. When considering measures for inclusion in

the program, we assess measures that are currently available, risk-adjusted, and reflective of hospital performance. Endorsement by the NQF and input from the Measures Application Partnership (MAP) are also considered. Section 1886(p)(3) of the Act defines "hospital acquired conditions" and does not require that each measure we adopt for the HAC Reduction Program be endorsed by a national consensus building entity, or the NQF specifically. Under this provision, the Secretary has further authority to adopt non-NQF-endorsed measures. While we strive to adopt NQF-endorsed measures when possible, we believe consensus among affected parties can be achieved in other ways, including through the measure development process, stakeholder input via the TEP, broad acceptance and use of the measure, and public comments. We will take commenters' feedback into consideration for future measure selection and rulemaking.

5. Accounting for Social Risk Factors in the HAC Reduction Program

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19988 through 19989), we discussed the issue of accounting for social risk factors in the HAC Reduction Program. We understand that social risk factors such as income, education, race and ethnicity, employment, disability, community resources, and social support (certain factors of which are also sometimes referred to as socioeconomic status (SES) factors or socio-demographic status (SDS) factors) play a major role in health. One of our core objectives is to improve beneficiary outcomes, including reducing health disparities, and we want to ensure that all beneficiaries, including those with social risk factors, receive high quality care. In addition, we seek to ensure that the quality of care furnished by providers and suppliers is assessed as fairly as possible under our programs while ensuring that beneficiaries have adequate access to excellent care.

We have been reviewing reports prepared by the Office of the Assistant Secretary for Planning and Evaluation (ASPE)⁸⁷ and the National Academies of Sciences, Engineering, and Medicine on the issue of accounting for social risk factors in CMS' quality measurement and payment programs, and considering options on how to address the issue in these programs. On December 21, 2016, ASPE submitted a report to Congress on

⁸⁷ <https://aspe.hhs.gov/pdf-report/report-congress-social-risk-factors-and-performance-under-medicare-value-based-purchasing-programs>.

a study it was required to conduct under section 2(d) of the Improving Medicare Post-Acute Care Transformation (IMPACT) Act of 2014. The study analyzed the effects of certain social risk factors in Medicare beneficiaries on quality measures and measures of resource use used in one or more of nine Medicare value-based purchasing programs, including the HAC Reduction Program.⁸⁸ The report also included considerations for strategies to account for social risk factors in these programs. In a January 10, 2017 report released by the National Academies of Sciences, Engineering, and Medicine, that body provided various potential methods for measuring and accounting for social risk factors, including stratified public reporting.⁸⁹

As noted in the FY 2017 IPPS/LTCH PPS final rule, the NQF undertook a 2-year trial period in which certain new measures, measures undergoing maintenance review, and measures endorsed with the condition that they enter the trial period were assessed to determine whether risk-adjustment for selected social risk factors was appropriate for these measures. This trial entailed temporarily allowing inclusion of social risk factors in the risk-adjustment approach for these measures. The trial has concluded, and NQF will issue recommendations regarding the future inclusion of social risk factors in risk-adjustment for these quality measures, and we will closely review its findings.

We note that measures in the HAC Reduction Program, generally, represent never events,⁹⁰ and are often preventable conditions like central line associated bloodstream infections, catheter associated urinary tract infections, and other complications or conditions that arise after a patient was

admitted to the hospital for the treatment of another condition. We believe these events should not be influenced by social risk factors; instead, they are risk-adjusted for factors listed in specifications for the AHRQ and CDC developed measures. Currently, risk factors such as the patient's age, gender, comorbidities, and complications are considered in the calculation of the measure rates so that they account for the clinical differences in the patients served by hospitals. Our measures continually undergo maintenance to determine the need for updated specifications, and to monitor for trends and any relevant risk-adjustment changes needed for the measures. We remind readers that, beginning for payments made in FY 2018, we adopted the modified PSI 90: Patient Safety and Adverse Events Composite (NQF #0531); the composite was revised to reflect the relative importance and harm associated with each component indicator, and to provide a more reliable and valid signal of patient safety events (81 FR 57020). We also adopted a continuous scoring approach in the HAC Reduction Program that brings our scoring domains into alignment with each other, essentially eliminates ties in Total HAC scores, reduces effects on outliers, and enhances the ability to distinguish among hospitals of varying quality (81 FR 57025).

As we continue to consider the analyses and recommendations from these reports and await the results of the NQF trial on risk-adjustment for quality measures, we are continuing to work with stakeholders in this process. As we have previously communicated, we are concerned about holding providers to different standards for the outcomes of their patients with social risk factors because we do not want to mask potential disparities or minimize incentives to improve the outcomes for disadvantaged populations. Keeping this concern in mind, we continue to seek public comment on whether we should account for social risk factors in the HAC Reduction Program and, if so, what method or combination of methods would be most appropriate for accounting for social risk factors. Examples of methods include: Adjustment of the payment adjustment methodology under the HAC Reduction Program; adjustment of provider performance scores (for instance, stratifying providers based on the proportion of their patients who are dual eligible); confidential reporting of stratified measure rates to providers; public reporting of stratified measure

rates; risk-adjustment of a particular measure as appropriate based on data and evidence; and redesigning payment incentives (for instance, rewarding improvement for providers caring for patients with social risk factors or incentivizing providers to achieve health equity).

We note that in section V.I.9. of the preamble of this final rule, we discuss considerations for stratifying hospitals into peer groups for purposes of assessing payment adjustments under the Hospital Readmissions Reduction Program, as required under the 21st Century Cures Act. We refer readers to that section for a detailed discussion of these alternatives; while this discussion and corresponding proposal are specific to the Hospital Readmissions Reduction Program, they reflect the level of analysis we would undertake when evaluating methods and combinations of methods for accounting for social risk factors in CMS' other value-based purchasing programs, such as the HAC Reduction Program. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19989), we sought comment on whether any of these methods should be considered, and if so, which of these methods or combination of methods would best account for social risk factors in the HAC Reduction Program.

In addition, in the proposed rule, we sought public comment on which social risk factors might be most appropriate for stratifying measure scores and/or potential risk-adjustment of a particular measure. Examples of social risk factors include, but are not limited to, dual eligibility/low-income subsidy, race and ethnicity, and geographic area of residence. We also sought comments on which of these factors, including current data sources where this information would be available, could be used alone or in combination, and whether other data should be collected to better capture the effects of social risk. We will take commenters' input into consideration as we continue to assess the appropriateness and feasibility of accounting for social risk factors in the HAC Reduction Program. We note that any such changes would be proposed through future notice-and-comment rulemaking.

We look forward to working with stakeholders as we consider the issue of accounting for social risk factors and reducing health disparities in CMS programs. Of note, implementing any of the above methods would be taken into consideration in the context of how this and other CMS programs operate (for example, data submission methods, availability of data, statistical considerations relating to reliability of

⁸⁸ <https://aspe.hhs.gov/pdf-report/report-congress-social-risk-factors-and-performance-under-medicare-value-based-purchasing-programs>.

⁸⁹ National Academies of Sciences, Engineering, and Medicine. 2017. Accounting for social risk factors in Medicare payment. Washington, DC: The National Academies Press.

⁹⁰ The term "Never Event" was first introduced in 2001 by Ken Kizer, MD, former CEO of the National Quality Forum (NQF), in reference to particularly shocking medical errors (such as wrong-site surgery) that should never occur. Over time, the list has been expanded to signify adverse events that are unambiguous (clearly identifiable and measurable), serious (resulting in death or significant disability), and usually preventable. The NQF initially defined 27 such events in 2002. The list has been revised since then, most recently in 2011, and now consists of 29 events grouped into 6 categories: Surgical, product or device, patient protection, care management, environmental, radiologic, and criminal. Never Events, <https://psnet.ahrq.gov/primer/3/never-events>, accessed on February 22, 2017.

data calculations, among others), so we also welcomed comment on operational considerations. CMS is committed to ensuring its beneficiaries have access to and receive excellent care, and the quality of care furnished by providers and suppliers is assessed fairly in CMS programs.

Comment: Many commenters expressed concern that hospitals caring for large numbers of disadvantaged patients are more likely to receive penalties in the value-based programs. Commenters suggested that the lack of adjustment for social factors can worsen health care disparities because the penalties divert resources away from hospitals and other providers treating large proportions of vulnerable patients. Commenters recommended socio-demographic factors should be included in the HAC Reduction Program's risk-adjustment methodology to ensure the measures accurately reflect quality outcomes within a hospital's control. Commenters suggested that social and economic conditions within the patient population influence the health of the patients when they arrive to the hospital and impact whether patients acquire HACs.

Other commenters supported the inclusion of factors such as: Socioeconomic position (for example dual eligible status, income, and education); race, ethnicity and cultural context; gender; social relationships (for example marital status); residential and community context (for example, housing, walkability, transportation options, and proximity to services); and health literacy. Commenters further recommended that CMS stratify hospitals into peer groups so that hospitals are compared to others with a similar patient mix or grouping such as bed size. Commenters further recommended that, in addition to adjusting payments based on social risk factors, CMS should adjust the measures for public reporting. Commenters noted that failure to adjust measures for public reporting provides an inadequate picture to consumers about provider quality.

Commenters also recommended that CMS examine the National Academies of Sciences, Engineering, and Medicine report for examples of currently available data that could be included in measure risk-adjustment. Some commenters recommended CMS closely examine the considerations provided by National Association of Medicine (NAM) for risk-adjustment. NAM recommended four domains of risk indicators: Income, education, and dual eligibility; race, ethnicity, language, and nativity; marital/partnership status and

living alone; and neighborhood deprivation, urbanicity, and housing. NAM found community-level elements that providers are not able to change can indicate risk unrelated to quality of care; this finding is also being reported in the growing body of research on socioeconomic risk-adjustment.

Commenters recommended that CMS work closely with the relevant medical societies with the goal of incorporating appropriate social risk factors into quality measures as soon as possible.

Some commenters recommended that CMS consider the use of confidential patient-reported data because these offer a reasonably valid estimate of differences in utilization of health care between socioeconomic groups. Commenters requested that CMS consider providing hospitals with confidential reports of performance on accountability measures stratified by dual eligible status or other nationally available data elements. Once hospitals have had sufficient opportunity to review and understand their performance on these stratified measures, the commenters suggested that CMS work with stakeholders to publicly report this data in an appropriate fashion. Commenters further recommended the implementation of demonstration projects to encourage hospitals to collect data on social risk factors through their electronic health records (EHR). Commenters noted that where meaningful and comprehensive neighborhood level socio-demographic data currently exists, CMS should encourage empirical tests of quality metrics adjusted for those factors to assess the impact of those adjustments on local provider performance metrics. Commenters further recommended including functional status (activities of daily living, instrumental activities of daily living, and mobility) as a risk-adjustment variable to accurately assess patients across settings.

In addition, commenters specifically suggested that CMS stratify hospitals into peer groups so that hospitals would be compared to others with a similar patient mix or grouping, such as number of patient beds.

Some commenters did not support changing payment policies to risk-adjust for social risk factors. Commenters noted that this approach would not address the underlying disparities often associated with poor health outcomes. Instead, these commenters maintained, it would mask potential disparities or minimize incentives to improve the outcomes for disadvantaged populations. Commenters suggested that adjusting for socioeconomic and socio-

demographic risk factors would create perverse incentives for poor performers to continue with the status quo and for high performers to retreat from their efforts to address disparities in high socioeconomic status populations. There was also a concern that risk-adjusting for social risk factors would not address the underlying disparities often associated with poor health outcomes and could mask potential disparities.

Commenters suggested that it was unacceptable for patients with social risk factors to experience never events, or a higher incidence of other serious events assessed by patient safety measures. Commenters stated that safe care should be a consistent and universal expectation for all patients. Commenters noted this position has also been taken by the NQF; patient safety measures were not included in the two-year trial period. Commenters recommended that CMS continue to collect a variety of data that could be analyzed over a 2-year period to establish a baseline that identifies how social risk factors impact populations and appropriately weigh those factors when measuring HACs.

Response: We appreciate the recommendations from the commenters about consideration of socioeconomic position; race, ethnicity and cultural context; gender; social relationships; residential and community context; and health literacy and will work to determine the feasibility of collecting these patient-level variables. We also will consider whether we should stratify hospitals into peer groups so that hospitals are compared to others with a similar patient mix or grouping such as number of beds.

We intend to explore options including, but not limited to, measure stratification by social risk factors in a consistent manner across programs, informed by considerations of stratification methods described in section IX.A.13. of the preamble of this final rule. We thank the commenters for this important feedback and will continue to consider options to account for social risk factors that would allow us to view disparities and potentially incentivize improvement in care for patients and beneficiaries. We also will consider providing feedback to providers on outcomes for individuals with social risk factors in confidential reports. As we consider the feasibility of collecting patient-level data and the impact of strategies to account for social risk factors through further analysis, we will continue to evaluate the reporting burden on providers. We also will consider the concerns commenters

raised about masking disparities associated with adjusting for social risk factors. Future proposals would be made after further research and continued stakeholder engagement.

We thank the commenters, and we will consider their views as we develop further policy regarding social risk factors in the HAC Reduction Program.

6. Request for Comments on Inclusion of Disability and Medical Complexity for CDC NHSN Measures

The intent of the HAC Reduction Program is to encourage all hospitals to reduce the incidence of HACs. We continue to believe that there is room for improvement in the incidence of HACs, regardless of the institution or hospital. The measures adopted in the HAC Reduction Program, which are risk-adjusted to account for the different patient populations that hospitals service, target important quality improvement areas. In its IMPACT Act report,⁹¹ ASPE suggested payment strategies to improve the HAC Reduction Program. ASPE noted that it is well-proven that higher levels of medical risk are associated with a higher risk for many (although not all) patient safety events, particularly infections.⁹² For example, diabetes is associated with roughly 70 percent higher odds of surgical site infections and diabetes, pulmonary disease, renal failure, and exposure to nursing homes are associated with a higher risk of MRSA.⁹³ Many of the same medical factors also confer a higher risk of *C. diff.* infection, as well as CAUTI and CLABSI.⁹⁴

ASPE suggested that patient-level clinical data from the CDC healthcare-associated infection (HAI) measures should be examined and considered for additional risk-adjustment.⁹⁵ ASPE also noted that the clinical risk-adjustment of the patient safety and hospital-acquired infection measures should be improved to ensure the measures adequately adjust for differences in patients' clinical risk, so that fair comparisons for hospital accountability and performance assessment can be made to hold providers to the same fair standard.⁹⁶ ASPE recommended additional analyses for measure

developers such as AHRQ and CDC to determine whether adjusting key components of the patient safety or HAI measures (for example frailty, functional limitations, prior hospitalizations or nursing home residence, or other markers of immune system deficiencies or unmeasured medical complexity) may better account for susceptibility to infection and patient safety events.⁹⁷

Based on ASPE's analysis and considerations, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19899), we requested stakeholder feedback on risk-adjusting the CDC NHSN measures for disability or medical complexity. Although we did not propose any specific changes to the measures in the proposed rule, we will consider all comments as a guide to potential future action.

Comment: Many commenters supported the adjustment of the CDC NHSN measures to account for patient medical complexity. Commenters agreed that patients with certain medical conditions (for example, diabetes, pulmonary disease, adrenal failure) are at higher risk for infection, and that frailty and functional limitations are risk factors for some patient safety events. Commenters noted the complex linkages between socioeconomic factors and performance in the HAC Reduction Program; the program's measures, healthcare-associated infections (HAIs), and serious safety events largely reflect actions within a hospital's control. This contrasts with other outcome measures such as readmissions, cost or patient experience, where socioeconomic factors like poverty and access issues can affect outcomes. Commenters agreed with the findings of the ASPE report that patient disability and complexity have a significant impact on patient outcomes, and may not be adequately captured in the current measures.

Commenters encouraged CMS to work with CDC on gathering additional data on medical complexity for further evaluation as part of improved risk-adjustment as well as being able to trend the risks associated with infections for use in prevention strategies. Commenters recommended that any adjustments to the CDC NHSN measures should come directly from CDC based on their experience, testing, and feasibility of accurately obtaining the additional data.

One commenter recommended that CMS examine whether there are any broader community environmental factors that may impact a patient's risk for infections or other complications.

For example, poorer communities can have environmental pollution, reduced access to resources to manage chronic conditions, and food deserts that impact nutrition. One commenter suggested that exposure to nursing homes increased the risk for infection, and urged CMS to consider this as a factor. Another commenter recommended that CMS adopt risk factors that can be extracted from EHRs or claims data rather than chart abstraction.

Response: We thank the commenters and we will consider their views as we develop further policy regarding risk-adjusting the CDC NHSN measures for disability or medical complexity in the HAC Reduction Program. We also appreciate the suggestion to examine whether broader community environmental factors have a differential bearing on the healthcare-associated infection (HAI) outcome measures. While community environmental factors are a plausible contributor to differential risks for HAIs, we are not aware of empirical data that establishes an association or associations. We will continue to partner with CDC to analyze whether we should include additional patient risk factors, preexisting or coexisting conditions, community environmental exposures or healthcare exposures to the CDC NHSN measures.

7. Extraordinary Circumstance Exception (ECE) Policy for the HAC Reduction Program

Many of our quality reporting and value-based purchasing programs share a common process for requesting an exception from program reporting due to an extraordinary circumstance not within a provider's control. The Hospital IQR, Hospital OQR, IPFQR, ASCQR, and PCHQR Programs, as well as the Hospital Readmissions Reduction Program, share common processes for Extraordinary Circumstance Exception (ECE) requests. In reviewing the policies for these programs, we recognized that there are five areas in which these programs have variance regarding ECE requests. These are: (1) Allowing the facilities or hospitals to submit a form signed by the facility's or hospital's CEO versus CEO or designated personnel; (2) requiring the form be submitted within 30 days following the date that the extraordinary circumstance occurred versus within 90 days following the date the extraordinary circumstance occurred; (3) inconsistency regarding specification of a timeline for us to provide our formal response notifying the facility or hospital of our decision; (4) inconsistency regarding specification of our authority to grant ECEs due to CMS data system issues; and (5)

⁹¹ ASPE, "Report to Congress: Social Risk Factors and Performance Under Medicare's Value-Based Purchasing Programs." 21 Dec 2016. Available at: <https://aspe.hhs.gov/pdf-report/report-congress-social-risk-factors-and-performance-under-medicare-value-based-purchasing-programs>.

⁹² *Ibid.* 102.

⁹³ *Ibid.* 102.

⁹⁴ *Ibid.* 102.

⁹⁵ *Ibid.* 135.

⁹⁶ *Ibid.* 136.

⁹⁷ *Ibid.* 136.

referring to the program as “extraordinary extensions/exemptions” versus as “extraordinary circumstances exceptions.” We believe addressing these five areas, as appropriate, can improve administrative efficiencies for affected facilities or hospitals.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49579 through 49581), we adopted an ECE policy for the HAC Reduction Program beginning in FY 2016. This policy was similar to the ECE policy for the Hospital IQR Program, as finalized in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51651), modified in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50836) (designation of a non-CEO hospital contact), and further modified in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50277) (amended 42 CFR 412.140(c)(2) to refer to “extension or exemption” instead of the former “extension or waiver”). In section IX.A.15. of the preamble of this final rule, we discuss our proposal to amend the Hospital IQR Program regulations at 42 CFR 412.140(c)(2) to refer to “extraordinary circumstances exceptions” and we will continue to use this nomenclature for the HAC Reduction Program.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19990), we proposed to modify the ECE policy for the HAC Reduction Program by: (1) Allowing the facility to submit a form signed by the facility’s CEO or designated personnel; (2) specifying that we will strive to provide our formal response notifying the facility of our decision within 90 days of receipt of the facility’s request; and (3) specifying that CMS may grant ECEs due to CMS data system issues which affect data submission. These proposed modifications generally align with policies in the Hospital IQR Program (76 FR 51651 through 51652; 78 FR 50836 through 50837; and 81 FR 57181 through 57182), the Hospital OQR Program (77 FR 68489 and 81 FR 79795), as well as other quality reporting programs. We proposed that these modifications would apply beginning in FY 2018 as related to extraordinary circumstances that occur on or after October 1, 2017.

We note that there may be circumstances in which it is not feasible for a facility’s CEO to sign the ECE request form. In these circumstances, we believe that facilities affected by such circumstances should be able to submit ECE forms regardless of the CEO’s availability to sign. Therefore, the first proposed modification would allow any hospital to designate an appropriate, non-CEO, contact at its discretion. This individual would be responsible for the

submission, and would be the one signing the form. We would accept ECE forms which have been signed by designated personnel.

We also believe that it is important for facilities to receive timely feedback regarding the status of ECE requests. We strive to complete our review of each ECE request as quickly as possible. However, we recognize that the number of requests we receive, and the complexity of the information provided impacts the actual timeframe to make ECE determinations. To improve transparency of our process, we believe it is appropriate to clarify that we will strive to provide our response within 90 days of receipt.

Although we do not anticipate this situation will happen on a regular basis, there may be times where CMS experiences issues with its data systems that directly affects facilities’ abilities to submit data. In these cases, we believe it would be inequitable to require facilities to report. Therefore, we proposed to allow CMS to grant ECEs to facilities if we determine that a systemic problem with one of our data collection systems directly affected the ability of the facilities to submit data. If we make the determination to grant ECEs, we proposed to communicate this decision through routine communication channels.

We invited public comment on these proposed modifications to the HAC Reduction Program’s ECE policy.

Comment: Commenters supported the proposals to modify the extraordinary circumstances exceptions (ECE) policies to align across CMS quality reporting and value-based purchasing programs. One commenter recommended CMS communicate to other agencies when transmission or submission of data to CMS is affected so deadlines imposed by those agencies can be adjusted. One commenter further recommended that if dual eligible hospitals or providers are submitting eQMs and Attestation data through the CMS portal, CMS work with and instruct State Medicaid agencies to accept the data from CMS regardless of deadlines or time frames, if reasonable. In addition, some commenters recommended a definition that includes circumstances of a health-related nature that make it more difficult to provide patient care, such as disease outbreaks, epidemics, drug or vaccine shortages.

Response: We appreciate the commenters’ recommendations and we will take them into consideration as we determine operational decisions. As we discussed in the 2016 IPPS/LTCH PPS final rule (80 FR 49581), based on our experience with the Hospital VBP Program and the Hospital IQR Program,

we anticipate providing exemptions to only a small number of hospitals where the ability to accurately or timely submits claims has been directly impacted as a direct result of experiencing a significant disaster or other extraordinary circumstance beyond the control of the hospital. We do not intend to modify the criteria for an extraordinary circumstance exception at this time.

Comment: A few commenters noted that there is currently no ECE policy for Indian Health Service or Tribally-operated programs, although tribal programs have requested an exception from CMS in previous fiscal years. Commenters requested an ECE specifically for IHS and tribal healthcare programs.

Response: We appreciate the commenters’ concern; however, we note that sections 1886(p)(2)(A) and (B) of the Act defines applicable hospitals and requires all subsection (d) hospitals to be included in the HAC Reduction Program. The ECE policy was not designed to allow a category of hospital to seek exclusion from the HAC Reduction Program in its entirety, but to provide relief for a hospital whose ability to accurately collect quality measure data and/or to report those data in a timely manner has been negatively impacted as a direct result of experiencing a significant disaster or other extraordinary circumstance beyond the control of the hospital.

After consideration of the public comments we received we are finalizing the modifications to the Extraordinary Circumstances Exception (ECE) policy as proposed.

8. Maintenance of Technical Specifications for Quality Measures

Technical specifications for Patient Safety and Adverse Events Composite Measure in Domain 1 can be found at AHRQ’s Web site at: http://qualityindicators.ahrq.gov/Modules/PSI_TechSpec.aspx. Technical specifications for the CDC NHSN HAI measures in Domain 2 can be found at CDC’s NHSN Web site at: <http://www.cdc.gov/nhsn/acute-care-hospital/index.html>. Both Web sites provide measure updates and other information necessary to guide hospitals participating in the collection of HAC Reduction Program data.

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50100), we described a policy under which we use a subregulatory process to make nonsubstantive updates to measures used for the HAC Reduction Program. In the FY 2018 IPPS/LTCH PPS proposed

rule (82 FR 19989), we did not propose any changes to this policy at this time.

L. Rural Community Hospital Demonstration Program

1. Introduction

The Rural Community Hospital Demonstration was originally authorized for a 5-year period by section 410A of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) (Pub. L. 108–173), and extended for another 5-year period by sections 3123 and 10313 of the Affordable Care Act (Pub. L. 111–148). Subsequently, section 15003 of the 21st Century Cures Act (Pub. L. 114–255), enacted December 13, 2016, amended section 410A of Public Law 108–173 to require a 10-year extension period (in place of the 5-year extension required by the Affordable Care Act, as further discussed below). Section 15003 also requires that no later than 120 days after enactment of Public Law 114–255 the Secretary must issue a solicitation for applications to select additional hospitals to participate in the demonstration program for the second 5 years of the 10-year extension period so long as the maximum number of 30 hospitals stipulated by the Affordable Care Act is not exceeded. In this final rule, we provide a summary of the previous legislative provisions and their implementation; a description of the provisions of section 15003 of Public Law 114–255; our proposals and final policies for implementation; and our proposals and finalized policies for budget neutrality, including a discussion of the budget neutrality methodology used in previous final rules, the budget neutrality methodology for the extension period authorized by section 15003 of Public Law 114–255, and the reconciliation of actual and estimated costs of the demonstration for previous years (2011, 2012, and 2013).

2. Background

Section 410A(a) of Public Law 108–173 required the Secretary to establish a demonstration program to test the feasibility and advisability of establishing “rural community” hospitals to furnish covered inpatient hospital services to Medicare beneficiaries. The demonstration pays rural community hospitals under a reasonable cost-based methodology for Medicare payment purposes for covered inpatient hospital services furnished to Medicare beneficiaries. A rural community hospital, as defined in section 410A(f)(1), is a hospital that—

- Is located in a rural area (as defined in section 1886(d)(2)(D) of the Act) or is treated as being located in a rural area under section 1886(d)(8)(E) of the Act;
- Has fewer than 51 beds (excluding beds in a distinct part psychiatric or rehabilitation unit) as reported in its most recent cost report;
- Provides 24-hour emergency care services; and
- Is not designated or eligible for designation as a CAH under section 1820 of the Act.

Section 410A(a)(4) of Public Law 108–173 specified that the Secretary was to select for participation no more than 15 rural community hospitals in rural areas of States that the Secretary identified as having low population densities. Using 2002 data from the U.S. Census Bureau, we identified the 10 States with the lowest population density in which rural community hospitals were to be located in order to participate in the demonstration: Alaska, Idaho, Montana, Nebraska, Nevada, New Mexico, North Dakota, South Dakota, Utah, and Wyoming (Source: U.S. Census Bureau, Statistical Abstract of the United States: 2003).

CMS originally solicited applicants for the demonstration in May 2004; 13 hospitals began participation with cost reporting periods beginning on or after October 1, 2004. In 2005, 4 of these 13 hospitals withdrew from the demonstration program and converted to CAH status. This left 9 hospitals participating at that time. In 2008, we announced a solicitation for up to 6 additional hospitals to participate in the demonstration program. Four additional hospitals were selected to participate under this solicitation. These 4 additional hospitals began under the demonstration payment methodology with the hospitals’ first cost reporting period starting on or after July 1, 2008. At that time, 13 hospitals were participating in the demonstration.

Five hospitals (3 of the hospitals were among the 13 hospitals that were original participants in the demonstration program and 2 of the hospitals were among the 4 hospitals that began the demonstration program in 2008) withdrew from the demonstration program during CYs 2009 and 2010. In CY 2011, one hospital that was among the original set of hospitals that participated in the demonstration withdrew from the demonstration. These actions left 7 of the originally participating hospitals (that is, hospitals that were selected to participate in either 2004 or 2008) participating in the demonstration program as of June 1, 2011.

Sections 3123 and 10313 of the Affordable Care Act (Pub. L. 111–148) amended section 410A of Public Law 108–173, changing the Rural Community Hospital Demonstration Program in several ways. First, the Secretary was required to conduct the demonstration program for an additional 5-year period, to begin on the date immediately following the last day of the initial 5-year period. Further, the Affordable Care Act required, in the case of a rural community hospital participating in the demonstration program as of the last day of the initial 5-year period, the Secretary to provide for the continued participation of such rural community hospital in the demonstration program during the 5-year extension period, unless the hospital made an election to discontinue participation.

In addition, the Affordable Care Act required that, during the 5-year extension period, the Secretary shall expand the number of States with low population densities determined by the Secretary to 20. Further, the Secretary was required to use the same criteria and data that the Secretary used to determine the States for purposes of the initial 5-year period. The Affordable Care Act also allowed not more than 30 rural community hospitals in such States to participate in the demonstration program during the 5-year extension period.

We published a solicitation for applications for additional participants in the Rural Community Hospital Demonstration program in the **Federal Register** on August 30, 2010 (75 FR 52960). The 20 States with the lowest population density that were eligible for the demonstration program were: Alaska, Arizona, Arkansas, Colorado, Idaho, Iowa, Kansas, Maine, Minnesota, Mississippi, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, and Wyoming (Source: U.S. Census Bureau, Statistical Abstract of the United States: 2003). Sixteen new hospitals began participation in the demonstration with the first cost reporting period beginning on or after April 1, 2011.

In addition to the 7 hospitals that were selected in either 2004 or 2008, the new selection led to a total of 23 hospitals in the demonstration. During CY 2013, one additional hospital among the set selected in 2011 withdrew from the demonstration, which left 22 hospitals participating in the demonstration, effective July 1, 2013, all of which continued their participation through December 2014. Starting from that date and extending through the end

of FY 2015, the 7 “originally participating” hospitals, that is, hospitals that were selected in either 2004 or 2008, ended on a rolling basis their scheduled 5-year periods of performance authorized by the Affordable Care Act (referred to hereafter as “Cohort 1” hospitals). Likewise, the participation period for the 14 hospitals that entered the demonstration following the mandate of the Affordable Care Act and that were still participating (referred to as “Cohort 2” hospitals) ended their scheduled periods of performance on a rolling basis according to the end dates of the hospitals’ cost report periods, respectively, from April 30, 2016 through December 31, 2016. (One hospital among the Cohort 2 hospitals closed in October 2015.)

3. Provisions of the 21st Century Cures Act (Pub. L. 114–255) and Proposals and Finalized Policies for Implementation

a. Statutory Provisions

As stated earlier, section 15003 of Public Law 114–255 further amended section 410A of Public Law 108–173 to require the Secretary to conduct the Rural Community Hospital Demonstration for a 10-year extension period (in place of the 5-year extension period required by the Affordable Care Act), beginning on the date immediately following the last day of the initial 5-year period under section 410A(a)(5) of Public Law 108–173. Thus, the Secretary is required to conduct the demonstration for an additional 5-year period. Specifically, section 15003 of Public Law 114–255 amended section 410A(g)(4) of Public Law 108–173 to require that, for hospitals participating in the demonstration as of the last day of the initial 5-year period, the Secretary shall provide for continued participation of such rural community hospitals in the demonstration during the 10-year extension period, unless the hospital makes an election, in such form and manner as the Secretary may specify, to discontinue participation. In addition, section 15003 of Public Law 114–255 amended section 410A(g)(4)(B) (Pub. L. 108–173) to provide that in calculating the amount of payment under the demonstration program to the rural community hospital for covered inpatient hospital services furnished by the hospital during each 5-year period of such 10 year extension period, the amount of payment (for the first cost reporting period) is the reasonable costs of providing such services for discharges occurring in the first cost reporting period beginning on or after the first day of each applicable 5-year

period in the 10-year extension period. Furthermore, section 15003 of Public Law 114–255 added subsection (g)(5) to section 410A of Public Law 108–173 to require that, during the second 5 years of the 10-year extension period, the Secretary shall apply the provisions of section 410A(g)(4) of Public Law 108–173 to rural community hospitals that are not described in subsection (g)(4) but that were participating in the demonstration as of December 30, 2014, in a similar manner as such provisions apply to hospitals described in subsection (g)(4). We interpret this as providing for participation in and payment under the demonstration during the second 5 years of the 10-year extension period for hospitals that are not described in section 410A(g)(4) of Public Law 108–173 (as amended) but that were participating in the demonstration as of December 30, 2014, in a similar manner as such extension and payment applies to hospitals described in section 410A(g)(4) of Public Law 108–173 (as amended), unless a hospital makes an election, in such form and manner as the Secretary may specify, to discontinue participation.

In addition, section 15003 of Public Law 114–255 amended section 410A of Public Law 108–173 to add paragraph (g)(6)(A) which requires that, no later than 120 days after enactment of paragraph (g)(6), the Secretary shall issue a solicitation for applications to select additional rural community hospitals located in any State to participate in the demonstration program for the second 5 years of the 10-year extension period, without exceeding the maximum number of hospitals (that is, 30) permitted under section 410A(g)(3) of Public Law 108–173 (which was added by the Affordable Care Act). Section 15003 also amended section 410A of Public Law 108–173 to add paragraph (g)(6)(B) which provides that, in determining which hospitals submitting an application pursuant to this solicitation are to be selected for participation in the demonstration, the Secretary shall give priority to rural community hospitals located in one of the 20 States with the lowest population densities, as determined using the 2015 Statistical Abstract of the United States. In addition, in determining which among the hospitals submitting an application pursuant to this solicitation are to be selected for participation in the demonstration, section 410A(g)(6)(B) specifies that the Secretary may consider closures of hospitals located in rural areas in the State in which an applicant hospital is located during the

5-year period immediately preceding the date of enactment of section 410A(g)(6) of Public Law 108–173, as well as the population density of the State in which the rural community hospital is located.

b. Terms of Continuation for Previously Participating Hospitals

As discussed earlier, section 15003 of Public Law 114–255 (the 21st Century Cures Act) amended section 410A of Public Law 108–173 to provide for a 10-year extension of the demonstration (in place of the 5-year extension required by the Affordable Care Act) beginning on the date immediately following the last day of the initial 5-year period under section 410A(a)(5) of Public Law 108–173. Thus, section 15003 of Public Law 114–255 requires an additional 5-year extension of the demonstration beyond the extension required by the Affordable Care Act. Given the timing of the enactment of Public Law 114–255, for most of the previously participating hospitals, there is a gap between the end date of each hospital’s participation in the first 5-year extension period and enactment of Public Law 114–255 on December 13, 2016. For these hospitals, this gap is for a period of between 2 to 23 months. Section 15003 of Public Law 114–255 does not address how the second 5 years of the 10-year extension is to be implemented in the event of a gap between the end of the first 5 years of the 10-year extension period for a participating hospital and the enactment of Public Law 114–255 authorizing the second 5 years of the 10-year extension period. As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19992), given this gap and the lack of specific direction in the statute regarding how to implement the extension in this situation for these previously participating hospitals, and the mandate under section 15003 of Public Law 114–255 to issue a solicitation for additional participants for the second 5 years of the 10-year extension, we considered how to implement the second 5 years of the 10-year extension period. In the FY 2018 IPPS/LTCH PPS proposed rule, for each previously participating hospital that decides to participate in the second 5 years of the 10-year extension period, we proposed that the start date for the period of performance under the second 5-year extension period would be the start of the first cost reporting period on or after October 1, 2017 following upon the announcement of the selection of the additional hospitals for the demonstration. In this manner, we proposed to align the periods of performance for the previously

participating hospitals that decide to participate in the second 5-year extension period with the periods of performance for the additional hospitals authorized by section 15003 of Public Law 114–255. In the FY 2018 IPPS/LTCH PPS proposed rule, we stated that we believe the approach we proposed above is consistent with section 410A of Public Law 108–173, as amended by Public Law 114–255. We also stated that aligning, to the extent possible, the periods of performance of the previously participating hospitals with those of those newly selected under the demonstration was reasonable, given the need for time to carry out demonstration administration activities, evaluation considerations, and the necessity for the calculation of budget neutrality offset amounts.

We invited public comments on the proposed approach discussed earlier for implementing the second 5-year period of the 10-year extension required under section 15003 of Public Law 114–255 for the previously participating hospitals. In addition, we invited public comments on alternative approaches under the statute for implementing the extension, particularly with respect to the commencement of the second 5-year period of the extension for previously participating hospitals.

We described an alternative approach according to which each previously participating hospital would begin the second 5 years of the 10-year extension period and the cost-based payment methodology under section 410A of Public Law 108–173 (as amended by section 15003 of Pub. L. 114–255), on the date immediately after the date the period of performance under the first 5-year extension period ended. For example, for a hospital whose 5-year period of performance authorized by the Affordable Care Act ended June 30, 2015, the extension period under section 15003 of Public Law 114–255 would be effective July 1, 2015, and it would extend through June 30, 2020. Likewise, for a hospital whose 5-year period of performance ended June 30, 2016, the extension period under section 15003 of Public Law 114–255 would be effective July 1, 2016, and it would extend through June 30, 2021. The methodology we considered for calculating the budget neutrality offset amount under this alternative approach is described in section V.L.4.d. of the preamble of the proposed rule. We stated that this alternative approach would also be consistent with the language of section 410A of Public Law 108–173 (as amended), and, unlike the proposed approach, would not provide for a gap in the reasonable cost payment

methodology between the end of the first and start of the second 5-year periods of the 10-year extension period. We also sought public comments on this alternative approach to implementing the extension to the demonstration under section 15003 of Public Law 114–255 and the corresponding alternative budget neutrality calculation described in section V.L.4.d. of the preamble of the proposed rule.

Comment: Several commenters expressed concern about our proposed approach, stating that section 15003 of Public Law 114–255, which authorizes the second 5-year extension, changes the language in Public Law 111–148 from 5 years to 10 years, beginning on the date immediately following the last day of the initial 5-year period, and that thus the alternative approach should be implemented so as to apply the cost-based payment methodology continuously for the previously participating hospitals. The commenters added that adopting our proposed approach would create financial hardship for some of the previously participating hospitals. They noted that, in certain cases, these hospitals play a vital role in providing health services in remote communities, and that the gap in applying the cost-based payment under our proposed approach would jeopardize access to essential health care services.

Response: We believe that our proposed approach to align the periods of participation for all participating hospitals for the second 5-year extension period is consistent with the statute and reasonable, given the gap between the end of the first 5-year extension period for previously participating hospitals and the enactment of Public Law 114–255 authorizing the second 5-year extension period. Nevertheless, we acknowledge that we have administered this demonstration program for the previous 5-year periods, as authorized by section 410A of Public Law 108–173 and sections 3123 and 10313 of Public Law 111–148, respectively, by aligning the period of participation for each of the hospitals with the start of the first cost report year upon selection to the demonstration program. Considering this previous experience for the demonstration program, we believe that implementing the periods of performance for the second 5-year extension period in accordance with the alternative approach would also be consistent with the language of the authorizing statutes and reasonable.

We have considered the concerns expressed about the negative impact that our proposed approach of a gap in

the cost-based payment methodology would have on the ability of the previously participating hospitals to provide essential health care services. We believe these are important concerns to balance against any considerations under the proposed approach in undertaking the administrative, evaluation, and budget neutrality functions for the demonstration. Therefore, we are finalizing the alternative approach with regard to the effective date for the application of the demonstration payment methodology for those previously participating hospitals that choose to participate in the second 5-year extension period. Thus, each previously participating hospital would begin the second 5 years of the 10-year extension period and the cost-based payment methodology under section 410A of Public Law 108–173 (as amended by section 15003 of Pub. L. 114–255) on the date immediately after the date the period of performance under the first 5-year extension period ended.

c. Solicitation for Additional Participants

We stated in the FY 2018 IPPS/LTCH PPS proposed rule that, as required under section 15003 of Public Law 114–255, we would issue a solicitation for additional hospitals to participate in the demonstration. We released this solicitation on April 17, 2017, with applications due May 17, 2017. Among other things, the solicitation asked hospitals to describe challenges experienced with the current method of Medicare payment, the impact of rural hospital closures within the State or surrounding area, and a strategy for financial viability and improving the health care of the population.

Section 15003 of Public Law 114–255, adding section 410A(g)(6)(B) to Public Law 108–173, provides that, in determining which rural community hospitals that submitted an application pursuant to the solicitation under section 410A(g)(6)(A) to select for participation in the demonstration program, the Secretary shall give priority to rural community hospitals located in one of the 20 States with the lowest population densities (as determined by the Secretary using the 2015 Statistical Abstract of the United States). We note that the U.S. Census Bureau ceased publishing the Statistical Abstract of the United States in 2011, and that in the years since then, ProQuest, LLC, a private vendor, has produced a volume intended to serve the same function as a comprehensive collection of national statistics, compiling data from different sources

including published reports from the Census Bureau. Thus, we used ProQuest Statistical Abstract of the United States, 2015 in determining which States to give priority in selecting additional participants for the demonstration. We believe that, in the absence of a volume produced by the Census Bureau, using this compendium is consistent with the intent of the statute, and is appropriate for the purpose of designating States to which priority is to be given under section 410A(g)(6)(B)(i) of Public Law 108–173.

In the FY 2018 IPPS/LTCH PPS proposed rule, we noted that the table in this compendium presenting information on State population density includes separate sets of statistics for 2010 and 2013. Both data sources are available on the Census Bureau Web site. The source for the 2010 statistics is “2010 Census Briefs, Population Distribution and Change: 2000 to 2010, March 2011” (<http://www.census.gov/prod/cen2010/briefs/c2010br-01.pdf>); the source for 2013 is “Annual Estimates of the Population for the United States, Regions, States, and Puerto Rico: April 1, 2010 to July 1, 2013” (<http://www.census.gov/popest/data/state/totals/2013/index.html>). Consistent with our policy for the previous solicitations, we chose the more recent data source to identify the 20 States to which priority is to be given. These States are: Alaska, Arizona, Arkansas, Colorado, Idaho, Iowa, Kansas, Maine, Mississippi, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Vermont, and Wyoming.

We noted that section 410A(g)(6)(B)(ii)(II) of Public Law 108–173 as added by section 15003 of Public Law 114–255 also states that, in selecting additional participants, the Secretary may consider the population density of the State in which the rural community hospital is located. We are doing so because the demonstration may have differing effects for health care services and populations depending on State population density. In addition, as permitted by section 410A(g)(6)(B)(ii)(I) of Public Law 108–173, in selecting additional participants under this solicitation, we will consider the impact of closures of hospitals located in rural areas in the State in which the hospital is located during the 5-year period immediately preceding December 13, 2016. We believe that this consideration is reasonable, given the possibility that enhanced Medicare payment through the demonstration may increase access to health care services for populations thus affected by hospital closures.

We stated that our goal was to finalize this selection by June 2017, in time to include in the FY 2018 IPPS/LTCH PPS final rule an estimate of the costs of the demonstration during FY 2018 and the resulting budget neutrality offset amount for these newly participating hospitals (referred to as “Cohort 3” hospitals), as well as for those hospitals among the previously participating hospitals that decide to participate in the extension period (Cohorts 1 and 2 hospitals). Upon announcing the selection of new participants, we indicated that we would confirm the start dates for the periods of performance for these newly selected hospitals and for previously participating hospitals. We stated that in accordance with the proposed implementation approach discussed in section V.L.3.b. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule, if the selection were to be announced by June 2017, we would expect that we would determine the periods of performance for all of the participating hospitals to begin with the first cost reporting period on or after October 1, 2017, and we would include an estimate of the costs for the demonstration for FY 2018 for Cohorts 1, 2, and 3 hospitals in the FY 2018 IPPS/LTCH PPS final rule.

We stated, on the other hand, that if final selection of the Cohort 3 hospitals were not to occur by June 2017, under our proposed approach, we would not be able to include an estimate of the costs of the demonstration or an estimate of the budget neutrality offset amount for FY 2018 for either these Cohort 3 hospitals or the previously participating Cohorts 1 and 2 hospitals in the FY 2018 IPPS/LTCH PPS final rule. Considering that periods of performance for the Cohorts 1 and 2 hospitals would not be determined until after the selection of the Cohort 3 hospitals, we would not know precisely when the periods of performance would begin for the Cohorts 1 and 2 hospitals, or to what extent they would overlap with the 12 months in FY 2018 until the Cohort 3 hospitals were selected. Therefore, if the announcement of the final selection of the Cohort 3 hospitals were not to occur by June 2017, we would not be able to include an estimate of the demonstration costs or budget neutrality offset amount for FY 2018 for the Cohorts 1 and 2 hospitals in the FY 2018 IPPS/LTCH PPS final rule. As a result, if the announcement of the final selection of the Cohort 3 hospitals were not to occur by June 2017, we would specify the dates on which all participating hospitals would start in the second 5 years of the 10-year

extension period at the time the selection was announced in accordance with our proposal. We proposed that if the selection of the Cohort 3 hospitals was not announced in June 2017, we would include the estimated costs of the demonstration for all participating hospitals for FY 2018 in the budget neutrality offset amount to be calculated in the FY 2019 IPPS/LTCH PPS proposed and final rules.

Comment: One commenter supported CMS’ goal of aligning performance periods across all of the hospitals participating in the demonstration program. However, the commenter recommended that CMS achieve this end by implementing a retroactive reimbursement policy for the hospitals newly entering the demonstration program as well, so that all hospitals participating in the second 5-year extension period are subject to the demonstration payment methodology for the gap period occurring between the end of the first 5 years of the 10-year extension period and the enactment of Public Law 114–255 authorizing the second 5 years of the 10-year extension period.

Response: We appreciate the commenter’s support and recommendation. As of the time of the publication of this final rule, we have not finalized the selection of additional participants (Cohort 3 hospitals) to participate in the demonstration. Once we announce selections, we will also announce the start dates for the 5-year extension period for the additional hospitals selected (Cohort 3). In addition, for the previously participating Cohorts 1 and 2 hospitals, as discussed in section V.L.3.b. of the preamble of this final rule, we are not finalizing the proposed approach under which the start date for the period of performance under the second 5-year extension period would be the start of the first cost reporting period on or after October 1, 2017, following upon the announcement of the selection of the additional hospitals for the demonstration. We are finalizing the alternative approach, under which the start date of each previously participating Cohort 1 and 2 hospital for the second 5 years of the 10-year extension period would be the date immediately after the date the period of performance under the first 5-year extension period ended. We will confirm the start dates for these hospitals after verifying which among them will continue to participate in the second 5-year extension period.

Inasmuch as the selection of the Cohort 3 hospitals was not announced in June 2017, we are finalizing our

proposal to include the estimated costs of the demonstration for all participating hospitals (Cohorts 1, 2, and 3) for FY 2018 in the budget neutrality offset amount to be calculated in the FY 2019 IPPS/LTCH PPS proposed and final rules. We refer readers to section V.L.4.d. of the preamble of this final rule for a discussion of our finalized calculation methodology for the budget neutrality offset amount for FY 2018.

4. Budget Neutrality

a. Statutory Budget Neutrality Requirement

Section 410A(c)(2) of Public Law 108–173 requires that, in conducting the demonstration program under this section, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration program under this section was not implemented. This requirement is commonly referred to as “budget neutrality.” Generally, when we implement a demonstration program on a budget neutral basis, the demonstration program is budget neutral on its own terms; in other words, the aggregate payments to the participating hospitals do not exceed the amount that would be paid to those same hospitals in the absence of the demonstration program. Typically, this form of budget neutrality is viable when, by changing payments or aligning incentives to improve overall efficiency, or both, a demonstration program may reduce the use of some services or eliminate the need for others, resulting in reduced expenditures for the demonstration program’s participants. These reduced expenditures offset increased payments elsewhere under the demonstration program, thus ensuring that the demonstration program as a whole is budget neutral or yields savings. However, the small scale of this demonstration program, in conjunction with the payment methodology, makes it extremely unlikely that this demonstration program could be held to budget neutrality under the methodology normally used to calculate it—that is, cost-based payments to participating small rural hospitals are likely to increase Medicare outlays without producing any offsetting reduction in Medicare expenditures elsewhere. In addition, a rural community hospital’s participation in this demonstration program would be unlikely to yield benefits to the participants if budget neutrality were to be implemented by reducing other payments for these same

hospitals. Therefore, in the 12 IPPS final rules spanning the period from FY 2005 through FY 2016, we adjusted the national inpatient PPS rates by an amount sufficient to account for the added costs of this demonstration program, thus applying budget neutrality across the payment system as a whole rather than merely across the participants in the demonstration program. (In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57034), we described a different methodology which we specify below.) As we discussed in the FYs 2005 through 2017 IPPS final rules (69 FR 49183; 70 FR 47462; 71 FR 48100; 72 FR 47392; 73 FR 48670; 74 FR 43922, 75 FR 50343, 76 FR 51698, 77 FR 53449, 78 FR 50740, 77 FR 50145; 80 FR 49585; and 81 FR 57034, respectively), we believe that the language of the statutory budget neutrality requirements permits the agency to implement the budget neutrality provision in this manner.

b. Methodology Used In Previous Final Rules

We generally incorporated two components into the budget neutrality offset amounts identified in the final IPPS rules in previous years. First, we estimated the costs of the demonstration for the upcoming fiscal year, generally determined from historical, “as submitted” cost reports for the hospitals participating in that year. Update factors representing nationwide trends in cost and volume increases were incorporated into these estimates, as specified in the methodology described in the final rule for each fiscal year. Second, as finalized cost reports became available, we determined the amount by which the actual costs of the demonstration for an earlier, given year differed from the estimated costs for the demonstration set forth in the final IPPS rule for the corresponding fiscal year, and we incorporated that amount into the budget neutrality offset amount for the upcoming fiscal year. If the actual costs for the demonstration for the earlier fiscal year exceeded the estimated costs of the demonstration identified in the final rule for that year, this difference was added to the estimated costs of the demonstration for the upcoming fiscal year when determining the budget neutrality adjustment for the upcoming fiscal year. Conversely, if the estimated costs of the demonstration set forth in the final rule for a prior fiscal year exceeded the actual costs of the demonstration for that year, this difference was subtracted from the estimated cost of the demonstration for the upcoming fiscal year when determining the budget neutrality

adjustment for the upcoming fiscal year. (We note that we have calculated this difference for FYs 2005 through 2010 between the actual costs of the demonstration as determined from finalized cost reports once available, and estimated costs of the demonstration as identified in the applicable IPPS final rules for these years.)

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57036), we finalized a different methodology as compared to previous years for analyzing the costs attributable to the demonstration for FY 2017. We noted in the FY 2017 IPPS/LTCH PPS final rule that, in accordance with the extension mandated by the Affordable Care Act, the demonstration would have substantially phased out by the beginning of FY 2017. In addition to the 7 originally participating hospitals (Cohort 1 hospitals) having ended their scheduled period of performance in the 5-year extension period prior to the start of FY 2016, we noted that the participation periods for the 14 hospitals that entered the demonstration following the extension mandated by the Affordable Care Act (Cohort 2 hospitals) that were still participating were to end on a rolling basis according to the end dates of the hospitals’ cost report periods, respectively, from April 30, 2016 through December 31, 2016. (As noted earlier, 1 hospital among the Cohort 2 hospitals closed in October 2015.) Of these 14 hospitals, 10 ended participation on or before September 30, 2016, leaving 4 hospitals participating for the last 3 months of CY 2016 (that is, the first 3 months of FY 2017). We stated that, given the small number of participating hospitals and the limited time of participation for such hospitals during FY 2017, a revised methodology was appropriate for determining the costs of the demonstration during this period. We noted that, for the 4 hospitals that would end their participation in the demonstration effective December 31, 2016, the financial experience of the last 3 months of the calendar year (that is, the first 3 months of FY 2017) would be included in the finalized cost reports for FY 2016. We stated that examining the finalized cost reports for FY 2016 for these hospitals would lead to a more accurate and administratively feasible calculation of budget neutrality for the demonstration in FY 2017 than conducting an estimate of the costs of the demonstration for this 3-month period based on “as submitted cost reports” (as would occur according to the budget neutrality methodology used

prior to the FY 2017 IPPS/LTCH PPS final rule).

Thus, in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57037), we finalized the proposal to forego the process of estimating the costs attributable to the demonstration for FY 2017, and to instead calculate the costs of the demonstration and the resulting budget neutrality adjustment factor for the demonstration for FY 2017 once the finalized cost reports for cost reporting periods beginning in FY 2016 became available.

c. Budget Neutrality Methodology for Extension Period Authorized by the 21st Century Cures Act (Pub. L. 114–255)

For the implementation approach that we proposed in section V.L.3.b. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule, we proposed that a budget neutrality offset methodology similar to previous years (prior to FY 2017) would be applied to the periods of performance under the second 5 years of the 10-year extension period authorized by section 15003 of Public Law 114–255. With the potential exception of the demonstration costs for FY 2018 as discussed below, for the periods of performance under the second 5 years of the 10-year extension period, an estimate of the costs of the demonstration, generally determined from historical, “as submitted” cost reports for the participating hospitals and the appropriate update factors, would be incorporated into a budget neutrality offset amount to be applied to the national IPPS rates for the upcoming fiscal year. We proposed that we would implement this adjustment through the corresponding proposed and final IPPS rules. In addition, we proposed that we would include as a second component to the budget neutrality offset amount, the amount by which the actual costs of the demonstration for an earlier, given year (as determined from finalized cost reports when available) differed from the estimated costs for the demonstration set forth in the final IPPS rule for the corresponding fiscal year.

Regarding demonstration costs specifically for FY 2018, as described in section V.L.3.c. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule, we proposed that if the selection of additional hospitals pursuant to section 410A(g)(6) of Public Law 108–173 (as added by section 15003 of Pub. L. 114–255) were to be announced by June 2017, we would include in this FY 2018 IPPS/LTCH PPS final rule an estimate of the costs of the demonstration for FY 2018 and the resulting estimated budget neutrality offset amount for the newly selected hospitals (Cohort 3 hospitals)

and for the previously participating hospitals (Cohorts 1 and 2 hospitals). As discussed earlier, if the final selection of the additional hospitals were not to occur by June 2017, we stated in the proposed rule that we would not be able to include an estimate of the costs of the demonstration for any participating hospitals or an estimated budget neutrality adjustment for FY 2018 in the FY 2018 IPPS/LTCH PPS final rule. In that situation, we proposed to include the estimated costs of the demonstration for FY 2018 for all participating hospitals (Cohorts 1, 2 and 3 hospitals) in the budget neutrality offset adjustment in the FY 2019 IPPS/LTCH PPS proposed and final rules. The budget neutrality offset adjustment for the FY 2019 IPPS/LTCH PPS proposed and final rules would also include the estimated costs of the demonstration for FY 2019 for all participating hospitals based on historical, “as submitted” cost reports and the appropriate update factors.

Under our proposed implementation approach for the second 5-year extension period as described in section V.L.3.b. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule, if the selection of the new hospitals were to be announced by June 2017, we stated that we would continue to use the general methodology finalized in previous final rules (prior to FY 2017) to calculate the estimated budget neutrality adjustment factor to be applied to the FY 2018 national IPPS rates. (We noted that the same general methodology would be used if the announcement of the selection of additional hospitals did not occur by June 2017, and thus the budget neutrality offset amount reflecting the costs of the demonstration for hospitals participating in FY 2018 would be applied to the national IPPS rates for FY 2019.)

We did not receive any public comments on this issue.

Consistent with the approach adopted in the FY 2016 IPPS/LTCH PPS final rule, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19996), we proposed a specific calculation to account for the fact that the periods of performance for the participating hospitals would start at different points of time during FY 2018. That is, we proposed to prorate estimated reasonable cost amounts and amounts that would be paid without the demonstration for FY 2018 according to the fraction of the number of months that the hospital would be participating out of the 12 months within FY 2018. For example, if a hospital would be starting this second 5-year period of the 10-year extension period on January 1,

2018, we would multiply the estimated cost and payment amounts, derived as described below, by a factor of 0.75. (In this discussion of how the overall calculations are conducted, this factor is referred to as “the hospital-specific prorating factor”.) Our proposed methodology for calculating the budget neutrality offset amount proceeds in several steps, as set forth below:

Step 1: For each of the participating hospitals, we proposed to identify the reasonable cost amount calculated under the reasonable cost methodology for covered inpatient hospital services, as indicated on the “as submitted” cost report for the most recent cost reporting period available. (We stated that we expected that, for most of the hospitals, these “as submitted” cost reports would be those with cost report period end dates in CY 2015. In the solicitation for additional participants, we requested that applicants submit cost report information from the most recent year available. For the selected additional hospitals (that is, Cohort 3), we stated that we would be using the submitted information for the calculation of the budget neutrality offset amount for FY 2018.) We stated that we believed the most recent available cost reports to be an accurate predictor of the costs of the demonstration in FY 2018 because they would give us a recent picture of the participating hospitals’ costs.

Because section 410A of Public Law 108–173 stipulates swing-bed services are to be included among the covered inpatient hospital services for which the demonstration payment methodology applies, we proposed to include the cost of these services, as reported on the cost reports for the hospitals that provide swing-bed services, in estimating the total reasonable cost amount for covered inpatient hospital services under the demonstration. Similar to what is stated above, we proposed to use the most recently available “as submitted” cost reports for this calculation.

For each hospital, we proposed to sum the two above-referenced amounts, and then multiply this sum by the hospital-specific prorating factor (described above), to obtain an unadjusted hospital-specific amount, calculated for each hospital prior to applying adjustments for increases in cost or volume, as described below. (In the discussion below, we refer to this amount as the “unadjusted hospital-specific amount”.) We proposed to sum these unadjusted hospital-specific amounts for all participating hospitals to obtain an unadjusted total estimated reasonable cost amount for covered inpatient hospital services (for all participating hospitals) to which update

factors representing increases in costs and volume would be applied.

Accordingly, we proposed to multiply this sum (that is, the unadjusted total estimated reasonable cost amount for covered inpatient hospital services for all participating hospitals) by the FY 2016, FY 2017, and final FY 2018 IPPS market basket percentage increases, which are formulated by the CMS Office of the Actuary. We proposed to use the market basket percentage increases for these particular years because we expect that most of the “as submitted” cost reports that would be used in determining the unadjusted hospital-specific amounts will end in FY 2015. If a majority of these “as submitted” cost reports end in FY 2016, we stated that we would apply only the FY 2017 and final FY 2018 market basket percentage increases. We recognized that applying the set of FY 2016, FY 2017, and FY 2018 market basket percentage increases to a sum that may include information from “as submitted” cost reports ending in FY 2016 (or, conversely, applying these update factors for FY 2017 and FY 2018 to a sum that may include information from “as submitted” cost reports ending in FY 2015) might appear to reduce the precision of the estimate. However, we stated that we believed that the potential margin of error in estimating the total costs for the demonstration hospitals inherent in using a uniform set of update factors would be justifiable for purposes of streamlining and applying a consistent calculation method for all participating hospitals. In addition, we noted that, as in previous years, we proposed to reconcile the actual costs of the demonstration as determined from finalized cost reports when available with the estimate of the costs of the demonstration in FY 2018 as included in the budget neutrality offset amount, which would ultimately address any potential error in estimating the costs of the demonstration for FY 2018, thereby enhancing the accuracy of the calculation.

In the proposed rule, we stated that the current estimate of the FY 2018 IPPS market basket percentage increase provided by the CMS Office of the Actuary is specified in section V.B.1. of the preamble of the proposed rule. We also proposed to then multiply the product of the unadjusted total estimated reasonable cost amount for all participating hospitals and the market basket percentage increases applicable to the years involved by a 3-percent annual volume adjustment for each of FYs 2016 through 2018 (or only FYs 2017 and 2018, in accordance with the discussion above). The result would be

the general total estimated FY 2018 reasonable cost amount for covered inpatient hospital services for all participating hospitals.

We proposed to apply the IPPS market basket percentage increases applicable for FYs 2016 through 2018 (or FYs 2017 and 2018, in accordance with the discussion above) to the applicable total estimated reasonable cost amount described above to model the estimated FY 2018 reasonable cost amount under the demonstration. We proposed to use the IPPS market basket percentage increases because we believe that these update factors appropriately indicate the trend of increase in inpatient hospital operating costs under the reasonable cost methodology for the years involved. The 3-percent annual volume adjustment was stipulated by the CMS Office of the Actuary and was proposed because it is intended to accurately reflect the tendency of hospitals’ inpatient caseloads to increase. We acknowledged the possibility that inpatient caseloads for small hospitals may fluctuate, and thus proposed to incorporate into the estimate of demonstration costs a factor to allow for a potential increase in inpatient hospital services.

Step 2: For each of the participating hospitals, we proposed to identify the general estimated amount that would otherwise be paid in FY 2018 under applicable Medicare payment methodologies for covered inpatient hospital services (as indicated on the same set of “as submitted” cost reports as in Step 1) if the demonstration was not implemented. Similarly, as in Step 1, for the hospitals that provide swing-bed services, we proposed to identify the estimated amount that generally would otherwise be paid for these services (using the same “as submitted” cost reports as in Step 1) and include it in estimating the total FY 2018 general amount that would otherwise be paid for covered inpatient hospital services without the demonstration. Similar to Step 1, we proposed to multiply this sum for each participating hospital by the hospital-specific prorating factor. We then proposed to add together the resulting amounts for all participating hospitals to obtain an estimate of the amount that would otherwise be paid for covered inpatient hospital services for all participating hospitals without the demonstration, to which update factors representing increases in costs and volume would be applied.

Accordingly, we proposed to then multiply this amount by the FYs 2016 through 2018 (or only FYs 2017 and 2018, in accordance with the discussion above) IPPS applicable percentage

increases, depending on whether the majority of the “as submitted” cost reports end in FY 2015 or FY 2016, as discussed in Step 1. This methodology differs from Step 1, in which we proposed to apply the market basket percentage increases to the sum of the hospitals’ applicable total estimated reasonable cost amount for covered inpatient hospital services. We stated that we believed that the IPPS applicable percentage increases are appropriate factors to update the estimated amounts that generally would otherwise be paid without the demonstration. This is because IPPS payments would constitute the majority of payments that would otherwise be made without the demonstration and the applicable percentage increase is the factor used under the IPPS to update the inpatient hospital payment rates. Most of the hospitals participating in the demonstration would be paid under the IPPS payment methodology if they were not in the demonstration. Then, for the same reasons discussed in Step 1, we proposed to multiply the product of the applicable estimated total payments that generally would otherwise be made without the demonstration and the IPPS applicable percentage increases applicable to the years involved by the 3-percent annual volume adjustment for each of FYs 2016 through 2018 (or FYs 2017 and 2018, in accordance with the discussion above). The result would be the general total estimated payment amount that would otherwise be paid without the demonstration for FY 2018 to participating hospitals for covered inpatient hospital services.

Step 3: We proposed to subtract the amount derived in Step 2 (representing the sum of estimated amounts that generally would otherwise be paid to the participating hospitals for covered inpatient hospital services for FY 2018 if the demonstration were not implemented) from the amount derived in Step 1 (representing the sum of the estimated reasonable cost amounts that generally would be paid under the demonstration to all participating hospitals for covered inpatient hospital services for FY 2018). We proposed that the resulting difference would be the estimated amount of the costs of the demonstration for FY 2018, which would be incorporated into an adjustment to the national IPPS rates.

Similar to previous years, in order to meet the budget neutrality requirement in section 410A(c)(2) of Public Law 108–173, we proposed that when finalized cost reports for each of the second 5 years of the 10-year extension period become available, we would determine the difference between the

actual costs of the demonstration as determined from these finalized cost reports and the estimated cost indicated in the corresponding fiscal year IPPS final rule, and include that difference either as a positive or negative adjustment in the upcoming year's final rule.

Specifically for FY 2018, when the finalized cost reports beginning in FY 2018 are available, we stated that we would determine the difference between the actual costs of the demonstration as determined from these finalized cost reports and the estimated cost indicated in the FY 2018 (or FY 2019, as discussed above) IPPS/LTCH PPS final rule, and include that difference either as a positive or negative adjustment in the applicable year's final rule.

Thus, in keeping with the methodologies used in previous final rules, we stated that we would continue to use a methodology for calculating the budget neutrality offset amount for the second 5-years of the 10-year extension period consisting of two components: (1) The estimated demonstration costs in the upcoming fiscal year (as described above); and (2) the amount by which the actual demonstration costs corresponding to an earlier, given year (which would be known once finalized cost reports became available for that year) differed from the budget neutrality offset amount finalized in the corresponding year's IPPS final rule.

We invited public comments on the budget neutrality calculation methodology proposed above. In addition, we invited public comments on other approaches that would be consistent with section 410A(c)(2) of Public Law 108–173, and that would provide a reasonable determination of budget neutrality for the demonstration.

We did not receive any public comments on the budget neutrality calculation that we proposed, which would apply in accordance with our proposed implementation approach. However, because we are not finalizing our proposed implementation approach, we are not finalizing the proposed budget neutrality calculation methodology. As subsequently discussed in section V.L.4.d. of the preamble of this final rule, we are finalizing the alternative budget neutrality methodology that was described in section V.L.4.d. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule.

d. Finalized Budget Neutrality Approach

In section V.L.3.b. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19993), we described an

alternative approach that we considered for implementing the extension of the demonstration pursuant to section 15003 of Public Law 114–255, and we invited public comments on this alternative approach. Under this alternative approach, for each previously participating hospital that decided to participate in the second 5 years of the 10-year extension period, the cost-based payment methodology under section 410A of Public Law 108–173 (as amended by section 15003 of Pub. L. 114–255) would begin on the date immediately following the end date of its period of performance for the first 5-year extension period.

As discussed above, we are finalizing and adopting this alternative implementation approach in this final rule. Depending on which among the Cohort 1 and 2 hospitals choose to participate in this second 5-year extension period, the demonstration's cost-based payment methodology would be applied to dates as far back as January 1, 2015 and as late as January 1, 2017. This will require reconciling the reasonable costs associated with furnishing Medicare covered inpatient hospital services as reported on cost reports with the amounts already paid under the other Medicare payment methodologies applied since the end of their periods of performance for the first 5-year extension. Under this approach, any additional amounts associated with the cost-based payment methodology for this period would be paid to the hospitals.

In general, as described in the proposed rule, the methodology for calculating the budget neutrality offset under this approach would involve the following steps:

- To reflect the costs of the demonstration for fiscal years before FY 2018, for the previously participating hospitals (Cohorts 1 and 2) that decide to participate in the 5-year extension period authorized by section 15003 of Public Law 114–255, when finalized cost reports become available, we indicated that we would determine the actual costs of the demonstration for cost report periods beginning on the day after the last day of the hospitals' periods of performance in the first 5-year extension period and extending through the last day of the cost report periods ending in FY 2018 (or FY 2017 for hospitals with an October 1 cost report start date, as explained below), and incorporate these amounts in the budget neutrality offset amount to be included in a future IPPS final rule. Thus, we would determine the actual costs for the previously participating hospitals for the period prior to the start

of FY 2018. Similar to our proposed approach for implementation and budget neutrality, as described in sections V.L.3.b. and V.L.4.c. of the preamble of the proposed rule, under this methodology, we would begin our estimation of the costs of the demonstration for all hospitals in the same fiscal year (that is, in FY 2018, with each hospital's first cost reporting period beginning on or after October 1, 2017).

Thus, under this approach, for a Cohort 1 hospital whose period of performance in the first extension period ended June 30, 2015, we would determine the actual costs of the demonstration for the cost reporting periods from July 1, 2015 through June 30, 2016, from July 1, 2016 through June 30, 2017, and from July 1, 2017 through June 30, 2018. For a Cohort 2 hospital whose period of performance in the first extension period ended June 30, 2016, under this approach, we would determine the actual costs of the demonstration for the cost reporting periods from July 1, 2016 through June 30, 2017, and from July 1, 2017 through June 30, 2018. We noted that for both of these Cohorts 1 and 2 hospitals, this last cost report period would encompass services occurring since the enactment of Public Law 114–255, which authorizes the second extension period. However, we stated that we believed that applying a uniform method for determining costs across a cost report year would be more reasonable from the standpoint of operational feasibility and consistent application of cost determination principles. (We noted that, for hospitals (either Cohort 1 or 2) with an October 1 cost report start date, the estimation of costs for FY 2018 would apply for the period starting October 1, 2017, that is, the first day of FY 2018. Therefore, for these hospitals, we would determine actual costs from finalized cost reports when available for the period starting from the day after the last day of the period of performance under the first 5-year extension period and concluding with the last day of FY 2017.) For all hospitals, under this approach, we stated that we would incorporate these amounts into a single amount to be included in the calculation of the budget neutrality offset amount to the national IPPS rates in a future final rule after such finalized cost reports become available.

- To reflect the costs of the demonstration for the upcoming fiscal year (that is, FY 2018) for Cohorts 1 and 2 hospitals that have decided to participate in the second 5-years of the 10-year extension period, we indicated that we would estimate the costs of the

demonstration for FY 2018, based on historical “as submitted” cost reports, applying prorating factors and updates as appropriate, as described below. Similar to the proposed methodology described in section V.L.4.c. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule for estimating the costs of the demonstration for FY 2018, we stated that the methodology for this approach for estimating the costs of the demonstration for FY 2018 would follow 3 steps:

Step 1: We stated that we would determine the total estimated reasonable cost amount for covered inpatient hospital services (as indicated on the “as submitted” cost reports for the most recent cost reporting period available) for all participating hospitals for FY 2018 calculated under the demonstration’s reasonable cost-based payment methodology. We stated that these calculations would be identical to those described for our proposed methodology in section V.L.4.c. of the preamble of the proposed rule, with the exception that the formulation of the “hospital-specific prorating factor,” to be applied to each participating hospital’s reasonable cost amounts as derived from its most recently available “as submitted” cost report, would be different. Under the different methodology for the formulation of the hospital-specific prorating factor, for hospitals with a cost report start date other than October 1, we indicated that the hospital-specific prorating factor would be the ratio of the number of months between the end of the cost reporting period ending in FY 2018, on the basis of which actual costs are determined (as described above), and the end of the fiscal year, out of the total number of months in the fiscal year. Therefore, for a hospital (either Cohort 1 or 2) for which the end of the period on which we would determine actual costs (that is, the end date of the hospital’s cost report year) would be June 30, 2018, there would be 3 months remaining in FY 2018, and the hospital-specific prorating factor would be .25. (We noted that hospitals with an October 1 cost report start date would participate in the demonstration for the full 12 months of FY 2018 and thus would have a hospital-specific prorating factor of 1.0.) We stated that we would then follow the same calculations as in our proposed budget neutrality calculation described in section V.L.4.c. of the preamble of the proposed rule, including application of the same update factors to reflect increases in cost and volume.

Step 2: We stated that we would estimate the amount that would

otherwise be paid for Medicare covered inpatient hospital services to all participating hospitals in FY 2018 without the demonstration. These calculations would be identical to those described for our proposed methodology in section V.L.4.c. of the preamble of the proposed rule, except for the difference that the hospital-specific prorating factor, to be applied to the estimated amount that the hospital would be paid without the demonstration, as derived from its most recently available “as submitted” cost report, would be formulated in the same manner as described in Step 1 above under this methodology.

Step 3: We stated that we would then subtract the amount derived in Step 2 (representing the estimated amount that would otherwise be paid to the participating hospitals for covered inpatient hospital services for FY 2018 if the demonstration were not implemented) from the amount derived in Step 1 (representing the estimated reasonable cost amounts that generally would be paid under the demonstration to all participating hospitals for covered inpatient hospital services for FY 2018). The resulting difference would be the estimated amount of the costs of the demonstration for FY 2018, which would be incorporated into an adjustment to the national IPPS rates.

- For the Cohort 3 hospitals, we indicated that we would follow the identical methodology for estimating the costs of the demonstration for FY 2018 as described for the proposed budget neutrality methodology discussed in section V.L.4.c. of the preamble of the proposed rule under the proposed implementation approach. In the proposed rule, we noted that if the selection of additional participants under the solicitation authorized by Public Law 114–255 were not announced by June 2017, we would not be able to include the estimates of the costs of the demonstration for FY 2018 for the Cohort 3 hospitals in the budget neutrality offset adjustment for FY 2018, and similar to our proposed methodology in that situation, we would incorporate this estimate in the budget neutrality offset adjustment in the FY 2019 IPPS/LTCH PPS final rule. We noted that, under these circumstances, the budget neutrality offset adjustment for the FY 2019 IPPS proposed and final rules would also include the estimated costs of the demonstration for FY 2019 for these Cohort 3 hospitals based on historical, “as submitted” cost reports and the appropriate update factors.

- Consistent with our approach in previous final rules, when the finalized

cost reports for cost reporting periods beginning in FY 2018 are available, we stated that we would determine the difference between the actual costs of the demonstration as determined from these finalized cost reports and the estimated cost indicated in the FY 2018 IPPS/LTCH PPS final rule (or the FY 2019 IPPS/LTCH PPS final rule, as explained earlier), and include that difference either as a positive or negative adjustment in the upcoming year’s final rule.

- For future years, we stated that we would continue to incorporate the estimated costs of the demonstration for all participating hospitals for the upcoming fiscal year in the budget neutrality offset adjustment in the IPPS final rule of the corresponding fiscal year. For these hospitals, we indicated that we also would determine the actual costs of the demonstration when finalized cost reports become available, and include the difference between the estimated and actual costs of the demonstration in the calculation of the budget neutrality offset amount to the national IPPS rates in the final rule for a future year.

We noted that, under this approach, although we would not be able to include an estimate of the costs of the demonstration for FY 2018 Cohort 3 hospitals in the budget neutrality offset adjustment in the FY 2018 final rule if we were not able to announce the selection of additional hospitals by June 2017, we would do so for the Cohorts 1 and 2 hospitals.

We invited public comments on this alternative budget neutrality calculation methodology, as discussed earlier.

We did not receive any public comments on this alternative methodology.

Because we are finalizing the alternative implementation approach described in section V.L.3.b. of the preamble of this final rule, according to which each previously participating hospital would begin the second 5 years of the 10-year extension period and the cost-based payment methodology under section 410A of Public Law 108–173 (as amended by section 15003 of Pub. L. 114–255) on the date immediately after the date the period of performance under the first 5-year extension period ended, we are finalizing the alternative budget neutrality methodology from the proposed rule, as described in section V.L.4.d. of the preamble of this final rule specific to this approach. We note that in advance of finalizing our policy about the start date for the period of performance for the second 5-year extension period for the previously participating hospitals (Cohorts 1 and

2), at the time of publication of this final rule, we have not been able to verify which among these hospitals will continue to participate in the second 5-year extension period. Therefore, we are not including an estimate of the costs of the demonstration for any of the previously participating Cohort 1 or 2 hospitals for FY 2018 in the budget neutrality offset adjustment in this FY 2018 IPPS/LTCH PPS final rule. In addition, because the selection of additional participants under the solicitation authorized by Public Law 114–255 was not announced by June 2017, we also are not able to include the estimates of the costs of the demonstration for the Cohort 3 hospitals for FY 2018 in the budget neutrality offset adjustment in this FY 2018 IPPS/LTCH PPS final rule. As a result, there will be no budget neutrality offset adjustment for the demonstration in this FY 2018 IPPS/LTCH PPS final rule. We will include the estimated costs of the demonstration for all participating hospitals (Cohorts 1, 2, and 3) for FY 2018 in the budget neutrality offset amount in the FY 2019 IPPS proposed and final rules.

e. Reconciling Actual and Estimated Costs of the Demonstration for Previous Years (2011, 2012, and 2013)

As described earlier, we have calculated the difference for FYs 2005 through 2010 between the actual costs of the demonstration, as determined from finalized cost reports once available, and estimated costs of the demonstration as identified in the applicable IPPS final rules for these years. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57037), we finalized a proposal to reconcile the budget neutrality offset amounts identified in the IPPS final rules for FYs 2011 through 2016 with the actual costs of the demonstration for those years, considering the fact that the demonstration was scheduled to end December 31, 2016. In that final rule, we stated that we believed it would be appropriate to conduct this analysis for FYs 2011 through 2016 at one time, when all of the finalized cost reports for cost reporting periods beginning in FYs 2011 through 2016 are available. We stated that such an aggregate analysis encompassing the cost experience through the end of the period of performance of the demonstration would represent an administratively streamlined method, allowing for the determination of any appropriate adjustment to the IPPS rates and obviating the need for multiple, fiscal year-specific calculations and regulatory actions. Given the general lag of 3 years

in finalizing cost reports, we stated that we expected any such analysis would be conducted in FY 2020.

With the extension of the demonstration for another 5-year period, as authorized by section 15003 of Public Law 114–255, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20000), we proposed to modify the plan outlined in the FY 2017 IPPS/LTCH PPS final rule, and instead return to the general procedure in previous final rules; that is, as finalized cost reports become available, to determine the amount by which the actual costs of the demonstration for an earlier, given year differ from the estimated costs for the demonstration set forth in the IPPS final rule for the corresponding fiscal year, and then incorporate that amount into the budget neutrality offset amount for an upcoming fiscal year. We proposed that if the actual costs of the demonstration for the earlier fiscal year exceed the estimated costs of the demonstration identified in the final rule for that year, this difference would be added to the estimated costs of the demonstration for the upcoming fiscal year when determining the budget neutrality adjustment for the final rule. Conversely, we proposed that if the estimated costs of the demonstration set forth in the final rule for a prior fiscal year exceed the actual costs of the demonstration for that year, this difference would be subtracted from the estimated cost of the demonstration for the upcoming fiscal year when determining the budget neutrality adjustment for an upcoming fiscal year. However, given that this adjustment for specific years could be positive or negative, we proposed to combine this reconciliation for multiple prior years into one adjustment to be applied to the budget neutrality offset amount for a single fiscal year, thus reducing the possibility of both positive and negative adjustments to be applied in consecutive years, and enhancing administrative feasibility. Specifically, we proposed that when finalized cost reports for FYs 2011, 2012, and 2013 are available, we would include this difference for these years in the budget neutrality offset adjustment to be applied to the national IPPS rates in a future final rule. We stated that we expected that this would occur in FY 2019. We also proposed that when finalized cost reports for FYs 2014 through 2016 are available, we would include the difference between the actual costs as reflected on these cost reports and the amounts included in the budget neutrality offset amounts for these fiscal years in a future final rule.

We stated in the proposed rule that we plan to provide an update in a future final rule regarding the year that we would expect that this analysis would occur.

We invited public comments on this proposal.

We did not receive any public comments on this proposal. We are finalizing our proposal for reconciling the actual and estimated costs of the demonstration for 2011 through 2013.

M. Adjustment to IPPS Rates Resulting From 2-Midnight Policy for FY 2018

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50906 through 50954), we adopted the 2-midnight policy, effective for dates of admission on or after October 1, 2013. As discussed in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57058 through 57060), under the 2-midnight policy, an inpatient admission is generally appropriate for Medicare Part A payment if the physician (or other qualified practitioner) admits the patient as an inpatient based upon the reasonable expectation that the patient will need hospital care that crosses at least 2 midnights. In assessing the expected duration of necessary care, the physician (or other qualified practitioner) may take into account outpatient hospital care received prior to inpatient admission. If the patient is expected to need less than 2 midnights of care in the hospital, the services furnished should generally be billed as outpatient services. We note that revisions were made to this policy in the CY 2016 OPPI/ASC final rule with comment period (80 FR 70545). Our actuaries estimated that the 2-midnight policy would increase expenditures by approximately \$220 million in FY 2014 due to an expected net increase in inpatient encounters. We used our authority under section 1886(d)(5)(I)(i) of the Act to make a reduction of 0.2 percent to the standardized amount, the Puerto Rico standardized amount, and the hospital-specific payment rates, and we used our authority under section 1886(g) of the Act to make a reduction of 0.2 percent to the national capital Federal rate and the Puerto Rico-specific capital rate, in order to offset this estimated \$220 million in additional IPPS expenditures in FY 2014.

For the reasons outlined in the FY 2017 IPPS/LTCH PPS proposed and final rules (81 FR 25136 through 25138 and 81 FR 57058 through 57060), we used our authority under sections 1886(d)(5)(I)(i) and 1886(g) of the Act to prospectively remove, beginning in FY 2017, the 0.2 percent reduction to the rates put in place beginning in FY 2014. The 0.2 percent reduction was

implemented by including a factor of 0.998 in the calculation of the FY 2014 standardized amount, hospital-specific payment rates, and the national capital Federal rate, permanently reducing the rates for FY 2014 and future years until the 0.998 is removed. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57281 and 57294), we permanently removed the 0.998 reduction beginning in FY 2017 by including a factor of (1/0.998) in the calculation of the FY 2017 standardized amount, the hospital-specific payment rates, and the national capital Federal rate.

We also stated in the FY 2017 IPPS/LTCH PPS proposed and final rules that, for the reasons outlined in those rules, we believe it would be appropriate to use our authority under sections 1886(d)(5)(I)(i) and 1886(g) of the Act to temporarily increase the rates, only for FY 2017, to address the effect of the 0.2 percent reduction to the rates in effect for FY 2014, the 0.2 percent reduction to the rates in effect for FY 2015 (recall the 0.998 factor included in the calculation of the FY 2014 rates permanently reduced the rates for FY 2014 and future years until it is removed), and the 0.2 percent reduction to the rates in effect for FY 2016. We stated that we believe the most transparent, expedient, and administratively feasible method to accomplish this was a temporary one-time prospective increase to the FY 2017 rates of 0.6 percent (= 0.2 percent + 0.2 percent + 0.2 percent). Specifically, we finalized our proposal to include a factor of 1.006 in the calculation of the standardized amount, the hospital-specific payment rates, and the national capital Federal rate in FY 2017 and then to remove this temporary one-time prospective increase by including a factor of (1/1.006) in the calculation of the rates for FY 2018. We stated that while we generally did not believe it is appropriate in a prospective system to retrospectively adjust rates, we took this action in the specific context of this unique situation.

In summary, for the reasons described in the FY 2017 IPPS/LTCH PPS proposed and final rules, we finalized our proposal to include a permanent factor of (1/0.998) and a temporary one-time factor of (1.006) in the calculation of the FY 2017 standardized amount, hospital-specific payment rates, and national capital Federal rate and to include a factor of (1/1.006) in the calculation of the FY 2018 standardized amount, hospital-specific payment rates, and national capital Federal rate to remove the temporary one-time factor of 1.006.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20001), we stated that we were including a factor of (1/1.006) in the calculation of the FY 2018 standardized amount, hospital-specific payment rates, and national capital Federal rate to remove the temporary one-time factor of 1.006, as explained in detail in section II. of the Addendum to the proposed rule.

We noted that, in the FY 2017 IPPS/LTCH PPS final rule, in our response to public comments, we recognized that for closed, converted, or new hospitals, our prospective method generally may have had a differential positive or negative impact compared to hospitals that were IPPS hospitals for all of the FY 2014 through FY 2017 time period. We stated that we generally believe that, given the prospective nature of our method and our goal to adopt a transparent, expedient, and administratively feasible approach, these differential impacts would be an appropriate consequence. However, after consideration of the public comments received, we agreed that we should provide a process to address the situation of closed or converted hospitals. Due to the small number of hospitals impacted, we stated that we will address closed and converted hospitals as part of the cost report settlement process. We stated that these hospitals should identify themselves to their MACs so that the appropriate cost report adjustment can be applied.

Comment: One commenter opposed the removal of the one-time 1.006 adjustment, stating that the original reduction was improper. Another commenter indicated that CMS should recalculate an adjustment to the IPPS rates using both medical and surgical Medicare claims data and recalculate the FY 2018 IPPS rates accordingly.

Response: We did not propose to make any adjustment to the FY 2018 rates related to the 2-midnight policy. We note that in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57060), we finalized the policy to remove the one-time 1.006 adjustment in the FY 2018 rates. We also refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57060), where we responded to similar comments.

As we finalized in the FY 2017 IPPS/LTCH PPS final rule, we are including a factor of (1/1.006) in the calculation of the FY 2018 standardized amount, hospital specific payment rates, and national capital Federal rate to remove the temporary one-time factor of 1.006 that was in place for FY 2017.

