Comment: A commenter expressed support for the simplification resulting from removing duplicative measures used in multiple quality programs, but noted that such removals would not result in provider cost reduction because hospitals would still be required to monitor those measures retained in another quality program.

Response: We recognize that hospitals would still be required to monitor measures removed from one program, but retained in another quality program. However, we believe that simplification benefits will be gained by hospitals that have been reviewing their multiple reports and will no longer be required to identify discrepancies in reporting and identify whether those discrepancies are due to differing measure specifications or due to a CMS measure calculation error. Furthermore, we believe this simplification will benefit patients and caregivers who view measure results information on the *Hospital Compare* website because they will be less likely to be confused if they see slightly different measure results for the same measures for the same hospital but through multiple programs.

Comment: Many commenters did not support the adoption of removal Factor 8. Several commenters did not support the adoption of removal Factor 8 due to the perceived lack of transparency on the methods or criteria that would be used to assess the costs and benefits associated with a measure. A number of commenters asserted that the assessment of value should also include a clear prioritization of the needs of patients.

Response: We wish to clarify that it is not our intent to remove measures that continue to benefit patients or providers solely because these measures incur administrative costs to CMS or to others. We will be transparent in our assessment of measures under this measure removal factor. As described above, there are various considerations of costs and benefits, direct and indirect, financial and otherwise, that we will evaluate in applying removal Factor 8, and we will take into consideration the perspectives of multiple stakeholders. However, because we intend to evaluate each measure on a case-by-case basis, and each measure has been adopted to fill different needs of the Hospital IQR Program, we do not believe it would be meaningful to identify a specific set of assessment criteria to apply to all measures.

In addition, we note that the benefits we will consider center around benefits to patients and caregivers as the primary beneficiaries of our quality reporting and value-based payment programs. When we propose a measure for removal under this measure removal factor, we will provide information on the costs and benefits we considered in evaluating the measure. We continue to monitor and evaluate our programs to identify their benefit with respect to quality of care and patient safety as well as their costs with respect to provider burden, potentially contradictory public information for beneficiaries to analyze in their decision making, and measure maintenance. When our analyses indicate that a measure's costs outweigh the benefit of continuing to use the measure in the program, we will propose to remove that measure through notice and comment rulemaking.

Comment: A few commenters believed that the existing seven factors are sufficient for determining whether it is appropriate to remove a measure.

Response: While we acknowledge that there are seven factors currently adopted that may be used for considering measure removal from the Hospital IQR Program, we believe the proposed new measure removal factor adds a new criterion that is not captured in the other seven factors. The proposed new measure removal factor will help advance the goals of the Meaningful Measures Initiative, which aims to improve outcomes for patients, their families, and health care providers while reducing burden and costs for clinicians and providers.

Comment: A number of commenters expressed the concern that the benefits associated with a measure proposed for removal would be determined based solely on the cost reductions associated with reduced administrative burden for hospitals. Several commenters also expressed concern that Factor 8 could result in the removal of measures based solely on cost reductions to providers and/or CMS, and thus not consider or prioritize patient perspectives. One commenter urged CMS to prioritize the needs of patients and consumers when assessing the benefits of a measure under Factor 8, by taking into consideration the public's right to quality and cost transparency, as well as consumers' reliance on publicly available information to make important healthcare decisions. Another commenter expressed the concern that costs are typically imposed on providers while benefits are rendered to beneficiaries, and therefore does not believe that costs and benefits can be compared.

Response: As described above, there are various considerations of costs and benefits, direct and indirect, financial and otherwise, that we will evaluate in applying removal Factor 8, and we will take into consideration the perspectives of multiple stakeholders. We intend to apply measure removal Factor 8 on a case-by-case basis because the costs and benefits associated with each measure are unique to that measure. We agree with the commenter that while a measure may contribute costs to many entities, providers do bear the primary cost of participation in Hospital IQR Program. However, we will assess the costs to all stakeholders, including but not limited to, patients, caregivers, providers, CMS, and other entities, in determining whether to propose removal of a measure under Factor 8. We also agree that while a measure's use in the Hospital IQR Program may benefit many entities, the primary benefit is to patients and their caregivers through incentivizing the provision of high quality care and through providing publicly reported data regarding the quality of care available. We also believe that the benefits of measures can include benefits for all stakeholders, including but not limited to, patients, caregivers, providers, CMS, advocacy organizations, healthcare researchers, healthcare purchasers, and others. We intend to identify the relevant stakeholders and assess both costs and benefits to these stakeholders in our assessment of each measure.

Comment: Some commenters expressed concern that this measure removal factor could allow providers to recommend removal of measures they do not support based on the argument that these measures are costly.

Response: We agree that it is possible that providers may recommend removal of measures they do not support based on the argument that these measures are costly. However, input from providers is only part of our case-by-case evaluation of measures. We also intend to consider input from other stakeholders, including patients, caregivers, advocacy organizations, healthcare researchers, healthcare purchasers, and other parties as appropriate to each measure. We will weigh input we receive from all stakeholders with our own analysis of each measure to make our case-by-case determination of whether it would be appropriate to remove a measure based on its costs outweighing the benefit of its continued use in the program.

Comment: A few commenters expressed concern that the lack of references to patient considerations in the proposed rule appeared to suggest that this measure removal factor does not take into account the value of a measure to beneficiaries, and noted that the Factor 8 does not appear to include the following benefits associated with patient perspectives:

- Saving lives;
- Ensuring high quality care;
- Ensuring patient safety; and
- Facilitating consumer access to information.

Response: We intend to consider all benefits of measure, similar to our intent to consider all costs, when assessing whether the costs outweigh the benefits of the measure's continued use in the Hospital IQR Program. The likelihood of a measure to significantly improve patient well-being is a non-quantifiable benefit that would be weighed against potential costs to ensure that measures that save lives and ensure patient safety are retained when appropriate. We agree with the commenters that these benefits are all potential benefits associated with a measure's continued use in the Hospital IQR Program and will continue to consider these and other benefits in our evaluations.

Comment: A few commenters urged CMS to retain measures that, while costly or burdensome, hold value to beneficiaries, because in these cases the benefits would justify the cost. A few commenters noted certain measures of value to beneficiaries, such as measures that continuously monitor the aspects of care quality that are deemed essential to high-quality patient care or have serious consequences if done poorly. Some of these commenters further recommended that measures of such value to beneficiaries should never be removed from quality programs, even if they are topped-out.

Response: We appreciate the commenters' feedback. We intend to consider all benefits of a measure, including the ability of a measure to promote patient safety and experience, when assessing whether the costs outweigh the benefits of the measure's continued use in the Hospital IQR Program.

Comment: One commenter questioned how measures that were not too costly to implement could now be too costly to maintain in the program. Another commenter asserted the value of measures is self-evident in their initial adoption, and that the removal of any measure would thereby decrease the ability of that measure to improve patient care and reduce Medicare costs, and concluded that the removal of a measure, by definition, would decrease the effectiveness of the program itself.

Response: There are several ways that a measure for which the benefit once outweighed costs may now have the costs outweigh its benefit. As one example, measures that incentivize providers to update clinical workflows or adopt specific infrastructure may become less beneficial over time as an increasing number of providers adopt the appropriate processes into their workflows and performance approaches or reaches topped-out status. Under this example, the measure was highly beneficial upon adoption but may become less beneficial as it incentivizes a smaller number of providers. Therefore, such measures may still cost the same, but because of their now reduced benefit these costs may now outweigh the benefit of continuing to maintain and require reporting on these measures.

We also disagree with the assertion that removing measures from the program inherently decreases the effectiveness of the program itself. We believe one of the Hospital IQR Program's primary benefits to patients and the public is its ability to collect and publicly report data for patients to use in making decisions about their care. We further believe maintaining an unnecessarily large or complicated measure set including measures that are not meaningful to patients hampers the program's effectiveness at presenting valuable data in a useful or usable manner. For this reason, we believe it is in the interest of patients for the Hospital IQR Program to ensure an individual measure continues to benefit patients. Furthermore, we note that removal of such measures would free up CMS programmatic resources to focus on other priority measures or areas of the Hospital IQR Program.

Comment: A few commenters expressed concern that this factor is not supported by scientific criteria.

Response: We believe it is important to adequately weigh the potential benefits of a measure in determining whether the costs outweigh those benefits. However, we disagree that this can only be achieved by applying scientific criteria. We believe that an appropriate measure set for a specific program is achieved by applying a balanced set of factors and taking into consideration the potential impact to multiple stakeholders to ensure that each measure serves a purpose in the program, and this is one element of that set of factors.

After consideration of the public comments we received, we are finalizing our proposal to adopt measure removal Factor 8, ''the costs associated with a measure outweigh the benefit of its continued use in the program,'' beginning with the effective date of the FY 2019 IPPS/LTCH PPS final rule as proposed.

5. Removal of Hospital IQR Program Measures

We refer readers to section VIII.A.4. of the preamble of this final rule for a discussion of our current and proposed measure removal criteria. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20472 through 20485), we proposed to remove a total of 39 measures from the Hospital IQR Program across the FYs 2020, 2021, 2022, and 2023 payment determinations. In this final rule, we are finalizing removal of all 39 of those measures with some modification as discussed below.

a. Removal of Measure—Removal Factor 4, Performance or Improvement on a Measure Does Not Result in Better Patient Outcomes: Hospital Survey on Patient Safety Culture

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20473), we proposed to remove the Hospital Survey on Patient Safety Culture measure beginning with the CY 2018 reporting period/FY 2020 payment determination based on removal Factor 4, ''performance or improvement on a measure does not result in better patient outcomes.'' The Hospital Survey on Patient Safety Culture measure was adopted in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49662 through 49664) for the FY 2018 payment determination and subsequent years, to allow us to assess whether and which patient safety culture surveys were being utilized by hospitals and the frequency of their use. In that rule, we stated our belief that this would be a time-limited measure that would assist us in assessing the feasibility of implementing a single survey on patient safety culture in the future (80 FR 49661). When we adopted the measure, we acknowledged that we had not yet determined for how many years we would keep the measure in the Hospital IQR Program (80 FR 49664). By design, this structural measure does not provide information on patient outcomes, because hospitals are asked only whether they administer a patient safety culture survey, and therefore, does not result in better patient outcomes, removal Factor 4.

Our data indicate that 98 percent of hospitals have reported they use some version of a patient safety culture survey; a large majority of hospitals (69.6 percent) that reported on the measure for the CY 2016 reporting period/FY 2018 payment determination use the AHRQ Surveys on Patient Safety Culture (SOPS).[269] While we proposed to remove this measure, the data already collected would still help inform consideration of a potential future patient safety culture measure for the Hospital IQR Program. However, at this time, we believe that the burden of reporting this measure outweighs the benefits of continued data collection. Therefore, we proposed to remove the Hospital Survey on Patient Safety Culture measure for the CY 2018 reporting period/FY 2020 payment determination (for which the data submission period is April 1, 2019 through May 15, 2019) and subsequent years.

Comment: A majority of commenters supported CMS' proposal to remove the Hospital Survey on Patient Safety Culture measure from the Hospital IQR Program beginning with the CY 2018 reporting period/FY 2020 program year. One commenter specifically noted its opinion that collecting, analyzing, and reporting data on this measure is burdensome. A few commenters stated their belief the measure no longer has value. Another commenter supported removal of the Hospital Survey on Patient Safety Culture measure, but recommended CMS evaluate opportunities to adopt another measure that utilizes the data gathered under this

[269] The Agency for Healthcare Research and Quality (AHRQ) sponsored the development of patient safety culture assessment tools for various healthcare organizations which assess patient safety culture in a health care setting. Patient safety culture is the extent to which an organization's culture supports and promotes patient safety. The survey tools are measured by what is rewarded, supported, and accepted, expected, and accepted in an organization as it relates to patient safety. (*https://www.ahrq.gov/sops/quality-patient-safety/patientsafetyculture/index.html*).

survey, as opposed to the current structural measure.

Response: We thank the commenters for the support. While we continue to believe that patient safety culture is an important topic for hospitals, as a structural measure, this particular measure no longer meets the needs of the Hospital IQR Program. We appreciate the commenter's suggestion and we intend to evaluate opportunities to adopt another non-structural measure utilizing the data gathered under this survey.

Comment: A number of commenters did not support CMS' proposal to remove the Hospital Survey on Patient Safety Culture measure from the Hospital IQR Program beginning with the CY 2018 reporting period/FY 2020 program year. Several commenters expressed concern that removing this measure would encourage hospitals to stop assessing patient safety culture, whereas requiring the measure incentivizes hospitals to improve their patient safety culture, and asserted their belief that there is a strong correlation between safety culture assessment and improved clinical outcomes.

Response: We acknowledge commenters' concerns that some hospitals might stop assessing patient safety culture; however, we believe most hospitals are committed to assessing and improving their patient safety culture and will continue to survey employees regarding patient safety culture. Our data indicate that 98 percent of hospitals use some version of a patient safety culture survey, such that no further incentive is required to encourage hospitals to implement patient safety culture surveys.

Comment: Despite opposing the removal of the hospital survey on patient safety culture, one commenter acknowledged that these surveys have become a part of routine operational assessments and expressed their belief that most organizations will continue to conduct the survey regardless of whether it is required by the Hospital IQR Program. Another commenter asserted that requiring the measure allows for meaningful comparisons between hospitals. A third commenter expressed their belief that CMS should prioritize patient safety culture, and further stated that surveys are the most effective means of capturing hospital employees' feedback on the safety culture.

Response: We agree with commenters that assessing patient safety culture has become a routine part of operational safety assessments, and further agree that surveys can be an effective way of capturing employee feedback on a hospital's patient safety culture. We therefore believe that hospitals will continue to survey their employees about patient safety culture after this measure is removed from the Hospital IQR Program.

However, we disagree that the measure allows for meaningful comparisons between hospitals due to its design as a structural measure. The Hospital Survey on Patient Safety Culture measure does not collect data on either a hospital's survey results or those results' impact on patient safety outcomes. As a result, comparisons between hospitals on this measure only inform the public about whether or not hospitals use a patient safety culture survey. Because the data indicate 98 percent of hospitals are now administering patient safety culture surveys, we believe continuing to collect and publicly report this data does not capture information that will incentivize specific improvements for hospitals or provide valuable information for use by patients in making decisions about where to seek care. Therefore, we do not believe continuing to collect—or, conversely, ceasing to collect—data under this measure will assess or affect the patient safety culture within hospitals.

