

neutralizing diverse group 1 and group 2 influenza A viruses. Specifically, the families of antibodies identified precisely target parts of the hemagglutinin (HA) protein, present on the surface of the influenza virus, that are least variable from season to season (Joyce, M.G., et al. Cell (2016) 166 (3): 609–623). Therefore, it is hypothesized that passive administration of members of these families of antibodies to individuals would represent an alternative to the current standard of care for severe influenza virus infection. Additionally, these families of antibodies could be useful for development of a product aimed at conferring passive immunity in vulnerable populations during the time of an outbreak or emergence of a pandemic strain of influenza.

This technology is available for licensing for commercial development in accordance with 35 U.S.C. 209 and 37 CFR part 404, as well as for further development and evaluation under a research collaboration.

NIAID is continuing development of these neutralizing antibodies to influenza toward a clinical product for treatment and/or prevention of influenza virus infection. Consequently, for some fields of use, NIAID will evaluate a license applicant's capabilities and experience in advancing similar technologies through the regulatory process.

Potential Commercial Applications:

- Prevention of influenza A virus infection

- Therapeutic intervention to treat influenza infection

Competitive Advantages:

- Ability to potentially neutralize both group 1 and group 2 influenza A strains

Development Stage:

- Proof of concept in animal models