N. Provider-Based Status of Indian Health Service and Tribal Facilities and Organizations

As we discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20001 through 20002), since the beginning of the Medicare program, some providers, which we refer to as “main providers,” have functioned as a single entity while owning and operating multiple departments, locations, and facilities. We have maintained that having clear criteria for provider-based status is important because a provider-based status designation can result in additional Medicare payments under the OPSS for services provided at the provider-based facility, as well as increased beneficiary coinsurance liability for Medicare beneficiaries.

The Medicare criteria for provider-based status are set forth in our regulations at 42 CFR 413.65. In the April 7, 2000 OPSS final rule (65 FR 18507), CMS (then HCFA), responded to several commenters who were concerned that the implementation of the proposed provider-based regulations would have the effect of denying Medicare participation as provider-based entities to a number of Indian Health Service (IHS) facilities that were being operated by Indian Tribes under the auspices of the Indian Self-Determination and Education Assistance Act (Pub. L. 93–638). Other commenters were concerned that the regulations would jeopardize statutorily authorized contracting and compacting relationships and would severely restrict a number of IHS and Tribal clinics from receiving payments for outpatient services. The IHS itself strongly recommended that the proposed regulations not apply to IHS and the Tribal health system. In response to these concerns, we stated in that final rule (68 FR 18507): “We recognize that the provision of health services to members of federally recognized Tribes is based on a special and legally recognized relationship between Indian Tribes and the United States Government. To address this relationship, the IHS has developed an integrated system to provide care that has its foundation in IHS hospitals. Because of these special circumstances, not present in the case of private, non-Federal facilities and organizations that serve patients generally, we agree that it would not be appropriate to apply the provider-based criteria to IHS facilities or organizations or to most tribal facilities or organizations.”

In the April 7, 2000 OPSS final rule (65 FR 18507), we finalized a policy at § 413.65(m) of our regulations under

which facilities and organizations operated by the IHS or Tribes would be considered to be “departments of hospitals operated by the IHS or Tribes,” and thereby grandfathered from application of the provider-based rules, if on or before April 7, 2000, they furnished only services that were billed as if they had been furnished by a department of a hospital operated by the IHS or a Tribe and they are: (1) Owned and operated by the IHS; (2) owned by the Tribe but leased from the Tribe by the IHS under the Indian Self-Determination and Education Assistance Act in accordance with applicable regulations and policies of the IHS in consultation with Tribes; or (3) owned by the IHS but leased and operated by the Tribe under the Indian Self-Determination and Education Assistance Act in accordance with applicable regulations and policies of the IHS in consultation with Tribes.

In order to qualify for grandfathering under § 413.65(m), we required that the services be furnished by the facility or organization on or before April 7, 2000 because of our concern that, without such a date limitation, this provision would create an incentive for IHS or Tribal hospitals to establish new outpatient departments that were not sufficiently integrated with the main provider to support payment under the OPPS for the services that they furnished. Our intent was to implement a policy that both addressed a primary concern (that is, the rapid growth of off-campus provider-based clinics) that necessitated the provider-based regulations and recognized longstanding and complex IHS and Tribal arrangements. Since we finalized the policy at § 413.65(m), we have issued guidance on circumstances that would and would not result in a facility or organization losing its grandfathered status. In particular, we recognized the special relationship between Tribes and the IHS under the Self-Determination and Education Assistance Act and stated that changes in the status of a hospital or a facility from IHS to Tribal operation, or vice versa, or the realignment of a facility from one IHS or Tribal hospital to another IHS or Tribal hospital, would not be a basis for losing such a grandfathered status, so long as the resulting configuration is one that would have qualified for grandfathering under § 413.65(m) had it been in effect on April 7, 2000.

In the years since we implemented § 413.65(m) and issued the guidance described earlier, we have considered whether it remains necessary to require that facilities and organizations be furnishing the services on or before

April 7, 2000 in order to qualify for grandfathering. We have concluded that it does not because IHS policies and procedures (for example, as specified in the Indian Health Manual available on the IHS Web site at: <https://ihs.gov/aboutihs/indianhealthmanual/>) regarding the planning, operation, and funding of such facilities and organizations are resulting in appropriate Medicare payments to them. Therefore, after further consideration of the position CMS has set out in prior guidance, the special and legally recognized relationship between Indian Tribes and the U.S. Government, as well as current IHS policies and procedures, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20002), we proposed to remove the date limitation in § 413.65(m) that restricted the grandfathering provision to IHS or Tribal facilities and organizations furnishing services on or before April 7, 2000.

We also proposed to make a technical change to the billing reference in § 413.65(m) by replacing “were billed” with “are billed using the CCN of the main provider and with the consent of the main provider.” We stated that we believe this proposed change will make the regulation text more consistent with our current rules that require these facilities to comply with all applicable Medicare conditions of participation that apply to the main provider. In the proposed rule, we did not propose to otherwise change the requirement that the only services furnished at the facility or organization must be hospital outpatient services, or to change the other requirements for grandfathering in paragraphs (m)(1) through (3) of § 413.65. Therefore, under our proposal, a facility or organization operated by the IHS or a Tribe will be considered to be a department of a hospital operated by the IHS or a Tribe if it furnishes only hospital outpatient services that are billed using the CMS Certification Number (CCN) of the main provider with the consent of the main provider, and it also meets one of the conditions in § 413.65(m)(1) through (3).

We welcomed public comments on our proposals.

Comment: Commenters supported both CMS proposals to remove the date limitation and to clarify that only hospital outpatient services can be billed using the CCN of the main provider and with the consent of the main provider. Commenters requested that CMS further revise § 413.65(m)(1) through (3) to add an additional condition for facilities owned and operated by a Tribe or Tribal Organization pursuant to a contract or

compact under the Indian Self-Determination Act (ISDA). Commenters contended that it is clear in the ISDA that Congressional intent was that the same resources available to the IHS be also available to Tribes to operate the same programs and services. Therefore, the commenters believed that the provisions in § 413.65(m) should be applied uniformly. Finally, commenters requested CMS to consider making regulatory changes to create flexibility in applying requirements at 42 CFR part 482, the conditions of participation (CoP) for provider-based IHS and Tribal facilities, and to similarly remove the April 7, 2000 date restriction for Tribal Grandfathered FQHC requirements.

Response: We appreciate the commenters’ support for our proposals. Regarding the commenters’ request to add an additional condition for exemption under § 413.65(m)(1) through (3), we did not propose to change the other requirements for grandfathering in paragraphs (m)(1) through (3) of § 413.65. However, we will take this comment under consideration and, if appropriate, address it in future rulemaking.

We appreciate the views shared by commenters regarding compliance with the hospital Conditions of Participation (CoPs) set out at 42 CFR part 482, and how the hospital CoPs might apply to provider-based facilities. We reiterate that the provider-based rules at § 413.65 govern whether a facility or organization is considered to be part of the main provider for purposes of Medicare payment, and those rules do not exempt any provider-based facilities from the need to comply with hospital requirements under the CoPs at Part 482. We also did not propose any changes to the Tribal grandfathered FQHC policy. As discussed in the CY 2016 Medicare Physician Fee Schedule final rule (80 FR 71089 through 71096), in order to qualify for the “grandfathered” Tribal FQHC payment rate, a Tribal facility is required to have billed as a department of a provider prior to April 7, 2000. While we are finalizing our proposed removal of the April 7, 2000 date from § 413.65(m) in this final rule, this date requirement will remain in effect for Tribal FQHCs. However, we will take these views into consideration for future rulemaking.

After consideration of public comments we received, we are finalizing the proposed revisions to § 413.65(m). We are removing the date limitation in § 413.65(m) that restricted the grandfathering provision to IHS or Tribal facilities and organizations furnishing services on or before April 7, 2000. We also are finalizing the

technical change to the billing reference in § 413.65(m) by replacing “were billed” with “are billed using the CCN of the main provider and with the consent of the main provider.”

VI. Changes to the IPPS for Capital-Related Costs

A. Overview

Section 1886(g) of the Act requires the Secretary to pay for the capital-related costs of inpatient acute hospital services in accordance with a prospective payment system established by the Secretary. Under the statute, the Secretary has broad authority in establishing and implementing the IPPS for acute care hospital inpatient capital-related costs. We initially implemented the IPPS for capital-related costs in the FY 1992 IPPS final rule (56 FR 43358). In that final rule, we established a 10-year transition period to change the payment methodology for Medicare hospital inpatient capital-related costs from a reasonable cost-based payment methodology to a prospective payment methodology (based fully on the Federal rate).

FY 2001 was the last year of the 10-year transition period that was established to phase in the IPPS for hospital inpatient capital-related costs. For cost reporting periods beginning in FY 2002, capital IPPS payments are based solely on the Federal rate for almost all acute care hospitals (other than hospitals receiving certain exception payments and certain new hospitals). (We refer readers to the FY 2002 IPPS final rule (66 FR 39910 through 39914) for additional information on the methodology used to determine capital IPPS payments to hospitals both during and after the transition period.)

The basic methodology for determining capital prospective payments using the Federal rate is set forth in the regulations at 42 CFR 412.312. For the purpose of calculating capital payments for each discharge, the standard Federal rate is adjusted as follows:

$$(\text{Standard Federal Rate}) \times (\text{DRG Weight}) \\ \times (\text{Geographic Adjustment Factor (GAF)}) \times (\text{COLA for hospitals located in Alaska and Hawaii}) \times (1 + \text{Capital DSH Adjustment Factor} + \text{Capital IME Adjustment Factor, if applicable}).$$

In addition, under § 412.312(c), hospitals also may receive outlier payments under the capital IPPS for extraordinarily high-cost cases that qualify under the thresholds established for each fiscal year.

B. Additional Provisions

1. Exception Payments

The regulations at 42 CFR 412.348 provide for certain exception payments under the capital IPPS. The regular exception payments provided under §§ 412.348(b) through (e) were available only during the 10-year transition period. For a certain period after the transition period, eligible hospitals may have received additional payments under the special exceptions provisions at § 412.348(g). However, FY 2012 was the final year hospitals could receive special exceptions payments. For additional details regarding these exceptions policies, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725).

Under § 412.348(f), a hospital may request an additional payment if the hospital incurs unanticipated capital expenditures in excess of \$5 million due to extraordinary circumstances beyond the hospital's control. Additional information on the exception payment for extraordinary circumstances in § 412.348(f) can be found in the FY 2005 IPPS final rule (69 FR 49185 and 49186).

2. New Hospitals

Under the capital IPPS, the regulations at 42 CFR 412.300(b) define a new hospital as a hospital that has operated (under previous or current ownership) for less than 2 years and lists examples of hospitals that are not considered new hospitals. In accordance with § 412.304(c)(2), under the capital IPPS, a new hospital is paid 85 percent of its allowable Medicare inpatient hospital capital-related costs through its first 2 years of operation, unless the new hospital elects to receive full prospective payment based on 100 percent of the Federal rate. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725) for additional information on payments to new hospitals under the capital IPPS.

3. Payments for Hospitals Located in Puerto Rico

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57061), we revised the regulations at 42 CFR 412.374 relating to the calculation of capital IPPS payments to hospitals located in Puerto Rico beginning in FY 2017 to parallel the change in the statutory calculation of operating IPPS payments to hospitals located in Puerto Rico, for discharges occurring on or after January 1, 2016, made by section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113). Section 601 of Public Law 114–113 increased the applicable Federal percentage of the operating IPPS

payment for hospitals located in Puerto Rico from 75 percent to 100 percent and decreased the applicable Puerto Rico percentage of the operating IPPS payments for hospitals located in Puerto Rico from 25 percent to zero percent, applicable to discharges occurring on or after January 1, 2016. As such, under revised § 412.374, for discharges occurring on or after October 1, 2016, capital IPPS payments to hospitals located in Puerto Rico are based on 100 percent of the capital Federal rate.

C. Annual Update for FY 2018

The annual update to the national capital Federal rate, as provided for at § 412.308(c), for FY 2018 is discussed in section III. of the Addendum to this final rule.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50906 through 50954), we adopted the 2-midnight policy effective for dates of admission on or after October 1, 2013, under which an inpatient admission is generally appropriate for Medicare Part A payment if the physician (or other qualified practitioner) admits the patient as an inpatient based upon the reasonable expectation that the patient will need hospital care that crosses at least 2 midnights. At that time, our actuaries estimated that the 2-midnight policy would increase expenditures by approximately \$220 million in FY 2014 due to an expected net increase in inpatient encounters. Using our authority under section 1886(g) of the Act, and consistent with the approach taken for the operating IPPS standardized amount, the Puerto Rico-specific standardized amount and the hospital-specific payment rates, we made a reduction of 0.2 percent (an adjustment factor of 0.998) to the national capital Federal rate and the Puerto Rico-specific capital rate to offset the estimated increase in capital IPPS expenditures associated with the projected increase in inpatient encounters that was expected to result from the new inpatient admission guidelines (78 FR 50746 through 50747). (As explained in section V.B.3. of the FY 2017 IPPS/LTCH PPS final rule, we discontinued use of the Puerto Rico capital rate in the calculation of capital IPPS payments to hospitals located in Puerto Rico beginning in FY 2017.)

For the reasons discussed in the FY 2017 IPPS/LTCH PPS proposed and final rules (81 FR 25136 through 25138 and 57058 through 57060) and consistent with our approach for the operating IPPS rates, we used our authority under section 1886(g) of the Act to permanently remove the 0.2 percent reduction to the national capital

Federal rate beginning in FY 2017. Specifically, we made an adjustment of (1/0.998) to the national capital Federal rate to remove the 0.2 percent reduction, consistent with the adjustment to the operating IPPS standardized amount and the hospital-specific payment rates.

In addition, consistent with our approach for the operating IPPS standardized amount and hospital-specific payment rates, and for the reasons discussed in the FY 2017 IPPS/LTCH PPS proposed and final rules, we finalized our proposal to use our authority under section 1886(g) of the Act to adjust the FY 2017 national capital Federal rate to address the effects of the 0.2 percent reduction to the national capital Federal rates in effect for FY 2014, FY 2015, and FY 2016 by making a one-time prospective adjustment of 1.006 in FY 2017 to the national capital Federal rate and, for FY 2018, to remove the effects of this one-time prospective adjustment through an adjustment of (1/1.006) to the national capital Federal rate. Therefore, consistent with our finalized policy, and as discussed in the FY 2018 IPPS/LTCH PPS proposed rule, for FY 2018, we are including a factor of (1/1.006) in the calculation of the FY 2018 operating IPPS standardized amount, the hospital-specific payment rates, and the national capital Federal rate to remove the temporary one-time factor of 1.006. (For additional details, we refer readers to section IV.P. of the preamble of the FY 2017 IPPS/LTCH PPS final rule (81 FR 57058 through 57060 and 57062 through 57063) and to section V.M. of the preamble of this final rule.)

In section II.D. of the preamble of this final rule, we present a discussion of the MS-DRG documentation and coding adjustment, including previously finalized policies and historical adjustments, as well as the adjustment to the standardized amount under section 1886(d) of the Act that we proposed, and are finalizing, for FY 2018 in accordance with the amendments made to section 7(b)(1)(B) of Public Law 110–90 by section 414 of the MACRA and section 15005 of the 21st Century Cures Act. Because these provisions require us to make an adjustment only to the operating IPPS standardized amount, we are not making a similar adjustment to the national capital Federal rate (or to the hospital-specific rates).

VII. Changes for Hospitals Excluded From the IPPS

A. Rate-of-Increase in Payments to Excluded Hospitals for FY 2018

Certain hospitals excluded from a prospective payment system, including children's hospitals, 11 cancer hospitals, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) receive payment for inpatient hospital services they furnish on the basis of reasonable costs, subject to a rate-of-increase ceiling. A per discharge limit (the target amount as defined in § 413.40(a) of the regulations) is set for each hospital based on the hospital's own cost experience in its base year, and updated annually by a rate-of-increase percentage. For each cost reporting period, the updated target amount is multiplied by total Medicare discharges during that period and applied as an aggregate upper limit (the ceiling as defined in § 413.40(a)) of Medicare reimbursement for total inpatient operating costs for a hospital's cost reporting period. In accordance with § 403.752(a) of the regulations, religious nonmedical health care institutions (RNHCIs) also are subject to the rate-of-increase limits established under § 413.40 of the regulations discussed previously. Furthermore, as discussed in VIII.J. of the preamble of this final rule, in accordance with § 412.526(c)(3) of the regulations, extended neoplastic disease care hospitals (formerly termed long-term care neoplastic disease hospitals) also are subject to the rate-of-increase limits established under § 413.40 of the regulations discussed previously.

As explained in the FY 2006 IPPS final rule (70 FR 47396 through 47398), beginning with FY 2006, we have used the percentage increase in the IPPS operating market basket to update the target amounts for children's hospitals, cancer hospitals, and RNHCIs. Consistent with §§ 412.23(g), 413.40(a)(2)(ii)(A), and 413.40(c)(3)(viii), we also have used the percentage increase in the IPPS operating market basket to update the target amounts for short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa. In the FYs 2014 and 2015 IPPS/LTCH PPS final rules (78 FR 50747 through 50748 and 79 FR 50156 through 50157, respectively), we adopted a policy of using the percentage increase in the FY 2010-based IPPS operating market basket to update the target amounts for

FY 2014 and subsequent fiscal years for children's hospitals, cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa. However, as discussed in section IV. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20004), we proposed to rebase and revise the IPPS operating basket to a 2014 base year. Therefore, we proposed to use the percentage increase in the 2014-based IPPS operating market basket to update the target amounts for children's hospitals, the 11 cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa for FY 2018 and subsequent fiscal years.

Accordingly, for FY 2018, the rate-of-increase percentage to be applied to the target amount for these hospitals would be the FY 2018 percentage increase in the 2014-based IPPS operating market basket. We did not receive any public comments on these proposals.

Therefore, we are finalizing these policies as proposed. Based on IGI's 2016 fourth quarter forecast, for the proposed rule, we estimated that the 2014-based IPPS operating market basket update for FY 2018 would be 2.9 percent (that is, the estimate of the market basket rate-of-increase). We indicated in the proposed rule that if more recent data became available for the final rule, we would use them to calculate the IPPS operating market basket update for FY 2018. For this FY 2018 IPPS/LTCH PPS final rule, based on IGI's 2017 second quarter forecast (which is the most recent data available), we calculated the 2014-based IPPS operating market basket update for FY 2018 to be 2.7 percent. Therefore, the FY 2018 rate-of-increase percentage that is applied to the FY 2017 target amounts in order to calculate the FY 2018 target amounts for children's hospitals, cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa is 2.7 percent, in accordance with the applicable regulations at 42 CFR 413.40.

In addition, as discussed in section VIII.J. of the preamble of this final rule, as originally enacted section 1886(d)(1)(B)(iv) of the Act established an IPPS-excluded category of hospitals that experience extended average inpatient length-of-stays, which are known as LTCHs under the Medicare program. Historically, section 1886(d)(1)(B)(iv) of the Act consisted of

two subclauses (I) and (II) (that is, sections 1886(d)(1)(B)(iv)(I) and (d)(1)(B)(iv)(II) of the Act), and the two categories of hospitals were generally referred to as “subclause (I)” and “subclause (II)” LTCHs. Section 15008 of the 21st Century Cures Act (Pub. L. 114–255) amended section 1886(d)(1)(B) of the Act by redesignating the “subclause (II) LTCH” provision in section 1886(d)(1)(B)(iv)(II) of the Act to section 1886(d)(1)(B)(vi) of the Act. In addition, subsection (b) of section 15008 of Public Law 114–255 specifies that, for cost reporting periods beginning on or after January 1, 2015, hospitals classified under section 1886(d)(1)(B)(vi) of the Act are not subject to section 1886(m) of the Act, which sets forth the LTCH PPS. Section 15008(c) further specifies that, for cost reporting periods beginning on or after January 1, 2015, payment for inpatient operating costs for such hospitals is to be made as described in 42 CFR 412.526(c)(3), and payment for capital costs is to be made as described in 42 CFR 412.526(c)(4). In order to implement these requirements, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20029), we proposed to amend § 412.23 to codify the redesignation of such hospitals from section 1886(d)(1)(B)(iv)(II) of the Act to new section 1886(d)(1)(B)(vi) of the Act (which we referred to as “long-term care neoplastic disease hospitals”) and the statutory payment requirements for inpatient operating and capital costs. (For additional information on “subclause (II)” LTCHs, including the statutory criteria and the establishment of the payment adjustment under § 412.526, and our changes to § 412.22 to implement the provisions of section 15008 of Public Law 114–255, we refer readers to section VIII.J. of the preamble of this final rule.)

Under the redesignation of subclause (II) LTCHs to long-term care neoplastic disease hospitals provided by section 15008 of Public Law 114–255 (described above), the statute specifies that payment for inpatient operating costs shall continue to be made on a reasonable cost basis in the manner provided in § 412.526(c)(3) of the regulations. Section 412.526(c)(3) provides that the hospital’s Medicare allowable net inpatient operating costs for that period are paid on a reasonable cost basis, subject to that hospital’s ceiling, as determined under § 412.526(c)(1), for that period. Under section 412.526(c)(1), for each cost reporting period, the ceiling was determined by multiplying the updated target amount, as defined in

§ 412.526(c)(2), for that period by the number of Medicare discharges paid during that period. Section 412.526(c)(2)(i) describes the method for determining the target amount for cost reporting periods beginning during FY 2015. Section 412.526(c)(2)(ii) specifies that, for cost reporting periods beginning during fiscal years after FY 2015, the target amount will equal the hospital’s target amount for the previous cost reporting period updated by the applicable annual rate-of-increase percentage specified in § 413.40(c)(3) for the subject cost reporting period (79 FR 50197).

For FY 2018, in accordance with proposed § 412.23(j)(2) and existing § 412.526(c)(2)(ii) of the regulations, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20029), we proposed that, for cost reporting periods beginning during FY 2018, the update to the target amount for long-term care neoplastic disease hospitals (that is, hospitals described under proposed § 412.23(j)) would be the applicable annual rate-of-increase percentage specified in § 413.40(c)(3) for FY 2018, which would be equal to the percentage increase projected by the hospital market basket index, which, in the proposed rule, was estimated to be the percentage increase in the proposed 2014-based IPPS operating market basket (that is, the estimate of the market basket rate-of-increase). Accordingly, for the proposed rule, the update to a long-term care neoplastic disease hospital’s target amount for FY 2018 was 2.9 percent, which was based on IGI, Inc.’s 2016 fourth quarter forecast. Furthermore, we proposed that if more recent data became available for the final rule, we would use that updated data to calculate the IPPS operating market basket update for FY 2018. For this final rule, based on IHS Global Insight, Inc.’s second quarter forecast (which is the most recent data available), the update to an extended neoplastic disease care hospital’s target amount for FY 2018 is 2.7 percent.

Comment: Some commenters requested that CMS move the regulations concerning payment for these hospitals from proposed § 412.23 to § 412.22.

Response: We agree with these commenters and are finalizing our payment regulation at new paragraph (i) under § 412.22. We note that the language of this paragraph is identical (with the exception of minor technical editing for cross-references) to the language we proposed.

Comment: Some commenters pointed out that the proposed rule preamble description of hospitals excluded from

the IPPS does not include these hospitals and requested their inclusion.

Response: We agree and have made conforming changes to the preamble of this final rule.

Comment: Some commenters requested that CMS change the name of these hospitals from “long-term care neoplastic disease hospitals” to “hospital for the treatment of advanced cancer and other diseases.”

Response: We do not believe that the name suggested by the commenters is sufficiently descriptive to accurately capture a specific subset of hospitals. Most, if not all, hospitals treat advanced cancer and other diseases. However, given the commenters’ concerns about the use of the term “long-term care” in the name of the new category of hospital, we are finalizing the name “extended neoplastic disease care hospital.” We believe this is appropriate because it distinguishes these hospitals from the 11 cancer hospitals and to account for the fact that these hospitals are still statutorily required to maintain a minimum average length of stay.

Comment: Some commenters requested CMS to add a claims processing provision to the Medicare payment regulations for these hospitals.

Response: We do not believe that it is appropriate to include claims processing information in our regulations and, therefore, are not adding the additional language requested by commenters.

Comment: Some commenters requested that CMS include sunset dates to § 412.526.

Response: As we have added a sunset date to § 412.22 (proposed § 412.23(e)(ii)), we do not believe that it is necessary to include separate sunset dates in § 412.526.

After consideration of the public comments we received, we are finalizing our proposals with the minor technical changes noted above.

B. Changes to the Hospital-Within-Hospital Regulations

On September 1, 1994, we published regulations governing hospitals-within-hospitals (HwHs) to address inappropriate Medicare payments to LTCHs that were effectively units of other hospitals (59 FR 45330). There was concern that the LTCH HwH model was being used by some acute care hospitals paid under the IPPS as a way of inappropriately receiving higher payments for a subset of their cases. Moreover, we stated that the IPPS-exclusion of long-term care “units” may be inconsistent with the statutory scheme, which does not provide for the

exclusion from the IPPS of long-term care units.

Therefore, we codified the HwH regulations at 42 CFR 412.23 (currently at § 412.22(e)) for an LTCH HwH that is co-located with another hospital. A co-located hospital is a hospital that occupies space in a building also used by another hospital or in one or more separate buildings located on the same campus as buildings used by another hospital. The regulations at § 412.22(e) required that, to be excluded from the IPPS, long-term care HwHs must have a separate governing body, a chief medical officer, medical staff, and a chief executive officer, from that of the hospital with which it is co-located. In addition, the long-term care HwH must have met either of the following two criteria: The HwH must perform certain specified basic hospital functions on its own and not receive them from the host hospital or a third entity that controls both hospitals; or the HwH must receive at least 75 percent of its inpatients from sources other than the co-located hospital. A third option was added to the regulations on September 1, 1995 (60 FR 45778) that allowed long-term care HwHs to demonstrate their separateness by showing that the cost of the services that the hospital obtains under contracts or other agreements with the co-located hospital or a third entity that controls both hospitals is no more than 15 percent of the hospital's total inpatient operating cost. In 1997, we extended application of the HwH regulations at § 412.22 to all classifications of IPPS-excluded hospitals. Therefore, effective for cost reporting periods beginning on or after October 1, 1997, psychiatric, rehabilitation, cancer, and children's hospitals that are co-located with another hospital also are generally required to meet the "separateness" criteria at § 412.22(e). In addition, a "grandfathering" provision (that is, hospitals that were IPPS-excluded HwHs before October 1, 1995 are not required to comply with the separateness and control regulations so long as they continue to operate under the same terms and conditions) was added to the regulations at § 412.22(f). We later modified the grandfathering provision to allow for a grandfathered hospital to make specified changes (for example increasing the number of beds) during particular timeframes, which vary depending on the change the hospital had made. Below we discuss our FY 2018 proposed and finalized changes to our HwH regulations.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20004), we proposed to revise our HwH regulations

so that the separateness and control requirements would only apply to IPPS-excluded HwHs that are co-located with IPPS hospitals. Under this proposal, any hospital that occupies a building also used by another hospital, or in one or more separate buildings located on the same campus as buildings used by another hospital would remain, by definition, an HwH. However, the separateness and control requirements for IPPS-excluded HwHs would apply only when the IPPS-excluded hospital is co-located with an IPPS hospital. The proposal was premised on the belief that the policy concerns that underlie our existing HwH regulations (that is, inappropriate patient shifting and hospitals acting as illegal de facto units) are sufficiently moderated in situations where IPPS-excluded hospitals are co-located with each other but not IPPS hospitals, in large part due to the payment system changes that have occurred over the intervening years for IPPS-excluded hospitals. For example, LTCHs, inpatient rehabilitation facilities (IRFs) and inpatient psychiatric facilities (IPFs) are no longer paid on a reasonable cost-basis as was the case when HwH regulations were adopted. Currently, LTCHs, IRFs, and IPFs are each paid under their own respective PPS, and those payment systems include policies based on the types of patients they admit for treatment. For example, to be classified for payment under Medicare's IRF PPS, at least 60 percent of a facility's total inpatient population must require inpatient hospital-level treatment for one or more of 13 conditions listed in 42 CFR 412.29(b)(2), and recent statutory changes require that specified patient-level criteria be met for LTCH discharges to be paid based on the standard Federal payment rate under the LTCH PPS. For these reasons, we proposed to revise our HwH regulations so that the separateness and control requirements would only apply to IPPS-excluded HwHs that are co-located with IPPS hospitals; we proposed to revise the introductory language of § 412.22(e) to reflect the proposed change. That is, the introductory language of § 412.22(e) would state that, beginning on or after October 1, 2017, an HwH that is excluded from the IPPS that occupies space in a building also used by an IPPS hospital, or in one or more separate buildings located on the same campus as buildings used by an IPPS hospital, must meet the criteria specified in §§ 412.22(e)(1) through (e)(3) in order to be excluded from the IPPS. While we did not propose to make changes to our HwH regulations for co-located IPPS

and IPPS-excluded hospitals, we invited public comments on the issue of whether the separateness and control requirements are still necessary for IPPS-excluded HwHs that are co-located with IPPS hospitals, which we would consider for potential future rulemaking.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20004), we also proposed to revise the requirements at § 412.22(e)(1)(v), which outlines performance of basic hospital functions, to make them effective for fiscal years prior to FY 2018. We believe that the requirements in paragraph (e)(1)(v)(A) are generally duplicative of CMS' interpretative guidance that relate to a number of hospital conditions of participation (CoPs) that are in the regulations (for example, 42 CFR 482.21 through 482.27, 482.30, 482.42, 482.43, and 482.45). As such, we proposed to remove the overlap between the HwH regulations and the CoP Interpretative Guidance from the regulations by sunsetting the requirements in paragraph (e)(1)(v)(A) of § 412.22. (The COP Interpretive Guidance for hospitals can be found in Appendix A of the State Operations Manual (CMS Pub. 100-07).) In addition, we proposed to remove the requirements in paragraph (e)(1)(v)(B) of § 412.22 because we believe these payment requirements could be interpreted to conflict with the requirements under the hospital CoPs, which do not provide for a minimum cost threshold regarding the services the HwH obtains from the hospital with which it is occupying space. We stated that we did not believe that this proposed revision would result in a practical change to how HwHs are currently operated because the performance of basic hospital functions requirements at § 412.22(e)(1)(v) are currently addressed under CMS' Interpretative Guidance for the hospital CoPs. In addition, we stated that we did not believe, at that time, that there are payment policy concerns that would justify imposition of regulatory requirements on the performance of basic hospital functions for HwHs that are more stringent than what is addressed under the Interpretative Guidance for the hospital CoPs.

We invited public comment on these proposals.

Comment: Several commenters supported CMS' proposal to apply the separateness and control requirements only to IPPS-excluded HwHs that are co-located with IPPS hospitals. Some commenters requested clarification that § 412.22(e)(1)(v)(C) would also not apply to a HwH after October 1, 2017 because the retention of that

requirement, taken together with the removal of § 412.22(e)(1)(v)(A) and (B), would have the result of eliminating HwH status for many IPPS-excluded HwHs. Some commenters also stated that the proposed revision to § 412.22(e)(1)(v) should not be interpreted to mean that a HwH must have complied with § 412.22(e)(1)(v) prior to October 1, 2017 in order to maintain its IPPS-excluded status after October 1, 2017.

Response: We thank the commenters for their support and confirm that our intent was to eliminate the requirement that HwHs comply with § 412.22(e)(1)(v) in its entirety starting in FY 2018. Eliminating § 412.22(e)(1)(v)(A) and (B), but not (C), would have the unintended effect of requiring HwHs to ensure that they met the 75 percent inpatient population requirement during the 6-month period immediately preceding the first cost reporting period for which they sought an exclusion in order to maintain that excluded status. As that was not our intent, we are finalizing that, beginning with FY 2018, HwHs will no longer be required to satisfy any of the criteria in § 412.22(e)(1)(v) in order to maintain their HwH status. This change will not affect requirements applicable to HwHs prior to October 1, 2017. We also note that none of the changes to the HwH regulations that we are finalizing in this final rule constitute changes to the conditions of participation (CoPs) at 42 CFR part 482 and applicable interpretative guidance; and that every hospital, regardless of co-location, must independently comply with all applicable CoPs.

Comment: Some commenters believed that the proposed revisions to the HwH rules apply to all forms of co-located hospitals. Other commenters requested that CMS make analogous changes to the satellite facility rules in addition to the HwH rules.

Response: We believe that some commenters have misunderstood the scope of our proposals. Co-located hospital locations can be either HwHs (entire hospitals that are co-located with another hospital) or satellite facilities (parts of hospitals that are co-located with another hospital). The HwH rules do not apply to satellite facilities. Regulations governing payment to satellite facilities can be found at § 412.22(h). We appreciate the request by some commenters to consider making analogous changes to the regulations governing satellite facilities, and we will take that request under advisement for future rulemaking.

Comment: Several commenters responded to CMS' solicitation of comments on whether it remains necessary to maintain the separateness and control requirements for IPPS-excluded HwHs that are co-located with IPPS hospitals.

Response: We appreciate the comments we received on this topic and will take them under advisement for future rulemaking.

After consideration of the public comments we received, we are finalizing our proposals as proposed, with one modification. Under our final policies, HwHs will no longer be required to satisfy any of the criteria at § 412.22(e)(1)(v), including paragraph (e)(1)(v)(C), in order to maintain their HwH status.

C. Report on Adjustment (Exceptions) Payments

Section 4419(b) of Public Law 105–33 requires the Secretary to publish annually in the **Federal Register** a report describing the total amount of adjustment payments made to excluded hospitals and hospital units by reason of section 1886(b)(4) of the Act during the previous fiscal year.

The process of requesting, adjusting, and awarding an adjustment payment is likely to occur over a 2-year period or longer. First, generally, an excluded hospital must file its cost report for the fiscal year in accordance with § 413.24(f)(2) of the regulations. The MAC reviews the cost report and issues a notice of provider reimbursement (NPR). Once the hospital receives the NPR, if its operating costs are in excess of the ceiling, the hospital may file a request for an adjustment payment. After the MAC receives the hospital's request in accordance with applicable regulations, the MAC or CMS, depending on the type of adjustment requested, reviews the request and determines if an adjustment payment is warranted. This determination is sometimes not made until more than 180 days after the date the request is filed because there are times when the request applications are incomplete and additional information must be requested in order to have a completed request application. However, in an attempt to provide interested parties with data on the most recent adjustment payments for which we have data, we are publishing data on adjustment payments that were processed by the MAC or CMS during FY 2016.

The table below includes the most recent data available from the MACs and CMS on adjustment payments that were adjudicated during FY 2016. As indicated above, the adjustments made during FY 2016 only pertain to cost reporting periods ending in years prior to FY 2016. Total adjustment payments given to excluded hospitals during FY 2016 are \$13,123,870. The table depicts for each class of hospitals, in the aggregate, the number of adjustment requests adjudicated, the excess operating costs over the ceiling, and the amount of the adjustment payments.

Class of hospital	Number	Excess cost over ceiling	Adjustment payments
Hospitals in Territories	1	\$3,007,636	\$2,112,404
Cancer	1	21,255,065	10,236,366
Religious Nonmedical Health Care Institution (RNHCI)	4	420,960	420,960
Psychiatric Unit	1	2,116,384	354,140
Total			13,123,870

D. Critical Access Hospitals (CAHs)

1. Background

Section 1820 of the Act provides for the establishment of Medicare Rural Hospital Flexibility Programs (MRHFPs), under which individual States may designate certain facilities as

critical access hospitals (CAHs). Facilities that are so designated and meet the CAH conditions of participation under 42 CFR part 485, subpart F, will be certified as CAHs by CMS. Regulations governing payments to CAHs for services to Medicare

beneficiaries are located in 42 CFR part 413.

2. Frontier Community Health Integration Project (FCHIP) Demonstration

Section 123 of the Medicare Improvements for Patients and

Providers Act of 2008 (Pub. L. 110–275), as amended by section 3126 of the Affordable Care Act, authorizes a demonstration project to allow eligible entities to develop and test new models for the delivery of health care services in eligible counties in order to improve access to and better integrate the delivery of acute care, extended care and other health care services to Medicare beneficiaries. The demonstration is titled “Demonstration Project on Community Health Integration Models in Certain Rural Counties,” and is commonly known as the Frontier Community Health Integration Project (FCHIP) demonstration.

The authorizing statute states the eligibility criteria for entities to be able to participate in the demonstration. An eligible entity, as defined in section 123(d)(1)(B) of Public Law 110–275, as amended, is an MRHFP grantee under section 1820(g) of the Act (that is, a CAH); and is located in a State in which at least 65 percent of the counties in the State are counties that have 6 or less residents per square mile.

The authorizing statute stipulates several other requirements for the demonstration. Section 123(d)(2)(B) of Public Law 110–275, as amended, limits participation in the demonstration to eligible entities in not more than 4 States. Section 123(f)(1) of Public Law 110–275 requires the demonstration project to be conducted for a 3-year period. In addition, section 123(g)(1)(B) of Public Law 110–275 requires that the demonstration be budget neutral. Specifically, this provision states that in conducting the demonstration project, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project under the section were not implemented. Furthermore, section 123(i) of Public Law 110–275 states that the Secretary may waive such requirements of titles XVIII and XIX of the Act as may be necessary and appropriate for the purpose of carrying out the demonstration project, thus allowing the waiver of Medicare payment rules encompassed in the demonstration.

In January 2014, CMS released a request for applications (RFA) for the FCHIP demonstration. Using 2013 data from the U.S. Census Bureau, CMS identified Alaska, Montana, Nevada, North Dakota, and Wyoming as meeting the statutory eligibility requirement for participation in the demonstration. The RFA solicited CAHs in these five States to participate in the demonstration,

stating that participation would be limited to CAHs in four of the States. To apply, CAHs were required to meet the eligibility requirements in the authorizing legislation, and, in addition, to describe a proposal to enhance health-related services that would complement those currently provided by the CAH and better serve the community's needs. In addition, in the RFA, CMS interpreted the eligible entity definition in the statute as meaning a CAH that receives funding through the MHRFP. The RFA identified four interventions, under which specific waivers of Medicare payment rules would allow for enhanced payment for telehealth, skilled nursing facility/nursing facility beds, ambulance services, and home health services, respectively. These waivers were formulated with the goal of increasing access to care with no net increase in costs.

Ten CAHs were selected for participation in the demonstration, which started on August 1, 2016. These CAHs are located in Montana, Nevada and North Dakota, and they are participating in three of the four interventions identified in the FY 2017 IPPS/LTCH PPS final rule. Eight CAHs are participating in the telehealth intervention, three CAHs are participating in the skilled nursing facility/nursing facility bed intervention, and two CAHs are participating in the ambulance services intervention. Each CAH is allowed to participate in more than one of the interventions. None of the selected CAHs are participants in the home health intervention, which was the fourth intervention proposed in the RFA.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57064 through 57065), we finalized a policy to address the budget neutrality requirement for the demonstration. As explained in the FY 2017 IPPS/LTCH PPS final rule, we based our selection of CAHs for participation with the goal of maintaining the budget neutrality of the demonstration on its own terms (that is, the demonstration will produce savings from reduced transfers and admissions to other health care providers, thus offsetting any increase in payments resulting from the demonstration). However, because of the small size of this demonstration and uncertainty associated with projected Medicare utilization and costs, we adopted a contingency plan to ensure that the budget neutrality requirement in section 123 of Public Law 110–275 is met. If analysis of claims data for Medicare beneficiaries receiving services at each

of the participating CAHs, as well as from other data sources, including cost reports for these CAHs, shows that increases in Medicare payments under the demonstration during the 3-year period are not sufficiently offset by reductions elsewhere, we will recoup the additional expenditures attributable to the demonstration through a reduction in payments to all CAHs nationwide. Because of the small scale of the demonstration, we indicated that we did not believe it would be feasible to implement budget neutrality by reducing payments to only the participating CAHs. Therefore, in the event that this demonstration is found to result in aggregate payments in excess of the amount that would have been paid if this demonstration were not implemented, we will comply with the budget neutrality requirement by reducing payments to all CAHs, not just those participating in the demonstration. We stated that we believe it is appropriate to make any payment reductions across all CAHs because the FCHIP demonstration is specifically designed to test innovations that affect delivery of services by the CAH provider category. We explained our belief that the language of the statutory budget neutrality requirement at section 123(g)(1)(B) of Public Law 110–275 permits the agency to implement the budget neutrality provision in this manner. The statutory language merely refers to ensuring that aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project was not implemented, and does not identify the range across which aggregate payments must be held equal.

Based on actuarial analysis using cost report settlements for FYs 2013 and 2014, the demonstration is projected to satisfy the budget neutrality requirement and likely yield a total net savings. For the FY 2017 IPPS/LTCH PPS final rule, we estimated that the total impact of the payment recoupment would be no greater than 0.03 percent of CAHs' total Medicare payments within one fiscal year (that is, Medicare Part A and Part B). The final budget neutrality estimates for the FCHIP demonstration will be based on the demonstration period, which is August 1, 2016 through July 31, 2019.

The demonstration is projected to impact payments to participating CAHs under both Medicare Part A and Part B. As stated in the FY 2017 IPPS/LTCH PPS final rule, in the event the demonstration is found not to have been budget neutral, any excess costs will be recouped over a period of 3 cost

reporting years, beginning in CY 2020. The 3-year period for recoupment will allow for a reasonable timeframe for the payment reduction and to minimize any impact on CAHs' operations. Therefore, because any reduction to CAH payments in order to recoup excess costs under the demonstration will not begin until CY 2020, this policy will have no impact for any national payment system for FY 2018.

We did not receive any public comments on our discussion of this demonstration in the proposed rule.

3. Physician Certification Requirement for Payment of Inpatient CAH Services Under Medicare Part A

a. Background

For inpatient CAH services to be payable under Medicare Part A, section 1814(a)(8) of the Act requires that a physician certify that the individual may reasonably be expected to be discharged or transferred to a hospital within 96 hours after admission to the CAH. The regulations implementing this statutory requirement are located at 42 CFR 424.15.

We most recently addressed the 96-hour certification requirement in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50163 through 50165). In that rule, we finalized a policy regarding the timing of this physician certification requirement. We revised the regulations such that all physician certification requirements must be completed, signed, and documented in the medical record no later than 1 day before the date on which the claim for payment for the inpatient CAH service is submitted. This policy change was effective October 1, 2014. Prior to that revision, our policy, which was in effect during FY 2014, had been that the certification began with the order for inpatient admission and was required to be completed, signed, and documented in the medical record prior to discharge.

In addition to this change regarding the timing of the 96-hour certification requirement, we also provided a general review of this certification requirement in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50165). We stated that because the statutory requirement at section 1814(a)(8) of the Act is based on an expectation, if a physician certifies, in good faith, that an individual may reasonably be expected to be discharged or transferred to a hospital within 96 hours after admission to the CAH and then something unforeseen occurs that causes the individual to stay longer at the CAH, Medicare will pay for the costs of treating that patient and there would not be a problem with regard to the CAH

designation as long as that individual's stay does not cause the CAH to exceed its 96-hour annual average condition of participation (CoP) requirement under 42 CFR 485.620(b) (which we note is separate and distinct from the 96-hour physician certification requirement). However, if a physician cannot in good faith certify that an individual may reasonably be expected to be discharged or transferred within 96 hours after admission to the CAH, the CAH will not receive Medicare Part A payment for any portion of that individual's inpatient stay (79 FR 50165). We further noted that time as an outpatient at the CAH is not included in applying the 96-hour requirement, nor does time in a CAH swing bed, which is being used to provide skilled nursing services, count towards the 96-hour requirement. The clock for the 96 hours only begins once the individual is admitted to the CAH as an inpatient.

b. Notice Regarding Changes to Instructions for the Review of the CAH 96-Hour Certification Requirement

As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20007), based on feedback from stakeholders, we reviewed the CAH 96-hour certification requirement to determine if there were ways to minimize providers' concerns regarding this requirement. We noted that the requirement is statutory and cannot be modified through regulation. However, we do have discretion to determine how CMS will prioritize monitoring and enforcement of the requirement. In order to minimize the concerns of CAHs with respect to the 96-hour certification requirement, in the FY 2018 IPPS/LTCH PPS proposed rule, we provided notice that CMS will direct Quality Improvement Organizations (QIOs), Medicare Administrative Contractors (MACs), the Supplemental Medical Review Contractor (SMRC), and Recovery Audit Contractors (RACs) to make the CAH 96-hour certification requirement a low priority for medical record reviews conducted on or after October 1, 2017. We stated that this means that, absent concerns of probable fraud, waste, or abuse, these contractors will not conduct medical record reviews with respect to the 96-hour certification requirement. Reviews by other entities, including, but not limited to, Zone Program Integrity Contractors (ZPICs), the Office of Inspector General, and the Department of Justice will continue as appropriate. Quality reviews and automated reviews (for example, those reviews that do not involve medical records) will also continue as appropriate.

We stated that, in the past, RACs have never performed medical record reviews for CAH claims, and we will not approve medical record review of CAHs for only the 96-hour certification requirement. We provided notice that, beginning October 1, 2017, CMS will direct the QIOs, MACs, and the SMRC to make medical record review of CAHs for only the 96-hour certification requirement a low priority. We stated that QIOs and MACs may continue to conduct medical record review of CAH claims for the purposes of verifying compliance with other requirements, such as beneficiary complaints, quality of care reviews, higher weighted DRG reviews, readmission reviews, and the requirement that procedures be medically necessary.

In the FY 2018 IPPS/LTCH PPS proposed rule, we stated that, under the revised instructions to contractors, CAHs will not receive any medical record requests from MACs, RACs, QIOs, or the SMRC related to the 96-hour certification requirement unless CMS or its contractors find evidence of gaming or a failure to comply with CMS' provider screening and revalidation requirements, or if medical review is needed for other issues. If this occurs, the MACs, RACs, QIOs, or the SMRC could also review the 96-hour certification requirement. In addition, if data analysis or other information indicates that possible fraud exists, CAHs may also receive medical record requests for the 96-hour certification requirement.

Comment: Commenters supported CMS' notice in the FY 2018 IPPS/LTCH PPS proposed rule that, with respect to the 96-hour certification requirement, CMS is directing QIOs, MACs, the SMRC, and RACs to make the CAH 96-hour certification requirement a low priority for medical record reviews conducted on or after October 1, 2017.

Commenters requested permanent removal of the 96-hour certification requirement, and many noted they are continuing to advocate for a legislative solution.

Commenters stated they appreciated CMS recognizing that the 96-hour certification requirement could hinder the promotion of essential and life-saving health care services to rural America. Commenters also noted they appreciated CMS recognizing the conflict between the 96-hour certification requirement and the 96-hour annual average CoP requirement, as well as the administrative complexity associated with the certification requirement. Some commenters urged CMS to finalize the proposed notice so that CAHs can be assured that the 96-

hour certification requirement will not be the subject of future audits. Other commenters stated that providing notice that the CAH 96-hour certification requirement is a low priority for medical record reviews is a positive first step. One commenter stated that the notice demonstrates that CMS is aware of the problems inherent in the 96-hour certification requirement, and asked CMS to provide a solution for these problems in future rulemaking that goes beyond instructing contractors to forego reviews of medical records associated with the 96-hour certification requirement apart from instances where there are specific concerns related to program integrity.

Other commenters stated they appreciated CMS' notice but were concerned that the notice, as included in the proposed rule, is too ambiguous because it does not remove the 96-hour certification requirement from the statute, and, therefore, CAHs are still at risk for penalties. The commenters believed there would be varying levels of enforcement of the 96-hour certification because of both broad definitions and concerns of fraud, waste and abuse. They encouraged CMS to finalize permanent removal of the 96-hour certification requirement to give CAHs certainty that CMS will not engage in future audits related to the 96-hour certification requirement.

One commenter appreciated the recognition that the 96-hour certification requirement is burdensome and unnecessary. However, the commenter indicated that the notice regarding the 96-hour certification requirement included in the proposed rule is not a permanent moratorium. The commenter stated that CAHs must still comply with the requirement and, therefore, can still be audited for noncompliance. The commenter expressed concern regarding the impact on large health systems where failures of one hospital in the system can result in consequences for the entire system. The commenter stated that the notice included in the proposed rule "muddies the waters" and urged CMS to eliminate the 96-hour certification requirement.

Commenters stated that, while the notice provides some relief, it does not remove the 96-hour certification requirement from statute, and, therefore, there are concerns that CAHs may still be at risk for penalties, including liability under the False Claims Act, as well as outside auditors using the 96-hour certification requirement to target and penalize CAHs.

Response: We appreciate commenters' support of the notice included in the proposed rule regarding the 96-hour

certification requirement. In this final rule, we are reiterating that CMS will direct QIOs, MACs, the SMRC, and RACs to make the CAH 96-hour certification requirement a low priority for medical record reviews conducted on or after October 1, 2017. CAHs should not expect to receive any medical record requests from QIOs, MACs, RACs, or the SMRC related to the 96-hour certification requirement unless CMS or its contractors find evidence of gaming or a failure to comply with CMS' provider screening and revalidation requirements, or if medical review is needed for other issues. As commenters have noted, the 96-hour certification requirement is statutory; therefore, removal of this requirement requires legislative action.

Comment: Commenters expressed their concerns with respect to the 96-hour certification requirement in general. Commenters stated that while CAHs may meet the 96-hour annual average length of stay CoP requirement, they also provide medical services that require inpatient stays of more than 96 hours. In these situations, CAHs cannot adhere to the 96-hour certification requirement because a physician cannot, in good faith, certify that the beneficiary's stay will be 96 hours or less. In this scenario, if the 96-hour certification requirement were to be enforced, a CAH would not receive payment for the specific inpatient service and, as a result, patients would no longer have access to critical services that require an inpatient length of stay of more than 96 hours. Commenters further noted that because Medicare payments comprise approximately 47 percent of CAHs' revenues, any change in these payments is difficult to absorb and affects CAHs' ability to provide care to those living in rural areas.

One commenter stated that from the inception of the CAH program through late 2013, the 96-hour annual average CoP requirement provided CAHs with greater flexibility within the CAH designation process. The commenter stated that strict enforcement of the 96-hour certification requirement leads to unnecessary red tape and barriers for CAHs as well as eliminates the flexibility to allow general surgical services to be provided by high quality local providers. The commenter stated that the 96-hour certification requirement is not consistent with congressional intent to provide CAHs with greater flexibility. The commenter referenced the change made as part of the Balanced Budget Refinement Act of 1999 (Pub. L. 106–113), which amended the CAH CoP length of stay requirement such that it became based on an annual

average number of hours. The commenter stated that the 96-hour certification requirement limits access to rural health care because it does not permit providers to focus on patient care. The commenter further stated that the 96-hour certification requirement interferes with practitioner judgment because high quality and qualified local providers are placed in a situation where they cannot care for their patients, and therefore patients have to travel further from home to receive care. The commenter believed these transfers result in additional Medicare expenditures because it is 2.5 percent less expensive to provide the same Medicare services in a rural setting versus an urban or suburban setting. The commenter referred to a study published in the *Journal of the American Medical Association* (JAMA), which stated that Medicare expenditures for minor general surgical procedures, when adjusted for patient factors and procedure type, are lower in CAHs, and that such procedures are associated with lower rates of serious complications when performed in CAHs. The commenter noted that these are the types of procedures generally called into question under the 96-hour certification requirement. Another comment raised concerns regarding "judgmental pressure" placed on admitting physicians and inconveniences placed on patients and their families with respect to meeting the 96-hour certification requirement.

One commenter stated that the 96-hour certification requirement has imposed significant burdens on the surgical community, whose members extend essential surgical care to Medicare's rural beneficiaries. The commenter also expressed concerns regarding compliance with the 96-hour certification requirement and its intersection with the Emergency Medical Treatment and Labor Act (EMTALA) and the CoPs. Another commenter communicated concern that the 96-hour certification requirement is a quality and safety CoP requirement and is, therefore, for enforcement purposes, required to be included in accrediting body manuals. The commenter requested that CMS remove the 96-hour certification requirement from the quality and safety CoPs and instead rely on MACs such that accrediting organizations are not required to enforce the requirement but rather it is a part of CMS' fiscal oversight.

Response: We appreciate commenters sharing their concerns regarding the 96-hour certification requirement. As noted throughout this section of the preamble,

the 96-hour certification requirement is statutory and cannot be amended through notice-and-comment rulemaking without a change in legislation. We also clarify that the 96-hour certification requirement (section 1814(a)(8) of the Act) is separate and distinct from the 96-hour annual average length of inpatient stay CoP (meaning condition of participation) requirement (section 1820(c)(2)(B)(iii) of the Act). The 96-hour certification requirement is not directly relevant to determining whether a facility remains eligible for designation as a CAH, but rather is applicable to determining whether a CAH may receive Medicare payment under Part A for inpatient CAH services. Therefore, primary enforcement of the 96-hour certification requirement should not be conducted by accrediting bodies.

In summary, as stated earlier, we are reiterating that CMS will direct QIOs, MACs, the SMRC, and RACs to make the CAH 96-hour certification requirement a low priority for medical record reviews conducted on or after October 1, 2017. CAHs should not expect to receive any medical record requests from QIOs, MACs, RACs, or the SMRC related to the 96-hour certification requirement unless CMS or its contractors find evidence of gaming or a failure to comply with CMS' provider screening and revalidation requirements or if medical review is needed for other issues.

VIII. Changes to the Long-Term Care Hospital Prospective Payment System (LTCH PPS) for FY 2018

A. Background of the LTCH PPS

1. Legislative and Regulatory Authority

Section 123 of the Medicare, Medicaid, and SCHIP (State Children's Health Insurance Program) Balanced Budget Refinement Act of 1999 (BBRA) (Pub. L. 106–113) as amended by section 307(b) of the Medicare, Medicaid, and SCHIP Benefits Improvement and Protection Act of 2000 (BIPA) (Pub. L. 106–554) provides for payment for both the operating and capital-related costs of hospital inpatient stays in long-term care hospitals (LTCHs) under Medicare Part A based on prospectively set rates. The Medicare prospective payment system (PPS) for LTCHs applies to hospitals that are described in section 1886(d)(1)(B)(iv) of the Act, effective for cost reporting periods beginning on or after October 1, 2002.

Section 1886(d)(1)(B)(iv)(I) of the Act originally defined an LTCH as a hospital which has an average inpatient length of stay (as determined by the Secretary) of

greater than 25 days. Section 1886(d)(1)(B)(iv)(II) of the Act also provided an alternative definition of LTCHs: Specifically, a hospital that first received payment under section 1886(d) of the Act in 1986 and had an average inpatient length of stay (as determined by the Secretary of Health and Human Services (the Secretary)) of greater than 20 days and had 80 percent or more of its annual Medicare inpatient discharges with a principal diagnosis that reflected a finding of neoplastic disease in the 12-month cost reporting period ending in FY 1997. However, as discussed below, section 15008 of the 21st Century Cures Act (Pub. L. 114–255) amended section 1886 of the Act to exclude former “subclause II” LTCHs from payment under the LTCH PPS and created a new category of IPPS-excluded hospitals (named in the proposed rule “long-term care neoplastic disease hospitals” but renamed in this final rule “extended neoplastic disease care hospitals”) for hospitals that were formally classified as “subclause (II)” LTCHs.

Section 123 of the BBRA requires the PPS for LTCHs to be a “per discharge” system with a diagnosis-related group (DRG) based patient classification system that reflects the differences in patient resources and costs in LTCHs.

Section 307(b)(1) of the BIPA, among other things, mandates that the Secretary shall examine, and may provide for, adjustments to payments under the LTCH PPS, including adjustments to DRG weights, area wage adjustments, geographic reclassification, outliers, updates, and a disproportionate share adjustment.

In the August 30, 2002 **Federal Register**, we issued a final rule that implemented the LTCH PPS authorized under the BBRA and BIPA (67 FR 55954). For the initial implementation of the LTCH PPS (FYs 2003 through FY 2007), the system used information from LTCH patient records to classify patients into distinct long-term care diagnosis-related groups (LTC–DRGs) based on clinical characteristics and expected resource needs. Beginning in FY 2008, we adopted the Medicare severity long-term care diagnosis-related groups (MS–LTC–DRGs) as the patient classification system used under the LTCH PPS. Payments are calculated for each MS–LTC–DRG and provisions are made for appropriate payment adjustments. Payment rates under the LTCH PPS are updated annually and published in the **Federal Register**.

The LTCH PPS replaced the reasonable cost-based payment system under the Tax Equity and Fiscal Responsibility Act of 1982 (TEFRA) (Pub. L. 97–248) for payments for

inpatient services provided by an LTCH with a cost reporting period beginning on or after October 1, 2002. (The regulations implementing the TEFRA reasonable cost-based payment provisions are located at 42 CFR part 413.) With the implementation of the PPS for acute care hospitals authorized by the Social Security Amendments of 1983 (Pub. L. 98–21), which added section 1886(d) to the Act, certain hospitals, including LTCHs, were excluded from the PPS for acute care hospitals and were paid their reasonable costs for inpatient services subject to a per discharge limitation or target amount under the TEFRA system. For each cost reporting period, a hospital-specific ceiling on payments was determined by multiplying the hospital's updated target amount by the number of total current year Medicare discharges. (Generally, in this section of the preamble of this final rule, when we refer to discharges, we describe Medicare discharges.) The August 30, 2002 final rule further details the payment policy under the TEFRA system (67 FR 55954).

In the August 30, 2002 final rule, we provided for a 5-year transition period from payments under the TEFRA system to payments under the LTCH PPS. During this 5-year transition period, an LTCH's total payment under the PPS was based on an increasing percentage of the Federal rate with a corresponding decrease in the percentage of the LTCH PPS payment that is based on reasonable cost concepts, unless an LTCH made a one-time election to be paid based on 100 percent of the Federal rate. Beginning with LTCHs' cost reporting periods beginning on or after October 1, 2006, total LTCH PPS payments are based on 100 percent of the Federal rate.

In addition, in the August 30, 2002 final rule, we presented an in-depth discussion of the LTCH PPS, including the patient classification system, relative weights, payment rates, additional payments, and the budget neutrality requirements mandated by section 123 of the BBRA. The same final rule that established regulations for the LTCH PPS under 42 CFR part 412, subpart O, also contained LTCH provisions related to covered inpatient services, limitation on charges to beneficiaries, medical review requirements, furnishing of inpatient hospital services directly or under arrangement, and reporting and recordkeeping requirements. We refer readers to the August 30, 2002 final rule for a comprehensive discussion of the research and data that supported the

establishment of the LTCH PPS (67 FR 55954).

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623), we implemented the provisions of the Pathway for Sustainable Growth Rate (SGR) Reform Act of 2013 (Pub. L. 113–67), which mandated the application of the “site neutral” payment rate under the LTCH PPS for discharges that do not meet the statutory criteria for exclusion beginning in FY 2016. For cost reporting periods beginning on or after October 1, 2015, discharges that do not meet certain statutory criteria for exclusion are paid based on the site neutral payment rate. Discharges that do meet the statutory criteria continue to receive payment based on the LTCH PPS standard Federal payment rate. For more information on the statutory requirements of the Pathway for SGR Reform Act of 2013, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623).

Section 231 of Consolidated Appropriations Act, 2016 (Pub. L. 114–113) amended section 1886(m)(6) of the Act by revising subparagraph (A)(i) and adding new subparagraph (E), which established a temporary exception to the site neutral payment rate for certain severe wound care discharges occurring prior to January 1, 2017 from LTCHs identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997 that are located in a rural area (as defined in section 1886(d)(2)(D) of the Act) or treated as being so located in accordance with section 1886(d)(8)(E) of the Act.

We implemented the provisions of section 231 of Public Law 114–113, and amended our regulations at 42 CFR 412.522 to reflect those policies, in an interim final rule with comment period (IFC) that appeared in the **Federal Register** on April 21, 2016 (81 FR 23428 through 23438). In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57068), we finalized the provisions of the April 21, 2016 IFC and made limited modifications of those policies set forth in the April 21, 2016 IFC by revising the definitions of a “wound with morbid obesity” and an “infected wound,” and adding additional ICD–10 diagnosis codes to our list of such codes to identify cases that meet the established definition of a “severe wound” for the six severe wound categories other than the categories of a “wound with morbid obesity” and an “infected wound.” The provisions implementing section 231 of Public Law 114–113 were effective for LTCH discharges from qualifying LTCHs for discharges on or after April 21, 2016, through December 31, 2016. For a full discussion of these provisions, we refer

readers to the April 21, 2016 IFC (81 FR 23428) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57068 through 57075).

The 21st Century Cures Act (“the Cures Act”) (Pub. L. 114–255) contains several provisions that affect the LTCH PPS. Section 15004 of Public Law 114–255 contains provisions that change the moratorium on increasing the number of beds in existing LTCHs and LTCH satellite facilities. We discuss our implementation of the provisions of section 15004 in section VIII.H. of the preamble of this final rule. The provisions of section 15004 also included a change to the payment methodology for high-cost outlier payments made to LTCHs. We discuss our proposals and final policies related to high-cost outlier payments in section V.D. of the Addendum of this final rule. The provisions of section 15006 of Public Law 114–255 extended various moratoria on the implementation of the 25-percent threshold policy. We discuss our proposals and final policy related to the provisions of section 15006 in section VIII.G. of the preamble of this final rule. The provisions of section 15007 of Public Law 114–255 revised the requirements of the average length-of-stay criterion for LTCH classification. We discuss our proposals and final policy related to the provisions of section 15007 in section VIII.I. of the preamble of this final rule. The provisions of section 15008 of Public Law 114–255 changed the classification of certain hospitals. We discuss our proposals and final policy related to the provisions of section 15008 in section VIII.J. of the preamble of this final rule. The provisions of section 15009 of Public Law 114–255 contain a temporary exception to the site neutral payment rate for certain spinal cord specialty hospitals. We discuss our proposals and final policy related to the provisions of section 15009 in section VIII.E. of the preamble of this final rule. The provisions of section 15010 of Public Law 114–255 contain a temporary exception to the site neutral payment rate for certain severe wound care discharges from certain LTCHs. We discuss our proposals and final policy related to the provisions of section 15010 in section VIII.F. of the preamble of this final rule. In addition, as we proposed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20009), in this final rule we are amending 42 CFR 412.500 to include Public Law 114–255 as one of the bases and scope of subpart O of part 412.

We received several public comments that addressed issues that were outside the scope of the FY 2018 proposed rule. We will keep these comments in mind

and may consider them for future rulemaking.

2. Criteria for Classification as an LTCH

a. Classification as an LTCH

Under the regulations at § 412.23(e)(1), to qualify to be paid under the LTCH PPS, a hospital must have a provider agreement with Medicare. Furthermore, § 412.23(e)(2)(i), which implements section 1886(d)(1)(B)(iv) of the Act, requires that a hospital have an average Medicare inpatient length of stay of greater than 25 days to be paid under the LTCH PPS. Alternatively, existing § 412.23(e)(2)(ii) states that, for cost reporting periods beginning on or after August 5, 1997, a hospital that was first excluded from the PPS in 1986 and can demonstrate that at least 80 percent of its annual Medicare inpatient discharges in the 12-month cost reporting period ending in FY 1997 have a principal diagnosis that reflects a finding of neoplastic disease must have an average inpatient length of stay for all patients, including both Medicare and non-Medicare inpatients, of greater than 20 days (referred to as “subclause (II)” LTCHs). In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20029), under our proposed changes to § 412.23(e)(2)(ii) of the regulations to implement the provisions of section 15008 of Public Law 114–255, we proposed to add a sunset date to subclause (II) LTCHs (which have become a new category of IPPS-excluded hospitals named in the proposed rule “long-term care neoplastic disease hospitals” but renamed “extended neoplastic disease care hospitals” in this final rule). Extended neoplastic disease care hospitals are discussed in greater detail in section VIII.J. of the preamble of this final rule. In addition, in section VIII.I. of the preamble of the proposed rule and this final rule, we discuss the proposed and finalized changes to the calculation of the greater than 25-day average length-of-stay requirement provided by the provisions of section 15007 of Public Law 114–255.

b. Hospitals Excluded From the LTCH PPS

The following hospitals are paid under special payment provisions, as described in § 412.22(c) and, therefore, are not subject to the LTCH PPS rules:

- Veterans Administration hospitals.
- Hospitals that are reimbursed under State cost control systems approved under 42 CFR part 403.
- Hospitals that are reimbursed in accordance with demonstration projects authorized under section 402(a) of the

Social Security Amendments of 1967 (Pub. L. 90–248) (42 U.S.C. 1395b–1), section 222(a) of the Social Security Amendments of 1972 (Pub. L. 92–603) (42 U.S.C. 1395b–1 (note)) (Statewide all-payer systems, subject to the rate-of-increase test at section 1814(b) of the Act), or section 3201 of the Patient Protection and Affordable Care Act (Pub. L. 111–148 (42 U.S.C. 1315a)).

- Nonparticipating hospitals furnishing emergency services to Medicare beneficiaries.

3. Limitation on Charges to Beneficiaries

In the August 30, 2002 final rule, we presented an in-depth discussion of beneficiary liability under the LTCH PPS (67 FR 55974 through 55975). This discussion was further clarified in the RY 2005 LTCH PPS final rule (69 FR 25676). In keeping with those discussions, if the Medicare payment to the LTCH is the full LTC–DRG payment amount, consistent with other established hospital prospective payment systems, § 412.507 currently provides that an LTCH may not bill a Medicare beneficiary for more than the deductible and coinsurance amounts as specified under §§ 409.82, 409.83, and 409.87 and for items and services specified under § 489.30(a). However, under the LTCH PPS, Medicare will only pay for days for which the beneficiary has coverage until the short-stay outlier (SSO) threshold is exceeded. If the Medicare payment was for a SSO case (§ 412.529), and that payment was less than the full LTC–DRG payment amount because the beneficiary had insufficient remaining Medicare days, the LTCH is currently also permitted to charge the beneficiary for services delivered on those uncovered days (§ 412.507). In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49623), we amended our regulations to expressly limit the charges that may be imposed on beneficiaries whose discharges are paid at the site neutral payment rate under the LTCH PPS.

In section VII.G. of the preamble of the FY 2017 IPPS/LTCH PPS final rule (81 FR 57102), we also amended the existing regulations relating to the limitation on charges to expressly address beneficiary charges for LTCH services provided by subclause (II) LTCHs as part of our refinement of the payment adjustment for subclause (II) LTCHs under § 412.526. We also amended the regulations under § 412.507 to clarify our existing policy that blended payments made to an LTCH during its transitional period (that is, payment for discharges occurring in cost reporting periods beginning in FY

2016 or 2017) are considered to be site neutral payment rate payments.

4. Administrative Simplification Compliance Act (ASCA) and Health Insurance Portability and Accountability Act (HIPAA) Compliance

Claims submitted to Medicare must comply with both the Administrative Simplification Compliance Act (ASCA) (Pub. L. 107–105), and the Health Insurance Portability and Accountability Act of 1996 (HIPAA) (Pub. L. 104–191). Section 3 of the ASCA generally requires that the Medicare Program deny payment under Part A or Part B for any expenses incurred for items or services for which a claim is submitted other than in an electronic form specified by the Secretary. Section 1862(h) of the Act (as added by section 3(a) of the ASCA) provides that the Secretary shall waive such denial in two specific types of cases, and may also waive such denial in such unusual cases as the Secretary finds appropriate (68 FR 48805). Section 3 of the ASCA operates in the context of the HIPAA regulations, which include, among other provisions, the transactions and code sets standards requirements codified under 45 CFR parts 160 and 162 (generally known as the Transactions Rule). The Transactions Rule requires covered entities, including covered health care providers, to conduct certain electronic health care transactions according to the applicable transactions and code sets standards.

The Department of Health and Human Services (HHS) has a number of initiatives designed to encourage and support the adoption of health information technology (health IT) and promote nationwide health information exchange to improve health care. The Office of the National Coordinator for Health Information Technology (ONC) leads these efforts in collaboration with other agencies, including CMS and the Office of the Assistant Secretary for Planning and Evaluation (ASPE). Through a number of activities, including several open government initiatives, HHS is promoting the adoption of health IT products, including electronic health record (EHR) technology certified under the ONC Health IT Certification Program (<https://www.healthit.gov/policy-researchers-implementers/about-onc-health-it-certification-program>) developed to support secure, interoperable, health information exchange. We believe that the use of certified EHRs by LTCHs (and other types of providers that are ineligible for the Medicare and

Medicaid EHR Incentive Programs) can effectively and efficiently help providers improve internal care delivery practices, support the exchange of important information across care partners and during transitions of care, and enable the reporting of electronically specified clinical quality measures (eCQMs) (as described elsewhere in this final rule). In 2015, ONC released a document entitled “Connecting Health and Care for the Nation: A Shared Nationwide Interoperability Roadmap” (available at: <https://www.healthit.gov/sites/default/files/hie-interoperability/nationwide-interoperability-roadmap-final-version-1.0.pdf>). In the near term, the Roadmap focuses on actions that will enable individuals and providers across the care continuum to send, receive, find, and use a common set of electronic clinical information at the nationwide level by the end of 2017. The Roadmap’s goals also align with the Improving Medicare Post-Acute Care Transformation Act of 2014 (Pub. L. 113–185) (IMPACT Act), which requires assessment data to be standardized and interoperable to allow for exchange of the data. Moreover, the vision described in the Roadmap significantly expands the types of electronic health information, information sources, and information users well beyond clinical information derived from EHRs. The Roadmap identifies four critical pathways that health IT stakeholders should focus on now in order to create a foundation for long-term success: (1) Improve technical standards and implementation guidance for priority data domains and associated elements; (2) rapidly shift and align Federal, State, and commercial payment policies from fee-for-service to value-based models to stimulate the demand for interoperability; (3) clarify and align Federal and State privacy and security requirements that enable interoperability; and (4) align and promote the use of consistent policies and business practices that support interoperability and address those that impede interoperability, in coordination with stakeholders.

In support of the goals of the Roadmap, ONC released the 2017 Interoperability Standards Advisory (ISA) (available at: <https://www.healthit.gov/standards-advisory>), a coordinated catalog of standards and implementation specifications developed and used to meet specific interoperability needs. The ISA is intended to serve as an industry resource to further the use of

interoperable electronic health information exchange.

B. Medicare Severity Long-Term Care Diagnosis-Related Group (MS-LTC-DRG) Classifications and Relative Weights for FY 2018

1. Background

Section 123 of the BBRA required that the Secretary implement a PPS for LTCHs to replace the cost-based payment system under TEFFRA. Section 307(b)(1) of the BIPA modified the requirements of section 123 of the BBRA by requiring that the Secretary examine the feasibility and the impact of basing payment under the LTCH PPS on the use of existing (or refined) hospital DRGs that have been modified to account for different resource use of LTCH patients.

When the LTCH PPS was implemented for cost reporting periods beginning on or after October 1, 2002, we adopted the same DRG patient classification system utilized at that time under the IPPS. As a component of the LTCH PPS, we refer to this patient classification system as the “long-term care diagnosis-related groups (LTC-DRGs).” Although the patient classification system used under both the LTCH PPS and the IPPS are the same, the relative weights are different. The established relative weight methodology and data used under the LTCH PPS result in relative weights under the LTCH PPS that reflect the differences in patient resource use of LTCH patients, consistent with section 123(a)(1) of the BBRA (Pub. L. 106–113).

As part of our efforts to better recognize severity of illness among patients, in the FY 2008 IPPS final rule with comment period (72 FR 47130), the MS-DRGs and the Medicare severity long-term care diagnosis-related groups (MS-LTC-DRGs) were adopted under the IPPS and the LTCH PPS, respectively, effective beginning October 1, 2007 (FY 2008). For a full description of the development, implementation, and rationale for the use of the MS-DRGs and MS-LTC-DRGs, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47141 through 47175 and 47277 through 47299). (We note that, in that same final rule, we revised the regulations at § 412.503 to specify that for LTCH discharges occurring on or after October 1, 2007, when applying the provisions of 42 CFR part 412, subpart O applicable to LTCHs for policy descriptions and payment calculations, all references to LTC-DRGs would be considered a reference to MS-LTC-DRGs. For the remainder of

this section, we present the discussion in terms of the current MS-LTC-DRG patient classification system unless specifically referring to the previous LTC-DRG patient classification system that was in effect before October 1, 2007.)

The MS-DRGs adopted in FY 2008 represent an increase in the number of DRGs by 207 (that is, from 538 to 745) (72 FR 47171). The MS-DRG classifications are updated annually. There are currently 757 MS-DRG groupings. For FY 2018, there will be 754 MS-DRG groupings based on the changes discussed in section II.F. of the preamble of this FY 2018 IPPS/LTCH PPS final rule. Consistent with section 123 of the BBRA, as amended by section 307(b)(1) of the BIPA, and § 412.515 of the regulations, we use information derived from LTCH PPS patient records to classify LTCH discharges into distinct MS-LTC-DRGs based on clinical characteristics and estimated resource needs. We then assign an appropriate weight to the MS-LTC-DRGs to account for the difference in resource use by patients exhibiting the case complexity and multiple medical problems characteristic of LTCHs.

In this section of the final rule, we provide a general summary of our existing methodology for determining the FY 2018 MS-LTC-DRG relative weights under the LTCH PPS.

As we proposed, in this final rule, in general, for FY 2018, we are continuing to use our existing methodology to determine the proposed MS-LTC-DRG relative weights (as discussed in greater detail in section VIII.B.3. of the preamble of this final rule). As we established when we implemented the dual rate LTCH PPS payment structure codified under § 412.522, which began in FY 2016, the annual recalibration of the MS-LTC-DRG relative weights are determined: (1) Using only data from available LTCH PPS claims that would have qualified for payment under the new LTCH PPS standard Federal payment rate if that rate had been in effect at the time of discharge when claims data from time periods before the dual rate LTCH PPS payment structure applies are used to calculate the relative weights; and (2) using only data from available LTCH PPS claims that qualify for payment under the new LTCH PPS standard Federal payment rate when claims data from time periods after the dual rate LTCH PPS payment structure applies are used to calculate the relative weights (80 FR 49624). That is, under our current methodology, our MS-LTC-DRG relative weight calculations do not use data from cases paid at the site neutral payment rate under

§ 412.522(c)(1) or data from cases that would have been paid at the site neutral payment rate if the dual rate LTCH PPS payment structure had been in effect at the time of that discharge. For the remainder of this discussion, we use the phrase “applicable LTCH cases” or “applicable LTCH data” when referring to the resulting claims data set used to calculate the relative weights (as described later in greater detail in section VIII.B.3.c. of the preamble of this final rule). In addition, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20011), for FY 2018, we proposed to continue to exclude the data from all-inclusive rate providers and LTCHs paid in accordance with demonstration projects, as well as any Medicare Advantage claims from the MS-LTC-DRG relative weight calculations for the reasons discussed in section VIII.B.3.c. of the preamble of the proposed rule.

Furthermore, for FY 2018, in using data from applicable LTCH cases to establish MS-LTC-DRG relative weights, we proposed to continue to establish low-volume MS-LTC-DRGs (that is, MS-LTC-DRGs with less than 25 cases) using our quintile methodology in determining the MS-LTC-DRG relative weights because LTCHs do not typically treat the full range of diagnoses as do acute care hospitals. Therefore, for purposes of determining the relative weights for the large number of low-volume MS-LTC-DRGs, we group all of the low-volume MS-LTC-DRGs into five quintiles based on average charges per discharge. Then, under our existing methodology, we account for adjustments made to LTCH PPS standard Federal payments for short-stay outlier (SSO) cases (that is, cases where the covered length of stay at the LTCH is less than or equal to five-sixths of the geometric average length of stay for the MS-LTC-DRG), and we make adjustments to account for nonmonotonically increasing weights, when necessary. The methodology is premised on more severe cases under the MS-LTC-DRG system requiring greater expenditure of medical care resources and higher average charges such that, in the severity levels within a base MS-LTC-DRG, the relative weights should increase monotonically with severity from the lowest to highest severity level. (We discuss each of these components of our MS-LTC-DRG relative weight methodology in greater detail in section VIII.B.3.g. of the preamble of this final rule.)

We did not receive any public comments on these proposals. Therefore, we are finalizing our proposals for calculating the MS-LTC-

DRG relative weights for FY 2018 without modification.

2. Patient Classifications Into MS–LTC–DRGs

a. Background

The MS–DRGs (used under the IPPS) and the MS–LTC–DRGs (used under the LTCH PPS) are based on the CMS DRG structure. As noted previously in this section, we refer to the DRGs under the LTCH PPS as MS–LTC–DRGs although they are structurally identical to the MS–DRGs used under the IPPS.

The MS–DRGs are organized into 25 major diagnostic categories (MDCs), most of which are based on a particular organ system of the body; the remainder involve multiple organ systems (such as MDC 22, Burns). Within most MDCs, cases are then divided into surgical DRGs and medical DRGs. Surgical DRGs are assigned based on a surgical hierarchy that orders operating room (O.R.) procedures or groups of O.R. procedures by resource intensity. The Grouper software program does not recognize all ICD–10–PCS procedure codes as procedures affecting DRG assignment. That is, procedures that are not surgical (for example, EKGs), or minor surgical procedures (for example, a biopsy of skin and subcutaneous tissue (procedure code 0JBH3ZX)) do not affect the MS–LTC–DRG assignment based on their presence on the claim.

Generally, under the LTCH PPS, a Medicare payment is made at a predetermined specific rate for each discharge that varies based on the MS–LTC–DRG to which a beneficiary's discharge is assigned. Cases are classified into MS–LTC–DRGs for payment based on the following six data elements:

- Principal diagnosis;
- Additional or secondary diagnoses;
- Surgical procedures;
- Age;
- Sex; and
- Discharge status of the patient.

Currently, for claims submitted using version ASC X12 5010 format, up to 25 diagnosis codes and 25 procedure codes are considered for an MS–DRG assignment. This includes one principal diagnosis and up to 24 secondary diagnoses for severity of illness determinations. (For additional information on the processing of up to 25 diagnosis codes and 25 procedure codes on hospital inpatient claims, we refer readers to section II.G.11.c. of the preamble of the FY 2011 IPPS/LTCH PPS final rule (75 FR 50127).)

Under the HIPAA transactions and code sets regulations at 45 CFR parts 160 and 162, covered entities must

comply with the adopted transaction standards and operating rules specified in Subparts I through S of Part 162. Among other requirements, by January 1, 2012, covered entities were required to use the ASC X12 Standards for Electronic Data Interchange Technical Report Type 3—Health Care Claim: Institutional (837), May 2006, ASC X12N/005010X223, and Type 1 Errata to Health Care Claim: Institutional (837) ASC X12 Standards for Electronic Data Interchange Technical Report Type 3, October 2007, ASC X12N/005010X233A1 for the health care claims or equivalent encounter information transaction (45 CFR 162.1102(c)).

HIPAA requires covered entities to use the applicable medical data code set requirements when conducting HIPAA transactions (45 CFR 162.1000). Currently, upon the discharge of the patient, the LTCH must assign appropriate diagnosis and procedure codes from the most current version of the International Classification of Diseases, 10th Revision, Clinical Modification (ICD–10–CM) for diagnosis coding and the International Classification of Diseases, 10th Revision, Procedure Coding System (ICD–10–PCS) for inpatient hospital procedure coding, both of which were required to be implemented October 1, 2015 (45 CFR 162.1002(c)(2) and (3)). For additional information on the implementation of the ICD–10 coding system, we refer readers to section II.F.1. of the FY 2017 IPPS/LTCH PPS final rule (81 FR 56787 through 56790) and section II.F.1. of the preamble of this final rule. Additional coding instructions and examples are published in the AHA's *Coding Clinic for ICD-10-CM/PCS*.

To create the MS–DRGs (and by extension, the MS–LTC–DRGs), base DRGs were subdivided according to the presence of specific secondary diagnoses designated as complications or comorbidities (CCs) into one, two, or three levels of severity, depending on the impact of the CCs on resources used for those cases. Specifically, there are sets of MS–DRGs that are split into 2 or 3 subgroups based on the presence or absence of a CC or a major complication or comorbidity (MCC). We refer readers to section II.D. of the FY 2008 IPPS final rule with comment period for a detailed discussion about the creation of MS–DRGs based on severity of illness levels (72 FR 47141 through 47175).

MACs enter the clinical and demographic information submitted by LTCHs into their claims processing systems and subject this information to a series of automated screening

processes called the Medicare Code Editor (MCE). These screens are designed to identify cases that require further review before assignment into a MS–LTC–DRG can be made. During this process, certain cases are selected for further explanation (74 FR 43949).

After screening through the MCE, each claim is classified into the appropriate MS–LTC–DRG by the Medicare LTCH Grouper software on the basis of diagnosis and procedure codes and other demographic information (age, sex, and discharge status). The Grouper software used under the LTCH PPS is the same Grouper software program used under the IPPS. Following the MS–LTC–DRG assignment, the MAC determines the prospective payment amount by using the Medicare PRICER program, which accounts for hospital-specific adjustments. Under the LTCH PPS, we provide an opportunity for LTCHs to review the MS–LTC–DRG assignments made by the MAC and to submit additional information within a specified timeframe as provided in § 412.513(c).

The Grouper software is used both to classify past cases to measure relative hospital resource consumption to establish the MS–LTC–DRG relative weights and to classify current cases for purposes of determining payment. The records for all Medicare hospital inpatient discharges are maintained in the MedPAR file. The data in this file are used to evaluate possible MS–DRG and MS–LTC–DRG classification changes and to recalibrate the MS–DRG and MS–LTC–DRG relative weights during our annual update under both the IPPS (§ 412.60(e)) and the LTCH PPS (§ 412.517), respectively.

b. Changes to the MS–LTC–DRGs for FY 2018

As specified by our regulations at § 412.517(a), which require that the MS–LTC–DRG classifications and relative weights be updated annually, and consistent with our historical practice of using the same patient classification system under the LTCH PPS as is used under the IPPS, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20012), we proposed to update the MS–LTC–DRG classifications effective October 1, 2017, through September 30, 2018 (FY 2018), consistent with the proposed changes to specific MS–DRG classifications presented in section II.F. of the preamble of the proposed rule. Accordingly, the MS–LTC–DRGs for FY 2018 presented in the proposed rule and this final rule are the same as the MS–DRGs that will be used under the IPPS for FY 2018. In addition, because the

MS-LTC-DRGs for FY 2018 are the same as the MS-DRGs for FY 2018, the other changes that affect MS-DRG (and by extension MS-LTC-DRG) assignments under GROUPER Version 35 as discussed in section II.F. of the preamble of this final rule, including the changes to the MCE software and the ICD-10-CM/PCS coding system, also will be applicable under the LTCH PPS for FY 2018.

3. Development of the FY 2018 MS-LTC-DRG Relative Weights

a. General Overview of the Development of the MS-LTC-DRG Relative Weights

One of the primary goals for the implementation of the LTCH PPS is to pay each LTCH an appropriate amount for the efficient delivery of medical care to Medicare patients. The system must be able to account adequately for each LTCH's case-mix in order to ensure both fair distribution of Medicare payments and access to adequate care for those Medicare patients whose care is more costly (67 FR 55984). To accomplish these goals, we have annually adjusted the LTCH PPS standard Federal prospective payment rate by the applicable relative weight in determining payment to LTCHs for each case. In order to make these annual adjustments under the dual rate LTCH PPS payment structure, beginning with FY 2016, we recalibrate the MS-LTC-DRG relative weighting factors annually using data from applicable LTCH cases (80 FR 49614 through 49617). Under this policy, the resulting MS-LTC-DRG relative weights would continue to be used to adjust the LTCH PPS standard Federal payment rate when calculating the payment for LTCH PPS standard Federal payment rate cases.