Comment: A number of commenters suggested refining the measure instead of removing it. One commenter highlighted that there are a variety of methods to survey and report data that allow hospitals to use a mechanism that minimizes burden while generating important information to manage patient safety culture. Another commenter recommended modifying the measure to reflect a more meaningful measure of actions taken to promote a strong patient safety culture, or modifying the measure to have hospitals report scores on a particular safety culture domain that is consistent across safety culture surveys. A third commenter suggested implementing this measure as an outcomes measure instead of a structural measure. Another commenter recommended that the survey be conducted bi-annually rather than annually because hospital safety culture can be slow to change.

Response: We appreciate commenters' recommendations regarding potential refinements to this measure. We agree that patient safety cultures generally do not change overnight. While we are finalizing removal of this measure, we believe the data already collected could help inform consideration and/or development of a potential future patient safety culture measure that might assess patient safety culture in more detail, as commenters recommended. We will therefore take these recommendations into consideration for future measure development.

After consideration of the public comments we received, we are finalizing removal of the Hospital Survey on Patient Safety Culture from the Hospital IQR Program measure set beginning with the CY 2018 reporting period/FY 2020 payment determination as proposed.

b. Removal of Measures—Removal Factor 8, the Costs Associated With a Measure Outweigh the Benefit of Its Continued Use in the Program

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20473 through 20484), we proposed to remove a number of measures under our proposed new removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program, across the FYs 2020, 2021, 2022, and 2023 payment determinations. These proposals are presented by measure type: (1) Structural measure: Safe Surgery Checklist Use; (2) patient safety; (3) claims-based readmission; (4) claims-based mortality; (5) hip/knee complications; (6) Medicare Spending Per Beneficiary (MSPB)—Hospital (NQF #2158); (7) clinical episode-based payment; (8) chart-abstracted clinical process of care; and (9) eCQMs. These are discussed in detail below.

(1) Structural Measure: Safe Surgery Checklist Use

We refer readers to the FY 2013 IPPS/LTCH PPS final rule where we adopted the Safe Surgery Checklist Use measure (77 FR 53531 through 53533). In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20473 through 20474), we proposed to remove the Safe Surgery Checklist Use measure beginning with the CY 2018 reporting period/FY 2020 payment determination under proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program.

We refer readers to section VIII.A.4.b. of the preamble of the proposed rule, where we acknowledge that costs are multi-faceted and include not only the burden associated with reporting, but also the costs associated with implementing and maintaining the program. For example, we believe it may be unnecessarily costly for health care providers to report a measure for which our analyses show that there is no meaningful difference in performance or there is little room for continued improvement.

Based on our review of reported data on this measure, there is no meaningful difference in performance or there is little room for continued improvement. Our analysis is captured by the table below:

Payment determination	Encounters	Number of hospitals	Rate	75th percentile	90th percentile	Truncated COV
FY 2017	CY 2015 Q1–Q4	3,201	0.961	100.00	100.00	0.201
FY 2018	CY 2016 Q1–Q4	3,195	0.968	100.00	100.00	0.181

Based on the analysis above, the national rate of ''Yes'' response for this measure is nearly 1.0, or 100 percent, nationwide, and has remained at this level for the last two years, such that there is no distinguishable difference in hospital performance between the 75th and 90th percentiles. In addition, the truncated coefficient of variation (COV) has decreased such that it is trending towards 0.10. Our analysis indicates that performance on this measure is trending towards topped-out status, that is to say, safe surgery checklists for surgical procedures are widely in use and there is little room for improvement on this structural measure.

In addition, we believe this measure is of more limited utility for internal hospital quality improvement efforts. This structural measure of hospital process determines whether a hospital utilizes a safe surgery checklist that assesses whether effective communication and safe practices are performed during three distinct perioperative periods. For the measure, hospitals indicate by ''Yes'' or ''No'' whether or not they use a safe surgery checklist for surgical procedures that includes safe surgery practices during each of the aforementioned perioperative periods. The measure does not require a hospital to report whether it uses a checklist in connection with each individual inpatient procedure.

Furthermore, removal of this measure would alleviate burden to hospitals associated with reporting on this measure. We anticipate a reduction in information collection burden because reporting on this measure takes hospitals approximately two minutes each year (77 FR 53666). As such, we believe the costs associated with reporting on this measure outweigh the associated benefits of keeping it in the Hospital IQR Program because it no longer meaningfully supports the Program objective of informing beneficiary choice since safe surgery checklists are widely in use.

Therefore, we proposed to remove the Safe Surgery Checklist Use measure beginning with the CY 2018 reporting period/FY 2020 payment determination, for which the data submission period is April 1, 2019 through May 15, 2019, under proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program. We also refer readers to the CY 2018 OPPS/ASC PPS final rule in which the Hospital Outpatient Quality Reporting (OQR) and Ambulatory Surgical Center Quality Reporting (ASCQR) Programs finalized removal of the Safe Surgery Checklist Use measure beginning with the CY 2018 reporting period/CY 2020 payment determination for the Hospital OQR Program and with the CY 2019 payment determination for the ASCQR Program (82 FR 52363 through 52364; 82 FR 52571 through 52572; and 82 FR 52588 through 52589).

Comment: Many commenters supported CMS' proposal to remove the Safe Surgery Checklist Use measure from the Hospital IQR Program beginning with the CY 2018 reporting period/FY 2020 payment determination. A few commenters specifically supported CMS' position that the cost of collecting and reporting data under the measure outweighs the benefit of retaining it in the Hospital IQR Program. Other commenters noted that the measure's nature as a structural measure hinders its ability to provide data on whether the communication among surgical team members was effective in translating anticipated critical events or improving patient outcomes.

One commenter stated that while there is value in ensuring quality communication during critical phases of the surgical patient experience, the high level of compliance for this measure strongly suggests that the measure is deeply embedded in clinical workflows and processes, leaving little to be gained from continued reporting of the measure. The commenter agreed that use of a safe surgery checklist has been widely adopted by hospitals, but asserted that there is little evidence demonstrating that the measure provides educational opportunities for improving the ongoing competency of surgical teams regarding patient harm prevention. The commenter asserted that education aimed at reducing near-miss events has been proven to be effective and recommended that CMS revisit and refine the measure criteria to ensure that it requires education to be provided and to demonstrate improved communication ongoing surgical team competency.

Response: We thank commenters for their support. We agree that the high level of compliance for this measure strongly suggests that safe surgery checklist use is deeply embedded in clinical workflows and processes, indicating there is little room for improvement under the current measure. We also appreciate commenters' recommendations for future measures of perioperative communication, and will take these into consideration for future years.

Comment: A number of commenters opposed CMS' proposal to remove the Safe Surgery Checklist Use measure from the Hospital IQR Program beginning with the CY 2018 reporting period/FY 2020 payment determination. A few commenters expressed their concern about the potential adverse impact removing this measure might have on patient care, asserting that hospitals may stop using safe surgery checklists if the measure is removed. One commenter asserted that the potential negative impact of removal outweighs any projected benefit associated with no longer collecting the information, and recommended that the measure be kept as a reminder to the surgical community to practice good communication in the operating room. Another commenter asserted that the rate of ''never events'' occurring in hospitals indicates the measure is not topped out, and further expressed their concern that many hospitals may only use safe surgery checklists in a cursory or rote manner. The commenter therefore recommended that CMS ensure never events and wrong site surgeries be adequately monitored through another IPPS quality program to avoid negative patient outcomes before removing the Safe Surgery Checklist Use measure. Another commenter recommended that CMS delay removing the measure until use of a safe surgery checklist has been added as a Condition of Participation for hospitals.

Response: While we understand commenters' position that retaining the measure may add some value to the program, we would like to make clear that high performance on the Safe Surgery Checklist Use measure is not

intended to indicate whether perioperative communication among surgical team members is effective. This measure is not specified to assess the effectiveness of a team's communication, only whether a safe surgery checklist is used. Therefore, we do not believe continuing to collect *or* ceasing to collect data under this measure will assess or affect the effectiveness of perioperative communication within hospitals. As a result, we believe the administrative burden to hospitals associated with collecting and reporting this data to CMS outweighs the benefit of publicly reporting this data. We will also take commenters' recommendations regarding updates to the Conditions of Participation and monitoring of never-events into consideration as we continue to implement the Meaningful Measures initiative across CMS' quality programs.

Comment: One commenter recommended that for measures on which providers continually have high scores, CMS should improve the measures instead of removing them from the Hospital IQR Program entirely.

Response: We appreciate the recommendation to revise this measure and will take this into consideration as we continue to develop and refine measures for the Hospital IQR Program.

After consideration of the public comments we received, we are finalizing removal of the Safe Surgery Checklist Use measure from the Hospital IQR Program measure set beginning with the CY 2018 reporting period/FY 2020 payment determination as proposed.

(2) Patient Safety Measures

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20474 through 20475), we proposed to remove the Patient Safety and Adverse Events Composite [270] (PSI 90) beginning with the CY 2018 reporting period/FY 2020 payment determination and five National Health and Safety Network (NHSN) hospital-acquired infection (HAI) measures beginning with the CY 2019 reporting period/FY 2021 payment determination under the proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program.

[270] We note that measure stewardship of the recalibrated version of the Patient Safety and Adverse Events Composite (PSI 90) is transitioning from AHRQ to CMS and, as part of the transition, the measure will be referred to as the CMS Recalibrated Patient Safety Indicators and Adverse Events Composite (CMS PSI 90) when it is used in CMS quality programs.

In this final rule, we wish to clarify that our proposals in the FY 2019 IPPS/LTCH PPS proposed rule, and ultimately, our finalized policy as discussed below, to remove these measures from the Hospital IQR Program will not end or otherwise interfere with collection or public reporting of these data. The HAI data will continue to be made publicly available on a quarterly basis and the PSI 90 data on an annual basis in a consumer-friendly manner on the *Hospital Compare* website and through downloadable files under the HAC Reduction Program. We refer readers to section IV.J.4.h. of the preamble of this final rule where this is discussed in the HAC Reduction Program. We will also strive to minimize disruptions to preexisting processes and timelines for publicly reporting these data, as discussed further below in our responses to comments received.

(a) Removal for CY 2018 Reporting Period/FY 2020 Payment Determination—Patient Safety and Adverse Events Composite (PSI 90) (NQF #0531) (Adopted at 73 FR 48602, Refined at 81 FR 57128 Through 57133)

We proposed to remove the PSI 90 measure beginning with the FY 2020 payment determination (which would use a performance period of July 1, 2016 through June 30, 2018). As the PSI 90 measure is a claims-based measure, it uses claims and administrative data to calculate the measure without any additional data collection from hospitals. Thus, operationally, we would be able to remove the PSI 90 measure sooner than the NHSN HAI measures. Our reasons for proposing to remove this measure are discussed further below.

(b) Removals for the CY 2019 Reporting Period/FY 2021 Payment Determination

- National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure (NQF #1717) (adopted at 76 FR 51630 through 51631);
- National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (NQF #0138) (adopted at 76 FR 51616 through 51618);
- National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (NQF #0139) (adopted at 75 FR 50200 through 50202);
- National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-Resistant *Staphylococcus Aureus* Bacteremia (MRSA) Outcome Measure (NQF #1716) (adopted at 76 FR 51630); and
- American College of Surgeons—Centers for Disease Control and Prevention (ACS–CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure (NQF #0753) (Colon and Abdominal Hysterectomy SSIs) (adopted at 75 FR 50200 through 50202).

We proposed to remove the CDI, CAUTI, CLABSI, MRSA Bacteremia, and Colon and Abdominal Hysterectomy SSI measures from the Hospital IQR Program beginning with the CY 2019 reporting period/FY 2021 payment determination. These measures would remain in the Hospital IQR Program until that time, and their reporting would still be tied to FY 2019 and FY 2020 payment determinations under the Hospital IQR Program. Although we proposed to remove these measures from the Hospital IQR Program, we did not propose to remove them from the HAC Reduction Program, and they will continue to be tied to the payment adjustment under that program (section IV.J.1. of the preamble of the proposed rule). After removal from the Hospital IQR Program, these measures would continue to be reported on the *Hospital Compare* website under the public reporting requirements of the HAC Reduction Program. We proposed to remove these measures beginning with the FY 2021 payment determination because hospitals already would have collected and reported data for the first three quarters of the CY 2018 reporting period for the FY 2020 payment determination by the time of publication of the FY 2019 IPPS/LTCH PPS final rule. Removing these five NHSN HAI measures in the proposed timeline would allow us to use the data already reported by hospitals in the CY 2018 reporting period for purposes of the FY 2020 payment adjustment.

We proposed to remove these six patient safety measures under proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program. We believe that removing the PSI 90, CDI, CAUTI, CLABSI, MRSA, and Colon and Abdominal Hysterectomy SSI measures from one program would eliminate development and release of duplicative and potentially confusing CMS confidential feedback reports provided to hospitals across multiple hospital quality and value-based purchasing programs. We refer readers to section VIII.A.4.b. of the preamble of this final rule where we discuss examples of the costs associated with implementing and maintaining these measures for the

programs. For example, it may be costly for health care providers to track the confidential feedback, preview reports, and publicly reported information on a measure where we use the measure in more than one program. Health care providers incur additional cost to monitor measure performance in multiple programs for internal quality improvement and financial planning purposes when measures are used across multiple programs. Hospitals currently review multiple feedback reports for the NHSN HAI measures from three different hospital quality programs that use three different reporting periods, which result in interpreting slightly different measure rates for the same measures (under the Hospital IQR Program, a rolling four quarters of data are used to update the *Hospital Compare* website; under the Hospital VBP Program, 1-year periods are used for each of the baseline period and the performance period; and under the HAC Reduction Program, a 2-year performance period is used). Beneficiaries may also find it confusing to see public reporting on the same measures in different programs. In addition, maintaining the specifications for the measures, as well as the tools we need to collect, validate, analyze, and publicly report the measure data result in costs to CMS.

We stated in the proposed rule that we believe the costs as discussed above outweigh the associated benefit to maintaining these measures in multiple programs, because that information can be captured through inclusion of these measures in the HAC Reduction Program. Although we are finalizing our proposals to remove these six patient safety measures from the Hospital IQR Program, we continue to recognize that improving patient safety and reducing NHSN HAIs is a critical quality area for which continued progress and improvement is needed, and that patient safety should be a high priority focus of quality programs. For these reasons, and as discussed below, we will continue to use these measures in the HAC Reduction Program and we will not finalize their removal from the Hospital VBP Program. (We refer readers to section IV.I.2.c.(2) of the preamble of this final rule where we discuss retaining these safety measures in the Hospital VBP Program.) Unlike the Hospital IQR Program, performance data on measures maintained in the HAC Reduction and Hospital VBP Programs are used both to assess the quality of care provided at a hospital and to calculate incentive payment adjustments for a given year of each respective program based on performance. Also, the HAC Reduction and Hospital VBP Programs' incentive payment structures tie hospitals' payment adjustments on claims paid under the IPPS to their performance on selected quality measures, including the above measures sufficiently incentivizing high performance as well as performance improvement on these measures among participating hospitals. By keeping the measures in the HAC Reduction and Hospital VBP Programs, patients, hospitals, and the public also continue to receive information about the quality of care provided with respect to these measures.

We discussed in the proposed rule that we believed removing these measures from the Hospital IQR Program, while keeping them in the HAC Reduction Program, would strike an appropriate balance of benefits in driving improvement on patient safety and costs associated with retaining these measures in more than one program, while continuing to keep patient safety improvement and reducing NHSN HAIs as high priorities. We refer readers to section IV.J.1. of the preamble of this final rule where we discuss safety measures included in the HAC Reduction Program and section IV.I.2.c.(2) of the preamble of this final rule for this discussion in the Hospital VBP Program. As discussed in section VIII.A.4.b. of the preamble this final rule, one of our main goals is to move forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients. We believe retaining these measures in the HAC Reduction Program and the Hospital VBP Program addresses the Meaningful Measures Initiative quality priority of making care safer by reducing harm caused in the delivery of care.[271] In addition, as discussed in more detail below, we believe keeping these measures in the Hospital IQR Program would not align with our goal of not adding unnecessary complexity or cost with duplicative measures.

In the proposed rule, we proposed to remove the: (1) PSI 90 measure for the FY 2020 payment determination (which applies to the performance period of July 1, 2016 through June 30, 2018) and subsequent years; and (2) CDI, CAUTI, CLABSI, MRSA, and Colon and Abdominal Hysterectomy SSI measures for the CY 2019 reporting period/FY 2021 payment determination and subsequent years.

Comment: Many commenters did not support removal of the patient safety measures from the Hospital IQR Program, because although the reporting burden on hospitals associated with these measures may be significant, they believe the cost of infections to patients and to the economy is greater. Commenters noted that these measures are critical because hospital iatrogenic infections, accidents, errors, and injuries together are a leading cause of death in the United States.

Response: We agree with commenters that hospital-acquired conditions can pose substantial financial costs, as well as cause severe negative effects on patients' health and well-being.[272] It is for this reason that we did not propose to remove the PSI 90, CDI, CAUTI, CLABSI, MRSA, and Colon and Abdominal Hysterectomy SSI measures, collectively referred to as the patient safety measures, from the HAC Reduction Program, and we are not finalizing their proposed removal from the Hospital VBP Program. (We refer readers to section IV.I.2.c.(2) of the preamble of this final rule where we discuss retaining these safety measures in the Hospital VBP Program.) Because many commenters agreed with our assessment that there are costs associated with using the same measures in multiple programs, to providers, to CMS, and to patients and consumers trying to understand information about the same measures used in different programs, we are finalizing our proposal to remove the PSI 90 measure for the FY 2020 payment determination as proposed. We are also finalizing our proposal to remove the five NHSN HAI measures (that is, the CDI, CAUTI, CLABSI, MRSA, and Colon and Abdominal Hysterectomy SSI measures) but with modification to remove the five NHSN HAI measures from the Hospital IQR Program one year later than proposed beginning with the CY 2020 reporting period/FY 2022 payment determination and for subsequent years. These policies are discussed in more detail below.

Comment: A few commenters did not support removal of the patient safety measures because they believed the rationale under proposed removal Factor 8 contradicts the Meaningful Measures Initiative priority of making

[271] *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityInitiativesGenInfo/MMF/General-info-Sub-Page.html.*

[272] Zimlichman E, et al. Health Care—Associated Infections A Meta-analysis of Costs and Financial Impact on the US Health Care System. *JAMA Intern Med.* 2013;173(22):2039–2046.

clinically meaningful improvement to patient care with measurable reductions in patient safety events. Some commenters expressed concern that CMS may be inappropriately prioritizing the cost for those who collect the information over the benefits of the information to patients or direct care providers and recommended that protecting and improving the health of the public be central to decisions made regarding measure removals, particularly with regard to measures of patient safety.

Response: Because we continue to consider patient safety and reducing hospital-acquired conditions as high priorities (as reflected in the Meaningful Measures Initiative quality priority of making care safer by reducing harms caused in the delivery of care), we are not finalizing our proposed to remove these six patient safety measures from the Hospital VBP Program. We refer readers to section IV.I.2.c.(2) of the preamble of this final rule where we discuss retaining these safety measures in the Hospital VBP Program. We are also finalizing a modified version of our proposal under the Hospital IQR Program, such that instead of removing the five NHSN HAI measures (that is, the CDI, CAUTI, CLABSI, MRSA, and Colon and Abdominal Hysterectomy SSI measures) for the CY 2019 reporting period/FY 2021 payment determination and subsequent years as proposed, we are delaying removal for one additional year, until the CY 2020 reporting period/FY 2022 payment determination and subsequent years. By delaying removal of these measures from the Hospital IQR Program by one year, we will ensure consistency in collection and reporting of these data for continued use in the Hospital VBP Program and until such time when the collection, reporting, and validation of these data are transitioned to the HAC Reduction Program.

Because these measures will be publicly reported under the HAC Reduction and Hospital VBP Programs while also being used to assess hospital performance and impose payment adjustments on hospitals that perform poorly on these measures, we believe retaining the measures in two value-based purchasing programs and removing them from the Hospital IQR Program, will at least partly address the concerns of both the commenters who want to retain these measures and the commenters who supported their removal and de-duplication. We are, however, removing the PSI 90 measure for the FY 2020 payment determination (which applies to the performance period of July 1, 2016 through June 30, 2018) and subsequent years as proposed, because the data used to assess performance under this measure are collected via claims and therefore require no additional collection processes. We reiterate that removing the patient safety measures from the Hospital IQR Program beginning with the CY 2020 reporting period/FY 2022 payment determination for the five NHSN HAIs, and beginning with the FY 2020 payment determination for the PSI 90 measure, will not end or otherwise interfere with collection or public reporting of these data under other CMS quality programs. Under the HAC Reduction Program: (1) The NHSN HAI measures data will continue to be made publicly available on the *Hospital Compare* website on a quarterly basis, and (2) the PSI 90 data will continue to be made public on an annual basis, with all of these measures publicly reported in a consumer-friendly manner as well as through downloadable files. We refer readers to sections IV.J.4.e. and IV.J.4.h.(1) of the preamble of this final rule for discussions of data collection and public reporting in the HAC Reduction Program. We note that section 1886(p)(6) of the Act requires the HAC Reduction Program to make information available to the public regarding hospital-acquired conditions of each applicable hospital on the *Hospital Compare* website in an easily understandable format. Furthermore, section 1886(o)(10)(A) of the Act requires the Hospital VBP Program to make information available to the public regarding the performance of individual hospitals, including performance with respect to each measure, on the *Hospital Compare* website in an easily understandable format. We refer readers to section IV.J.4.h.(1) of the preamble of this final rule for discussion of public reporting under the HAC Reduction Program. We will continue to monitor hospital performance on these measures under both the HAC Reduction and Hospital VBP Programs, including any unintended consequences that may be associated with removing the measures from the Hospital IQR Program.

Comment: Several commenters specifically supported the removal of the NHSN HAI measures from the Hospital IQR Program to minimize redundancy in the programs and to reduce the costs associated with tracking and previewing reports in multiple programs, while noting that the cost and burden of infection surveillance, NHSN case identification, NHSN program maintenance, and data submission would not change. One commenter noted the benefit of removing the measures from the Hospital IQR Program, which only encourages reporting of quality data, while retaining them in the HAC Reduction Program, which directly ties payment to quality outcomes. A few commenters supported removing the NHSN HAI measures from the Hospital IQR Program, but encouraged CMS to maintain transparency of individual NHSN HAI measures by continuing to publicly report performance data on the *Hospital Compare* website. A few commenters expressed hope that removal of these measures from the Hospital IQR Program would not weaken incentives for facilities to report HAI surveillance data to the NHSN because conducting HAI surveillance using NHSN methods and maintaining quality infection prevention and control programs improves patient safety. Commenters recommended that CMS work with other agencies, experts, and State health departments to continue to improve quality around patient safety.

Response: We thank the commenters for their support of our proposal to de-duplicate the NHSN HAI measures (that is, the CDI, CAUTI, CLABSI, MRSA, and Colon and Abdominal Hysterectomy SSI measures) from the Hospital IQR Program. As noted previously, we will continue to publicly report hospital performance data on these measures under the HAC Reduction and Hospital VBP Programs in a manner that is transparent and easily understood by patients. As noted above, we refer readers to sections IV.J.4.h.(1) and IV.I.2.c.(2) of the preamble of this final rule where we detail our policies for these measures in the HAC Reduction and Hospital VBP Programs. Specifically, the NHSN HAI data will continue to be made available on a quarterly basis in a consumer-friendly manner on *Hospital Compare* and also through downloadable files. We will also strive to minimize disruptions to preexisting processes and timelines for publicly reporting these data. We further believe removing the NHSN HAI measures from the Hospital IQR Program will have no impact on the incentive to report these measure data because the measures will remain in both the HAC Reduction and Hospital VBP Programs' measure sets, under which hospitals are subject to payment adjustments based on their performance.

Comment: Several commenters supported removal of the measures from the Hospital IQR Program but recommended that the measures, and their associated validation, scoring, and public reporting requirements, be retained in the Hospital VBP Program instead of the HAC Reduction Program

because the Hospital VBP Program provides incentives for each facility's performance improvement as well as penalties for poor performance, whereas the HAC Reduction Program only penalizes hospitals in the worst-performing quartile (25 percent) of program performance. One commenter similarly supported only retaining the NHSN HAI measures in the Hospital VBP Program because the HAC Reduction Program's risk adjustment strategies are limited and may not appropriately account for facility-specific populations, leading to the over-penalization of hospitals that serve predominately high-risk patients. If retaining the NHSN HAI measures only in the Hospital VBP Program were not possible, one commenter recommended modifying the HAC Reduction Program to incorporate an incentive structure like that used in the Hospital VBP Program.

Response: We thank the commenters for their comments. As discussed above, we are finalizing removal of the NHSN HAI and PSI 90 measures from the Hospital IQR Program with modification and retaining them in both the HAC Reduction and Hospital VBP Programs. In connection with these measure removals from the Hospital IQR Program, we are finalizing our proposals to adopt HAI data collection and validation processes under the HAC Reduction Program that align with those currently used in the Hospital IQR Program. We refer readers to section IV.J.4.e. of the preamble of this final rule where we discuss the HAI data collection and validation processes under the HAC Reduction Program in further detail.

While we recognize that the payment structures of the HAC Reduction Program and Hospital VBP Program are different, particularly in that the Hospital VBP Program scoring methodology scores hospitals on the higher of improvement or achievement on each measure, and incentivizes all hospitals to improve and achieve high performance with both positive and negative payment adjustments. Because many commenters have expressed this similar concern about the potential reduced incentive for hospitals to continue to improve and achieve high performance on these safety measures, we are not finalizing our proposal to remove these measures from the Hospital VBP Program and refer readers to section IV.I.2.c.(2) of the preamble of this final rule where we discuss this decision in detail.

We note that the HAC Reduction Program was designed to include risk-adjusted measures that are reflective of hospital performance (78 FR 50712 through 50715). We will continue to consult with the CDC and take this feedback into consideration for measure maintenance and future refinement of measure specifications. Furthermore, we will continue to monitor hospital performance on these measures under both the HAC Reduction and Hospital VBP Programs, including any unintended consequences. We will take the commenter's feedback regarding the HAC Reduction Program incentive structure into consideration for future years to the extent authorized under section 1886(p) of the Act.

Comment: Several commenters disagreed that the patient safety measures in the Hospital IQR Program are duplicative of measures in other programs and further recommended that more patient safety measures should be added to quality reporting programs out of concern that quality and cost-effectiveness are nullified when safety is absent. One commenter noted that by virtue of being housed in the Hospital IQR Program, virtually all hospitals report on and are accountable to the public for these measures and, if removed from the Hospital IQR Program, many hospitals might choose to no longer report on these measures. Moreover, some commenters expressed concern that if the patient safety measures were removed from the Hospital IQR Program, then hospitals would not be given the payment incentive for full reporting, creating a financial disincentive to report the measures because the HAC Reduction Program only penalizes hospitals that perform in the lowest quartile of performance, potentially resulting in increased infections and patient safety issues. Several commenters expressed concern that if these measures are retained only in the HAC Reduction Program, and the HAC Reduction Program was repealed (through a repeal of the Patient Protection and Affordable Care Act), that hospitals would be left with nothing to incentivize reporting on patient safety measures.

Response: We seek to clarify that these patient safety measures previously finalized for the Hospital IQR, Hospital VBP, and HAC Reduction Programs are the same six measures, and that subsection (d) hospitals are subject to all three programs. Because the HAC Reduction Program imposes a 1 percent payment penalty on all hospitals scoring in the worst-performing quartile of all subsection (d) hospitals (and hospitals that do not report measures and do not have a waiver receive the worst-possible score for those measures, (79 FR 50098 and 81 FR 57013)) and the Safety domain using patient safety measures comprises 25 percent of a hospital's Total Performance Score under the Hospital VBP Program, we believe there are sufficiently strong incentives to ensure hospitals continue to report and strive for high performance on these patient safety measures. We note that the payment adjustment associated with not reporting data to the Hospital IQR Program is a one-quarter reduction in the hospital's annual payment update (APU). There is no positive payment adjustment associated with either reporting data to the program or a hospital's performance on a measure collected under the Hospital IQR Program.[273] We refer readers to the table below for more information on average APU percentages since FY 2015 when the financial risk for failure to report data under the Hospital IQR Program became a one-fourth reduction of the annual payment update:

FY	APU	One-fourth of APU
2015	1.4	0.35
2016	0.9	0.23
2017	0.95	0.24
2018	1.2	0.3
Average	1.11	0.28

[273] Sections 1886(b)(3)(B)(viii)(I) and (b)(3)(B)(viii)(II) of the Act state that the applicable percentage increase for FY 2015 and each subsequent year shall be reduced by one-quarter of such applicable percentage increase (determined without regard to sections 1886(b)(3)(B)(ix), (xi), or (xii) of the Act) for any subsection (d) hospital that does not submit data required to be submitted on measures specified by the Secretary in a form and manner, and at a time, specified by the Secretary.