The established methodology to develop the MS-LTC-DRG relative weights is generally consistent with the methodology established when the LTCH PPS was implemented in the August 30, 2002 LTCH PPS final rule (67 FR 55989 through 55991). However, there have been some modifications of our historical procedures for assigning relative weights in cases of zero volume and/or nonmonotonicity resulting from the adoption of the MS-LTC-DRGs, along with the change made in conjunction with the implementation of the dual rate LTCH PPS payment structure beginning in FY 2016 to use LTCH claims data from only LTCH PPS standard Federal payment rate cases (or LTCH PPS cases that would have qualified for payment under the LTCH PPS standard Federal payment rate if the dual rate LTCH PPS payment structure had been in effect at the time

of the discharge). (For details on the modifications to our historical procedures for assigning relative weights in cases of zero volume and/or nonmonotonicity, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47289 through 47295) and the FY 2009 IPPS final rule (73 FR 48542 through 48550).) For details on the change in our historical methodology to use LTCH claims data only from LTCH PPS standard Federal payment rate cases (or cases that would have qualified for such payment had the LTCH PPS dual payment rate structure been in effect at the time) to determine the MS-LTC-DRG relative weights, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49614 through 49617). Under the LTCH PPS, relative weights for each MS-LTC-DRG are a primary element used to account for the variations in cost per discharge and resource utilization among the payment groups (§ 412.515). To ensure that Medicare patients classified to each MS-LTC-DRG have access to an appropriate level of services and to encourage efficiency, we calculate a relative weight for each MS-LTC-DRG that represents the resources needed by an average inpatient LTCH case in that MS-LTC-DRG. For example, cases in an MS-LTC-DRG with a relative weight of 2 would, on average, cost twice as much to treat as cases in an MS-LTC-DRG with a relative weight of 1.

b. Development of the MS-LTC-DRG Relative Weights for FY 2018

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57078 through 57079), we presented our policies for the development of the MS-LTC-DRG relative weights for FY 2017.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20013), we proposed to continue to use our current methodology to determine the MS-LTC-DRG relative weights for FY 2018, including the continued application of established policies related to: The hospital-specific relative value methodology, the treatment of severity levels in the MS-LTC-DRGs, low-volume and no-volume MS-LTC-DRGs, adjustments for nonmonotonicity, the steps for calculating the MS-LTC-DRG relative weights with a budget neutrality factor, and only using data from applicable LTCH cases (which includes our policy of only using cases that would meet the criteria for exclusion from the site neutral payment rate (or, for discharges occurring prior to the implementation of the dual rate LTCH PPS payment structure, would have met the criteria for exclusion had those

criteria been in effect at the time of the discharge)).

In this section, we present our application of our existing methodology for determining the MS-LTC-DRG relative weights for FY 2018, and we discuss the effects of our policies concerning the data used to determine the FY 2018 MS-LTC-DRG relative weights on the various components of our existing methodology in the discussion that follows.

c. Data

For this final rule, consistent with our policies regarding the calculation of the MS-LTC-DRG relative weights for FY 2018, we obtained total charges from FY 2016 Medicare LTCH claims data from the March 2017 update of the FY 2016 MedPAR file, which are the best available data at this time, and we are using Version 35 of the GROUPER to classify LTCH cases. Consistent with our historical practice, we used those data and the finalized Version 35 of the GROUPER in establishing the FY 2018 MS-LTC-DRG relative weights in this final rule. To calculate the FY 2018 MS-LTC-DRG relative weights under the dual rate LTCH PPS payment structure, we are continuing to use applicable LTCH data, which includes our policy of only using cases that meet the criteria for exclusion from the site neutral payment rate (or would have met the criteria had they been in effect at the time of the discharge) (80 FR 49624). Specifically, we began by first evaluating the LTCH claims data in the March 2017 update of the FY 2016 MedPAR file to determine which LTCH cases would meet the criteria for exclusion from the site neutral payment rate under § 412.522(b) had the dual rate LTCH PPS payment structure been in effect at the time of discharge. (We note that while the dual rate LTCH PPS payment structure began to be phased in during FY 2016, due to the statutory requirement that individual LTCHs begin to receive payment under the dual rate LTCH PPS payment structure based on their individual cost reporting periods, there are LTCH discharges that occurred in FY 2016 that would not have been paid under that structure.) We identified the FY 2016 LTCH cases that were not assigned to MS-LTC-DRGs 876, 880, 881, 882, 883, 884, 885, 886, 887, 894, 895, 896, 897, 945 and 946, which identify LTCH cases that do not have a principal diagnosis relating to a psychiatric diagnosis or to rehabilitation; and that either—

- The admission to the LTCH was “immediately preceded” by discharge from a subsection (d) hospital and the immediately preceding stay in that

subsection (d) hospital included at least 3 days in an ICU, as we define under the ICU criterion; or

- The admission to the LTCH was “immediately preceded” by discharge from a subsection (d) hospital and the claim for the LTCH discharge includes the applicable procedure code that indicates at least 96 hours of ventilator services were provided during the LTCH stay, as we define under the ventilator criterion. Claims data from the FY 2016 MedPAR file that reported ICD-10-PCS procedure code 5A1955Z were used to identify cases involving at least 96 hours of ventilator services in accordance with the ventilator criterion. We note that, for purposes of developing the FY 2018 MS-LTC-DRG relative weights using our current methodology, we did not make any proposals regarding the identification of cases that would have been excluded from the site neutral payment rate under the statutory provisions that provided for temporary exception from the site neutral payment rate under the LTCH PPS for certain severe wound care discharges from certain LTCHs or for certain spinal cord specialty hospitals provided by sections 15009 and 15010 of Public Law 114–255, respectively, had our implementation of that law and the dual rate LTCH PPS payment structure been in effect at the time of the discharge. At this time, it is uncertain how many LTCHs and how many cases in the claims data we are using for this final rule would have met the criteria to be excluded from the site neutral payment rate under those exceptions (had the dual rate LTCH PPS payment structure been in effect at the time of the discharge). Therefore, for the remainder of this section, when we refer to LTCH claims only from cases that meet the criteria for exclusion from the site neutral payment rate (or would have met the criteria had the applicable statutes been in effect at the time of the discharge), such data do not include any discharges that would have been paid based on the LTCH PPS standard Federal payment rate under the provisions of sections 15009 and 15010 of Public Law 114–255, had the exception been in effect at the time of the discharge.

Furthermore, consistent with our historical methodology, as we proposed, we are excluding any claims in the resulting data set that were submitted by LTCHs that are all-inclusive rate providers and LTCHs that are paid in accordance with demonstration projects authorized under section 402(a) of Public Law 90–248 or section 222(a) of Public Law 92–603. In addition, consistent with our historical practice

and our policies, we are excluding any Medicare Advantage (Part C) claims in the resulting data. Such claims were identified based on the presence of a GHO Paid indicator value of “1” in the MedPAR files. The claims that remained after these three trims (that is, the applicable LTCH data) were then used to calculate the MS-LTC-DRG relative weights for FY 2018. In summary, in general, we identified the claims data used in the development of the FY 2018 MS-LTC-DRG relative weights in this final rule, as we proposed, by trimming claims data that would have been paid the site neutral rate had the dual payment rate structure been in effect (except for discharges which would have been excluded from the site neutral payment under the temporary exception for certain severe wound care discharges from certain LTCHs and under the temporary exception for certain spinal cord specialty hospitals), as well as the claims data of 9 all-inclusive rate providers reported in the March 2017 update of the FY 2016 MedPAR file and any Medicare Advantage claims data. (We note that there were no data from any LTCHs that are paid in accordance with a demonstration project reported in the March 2017 update of the FY 2016 MedPAR file. However, had there been we would trim the claims data from those LTCHs as well, in accordance with our established policy.) We used the remaining data (that is, the applicable LTCH data) to calculate the relative weights for FY 2018.

d. Hospital-Specific Relative Value (HSRV) Methodology

By nature, LTCHs often specialize in certain areas, such as ventilator-dependent patients. Some case types (MS-LTC-DRGs) may be treated, to a large extent, in hospitals that have, from a perspective of charges, relatively high (or low) charges. This nonrandom distribution of cases with relatively high (or low) charges in specific MS-LTC-DRGs has the potential to inappropriately distort the measure of average charges. To account for the fact that cases may not be randomly distributed across LTCHs, consistent with the methodology we have used since the implementation of the LTCH PPS, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20014), we proposed to continue to use a hospital-specific relative value (HSRV) methodology to calculate the MS-LTC-DRG relative weights for FY 2018. We believe that this method removes this hospital-specific source of bias in measuring LTCH average charges (67 FR 55985). Specifically, under this

methodology, we proposed to reduce the impact of the variation in charges across providers on any particular MS-LTC-DRG relative weight by converting each LTCH's charge for an applicable LTCH case to a relative value based on that LTCH's average charge for such cases.

Under the HSRV methodology, we standardize charges for each LTCH by converting its charges for each applicable LTCH case to hospital-specific relative charge values and then adjusting those values for the LTCH's case-mix. The adjustment for case-mix is needed to rescale the hospital-specific relative charge values (which, by definition, average 1.0 for each LTCH). The average relative weight for an LTCH is its case-mix; therefore, it is reasonable to scale each LTCH's average relative charge value by its case-mix. In this way, each LTCH's relative charge value is adjusted by its case-mix to an average that reflects the complexity of the applicable LTCH cases it treats relative to the complexity of the applicable LTCH cases treated by all other LTCHs (the average LTCH PPS case-mix of all applicable LTCH cases across all LTCHs).

In accordance with our established methodology, for FY 2018, as we proposed, we are continuing to standardize charges for each applicable LTCH case by first dividing the adjusted charge for the case (adjusted for SSOs under § 412.529 as described in section VIII.B.3.g. (Step 3) of the preamble of this final rule) by the average adjusted charge for all applicable LTCH cases at the LTCH in which the case was treated. SSO cases are cases with a length of stay that is less than or equal to five-sixths the average length of stay of the MS-LTC-DRG (§ 412.529 and § 412.503). The average adjusted charge reflects the average intensity of the health care services delivered by a particular LTCH and the average cost level of that LTCH. The resulting ratio is multiplied by that LTCH's case-mix index to determine the standardized charge for the case.

Multiplying the resulting ratio by the LTCH's case-mix index accounts for the fact that the same relative charges are given greater weight at an LTCH with higher average costs than they would at a LTCH with low average costs, which is needed to adjust each LTCH's relative charge value to reflect its case-mix relative to the average case-mix for all LTCHs. By standardizing charges in this manner, we count charges for a Medicare patient at an LTCH with high average charges as less resource intensive than they would be at an LTCH with low average charges. For example, a \$10,000 charge for a case at

an LTCH with an average adjusted charge of \$17,500 reflects a higher level of relative resource use than a \$10,000 charge for a case at an LTCH with the same case-mix, but an average adjusted charge of \$35,000. We believe that the adjusted charge of an individual case more accurately reflects actual resource use for an individual LTCH because the variation in charges due to systematic differences in the markup of charges among LTCHs is taken into account.

e. Treatment of Severity Levels in Developing the MS-LTC-DRG Relative Weights

For purposes of determining the MS-LTC-DRG relative weights, under our historical methodology, there are three different categories of MS-DRGs based on volume of cases within specific MS-LTC-DRGs: (1) MS-LTC-DRGs with at least 25 applicable LTCH cases in the data used to calculate the relative weight, which are each assigned a unique relative weight; (2) low-volume MS-LTC-DRGs (that is, MS-LTC-DRGs that contain between 1 and 24 applicable LTCH cases that are grouped into quintiles (as described later in this section of the final rule) and assigned the relative weight of the quintile); and (3) no-volume MS-LTC-DRGs that are cross-walked to other MS-LTC-DRGs based on the clinical similarities and assigned the relative weight of the cross-walked MS-LTC-DRG (as described in greater detail below). For FY 2018, we proposed to continue to use applicable LTCH cases to establish the same volume-based categories to calculate the FY 2018 MS-LTC-DRG relative weights.

In determining the FY 2018 MS-LTC-DRG relative weights, when necessary, as is our longstanding practice, as we proposed, we make adjustments to account for nonmonotonicity, as discussed in greater detail later in Step 6 of section VIII.B.3.g. of the preamble of this final rule. We refer readers to the discussion in the FY 2010 IPPS/R Y 2010 LTCH PPS final rule for our rationale for including an adjustment for nonmonotonicity (74 FR 43953 through 43954).

f. Low-Volume MS-LTC-DRGs

In order to account for MS-LTC-DRGs with low-volume (that is, with fewer than 25 applicable LTCH cases), consistent with our existing methodology, we proposed to continue to employ the quintile methodology for low-volume MS-LTC-DRGs, such that we group the “low-volume MS-LTC-DRGs” (that is, MS-LTC-DRGs that contain between 1 and 24 applicable LTCH cases into one of five categories (quintiles) based on average charges (67

FR 55984 through 55995; 72 FR 47283 through 47288; and 81 FR 25148)). In cases where the initial assignment of a low-volume MS-LTC-DRG to a quintile results in nonmonotonicity within a base-DRG, as we proposed, we make adjustments to the resulting low-volume MS-LTC-DRGs to preserve monotonicity, as discussed in detail in section VIII.B.3.g. (Step 6) of the preamble of this final rule.

In this final rule, based on the best available data (that is, the March 2017 update of the FY 2016 MedPAR files), we identified 262 MS-LTC-DRGs that contained between 1 and 24 applicable LTCH cases. This list of MS-LTC-DRGs was then divided into one of the 5 low-volume quintiles, each containing at least 52 MS-LTC-DRGs ($262/5 = 52$ with a remainder of 2). We assigned the low-volume MS-LTC-DRGs to specific low-volume quintiles by sorting the low-volume MS-LTC-DRGs in ascending order by average charge in accordance with our established methodology. Based on the data available for the proposed rule, the number of MS-LTC-DRGs with less than 25 applicable LTCH cases was not evenly divisible by 5 and, therefore, we employed our historical methodology for determining which of the proposed low-volume quintiles contain the additional proposed low-volume MS-LTC-DRG. However, based on the data available for this final rule, the number of MS-LTC-DRGs with less than 25 applicable LTCH cases was not evenly divisible by 5 and, therefore, we employed our historical methodology for determining which of the low-volume quintiles contain the additional proposed low-volume MS-LTC-DRG. Specifically for this final rule, after organizing the MS-LTC-DRGs by ascending order by average charge, we assigned the first 52 (1st through 52nd) of low-volume MS-LTC-DRGs (with the lowest average charge) into Quintile 1. The 52 MS-LTC-DRGs with the highest average charge cases were assigned into Quintile 5. Because the average charge of the 105th low-volume MS-LTC-DRG in the sorted list was closer to the average charge of the 104th low-volume MS-LTC-DRG (assigned to Quintile 2) than to the average charge of the 106th low-volume MS-LTC-DRG (assigned to Quintile 3), we assigned it to Quintile 2 (such that Quintile 2 contains 53 low-volume MS-LTC-DRGs before any adjustments for nonmonotonicity, as discussed below). Because the average charge of the 158th low-volume MS-LTC-DRG in the sorted list was closer to the 157th low-volume MS-LTC-DRG (assigned to Quintile 3) than to the

average charge of the 159th low-volume MS-LTC-DRG (assigned to Quintile 4), we assigned it to Quintile 3 (such that Quintile 3 contains 53 low-volume MS-LTC-DRGs before any adjustments for nonmonotonicity, as discussed below). This results in 3 of the 5 low-volume quintiles containing 52 MS-LTC-DRGs (Quintiles 1, 4, and 5) and 2 low-volume quintiles containing 53 MS-LTC-DRGs (Quintiles 2 and 3). Table 13A, listed in section VI. of the Addendum to this final rule and available via the Internet, lists the composition of the low-volume quintiles for MS-LTC-DRGs for FY 2018.

In order to determine the FY 2018 relative weights for the low-volume MS-LTC-DRGs, consistent with our historical practice, we used the five low-volume quintiles described previously. We determined a relative weight and (geometric) average length of stay for each of the five low-volume quintiles using the methodology described in section VIII.B.3.g. of the preamble of this final rule. We assigned the same relative weight and average length of stay to each of the low-volume MS-LTC-DRGs that make up an individual low-volume quintile. We note that, as this system is dynamic, it is possible that the number and specific type of MS-LTC-DRGs with a low-volume of applicable LTCH cases will vary in the future. Furthermore, we note that we continue to monitor the volume (that is, the number of applicable LTCH cases) in the low-volume quintiles to ensure that our quintile assignments used in determining the MS-LTC-DRG relative weights result in appropriate payment for LTCH cases grouped to low-volume MS-LTC-DRGs and do not result in an unintended financial incentive for LTCHs to inappropriately admit these types of cases.

g. Steps for Determining the FY 2018 MS-LTC-DRG Relative Weights

In this final rule, as we proposed, we are continuing to use our current methodology to determine the FY 2018 MS-LTC-DRG relative weights.

In summary, to determine the FY 2018 MS-LTC-DRG relative weights, we grouped applicable LTCH cases to the appropriate MS-LTC-DRG, while taking into account the low-volume quintiles (as described above) and cross-walked no-volume MS-LTC-DRGs (as described later in this section). After establishing the appropriate MS-LTC-DRG (or low-volume quintile), as we proposed, we calculated the FY 2018 relative weights by first removing cases with a length of stay of 7 days or less and statistical outliers (Steps 1 and 2 below). Next, we adjusted the number of applicable LTCH

cases in each MS–LTC–DRG (or low-volume quintile) for the effect of SSO cases (Step 3 below). After removing applicable LTCH cases with a length of stay of 7 days or less (Step 1 below) and statistical outliers (Step 2 below), which are the SSO-adjusted applicable LTCH cases and corresponding charges (step 3 below), we calculated “relative adjusted weights” for each MS–LTC–DRG (or proposed low-volume quintile) using the HSRV method.

Step 1—Remove cases with a length of stay of 7 days or less.

The first step in our calculation of the FY 2018 MS–LTC–DRG relative weights is to remove cases with a length of stay of 7 days or less. The MS–LTC–DRG relative weights reflect the average of resources used on representative cases of a specific type.

Generally, cases with a length of stay of 7 days or less do not belong in an LTCH because these stays do not fully receive or benefit from treatment that is typical in an LTCH stay, and full resources are often not used in the earlier stages of admission to an LTCH. If we were to include stays of 7 days or less in the computation of the FY 2018 MS–LTC–DRG relative weights, the value of many relative weights would decrease and, therefore, payments would decrease to a level that may no longer be appropriate. We do not believe that it would be appropriate to compromise the integrity of the payment determination for those LTCH cases that actually benefit from and receive a full course of treatment at an LTCH by including data from these very short stays. Therefore, consistent with our existing relative weight methodology and as proposed, in determining the FY 2018 MS–LTC–DRG relative weights, we removed LTCH cases with a length of stay of 7 days or less from applicable LTCH cases. (For additional information on what is removed in this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 2—Remove statistical outliers.

The next step in our calculation of the FY 2018 MS–LTC–DRG relative weights is to remove statistical outlier cases from the LTCH cases with a length of stay of at least 8 days. Consistent with our existing relative weight methodology, as we proposed, we continued to define statistical outliers as cases that are outside of 3.0 standard deviations from the mean of the log distribution of both charges per case and the charges per day for each MS–LTC–DRG. These statistical outliers are removed prior to calculating the relative weights because we believe that they may represent aberrations in the data

that distort the measure of average resource use. Including those LTCH cases in the calculation of the relative weights could result in an inaccurate relative weight that does not truly reflect relative resource use among those MS–LTC–DRGs. (For additional information on what is removed in this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.) After removing cases with a length of stay of 7 days or less and statistical outliers, we are left with applicable LTCH cases that have a length of stay greater than or equal to 8 days. In this final rule, we refer to these cases as “trimmed applicable LTCH cases.”

Step 3—Adjust charges for the effects of SSOs.

As the next step in the calculation of the FY 2018 MS–LTC–DRG relative weights, consistent with our historical approach and as we proposed, we adjusted each LTCH’s charges per discharge for those remaining cases (that is, trimmed applicable LTCH cases) for the effects of SSOs (as defined in § 412.529(a) in conjunction with § 412.503). Specifically, we made this adjustment by counting an SSO case as a fraction of a discharge based on the ratio of the length of stay of the case to the average length of stay for the MS–LTC–DRG for non-SSO cases. This has the effect of proportionately reducing the impact of the lower charges for the SSO cases in calculating the average charge for the MS–LTC–DRG. This process produces the same result as if the actual charges per discharge of an SSO case were adjusted to what they would have been had the patient’s length of stay been equal to the average length of stay of the MS–LTC–DRG.

Counting SSO cases as full LTCH cases with no adjustment in determining the FY 2018 MS–LTC–DRG relative weights would lower the FY 2018 MS–LTC–DRG relative weight for affected MS–LTC–DRGs because the relatively lower charges of the SSO cases would bring down the average charge for all cases within a MS–LTC–DRG. This would result in an “underpayment” for non-SSO cases and an “overpayment” for SSO cases. Therefore, as we proposed, we are continuing to adjust for SSO cases under § 412.529 in this manner because it would result in more appropriate payments for all LTCH PPS standard Federal payment rate cases. (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 4—Calculate the FY 2018 MS–LTC–DRG relative weights on an iterative basis.

Consistent with our historical relative weight methodology and as we proposed, we calculated the FY 2018 MS–LTC–DRG relative weights using the HSRV methodology, which is an iterative process. First, for each SSO-adjusted trimmed applicable LTCH case, we calculate a hospital-specific relative charge value by dividing the charge per discharge after adjusting for SSOs of the LTCH case (from Step 3) by the average charge per SSO-adjusted discharge for the LTCH in which the case occurred. The resulting ratio is then multiplied by the LTCH’s case-mix index to produce an adjusted hospital-specific relative charge value for the case. We used an initial case-mix index value of 1.0 for each LTCH.

For each MS–LTC–DRG, we calculated the FY 2018 relative weight by dividing the SSO-adjusted average of the hospital-specific relative charge values for applicable LTCH cases for the MS–LTC–DRG (that is, the sum of the hospital-specific relative charge value from above divided by the sum of equivalent cases from Step 3 for each MS–LTC–DRG) by the overall SSO-adjusted average hospital-specific relative charge value across all applicable LTCH cases for all LTCHs (that is, the sum of the hospital-specific relative charge value from above divided by the sum of equivalent applicable LTCH cases from Step 3 for each MS–LTC–DRG). Using these recalculated MS–LTC–DRG relative weights, each LTCH’s average relative weight for all of its SSO-adjusted trimmed applicable LTCH cases (that is, its case-mix) was calculated by dividing the sum of all the LTCH’s MS–LTC–DRG relative weights by its total number of SSO-adjusted trimmed applicable LTCH cases. The LTCHs’ hospital-specific relative charge values (from previous) are then multiplied by the hospital-specific case-mix indexes. The hospital-specific case-mix adjusted relative charge values are then used to calculate a new set of MS–LTC–DRG relative weights across all LTCHs. This iterative process continued until there was convergence between the relative weights produced at adjacent steps, for example, when the maximum difference was less than 0.0001.

Step 5—Determine a FY 2018 relative weight for MS–LTC–DRGs with no applicable LTCH cases.

Using the trimmed applicable LTCH cases, consistent with our historical methodology and as we proposed, we identified the MS–LTC–DRGs for which there were no claims in the March 2017

update of the FY 2016 MedPAR file and, therefore, for which no charge data was available for these MS-LTC-DRGs. Because patients with a number of the diagnoses under these MS-LTC-DRGs may be treated at LTCHs, consistent with our historical methodology, we generally assign a relative weight to each of the no-volume MS-LTC-DRGs based on clinical similarity and relative costliness (with the exception of “transplant” MS-LTC-DRGs, “error” MS-LTC-DRGs, and MS-LTC-DRGs that indicate a principal diagnosis related to a psychiatric diagnosis or rehabilitation (referred to as the “psychiatric or rehabilitation” MS-LTC-DRGs), as discussed later in this section of this final rule). (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55991 and 74 FR 43959 through 43960.)

We cross-walked each no-volume MS-LTC-DRG to another MS-LTC-DRG for which we calculated a relative weight (determined in accordance with the methodology described above). Then, the “no-volume” MS-LTC-DRG was assigned the same relative weight (and average length of stay) of the MS-LTC-DRG to which it was cross-walked (as described in greater detail in this section of this final rule).

Of the 754 MS-LTC-DRGs for FY 2018, we identified 348 MS-LTC-DRGs for which there are no trimmed applicable LTCH cases (the number identified includes the 8 “transplant” MS-LTC-DRGs, the 2 “error” MS-LTC-DRGs, and the 15 “psychiatric or rehabilitation” MS-LTC-DRGs, which are discussed below). We assigned relative weights to each of the 348 no-volume MS-LTC-DRGs that contained trimmed applicable LTCH cases based on clinical similarity and relative costliness to 1 of the remaining 406 (754 – 348 = 406) MS-LTC-DRGs for which we calculated relative weights based on the trimmed applicable LTCH cases in the FY 2016 MedPAR file data using the steps described previously. (For the remainder of this discussion, we refer to the “cross-walked” MS-LTC-DRGs as the MS-LTC-DRGs to which we cross-walked 1 of the 348 “no volume” MS-LTC-DRGs.) Then, we generally assigned the 348 no-volume MS-LTC-DRGs the relative weight of the cross-walked MS-LTC-DRG. (As explained below in Step 6, when necessary, we made adjustments to account for nonmonotonicity.)

We cross-walked the no-volume MS-LTC-DRG to a MS-LTC-DRG for which we calculated relative weights based on the March 2017 update of the FY 2016 MedPAR file, and to which it is similar

clinically in intensity of use of resources and relative costliness as determined by criteria such as care provided during the period of time surrounding surgery, surgical approach (if applicable), length of time of surgical procedure, postoperative care, and length of stay. (For more details on our process for evaluating relative costliness, we refer readers to the FY 2010 IPPS/RV 2010 LTCH PPS final rule (73 FR 48543).) We believe in the rare event that there would be a few LTCH cases grouped to one of the no-volume MS-LTC-DRGs in FY 2017, the relative weights assigned based on the cross-walked MS-LTC-DRGs would result in an appropriate LTCH PPS payment because the crosswalks, which are based on clinical similarity and relative costliness, would be expected to generally require equivalent relative resource use.

We then assigned the relative weight of the cross-walked MS-LTC-DRG as the relative weight for the no-volume MS-LTC-DRG such that both of these MS-LTC-DRGs (that is, the no-volume MS-LTC-DRG and the cross-walked MS-LTC-DRG) have the same relative weight (and average length of stay) for FY 2018. We note that, if the cross-walked MS-LTC-DRG had 25 applicable LTCH cases or more, its relative weight (calculated using the methodology described in Steps 1 through 4 above) is assigned to the no-volume MS-LTC-DRG as well. Similarly, if the MS-LTC-DRG to which the no-volume MS-LTC-DRG was cross-walked had 24 or less cases and, therefore, is designated to 1 of the low-volume quintiles for purposes of determining the relative weights, we assigned the relative weight of the applicable low-volume quintile to the no-volume MS-LTC-DRG such that both of these MS-LTC-DRGs (that is, the no-volume MS-LTC-DRG and the cross-walked MS-LTC-DRG) have the same relative weight for FY 2018. (As we noted previously, in the infrequent case where nonmonotonicity involving a no-volume MS-LTC-DRG resulted, additional adjustments as described in Step 6 are required in order to maintain monotonically increasing relative weights.)

For this final rule, a list of the no-volume MS-LTC-DRGs and the MS-LTC-DRGs to which each was cross-walked (that is, the cross-walked MS-LTC-DRGs) for FY 2018 is shown in Table 13B, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS Web site.

To illustrate this methodology for determining the relative weights for the proposed FY 2018 MS-LTC-DRGs with

no applicable LTCH cases, we are providing the following example, which refers to the no-volume proposed MS-LTC-DRGs crosswalk information for FY 2018 provided in Table 13B.

Example: There were no trimmed applicable LTCH cases in the FY 2016 MedPAR file that we are using for this final rule for MS-LTC-DRG 061 (Acute Ischemic Stroke with Use of Thrombolytic Agent with MCC). We determined that MS-LTC-DRG 070 (Nonspecific Cerebrovascular Disorders with MCC) is similar clinically and based on resource use to MS-LTC-DRG 061. Therefore, we assigned the same relative weight (and average length of stay) of MS-LTC-DRG 70 of 0.8833 for FY 2018 to MS-LTC-DRG 061 (we refer readers to Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS Web site). Again, we note that, as this system is dynamic, it is entirely possible that the number of MS-LTC-DRGs with no volume will vary in the future. Consistent with our historical practice, we used the most recent available claims data to identify the trimmed applicable LTCH cases from which we determined the relative weights in this rule.

For FY 2018, consistent with our historical relative weight methodology and as we proposed, we are establishing a relative weight of 0.0000 for the following transplant MS-LTC-DRGs: Heart Transplant or Implant of Heart Assist System with MCC (MS-LTC-DRG 001); Heart Transplant or Implant of Heart Assist System without MCC (MS-LTC-DRG 002); Liver Transplant with MCC or Intestinal Transplant (MS-LTC-DRG 005); Liver Transplant without MCC (MS-LTC-DRG 006); Lung Transplant (MS-LTC-DRG 007); Simultaneous Pancreas/Kidney Transplant (MS-LTC-DRG 008); Pancreas Transplant (MS-LTC-DRG 010); and Kidney Transplant (MS-LTC-DRG 652). This is because Medicare only covers these procedures if they are performed at a hospital that has been certified for the specific procedures by Medicare and presently no LTCH has been so certified. At the present time, we include these eight transplant MS-LTC-DRGs in the GROUPER program for administrative purposes only. Because we use the same GROUPER program for LTCHs as is used under the IPPS, removing these MS-LTC-DRGs would be administratively burdensome. (For additional information regarding our treatment of transplant MS-LTC-DRGs, we refer readers to the RY 2010 LTCH PPS final rule (74 FR 43964).) In addition, consistent with our historical policy and as we proposed, we are

establishing a relative weight of 0.0000 for the 2 “error” MS–LTC–DRGs (that is, MS–LTC–DRG 998 (Principal Diagnosis Invalid as Discharge Diagnosis) and MS–LTC–DRG 999 (Ungroupable)) because applicable LTCH cases grouped to these MS–LTC–DRGs cannot be properly assigned to an MS–LTC–DRG according to the grouping logic.

In this final rule, consistent with our practice in FYs 2016 and 2017 and as we proposed, we are establishing a relative weight for FY 2018 equal to the respective FY 2015 relative weight of the MS–LTC–DRGs for the following “psychiatric or rehabilitation” MS–LTC–DRGs: MS–LTC–DRG 876 (O.R. Procedure with Principal Diagnoses of Mental Illness); MS–LTC–DRG 880 (Acute Adjustment Reaction & Psychosocial Dysfunction); MS–LTC–DRG 881 (Depressive Neuroses); MS–LTC–DRG 882 (Neuroses Except Depressive); MS–LTC–DRG 883 (Disorders of Personality & Impulse Control); MS–LTC–DRG 884 (Organic Disturbances & Mental Retardation); MS–LTC–DRG 885 (Psychoses); MS–LTC–DRG 886 (Behavioral & Developmental Disorders); MS–LTC–DRG 887 (Other Mental Disorder Diagnoses); MS–LTC–DRG 894 (Alcohol/Drug Abuse or Dependence, Left Aka); MS–LTC–DRG 895 (Alcohol/Drug Abuse or Dependence, with Rehabilitation Therapy); MS–LTC–DRG 896 (Alcohol/Drug Abuse or Dependence, without Rehabilitation Therapy with MCC); MS–LTC–DRG 897 (Alcohol/Drug Abuse or Dependence, without Rehabilitation Therapy without MCC); MS–LTC–DRG 945 (Rehabilitation with CC/MCC); and MS–LTC–DRG 946 (Rehabilitation without CC/MCC). As we discussed when we implemented the dual rate LTCH PPS payment structure, LTCH discharges that are grouped to these 15 “psychiatric and rehabilitation” MS–LTC–DRGs do not meet the criteria for exclusion from the site neutral payment rate.

As such, under the criterion for a principal diagnosis relating to a psychiatric diagnosis or to rehabilitation, there are no applicable LTCH cases to use in calculating a relative weight for the “psychiatric and rehabilitation” MS–LTC–DRGs. In other words, any LTCH PPS discharges grouped to any of the 15 “psychiatric and rehabilitation” MS–LTC–DRGs would always be paid at the site neutral payment rate, and, therefore, those MS–LTC–DRGs would never include any LTCH cases that meet the criteria for exclusion from the site neutral payment rate. However, section 1886(m)(6)(B) of the Act establishes a transitional payment method for cases that would be

paid at the site neutral payment rate for LTCH discharges occurring in cost reporting periods beginning during FY 2016 or FY 2017. Under the transitional payment method for site neutral payment rate cases, for LTCH discharges occurring in cost reporting periods beginning on or after October 1, 2016, and on or before September 30, 2017, site neutral payment rate cases are paid a blended payment rate, calculated as 50 percent of the applicable site neutral payment rate amount for the discharge and 50 percent of the applicable LTCH PPS standard Federal payment rate. Because the LTCH PPS standard Federal payment rate is based on the relative weight of the MS–LTC–DRG, in order to determine the transitional blended payment for site neutral payment rate cases grouped to one of the “psychiatric or rehabilitation” MS–LTC–DRGs in FY 2018, we assigned a relative weight to these MS–LTC–DRGs for FY 2018 that is the same as the FY 2015 relative weight (which is also the same as the FY 2016 relative weight). We believe that using the respective FY 2015 relative weight for each of the “psychiatric or rehabilitation” MS–LTC–DRGs results in appropriate payments for LTCH cases that are paid at the site neutral payment rate under the transition policy provided by the statute because there are no clinically similar MS–LTC–DRGs for which we were able to determine relative weights based on applicable LTCH cases in the March 2017 update of the FY 2016 MedPAR file data using the steps described above. Furthermore, we believe that it would be administratively burdensome and introduce unnecessary complexity to the MS–LTC–DRG relative weight calculation to use the LTCH discharges in the MedPAR file data to calculate a relative weight for those 15 “psychiatric and rehabilitation” MS–LTC–DRGs to be used for the sole purpose of determining half of the transitional blended payment for site neutral payment rate cases during the transition period (80 FR 49631 through 49632).

In summary, for FY 2018, we are establishing a relative weight (and average length of stay thresholds) equal to the respective FY 2015 relative weight of the MS–LTC–DRGs for the 15 “psychiatric or rehabilitation” MS–LTC–DRGs listed previously (that is, MS–LTC–DRGs 876, 880, 881, 882, 883, 884, 885, 886, 887, 894, 895, 896, 897, 945, and 946). Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS Web site, reflects this policy.

Step 6—Adjust the FY 2018 MS–LTC–DRG relative weights to account for

nonmonotonically increasing relative weights.

The MS–DRGs contain base DRGs that have been subdivided into one, two, or three severity of illness levels. Where there are three severity levels, the most severe level has at least one secondary diagnosis code that is referred to as an MCC (that is, major complication or comorbidity). The next lower severity level contains cases with at least one secondary diagnosis code that is a CC (that is, complication or comorbidity). Those cases without an MCC or a CC are referred to as “without CC/MCC.” When data do not support the creation of three severity levels, the base MS–DRG is subdivided into either two levels or the base MS–DRG is not subdivided. The two-level subdivisions may consist of the MS–DRG with CC/MCC and the MS–DRG without CC/MCC. Alternatively, the other type of two-level subdivision may consist of the MS–DRG with MCC and the MS–DRG without MCC.

In those base MS–LTC–DRGs that are split into either two or three severity levels, cases classified into the “without CC/MCC” MS–LTC–DRG are expected to have a lower resource use (and lower costs) than the “with CC/MCC” MS–LTC–DRG (in the case of a two-level split) or both the “with CC” and the “with MCC” MS–LTC–DRGs (in the case of a three-level split). That is, theoretically, cases that are more severe typically require greater expenditure of medical care resources and would result in higher average charges. Therefore, in the three severity levels, relative weights should increase by severity, from lowest to highest. If the relative weights decrease as severity increases (that is, if within a base MS–LTC–DRG, an MS–LTC–DRG with CC has a higher relative weight than one with MCC, or the MS–LTC–DRG “without CC/MCC” has a higher relative weight than either of the others), they are nonmonotonic. We continue to believe that utilizing nonmonotonic relative weights to adjust Medicare payments would result in inappropriate payments because the payment for the cases in the higher severity level in a base MS–LTC–DRG (which are generally expected to have higher resource use and costs) would be lower than the payment for cases in a lower severity level within the same base MS–LTC–DRG (which are generally expected to have lower resource use and costs). Therefore, in determining the FY 2018 MS–LTC–DRG relative weights, consistent with our historical methodology, we are continuing to combine MS–LTC–DRG severity levels within a base MS–LTC–DRG for the purpose of computing a relative weight

when necessary to ensure that monotonicity is maintained. For a comprehensive description of our existing methodology to adjust for nonmonotonicity, we refer readers to the FY 2010 IPPS/R Y 2010 LTCH PPS final rule (74 FR 43964 through 43966). Any adjustments for nonmonotonicity that were made in determining the FY 2018 MS-LTC-DRG relative weights in this final rule by applying this methodology are denoted in Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS Web site.

Step 7—Calculate the FY 2018 MS-LTC-DRG reclassification and recalibration budget neutrality factor.

In accordance with the regulations at § 412.517(b) (in conjunction with § 412.503), the annual update to the MS-LTC-DRG classifications and relative weights is done in a budget neutral manner such that estimated aggregate LTCH PPS payments would be unaffected, that is, would be neither greater than nor less than the estimated aggregate LTCH PPS payments that would have been made without the MS-LTC-DRG classification and relative weight changes. (For a detailed discussion on the establishment of the budget neutrality requirement for the annual update of the MS-LTC-DRG classifications and relative weights, we refer readers to the RY 2008 LTCH PPS final rule (72 FR 26881 and 26882).)

The MS-LTC-DRG classifications and relative weights are updated annually based on the most recent available LTCH claims data to reflect changes in relative LTCH resource use (§ 412.517(a) in conjunction with § 412.503). To achieve the budget neutrality requirement at § 412.517(b), under our established methodology, for each annual update, the MS-LTC-DRG relative weights are uniformly adjusted to ensure that estimated aggregate payments under the LTCH PPS would not be affected (that is, decreased or increased). Consistent with that provision and as we proposed, we are update the MS-LTC-DRG classifications and relative weights for FY 2018 based on the most recent available LTCH data for applicable LTCH cases, and continue to apply a budget neutrality adjustment in determining the FY 2018 MS-LTC-DRG relative weights. In this FY 2018 IPPS/LTCH PPS final rule, as we proposed, to ensure budget neutrality in the update to the MS-LTC-DRG classifications and relative weights under § 412.517(b), we are continuing to use our established two-step budget neutrality methodology.

To calculate the normalization factor for FY 2018, we grouped applicable LTCH cases using the FY 2018 Version 35 GROUPER, and the recalibrated FY 2018 MS-LTC-DRG relative weights to calculate the average case-mix index (CMI); we grouped the same applicable LTCH cases using the FY 2017 GROUPER Version 34 and MS-LTC-DRG relative weights and calculated the average CMI; and computed the ratio by dividing the average CMI for FY 2017 by the average CMI for FY 2018. That ratio is the normalization factor. Because the calculation of the normalization factor involves the relative weights for the MS-LTC-DRGs that contained applicable LTCH cases to calculate the average CMIs, any low-volume MS-LTC-DRGs are included in the calculation (and the MS-LTC-DRGs with no applicable LTCH cases are not included in the calculation).

To calculate the budget neutrality adjustment factor, we simulated estimated total FY 2018 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the FY 2018 normalized relative weights and GROUPER Version 35; simulated estimated total FY 2017 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the FY 2017 MS-LTC-DRG relative weights and the FY 2017 GROUPER Version 34; and calculated the ratio of these estimated total payments by dividing the simulated estimated total LTCH PPS standard Federal payment rate payments for FY 2018. The resulting ratio is budget neutrality adjustment factor. The calculation of the budget neutrality factor involves the relative weights for the LTCH cases used in the payment simulation, which includes any cases grouped to low-volume MS-LTC-DRGs or to MS-LTC-DRGs with no applicable LTCH cases, and generally does not include payments for cases grouped to a MS-LTC-DRG with no applicable LTCH cases. (Occasionally, a few LTCH cases (that is, those with a covered length of stay of 7 days or less, which are removed from the relative weight calculation in step 2) that are grouped to a MS-LTC-DRG with no applicable LTCH cases are included in the payment simulations used to calculate the budget neutrality factor. However, the number and payment amount of such cases have a negligible impact on the budget neutrality factor calculation).

In this final rule, to ensure budget neutrality in the update to the MS-LTC-DRG classifications and relative weights

under § 412.517(b), as we proposed, we are continuing to use our established two-step budget neutrality methodology. Therefore, in this final rule, in the first step of our MS-LTC-DRG budget neutrality methodology, for FY 2018, we calculate and apply a normalization factor to the recalibrated relative weights (the result of Steps 1 through 6 discussed previously) to ensure that estimated payments are not affected by changes in the composition of case types or the changes to the classification system. That is, the normalization adjustment is intended to ensure that the recalibration of the MS-LTC-DRG relative weights (that is, the process itself) neither increases nor decreases the average case-mix index.

To calculate the normalization factor for FY 2018 (the first step of our budget neutrality methodology), we used the following three steps: (1.a.) Used the most recent available applicable LTCH cases from the most recent available data (that is, LTCH discharges from the FY 2016 MedPAR file) and grouped them using the FY 2018 GROUPER (that is, Version 35 for FY 2018) and the recalibrated FY 2018 MS-LTC-DRG relative weights (determined in Steps 1 through 6 above) to calculate the average case-mix index; (1.b.) grouped the same applicable LTCH cases (as are used in Step 1.a.) using the FY 2017 GROUPER (Version 34) and FY 2017 MS-LTC-DRG relative weights and calculated the average case-mix index; and (1.c.) computed the ratio of these average case-mix indexes by dividing the average CMI for FY 2017 (determined in Step 1.b.) by the average case-mix index for FY 2018 (determined in Step 1.a.). As a result, in determining the MS-LTC-DRG relative weights for FY 2018, each recalibrated MS-LTC-DRG relative weight is multiplied by the normalization factor of 1.28590 (determined in Step 1.c.) in the first step of the budget neutrality methodology, which produced “normalized relative weights.”

In the second step of our MS-LTC-DRG budget neutrality methodology, we calculate a second budget neutrality factor consisting of the ratio of estimated aggregate FY 2018 LTCH PPS standard Federal payment rate payments for applicable LTCH cases (the sum of all calculations under Step 1.a. mentioned previously) after reclassification and recalibration to estimated aggregate payments for FY 2018 LTCH PPS standard Federal payment rate payments for applicable LTCH cases before reclassification and recalibration (that is, the sum of all calculations under Step 1.b. mentioned previously).

That is, for this final rule, for FY 2018, under the second step of the budget neutrality methodology, as we proposed, we determine the budget neutrality adjustment factor using the following three steps: (2.a.) Simulated estimated total FY 2018 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the normalized relative weights for FY 2018 and GROUPER Version 35 (as described above); (2.b.) simulated estimated total FY 2017 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the FY 2017 GROUPER (Version 34) and the FY 2017 MS–LTC–DRG relative weights in Table 11 of the FY 2017 IPPS/LTCH PPS final rule available on the Internet, as described in section VI. of the Addendum of that final rule; and (2.c.) calculated the ratio of these estimated total payments by dividing the value determined in Step 2.b. by the value determined in Step 2.a. In determining the FY 2018 MS–LTC–DRG relative weights, each normalized relative weight is then multiplied by a budget neutrality factor of 0.9907845 (the value determined in Step 2.c.) in the second step of the budget neutrality methodology to achieve the budget neutrality requirement at § 412.517(b).

Accordingly, in determining the FY 2018 MS–LTC–DRG relative weights in this final rule, consistent with our existing methodology, we applied a normalization factor of 1.28590 and a budget neutrality factor of 0.9907845. Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS Web site, lists the MS–LTC–DRGs and their respective relative weights, geometric mean length of stay, and five-sixths of the geometric mean length of stay (used to identify SSO cases under § 412.529(a)) for FY 2018.

C. Changes to the LTCH PPS Payment Rates and Other Changes to the LTCH PPS for FY 2018

1. Overview of Development of the LTCH PPS Standard Federal Payment Rates

The basic methodology for determining LTCH PPS standard Federal payment rates is currently set forth at 42 CFR 412.515 through 412.538. In this section, we discuss the factors that we used to update the LTCH PPS standard Federal payment rate for FY 2018, that is, effective for LTCH discharges occurring on or after October 1, 2017 through September 30, 2018. Under the dual rate LTCH PPS payment structure required by statute, beginning with discharges in cost reporting

periods beginning in FY 2016, only LTCH discharges that meet the criteria for exclusion from the site neutral payment rate are paid based on the LTCH PPS standard Federal payment rate specified at § 412.523. (For additional details on our finalized policies related to the dual rate LTCH PPS payment structure required by statute, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623).)

Prior to the implementation of the dual payment rate system in FY 2016, all LTCHs were paid similarly to those now exempt from the site neutral payment rate. That legacy payment rate was called the standard Federal rate. For details on the development of the initial standard Federal rate for FY 2003, we refer readers to the August 30, 2002 LTCH PPS final rule (67 FR 56027 through 56037). For subsequent updates to the standard Federal rate (FYs 2003 through 2015)/LTCH PPS standard Federal payment rate (FY 2016 through present) as implemented under § 412.523(c)(3), we refer readers to the following final rules: RY 2004 LTCH PPS final rule (68 FR 34134 through 34140); RY 2005 LTCH PPS final rule (68 FR 25682 through 25684); RY 2006 LTCH PPS final rule (70 FR 24179 through 24180); RY 2007 LTCH PPS final rule (71 FR 27819 through 27827); RY 2008 LTCH PPS final rule (72 FR 26870 through 27029); RY 2009 LTCH PPS final rule (73 FR 26800 through 26804); FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 44021 through 44030); FY 2011 IPPS/LTCH PPS final rule (75 FR 50443 through 50444); FY 2012 IPPS/LTCH PPS final rule (76 FR 51769 through 51773); FY 2013 IPPS/LTCH PPS final rule (77 FR 53479 through 53481); FY 2014 IPPS/LTCH PPS final rule (78 FR 50760 through 50765); FY 2015 IPPS/LTCH PPS final rule (79 FR 50176 through 50180); FY 2016 IPPS/LTCH PPS final rule (80 FR 49634 through 49637); and FY 2017 IPPS/LTCH PPS final rule (81 FR 57296 through 57310).

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20021 through 20022), we presented our proposals related to the proposed annual update to the LTCH PPS standard Federal payment rate for FY 2018, which include certain statutory requirements as discussed below.

The application of the update to the LTCH PPS standard Federal payment rate for FY 2018 is presented in section V.A. of the Addendum to this final rule. The components of the annual update to the LTCH PPS standard Federal payment rate for FY 2018 are discussed below, including the reduction to the

annual update for LTCHs that fail to submit quality reporting data for FY 2018 as required by the statute (as discussed in section VIII.C.2.c. of the preamble of this final rule). In addition, we are making an adjustment to the LTCH PPS standard Federal payment rate to account for the estimated effect of the changes to the area wage level adjustment for FY 2018 on estimated aggregate LTCH PPS payments, in accordance with § 412.523(d)(4) (as discussed in section V.B. of the Addendum to this final rule), and a budget neutrality adjustment stemming from our change to the SSO payment methodology (as discussed in VIII.D. of the preamble of this final rule).

2. FY 2018 LTCH PPS Standard Federal Payment Rate Annual Market Basket Update

a. Overview

Historically, the Medicare program has used a market basket to account for input price increases in the services furnished by providers. The market basket used for the LTCH PPS includes both operating and capital related costs of LTCHs because the LTCH PPS uses a single payment rate for both operating and capital-related costs. We adopted the 2013-based LTCH-specific market basket for use under the LTCH PPS beginning in FY 2017 (81 FR 57101 through 57102). For additional details on the historical development of the market basket used under the LTCH PPS, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53467 through 53476), and for a complete discussion of the LTCH market basket and a description of the methodologies used to determine the operating and capital-related portions of the 2013-based LTCH market basket, we refer readers to section VII.D. of the preamble of the FY 2017 IPPS/LTCH PPS proposed and final rules.

Section 3401(c) of the Affordable Care Act provides for certain adjustments to any annual update to the LTCH PPS standard Federal payment rate and refers to the timeframes associated with such adjustments as a “rate year” (which are discussed in more detail in section VIII.C.2.b. of the preamble of this final rule.) We note that because the annual update to the LTCH PPS policies, rates, and factors now occurs on October 1, we adopted the term “fiscal year” (FY) rather than “rate year” (RY) under the LTCH PPS beginning October 1, 2010, to conform with the standard definition of the Federal fiscal year (October 1 through September 30) used by other PPSs, such as the IPPS (75 FR 50396 through

50397). Although the language of sections 3004(a), 3401(c), 10319, and 1105(b) of the Affordable Care Act refers to years 2010 and thereafter under the LTCH PPS as “rate year,” consistent with our change in the terminology used under the LTCH PPS from “rate year” to “fiscal year,” for purposes of clarity, when discussing the annual update for the LTCH PPS standard Federal payment rate, including the provisions of the Affordable Care Act, we use “fiscal year” rather than “rate year” for 2011 and subsequent years.

b. Annual Update to the LTCH PPS Standard Federal Payment Rate for FY 2018

Section 1886(m)(3)(A) of the Act provides that, beginning in FY 2010, any annual update to the LTCH PPS standard Federal payment rate is reduced by the adjustments specified in clauses (i) and (ii) of subparagraph (A). Clause (i) of section 1886(m)(3)(A) of the Act provides for a reduction, for FY 2012 and each subsequent rate year, by the productivity adjustment described in section 1886(b)(3)(B)(xi)(II) of the Act (that is, “the multifactor productivity (MFP) adjustment”). Clause (ii) of section 1886(m)(3)(A) of the Act provides for a reduction, for each of FYs 2010 through 2019, by the “other adjustment” described in section 1886(m)(4)(F) of the Act.

Section 411(e) of the Medicare Access and CHIP Reauthorization Act (MACRA) (Pub. L. 114–10), enacted on April 16, 2015, amended section 1886(m)(3) of the Act by amending subparagraph (A) to be “subject to subparagraph (C)” and by adding new subparagraph (C), which specifies an additional special rule for FY 2018. Specifically, section 1886(m)(3)(C) of the Act states for FY 2018, the annual update under subparagraph (A) for the fiscal year, after application of clauses (i) and (ii) of subparagraph (A), shall be 1 percent. That is, the annual update for FY 2018, after applications of the reductions for the MFP adjustment (under clause (i) of section 1886(m)(3)(A)) and the “other adjustment” (under clause (ii) of section 1886(m)(3)(A)) is 1 percent.

Historically, CMS has used an estimated market basket increase to update the LTCH PPS. Under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, we adopted a newly created 2013-based LTCH-specific market basket for use under the LTCH PPS beginning in FY 2017. The 2013-based LTCH-specific market basket is based solely on the Medicare cost report data submitted by LTCHs and, therefore, specifically reflects the cost structures of only

LTCHs. For additional details on the development of the 2013-based LTCH-specific market basket, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57101 through 57102). For FYs 2010 through 2017, the estimated market basket update under the LTCH PPS was reduced by the MFP adjustment and “other adjustment” as applicable. However, as described above, section 411(e) of the MACRA subsequently amended section 1886(m)(3)(A) of the Act so that, after the adjustments above, the FY 2018 annual update is set at 1 percent.

c. Adjustment to the LTCH PPS Standard Federal Payment Rate Under the Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

In accordance with section 1886(m)(5) of the Act, as added by section 3004(a) of the Affordable Care Act, the Secretary established the Long-Term Care Hospital Quality Reporting Program (LTCH QRP). Failure to report quality data under the LTCH QRP for FY 2014 and subsequent fiscal years results in a 2.0 percentage point reduction in the annual update as codified under § 412.523(c)(4) of the regulations. (As previously noted, although the language of section 3004(a) of the Affordable Care Act refers to years 2011 and thereafter under the LTCH PPS as “rate year,” consistent with our change in the terminology used under the LTCH PPS from “rate year” to “fiscal year,” for purposes of clarity, when discussing the annual update for the LTCH PPS, including the provisions of the Affordable Care Act, we use “fiscal year” rather than “rate year” for 2011 and subsequent years.) The LTCH QRP, as required for FY 2014 and subsequent fiscal years by section 1886(m)(5)(A)(i) of the Act, applies a 2.0 percentage point reduction to any update under § 412.523(c)(3) for an LTCH that does not submit quality reporting data to the Secretary in accordance with section 1886(m)(5)(C) of the Act with respect to such a year (that is, in the form and manner and at the time specified by the Secretary under the LTCH QRP) (§ 412.523(c)(4)(i)). Section 1886(m)(5)(A)(ii) of the Act provides that the application of the 2.0 percentage points reduction may result in an annual update that is less than 0.0 for a year, and may result in LTCH PPS payment rates for a year being less than such LTCH PPS payment rates for the preceding year (§ 412.523(c)(4)(iii)). Furthermore, section 1886(m)(5)(B) of the Act specifies that the 2.0 percentage points reduction is applied in a noncumulative manner, such that any reduction made under section

1886(m)(5)(A) of the Act shall apply only with respect to the year involved, and shall not be taken into account in computing the LTCH PPS payment amount for a subsequent year (§ 412.523(c)(4)(ii)).

d. Annual Update Under the LTCH PPS for FY 2018

Consistent with the amendments to section 1886(m)(3)(C) of the Act provided by section 411 of the MACRA, as we proposed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20021), we are making an update to the LTCH PPS standard Federal payment rate of 1 percent for FY 2018.

For FY 2018, section 1886(m)(5) of the Act requires that, for LTCHs that do not submit quality reporting data as required under the LTCH QRP, any annual update to an LTCH PPS standard Federal payment rate, after application of the adjustments required by section 1886(m)(3) of the Act, shall be further reduced by 2.0 percentage points. For LTCHs that fail to submit quality reporting data under the LTCH QRP, under § 412.523(c)(3)(xiv) in conjunction with § 412.523(c)(4), as we proposed, we are further reducing the annual update to the LTCH PPS standard Federal payment rate by 2.0 percentage points in accordance with section 1886(m)(5) of the Act. As such, the update to the LTCH PPS standard Federal payment rate for FY 2018 for LTCHs that fail to submit quality reporting data under the LTCH QRP is the 1-percent annual rate increase for FY 2018 reduced by 2.0 percentage points. For this final rule, we are establishing an annual update to the LTCH PPS standard Federal payment rate of –1 percent (that is, 1 percent minus 2.0 percentage points) for FY 2018 for LTCHs that fail to submit quality reporting data as required under the LTCH QRP. As provided in § 412.523(c)(4)(iii) and as noted above, the application of the 2.0 percentage points reduction may result in an annual update that is less than 0.0 for a year, and may result in LTCH PPS payment rates for a year being less than such LTCH PPS payment rates for the preceding year. (We note that, consistent with historical practice, in determining the FY 2018 LTCH PPS standard Federal payment rate, we are also applying an area wage level budget neutrality factor in accordance with § 412.523(d)(4) (as discussed in section V.B. of the Addendum to this final rule) and a budget neutrality adjustment stemming from our change to the SSO payment methodology (as discussed in VIII.D. of the preamble of this final rule).

Absent the special provisions for FY 2018 required by section 1886(m)(3)(C) of the Act, we note the annual market basket update would have been based on the FY 2018 full market basket increase of 2.7 percent (based on IGI's second quarter 2017 forecast of the 2013-based LTCH market basket) reduced by the FY 2018 MFP adjustment of 0.6 percentage point (also based on IGI's second quarter 2017 forecast). Following application of the productivity adjustment, the adjusted market basket update of 2.1 percent (2.7 percent minus 0.6 percentage point) would have then been further reduced by 0.75 percentage point, as required by sections 1886(m)(3)(A)(ii) and 1886(m)(4)(F) of the Act. This would have resulted in an annual market basket update under to the LTCH PPS standard Federal payment rate for FY 2018 of 1.35 percent (that is, 2.7 percent, less the MFP adjustment of 0.6 percentage point, and less the 0.75 percentage point required under section 1886(m)(4)(F) of the Act). (For additional information on the application of the MFP adjustment and "other adjustment" in developing the annual market based update under our historical approach, refer to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57296 through 57310).)

D. Changes to the Short-Stay Outlier Adjustment Policy (§ 412.529)

In the FY 2003 LTCH PPS final rule (67 FR 55954) that implemented the LTCH PPS, under § 412.529, we established a special payment policy for short-stay outlier (SSO) cases; that is, cases with a covered length of stay that is less than or equal to five-sixths of the geometric average length of stay for each LTC-DRG. When we established the SSO policy, we explained that a short-stay outlier case may occur when a beneficiary receives less than the full course of treatment at the LTCH before being discharged (67 FR 55995). Also, in the FY 2003 LTCH PPS final rule, we stated that when we first described the policy in the proposed rule, we based the proposed policy on the belief that many of these patients could have been treated more appropriately in an acute hospital subject to the acute care hospital inpatient prospective payment system (67 FR 55995).

Therefore, under the LTCH PPS, we implemented a special payment adjustment for SSO cases. Under the original SSO policy, for LTCH PPS discharges with a covered length of stay of up to and including five-sixths of the geometric average length of stay for the LTC-DRG, we adjusted the per discharge payment amount under the

LTCH PPS as the least of 120 percent of the estimated cost of the case, 120 percent of the LTC-DRG specific per diem amount multiplied by the covered length of stay of that discharge, or the full LTC-DRG payment amount (67 FR 55995 through 56000).

As noted previously, generally LTCHs are defined by statute as having an average length of stay of greater than 25 days. In the FY 2003 LTCH PPS final rule, we stated that we believed that the SSO payment adjustment results in more appropriate payments because these SSO cases most likely did not receive a full course of treatment at a LTCH level in such a short period of time, and the full LTC-DRG payment would generally not be appropriate. Payment-to-cost ratio analyses at that time indicated that if LTCHs received a full LTC-DRG payment for those cases, they would have been significantly "overpaid" for the resources they actually expended in treating those patients (67 FR 55995 through 56000). Furthermore, in establishing the SSO policy, we stated that we believed that providing a reduced payment for SSO cases would discourage hospitals from admitting these patients. We also believed that the policy did not severely penalize providers that, in good faith, had admitted a patient and provided some services before realizing that the beneficiary could receive more appropriate treatment at another site of care. As we further explained in the FY 2003 LTCH PPS final rule, establishing a SSO payment adjustment for these types of cases addresses the incentives inherent in a discharge-based PPS for LTCHs for treating patients with a short length of stay (67 FR 55995 through 56000). We have made several changes to our SSO policy since it was first introduced.

For a full discussion of those historic changes, we refer readers to the RY 2008 LTCH PPS final rule (72 FR 26904 through 26919).

During our FY 2016 and FY 2017 IPPS/LTCH PPS rulemaking cycles, we received public comments that we determined were outside the scope of the FY 2016 and FY 2017 proposed rules that expressed concern with our existing SSO policy. Commenters stated that our SSO payment adjustment appears to result in an incentive to improperly hold patients beyond the SSO threshold (five-sixths the geometric average length of stay for the MS-LTC-DRG). Specifically, as SSO cases are paid the "lesser of" various payment options, while non-SSO cases are paid the full MS-LTC-DRG payment, there is an economic incentive to hold a patient beyond the SSO threshold in order to

increase (and in some cases dramatically increase) the LTCH PPS payment for that case. In its comment in response to the FY 2016 IPPS/LTCH PPS proposed rule, MedPAC stated that its analysis of LTCH discharge patterns have shown that LTCHs respond to that incentive. Analyses of lengths-of-stay by MS-LTC-DRG have consistently shown that the frequency of discharges rises sharply immediately after the SSO threshold is met.

This pattern holds true across MS-LTC-DRGs and for every category of LTCHs. We believe that these analyses strongly suggest that LTCHs' discharge decisions are influenced at least as much by this financial incentive as by clinical considerations. Our own analysis of LTCH claims data showed similar findings.

In light of these concerns, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20023), we proposed to address this financial incentive and discourage such delay in the discharge of LTCH patients by proposing to revise our SSO policy. We note that, under the dual rate LTCH PPS payment structure, our existing SSO policy only applies to the LTCH PPS standard Federal payment rate. Accordingly, as explained in the proposed rule, the proposed changes to our SSO policy would only apply to LTCH PPS standard Federal payment rate cases (or, for cost reporting periods beginning before October 1, 2017, the LTCH PPS standard Federal payment rate portion of the blended rate payment under § 412.522(c)(3)(ii)).

Under our proposed policy, the SSO definition remained unchanged, but the current payment adjustment options would be replaced with a single graduated per diem payment adjustment calculated using a blended payment rate that, as the length of stay increases, consists of a decreasing portion of the payment amount paid at the IPPS per diem amount (referred to as the "IPPS comparable amount") and an increasing portion paid at 120 percent of the MS-LTC-DRG per diem payment amount (referred to as the "LTCH PPS per diem amount"), with a maximum payment amount set at the full LTCH PPS standard Federal payment rate. Specifically, beginning with discharges occurring on or after October 1, 2017, we proposed to pay SSO cases solely on the "blended" option in the current SSO payment adjustment formula described at § 412.529(c)(2)(iv); that is, a SSO case would be paid based on a blend of the IPPS comparable amount (determined under § 412.529(d)(4)(i)) and the MS-LTC-DRG per diem amount (determined under § 412.529(d)(1) in conjunction with § 412.503).

Under this blended payment method at existing § 412.529(c)(2)(iv), as the length of stay of a SSO case increases, the percentage of the per diem payment amounts based on the full MS-LTC-DRG standard Federal payment rate would increase, and the percentage of the payment based on the IPPS comparable amount would decrease. This blended per diem payment rate adjustment would result in paying LTCH cases with a very short length of stay more like an IPPS case, and LTCH cases with relatively longer lengths-of-stay more like a non-short-stay LTCH PPS standard Federal payment rate case.

Therefore, as the length of stay of a SSO case increases, the treatment resources and costs associated with the stay are more comparable with typical LTCH PPS standard Federal payment rate payments and less comparable to payments for the same stay at an acute care hospital under the IPPS.

We stated in the proposed rule that, if adopted, this policy would result in payment amounts becoming more commensurate with the LTCH PPS standard Federal payment rate as the case begins to resemble a more characteristic LTCH PPS standard Federal payment rate case. We stated that we believe that, by paying SSO cases on this basis, we would reduce, if not eliminate, the payment “cliffs” (or payment differentials) inherent in our current payment methodology, as well as the financial incentives that appear to have resulted in potentially improper delays in patient discharges other than solely for medical reasons. In addition, we stated that we believe that the per diem “blended” approach would provide an appropriate balance between the 1-day marginal payment and the 1-day marginal incurred cost.

Under this proposal, we proposed to codify the change to the SSO policy described above by revising § 412.529 of the regulation. Specifically, we proposed to add paragraph (c)(4) to provide that, for discharges occurring on or after October 1, 2017, SSO cases will be paid according to the blended payment option at existing § 412.529(c)(2)(iv) and corresponding changes to § 412.529(c)(3) by sunseting the previous SSO payment formula as of October 1, 2017.

Comment: Commenters supported the proposal to revise the SSO policy. Many commenters requested clarification on the interaction between the proposal and the so-called “very short stay outlier” policy at § 412.529(c)(3)(ii).

Response: We appreciate the commenters’ support. In response to those seeking clarification, we note that our proposed changes to the SSO policy

would apply to all short-stay cases, including those cases currently paid under § 412.529(c)(3)(ii) (that is, the “very short stay outlier” policy). Because the proposed blended payment method pays cases with relatively short stays more like IPPS cases, we believe this single payment option provides appropriate payments for those SSO cases that most likely did not receive a full course of treatment at an LTCH. Moreover, as stated above, in the proposed rule, we proposed to sunset the existing SSO payment formula at § 412.529(c)(3), effective October 1, 2017. Because the “very short stay outlier” payment is paragraph (ii) of § 412.529(c)(3), our proposal would eliminate that payment option, while our proposed addition of § 412.529(c)(4) provides for an adjustment to all SSO cases under a single payment formula.

After consideration of the public comments we received, we are adopting our proposed changes to § 412.529 as final without modification. Specifically, we are finalizing our proposal to add paragraph (c)(4) to provide that, for discharges occurring on or after October 1, 2017, SSO cases will be paid according to the blended payment option at existing § 412.529(c)(2)(iv) and finalizing our proposal to make corresponding changes to § 412.529(c)(3) by sunseting the previous SSO payment formula as of October 1, 2017.

The goal of revising the SSO policy is to remove the incentive to delay patient discharges for payment reasons. As explained in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20023), in assessing the potential impact of this proposed policy change, we found two different impacts on Medicare LTCH spending: One would increase spending while the other would decrease spending.

First, as we stated in the proposed rule, we expect this SSO payment adjustment methodology would result in increased payments to SSO cases. Based on data and FY 2018 payment estimates used for the proposed rule, we estimate that, under this SSO payment adjustment, Medicare payments to SSO cases will increase approximately 30 percent, or approximately \$145 million (without taking into account any assumptions on changes to LTCHs’ discharge practices). These increased payments for SSO cases will produce a somewhat substantial increase in aggregate Medicare spending for LTCH PPS standard Federal payment rate cases (that is, an approximate 4.6-percent increase to current projected LTCH PPS standard Federal payment rate case payments).

At the same time, without the economic incentive to delay discharge until the SSO threshold is met, under our proposal, we stated that we expect LTCHs would discharge some patients sooner, even while the length of stay of the patient is still within the SSO period. Therefore, in the absence of this policy, these cases would not have previously been SSO cases. We stated our belief that this policy would result in some reduction in Medicare spending due to an expected decrease in Medicare payments for LTCH PPS standard Federal payment rate cases that, under the current SSO policy, were not receiving the SSO payment adjustment (because discharges were delayed until the SSO threshold was met).

However, as also discussed in the proposed rule, while we expect this behavior change by LTCHs will reduce Medicare expenditures, we do not believe that the decrease in expenditures from fewer delayed discharge cases will offset the estimated increase in expenditures under the proposed SSO payment adjustment methodology. As such, we projected that the proposed change to the payment formula for SSOs would result in a net increase in aggregate Medicare LTCH payments compared to aggregate Medicare payments under the current methodology.

As we stated in the proposed rule, the goal of the proposed policy is to remove the incentive to delay patient discharges for payment reasons, not to increase aggregate Medicare LTCH PPS payments. Therefore, we believed the appropriate policy approach was to propose to implement this change to the SSO payment methodology on a budget neutral basis; that is, to implement the SSO payment adjustment methodology by adjusting the LTCH PPS standard Federal payment rate so that our projection of aggregate FY 2018 payments for LTCH PPS standard Federal payment rate cases made under this SSO payment adjustment methodology would be equal to our projection of aggregate FY 2018 payments paid for LTCH PPS standard Federal payment rate cases under our existing SSO payment adjustment methodology.

We further note that, based on most recent claims data, we believe the effects of a budget neutral approach would primarily occur within each LTCH and, therefore, result in minimal redistribution between different LTCHs. Specifically, FY 2015 claims data show that nearly all LTCHs treated at least one SSO case, and those that did not treat any SSO cases, on average, had very few LTCH PPS standard Federal

payment rate cases. In addition, for over 90 percent of all LTCHs, at least 20 percent of their LTCH PPS standard Federal payment rate cases were SSO cases. Therefore, in the proposed rule, we stated that we expect that, for most LTCHs, the increase in payments for their SSO cases under this proposed change to the SSO payment methodology would generally offset any SSO budget neutrality-related decrease in payment to their non-SSO LTCH PPS standard Federal payment rate cases.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20023), we proposed to implement the proposed change to the SSO payment methodology by using a budget neutrality adjustment to offset the projected net increase in Medicare spending while accounting for both the estimated decrease in Medicare payments resulting from LTCHs no longer holding patients until the SSO threshold is met and the larger estimated increase in spending to SSO cases described earlier. We stated that we believe our proposal to incorporate a projection of the expected decrease in spending resulting from a behavior change to not hold patients beyond the SSO threshold appropriately reflects the net impact of the proposed change. Further, this lessens the impact of any budget neutrality adjustment estimated without accounting for these expected behavioral changes—in other words, if the budget neutrality adjustment only adjusted for the increased payments to SSO cases.

To do so, we proposed to amend § 412.523(d) by adding a new paragraph (5), which would specify that the LTCH PPS standard Federal payment rate will be adjusted by a one-time, permanent factor that accounts for the projected change in estimated aggregate payments to LTCH PPS standard Federal payment rate cases in FY 2018 due to the change in the payment methodology for SSO cases described at § 412.529(c)(4). (As noted earlier, this budget neutrality adjustment would only affect the LTCH PPS standard Federal payment rate.) This factor would ensure that the proposed change to the SSO payment methodology in FY 2018 does not affect aggregate LTCH PPS payments; that is, this proposed policy change is budget neutral. Specifically, in the proposed rule, we set out a proposed methodology to determine the budget neutrality factor that would be applied to the FY 2018 LTCH PPS standard Federal payment rate using the 2016 LTCH standard Federal payment rate payment cases used for the proposed rule. These estimates were based upon the most recently available data (the December

2016 update of the FY 2016 MedPAR file), and consistent with historical practice, if more recent data become available, we proposed to use such data for the final rule.

Comment: A few commenters, including MedPAC, supported the proposal to implement changes to the SSO payment adjustment by including a budget neutrality factor to the FY 2018 LTCH PPS standard Federal payment rate. Several other commenters urged CMS to implement these changes without a budget neutrality adjustment in light of various other changes to Medicare payment policies relating to LTCHs, such as the decrease in payments to site neutral payment rate cases resulting from the end of the blended payment rate provided under the statute. Many commenters objected to making the proposed changes to the SSO payment methodology (which, if finalized, would increase payments) budget neutral on the grounds that previous revisions to the SSO payment adjustment resulted in a net decrease in aggregate LTCH PPS payments and were not made budget neutral. Other commenters urged CMS to apply this factor in FY 2018 but not make it permanent. Commenters generally supported the proposal to include behavioral impact estimates in determining the budget neutral factor.

However, some commenters addressed the actuarial assumptions used in the proposal, which we discuss in greater detail below.

Response: We thank MedPAC and other commenters for their support of our proposal. In regard to those comments urging us to implement these changes without the budget neutral adjustment or only a temporary budget neutral adjustment, as we stated earlier and in the proposed rule, the goal of the proposed policy is to remove the incentive to delay patient discharges for payment reasons, not to increase aggregate Medicare LTCH PPS payments. While commenters are correct that previous changes to the SSO policy were not budget neutral, the proposed change to the SSO policy is being made for considerably different policy reasons than previous ones. In the past, we made changes to the SSO policy to ensure that LTCHs were paid appropriately for cases that were notably shorter than average. The proposed change in the SSO policy in the FY 2018 proposed rule was developed in response to LTCHs' apparent inappropriate behavior in delaying discharge in order to maximize Medicare payment. We see no reason why addressing the financial incentive for such behavior should result in

increased payments to LTCHs. Therefore, we believe that it is wholly appropriate to make this change in a budget neutral manner. We further note that, under our proposed budget neutrality adjustment, the redistributive effects occur largely within individual LTCHs. As such, while individual hospitals will experience a difference in payment for individual discharges, they will not typically experience an overall reduction in aggregate payments for all of the LTCH's discharges due to this budget neutral change to the SSO policy. A temporary budget neutral adjustment would only maintain the level of aggregate payments for the period the budget neutrality adjustment is applied, thereby merely delaying the increase aggregate Medicare LTCH PPS payments until that adjustment is removed. Lastly, the purpose of the budget neutrality adjustment is not related to the statutory change in payments under the application of the site neutral payment rate and, therefore, does not provide sufficient explanation for implementing the proposed changes to the SSO policy without a budget neutrality adjustment.

After consideration of the public comments we received, we are finalizing our proposal, without modifications, to amend § 412.523(d) by adding a new paragraph (5), which will specify that the LTCH PPS standard Federal payment rate will be adjusted by a one-time, permanent factor that accounts for the projected change in estimated aggregate payments to LTCH PPS standard Federal payment rate cases in FY 2018 due to the change in the payment methodology for SSO cases described at § 412.529(c)(4). Moreover, we are finalizing our proposal to include behavioral impact estimates in determining the budget neutral factor.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20023 through 20026), we proposed to use a 3-step methodology (which contained substeps) to determine the budget neutrality factor that would be applied to the FY 2018 LTCH PPS standard Federal payment rate. The steps in our proposed methodology are summarized below.

Step 1—Simulate estimated aggregate FY 2018 LTCH PPS standard Federal payment rate payments using the existing SSO payment methodology at § 412.529(c)(3).

Step 2—Simulate estimated aggregate FY 2018 LTCH PPS standard Federal payment rate payments using the proposed SSO payment methodology at proposed § 412.529(c)(4), after accounting for expected changes in

LTCHs' discharge behavior, which is determined as follows in Step 2a through Step 2d.

Step 2a—Simulate estimated aggregate FY 2018 LTCH PPS standard Federal payment rate payments under the proposed SSO payment methodology without accounting for expected changes in LTCHs' discharge behavior.

Step 2b—Determine the estimated amount of aggregate FY 2018 LTCH PPS standard Federal payment rate payments that would reflect the projected decrease in non-SSO cases under the changes to the SSO policy.

Step 2c—Determine the estimated amount of aggregate FY 2018 LTCH PPS standard Federal payment rate payments that reflect the projected increase in SSO cases under the proposed changes to the SSO policy.

Step 2d—Adjust the original estimated unadjusted FY 2018 payments under the proposed SSO payment methodology (from Step 2a) to account for the projected decrease in non-SSO cases under the proposed changes to the SSO policy (by subtracting the amount determined in Step 2b) and for the projected increase in SSO cases under the proposed changes to the SSO policy (by adding the amount estimated in Step 2c).

Step 3—Calculate the ratio of the estimated aggregate FY 2018 LTCH PPS standard Federal payment rate payments under the existing and proposed SSO policies to determine the adjustment factor that would need to be applied to the proposed FY 2018 LTCH PPS standard Federal payment rate to achieve budget neutrality (that is, where the estimated aggregate payments calculated in Step 2 are estimated to be equal to the estimated aggregate payments calculated in Step 1). A discussion and supporting details for the assumptions for expected changes in LTCHs' discharge behavior used in Step 2 are provided below. (A complete discussion of our proposed budget neutrality methodology, which we are finalizing without modification as discussed more fully below, can be found in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20023 through 20026).)

Specifically, in the proposed rule (82 FR 20024 through 20025), we discussed the actuarial assumptions for shifts in cases used under Steps 2b and 2c in our proposed methodology for determining the budget neutrality factor or the proposed changes to the SSO payment methodology. As explained in the proposed rule, our actuarial assumptions for LTCHs' discharge behavior under our proposed SSO

policy were estimated based on a comparative analysis of distributions of LTCH discharges relative to the SSO thresholds in FY 2003 and FY 2015 using data from FY 2002 (the year before the LTCH PPS was implemented and the final year prior to a SSO payment adjustment) to LTCH discharges in FY 2015 (the most recent complete year of data available at the time the comparative analysis was performed in preparation for the proposed rule). (We note that, for FY 2002, because there was no applicable SSO threshold, we used the SSO thresholds from FY 2003 (LTC-DRG Version 23) based on the billed LTC-DRG (LTC-DRG Version 22) on the FY 2002 claim.)

The FY 2002 distribution shows a nearly continuous distribution of LTCH discharges relative to what would become the SSO threshold in FY 2003, and approximate symmetry before and after the SSO threshold. In other words, for FY 2002, the distribution of discharges just after what would become the FY 2003 threshold looks similar to the distribution of discharges just before that threshold, and there is a corresponding similarity between discharges well after and well before what would become the SSO threshold.

While the FY 2015 distribution of LTCH discharges relative to the SSO threshold shows the same symmetry among discharges well before and well after the threshold, there are significantly fewer discharges just before the SSO threshold and significantly more discharges just after the SSO threshold (instead of a symmetry among discharges just before and just after the SSO threshold). For FY 2015, this lack of symmetry is concentrated in the 3 days leading up to the SSO threshold. (We note that, in our analysis of LTCH discharge patterns relative to the applicable SSO threshold, we found similar patterns for FYs 2003 through 2014 as those observed for FY 2015, as well as for FY 2016 LTCH discharges.)

In particular, the FY 2015 LTCH discharges have, as a proportion of total FY 2015 LTCH discharges, approximately 20 percent more discharges occurring just after the SSO threshold when compared to FY 2002 discharges. However, due to other substantial changes in Medicare payments to LTCHs, including the introduction of the LTCH PPS in FY 2003, we stated that we do not believe the entire 20-percent shift in discharges is attributable to only the introduction and subsequent revisions to the LTCH PPS SSO payment adjustment. Moreover, this shift is not uniform across all SSO discharges because the

majority of shifting past the SSO threshold occurs within 3 days of the SSO threshold. Based on this, we stated that our actuaries estimate that the elimination of the payment cliff would result in a 10-percent reduction in non-SSO cases, so that SSO cases increase at the same level as the projected decrease in non-SSO cases. For these non-SSO cases that shift, we stated that our actuaries estimate the discharges to occur within 3 days prior to the SSO threshold based on the analysis of LTCH discharge patterns relative to the applicable SSO threshold described earlier.

Comment: Several commenters advocated for a smaller budget neutrality reduction, with many commenters urging CMS to reconsider the actuarial assumptions used to arrive at the 10 percent behavioral shift as they believed this shift should be higher. A few commenters considered CMS' 10 percent behavioral shift to be arbitrary, and some commenters urged CMS to consider 15 percent to 20 percent or higher. Among those urging CMS to consider 15 percent to 20 percent, a few commenters pointed to a working paper⁹⁸ that they believed supports a 15-percent behavioral shift, while other commenters referred to analysis by KNG Health Consulting on behalf of the National Association of Long Term Hospitals (NALTH) that shows LTCHs can shift 20 percent or more of non-SSO cases to below the SSO threshold and still meet the greater than 25-day average length of stay requirement. Other commenters, based on comparisons of historic LTCH discharge rates, suggested that CMS consider LTCH cases discharged within 6 days of the threshold, thereby increasing the expected shift beyond the 10 percent estimated by our actuaries. One commenter stated that its internal modeling suggested the budget neutrality adjustment should be 2.7 percent instead of the approximately 3.3 percent reduction in the proposed rule.

Response: We reviewed all the supporting material and studies submitted or referenced by commenters. We note that we do not have sufficient information to evaluate the individual commenter's claim that the budget neutrality adjustment should be 2.7 percent. However, we note that an adjustment of this magnitude is in line with what we estimate the budget neutrality adjustment would be under our proposed methodology if we were to

⁹⁸ Paul J. Eliason, et al. Strategic Patient Discharge: The Case of Long-Term Care Hospitals. National Bureau of Economic Research. NBER Working Paper 22958. Available at: <http://www.nber.org/papers/w22958.pdf>.

use an assumption of a behavioral shift in the 15 to 20 percent range as suggested by other commenters.

As stated in the proposed rule and earlier in this final rule, while we observed a shift of 20 percent in non-SSO cases from FY 2002 to FY 2015, the introduction of various payment policies in the intervening years does not support attributing the full 20 percent to the SSO payment policy alone, and thus, our actuarial assumption of 10 percent is based upon consideration of the impact such changes have had over the years. Similarly, we do not believe it is appropriate to further extend our analysis based on a 3-day window to a 6-day window because we do not have any rationale or evidence to attribute the FY 2002 to FY 2015 change in discharges 6 days past the threshold to the SSO policy. In this case, particularly, we do not believe cases more than 3 days past the threshold represent a response to financial incentives because each day past the threshold a patient remains in the LTCH represents a negative response to these financial incentives: each day a patient is held beyond the threshold increases the provider's costs without the opportunity to increase the full MS-LTC-DRG payment. In other words, there are diminishing returns the longer a discharge is delayed for financial reasons.

After consideration of the public comments and supporting documents we received, we believe the available data and supporting studies are consistent with our actuarial assumption of a 10-percent behavioral shift. As noted by commenters, the KNG Health Consulting study only shows that increasing the shift to 20 percent is feasible in light of the greater than 25 average length of stay requirement for LTCHs. In other words, this finding establishes a ceiling for the behavioral shift, but it does not establish a lower bound nor does it point to an appropriate or expected shift resulting from the proposed changes to the SSO policy. Therefore, this analysis is consistent with a shift of up to 20 percent, which includes our actuarial assumption of a 10-percent shift.

While commenters pointed to the working paper as evidence for increasing our assumption of the shift in LTCH cases to 15 percent, we note the working paper is not addressing the same issue. The study examines the influence of financial incentives on LTCHs' discharges in order to compare the effectiveness various SSO payment policies have on this incentive by building a model incorporating financial

incentives of a selected category of LTCH discharges. Specifically, as noted in the paper, the study assesses the impact of various SSO payment policies on nine selected MS-LTC-DRGs (177, 189, 190, 193, 207, 539, 592, 871, and 949) and among these DRGs, only those LTCH patients discharged to home or a nursing facility as "these are the discharges for which hospitals have the most discretion." (Paul J. Eliason, et al., p. 18.) The 15 percent cited by commenters represents the proportion of change in modeled non-SSO discharges, limited to these select cases, from our current SSO payment policy (their baseline) to a per diem SSO payment policy among these selected cases. As noted above, the paper presumes their selected category of cases are the LTCH cases most likely to be held, and thus, much like the average length of stay analysis discussed above, the 15 percent cited by commenters, as with the analysis by KNG Health Consulting, represents a ceiling on the behavioral shift and is not inconsistent with our actuarial assumption of 10 percent, which is representative of all MS-LTC-DRGs and cases.

After consideration of the public comments we received, for the reasons presented above, we are finalizing our proposed methodology for computing the budget neutrality factor, including the 10 percent actuarial assumption in steps 2b and 2c, without modification.

Based on the claims data used for the proposed rule, we estimated that our proposed change to the SSO payment methodology would result in an increase in payments of approximately \$102 million (that is, the \$3.177 billion as calculated in Step 1 in the proposed rule minus the \$3.279 billion as calculated in Step 2 in the proposed rule) which reflected the approximate \$43 million decrease that accounts for our actuarial assumptions for expected changes in LTCHs' discharge behavior under the proposed changes to the SSO policy. For the proposed rule, using the steps in the proposed methodology, we then determined a proposed budget neutrality factor for the proposed change to the SSO payment methodology of 0.9672. Accordingly, in section V.A. of the Addendum to the proposed rule, to determine the proposed FY 2018 LTCH PPS standard Federal payment rate, we proposed to apply a one-time, permanent budget neutrality factor of 0.9672 for the proposed change in the SSO payment methodology (82 FR 20025 through 20026).

For this final rule, as we proposed, we are using the most recent available data (that is, FY 2016 LTCH standard Federal

payment rate payment cases from the March 2017 update of the FY 2016 MedPAR file) to determine the budget neutrality factor applied to the FY 2018 LTCH PPS standard Federal payment rate to ensure that the change to the SSO payment methodology in FY 2018 does not affect aggregate LTCH PPS payments. Based upon the most recent data, and discussed in greater detail below, we are applying a one-time, permanent budget neutrality factor of 0.9651 under new § 412.523(d)(5) for the change in the SSO payment methodology at new § 412.529(c)(4).

Specifically, the methodology summarized above and outlined in the proposed rule (82 FR 20025 through 20026) applied to the best available data used for this final rule yields the following results. We estimate that our change to the SSO payment methodology results in an increase in payments of approximately \$112 million (that is, the \$3.204 billion as calculated in Step 1 using data for this final rule minus the \$3.316 billion as calculated in Step 2 using data for this final rule) which reflects the approximate \$40 million decrease that accounts for our actuarial assumptions for expected changes in LTCHs' discharge behavior under the changes to the SSO policy. Therefore, for this final rule, using the steps in the methodology outlined in the proposed rule and using the most recently updated data, we have determined a budget neutrality factor for the change to the SSO payment methodology of 0.9651. Accordingly, in section V.A. of the Addendum to this final rule, to determine the FY 2018 LTCH PPS standard Federal payment rate, we are finalizing the application of a one-time, permanent budget neutrality factor of 0.9651 for the change in the SSO payment methodology.