In order to ensure continuity under the HAC Reduction Program for the public reporting of the NHSN HAI data quarterly and to assess payment penalties based on hospitals' performance on the measures, we believe it is appropriate to transfer collection of these patient safety measure data to that program. We further note that in retaining these measures in the Hospital VBP Program, performance on these measures will also continue to be tied to that program's payment incentive structure, reinforcing improvement and high achievement on the measures, and providing positive as well as negative payment adjustments. We acknowledge commenters' concern regarding future potential statutory changes, and would address any such changes in future rulemaking.

Comment: A few commenters did not support removal of the patient safety measures, asserting that retaining the measures in only one program would not alleviate any significant burden on hospitals because there is no burden associated with data submission for claims-based measures, such as the PSI 90 measure, and hospitals submit data to the NHSN only once for multiple programs in the case of the NHSN HAI measures.

Response: While we agree with commenters that removal of these measures from the Hospital IQR Program may not significantly reduce the information collection burden of reporting associated with these measures due to either their claims-based collection or their continued use in another program, the costs associated with a measure also include those associated with reviewing multiple preview reports, which would be reduced by streamlining measure sets. Further, as discussed in section VIII.A.4.b. of the preamble of this final rule, when evaluating the removal of a measure under removal Factor 8, we consider costs beyond the information collection burden, including, but not limited to: (1) Provider and clinician information collection burden and related cost and burden associated with the submission/reporting of quality measures to CMS; (2) the provider and clinician cost associated with complying with other quality programmatic requirements; (3) the provider and clinician cost associated with participating in multiple quality programs, and tracking multiple similar or duplicative measures within or across those programs; (4) the CMS cost associated with the program oversight of the measure, including measure maintenance and public display; and (5) the provider and clinician cost associated with compliance with other federal and/or State regulations (if applicable). As stated above, in response to many commenters, we are not finalizing their proposed removal from the Hospital VBP Program. We refer readers to section IV.I.2.c.(2) of the preamble of this final rule where we discuss retaining these safety measures in the Hospital VBP Program. We also note that, as discussed above, we are finalizing a modified version of our proposal, such that we are delaying removal of the NHSN HAI measures from the Hospital IQR Program for one year such that removal begins with the CY 2020 reporting period/FY 2022 payment determination in order to ensure consistency in data collection and reporting while we work to establish data collection policies for these measures under the Hospital VBP Program. This will also help to have a more seamless transition for data collection, validation, and public reporting under the HAC Reduction Program.

Comment: Many commenters did not support removal of the patient safety measures due to concerns about transparency in public reporting. These commenters expressed concern that if the patient safety measures were removed from the Hospital IQR Program, that public reporting of the measure data would no longer be available, decreasing the information available to the public, and thereby, disincentivizing related hospital quality improvement efforts, leading to endangering the lives and safety of vulnerable patients. A few commenters noted that informing the public of hospital quality performance is a central purpose of the Hospital IQR Program; public reporting of these measures helps focus and strengthen efforts to improve healthcare safety and quality. One commenter asserted that 90 percent of the measures in the Hospital IQR Program have seen improvement, a record unparalleled in any other health quality programs. Several commenters further expressed concern that even if these measures are retained in another CMS quality program, the resulting data may not be reported in an easily accessible manner. Therefore, commenters urged CMS to prioritize transparency throughout its programs, particularly as it relates to patient safety measures, by continuing to publicly report patient safety measure data on the *Hospital Compare* website to enable hospitals to compare their performance with other hospitals to drive quality improvement efforts and for patients to make informed decisions about their health care.

Response: We appreciate the commenters' concerns and reiterate that we will continue to report measure-level data for all of CMS' quality programs in a manner that is transparent and easily understood by patients and consumers. As noted above, under the HAC Reduction Program, data on the NHSN HAI measures will continue to be made publicly available on the *Hospital Compare* website as they have been on a quarterly basis; furthermore, data on the PSI 90 measure will continue to be published on an annual basis, with all of these measures publicly reported in a consumer-friendly manner and also through downloadable files. We will also strive to minimize disruptions to preexisting processes and timelines for publicly reporting these data. We refer readers to section IV.J.4.h.(1) of the preamble of this final rule where this is discussed in more detail for the HAC Reduction Program.

Comment: Several commenters did not support removal of the patient safety measures from the Hospital IQR Program because it provided the original statutory mechanism requiring quality data to be made public on the *Hospital Compare* website and because it has served as the primary vehicle for public reporting of hospital performance data. One commenter asserted its interpretation that measures not reported through the Hospital IQR Program cannot, by statute, be used in other payment programs, noting that CMS attempted to report a set of Deficit Reduction Act (DRA)-HAC measures removed from the Hospital IQR Program on the *Hospital Compare* website, but concluded the HAC Reduction Program lacked the statutory authority because measures not in the Hospital IQR Program could not be reported on the *Hospital Compare* website.

Response: Under the holistic approach of evaluating the measures used in the four inpatient hospital quality programs—the Hospital IQR, Hospital VBP, HAC Reduction, and Hospital Readmissions Reduction Programs—as discussed above and in the preamble of the proposed rule, the Hospital IQR Program will continue to serve as the primary quality reporting program for quality and cost measures that are important for data collection and public reporting, but may not be ready or appropriate for use in one of the other value-based purchasing programs. As required under sections 1886(o)(2)(A) and 1886(o)(2)(C)(i) of the Act, we will continue to select measures for the Hospital VBP Program that have been specified for the Hospital IQR

Program and refrain from beginning the performance period for any new measure until the data on that measure have been posted on *Hospital Compare* for at least one year. We note the statute does not require a measure that has met these statutory requirements to remain in the Hospital IQR Program at the same time as the Hospital VBP Program. The HAC Reduction and Hospital Readmissions Reduction Programs do not have any similar statutory requirements.

We believe removing measures that have transitioned to a value-based purchasing program from the Hospital IQR Program will better enable us to focus on new quality measures and collecting and publicly reporting these data for both patients and providers without imposing additional cost or burden on providers for duplicative measures unless the benefits outweigh the costs. (For example, we refer readers to section IV.I.2.c.(2) of the preamble of this final rule where we discuss retaining these patient safety measures in the Hospital VBP Program.)

We would like to clarify that the payment provision established by section 5001(c) of the Deficit Reduction Act (DRA) of 2005 (also known as DRA–HAC or the Hospital-Acquired Conditions (Present on Admission Indicator) payment provision), is a policy under which hospitals no longer receive additional payment for cases in which one of a selected set of HACs occurred but was not present on admission.[274] [275] While CMS does calculate and report rates for a subset of the conditions included in the DRA–HAC payment provision under DRA HAC Reporting via public use files, this payment policy and associated reporting are separate and distinct from the Hospital IQR and HAC Reduction Programs discussed in this final rule.

We further disagree that the HAC Reduction Program lacks statutory authority to publicly report measures that are not also in the Hospital IQR Program, and refer readers to section 1886(p)(6) of the Act, which specifically requires the Secretary to make publicly available information regarding hospital acquired conditions under the HAC Reduction Program and to post such information on *Hospital Compare* in an easily understandable format. We also refer readers to sections IV.J.4.b. and IV.J.4.h.(1) of the preamble of this final rule where we address in detail how the NHSN HAI measures will be publicly reported on *Hospital Compare* under the HAC Reduction Program.

Comment: Several commenters expressed concern that removing these measures could negatively impact States that have structured their laws to align with CMS regulations.

Response: We acknowledge commenters' concern, but we disagree because, as stated above, these measure data will continue to be collected under HAC Reduction Program and made publicly available—the NHSN HAI data on a quarterly basis and PSI 90 data on an annual basis—in a consumer-friendly manner on *Hospital Compare* and also through downloadable files which can be accessed by all stakeholders, including States and public health agencies.

Comment: Several commenters expressed particular concern regarding removal of the PSI 90 measure. Specifically, one commenter worried that the measure's 10 individual component indicators of the composite measure may no longer be publicly reported with the same level of granularity if the measure were removed from the Hospital IQR Program. This commenter recommended CMS continue to publicly report both the full composite score for the PSI 90 measure as well as the scores of individual indicators comprising the measure, because the commenter believed that the PSI 90 measure represents important patient safety outcomes data. Another commenter recommended that CMS delay the removal of the PSI 90 measure from the Hospital IQR Program until the measure steward transfer from AHRQ to CMS is completed.

Response: As discussed above, we believe retaining the PSI 90 measure in the HAC Reduction Program, which specifically focuses on reducing hospital-acquired conditions and improving patient safety outcomes, as well as not finalizing removal of this measure from the Hospital VBP Program, while finalizing its removal as proposed from the Hospital IQR Program will at least partly address the concerns of both commenters who want to retain this measure and commenters who supported its removal and de-duplication. We reiterate that removing this measure from the Hospital IQR Program will not end or otherwise interfere with public reporting of these data. We refer readers to section IV.J.4.h. of the preamble of this final rule in which the HAC Reduction Program is finalizing its proposal to make data available in the same form and manner as currently displayed under the Hospital IQR Program. The data will continue to be made available in a consumer-friendly manner on *Hospital Compare,* with the same granularity, and also through downloadable files. We therefore continue to believe that removing this measure from the Hospital IQR Program as proposed while retaining it in two value-based purchasing programs strikes the appropriate balance of benefits and costs associated with using the PSI 90 measure across the programs. We further believe it is unnecessary to delay removal of the PSI 90 measure from the Hospital IQR Program until after measure stewardship has transitioned from AHRQ to CMS because the measure specifications as previously adopted for both the HAC Reduction Program and Hospital IQR Program remain unchanged.[276]

Comment: One commenter suggested modifying the patient safety measures to include bidirectional case reporting, which the commenter believed incentivizes public health reporting and is important to public health agencies.

Response: We thank the commenter for its suggestion. We interpret the commenter's reference to ''bidirectional case reporting'' as the NHSN system allowing data from public health agencies to populate NHSN and the NHSN system allowing public health agencies access to NHSN data. We will consult with the CDC and evaluate whether bidirectional case reporting is feasible and consider this option in the future if feasible and appropriate to do so.

Comment: Several commenters supported the removal of the patient safety measures from the Hospital IQR Program for the following reasons: (1) To reduce the costs associated with reporting the same measure in multiple programs with differing reporting periods; (2) to reduce the confusion associated with reviewing multiple reports from multiple programs for the same measures; and (3) to streamline quality reporting requirements. Some commenters supported the removal of patient safety measures from the Hospital IQR Program, but recommended that we continue to

[274] Additional information about the DRA–HAC payment provision is available at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/HospitalAcqCond/index.html.*

[275] *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/HospitalAcqCond/Downloads/FAQ-DRA-HAC-PSI.pdf.*

[276] We note that measure stewardship of the recalibrated version of the Patient Safety and Adverse Events Composite (PSI 90) is transitioning from AHRQ to CMS and, as part of the transition, the measure will be referred to as the CMS Recalibrated Patient Safety Indicators and Adverse Events Composite (CMS PSI 90) when it is used in CMS quality programs. The 2018 measure specifications for PSI 90 as it is used in both the HAC Reduction Program and the Hospital IQR Program can be found at: *https://qualityindicators.ahrq.gov/Modules/PSI_TechSpec_ICD10_v2018.aspx.*

publicly report these measures on the *Hospital Compare* website under the HAC Reduction Program, because commenters believed these measures are of great interest to the public.

Response: We thank the commenters for their support of our proposal to de-duplicate the patient safety measures from the Hospital IQR Program. As discussed above, we are finalizing removal of these measures from the Hospital IQR Program with modification to delay removal of the NHSN HAI measures for one year and retaining them in the HAC Reduction and Hospital VBP Programs.

Comment: One commenter recommended that whichever quality program retains the patient safety measures should retain the administrative requirements previously provided under the Hospital IQR Program, including data collection requirements, validation requirements, and scoring associated with data completeness, timeliness, and accuracy, as well as public reporting of the data on *Hospital Compare* website. Another commenter specifically supported the removal of the PSI 90 measure from the Hospital IQR Program and retention in the HAC Reduction Program because the HAC Reduction Program will be the program primarily focusing on safety of care quality for the inpatient hospital setting. In addition, the commenter recommended that the PSI 90 measure be validated and publicly reported on the *Hospital Compare* website.

Response: We appreciate the first commenter's suggestion and note that while the patient safety measures are being removed from the Hospital IQR Program, they are being retained in the HAC Reduction Program and the Hospital VBP Program and will be subject to the administrative requirements and scoring methodologies of those programs. Further, we refer readers to section IV.J.4.h. of the preamble of this final rule in which the HAC Reduction Program is finalizing its proposal to make data available in the same form and manner as currently displayed under the Hospital IQR Program. We reiterate that the PSI 90 measure will be publicly reported on the *Hospital Compare* website, however, it will not be included in the HAC Reduction Program validation process because it is a claims-based measure for which hospitals do not submit any additional quality measure data for validation.

Comment: A few commenters expressed support specifically for the removal of the PSI 90 measure from the Hospital IQR Program to reduce: (1) Redundant and duplicative work for providers; and (2) costs associated with reporting and remaining in compliance with the requirements of quality reporting programs. One commenter supported removal of the PSI 90 measure from the Hospital IQR Program because it believed that it is unclear whether recent measure modifications might affect hospital performance. Further, the commenter did not believe that such population-based measures are appropriate for hospital accountability, and recommended that the effects of the modification on performance and ranking be explored before implemented in any of the quality reporting programs.

Response: We thank the commenters for their support of our proposal to de-duplicate the PSI 90 measure from the Hospital IQR Program. As discussed above, we are finalizing removal of this measure from the Hospital IQR Program as proposed because the cost of keeping the measure in three CMS programs outweighs the benefits. We acknowledge the commenter's concern about the impact of the recent measure modifications, which we interpret as referencing the ICD–10 change and broadening of the cohort (81 FR 57128 through 57133). However, we continue to believe this measure as specified is valid and reliable, and therefore, appropriate for use in other CMS quality programs. We appreciate the commenter's feedback regarding population-based measures and will take that into consideration for future program years.

Comment: One commenter opposed the inclusion of the PSI 90 measure in any quality program and recommended that CMS not reintroduce the measure until it meets the standards of the National Quality Forum.