E. Temporary Exception to the Site Neutral Payment Rate for Certain Spinal Cord Specialty Hospitals

Section 15009 of Public Law 114-255 added new subparagraph (F) to section 1886(m)(6) of the Act, which provides for a temporary exception to the site neutral payment rate for certain spinal cord specialty hospitals. Under this provision, discharges occurring in cost reporting periods beginning during FY 2018 and FY 2019 for LTCHs that meet the specified statutory criteria are excepted from the site neutral payment rate (that is, all discharges from such LTCHs during this period would be paid at the LTCH PPS standard Federal payment rate). Clauses (i) through (iii) of section 1886(m)(6)(F) of the Act state that, in order for an LTCH to qualify for this temporary exception, the LTCH

must: (1) Have been a not-for-profit LTCH on June 1, 2014, as determined by cost report data; (2) of the discharges in calendar year 2013 from the LTCH for which payment was made under the LTCH PPS, at least 50 percent were classified under MS-LTC-DRGs 28, 29, 52, 57, 551, 573, and 963; and (3) have discharged inpatients (including both individuals entitled to, or enrolled for, Medicare Part A benefits and individuals not so entitled or enrolled) during FY 2014 who had been admitted from at least 20 of the 50 States, determined by the States of residency of such inpatients and based on such data submitted by the hospital to the Secretary as the Secretary may require. The statute further provides authority for the Secretary to implement the third criterion (set forth at section 1886(m)(6)(F)(iii) of the Act and referred to as the “significant out-of-state admissions criterion”) by program instruction or otherwise, and exempts the policy initiatives from any information collection requirements under the Paperwork Reduction Act (Chapter 35 of Title 44 of the United States Code). Given this express authority, as we stated in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20026), we plan to provide further details regarding the implementation of the significant out-of-state admissions criterion through subregulatory guidance. However, in the proposed rule, we proposed to codify the requirements of the temporary exception to the site neutral payment rate for certain spinal cord specialty hospitals specified under section 1886(m)(6)(F) of the Act, as added by section 15009 of Public Law 114–255. Specifically, we proposed to codify the requirements of this provision at new § 412.522(b)(4), by providing for an exception from the site neutral payment rate for discharges occurring in cost reporting periods beginning during FYs 2018 and 2019 for LTCHs that meet the specified statutory criteria.

We sought public comments on this proposal. Based on information currently available, we believe that two hospitals may qualify for this exception.

Comment: Several commenters supported CMS’ proposals to implement section 15009 of the 21st Century Cures Act.

Response: We thank these commenters for their support.

After consideration of the public comments we received, we are finalizing our proposals without modification.

F. Temporary Exception to the Site Neutral Payment Rate for Certain Discharges With Severe Wounds From Certain LTCHs

Section 15010 of Public Law 114–255 added a new subparagraph (G) to section 1886(m)(6) of the Act, which creates a temporary exception to the site neutral payment rate for certain severe wound discharges from certain LTCHs during such LTCHs’ cost reporting periods beginning during FY 2018 (that is, for cost reporting period beginning on or after October 1, 2017 and on or before September 30, 2018). Under the provisions of section 15010 of Public Law 114–255, in order for an LTCH’s discharge to be excluded from the site neutral payment rate under this exception during its FY 2018 cost reporting period, the discharge must be: (1) From an LTCH “identified by the last sentence of subsection (d)(1)(B)” of the Act; (2) classified under MS-LTC-DRG 602, 603, 539, or 540; and (3) with respect to an individual treated by an LTCH, for a severe wound. The statute defines a “severe wound,” for the purposes of the exception, as “a wound which is a stage 3 wound, stage 4 wound, unstageable wound, non-healing surgical wound, or fistula as identified in the claim from the long-term care hospital.” The statute further defines a “wound” as “an injury involving division of tissue or rupture of the integument or mucous membrane with exposure to the external environment.”

Much of this language is identical or substantially similar to the language for the previous temporary exception for discharges for the treatment of severe wounds provided for under the amendments made by section 231 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113), except for three key differences. First, the previous temporary exception for severe wound discharges applied to LTCHs that are grandfathered hospitals-within-hospitals (HwHs) (that is, hospitals that are described under § 412.23(e)(2)(i) that meet the criteria of § 412.22(f) and are located in a rural area or treated as rural (§ 412.522(b)(2)(ii)(B)), while the new temporary exception for severe wound discharges only requires that LTCHs are grandfathered HwHs (and does not require the LTCH to also be located in a rural area or treated as rural). Second, under this new temporary exception for severe wound discharges, the definition of a “severe wound” includes only five of the eight categories (stage 3 wound, stage 4 wound, unstageable wound, non-healing surgical wound, and fistula) included in the definition of a “severe

wound” under the original temporary exception for severe wound discharges (and does not include the categories of infected wound, osteomyelitis, and wound with morbid obesity). Finally, this new temporary exception for severe wound discharges is limited to discharges that meet the definition of a severe wound and are grouped to certain specified MS-LTC-DRGs, while the previous temporary exception for severe wound discharges only required the discharge to meet the definition of a severe wound (and did not include the requirement for the discharge to also be grouped to certain specified MS-LTC-DRGs). Additional details of the new temporary exception for payment for severe wound discharges provided by Public Law 114–255, including further discussion of the likenesses to and differences from the original temporary exception for payment for severe wound discharges provided by Public Law 114–113 are discussed below.

We implemented the original temporary exception for payment for discharges for the treatment of severe wounds that was provided by the amendments made by section 231 of Public Law 114–113 in an interim final rule with comment period (IFC) that appeared in the **Federal Register** on April 21, 2016 (81 FR 23428 through 23438) (referred to as the “April 21, 2016 IFC”) and finalized our FY 2017 proposed rule and that IFC concurrently in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57070). Therefore, to the extent applicable, we are implementing the temporary exception provision in an identical manner to our implementation of the original temporary exception under section 231 of Pub. L. 114–113, which is codified in the LTCH PPS regulations at § 412.522(b)(2). Specifically, § 412.522(b)(2)(ii)(B)(1) refers to LTCHs “identified by the last sentence of subsection (d)(1)(B)” of the Act as LTCHs “[d]escribed in § 412.23(e)(2)(i) and meets the criteria of § 412.22(f).” In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20026), we proposed to codify the requirements of this “new” temporary exception for severe wounds at new § 412.522(b)(3), by providing for an exception for discharges meeting the statutory criteria that occur in a cost reporting period that begins during FY 2018 for LTCHs described in § 412.23(e)(2)(i) and meet the criteria of § 412.22(f).

Clauses (ii) and (iii) of section 1886(m)(6)(G) of the Act, respectively, as added by section 15010 of Public Law 114–255, includes definitions of “severe wound” and “wound” for purposes of this “new” temporary exception for discharges for the treatment of severe

wounds. We proposed to incorporate the definitions of “wound” and “severe wound” at § 412.522(b)(3)(i) as they are defined in the statute. We note that the definition of a “wound” in section 15010 is nearly identical to CMS’ definition of “wound” at existing § 412.522(b)(2)(i). We further note that the definition of a “severe wound” is nearly identical to the definition used in section 231 of Public Law 114–113 with the exception that three categories included in the latter (that is, infected wound, osteomyelitis, and wound with morbid obesity) are not included in the definition set forth in section 15010 of Public Law 114–255. The five remaining categories of stage 3 wound, stage 4 wound, unstageable wound, non-healing surgical wound, and fistula are identified by the list of ICD–10–CM codes posted to the CMS Web site at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/LongTermCareHospitalPPS/download.html> under the “Severe Wound Diagnosis Codes by Category for Implementation of Section 231 of Public Law 114–113” download file. For more information on our interpretation of these terms, we refer readers to the April 21, 2016 IFC (81 FR 23428 through 23438) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57070). Therefore, this information on how CMS interpreted the meanings of these categories of a “severe wound” for Public Law 114–113 was available at the time Public Law 114–255 was enacted. As such, we are implementing the “new” temporary exception for discharges for the treatment of severe wounds provided for by section 15010 using the same list of ICD–10–CM codes to identify the five categories of severe wounds enumerated in that section of Public Law 114–255. In addition, as provided by section 1886(m)(6)(G)(i)(III) of the Act as added by section 15010 of Public Law 114–255, we proposed at new § 412.522(b)(3)(ii) that the patient must be treated for a severe wound that meets the statutory definition of a “severe wound” at proposed § 412.522(b)(3)(i) in order for the LTCH discharge to meet this “new” temporary exception for discharges for the treatment of severe wounds.

As we stated in the proposed rule, we believe that the requirement under the “new” temporary exception for discharges for the treatment of severe wounds set forth under section 1886(m)(6)(G)(i)(II) of the Act as added by section 15010 of Public Law 114–255 for an LTCH discharge be classified under MS–LTC–DRG 602, 603, 539, or 540 is self-implementing. Accordingly,

we proposed to codify this requirement at new § 412.522(b)(3)(ii)(C) by listing the applicable MS–LTC–DRGs.

Section 1886(m)(6)(G)(i)(I) of the Act, as added by section 15010 of Public Law 114–255, specifies that, for purposes of this “new” temporary exception for discharges for the treatment of severe wounds, the LTCH discharge must be from an LTCH “identified by the last sentence of subsection (d)(1)(B)”. The phrase “identified by the last sentence of subsection (d)(1)(B) [of the Act]” is equivalent to the phrase “identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997” used in section 231 of Public Law 114–113, because the amendment made by section 4417(a) of the Balanced Budget Act of 1997 added the last sentence of subsection (d)(1)(B) to the Act. As discussed in the April 21, 2016 IFC (81 FR 23428), the phrase “identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997” (which as previously discussed is equivalent to “identified by the last sentence of subsection (d)(1)(B) of the Act”) has been interpreted by CMS to mean hospitals-within-hospitals (HwHs) that were participating in Medicare, but excluded from the hospital IPPS on or before September 30, 1995 (that is, hospitals which are described under § 412.23(e)(2)(i)) that meet the criteria of § 412.22(f) (81 FR 23430 through 23432). As further discussed in the April 21, 2016 IFC, § 412.22(f) generally requires that, in order to have grandfathered status, an HwH must continue to operate under the same terms and conditions, including, but not limited to, the number of beds. A limited exception to this general policy allowed eligible hospitals to increase the number of beds between October 1, 1995, and September 30, 2003, without loss of their grandfathered status. A second exception allows grandfathered HwHs to increase square footage or decrease the number of beds for cost reporting periods beginning on or after October 1, 2006, while still retaining grandfathered status. Because this phrase had already been interpreted in this manner, the April 21, 2016 IFC adopted the same meaning of the phrase for purposes of implementing section 231 of Public Law 114–113. For additional information on hospitals “identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997,” we refer readers to the April 21, 2016 IFC (81 FR 23431 through 23432). Therefore, for the purposes of the new temporary exception for LTCH discharges for the treatment of severe wounds, “identified by the last sentence of subsection

(d)(1)(B) of the Act” means HwHs that were participating in Medicare, but excluded from the hospital IPPS on or before September 30, 1995 (that is, hospitals which are described under § 412.23(e)(2)(i)) that meet the criteria of § 412.22(f). We finalized this policy without modification in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57069). Because we have already finalized our interpretation of this phrase, we believe that the requirement at section 1886(m)(6)(G)(i)(I) of the Act is self-implementing. Accordingly, we proposed to codify this requirement at new § 412.522(b)(3)(ii)(B). LTCHs that believe they meet the requirements to be a grandfathered HwH should contact their MACs. MACs will verify that the LTCH meets these requirements.

Comment: Several commenters supported CMS’ proposals to implement section 15010 of the 21st Century Cures Act.

Response: We thank the commenters for their support.

Comment: Some commenters requested that CMS expand the scope of the exception to allow additional LTCHs to benefit from the provision. Other commenters requested that CMS exclude severe wound discharges from the site neutral payment rate all together or to otherwise broaden the scope of cases excepted from the site neutral payment rate.

Response: As we have stated in response to substantially similar comments in the past (80 FR 49602), under the LTCH PPS we do not have the authority to pay anything other than the site neutral payment rate for any LTCH discharge that does not meet the exclusion criteria. The statute explicitly established the dual payment rate structure, which expressly provides that payment for all LTCH discharges will be calculated based on the site neutral payment rate, unless the LTCH discharge meets the statutorily defined exclusion criteria to be paid based on the LTCH PPS standard Federal payment rate.

After consideration of the public comments we received, we are finalizing our proposals without modification.

G. Moratorium and Regulatory Delay of the Full Implementation of the “25-Percent Threshold Policy” Adjustment (§ 412.538)

The “25-percent threshold policy” is a per discharge payment adjustment in the LTCH PPS that is applied to payments for Medicare patient discharges from an LTCH when the number of such patients originating from any single referring hospital is in

excess of the applicable threshold for a given cost reporting period (such threshold is generally set at 25 percent, with exceptions for rural and urban single or MSA-dominant hospitals). If an LTCH exceeds the applicable threshold during a cost reporting period, payment for the discharge that puts the LTCH over its threshold and all discharges subsequent to that discharge in the cost reporting period from the referring hospital are adjusted at cost report settlement (discharges not in excess of the threshold are unaffected by the 25-percent threshold policy). The 25-percent threshold policy was originally established in the FY 2005 IPPS final rule for LTCH HwHs and satellites (69 FR 49191 through 49214). We later expanded the 25-percent threshold policy in the RY 2008 LTCH PPS final rule to include all LTCHs and LTCH satellite facilities (72 FR 26919 through 26944). Several laws have mandated delayed implementation of the policy, including, most recently, section 1206 of the Pathway for Sustainable Growth Rate (SGR) Reform Act (Pub. L. 113–67). Section 1206(b)(1)(B) provides a permanent exemption from the application of the 25-percent threshold policy for LTCHs identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997 (Pub. L. 105–33). As explained more fully in section VIII.H. of the preamble of this final rule, LTCHs “identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997” are HwHs that were participating in Medicare, but excluded from the hospital IPPS on or before September 30, 1995 (that is, hospitals which are described under § 412.23(e)(2)(i)) that meet the criteria of § 412.22(f). LTCHs that believe they meet the requirements to be a grandfathered HwH should contact their MACs. MACs will verify that the LTCH meets these requirements. Section 1206(b)(1)(A) of Public Law 113–67 extended prior moratoria on the full implementation of the 25-percent threshold policy until cost reporting periods beginning on or after either July 1, 2016 (for LTCHs subject to 42 CFR 412.534) or October 1, 2016 (for LTCHs subject to 42 CFR 412.536). For more details on the various laws that delayed the full implementation of the 25-percent threshold policy, we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50356 through 50357). In the FY 2017 IPPS/LTCH PPS final rule, we consolidated the 25-percent threshold policy by sunseting §§ 412.534 and 412.536 and establishing provisions under new § 412.538.

Section 15006 of Public Law 114–255 further amended section 114(c)(1)(A) of the MMSEA (as amended) by striking “for a 9-year period” and inserting “through June 30, 2016, and for discharges occurring on or after October 1, 2016 and before October 1, 2017”, which provides for an extension of the moratorium on the full implementation of the 25-percent threshold policy. In addition, section 15006(b) of Public Law 114–255 further amended section 114(c)(2) of the MMSEA (as amended) by inserting “or any similar provision,” after “Regulations,” in subparagraphs (A) and (B). (We note that the functional result of the extension of the moratorium under section 15006(a) of Public Law 114–255 only extends to discharges on or after October 1, 2016 and before October 1, 2017.)

To implement the provisions of section 15006 of Public Law 114–255, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20028), we proposed to make conforming amendments to the regulations that currently govern the application of the 25-percent threshold policy. Section 114(c)(1) of the MMSEA, from its inception, precluded CMS from implementing either §§ 412.534 or 412.536 (as applicable), as well as any similar provision to hospitals described in the provision of the MMSEA. Section 15006 of Public Law 114–255 amended section 114(c)(2) of the MMSEA by adding the words “or any similar provisions” to both (A) and (B). Section 412.538 of the regulations is a similar provision to the provisions of both §§ 412.534 and 412.536 (we adopted the payment policy under § 412.538 to create a consolidated and streamlined 25-percent threshold policy to replace the policies under §§ 412.534 and 412.536, which were sunset).

Therefore, in order to implement the moratorium on the implementation of the 25-percent threshold policy provided under section 15006 of Public Law 114–255, we proposed to amend § 412.538 to account for these statutory changes. We note that, similar to the July 1, 2012 through September 30, 2012 “gap” period discussed in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53484 through 53486), this extension of the moratorium on the full application of the 25-percent threshold policy results in a “gap” period where LTCHs are required to comply with the fully-implemented 25-percent threshold policy for their cost reporting periods beginning on or after July 1, 2016, and before October 1, 2016, for any discharges occurring on or before September 30, 2016. For the same reasons discussed in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53485

through 53486), although those LTCHs with cost reporting periods beginning on or after July 1 and before October 1, 2016 are “technically” subject to the 25-percent threshold policy until October 1, 2016, we believe that very few, if any, LTCHs will actually receive a payment adjustment because these LTCHs would rarely, if ever, admit more than 25 percent of their discharges from any one referring hospital during the limited period of 1 to 3 months (depending on the LTCH’s cost reporting beginning date) that the 25-percent threshold policy was technically in effect.)

Comment: Several commenters supported CMS’ proposals to implement section 15006 of the 21st Century Cures Act.

Response: We thank these commenters for their support.

After consideration of the public comments we received, we are finalizing our proposals without modification.

In addition, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20028), we proposed to adopt a 1-year regulatory moratorium on the implementation of the 25-percent threshold policy; that is, we proposed to impose a regulatory moratorium on our implementation of § 412.538 until October 1, 2018. This proposal was made in response to the further statutory delays and our continued consideration of public comments received in response to our proposal to consolidate and streamline the 25-percent threshold policy in the FY 2017 IPPS/LTCH PPS proposed rule. In response to that proposed rule, several commenters stated that the new site neutral payment rate would alleviate the policy concerns underlying the 25-percent threshold policy. As we stated in more detail in our response to those comments in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57106), we are not convinced that this is the case.

However, given this additional statutory moratorium, we believe that it was appropriate at that time to propose to establish a regulatory moratorium on the implementation of the 25-percent threshold policy until we can examine data under the application of the site neutral payment rate to further evaluate, when more data are available, whether the policy is in fact still necessary. We stated in the proposed rule that while we are not convinced that the application of the site neutral payment rate removes the need for the 25-percent threshold policy, we believe that evaluating the impact of the application of the site neutral payment rate on LTCH admission practices would be premature at that time. The statute

provides that the site neutral payment rate be phased in, effective with LTCH cost reporting periods beginning on or after October 1, 2015 and before October 1, 2017 (that is, LTCH cost reporting periods beginning in FYs 2016 and 2017). LTCH claims data for discharges that occurred in FY 2016 is currently the best available data, and given that phase-in of the site neutral payment rate is based on LTCHs' cost reporting period start dates, many LTCH discharges that occurred during FY 2016 were not yet subject to the site neutral payment rate because they occurred in a LTCH cost reporting period that had begun prior to October 1, 2016. Consequently, at the time of the proposed rule, we only had a partial year of LTCH claims data under the period where the site neutral payment rate was in effect, which may not be fully reflective of any changes in LTCH admission practices under the new dual rate LTCH PPS. We stated in the proposed rule that proposing an additional regulatory moratorium on the 25-percent threshold policy through FY 2018 would allow CMS the opportunity to do an analysis of LTCH admission practices under the new dual payment rate LTCH PPS based on more complete data and would avoid creating any additional confusion by having the 25-percent threshold policy become effective for a period of time when future analysis of LTCH claims data may indicate the policy concerns underlying the 25-percent threshold policy have been moderated.

Therefore, in the proposed rule, we proposed to revise the effective date of § 412.538 so that the 25-percent threshold policy would apply to discharges occurring on or after October 1, 2018. Further, we proposed that if, in response to public comments, we did not finalize this proposed additional 1-year regulatory moratorium, we would revise § 412.538 so that the 25-percent threshold policy would apply to discharges occurring on or after October 1, 2017, consistent with the provisions of section 15006 of Public Law 114–255. We sought public comments on our proposals.

Comment: Several commenters supported CMS' proposal for an additional 1-year regulatory delay in the full application of the 25-percent threshold policy. In addition, several commenters requested that, in lieu of or in addition to the additional 1-year regulatory delay in the full application of the 25-percent threshold policy, CMS rescind the policy. Some of these commenters also requested that CMS make public its analysis about whether the policy continues to be necessary.

MedPAC opposed the proposed additional 1-year delay in the full application of the 25-percent threshold policy.

Response: We thank commenters for their support of the proposed additional 1-year regulatory delay of the 25-percent threshold policy for FY 2018. As we explained in both the FY 2016 and FY 2017 rulemaking cycles, and reiterated in the proposed rule, we are not convinced that recent revisions to the LTCH PPS (for example the introduction of the site-neutral payment rate) have addressed the policy concerns which caused us to adopt the policy. We believe that the 1-year delay will allow both CMS and providers to gain additional experience with the site neutral payment rate and allow us to determine whether the policy is still necessary. For this reason, although we understand MedPAC's concerns, we believe that we should have additional experience under the revised LTCH PPS prior to the policy becoming effective in order to ensure it is still necessary and appropriate. We note that if we undertake further rulemaking on this topic, we will, in accordance with the APA, publically note our reasons for any potential proposed changes.

After consideration of the public comments we received, we are finalizing the proposal for an additional 1-year regulatory delay of the 25-percent threshold policy for FY 2018 without modification.

Comment: Some commenters requested confirmation that the regulations at §§ 412.534 and 412.536 would not apply until October 1, 2018 and that the 25-percent threshold policy would not apply during the “gap” period between July 1, 2016 and October 1, 2016 for certain locations of certain hospitals.

Response: In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57102), we sunsetted both §§ 412.534 and 536 and replaced them with the unified 25-percent threshold policy at § 412.538. Under the unified policy, regardless of any statutory or regulatory moratorium on § 412.538, by the terms of § 412.534 and 536 themselves, hospitals are no longer subject to them. As discussed above, we are finalizing our proposal of an additional 1-year regulatory delay of the 25-percent threshold policy for FY 2018. As such, we confirm that, under our finalized changes to the regulations, no hospital will be subject to § 412.538 until discharges occurring on or after October 1, 2018. The commenters are incorrect that we proposed not to apply the 25-percent threshold policy during the “gap” period. However, as we stated in the proposed rule, we do not believe

that there will be any practical effect of the application of the policy. The 25-percent threshold policy (under §§ 412.434, 412.536, and 412.538) is calculated based on a hospital's entire cost reporting period, which is generally a full calendar year (12 months). In order for a hospital to have any payment reduction during the “gap” period (which would only apply to discharges occurring before October 1, 2016 in cost reporting periods beginning on or after July 1, 2016) the hospital must exceed the 25-percent threshold with respect to a referring hospital within (at most) a 3-month period.

H. Revision To Moratorium on Increasing Beds in Existing LTCH or LTCH Satellite Locations Under the 21st Century Cures Act (Pub. L. 114–255) (§ 412.23)

Section 1206(b)(2) of Public Law 113–67, as amended by section 112(b) of the Protecting Access to Medicare Act of 2014 (PAMA) (Pub. L. 113–93), established “new” statutory moratoria on the establishment of new LTCHs and LTCH satellite facilities and on the increase in the number of hospital beds in existing LTCHs and LTCH satellite facilities, effective April 1, 2014 through September 30, 2017, by amending section 114(d)(1) of the MMSEA (as amended). In addition, the statute also provided an exception under the “new” moratorium under section 114(d)(7) of the MMSEA (as amended) to establish a new LTCH or LTCH satellite facility during the period between April 1, 2014, and September 30, 2017, if a hospital or entity meets criteria, which mirror the expired provisions of section 114(d)(2)(A). For a discussion on our implementation of these moratoria, we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50189 through 50193).

Section 15004(a) of Public Law 114–255 further amended section 114(d)(7) of the MMSEA (as amended) by striking “The moratorium under paragraph (1)(A)” and inserting “[a]ny moratorium under paragraph (1)” and specified that such amendment shall take effect as if included in the enactment of section 112 of the PAMA. Under this amendment, all existing LTCHs or LTCH satellite locations are no longer subject to a moratorium on an increase in LTCH beds set forth in paragraph (1)(B) if they meet certain criteria. In order to implement this statutory change, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20029), we proposed to amend § 412.23(e)(7) by revising paragraph (e)(7)(iii) to specify that the moratorium on increasing the number of beds in existing LTCHs and

existing LTCH satellites does not apply if one or more of the exceptions described in § 412.23(e)(6)(ii) is met in accordance with the provisions of section 15004(a) of Public Law 114–255. (We note that section 15004(b) of Public Law 114–255 provides for a modification to LTCH high-cost outlier payments. Our proposals to implement this provision were discussed in section V.D. of the Addendum to the proposed rule.) We sought public comments on this proposal.

Comment: Several commenters supported CMS' proposal to implement section 15004(a) of the 21st Century Cures Act.

Response: We thank these commenters for their support.

After consideration of the public comments we received, we are finalizing our proposal, without modification, to amend § 412.23(e)(7) by revising paragraph (e)(7)(iii) to specify that the moratorium on increasing the number of beds in existing LTCHs and existing LTCH satellites does not apply if one or more of the exceptions described in § 412.23(e)(6)(ii) is met in accordance with the provisions of section 15004(a) of Public Law 114–255.

I. Change To the Average Length of Stay Criterion Under the 21st Century Cures Act (Pub. L. 114–255)

Under the requirements at sections 1886(d)(1)(B)(iv)(I) and 1861(ccc) of the Act, in order for a hospital to be classified as an LTCH, the hospital has to maintain an average length of stay of greater than 25 days as calculated by the Secretary. Section 1206(a)(3) of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67) excluded Medicare Advantage plans' and site neutral payment rate discharges from this calculation for hospitals that were classified as LTCHs as of December 10, 2013. We implemented this provision in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49638). Section 15007 of Public Law 114–255 amended section 1206(a)(3) of the Pathway for SGR Reform Act by extending the exclusion of Medicare Advantage plans' and site neutral payment rate discharges from the calculation of the average length of stay to all LTCHs, for discharges occurring in cost reporting periods beginning on or after October 1, 2015. In order to implement this provision, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20029), we proposed to remove the final sentence of our regulations at 42 CFR 412.23(e)(2)(vi), which included site neutral payment rate and Medicare Advantage discharges in the calculation of the average length of stay for LTCHs which were classified

as such after December 10, 2013. We sought public comments on our proposal.

Comment: Several commenters supported CMS' proposal to implement section 15007 of the 21st Century Cures Act.

Response: We thank these commenters for their support.

Comment: Several commenters requested that CMS remove the requirement for LTCHs to maintain a greater than 25 day average length of stay entirely, lower the requisite average length of stay, and/or make changes to the method of calculating the average length of stay.

Response: While we consider these comments outside the scope of this proposed rule, we note that the requirement that LTCHs maintain an average length of stay of greater than 25 days is required under section 1886(d)(1)(B)(iv) of the Act, and therefore we have no authority to either remove or reduce this requirement. We may consider the possibility of refining the method of calculating whether an LTCH has maintained the requisite average length of stay in future rulemaking.

After consideration of the public comments we received, we are finalizing our proposal, without modification, to remove the final sentence of our regulations at 42 CFR 412.23(e)(2)(vi), which included site neutral payment rate and Medicare Advantage discharges in the calculation of the average length of stay for LTCHs which were classified as such after December 10, 2013.

J. Change in Medicare Classification for Certain Hospitals (§ 412.22)

When enacted, section 1886(d)(1)(B)(iv) of the Act established a category of hospitals that experience extended average inpatient length of stays, which are known as LTCHs under the Medicare program. Clause (iv) of section 1886(d)(1)(B) consisted of two subclauses (I) and (II) (that is, section 1886(d)(1)(B)(iv)(I) and section 1886(d)(1)(B)(iv)(II) of the Act) which corresponded to two categories of hospitals that were generally referred to as “subclause (I)” and “subclause (II)” LTCHs. “Subclause (I)” LTCHs were required to have an average inpatient length of stay that is greater than 25 days. “Subclause (II)” LTCHs were only required to have an average inpatient length of stay of greater than 20 days. The “subclause (II)” LTCH definition further limited the classification of a “subclause (II)” LTCH by including the requirement that the LTCH must have been first excluded from the IPPS in CY

1986, and treated a Medicare inpatient population in which 80 percent of the discharges in the 12-month reporting period ending in Federal FY 1997 had a principal diagnosis that reflected a finding of neoplastic disease as defined in subsection (f)(1)(iv) section 1886 of the Act. This statutory requirement was implemented under 42 CFR 412.23(e)(2)(ii).

As part of our FY 2015 IPPS/LTCH PPS rulemaking cycle, under the authority provided by section 1206(d)(2) of the Pathway to SGR Reform Act (Pub. L. 113–67), we adopted an adjustment to the LTCH PPS payment for LTCHs classified under section 1886(d)(1)(B)(iv)(II) of the Act (“subclause (II)” LTCHs). Under this payment adjustment, “subclause (II)” LTCHs receive payment under the LTCH PPS that is generally equivalent to an amount determined under the reasonable cost-based payment rules for both operating and capital-related costs under 42 CFR part 413 (that is, an amount generally equivalent to an amount determined under the TEFRA payment system methodology). This payment adjustment for “subclause (II)” LTCHs is specified at § 412.526. For more information on this payment adjustment, we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50193 through 50197). As initially adopted, the “TEFRA-like” reasonable cost-based payment adjustment for “subclause (II)” LTCHs did not incorporate the limitation on charges to Medicare beneficiaries policies under the TEFRA payment system. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57109 through 57110), we amended the regulations at § 412.507 relating to the limitation on charges to address beneficiary charges for LTCH services provided by “subclause (II)” LTCHs as part of our refinement of the payment adjustment for “subclause (II)” LTCHs under § 412.526. Under this refinement, “subclause (II)” LTCHs are treated the same as IPPS-excluded hospitals paid under the TEFRA payment system for purposes of the limitation on charges to beneficiaries and related billing requirements.

Section 15008 of Public Law 114–225 provides for a change in Medicare classification for “subclause (II)” LTCH by redesignating such hospitals from section 1886(d)(1)(B)(iv)(II) to section 1886(d)(1)(B)(vi) of the Act. In addition, subsection (b) of section 15008 specifies that, for cost reporting periods beginning on or after January 1, 2015, such hospitals classified under section 1886(d)(1)(B)(vi) of the Act are not subject to section 1886(m) of the Act, which sets forth the LTCH PPS. Section

15008 further specifies that, for cost reporting periods beginning on or after January 1, 2015, payment for inpatient operating costs is to be made as described in 42 CFR 412.526(c)(3), including any subsequent modifications, and payment for capital costs is to be made as described in 42 CFR 412.526(c)(4) as in effect on January 1, 2015. (We note that there have been no revisions to the regulations at 42 CFR 412.526, including § 412.526(c)(3) and § 412.526(c)(4), since January 1, 2015.)

In order to implement these requirements, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20029), we proposed to revise § 412.23(e)(2)(ii) so that the definition in that paragraph would apply to hospitals in cost reporting periods beginning on or after August 5, 1997 and on or before December 31, 2014. In addition, we proposed to add a new paragraph (j) to § 412.23 that would establish a new classification of IPPS-excluded hospital (formerly named “long-term care neoplastic disease hospitals” but renamed “extended neoplastic disease care hospital”) that would identify hospitals classified under new section 1886(d)(1)(B)(vi) of the Act. Proposed new paragraph (j) would further specify in paragraph (j)(2) that payment for inpatient operating costs for these hospitals is made as described in § 412.526(c)(3) and payment for capital costs for these hospitals is made as described in § 412.526(c)(4). (We note that we did not propose to make changes to Subpart O by removing references to “subclause (II) LTCHs” due to the sunset date we proposed to add to § 412.23(e)(2)(ii).) We sought public comments on our proposal.

In section VII.A of the preamble of this final rule, we summarize and respond to the public comments on these proposals. In summary, as discussed in greater detail in section VII.A of this preamble, we are finalizing our proposal, without modification, to revise § 412.23(e)(2)(ii) so that the definition in that paragraph will apply to hospitals in cost reporting periods beginning on or after August 5, 1997 and on or before December 31, 2014; and in response to public comments we are making our changes to payment regulations at new paragraph (i) under § 412.22 (which is identical, with the exception of minor technical editing for cross-references, to the language we proposed at § 412.23(j)) that establishes a new classification of IPPS-excluded hospital (formerly termed “long-term care neoplastic disease hospitals,” but renamed “extended neoplastic disease care hospitals”) that will identify

hospitals classified under new section 1886(d)(1)(B)(vi) of the Act.

IX. Quality Data Reporting Requirements for Specific Providers and Suppliers

We seek to promote higher quality and more efficient healthcare for Medicare beneficiaries. This effort is supported by the adoption of widely agreed-upon quality measures. We have worked with stakeholders to define quality measures for most settings and to measure various aspects of care for most Medicare beneficiaries. These measures assess structural aspects of care, clinical processes, care coordination, and improving patient outcomes (including patient experiences with care).

We have implemented quality reporting programs for multiple care settings, including, for example:

- Hospital inpatient services under the Hospital Inpatient Quality Reporting (IQR) Program (formerly referred to as the Reporting Hospital Quality Data for Annual Payment Update (RHQDAPU) Program);
- Prospective Payment System (PPS)-exempt cancer hospitals under the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program;
- Long-term care hospitals under the Long-Term Care Hospital Quality Reporting Program (LTCH QRP) (also referred to as the LTCHQR Program);
- Inpatient psychiatric facilities under the Inpatient Psychiatric Facilities Quality Reporting (IPFQR) Program;
- Hospital outpatient services under the Hospital Outpatient Quality Reporting (OQR) Program (formerly referred to as the Hospital Outpatient Quality Data Reporting Program (HOP QDRP));
- Ambulatory surgical centers under the Ambulatory Surgical Center Quality Reporting (ASCQR) Program;
- Inpatient rehabilitation facilities under the Inpatient Rehabilitation Facility Quality Reporting Program (IRF QRP);
- Care furnished by physicians and other eligible professionals under the Physician Quality Reporting System (PQRS). We note that beginning in CY 2019, PQRS will be replaced by the Quality Payment Program (QPP), as stated in the MIPS APM final rule with comment period (81 FR 77008);
- Skilled nursing facilities under the Skilled Nursing Facility Quality Reporting Program (SNF QRP);
- Home health agencies under the Home Health Quality Reporting Program (HH QRP); and

- Hospices under the Hospice Quality Reporting Program (HQRP).

We have also implemented programs which link payment to performance including: The Hospital Readmissions Reduction Program (HRRP); the Hospital Value-Based Purchasing (VBP) Program (described further below); the Hospital-Acquired Condition (HAC) Reduction Program; the End-Stage Renal Disease Quality Incentive Program (ESRD QIP); and the Quality Payment Program (QPP).

In implementing the Hospital IQR Program and other quality reporting programs, we have focused on measures which have high impact and support CMS and HHS priorities for improved quality and efficiency of care for Medicare beneficiaries. We have made significant progress over recent program years in reaching our goal of aligning the clinical quality measure requirements of the Hospital IQR Program with various other Medicare and Medicaid programs, including those authorized by the Health Information Technology for Economic and Clinical Health (HITECH) Act, so that the reporting burden of multiple programs on providers will be reduced. We outline the aligned policies between the Hospital IQR Program and the Medicare and Medicaid EHR Incentive Programs in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57172). Our goal for the future is to continue to align those quality measurement requirements and to adopt a more streamlined set of clinical quality measures with electronic specifications aligned to standardized data elements so that electronic collection of performance information is a seamless component of care delivery. We believe the electronic collection and reporting of quality data using health IT will greatly simplify and streamline reporting for various CMS quality reporting programs, and hospitals will experience decreased financial and administrative burden as they are able to switch primarily to health IT based data reporting for many measures that are currently manually chart-abstracted.

We also have implemented a Hospital VBP Program under section 1886(o) of the Act, described in the FY 2013 Hospital Inpatient VBP Program final rule (76 FR 26490 through 26547); the FY 2014 the FY 2014 IPPS/LTCH PPS final rule (78 FR 50676 through 50707); the FY 2015 IPPS/LTCH PPS final rule (79 FR 50048 through 50087); the FY 2016 IPPS/LTCH PPS final rule (80 FR 49544 through 49570); the FY 2017 IPPS/LTCH PPS final rule (81 FR 56979 through 57011); and the CY 2017 OPSS/ASC final rule with comment period (81

FR 79855 through 79862). Under the Hospital VBP Program, performance standards are set and applied to a performance period for the applicable FY. Hospitals receive value based incentive payments based on these performance standards. The measures under the Hospital VBP Program must be selected from current measures (other than readmission measures) specified under the Hospital IQR Program as required by section 1886(o)(2)(A) of the Act.

In selecting measures for the Hospital IQR Program, we are mindful of the conceptual framework we have developed for the Hospital VBP Program. Because measures adopted for the Hospital VBP Program must first have been adopted and publicly reported under the Hospital IQR Program, these two programs are linked. We view the Hospital VBP Program as the next step in promoting higher quality care for Medicare beneficiaries by transforming Medicare from a passive payer of claims into an active purchaser of quality healthcare for its beneficiaries. Value-based purchasing is an important step to revamping how care and services are paid for, moving increasingly toward rewarding better value, outcomes, and innovations.

We also view the HAC Reduction Program, authorized by section 1886(p) of the Act, and the Hospital VBP Program as related but separate efforts to reduce HACs. The Hospital VBP Program is an incentive program that awards payments to hospitals based on quality performance on a wide variety of measures (scoring performance on each measure on the greater of improvement or achievement), while the HAC Reduction Program creates a payment adjustment resulting in payment reductions for hospitals with scores in the lowest performing quartile based on their rates of HACs.

In the preamble of FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20030 through 20064), we proposed changes to the following Medicare quality reporting systems:

- In section IX.A., the Hospital IQR Program.
- In section IX.B., the PCHQR Program.
- In section IX.C., the LTCH QRP.
- In section IX.D., the IPFQR Program.

In addition, in section IX.E. of the preamble of the proposed rule (82 FR 20130 through 20139), we proposed changes to the Medicare and Medicaid EHR Incentive Programs for eligible hospitals and critical access hospitals (CAHs).

A. Hospital Inpatient Quality Reporting (IQR) Program

1. Background

a. History of the Hospital IQR Program

We seek to promote higher quality and more efficient health care for Medicare beneficiaries. This effort is supported by the adoption of widely-agreed upon quality measures. We have worked with relevant stakeholders to define measures of quality in almost every setting and currently measure some aspect of care for almost all Medicare beneficiaries. These measures assess structural aspects of care, clinical processes, patient experiences with care, and outcomes. We have implemented quality measure reporting programs for multiple settings of care. To measure the quality of hospital inpatient services, we implemented the Hospital Inpatient Quality Reporting (IQR) Program, previously referred to as the Reporting Hospital Quality Data for Annual Payment Update (RHQDAPU) Program. We refer readers to the FY 2010 IPPS/LTCH PPS final rule (74 FR 43860 through 43861) and the FY 2011 IPPS/LTCH PPS final rule (75 FR 50180 through 50181) for detailed discussions of the history of the Hospital IQR Program, including the statutory history, and to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50217 through 50249), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49660 through 49692), and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57148 through 57150) for the measures we have adopted for the Hospital IQR Program measure set through the FY 2019 payment determination and subsequent years.

We strive to put patients first, ensuring they are empowered to make decisions about their own healthcare along with their clinicians using information from data-driven insights that are increasingly aligned with meaningful quality measures. We support technology that reduces burden and allows clinicians to focus on providing high-quality healthcare for their patients. We also support innovative approaches to improve quality, accessibility, and affordability of care while paying particular attention to improving clinicians' and beneficiaries' experience when interacting with our programs. In combination with other efforts across the Department of Health and Human Services, we believe the Hospital IQR Program helps to incentivize hospitals to improve healthcare quality and value, while giving patients and providers the tools and information needed to make the best decisions for them. Recognizing

that the Hospital IQR Program represents a key component of the way that we bring quality measurement and improvement together with payment, we have taken efforts to review existing policies to identify how to move the program forward in the least burdensome manner possible while continuing to incentivize improvement in the quality of care provided to patients.

b. Maintenance of Technical Specifications for Quality Measures

The technical specifications for chart-abstracted clinical process of care measures used in the Hospital IQR Program, or links to Web sites hosting technical specifications, are contained in the CMS/The Joint Commission (TJC) Specifications Manual for National Hospital Inpatient Quality Measures (Specifications Manual). This Specifications Manual is posted on the QualityNet Web site at: <http://www.qualitynet.org/>. We generally update the Specifications Manual on a semiannual basis and include in the updates detailed instructions and calculation algorithms for hospitals to use when collecting and submitting data on required chart-abstracted clinical process of care measures.

The technical specifications for electronic clinical quality measures (eCQMs) used in the Hospital IQR Program are contained in the CMS Annual Update for Hospital Quality Reporting Programs (Annual Update). This Annual Update is posted on the eCQI Resource Center webpage at: <https://ecqi.healthit.gov/>. We generally update the measure specifications on an annual basis through the Annual Update, which includes code updates, logic corrections, alignment with current clinical guidelines, and additional guidance for hospitals and EHR vendors to use in order to collect and submit data on eCQMs from hospital EHRs.

In addition, we believe that it is important to have in place a sub-regulatory process to incorporate non-substantive updates to the measure specifications for measures we have adopted for the Hospital IQR Program so that these measures remain up-to-date. We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53504 through 53505) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50203) for our policy for using a sub-regulatory process to make non-substantive updates to measures used for the Hospital IQR Program.

We recognize that some changes made to measures undergoing maintenance review are substantive in nature and

might not be appropriate for adoption using a sub-regulatory process. We will continue to use rulemaking to adopt substantive updates made to measures we have adopted for the Hospital IQR Program. We refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57111) for additional discussion of the maintenance of technical specifications for quality measures for the Hospital IQR Program. We also refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50202 through 50203) for additional details on the measure maintenance process.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20031), we did not propose any changes to our policies on the measures maintenance process, including the maintenance of non-substantive updates to measures used for the Hospital IQR Program.

c. Public Display of Quality Measures

Section 1886(b)(3)(B)(viii)(VII) of the Act was amended by the Deficit Reduction Act (DRA) of 2005. Section 5001(a) of the DRA requires that the Secretary establish procedures for making information regarding measures submitted available to the public after ensuring that a hospital has the opportunity to review its data before they are made public. Our current policy is to report data from the Hospital IQR Program as soon as it is feasible on CMS Web sites such as the *Hospital Compare* Web site, <http://www.medicare.gov/hospitalcompare> after a 30-day preview period (78 FR 50776 through 50778).

Information is available to the public on the *Hospital Compare* Web site. *Hospital Compare* is an interactive web tool that assists beneficiaries by providing information on hospital quality of care to those who need to select a hospital. The Hospital IQR Program currently includes process of care measures, risk-adjusted outcome measures, the HCAHPS patient experience-of-care survey measure, structural measures, Emergency Department throughput measures, patient safety and adverse event measures, immunization measures, hospital-acquired infection measures, and payment measures, all of which are featured on the *Hospital Compare* Web site. For more information on measures reported to *Hospital Compare*, we refer readers to the Web site at: <http://www.medicare.gov/hospitalcompare>.

Other information that may not be as relevant to or easily understood by beneficiaries and information for which there are unresolved display issues or design considerations are not reported on *Hospital Compare* and may be made

available on other CMS Web sites, such as <https://data.medicare.gov>. CMS also provides stakeholders access to archived data from *Hospital Compare*, which can be found at: <https://data.medicare.gov/data/archives/hospital-compare>.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20031 through 20032), we did not propose any changes to these policies.

d. Accounting for Social Risk Factors in the Hospital IQR Program

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20032 through 20033), we discussed the accounting for social risk factors in the Hospital IQR Program. We understand that social risk factors such as income, education, race and ethnicity, employment, disability, community resources, and social support (certain factors of which are also sometimes referred to as socioeconomic status (SES) factors or socio-demographic status (SDS) factors) play a major role in health. One of our core objectives is to improve beneficiary outcomes including reducing health disparities, and we want to ensure that all beneficiaries, including those with social risk factors, receive high quality care. In addition, we seek to ensure that the quality of care furnished by providers and suppliers is assessed as fairly as possible under our programs while ensuring that beneficiaries have adequate access to excellent care.

We have been reviewing reports prepared by the Office of the Assistant Secretary for Planning and Evaluation (ASPE)⁹⁹ and the National Academies of Sciences, Engineering, and Medicine on the issue of measuring and accounting for social risk factors in CMS' quality measurement and payment programs, and considering options on how to address the issue in these programs. On December 21, 2016, ASPE submitted a Report to Congress on a study it was required to conduct under section 2(d) of the Improving Medicare Post-Acute Care Transformation (IMPACT) Act of 2014. The study analyzed the effects of certain social risk factors of Medicare beneficiaries on quality measures and measures of resource use used in one or more of nine Medicare value-based purchasing programs.¹⁰⁰ The report also included considerations for strategies to account for social risk factors in these programs.

⁹⁹ <https://aspe.hhs.gov/pdf-report/report-congress-social-risk-factors-and-performance-under-medicare-value-based-purchasing-programs>.

¹⁰⁰ <https://aspe.hhs.gov/pdf-report/report-congress-social-risk-factors-and-performance-under-medicare-value-based-purchasing-programs>.

In a January 10, 2017 report released by the National Academies of Sciences, Engineering, and Medicine, that body provided various potential methods for measuring and accounting for social risk factors, including stratified public reporting.¹⁰¹

As noted in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57124), the NQF undertook a 2-year trial period in which new measures, measures undergoing maintenance review, and measures endorsed with the condition that they enter the trial period could be assessed to determine whether risk adjustment for selected social risk factors is appropriate for these measures. This trial entailed temporarily including social risk factors in the risk-adjustment approach for these measures. Since publication of the FY 2018 IPPS/LTCH PPS proposed rule, we have learned that the trial period ended in April 2017 and a draft report is available at: http://www.qualityforum.org/SES_Trial_Period.aspx.

As we continue to consider the analyses and recommendations from these reports, we are continuing to work with stakeholders in this process. As we have previously communicated, we are concerned about holding providers to different standards for the outcomes of their patients with social risk factors because we do not want to mask potential disparities or minimize incentives to improve the outcomes for disadvantaged populations. Keeping this concern in mind, while we sought input on this topic previously, we continue to seek public comment on whether we should account for social risk factors in the Hospital IQR Program, and if so, what method or combination of methods would be most appropriate for accounting for social risk factors. Examples of methods include: Confidential reporting to providers of measure rates stratified by social risk factors; public reporting of stratified measure rates; and potential risk adjustment of a particular measure as appropriate based on data and evidence.

In addition, in the proposed rule (82 FR 20032), we sought public comment on which social risk factors might be most appropriate for reporting stratified measure scores and/or potential risk adjustment of a particular measure. Examples of social risk factors include, but are not limited to: Dual eligibility/low-income subsidy, race and ethnicity, and geographic area of residence. We also sought comments on which of these

¹⁰¹ National Academies of Sciences, Engineering, and Medicine. 2017. Accounting for social risk factors in Medicare payment. Washington, DC: The National Academies Press.

factors, including current data sources where this information would be available, could be used alone or in combination, and whether other data should be collected to better capture the effects of social risk. We will take commenters' input into consideration as we continue to assess the appropriateness and feasibility of accounting for social risk factors in the Hospital IQR Program. We note that any such changes would be proposed through future notice-and-comment rulemaking.

We refer readers to section IX.A.13. of the preamble of this final rule, where we discuss the potential future confidential reporting of stratified measure data for the Hospital 30-day, All-Cause, Risk-Standardized Readmission Rate Following Pneumonia Hospitalization (NQF #0506) and the Hospital 30-day, All-Cause, Risk Standardized Mortality Rate (RSMR) for Pneumonia measures. Our goal is to provide examples from several domains for the same issue (pneumonia). We want the reader to understand the approaches from as many perspectives as possible. In addition, we sought comments on options for publicly displaying stratified rates using social risk factors as well as which other social risk factors besides dual eligibility should be used.

Of note, implementing any of the above methods would be taken into consideration in the context of how this and other CMS programs operate (for example, data submission methods, availability of data, statistical considerations relating to reliability of data calculations, among others), so we also welcomed comment on operational considerations.

We received extensive comments in response to our request for public comment on whether we should account for social risk factors in the Hospital IQR Program, and if so, what method or combination of methods would be most appropriate for accounting for social risk factors.

Comment: Several commenters were generally supportive of accounting for social risk factors in the Hospital IQR Program. The commenters expressed appreciation for CMS' interest in providing data to hospitals and to the public to inform these efforts, and urged CMS to provide data in a way that minimizes the risk of providing divergent signals to hospitals. The commenters noted that risk stratification and adjustment are equally significant components of valid quality assessment. Specifically, the commenters believed that risk-adjusting quality measures would: (1) Have a positive impact on provider performance; (2) provide

information essential to allocating resources in high-risk areas; (3) encourage equitable care delivery, while also accounting for the currently disproportionate penalties for safety net and academic medical centers; (4) reduce costs; and (5) prevent weakening of the network of providers that serve disadvantaged populations, which could have the unintended consequence of worsening health disparities. Conversely, some commenters voiced concerns such as: (1) This approach will not address the underlying disparities that are often associated with poor health outcomes and might instead, mask potential disparities or minimize incentives to improve the outcomes for disadvantaged populations; and (2) adjustments to quality measures could create a two-tier system of care where those with few economic or social resources are diminished in the calculation of quality measures. Some commenters stated that providers should not be financially penalized while caring for patients with greater needs.

Several commenters recommended that comorbidities, functional impediments, and cognitive limitations must be accounted for when assessing quality and costs. The commenters suggested that CMS conduct analyses to determine the degree to which certain variables, such as insurance, age, race, and ethnicity, impact admission rates before these factors are weighted as part of any quality scoring metrics. Where meaningful and comprehensive neighborhood level SDS-data currently exist, several commenters stated that CMS should encourage empirical tests of quality metrics adjusted for those factors to assess the impact of said adjustments on local provider performance metrics. Based on these tests, CMS and other agencies would be able to prioritize the national collection of data most essential for valid risk adjustment methodologies.

Many commenters suggested that CMS explore a variety of approaches for accounting for social risk factors, including: risk adjustment, stratification of measure rates for public reporting, and confidential stratification of measures. The commenters also encouraged CMS to work with measure developers and relevant medical societies to ensure social risk factors are considered during the measure development and update processes. Some commenters recommended that stratification or risk-adjustment decisions should be made on a measure by measure level and incorporated into the measure specifications. Some commenters recommended that CMS

require measure developers to test a range of national-level socio-demographic data elements, identified in the ASPE¹⁰² and NAM¹⁰³ reports, into the risk adjustment methodology of accountability metrics.

Many commenters recommended providing this risk-adjusted data alongside unadjusted data so that interventions can be appropriately targeted, but discouraged the use of unadjusted data in publicly reported and pay-for-performance measures. Some commenters stated that CMS should work with stakeholders after the hospitals' review is complete to publicly report this data in an appropriate fashion. Other concerns expressed by some commenters included that data should not be publicly reported until hospitals have had sufficient time to review and understand the results and correct any errors that may stem from the initial implementation of any new methodology. Some commenters suggested that CMS provide hospitals with confidential reports of performance on accountability measures stratified by dual eligible status or other nationally available data elements within a year of this testing.

Commenters encouraged CMS to continue to work on developing more precise approaches to risk adjustment to account for social factors in the rural context. Some commenters stated that CMS should implement demonstration projects to encourage hospitals to collect SDS data through their electronic health records (EHR). Some commenters advised CMS to monitor the effects of changes to quality programs on hospitals serving beneficiaries with social risk factors so that future programmatic changes are made with these concerns in mind. Some commenters also encouraged CMS to reconsider the use of a 3-year look back period historically used to calculate readmission rates as it moves forward with changes to this program.

Response: We appreciate all the comments and interest in this topic. As we have previously stated, we are concerned about holding providers to different standards for the outcomes of their patients with social risk factors, because we do not want to mask potential disparities or minimize

¹⁰² Office of the Assistant Secretary for Planning and Evaluation. 2016. Report to Congress: Social Risk Factors and Performance Under Medicare's Value-Based Purchasing Programs. Available at: <https://aspe.hhs.gov/pdf-report/report-congress-social-risk-factors-and-performance-under-medicare-value-based-purchasing-programs>.

¹⁰³ National Academies of Sciences, Engineering, and Medicine. 2017. Accounting for social risk factors in Medicare payment. Washington, DC: The National Academies Press.

incentives to improve outcomes for disadvantaged populations. We believe that the path forward should incentivize improvements in health outcomes for disadvantaged populations while ensuring that beneficiaries have access to excellent care. We appreciate that some commenters recommended risk adjustment as a strategy to account for social risk factors, while others stated a concern that risk adjustment could minimize incentives and reduce efforts to address disparities for patients with social risk factors. We will consider all suggestions as we continue to assess the issue of accounting for social risk factors within individual measures and the program as a whole, and will actively perform additional research and monitor for trends to prevent unintended consequences. We intend to explore options including, but not limited to, measure stratification by social risk factors in a consistent manner across programs when appropriate, informed by considerations described in section IX.A.13. of the preamble of this final rule, which describes options of: (1) Stratified reporting of a measure by patient factors, which highlights disparities in outcomes by patient subgroup; and (2) peer-to-peer benchmarking based on hospital's share of patient factors, which allows hospitals to compare their performance with like-peers. We also intend to conduct further analyses on the impact of different approaches such as measure-level risk adjustment and stratifying performance scoring to account for social risk factors including the options suggested by commenters. In addition, we will consider the commenters' suggestion that we conduct empirical testing of risk-adjusted quality metrics, and assess the potential impact of the findings from such testing on the

prioritization of national data collection, in relation to risk adjustment methodologies.

We appreciate commenters' recommendations regarding specific social risk factor variables and will work to determine the feasibility of collecting these patient-level variables. As we consider the feasibility of collecting patient-level data and the impact of strategies to account for social risk factors through further analysis, we will also continue to evaluate the reporting burden on providers.

We are committed to ensuring that CMS beneficiaries have access to and receive excellent care and that the quality of care furnished by providers and suppliers is assessed fairly in CMS programs. We thank the commenters, and we will consider their views as we develop further policy regarding social risk factors in the Hospital IQR Program. Any proposals would be made in future rulemaking after further research and continued stakeholder engagement.

2. Retention of Previously Adopted Hospital IQR Program Measures for Subsequent Payment Determinations

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53512 through 53513) for our finalized measure retention policy. Pursuant to this policy, when we adopt measures for the Hospital IQR Program beginning with a particular payment determination, we automatically re-adopt these measures for all subsequent payment determinations unless we propose to remove, suspend, or replace the measures. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20033), we did not propose any changes to this policy.

3. Removal and Suspension of Previously Adopted Hospital IQR Program Measures

As discussed above, we generally retain measures from the previous year's Hospital IQR Program measure set for subsequent years' measure sets except when we specifically propose to remove, suspend, or replace a measure. We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50185) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50203 through 50204) for more information on the criteria we consider for removing quality measures. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49641 through 49643) for more information on the additional factors we consider in removing quality measures and the factors we consider in order to retain measures. We note in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50203 through 50204), we clarified the criteria for determining when a measure is "topped-out." In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20033), we did not propose any changes to these policies.

We refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57112 through 57120) for the list of 15 measures finalized for removal for the FY 2019 payment determination and subsequent years. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20033), we did not propose any measures for removal.

4. Previously Adopted Hospital IQR Program Measures for the FY 2019 Payment Determination and Subsequent Years

The Hospital IQR Program has previously finalized 62 measures for the FY 2019 payment determination and subsequent years as outlined in the table below:

HOSPITAL IQR PROGRAM MEASURES FOR THE FY 2019 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Short name	Measure name	NQF #
Healthcare-Associated Infection Measures		
CAUTI	National Healthcare Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure.	0138
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset <i>Clostridium difficile</i> Infection (CDI) Outcome Measure.	1717
CLABSI	National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure.	0139
Colon and Abdominal Hysterectomy SSI.	American College of Surgeons—Centers for Disease Control and Prevention (ACS—CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	0753
HCP	Influenza Vaccination Coverage Among Healthcare Personnel	0431
MRSA Bacteremia	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) Bacteremia Outcome Measure.	1716
Claims-Based Patient Safety Measures

5. Considerations in Expanding and Updating Quality Measures

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53510 through 53512) for a discussion of the considerations we use to expand and update quality measures under the Hospital IQR Program. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20035), we did not propose any changes to these policies.

6. Refinements To Existing Measures in the Hospital IQR Program for the FY 2020 Payment Determination and Subsequent Years

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20035 through 20043), we proposed refinements to two measures. First, we proposed refinements to the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey (NQF #0166) measure for the FY 2020 payment determination and subsequent years. Second, we proposed refinements to the Stroke 30-Day Mortality Rate (MORT-30-STK) measure for the FY 2023 payment determination and subsequent years. We discuss these refinements in more detail below.

a. Refining the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey (NQF #0166) Measure for the FY 2020 Payment Determination and Subsequent Years

For the FY 2020 payment determination and subsequent years, we proposed to refine the existing Hospital Consumer Assessment of Healthcare

Providers and Systems (HCAHPS) Survey by refining the current Pain Management questions (HCAHPS Q12, Q13, and Q14) to focus on the hospital's communications with patients about the patients' pain during the hospital stay. In accord with this new focus, we proposed to update the name of the composite measure from "Pain Management" to "Communication About Pain."

(1) Background

The HCAHPS Survey (NQF #0166) was adopted in the Reporting Hospital Quality Data Annual Payment Update Program in the CY 2007 OPPS final rule (71 FR 68202 through 68204), beginning with the FY 2008 payment determination and for subsequent years. This Survey includes three Pain Management questions, Q12, Q13 and Q14. In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53513 through 53516), we added the Care Transition Measure (CTM-3) (NQF #0228) to the existing HCAHPS Survey, NQF #0166. The HCAHPS Survey, combining both NQF #0166 for the original survey and NQF #0228 for the Care Transition Measure adopted into the HCAHPS Survey in 2013, is the first national, standardized, publicly reported survey of patients' experience of hospital care. The HCAHPS Survey asks discharged patients 25 questions about their recent hospital stay and 7 "About You" questions. Survey results have been publicly reported on the *Hospital Compare* Web site since 2008. We refer readers to the FY 2011 IPPS/LTCH PPS

final rule (75 FR 50220), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51641 through 51643), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53537 through 53538), and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50819 through 50820) for details on previously-adopted HCAHPS requirements. We also refer hospitals and HCAHPS Survey vendors to the official HCAHPS Web site at: <http://www.hcahpsonline.org> for new information and program updates regarding the HCAHPS Survey, its administration, oversight, and data adjustments.

The HCAHPS Survey (OMB control number 0938-0981) is administered to a random sample of adult patients who receive medical, surgical, or maternity care between 48 hours and 6 weeks (42 calendar days) after discharge and is not restricted to Medicare beneficiaries. Hospitals must survey patients throughout each month of the year. The HCAHPS Survey is available in official English, Spanish, Chinese, Russian, Vietnamese, and Portuguese versions. The HCAHPS Survey and its protocols for sampling, data collection and coding, and file submission can be found in the current HCAHPS *Quality Assurance Guidelines*, which is available on the official HCAHPS Web site at: <http://www.hcahpsonline.org/qaguidelines.aspx>. AHRQ carried out a rigorous, scientific process to develop and test the HCAHPS instrument. This process entailed multiple steps, including: A public call for measures; literature reviews; cognitive interviews; consumer focus groups; multiple

opportunities for additional stakeholder input; a 3-State pilot test; small-scale field tests; and notice-and-comment rulemaking.¹⁰⁴ We refer readers to the CY 2007 OPPS final rule (71 FR 68201)

for a more in-depth discussion about this process. The HCAHPS Survey was endorsed by the NQF on August 5, 2005 (#0166).

The Pain Management questions currently included in the HCAHPS Survey are as follows:

12. During this hospital stay, did you need medicine for pain?

¹ ☐ Yes

² ☐ No → If No, Go to Question 15

13. During this hospital stay, how often was your pain well controlled?

¹ ☐ Never

² ☐ Sometimes

³ ☐ Usually

⁴ ☐ Always

14. During this hospital stay, how often did the hospital staff do everything they could

to help you with your pain?

¹ ☐ Never

² ☐ Sometimes

³ ☐ Usually

⁴ ☐ Always

In the CY 2017 OPPS/ASC final rule with comment period in the context of the Hospital VBP Program (81 FR 79856), we stated that we received feedback that some stakeholders are concerned about the Pain Management dimension questions being used in a program where there is any link between scoring well on the questions and higher hospital payments (81 FR 79856). The Pain Management dimension used in the Hospital VBP Program is identical in composition to the Pain Management measure used in the Hospital IQR Program, questions Q12, Q13 and Q14 with one difference: The HCAHPS dimension score in the Hospital VBP program is based on the percentage of patients who chose the most positive response option (“top-

box” response). For more information about the Hospital VBP Program scoring methodology, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57006).

Some stakeholders believed that the linkage of the Pain Management dimension questions to the Hospital VBP Program payment incentives created pressure on hospital staff to prescribe more opioids in order to achieve higher scores on this dimension (81 FR 79856). We stated that we continue to believe that pain control is an appropriate part of routine patient care that hospitals should manage and is an important concern for patients, their families, and their caregivers (81 FR 79856). Further, we stated that it is important to note that the HCAHPS

Survey does not specify any particular type of pain control method (81 FR 79856). We added that appropriate pain management includes communication with patients about pain-related issues, setting expectations about pain, shared decision-making, and proper prescription practices (81 FR 79856). Furthermore, we stated that although we were not aware of any scientific studies that support an association between scores on the Pain Management dimension questions and opioid prescribing practices, we were developing alternative questions for the Pain Management dimension in order to remove any potential ambiguity in the HCAHPS Survey. We noted that we believe that removing the Pain Management dimension from the

¹⁰⁴ “Development, Implementation, and Public Reporting of the HCAHPS Survey.” L.A. Giordano,

M.N. Elliott, E. Goldstein, W.G. Lehrman and P.A.

Spencer. Medical Care Research and Review, 67 (1): 27–37. 2010.

Hospital VBP Program scoring calculations would address potential confusion about the appropriate use of the Pain Management dimension, and provide us with an opportunity to further refine the pain management questions used in the HCAHPS Survey (81 FR 79859).

In the same final rule, we stated we would follow our standard survey development processes, which included drafting alternative questions, cognitive interviews and focus group evaluation, field testing, statistical analysis, stakeholder input, the Paperwork Reduction Act, and NQF endorsement (81 FR 79856).

In that final rule, numerous commenters supported the development of modified questions regarding pain management for the HCAHPS Survey and some commenters expressed particular support for modified pain management questions that focused on effective communication with patients about pain management-related issues (81 FR 79859 through 79860). Specifically, a number of commenters recommended modified pain management questions focused on shared decision-making, discussion of treatment options, including non-opioid pain management therapies, patient understanding of pain management options, and patient engagement in their care (81 FR 79860).

Therefore, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20035 through 20039), for the FY 2020 payment determination and subsequent years, we proposed to update and refine the existing HCAHPS Survey questions (HCAHPS Q12, Q13, and Q14) to focus more directly on communication with patients about their pain during the hospital stay.

These proposed revised questions would be used to form the composite measure “Communication About Pain.” The proposed revised Communication about Pain composite measure would be a part of the HCAHPS Survey and would be publicly reported in the Hospital IQR Program. More information about the revised questions/composite measure is included below.

In compliance with section 1890A(a)(2) of the Act, measures proposed for the Hospital IQR Program were included in a publicly available document: “List of Measures under Consideration for December 1, 2016” available at: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityMeasures/Downloads/Measures-under-Consideration-List-for-2016.pdf>.

The Measure Applications Partnership (MAP), a multi-stakeholder

group convened by the NQF, reviews the measures under consideration for the Hospital IQR Program, among other Federal programs, and provides input on those measures to the Secretary. The MAP’s 2017 recommendations for quality measures under consideration are captured in the following documents: “2016–2017 Process and Approach for MAP Pre Rulemaking Deliberations” available at: <http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=84455> and “2016–2017 Spreadsheet of Final Recommendations to HHS and CMS” available at: <http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=84452>.

We considered the input and recommendations provided by the MAP.

The Communication About Pain (MUC16–263) composite measure was reviewed by the MAP in December 2016. The MAP recommended that this composite measure be refined and resubmitted prior to rulemaking. The MAP emphasized the need to include non-pharmacological options used to treat pain. The MAP recommended that the testing results demonstrate reliability and validity for the Hospital IQR Program. The MAP also recommended that the measure be submitted to NQF for review and endorsement.¹⁰⁵ We plan to resubmit the proposed refined Communication About Pain composite measure to the MAP at the next opportunity. As we discuss in more detail below, the proposed refined Communication About Pain composite measure underwent field testing in 2016. Results were not yet available for the MAP’s review in December 2016, but are now complete and are posted on the official HCAHPS On-Line Web site, “Development of a New Communication About Pain Composite Measure for the HCAHPS Survey,” available at: <http://www.hcahpsonline.org/modeadjustment.aspx>. We believe the measure is now fully developed and tested and we intend to provide feedback to the MAP Hospital Workgroup for review of testing results.

In early 2016, we empirically tested as part of the field test the reliability and validity of the proposed refined Communication About Pain composite measure in a large-scale experiment that involved patients from 51 hospitals across the nation. (We note that we are correcting a technical error here; the

proposed rule (82 FR 20037) stated “50 hospitals.”) Our analyses suggest the proposed refined Communication About Pain composite measure, which includes two substantive items regarding how often staff talked about pain and how often staff discussed how to treat pain while in the hospital (Q13 and Q14), as well as a screener item (Q12), have strong reliability (evidence that scores for hospitals are precisely measured) and validity (evidence that the measure does measure the intended construct of patient experience).¹⁰⁶ These properties of the individual questions used in the proposed refined Communication About Pain composite measure are as good as or better than the current Pain Management questions. The new questions are not subject to floor or ceiling effects (which would occur if almost all responses were in the lowest or highest response category), have excellent hospital-level reliability (here 0.88 or higher, where 0.70 or higher is the conventional standard) at recommended sample sizes, are not redundant with other current questions, are related in a predictable manner with the standard patient-mix characteristics, positively correlate with the two HCAHPS questions that assess overall patient experience (rating and recommendation) with the hospital, providing evidence of validity and do not vary systematically by survey mode, patient race/ethnicity, or hospital characteristics after adjusting for patient mix. They also have higher internal consistency as a composite measure (Cronbach’s alpha = 0.81), with 0.70 or higher being the conventional threshold, providing further evidence of reliability.¹⁰⁷

As stated above, the MAP recommended the proposed refined Communication About Pain composite measure be submitted to the NQF for review and endorsement once testing has been completed.¹⁰⁸ The proposed refined Communication About Pain composite measure is not yet NQF endorsed; however, we intend to submit the measure to the NQF for endorsement when the Person and Family Centered Care Project has a call for measures.

Whenever feasible, we adopt measures that are NQF-endorsed, but note sometimes there are important

¹⁰⁶ Judd, C.M., & McClelland, G.H. (1998). Measurement. In D.T. Gilbert, S.T. Fiske, & G. Lindzey (Eds.), *The handbook of social psychology* (4th ed., Vol. 1, pp. 180–232). New York: McGraw-Hill.

¹⁰⁷ Cronbach, L.J. (1984). *Essentials of psychological testing* (4th ed.). New York: Harper.

¹⁰⁸ “2017 Considerations for Implementing Measures Hospitals-Final Report,” available at: <http://www.qualityforum.org/map/>.

¹⁰⁵ “2016–2017 Spreadsheet of Final Recommendations to HHS and CMS” available at: <http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=84452>.

areas of clinical concern for which NQF-endorsed measures do not exist. Section 1886(b)(3)(B)(IX)(bb) of the Act provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. (The NQF currently holds this contract.) We considered other existing measures which have been endorsed by the NQF and other consensus organizations, but we were unable to identify any NQF-endorsed (or other consensus organization endorsed) measures that were feasible and practical.

While we consider MAP recommendations and NQF endorsement status as part of our decision-making process for which measures to include in the Hospital IQR Program, we believe it is important to adopt this proposed refined Communication About Pain composite measure, because communicating with patients about their pain is an integral part of delivering high quality, person-centered care.¹⁰⁹ In developing the proposed refined Communication About Pain composite measure, we followed our standard survey development processes,¹¹⁰ which included drafting alternative questions, cognitive interviews, focus group evaluation, field testing, statistical analysis, and stakeholder input. We believe the proposed refined Communication About Pain composite measure has been sufficiently tested, demonstrating high levels of reliability and validity, as noted above.

Further, we have consistently received feedback from some

stakeholders expressing concern that the current Pain Management questions encourage overprescribing of opioids as discussed in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79856). As a result, we believe it is important to refine the existing Pain Management measure. In the proposed rule (82 FR 20038), we noted that if our proposal to revise the current Pain Management measure questions with those in the proposed refined Communication About Pain composite measure is not finalized, we would continue to use the Pain Management questions as previously finalized.

The proposed refined Communication About Pain composite measure is discussed below. We proposed to revise the current Pain Management questions (Q12, Q13, and Q14) in the HCAHPS Survey for the FY 2020 payment determination and subsequent years by adopting the proposed refined Communication About Pain composite measure in the HCAHPS Survey beginning with the FY 2020 payment determination, which would be applicable to surveys administered to patients beginning with January 1, 2018 discharges and for subsequent years.

In compliance with section 1886(b)(3)(B)(viii)(VII) of the Act, we calculate and publicly report HCAHPS measures from four consecutive quarters of data. From that point and forward, the oldest quarter of data is rolled off, the newest quarter is rolled on, and the measure scores are calculated for this unique set of four quarters and are publicly reported on the *Hospital Compare* Web site and available for payment determination. Data submitted for the current Pain Management measure in CY 2017 for the FY 2019 payment determination will be publicly reported on the *Hospital Compare* Web site in October 2018. In the proposed rule (82 FR 20038), we noted that if our proposal to revise the HCAHPS Pain Management measure with the HCAHPS Communication About Pain composite measure is finalized, we would begin to use the new Pain Management questions on the HCAHPS Survey in January of 2018. Once we have collected four consecutive quarters of the HCAHPS Communication About Pain composite measure questions, we would create

scores for the Communication About Pain composite measure.

We would be unable to report or use for payment determination either the original or new Pain Management measure unless and until we have collected 4 quarters of data for the measure. The CY 2017 reporting period/FY 2019 payment determination would be the last period for which we have four quarters of the original Pain Management measure data which, as stated above, would be publicly reported on the *Hospital Compare* Web site in October 2018. We would be unable to publicly report either the original or proposed refined Communication About Pain composite measure on the *Hospital Compare* Web site in December 2018, April 2019, or July 2019 because there would be fewer than 4 quarters of data for both the original and the new measure. The CY 2018 reporting period/FY 2020 payment determination would be the first period for which we have four quarters of the proposed refined Communication About Pain composite measure. Therefore, the first opportunity to publicly report the Communication About Pain composite measure on the *Hospital Compare* Web site would be in October 2019. From this point forward, the proposed refined Communication About Pain composite measure could be used for payment determinations.

(2) Overview of Measure

The refined questions that comprise the proposed refined Communication About Pain composite measure closely mirror the structure and style of the existing Pain Management questions. However, the new questions address how providers communicate with patients about pain while removing any ambiguities in the wording or intent of the questions. This refinement is consistent with the HCAHPS Survey's original design, development, and NQF endorsement (NQF #0166). Further, we designed the Communication About Pain composite measure to be consistent and compatible with existing HCAHPS questions and HCAHPS sampling and survey administration protocols. The three Communication About Pain composite measure questions are as follows:

¹⁰⁹ "A Special Contribution from the Centers for Medicare and Medicaid Services: Valuing Patient Experience While Addressing the Prescription Opioid Epidemic." L. Tefera, W.G. Lehrman, E.G. Goldstein and S. Agrawal. *Annals of Emergency Medicine*. 2016. Published online, 7–19–16. [http://www.annemergmed.com/article/S0196-0644\(16\)30367-5/fulltext](http://www.annemergmed.com/article/S0196-0644(16)30367-5/fulltext).

¹¹⁰ "Development, Implementation, and Public Reporting of the HCAHPS Survey." L.A. Giordano, M.N. Elliott, E. Goldstein, W.G. Lehrman and P.A. Spencer. *Medical Care Research and Review*, 67 (1): 27–37. 2010.

- HP1: “During this hospital stay, did you have any pain?”

☐ Yes

☐ No → *If No, Go to Question* ____

- HP2: “During this hospital stay, how often did hospital staff talk with you about how much pain you had?”

☐ Never

☐ Sometimes

☐ Usually

☐ Always

- HP3: “During this hospital stay, how often did hospital staff talk with you about how to treat your pain?”

☐ Never

☐ Sometimes

☐ Usually

☐ Always

As stated above, in light of the ongoing opioid epidemic, we believe it is important the Communication About Pain composite measure is abundantly clear in its focus on communication about pain between providers and their patients, and it is applicable to all patients who experienced pain during their hospital stay.

(3) Data Collection

The proposed refined Communication About Pain composite measure questions would be administered and data collected in exactly the same manner as the current Pain Management measure questions. There would be no changes to HCAHPS patient eligibility or exclusion criteria. Detailed information on HCAHPS data collection protocols can be found in the current HCAHPS Quality Assurance Guidelines, located at: <http://www.hcahpsonline.org/qaguidelines.aspx>. We reiterate that other than the revision of the HCAHPS Pain Management questions, the

HCAHPS Survey and its administration and data collection protocols would be unchanged. The survey adjustment and patient-mix adjustment for the proposed refined Communication About Pain composite measure would be made available on the official HCAHPS On-Line Web site at: <http://www.hcahpsonline.org/modeadjustment.aspx>.

(4) Public Reporting

The scoring of the proposed refined Communication About Pain composite measure would be the same as the current Pain Management measure. Detailed information on how the measure would be scored for purposes of public reporting can be found on the HCAHPS Web site at: <http://www.hcahpsonline.org/Files/Calculation%20of%20HCAHPS%20Scores.pdf>.

We invited public comment on our proposal to revise the current Pain Management questions (Q12, Q13, and Q14) in the HCAHPS Survey for the FY

2020 payment determination and subsequent years by adopting the proposed refined Communication About Pain composite measure in the HCAHPS Survey beginning with the FY 2020 payment determination and subsequent years, which would be applicable to surveys administered to patients beginning with January 1, 2018 discharges and for subsequent years as discussed above.

Comment: There was a consensus among commenters that pain care is a critical matter to measure as part of HCAHPS. Many commenters supported the proposed refinement to the HCAHPS Survey measure pain management questions. The commenters noted reframing the HCAHPS pain measures as “Communication About Pain” is a positive change that would help ensure care is more patient-centered. The commenters appreciated the fact the new questions focus more directly on communication with patients about their pain during the hospital stay, as

opposed to patients' perceptions of the adequacy of pain treatment during the hospital stay. One commenter commended CMS on its responsiveness to concerns about pain and the development of new items focusing less on pharmacotherapy items. Another commenter noted that pain management measures address an important aspect of patient care. Another commenter noted that Pain Management questions are needed for improved delivery of care, proper pain management, and shared decision making. Another commenter noted that the revised pain management questions are an improvement. One commenter supported refining the pain management questions to dissuade over-prescription of opioids and remove ambiguities, and appreciated the steps taken by CMS to test for reliability and validity. One commenter noted that the new focus on pain communication is positive, ensuring that care is more patient-centered. Another commenter noted that CMS should proceed with the proposed changes to the pain management questions.

Response: We thank the commenters for their support. We believe that the proposed refined pain management questions as formulated shift focus from the method of pain management to patient-centered communication between provider and patient. We believe the proposed refined Communication About Pain composite measure adequately reflects shared decision making and pain management by focusing on communication between patients and providers rather than the particular course of treatment. We engaged the patient and caregiver community in evaluating and refining the questions related to pain management as part of our standard survey development process.

Comment: Several commenters supported complete removal of the pain management questions from the HCAHPS Survey measure, arguing that questions evaluating how pain is discussed offer no benefit to patients.

Another commenter encouraged CMS to reduce external pressure on providers to prescribe opioids inappropriately by completely removing the current Pain Management questions from the HCAHPS Survey measure beginning in CY 2018 because doing so would help ensure physicians have the ability to treat patients in the most appropriate manner. In addition, the commenter urged CMS to eliminate pain as a "fifth vital sign" from all professional standards because the current culture of pain as a fifth vital sign minimizes investigation into causes of pain and incentivizes methods of addressing pain

in a manner that may not support the patient's health in the long term.

Response: Pain management is an important component of the quality of care provided at a hospital, and we believe continued inclusion of the HCAHPS Survey measure in the Hospital IQR Program provides patients with critical information for use in selecting a hospital setting for their care, ensures hospitals continue to appropriately manage patients' pain, and encourages hospitals to engage in quality improvement efforts in addressing pain management and communication about pain. We continue to believe pain control is a critical part of routine patient care that hospitals should manage and is an important concern for patients, their families, and patient caregivers. Furthermore, as revised, the pain management questions focus entirely on communication about pain with patients and do not refer to, recommend, or imply that any particular type of treatment is appropriate. We believe the revised Communication About Pain composite measure questions should encourage more and better communication between hospital staff and patients about pain and should not affect patient treatment. Therefore, we believe there is continued benefit to include and publicly report the HCAHPS Survey Pain Management questions in this and other CMS quality programs that use the HCAHPS Survey.

Finally, we acknowledge the commenter's recommendation that we eliminate pain as a "fifth vital sign" from professional standards, and we note that such requests should be referred to and addressed by relevant professional societies.

Comment: Many commenters supported the proposed refinement of the HCAHPS Survey measure pain management questions to focus more on communication about pain, but only if first endorsed by the NQF. The commenters stated that having the NQF endorse the revised questions would allow the measure to be publicly vetted by different stakeholders, including hospitals and patient advocates and address concerns about the reliability and validity of the proposed refined Communication About Pain composite measure before they are implemented. The commenters expressed concern that CMS intends to resubmit the measure to the MAP Hospital Workgroup and to NQF for endorsement when there is a call for measures by the Person and Family Centered Care Project, after the measure is proposed to have been implemented in Hospital IQR Program

already. In addition, one commenter believed the potential unintended consequences of the current pain management questions has resulted in CMS working too quickly to develop the proposed refined Communication About Pain composite measure, and cautioned that field testing including patients from 51 hospitals does not produce strong reliability and validity that are better than the current questions.

Many commenters requested CMS release findings from the field testing of these proposed refined Communication About Pain composite measure and move the measure forward through the NQF process prior to considering adoption into the Hospital IQR Program.

Response: We thank the commenters for their support. We continue to believe the HCAHPS Survey measure Pain Management questions, and the HCAHPS Survey as a whole, are valid and reliable measures of hospital quality that encourage hospitals to assess and improve the patient experience.^{111 112} The HCAHPS Survey as a whole is already NQF-endorsed (NQF #0166). We anticipate the proposed refined Communication About Pain composite measure will receive NQF-endorsement when there is a call for measures by the Person and Family Centered Care Project. We intend to resubmit the measure to the MAP and submit the measure to the NQF for endorsement after the measure refinement has already been implemented in the Hospital IQR Program. However, we have had to weigh the potential, unintended public health concerns against the necessary time to complete these reviews. Out of an abundance of caution, in the face of a nationwide epidemic of opioid over-prescription, we believe implementing the proposed refined Communication About Pain composite measure as soon as feasible is necessary to address any perceived conflict between appropriate management of opioid use and patient satisfaction by relieving any potential pressure physicians may feel to overprescribe opioids. We believe that replacing the current pain management questions in the HCAHPS Survey with revised questions that focus on the adequacy and frequency of communication about pain will remove any perceived ambiguity or confusion about the intent of the pain items and

¹¹¹ "Do Hospitals Rank Differently on HCAHPS for Different Patient Subgroups?" M.N. Elliott, W.G. Lehrman, E. Goldstein, K. Hambarsoomian, M.K. Beckett and L.A. Giordano. Medical Care Research and Review, 67 (1): 56–73. 2010.

¹¹² National Quality Forum. NQF-Endorsed Measures for Person- and Family-Centered Care. Phase 1 Technical Report March 4, 2015. Pp. 26–40.

enhance communication about the particular needs individual patients have with respect to pain. We hope the refined pain management questions will shift focus from the method of pain management to patient-centered communication between provider and patient.

As discussed in our proposal above, whenever feasible, we adopt measures that are NQF-endorsed, but note sometimes there are important areas of clinical concern for which NQF-endorsed measures do not exist. Section 1886(b)(3)(B)(IX)(bb) of the Act provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. (The NQF currently holds this contract.) We considered other existing measures which have been endorsed by the NQF and other consensus organizations, but we were unable to identify any NQF-endorsed (or other consensus organization endorsed) measures that were feasible and practical.

In addition, while we consider MAP recommendations and NQF endorsement status as part of our decision-making process for which measures to include in the Hospital IQR Program, we believe it is important to adopt the proposed refined Communication About Pain composite measure. In addition, in response to the MAP's request to receive an update on the status of measures that received a Refine and Resubmit recommendation, we intend to update the MAP about these Communication About Pain composite measure questions.

The refined Communication About Pain composite measure was informed by input and guidance on survey content and approach from a technical expert panel, focus groups and cognitive testing to explore patient experience and interpretation of survey items, and field testing of survey items to test item properties and psychometric performance and composite measures. We disagree that field testing including patients from 51 hospitals does not produce strong reliability and validity that are better than the current questions. As described in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20037), in early 2016, we empirically tested, as part of the field testing, the reliability and validity of the proposed refined Communication About Pain

composite measure in a large-scale experiment that involved patients from 51 hospitals across the nation. The 51 hospitals were carefully selected to be nationally representative, and the sample sizes of patients and hospitals exceeded requirements for assessing reliability and validity. The statistical reliability and validity of the new proposed items meet high psychometric standards and have undergone testing that meets the standards of the field. Our analyses suggest the proposed refined Communication About Pain composite measure has strong reliability (evidence that scores for hospitals are precisely measured) and validity (evidence that the measure does measure the intended construct of patient experience).¹¹³ These properties of the individual questions used in the proposed refined Communication About Pain composite measure are as good as or better than the current Pain Management questions. The new questions are not subject to floor or ceiling effects (which would occur if almost all responses were in the lowest or highest response category), have excellent hospital-level reliability (here 0.88 or higher, where 0.70 or higher is the conventional standard) at recommended sample sizes, are not redundant with other current questions, are related in a predictable manner with the standard patient-mix characteristics, positively correlate with the two HCAHPS questions that assess overall patient experience (rating and recommendation) with the hospital, providing evidence of validity and do not vary systematically by survey mode, patient race/ethnicity, or hospital characteristics after adjusting for patient mix. They also have higher internal consistency as a composite measure (Cronbach's alpha = 0.81), with 0.70 or higher being the conventional threshold, providing further evidence of reliability.¹¹⁴ Therefore, we disagree that the field testing does not produce strong reliability and validity. With respect to commenters' request that we release findings from the field testing of the proposed refined Communication About Pain questions, a summary of the results of the field testing of the proposed refined Communication About Pain composite measure, among others, became available in early July 2017 on our HCAHPS On-Line Web site. We refer readers to "Development of a New

Communication About Pain Composite Measure for the HCAHPS Survey," available at: <http://www.hcahpsonline.org/modeadjustment.aspx>.

As discussed in the CY 2017 OPPI/ASC final rule with comment period (81 FR 79855 through 79862), and in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20035), we followed our standard survey development processes, which included drafting alternative questions, cognitive interviews and group evaluation, field testing, statistical analysis, and soliciting stakeholder input. We believe the proposed refined Communication About Pain questions represent stakeholder consensus and have been specifically designed to reduce the probability of unintended consequences and to maximize improved patient outcomes. We will monitor the proposed refined Communication About Pain composite measure for any possible unintended consequences.

Comment: A few commenters supported the proposed refinements to the HCAHPS pain management questions, but recommended suspending public reporting of pain management questions on the *Hospital Compare* Web site until the questions have been fully vetted by the NQF.

One commenter encouraged CMS to consider publicly reporting less than four quarters of data in the interim period in which less than four quarters of data are available so that this important measure can be brought to the public sooner.

Response: We believe continued public reporting of Pain Management performance rates provides the public with important quality data for use in health care decision-making and incentivizes quality improvement regarding pain management and communication. We further believe continued public reporting of the score for the composite Pain Management measure performance rates provides valuable information to patients and consumers and encourages hospitals to appropriately manage patients' pain and continue engaging in quality improvement efforts.¹¹⁵ However, in order to be responsive to stakeholder concerns, we are finalizing a modification of our proposal, to delay public reporting of the revised Communication About Pain composite measure. Instead of publicly reporting

¹¹³ Judd, C. M., & McClelland, G.H. (1998). Measurement. In D.T. Gilbert, S.T. Fiske, & G. Lindzey (Eds.), *The handbook of social psychology* (4th ed., Vol. 1, pp. 180–232). New York: McGraw-Hill.

¹¹⁴ Cronbach, L.J. (1984). *Essentials of psychological testing* (4th ed.). New York: Harper.

¹¹⁵ L. Tefera, W.G. Lehrman, and P. Conway. "Measurement of the Patient Experience: Clarifying Facts, Myths, and Approaches." *Journal of the American Medical Association*. Published online, 3–10–16. <http://jama.jamanetwork.com/article.aspx?articleid=2503222>.

in October 2019 using data from the CY 2018 reporting period/FY 2020 payment determination, we will delay public reporting of the refined Communication About Pain composite measure on the *Hospital Compare* Web site until October of 2020, using data from the CY 2019 reporting period/FY 2021 payment determination. After this initial public reporting, public reporting will continue for subsequent years.

In the meantime, we will provide results on the refined Communication About Pain composite measure questions to hospitals in confidential preview reports upon the availability of four quarters of data based on CY 2018 data. We anticipate that the confidential preview reports will be disseminated in the summer of 2019. We note hospitals may have access to their raw HCAHPS data and to unofficial HCAHPS scores through their survey vendor prior to the submission of their HCAHPS data to CMS and prior to the dissemination of the Hospital Specific Confidential Preview Reports that contain official HCAHPS scores.

As stated above, we intend to resubmit the measure to the MAP Hospital Workgroup and to the NQF for endorsement when there is a call for measures by the Person and Family Centered Care Project and we anticipate the proposed refined Communication About Pain composite measure will receive MAP approval and NQF endorsement. Delaying public reporting of the proposed refined Communication About Pain composite measure on the *Hospital Compare* Web site until October of 2020 should provide sufficient time for NQF review prior to public display of this measure data. In addition, delaying public reporting of this measure until October of CY 2020 will give hospitals one year to review their performance data on the refined Communication About Pain composite measure questions prior to public reporting of their performance data on the *Hospital Compare* Web site.

In response to the commenter's suggestion that we consider publicly reporting less than four quarters of data in the interim period in which less than four quarters of data are available so this measure can be brought to the public sooner, while we agree the Pain Management questions convey important information about hospital quality, we believe the value of the proposed refined Communication About Pain composite measure would be enhanced by adhering to the established practice of collecting four quarters of data for public reporting. Doing so ensures that publicly reported HCAHPS measures are based on the same

discharge period and provides more time for hospitals to attain the minimum number of completed surveys required for public reporting.

Comment: Many commenters supported removal of the existing pain management questions from the HCAHPS Survey measure, but expressed concern with the wording of the refined Communication About Pain composite measure. The commenters believed the exact wording of the pain management questions is important because results from patient satisfaction surveys influence quality improvement initiatives since hospitals are partially reimbursed based on patient satisfaction scores. While commenters agreed it is important to remove ambiguities in the wording or intent of the questions and appreciated CMS' steps to appropriately test the measure for reliability and validity, some commenters expressed concern the proposed refined Communication About Pain composite measure may not assist with quality improvement activities to ensure that patients receive appropriate pain management. The commenters provided a variety of alternate formulations for the pain questions for CMS to consider. Several commenters provided specific suggested language with which to replace the three existing pain management questions. In addition to specific language changes, some commenters made more general recommendations with respect to the refinement of the Pain Management questions.

One commenter expressed concern with the use of the word "treat" in question HP3. The commenter believed the word "treat" implies complete pain relief should be achieved, which is not always possible. As such, the commenter suggested question HP3 be re-worded to replace the word "treat" with the words "manage or treat." The commenters asserted this wording revision would be a better way to encompass all methods of pain management, rather than just medication.

Another commenter challenged the terminology used in all three questions because the word "pain" has a negative connotation and suggested that asking a patient about their "comfort," instead of "pain" would be more appropriate.

Finally, one commenter suggested all three revised pain management questions be modified to explicitly include the type of clinical staff (that is, nurses, primary care giver, or physician) communicating with the patient at the time the pain is being assessed.

Response: We thank the commenters for their recommendations regarding

alternative refinements to the wording of the Pain Management questions in the HCAHPS Survey measure. We would like to reiterate that the HCAHPS Survey is a patient experience of care survey and not a patient satisfaction survey. The HCAHPS Survey asks recently discharged patients about aspects of their hospital experience that they are uniquely suited to address. The survey asks "how often" or whether patients experienced a critical aspect of hospital care, rather than whether they were "satisfied" with their care.¹¹⁶ Furthermore, we are unaware of any empirical evidence demonstrating that failing to prescribe opioids lowers a hospital's HCAHPS Survey scores. However, we believe the potential confusion about the appropriate use and interpretation of the Pain Management questions, coupled with the public health concern about the opioid epidemic, warrants refinement to the existing Pain Management questions. As outlined above, we received multiple suggestions for alternate wording of the Pain Management questions. We appreciate the alternative survey question wording submitted by numerous commenters and will consider them for future use. In some instances, we have given consideration to similar concepts and formulations, but we note that for use in relatively short, national surveys of patient experience of care, items must be widely applicable, simple, clear, easily understood, and unambiguous.

As discussed in the CY 2017 OPPI/ASC final rule with comment period (81 FR 79855 through 79862), and in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20035), in developing the proposed refined Pain Management questions, we have followed our standard survey development processes, working with our contractors, which included drafting alternative questions, cognitive interviews and group evaluation, field testing, statistical analysis, empirical testing in a large-scale experiment, and soliciting stakeholder input. We conducted interviews with providers and patients as well as cognitive testing with patients.

We developed and submitted two measures related to the refinement of the pain management questions for consideration by the MAP and, subsequently, narrowed consideration to just one measure, "Communication about pain during the hospital stay," withdrawing the measure "Communication about pain after

¹¹⁶ HCAHPS Fact Sheet available at: <http://www.hcahpsonline.org/Facts.aspx>.

discharge.”¹¹⁷ The proposed refined Communication About Pain composite measure has proceeded through the pre-rulemaking process, including addition onto the “Measures Under Consideration” list and review by the MAP, as well as notice-and-comment rulemaking through this final rule. Furthermore, we intend to seek NQF endorsement for the proposed refined Pain Management questions. We believe the proposed refined pain management questions as formulated shift focus from the method of pain management to patient-centered communication between provider and patient.

Moreover, we cognitively tested with both English- and Spanish-speaking patients how the words “treat,” “manage,” and “reduce” pain were interpreted. After assessing the results, we decided we decided to use “treat” in the refined Communication About Pain composite measure.

While we appreciate the suggestion, we believe that use of the word “comfort” may lead to more misunderstanding than use of the word “pain” because the concept of “comfort” is even more subjective than the concept of the word “pain.” Finally, in response to the commenter’s suggestion that the Pain Management questions be modified to explicitly include the type of clinical staff communicating with the patient, doing so would entail adding more questions to the survey, which would result in an increase in the length and complexity of the survey, and thus, also increase the burden for both patients and hospitals, which we believe is inadvisable and unnecessary.

Comment: Several commenters supported the refinements to the HCAHPS Survey measure pain management questions, but lacked confidence that simply including communication questions regarding pain management would reflect the true perception the patients have of their experience relative to pain management. These commenters encouraged CMS to continue to explore other ways to ensure better measurement of patients’ experience with pain management, such as including additional questions about whether hospital staff talked about alternatives to medication for pain management and clearly communicated to the patients the addictive potential of opioid medications. The commenters also expressed concerns the questions related to pain management pertain only

to whether the caregiver discussed the patient’s pain but do not reflect the patient’s engagement in this discussion.

Several commenters recommended incorporating concepts of care quality for pain management, such as: (1) The degree to which hospital staff listened to patients and responded to their pain (including offering non-opioid or non-medication options); and (2) the degree to which patients felt the hospital staff helped them understand their options to manage their pain.

Response: We thank the commenters for their support. In the comments received, there was broad support for shifting the focus of the pain management questions in the HCAHPS Survey from assessment of the adequacy and effectiveness of pain control efforts among patients who needed medicine for pain, to assessment of the frequency of hospital staff’s efforts to talk about pain and its treatment among patients who experienced pain during their hospital stay. We continue to believe pain control is a critical part of routine patient care that hospitals should manage and is an important concern for patients, their families, and their caregivers.

With respect to how pain is captured and monitored, we believe that adequate pain management is an important goal for hospitals and a concern of patients and consumers. By focusing directly on communication about pain with the patient, we believe that the refined Communication About Pain composite measure will encourage and enhance hospital staff’s discussions with patients about patients’ particular circumstances while reducing the potential for misinterpretation that could lead hospital staff to using inappropriate treatment. During measure development, in the 2016 HCAHPS mode experiment, we tested a question that asked patients about various non-prescription pain treatments. However, the question did not meet statistical criteria for acceptability,¹¹⁸ and could cause providers to infer that these treatments are appropriate for every patient. We will continue to evaluate this question for possible future inclusion as a question on the HCAHPS Survey.

In addition, regarding the comment raising concerns that the questions pertain only to whether the caregiver discussed the patient’s pain, but do not reflect the patient’s engagement in this discussion, we had tested different

words during measure development to determine which would give better responses. Through cognitive interviews with patients and interviews with providers, we have learned that “talking” with hospital staff about how much pain the patient had or how to treat pain indicated greater patient engagement than did “discussing” or “telling” patients.

Furthermore, although important, Pain Management is only one of nine aspects of patient experience explored by the HCAHPS Survey. Because parsimony and brevity are fundamental to the success of the survey, we believe there are limits on the number and specificity of the questions that can be devoted to any particular topic. Therefore, we had to balance brevity with utility in determining the ultimate version of the refined Communication About Pain composite measure questions. However, we will take into consideration commenters’ suggestions for the future and continue to investigate effective means of exploring patients’ pain management experience and ways to ensure better measurement of patients’ experiences with pain management.

Comment: One commenter believed these answers still would not provide much real, significant information about the patients’ experience or provide information about whether their pain was addressed. The commenter suggested formulating questions that focus on patient function and regular assessment and treatment of their overall status rather than solely on their pain. A few commenters suggested that the Communication About Pain composite measure reflect current best practice for both acute and chronic pain, which is the use of multi-modal therapy and poly-pharmacy. The commenters suggested that treating pain using different receptors and mechanisms not only allows for the reduction of opioid use and morbidity, but allows an opportunity to optimize the patient’s pain experience. One commenter recommended the HCAHPS Survey measure’s pain management questions should capture whether this multi-modal pain pathway process happened during a hospitalization.

Response: We note that some stakeholders have criticized the current Pain Management questions because they believed that asking patients who needed medicine for pain how often their pain was well controlled and how often hospital staff did everything they could to help with pain had the unintended consequence of creating pressure on physicians to over-prescribe opioid treatment for pain. In response to

¹¹⁷ List of Measures Under Consideration for December 1, 2016.” Available at: https://www.qualityforum.org/Projects/i-m/MAP/2016_Measures_Under_Consideration_List.aspx.

¹¹⁸ “Development of a New Communication About Pain Composite Measure for the HCAHPS Survey,” <http://www.hcahpsonline.org/modeadjustment.aspx>.

this criticism, in the face of a national epidemic of overuse of opioids, the refined Communication About Pain questions shift the focus from patient assessments of the adequacy and vigor of pain management efforts to the frequency of communication about pain and addressing the availability of treatments.

We agree that the concepts of care quality for pain management and use of multi-modal therapy and poly-pharmacy are important components in pain management for patients, as are differences in chronic and acute pain. In developing the new Communication About Pain measure, we explored these concepts in cognitive interviews and focus groups with patients. We note that the questions in the HCAHPS Survey were designed to be applicable to and easily understood by the wide spectrum of patients in American hospitals, and that its results are intended primarily for public reporting. As such, we are constrained to use questions in which the wording and intent are applicable and correctly understood by a wide spectrum of patients. However, we will consider use of multi-modal therapy and poly-pharmacy and other steps to address pain management, including additional questions about pain management in the HCAHPS Survey in the future.

Comment: Some commenters recommended further steps to address pain management including analysis of: (1) The complete care continuum to identify breakdowns in communication (such as insufficient medication reconciliation on admission) that lead to opioid misuse; (2) additional considerations (pre-admission pain, unclear guidance on pain management, failure of the provider to identify non-opioid approaches to pain management, etc.) that may affect the patient's pain management; and (3) enhancement of the Communication About Pain composite measure (MUC16–263) with additional questions related to pain.

Response: We acknowledge the commenters' recommendations that we analyze the complete care continuum to identify breakdowns in communication and additional considerations that may affect the patient's pain management, however, we note the HCAHPS Survey asks patients only about care experiences during a specific hospital stay. The HCAHPS Survey does not inquire about specific individuals, departments, or wards within the hospital. HCAHPS data submitted to us are patient de-identified. As such, it is not possible to link the patient or survey to anything that occurs pre-admission or post-discharge, or to clinical records,

thus we are prevented from following patients through the continuum of care. Furthermore, as stated above, although important, Pain Management is only one of nine aspects of patient experience explored by the HCAHPS Survey. Because parsimony and brevity are fundamental to the success of the survey, we believe there are limits on the number and specificity of items that can be devoted to any particular topic. As noted above, we had to balance brevity with utility in determining the ultimate version of pain management questions proposed.

Comment: Another commenter urged CMS to revisit how pain is captured and monitored because asking only about the presence of pain does not provide enough information to improve an individual's overall quality of life. For example, pain levels may never change, even when the function/ability of the patient improves. Therefore, the focus on pain should be on how the patient's pain limits their functioning and physical abilities.

A few commenters suggested the focus of the revised HCAHPS pain questions include a discussion of patient safety options, as well as the effectiveness of the provided pain treatment options, as opposed to solely focusing on pain treatment options and suggested that CMS cannot effectively evaluate the efficacy of treatment merely by including a question that asks whether or not hospital staff discussed pain treatment. One commenter supported the proposed refinements to the HCAHPS Survey measure Pain Management questions, but recommended CMS also consider the measurement of an overall analgesia strategy as part of an enhanced recovery pathway (ERP).¹¹⁹ The commenter noted that while the need for patient reported experiences in the management and communication of pain will continue to be critical, the ERP analgesia approach through enhanced recovery after surgery (ERAS) is a more comprehensive and patient-centered approach to optimize patient pain relief.

Response: In response to the commenters' concern that the Communication About Pain composite measure does not effectively evaluate the efficacy of treatment, the HCAHPS Survey is not intended to evaluate the efficacy of treatment. The refined Communication About Pain composite

measure shifts the focus to communication with patients to promote more patient-centered care. As discussed earlier, in response to numerous public comments and out of an abundance of caution, we revised these pain management questions in the face of a nation-wide epidemic of opioid over-prescription. We believe that replacing the current Pain Management question in the HCAHPS Survey with revised questions that focus on the adequacy and frequency of communication about pain will remove any perceived ambiguity or confusion about the intent of the pain questions and enhance communication about the particular needs individual patients have with respect to pain. We hope the refined Communication About Pain questions will shift focus from the method of pain management to patient-centered communication between provider and patient.

We appreciate the commenter's suggestion that we consider the measurement of an overall analgesia strategy as part of an ERP, but the HCAHPS Survey was not intended or designed to ask patients about the efficacy or outcome of clinical care or treatment.

Comment: Some commenters supported the proposed refinements to the HCAHPS Survey measure, but expressed concern with frequency rating scale, observing that the response options do not seem to align realistically with the questions themselves. The commenters criticized the refined questions for being intangible and insufficient for the purpose of supporting beneficial initiatives tailored to promote pain management. Several commenters recommended changing from the "Never-Always" response scale to a "Yes/No" response option. One commenter expressed concerns about asking the frequency of the communications and not necessarily the quality or impact of the communication on the patient's perception of their pain control. The commenter urged CMS to shift from the physical experience of pain to focus more on communication about pain and ways to manage it, both pharmacological and non-pharmacological. Another commenter was concerned that the proposed refined Communication About Pain composite measure may inappropriately lead to scores that are not meaningful, specifically because the "Never-Always" response scale is unclear with respect to how patients or providers should assess the term "Always."

Response: We designed the refined Communication About Pain composite measure in conformance with CAHPS

¹¹⁹ An "Enhanced Recovery Pathway" is a care pathway designed to achieve early recovery after surgical procedures. Definition ascertained from the American Association of Nurse Anesthetist, available at: <http://www.aana.com/resources2/professionalpractice/Pages/Enhanced-Recovery-After-Surgery.aspx>.

survey principles and the established format of the HCAHPS Survey, including asking patients about the frequency of communication rather than whether such communication had ever occurred. From its inception, HCAHPS has inquired about frequency of experiences and employed the “Never-Always” response options for most survey items. This scale and the associated structure of survey questions allows more granular responses than binary options such as “Yes-No,” and it is less susceptible to ceiling or floor effects, enhances commonality among survey questions, and maintains continuity over time. Testing of the HCAHPS Survey and other CAHPS surveys with patients and caregivers supports the understandability and utility of the “Never-Always” response scale.¹²⁰ Further, the development of the refined Communication About Pain composite measure was in response to stakeholder concerns that the existing survey items, which inquire about patients’ assessment of the efficacy of pain management, unintentionally created pressure on physicians to over-prescribe opioid medications. Therefore, we decided to shift away from the patient’s assessment of the efficacy of pain treatment and instead focus on whether providers communicated with patients about their pain.

Comment: One commenter supported the refinements to the HCAHPS Survey measure Pain Management questions, but recommended CMS also consider the measurement of an overall analgesia strategy as part of an ERP.¹²¹ The commenter noted that while the need for patient reported experiences in the management and communication of pain will continue to be critical, the ERP analgesia approach through enhanced recovery after surgery (ERAS) is a more comprehensive and patient-centered approach to optimize patient pain relief.

Response: We appreciate the commenter’s suggestion that we consider the measurement of an overall analgesia strategy as part of an ERP (a pathway for a surgical specialty), but the HCAHPS Survey was not intended or designed to ask patients about the efficacy or outcome of clinical care or treatment.

Comment: Several commenters supported the refinements to the HCAHPS Survey measure, but expressed concern about potential unintended consequences associated with the proposed refined Communication About Pain composite measure, given the toll of the opioid epidemic on communities. One commenter commended CMS for previously removing the HCAHPS Survey questions related to pain management from the Hospital VBP Program because it eliminated any perceived expectation that pain management should always include the use of powerful prescription drugs such as opioids. The commenter recommended CMS focus on overall patient satisfaction, rather than the granular level of detail currently included in many of the HCAHPS questions, and encouraged CMS to leave this level of patient satisfaction data to providers to determine and measure. Another commenter believed the changes would result in doctors and hospitals denying patients their needed pain medications.

One commenter cautioned CMS that hospital payment incentives under the Hospital VBP Program should not be structured in such a manner to cause hospitals to change their opioid prescribing patterns in order to achieve higher scores on the HCAHPS pain management dimension.

Another commenter expressed concern the refined Pain Management questions may inappropriately lead to scores that are not meaningful. The commenter suggested additional testing and understanding of these measures is needed prior to implementation.

A few commenters urged CMS to conduct regular assessments to ensure no unintended or inappropriate consequences on legitimate patient access to needed medicines arise as a result of the changes. These commenters encouraged CMS to continue to evaluate the proposed refined Communication About Pain composite measure for impact on HCAHPS scoring and resulting prescribing habits, including collecting more data for the measure. In addition, commenters cautioned that the proposed refined Communication About Pain composite measure should be carefully monitored for other unexpected and unintended consequences that may arise, including altering patient expectations and negatively impacting the doctor-patient relationship.

Finally, several commenters urged CMS not to continue to use the existing pain questions if the proposed refined Communication About Pain composite

measure are not finalized, but rather remove the pain management questions from the HCAHPS Survey measure from quality programs because the existing pain management questions may pose unintended consequences.

Response: We thank the commenters for their support. As stated above, we are not aware of any scientific studies or empirical evidence that support an association between scores on the Pain Management questions and opioid prescribing practices. In addition, we do not believe that removing the pain questions from the HCAHPS Survey is appropriate because: (1) Many factors outside the control of our quality program requirements may contribute to the perception of a link between the Pain Management questions and opioid prescribing practices, (2) pain control is an appropriate part of routine patient care that hospitals should manage, and (3) pain control is an important concern for patients, their families, and their caregivers.¹²² To confront the opioid epidemic in America, our agency and other divisions of HHS have launched a multi-dimensional effort.¹²³ Removing the Pain Management dimension from the HCAHPS component of the Hospital VBP Program and revising the Pain Management questions on the HCAHPS Survey are among those efforts. We believe refining the Pain Management questions in the HCAHPS Survey measure will: (1) Help remove any perceived ambiguity, and (2) shift focus from strictly considering the method of pain management to patient-centered communication between provider and patient.

With regard to the recommendation that we focus on overall patient satisfaction, rather than the granular detail featured in most HCAHPS questions, we do not agree. We always have believed the survey should cover a spectrum of patient experience, rather than focus on patient satisfaction. The HCAHPS Survey was designed to ask about specific aspects of patient experience of care (not patient satisfaction) that are important to patients and consumers and actionable by hospitals. For that reason, the survey delves into nine specific and actionable aspects of the hospitals experience,

¹²⁰ Development and Evaluation of the CAHPS Hospital Survey. Health Services Research. Special Issue. Volume 40, Number 6, Part II. December 2005.

¹²³ HHS’ Opioid Initiative, available at: <https://www.hhs.gov/sites/default/files/Factsheet-opioids-061516.pdf>, focuses on improving opioid prescribing practices, expanding access to medication-assisted treatment, and increasing the use of naloxone to reverse opioid overdoses.

including pain management. We note that the survey does contain two questions about the overall experience: (1) The patient's overall rating of the hospital; and (2) whether the patient would recommend the hospital. We continue to believe that it is valuable for providers to understand patient experience of care (not satisfaction with care) in actionable areas that are important to patients. We note that providers are not prevented from gathering additional information from patients for their own purposes.

We do not believe the refined Communication About Pain composite measure will lead to scores that are not meaningful because we believe, as noted earlier, that large-scale testing of the new Communication About Pain measure questions has demonstrated that they are valid and reliable. We have thoroughly tested and evaluated the proposed refined Communication About Pain composite measure. We refer readers to a summary of this analysis which can be found on the HCAHPS On-Line Web site: "Development of a New *Communication About Pain* Composite Measure for the HCAHPS Survey," at <http://www.hcahpsonline.org/modestadjustment.aspx>. To briefly summarize the findings of that analysis, as detailed earlier, a two-item version of Communication About Pain composite measure based on how often staff talked about pain and how often staff discussed how to treat pain, preceded by a screener item asking whether the patient had any pain during the hospital stay, has strong psychometric properties. The properties of the individual items used in the proposed refined Communication About Pain composite measure themselves are as good as or better than the two Pain Management questions currently on the HCAHPS Survey. The refined Communication About Pain questions in which a preponderance of responses fall into the highest or lowest response category are not subject to floor or ceiling effects, have good (>0.80) or excellent (>0.90) hospital-level reliability at recommended sample sizes, are not redundant with the current items, are related in a predictable manner with the standard patient-mix characteristics, are predictive of the global Hospital Rating question on the HCAHPS Survey, question number 21, and do not vary systematically by survey mode after adjusting for patient mix. They also have high internal consistency as a

composite (Cronbach's $\alpha=0.81$).¹²⁴ We reiterate that the HCAHPS Survey is a valid and reliable instrument for assessing patient experience of care at the hospital level, however, use of the survey to measure and compare individual practitioners is strongly discouraged.¹²⁵

We acknowledge the commenters' concerns about unintended or inappropriate consequences on legitimate patient access to needed medicines, and we will actively monitor and analyze responses to the proposed refined Communication About Pain composite measure to understand performance, relationship to other survey measures, and possible unintended consequences.

With respect to the commenter who believed the changes would result in doctors and hospitals denying patients their needed pain medications, the refined Communication About Pain questions no longer reference any specific pain treatment or circumstance but rather focus on communication about pain to address the concern that the current items may have had an unintended consequence of encouraging opioid-based treatment of pain. We will monitor use of the refined Communication About Pain questions and any feedback we receive from stakeholders as they implement these questions.

With respect to the commenter who cautioned that hospital payment incentives under the Hospital VBP Program should not be structured in such a manner to cause hospitals to change their opioid prescribing patterns in order to achieve higher scores on the HCAHPS pain management dimension, we note that in the CY 2017 OPPI/ASC PPS final rule with comment period (81 FR 79862), we removed the Pain Management dimension from the Hospital VBP Program beginning with the FY 2018 program year. We are not intending to adopt the refined Communication About Pain questions as part of the HCAHPS pain management dimension in the Hospital VBP Program at this time. In addition,

¹²⁴ "A Special Contribution from the Centers for Medicare and Medicaid Services: Valuing Patient Experience While Addressing the Prescription Opioid Epidemic." L. Tefera, W.G. Lehrman, E.G. Goldstein and S. Agrawal. *Annals of Emergency Medicine*. 2016. Published online, 7–19–16. [http://www.annemergmed.com/article/S0196-0644\(16\)30367-5/fulltext](http://www.annemergmed.com/article/S0196-0644(16)30367-5/fulltext).

¹²⁵ "Measurement of the Patient Experience: Clarifying Facts, Myths, and Approaches." L. Tefera, W.G. Lehrman and P. Conway. *Journal of the American Medical Association*. 2016. 315: 2167–2168. Published online, 3–10–16. <http://jama.jamanetwork.com/article.aspx?articleid=2503222>.

we note that, as required under section 1890A of the Act, measures must be reviewed by a multi-stakeholder group (currently the MAP, convened by the NQF) before they can be proposed for adoption by a program.

Comment: Several commenters supported the refinements to the HCAHPS Survey measure pain management questions, but expressed concerns about the timing of implementation of the proposed refined Communication About Pain composite measure.

One commenter generally requested CMS allow pharmacists, physicians, and other members of the healthcare team sufficient time and opportunity to provide meaningful input and recommendations prior to finalizing and implementing the refinements.

Another commenter suggested transition to the revised wording begin with January 1, 2018 discharges, as proposed, would be feasible and would provide enough time for hospitals to properly prepare.

Response: We thank the commenters for their support. As discussed in the CY 2017 OPPI/ASC final rule with comment period (81 FR 79855 through 79862), and the FY 2018 IPPI/LTCH PPS proposed rule (82 FR 20035), in developing the proposed refined Pain Management questions, we have followed our standard survey development processes, which include drafting alternative questions, cognitive interviews and group evaluations, field testing, statistical analysis, and soliciting stakeholder input. In addition, the proposed refined Pain Management questions have proceeded through the pre-rulemaking process, including adding the measures to the "Measures Under Consideration" list and having them reviewed by the MAP, as well as including them in notice-and-comment rulemaking. In addition, we intend to seek NQF endorsement for the proposed refined Pain Management questions. We believe that all of these processes have allowed pharmacists, physicians, other members of the healthcare team, and the public at large, time and opportunity to provide meaningful input and recommendations. With respect to the suggestion that we transition to the revised wording beginning with January 1, 2018 discharges, we note that our proposal stated that the revised questions would be implemented beginning with October of 2019 using CY 2018 data, which is what we are finalizing. In addition, implementation of the proposed refined Communication About Pain composite measure beginning with patients discharged January 1, 2018 will produce a full

calendar year of data, which will provide prompt feedback to hospitals on their performance on this measure via their confidential Preview Reports. We will make information about the Pain Management questions available to HCAHPS Survey vendors and hospitals through HCAHPS training and information posted on the HCAHPS On-Line Web site, www.HCAHPSonline.org.

Comment: A few commenters did not support the refinements to the HCAHPS Survey Pain Management questions because there is no peer-reviewed evidence to suggest a link between opioid prescribing and the current pain management questions in this survey, nor do the existing questions even specify opioids as the treatment of choice for pain. The commenters disagreed with CMS' assessment that the HCAHPS pain management questions influence clinical decision-making in a manner that creates pressure on hospital staff to prescribe more opioids in order to achieve higher scores. The commenters suggested that rather than recreating new medication-oriented pain questions to incorporate back into HCAHPS at some future date, CMS should develop questions in collaboration with pain and palliative medicine specialists to measure a hospital's overall pain management strategies.

Response: We agree with the commenters' assertions that neither is there any peer-reviewed evidence to suggest a link between opioid prescribing and the existing HCAHPS questions regarding pain, nor the existing questions even specify opioids as the treatment of choice for pain. As we stated above, we are not aware of any scientific studies that support an association between scores on the Pain Management questions and opioid prescribing practices. Furthermore, we are unaware of any empirical evidence demonstrating that failing to prescribe opioids lowers a hospital's HCAHPS Survey scores. However, we believe the potential confusion about the appropriate use of the Pain Management questions, coupled with the public health concern about the opioid epidemic, warrants refinement of the Pain Management questions. We will consider the commenter's suggestion to develop questions that assess a hospital's overall pain management strategies in future rulemaking.

The current Pain Management questions in the HCAHPS Survey apply to patients who needed medicine for pain; whereas, the proposed refined Communication About Pain composite measure will apply to patients who experienced any pain during the

hospital stay. As such, when implemented, more patients will have the opportunity to answer the proposed refined Communication About Pain composite measure, providing a broader perspective on pain management in hospitals. As stated in previous responses, out of an abundance of caution, in the face of a nation-wide epidemic of opioid over-prescription, we have chosen to focus the proposed refined Communication About Pain composite measure on communication between hospital staff and patients about patients' pain. We believe this will emphasize the importance of communication about pain and its treatment while avoiding any potential inference that medication is the best or only way to treat pain.

The Communication About Pain measure questions were developed in collaboration with pain and palliative medicine specialists; we refer readers to our response earlier in this section that details the testing we undertook.

Comment: Some commenters noted treating pain should be the objective of physicians and should be managed exclusively within the physician's scope of practice. However, another commenter stated that patient experience and satisfaction should not be used for accountability purposes because these are often not directly under the control of the physician.

Response: We note that the HCAHPS Survey assesses patient experience of care at the hospital level, not the physician level. We strongly advise hospitals against using the HCAHPS Survey to measure, assess, and/or compare individual hospital staff.¹²⁶

Comment: One commenter noted patients' experience of pain is subjective and uniform guidelines dictating pain management could contribute to patients suffering as a result. Another commenter stated that patient experience and satisfaction should not be used for accountability purposes as these are: (1) Often subjective in nature; and (2) not necessarily true indicators of quality of overall care.

Response: We believe the HCAHPS Survey measure is an appropriate mechanism for hospital accountability because patient experience of care is a valid and vital measure of provider quality across the healthcare spectrum and is an essential element of public reporting of provider quality and, where appropriate, a basic component of pay-

for-performance programs. Carefully constructed and thoroughly tested surveys that attain high levels of reliability and validity, such as the CAHPS family of surveys,¹²⁷ when implemented in a standardized manner by trained survey vendors and hospitals subject to constant oversight, such as HCAHPS, produce information that allows fair comparisons of providers. Thus, we do not agree that pain/patient experience and satisfaction is subjective. Not only do surveys such as HCAHPS produce information about the patient's perspective that is beneficial in its own right, but a growing body of empirical research finds that hospitals that perform well on the HCAHPS Survey also perform well on indicators of clinical process, outcomes, readmissions, and mortality.¹²⁸

We also refer readers to our response above in which we detail the testing these questions underwent. We also disagree that the HCAHPS Survey dictates pain management or contributes to patient suffering. We continue to believe many factors outside the control of our quality program requirements may contribute to the perception of a link between the Pain Management questions and opioid prescribing practices, such as misuse of the survey, use of the survey with patients other than hospital inpatients (such as, emergency room patients, outpatients, or physician office patients), disaggregation of surveys results to assess the performance of individual hospital staff, and/or failure to recognize the HCAHPS Survey excludes certain populations from the sampling frame.

Comment: Several commenters did not support the refinements to the HCAHPS Pain Management questions and recommended that the pain management questions in the HCAHPS Survey measure remain unchanged. These commenters did not believe changing the questions will address the real issue—whether or not a patient's pain was controlled. This is because the questions do not rate care based on how pain was managed and the questions do not hold hospitals accountable for failing to manage patients' pain.

¹²⁶ L. Tefera, W.G. Lehrman, and P. Conway. "Measurement of the Patient Experience: Clarifying Facts, Myths, and Approaches." *Journal of the American Medical Association*. Published online, 3–10–16. <http://jama.jamanetwork.com/article.aspx?articleid=2503222>.

One commenter generally referenced studies demonstrating patients get healthier faster and are less prone to secondary illness if their pain is sufficiently treated, and suggested that it is counter-intuitive that the proposed refined Communication About Pain composite measure does not assess any action taken to reduce pain. The commenter encouraged CMS to keep the existing pain questions, or modify the proposed refined Communication About Pain composite measure to focus on efforts or actions taken to reduce pain. In addition, several commenters noted discussions about pain are an inadequate substitute for effective pain treatment, arguing that attempting to reduce addiction is not a valid reason for causing patients to endure physical and psychological pain.

Response: As stated above, we believe pain management is an important component of the quality of care provided at a hospital, and we believe the HCAHPS Survey measure provides patients with critical information for use in selecting a hospital setting for their care, ensures hospitals continue to appropriately manage patients' pain, and encourages hospitals to engage in quality improvement efforts addressing pain management and communication about pain. We believe that replacing the current Pain Management questions in the HCAHPS Survey, which are addressed to patients who needed medicine for pain, with items addressed to patients who had any pain during their hospital stay and that are focused on the adequacy and frequency of communication about pain, will remove any ambiguity about the intent of the pain items and enhance communication about the particular needs individual patients have with respect to pain.

We disagree the current Pain Management questions should be retained because we believe refining the Pain Management questions will address any potential confusion about appropriate pain management. Moreover, we believe the proposed refined pain management questions will shift focus from the method of pain management to patient-centered communication between provider and patient.

As noted in the CY 2017 OPPI/ASC final rule with comment period (81 FR 79855 through 79862), some stakeholders believe that the current Pain Management items' focus on the vigor and efficaciousness of pain control efforts creates pressure on physicians to over-treat pain, therefore, the proposed refined Communication About Pain composite measure does not delve into these topics. The shift in focus away

from patients' assessment of treatment and outcomes and toward patient communication brings the Pain Management questions into closer alignment with the other survey items. We believe that placing greater emphasis on communication with patients about pain should encourage appropriate pain management. We reiterate the HCAHPS Survey is designed to produce valid measures of hospital-level performance, not that of individual physicians or nurses.

Comment: A few commenters urged CMS to move away from medication-based pain questions entirely.

Response: We continue to believe pain control is an appropriate part of routine patient care that hospitals should manage and is an important concern for patients, their families, and patient caregivers. We believe the proposed refined Communication About Pain questions appropriately focus more clearly on patient-focused care than on the method of pain management.

Comment: Many commenters did not support the refinements to the HCAHPS Survey measure pain management questions because they stated the proposed revised questions do not assure and reflect quality pain management, fail to objectively address the existence of pain, and remain ambiguous and open-ended. Several commenters recommended CMS restart the process of developing new pain management questions with additional testing and research prior to implementation of these proposed questions.

One commenter advised CMS to test a variety of questions and answer options to see which questions provide the most accurate data without negatively affecting patient care. Specifically, the commenter suggested CMS work with stakeholders to reach consensus on the intent of the pain measures to ensure there are no unintended consequences, the measures are understood by patients, and the measures lead to improved patient outcomes.

One commenter expressed concern that neither the existing nor the proposed refined pain management questions adequately reflect either shared decision making or adequate pain management. The commenter urged CMS to engage the patient and caregiver community in evaluating and refining the questions related to pain management.

Another commenter believed the proposed refined questions fail to promise resolution of all pain or suggest that pain treatment should always include any one particular mode of

therapy. The commenter urged CMS to lead the way in incentivizing evidence based multi-modal pain care through development of alternative methods for assessing pain management in quality reporting programs. Conversely, another commenter noted that "no pain" is not always a reasonable goal and decreasing pain should be the expectation for the patient.

Response: We disagree that the revised questions do not assure and reflect quality pain management, fail to objectively address the existence of pain, and remain ambiguous and open-ended, and that we should restart the process of developing new pain management questions with additional testing and research prior to implementation. We believe the refined Communication About Pain questions have already undergone rigorous development and testing, and we refer readers to our response earlier in this section that details the testing we undertook.

We thank the commenters for their suggestion that we lead the way in incentivizing evidence based multi-modal pain care through development of alternative methods for assessing pain management in quality reporting programs, but we believe that while potentially valuable, these activities are beyond the scope of the HCAHPS Survey. We reiterate that the primary purpose of the HCAHPS Survey is to collect and report patient experience of care in hospitals, not to collect clinical information, promote particular therapies, report patient outcomes or create standards of care. During this communication between patients and providers, reasonable pain goals should be addressed. Although "no pain" is not always an achievable outcome, the intent of the measure is to establish this frequent communication to achieve reasonable, mutually agreed upon pain goals. We will consider additional methods for assessing pain management in quality reporting programs and for incentivizing evidence-based multi-modal pain care in the Hospital IQR Program in the future.

Comment: One commenter recommended CMS consider proxy reporting as a subsequent change to the HCAHPS Survey measure. The commenter noted that by allowing proxy reporting, CMS would have more complete information on the experience of care for all patients, rather than just those who are healthy enough to complete the survey.

Response: Although we have never permitted proxy respondents, meaning permitting any person other than the patient who experienced the hospital

stay to respond to the HCAHPS Survey on behalf of the patient, we recently collected and are in the process of analyzing test data, in which proxies were permitted. These analyses will provide information about whether to proceed with potential future changes to the survey. Pending results of these analyses, we may consider allowing proxy reporting in the future.

Comment: One commenter urged CMS to carefully consider whether measures in general add value and improve overall patient care before including them in payment or public reporting programs.

Response: We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53510 through 53512) for a discussion of the considerations we use to expand and update quality measures under the Hospital IQR Program. With regard to the proposed refined Communication About Pain composite measure, and the HCAHPS Survey in general, we believe these improve overall patient care and add value to public reporting programs. Pain management is an important component of the quality of care provided at a hospital, and we believe public reporting of hospital rates on the HCAHPS Survey Pain Management questions provides patients with critical information for use in selecting a hospital setting for their care, ensures hospitals continue to appropriately manage patients' pain, and encourages hospitals to engage in quality improvement efforts addressing pain management and communication. We continue to believe pain control is a critical part of routine patient care that hospitals should manage and is an important concern for patients, their families, and their caregivers, and we continue to explore ways to ensure better measurement of patients' experiences with pain management.

Comment: One commenter recommended CMS distinguish between hospice care (which usually occurs in the last six months of a patient's life) and palliative care (which could occur at any time during a patient's life and could re-occur at any time as well).

Response: The HCAHPS Survey only asks about patient experience of care during a hospital stay. In addition, patients who are discharged to hospice care are not eligible to receive the HCAHPS Survey. We have implemented a separate survey for patient experience of care in hospices.

After consideration of the public comments we received we are finalizing our proposed refinements to the HCAHPS Survey measure pain management questions as proposed, with a modification regarding public

display. Instead of publicly reporting results beginning with October of 2019 using CY 2018 data as proposed, we are delaying public reporting, such that hospital performance data on the refined Communication About Pain composite measure questions will not be publicly reported on the *Hospital Compare* Web site until October of CY 2020, using CY 2019 data. We will provide performance results, based on CY 2018 data on the refined Communication About Pain composite measure questions to hospitals in confidential preview reports, upon the availability of four quarters of data. We anticipate that these confidential preview reports would be available as early as July 2019.

b. Refinement of the Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Ischemic Stroke Hospitalization Measure for the FY 2023 Payment Determination and Subsequent Years

(1) Background

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20039 through 20043), for the FY 2023 payment determination and subsequent years, we proposed a refinement of the CMS Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) following Acute Ischemic Stroke Hospitalization Measure (hereafter referred to as the Stroke 30-Day Mortality Rate measure) by changing the measure's risk adjustment to include stroke severity (Stroke 30-Day Mortality Rate with the refined risk adjustment) obtained from International Classification of Disease, Tenth Edition Clinical Modifier (ICD-10-CM) codes in the administrative claims. The current Stroke 30-Day Mortality Rate measure was finalized in the Hospital IQR Program in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50798). The previously adopted measure includes 42 risk variables, but does not include an assessment of stroke severity because, previously, it has not been available in claims data and was not routinely performed by all providers. For more details on the measure as currently adopted and implemented, we refer readers to its measure methodology report and measure risk-adjustment statistical model in the AMI, HF, PN, COPD, and Stroke Mortality Update zip file on our Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57161), we considered

potential inclusion of the National Institutes of Health (NIH) Stroke Scale for the Hospital 30-Day Mortality Following Acute Ischemic Stroke Hospitalization measure beginning as early as the FY 2022 payment determination. Commenters generally supported the inclusion of the NIH Stroke Scale score in the Stroke 30-Day Mortality Rate measure for future inclusion in the Hospital IQR Program. We refer readers to FY 2017 IPPS/LTCH PPS final rule (81 FR 57161 through 57163) for a complete discussion of the considered potential measure, public comments, and our responses.

Initial assessment of stroke severity, such as the NIH Stroke Scale score, is one of the strongest predictors of mortality in ischemic stroke patients,^{129 130 131} and is part of the national guidelines on stroke care.¹³²

This measure refinement was developed in collaboration with the American Heart Association (AHA) and American Stroke Association (ASA). We are seeking to update the current measure to include an assessment of stroke severity, because it has become feasible to do so due to both the increased use of the NIH Stroke Scale related to the AHA/ASA guidelines that recommend administering the NIH Stroke Scale on all stroke patients, as well as due to the recent ability to obtain the scores through claims data by incorporation into ICD-10. The proposed refinement would create a more parsimonious risk model by reducing the total number of risk adjustment variables from 42 to 20 and includes the NIH Stroke Scale¹³³ in the risk-adjustment model as a measure of stroke severity. These refinements result in a modestly higher c-statistic,¹³⁴ a measure of the ability to discriminate between patients at low and high risk of mortality following ischemic stroke,

¹²⁹ Fonarow GC, Saver JL, Smith EE, et al. Relationship of national institutes of health stroke scale to 30-day mortality in medicare beneficiaries with acute ischemic stroke. *J Am Heart Assoc.* Feb 2012;1(1):42–50.

¹³² Jauch EC, Saver JL, Adams HP, Jr., et al. Guidelines for the early management of patients with acute ischemic stroke: A guideline for healthcare professionals from the American Heart Association/American Stroke Association. *Stroke.* Mar 2013;44(3):870–947.

¹³³ NIH Stroke Scale. Available at: <http://www.nihstrokescale.org/>.

¹³⁴ C-Statistic Definition available at: <http://www.statisticshowto.com/c-statistic/>.

compared with the risk-adjustment model in the current Stroke 30-Day Mortality Rate, which means the updated measure model differentiates the risk of mortality among patients better than the current model.

Mortality following stroke is an important adverse outcome which can be measured reliably and objectively and is influenced by both the severity of the stroke as well as the quality of care provided to patients during their initial hospitalization; therefore, mortality is an appropriate measure of quality of care following stroke hospitalization.^{135 136}

Specifically, post-stroke mortality rates have been shown to be influenced by critical aspects of care such as response to complications, speediness of delivery of care, organization of care, and appropriate imaging.^{137 138 139 140}

We proposed a refinement to the Stroke 30-Day Mortality Rate for several reasons. First, the proposed, refined measure would allow for more rigorous risk adjustment by incorporating the NIH Stroke Scale, discussed in more detail below, as an assessment of stroke severity.¹⁴¹ Second, the inclusion of the NIH Stroke Scale is aligned with and supportive of clinical guidelines, as use of the NIH Stroke Scale to assess stroke severity when patients first present with acute ischemic stroke is Class I recommended in the AHA and ASA guidelines.¹⁴²

¹⁴¹ NIH Stroke Scale. Available at: <http://www.nihstrokescale.org/>.

¹⁴² Jauch EC, Saver JL, Adams HP, Jr., et al. Guidelines for the early management of patients

Third, in October 2016, the ICD–10–CM codes for the NIH Stroke Scale were implemented. As of that date, hospitals can record the NIH Stroke Scale as a representation of stroke severity in Medicare claims by using ICD–10–CM codes, and we can use this information as a variable in the risk-adjustment model for the refined Stroke 30-Day Mortality Rate measure and other claims-based measures with minimal data collection burden for hospitals.¹⁴³

Fourth, clinicians and stakeholders, including AHA, ASA, and other professional organizations, highlight the importance of including an assessment of stroke severity in risk-adjustment models of stroke mortality.¹⁴⁴ In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50798 through 50802), commenters emphasized that the medical literature and their own experience suggest that stroke severity is the dominant predictor of mortality in stroke patients; individuals and organizations expressed concern the measure might be misleading, limited, or inaccurate without adjustment for stroke severity, and four comments suggested risk adjusting using the NIH Stroke Scale or a similar index (78 FR 50800).

Members of the Technical Expert Panel convened by the measure developer also suggested risk-adjusting for stroke severity. In addition, during the 2012 Neurology Endorsement Maintenance Consensus Development Project, the NQF Neurology Steering Committee specifically identified the lack of the NIH Stroke Scale score in the risk-adjustment model as a concern (78 FR 50800). Therefore, the refined Stroke 30-Day Mortality Rate is responsive to public comments from a broad array of stakeholder groups, including clinical societies and clinical experts, and to feedback received from the Technical Expert Panel convened by the measure developer (81 FR 57162).

Fifth, in addition to a modestly higher c-statistic, which evaluates the measure's ability to differentiate between patients at varying risks of mortality following an acute ischemic stroke, the refined Stroke 30-Day Mortality Rate includes a more parsimonious risk model than the stroke

with acute ischemic stroke: A guideline for healthcare professionals from the American Heart Association/American Stroke Association. *Stroke*. Mar 2013;44(3):870–947.

¹⁴³ ICD–10–CM Official Guidelines for Coding and Reporting. Available at: https://www.cdc.gov/nchs/data/icd/10cmguidelines_2017_final.pdf.

¹⁴⁴ Jauch EC, Saver JL, Adams HP, Jr., et al. Guidelines for the early management of patients with acute ischemic stroke: A guideline for healthcare professionals from the American Heart Association/American Stroke Association. *Stroke*. Mar 2013;44(3):870–947.

mortality measure as previously adopted and specified, with a total of 20 risk adjustment variables including the NIH Stroke Scale, compared to the current use of 42 risk adjustment variables.

In compliance with section 1890A(a)(2) of the Act, the Stroke 30-Day Mortality Rate (MUC15–294) with the refined risk adjustment (using the NIH Stroke Scale) was included on a publicly available document entitled “List of Measures under Consideration for December 1, 2015” (available at: <http://www.qualityforum.org/ProjectMaterials.aspx?projectId=75367>. Select “2015 Measures Under Consideration List.”). The MAP reviewed and conditionally supported the Stroke 30-Day Mortality Rate (MUC15–294) with the refined risk adjustment pending NQF review and endorsement, and asked that we consider a phased approach in regards to implementation, to avoid multiple versions of the same measure.¹⁴⁵ The MAP also noted outcomes other than mortality may be more meaningful for stroke patients and to consider cognitive or functional outcomes such as impaired capacity. We considered the input and recommendations provided by the MAP and note the NIH Stroke Scale incorporates cognitive functions in assessing severity.

To avoid implementing multiple versions of the same measure, we intend for the Hospital IQR Program FY 2023 payment determination measure set either to include the 30-day stroke mortality measure as currently implemented or this modified version that includes the NIH stroke severity scale in the measures risk-adjustment model.

The Stroke 30-Day Mortality Rate with the refined risk adjustment was submitted to NQF for endorsement in the neurology project on January 15, 2016, but did not obtain endorsement. NQF endorsement was not granted primarily due to the inability to test the validity of NIH Stroke Scale data elements derived from Medicare claims prior to implementation of the new ICD–10–CM codes in October 2016.¹⁴⁶ The NQF Consensus Standards Advisory Committee (CSAC) supported the concern of the NQF committee regarding our inability to test the measure using ICD–10–CM codes since

¹⁴⁵ 2016 Spreadsheet of Final Recommendations to HHS & CMS Available at: <http://www.qualityforum.org/ProjectMaterials.aspx?projectId=75367>.

¹⁴⁶ The memo regarding the CSAC's decision is available at: <http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=83217>.

the codes were not implemented until October 2016. While we provided risk-standardized mortality rates using data from Medicare administrative claims and data from the Get With The Guidelines (GWTG)-Stroke Registry, the Committee noted we could not validate the National Institutes of Health Stroke Scale (NIH Stroke Scale) against ICD-10-CM codes at the time the measure was considered for endorsement. The CSAC also acknowledged the primary reason for upholding the Committee's decision was based on the lack of testing of the measure using ICD-10-CM codes. This measure went through the same rigorous development process as the other publicly reported outcomes measures and involved extensive input by stakeholders and clinical experts. It follows the same scientific approach to evaluate hospital performance as other Hospital IQR Program outcome measures.

When the NQF committee considered the scientific acceptability of the Stroke 30-Day Mortality Rate measure, 19 of 22 members voted the measure met the NQF's evidence criterion, 19 members voted the measure met the high or moderate standard for the Performance Gap, 18 members voted the measure met high or moderate standard for reliability, 19 members voted the measure met the high or moderate standard for feasibility, and 18 members voted the measure met the moderate standard for Use and Usability.¹⁴⁷ We tested and validated the measure using NIH Stroke Scale data derived from medical record review done by the GWTG-Stroke registry data supplied by AHA/ASA. However, the NQF committee ultimately determined the validity testing was not sufficient for endorsement.¹⁴⁸

We believe the inclusion of the NIH Stroke Scale score in the measure's risk-adjustment model improves upon the Stroke 30-Day Mortality Rate measure which is currently publicly reported on *Hospital Compare* and has been implemented in the Hospital IQR Program since FY 2016 (78 FR 50802). This is supported by the improved risk-adjustment model performance. For example, the c-statistic, which is a measure of the ability to discriminate between patients at low and high risk of mortality following ischemic stroke,

associated with the new, modified risk-adjustment model was 0.81 in the measure development sample¹⁴⁹ and improved to a c-statistic of 0.75 in the most recent measurement period for the Stroke 30-Day Mortality Rate measure that is currently implemented in the Hospital IQR Program.¹⁵⁰

The new refined Stroke 30-Day Mortality Rate measure also has increased face validity which is supported by the comments received from stakeholders. For example, we received comments that the more rigorous risk adjustment facilitated by the NIH Stroke Scale would help ensure the measure accurately risk adjusts for different hospital populations without unfairly penalizing high-performance providers, and the NIH Stroke Scale is well validated, highly reliable, widely used by providers caring for stroke patients, and a strong predictor of mortality and short- and long-term functional outcomes. However, we were not able to test the ICD-10 CM codes for NIH Stroke Scale score in claims during measure development because those codes were not available for hospitals to use in their claims until October 2016. Therefore, we proposed this measure now to inform hospitals they should begin to include the NIH stroke severity scale codes in the claims they submit for patients with a discharge diagnosis of ischemic stroke. Once hospitals have submitted these data, it will be possible for us to examine the completeness of these data in re-evaluation of the new refined Stroke 30-Day Mortality Rate measure before the proposed measure dry run and before the proposed implementation in the Hospital IQR Program. Once that testing is complete we will submit the retested measure to the NQF for endorsement prior to implementation.

Section 1886(b)(3)(B)(IX)(bb) of the Act provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus

organization identified by the Secretary. Although the proposed measure and the existing Stroke 30-Day mortality measure are not currently NQF-endorsed, we considered other available measures which have been endorsed or adopted by the NQF, and we were unable to identify any other NQF-endorsed measures that assess stroke mortality with a standard period of follow-up. We also are not aware of any other 30-day stroke mortality measures that have been endorsed or adopted by a consensus organization.

We proposed this measure now because we believe the modifications to the measure's risk-adjustment model represent a substantial improvement over the Stroke 30-Day Mortality Rate measure that is currently publicly reported and implemented in the Hospital IQR Program and which does not include an assessment of stroke severity in the risk-adjustment model. In addition, by announcing our intention to include the Refined 30-Day Stroke Mortality Rate measure in the Hospital IQR Program in advance of implementation for FY 2023 payment determination and subsequent years, and by describing the proposed additional testing, dry run, and our intent to re-submit the measure to NQF once the NIH Stroke Scale data become available in claims, we are providing information that hospitals should begin to plan and alter their clinical workflows and billing processes in order to capture the NIH Stroke Scale score and include it in Medicare claims. Further, this notice will allow hospitals to complete collecting NIH Stroke Scale data over the three-year time period needed for measure calculation and implementation prior to any payment adjustment. The measure, as refined, is described in more detail below.

(2) Overview of Refined Measure

The measure cohort is aligned with the currently adopted Stroke 30-Day Mortality Rate measure. In addition, the data sources (Medicare fee-for-service (FFS) claims), three-year reporting period, inclusion and exclusion criteria, as well as the assessment of the outcome of mortality (assessed using Medicare enrollment data) would all align with the currently adopted measure (78 FR 50798). Only the measures' risk-adjustment models differ, as described in detail below. For the new refined Stroke 30-Day Mortality Rate measure, we proposed the first measurement period would include discharges between July 1, 2018 and June 30, 2021 for public reporting in FY 2022 and for the FY 2023 payment determination.

¹⁴⁷ The memo regarding the CSAC's decision is available at: <http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=83217>.

(3) Risk Adjustment

The Stroke 30-Day Mortality Rate measure that is currently adopted in the Hospital IQR Program adjusts for differences in patients' level of risk for death in one hospital relative to patients receiving care in another hospital but not for stroke severity. For details about the risk-adjustment model for the currently adopted measure, we refer readers to the Technical Report (78 FR 50798).¹⁵¹

However, in developing the proposed, refined Stroke 30-Day Mortality Rate measure, we re-selected risk variables, resulting in a final model with 20 risk-adjustment variables, including the NIH Stroke Scale risk variable as an assessment of stroke severity. The NIH Stroke Scale is a 15-item neurologic examination stroke scale used to provide a quantitative measure of stroke-related neurologic deficit. The NIH Stroke Scale evaluates the effect of acute ischemic stroke on a patient's level of consciousness, language, neglect, visual-field loss, extra-ocular movement, motor strength, ataxia (the loss of full control of bodily movements), dysarthria (difficult or unclear articulation of speech), and sensory loss. The NIH Stroke Scale was designed to be a simple, valid, and reliable assessment tool that can be administered at the bedside consistently by neurologists, physicians, nurses, or therapists, and is Class I recommended in the AHA/ASA guidelines.¹⁵² The NIH Stroke Scale is a publicly available standardized tool, the results of which should be assessed by a clinician when first examining a patient presenting to the hospital with a stroke and subsequently documented in the patient's medical record. Once this information has been documented by a clinician, it can then be recorded in the claim for that hospital admission using ICD-10-CM codes through the hospital's normal coding practices.

We sought to develop a risk-adjustment model that included the NIH Stroke Scale variable and other key variables which we believe are clinically relevant and demonstrate a strong statistical association with 30-day mortality. To select candidate variables, we considered those 42 risk-adjustment variables in the currently adopted measure, plus the NIH Stroke Scale as

candidate variables. We then performed a bootstrapping simulation method for variable selection. This bootstrapping simulation method is a means of creating multiple samples to determine which risk variables are most important to include in a model. We selected the best model using the logistic regression model with the stepwise selection method based on 1,000 bootstrapping samples for each copy of the multiple imputed (MI) data. Variable selection rate for all the variables selected into the best model was calculated for each copy of the MI data, and variables were included into the final model if the minimum variable selection rate among the 5 copies of MI was 90 percent or more. This method resulted in 20 risk-adjustment variables that were included more than 90 percent of the time for all the copies of the imputed data were retained in the final model, including the NIH Stroke Scale. For more details on the risk-adjustment variable selection process, we refer readers to the measure methodology report and measure risk-adjustment statistical model in the AMI, HF, PN, COPD, and Stroke Mortality Update zip file on our Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

Refining the risk adjustment model of the Stroke 30-Day Mortality Rate created a modestly higher c-statistic with fewer risk variables, meaning the proposed, refined measure's risk-adjustment model better distinguishes among patients with a low risk and high risk of mortality following ischemic stroke compared with the Stroke 30-Day Mortality Rate measure that is currently implemented in the Hospital IQR Program. Including the NIH Stroke Scale in the risk-adjustment model allows the measure to more accurately account for patients' status upon arrival at the hospital, which is responsive to clinical guidelines and feedback from the medical community and other stakeholders, as discussed above.

In order to use the NIH Stroke Scale data in the proposed, refined Stroke 30-Day Mortality Rate measure, many hospitals that have not routinely captured these data on patients with ischemic stroke will need to implement new workflows to ensure that their clinicians measure and record stroke severity. In addition, hospital coders will need to include the appropriate ICD-10 code for the clinician's documented NIH Stroke Scale score in the Medicare claim. By proposing this measure, we are providing hospitals the information and advanced notice that they would be required to submit this

information in their Medicare claims for this proposed, refined Stroke 30-Day Mortality Rate measure.

(4) Effect of ICD-10

New ICD-10 codes for the NIH Stroke Scale were implemented on October 1, 2016; these codes were included so that hospitals could characterize the severity of their patients' strokes using a rigorously validated and standardized approach and include that information in claims and for quality measurement purposes.¹⁵³ However, because there were previously no ICD-9 or ICD-10 CM codes for the NIH Stroke Scale scores, hospitals have not previously included this information on claims they submit to CMS. In order to have information on the severity of patients' ischemic stroke included in the calculation Stroke 30-Day Mortality Rate, some hospitals that do not currently capture or record the NIH Stroke Scale would have to create workflows and processes to do this. This additional work, however, is consistent with current clinical guidelines for the care of ischemic stroke patients, and are consistent with the standard of care. Implementation of the proposed, refined Stroke 30-Day Mortality Rate with the refined risk adjustment would require hospitals to document in the medical record the first NIH Stroke Scale on every eligible patient who is admitted for treatment of acute ischemic stroke and provide that information among the ICD-10-CM code recorded on the claim. The new ICD-10-CM code representing the NIH Stroke Scale will be included in the risk adjustment model for the Stroke 30-Day Mortality Rate measure.

Because many hospitals would have to create new clinical workflows to assess and document the NIH Stroke Scale in patients' medical records as well as include the appropriate ICD-10-CM code for the documented NIH Stroke Scale score in the claim they submit, we would provide hospitals with dry run results of this proposed, refined measure in their confidential hospital-specific feedback reports prior to implementation of the proposed, refined measure for the FY 2023 payment determination. For example, we anticipate using claims data, which would include ICD-10-CM codes for the NIH Stroke Scale, for discharges occurring between October 1, 2017 through June 30, 2020, to calculate measure results for the dry run

¹⁵¹ Bernheim S WC, Want Y, et al. *Hospital 30-Day Mortality Following Acute Ischemic Stroke Hospitalization Measure Methodology Report*. 2010.

¹⁵² Jauch EC, Saver JL, Adams HP, Jr., et al. Guidelines for the early management of patients with acute ischemic stroke: A guideline for healthcare professionals from the American Heart Association/American Stroke Association. *Stroke*. Mar 2013;44(3):870-947.

¹⁵³ ICD-10-CM Official Guidelines for Coding and Reporting. Available at: https://www.cdc.gov/nchs/data/icd/10cmguidelines_2017_final.pdf.

anticipated in CY 2021.¹⁵⁴ The data in the confidential hospital-specific feedback reports would not be publicly reported.

We invited public comment on our proposal to adopt a refinement of the Stroke 30-Day Mortality Rate in the Hospital IQR Program for the FY 2023 payment determination and subsequent years as discussed above.

Comment: Many commenters supported the proposed refinement to the Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate following Acute Ischemic Stroke Hospitalization (Stroke Mortality Measure) measure to include the NIH Stroke Scale as a measure of stroke severity beginning with the FY 2023 payment determination. One commenter believed the proposed refinements would provide an opportunity to better evaluate hospital performance and would not add additional reporting burden to providers. Another commenter believed the proposed refinements represent a significant improvement of the measure as it is currently reported because the more parsimonious and discriminating risk model would greatly enhance the accuracy of reporting and classifying the performance of hospitals.

Response: We thank the commenters for their support.

Comment: Some commenters acknowledged that while switching from ICD-9 to ICD-10 codes allowed for more robust coding, they were concerned about reliability and accuracy of ICD-10 coding, and comparability across sites. They requested CMS field test the measure using the new ICD-10 codes. Many commenters recommended that CMS fully test the refined measure using ICD-10 codes that included the NIH Stroke Scale and resubmit the measure for NQF-endorsement prior to implementation. Several commenters supported the proposed refinements to the Stroke Mortality measure, but asked that CMS not adopt this measure until it was endorsed by NQF.

Response: Regarding the commenters' concern about the reliability and accuracy of ICD-10 coding and the comparability across sites, the refined stroke measure which includes stroke severity was developed and tested exclusively with ICD-9-coded claims.

However, we note that we have completed extensive testing of the current stroke mortality measure specifications in ICD-10 coded claims and of measure performance in the 3-year measurement period, which includes a combination of ICD-9 and ICD-10 coded claims.¹⁵⁵ The measure cohort sizes and number of hospitals with publicly reported results are similar, and the national and hospital-level measure results as well as the performance of the risk-adjustment model are similar to the results observed when calculating the measure with only ICD-9 coded-claims in previous reporting years. Results of some of this testing are described in the publicly available 2017 Annual Updates and Specifications Report Hospital-Level 30-Day Risk-Standardized Mortality Measures.¹⁵⁶ In addition, consistent with the commenters' request, we do plan to further test the refined measure using ICD-10 codes. The ICD-10-CM codes for the NIH Stroke Scale were implemented in October 2016, so we were not able to test the ICD-10-CM codes for NIH Stroke Scale score during measure development. However, since the ICD-10-CM codes for the NIH Stroke Scale have been available since October 2016 for use in claims, it will be possible for us to examine these data under the refined Stroke 30-Day Mortality Rate measure before both the measure dry run and implementation in the Hospital IQR Program.

Similarly, because the ICD-10 code system was implemented in October 2015, there were insufficient claims coded with ICD-10 (and the NIH Stroke Scale) submitted by hospitals to provide any testing results to NQF during the endorsement process in 2016.

We will submit testing results in claims data coded using ICD-10 codes in future cycles of NQF endorsement, as discussed in our proposal above. We plan to re-submit this measure to NQF for endorsement once we have adequate NIH Stroke Scale data from hospitals, which we anticipate will be prior to the FY 2023 payment determination. In addition, we will continue to assess the measure, including risk adjustment and model performance, as part of annual re-evaluation as the three-year measurement period includes a greater

proportion of ICD-10 coded data over time. However, we did not want to delay finalization of the refined measure beginning with the FY 2023 payment determination because this provides hospitals with additional time to prepare for the implementation, which is generally perceived as an improvement in the measure by the stakeholder community.

Furthermore, as discussed above in our proposal, we note that section 1886(b)(3)(B)(IX)(bb) of the Act provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. Although the proposed refined measure and the existing Stroke 30-Day mortality measure are not currently NQF-endorsed, we considered other available measures which have been endorsed or adopted by the NQF, and we were unable to identify any other NQF-endorsed measures that assess stroke mortality with a standard period of follow-up.

Comment: Some commenters believed delaying implementation would allow hospitals time needed to implement new workflows to ensure that clinicians measure and record stroke severity, as many hospitals have not routinely captured the NIH Stroke Scale data.

Response: We acknowledge hospitals need time prior to implementation of this measure since they have not previously included the NIH Stroke Scale information on claims they submit to CMS, and many hospitals will have to create new clinical workflows to assess and document the NIH Stroke Scale in patients' medical records as well as include the appropriate ICD-10-CM code in their administrative claims. In an effort to provide hospitals with more time to prepare for the use of ICD-10 stroke severity codes, in FY 2017 IPPS/LTCH PPS final rule (81 FR 57161), we included a detailed discussion of the refined Stroke 30-Day Mortality Rate measure, which included the NIH Stroke Scale as a measure of stroke severity, as a measure for future consideration. In addition, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20043), we proposed the refined measure for the FY 2023 payment determination and subsequent years, affording hospitals multiple years to prepare. We also discussed conducting a dry run prior to implementation, in

¹⁵⁴ We note that we have made a correction to the date provided here. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20043), a typographical error resulted in the date of June 1, 2020; however, we have corrected the date within the preamble of this final rule to reflect the correct time period that will be used to calculate measure results for the dry run.

¹⁵⁵ Testing results found in the "AMI, HF, PN, COPD and Stroke Mortality Update" zip file, available at: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

¹⁵⁶ 2017 Condition-Specific Mortality Measures Updates and Specifications Report. Available at: www.qualitynet.org > Hospitals—Inpatient > Claims-Based Measures > Mortality Measures > Measure Methodology.

which hospitals would receive dry run results in their confidential hospital-specific feedback reports a year prior to the measure being implemented and publicly reported in the Hospital IQR Program. For the dry run anticipated in CY 2021, we intend to calculate the measure by using discharges occurring between October 1, 2017 through June 30, 2020.

Comment: One commenter requested clarification on which NIH Stroke Scale assessment to use, since clinical personnel can record stroke scale scores at regular intervals on each patient should the NIH Stroke Scale be implemented.

Response: The intent of the risk adjustment for stroke severity is to account for patients' clinical status at the time they are admitted to the hospital. Therefore, the refined Stroke 30-Day Mortality Rate measure would utilize only the initial NIH Stroke Scale score, which is administered upon admission. We refer readers to the current clinical guidelines describing the qualifications and appropriate administration of the NIH Stroke Scale.

Comment: One commenter was concerned that since registry data was used as a proxy for EHR data, CMS should test whether the measure captures valid data.

Response: We would like to clarify that while this measure was developed using data from Medicare administrative claims and GWTG-Stroke Registry, the Stroke 30-Day Mortality Rate measure uses the NIH Stroke Scale obtained from ICD-10 codes, and not from electronically submitted EHR data. In addition, we intend to conduct at least one dry run prior to the measure being implemented in order to ensure that enough hospitals are submitting data on stroke severity to be used in measure risk adjustment given that the original measure testing was done using registry data as a surrogate source of NIH Stroke Scale.

Comment: One commenter encouraged CMS to recognize the value of the NIH Stroke Scale in future measures for the Hospital IQR Program, including measures that promote the use of the tool throughout the stages of care of a patient. Another commenter suggested if a measure of stroke mortality is proposed for any other CMS program, CMS require use of the NIH Stroke Scale in that measure. One commenter recommended CMS consider this refined stroke mortality measure for the Hospital VBP Program.

Response: We thank the commenters for their suggestions. We will take these suggestions for future measures and

other CMS programs into consideration in future rule-making.

Comment: Several commenters recommended that CMS consider moving up the proposed year of implementation for the refinement of the Stroke Mortality measure from the FY 2023 payment determination to the FY 2022 payment determination. The commenters believed that one year of preparation for hospitals to put the processes in place for documenting and coding for the NIH Stroke Scale is adequate. In addition, the commenters requested that CMS generate a parallel report that includes the NIH Stroke Scale for hospitals to track their progress on achieving completeness of documentation and coding beginning in FY 2018.

Response: We thank the commenters for their support, however, we want to allow hospitals sufficient time to adjust their clinical workflows to capture the NIH Stroke Scale and include it in their claims. We believe adopting the Stroke 30-Day Mortality Rate measure in the Hospital IQR Program beginning with the FY 2023 payment determination (using discharges occurring between July 1, 2018 through June 30, 2021) appropriately balances the need to implement this substantive improvement to the measure with allowing time for hospitals to prepare for the use of ICD-10 stroke severity codes if they are not already doing so.

With regards to a parallel report that includes the NIH Stroke Scale for hospitals to track their progress, we believe the confidential hospital-specific feedback reports will achieve this. The hospital-specific report (HSR) generally includes a hospital's results, summary results from other hospitals in the State and the nation, discharge-level data for all eligible discharges, and the prevalence of risk factors for a hospital's patients compared to State and national averages. In addition, we intend that the reports for the refined measure will include an enumeration of each hospital discharge with a principal diagnosis of ischemic stroke along with the NIH Stroke Scale code included in the Medicare claim sent to CMS, as well as each hospital discharge if no NIH Stroke Scale code is included. This will allow hospitals to explore processes and workflows involving capture and reporting of NIH Stroke Scale codes in their claims, and avoid having an additional, separate report run during the same time period specifically for the hospital's NIH Stroke Scale.

Comment: Several commenters requested the measure add risk adjustments for tPA (tissue plasminogen activator) administration or

thrombectomy, and for socio-demographic (SDS) factors.

Response: We thank the commenters for their input. The measure seeks to adjust for case mix differences among hospitals based on the clinical status of the patient at the time of the index admission. We do not generally adjust the measures for actions taken by the hospital, such as administration of tPA, as such factors may be related to the quality of care rather than patient factors.

In addition, we understand social risk factors such as income, education, race and ethnicity, employment, disability, community resources, and social support (certain factors of which are also sometimes referred to as socioeconomic status (SES) factors or socio-demographic status (SDS) factors) play a major role in overall health. As noted in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57124), the NQF has undertaken a 2-year trial period in which new measures, measures undergoing maintenance review, and measures endorsed with the condition that they enter the trial period can be assessed to determine whether risk adjustment for selected social risk factors is appropriate for these measures. This trial entailed temporarily allowing inclusion of social risk factors in the risk-adjustment approach for these measures. This measure was considered for endorsement during the trial period. The results of the analyses presented to the committee demonstrated that the SES variables that could be feasibly incorporated into this model only have a small, though statistically significant, relationship with the outcome in multivariable modeling and that adding them in the risk model did not change hospitals' mortality rates.¹⁵⁷ Although the measure was not recommended for endorsement, the exclusion of social risk factors from the risk-adjustment model was not among the concerns raised by the committee.¹⁵⁸ We also refer readers to section IX.A.1.d. of the preamble of this final rule where SDS is discussed in more detail.

Comment: One commenter noted this measure excludes patients under age 65, which impacts its generalizability to all stroke patients.

Response: The measure only includes admissions of Medicare FFS beneficiaries aged 65 years or older who were discharged from an inpatient stay

¹⁵⁷ <http://www.qualityforum.org/ProjectMaterials.aspx?projectID=80601>.

¹⁵⁸ *Ibid.*

at a short-term acute care hospital.¹⁵⁹ The measure does not include Medicare patients who are younger than 65 because these patients usually qualify for the program due to severe disability and, thus, are considered to be clinically distinct from Medicare patients 65 and over. Furthermore, this refined measure has not been tested on a population under 65. With respect to the generalizability of the measure to all stroke patients, we are unable to comment on the appropriateness of the

use of the measure in data other than the Medicare data for which it was developed.

After consideration of the public comments we received, we are finalizing our proposal to refine the Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate following Acute Ischemic Stroke Hospitalization (Stroke Mortality Measure) measure for the FY 2023 payment determination and subsequent years as proposed.

c. Summary of Previously Adopted and Finalized Hospital IQR Program Measures for the FY 2020 Payment Determination and Subsequent Years

The table below outlines the Hospital IQR Program measure set (including previously adopted measures and finalized refinements from this final rule) for the FY 2020 payment determination and subsequent years. The refined measures, as discussed above, are denoted with a superscript as defined in the legend below the table.

PREVIOUSLY ADOPTED HOSPITAL IQR PROGRAM MEASURES FOR THE FY 2020 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Short name	Measure name	NQF #
Healthcare-Associated Infection Measures		
CAUTI	National Healthcare Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure.	0138
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset <i>Clostridium difficile</i> Infection (CDI) Outcome Measure.	1717
CLABSI	National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure.	0139
Colon and Abdominal Hysterectomy SSI.	American College of Surgeons—Centers for Disease Control and Prevention (ACS—CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	0753
HCP	Influenza Vaccination Coverage Among Healthcare Personnel	0431
MRSA Bacteremia	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) Bacteremia Outcome Measure.	1716
Claims-Based Patient Safety Measures		
Hip/knee complications	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	1550
PSI 04	Death Rate among Surgical Inpatients with Serious Treatable Complications	0351
PSI 90	Patient Safety for Selected Indicators Composite Measure, Modified PSI 90 (Updated Title: Patient Safety and Adverse Events Composite).	0531
Claims-Based Mortality Outcome Measures		
MORT-30-AMI	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (AMI) Hospitalization.	0230
MORT-30-CABG	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery.	2558
MORT-30-COPD	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization.	1893
MORT-30-HF	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Heart Failure (HF) Hospitalization.	0229
MORT-30-PN	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization.	0468
MORT-30-STK	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Ischemic Stroke*.	N/A
Claims-Based Coordination of Care Measures		
READM-30-AMI	Hospital 30-Day All-Cause Risk-Standardized Readmission Rate (RSRR) Following Acute Myocardial Infarction (AMI) Hospitalization.	0505
READM-30-CABG	Hospital 30-Day, All-Cause, Unplanned, Risk-Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery.	2515
READM-30-COPD	Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization.	1891
READM-30-HF	Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Heart Failure (HF) Hospitalization.	0330
READM-30-HWR	Hospital-Wide All-Cause Unplanned Readmission Measure (HWR)	1789
READM-30-PN	Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Pneumonia Hospitalization.	0506
READM-30-STK	30-Day Risk-Standardized Readmission Rate Following Stroke Hospitalization	N/A

(+) NQF endorsement has been removed.

7. Voluntary Hybrid Hospital-Wide Readmission Measure With Claims and Electronic Health Record Data (NQF #2879)

a. Background

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49698), we stated that we are considering the use of a set of core clinical data elements extracted from hospital EHRs for each hospitalized Medicare FFS beneficiary over the age of 65 years. The core clinical data elements are data which are routinely collected on hospitalized adults, extraction from hospital EHRs is feasible, and can be utilized as part of specific quality outcome measures. One way in which we envisioned using core clinical data elements in conjunction with other sources of data, such as administrative claims, is to calculate “hybrid” outcome measures, which are quality measures that utilize more than one source of data. For more detail about core clinical data elements, we refer readers to our discussion in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49698 through 49704). In addition, we note an important distinguishing factor about core clinical data elements and the hybrid measures: Hybrid measure results must be calculated by CMS to determine hospitals’ risk-adjusted rates relative to national rates used in public reporting. With a hybrid measure, hospitals can submit data extracted from the EHR, and we can perform the measure calculations. This was the approach that was finalized for the calculation of the Hybrid Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (NQF #2473), which was incorporated into the Advancing Care Coordination Through Episode Payment Models as a voluntary measure for patients admitted for AMI in the AMI Model (82 FR 354 through 356).

In the FY 2016 IPPS/LTCH PPS final rule, we stated we developed two hybrid measures: (1) Hospital 30-Day Risk-Standardized Acute Myocardial Infarction (AMI) Mortality eMeasure (NQF #2473) (now called the Hybrid Hospital 30-Day All Cause Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) (NQF #2473)); and (2) a hybrid hospital-wide 30-day readmission measure now called the Hybrid Hospital-Wide Readmission Measure with Claims and Electronic Health Record Data (NQF #2879). Although the Hybrid Hospital-Wide Readmission Measure with Claims and Electronic Health Record Data (NQF #2879) (hereinafter referred to as Hybrid HWR measure) was not originally

endorsed when the MAP considered the measure, the MAP encouraged further development (80 FR 49698),¹⁶⁰ and the measure has since been endorsed by the NQF.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49702), commenters noted either outright or conditional support for the development of hybrid measures, and for the collection of additional administrative linkage variables to merge data from EHRs with claims. A few commenters noted collection of the core clinical data elements would not impose additional burden on hospitals (80 FR 49702). A few commenters recommended the hybrid measures should go through NQF review or be endorsed by NQF prior to inclusion in a quality reporting program, which we have done, as the Hybrid HWR measure was endorsed by NQF on December 9, 2016. Other commenters recommended that before we require the submission of the core clinical data elements, we should conduct further testing and analysis to ensure the accuracy and completeness of the data being submitted; specifically, one commenter suggested a testing period (80 FR 49703). We conducted further testing, which is further described below. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49702 through 49704) for a full discussion of all public comments and our responses related to core clinical data elements.

Since the FY 2016 IPPS/LTCH PPS final rule, in keeping with our goal to move toward greater use of data from EHRs for quality measurement, and in response to stakeholder feedback to include clinical data in outcome measures (80 FR 49702 through 49703), we have further developed the proposed voluntary Hybrid HWR measure. This measure would incorporate a combination of claims data and EHR data submitted by hospitals, and because of these combined data sources, it is referred to as a hybrid measure. The Hybrid HWR measure cohort and outcome are identical to those in the Hospital-Wide All-Cause Unplanned Readmission measure (NQF #1789), which was adopted into the Hospital IQR Program for the FY 2015 payment determination and subsequent years (77 FR 53521).

The Hybrid HWR measure was presented on the List of Measures under Consideration for December 1, 2014. The MAP encouraged further

development of the Hybrid HWR measure in December 2014.¹⁶¹ The Hybrid HWR measure (NQF #2879) was endorsed by NQF on December 9, 2016. This measure aligns with the National Quality Strategy (NQS) priorities of making care safer by reducing harm caused in the delivery of care and promoting effective communication and coordination of care.

Measure development followed the same scientific approach and rigorous process as other Hospital IQR Program outcome measures. To align the core clinical data elements with other measures that utilize EHR data, we developed and tested a Measure Authoring Tool and identified value sets for extraction of the core clinical data elements. As stated in the FY 2016 IPPS/LTCH PPS final rule, the core clinical data elements use existing value sets where possible in an effort to harmonize with other measures and reporting requirements and we completed testing of the electronic specifications for the core clinical data elements used in the Hybrid HWR measure (80 FR 49703). The electronic specifications were tested in four separate health systems that used three separate EHR systems. During Hybrid HWR measure development and testing we demonstrated that the core clinical data elements were feasibly extracted from hospital EHRs for nearly all adult patients admitted. We also demonstrated that the use of the core clinical data elements to risk-adjust the Hybrid HWR measure improves the discrimination of the measure, or the ability to distinguish patients with a low risk of readmission from those at high risk of readmission, as assessed by the c-statistic.^{162 163 164} In addition, inclusion of clinical information from patient EHRs is responsive to stakeholders who find it preferable to

use clinical information that is available to the clinical care team at the time treatment is rendered to account for patients' severity of illness rather than relying solely on data from claims (80 FR 49702). The Hybrid HWR measure is now fully developed and tested and NQF-endorsed (NQF #2879).

b. Voluntary Reporting of Electronic Health Record Data for the Hybrid HWR Measure (NQF #2879)

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20045 through 20049), in accordance with, and to the extent permitted by, the HIPAA Privacy Rule and other applicable law, we proposed the Hybrid HWR measure as a voluntary measure for the reporting of data on discharges over a 6-month period in the first two quarters of CY 2018 (January 1, 2018 through June 30, 2018). A hospital's annual payment determination would not be affected by this voluntary measure. As we stated when we adopted the Hospital-Wide All-Cause Unplanned Readmission measure (NQF #1789) that is currently used in the Hospital IQR Program, a hospital's readmission rate is affected by complex and critical aspects of care such as communication between providers or between providers and patients; prevention of, and response to, complications; patient safety; and coordinated transitions to the outpatient environment, such that a hospital-wide, all-condition readmission measure could portray a broader sense of the quality of care in hospitals and promote hospital quality improvement (77 FR 53522). We believe this would also be the case with using the Hybrid HWR measure (NQF #2879) that we proposed for voluntary data collection in the proposed rule.

Hospitals that voluntarily submit data for this measure would receive confidential hospital-specific reports that detail submission results from the performance reporting period, as well as the Hybrid HWR measure results assessed from merged files created by our merging of the EHR data elements submitted by each participating hospital with claims data from the same set of index admission. We note that in the proposed rule (82 FR 20047), we stated we are only seeking to collect data for the Hybrid HWR measure that are in accordance with the measure's electronic specifications, available on the CMS Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>. Hospitals that volunteer to submit data would also increase their familiarity with

submitting data for hybrid quality measures from their EHR systems. Participating hospitals would receive information and instruction on the use of the electronic specifications for this measure, would have an opportunity to test extraction and submission of data to CMS, and would receive reports from CMS, downloadable from QualityNet, with details on the success of their submission, such as the completeness and accuracy of the data. This would allow us to refine this measure if necessary to provide meaningful information on outcomes for hospitalizations for Medicare FFS beneficiaries with the intent to propose this as a required measure in future rulemaking. For example, we would consider feedback from hospitals when making refinements to improve the utility of the measure specifications. In addition, we would examine the completeness and accuracy of the data received to determine its adequacy for calculation of the measure's risk adjustment model and measure results.