Response: We note the PSI 90 measure (NQF #0531) is currently endorsed by the National Quality Forum (NQF).[277] As stated above, we continue to believe this measure is a valid and reliable measure of potentially preventable hospital-related events associated with harmful outcomes for patients. We further note that the PSI 90 measure remains in the HAC Reduction Program, as well as the Hospital VBP Program beginning with the FY 2023 program year (we refer readers to section IV.I.2.c.(2) of the preamble of this final rule where we discuss not finalizing our proposal to remove the PSI 90 measure from the Hospital VBP Program).

Comment: One commenter recommended that CMS carefully consider whether or not to include NHSN CDI in performance programs because the commenter believed that it is notably flawed due to variable documentation, surveillance, and testing practices among organizations.

Response: While we acknowledge variability in hospital documentation, reporting, and sensitivity of laboratory testing methods may make a difference in the event data hospitals report, the CDC's Multidrug-Resistant Organism & *Clostridium difficile* Infection (CDI) Module provides guidelines for identifying, documenting, and reporting events under this measure.[278] In addition, we believe the validation process established for the NHSN CDI measure and other NHSN measures is the best approach for us to systematically identify candidates that are likely to yield a high proportion of cases that should have been reported to NHSN.[279] As discussed in section IV.J.4.e. of the preamble of this final rule, the HAC Reduction Program is finalizing its proposal to begin validating the NHSN HAI measures following their removal from the Hospital IQR Program. We believe transitioning this validation process to a payment program will provide sufficient incentives for hospitals to ensure diligent and accurate reporting of CDI events; however, we will also consult with the CDC to take the commenter's concerns into consideration for future program years.

After consideration of the public comments we received, we are finalizing our proposal to remove the PSI 90 measure beginning with the FY 2020 payment determination (which applies to the performance period of July 1, 2016 through June 30, 2018) as proposed. Furthermore, we are finalizing our proposals to remove the CDI, CAUTI, CLABSI, MRSA, and Colon and Abdominal Hysterectomy SSI measures with modification; instead of removing them beginning with the CY 2019 reporting period/FY 2021 payment determination as proposed, we are finalizing a delay in the removal of these measures until the CY 2020 reporting period/FY 2022 payment determination.

[277] For a full history of the PSI 90 measure's NQF review and endorsement, we refer readers to the NQF Quality Positioning System page for this measure, available at: *http://www.qualityforum.org/QPS/0531*.

[278] We refer readers to the CDC's Multidrug-Resistant Organism & *Clostridium difficile* Infection Module for a detailed discussion of how to report these events. Available at: *https://www.cdc.gov/nhsn/PDFs/pscManual/12pscMDRO_CDADcurrent.pdf*.

[279] 78 FR 50829 through 50834.

(3) Claims-Based Readmission Measures

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20475 through 20476), we proposed to remove the following seven claims-based readmission measures beginning with the FY 2020 payment determination:

- Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Acute Myocardial Infarction (AMI) Hospitalization (NQF #0505) (READM–30–AMI) (adopted at 73 FR 68781);
- Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery (NQF #2515) (READM–30–CABG) (adopted at 79 FR 50220 through 50224);
- Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization (NQF #1891) (READM–30–COPD) (adopted at 78 FR 50790 through 50792);
- Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Heart Failure (HF) Hospitalization (NQF #0330) (READM–30–HF) (adopted at 73 FR 48606);
- Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Pneumonia Hospitalization (NQF #0506) (READM–30–PN) (adopted at 73 FR 68780 through 68781);
- Hospital-Level 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) (NQF #1551) (READM–30–THA/TKA) (adopted at 77 FR 53519 through 53521); and
- 30-Day Risk-Standardized Readmission Rate Following Stroke Hospitalization (READM–30–STK) (adopted at 78 FR 50794 through 50798).

We proposed to remove READM–30–AMI, READM–30–CABG, READM–30–COPD, READM–30–HF, READM–30–PN, and READM–30–THA/TKA under proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program. (The READM–30–STK measure is discussed further below.) We believe removing these measures from the Hospital IQR Program would eliminate costs associated with implementing and maintaining these measures for the program, and in particular, development and release of duplicative and potentially confusing CMS confidential feedback reports provided to hospitals across multiple hospital quality and value-based purchasing programs. We refer readers to section VIII.A.4.b. of the preamble of the proposed rule where we discuss examples of the costs associated with implementing and maintaining these measures for the programs. For example, it may be costly for health care providers to track the confidential feedback, preview reports, and publicly reported information on a measure where we use the measure in more than one program. Health care providers incur additional cost to monitor measure performance in multiple programs for internal quality improvement and financial planning purposes when measures are used across value-based purchasing programs. Beneficiaries may also find it confusing to see public reporting on the same measures in different programs. In addition, maintaining the specifications for the measures, as well as the tools we need to analyze and publicly report the measure data result in costs to CMS. We believe the costs as described above outweigh the associated benefit to beneficiaries of receiving the same information from multiple programs, because that information can be captured through inclusion of these measures solely in the Hospital Readmissions Reduction Program. We believe the benefit to beneficiaries of keeping this measure in the Hospital IQR Program is limited because the public would continue to receive measure information via another CMS quality program.

Because we continue to believe these measures provide important data on patient outcomes following inpatient hospitalization (addressing the Meaningful Measures Initiative quality priority of promoting effective communication and coordination of care), we will continue to use these measures in the Hospital Readmissions Reduction Program. By keeping the measures in the Hospital Readmissions Reduction Program, patients, hospitals, and the public would continue to receive information about the quality of care provided with respect to these measures.

Unlike the Hospital IQR Program, performance data on measures maintained in the Hospital Readmissions Reduction Program are used both to assess the quality and value of care provided at a hospital and to calculate incentive payment adjustments for a given year of the program based on performance. The Hospital Readmissions Reduction Program's incentive payment structure ties hospitals' payment adjustments on claims paid under the IPPS to their performance on selected quality measures, including the above measures which are already in the Hospital Readmissions Reduction Program, sufficiently incentivizing performance improvement on these measures among participating hospitals. As discussed in section VIII.A.4.b. of the preamble of the proposed rule, one of our main goals is to move the program forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients, and we believe removing these measures from the Hospital IQR Program is the best way to achieve this. In addition, as discussed in section I.A.2. of the preamble of this final rule, we believe keeping these measures in both programs no longer aligns with our goal of not adding unnecessary complexity or cost with duplicative measures across programs.

Furthermore, we proposed to remove the READM–30–STK measure under proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program. The READM–30–STK measure collects important hospital-level, risk-standardized readmission rates following inpatient hospitalizations for strokes (78 FR 50794). However, these data also are captured in the Hospital-Wide All-Cause Unplanned Readmission Measure (HWR) adopted into the Hospital IQR Program in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53521 through 53528), because that measure comprises a single summary score, derived from the results of different models for each of the following specialty cohorts: Medicine; surgery/gynecology; cardiorespiratory; cardiovascular; and neurology (77 FR 53522). These cohorts cover conditions and procedures defined by the AHRQ Clinical Classification Software (CCS), which collapsed more than 17,000 different ICD–9–CM diagnoses and procedure codes into 285 clinically-coherent, mutually-exclusive condition categories and 231 mutually-exclusive procedure categories (77 FR 53525). The transition of the CCS-based measure specifications to the ICD–10–CM version of the CCS is underway. The ICD–10 to CCS map and tools for its use are currently available at: *https://www.hcup-us.ahrq.gov/toolssoftware/ccs10/ccs10.jsp*. Readmission rates following inpatient hospitalizations for strokes are captured in that information, specifically, the neurology cohort. We believe that the costs associated with interpreting the requirements for two measures with overlapping data points

outweigh the benefit to beneficiaries of the additional information provided by this measure, because the measure data are already captured within another measure in the Hospital IQR Program. Also, maintaining the specifications for this measure, as well as the tools we need to analyze and publicly report the measure data result in costs to CMS. Thus, removing the READM–30–STK measure would help to reduce duplicative data and produce a more harmonized and streamlined measure set. As discussed in section VIII.A.4.b. of the preamble of this final rule, one of our main goals is to move forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients, and we believe removing this measure from the Hospital IQR Program is the best way to do that.

We recognize, however, that including condition- and procedure-specific clinical quality measure data can provide hospitals with actionable feedback to better equip them to implement targeted improvements in comparison to an overall quality measure. In addition, condition- and procedure-specific measures can provide valuable data to specialty societies by clearly assessing performance for their specialty, and may be valuable to persons and families who prefer information on certain conditions and procedures relevant to them. The Hospital-Wide Readmission measure, unlike condition- and procedure-specific measures, also requires improvement in quality across multiple service lines to produce improvement in the overall rate, which may give the perception of slower or smaller gains in hospital quality. Conversely, hospitals would still have a strong motivation to improve stroke readmissions performance if they want to improve their overall performance on the Hospital-Wide Readmission measure posted on *Hospital Compare*.

Therefore, we proposed to remove the READM–30–AMI, READM–30–CABG, READM–30–COPD, READM–30–HF, READM–30–PN, READM–30–THA/TKA, and READM–30–STK measures for the FY 2020 payment determination (which would apply to the performance period of July 1, 2015 through June 30, 2018) and subsequent years.

We invited public comment on our proposal to remove these measures from the Hospital IQR Program as well as feedback on whether there are reasons to retain one or more of the measures in the Hospital IQR Program.

Comment: A number of commenters supported CMS' proposals to remove seven claims-based readmission measures beginning with the FY 2020 payment determination. One commenter supported removal of the readmission measures because they are less applicable to its patient population. One commenter supported the removal of these measures, but highlighted its belief that removing them would not reduce burden because hospitals will still report most of these measures to the Hospital Readmissions Reduction Program.

Response: We thank commenters for their support of the removal of these measures. We respectfully disagree that removing these measures will not reduce the costs associated with these measures. We believe that removing these measures would reduce costs for providers by eliminating the need to monitor the same measures used in multiple programs, including tracking confidential feedback, preview reports, and publicly reported information on these measures. Beneficiaries may also find it confusing to see public reporting on the same measures in different programs. In addition, costs to CMS would be reduced by no longer having to maintain the tools needed to analyze and publicly report the measure data for multiple programs. We refer readers to section VIII.A.4.b. of the preamble of this final rule where we discuss examples of the costs associated with implementing and maintaining these measures.

Comment: One commenter supported CMS' proposals to remove READM–30–AMI, READM–30–CABG, READM–30–COPD, READM–30–HF, READM–30–PN, and READM–30–THA/TKA for the following reasons: (1) Reducing duplication, which will in turn reduce administrative burden as well as patient and provider confusion; and (2) preventing hospitals from being penalized or rewarded for the same measure across multiple programs.

Response: We thank the commenter for its support of the removal of READM–30–AMI, READM–30–CABG, and READM–30–HF and agree with the reasons.

Comment: One commenter supported CMS' proposals to remove READM–30–AMI, READM–30–CABG, and READM–30–HF for purposes of administrative simplification, and recommended that CMS eliminate use of those three measures from all quality programs altogether. The commenter also expressed their opinion that READM–30–HF may not be an appropriate indicator of quality based on emerging literature.

Response: We thank commenters for their support of the removal of READM–30–AMI, READM–30–CABG, and READM–30–HF measures from the Hospital IQR Program. While we continue to believe these measures as specified are valid and reliable (adopted at 73 FR 68781, 79 FR 50220, and 73 FR 48606 respectively), we are removing them from the Hospital IQR Program because the costs associated with these measures outweigh the benefits of their continued use in the Hospital IQR Program.

We note that, as discussed in section IV.H.4. of the preamble of this final rule, these measures will continue to be used in the Hospital Readmissions Reduction Program. However, we will take commenters' recommendations into consideration as we continue to evaluate the other quality programs' measure sets in future years.

Comment: One commenter specifically supported the proposal to remove READM–30–HF from the Hospital IQR Program because it would reduce the reporting burden on hospitals without compromising the measure in the Hospital Readmissions Reduction Program.

Response: We thank the commenter for its feedback.

Comment: A few commenters specifically supported the proposal to remove READM–30–THA/TKA. One commenter agreed that it is appropriate to address THA and TKA readmissions through the Hospital Readmissions Reduction Program.

Response: We thank the commenters for their feedback.

Comment: A few commenters supported CMS' proposal to remove the READM–30–STK measure for the following reasons: (1) The loss of condition-specific, hospital-level risk-standardized information is outweighed by the more important overarching goal of maintaining the least burdensome and most harmonized measure set; (2) the associated data will be used in aggregated form in the Hospital-Wide All-Cause Unplanned Readmission measure; and (3) the measure was never NQF endorsed.

Response: We thank the commenters for their feedback. We note that the Hospital IQR Program considers NQF endorsement when adopting measures into the measure set. Even if a measure is not NQF endorsed, the Hospital IQR Program may adopt it into the program under the exclusion authority in section 1886(b)(3)(B)(IX)(bb) of the Act, by considering other available topical measures that have been endorsed or adopted by a consensus organization.

Comment: A few commenters did not support CMS' proposals to remove the seven readmission measures. One commenter opposed removal of the seven condition-specific readmission measures due to concerns that their removal could result in a lack of public access to user-friendly condition-specific outcomes information, and suggested that measure-level reporting continue on *Hospital Compare* under the Hospital IQR Program to ensure that future improvements in public reporting can be adopted consistently across publicly reported measures.

Response: We thank the commenters for their concerns and reiterate that we will continue to publicly report measure-level data for all of CMS' quality programs in a manner that is transparent and easily understood by patients, as well as through downloadable files. These measures will continue to be included in the Hospital Readmissions Reduction Program, and we note that section 1886(q)(6) of the Act requires the Hospital Readmissions Reduction Program to make information available to the public regarding readmission rates of each subsection (d) hospital on the *Hospital Compare* website in an easily understandable format. We will also strive to minimize disruptions to preexisting processes and timelines for publicly reporting this data. We refer readers to section IV.H.4. of the preamble of this final rule where we discuss these measures under the Hospital Readmissions Reduction Program.

Comment: One commenter did not support CMS' ''holistic'' view of the hospital quality programs. The commenter stated that initially adopting measures into the Hospital IQR Program allows for a period of measure validation, and for health systems to gain familiarity with the measures before they are moved into value-based purchasing programs, and expressed concern that CMS' ''holistic'' view would allow new measures to be adopted immediately into the value-based purchasing programs without this time for familiarization and validation. The commenter stated their belief that adopting measures directly into the value-based purchasing programs would result in significant harm, undue hardship, and potentially financial penalties on healthcare systems.