EHR data or measure results for this proposed voluntary Hybrid HWR measure would not be publicly reported. However, if we propose to require mandatory reporting of the Hybrid HWR measure in future rulemaking, such a proposal would include public reporting of the measure results. Consistent with estimates for previous voluntary measure reporting, such as the Hospital IQR Program eCQM voluntary reporting (79 FR 50346), we believe up to approximately 100 hospitals would voluntarily submit data for the Hybrid HWR measure. Details about the measure and our proposal for voluntarily reporting certain data elements for this measure are discussed below.

c. Data Sources

We proposed to use two sources of data for the calculation of the proposed voluntary Hybrid HWR measure: Medicare Part A claims and core clinical data elements for Medicare FFS beneficiaries who are 65 years or older, comprising the measure cohort. Claims data would be used to identify index admissions included in the measure cohort, to create a risk-adjustment model, and to assess the 30-day unplanned readmission outcome. This data would be merged with core clinical data elements from each participant hospital's EHRs collected at presentation (discussed in more detail below) and used for risk-adjustment of patients' severity of illness (for Medicare FFS beneficiaries who are 65 years or older), in addition to data from claims. Medicare enrollment data, from

the Medicare Enrollment Database, are used to confirm Medicare enrollment for at least 30 days post hospital discharge for the unplanned readmission outcome assessment. For this proposed voluntary Hybrid HWR measure, in accordance with, and to the extent permitted by, the HIPAA Privacy Rule and other applicable law, the EHR data submission process would align as much as possible with existing electronic Clinical Quality Measure (eCQM) standards and data reporting procedures for hospitals, as further discussed below. We refer readers to section IX.A.10.e. of the preamble of this final rule for details on the Submission Form and Method for the Voluntary Hybrid Hospital-Wide Readmission Measure. The electronic specifications for the proposed voluntary Hybrid HWR measure, which include the electronic specifications for extraction of the core clinical data elements from hospital EHRs (the Measure Authoring Tool output and value sets) for all included data elements, are available on the CMS Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

d. Outcome

As stated above, the proposed voluntary Hybrid HWR measure outcome is aligned with the currently adopted, publicly reported, Hospital-Wide All-Cause Unplanned Readmission measure (NQF #1789), which was adopted into the Hospital IQR Program for the FY 2015 payment determination and subsequent years (77 FR 53521 through 53528). The proposed voluntary Hybrid HWR measure outcome assesses unplanned readmissions for any cause within 30 days of discharge from the index admission. It does not consider planned readmissions as part of the readmission outcome and identifies them by using the CMS Planned Readmission Algorithm, which is a set of criteria for classifying readmissions as planned using Medicare claims, and is currently used in the previously adopted, Hospital-Wide All-Cause Unplanned Readmission measure (77 FR 53521).¹⁶⁵ This algorithm identifies admissions that are typically planned and may occur within 30 days of discharge from the hospital.¹⁶⁶ The algorithm was most

¹⁶⁵ 2017 All-Cause Hospital-Wide Measure Updates and Specifications Report. Available at: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

¹⁶⁶ *Ibid*.

recently refined in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50211 through 50216) for the previously adopted, claims-based measure. The same algorithm is used for this proposed voluntary Hybrid HWR measure.¹⁶⁷ A complete description of the CMS Planned Readmission Algorithm, which includes lists of planned diagnoses and procedures, can be found on the CMS Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

e. Cohort

As noted above, the proposed voluntary Hybrid HWR measure cohort is aligned with the currently adopted, Hospital-Wide All-Cause Unplanned Readmission measure.¹⁶⁸ The measure cohort consists of Medicare FFS beneficiaries, aged 65 years or older, discharged from non-Federal acute care hospitals. Hospitals would only submit data for this cohort, and the measure would only be calculated for this cohort. The proposed voluntary Hybrid HWR measure includes admissions for nearly all Medicare FFS beneficiaries over the age of 65 years who are discharged alive from acute care non-Federal hospitals. However, during measure calculation, a small number of these admissions are excluded under the measure specifications. Excluded admissions include those for principal discharge diagnoses indicating some psychiatric disorders. These exclusions are only a small proportion of all index admissions

and are identified during the measure calculation process.

f. Inclusion and Exclusion Criteria

The proposed voluntary Hybrid HWR measure inclusion and exclusion criteria are also aligned with the currently adopted Hospital-Wide All-Cause Unplanned Readmission measure.¹⁶⁹ For both measures, the index admission is the hospitalization to which the readmission outcome is attributed. Both the claims-based, Hospital-Wide All-Cause Unplanned Readmission measure and the proposed voluntary Hybrid HWR measure include the following index admissions for patients:

- Enrolled in Medicare FFS Part A for the 12 months prior to the date of admission and during the index admission.
 - Aged 65 or older.
 - Discharged alive from a non-Federal acute care hospital.
 - Not transferred to another acute care facility.
- This measure excludes the following index admissions for patients:
- Admitted to prospective payment system (PPS)-exempt cancer hospitals.
 - Without at least 30 days of post-discharge enrollment in Medicare FFS.
 - Discharged against medical advice.
 - Admitted for primary psychiatric diagnoses.
 - Admitted for rehabilitation.
 - Admitted for medical treatment of cancer.

For both measures, each index admission is assigned to one of five mutually exclusive specialty cohort

groups: medicine; surgery/gynecology; cardiorespiratory; cardiovascular; and neurology. The cohorts reflect how care for patients is organized within hospitals. To assign admissions to cohorts, admissions are first screened for the presence of an eligible Agency for Healthcare Research and Quality (AHRQ) Clinical Classifications Software (CCS)¹⁷⁰ surgical procedure category. Admissions with an eligible surgical procedure category are assigned to the surgical cohort, regardless of the principal discharge diagnosis code of the admission. All remaining admissions are assigned to cohorts based on the AHRQ CCS diagnosis category of the principal discharge diagnosis.

g. Risk-Adjustment

The proposed voluntary Hybrid HWR measure adjusts both for case mix differences (clinical status of the patient, accounted for by adjusting for age and comorbidities, and the core clinical data elements from patients' EHRs) and service-mix differences (the types of conditions and procedures cared for and procedures conducted by the hospital, accounted for by adjusting for the discharge condition category). Patient comorbidities are based on the index admission, the admission included in the measure cohort, and a full year of prior history. The core clinical data elements are derived from information captured in the EHR during the index admission only, and are listed below.

Data elements	Units of measurement	Time window for first captured values (hours)
Heart Rate	Beats per minute	0–2.
Systolic Blood Pressure	mmHg	0–2.
Respiratory Rate	Breath per minute	0–2.
Temperature	Degrees Fahrenheit	0–2.
Oxygen Saturation	Percent	0–2.
Weight	Pounds	0–24.
Hematocrit	% red blood cells	0–24.
White Blood Cell Count	Cells/mL	0–24.
Potassium	mEq/L	0–24.
Sodium	mEq/L	0–24.
Bicarbonate	mmol/L	0–24.
Creatinine	mg/dL	0–24.
Glucose	mg/dL	0–24.

<https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

¹⁷⁰ Clinical Classifications Software (CCS) for ICD–9–CM Fact Sheet. Accessed at: <https://www.hcup-us.ahrq.gov/toolsoftware/ccs/ccsfactsheet.jsp>.

The risk-adjustment variables included in the development and testing of the proposed voluntary Hybrid HWR measure are derived from both claims and clinical EHR data. The variables are: (1) 13 Core clinical data elements derived from hospital EHRs; (2) the Clinical Classification Software (CCS) categories for the principal discharge diagnosis associated with each index admission derived from ICD-10 codes in administrative claims data; and (3) comorbid conditions of each patient identified from inpatient claims in the 12 months prior to and including the index admission derived from ICD-10 codes and grouped into the CMS condition categories (CC).

All 13 core clinical data elements were shown to be statistically significant predictors of readmission in one or more risk-adjustment models of the five specialty cohort groups used to calculate the proposed voluntary Hybrid HWR measure.¹⁷¹ The proposed voluntary Hybrid HWR measure specialty cohort groups are further defined in section IX.A.7.e. of the preamble of this final rule, below. The testing results demonstrate that the core clinical data elements enhanced the discrimination (assessed using the c-statistic) when used in combination with administrative claims data.¹⁷² For additional details regarding the risk-adjustment model, we refer readers to the proposed voluntary Hybrid HWR Measure technical report, which is posted on the CMS Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

We note this measure was developed using claims coded in ICD-9. However, we have identified and tested ICD-10 specifications for all information used in the measure derived from Medicare claims for both the claims-based, Hospital-Wide All-Cause Unplanned Readmission measure and for the proposed voluntary Hybrid HWR Measure. The ICD-10 specifications are identical for both measures. Only the use of the core clinical data elements in the risk-adjustment models differs between the two measures. Those data elements are not affected by ICD-10

implementation. For additional details regarding the measure specifications that accommodate ICD-10-coded claims, we refer readers to the 2017 All-Cause Hospital-Wide Measure Updates and Specifications Report, which is posted on the CMS Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

h. Calculating the Risk-Standardized Readmission Rate (RSRR)

The methods used for calculation of the proposed voluntary Hybrid HWR measure align with the methods used to calculate the currently adopted, Hospital-Wide All-Cause Unplanned Readmission measure. Index admissions are assigned to one of five mutually exclusive specialty cohort groups consisting of related conditions or procedures. The five specialty cohort groups are: Surgery/gynecology, general medicine, cardiorespiratory, cardiovascular, and neurology. For each specialty cohort group, the standardized readmission ratio (SRR) is calculated as the ratio of the number of “predicted” readmissions to the number of “expected” readmissions at a given hospital. For each hospital, the numerator of the ratio is the number of readmissions within 30 days predicted based on the hospital’s performance with its observed case mix and service mix, and the denominator is the number of readmissions expected based on the nation’s performance with that hospital’s case mix and service mix. This approach is analogous to a ratio of “observed” to “expected” used in other types of statistical analyses.

The specialty cohort SRRs are then pooled for each hospital using a volume-weighted geometric mean to create a hospital-wide composite SRR. The composite SRR is multiplied by the national observed readmission rate to produce the RSRR. For additional details regarding the measure specifications to calculate the RSRR, we refer readers to the 2017 All-Cause Hospital-Wide Measure Updates and Specifications Report, which is posted on the CMS Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

i. Data Submission and Reporting Requirements

We proposed hospitals use QRDA I files for each Medicare FFS beneficiary who is 65 years and older. Submission of data using QRDA I files is the current EHR data and measure reporting

standard adopted for electronic clinical quality measures (eCQMs) implemented in the Hospital IQR Program. This same standard would be used for reporting the core clinical data elements to the CMS data receiving system. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49706) where we have previously discussed QRDA I standards for use in the Hospital IQR Program. We also refer readers to section IX.A.10.e. of the preamble of this final rule for discussions of additional proposals related to data submission and reporting requirements for the Hybrid HWR measure.

We also proposed to use the following criteria to determine if a hospital has successfully submitted voluntary Hybrid HWR measure data:

- Submission of only the first-captured values, which are data collected routinely on each Medicare FFS beneficiary who is 65 years or older upon presentation to the hospital, for each of the 13 core clinical data elements used in risk adjustment to assess the patient’s severity of illness.
- Hospitals would be expected to successfully submit data values from hospital EHRs for vital signs (heart rate, respiratory rate, temperature, systolic blood pressure, oxygen saturation, weight), and six linking variables required to merge with the CMS claims data (CCN, HIC Number or Medicare Beneficiary Identifier, date of birth, sex, admission date, and discharge date). When we tested the electronic specifications for extraction of the core clinical data elements in hospital systems, we also tested the use of these linking variables to merge data from claims and from hospitals’ EHRs from several health systems, and achieved match rates over 90 percent accounting for missing or erroneous data. In order to calculate results for the Hybrid HWR measure, hospitals would need to submit these data on more than 95 percent of on all Medicare FFS patients who are 65 years and older discharged from the hospital.

- Participating hospitals would be requested to submit values for laboratory test results (hematocrit, white blood cell count, sodium, potassium, bicarbonate, creatinine, and glucose) for Medicare FFS beneficiaries, 65 years or older, included in the measure cohort. In order to calculate measure results for the Hybrid HWR measure, hospitals would need to submit these data elements on more than 80 percent of these beneficiaries. However, for the proposed voluntary measure for the CY 2018 reporting period (January 1, 2018 through June 30, 2018) we would request the data elements on at least 50

¹⁷¹ Hybrid Hospital-Wide Readmission Measure with Electronic Health Record Extracted Risk Factors (Version 1.1). Available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

¹⁷² Hybrid Hospital-Wide Readmission Measure with Electronic Health Record Extracted Risk Factors (Version 1.1). Available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

percent of these patients discharged over the same time period. Data submission to the CMS data receiving system would occur in the fall of 2018.

- The measurement period would include discharges occurring over a 6-month period in the first two quarters of CY 2018 (January 1, 2018 through June 30, 2018). However, for hospitals that choose to report this measure, we would request submission of these data elements on at least 50 percent of these patients. As we noted above, in our proposal for voluntary data collection of the Hybrid HWR measure, we are only seeking to collect data for this measure on applicable Medicare FFS beneficiaries in accordance with the measure's electronic specifications, available on the CMS Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

j. Confidential Hospital-Specific Reports

Hospitals that voluntarily submit data for this measure would receive confidential hospital-specific reports that detail submission results from the reporting period, including detailed information about the completeness and accuracy of the EHR data they submit, as well as the Hybrid HWR measure results assessed from merged files created by our merging of the EHR data elements submitted by each participating hospital with claims data from the same set of index admission. We would calculate and provide each participating hospital with their risk-standardized readmission rate for the voluntary Hybrid HWR measure. This would provide each hospital with an indication of their performance relative to the other hospitals that participate in the voluntary measure. In addition, we would create a hospital-specific report for each participating hospital which would include detailed information about their Medicare FFS beneficiaries who are 65 and older who had an unplanned readmission within 30-days of hospital discharge, including the patients' clinical risk factors from claims and EHR data. This information would allow hospitals to identify the factors that increase patients' risk of readmission and would inform quality improvement strategies to reduce unplanned readmissions. In addition, the reports would include the match rate between the hospital's submitted EHR data and corresponding claims data, as well as the proportion of patient data submitted relative to all qualifying admissions for each of the 13 core clinical data elements.

We note that we are considering proposing the Hybrid HWR (NQF #2879) measure as a required measure as early as the FY 2023 payment determination and requiring hospitals to submit the core clinical data elements and linking variables used in the measure as early as CY 2020 to support a dry run of the measure during which hospitals would receive a confidential preview of their results in 2021. Any requirement for mandatory reporting on this measure would be proposed through future rulemaking. We invited public comment on our proposal to adopt the Hybrid HWR measure (NQF #2879) for the Hospital IQR Program as a voluntary measure for the CY 2018 reporting period as described above.

Comment: A few commenters expressed that they would support the proposed voluntary reporting of the Hybrid HWR measure should it obtain NQF endorsement.

Response: We thank the commenters for their support. As stated in the proposed rule (82 FR 20046) and above, the Hybrid Hospital-Wide Readmission Measure with Claims and Electronic Health Record Data (NQF #2879) was endorsed by NQF on December 9, 2016.

Comment: Many commenters recommended that CMS focus efforts on using data elements from EHRs to risk-adjust condition specific measures that are currently being used in the Medicare performance or penalty programs. Specifically, commenters urged CMS to take steps to test the feasibility of using non-clinical EHR-derived elements, such as education, location, and other factors, to develop appropriate socio-demographic adjustments.

Response: We understand the important role that socio-demographic factors play in the care of patients, however, we believe the Hybrid HWR measure's risk-adjustment methodology is appropriate and reliable. The measure already incorporates a risk-adjustment methodology that accounts for age and comorbidities, as well as vital signs and laboratory values at the start of the inpatient encounter. We will take under consideration potential future inclusion of additional non-clinical EHR-derived elements, such as education, location, and other socio-demographic factors, however, we continue to have concerns about holding hospitals to different standards for the outcomes of their patients of diverse socio-demographic factors because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. In addition, as discussed in section V.J.3. of the preamble of this final rule, the Hybrid HWR measure recently underwent

successful NQF endorsement during the NQF's trial period for socio-demographic factors. We refer readers to section IX.A.1.d. of the preamble of this final rule for more details on accounting for social risk factors in the Hospital IQR Program. The NQF trial period considered the analyses and interpretations as well as performance scores with and without socio-demographic factors in the risk-adjustment model for this measure. In accordance with the NQF's trial criteria, NQF's evaluation indicated that SDS adjustment was not necessary for this measure.¹⁷³ We routinely monitor the impact of socio-demographic status on hospitals' results on our measures and will assess the appropriateness of further risk adjustment in the future, as well as the availability and feasibility of collecting social risk factor data elements from EHRs. We will also continue to consider using data elements from EHRs to risk-adjust condition specific measures, the claims-based versions of which are currently being used in the Medicare pay for performance programs (sometimes referred to as penalty programs).

Comment: Two commenters encouraged CMS to incentivize both hospitals and vendors to participate in voluntary reporting either through recognition or reduction in other requirements to offset the resources required to fully participate.

Response: We thank the commenter for their suggestion. We will continue to consider ways to reduce burden on hospitals as well as to incentivize participation in the voluntary reporting of this measure.

Comment: One commenter expressed concern about the proposed voluntary reporting of the Hybrid HWR measure, because merging clinical data derived from electronic health records (EHRs) with claims data is especially difficult and extremely complex.

Response: We will merge the EHR data submitted by hospitals as outlined in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20049) with the claims files and calculate the measure results. To clarify, participating hospitals or vendors are not expected to merge these data files themselves. We have successfully tested this process using EHR data and claims data submitted by three separate hospital systems during measure development. The additional experience we gain through voluntary data collection on

¹⁷³ NQF All-Cause Admissions and Readmissions 2015–2017 Technical Report: http://www.qualityforum.org/Publications/2017/04/All-Cause_Admissions_and_Readmissions_2015-2017_Technical_Report.aspx.

this measure will allow us to refine the data merging process as necessary without affecting payment or public reporting, since this voluntary measure will not be publicly reported. For hospitals that participate in the voluntary reporting of the Hybrid HWR measure, we will provide each hospital with a confidential hospital specific report that details submission results, as well as a description of the merged data set with both EHR and claims data included for the measure reporting period.

After consideration of the public comments we received, we are finalizing our proposal to adopt the Hybrid HWR measure (NQF #2879) as a voluntary measure for the CY 2018 reporting period, as proposed.

8. Changes to Policies on Reporting of eCQMs

a. Background

For a discussion of our previously finalized eCQMs and policies, we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50807 through 50810; 50811 through 50819), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50241 through 50253; 50256 through 50259; and 50273 through 50276), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49692 through 49698; and 49704 through 49709), and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57150 through 57161; and 57169 through 57172). In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57172), we finalized that hospitals must submit eCQM data by the end of two months following the close of the calendar year for the CY 2017 reporting period/FY 2019 payment determination and subsequent years.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20049 through 20051), we proposed two modifications to our finalized eCQM reporting policies for the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting period/FY 2020 payment determination. Specifically, we proposed to: (1) Decrease the number of eCQMs for which hospitals must submit data; and (2) decrease the number of calendar quarters for which hospitals are required to submit data, as further detailed below. These proposals were made in conjunction with our proposals discussed in sections IX.E.2.b. of the preamble of this final rule to align requirements for the Hospital IQR Program and the Medicare and Medicaid EHR Incentive Programs for hospitals and CAHs.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57150 through 57159), we finalized a policy to require hospitals to

submit one full calendar year of data (consisting of four quarterly data reporting periods) for 8 self-selected eCQMs out of the available eCQMs for both the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting period/FY 2020 payment determination.

Since the conclusion of the public comment period for the FY 2017 IPPS/LTCH PPS final rule, we have continued to receive frequent feedback (via email, webinar questions, help desk questions, and conference call discussions) from hospitals and EHR vendors about ongoing challenges of implementing eCQM reporting. A summary of the main concerns identified by these data submitters are as follows:

- The timing of the transition to a new EHR system during 2017 (or system upgrades or new EHR vendor) affects hospitals' ability to report on an increased number of measures in a timely manner;

- There is a need for at least one year between new EHR requirements due to the varying 6- to 24-month cycles needed for vendors to code new measures, test and institute measure updates, train hospital staff, and rollout other upgraded features;

- Hospitals have had difficulty identifying applicable measures that reflect their patient population, given the reduction in the number of available eCQMs (from 28 to 15) for CY 2017 reporting;

- Hospitals have had challenges with data mapping (aligning the information available in an electronic health record (EHR), particularly if the information is not located in a structured field (for example, PDF attachment, free text section) to the required fields in a QRDA Category I (QRDA I) file), and workflow (the process of extrapolating the pertinent patient data from an EHR, transferring that data to a QRDA I file, and submission of the QRDA I file to CMS) because hospitals still need to collect CY 2017 data while reporting CY 2016 data; and

- Hospitals have identified challenges in implementing annual updates and new editions of certified health IT because of significant impacts on workflow, staffing, and connected technology systems. (We note that this information was inadvertently omitted in the proposed rule at 82 FR 20050.)

In response to these issues, we proposed to modify the eCQM reporting requirements for both the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting period/FY 2020 payment determination as discussed in more detail below.

b. Modifications to the eCQM Reporting Requirements for the Hospital IQR Program for the CY 2017 Reporting Period/FY 2019 Payment Determination

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20050), for the CY 2017 reporting period/FY 2019 payment determination, we proposed to modify eCQM reporting requirements, such that hospitals: (1) Report on at least 6 of the available eCQMs, instead of 8 as previously finalized; and (2) submit two, self-selected quarters of data, instead of one full calendar year of data as previously finalized.

We stated in the proposed rule that although the publication of the FY 2018 IPPS/LTCH PPS final rule will not occur until on or about August 1, 2017, the data submission deadline for the CY 2017 reporting period/FY 2019 payment determination is not until February 28, 2018 which should provide hospitals with ample time to adjust to these modified policies. Hospitals that were prepared to submit one full calendar year of data for 8 eCQMs in accordance with the previously finalized CY 2017 eCQM reporting requirements should be able to submit two, self-selected quarters of data for 6 eCQMs in accordance with the modified CY 2017 reporting requirements. Reducing the number of data reporting periods to two quarters, rather than four, and allowing hospitals to self-select which two quarters of CY 2017 to report also offers greater reporting flexibility and allows hospitals and their vendors more time to plan for reporting and to account for and schedule hospital-specific scenarios, such as EHR upgrades or system transitions.

We believe these modified reporting requirements directly address stakeholder concerns while remaining consistent with our goal to incrementally transition to electronic reporting (80 FR 49694).

We note we proposed similar policies in the EHR Incentive Program and refer readers to section IX.E.2.b. of the preamble of this final rule. Our policies to modify the CY 2017 eCQM reporting requirements in the Hospital IQR Program continue to align with the requirements of the CQM electronic reporting requirements in the Medicare and Medicaid EHR Incentive Programs for eligible hospitals and CAHs to reduce confusion and reporting burden. In addition, in the proposed rule (82 FR 20050), we did not propose any changes to the February 28, 2018 submission deadline for CY 2017 reporting (81 FR 57172) to ensure that APU determinations for FY 2019 are not affected and to maintain the established

alignment with the Medicare EHR Incentive Program's submission deadline (81 FR 57255).

We invited public comment on our proposals to modify the eCQM reporting requirements for the CY 2017 reporting period/FY 2019 payment determination for the Hospital IQR Program as described above.

Comment: Several commenters supported the proposed policies for the CY 2017 reporting period/FY 2019 payment determination that reduce the reporting period from one full calendar year of data to two, self-selected quarters of data and the number of eCQMs required to report from 8 to 6, but recommended that CMS further reduce the CY 2017 reporting requirements by retaining the previously finalized CY 2016 policies that required the reporting of 4 eCQMs for one quarter of data. The commenters indicated that maintaining the CY 2016 eCQM reporting requirements would provide certified health IT vendors and CMS additional time to work on measure specification and, data validation, while giving hospitals more time to focus on incorporating system upgrades, data mapping, staff training, and planning for data processing for CMS reporting. In addition, some commenters expressed concern regarding the increase in eCQM reporting requirements impacting the ability of hospitals to effectively execute current eCQM reporting requirements and prepare for potential future increases in eCQM reporting requirements, thus placing an additional burden on hospitals by limiting available time for testing prior to production file submission. These commenters indicated that recent updates to measure specifications have required labor-intensive updates to complete terminology mapping, which has reduced hospitals' ability to expand eCQM reporting to additional eCQMs. The commenters noted that implementation of eCQM reporting is a multi-year process that requires significant capital and operating expenditures and requires close collaboration with clinical and other operations staff. The commenters encouraged CMS to continue to take into account the operational implications of eCQM data submission requirements for smaller hospitals that have resource limitations. One commenter indicated that even if facilities were already collecting data on 8 eCQMs, the reduction in the number of eCQMs required to report and the decreased reporting period would give facilities that have limited resources or difficulties reporting for an entire

calendar year the opportunity to be more successful.

Response: We appreciate commenters expressing their concerns and providing more details regarding their challenges associated with eCQM reporting. Based on commenter feedback, we are finalizing a modification to our proposals for eCQM reporting requirements for the CY 2017 reporting period/FY 2019 payment determination. Instead of requiring submission of one calendar year of data, for 8 eCQMs, as previously finalized in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57150 through 57159), or submission of two, self-select calendar quarters of data, for 6 eCQMs, as proposed in the FY 2018 IPPS proposed rule (82 FR 20050), we are finalizing a modification of our proposal to further reduce the eCQM reporting requirements, such that hospitals are required to submit only one, self-selected calendar quarter of data for 4 eCQMs. This retains reporting requirements similar to the CY 2016 reporting period/FY 2018 payment determination (80 FR 49698) with one change, such that hospitals will be able to submit data for any one of the 4 quarters for the CY 2017 reporting period/FY 2019 payment determination, whereas hospitals were only able to submit data for either Q3 or Q4 for the CY 2016 reporting period/FY 2018 payment determination.

In determining the modified number of eCQMs to report for the CY 2017 reporting period, we decided to continue the CY 2016 reporting period/FY 2018 payment determination requirements to give hospitals more time to gain experience reporting eCQMs. While we believe many hospitals are ready to successfully report on at least 6 eCQMs beginning with the CY 2017 reporting period/FY 2019 payment determination, as proposed, we also want to be responsive to feedback that many hospitals, especially small, rural, and IHS and tribal hospitals, as well as hospitals with fewer financial resources, need additional time and flexibility to successfully implement all of the eCQM reporting requirements. We intend to review the results of the first year of required eCQM data collection prior to increasing requirements for subsequent years.

We believe these modified, reduced reporting requirements directly address stakeholder concerns while remaining consistent with our goal to gradually transition toward more robust electronic quality measure reporting. Further, we believe reducing the number of eCQMs required to be reported and reducing the quarters of data to be reported eases the

burden on data submitters, allowing them to shift resources to support system upgrades, data mapping, and staff training related to eCQMs. Successful reporting in CY 2016 should streamline CY 2017 reporting because hospitals can re-use the same measures submitted to satisfy the CY 2016 reporting requirements. In addition, we believe that these modified, reduced reporting requirements will provide hospitals and health IT vendors more time to report quality data to CMS, including more time to submit test QRDA files before submitting production QRDA files for program credit. We also believe the reduction in the number of required eCQMs lessens the burden of identifying new measures to report; under the modified policy, hospitals are not required to identify any additional measures between CY 2016 and CY 2017. We will continue to assess the progress of hospitals in implementing eCQM reporting requirements and engage in discussions with hospitals and health IT vendors regarding their experiences as we consider eCQM policies in future rulemaking.

Although we are not finalizing our original proposal to require reporting on 6 eCQMs, we encourage hospitals to continue refining their electronic reporting implementation activities to successfully achieve electronic data capture and reporting. In addition, we encourage early testing and the use of pre-submission testing tools to reduce errors and inaccurate data submissions in eCQM reporting. Over time, we anticipate hospitals will continue to build and refine their EHR systems and gain more familiarity with reporting eCQM data, resulting in more accurate data submissions with fewer errors.

We note that we made similar proposals in the Medicare and Medicaid EHR Incentive Programs and refer readers to section IX.E.2.b. of the preamble of this final rule, where we also are finalizing a modification to our proposals. Our policies to modify and reduce the CY 2017 reporting period/FY 2019 payment determination eCQM reporting requirements in the Hospital IQR Program will continue to align with requirements in the Medicare and Medicaid EHR Incentive Programs. We also refer readers to section IX.A.10.d. of the preamble of this final rule for our eCQM submission policies.

Comment: A majority of commenters supported the proposed reduction from 8 required eCQMs to 6 eCQMs and the reduction from one full calendar year of data to two, self-selected quarters of data for the CY 2017 reporting/FY 2019 payment determination. The

commenters noted that as proposed, the requirements align with the CY 2017 Joint Commission reporting standards. A few commenters requested CMS finalize the proposed requirements as soon as possible in order for hospitals to prepare and educate appropriate staff.

Several commenters indicated that the modified reporting period from one full year to two quarters of data would provide hospitals with sufficient time to adequately transition their EHR systems and allow them to avoid a reporting period that overlaps with the quarter in which they transition EHR systems.

Response: We thank the commenters for their support. At this time, we believe that continuing the CY 2016 reporting requirements for hospitals to report one, self-selected calendar quarter of data for 4 eCQMs, as discussed above, balances stakeholder concerns while remaining consistent with our goal to gradually transition toward more robust electronic quality measure reporting. As previously stated, we believe the electronic collection and reporting of quality data using health IT will ultimately simplify and streamline reporting for various CMS quality reporting programs and hospitals will experience decreased financial and administrative burden as we continue to align program reporting requirements and adopt a more streamlined set of clinical quality measures with electronic specifications.

Comment: One commenter believed the current methodology of collecting information for more eCQMs, over a greater period of time, relies too heavily upon the entry of “hardcoded” documentation by physicians and nurses within certain timing constraints.

Response: We interpret the commenter’s concern about eCQMs relying too heavily upon entry of “hardcoded” documentation to mean that the commenter believes clinical staff may have difficulty inputting patient information in “real time” into the appropriate structured fields during the patient encounter due to competing clinical demands. The EHR may allow the clinician to update the patient information at a later time in the event that clinical staff need to provide crisis care and cannot record patient information at the time of the encounter without compromising patient care or in the case that additional information needs to be added to the medical record after the patient encounter. We recommend hospitals and their EHR vendors work together to implement EHR functionalities that will successfully support clinical activities, documentation, and quality measure reporting that are also consistent with

each hospital’s policies and procedures. We believe that recording patient information in structured fields for the purpose of reporting eCQMs is more accurate, less prone to errors because it relies less on interpretation, and ultimately reduces burden on hospitals because it does not require manual abstraction, as compared with conventional chart-abstracted data reporting.

Comment: One commenter did not support the proposal to reduce the eCQM submission requirements and recommended that the number of measures and the reporting window be kept the same, if not increased. The commenter indicated that capturing and exporting the data for a QRDA I file is part of the ONC EHR certification program, and if a hospital is not capturing data in such a way that a QRDA I file can be generated, then this implies that either the EHR is violating its certification or the hospital is not using its EHR appropriately. Rather than modifying the Hospital IQR Program eCQM reporting requirements to make it acceptable for EHRs to violate their certification, the commenter suggested that the existing regulations be enforced and penalties be applied to these health IT vendors.

In addition, the commenter suggested measure specifications could be published in advance to enable hospitals to view them before the reporting period begins; this does not require the total number of measures to be reduced. The commenter recognized the challenges some hospitals are having, but argued that these issues should be addressed directly with individual hospitals instead of through indirect mechanisms like changing the number of measures for all hospitals. The commenter expressed support for the creation of new eCQMs as a more appropriate approach to addressing concerns regarding the lack of measures rather than simply reducing the requirements.

Response: We thank the commenter for their support of the eCQM reporting requirements for the CY 2017 reporting period/FY 2019 payment determination as previously finalized in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57150 through 57161; and 57169 through 57172). We note that hospitals have reported data electronically for several years to both the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program (3 prior years of pilot reporting and 3 prior years of voluntary reporting), and thus we believe most hospitals are able to successfully meet our previously finalized eCQM reporting requirements

to report on additional measures for the CY 2017 reporting period/FY 2019 payment determination. However, as discussed above, we also want to be sensitive and responsive to feedback that a number of hospitals, especially small, rural, and IHS and tribal hospitals as well as hospitals with fewer financial resources, need additional time and flexibility to successfully implement all of the eCQM reporting requirements. At this time, we believe that continuing the CY 2016 reporting requirements for hospitals to report one, self-selected calendar quarter of data for 4 eCQMs, as discussed above, better balances stakeholder concerns while remaining consistent with our goal to gradually transition toward more robust electronic quality measure reporting.

We appreciate the commenter’s suggestion that measure specifications could be published further in advance to enable hospitals to view them before the reporting period begins as well as the suggestion to find and develop better measures. We will take these suggestions into consideration. We note that, generally, each year we issue a call for new measures, including eCQMs and other types of electronic measures, to be considered for adoption in the Hospital IQR Program. We also refer readers to section IX.A.9. of the preamble of this final rule for discussion of future potential eCQMs under consideration for the Hospital IQR and Medicare and Medicaid EHR Incentive Programs. Interested stewards and/or developers may submit measures for consideration by NQF. Submission guidance for eCQMs are available at: www.qualityforum.org/Electronic_Quality_Measures.aspx.

Comment: A few commenters recommended that CMS clarify the definitions used for the terms “workflow” and “data submission,” in the context of electronic measure reporting. Specifically, the commenters suggested that while “workflow” is related to technical challenges, the term is not appropriate in defining the process of data extraction and QRDA I submission.

Response: We thank the commenters for their suggestion. Our references to the terms “data submission” and “workflow” depend on the context in which the terms are used, which party is providing data to which party, and for what purpose. In the context of eCQM reporting, hospitals may experience challenges modifying workflow in regards to clinical care, corresponding documentation, and data capture, such that clinical staff enter patient information into the appropriate fields of the EHR at the time of the patient

encounter. Sometimes the clinician, medical assistant, scribe, or other staff member entering data into the EHR may find it easier or more expeditious to enter patient information in the “free text” section of the EHR, even though specific fields exist in the EHR where that data should be recorded so that it maps appropriately when the eQCMs pull data from the EHRs. To clarify, when we suggested that hospitals need to make changes to workflow, we meant hospitals should focus additional time and effort on training the appropriate staff to effectively capture patient data within the EHR. We further encourage hospitals to innovate and design workflows that fit their unique needs to make the best use of both clinical and non-clinical staff resources to maintain patient health information in the EHR.

In addition, when the staff enter patient information in the “free text” section of the EHR, it is also sometimes the case that staff or hospital administrators go back after the patient encounter has completed and manually enter that information into the appropriate fields. This also could be considered part of the “workflow” under the definition provided by the commenter. Data submission in the context of eCQM reporting would refer to the sending and subsequent receiving of that documented clinical data corresponding to eCQM specifications through the QualityNet Secure Portal for purposes of the Hospital IQR Program eCQM submissions.

Comment: One commenter urged CMS to begin allowing hospitals to select eQCMs as their official Hospital IQR Program performance metric and opt out of the manual submission of the same quality metric; the commenter noted that it would encourage organizations to begin the transition towards eQCMs by relieving the burden of dual abstraction when the organization is comfortable with the accuracy of its eCQM data.

Response: We thank the commenter for their suggestion to allow hospitals to elect to report eQCMs as their official Hospital IQR Program performance metric and opt out of manual submission for chart-abstracted measures, and will take the suggestion under consideration for future policies on quality measure reporting for the Hospital IQR Program. At this time, as we are planning to validate eCQM data starting with CY 2017 data and not publicly displaying the eCQM data, we believe it is important for chart-abstracted measure data to continue to be collected and publicly displayed to provide important information to consumers and providers.

Comment: One commenter urged CMS to suspend all regulatory requirements that mandate submission of eQCMs given that hospitals have spent significant time and resources to revise certified EHRs to meet eCQM requirements for the CY 2016 reporting period/FY 2018 payment determination, with no benefit for patient care.

Response: We thank the commenter for their recommendations, but disagree that eCQM reporting does not benefit patients. While we recognize the current burden associated with implementing the necessary infrastructure and EHR technology as well as training and refinement of work flows for transitioning to electronic quality reporting and understand that there are operational shortcomings that need to be further reconciled to streamline the process, we do not believe that suspending all eCQM reporting would be the best way to advance the Hospital IQR Program’s goals of improving the quality of care and transparency through quality measurement while also reducing the associated operational, administrative, and financial burdens associated with manual chart-abstractation. In addition, suspending all eCQM reporting in the Hospital IQR Program would result in misalignment with the EHR Incentive Program’s CQM reporting policies.

We believe electronic reporting furthers CMS and HHS policy goals to promote quality through performance measurement and, in the long-term, will both improve the accuracy of the data and reduce reporting burden for providers. Moreover, we believe it is appropriate to require reporting and validation of eCQM data given that measures available now and those being developed for the future are based increasingly on electronic standards (80 FR 49696).

We encourage hospitals to work closely with health IT vendors to ensure that a contract is in place that supports the hospital’s quality reporting requirements and the annual update of quality measures. We understand that hospitals have spent resources to update certified EHRs to meet eCQM requirements, but we believe eQCMs will promote better quality of care as hospitals and health IT vendors continue to refine EHR systems to appropriately structure them commensurate with the clinical work flow. Further, we believe these updates will lead to improved accuracy, reliability, and completeness of the eCQM data, which will promote higher quality outcomes and lower costs while ultimately decreasing reporting burden on hospitals as compared with chart-

abstraction of quality measure data. We will continue to monitor the progress of hospitals implementing eCQM reporting requirements and encourage hospitals to share their experiences in preparing for and meeting reporting requirements. In addition, we will evaluate the eQCMs available to report as part of routine measure maintenance as well as consider new electronic measures as they become available for potential use in the Hospital IQR and Medicare and Medicaid EHR Incentive Programs.

After consideration of the public comments we received, we are finalizing a modification of our proposal. Instead of reporting two, self-selected quarters of data for 6 eQCMs as proposed, we are further reducing requirements, such that hospitals are required to report only one, self-selected calendar quarter of data for 4 self-selected eQCMs for the CY 2017 reporting period/FY 2019 payment determination. We refer readers to section IX.E.2.b. of the preamble of this final rule where we are finalizing a similar modified policy under the Medicare and Medicaid EHR Incentive Programs.

c. Modifications to the eCQM Reporting Requirements for the Hospital IQR Program for the CY 2018 Reporting Period/FY 2020 Payment Determination

As stated above, in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57150 through 57159), we finalized a policy requiring submission of 8 self-selected eQCMs out of the available eQCMs in the Hospital IQR Program for both the CY 2017 reporting period/FY 2019 payment determination and CY 2018 reporting period/FY 2020 payment determination. In addition, for the CY 2018 reporting period/FY 2020 payment determination, hospitals are required to submit the data by February 28, 2019 (the end of two months following the close of the calendar year, as set out in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57172)). For the same reasons as discussed above, we proposed similar modifications for the CY 2018 reporting period/FY 2020 payment determination in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20050 through 20051). Specifically, we proposed to require hospitals to report on at least six of the available eQCMs for the CY 2018 reporting period/FY 2020 payment determination, instead of eight as previously finalized. These six eQCMs may be the same or a different set of six eQCMs a hospital reports for the CY 2017 reporting period. In addition, we proposed to decrease the number of required reporting periods, from four quarters as previously finalized, to the

first three quarters of the CY 2018 reporting period (that is, Q1, Q2, and Q3 of CY 2018). We noted that this differs from our proposal for the CY 2017 reporting period as discussed above, which would only require two self-selected quarters of data.

In crafting this proposal, we considered several alternatives. Specifically, we considered aligning the CY 2018 reporting period requirements with the proposed CY 2017 reporting period requirements, such that hospitals would report on at least six of the available eCQMs and submit two self-selected quarters of data for both years. We also considered retaining the reporting requirements finalized in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57150 through 57159), such that hospitals would submit one full calendar year of data for 8 self-selected eCQMs for the CY 2018 reporting period/FY 2020 payment determination. Ultimately, we believe that our proposals as stated above balance our goal to progressively shift towards electronic reporting of quality measure data with hospitals' concerns of the burden this increase may cause. In addition, hospitals will have had several years to report data electronically for the Hospital IQR and Medicare and Medicaid EHR Incentive Programs. Therefore, we believe that hospitals will be better prepared to submit an additional quarter of data for the CY 2018 reporting period compared to the number of quarterly reporting periods we are proposing for the CY 2017 reporting period. We also believe that hospitals will be better prepared to submit additional eCQMs in the future, since hospitals will have had a sufficient number of cycles of eCQM reporting.

Our proposals for the CY 2018 reporting period/FY 2020 payment determination were made in conjunction with proposals discussed in section IX.E.3. of the preamble of the proposed rule that fully align requirements for the Hospital IQR Program with the requirements for the CQM electronic reporting option in the Medicare EHR Incentive Program for eligible hospitals and CAHs. We noted that the deadline for submission would be the same as previously finalized, two months following the end of the reporting period calendar year, specifically February 28, 2019 (81 FR 57172).

We invited public comment on our proposals to modify the CY 2018 reporting period/FY 2020 payment determination eCQM reporting requirements for the Hospital IQR Program as described above.

Comment: Several commenters supported the proposed policies for the CY 2018 reporting period/FY 2020 payment determination that would reduce the reporting period from one full calendar year of data to the first three quarters of data and the number of eCQMs required to report from 8 to 6, for the CY 2018 reporting period/FY 2020 payment determination as a step in the right direction, but recommended that CMS further reduce the requirements by continuing the CY 2016 eCQM reporting requirement of one, self-selected calendar quarter of data for 4 eCQMs. The commenters indicated that maintaining the CY 2016 eCQM reporting requirements would provide certified health IT vendors and CMS additional time to work on measure specification and data validation, while giving hospitals more time to focus on incorporating system upgrades, data mapping, staff training, and planning for data processing for CMS reporting.

Some commenters remained concerned with the pace of the expansion of eCQM reporting requirements impacting the ability of hospitals to effectively execute current eCQM reporting requirements and prepare for potential future increases in eCQM reporting requirements, thus placing an additional burden on hospitals by limiting available time for testing prior to production file submission. These commenters indicated that recent updates to measure specifications have required labor-intensive updates to complete terminology mapping, which has hindered hospitals' ability to expand reporting to additional eCQMs. The commenters noted that implementation of eCQM reporting is a multi-year process that requires significant capital and operating expenditures and requires close collaboration with clinical and other operations staff.

A few commenters expressed concern about the considerable burden required to map the necessary data elements from the EHR to the appropriate QRDA file format given that some vendors are not properly equipped to collect and transmit such data through the CMS QualityNet Secure Portal. The commenters stated that until these issues are sufficiently addressed, CMS should not increase the required eCQM reporting requirements for the Hospital IQR Program.

Response: We appreciate commenters expressing their concerns and providing more detail regarding their challenges associated with eCQM reporting. Based on commenter feedback we are finalizing a modification to our proposals for eCQM reporting

requirements for the CY 2018 reporting period/FY 2020 payment determination. Instead of requiring submission of one calendar year (four quarters) of data, for 8 eCQMs, as previously finalized in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57150 through 57159), or submission of two, self-selected calendar quarters of data, for 6 eCQMs, as proposed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20050), we are modifying our proposal to further reduce the eCQM reporting requirements, such that hospitals are required to submit only one, self-selected calendar quarter of data for 4 eCQMs. This continues reporting requirements similar to the CY 2016 reporting period/FY 2018 payment determination (80 FR 49698) with one change, such that hospitals will be able to submit data for any one of the 4 quarters for the CY 2018 reporting period/FY 2020 payment determination, whereas hospitals are only able to submit data for either Q3 or Q4 for the CY 2016 reporting period/FY 2018 payment determination.

We believe reducing the number of eCQMs required to be reported and reducing the quarters of data to be reported offers greater reporting flexibility and eases the burden on data submitters, allowing them to shift resources to support system upgrades, data mapping, and staff training related to eCQM documentation and reporting. In addition, we believe that these modified reporting requirements will provide hospitals and health IT vendors more time to report quality data to CMS, including more time to submit test QRDA files before submitting production QRDA files for program credit. We note we are aligning the requirement for hospitals to submit data on one, self-selected calendar quarter of data for 4 eCQMs between the Hospital IQR Program and the Medicare and Medicaid EHR Incentive Programs in order to streamline the electronic submission of quality data for hospitals.

Further, successful reporting in CY 2016 and CY 2017 should streamline CY 2018 reporting because hospitals can reuse the same measures with which they already have gained familiarity. Once hospitals have become comfortable submitting data for 4 eCQMs in CY 2016 and CY 2017, the requirements we are finalizing will also allow greater flexibility if hospitals wish to select different eCQMs from those they submitted for CY 2016 or CY 2017 reporting. In addition, hospitals will have flexibility to select which quarter of data to report data based upon their individual quality improvement needs and electronic reporting capabilities.

Our decision to finalize the same requirements for both the CY 2017 and CY 2018 reporting periods is in an effort to be responsive to the feedback we have received about the challenges of eCQM reporting and recommendations to allow more time to become familiar with and improve upon electronic reporting capabilities. While we believe most hospitals will be ready to successfully report on at least 6 eCQMs beginning with the CY 2018 reporting period/FY 2020 payment determination, we also want to be responsive to feedback that a number of hospitals, especially small, rural, and IHS and tribal hospitals as well as hospitals with fewer financial resources, need additional time and flexibility to successfully implement all of the eCQM reporting requirements. We intend to review the results of the first year of required eCQM data collection prior to increasing requirements for subsequent years. We believe these modified, reduced reporting requirements directly address stakeholder concerns while remaining consistent with our goal to gradually transition to more robust electronic quality measure reporting. In addition, we believe that these modified, reduced reporting requirements will provide hospitals more time and flexibility to address measure specification updates, data validation, technology readiness, system issues, and future requirements generally. We will continue to assess the progress of hospitals implementing eCQM reporting requirements and engage in discussions with hospitals regarding their experiences as we consider eCQM policies in future rulemaking. We intend to determine requirements for the CY 2019 reporting period/FY 2021 payment determination and subsequent years in future rulemaking.

Although we are not finalizing our original proposal to require reporting on 6 eCQMs, we encourage hospitals to continue refining their electronic reporting implementation activities to successfully achieve electronic data capture and reporting. In addition, we encourage early testing and the use of pre-submission testing tools to reduce errors and inaccurate data submissions in eCQM reporting. Over time, we anticipate hospitals will continue to build and refine their EHR systems and gain more familiarity with reporting eCQM data, resulting in more accurate data submissions with fewer errors. We note that we made similar proposals in the Medicare and Medicaid EHR Incentive Programs and refer readers to section IX.E.2.b. of the preamble of this

final rule where we also are finalizing the same modification of our proposal and is a continuation of our policy to align the eCQM reporting requirements of the Hospital IQR Program with the CQM electronic reporting requirements in the Medicare and Medicaid EHR Incentive Programs in order to reduce confusion and reporting burden for all hospitals. We also refer readers to section IX.10.d. of the preamble of this final rule for our eCQM submission policies for the Hospital IQR Program.

In arriving at this modified finalized policy, we considered several alternatives. Specifically, we considered aligning the CY 2018 reporting period requirements with the proposed CY 2017 reporting period requirements, such that hospitals would report on at least 6 of the available eCQMs and submit two, self-selected quarters of data. We also considered retaining the reporting requirements finalized in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57150 through 57159), such that hospitals would submit one full calendar year of data for 8 self-selected eCQMs for the CY 2018 reporting period/FY 2020 payment determination. Ultimately, based on commenter feedback and for the reasons articulated above, we have decided to modify our policy to further reduce the eCQM reporting requirements for the CY 2018 reporting period/FY 2020 payment determination, such that hospitals are required to submit one, self-selected calendar quarter of data for 4 eCQMs. Our decision to keep the same eCQM reporting requirements for the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting period/FY 2020 payment determination was also based on commenter feedback recommending additional time and flexibility to successfully implement electronic reporting capabilities. As previously stated, we believe the electronic collection and reporting of quality data using health IT will ultimately simplify and streamline reporting for various CMS quality reporting programs and hospitals will experience decreased financial and administrative burden as we continue to align program reporting requirements and adopt a more streamlined set of clinical quality measures with electronic specifications.

Comment: Many commenters supported the proposed reduction from 8 required eCQMs to 6 required eCQMs and the reduction from one full calendar year of data to the first three calendar quarters of data for the CY 2018 reporting period/FY 2020 payment determination. A few commenters suggested CMS maintain the

requirement to report 6 eCQMs beyond the CY 2018 reporting period, while increasing the performance period to one year and then gradually increasing the number of required eCQMs in future years.

The commenters believed this approach would allow hospitals to adapt to more robust eCQM requirements. Other commenters supported the proposed reduction from 8 required eCQMs to 6 for the CY 2018 reporting period/FY 2020 payment determination, but suggested that CMS retain the proposed CY 2017 reporting period/FY 2019 payment determination requirement, such that hospitals are required to report two, self-selected quarters of data for the CY 2018 reporting period/FY 2020 payment determination. Some commenters noted smaller hospitals, with fewer resources, require more time to become proficient in all of the parameters (mapping, new work flows, staff education, etc.) associated with electronic reporting.

A few commenters indicated that if hospitals were allowed to self-select two quarters of data (instead of three or four quarters of data) for the CY 2018 reporting period/FY 2020 payment determination, it would provide the necessary time for quality, health IT, and clinical teams to more effectively utilize change management processes to improve scores until such time as alternative and more advanced techniques are more commonplace and tested without significantly impairing CMS' ability to review and analyze data generated by eCQMs.

Response: We thank the commenters for their support. While we believe that most hospitals would be ready to successfully report on at least 6 eCQMs for the CY 2018 reporting period/FY 2020 payment determination, we also want to be responsive to feedback that a number of hospitals, especially small, rural, and IHS and tribal hospitals as well as hospitals with fewer financial resources, need additional time and flexibility to successfully implement all of the eCQM reporting requirements. Therefore, at this time, we believe finalizing the modified, reduced requirements for hospitals to report one, self-selected calendar quarter of data for 4 eCQMs, as discussed above, better balances stakeholder concerns while remaining consistent with our goal to gradually transition toward more robust electronic quality measure reporting.

Although we are not finalizing our original proposal to require reporting on the first three calendar quarters of data for 6 eCQMs, we encourage hospitals to continue refining their electronic reporting implementation activities to

successfully achieve electronic data capture and reporting. In addition, we encourage early testing and the use of pre-submission testing tools such as the PSVA to reduce errors and inaccurate data submissions in eCQM reporting. As time passes, we anticipate that hospitals will continue to build and refine their EHR systems and gain more familiarity with reporting eCQM data, resulting in more accurate data submissions with fewer errors.

Comment: Several commenters supported the proposed reduction from 8 required eCQMs to 6 for the CY 2018 reporting period/FY 2020 payment determination, but suggested that CMS allow hospitals to self-select the three quarters for which they provide data. The commenters noted that the comprehensive process at the start of the calendar year is still very time consuming and cumbersome with changing/updating eCQM logic definitions, vendor relations, schemas for running reports, and XML files occurring at the same time. Some commenters indicated that they would support reporting data from the first quarter performance period when this year-end process is more established and predictable.

Response: We refer readers to our reduced requirements as discussed above. We acknowledge the burden associated with eCQM logic definitions, implementation of report schemas and reconciliation of XML files, which is why we have further reduced the reporting requirements for both the CY 2017 and CY 2018 reporting periods. In addition, we refer readers to section IX.A.10.d.(2)(b)(ii) of the preamble of this final rule, in which we discuss our policy to require EHRs to be certified to all available eCQMs. We believe that satisfying this requirement will offset the burden associated with health IT vendor relations, as hospitals will not have to certify individual electronic measures at the time electronic reporting is increased. Furthermore, we will take these comments into consideration for future policies. We believe that with time, as hospitals continue to gain more experience with eCQM reporting, the challenges hospitals encounter at the beginning of each calendar year will be reduced.

Comment: One commenter supported the reduction in the number of required eCQMs from 8 to 6 for the CY 2018 reporting period/FY 2020 payment determination, but suggested that CMS retain the requirement to report one full calendar year of data. Further, the commenter suggested gradually increasing the number of required eCQMs in future years. The commenter

believed that this approach would allow hospitals to adapt to more robust eCQM requirements.

Response: We thank the commenter for their support. We refer readers to our modified policies as discussed above. For future years, we will consider requiring hospitals to report more quarters of data and gradually increase the electronic reporting of quality measure data in the Hospital IQR Program. In the meantime, we will continue to assess the progress of implementing eCQM reporting capabilities and engage in discussions with hospitals regarding their experiences as we consider the establishment of eCQM policies in future rulemaking.

Comment: One commenter sought clarification on whether or not the CY 2018 eCQM data would be publicly reported.

Response: In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50815 through 50818), we adopted a policy under which we would only publicly report eCQM data in the Hospital IQR Program if we deem that the data are accurate enough to be publicly reported (78 FR 50816). As described in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57176), we will not conduct the first validation of eCQM data until spring of 2018 to validate data from the CY 2017 reporting period. Validation of CY 2017 data during spring of 2018 affects the FY 2020 payment determination (81 FR 57177).

We believe it is important to confirm the validity of quality performance data before it is publicly reported on the *Hospital Compare* Web site. A number of commenters have expressed concerns about the accuracy of eCQM data or the comparability of eCQM data to non-electronic CQMs, and a full validation of the CY 2017 data will allow us to assess the merit of these concerns. Once we have analyzed the first year of eCQM data validation results, we will determine whether the data should be publicly reported the *Hospital Compare* Web site.

After consideration of the public comments we received, we are finalizing a modification of our proposal, such that instead of requiring submission of 6 eCQMs for the first three calendar quarters (Q1–Q3) of CY 2018, we are further reducing requirements, such that hospitals are required to report only one, self-selected calendar quarter of data for 4 eCQMs for the CY 2018 reporting period/FY 2020 payment determination. We also refer readers to section IX.E.2.b. of the preamble of this final rule where we are finalizing the same modified policy for

CQM electronic reporting requirements under the Medicare and Medicaid EHR Incentive Programs.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20051), we stated that the proposals related to the CY 2017 reporting period/FY 2019 payment determination and CY 2018 reporting period/FY 2020 payment determination, if finalized, would also have implications for eCQM validation in the Hospital IQR Program. Validation of eCQM data under the Hospital IQR Program is set to begin using CY 2017 reported data for the FY 2020 payment determination, as finalized in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57153 through 57181). We refer readers to section IX.A.11. of the preamble of this final rule where we discuss our finalized validation policies.

9. Possible New Quality Measures and Measure Topics for Future Years

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53510 through 53512), we outlined considerations to guide us in selecting new quality measures to adopt into the Hospital IQR Program. Specifically, we seek to adopt measures for the Hospital IQR Program that would: (1) Promote better, safer, more efficient care; (2) expand the pool of measures to include measures that aim to improve patient safety; (3) support the NQS' three-part aim of better health care for individuals, better health for populations, and lower costs for health care by creating transparency around the quality of care at inpatient hospitals to support patient decision-making and quality improvement; (4) collect data in a manner that balances the need for information related to the full spectrum of quality performance and the need to minimize the burden of data collection and reporting; (5) weigh the relevance and utility of the measures compared to the burden on hospitals in submitting data under the Hospital IQR Program; (6) to the extent practicable, consider measures that have been nationally endorsed by a multi-stakeholder organization, developed with the input of providers, purchasers/payers, and other stakeholders, and aligned with best practices among other payers and the needs of the end users of the measures; (7) in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed, give due consideration to measures that have been endorsed or adopted by a consensus organization identified by the Secretary; (8) give priority to measures that assess performance on conditions that result in the greatest mortality and morbidity in

the Medicare population, are high volume and high cost for the Medicare program, and for which wide cost and treatment variations in the Medicare population have been reported across populations or geographic areas despite established clinical guidelines; (9) focus on selecting measures that will also meet the Hospital VBP Program measure inclusion criteria and advance the goals of the Hospital VBP Program by targeting hospitals' ability to improve patient care and patient outcomes; and (10) align with the HHS Strategic Plan and Initiatives¹⁷⁴ and the CMS Strategic Plan.¹⁷⁵

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20051 through 20064), in keeping with these considerations, we invited public comment on the potential future inclusion of the following seven measures in the Hospital IQR Program (one measure related to the quality of informed consent documents, four measures that evaluate end-of-life processes and outcomes for cancer patients, and two measures that evaluate nursing skill mix):

- Quality of Informed Consent Documents for Hospital-Performed, Elective Procedures measure;
- Proportion of Patients Who Died from Cancer Receiving Chemotherapy in the Last 14 Days of Life measure (NQF #0210);
- Proportion of Patients Who Died from Cancer Not Admitted to Hospice measure (NQF #0215);
- Proportion of Patients Who Died from Cancer Admitted to the ICU in the Last 30 Days of Life measure (NQF #0213);
- Proportion of Patients Who Died from Cancer Admitted to Hospice for Less Than Three Days measure (NQF #0216);
- Skill Mix (Registered Nurse [RN], Licensed Vocational/Practical Nurse [LVN/LPN], Unlicensed Assistive Personnel [UAP], and contract) (Nursing Skill Mix) Measure (NQF #0204); and
- Nursing Hours per Patient Day Measure (NQF #0205).

We also are considering newly specified eCQMs for possible inclusion in future years of the Hospital IQR and Medicare and Medicaid EHR Incentive Programs. These measures are listed and these topics are further discussed below.

- Safe Use of Opioids—Concurrent Prescribing;

- Completion of a Malnutrition Screening within 24 Hours of Admission;
- Completion of a Nutrition Assessment for Patients Identified as At-Risk for Malnutrition within 24 Hours of a Malnutrition Screening;
- Nutrition Care Plan for Patients Identified as Malnourished after a Completed Nutrition Assessment;
- Appropriate Documentation of a Malnutrition Diagnosis;
- Tobacco Use Screening (TOB-1);
- Tobacco Use Treatment Provided or Offered (TOB-2)/Tobacco Use Treatment (TOB-2a);
- Tobacco Use Treatment Provided or Offered at Discharge (TOB-3)/Tobacco Use Treatment at Discharge (TOB-3a);
- Alcohol Use Screening (SUB-1);
- Alcohol Use Brief Intervention Provided or Offered (SUB-2)/Alcohol Use Brief Intervention (SUB-2a); and
- Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge (SUB-3)/Alcohol & Other Drug Use Disorder Treatment at Discharge (SUB-3a).

a. Potential Inclusion of the Quality of Informed Consent Documents for Hospital-Performed, Elective Procedures Measure

(1) Background

The process and documentation of informed consent for surgical procedures is an ethical obligation and legal mandate intended to uphold patient autonomy. It is also a standard part of clinical practice performed prior to most procedures and therapies with material risks. This process provides information to patients about the associated risks and benefits, alternative treatment options, and what to expect during and after the procedure. As described in the literature and reported by patients, comprehensive informed consent documents can improve patient comprehension and satisfaction, and support patients in making decisions that are aligned with their expectations, preferences, and goals.^{176 177 178 179 180 181 182}

Available at: http://www.qualityforum.org/Publications/2005/09/Improving_Patient_Safety_Through_Informed_Consent_for_Patients_with_Limited_Health_Literacy.aspx. Accessed: July 5, 2016.

Despite their importance, and our regulations in the Conditions for Participation Guidelines,¹⁸³ informed consent documents are frequently generic, lack information that is relevant to the procedure, and include illegible, hand-written information. Moreover, patients are often given and asked to sign the informed consent document minutes before the start of a procedure when they are most vulnerable and least likely to ask questions.

Therefore, we developed the Measure of Quality of Informed Consent Documents for Hospital-Performed, Elective Procedures (hereinafter referred to as, Quality of Informed Consent Documents measure). This measure was developed in conjunction with feedback from patients and patient advocates convened by the measure developers, all of whom affirmed the measure captured the most salient elements of informed consent documents, and represented a minimum, though significant, standard all hospitals should meet. We recognize the Quality of Informed Consent Documents measure does not capture all aspects of the informed consent process or all aspects of quality related to patient engagement in shared decision making. However, we view the Quality of Informed Consent Documents measure as a critical first step to incentivize hospitals to improve the informed consent process and to ensure patients receive basic information in a written format which is understandable, legible and presented with sufficient time allowed for questions and deliberation. The members of the patient workgroup involved in measure development also agreed with this determination and supported the measure.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20052 through 20055), we stated that we are considering including the Quality of Informed Consent Documents measure in the Hospital IQR Program in future rulemaking.

(2) Overview of Measure

Improving the quality of informed consent documents is a fundamental step for advancing patient-centered decision making.^{184 185 186 187 188 189} The written quality of informed consent documents is a critical component of the informed consent process, and hospitals have a role in ensuring their patients have the information they need in a readable form and with time to consider their options. We expect the Quality of Informed Consent Documents measure will help to pave the way for future measures which evaluate other components of the informed consent process, including shared decision-making.

The measure focuses on the quality of informed consent documents for elective procedures. Further, with a focus on ensuring that each person and family is engaged as partners in their care, this measure addresses the NQS priority of promoting effective communication and coordination of care. Elective procedures were chosen as the focus of the measure because all elective procedures have informed consent documents as standard practice. In addition, we believe patients undergoing elective, rather than emergent surgery, will benefit from a measure aimed at optimizing communications about the risk, benefits, and purpose of the procedure because there are typically reasonable alternatives to elective procedures and

different patients may choose different options depending on their preferences, values, and goals. Further, elective procedures usually allow ample decision time and do not require expedited explanations and decisions due to life threatening situations.

The measure would require hospitals to evaluate a sample of their informed consent documents from elective procedures performed among Medicare FFS patients aged 18 years and older hospitalized at acute care hospitals. The measure uses administrative claims to select a stratified random sample of elective procedures across specialties that are performed in hospitals. The informed consent documents associated with these procedures are reviewed and abstracted by trained personnel using a validated Abstraction Tool. Abstractors are trained using standard instructions, videos, and test documents with audit review we have developed. For additional information about the training materials and procedures, see the measure methodology report on our Web site available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>. After completing this training, we estimate the abstraction time is approximately four minutes per document and the inter-rater reliability is high. The tool captures 10 items which are fundamental to informed consent document quality. Documents are scored on a scale of 0 to 20, with 20 representing a better quality document. Document scores are then aggregated to calculate hospital-level performance on the measure. The measure is not risk adjusted because patient characteristics should not impact informed consent document quality. We invited public comment on how the measure would be reported and implemented.

We developed the Quality of Informed Consent Documents measure in 8 hospitals, and demonstrated the measure to be valid, reliable, feasible and of minimal hospital burden. We then tested the measure among a sample of 25 additional hospitals, which also showed feasibility and low burden on hospitals. In both the development and testing samples, we observed overall low performance on the measure, with intra-hospital and inter-hospital variation in the quality of consent documents. The Quality of Informed Consent Documents measure aligns with our goal to increase opportunities for shared decision making with patients and the NQS priorities of: (1) Ensuring person- and family-centered care; and (2) promoting effective communication

and coordination of care. For details on development and testing, we refer readers to the measure methodology report on our Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

(3) Data Sources

The measure uses two sources of data to calculate the Quality of Informed Consent Documents measure: Medicare Part A administrative claims, specified below, to generate a random sample of qualified elective procedures performed at each hospital; and a sample of each hospital's informed consent documents and the first page of the procedure/operative report for those elective procedures. Basing the sample selection on administrative data to identify medical records of elective procedures ensures a diversity of informed consent documents on a range of procedures will be reviewed, and minimizes selection bias.

(4) Outcome

The outcome for the Quality of Informed Consent Documents measure is a quality score which is calculated by aggregating the scores for individual informed consent documents from each hospital assessed with the Abstraction Tool. The items selected for inclusion in the Abstraction Tool were important to patients, supported by evidence in the literature and published standards and guidelines, applicable to the cohort of elective procedures, easily abstracted from medical records without undue burden on patients and hospitals, and feasibly and reliably measured. These elements are also meaningful components of informed consent document quality from the patient perspective. Further, we received consistent feedback from all participating hospitals during testing of this measure that this information was useful for hospitals' efforts to improve their informed consent documents and processes by identifying important gaps in existing documentation. Quality scores on each informed consent document will be aggregated to derive a hospital-level performance score.

The measure outcome does not overlap with our current regulations holding hospitals accountable for informed consent pursuant to our Conditions of Participation or The Joint Commission 2009 Requirements Related to the Provision of Culturally Competent Patient-Centered Care Hospital

¹⁸⁹ Krumholz HM. Informed consent to promote patient-centered care. *JAMA*. 2010;303(12):1190–1191.

Accreditation Program (HAP),¹⁹⁰ and fully aligns with State laws within the few States which have more specified informed consent rules. Current Conditions of Participation regulations focus on whether informed consent occurred and emphasize informed consent documents should include the name of the hospital, procedure, and practitioner performing the procedure along with a statement certifying the procedure, anticipated benefits, material risks, and alternative treatment options were explained to the patient or the patient's legal representative.¹⁹¹ The Joint Commission offers additional guidance for best practices.¹⁹² However, there are no regulations to ensure hospitals provide patients with adequate written information about the procedure. We believe the use of this measure would supplement and augment existing standards by incentivizing hospitals to provide a minimum set of critical information about an elective procedure to the patient within a reasonable time before the patient undergoes the procedure and to enable the patient to receive and process the information prior to signing and providing informed consent.

(5) Cohort

The cohort for the Quality of Informed Consent Documents measure includes informed consent documents for a randomly selected sample of qualifying elective surgical procedures performed within non-federal acute care hospitals performed on Medicare FFS beneficiaries, aged 18 years and over who are enrolled in Part A at the time of the procedure. The list of qualifying elective procedures includes procedures for which informed consent is standard practice. The list of qualifying procedures is broad, capturing 10 specialties and various levels of invasiveness. For example, electively-performed knee replacements and coronary artery bypass surgeries are both included. For more information about the list of qualifying procedures,

we refer readers to the measure methodology report on our Web site available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

(6) Inclusion and Exclusion Criteria

Qualifying electively-performed procedures were identified using the AHRQ Clinical Classification Software (CCS) codes¹⁹³ from the list of potentially planned procedures and the list of acute discharge diagnosis AHRQ CCS codes in the CMS Planned Readmission Algorithm. The Planned Readmission Algorithm used for existing CMS readmission measures was refined in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50211 through 50216). A complete description of the CMS Planned Readmission Algorithm, which includes lists of potentially planned procedures and acute discharge diagnoses, can be found on the CMS Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

The CMS Planned Readmission Algorithm identifies a list of potentially planned procedures and a list of acute discharge diagnosis codes. Admissions that have a potentially planned procedure without an acute discharge diagnosis code are considered planned according to the CMS Planned Readmission Algorithm. The Quality of Informed Consent Documents measure does not use the Planned Readmission Algorithm to identify planned versus unplanned readmissions. The measure builds upon the established approach of the Planned Readmission Algorithm to identify only electively-performed procedures because planned procedures are also commonly electively-performed. We used clinical expert review to further narrow the list of potentially planned procedures from the Planned Readmission Algorithm to those which are consistently electively-performed and likely to have informed consent obtained prior to every procedure.

The measure excludes highly specialized procedures, such as organ transplantation because they typically use unique informed consent processes; non-invasive radiographic diagnostic tests because informed consent standards may be different than

standards for invasive procedures and surgeries; and procedures that are conducted over several encounters since informed consent is likely only conducted prior to the first procedure. For more information about the list of qualifying procedures and excluded procedures, we refer readers to the measure methodology report on our Web site available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

(7) Abstraction Tool

The Abstraction Tool is an instrument used to evaluate the quality of a hospitals' informed consent documents based on a score of 0–20; a higher score indicates better quality. The Abstraction Tool is a checklist evaluating the presence of the following items in the consent document: A description of the procedure; how the procedure will be performed; the rationale for why the procedure will be performed; and the risks, benefits, and alternatives to the procedure. The Abstraction Tool also includes an item to assess whether patients received the document at least one calendar day in advance of the procedure date. Inclusion of the timing item ensures informed consent documents are not shared for the first time with patients on the day of the procedure. The Abstraction Tool provides an option for hospitals to note if a patient chose to opt out of signing their informed consent document 24 or more hours before surgery, enabling full credit to be given to the hospital for this item in that scenario. In addition, the tool gives credit for sharing the document prior to the day of the procedure, even if the patient does not sign the document until the day of the procedure. These aspects were raised with the patient and patient advocate workgroup and deemed to be more flexible to a range of scenarios and contexts, and therefore more patient-sensitive. To assess the reliability of the Abstraction Tool, we examined the inter-rater reliability (the degree of agreement among abstractors) of each item on the Abstraction Tool as well as the document scores produced by the Abstraction Tool for 80 of the 800 documents tested from the pilot project hospitals. For additional information about testing refer to our Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

Abstractors enter responses for each item evaluated in each informed consent document. We would provide

comprehensive standardized training materials including an instruction manual with guidance and examples of what meets criteria for each item in the Abstraction Tool, a training video, and sample test documents. This process has previously been piloted and found to be effective and efficient. For more information about the Abstraction Tool and instructions manual, we refer readers to our Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

(8) Calculating the Measure Score

The measure will be calculated by aggregating the scores of the sample of hospitals' informed consent documents, as assessed using the Abstraction Tool. Based on input from stakeholders during the measure development stage, including the Technical Expert Panel convened by the measure developer, and feedback from patients and patient advocates, we are considering reporting the proportion of a hospital's sampled informed consent documents that achieve a pre-specified threshold score. For example, the proportion of a hospital's sampled informed consent documents which meet a minimum, patient-centered standard. We are considering setting the threshold score at 10 (out of 20 total points), and increasing the threshold over time. The stakeholders we sought input from during the measure development process agreed with incrementally increasing the threshold score over time. This would establish an initial target that hospitals could feasibly meet in a short period of time, and allow for further informed consent improvement. Ultimately, we envision this measure would either evolve to include additional components or could complement a measure of shared decision making when an appropriate measure becomes available for potential use in the Hospital IQR Program.

Using this scoring approach, performance scores among the 25 hospitals in the testing sample were poor. The median hospital level score, based on evaluation of 100 informed consent documents, ranged from 0 (95 percent CI: 0–5) to 12 (95 percent CI: 10–12) out of a total of 20 points. The proportion of documents achieving a threshold score of at least 10 (out of 20 points) per hospital, ranged from 0 percent to 70 percent, demonstrating that the quality of informed consent documents varies both within and between hospitals.

(9) Implementation

We are considering two implementation approaches. One approach implements the measure in a centralized fashion where hospitals send their sample of informed consent documents directly to CMS or to an entity contracted by us for central abstraction and measure score calculation. Another approach is local; hospitals abstract their own informed consent documents and transmit the abstraction results to CMS for measure calculation.

During measure development, we worked closely with hospitals to evaluate the burden associated with each approach. The greatest burden was associated with copying and electronically sending informed consent documents, making centralized abstraction a more burdensome option for hospitals. Using a brief formal training process and materials to prepare abstractors, we found hospital abstractors can reliably abstract documents at a rate of 15–20 documents per hour or 3–4 minutes per document. The final sample size required for measure reporting has not been determined but will not exceed 100 documents per hospital and may be substantially fewer than 100 documents per hospital.

Implementation would entail identifying a hospital's elective procedures which meet eligibility for the Quality of Informed Consent Documents measure using administrative claims data. We would then provide hospitals with a list of procedures and encounter dates selected from a hospital's eligible elective procedures, along with the HIC number and date of birth of the patient who had the procedure in order to identify the medical record, the qualifying procedure, and the corresponding informed consent document and operative report. Hospitals would then locally evaluate the informed consent documents for these procedures using the Abstraction Tool and transmit the results of the abstraction through a secure data file transfer or similar process, such as the QualityNet Secure Portal or the External File Online Tool. We would then calculate and report the results as the proportion of a hospital's sampled informed consent documents achieving the threshold score of 10 out of 20. Hospitals could submit data on the prior year's informed consent documents on an annual basis or more frequently, such as quarterly or every six months, allowing for more rapid cycle improvements in measure performance. If we were to pursue a

local abstraction approach, we would also consider expanding the data validation process in the Hospital IQR Program to ensure hospitals' abstraction work was accurate, requiring hospitals to submit select informed consent documents to us or an entity contracted by us via a secure mechanism for review and validation.

The Quality of Informed Consent Documents for Hospital-Performed, Elective Procedures (MUC16–262) measure is included in a publicly available document entitled “2016–2017 Spreadsheet of Final Recommendations to HHS and CMS,” which is available on the NQF Web site.¹⁹⁴ The MAP did not support this measure, indicating concern about the lack of evidence that implementation will affect hospital practices and the complexity of existing guidelines, regulations and State laws related to informed consent. Further, the MAP noted that this measure captures the quality of informed consent documents rather than the quality of communication between patients and their providers.¹⁹⁵ However, the MAP noted that this measure concept is critical for shared decision making, and recommended that future measures on informed consent be patient-centered. In addition, the MAP noted that this measure should demonstrate reliability and validity, at the facility level, in the hospital setting, prior to being suitable for inclusion in the Hospital IQR Program measure set. Lastly, the MAP recommended the measure be submitted to NQF for review and endorsement.¹⁹⁶

We invited public comment on multiple aspects of the measure. Specifically, we sought public comment on the potential scoring approach described above, reporting the proportion of a hospital's sampled informed consent documents, and setting a threshold score of 10 out of 20. In addition, we sought input on how the measure should be implemented, either through local abstraction where hospitals provide us with the results of their own abstraction work or by transmitting informed consent documents to us for centralized abstraction. We also sought public comment on the frequency of measure reporting for this measure, whether annually, quarterly, or at some other interval. More frequent reporting updates would require hospitals to abstract documents and submit the

¹⁹⁴ “2016–2017 Spreadsheet of Final Recommendations to HHS and CMS, available at: <http://www.qualityforum.org/map/>.

¹⁹⁵ “2017 Considerations for Implementing Measures Hospitals-Final Report,” available at: <http://www.qualityforum.org/map/>.

¹⁹⁶ *Ibid.*

results more often than less frequent reporting. Finally, we sought input on a potential validation process for the Quality of Informed Consent Documents measure.

Comment: Many commenters supported the future inclusion of the “Quality of Informed Consent Measure.” The commenters noted that this measure is critical to patient care because it would establish standards for informed consent that would help to alleviate confusion patients have about their care (by awarding credit for the use of lay terms on the consent document) and provide opportunities for patients to ask questions (because the consent documents that are shared with patients in advance of a procedure are given credit). The commenters also stated that the more patients are empowered to be proactive and educated in their own care, the more the care provided will align with their preferences and goals. In addition, the commenters noted that measurement of informed consent documents is important because communication about care is essential to patients and their families since written information, when provided in advance, can be reviewed and shared. Further, the commenters suggested that implementing this measure would instate new standard operating procedures that could improve the patient experience. To that end, the commenters recommended that the consent forms be tailored to patient-centered care by indicating diagnosis, procedure, and alternative methods of treatment. Lastly, the commenters suggested that the document also include any/all known harmful drug and/or procedural side effects so patients are fully informed of what to expect.

Response: We thank the commenters for their support. The current version of the Abstraction Tool evaluates the informed consent document for the presence, readability, and legibility of the procedure name and a description of how the procedure is performed. It also assesses whether the document includes the rationale for the procedure (including the diagnosis), a quantitative and qualitative description of the risks associated with the procedure, patient-oriented benefits of the procedure (in other words, the physical impact of the procedure on patients), and alternatives to the procedure. The Tool also assesses whether the document was shared with the patient at least one calendar day prior to the procedure. These elements of informed consent documents were selected and developed for the measure in close partnership with a patient workgroup; they represent priority

quality standards that are feasible to abstract reliably. The Tool gives credit for each item, and gives a score of 0 to 20; as such, the measure would demonstrate variation in quality between informed consent documents within a single hospital, and would illuminate overall quality differences between hospitals. In addition to illuminating quality, the measure is intended to incentivize hospitals to produce more patient-centered informed consent documents that meet, at a minimum, the standards set forth in this tool.

Comment: Many commenters supported the future inclusion of the “Quality of Informed Consent” measure in the Hospital IQR Program measure set, but provided several recommendations for CMS to consider. Specifically, the commenters suggested being more prescriptive about the content and form of the description of alternative treatments, noting that this content should contain comparative benefits versus risks and a disclosure of any financial incentives in place. In addition, the commenters noted that the provided scoring standard is limited in the number of elements that are essential for an informed consent document. Commenters noted that facilities could develop a standardized consent form that meets the criteria of all elements that are specified in the measure.

Response: We thank the commenters for their support and will consider these recommendations in planning for any potential future proposal of this measure. We acknowledge that although the Abstraction Tool captures many aspects of informed consent documents which commenters noted were important, it does not currently require a description of the comparative benefits versus risks associated with different treatment options or a disclosure of any financial incentives in place. While we believe the current Abstraction Tool effectively and concisely captures key elements of informed consent document quality that represent a minimum standard for informed consent documents that are meaningful to patients, we will continue to collect and evaluate feedback from stakeholders and consider commenters’ suggestions to refine the Abstraction Tool during ongoing measure re-evaluation work. The measure is intended to evaluate quality and illuminate deficiencies in the current informed consent process. We hope this measure would lead hospitals to produce more patient-centered informed consent documents that meet, at a

minimum, the standards set forth in this measure.

Comment: Other commenters encouraged CMS to require shared decision making for its hospital elective procedures and for all conditions that it has identified under its *Beneficiary Engagement* models. Many commenters suggested that informed consent should be a shared process when the patient has a partner or spouse. Other commenters also recommended that the measure developer consider incorporating the American College of Surgeons (ACS) principles in the development of the informed consent document and capture the informed consent discussion, not simply the timing of when the legal document is shared. Other commenters were concerned that this measure focused on documentation rather than the actual communication process.

Response: This measure evaluates one aspect of the quality of informed consent and is not intended to be a comprehensive measure of the informed consent process or shared decision-making. It is intended as an initial step toward improving the informed consent process and represents a minimum requirement for optimal informed consent and shared decision-making. The measure assesses basic elements of the informed consent document and captures when the document is shared with the patient, a signal of when an informed consent discussion took place. We did not consider the elements of the *Beneficiary Engagement* models, as they pertain to shared-decision making and not specifically to the informed consent document. Additional information about *Beneficiary Engagement* models can be found on the CMS Innovation Center Web site at: <https://innovation.cms.gov/initiatives/Beneficiary-Engagement/>. Regarding commenters’ concern that the focus of the measure is on documentation rather than the actual communication process, there are significant challenges in both the methods and feasibility of assessing whether shared decision-making occurred prior to a broad range of elective procedures. While we acknowledge that this measure of informed consent does not assess all aspects of decision-making quality, we believe the informed consent document is a critical part of the informed consent process. Patients and families have observed and experienced that many informed consent documents are of poor quality and in need of improvement. They have encouraged policymakers to work towards a more patient-centered standard. We have worked closely with patients, patient advocates, and families

to develop this measure, which provides a mechanism for assessing the quality of informed consent documents and the timing in relation to the procedure in which they are shared, as two aspects of the communication needed for informed decision-making. We received broad stakeholder support for the concept of measuring the quality of informed consent documents, and we believe this measure represents an important first step forward in improving high-quality decision-making. The measure would fill a significant gap in evaluating the quality of current informed consent documents. We will consider incorporating the American College of Surgeons (ACS) principles¹⁹⁷ and other aspects of shared decision-making in future versions of the measure.

Comment: A few commenters urged CMS to require that patient decision aids are certified pursuant to the certification criteria adopted by the NQF.

Response: We recognize commenters' desire to capture the use of patient decision aids, which are tools designed for patients who have certain conditions to help them think about what is important to them when discussing with their clinician the options for health management. While standards exist for what defines a decision aid, pamphlets about a procedure and patient instructions are frequently labeled as decision aids¹⁹⁸ despite not meeting the standards. As such, without the certification of decision aids, there is a risk of incentivizing the use of low-quality tools. While certification may be feasible in the future, at the current time, no national certification program exists. The NQF has put forth criteria for certifying decision aids, though the process for doing so has yet to be defined. We refer readers to the NQF Web site for more information regarding the decision aids project at: http://www.qualityforum.org/Decision_Aids.aspx. We will continue to evaluate the inclusion of decision aids as well as other elements of high-quality informed consent documents, as suggested above.

Comment: Several commenters expressed concerns about the Quality of Informed Consent measure's lack of NQF endorsement.

Response: Although the Quality of Informed Consent measure has yet to undergo NQF endorsement review, the measure was developed according to

and adhering to the guidelines and standards from NQF. NQF provides measure evaluation criteria on its Web site at: http://www.qualityforum.org/Masuring_Performance/Subsubmitting_Standards/Measure_Evaluation_Criteria.aspx. We plan to submit the measure for NQF endorsement during the next appropriate call for measures.

Comment: Several commenters expressed concern the Quality of Informed Consent measure fails to account for patient variables, such as health literacy and additional education.

Response: We recognize that patients of different levels of English language proficiency and health literacy may require tailored informed consent documents. The current measure assesses lay language in English. Future measure development efforts may consider adapting the Abstraction Tool used to evaluate the quality of informed consent documents in non-English languages and the technical capacity for literacy support (for example, text readers, large print, health coaches, etc.).

Comment: Several commenters stated that if hospitals are not communicating information necessary to achieve informed consent, the issue should be addressed through existing processes as opposed to layering on a new quality metric.

Response: We believe the Quality of Informed Consent measure would fill a gap in existing processes, which may not be sufficient to ensure high quality informed consent documentation. Guidelines do not specify which details should be included in the written informed consent document, despite the documents' design to support patient- and procedure-specific information. Research has shown there is no standardization of informed consent documents and often the most important information about the procedure is missing, illegible, or incomprehensible.¹⁹⁹ The Quality of Informed Consent measure is designed to set a basic standard for the quality of informed consent documents administered by hospitals and, as such, is an important quality improvement tool.

Comment: Several commenters indicated they did not believe this measure would lead to improved patient engagement. The commenters encouraged CMS to work with hospitals, patient advocates, Congress, and States

to streamline the amount of paperwork that patients, patient advocates, and their families are required to sign prior to or upon admission.

Response: We collaborated closely with patients in developing this measure in order to identify the essential elements of informed consent documents. We designed the measure to illuminate deficiencies with informed consent and to incentivize improved, patient-centered informed consent documents that are shared with patients ahead of the procedure, which we and our patient collaborators believe would lead to improved patient engagement and more meaningful informed consent documents. The measure is a first step towards increasing the attention and effort that hospitals dedicate to providing high-quality informed consent, a critical aspect of patient-centered decision making.

We appreciate the commenters' concerns about the burden of paperwork on patients. This measure assesses a practice that is already in place; informed consent documents are signed and scanned into patients' medical charts as routine medical care making them feasible to review without the need for further data collection.

Comment: Some commenters expressed concern about the future inclusion of the Quality of Informed Consent measure in the Hospital IQR Program. Specifically, the commenters were concerned about the administrative burden of abstraction or transmission of informed consent documents to CMS for centralized abstraction in order to report the Quality of Informed Consent measure, especially for large academic medical hospitals. The commenters requested that CMS allow hospitals ample time to review and implement each abstracted element prior to the data collection period. Further, the commenters stated that additional testing should be performed and workable solutions identified prior to implementation. In addition, the commenters believed the collective administrative burden of reporting this measure would be immense, costly, and would not commensurately improve value for the patient. Several commenters did not support the future inclusion of the Quality of Informed Consent measure, indicating that the measure does not assess quality of care and is significantly burdensome.

Response: We have performed testing across a diverse spectrum of hospitals and those findings indicate the measure would not be significantly burdensome. In developing this measure, we have worked with 33 hospitals to assess the feasibility of the abstraction process and

¹⁹⁷ American College of Surgeons Principles and Practice 7th Edition, available at: <http://booksmedicos.org/acs-surgery-principles-and-practice-7th-edition/>.

¹⁹⁸ Herrin J, Harris K, K K, Hines M, Frosch D. Patient and family engagement: a survey of US hospital practices. *BMJ Qual Saf.* 2016;25:182-9.

¹⁹⁹ Shahu A, Schwartz J, Perez M, Bernheim SM, Krumholz HM, Spatz ES. Discerning quality: an analysis of informed consent documents for common cardiovascular procedures. *BMJ Qual Saf.* 2016.

have determined it presents a low burden to hospitals. While abstraction was conducted centrally for the development and testing of the measure, we would recommend local abstraction of informed consent documents by hospital personnel, eliminating the transfer of documents. We have developed training materials and a process for easily identifying the informed consent document in the medical record and for rating the quality of informed consent documents. Among our test hospitals, experienced abstractors required less than 1 hour of training to be able to abstract documents accurately, with high inter-rater reliability, at a rate of approximately 3 minutes per document. We will continue to consider this feedback and would inform stakeholders about the abstraction process if we decide to move forward with proposing to adopt the Quality of Informed Consent measure in the Hospital IQR Program through future rulemaking. With regard to the comment that the Quality of Informed Consent measure does not assess quality of care, we have received positive feedback from patients, patient advocates, and patient families, both during measure development and during this public comment period in support of this measure as a meaningful metric of quality of care.

Comment: Some commenters expressed concern with the scoring standard used for determining a high-quality informed consent document, noting that the current threshold score is too low, and recommended that CMS raise the threshold to ensure overall form improvement via the inclusion of information on the suggested items of alternative treatments and comparative benefits versus risks. These commenters strongly recommended that CMS raise the minimum passing score of 10 out of 20 points substantially, to 18 out of 20 points. The commenters noted that changing a singular document at multiple intervals to improve the score requires unnecessary, repeated corporate and legal review and may also confuse providers as well as patients. Setting the threshold at a higher level from the beginning better serves both patients and hospitals. Lastly, some commenters noted that all the scores are solely based on a “Yes” or “No” checklist completed by a healthcare provider, and suggested that those response options are insufficient to adequately represent the patient experience.

Response: The threshold approach sets an external standard for quality. The threshold score we sought comment on (that is, the percentage of documents

scoring at least 10 out of 20 points) was supported by the patient working group and TEP which was convened by a contractor during measure development. The patient working group and TEP felt that an intermediate threshold would reward hospitals in their efforts to improve documents. While this standard would need to be set by consensus, the standard could increase as hospitals gain more experience with the measure, which would also decrease the initial burden of training.

We do not believe that increasing the threshold score over time would lead to repeated corporate or legal review, or be confusing to clinicians or patients, because hospitals could work to revise the content included in their informed consent document at one time and then focus on improving their score through efforts to share the documents at least one calendar day prior at a future time. These efforts may take longer, as they require changes in process and in some cases, the use of technology, but not necessarily corporate or legal review.

While we agree the “Yes” or “No” checklist does not capture the spectrum of informed consent document quality, we developed definitions and criteria for what qualifies as “passing” based on iterative review of consent forms from 33 hospitals, considering a range of elective procedures and using feedback from the patient workgroup. Thus, we believe that the “Yes” or “No” approach is a meaningful indicator of quality. Nonetheless, we recognize that quality exists on a spectrum, and we will take into consideration the commenters’ feedback in future development of the measure. We also will continue to collect and evaluate feedback from stakeholders and consider commenters’ suggestions to refine the threshold used for initial measure implementation during ongoing measure re-evaluation work. We will inform stakeholders of any changes to the Abstraction Tool and/or minimum threshold in future rulemaking, should we move forward with proposing to adopt the Quality of Informed Consent Document measure for the Hospital IQR Program.

Comment: Several commenters also recommended that the manual abstraction process defined in the Quality of Informed Consent measure be converted to electronic extraction. Several commenters recommended that this be a voluntary measure in at least the first year of reporting to determine feasibility of being able to electronically capture the data. Other commenters suggested that manual abstraction should remain an option for those organizations that are not early adopters. One commenter encouraged

the use of Health Information Technology (HIT) to facilitate the informed consent process and suggested the inclusion of the Advancing Care Information requirements complementary to certified HIT standards (already in the 2015 Edition) that support patient specific education and clinical decision support selection for use in the selection of patient-specific informed consent, and the patient’s response incorporated into the HIT using the existing clinical content document (CCD–CCDA) standards.

Response: The measure currently utilizes a manual abstraction process, but we agree electronic extraction could potentially improve efficiency and decrease reporting burden in the future. Specifically, we appreciate the suggestion that this measure might be appropriate for the Advancing Care Information performance category under the Merit-based Incentive Payment System (MIPS), which is part of the Quality Payment Program established under the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA).²⁰⁰ We also recognize that some hospitals already have in place technology to assist with providing informed consent documents to patients. The purpose of the Quality of Informed Consent measure is to improve the quality of informed consent documents rather than assessing the methods by which hospitals choose to provide their informed consent documents to patients. We encourage innovation in informed consent development and delivery to patients. This measure captures hospital quality by assigning higher ratings to informed consent documents that are patient- and procedure-specific and that are shared with patients ahead of their procedures. We will consider additional abstraction options prior to proposing to adopt this measure for the Hospital IQR Program in the future.

We thank the commenters and we will consider their views as we develop future policy regarding the use of a Quality of Informed Consent Documents for Hospital-Performed, Elective Procedures measure in the Hospital IQR Program.

b. Potential Inclusion of Four End-of-Life (EOL) Measures for Cancer Patients (1) Background

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20055 through 20056), we discussed the potential use of palliative and end-of-life care measures in the Hospital IQR Program.

²⁰⁰ <https://qpp.cms.gov/mips/advancing-care-information>.

The quality of palliative and end-of-life care has been identified as a measurement gap in the Hospital IQR Program.²⁰¹ End-of-life care may be defined as “comprehensive care that addresses medical, emotional, spiritual, and social needs during the last stages of a person’s terminal illness.”²⁰² While end-of-life care may include palliative care, palliative care is generally defined as multi-faceted, holistic care that anticipates, prevents, and alleviates suffering.²⁰³ Both palliative and end-of-life care can be provided when a patient is receiving hospice services, but it is not necessary for a patient to be admitted to hospice to receive such care. Hospitals are encouraged to counsel patients about palliative and end-of-life care; however, the National Academy of Medicine (NAM) of the National Academies has noted that “too few patients and families receive this help [palliative and end-of-life care] in a timely manner,”²⁰⁴ despite evidence that this care improves patient quality of life. In the same report, the NAM proposed a number of core components of quality palliative and end-of-life care. These proposals included offering a referral to hospice if a patient “has a prognosis of 6 months or less” and regular revision of a patient’s care plan to address the patient’s changing needs, as well as the changing needs of the patient’s caregivers.²⁰⁵ The four palliative and end-of-life measures described below seek to improve the quality of care for cancer patients.

(2) Overview of Measures

All four of these end-of-life measures seek to assess the quality of end-of-life care for patients who died of cancer in order to improve the quality of end-of-life care for future cancer patients. As such, the four palliative and end-of-life measures all address the NQS priority of communication and care coordination. The Proportion of Patients Who Died from Cancer Receiving Chemotherapy in the Last 14 Days of Life (EOL-Chemo) (NQF #0210) measure evaluates the proportion of patients who died from cancer who received chemotherapy in the last 14 days of life. This measure was finalized for CY 2017 for the MIPS

(81 FR 77672). The Proportion of Patients Who Died from Cancer Not Admitted to Hospice (EOL-Hospice) (NQF #0215) measure assesses the proportion of patients who died from cancer who were not admitted to hospice and evaluates whether or not patients were admitted to hospice. The Proportion of Patients Who Died from Cancer Admitted to Hospice for Less Than Three Days (EOL-3DH) (NQF #0216) measure evaluates whether patients who were admitted to hospice were admitted to hospice late in the course of their illness, defined as within three days of their death. The Proportion of Patients Who Died from Cancer Admitted to the ICU in the Last 30 Days of Life (EOL-ICU) (NQF #0213) measure assesses whether cancer patients were admitted to the ICU in the last 30 days of their lives.

These measures were reviewed by the MAP in December of 2016 for the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program (MUC16–271, MUC16–273, MUC16–274, and MUC16–275).²⁰⁶ The MAP Hospital Workgroup supported the inclusion of these measures in the PCHQR Program. Specifically, the MAP stressed the importance of end-of-life care as an area of cancer care that needs improvement and noted that these measures could help improve the patient and caregiver experience. The MAP also noted these measures could help encourage the use of hospice care and help avoid aggressive treatment in the last days of life, as unnecessary treatment at the end of life has been found to negatively impact a person’s quality of life.²⁰⁷ We note that prior to implementation in the Hospital IQR Program, these measures would require a subsequent review from the MAP to assess appropriateness for programmatic inclusion.

With additional testing to assess the appropriateness of these measure in the acute care setting, we believe that these measures may be suitable for the Hospital IQR Program because they provide insight on the quality of end-of-life care for cancer patients provided in inpatient settings other than at PPS-exempt cancer hospitals. Currently, the Hospital IQR Program measure set does not contain any measure that assesses end-of-life care. As such, the future inclusion of these measures could promote the expansion of the Hospital IQR Program measure set to include a

more robust set of measures that evaluate end-of-life care and address the NQS priority of improving person and family engagement. In addition, because these measures are specific to cancer patients, future inclusion would promote programmatic alignment between the Hospital IQR and PCHQR Programs should these measures be finalized as discussed in section IX.B.4.b. of the preamble of the final rule for inclusion in the PCHQR Program.

Additional information on these measures is available at: http://www.qualityforum.org/Publications/2016/12/Palliative_and_End-of-Life_Care_2015-2016.aspx.

We invited public comment on the possible future inclusion of one or more of these end-of-life measures in the Hospital IQR Program.

Comment: Many commenters supported the proposed future inclusion of the End of Life Cancer measure set. The commenters believed that these measures represent a good start to ensuring that patients with cancer, who are at the end of life, receive appropriate care that serves to protect quality of life. The commenters indicated that the data from these measures would be useful in evaluating the impact of the use or lack of use of hospice services, and influential in improving the care of those with advanced illness. The commenters also stated there is a pressing need to establish additional quality measures that support evidence-based care for individuals with advanced illness and recommended CMS consider expanding measures to include additional illnesses, provider types, and use in additional care settings. In addition, commenters encouraged CMS to pair these utilization measures with measures of shared care planning, such as an assessment of how closely care received aligns with patient preferences and goals. Lastly, commenters noted these measures have been thoroughly tested and are NQF-endorsed. Some commenters suggested that CMS consider adding additional measures (“Advance Care Plan” (NQF #0326) and “Patients Admitted to the ICU Who Have Care Preferences Documented” (NQF #1626)) to the Hospital IQR Program. The commenters stated these two measures would help fill a gap in the Program by ensuring that hospitals have documented patients’ care preferences and make efforts to revisit and update these preferences as conditions change and critical care is needed.

Response: We thank the commenters for their support. We will consider the

possibility of pairing these measures with measures of shared care planning if we move forward with proposing one or more these measures for future adoption in the Hospital IQR Program. Further, we will assess the suitability of the suggested measures (“Advance Care Plan” (NQF #0326) and “Patients Admitted to the ICU Who Have Care Preferences Documented” (NQF #1626)), and any other measures that address patients with advance illness, as we consider future measures the Hospital IQR Program measure set. We recognize that in order for these measures to be considered for inclusion in the Hospital IQR Program measure set they would have to be re-specified for the inpatient setting. If the measure steward expands these end-of-life measures to include additional illnesses and provider types, we will examine how these additional variables affect their reliability and validity as we consider whether to propose to adopt these measures in the Hospital IQR Program in the future.

Comment: Some commenters did not support the proposed future inclusion of the End of Life cancer measures in the Hospital IQR Program. These commenters expressed concern that these measures are not adjusted to exclude patients from the numerator and denominator who have stated a desire to pursue aggressive treatment through the end of life.

Response: We acknowledge the commenters’ concerns that these measures are not adjusted to exclude patients from the numerator and denominator who have stated a desire to pursue aggressive treatment through the end of life. We note that prior to proposing to adopt the End of Life cancer measures in the Hospital IQR Program, these measures would require a subsequent review by the MAP to assess appropriateness for programmatic inclusion, which would include feedback on the appropriateness of numerator and denominator exclusion criteria. Should we decide to move forward with proposing to adopt these measures for the Hospital IQR Program in the future, we may consult the measure steward to determine whether patients who have undergone aggressive treatment through the end of life should be excluded from the measurement cohort.

Comment: Some commenters expressed concerns about the future inclusion of the End of Life cancer measure set in the Hospital IQR Program, noting that the proposed measures should remain only in the PCHQR Program, where they are more appropriate. The commenters expressed

that patient mix and cancer stage at time of diagnosis can greatly impact the measures. In addition, the commenters suggested that, although these are inpatient measures, they are highly dependent on access to ambulatory services (for example, hospice, palliative care, and supportive services), which is in limited supply in many geographic areas. Other commenters stated that because measure performance is predicated on the physician, who is responsible for the patient’s care, in instances where the hospital does not employ the oncologist (or primary care physician), the ability to drive performance improvement is limited. Further, these measures would disadvantage community hospitals that don’t employ the oncologists in their community. Some commenters recommended CMS test the measures for use in both cancer hospitals and IPPS acute hospitals and the measures be reviewed for NQF endorsement in those settings prior to proposing to implement the measures in a public quality reporting program. Other commenters suggested these measures be tested in facilities with cancer patients and that CMS should adjust the specifications as needed prior to implementation.

Response: We acknowledge the commenters’ concerns. We note that prior to proposing to adopt the End of Life cancer measures for the Hospital IQR Program, these measures would require testing in acute care hospitals by the measure steward, which would provide insight on the burden associated with data collection in these settings. Through testing the measure steward could be able to better assess the impact of factors such as patient mix and cancer stage at time of diagnosis, and determine if they should be a part of numerator and/or denominator exclusion criteria. Further, testing could help determine the impact of factors such as access to ambulatory services (as the commenter described) and the impact on quality of hospitals that have an oncologist on staff versus hospitals that do not. In addition, these measures would be subject to review by the MAP to assess appropriateness for Hospital IQR Program inclusion, which would include feedback on the appropriateness of risk adjustment, and the degree of specificity required in the measures’ components (for example, title, numerator description, denominator description, etc.) and to ensure no unintended consequences result, such as dis-incentivizing physicians to refer terminally ill patients to appropriate palliative care. We reiterate when the

MAP reviewed these measures for the PCHQR Program, it noted these measures could help encourage the use of hospice care and help avoid aggressive treatment in the last days of life, as unnecessary treatment at the end of life has been found to negatively impact a person’s quality of life.²⁰⁸ Further, we believe these measures may be suitable for the Hospital IQR Program as well, because they could provide insight on the quality of end-of-life care for cancer patients provided in inpatient settings other than at PPS-exempt cancer hospitals.

Comment: Some commenters also expressed concerns about manual data collection for these items affecting data quality and reliability, and about unintended consequences, such as providers refraining from offering treatment of potential value in the face of prognostic uncertainty. The commenters suggested since not all cancer patients are terminal, at minimum, CMS should add the word “terminal” before the word “cancer” in each of the measures’ titles, which would avoid undesired penalties and incentivize physicians to refer terminally ill patients to appropriate palliative care. The commenters also recommended CMS consider the NQF palliative care measure for Documentation of Preferences for Patients Admitted to the ICU (NQF #1626) instead.

Response: We acknowledge the concerns about manual data collection for these items affecting data quality and reliability and about unintended consequences. As we noted above, prior to proposing to adopt the End of Life Cancer measures for the Hospital IQR Program in the future, these measures would require testing in the inpatient setting, which would provide insight on the burden associated with data collection in that setting. In addition, testing could provide the measure steward with data to be able to assess potential unintended consequences.

We thank the commenter for their suggested revision to the name of the measure, and will consider this, as well as the impact of terminally ill patients being a part of the measurement cohort, should we decide to move forward with proposing to adopt these measures for the Hospital IQR Program. We will consider the suggested measure (for Documentation of Preferences for Patients Admitted to the ICU (NQF #1626)) and any other measures that

²⁰⁸ 2017 Considerations for Implementing Measures Final Report—Hospitals, available at: http://www.qualityforum.org/Publications/2017/02/2017_Considerations_for_Implementing_Measures_Final_Report_-_Hospitals.aspx.

evaluate the quality of end-of-life care for cancer patients if we move forward with proposing adoption of these types of measures for the Hospital IQR Program in the future.

Comment: One commenter recommended CMS consider a more comprehensive approach to measurement for end of life care and advance care planning that is consistent with the Institute of Medicine's (IOM) recommendations and sensitive to patient preferences.

Response: We thank the commenter for their suggestion and will consider the National Academy of Medicine (NAM's) (formerly, the IOM) recommendations²⁰⁹ and the impact of patient preferences should we move forward with proposing to adopt the End of Life cancer measures in the Hospital IQR Program in the future.

We thank the commenters and we will consider their views as we develop future policy regarding the use of one or more of these end-of-life measures in the Hospital IQR Program.

c. Potential Inclusion of Two Nurse Staffing Measures

(1) Background

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20056 through 20059), we discussed the potential inclusion of two nurse staffing measures in the Hospital IQR Program. Nursing care is a core service of hospitals, and accordingly, hospital nurse staffing practices are increasingly recognized as a tool to improve the quality and value of patient care.²¹⁰ Studies have shown there is a link between appropriate nurse staffing and care quality and patient outcomes. For example, the AHRQ conducted a systematic review and meta-analysis examining the relationship between nurse staffing and patient outcomes. The review of 96 studies, published between 1990 and 2006, found that increased nurse staffing is associated with a reduction in hospital-related mortality and adverse patient events, such as respiratory failure, cardiac arrest, and hospital-acquired conditions.²¹¹ A review of studies examining the impact of nurse staffing on hospital costs and patient

length of stay found that an increased level of registered nurse (RN) staffing may result in reduced patient length of stay and hospital costs.²¹² Furthermore, recent literature has demonstrated appropriate nursing skill mix (including licensure level and area of training for specialty) and increased RN nursing hours are associated with decreased rates of patient falls, pressure ulcers, urinary tract infections, and bloodstream infections.^{213 214 215}

We believe there is an opportunity for hospitals to develop nurse staffing strategies to improve quality and the value of care. The inclusion of nurse staffing measures in the Hospital IQR Program would allow hospitals to assess how their nurse staffing and skill mix compare to similar hospitals and State and national levels, as well as encourage hospitals to develop optimal nurse staffing plans that meet the needs of their patients and improve quality of care. Because of the important role of nursing in providing high value care, we sought public comment on including two nurse staffing measures in the Hospital IQR Program: (1) Skill Mix (Registered Nurse [RN], Licensed Vocational/Practical Nurse [LVN/LPN], Unlicensed Assistive Personnel [UAP], and Contract) (Nursing Skill Mix) Measure (NQF #0204); and (2) Nursing Hours per Patient Day Measure (NQF #0205).

These two measures (Skill Mix (Registered Nurse [RN], Licensed Vocational/Practical Nurse [LVN/LPN], Unlicensed Assistive Personnel [UAP], and Contract) (Nursing Skill Mix) Measure (NQF #0204) (MUCEO204) and Nursing Hours per Patient Day Measure (NQF #0205) (MUCEO205)), are included in a publicly available document entitled "Spreadsheet of MAP 2015 Final Recommendations," which

is available on the NQF Web site.²¹⁶ These measures address the NQS priority of effective prevention and treatment, and were reviewed by the MAP in 2014. The MAP noted the need for resolution of data issues, specifically that hospitals participating in the National Database of Nursing Quality Indicators® (NDNQI®) program can have their data directly shared with CMS while those that do not currently participate in that program have the opportunity to send their data directly to CMS. In addition, the MAP noted that, at the time, there was no gold standard for these measures, and thus it is difficult to access relative performance on these measures.²¹⁷ The final recommendation from that review was to conditionally support the inclusion of these measures, contingent upon review and endorsement by the NQF. We note these measures initially obtained NQF endorsement on August 5, 2009, and after subsequent review by the NQF for aggregation at the hospital level, the measures retained their endorsement as of December 10, 2015.²¹⁸ Further, we note approximately 2,000 hospitals are already reporting this information to the NDNQI®,²¹⁹ founded by the American Nurses Association (ANA).²²⁰ NDNQI® data are not publicly reported.

We received a number of comments applicable to both measures and will respond to those first. A more detailed discussion of each of the two measures, along with comments and responses, follows further below.

Comment: An overwhelming number of commenters supported the proposed future inclusion of the Nurse Staffing measure set in the Hospital IQR Program. The commenters stated that nurses are critical to patient safety in hospital settings and that inadequate staffing is associated with increased mortality and adverse events. The commenters indicated that proper use of support personnel improves workflow and hospitals that invest in appropriate

²²⁰ Press Ganey Nursing Quality (NDNQI), available at: <http://www.pressganey.com/solutions/clinical-quality/nursing-quality>.

nurse staffing and skill mix to meet the needs of their patients will receive higher ratings. The commenters also noted that reporting these data is not burdensome to hospitals, nurses, or other clinicians because the information is not being newly collected but rather, newly reported. Further, the electronic data collected for these measures is already included in hospital databases, as more than 2,000 hospitals in the U.S. have already adopted these measures. Finally, the commenters indicated the measures are endorsed by the American Nurses Association and the NQF, which strengthens the argument for their implementation in the Hospital IQR Program.

Response: We thank the commenters for their support. We are pleased to learn that electronic data collection of these measures is already widely in effect, as increased electronic reporting is an ongoing measurement goal for CMS.

Comment: In addition to the support received from stakeholders who provided form letters, several additional commenters supported the proposed future inclusion of the nursing measure set. These commenters noted that these measures have been NQF-endorsed, which is a positive testament to the thoroughness of their reliability and validity. The commenters stated that skill mix is part of the formula for appropriate staffing and that proper use of support personnel improves nurses' workflow, permitting nurses to fully apply their professional knowledge and skill. The commenters also noted that better staffing results in better patient care and that patients and their families should have access to this data as tools to make educated and informed care decisions when selecting from comparable hospitals. Further, commenters noted that these measures promote transparency, which empowers patients.

Response: We thank the commenters for their support. We recognize the importance of transparency and nurse staffing in the inpatient setting as it relates to patient engagement and quality of care.

Comment: A few commenters particularly supported the provisions that establish public reporting of the two nurse staffing quality measures. Currently, patients and their families compare hospitals on several factors on the *Hospital Compare* Web site, but they are unable to access information on how many nurses are staffing the unit to which they may be admitted or the staff skill mix, both of which ultimately impact patient outcomes. The commenters noted that public reporting

would provide patients with information on how prepared comparable hospitals are to provide high quality and safe care, because there is a direct correlation between nurse staffing, patient satisfaction, readmissions, and adverse events. The commenters urged CMS to consider adding nurse staffing measures to the *Hospital Compare* Web site to provide greater transparency for patients and their families.

Response: We thank the commenters for their support, and share the commenters' opinion that public reporting of these measures could better equip patients to make more informed decisions when selecting from comparable hospitals. Transparency is a facet of patient care that is often overlooked and we will consider the future inclusion of these nurse staffing measures on the *Hospital Compare* Web site, should we move forward with proposing to adopt the nurse staffing measures in the Hospital IQR Program in the future.

Comment: One commenter supported the future inclusion of the nursing measures in the Hospital IQR Program if the definitions continue to align with National Database of Nursing Quality Indicators.²²¹ However, the commenter noted the measures fail to reflect the complexity of the patient population and any staffing challenges in the local environment (rural, labor supply, urban, etc.). The commenter recommended these measures not be linked to payment (through the Hospital VBP Program, for example) and that any publication of these measures be accompanied by explanations which clarify for the reader that these are not quality-of-care measures.

Response: We thank the commenter for their support, and appreciate their acknowledgement of other integral components that help in the evaluation of nursing care (that is patient population complexity and staffing challenges). These components are elements that we will consider as we continue to solicit feedback on clinical quality measures that assess nurse staffing practices. We disagree that these are not quality of care measures. We believe the potential future inclusion of nurse staffing measures in the Hospital IQR Program would allow hospitals to assess how their nurse staffing and skill mix compare to similar hospitals at the State and national level, as well as encourage hospitals to develop optimal nurse staffing plans that meet the needs

of their patients and improve quality of care. As such, there would be no need to footnote publications of these measures, as suggested by the commenter. Should we move forward with proposing to adopt these measures for the Hospital IQR Program in the future, we will consider the potential benefit of linking these quality measures to cost measures and/or linking them to payment (via the Hospital VBP Program, for example).

Comment: Some commenters expressed concerns regarding the nurse staffing measures. Specifically, the commenters noted that the generalist ideology expected by hospital administration for its nursing staff, when specialty care nursing is often best for patient care, could be problematic. Further, staffing should not only encompass proper numbers but should also encompass nursing proficiency, education, and work environment. The commenters suggested that CMS conduct additional testing to ensure there are not unintended consequences associated with making information on the nurse staffing measures available to consumers. The commenters also suggested that CMS should develop a simple metric that can be understood by consumers and is associated with care outcomes. Lastly, other commenters suggested CMS explore simpler metrics that are meaningful to consumers.

Response: We acknowledge the commenters' concerns. In our continued efforts to solicit clinical quality measures that assess nurse staffing practices, we will consider additional factors (that is nurse education and work environment) that influence an appropriate nurse staffing plan as we continue to review these measures for future use in the Hospital IQR Program. While we understand the importance of developing a metric that is easily understood by consumers, we want to ensure that such a metric would adequately convey the impact of the varying facets that contribute to the quality of patient care, in the context of nurse staffing. We believe that to provide comprehensive quality nursing care, and to avoid unintended consequences, there should be multiple metrics that assess nurse staffing in the Hospital IQR Program. Accordingly, we will continue to consider additional factors that the measure steward may determine to be appropriate to include in this measure and be vigilant about potential unintended consequences associated with sharing nursing staffing information with consumers.

Comment: Some commenters did not support future inclusion of the nurse staffing measures in the Hospital IQR

²²¹ National Database of Nurse Quality Indicators, available at: <http://www.pressganey.com/solutions/clinical-quality/nursing-quality>.

Program, indicating these measures are already collected and used locally for quality improvement, thus, there would be no added value to reporting these measures on a national level. In addition, commenters stated that manual web-based submission causes undue burden in the form of labor resources to enter the data, as hospitals are duplicating the effort by submitting to NDNQI and CMS. Further, the commenters suggested that the administrative burden of frequent reporting far exceeds its value, as quarterly reporting warrants susceptibility to inaccurate data. The commenters also expressed disapproval of the American Nurses Association's dismissal of LPNs and LVNs as members of the nursing staff. The commenters recommended considering inclusion of this subset of nurses as a way of using all available resources in provision and delivery of patient care.

Response: We appreciate the commenters sharing their concerns. We believe there is an opportunity for hospitals to develop nurse staffing strategies to improve quality and the value of care, and that future inclusion of nurse staffing measures in the Hospital IQR Program would allow hospitals to assess how their nurse staffing and skill mix compare to similar hospitals at the State and national level, as well as encourage hospitals to develop optimal nurse staffing plans that meet the needs of their patients and improve quality of care. We also note numerous studies have demonstrated that increased nurse staffing is associated with a reduction in hospital-related mortality and adverse patient events.²²² We recognize that adding new measures to for the Hospital IQR Program could increase administrative and reporting burden for hospitals; however, as with any potential new measure, we would weigh the benefits of the measure with the burden. We note according to the public comments received, there are already over 2,000 hospitals nationwide that are reporting these measures. We also note that the Skill Mix measure includes LPNs and LVNs as members of the nursing staff. This measure acknowledges the contributions of all members of the nursing team, but notes that differing levels of education and skill need to be considered when making staffing decisions for individual units.

We thank the commenters, and we will consider their views as we develop

future policy regarding use of the nurse staffing measures in the Hospital IQR Program.

(2) Skill Mix (Registered Nurse [RN], Licensed Vocational/Practical Nurse [LVN/LPN], Unlicensed Assistive Personnel [UAP], and Contract) (Nursing Skill Mix) Measure (NQF #0204)

(a) Overview of Measure

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20057 through 20058), we discussed the potential use of the Skill Mix (Registered Nurse [RN], Licensed Vocational/Practical Nurse [LVN/LPN], Unlicensed Assistive Personnel [UAP], and Contract) (Nursing Skill Mix) Measure (NQF #0204) in the Hospital IQR Program. The NQF-endorsed Nursing Skill Mix measure assesses the percentage of productive nursing care hours worked by nursing staff with direct patient care responsibilities for each nursing licensure category (RN, LPN/LVN, and UAP) and staff employment status (contract/agency versus hospital employee), by eligible hospital unit. The intent of this measure is to enable hospitals to track and assess their nursing skill mix, given that research demonstrates a relationship between skill mix and certain quality outcomes.²²³

The measure focuses on the structure of care quality and includes the skill mix for adult and pediatric medical-surgical hospital units. Medical-surgical hospital units include hospitals areas for the evaluation of patients with medical and/or surgical conditions. Eligible adult and pediatric medical-surgical units can be mapped to the CDC's National Healthcare Safety Network (NHSN) Healthcare Service locations codes as defined in the NHSN Patient Safety Component Manual.²²⁴ Additional unit types, such as adult and pediatric critical-care, step-down, medical, and surgical units could be included in the future. At this time, we believe limiting the measure to adult and pediatric medical-surgical units would allow hospitals to become accustomed to collecting and reporting staffing data while also providing important staffing information to consumers. However, we sought public comment on how many inpatient units

to include and which units should be prioritized.

Productive nursing care hours are defined as the hours worked by nursing staff (RN, LPN/LVN, and UAP) with direct patient care responsibilities, including unbudgeted overtime or scheduled hours. Direct patient care responsibilities are nursing activities performed by unit-based staff in the presence of the patients and activities that occur away from the patient that are patient related, such as the following:

- Medication administration
- Nursing treatments
- Nursing rounds
- Admission, transfer, and discharge activities
- Patient education
- Patient communication
- Coordination of patient care
- Documentation time
- Treatment planning
- Patient screening and assessment

Unlicensed assistive personnel (UAP) are defined as individuals trained to function in an assistive role to nursing in the provision of patient care, as delegated by and under the supervision of a registered nurse. UAPs include nursing assistants, patient care technicians/assistants, and graduate nurses not yet licensed who have completed orientations.

The measure includes: All nursing staff employed by the hospital; temporary staff who are not employed by the hospital (contract or agency); and float staff who are hospital employees temporarily assigned to provide direct patient care on an eligible unit other than their usual unit of employment.

(b) Data Source

Data collection for this structural measure would occur quarterly for each eligible unit from January 1 through December 31 of each calendar year, with data submission occurring 4.5 months after the end of each reporting quarter. An eligible unit must be open, with patients present, at least one month during the reporting period to be included. These data would be collected via a web-based tool available on the QualityNet Web site.

(c) Measure Calculation

For staff with direct patient care responsibilities, the measure assesses the percentage of total productive nursing hours worked by either employee or contract RNs, LPN/LVNs, and UAPs, as well as at the percentage of total productive nursing hours worked for contract or agency staff. Accordingly, four rates (percentages) are determined for each eligible hospital

²²² Safe Staffing Literature Review from the American Nurses Association. March 2017. Available at: <http://www.nursingworld.org/SafeStaffing-LiteratureReview>.

²²³ Kane, R.L., Shamliyan, T.A., Mueller, C., Duval, S., & Wilt, T.J. (2007). The association of registered nurse staffing levels and patient outcomes: systematic review and meta-analysis. *Medical Care*, 45(12), 1195–1204.

²²⁴ NHSN Patient Safety Component Manual <https://www.cdc.gov/nhsn/about-nhsn/index.html> [under "Related Links"].

unit, one for each type of nursing staff, and one for contract and agency nursing staff. The four separate rates are as follows: (1) RN hours—Productive nursing care hours worked by RNs (employee and contract) with direct patient care responsibilities for each eligible inpatient unit/the total number of productive hours worked by employee or contract nursing staff with direct patient care responsibilities (RN, LPN/LVN, and UAP) for each eligible inpatient unit; (2) LPN/LVN hours—Productive nursing care hours worked by LPNs/LVNs (employee and contract) with direct patient care responsibilities for each eligible inpatient unit/the total number of productive hours worked by hospital employee or contract nursing staff with direct patient care responsibilities (RN, LPN/LVN, and UAP) for each eligible inpatient unit; (3) UAP hours—Productive nursing care hours worked by UAP (employee and contract) with direct patient care responsibilities for each eligible inpatient unit/the total number of productive hours worked by hospital employee or contract nursing staff with direct patient care responsibilities (RN, LPN/LVN, and UAP) for each eligible inpatient unit; and (4) Contract or agency hours—Productive nursing care hours worked by contract or agency staff nursing staff (RN, LPN/LVN, and UAP) with direct patient care responsibilities for each eligible inpatient unit/the total number of productive hours worked by employee or contract nursing staff with direct patient care responsibilities (RN, LPN/LVN, and UAP) for each eligible inpatient unit. The data collected and the rates calculated are aggregate nursing care hours worked by each licensure category, by unit type. Hospital rates are weighted for patient volume (patient days) to account for differences in unit sizes.

(d) Cohort

Hospital employee, contract, or agency RNs, LPN/LVNs, and UAPs with direct patient care responsibilities are included in the numerator and denominator statements. The measure numerator and denominator include nursing staff assigned to the eligible unit who have direct patient care responsibilities for greater than 50 percent of their shift who are counted in an eligible unit's staffing matrix, are replaced if they call in sick, and whose work hours are charged to the unit's cost center. The measure numerator and denominator exclude the following: Nursing staff with no direct patient care responsibilities whose primary responsibility is administrative in nature; specialty teams (for example,

wound care), patient educators, or case managers who are not assigned to a specific unit; unit clerks, monitor technicians, and secretaries with no direct patient care responsibilities; sitters not providing routine UAP activities; therapy assistants; student nurses fulfilling educational requirements; and nursing staff undergoing orientation who are not included in the eligible units staffing matrix. For more information regarding the Nursing Skill Mix measure, we refer readers to the NQF measure information page available at: <http://www.qualityforum.org/QPS/0204>.

We invited public comment on the future inclusion of the Skill Mix (Registered Nurse [RN], Licensed Vocational/Practical Nurse [LVN/LPN], Unlicensed Assistive Personnel [UAP], and Contract) (Nursing Skill Mix) measure for the Hospital IQR Program. Specifically, we sought public comments on narrowing the number of hospital units included in the measures' calculation, which units we should consider for inclusion, and the burden of data collection on hospitals.

Comment: One commenter requested that CMS evaluate the Nursing Skill Mix measure against the ever-increasing pressure of reimbursement reductions from CMS and other payers who follow the CMS example. The commenter noted that the metric of two events seems counterproductive and that increased skill mix and staffing ratios will increase costs to the organization at the same time reductions in reimbursements will not allow for additional funds to support this need. As such, the commenter suggested that where facilities can meet/exceed the best practice measure, an incentive be provided so that funding could continue to support this measure as opposed to negatively impacting organizations trying to meet the needs of the patients through increased skill mix and staffing levels.

Response: We acknowledge the commenter's concern about costs associated with increased skill mix and staffing ratios and will take that under consideration; however, existing research shows improved patient outcomes when the nursing skill mix and number of RN hours are appropriate for the level of care on the individual unit.²²⁵ We appreciate the need to balance long-term and short-term considerations with respect to nurse staffing decisions. We note the potential

long-term benefits of the improved outcomes and reduction in adverse events may outweigh the potential short term goal of decreasing the immediate costs of appropriate staffing ratios and skill mix.

We thank the commenter, and we will consider their views as we develop future policy regarding the future inclusion of the Skill Mix (Registered Nurse [RN], Licensed Vocational/Practical Nurse [LVN/LPN], Unlicensed Assistive Personnel [UAP], and Contract) (Nursing Skill Mix) measure in the Hospital IQR Program.

(3) Nursing Hours per Patient Day Measure (NQF #0205)

(a) Overview of Measure

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20058 through 20059), we discussed the potential use of the Nursing Hours per Patient Day Measure (NQF #0205) in the Hospital IQR Program. The NQF-endorsed Nursing Hours per Patient Day measure assesses the number of productive hours worked by both RNs and all nursing staff (RN, LPN/LVN, and UAP) with direct patient care responsibilities per patient day, by eligible hospital inpatient unit. The intent of this measure is to enable hospitals to track and assess the ratio of hours worked by nursing staff per patient day, given that research demonstrates a relationship between increased nursing hours and certain quality outcomes.

The measure focuses on the structure of care quality and includes Nursing Hours per Patient Day for eligible adult and pediatric medical-surgical inpatient hospital units. Medical-surgical hospital units include hospitals areas for the evaluation of patients with medical and/or surgical conditions. Eligible adult and pediatric medical-surgical units can be mapped to the CDC's National Healthcare Safety Network (NHSN) Healthcare Service locations codes as defined in the NHSN Patient Safety Component Manual. Similar to the Nursing Skill Mix Measure, additional unit types, such as adult and pediatric critical-care, step-down, medical, and surgical units could be included, but at this time, we believe limiting the measure to adult and pediatric medical-surgical units would allow hospitals to become accustomed to collecting and reporting staffing data while also providing important staffing information to consumers. However, we sought comment on how many inpatient units to include and which units should be prioritized.

Productive hours are defined as the hours worked by nursing staff (RN,

²²⁵ Safe Staffing Literature Review from the American Nurses Association. March 2017. Available at: <http://www.nursingworld.org/SafeStaffing-LiteratureReview>.

LPN/LVN, and UAP) with direct patient care responsibilities, including overtime, not budgeted, or scheduled hours. Direct patient care responsibilities are nursing activities performed by unit-based staff in the presence of the patients and activities that occur away from the patient that are patient related, such as the following:

- Medication administration
- Nursing treatments
- Nursing rounds
- Admission, transfer, and discharge activities
- Patient education
- Patient communication
- Coordination of patient care
- Documentation time
- Treatment planning
- Patient screening and assessment

UAP are individuals trained to function in an assistive role to nursing staff in the provision of patient care, as delegated by and under the supervision of a registered nurse. UAPs include nursing assistants, patient care technicians/assistants, and graduate nurses not yet licensed who have completed orientations.

The measure includes all nursing staff employed by the hospital; temporary staff who are not employed by the hospital (contract or agency); and float staff who are hospital employees temporarily assigned to provide direct patient care on an eligible unit other than their usual unit of employment.

(b) Data Source

Data collection for this structural measure for hospitals occurs quarterly, for each eligible unit, from January 1 through December 31 of each calendar year, with data submission occurring 4.5 months after the end of each reporting quarter. These data would be collected via a web-based tool available on the QualityNet Web site.

(c) Measure Calculation

For staff with direct patient care responsibilities, the measure assesses the number of productive hours per patient day worked by both RNs and by total nursing staff (RNs, LPN/LVNs, and UAPs). Accordingly, two rates are determined for each eligible hospital unit. The two separate rates are as follows: (1) RN hours per patient day—Total number of productive hours worked by RN nursing staff (contract and hospital employee) with direct patient care responsibilities for each eligible inpatient unit/total number of patient days for each eligible inpatient unit; and (2) Total nursing care hours per patient day—Total number of productive hours worked by RN, LPN/

LVN, and UAP nursing staff (contract and employee) with direct patient care responsibilities for each eligible inpatient unit/total number of patient days for each eligible inpatient unit. Patient days must be from the same unit in which nursing care hours are reported. The data collected and the rates calculated are aggregate nursing hours per patient day, by unit type. Hospital rates are weighted for patient volume (patient days) to account for differences in unit sizes.

(d) Cohort

RNs, LPN/LVNs, and UAPs with direct patient care responsibilities are included in the numerator and denominator statement. The measure numerator includes nursing staff assigned to the eligible inpatient unit who have direct patient care responsibilities for greater than 50 percent of their shift, who are counted in an eligible unit's staffing matrix, are replaced if they call in sick, and work hours are charted to the unit's cost center. The numerator excludes the following: Nursing staff with no direct patient care responsibilities whose primary responsibility is administrative in nature; specialty teams (for example, wound care), patient educators, or case managers who are not assigned to a specific unit; unit clerks, monitor technicians, and secretaries with no direct patient care responsibilities; sitters not providing routine UAP activities; therapy assistants; student nurses fulfilling educational requirements; and nursing staff undergoing orientation who are not included in the eligible units staffing matrix. The measure denominator excludes patient days from ineligible units. For more information regarding the Nursing Hours Per Day measure, we refer readers to the National Quality Forum measure information page available at: <http://www.qualityforum.org/QPS/0205>.

We invited public comment on the possible future inclusion of the Nursing Hours per Patient Day measure for the Hospital IQR Program. Specifically, we sought comments on narrowing the number of hospital units included in the measures' calculation, which units we should consider for inclusion, and the burden of data collection on hospitals.

Comment: One commenter cautioned CMS that the complexity involved in determining the hours and staffing for the Nursing Hours Per Patient Days measure could be burdensome for the organizations. Further, the commenter stated that if the intent is to evaluate the impact of increased staffing in areas with respect to quality outcomes, it

would seem more appropriate for an organization to provide the total number of patient days for a given unit (denominator) divided into the total hours (as categorized by the 4 groups noted) of staffing on that unit. The commenter suggested that this may be a simpler, less burdensome approach that would provide a better indication of the total number of hours that are dedicated to patient care in a given unit. In addition, another commenter stated that the management and oversight of the reporting has an element of burden and time commitment that is not easily supported in today's health care environment in which resources should be focused on the care of the patient.

Response: We appreciate the commenter's feedback, and will consider the suggested approach on how to calculate nursing hours per patient day. It is our intent to promote improved quality of care in the least burdensome manner possible. This measure is not meant to simply increase RN staffing in the areas evaluated in the measure, but also to evaluate the number of hours provided to patients by RNs as related to patient care requirements and whether the current staffing mix is appropriate. Studies have demonstrated improved outcomes especially in complex patients when the nursing provider is an RN versus an LPN/LVN or UAP.²²⁶

Comment: One commenter did not support the future inclusion of the Nursing Hours per Patient Day measure in the Hospital IQR Program, citing a concern that nurse staffing levels are influenced by a variety of factors that, in varying combinations, could influence patient care outcomes and may or may not be reflected in RN Hours Per Patient Day (RN HPPD). The commenter noted when nurse staffing is examined in the nursing research literature, no evidence exists that identifies a nurse staffing configuration or a process to use when making staffing decisions. The commenter believed that staffing decisions that influence RN HPPD need to be based on evidence, including patient need, the education and skill level of staff, the geography and size of units, the availability of technology and support staff, and multiple other factors. The commenter noted their belief that one of the most effective ways to attain superior patient outcomes and enhance nurse satisfaction is for nurse leaders and nursing staff to openly and continually communicate, assess, plan, execute, and evaluate strategies used in the provision of patient care.

²²⁶ *Ibid.*

Response: We acknowledge the commenter's concerns. We recognize the importance of having an evidence base, rooted in empirical data, to support any clinical quality measure implemented in the Hospital IQR Program. We also understand that there are numerous factors that contribute to the overall quality of nursing care. At this time, we are interested in the impact and effects of skill mix and nursing hours per patient on quality of nursing care, and we will consider additional quality metrics that examine nursing care using different factors in the future. We agree that attaining superior patient outcomes and enhanced nurse satisfaction could be achieved through enhanced communication and the execution of "best practice" strategies in the provision of patient care; however, we are also concerned about the limitations placed on nurse managers and nursing staff when the hospital administration does not provide the available resources to adjust the staffing mix as appropriate for optimal patient care and positive outcomes. We refer readers to the American Nurses Association's literature review²²⁷ of evidence to identify the proper nurse staffing configuration and/or process to use when making staffing decisions.

Comment: One commenter noted that publicly reported RN HPPD to the lay person or a regulating body does not facilitate comparisons that are relevant and meaningful.

Response: We believe that publicly reporting RN hours per patient day, coupled with the existing evidence that

shows improvement in patient and nurse outcomes, based on workplace environment²²⁸ could be useful for the lay person and regulating bodies to make meaningful and relevant hospital comparisons.

We thank the commenters and we will take these comments into consideration if we propose to adopt the Nursing Hours per Patient Day Measure (NQF #0205) in the future.

d. Potential Inclusion of Additional Electronic Clinical Quality Measures (eCQMs) in the Hospital IQR and Medicare and Medicaid EHR Incentive Programs

As we previously indicated in the FY 2013 IPPS/LTCH PPS final rule, EHR technology continues to evolve and additional infrastructure is being put in place to afford us the capacity to accept enhanced electronic reporting of many of the clinical chart-abstracted measures that are currently part of the Hospital IQR Program (77 FR 53534). We continue to believe that electronic reporting of quality measure data derived from the EHR will, in the long run, reduce the burden on hospitals to collect and submit data for the Hospital IQR Program.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20059 through 20064), in keeping with this goal, we solicited feedback on the potential inclusion of additional eCQMs in the Hospital IQR and Medicare and Medicaid EHR Incentive Programs. These measures assess opioid prescribing practices, malnutrition, tobacco use, and substance use among

the adult, inpatient population. As we continue to advance electronic reporting, we want to ensure that we provide hospitals with a robust selection of eCQMs. As we state in section IX.A.8. of the preamble of this final rule, hospitals have expressed concerns with identifying applicable measures that reflect their patient population; thus, we believe that the addition of new eCQMs in the future will offer more clinically relevant eCQMs with meaningful data that will help drive quality improvement.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57116 through 57120), we removed 13 eCQMs from the Hospital IQR Program measure set, beginning with the CY 2017 reporting period/FY 2019 payment determination, in order to enable hospitals to focus on a smaller, more specific subset of eCQMs. In that same rule, we indicated that we are considering behavioral health measures for inclusion in the Hospital IQR Program to address an important gap in understanding the quality of care given to inpatient psychiatric patients treated in the acute care hospital setting rather than a distinct psychiatric unit or IPF (81 FR 57166 through 57167). The future inclusion of measures assessing opioid prescribing practices, tobacco use, and substance use will help to inform how we can improve the quality of care in these clinical domains, and help to fill this identified gap area. The table below lists the eCQMs being considered for future inclusion in the Hospital IQR and Medicare and Medicaid EHR Incentive Programs and for which we sought public feedback.

ELECTRONIC CLINICAL QUALITY MEASURES (ECQMS) FOR FUTURE CONSIDERATION IN THE HOSPITAL IQR AND MEDICARE AND MEDICAID EHR INCENTIVE PROGRAMS

Measure name	NQF #
Safe Use of Opioids—Concurrent Prescribing	N/A
Completion of a Malnutrition Screening within 24 Hours of Admission	N/A
Completion of a Nutrition Assessment for Patients Identified as At-Risk for Malnutrition within 24 Hours of a Malnutrition Screening	N/A
Nutrition Care Plan for Patients Identified as Malnourished after a Completed Nutrition Assessment	N/A
Appropriate Documentation of a Malnutrition Diagnosis	N/A
Tobacco Use Screening (TOB-1)	N/A
Tobacco Use Treatment Provided or Offered (TOB-2)/Tobacco Use Treatment (TOB-2a)	N/A
Tobacco Use Treatment Provided or Offered at Discharge (TOB-3)/Tobacco Use Treatment at Discharge (TOB-3a)	N/A
Alcohol Use Screening (SUB-1)	N/A
Alcohol Use Brief Intervention Provided or Offered (SUB-2)/Alcohol Use Brief Intervention (SUB-2a)	N/A
Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge (SUB-3)/Alcohol & Other Drug Use Disorder Treatment at Discharge (SUB-3a)	N/A

²²⁸ *Ibid.*

(1) Safe Use of Opioids-Concurrent Prescribing Measure

(a) Background

Unintended opioid overdose fatalities have reached epidemic proportions in the last 20 years and are a major public health concern in the United States.²²⁹ Reducing the number of unintended opioid overdoses has become a priority for numerous HHS agencies. Concurrent prescriptions of opioids or opioids and benzodiazepines put patients at greater risk of unintended opioid overdose due to increased risk of respiratory depression.^{230 231} Despite this risk, studies of multiple claims and prescription databases have shown that between 5 to 15 percent of patients receive concurrent opioid prescriptions, and 5 to 20 percent of patients receive concurrent opioid and benzodiazepine prescriptions across various settings.^{232 233 234} In addition, an analysis of more than 1 million hospital admissions in the United States found that over 43 percent of all patients with nonsurgical admissions were exposed to multiple opioids during their hospitalization.²³⁵

(b) Overview of Measure

The Safe Use of Opioids—Concurrent Prescribing (MUC16–167) measure assesses patients (excluding cancer

patients or patients receiving palliative care), ages 18 years and older with active, concurrent prescriptions for opioids, or opioids and benzodiazepines, at discharge.²³⁶ This measure addresses the following NQS priorities: (1) Making care safer by reducing harm caused in the delivery of care; (2) promoting effective communication and coordination of care; and (3) promoting the most effective prevention and treatment practices for the leading causes of mortality, starting with cardiovascular disease.

This measure was reviewed by the MAP in December 2016 and received the recommendation to refine and resubmit for consideration for programmatic inclusion. MAP stakeholders acknowledged the significant health risks associated with concurrent prescribing of opioids, and opioids and benzodiazepines, but expressed concern with the measure specifications, indicating the need for a stronger evidence base for clinical guidelines and refinement of the measure exclusions to reduce the risk of unintended consequences.²³⁷

Additional information on this measure can be found in the 2016 Measures Under Consideration Spreadsheet, available at: <http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367>.

We invited public comment on the possible future inclusion of this opioid prescribing measure in the Hospital IQR Program.

Comment: Some commenters supported the future inclusion of the Safe Use of Opioids measure in the Hospital IQR Program. The commenters believed that there is a need for measures that assess opioid follow-up, prescription, and appropriate prescribing, even though there are times when concurrent prescriptions of opioids and benzodiazepines are appropriate. There are studies that demonstrate that chronic pain patients are unlikely to become addicts or abuse their medication. Further, the addition of this measure would encourage appropriate pain management practices by providers and patients. In addition, commenters noted that adopting a measure that calculates the proportion of patients prescribed two or more different opioids or opioids and benzodiazepines concurrently has the potential to reduce preventable

mortality and reduce the costs associated with adverse events. The commenters encouraged CMS to consider policies that promote alternatives to opioids for pain management, arguing that prescription opioids are often prescribed in the absence of affordable alternatives. The commenters also urged CMS to take an active role in educating prescribers about alternatives such as exercise, mindfulness, over-the-counter medications, etc. Lastly, the commenters suggested that implementation of a system that flags the surveys of frequent opioid users could be used to prevent addicts skewing hospital scores.

Response: We thank the commenters for their support. We understand the importance of provider education and will work towards including “best practices” for prescription protocols and opioid alternatives in our education and outreach efforts. We appreciate the commenters’ suggestion of a survey monitoring system and will consult with the appropriate technological entities to discuss the impact on existing workflows and infrastructure, and the feasibility of implementing such a system. In addition, we will consider the commenters’ suggestion to establish policies that promote alternatives to opioids for pain management in the future.

Comment: Many commenters indicated that they would support the future inclusion of the Safe Use of Opioids measure in the Hospital IQR Program measure set if CMS refined the measure in response to stakeholder feedback and if the measure obtained NQF endorsement. In addition, the commenter recommended that CMS prioritize the development and adoption of measures designed to improve identification of, and intervention with, patients at risk for developing a substance abuse disorder. Lastly, commenters advised CMS to consider the variation in States’ prescribing requirements, citing concern that these differences may make the measure more complex and that in some cases, as determined by the physician, it can be appropriate for a patient to have multiple prescriptions.

Response: We thank the commenters for their support. We agree that the development and adoption of measures designed to improve identification of, and intervention with, patients at risk for developing a substance abuse disorder is valuable. We will continue to assess our measure set in alignment with our evolving programmatic goals to ensure we prioritize certain clinical topical areas appropriately. We

²³⁷ “2017 Considerations for Implementing Measures Hospitals-Final Report,” available at: <http://www.qualityforum.org/map/>.

understand that NQF-endorsement lends credibility to quality measures, and we recognize that variation in State prescribing practices could affect the data extrapolated from hospitals that report on this measure. We will consider both of these factors, as well as the provided stakeholder feedback on suggested measure refinements, should we propose to adopt this measure in the Hospital IQR Program in the future.

Comment: A few commenters supported the future inclusion of a measure that assesses opioid prescribing patterns, specifically for patients already using an opioid or patients using benzodiazepine. However, commenters expressed concern that the “Safe Use of Opioids” measure may introduce unintended consequences, such as under treatment of pain and placing undue accountability on acute settings for long-term pain management. Other commenters indicated that due to existing infrastructure deficiencies, the adoption of this measure would place unnecessary burden related to accountability upon acute care facilities. Some commenters stated that inclusion of this measure could encourage anti-opioid sentiments to irrational extremes. A few commenters noted that there are circumstances in which it may be appropriate for patients to be treated concurrently with opioids and recommended that the measure provides for the exclusion of cases in which polypharmacy may be warranted.

Response: We thank the commenters for their support. We recognize the heightened sensitivity associated with opioid prescribing. We understand that there are existing operational and technological infrastructure hurdles that should be addressed to reduce the burden associated with electronically extrapolating data for this measure. We acknowledge that concurrent prescribing is appropriate in certain situations. We also note the intent of the measure is to raise prescriber awareness, when and if the patient requires concurrent prescriptions, and to take appropriate steps to provide education regarding potential side effects and alternative pain management techniques to the patient, in an effort to reduce adverse side effects and potentially prevent dependence. Should we decide to move forward with proposing to adopt this measure in the Hospital IQR Program in the future, we will be vigilant about potential unintended consequences, such as under treatment of pain and undue accountability based on care setting. We also note that the intent of any future inclusion of this measure in the Hospital IQR Program would not be to stigmatize the use of

opioids, but to evaluate through quality measurement adherence to clinical standards that could help improve prescribing practices for these drugs and combat current misuse.

Comment: One commenter supported the future inclusion of all the eQMs we sought public comment for future inclusion in the Hospital IQR Program, including the Safe Use of Opioids measure, noting that the addition of these measures would give hospitals more options in selecting eQMs that are applicable to their patient populations.

Response: We thank the commenter for their support.

Comment: Some commenters did not support the proposed future inclusion of the Safe Use of Opioids measure in the Hospital IQR Program. The commenters stated that the measure lacks sensitivity to the needs of the specific patient (that is, adequate patient education). Specifically, the commenters also expressed that until all facilities, vendors, and pharmacies are required to implement ePrescribing of controlled substances, and given ample development, testing, and implementation time, there is a risk of prescriptions not being included in data transfer systems (that is, Sure Scripts, Dr. First, etc.). The commenters noted that these circumstances would allow for continued risks associated with overdose due to lack of information.

Response: We appreciate the commenters’ concerns. We recognize the heightened sensitivity associated with opioid prescribing given the current opioid epidemic in our nation. We note again that the intent of the measure is not to completely eliminate concurrent prescriptions, but rather to raise provider awareness of appropriate prescribing practices and provide both education and alternative treatments to patients. In addition, we will monitor the impact of ePrescribing on streamlining hospital workflows as a part of efforts to better assess how to reduce the risk of overdose. Should we decide to move forward with proposing to adopt this measure in the Hospital IQR Program in the future, we will consider the impact of adequate patient education on the measure results as well as potential unintended consequences, such as patient overdose.

We thank the commenters, and we will consider their views as we develop future policy regarding the use of an eQM version of the Safe Use of Opioids—Concurrent Prescribing (MUC16–167) measure in the Hospital IQR Program.

(2) Malnutrition Measures

(a) Background

Malnutrition is associated with many adverse outcomes including depression of the immune system, impaired wound healing, muscle wasting, and increased mortality.^{238,239} Patients who are malnourished during a hospital stay have an increased risk of complications, readmissions, and length of stay. In addition, evidence demonstrates an association between malnutrition risk and increased inpatient costs. One study found that patients identified with under-nutrition risk and high under-nutrition risk experience increased costs by 28.8 percent and 21.1 percent, respectively, when compared to non-malnourished patients.²⁴⁰ Malnutrition risk screening, using a validated screening tool, can be useful in predicting certain patient outcomes including length of stay, mortality, and post-operative complications.²⁴¹ Nutrition assessments for patients identified as at-risk for malnutrition have been associated with improved patient outcomes including less weight loss, reduced length of stay, improved muscle function, better nutritional intake, and fewer readmissions.²⁴² Further, there is evidence of a performance gap with regard to nutrition screening and assessment. A national survey of hospital-based professionals in the United States focused on nutrition screening and assessment practices demonstrated that out of 1,777 unique respondents, only 36.7 percent reported completing nutrition screening at admission and 50.8 percent reported doing so within 24 hours.²⁴³ Thus, there is an

opportunity for hospitals to improve nutrition screening and assessment.

(b) Overview of Measures

The malnutrition measure set consists of the following four measures:

- Completion of a Malnutrition Screening within 24 Hours of Admission (MUC16–294);
- Completion of a Nutrition Assessment for Patients Identified as At-Risk for Malnutrition within 24 Hours of a Malnutrition Screening (MUC16–296);
- Appropriate Documentation of a Malnutrition Diagnosis (MUC16–344); and
- Nutrition Care Plan for Patients Identified as Malnourished after a Completed Nutrition Assessment (MUC16–372).

These malnutrition measures are new eCQMs that collectively evaluate the quality of care rendered to adult patients that are identified as malnourished. These measures address the NQS priorities of: (1) Making care safer by reducing harm caused in the delivery of care; and (2) promoting effective communication and coordination of care. The Completion of a Malnutrition Screening within 24 Hours of Admission measure (MUC16–294) assesses whether patients age 18 years or older are screened for malnutrition within 24 hours of admission to the hospital. The Completion of a Nutrition Assessment for Patients Identified as At-Risk for Malnutrition measure (MUC16–296) assesses whether patients age 65 years or older, who screen positive for being at-risk for malnutrition, have a nutrition assessment documented in the medical record within 24 hours of the most recent malnutrition screening. The Appropriate Documentation of a Malnutrition Diagnosis measure (MUC16–344) assesses whether patients age 65 years and older, who are found to be malnourished on the nutrition assessment, have adequate documentation of a malnutrition diagnosis in their medical record. This measure is important because there is often a disconnect between screening for malnutrition and documentation of a diagnosis of malnutrition, which is necessary for appropriate follow-up after hospital discharge. Data analyzed from the Healthcare Cost and Utilization Project (HCUP), a nationally-representative data set describing U.S. hospital discharges, indicated that approximately 3.2 percent of hospital discharges in 2010 included malnutrition as a diagnosis. However, this same research article notes that the prevalence of a malnutrition diagnosis may be significantly higher as past

researchers, using validated screening tools, indicate a significantly higher prevalence of undiagnosed malnutrition in the hospital, ranging from 33 to 54 percent.²⁴⁴ Lastly, the Nutrition Care Plan for Patients Identified as Malnourished after a Completed Nutrition Assessment measure (MUC16–372) assesses whether patients age 65 years and older, who are found to be malnourished on a completed nutrition assessment, have a nutrition care plan documented in their medical record.

These measures were reviewed by the MAP in December 2016 and received mixed support. The Nutrition Care Plan for Patients Identified as Malnourished after a Completed Nutrition Assessment (MUC16–372), Completion of a Malnutrition Screening within 24 Hours of Admission (MUC16–294), and Completion of a Nutrition Assessment for Patients Identified as At-Risk for Malnutrition within 24 Hours of a Malnutrition Screening (MUC16–296) measures were recommended to be refined and resubmitted for consideration for programmatic inclusion. For these three measures, the MAP encouraged providing more evidence to prove clinical importance and recommended that the exclusions continue to be tested for validity.²⁴⁵ The Appropriate Documentation of a Malnutrition Diagnosis measure (MUC16–344) was not supported because there was concern that there was insufficient evidence to support the link between documenting a malnutrition diagnosis and improved patient outcomes.

The MAP concluded that completing a malnutrition assessment provided the most potential value to the measure set and quality of care. The MAP also encouraged the measure developer to test the individual malnutrition measures as a composite in an effort to balance the number of measures in the Hospital IQR Program with the need to fill the measure gap addressing malnutrition.²⁴⁶ We note that we received written support (formal letters addressed to CMS) of these measures from other stakeholders who noted that addressing malnutrition among

beneficiaries is an important clinical issue.

Additional information on these measures is available at: <http://www.qualityforum.org/ProjectMeasures.aspx?projectID=80741>.

We invited public comment on the possible future inclusion of one or more of these malnutrition measures in the Hospital IQR Program. In addition, we invited public comment on the possible future inclusion of a composite measure comprised of all or a subset of these individual malnutrition measures in the Hospital IQR Program.

Comment: Several commenters supported the future inclusion of the malnutrition measure set as individual measures. These commenters stated malnutrition is an ongoing healthcare issue with demonstrated impacts on patient outcomes and, as such, it is imperative to have performance measures that quantify the degree to which established best practices are carried out. The commenters noted poor nutrition status is also associated with poor functional and clinical outcomes for patients and increased costs to healthcare systems, and asserted taking a systematic approach to increasing awareness of malnutrition and improving management of nutrition in hospitals would improve health outcomes and reduce the associated costs imposed on healthcare systems.

The commenters also noted that the measures are reliable and valid, and that their implementation in the Hospital IQR Program would satisfy a measure gap area and incentivize the adoption of evidence-based malnutrition care best practices, thereby improving patient outcomes. Several commenters also noted that there is a need for more validated malnutrition screening tools to promote reliability between practitioners and to reduce the number of false-positive referrals that are being made due to use of invalid tools. The commenters indicated that the malnutrition eCQMs reflect key components of the recommended malnutrition clinical workflow, and that malnutrition intervention is a low-risk, low-cost clinical strategy that would help improve care coordination and the quality of hospital care.

Commenters stated that Medicare beneficiaries would benefit from the adoption of malnutrition eCQMs that support prompt malnutrition screening, assessment, diagnosis, and development of a care plan. In addition, the commenters stated that because these eCQMs have been specifically designed and tested to be used with patient data included directly in the EHR, the burden of data collection and reporting

²⁴⁴ Corkins, M.R., Guenter, P., DiMaria-Ghalili, R.A., Jensen, G.L., Malone, A., Miller, S., Patel, V., Plogsted, S. and Resnick, H.E., 2014. Malnutrition diagnoses in hospitalized patients: United States, 2010. *Journal of Parenteral and Enteral Nutrition*, 38(2), pp.186–195.

²⁴⁵ “2017 Considerations for Implementing Measures Hospitals-Final Report,” available at: <http://www.qualityforum.org/map/>.

²⁴⁶ *Ibid.*

will be minimal. Lastly, the commenters stated that the inclusion of this measure set in the Hospital IQR Program could help improve outcomes and quality of life for patients, especially seniors and the disadvantaged. The commenters therefore recommended CMS adopt these measures into the Hospital IQR Program as soon as possible to ensure quality care for older adults.

Response: We thank the commenters for their support. We agree that a systematic approach to quality improvement is essential and could include increasing awareness of malnutrition and improving management of nutrition in hospitals. We acknowledge the benefits and need for inclusion of malnutrition measures, as outlined by the commenters, and will consider the feasibility of implementing these measures in the Hospital IQR Program in the future.

Comment: Some commenters supported the future proposed inclusion of the malnutrition measure set in the Hospital IQR Program as a composite measure, stating that this measure format would optimize assessment of nutrition care for those at risk of malnutrition or who are already malnourished in the hospital setting. These commenters further recommended that CMS adopt the measures as a composite immediately, as opposed to in the future.

Response: We thank the commenters for their support. We note that as discussed in the proposed rule (82 FR 20061), in the preliminary review of these individual measures, both the MAP and the NQF Health and Well-Being Standing Committee advocated for the resubmission of the individual measures as a composite. Moving forward, we will weigh the benefits of adopting these measures as a composite versus as individual indicators. However, because the measures have not yet been evaluated by the MAP as a composite, they would need to undergo MAP review as a composite measure before we could propose to adopt it for the Hospital IQR Program in the future. We also appreciate commenters' recommendation that we adopt the measures immediately; however, we are not able to adopt them at this time because: (1) We are considering the future inclusion of these measures as a composite measure, but they have not yet been submitted as a Measure Under Consideration or reviewed by the MAP as a composite; and (2) the measures were not proposed for adoption in the FY 2018 IPPS/LTCH PPS proposed rule.

Comment: A few commenters supported the future inclusion of the

malnutrition eQCMs in the Hospital IQR Program only if they received NQF endorsement, to demonstrate that they are clinically important or linked to improved patient outcomes. A few commenters noted that these measures are not NQF-endorsed and did not receive MAP support for inclusion in Hospital IQR Program.

Response: We thank the commenter for their support. We agree with commenters regarding the importance of adopting sound, evidence-based performance measures, and will work to ensure that any measure included in the Hospital IQR Program is thoroughly vetted prior to adoption. If the measure steward submits this measure for NQF endorsement review under the next applicable call for measures, we will consider the NQF's endorsement status prior to moving forward with proposing to adopt these measures in the Hospital IQR Program. However, we note that NQF endorsement is not a requirement for inclusion in the Hospital IQR Program measure set. Section 1886(s)(4)(D)(ii) of the Act provides that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by, the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary.

Comment: One commenter supported the future inclusion of the malnutrition eQCMs in the Hospital IQR Program, and recommended that "Completion of a Nutrition Assessment for Patients Identified as At-Risk for Malnutrition within 24 Hours of a Malnutrition Screening" measure be extended to all age groups.

Response: We thank the commenter for their support. We note that these measures are intended to operate as a group, and as such, expanding the patient population in one measure would most likely require the expansion of the patient population in all the measures. We reiterate that the focus of this set of measures as currently specified is the assessment of malnutrition care among elderly patient populations (age 65 years and older), as they have been identified as the most at-risk cohort. We offer that if future testing of these measures yields results that improve care for this designated patient population, we could potentially assess how patients in other age groups are affected by malnutrition and whether the observed improvements could be broadly applied.

Comment: A few commenters did not support the inclusion of the malnutrition measures in the Hospital IQR Program because nutritional screening is already a requirement under the CMS Conditions of Participation (CoP), therefore, these commenters believed these measures would provide no additional incentives for performance improvement. Further, the commenters stated that these measures would create a distracting documentation "checkbox" process which is unlikely to advance meaningful care improvement.

Response: We note the measure steward is performing additional testing on all four of the malnutrition measures. Malnutrition is an ongoing healthcare issue with demonstrated impacts on patient outcomes. As such, we believe there could be important benefits to patients of having malnutrition measures that quantify the degree to which established best practices are carried out, improve health outcomes, and reduce cost burdens to healthcare systems. By referring to "checkbox" practices, we interpret that commenters have concerns about implementing process measures. We will take the concerns into consideration, however, we also believe these measures could be an important first step to incentivizing hospitals to improve malnutrition awareness and care.

Comment: Some commenters made suggestions on how to improve the malnutrition eQCM measures set. Specifically, the commenters suggested that the timeframe associated with the "Completion of a Nutrition Assessment" measure be modified such that hospitals can define their own time-intensive guidelines for documentation of assessments, as well as determining other patient populations who may be at potential nutrition risk. Other commenters suggested that the components of each assessment should be defined by each organization, arguing that organizations should guide practice based on their unique patient populations. In addition, the commenters recommended that consideration be given to the follow-up care provided for patients afflicted with malnutrition. The commenters also noted that nutrition assessment tools should be validated via clinical trials.

Response: We appreciate the commenters' suggestions. If the measure steward moves forward with additional testing of these measures, both individually and as a composite, we will consider the impact of follow-up care for patients afflicted with malnutrition, should we move forward with proposing to adopt these measures

in the Hospital IQR Program in the future. We understand the importance of hospitals having the autonomy to define their own guidelines related to the timing of documentation, however, we do not believe it is appropriate to allow hospitals to establish uniquely defined components for each measure based on their specific patient population because doing so introduces an untenable degree of variability and may mask disparities in patient care. It is imperative to evaluate the patient population as defined by the measures' denominators, as opposed to an individual hospital's or organization's parameters, in order to retain measurement integrity and not to skew the observed results with information bias. We agree with the commenters about the importance of ensuring the validity of tools and should we decide to move forward with proposing to adopt these measures for the Hospital IQR Program in the future, we will consider the feasibility of conducting a clinical trial of the nutrition assessment tools.

We thank the commenters and we will consider their views as we develop future policy regarding the use of eCQM versions of one or more measures in the malnutrition measure set and the possible future inclusion of a composite measure comprised of all or a subset of these individual malnutrition measures in the Hospital IQR Program.

(3) Tobacco Use Measures

(a) Background

Tobacco use is the single greatest cause of disease in the United States today and accounts for more than 480,000 deaths each year.²⁴⁷ Tobacco use creates a heavy cost to society as well as to individuals. Smoking is a known cause of multiple cancers, heart disease, stroke, complications of pregnancy, chronic obstructive pulmonary disease, other respiratory problems, poorer wound healing, and many other diseases.²⁴⁸

Smoking-attributable health care expenditures are estimated to cost at least \$130 billion per year in direct medical expenses for adults and over

\$150 billion in lost productivity.²⁴⁹ There is strong and consistent evidence that tobacco dependence interventions, if delivered in a timely and effective manner, significantly reduce the user's risk of suffering from tobacco-related disease and improve outcomes for those already suffering from a tobacco-related disease.^{250 251 252 253} Effective, evidence-based tobacco dependence interventions have been clearly identified and include brief clinician advice, individual, group, or telephone counseling, and use of FDA-approved medications. Tobacco cessation treatments are clinically effective and extremely cost-effective relative to other commonly used disease prevention interventions and medical treatments.²⁵⁴ Performance on the chart-abstracted versions of these measures, as reported by The Joint Commission, yields that the Tobacco Use Screening (TOB-1) measure had a screening rate of 98.15 percent, based on a reporting period of July 2015–June 2016.²⁵⁵ TOB-1 is necessary to operationalize Tobacco Use Treatment Provided or Offered (TOB-2)/Tobacco Use Treatment (TOB-2a) and Tobacco Use Treatment Provided or Offered at Discharge (TOB-3)/Tobacco Use Treatment at Discharge (TOB-3a) measures. The goal of TOB-1 is to achieve 100 percent screening so that all tobacco users are consistently identified and offered appropriate interventions, which are evaluated by TOB-2/2a and TOB-3/3a. As noted in the table²⁵⁶ below, the performance rates for the chart-abstracted versions of TOB-2/2a and TOB-3/3a measures suggest that there is an opportunity for hospitals to improve tobacco use treatment during the hospital stay and at discharge.

²⁵⁶ The Joint Commission Quality Check Data available at: <https://www.qualitycheck.org/>.

TOBACCO USE MEASURES SCREENING RESULTS JULY 2015–JUNE 2016

Measure name	Screening rate (%)
Tobacco Use Treatment Provided or Offered (TOB-2)	66.41
Tobacco Use Treatment (TOB-2a)	32.97
Tobacco Use Treatment Provided or Offered at Discharge (TOB-3)	46.20
Tobacco Use Treatment at Discharge (TOB-3a)	10.71

(b) Overview of Measures

The tobacco use measure set consists of the following three measures:

- Tobacco Use Screening (TOB-1) (MUC16-50);
- Tobacco Use Treatment Provided or Offered (TOB-2)/Tobacco Use Treatment (TOB-2a) (MUC16-51); and
- Tobacco Use Treatment Provided or Offered at Discharge (TOB-3)/Tobacco Use Treatment at Discharge (TOB-3a) (MUC16-52).

The TOB measures are eCQMs that assess tobacco use screening and treatment for patients age 18 years or older during the hospital stay and at discharge. We note that these measures were derived from the chart-abstracted versions in use by The Joint Commission. The Joint Commission has been using the chart-abstracted versions of these measures for voluntary reporting since January 1, 2012.²⁵⁷ In addition, the chart-abstracted versions of these measures (TOB-1, TOB-2/TOB-2a, and TOB-3/TOB-3a) are also part of the IPFQR Program measure set (81 FR 57246). These measures address the NQS priority of promoting the most effective prevention and treatment practices for the leading causes of mortality.

TOB-1 assesses the proportion of hospitalized patients who are screened, or refuse screening, within the three days prior to admission through 1 day after admission, for tobacco use during the 30 days prior to the screening. TOB-2 assesses the proportion of patients who are light tobacco users who received or refused practical counseling to quit within 3 days prior to or anytime during admission. TOB-2 also assesses the proportion of heavy tobacco users who received or refused practical counseling to quit and received, had a medical reason not to receive, or refused FDA-approved cessation medications within 3 days prior to or anytime during

²⁵⁷ The Joint Commission, Substance Use Measures overview, available at: https://www.jointcommission.org/core_measure_sets.aspx.

²⁴⁸ U.S. Department of Health and Human Services. The health consequences of smoking—50 years of progress: a report of the Surgeon General. Atlanta, GA: U.S. Department of Health and Human Services, CDC; 2014. Available at: <http://www.surgeongeneral.gov/library/reports/50-years-of-progress/full-report.pdf>.

admission. The subset measure TOB–2a only assesses light tobacco users who received practical counseling to quit within 3 days prior to or anytime during admission, and heavy tobacco users who received practical counseling to quit and received, or had a medical reason not to receive, FDA-approved cessation medications within 3 days prior to or anytime during admission. TOB–3 assesses the proportion of patients who are light tobacco users who were referred to or refused counseling within 3 days prior to admission through 1 day after discharge. TOB–3 also assesses the proportions of heavy tobacco users who were referred to or refused evidence-based counseling and received, had a medical reason not to receive, or refused a prescription for FDA-approved cessation medication upon discharge. The subset measure TOB–3a assesses light tobacco users who were referred to counseling within 3 days prior to admission through one day after discharge, and heavy tobacco users who were referred to evidence-based counseling and received, or had a medical reason not to receive, a prescription for FDA-approved cessation medication upon discharge.

We note that we previously solicited comments on the future inclusion of electronically-specified versions of the tobacco use measures TOB–1, TOB–2/2a and TOB–3/3a, previously referred to as TAM–1, TAM–2, and TAM–3, respectively, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53535). Commenters equally supported and opposed the future inclusion of the tobacco use measures in the Hospital IQR Program. Commenters highlighted the importance of high validation rates such as 95 percent, across the electronic data capture method and manual chart-abstraction (77 FR 53535). We note that at the time we sought public comments on these measure concepts related to tobacco use, electronically-specified measures were not yet developed.

In the most recent MAP deliberations in December 2016, only the Tobacco Use Screening (TOB–1) eCQM (MUC16–50) was reviewed. The TOB–2/TOB–2a (MUC16–51) and TOB–3/TOB–3a (MUC16–52) eCQMs were on the December 2016 MUC List, but were not submitted for MAP review because they were still undergoing field testing. We anticipate these measures should be ready for review by the MAP in the winter of CY 2017.

The TOB–1 eCQM was recommended to be refined and resubmitted for consideration for programmatic

inclusion.²⁵⁸ The MAP indicated that the measure should be tested to ensure that it returns accurate, reliable results. In addition, the MAP Hospital Workgroup noted that it will be important to carefully assess feasibility and burden of data collection.²⁵⁹ As previously stated, the chart-abstracted versions of the Tobacco Use Screening measures (TOB–1, TOB–2/TOB–2a, and TOB–3/TOB–3a) are part of the IPFQR Program measure set (81 FR 57246); thus, future inclusion of the eCQM versions of these measures in the Hospital IQR Program measure set would promote programmatic alignment across these quality reporting programs.

Additional information on the chart-abstracted version of these measures is available at: <https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228775749207>.

We invited public comment on the possible future inclusion of one or more of the eCQM versions of these tobacco use measures (TOB–1, TOB–2/2a and TOB–3/3a) in the Hospital IQR Program. In addition, we invited public comment on the possible future inclusion of a composite measure comprised of all or a subset of these individual tobacco use measures in the Hospital IQR Program.

Comment: Many commenters supported the proposed future inclusion of the tobacco eCQM measure set. The commenters noted that hospitalizations and readmission rates are high among tobacco users, however, most hospitals have not placed high priority on systematically assessing (identifying, noting status, offering cessation methods and following-up with) smokers. As such, the inclusion of these measures would help address this lost clinical care opportunity and decrease the incidence of tobacco related illness. In addition, the commenters noted that the parameters evaluated by measures TOB–2a and TOB–3a are patient engagement activities that could help promote the adjustment of quality measures by social risk factors, as many times smoking habits are related to SES and/or SDS factors. Lastly, the commenters noted that the tobacco use measures address a gap area within the Hospital IQR Program measure set. The commenters recommended ensuring programmatic alignment with other regulatory bodies to align tobacco and smoking code sets and requirements or to provide mapping guidance because

misalignment will result in increased provider burden.

Response: We thank the commenters for their support. We will continue to work with other quality reporting programs and regulatory bodies as needed to align tobacco and smoking code sets and requirements. We appreciate the commenters input regarding the potential impact of the inclusion of these measures in the Hospital IQR Program on the broader CMS goal of accounting for social risk factors in clinical quality measures.

Comment: A few commenters supported the future inclusion of the Tobacco Use eCQMs in the Hospital IQR Program only if they receive NQF endorsement to ensure they are clinically important and linked to improved patient outcomes.

Response: We note that currently, the eCQM versions of the measures are undergoing beta testing. Upon completion of the testing, and the availability of a suitable project provided by the NQF, the eCQM versions of these measures will be submitted for endorsement consideration via NQF's consensus development process. However, we note that NQF endorsement is not a requirement for inclusion in the Hospital IQR measure set. Section 1886(s)(4)(D)(ii) of the Act provides that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary.

Comment: Some commenters urged CMS to develop the protocols and testing environments necessary to validate eCQMs.

Response: We have previously finalized a validation process for eCQM data and we refer readers to section IX.A.11. of the preamble of this final rule for more details.

Comment: The commenters also recommended that CMS convene a TEP to identify eCQMs that are appropriate for use across care settings.

Response: An existing TEP has convened to assess these measures, and we will share the results of the beta testing of the eCQM versions prior to submission to NQF.

Comment: A few commenters expressed that the tobacco use measures should be included as individual indicators, as opposed to a composite measure because the all-or-none scoring

²⁵⁸ "2016–2017 Spreadsheet of Final Recommendations to HHS and CMS, available at: <http://www.qualityforum.org/map/>.

²⁵⁹ *Ibid.*

of a composite measure could potentially dilute the quality improvement aspect of the measures' respective measurement domains. In addition, the commenters noted that combining multiple metrics into a composite measure increases challenges exponentially and does not allow the level of granularity necessary to know where improvements should be made. Further, commenters suggested that it would be less burdensome for hospitals to identify where improvement is required if the measures remain separate as opposed to determining deficiencies within a composite measure. The commenters urged CMS not to consider composite eCQMs until current single measure eCQMs are proven to be reliable and accurate.

Response: We thank the commenters for their support. We acknowledge the commenters' concerns about the importance of retaining the integrity of the quality improvement aspect garnered by scoring each measure individually, as opposed to combining them into a composite. In addition, we recognize that there may be differences in burden associated with data collection and the level of granularity associated with observed results for the individual indicators, as opposed to a composite measure. We will take these factors into account if we move forward with proposing to adopt these measures in the Hospital IQR Program in the future.

Comment: Some commenters did not support the future inclusion of the Tobacco measure set in the Hospital IQR Program because these measures are redundant and capturing these data elements electronically has proven to be a challenge. The commenters suggested that these measures be combined and reported as treatment provided/offered at any time during the hospital stay. Further, the commenters noted that capturing these data elements electronically has proven to be a challenge and has required substantial, time consuming electronic medical record revisions. The commenters acknowledged that while specifying the measures as eCQMs may eliminate some of the burden on hospitals, the measures should be field tested as eCQMs in acute care hospitals prior to consideration in the Hospital IQR Program to ensure the measures are accurately assessing clinically relevant variations in care. Finally, the commenters expressed concern that it would be difficult to submit information for TOB-2/2a in an eCQM format and believed that implementation of the TOB-1 as a standalone measure outside of the psychiatric setting would be most

appropriate in the Hospital IQR Program. In addition, the commenters recommended that the tobacco use measures be tested as eCQMs, to ensure the measures are appropriately assessing clinically relevant variations in care, prior to being proposed for adoption in the Hospital IQR Program. Finally, the commenters recommended that CMS wait to implement these measures as eCQMs until the current core measures are more mature.

Response: We note that the eCQM versions of the measures are currently undergoing beta testing, to ensure the feasibility of electronic data abstraction and to ensure that these measures are appropriately assessing clinical variations in care. In both the alpha and beta testing phases we have not observed any significant difficulty in electronically capturing the data elements for these measures. We will continue to monitor the level of effort associated with electronic data extraction and make note of any significant challenges (for example, electronic medical record revisions) that arise. We are considering combining these measures into a composite, however, we will continue to solicit stakeholder feedback on how to implement these measures (individually or as composite) in the Hospital IQR Program should we elect to move forward with proposing to adopt them in the future.

We disagree with commenters that the measures are redundant, as there are currently no measures of behavioral health in the Hospital IQR Program. We also disagree that only the Tobacco Use Screening (TOB-1) measure is suitable for inclusion in the Hospital IQR Program. The performance rates for the chart-abstracted versions of Tobacco Use Treatment Provided or Offered (TOB-2)/Tobacco Use Treatment (TOB-2a) and Tobacco Use Treatment Provided or Offered at Discharge (TOB-3)/Tobacco Use Treatment at Discharge (TOB-3a) measures suggest that there is an opportunity for hospitals to improve tobacco use treatment during the hospital stay and at discharge. We reiterate that these measures are intended to be used as part of a linked set. Specifically, the TOB-2/2a and TOB-3/3a measures ensure hospitals are not only screening patients for tobacco use, but also offering evidence-based interventions to improve the quality of care for patients with tobacco use. Lastly, to address the commenters' statement regarding the maturity of the core measures, we note that the chart-abstracted versions of these measures (TOB-1, TOB-2/TOB-2a, and TOB-3/

TOB-3a) are also part of the IPFQR Program measure set (81 FR 57246).

Comment: One commenter recommended that the Tobacco Use Measures be included in ambulatory quality reporting programs rather than in the Hospital IQR Program.

Response: We thank the commenter for their suggestion, and acknowledge increased screening in ambulatory settings could lead to increased overall tobacco cessation success. We recognize these results could be used by researchers and health-care providers to learn of opportunities for tobacco cessation as a covered health benefit. Currently, these measures are not specified to assess care in ambulatory settings, however, this may be something we consider in future rulemaking. We thank the commenters, and we will consider their views as we develop future policy regarding the use of eCQM versions of one or more measures in the tobacco use measure set and the possible future inclusion of a composite measure comprised of all or a subset of these individual tobacco use measures in the Hospital IQR Program.

(4) Substance Use Measures

(a) Background

Excessive alcohol consumption and drug misuse or abuse have a significant impact on the health of the U.S. population.²⁶⁰ Excessive alcohol consumption is a leading cause of preventable death and disability resulting in approximately 88,000 deaths per year with an estimated economic cost of \$249 billion, including \$28 billion (2010 dollars) in direct health care costs.²⁶¹ In 2015, approximately 20.8 million individuals were classified as having a substance use disorder. Of those individuals with substance use disorders, 13.1 million had an alcohol use disorder, 5.1 million had an illicit drug use disorder, and 2.7 million had an alcohol and illicit drug

²⁶⁰ Excessive alcohol consumption includes binge drinking, heavy drinking, and any drinking by pregnant women or people younger than age 21. Definitions are available from the Centers for Disease Control and Prevention at: <https://www.cdc.gov/alcohol/fact-sheets/alcohol-use.htm>.

²⁶¹ Centers for Disease Control and Prevention Alcohol and Public Health: Alcohol-Related Disease Impact available at: [http://dx.doi.org/10.5888/pcd11.130293](https://nccd.cdc.gov/DPH/ARDI/Default/Report.aspx?T=AAM&P=f6d7eda7-036e-4553-9968-9b17ffad620e&R=d7a9b303-48e9-4440-bf47-070a4827e1fd&M=8E1C5233-5640-4EE8-9247-1ECA7DA325B9&F=eD= ; Sacks JJ, Gonzales KR, Bouchery EE, Tomedi LE, Brewer RD. 2010 national and state costs of excessive alcohol consumption. American journal of preventive medicine. 2015 Nov 30;49(5): e73-9.; Stahre M, Roeber J, Kanny D, Brewer RD, Zhang X. Contribution of Excessive Alcohol Consumption to Deaths and Years of Potential Life Lost in the United States. Prev Chronic Dis 2014;11:130293. DOI: <a href=).

use disorder.²⁶² Excessive alcohol consumption and substance use disorders can increase the risk of preventable injury, worsen existing chronic diseases, such as mental illness, and lead to the development of diseases, such as heart disease, cancer, and liver disease.²⁶³ Studies show the majority of individuals who consume alcohol excessively do not meet the clinical

criteria for diagnosis of a substance use disorder; yet evidence demonstrates screening and brief interventions, especially prior to the onset of a substance use disorder, can improve health and reduce costs.²⁶⁴ Similar benefits have been observed for individuals with substance use disorders who are identified and referred to treatment.^{265 266} The table

below provides performance rates based on the July 2015–June 2016 reporting period for the chart-abstracted versions of these measures, as reported by The Joint Commission.²⁶⁷ The results show that there is an opportunity for hospitals to improve substance use screening, brief intervention, and treatment.