Response: We thank the commenter for its comment, but emphasize that our proposal to remove duplicative measures from the Hospital IQR Program does not affect the underlying statutory requirements of the Hospital VBP, HAC Reduction, or Hospital Readmissions Reduction Programs. Those programs will continue to select new measures as required by their statutory authority. For instance, the Hospital VBP Program will continue to select measures that have been specified under the Hospital IQR Program and refrain from beginning the performance period for any new measure until the data on that measure have been posted on *Hospital Compare* for at least one year. We note the HAC Reduction and Hospital Readmissions Reduction Programs do not have any similar statutory requirements in this regard as the Hospital VBP Program. We therefore disagree that these removals could result in harm, undue hardship, or financial penalties to hospitals because they do not alter the processes associated with adopting new measures into the Hospital VBP, HAC Reduction, or Hospital Readmissions Reduction Programs. We will, however, continue to consider on a case-by-case basis for each new measure whether it would be appropriate to propose the measure for the Hospital IQR Program before proposing to use it in either the HAC Reduction Program or the Hospital Readmissions Reduction Program.

Comment: One commenter did not support removal of the READM–30–AMI, READM–30–HF, and READM–30–PN measures because the commenter believed they are essential health and safety measurements, key to hospital accountability and incentivizing quality care. The commenter also expressed its opinion that the removal would decrease transparency and public accountability.

Response: We appreciate the commenter's concerns and reiterate that we will continue to publicly report measure-level data for all of CMS' quality programs in a manner that is transparent and easily understood by patients. The readmissions measures will continue to be publicly reported on *Hospital Compare* as they have been. We will also strive to minimize disruptions to preexisting processes and timelines for publicly reporting this data. Because the READM–30–AMI, READM–30–CABG, READM–30–COPD, READM–30–HF, READM–30–PN, and READM–30–THA/TKA measures will be retained in the Hospital Readmissions Reduction Program, which ties hospital performance on the measures to payment adjustments, we believe hospitals will continue to be strongly incentivized to improve on the measures. We refer readers to section IV.H.7. of the preamble of this final rule where we discuss these policies under the Hospital Readmissions Reduction Program. In addition, because readmission rates for stroke patients will continue to be captured by the Hospital-Wide Readmission measure that is being retained in the Hospital IQR Program, we believe hospitals will continue to be strongly incentivized to improve on this measure as well.

After consideration of the public comments we received, we are finalizing removal of the READM–30–AMI, READM–30–CABG, READM–30–COPD, READM–30–HF, READM–30–PN, READM–30–THA/TKA, and READM–30–STK measures from the Hospital IQR Program measure set beginning with the FY 2020 payment determination as proposed.

(4) Claims-Based Mortality Measures

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20476 through 20477), we proposed to remove five claims-based mortality measures across the FYs 2020, 2021, and 2022 payment determinations and subsequent years:

- Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) Hospitalization (NQF #0230) (MORT–30–AMI) beginning with the FY 2020 payment determination (adopted at 71 FR 68206);
- Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Heart Failure (HF) Hospitalization Surgery (NQF #0229) (MORT–30–HF) beginning with the FY 2020 payment determination (adopted at 71 FR 68206);
- Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Chronic Obstructive Pulmonary Disease (COPD) (NQF #1893) (MORT–30–COPD) beginning with the FY 2021 payment determination (adopted at 78 FR 50792 through 50794);
- Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization (NQF #0468) (MORT–30–PN) beginning with the FY 2021 payment determination (adopted at 72 FR 47351); and
- Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Coronary Artery Bypass Graft (CABG) Surgery (NQF #2515) (MORT–30–CABG) beginning with the FY 2022 payment determination (adopted at 79 FR 50224 through 50227).

We proposed to remove MORT–30–AMI, MORT–30–HF, MORT–30–COPD, MORT–30–PN, and MORT–30–CABG under proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program. Removing these measures from the Hospital IQR Program would eliminate costs associated with implementing and maintaining these measures for the program, and in particular, development

and release of duplicative and potentially confusing CMS confidential feedback reports provided to hospitals for both the Hospital IQR and Hospital VBP Programs. We refer readers to section VIII.A.4.b. of the preamble of this final rule where we discuss examples of the costs associated with implementing and maintaining these measures for the programs. For example, it may be costly for health care providers to track the confidential feedback, preview reports, and publicly reported information on a measure where we use the measure in more than one program. Health care providers incur additional cost to monitor measure performance in multiple programs for internal quality improvement and financial planning purposes when measures are used across value-based purchasing programs. Beneficiaries may also find it confusing to see public reporting on the same measures using different reporting periods in different programs. In addition, maintaining the specifications for the measures, as well as the tools we need to analyze and publicly report the measure data result in costs to CMS. We believe the costs associated with reviewing multiple feedback reports on these measures for more than one program outweigh the associated benefit to beneficiaries of receiving the same information from multiple programs, because that information can be captured through inclusion of these measures solely in the Hospital VBP Program.

We continue to believe these measures provide important data on patient outcomes following inpatient hospitalization (addressing the Meaningful Measures Initiative quality priority of promoting effective prevention and treatment of chronic disease), which is why we will continue to use these measures in the Hospital VBP Program. Unlike the Hospital IQR Program, performance data on measures maintained in the Hospital VBP Program are used both to assess the quality and value of care provided at a hospital and to calculate incentive payment adjustments for a given year of the program based on performance. The Hospital VBP Program's incentive payment structure ties hospitals' payment adjustments on claims paid under the IPPS to their performance on selected quality measures, including the above listed measures, sufficiently incentivizing performance improvement on these measures among participating hospitals. By keeping the measures in the Hospital VBP Program, patients, hospitals, and the public continue to receive information about the quality of care provided with respect to these measures.

As discussed in section VIII.A.4.b. of the preamble of this final rule, one of our main goals is to move forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing incentivize improvement in the quality of care provided to patients, and we believe removing these measures from the Hospital IQR Program is the best way to achieve that goal. In addition, as discussed in section I.A.2. of the preamble of this final rule, we believe keeping these measures in both programs no longer aligns with our goal of not adding unnecessary complexity or cost with duplicative measures across programs.

We note that the Hospital VBP Program has adopted the MORT–30–COPD measure beginning with the FY 2021 program year (80 FR 49558), the MORT–30–PN measure (modified with the expanded cohort) beginning with the FY 2021 program year (81 FR 56996), and the MORT–30–CABG measure beginning with the FY 2022 program year (81 FR 56998). Therefore, we proposed to stagger the beginning date of the removals of these measures from the Hospital IQR Program to avoid a gap in public reporting of measure data. For the Hospital IQR Program, we proposed to remove the: (1) MORT–30–AMI and MORT–30–HF measures for the FY 2020 payment determination (which would use a performance period of July 1, 2015 through June 30, 2018) and subsequent years; (2) MORT–30–COPD and MORT–30–PN measures for the FY 2021 payment determination (which would use a performance period of July 1, 2016 through June 30, 2019) and subsequent years; and (3) MORT–30–CABG measure for the FY 2022 payment determination (which would use a performance period of July 1, 2017 through June 30, 2020) and subsequent years.

Comment: A number of commenters supported CMS' proposals to remove five claims-based mortality measures. One commenter specifically agreed with removing these measures under the new removal Factor 8 while continuing to use them in the Hospital VBP Program. One commenter expressed support for CMS' proposals to remove MORT–30–AMI, MORT–30–HF, and MORT–30–CABG because it would reduce the burden of information collection and review for hospitals and would eliminate beneficiary confusion. One commenter specifically supported CMS' proposal to remove the MORT–30–HF measure from the Hospital IQR Program because it would reduce the reporting burden on hospitals without compromising the measure in the Hospital VBP Program.

Response: We thank the commenters for their support of removal of the five claims-based mortality measures.

Comment: One commenter supported the removal of these measures but noted that it did not believe burden would be reduced because the measures would still be reported in the Hospital VBP Program.

Response: We respectfully disagree that removing these measures will not reduce the costs associated with these measures. We believe that removing these measures would reduce the costs associated with tracking confidential feedback reports, preview reports, and publicly reported information for these measures in multiple programs. Healthcare providers incur additional cost to monitor measure performance in multiple programs for internal quality improvement and financial planning purposes when measures are used in multiple programs. Beneficiaries may also find it confusing to see public reporting on the same measures in different programs. In addition, costs to CMS would be reduced by no longer having to maintain the measure specifications, as well as the tools need to analyze and publicly report the measure data for multiple programs. We refer readers to section VIII.A.4.b. of the preamble of this final rule where we discuss examples of the costs associated with implementing and maintaining these measures.

Comment: One commenter sought clarification on whether removing these five mortality measures would also end public reporting on those measures. One commenter recommended that these measures continue to be publicly reported on *Hospital Compare.* A few commenters opposed CMS' proposals to remove five condition-specific mortality measures. A few commenters expressed concern that removing these measures would reduce program transparency and could result in a lack of public access to user-friendly condition-specific outcomes information. A few commenters recommended that measure-level reporting continue on *Hospital Compare* under the Hospital IQR Program, including frequency of reporting, for all measures in the Hospital VBP Program to ensure no loss of information to the public, and that future improvements in public reporting can be adopted consistently across publicly reported measures.

Response: We thank the commenters for their concerns and reiterate that we

will continue to publicly report measure-level data for the MORT–30–AMI, MORT–30–HF, MORT–30–COPD, MORT–30–PN, and MORT–30–CABG measures on the *Hospital Compare* website under the Hospital VBP Program, in accordance with its policies and in a manner that is transparent and easily understood by patients. Section 1886(o)(10)(A) of the Act requires the Hospital VBP Program to make information available to the public regarding the performance of individual hospitals, including performance with respect to each measure, on the *Hospital Compare* website in an easily understandable format. These measures will continue to be reported on *Hospital Compare* as they have been for the Hospital IQR Program, but under the requirements of the Hospital VBP Program. We will also strive to minimize disruptions to preexisting processes and timelines for publicly reporting these data.

Comment: One commenter did not support CMS' ''holistic'' view of the hospital quality programs. This commenter stated that initially adopting measures into the Hospital IQR Program allows for a period of measure validation, and for health systems to gain familiarity with the measures before they are moved into value-based purchasing programs, and expressed concern CMS' ''holistic'' view would allow new measures to be adopted immediately into the value-based purchasing programs without this time for familiarization and validation. The commenter stated its belief that adopting measures directly into the value-based purchasing programs would result in significant harm, undue hardship, and potentially financial penalties on healthcare systems.

Response: We thank the commenter for its comment, but emphasize that our proposal to remove duplicative measures from the Hospital IQR Program does not affect the underlying statutory requirements for adding new measures to the Hospital VBP, HAC Reduction, or Hospital Readmissions Reduction Programs. Those programs will continue to select measures as required by their statutory authority. For instance, the Hospital VBP Program will continue to select measures that have been specified under the Hospital IQR Program and refrain from beginning the performance period for any new measure until the data on that measure have been posted on *Hospital Compare* for at least one year, as required by section 1886(o)(2)(C)(i) of the Act. We note the HAC Reduction and Hospital Readmissions Reduction Programs do not have any similar statutory requirements in this regard as the Hospital VBP Program. We therefore disagree that these removals could result in harm, undue hardship, or financial penalties to hospitals because they do not alter the processes associated with adopting new measures into the Hospital VBP, HAC Reduction, or Hospital Readmissions Reduction Programs. We will, however, continue to consider on a case-by-case basis for each new measure whether it would be appropriate to propose the measure for the Hospital IQR Program before proposing to use it in either the HAC Reduction Program or the Hospital Readmissions Reduction Program.

Comment: One commenter did not support CMS' proposals to remove the MORT–30–AMI, MORT–30–HF, and MORT–30–PN measures because the commenter believed they are essential health and safety measurements, key to hospital accountability and incentivizing quality care. The commenter also expressed its opinion that the removal would decrease transparency and public accountability.

Response: We agree that these measures provide important information that can be used to promote accountability and to incentivize quality care. To further those goals, we will continue to include these measures in the Hospital VBP Program, which will both publicly report hospital performance on these measures and assess payment incentives to hospitals based on their performance on these and other quality measures. We refer readers to sections IV.I.2.d. and IV.I.2.e. of the preamble of this final rule where we list the measures used in the Hospital VBP Program. We appreciate the commenter's concerns and reiterate that we will continue to publicly report measure-level data for all of CMS' quality programs in a manner that is transparent and easily understood by patients. We will also strive to minimize disruptions to preexisting processes and timelines for publicly reporting this data.

After consideration of the public comments we received, we are finalizing removal of MORT–30–AMI, MORT–30–HF, MORT–30–COPD, MORT–30–PN, and MORT–30–CABG from the Hospital IQR Program measure set across the FYs 2020, 2021, and 2020 payment determinations as proposed.

(5) Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) (NQF #1550) (Hip/Knee Complications) Measure

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20477 through 20478), we proposed to remove one complications measure, Hospital-level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) (NQF #1550) (Hip/Knee Complications), beginning with the FY 2023 payment determination, under proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program. We refer readers to FY 2013 IPPS/LTCH PPS final rule (77 FR 53516 through 53518), where we adopted this measure.

We believe that removing this measure from the Hospital IQR Program would eliminate costs associated with implementing and maintaining the measure for the program, and in particular, development and release of duplicative and potentially confusing CMS confidential feedback reports provided to hospitals across multiple hospital quality and value-based purchasing programs. We refer readers to section VIII.A.4.b. of the preamble of this final rule where we discuss examples of the costs associated with implementing and maintaining these measures for the programs. For example, it may be costly for health care providers to track the confidential feedback, preview reports, and publicly reported information on this measure as we also use the measure in the Hospital VBP Program and the Comprehensive Care for Joint Replacement model (CJR model). Health care providers incur additional cost to monitor measure performance in multiple programs for internal quality improvement and financial planning purposes when measures are used across value-based purchasing programs. Beneficiaries may also find it confusing to see public reporting on the same measure in different programs. In addition, maintaining the specifications for the measure, as well as the tools we need to analyze and publicly report the measure data result in cost to CMS. We believe the costs as discussed above outweigh the associated benefit to beneficiaries of receiving the same information from more than one program, because that information can be captured through inclusion of this measure in the Hospital VBP Program.

As discussed in section VIII.A.4.b. of the preamble of this final rule, one of our main goals is to move the program forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients, and we believe removing this measure from the Hospital IQR Program is the best way to achieve this goal. We believe retaining the Hip/Knee Complications measure in both the Hospital IQR Program and the Hospital VBP Program no longer aligns with our current goal of not adding unnecessary complexity or cost with duplicative measures across programs, as stated in section I.A.2. of the preamble of this final rule.

We continue to believe this measure provides important data on patient outcomes following inpatient hospitalization (addressing the Meaningful Measures Initiative quality priority of promoting effective treatment), which is why we will continue to use this measure in the Hospital VBP Program. Unlike the Hospital IQR Program, performance data on measures maintained in the Hospital VBP Program are used both to assess the quality and value of care provided at a hospital and to calculate incentive payment adjustments for a given year of the program based on performance. The Hospital VBP Program's incentive payment structure ties hospitals' payment adjustments on claims paid under the IPPS to their performance on selected quality measures, including the Hip/Knee Complications measure, sufficiently incentivizing performance improvement on this measure among participating hospitals. By keeping the measure in the Hospital VBP Program, patients, hospitals, and the public continue to receive information about the quality of care provided with respect to this measure.

Therefore, we proposed to remove the Hip/Knee Complications measure from the Hospital IQR Program beginning with the FY 2023 payment determination (which applies to the performance period of April 1, 2018 through March 31, 2021) and subsequent years. We chose to propose this timeframe because the Comprehensive Care for Joint Replacement model (CJR model) previously adopted the same measure and requires use of data collected under the Hospital IQR Program through the FY 2022 payment determination (which would use a performance period of April 1, 2017 through March 31, 2020) (80 FR 73507). After removal from the Hospital IQR Program, we note that this measure would continue to be reported on the *Hospital Compare* website under the public reporting requirements of the Hospital VBP Program.

Comment: Many commenters supported CMS' proposal to remove the Hip/Knee Complications measure beginning with the FY 2023 payment determination. One commenter stated that including this measure in the Hospital VBP Program provides a stronger incentive for hospitals to focus on performance improvement.

Response: We thank the commenters for their support for the removal of this measure and agree that retaining this measure in the Hospital VBP Program incentivizes providers to perform well on this measure.

Comment: One commenter opposed CMS' proposal to remove the Hip/Knee Complications measure due to concerns that its removal will reduce program transparency and could result in a lack of public access to user-friendly condition-specific outcome information. The commenter recommended that measure-level data reporting continue on *Hospital Compare* under the Hospital IQR Program, including the frequency of reporting, for all measures in the Hospital VBP Program to ensure no loss of information to the public and that future improvements in public reporting can be adopted consistently across publicly reported measures.

Response: We thank the commenter for sharing its concerns, and reiterate that we will continue to publicly report measure-level data for the Hip/Knee Complications measure on the *Hospital Compare* website under the Hospital VBP Program according to program policies in a manner that is transparent and easily understood by patients. Section 1886(o)(10)(A) of the Act requires the Hospital VBP Program to make information available to the public regarding the performance of individual hospitals, including performance with respect to each measure, on the *Hospital Compare* website in an easily understandable format. We will also strive to minimize any disruptions to preexisting processes and timelines for publicly reporting this data.

After consideration of the public comments we received, we are finalizing removal of the Hip/Knee Complications measure from the Hospital IQR Program measure set beginning with the FY 2023 payment determination and for subsequent years as proposed.

(6) Medicare Spending per Beneficiary (MSPB)—Hospital Measure (NQF #2158) (MSPB)

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20478 through 20479), we proposed to remove one resource use measure, Medicare Spending Per Beneficiary (MSPB)—Hospital (NQF #2158) (MSPB), from the Hospital IQR Program beginning with the FY 2020 payment determination, under the proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51618) where we adopted this measure.

We believe that removing this measure from the Hospital IQR Program would eliminate costs associated with implementing and maintaining the measure, and in particular, development and release of duplicative and potentially confusing CMS confidential feedback reports provided to hospitals across multiple hospital quality and value-based purchasing programs. We refer readers to section VIII.A.4.b. of the preamble of this final rule where we discuss examples of the costs associated with implementing and maintaining these measures for the programs. For example, it may be costly for health care providers to track the confidential feedback, preview reports, and publicly reported information on this measure as we use the measure in the Hospital VBP Program. Health care providers incur additional cost to monitor measure performance in multiple programs for internal quality improvement and financial planning purposes when measures are used across value-based purchasing programs. Beneficiaries may also find it confusing to see public reporting on the same measure in different programs. In addition, maintaining the specifications for the measure, as well as the tools we need to analyze and publicly report the measure data result in costs to CMS. We believe the costs as discussed above outweigh the associated benefit to beneficiaries of receiving the same information from multiple programs, because that information can be captured through inclusion of this measure solely in the Hospital VBP Program.

As discussed in section VIII.A.4.b. of the preamble this final rule, one of our main goals is to move the program forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to

patients, and we believe removing this measure from the Hospital IQR Program helps achieve that goal. In addition, as discussed in section I.A.2. of the preamble of this final rule, we believe keeping this measure in both programs no longer aligns with our goal of not adding unnecessary complexity or cost with duplicative measures across programs.

We continue to believe this measure provides important data on resource use (addressing the Meaningful Measures Initiative priority of making care affordable), which is why we will continue to use this measure in the Hospital VBP Program. Unlike the Hospital IQR Program, performance data on measures maintained in the Hospital VBP Program are used both to assess the quality and value of care provided at a hospital and to calculate incentive payment adjustments for a given year of the program based on performance. The Hospital VBP Program's incentive payment structure ties hospitals' payment adjustments on claims paid under the IPPS to their performance on selected quality measures, including the MSPB measure, sufficiently incentivizing performance improvement on this measure among participating hospitals. By keeping the measure in the Hospital VBP Program, patients, hospitals, and the public continue to receive information about the quality of care provided with respect to these measures.

Therefore, we proposed to remove the MSPB measure from the Hospital IQR Program beginning with the FY 2020 payment determination (which applies to the performance period of January 1, 2018 through December 31, 2018) and subsequent years. As a claims-based measure, which uses claims and administrative data to calculate the measure without any additional data collection from hospitals, we can operationally remove the MSPB measure sooner than certain other measures we proposed for removal in the proposed rule.

Comment: A few commenters expressed their support for CMS' proposal to remove the MSPB measure from the Hospital IQR Program.

Response: We thank the commenters for their support.

Comment: One commenter did not support CMS' proposal to remove the MSPB measure from the Hospital IQR Program based on their concern that CMS' ''holistic'' view would allow new measures to be adopted immediately into the value-based purchasing programs without adequate time for familiarization and validation. Specifically, the commenter stated that initially adopting measures into the Hospital IQR Program allows for a period of measure validation, and for health systems to gain familiarity with the measures before they are moved into value-based purchasing programs. The commenter stated its belief that adopting measures directly into the value-based purchasing programs would result in significant harm, undue hardship, and potentially financial penalties on healthcare systems.

Response: We thank the commenter for its feedback. We note that the MSPB measure has been used in the Hospital VBP Program since the FY 2015 program year. We also emphasize that our proposal to remove duplicative measures from the Hospital IQR Program does not affect the underlying statutory requirements of adding new measures to the Hospital VBP, HAC Reduction, or Hospital Readmissions Reduction Programs. Those programs will continue to select new measures as required by their statutory authority. For instance, the Hospital VBP Program will continue to select measures that have been specified under the Hospital IQR Program, like the MSPB measure, and refrain from beginning the performance period for any new measure until the data on that measure have been posted on *Hospital Compare* for at least one year, as required by section 1886(o)(2)(C)(i) of the Act. We note the HAC Reduction and Hospital Readmissions Reduction Programs do not have any similar statutory requirements in this regard as the Hospital VBP Program. We therefore disagree that these removals could result in harm, undue hardship, or financial penalties to hospitals because they do not alter the processes associated with adopting new measures into the Hospital VBP, HAC Reduction, or Hospital Readmissions Reduction Programs. We will, however, continue to consider on a case-by-case basis for each new measure whether it would be appropriate to propose the measure for the Hospital IQR Program before proposing to use it in either the HAC Reduction Program or the Hospital Readmissions Reduction Program. We also note that we assess the reliability and validity of measures before proposing to adopt them into any program, and will continue to do so.

After consideration of the public comments we received, we are finalizing our proposal to remove the Medicare Spending Per Beneficiary—Hospital (NQF #2158) (MSPB) measure from the Hospital IQR Program, beginning with the FY 2020 payment determination as proposed.

(7) Clinical Episode-Based Payment Measures

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20479 through 20480), we proposed to remove six clinical episode-based payment measures from the Hospital IQR Program beginning with the FY 2020 payment determination:

- Cellulitis Clinical Episode-Based Payment Measure (Cellulitis Payment) (adopted at 80 FR 49664 through 49674);
- Gastrointestinal Hemorrhage Clinical Episode-Based Payment Measure (GI Payment) (adopted at 80 FR 49664 through 49674);
- Kidney/Urinary Tract Infection Clinical Episode-Based Payment Measure (Kidney/UTI Payment) (adopted at 80 FR 49664 through 49674);
- Aortic Aneurysm Procedure Clinical Episode-Based Payment Measure (AA Payment) (adopted at 81 FR 57133 through 57142);
- Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment Measure (Chole and CDE Payment) (adopted at 81 FR 57133 through 57142); and
- Spinal Fusion Clinical Episode-Based Payment Measure (SFusion Payment) (adopted at 81 FR 57133 through 57142).

We proposed to remove the Cellulitis Payment, GI Payment, Kidney/UTI Payment, AA Payment, Chole and CDE Payment, and SFusion Payment measures under proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program. We refer readers to section VIII.A.4.b. of the preamble of this final rule where we discuss examples of the costs associated with implementing and maintaining these measures for the programs. Specifically, maintaining the specifications for the measure, as well as the tools we need to analyze and publicly report the measure data result in costs to CMS. We believe the costs associated with interpreting the requirements for multiple measures with overlapping data points outweigh the benefit to beneficiaries and providers of the additional information provided by these measures, because the measure data are already captured within the overall hospital MSPB measure, which will be retained in the Hospital VBP Program.

These measures are clinically coherent groupings of health care services that can be used to assess providers' resource use associated with the clinically coherent groupings (80 FR

49664). Specifically, these measures all use Part A and Part B Medicare administrative claims data from Medicare FFS beneficiaries hospitalized for a clinical issue associated with the respective clinical groupings (80 FR 49664 through 49668; 81 FR 57133 through 57140). However, these data also are captured in the MSPB measure, which uses claims data for hospital discharges, including Medicare Part A and Part B payments for services rendered to Medicare beneficiaries during the Medicare spending per beneficiary episode surrounding an index hospitalization (76 FR 51618 through 51627). Although the MSPB measure does not provide the same level of granularity that these individual measures do, the most essential data elements will be captured by and publicly reported under the MSPB measure in the Hospital VBP Program. We understand that some hospitals may appreciate receiving more granular payment measure data from individual episode-based payment measures, while other hospitals may not benefit from the use of individual measures in addition to MSPB because they do not have a sufficient number of cases for those measures to be calculated. We proposed to remove these measures because we believe that in balancing the costs of keeping these measures in the program compared to the benefit, providers would prefer to focus their improvement efforts on total payment, rather than both total payment and the payments associated with these individual types of clinical episodes. While we proposed to remove the MSPB measure from the Hospital IQR Program as discussed in the section above, the measure would continue to be included in the Hospital VBP Program (section IV.I.2.e. of the preamble of this final rule). We also note that the Hospital IQR Program will retain certain condition- and procedure-specific payment measures (specifically, focusing on patients hospitalized for heart failure, AMI, pneumonia, and elective hip and/or knee replacement procedures) with readmissions and mortality measure data for the same patient cohorts. Since the MSPB measure would still be reported for the Hospital VBP Program, patients, hospitals, and the public would continue to receive information about the data provided by these resource measures. Thus, removing these six measures from the Hospital IQR Program would help to reduce duplicative data and produce a more harmonized and streamlined measure set. Further, and as explained above, the Hospital VBP Program's incentive payment structure ties hospitals' payment adjustments on claims paid under the IPPS to their performance on selected quality measures, including the MSPB measure, sufficiently incentivizing performance improvement on this measure among participating hospitals.

As discussed in section VIII.A.4.b. of the preamble of this final rule, above, one of our main goals is to move forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients, and we believe that removing these measures from the Hospital IQR Program helps achieve that goal. We recognize, however, that including specific episode-based payment measure data can provide hospitals with actionable feedback to better equip them to implement targeted improvements in comparison to an overall payment measure. In addition, these measures were only recently implemented in the Hospital IQR Program in the FY 2017 IPPS/LTCH PPS final rule and data have not yet become publicly available on the *Hospital Compare* website. However, because these episode-based payment measures are not tied directly with other clinical quality measures that could contribute to the overall picture of providers' clinical effectiveness and efficiency, we believe that the data derived from these measures may be of lower utility to patients in deciding where to seek care, as well as to providers in gaining feedback to reduce cost and improve efficiency while maintaining high quality care; they address resource use which is not directly tied to clinical quality, unless combined with other clinical quality measures (81 FR 57133 through 57134).

Therefore, we proposed to remove the Cellulitis Payment, GI Payment, Kidney/UTI Payment, AA Payment, Chole and CDE Payment, and SFusion Payment measures for the FY 2020 payment determination (which applies to the performance period of January 1, 2018 through December 31, 2018) and subsequent years. Because these are claims-based measures, operationally, we are able to remove them sooner than certain other measures we proposed for removal in the proposed rule.

We invited public comment on our proposal to remove these measures from the Hospital IQR Program as well as feedback on whether there are reasons to retain one or more of the measures in the Hospital IQR Program.

Comment: A number of commenters supported CMS' proposals to remove the clinical episode-based payment measures from the Hospital IQR Program. These commenters asserted that these clinical episode-based payment measures are of limited value to beneficiaries because without being tied directly to corresponding clinical quality measures, these measures only address resource use, and cost alone does not provide sufficient data for an assessment of the value of care provided. A few commenters also expressed support for removal of the clinical episode-based payment measures due to their overlap with the MSPB measure. One commenter asserted that the clinical episode-based payment measures should be removed because the commenter believes they have not been adequately assessed to address methodological issues such as attribution and the lack of social risk factor adjustments.

Response: We thank the commenters for their support, and appreciate the feedback on additional considerations for removing the clinical episode-based payment measures from the Hospital IQR Program. While we continue to believe that these measures as specified are valid and reliable as discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49660 through 49661; 80 FR 49664 through 49674) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57133 through 57142), we are finalizing their removal because we believe the costs outweigh the benefits supporting the continued use of these measures in the Hospital IQR Program. We also refer readers to section VIII.A.10. of the preamble of this final rule for a discussion of our ongoing efforts to account for social risk factors in the Hospital IQR Program.