SUBSTANCE USE MEASURES SCREENING RESULTS JULY 2015–JUNE 2016

Measure name	Screening rate (%)
Alcohol Use Screening (SUB–1)	85.30
Alcohol Use Brief Intervention Provided or Offered (SUB–2)	62.68
Alcohol Use Brief Intervention (SUB–2a)	57.43
Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge (SUB–3)	65.46
Alcohol & Other Drug Use Disorder Treatment at Discharge (SUB–3a)	54.27

(b) Overview of Measures

The substance use measure set consists of the following three measures:

- Alcohol Use Screening (SUB–1) (MUC16–179);
- Alcohol Use Brief Intervention Provided or Offered (SUB–2)/Alcohol Use Brief Intervention (SUB–2a) (MUC16–178); and
- Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge (SUB–3)/Alcohol & Other Drug Use Disorder Treatment at Discharge (SUB–3a) (MUC16–180).

The SUB–1, SUB–2/2a and SUB–3/3a measures address the NQS priority of promoting the most effective prevention and treatment practices for the leading causes of mortality. These measures are intended to be used as part of a linked set. Specifically, the SUB–2/2a and SUB–3/3a measures will ensure hospitals are not only screening patients for excessive alcohol use, but also offering evidence-based interventions to improve the quality of care for patients with excessive alcohol use or other use disorders. The SUB–1 Alcohol Use Screening measure assesses whether hospital patients 18 years of age and older are screened for alcohol use using a validated screening questionnaire for

excessive drinking during their inpatient stay. A validated screening questionnaire is defined as an instrument that has been psychometrically tested for reliability (the ability of the instrument to produce consistent results), validity (the ability of the instrument to produce true results), and sensitivity (the probability of correctly identifying a patient with the condition).

As previously noted, these measures are intended to be implemented as a set. As such, it would be necessary to adopt the SUB–1 measure in order to implement the other two measures. The SUB–2/2a measure assesses whether hospital patients age 18 years of age or older who screened positive for excessive alcohol use or an alcohol use disorder receive or refuse a brief intervention during the hospital stay (SUB–2). Subset measure SUB–2a includes only those patients who receive a brief intervention. A brief intervention is defined as a single session or multiple sessions conducted by a qualified healthcare professional or trained peer support person, which includes motivational discussion focused on increasing patient insight and awareness regarding alcohol use

and motivating behavioral change. The SUB–3/3a measures assess whether hospitals patients 18 years of age or older with a substance use disorder (alcohol or drug) receive or refuse at discharge a medication prescription for treatment or receive or refuse a referral for substance use disorder treatment (SUB–3). Subset measure SUB–3a includes only those patients who receive a medication prescription or treatment referral at discharge.

The chart-abstracted versions of these three measures, not the eCQM versions, were added to the MUC List in the summer of 2016,²⁶⁸ and reviewed by the MAP in December 2016 as discussed in the MAP Pre-Rulemaking Report and Spreadsheet entitled “2016–2017 Spreadsheet of Final Recommendations to HHS and CMS.”²⁶⁹ The MAP recommended that the SUB–1 measure (MUC16–179) be refined and resubmitted. The MAP noted that the measure encourages hospitals to screen patients for excessive alcohol use and can prevent life-threatening alcohol withdrawal syndrome, but recommended that the measure be paired with an appropriate intervention and follow-up measure. The MAP did not support the SUB–2/2a measure

²⁶² Substance Abuse and Mental Health Services Administration (SAMHSA) Key Substance Use and Mental Health Indicators in the United States: Results from the 2015 National Survey on Drug Use and Health available at: <https://www.samhsa.gov/data/sites/default/files/NSDUH-FRR1-2015/NSDUH-FRR1-2015/NSDUH-FRR1-2015.pdf>.

²⁶³ Excessive alcohol consumption includes binge drinking, heavy drinking, and any drinking by pregnant women or people younger than age 21. Definitions are available from the Centers for Disease Control and Prevention at: <https://www.cdc.gov/alcohol/fact-sheets/alcohol-use.htm>.

²⁶⁹ “2016–2017 Spreadsheet of Final Recommendations to HHS and CMS, available at: <http://www.qualityforum.org/map/>.

(MUC16–178) for adoption into the Hospital IQR Program. Proponents of the SUB–2/2a measure supported the incorporation of behavioral health measures into the Hospital IQR Program and noted that hospitalization is a prime opportunity to discuss harmful substance use because patients may be more amenable to a brief intervention during a hospital stay. Other stakeholders acknowledged the significant health impact of screening and brief intervention for substance use, but cited the burden of chart-abstracted data collection and encouraged the continued development of an electronic measure. MAP stakeholders also expressed concern the use of the measure in the hospital inpatient setting, rather than a primary care setting, was not strongly linked to improved patient outcomes. The MAP also did not support SUB–3/3a (MUC16–180) due to similar concerns as identified with the SUB–2/2a measure regarding the measure's link to improved outcomes.²⁷⁰

With respect to MAP stakeholder concerns regarding the evidence supporting the use of the measures in the inpatient setting, we note such supporting evidence, including the evidence of the generalizability of studies to the acute inpatient setting, was included as part of the endorsement process and these measures received NQF endorsement. Sufficient evidence exists linking the measures to improved patient outcomes^{271 272} in the inpatient setting.²⁷³ In addition, in light of the significant health impact of harmful substance use, and its associated healthcare costs, we believe the benefits of collecting these measure data from hospitals and publicly reporting the information outweigh the burden, and address a critical topic impacting a patient's quality of care and health outcomes.

We note that The Joint Commission has been using these chart-abstracted

measures for optional reporting since January 1, 2012.²⁷⁴ The chart-abstracted versions of the Substance Use measures (SUB–1, SUB–2/2a and SUB–3/3a) are also part of the IPFQR Program measure set (81 FR 57246); thus, future inclusion of the eCQM versions of these measures in the Hospital IQR Program measure set would promote programmatic alignment across these quality reporting programs. Lastly, we note that electronic versions of these measures are in development by SAMHSA; we anticipate that the eCQM versions will be ready for review within the next 18–24 months.

Additional information on the chart-abstracted versions of these measures is available in TJC's *Specification Manual for National Hospital Inpatient Quality Measures* at: https://www.jointcommission.org/specifications_manual_for_national_hospital_inpatient_quality_measures.aspx.

We invited public comment on the possible future inclusion of one or more of the eCQM versions of the Substance Use measures (SUB–1, SUB–2/2a and SUB–3/3a) in the Hospital IQR Program. In addition, we invited public comment on the possible future inclusion of a composite measure comprised of all of these individual substance use measures in the Hospital IQR Program.

Comment: Many commenters supported the proposed future inclusion of the Substance Use eCQM measure set. The commenters stated that substance use disorders are health issues that cause a great deal of illness in our country, but are terribly under-addressed by the treatment system. The commenters also stated that inclusion of these measures would incentivize screening, assessment, and evidence-based treatment for individuals with opioid and other substance use disorders. In addition, commenters agreed that these measures fill a gap area within the Hospital IQR Program measure set.

Some commenters recommended that the substance use measures should be added as individual measures as opposed to a composite because all-or-none scoring of a composite measure could potentially dilute the quality improvement aspect of the Substance Use measures and diminish the integrity of the quality improvement process. Further, commenters suggested that it would be less burdensome for hospitals to identify where improvement is required if the measures remain separate as opposed to determining deficiencies within a composite measure.

Response: We thank the commenters for their support. We acknowledge the commenters' concerns about the importance of retaining the integrity of quality improvement aspect garnered by scoring each measure individually, as opposed to combining them into a composite, and we will take these factors into account if we move forward with proposing to adopt these measures in the Hospital IQR Program in the future.

Comment: Some commenters supported the future inclusion of the Substance Use eCQMs in the Hospital IQR Program only if they receive NQF endorsement to ensure that they are clinically important and linked to improved patient outcomes.

Response: We thank the commenters for their support. We note that currently the eCQM versions of the measures are undergoing beta testing. Upon completion of the testing, and the availability of a suitable project provided by the NQF, the eCQM versions of these measures will be submitted for endorsement consideration via NQF's consensus development process. However, we note that NQF endorsement is not a requirement for inclusion in the Hospital IQR Program measure set. Section 1886(s)(4)(D)(ii) of the Act provides that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary.

Comment: Some commenters urged CMS to develop the protocols and testing environments necessary to validate eCQMs.

Response: We have previously finalized a validation process for eCQM data and we refer readers to section IX.A.11. of the preamble of this final rule for more details.

Comment: Some commenters also recommended that CMS convene a TEP to identify eCQMs that are appropriate for use across care settings.

Response: We also note that an existing TEP has convened to assess these measures and we will share the results of the beta testing of the eCQM versions prior to submission to NQF.

Comment: Some commenters expressed concern with the proposed future inclusion of the substance use eCQM measures. Specifically, the commenters noted that capturing these

²⁷⁴ The Joint Commission, Substance Use Measures overview, available at: https://www.jointcommission.org/core_measure_sets.aspx.

data elements electronically has proven to be a challenge and has required substantial, time consuming electronic medical record revisions. The commenters acknowledged that while specifying the measures as eQMs may eliminate some of the burden on hospitals, the measures should be field tested as eQMs in acute care hospitals prior to consideration in the Hospital IQR Program to ensure the measures are accurately assessing clinically relevant variations in care. Finally, the commenters expressed concern that it would be difficult to submit information for SUB-2/2a in an eCQM format and believed that implementation of the SUB-1 as a standalone measure outside of the psychiatric setting would be most appropriate.

Response: We acknowledge the commenters concerns. We note that currently, the eCQM versions of the measures are undergoing beta testing in acute care hospitals to ensure the feasibility of electronic data abstraction and to ensure that these measures are appropriately assessing clinical variations in care. We also note that in both the alpha and beta testing phases we have not observed any significant difficulty in electronically capturing the data elements for any of these measures.

We disagree that the Alcohol Use Screening (SUB-1) measure is more suitable for implementation in the Hospital IQR Program than the Alcohol Use Brief Intervention Provided or Offered (SUB-2)/Alcohol Use Brief Intervention (SUB-2a) and Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge (SUB-3)/Alcohol & Other Drug Use Disorder Treatment at Discharge (SUB-3a) measures. We reiterate that these measures are intended to be used as part of a linked set. Specifically, the SUB-2/2a and SUB-3/3a measures ensure hospitals are not only screening patients for excessive alcohol use, but also offering evidence-based interventions to improve the quality of care for patients with excessive alcohol use or other use disorders.

Comment: One commenter recommended that the Substance Use Measures be included in ambulatory quality reporting programs rather than in the Hospital IQR Program.

Response: We thank the commenter for their suggestion and acknowledge that preventable substance use events are common in ambulatory settings, with many resulting in hospitalization. Currently, these measures are not specified to assess care in ambulatory settings, however, this may be something we consider in future rulemaking. We note that quality

improvement programs at large could benefit from targeting substance use disorders among patients.

We thank the commenters, and we will consider their views as we develop future policy regarding the use of a one or more eCQM versions of the substance use measures and the possible future inclusion of a composite measure comprised of all of these individual substance use measures in the Hospital IQR Program.

10. Form, Manner, and Timing of Quality Data Submission

a. Background

Sections 1886(b)(3)(B)(viii)(I) and (b)(3)(B)(viii)(II) of the Act state that the applicable percentage increase for FY 2015 and each subsequent year shall be reduced by one-quarter of such applicable percentage increase (determined without regard to sections 1886(b)(3)(B)(ix), (xi), or (xii) of the Act) for any subsection (d) hospital that does not submit data required to be submitted on measures specified by the Secretary in a form and manner, and at a time, specified by the Secretary. Previously, the applicable percentage increase for FY 2007 and each subsequent fiscal year until FY 2015 was reduced by 2.0 percentage points for subsection (d) hospitals failing to submit data in accordance with the description above. In accordance with the statute, the FY 2018 payment determination will begin the fourth year that the Hospital IQR Program will reduce the applicable percentage increase by one-quarter of such applicable percentage increase.

In order to participate in the Hospital IQR Program, hospitals must meet specific procedural, data collection, submission, and validation requirements. For each Hospital IQR Program payment determination, we require that hospitals submit data on each specified measure in accordance with the measure's specifications for a particular period of time. The data submission requirements, Specifications Manual, and submission deadlines are posted on the QualityNet Web site at: <http://www.QualityNet.org/>. The annual update of electronic clinical quality measure (eCQM) specifications and implementation guidance documents are available on the eCQI Resource Center Web site at: <https://ecqi.healthit.gov/>. Hospitals must register and submit quality data through the secure portion of the QualityNet Web site. There are safeguards in place in accordance with the HIPAA Security Rule to protect patient information submitted through this Web site.

b. Procedural Requirements for the FY 2020 Payment Determination and Subsequent Years

The Hospital IQR Program's procedural requirements are codified in regulation at 42 CFR 412.140. We refer readers to these codified regulations for participation requirements, as further explained by the FY 2014 IPPS/LTCH PPS final rule (78 FR 50810 through 50811) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57168). In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20064), we did not propose any changes to these procedural requirements.

c. Data Submission Requirements for Chart-Abstracted Measures

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51640 through 51641), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53536 through 53537), and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50811) for details on the Hospital IQR Program data submission requirements for chart abstracted measures. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20064), we did not propose any changes to the data submission requirements for chart abstracted measures.

d. Changes to the Reporting and Submission Requirements for eQMs

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20064 through 20066), we proposed changes to the Hospital IQR Program eCQM reporting and submission requirements to align them with the Medicare EHR Incentive Program for eligible hospitals and CAHs.

(1) Background

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57157 through 57159), we finalized policies to require hospitals to submit a full calendar year (four quarterly reporting periods) of data on at least 8, self-selected eQMs from the available eQMs in the Hospital IQR Program for the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting period/FY 2020 payment determinations. In this final rule, we are finalizing modified versions of our proposals regarding the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting period/FY 2020 payment determination eCQM reporting requirements such that hospitals are required to submit one, self-selected, calendar quarter of data for 4 eQMs. We refer readers to section IX.A.8. of the preamble of this final rule for more detail on these policies. Consistent with previous years, with these finalized policies we have sought to align the

Hospital IQR Program eCQM reporting requirements and the CQM electronic reporting requirements in the Medicare EHR Incentive Program to the extent feasible for the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting period/FY 2020 payment determination in order to reduce reporting burden and confusion for hospitals and their health IT vendors. We refer readers to the finalized policies for the Medicare and Medicaid EHR Incentive Programs for eligible hospitals and CAHs in section IX.E.2.b. of the preamble of this final rule. We are finalizing these changes for both programs in order to assist hospitals in their efforts as they transition towards more robust electronic reporting of quality measure data and to be responsive to the feedback we have received about the challenges of eCQM reporting and recommendations to allow more time to become familiar with and improve upon eCQM reporting capabilities.

(2) Changes to the Reporting and Submission Requirements for eQMs for the FY 2019 Payment Determination and Subsequent Years

In the FY 2018 IPPS/LTCH PPS proposed rule, we did not propose any changes to our file format requirements or reporting deadlines. However, we proposed changes to our requirements related to eCQM electronic specification and certification. These are discussed in more detail below.

(a) File Format

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708), we finalized that hospitals must submit eCQM data via the Quality Reporting Document Architecture Category I (QRDA I) file format for the CY 2016 reporting period/FY 2018 payment determination. In addition, we finalized that for the CY 2016 reporting period/FY 2018 payment determination, hospitals may use third parties to submit QRDA I files on their behalf and can either use abstraction or pull the data from non-certified sources in order to then input these data into CEHRT for capture and reporting QRDA I (80 FR 49706). Consistent with previously finalized reporting requirements, hospitals can meet the reporting requirements by submitting data via QRDA I files, zero denominator declaration, or case threshold exemption. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57170), we finalized our proposal to continue these eCQM reporting policies for the CY 2017 reporting period/FY 2019 payment determination and subsequent years.

These finalized requirements align with the CQM electronic reporting requirements of the Medicare EHR Incentive Program for eligible hospitals and CAHs (81 FR 57255 through 57257). In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20065), we did not propose any changes to these requirements.

(b) Changes to the Certification Requirements for eCQM Reporting

(i) Background and Changes to the CY 2018 Reporting Period/FY 2020 Payment Determination Certification Requirements

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57170 through 57171), we finalized policies that hospitals must: (1) Report eCQM data using EHR technology certified to either the 2014 or 2015 Edition certification criteria for the CY 2017 reporting period/FY 2019 payment determination; and (2) report eCQM data using EHR technology certified to the 2015 Edition beginning with the CY 2018 reporting period/FY 2020 payment determination and subsequent years. As we discuss in further detail in section IX.G.4. of the preamble of this final rule where the same considerations are discussed in detail for the Medicare and Medicaid EHR Incentive Programs, based on our past experience with the transition from the 2011 Edition to the 2014 Edition and concerns expressed by stakeholders, we understand that transitioning to technology certified to a new Edition can be complex and can require more resources and time than anticipated, including the time necessary to effectively deploy the upgraded system and make the necessary patient safety, staff training, and workflow investments. We understand and appreciate these concerns and are working in cooperation with our federal partners at ONC to monitor progress on the 2015 Edition upgrade. Nevertheless, we believe that there are many benefits of switching to EHR technology certified to the 2015 Edition. We will work with ONC to monitor the status of EHR technology certified to the 2015 Edition and the deployment and implementation of such technology. In the proposed rule (82 FR 20065), we noted that if we identify a change in the current trends and significant issues with the certification and deployment of the 2015 Edition, we will consider additional methods to offer flexibility in CY 2018 for those hospitals that are not able to implement 2015 Edition certification criteria for CEHRT, including the flexibility to use technology certified to the 2014 Edition

or the 2015 Edition in CY 2018. Another option we noted is allowing a combination of EHR technologies certified to the 2014 Edition and 2015 Edition to be used in CY 2018, for those hospitals that are not able to fully implement EHR technology certified to the 2015 Edition. We invited public comment on these options for offering flexibility in CY 2018 with regard to EHR certification requirements.

Comment: A few commenters supported CMS' policy that eQMs must be submitted using the 2015 Edition certification criteria for CEHRT for the CY 2018 reporting period/FY 2020 payment determination because it offers increased interoperability which would make both the sharing and usage of data easier.

Response: We thank the commenters for their support. We believe using the most recent version of CEHRT, which incorporates updated standards and criteria, is important as it allows us to collect more relevant and accurate electronic data. We believe improved systems interoperability and use of the most current standards will facilitate more robust and accurate quality data reporting. One of the main tenets of the ONC 2015 Edition final rule (80 FR 62601) is to facilitate greater interoperability for several clinical health information purposes and enable health information exchange through new and enhanced certification criteria, standards, and implementation specifications. We note that we have worked closely with ONC to enhance testing and validation of certified technology's ability to capture, exchange, and report electronic patient data, such as improved testing and certification through the Cypress CQM testing and certification tool.²⁷⁵ As another example, we note that ONC proposed a "CQM—report" certification criterion at 45 CFR 170.315(c)(3) as part of its 2015 Edition certification criteria that we would then require as described in the FY 2016 IPPS/LTCH PPS proposed rule (80 FR 24613 through 24614).

Furthermore, we believe there are many benefits associated with upgrading to EHR technology certified to the 2015 Edition. Specifically, the 2015 Edition includes updates to standards for structured data capture as well as data elements in the common clinical data set which can be captured in a structured format. The use of relevant, up-to-date, standards-based structured data capture with an EHR certified to the 2015 Edition supports

²⁷⁵ Cypress Tool Overview, available at: <https://www.healthit.gov/cypress/>.

electronic clinical quality measurement. Further, the 2015 Edition certification criteria enables health information exchange through new and enhanced certification criteria standards, and implementation specifications for interoperability while incorporating changes that are designed to spur innovation and provide more choices to health care providers and patients for the exchange of electronic health information including new application access (API) certification criteria. For example, a new “transitions of care” certification criterion rigorously assess a product’s ability to create and receive an interoperable Consolidated-Clinical Document Architecture (C-CDA). ONC also adopted certification criteria that both support interoperability in other settings and use cases, such as the Common Clinical Data Set summary record, data segmentation for privacy, and care plan certification criteria (80 FR 62603). For additional details about the updates to the 2015 Edition, we refer readers to ONC’s Common Clinical Data Set resource, available at: https://www.healthit.gov/sites/default/files/commonclinicaldataset_ml_11-4-15.pdf.

The 2015 Edition certification criterion (that make up CEHRT) within the certification testing process includes features that are designed to improve the functionality and quality of eCQM data. Specifically, systems must demonstrate they can import and allow a user to export one or more QRDA files. This allows systems to share files and extract data for reporting into another system or send to another system. In addition, testing coverage is much more robust; all measures have >80 percent of test pathways tested in the test bundle with most >95 percent. The 2015 Edition certification criteria for CEHRT also includes optional certification criteria and program specific testing which can also support electronic clinical quality reporting. The filter criteria ensure a product can filter an electronic file based on demographics like sex or race, based on provider or site characteristics like TIN/NPI, and based on a diagnosis or problem. The testing for this function checks that patients are appropriately aggregated and calculated for this new function which supports flexibility, specificity and more robust analysis of eCQM data. Finally, the 2015 Edition provides optional testing to CMS requirements for reporting such as form and manner specifications and implementation guides. For these reasons, we encourage hospitals to deploy the 2015 Edition certification criteria as soon as practicable.

Comment: Many commenters did not support CMS’ previously finalized policy that eQMs must be submitted using the 2015 Edition certification criteria for CEHRT for the CY 2018 reporting period/FY 2020 payment determination.

Several commenters supported the options described in the FY 2018 IPPS/LTCH PPS proposed rule, such that hospitals be permitted to use the 2014 Edition certification criteria for CEHRT or a combination of 2014 and 2015 Editions for the CY 2018 reporting period/FY 2020 payment determination.

A few commenters recommended CMS delay the requirement for eQMs to be submitted using the 2015 Edition certification criteria for CEHRT until the CY 2019 reporting period/FY 2021 payment determination. The commenters suggested that additional time is necessary because the requirements for the 2015 Edition certification criteria for CEHRT are extensive and expensive. In addition, developers continue to struggle with completing the certification process by January 1, 2018.

One commenter mentioned that turn over in the industry has caused a backlog in the certification process. Another commenter expressed concern that the slow pace of certification, the number of upgrades still to be performed, and the number of trainings yet to be held makes it highly unlikely that health systems and medical practices will be prepared to submit eQMs using the 2015 Edition certification criteria for CEHRT for the CY 2018 reporting period/FY 2020 payment determination. Another commenter noted that implementing the 2015 Edition certification criteria for CEHRT does not automatically create the ability to submit “appropriate” or complete quality data.

Response: We recognize there is burden associated with the development and deployment of each new version of CEHRT, which may be labor intensive and expensive for hospitals. We understand that ONC considers trends within the industry when projecting for 2015 Edition readiness and has continued to update this tracking as the testing and certification process continues. This tracking, as of the end of the second quarter of CY 2017, indicates that overall progress is behind the first quarter projections.²⁷⁶ ONC has therefore updated the overall estimate to reflect an estimate of greater than 75 percent of hospitals will be ready by the end of CY 2017.²⁷⁷ We refer readers to

²⁷⁶ <https://dashboard.healthit.gov/dev/ticker.php>.

²⁷⁷ *Ibid*.

section IX.G.4. of the preamble of this final rule for more discussion of ONC’s efforts on this matter.

We acknowledge commenter concerns that vendor industry turnover may delay hospitals’ ability to deploy the 2015 Edition certification criteria for CEHRT. Since the conclusion of the public comment period for the FY 2017 IPPS/LTCH PPS final rule, we have continued to receive frequent feedback (via email, webinar questions, help desk questions, and conference call discussions) from hospitals and health IT vendors about ongoing challenges of implementing eCQM reporting. A summary of the main concerns identified by these data submitters are outlined in section IX.A.8.a. of the preamble of this final rule. One significant issue that commenters specifically identified is the timing of transitioning to new EHR systems during CY 2017 (for example, transition to a new EHR vendor or system upgrades necessary to deploy the 2015 Edition certification criteria for CEHRT) affects hospitals’ ability to complete the certification process by January 1, 2018.

Although we believe that the longer-term benefits of utilizing the 2015 Edition as discussed in the above response outweigh these costs and challenges, in response to stakeholder concerns, in part about the burden associated with upgrading EHR technology certified to the 2015 Edition, we will allow flexibility for hospitals to use the 2014 Edition, the 2015 Edition, or a combination of both for the CY 2018 reporting period/FY 2020 payment determination only. This is a change to our previously finalized policy that required hospitals to use the 2015 Edition certification criteria for CEHRT for the CY 2018 reporting period/FY 2020 payment determination (81 FR 57171).

We will continue to assess the progress of hospitals implementing certification requirements and engage in discussions with hospitals regarding their experiences as we consider certification policies related to eCQM reporting in future rulemaking. We intend to determine requirements for the CY 2019 reporting period/FY 2021 payment determination and subsequent years in future rulemaking. We are finalizing similar certification policies for the Medicare and Medicaid EHR Incentive Programs for hospitals and CAHs and refer readers to sections IX.E.2.b. of the preamble of this final rule.

Furthermore, we refer readers to section IX.A.8. of the preamble of this final rule for details on our modified eCQM reporting requirements for the CY

2018 reporting period/FY 2020 payment determination, such that hospitals will be required to report on 4 eCQMs for only one, self-selected calendar quarter of data (instead of a full calendar year) to reduce burden. By allowing providers to self-select which quarter of data they want to submit, they will have more flexibility to determine implementation timelines for EHR system upgrades, such as transitioning to the 2015 Edition.

We acknowledge the commenter's concern that implementing the 2015 Edition certification criteria for CEHRT may not automatically result in the ability to submit "appropriate" or complete quality data; however, as described above, we believe the most recent Edition of certification criteria for CEHRT will help support eCQM data capture and reporting in several ways.

Comment: Some commenters expressed concern that their current vendors will not be certifying to the 2015 Edition certification criteria for CEHRT and worried that CMS would not grant ECE requests for hospitals experiencing vendor issues or transitions. These commenters suggested that CMS revise its eCQM ECE policy to allow for EHR vendor changes. One commenter requested clarification on the statement that a hospital is "not able to implement the 2015 Edition of CEHRT." The commenter noted the wide variety of 2015 Edition certified products that are available and suggested waivers for the requirement to use the 2015 Edition be sparingly given, if at all, since use of the updated edition is an important and significant requirement.

Response: While we strive to move forward in our electronic reporting efforts and aim to stay abreast of evolving infrastructure, we must balance those goals with being responsive to stakeholder concerns. We refer readers to our change in policy discussed above in order to provide greater flexibility to hospitals transitioning to 2015 Edition certification criteria for CEHRT. However, if a hospital still finds it is unable to meet the eCQM submission deadline or other submission requirements, the hospital should review our criteria for an eCQM-related Extraordinary Circumstances Extension/Exemption (ECE) (81 FR 57182) and consider submitting an ECE request by the ECE request deadline. Currently, the deadline for the CY 2017 reporting period/FY 2019 payment determination is April 1st following the applicable eCQM submission deadline (February 28, 2018) (82 FR 57172). Our current policy allows hospitals to utilize the

existing ECE form to request an exception from the Hospital IQR Program's eCQM reporting requirement for the applicable program year based on hardships preventing hospitals from electronically reporting (81 FR 57182). Such hardships could include, but are not limited to, infrastructure challenges (hospitals must demonstrate that they are in an area without sufficient internet access or face insurmountable barriers to obtaining infrastructure) or unforeseen circumstances, such as vendor issues outside of the hospital's control (including a vendor product losing certification) (80 FR 49695 and 49713). ECE requests for the Hospital IQR Program are considered on a case by case basis (81 FR 57182). We will assess the hospital's request on a case-by-case basis to determine if an exception is merited. Therefore, our decision whether or not to grant an ECE will be based on the specific circumstances of the hospital. For additional information about eCQM-related ECE requests, we refer readers to, "The ECE Policy Clarification Questions and Answers" document located online at: <https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228775554109>, link to document: *ECE Policy Clarification Questions and Answers*, question #5).

Comment: One commenter believed it unfair to double penalize hospitals which may have excellent quality and are able to submit the chart-abstracted versions of the measure, but do not have fully operational EHRs. The commenter noted that only 5 percent of hospitals failed meaningful use, however, feared that number may increase with the transition to 2015 Edition certification criteria for CEHRT.

Response: With respect to the commenter's assertion that it is unfair to double penalize hospitals that do not have fully operational EHRs, we disagree that the requirements for electronic reporting in the Hospital IQR Program duplicate penalties. In an effort to align the Hospital IQR and EHR Incentive Programs with regard to electronic quality reporting, we have specified that hospitals meeting eCQM reporting requirements for the Hospital IQR Program will be considered to have successfully electronically reported CQMs for the Medicare EHR Incentive Program as well. As noted by the commenter and as we previously stated in the FY 2016 IPPS/LTCH PPS final rule, our data show that 95 percent of hospitals already attest to successful eCQM reporting under the EHR

Incentive Program and, accordingly, we believe that the majority of hospitals will be able to successfully report eCQMs to meet the Hospital IQR Program requirements (81 FR 57156). We do not believe that transition to the 2015 Edition certification criteria for CEHRT will materially impact the percentage of hospitals able to successfully report eCQM data, particularly in light of our change to previously finalized policy, discussed above, to allow flexibility for hospitals to use the 2014 Edition, 2015 Edition, or a combination of both for the CY 2018 reporting period/FY 2020 payment determination.

Comment: One commenter expressed concern that allowing flexibility on the use of a combination of the 2014 and 2015 Editions of CEHRT for the CY 2018 reporting period/FY 2020 payment determination might create more problems than it could potentially solve.

Response: We interpret the commenter's concern to be that allowing hospitals to use of a combination of the 2014 and 2015 Editions certification criteria for CEHRT might make it more difficult for them to meet the eCQM reporting requirements. We acknowledge the commenter's concern but do not share it; we have allowed hospitals to use a combination of the 2014 and 2015 Editions of CEHRT for the CY 2016 reporting period/FY 2018 payment determination and the CY 2017 reporting period/CY 2019 payment determination, and we are not aware of any specific issues in QRDA I file creation or submission. Based on the comments received, many hospitals and health IT vendors indicated they would prefer to have greater time and flexibility to implement upgrades to the 2015 Edition and specifically suggested we allow hospitals to use a combination of the 2014 and 2015 Editions of CEHRT to satisfy the eCQM certification requirements for the CY 2018 reporting period/FY 2020 payment determination. If we interpret commenter's concern to mean that delaying full transition to the 2015 Edition might stall progress toward more robust electronic data submission, we believe that we must balance these goals with other commenters' concerns about their ability to timely meet the certification requirements in the face of vendor issues and other challenges, as discussed above. We believe our changes, as discussed above, to the previously finalized policy allowing greater flexibility for hospitals transitioning to the 2015 Edition best achieves this balance. We will continue to assess the progress of hospitals implementing certification requirements and engage in discussions with

hospitals regarding their experiences as we consider certification policies in future rulemaking.

Comment: Several commenters noted their support for the previously finalized policy that eCQMs could be submitted via the 2014 or 2015 Edition certification criteria for CEHRT for the CY 2017 reporting period/FY 2019 payment determination and recommended that CMS extend this option to allow use of the 2014 or 2015 Edition certification criteria for CEHRT for the CY 2018 reporting period/FY 2020 payment determination, because it allows hospitals additional flexibility and enables facilities to spend appropriate time on implementation, testing, validation, and education of EHR systems.

Response: We refer these commenters and readers to our discussion above, expanding these policies through the FY 2020 payment determination.

Comment: A few commenters expressed concern that hospitals may be penalized more than once for failing to successfully report eCQMs in both the Hospital IQR and EHR Incentive Programs and thus a significant portion of their annual payment update hinges on the maturity of health IT vendor capabilities and the ability of CMS' QualityNet Secure Portal to manage and appropriately support the volume of incoming data submissions.

Commenters noted that hospitals continue to report barriers to successfully submitting eCQM data, including health IT vendor failures during the submission of production data (which did not present during test submissions) and limitations of the QualityNet Secure Portal, such as: (1) An inability to accept QRDA I files over a certain size; (2) an inability to run reports verifying that data have been submitted to CMS; and (3) frequent periods when the system is down because it cannot accommodate more than a certain number of users at one time. Moreover, a commenter expressed serious concerns about eCQM measure specification and data validation.

Response: We disagree with commenters that the requirements for electronic reporting in the Hospital IQR and Medicare EHR Incentive Programs duplicate penalties. As we previously stated in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57156), in an effort to align with the Medicare and Medicaid EHR Incentive Programs, we have specified that hospitals meeting electronic reporting requirements for the Hospital IQR Program will be considered to have successfully reported the eCQM requirement to the Medicare and Medicaid EHR Incentive

Programs as well. Our data show that 95 percent of hospitals already attest to successful electronic clinical quality measure reporting under the EHR Incentive Program and, accordingly, we believe the majority of hospitals will be able to successfully report electronic clinical quality measures, meeting the Hospital IQR Program requirements (81 FR 57156). In addition, if a hospital is unable to meet the Hospital IQR Program's eCQM reporting requirements due to extraordinary circumstances, the hospital should review the Hospital IQR Program's ECE policy, available at: <https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228775554109>, and the EHR Incentive Program's hardship exception policy, available at: https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/PaymentAdj_Hardship.html. We also refer readers to section IX.A.15. of the preamble of this final rule for more details about our ECE policy.

Regarding the limitations of the QualityNet Secure Portal and QRDA I file submission difficulties that commenters described, we acknowledge that at certain times of high submission volume leading up to the submission deadline on February 28, 2017, some data submitters reported longer file processing times and inability to timely run feedback reports. We are actively taking steps to improve the data submission experience for the CY 2017 reporting period (the next submission deadline is February 28, 2018), such as working with the infrastructure contractor to increase system throughput and increase responsiveness to issues that arise. In addition, the development contractor is working to identify efficiencies that can be gained in our Hospital Quality Reporting system source code. These efficiencies should reduce the time it takes to receive submission confirmation and run reports.

Regarding the comment that failures during the submission of production data were not identified during the test file submission process, we note the Pre-Submission Validation Application (PSVA) tool²⁷⁸ helps submitters to assess the QRDA I file format, however, hospitals and health IT vendors should submit files for testing in the CMS data receiving system via the QualityNet Secure Portal to ensure that production files are accepted prior to the submission deadline. Hospitals and

their health IT vendors were notified via educational materials and presentations that the utilization of the PSVA tool assesses the format of the QRDA Category I file; however, the CMS data receiving system performs additional checks, such as the Clinical Document Architecture (CDA) schema, submission period dates, and authorization for a vendor to submit on a hospital's behalf. The PSVA tool is a good starting point for initial validation and will help hospitals and their vendors to work through many file format issues. Both validation methods provide value, but ultimately the hospital should aim to ensure that files are accepted through the CMS data receiving system.

Regarding the QRDA file size limitation, hospitals and vendors were notified via education and outreach efforts the file size limit of QRDA I files is 5 MB for eCQM reporting. For the CY 2016 reporting period, we received a relatively small number of files which were greater than 5 MB. These few files typically exceeded the file size limit due to lack of linearization (in other words, the files did not utilize XML tools to remove unnecessary spaces and line breaks) or contained excessive data unrelated to eCQM reporting. We were able to individually work with most data submitters to help them reduce file sizes over the 5 MB limitation. We are evaluating the feasibility of expanding the QRDA I file size for future eCQM reporting activities.

In addition, as described in section IX.A.11.b. of the preamble of this final rule, we intend to address concerns about the reliability and accuracy of electronic data through validation. In order to be able to effectively validate eCQM data, we need to continuously assess more data. Moreover, we believe it is appropriate to require reporting and validation of eCQMs given that measures available now and those being developed for the future are increasingly based on electronic standards (80 FR 49696).

As discussed above, after review of the comments received and in alignment with the Medicare and Medicaid EHR Incentive Programs, we are offering greater flexibility and finalizing a change to our previously finalized CY 2018 reporting period/FY 2020 payment determination certification requirements. Instead of requiring that all EHR technology used to report eCQM data be certified to the 2015 Edition for the CY 2018 reporting period/FY 2020 payment determination, we will allow hospitals to use: (1) Technology certified to the 2014 Edition; (2) technology certified to the 2015 Edition; or (3) a combination of

²⁷⁸ <https://ecqi.healthit.gov/ecqm-tools-key-resources/tool-library/pre-submission-validation-application-psva>.

EHR technologies certified to the 2014 Edition and 2015 Edition for the CY 2018 reporting period/FY 2020 payment determination. We note the previously finalized certification requirements for the CY 2017 reporting period/FY 2019 payment determination will remain unchanged (81 FR 57170 through 57171). We intend to determine requirements for the CY 2019 reporting period/FY 2021 payment determination and subsequent years in future rulemaking. We refer readers to section IX.G.4. of the preamble of this final rule, where we are finalizing a similar policy for the Medicare and Medicaid EHR Incentive Programs.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20064 through 20065), we proposed two changes related to certification requirements with regard to eCQMs: (1) To require EHR technology certified to all eCQMs available to report; and (2) to note certified EHR technology does not need to be recertified each time it is updated to a more recent version of the eCQM specifications to align with the Medicare EHR Incentive Program requirements for eligible hospitals and CAHs. These proposals are discussed in more detail below.

(ii) Requirement for EHR Technology To Be Certified to all eCQMs That are Available To Report for the CY 2017 Reporting Period/FY 2019 Payment Determination and the CY 2018 Reporting Period/FY 2020 Payment Determination

We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705) where we noted that although we require CEHRT, eligible hospitals were not required to ensure their CEHRT products were recertified to the most recent version of the electronic specifications for the clinical quality measures. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20065 through 20066), we proposed new policies regarding the Hospital IQR Program eCQM specification requirements to align with the Medicare EHR Incentive Program's CQM electronic reporting requirements.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57256) for the Medicare EHR Incentive Program, we finalized the continuation of a policy that electronic submission of CQMs will require the use of the most recent version of the electronic specification for each eCQM to which the EHR is certified. For the Medicare EHR Incentive Program, we previously finalized that in the event an eligible hospital or CAH has EHR technology which is certified to the 2014 Edition but not certified to all of

the eCQMs that are available to electronically report for the CY 2017 reporting period/FY 2019 payment determination, we will require the hospital to have its EHR technology certified to all such eCQMs in order to meet the reporting requirements for the CY 2017 reporting period/FY 2019 payment determination (81 FR 57256). Further, for the Medicare EHR Incentive Program, we stated that for the CY 2017 reporting period eligible hospitals and CAHs will be required to use the Spring 2016 version of the eCQM specifications available on the eCQI Resource Center Web site at: <https://ecqi.healthit.gov/>.

In order to align the Hospital IQR Program's eCQM certification requirements and the Medicare EHR Incentive Program CQM electronic submission requirements for eligible hospitals and CAHs, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20133), we proposed that for the CY 2017 reporting period/FY 2019 payment determination, a hospital using EHR technology certified to the 2014 or 2015 Edition, but for which such EHR technology is not certified to all 15 available eCQMs, would be required to have its EHR technology certified to all 15 eCQMs that are available to report under the Hospital IQR Program. We further proposed (at 82 FR 20066) that for the CY 2017 reporting period/FY 2019 payment determination, hospitals would be required to use the most recent version of the eCQM electronic specifications (in other words, the Spring 2016 version of the eCQM specifications and any applicable addenda) available on the eCQI Resource Center Web site at: <https://ecqi.healthit.gov/>.

For the CY 2018 reporting period/FY 2020 payment determination, we proposed to apply this same policy regarding the reporting of eCQMs, such that hospitals would be required to use the most recent version of the eCQM specifications for each eCQM to which the EHR is certified (82 FR 20066). For the CY 2018 reporting period/FY 2020 payment determination, this means hospitals would be required to use the most recent version of the eCQM electronic specifications (in other words, the Spring 2017 version of the CQM electronic specifications and any applicable addenda) available on the eCQI Resource Center Web site at: <https://ecqi.healthit.gov/>. In addition, we proposed requiring that hospitals need to have their EHR technology certified to all 15 available eCQMs in order to meet the reporting requirements for the CY 2018 reporting period/FY 2020 payment determination. Furthermore, we proposed that an EHR

certified for eCQMs under the 2015 Edition certification criteria would not need to be recertified each time it is updated to a more recent version of the eCQMs. We believe it is not necessary for EHRs certified for eCQMs under the 2015 Edition certification criteria to be recertified each time it is updated to the most recent version of the eCQMs. This is because the EHR technology continues to meet the 2015 Edition certification criteria and any updates to the eCQM specifications would not impact any elements regarding certification. Therefore, we proposed that recertification would not be necessary and would reduce the burden associated with recertification. For further discussion regarding EHR certification requirements, we refer readers to section IX.G.4. of the preamble of this final rule.

We invited public comment on these proposals.

Comment: Several commenters supported the proposal to require EHR technology to be certified to all eCQMs for the CY 2017 reporting period/FY 2019 payment determination because all 15 eCQMs should be available for submission to allow for reporting flexibility to better reflect the populations hospitals serve.

Response: We thank the commenters for their support.

Comment: Several commenters did not support the proposal to require that EHRs be certified to all 15 eCQMs for the CY 2017 reporting period/FY 2019 payment determination. A few of these commenters noted there is no requirement as a condition of ONC certification for EHRs to support all eCQM reporting options for hospitals, leaving each hospital or health system to work independently with vendors in implementing their measures. The commenters expressed concern these conditions may result in additional costs and hours of additional work for providers, and cause a tremendous waste of limited financial and personnel resources.

Some commenters urged CMS to work with ONC and health IT vendors to ensure the 2015 Edition certified EHRs are capable of supporting hospitals' eCQM reporting, including the reporting of any of the eCQMs available to report in the Hospital IQR Program.

Response: We appreciate the commenters' concerns about the proposal to require EHRs be certified to all available eCQMs for the CY 2017 reporting period/FY 2019 payment determination, and we recognize the challenges associated with eCQM reporting. Although there is no specific requirement as a condition of ONC

certification for EHR technology to support all available eCQMs, ONC has adopted certification criteria that both support interoperability in other settings and use cases, such as the Common Clinical Data Set summary record, data segmentation for privacy, and care plan certification criteria (80 FR 62603). Specifically, systems must demonstrate they can import and allow a user to export one or more QRDA files. For additional details about certification criteria, we refer readers to ONC's Common Clinical Data Set resource, available at: https://www.healthit.gov/sites/default/files/commonclinicaldataset_ml_11-4-15.pdf.

We believe requiring EHRs to be certified to all available eCQMs for the Hospital IQR Program would help to streamline the process of collecting electronic data by allowing hospitals flexibility in the particular eCQMs they want to select for data capture and reporting. Having an EHR certified to all available eCQMs would help prevent hospitals from having to go back and consult their health IT vendors and certify individual measures each time they want/need to report on a new or different eCQM. The process of individual measure certification could potentially create a bottleneck in the process, as hospitals would be reliant on vendor availability and timelines. This would inadvertently increase the overall eCQM reporting burden. If EHRs are certified to all available eCQMs, however, hospitals would have greater flexibility in selecting which eCQMs they want to report for a given reporting period up until the eCQM submission deadline, and they would not need to select which measures in advance based upon availability of certified eCQMs offered by the vendor.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57256), we adopted policy for the Medicare EHR Incentive Program requiring that for an eligible hospital or CAH that has EHR technology certified to the 2014 Edition, the EHR technology must be certified to all CQMs that would be available for the Medicare EHR Incentive Program CY 2017 reporting period. Requiring EHRs to be certified to all available eCQMs in the Hospital IQR Program would align the Hospital IQR and EHR Incentive Programs, which would help streamline requirements across CMS programs, thereby reducing electronic reporting burden on hospitals. Because EHRs are already required to be certified to all available eCQMs for the EHR Incentive Program, most hospitals should already have EHR technology certified to all available eCQMs at least for the 2014 Edition.

With regard to commenters' suggestion that CMS work with ONC and health IT vendors to ensure technology certified to the 2015 Edition are capable of supporting hospitals' eCQM reporting, we will continue to seek stakeholder input and collaborate with colleagues at ONC to define standards for EHR organization and structure which would allow for documentation to fit into the clinical workflow and to ensure our policies are responsive to evolving electronic standards to the greatest extent possible. We will also work with ONC to monitor the status of EHR technology certified to the 2015 Edition and the deployment and implementation of such technology, including reporting of the eCQMs that are available to report in the Hospital IQR Program.

Comment: Some commenters expressed concern the proposal to require that EHRs be certified to all 15 eCQMs for the CY 2017 reporting period/FY 2019 payment determination inappropriately places the burden on hospitals, rather than vendors, to meet the requirement, especially for hospitals transitioning from 2014 to 2015 certified EHR technology and preparing for long-planned system upgrades.

Response: While we recognize that requiring EHRs to be certified to all available eCQMs initially creates some burden for both hospitals and health IT vendors, we disagree that it unduly places the burden on hospitals, rather than vendors, to meet the requirement. We believe requiring EHRs to be certified to all available eCQMs could help alleviate some reporting burden by offering hospitals greater flexibility to report eCQM data most appropriate and useful to internal quality improvement efforts rather than being limited to only those eCQMs selected and supported by their vendors. In addition, requiring EHRs to be certified to all eCQMs offers greater certainty to hospitals that their EHR systems will be capable of reporting the particular eCQMs they select and that they could decide to select different eCQMs if and when needed. Therefore, we believe the burden will be offset by the flexibility it allows hospitals to report on any eCQMs they choose and to select those most relevant for their purposes. Once the initial process of certifying the EHR to all available eCQMs has been completed, we believe the burden will be offset by the flexibility it allows hospitals to report on any eCQMs they choose, without having to potentially renegotiate with their health IT vendor for additional work to certify measures individually. Further, we note that, a certified health IT module supporting

eCQMs would not need to be recertified each time it is updated to a more recent version of the eCQMs as stated above, under this policy, EHR technology certified for reporting all available eCQMs would not need to be recertified each time it is updated to a more recent version of the eCQM specifications.

Comment: One commenter argued changes to certification requirements should be made in rules published by ONC, as this is the agency with authority over EHR certification standards.

Response: We believe changes to certification requirements related to electronic reporting of quality measure data in the Hospital IQR Program appropriately fall under the purview of the Hospital IQR Program to specify the "form and manner" of quality data. In addition, as we stated in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57111), our goal is to align electronic quality measure requirements of the Hospital IQR Program with various other Medicare and Medicaid programs, including those authorized by the Health Information Technology for Economic and Clinical Health (HITECH) Act, as much as feasible so that the reporting burden on providers will be reduced. We will continue to seek stakeholder input and collaborate with colleagues at ONC to define standards for EHR organization and structure. If we determine based upon stakeholder feedback that the benefits of requiring EHRs to be certified to all available eCQMs, as outlined above, do not outweigh the burden, we may revisit this requirement in future rulemaking.

Comment: One commenter expressed concern this policy eliminates the opportunity for a specialty product to focus on measures only applicable to its domain, such as a surgical suite product focusing on surgery measures. The commenter also noted its concern that this policy would reduce the availability of certified HIT for hospitals or lead to poorer workflows for capturing quality data.

Response: We appreciate the commenter's interest in specialty health IT products that may be even more applicable to their specialty services or patient population. We do not believe our eCQM certification requirements prevent health IT vendors from developing and offering such products or from providers asking for such products. With regard to our current eCQM measure set, adding new eCQMs that address unique and individual specialties, and incorporation of electronic products that assess specific clinical domains, is a consideration for future rules once the capabilities of

electronic reporting are more fully established. We will continue to seek stakeholder input and collaborate with colleagues at ONC to monitor the availability of certified health IT products for quality measure reporting.

After consideration of the public comments we received, for the CY 2017 reporting period/FY 2019 payment determination, we are finalizing our proposals as proposed to: (1) Require EHR technology used for eCQM reporting to be certified to all eCQMs, but that such certified EHR technology does not need to be recertified each time it is updated to a more recent version of the eCQM electronic specifications; and (2) require hospitals to use the most recent version of the eCQM electronic specifications. In addition, for the CY 2018 reporting period/FY 2020 payment determination, we are finalizing our proposals, as proposed, to: (1) Require EHR technology used for eCQM reporting to be certified to all eCQMs, but that such certified EHR technology does not need to be recertified each time it is updated to a more recent version of the eCQM electronic specifications; and (2) require hospitals to use the most recent version of the eCQM electronic specifications. We refer readers to section IX.G.4. of the preamble of this final rule where the EHR Incentive Program is finalizing similar policies.

(c) Electronic Submission Deadlines for the FY 2020 Payment Determination and Subsequent Years

We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50256 through 50259) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708) for our previously adopted policies to align eCQM data reporting periods and submission deadlines for both the Hospital IQR Program and the Medicare EHR Incentive Program for eligible hospitals and CAHs.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57172), we established eCQM submission deadlines for the Hospital IQR Program. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20066), we did not propose any changes to the eCQM submission deadlines for the FY 2020 payment determination or subsequent years. Specifically, we are not making any changes to the February 28, 2018 submission deadline for CY 2017 reporting or the February 28, 2019 submission deadline for CY 2018 reporting (81 FR 57172) to ensure that APU determinations for FY 2019 and FY 2020 payment determinations are not affected and to maintain the previously established alignment with the

Medicare EHR Incentive Program's submission deadline (81 FR 57255).

While we did not propose any changes to these policies, we received a few comments related to the submission deadline and general eCQM data submission and are addressing them below.

Comment: One commenter recommended the submission deadline be moved to the end of the first quarter of 2019 instead of February 28, 2019 because this would allow for final ICD-10 coding and corrections potentially needed after receiving final documentation from physicians.

Response: We thank the commenter for the recommendation to adjust the eCQM submission deadline from February 28, 2019 to the end of the first quarter of 2019. We will take this suggestion into consideration; however, at this time, we do not plan to extend the previously finalized submission deadline.

Comment: One commenter recommended that the CMS testing tools, such as updates to the PSVA tool and the QualityNet Secure Portal, need to be available at least three months before the start of the reporting year, instead of halfway through the reporting year, so that health IT developers can test with the new specifications and give healthcare organizations ample time to implement before the reporting period begins on January 1, 2018, because without sufficient time for adoption and testing, many organizations would not be ready for early submission.

Response: We thank the commenter for their suggestion that updates to CMS testing tools, such as the PSVA tool, and availability of our data receiving system via the QualityNet Secure Portal be made available to developers before the reporting period, but due to operational constraints, earlier release of PSVA tool updates and earlier availability of the QualityNet Secure Portal is not possible. We note that we did not develop the PSVA tool specifically as a development tool, but as a tool for data submitters to test their QRDA I files before submitting the files as production files for program credit. In addition, we have designed the QualityNet Secure Portal to allow for test file submissions as well as production file submissions. QualityNet is the only CMS-approved Web site for secure communications and healthcare quality data exchange between: Quality improvement organizations (QIOs), hospitals, data vendors, and other providers. We will look further into how we may be able to release PSVA tool updates and make the QualityNet Secure Portal available sooner for

hospitals and health IT vendors. We refer readers to section IX.A.8.b. of the preamble of this final rule, where we discuss the PSVA tool in more detail.

(d) Summary

As noted in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49759) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57257), we continue to encourage health IT developers to test any updates on an annual basis, including any updates to the eCQMs and eCQM reporting requirements for the Hospital IQR and Medicare EHR Incentive Programs based on the CMS Implementation Guide for Quality Reporting Document Architecture [QRDA] Category I and Category III Eligible Professional Programs and Hospital Quality Reporting (HQR) (CMS Implementation Guide for QRDA). The CMS Implementation Guide for QRDA, program specific performance calculation guidance, and eCQM electronic specifications and guidance documents are available on the eCQI Resource Center Web site at: <https://ecqi.healthit.gov/>.

As noted in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57172), we also continue to encourage all hospitals and health IT vendors to submit QRDA I files early, and to use one of the pre-submission testing tools for electronic reporting, such as the CMS PSVA tool, to allow additional time for testing and to make sure all required data files are successfully submitted by the deadline. The PSVA tool can be downloaded from the Secure File Transfer (SFT) section of the QualityNet Secure Portal at: https://cportal.qualitynet.org/QNet/pgm_select.jsp.

In summary, in section IX.A.10.d.(2)(b)(ii) of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule, for the CY 2017 reporting period/FY 2019 payment determination, for the Hospital IQR Program we proposed: (1) A hospital using EHR technology certified to the 2014 or 2015 Edition of CEHRT, but for which such EHR technology is not certified to all available eCQMs, would be required to have its EHR technology certified to all eCQMs that are available to report; and (2) EHR technology that is certified to all available eCQMs would not need to be recertified each time the eCQMs are updated to a more recent version of the eCQM specifications.

For the CY 2018 reporting period/FY 2020 payment determination, for the Hospital IQR Program we proposed: (1) A hospital using EHR technology certified to the 2015 Edition certification criteria for CEHRT, but for which such EHR technology is not

certified to all available eCQMs, would be required to have its EHR technology certified to all eCQMs that are available to report; and (2) EHR technology that is certified to all available eCQMs would not need to be recertified each time the eCQMs are updated to a more recent version of the eCQM specifications. Further, we proposed: (1) For the CY 2017 reporting period, hospitals would be required to use the most recent version of the eCQM electronic specifications (in other words, the Spring 2016 version of the eCQM specifications, and any applicable addenda); and (2) for the CY 2018 reporting period, hospitals would be required to use the most recent version of the eCQM electronic specifications (in other words, the Spring 2017 version of the eCQM specifications, and any applicable addenda). These eCQM specifications are available on the eCQI Resource Center Web site at: <https://ecqi.healthit.gov/>. We refer readers to section IX.E.3.c. of the preamble of this final rule, where similar policies are described for the Medicare EHR Incentive Program for eligible hospitals and CAHs.

We are reiterating our policies we are finalizing in this final rule related to the reporting and submission requirements of eCQM data for the Hospital IQR Program: (1) For the CY 2017 reporting period/FY 2019 payment determination and for the CY 2018 reporting period/FY 2020 payment determination, we will offer flexibility, such that hospitals may use: (a) EHR technology certified to the 2014 Edition; (b) EHR technology certified to the 2015 Edition; or (c) a combination of EHR technologies certified to the 2014 Edition and 2015 Edition; (2) for the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting/FY 2020 payment determination, EHR technology certified to the 2014 or 2015 Edition must be certified to all 15 eCQMs available to report in the Hospital IQR Program; (3) for the CY 2017 reporting period/FY 2019 payment determination, hospitals will be required to use the most recent version of the eCQM electronic specifications (in other words, the Spring 2016 version of the eCQM specifications and any applicable addenda); (4) for the CY 2018 reporting period/FY 2020 payment determination, hospitals will be required to use the most recent version of the eCQM electronic specifications (in other words, the Spring 2017 version of the eCQM specifications and any applicable addenda); and (5) an EHR certified for eCQMs under the 2014 or

2015 Edition certification criteria would not need to be recertified each time it is updated to a more recent version of the eCQM electronic specifications.

e. Submission Form and Method for the Voluntary Hybrid Hospital Wide Readmission Measure With Claims and Electronic Health Record Data (NQF #2879)

(1) Background

In section IX.A.7. of the preamble of the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20045 through 20049), we proposed voluntary reporting of the Hybrid Hospital-Wide Measure with Claims and Electronic Health Record Data. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49701 through 49704), we signaled our intent to use core clinical data elements in the Hospital IQR Program and requested comment on the use of the QRDA Category I (QRDA I) file format for this purpose. In that rule, we noted many commenters supported submitting the core clinical data elements using an EHR technology certified by the ONC. In addition, some commenters were supportive of our suggested use of QRDA I specifically for reporting core clinical data elements and recommended aligning the standards for data transmission requirements with those used in other reporting programs.

(2) Certification and File Format Requirements for Core Clinical Data Element Submissions

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20067), we proposed that hospitals that voluntary report data for the Hybrid Hospital-Wide Readmission measure use EHR technology certified to the 2015 Edition. We also referred readers to our discussion of EHR certification requirements for eCQM reporting above and in section IX.G.4. of the preamble of this final rule where the same proposed requirements are discussed in detail for the Medicare EHR Incentive Program for eligible hospitals and CAHs. In addition, we proposed that the 13 core clinical data elements and six linking variables for the Hybrid Hospital-Wide Readmission measure be submitted using the QRDA I file format.

In order to ensure the data have been appropriately connected to the encounter, the core clinical data elements specified for risk adjustment need to be captured in relation to the start of an inpatient encounter. The QRDA I standard enables the creation of an individual patient-level quality report that contains quality data for one patient for one or more quality

measures. We note that as described in section IX.A.7. of the preamble of this final rule, participating hospitals are expected to successfully submit data values for vital signs and six linking variables and are required to merge with the CMS claims data on more than 95 percent of all Medicare FFS patients who are 65 years and older and are discharged from the hospital during the voluntary data collection period. In addition, participating hospitals are expected to successfully submit values for laboratory test results on more than 50 percent of these patients discharged over the same time period. For further detail on QRDA I, the most recently available QRDA I specifications can be found at: http://www.hl7.org/implement/standards/product_brief.cfm?product_id=35.

We invited public comment on our proposals related to the reporting and submission requirements of core clinical data elements and linking variables for the proposed, voluntary Hybrid Hospital-Wide Readmission measure as discussed above.

Comment: Several commenters supported the proposed voluntary reporting of the Hybrid Hospital-Wide Readmission (HWR) measure, noting that the inclusion of core clinical data elements and laboratory test results may provide additional clinical variables that would enhance the administrative coding data that is utilized currently in the risk model variables. Other commenters supported the measure, because it is low burden and would further efforts to harmonize core clinical data elements with other measures and reporting requirements, without impacting payment. One commenter noted it displayed good use of EHR data, and testing this approach will develop useful information that could apply to other Medicare claims-based measures. In addition, commenters noted testing a measure through voluntary collection could highlight any data collection issues, while providing hospitals time needed to redesign their EHRs to collect and validate these data prior to mandatory reporting. The commenters noted reporting hybrid measure data will add hospital burden as compared to a measure using only claims, but expressed support for use of a QRDA I file when submitting electronic clinical data for this measure. Specifically, the commenters noted that use of a QRDA I file would streamline the submission process and enable hospitals to continue to direct resources toward electronic abstraction. One commenter believed that requiring QRDA I files increased the burden on hospitals.

Response: We thank the commenters for their support. We refer readers to section IX.A.7. of the preamble of this final rule for more information about the voluntary Hybrid HWR measure that we are finalizing. We note that there is burden associated with the collection of the electronic data for the Hybrid HWR measure. We do not expect any additional burden on hospitals to report the claims-based portion of this measure, because these data are already reported to the Medicare program for payment purposes. We refer readers to section XIII.B.6.e. of the preamble of this final rule for more detail on these burden calculations.

Comment: Several commenters supported the proposed voluntary reporting of the Hybrid HWR measure, but expressed concern that hospitals need time to redesign their EHRs to collect and validate these data, and believed CMS should maintain flexibility in the reporting requirements for several years. One commenter suggested CMS change the proposed initial reporting period from January 1 through June 30, 2018, to July 1 through December 31, 2018, or to require only a single quarter of reporting for the initial reporting year.

Response: We thank the commenters for their support. We reiterate that reporting on the Hybrid HWR measure is voluntary; we will take into consideration the commenter's suggestion that reporting requirements should remain flexible for several years as we consider adopting the Hybrid HWR measure as mandatory for the Hospital IQR Program in future rulemaking. We do not anticipate that hospitals will need to redesign their EHR systems to accommodate reporting of the Hybrid HWR measure, because these data elements are currently recorded in EHRs for nearly all Medicare FFS beneficiaries admitted to acute care hospitals, as the Hybrid HWR measure cohort includes most hospital admissions. However, hospitals will need to map the data elements in their stored EHR data, validate that they have identified the first value captured at the start of the episode of care, and populate QRDA I templates for data reporting.

We acknowledge not all hospitals will be able to submit data for the voluntary Hybrid HWR measure as soon as July 1, 2018. We note that we proposed the first two calendar quarters of 2018 as the reporting period so as not to overlap with the submission of eCQM data, which is usually very active during the winter up through the eCQM submission deadline of February 28th. We hope this July submission deadline will increase participation in voluntary

reporting of the hybrid measure. In addition, during Hybrid HWR measure development and testing, we demonstrated the core clinical data elements were feasibly extracted from hospital EHRs for nearly all adult patients admitted. The electronic specifications were tested in four separate health systems that used three separate EHR systems, and were successfully merged with our administrative claims data.

We are encouraging hospitals to participate in the voluntary reporting of the Hybrid HWR measure to gain experience validating the extracted EHR data. Participating hospitals would receive information and instruction on the use of the electronic specifications for this measure, have an opportunity to test extraction and submission of data to the QualityNet Secure Portal, and receive confidential feedback reports, downloadable from the QualityNet Secure Portal, with details on the success of their submission, such as the completeness and accuracy of the data. We will carefully consider these suggestions and all lessons learned from hospitals participating in the voluntary reporting of the Hybrid HWR measure before proposing any timeline for future potential implementation of the measure.

Comment: Some commenters suggested instead of jumping from 50 percent for the voluntary Hybrid HWR measure to 90 percent for the mandatory Hybrid HWR measure, the amount of data submitted should increase more gradually over time.

Response: Based on our previous testing of this measure, we believe successful submission of the EHR data used in the Hybrid HWR measure on at least 90 percent of adult inpatient admissions would be necessary in order to calculate the risk-standardized readmission rates and publicly report measure results in the future. During the voluntary phase of data submission, there will be no strict requirement. However, we will request that hospitals submit the data elements on at least 50 percent and as many as 100 percent of their admitted patients. Our intent in setting this 50 percent threshold is to mimic full reporting as closely as possible while also encouraging participation. We will carefully consider the success of data submission during the voluntary reporting period before proposing a timeline and data reporting expectations for mandatory measure implementation through future rulemaking.

Comment: One commenter recommended that if added to the Hospital IQR Program measure set as a

mandatory measure, the measure should be considered an eCQM for reporting purposes, allowing hospitals to choose if they report this measure or other eCQMs.

Response: We thank the commenter for their suggestion and will take it into consideration should we propose the Hybrid HWR measure as mandatory for the Hospital IQR Program and/or the EHR Incentive Programs for electronic reporting of CQMs in the future. We strive to align the electronic quality measure reporting requirements with the EHR Incentive Programs in order to reduce administrative burden and confusion about different reporting requirements in CMS programs to the extent feasible.

Comment: Several commenters suggested CMS explore developing hybrid condition-specific readmission measures for the Hospital Readmissions Reduction Program.

Response: We thank commenters for their suggestion and will take this under consideration in crafting future policies for other CMS programs.

Comment: Several commenters noted they are dependent on their EHR vendor to produce the necessary code to capture and report in the QRDA I file format, and urged CMS to encourage the EHR vendor community to support this initiative. The commenters suggested CMS should solicit feedback from hospitals and vendors that choose to report the Hybrid HWR measure voluntarily before this measure is implemented as mandatory in the Hospital IQR Program. To make the reporting of this or any other hybrid measure viable in the long run, the commenters suggested that CMS would need the input from stakeholders on the feasibility of extracting the EHR data and the accuracy of measure results. The commenters also suggested CMS should release results of the voluntary collection efforts, including feedback on measure implementation and measure results from participating hospitals. The commenters noted hospitals would need to have sufficient experience prior to the measure being in mandatory reporting.

Response: We will engage with stakeholders, including hospitals and health IT vendors, through educational webinars and national provider calls and welcome any feedback from hospitals and vendors that participate in voluntary submission of data for the Hybrid HWR measure. One purpose for voluntary reporting of this measure is so that hospitals and health IT vendors can become familiar with data extraction and submission for hybrid quality measures prior to any mandatory reporting. We will consider feedback

received from voluntary reporting to inform the future process and the timing for any proposals related to mandatory reporting.

In addition, voluntary reporting of the Hybrid HWR measure by participating hospitals will allow us to calculate the measure results, provide participating hospitals with feedback about the extracted data (including the success of data submission and the measure results calculated using their EHR data), and to solicit input from participating hospitals about any feasibility issues with extracting the core clinical data elements. Because hospitals do not calculate the measure within the EHR and do not therefore report measure results to CMS, we will not provide information about the accuracy of measure results. Rather, we calculate the measure using a combination of data from claims and the EHR data that hospitals submit and share these results with participating hospitals. Hospitals that voluntarily submit data for this measure would receive confidential hospital-specific reports that detail submission results from the performance reporting period, as well as the Hybrid HWR measure results assessed from merged files created by us merging the EHR data elements submitted by each participating hospital with claims data from the same set of index admissions. EHR data or measure results for the voluntary reporting of the Hybrid HWR measure will not be publicly reported. However, if we propose to require mandatory reporting of the Hybrid HWR measure in future rulemaking, we intend for such a proposal to include a dry run, during which hospitals could preview their results. In addition, we will take into consideration comments suggesting that we inform stakeholders about lessons learned from hospitals that participate in the voluntary measure prior to proposing to adopt the Hybrid HWR measure as mandatory for the Hospital IQR Program.

Comment: Some commenters requested additional details related to the proposed voluntary reporting of the Hybrid HWR measure. Specifically, commenters sought clarification on whether QRDA I file format would be required or whether participants could submit data via QualityNet Secure File Exchange or another method.

Response: Hospitals electing to participate in voluntary reporting of the Hybrid HWR measure will be required to use QRDA I files for submission of electronic data, which is the current EHR data and measure reporting standard for adopted eCQMs implemented in the Hospital IQR

Program. We refer readers to the measure specifications at: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>. We will not accept data via QualityNet Secure File Exchange or any other method. As discussed in our proposal above, in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49701 through 49704), we signaled our intent to use core clinical data elements in the Hospital IQR Program and requested comment on the use of the QRDA I file format for this purpose. In that rule, we noted many commenters supported submitting the core clinical data elements using an EHR technology certified by the ONC. In addition, some commenters were supportive of our suggested use of QRDA I specifically for reporting core clinical data elements and recommended aligning the standards for data transmission requirements with those used in other reporting programs.

Comment: Some commenters requested further guidance on whether the start “0–24” hours timing window for data capture for these data elements would be based on arrival time or admission time. Specifically, commenters asked if the 0–24 hours timeframe refers to the timeframe allotted to collect specimens for an ordered test or the timeframe to the result of the test.

Response: For hospitals that choose to voluntarily submit data, the Hybrid HWR measure requires submission of the first captured core clinical data element values for each Medicare FFS beneficiary who is 65 years or older and discharged from an acute care hospital during the measurement period.²⁷⁹ This includes data values captured in any department, including outpatient or emergency department visits that end inpatient admissions.

To clarify the “0–24” hours timeframe for the core clinical data elements, they represent the result of the first collected data element (not the time of the order) after arrival at the hospital for care (not necessarily inpatient admission time). For example, if a patient receives care for several hours in the Emergency Department and is later admitted to the inpatient facility for additional treatment, the measure requires the first captured data value in the Emergency Department. Vital signs (heart rate, respiratory rate, temperature, systolic

blood pressure, oxygen saturation), should be recorded within two hours (“0–2 hours”). Laboratory results (hematocrit, white blood cell count, sodium, potassium, bicarbonate, creatinine, and glucose) and weight should be recorded within 24 hours (“0–24 hours”). These time windows were based on empirical analysis of vital signs and laboratory test results captured in EHRs for patients admitted to acute care short stay hospitals. We assessed the time to capture of an initial set of vital signs and basic laboratory test results from the time of arrival at the facility for patients who were 65 years and older and subsequently admitted during the same encounter for treatment of a variety of medical conditions. We refer readers to the measure specifications²⁸⁰ for more details.

Comment: Some commenters sought clarification on whether the expectation would be that an EHR would only send data on encounters that meet the measure population requirements, since an EHR might not be able to identify an index admission.

Response: We understand that all or nearly all hospitals maintain electronic administrative records which identify inpatient admissions to support billing for Medicare FFS beneficiaries and patients insured through other payers. We understand that for many hospitals these administrative systems are separate from the clinical EHR and that identifying inpatient admissions and then extracting the EHR data elements for those patients might require separate queries in the two systems. However, the testing we have performed in four volunteer hospitals that developed and deployed queries within their EHR and successfully extracted the data elements used in the voluntary Hybrid HWR measure demonstrated that hospitals were able to identify inpatient admissions using stored electronic data and were able to extract the EHR data elements for those patients.

As we stated in the proposed rule (82 FR 20047), hospitals would only submit data for index admissions that meet the Hybrid HWR measure cohort inclusion criteria, and the measure would only be calculated for this cohort. The inclusion and exclusion criteria of the Hybrid HWR measure are also aligned with the currently adopted Hospital-Wide All-Cause Unplanned Readmission measure, which can be found in the 2017 All-Cause Hospital-Wide Measure Updates and Specifications Report, available at: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient>

²⁷⁹ Hybrid Hospital-Wide Readmission Measure with Electronic Health Record Extracted Risk Factors (Version 1.1). Available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

²⁸⁰ *Ibid.*

*Assessment-Instruments/
HospitalQualityInits/Measure-
Methodology.html.*

Further, we developed and tested a Measure Authoring Tool ²⁸¹ that uses existing value sets where possible, which includes identifying inpatient encounters (index admissions). As stated in the proposed rule (82 FR 20046), the electronic specifications were tested in multiple health systems, and they all were able to appropriately identify acute care hospital inpatient encounters.

Comment: One commenter inquired about the proposed deadline and frequency for reporting.

Response: We refer readers to section IX.A.7.b. of the preamble of this final rule for details on reporting and deadlines. To summarize, the voluntary reporting of the Hybrid HWR measure has a one-time measurement period for discharges occurring over a 6-month period in the first two quarters of CY 2018 (January 1, 2018 through June 30, 2018), with data being reported to CMS in the fall of 2018. For this voluntary reporting effort, we ask hospitals to submit electronic data once on applicable Medicare FFS beneficiaries, on at least 50 percent of these patients.

Comment: Several commenters requested that CMS not set any date for either mandatory submission or public reporting of the Hybrid HWR measure. The commenters expressed concerns the hybrid measure is incredibly challenging to implement and CMS does not have a robust infrastructure to collect these data.

Several commenters requested that CMS provide at least an eighteen-month window, and as much as 24-months, to organizations before a hybrid measure is implemented. The commenters recommended that CMS not require mandatory reporting of the Hybrid HWR measure until it has reviewed the experience of hospitals submitting the measure on a voluntary basis.

Response: We appreciate the suggestions on the timing of future implementation. Although, we recognize there is some burden to hospitals in identifying the data elements required for the Hybrid HWR measure, it is important to note that these data elements are currently recorded in EHRs for nearly all Medicare FFS beneficiaries admitted to acute care hospitals, as the Hybrid HWR measure cohort includes most hospital admissions. We do not anticipate hospitals will need to alter clinical workflows to capture these data.

However, hospitals will need to map the data elements in their stored EHR data, validate that they have identified the first value captured at the start of the episode of care, and populate QRDA I templates for data reporting.

We note reporting on the Hybrid HWR measure is purposefully voluntary and that we have not set any date for either mandatory submission or public reporting of the Hybrid HWR measure. We intend to review the experience of hospitals submitting the Hybrid HWR measure data on a voluntary basis prior to potentially proposing to adopt this measure as mandatory in the future.

With respect to commenters' concerns that CMS does not have a robust infrastructure to collect data for the Hybrid HWR measure, we disagree. Hybrid HWR measure data are derived from both claims and clinical EHR data, via submission of QRDA I files; we already collect and utilize claims data and QRDA I file data for other measures in the Hospital IQR Program measure set.

We refer readers to section IX.A.10.d.(2)(b) of the preamble of this final rule, where we are finalizing a policy to allow hospitals greater flexibility, such that hospitals may use EHR technology that is: (1) Certified to the 2014 Edition; (2) certified to the 2015 Edition; or (3) a combination of both the 2014 Edition and 2015 Edition. As a result, we are modifying our proposal for the Hybrid HWR measure from requiring use of EHR technology certified to the 2015 Edition to giving hospitals that elect to submit data voluntarily the option to use EHR technology that is: (1) Certified to the 2014 Edition; (2) certified to the 2015 Edition; or (3) a combination of both the 2014 Edition and 2015 Edition.

We recognize that these activities require effort and collaboration with health IT vendors and we will continue to solicit feedback from stakeholders throughout voluntary reporting of this measure and carefully consider provider burden before proposing any timeline for mandatory adoption or public reporting of hybrid measures.

Comment: One commenter requested CMS delay implementation until further improvements have been made related to submitting data using the QRDA I file format.

Response: We disagree that we should delay implementation until further improvements have been made related to submitting data using the QRDA I file format. We have experienced widespread utility of the QRDA I format among hospitals, dating back to electronic reporting pilots from 2012 and 2013, which included electronic

reporting via QRDA I, as the basis for aligned reporting in 2014 for the Medicare EHR Incentive and the Hospital IQR Programs (79 FR 50905). In addition, QRDA I is the current EHR data and measure reporting standard for adopted eCQMs implemented in the Hospital IQR and Medicare EHR Incentive Programs.

Comment: One commenter did not support the voluntary Hybrid HWR measure as they were concerned with the standardization of values.

Response: We interpret this comment to mean that the commenter had concerns about how the core clinical data elements were selected for potential use in the voluntary Hybrid HWR measure. To be feasible for use in the measure, we applied a strict set of criteria that the data elements must be: (1) Consistently obtained in the target population based on current clinical practice; (2) captured with a standard definition and recorded in a standard format; and (3) entered in structured fields that are feasibly retrieved from current EHR systems. These criteria align with those proposed by the NQF for assessing the feasibility of EHR data elements in quality measurement.²⁸² We established that the data elements used in the voluntary Hybrid HWR measure meet these criteria through empirical analysis of data provided by hospitals on patients who were 65 years and older admitted for treatment of a variety of conditions. This testing confirmed that the data elements are consistently obtained, captured as structured data, and recorded in standard format across different EHRs and different hospitals.

After consideration of the public comments we received, we are finalizing our proposals related to the voluntary reporting and submission of core clinical data elements and linking variables for the Hybrid Hospital-Wide Readmission measure as proposed, with one modification. Instead of requiring use of EHR technology certified to the 2015 Edition, we are allowing greater flexibility and will accept use of EHR technology that is: (1) Certified to the 2014 Edition; (2) certified to the 2015 Edition; or (3) a combination of both the 2014 Edition and 2015 Edition.

f. Sampling and Case Thresholds for the FY 2020 Payment Determination and Subsequent Years

We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50221), the FY 2012 IPPS/LTCH PPS final rule (76

²⁸¹ CMS Measure Authoring Tool. Available at: <https://www.emeasuretool.cms.gov/>.

²⁸² NQF Measure Evaluation Criteria. Available at: http://www.qualityforum.org/Masuring_Performance/Endorsed_Performance_Measures_Maintenance.aspx.

FR 51641), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53537), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50819), and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49709) for details on our sampling and case thresholds for the FY 2016 payment determination and subsequent years. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20067), we did not propose any changes to our sampling and case threshold policies.

g. HCAHPS Administration and Submission Requirements for the FY 2020 Payment Determination and Subsequent Years

We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50220), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51641 through 51643), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53537 through 53538), and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50819 through 50820) for details on previously-adopted HCAHPS requirements. We also refer hospitals and HCAHPS Survey vendors to the official HCAHPS Web site at: <http://www.hcahpsonline.org> for new information and program updates regarding the HCAHPS Survey, its administration, oversight, and data adjustments. We refer readers to section IX.A.6.a. of the preamble of this final rule for details on our proposal to refine the three questions of the Pain Management measure in the HCAHPS Survey. While we proposed to refine the survey with respect to the questions about pain management in section IX.A.6.a. of the preamble of the proposed rule, in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20067), we did not propose any changes to the HCAHPS administration nor the HCAHPS submission requirements.

h. Data Submission Requirements for Structural Measures for the FY 2020 Payment Determination and Subsequent Years

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51643 through 51644) and the FY 2013 IPPS/LTCH PPS final rule (77 FR 53538 through 53539) for details on the data submission requirements for structural measures. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20067), we did not propose any changes to data submission requirements for structural measures.

i. Data Submission and Reporting Requirements for HAI Measures Reported via NHSN

For details on the data submission and reporting requirements for HAI measures reported via the CDC's NHSN

Web site, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51629 through 51633; 51644 through 51645), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53539), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50821 through 50822), and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50259 through 50262). The data submission deadlines are posted on the QualityNet Web site at: <http://www.QualityNet.org/>. In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20067), we did not propose any changes to data submission and reporting requirements for HAI measures reported via the NHSN.

11. Modifications to the Validation of Hospital IQR Program Data

a. Background

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53539 through 53553), we finalized the processes and procedures for validation of chart-abstracted measures in the Hospital IQR Program for the FY 2015 payment determination and subsequent years; the FY 2013 IPPS/LTCH PPS final rule also contains a comprehensive summary of all procedures finalized in previous years that are still in effect. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50822 through 50835), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50262 through 50273), and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49710 through 49712) for detailed information on the modifications to these processes finalized for the FY 2016, FY 2017, and FY 2018 payment determinations and subsequent years.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57173 through 57181), we finalized our proposal to update the validation procedures in order to incorporate a process for validating eCQM data for the FY 2020 payment determination and subsequent years. Specifically, we finalized a policy to: (1) Validate eCQM data submitted by up to 200 hospitals selected via random sample; (2) exclude any hospital selected for chart-abstracted measure validation as well as any hospital that has been granted a Hospital IQR Program Extraordinary Circumstances Exemption for the applicable eCQM reporting period; and (3) randomly select 32 cases from the QRDA I files submitted by each hospital selected for eCQM data validation for the FY 2020 payment determination and subsequent years. As described in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57176), we will not conduct the first validation of eCQM data until spring of 2018 to validate data from the CY 2017 reporting period. Validation of CY 2017

data during spring of 2018 affects the FY 2020 payment determination (81 FR 57177). Accordingly, below we refer to the CY 2017 reporting period/FY 2020 payment determination for validation of data for encounters occurring during CY 2017 and the CY 2018 reporting period/FY 2021 payment determination for validation of data for encounters during CY 2018.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20067 through 20070), we proposed to change these previously finalized policies for eCQM data validation for the FY 2020 payment determination and subsequent years. First, for hospitals selected to participate in validation of eCQMs, we proposed that we will select eight cases per quarter for the CY 2017 reporting period/FY 2020 payment determination and subsequent years. We noted this proposal was contingent upon whether or not our proposed modifications to eCQM reporting requirements for the CY 2017 reporting period/FY 2019 payment determination and CY 2018 reporting period/FY 2020 payment determination, as described in section IX.A.8. of the preamble of this final rule, were finalized as proposed. Second, we proposed to add additional exclusion criteria to our hospital and case selection process for eCQM data validation for the CY 2017 reporting period/FY 2020 payment determination and subsequent years. Third, we proposed to continue our previously finalized medical record submission requirements for the FY 2021 payment determination and subsequent years as well as to provide clarification of our previously finalized policy.

For validation of chart-abstracted measures data, we proposed to update our educational review process for the FY 2020 payment determination and subsequent years. These proposals are discussed in more detail below.

b. Changes to the Existing Processes for Validation of Hospital IQR Program eCQM Data for the FY 2020 Payment Determination and Subsequent Years

(1) Number of Cases

We finalized in the FY 2017 IPPS/LTCH PPS final rule that we would select eight cases per quarter, for four quarters, for a total of 32 cases (individual patient-level reports), from the QRDA I files submitted by each hospital selected for eCQM data validation (81 FR 57178). In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20068), we proposed to update that requirement, such that we would select eight cases per quarter, (the number of quarters required would vary by specific

FY payment determination) to complete eCQM data validation for the FY 2020 payment determination and subsequent years, instead of 32 cases, over all four quarters, as previously finalized. This proposal was made in conjunction with our proposals to modify the number of quarters required for eCQM data submission from: (1) Four quarters to two, self-selected quarters for CY 2017 (with validation of these data affecting the FY 2020 payment determination); and (2) four quarters to the first three quarters for CY 2018 (with validation of these data affecting the FY 2021 payment determination). If all of these proposals were finalized as proposed, hospitals selected for eCQM data validation would be required to submit: (1) 16 cases over two calendar quarters (eight cases $\times$ two quarters) for the CY 2017 reporting period/FY 2020 payment determination; and (2) 24 cases over three quarters (eight cases $\times$ three quarters) for the CY 2018 reporting period/FY 2021 payment determination. We invited public comment on the proposals we made in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20068) as discussed above.

Comment: Several commenters supported the reduction to the number of eCQM cases to be validated from 32 to 16 cases for the CY 2017 reporting period, which would impact the FY 2020 payment determination, and to 24 cases for the CY 2018 reporting period, which would impact the FY 2021 payment determination.

Response: We thank the commenters for their support.

Comment: One commenter urged CMS to consider reducing the number of cases selected for validation each quarter from 8 to a lower number in order to minimize reporting burden for hospitals.

Response: We consider a sample of eight cases for each quarter to be the minimum sample size needed to accurately ascertain the quality of the reported data by measure. We believe using a sample size of eight cases per quarter balances the burden on hospitals of providing medical records for eCQM data validation with our need for a sufficient minimum number of cases to be able to properly evaluate the data. However, we refer readers to section IX.A.8. of the preamble of this final rule, where we are finalizing a modified policy to further reduce the eCQM reporting requirements, such that hospitals are only required to submit one, self-selected calendar quarter of data for 4 eCQMs for both the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting period/FY 2020 payment

determination. This does not directly change our proposal to select eight cases per quarter for eCQM data validation for the FY 2020 payment determination and subsequent years (for validation of eCQM data reported in CY 2017 data and subsequent years). However, in effect, due to these finalized modifications to the eCQM reporting requirements, hospitals selected for validation will be required to submit only 8 cases in total for each of the CY 2017 reporting period/FY 2020 payment determination (8 cases $\times$ 1 quarter) and CY 2018 reporting period/FY 2021 payment determination (8 cases $\times$ 1 quarter), instead of: (1) 16 cases over two calendar quarters (8 cases $\times$ 2 quarters) for the CY 2017 reporting period/FY 2020 payment determination; and (2) 24 cases over 3 quarters (8 cases $\times$ 3 quarters) for the CY 2018 reporting period/FY 2021 payment determination as discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20068).

After consideration of the public comments we received, we are finalizing our proposal, as proposed, to reduce the number of cases selected for eCQM data validation to eight cases per quarter for the FY 2020 payment determination and subsequent years.

(2) Selection of Hospitals and Cases

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20068 through 20069), for the CY 2017 reporting period/FY 2020 payment determination and subsequent years, we proposed changes to our policies related to the selection of hospitals and cases for eCQM data validation to: (1) Expand the types of hospitals that could be excluded; and (2) expand the types of cases excluded from selection. These proposals are discussed in more detail below.

(a) Selection of Hospitals

As previously finalized in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57174 through 57178), we will validate eCQM data submitted by up to 200 hospitals selected via random sample. Further, we finalized that the following hospitals may be excluded from this random sample of 200 hospitals selected for eCQM data validation (81 FR 57178):

- Any hospital selected for chart-abstracted measure validation; and
- Any hospital that has been granted a Hospital IQR Program Extraordinary Circumstances Exemption for the applicable eCQM reporting period.

In the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 20068), we proposed to expand the types of hospitals that could be excluded. For the FY 2020 payment determination and

subsequent years, we proposed to also exclude any hospital that does not have at least five discharges for at least one reported eCQM included among their QRDA I file submissions. In addition, we proposed that the three exclusions described above would be applied before the random selection of 200 hospitals for eCQM data validation, so that hospitals meeting any of these exclusions would not be eligible for selection. We believe that these proposals improve the likelihood that there would be sufficient data for validation obtained from the hospitals selected for eCQM data validation.