Comment: One commenter expressed particular support for CMS' proposal to remove the Aortic Aneurysm Procedure Clinical Episode-Based Payment Measure (AA Payment) from the Hospital IQR Program. The commenter noted that the measure was not supported by the MAP for adoption in the Hospital IQR Program and is not NQF-endorsed, and further stated their belief that due to the high rate of innovation and the ongoing introduction of new technologies and medical devices for treatment of aortic aneurysms, it is not an appropriate clinical area for cost measurement.

Response: We thank the commenter for its support.

Comment: A few commenters supported CMS' proposal to remove the Spinal Fusion Clinical Episode-Based Payment Measure (SFusion Payment) from the Hospital IQR Program. One commenter supported removal because

the measure data are captured within the overall hospital MSPB measure, which will be retained in the Hospital VBP Program. Another commenter specifically supported removal because the data derived from this clinical episode-based payment measure, in its current form, may be of lower utility to patients and providers since the measure is not tied directly with any other clinical quality measures, and thus does not provide a complete picture of providers' clinical effectiveness and efficiency.

Response: We thank the commenters for their support.

Comment: A few commenters did not support CMS' proposals to remove the clinical episode-based payment measures from the Hospital IQR Program because these commenters believe the MSPB measure, which is being retained in the Hospital VBP Program, is too broad of a measure to tie to specific existing quality measures and too general to be meaningful to providers. One commenter noted the lack of a demonstrated linkage between spending and outcomes under the MSPB measure. Some commenters also noted that the clinical episode-based payment measures allow hospitals to receive more precise and contextual data on healthcare costs, and asserted that this information cannot be derived from the MSPB measure. One commenter stated that the clinical episode-based payment measures, while not currently linked to corresponding clinical quality measures, have the potential to improve coordination and transitions of care and thereby increase the efficiency of care across the full continuum.

Response: We thank the commenters for their feedback. We understand commenters' appreciation for the more granular payment measure data derived from individual clinical episode-based payment measures rather than the MSPB measure, as we recognize that specific clinical episode-based payment measure data can provide hospitals with actionable feedback to better equip them to implement targeted improvements in comparison to an overall payment measure. However, we also understand that other hospitals may not benefit from the use of individual clinical episode-based payment measures because they lack a sufficient number of cases for those measures to be calculated. Although the MSPB measure does not provide the same level of granularity as the individual clinical episode-based payment measures, we believe the most essential data elements are captured by and publicly reported under the MSPB measure in the Hospital VBP Program. As stated in the proposed rule, we believe that in balancing the costs of keeping these measures in the program compared to the benefit, providers would prefer to focus their improvement efforts on total payment, rather than both total payment and the payments associated with these specific types of clinical episodes. Furthermore, while we recognize the MSPB [280] measure is not currently tied to a specific existing quality measure, we respectfully disagree with commenters' assertions that the measure is too general to be meaningful to providers, as we continue to believe the MSPB measure provides valuable information that captures a wide range of services provided in the inpatient hospital setting and immediately post-discharge, and addresses the Meaningful Measures Initiative priority of making care affordable, which is why we will continue to use this measure in the Hospital VBP Program.

Finally, we agree that the clinical episode-based payment measures, if tied to corresponding clinical quality measures, have the potential to improve coordination and transitions of care and thereby increase the efficiency of care across the full continuum, and will take these recommendations into consideration for future program years. However, as the clinical episode-based payment measures are not currently tied directly to other clinical quality measures, we believe that the data derived from these measures may be of lower utility to patients in deciding where to seek care, as well as to providers in receiving feedback to reduce cost and improve efficiency while maintaining high quality care.

After consideration of the public comments we received, we are finalizing our proposal as proposed to remove the six clinical episode-based payment measures from the Hospital IQR Program beginning with the FY 2020 payment determination: (1) Cellulitis Clinical Episode-Based Payment Measure (Cellulitis Payment); (2) Gastrointestinal Hemorrhage Clinical Episode-Based Payment Measure (GI Payment); (3) Kidney/Urinary Tract Infection Clinical Episode-Based Payment Measure (Kidney/UTI Payment); (4) Aortic Aneurysm Procedure Clinical Episode-Based Payment Measure (AA Payment); (5) Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment Measure (Chole and CDE Payment); and (6) Spinal Fusion Clinical Episode-Based Payment Measure (SFusion Payment).

[280] For a detailed discussion of our adoption of the MSPB measure in the Hospital IQR Program, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51618 through 51627).

(8) Chart-Abstracted Clinical Process of Care Measures

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20480 through 20481), we proposed to remove the Influenza Immunization, Incidence of Potentially Preventable Venous Thromboembolism, Median Time from ED Arrival to ED Departure for Admitted ED Patients, and Admit Decision Time to ED Departure Time for Admitted Patients measures as discussed in detail below. Manual abstraction of these chart-abstracted measures is highly burdensome. We have previously stated our intent to move away from chart-abstracted measures in order to reduce this information collection burden (78 FR 50808; 79 FR 50242; 80 FR 49693). We refer readers to our discussion below and to section XIV.B.3.b. of the preamble of the proposed rule, where we discuss the information collection burden associated with each of these measures with greater specificity.

We invited public comment on our proposals and received the following general comments. Measure-specific comments are discussed further below.

Comment: Several commenters supported CMS' proposal to remove the chart-abstracted Clinical Process of Care (CPOC) measures IMM–2, VTE–2, ED–1, and ED–2 because they are duplicative to measures in other programs and are burdensome to report. Commenters noted that measures should provide value in data generated in proportion to intensity of data collection effort. A few commenters expressed that while they supported the removal of these particular CPOC measures, they are not opposed to the use of chart-abstraction to gather data when necessary to achieve quality improvement goals, even though this data collection method represents the greatest reporting burden for hospitals. One commenter supported removal of the CPOC measures, but expressed concern about the SEP–1 Sepsis Management Bundle being the only measure subject to validation in the Hospital IQR Program because SEP–1 is extremely complex and a relatively new measure.

Response: We thank the commenters for their support and appreciate the feedback regarding the potential future adoption of chart-abstracted measures when necessary to achieve important quality improvement goals. We agree with commenters that removal of these four chart-abstracted CPOC measures from the Hospital IQR Program will

reduce reporting burden for hospitals, and we note that their removal will also reduce the costs and burden related to the validation of these measures, so that hospitals may direct resources to more meaningful measures such as the SEP–1 measure, which hospitals began reporting under the Hospital IQR Program with 4th quarter 2015 data. While we acknowledge the commenter's concern about the SEP–1 measure remaining as the only measure subject to chart-abstracted validation under the Hospital IQR Program, we note that the SEP–1 measure has been a part of the Hospital IQR Program for a number of years,[281] which we believe has given hospitals sufficient time to become familiar with the reporting and validation requirements for this measure to ensure they are accurately reporting data for this measure. Furthermore, because ensuring proper and timely care for patients with severe sepsis and septic shock aligns with the Meaningful Measures Initiative quality priority of making care safer by reducing harm caused in the delivery of care, we believe it is appropriate to continue incentivizing proper reporting of sepsis measure data through our current data validation policies.

Comment: One commenter did not support CMS' proposals to remove the IMM–2, ED–1, and ED–2 measures because it stated that these measures are part of the core measure set for the Medicare Beneficiary Quality Improvement Project (MBQIP) administered by HRSA, and they are both relevant to rural care delivery and resistant to low case volume. The commenter noted that removal of these measures would leave CAHs with very limited options in terms of relevant inpatient metrics for engagement in public reporting and demonstrating quality.

Response: We acknowledge that facilitating quality improvement for rural hospitals and CAHs presents unique challenges and is a high priority under the Meaningful Measures Initiative. However, as discussed in the proposed rule, in assessing the continued use of these specific measures in the Hospital IQR Program, we determined that the costs associated with these measures, particularly the data collection burden for hospitals, outweigh the benefit of their continued use in the program. We note that the eCQM version of ED–2 remains available under the Hospital IQR Program, as well as the Promoting Interoperability Program's eCQM measure set for reporting by CAHs. In addition, we are exploring opportunities to develop more relevant measures and less burdensome methods to collect quality measure data for use by small and rural hospitals. For more information about quality measurement efforts for rural health settings, we refer readers to the MAP Rural Health Workgroup at: *http://www.qualityforum.org/MAP_Rural_Health_Workgroup.aspx*. For more information about the reporting and use of MBQIP data, including the MBQIP measure set, we refer readers to the National Rural Health Resource Center at: *https://www.ruralcenter.org/tasc/mbqip/data-reporting-and-use*.

Comment: One commenter requested clarification about whether the 2018 eCQM reporting requirements also means that CAHs are required to submit chart-abstracted measures to the Hospital IQR Program.

Response: We clarify that under section 1886(b)(3)(B)(viii) of the Act, only subsection (d) hospitals are required to submit data to the Hospital IQR Program. CAHs are neither required to submit chart abstracted measure data to the Hospital IQR Program, nor subject to any payment reduction. CAHs participating in the Promoting Interoperability Programs have eCQM reporting requirements with respect to those programs; we refer readers to section VIII.D. of the preamble of this final rule where that is discussed.

(a) Influenza Immunization Measure (NQF #1659) (IMM–2)

We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50211) where we adopted the Influenza Immunization measure (NQF #1659) (IMM–2). In the proposed rule, we proposed to remove IMM–2 beginning with the CY 2019 reporting period/FY 2021 payment determination under removal Factor 1—topped-out measure and under proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program.

Hospital performance on IMM–2 is statistically ''topped-out''—removal Factor 1. The Hospital IQR Program previously finalized two criteria for determining when a measure is ''topped out'': (1) When there is statistically indistinguishable performance at the 75th and 90th percentiles; and (2) when the measure's truncated coefficient of variation is less than or equal to 0.10 (79 FR 50203). Our analysis indicates that performance on this measure has been topped-out for the past three payment determination years and also for Q1 and Q2 of 2017 encounters. This analysis is captured by the table below:

Payment determination	Encounters	Number of hospitals	Mean	75th percentile	90th percentile	Truncated COV
FY 2016	2014 (Q1–Q4)	3,326	0.9292	0.9867	0.9965	0.0560
FY 2017	2015 (Q1–Q4)	3,293	0.9372	0.9890	0.9970	0.0494
FY 2018	2016 (Q1–Q4)	3,258	0.9370	0.9890	0.9970	0.0500

Our topped-out analysis shows that administration of the influenza vaccination to admitted patients is widely in practice and there is little room for improvement. We believe that hospitals will continue this practice even after the measure is removed; thus, utility in the program is limited.

Moreover, we proposed to remove this measure under proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program. We believe the information collection burden associated with manual chart abstraction, as discussed above, outweighs the associated benefit to beneficiaries of receiving this information, because: (1) It is topped out and there is little room for improvement (discussed above); and (2) it does not directly measure patient outcomes.

As discussed in section I.A.2. of the preamble of this final rule, one of the goals of the Meaningful Measures Initiative is to reduce costs associated with payment policy, quality measures, documentation requirements, conditions of participation, and health information technology. Another goal of the Meaningful Measures Initiative is to utilize measures that are ''outcome-based where possible.'' IMM–2 is a

[281] We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50236 through 50241), where the SEP–1 measure was adopted into the Hospital IQR Program.

process measure that tracks patients assessed and given an influenza vaccination with their consent, but does not directly measure patient outcomes.

We recognize and agree that influenza prevention is an important public health issue. We note that the Influenza Vaccination Coverage Among Healthcare Personnel (HCP) measure (adopted at 76 FR 51631 through 51633), which assesses the percentage of healthcare personnel at a facility who receive the influenza vaccination, remains in the Hospital IQR Program. Although the HCP measure is focused on vaccination of providers and other hospital personnel and not beneficiaries, it promotes improved health outcomes among beneficiaries because: (1) Health care personnel that have received the influenza vaccination are less likely to transmit influenza to patients under their care; and (2) vaccination of health care personnel reduces the probability that hospitals may experience staffing shortages as a result of illness that would impact ability to provide adequate patient care. Thus, we believe the costs associated with reporting this chart-abstracted measure outweighs the associated benefits of keeping it in the Hospital IQR Program.

We proposed to remove the IMM–2 measure beginning with the CY 2019 reporting period/FY 2021 payment determination (which applies to the performance period of January 1, 2019 through December 31, 2019) because hospitals already would have collected and reported data for the first three quarters of the CY 2018 reporting period for the FY 2020 payment determination by the time of publication of the FY 2019 IPPS/LTCH PPS final rule. In addition, there are operational limitations associated with updating CMS systems in time to remove this measure sooner for the CY 2018 reporting period/FY 2020 payment determination. This proposed timeline (that is, beginning with the CY 2019 reporting period/FY 2021 payment determination) would subsequently allow us to use the data already reported by hospitals in the CY 2018 reporting period for public reporting on our *Hospital Compare* website and for data validation.

Therefore, we proposed to remove the IMM–2 measure from the Hospital IQR Program for the CY 2019 reporting period/FY 2021 payment determination and subsequent years.

Comment: Several commenters supported CMS' proposal to remove the chart-abstracted IMM–2 measure because it is topped-out, although they acknowledged vaccination in the hospital is beneficial to protect against the influenza and expressed the hope that removing the IMM–2 measure does not impact overall vaccination efforts and public health efforts during the influenza season. One commenter also noted that the IMM–2 measure does not directly measure patient outcomes.

Response: We thank commenters for their support.

Comment: Several commenters did not support CMS' proposal to remove the chart-abstracted IMM–2 measure because they believed there is still a need for improvement in immunization rates and the measure has significant public health implications. A few commenters expressed concern that there has been little progress toward the CDC Healthy People 2020 goal of 70 percent for influenza vaccinations with a current rate of 38.1 percent for 2014, and that once measures are removed, performance may deteriorate below the baseline.

Response: We recognize and agree that influenza prevention is an important public health issue. However, even though, as commenters suggest, there is significant room for improvement in nationwide vaccination rates toward the national immunization goals set by CDC Healthy People 2020,[282] the IMM–2 measure is a process measure that tracks only whether inpatients are assessed and given an influenza vaccination with their consent prior to discharge, if indicated. As a result, this measure does not directly assess patient outcomes and is limited to incentivizing immunization of patients admitted to an acute care hospital—a small subset of the total U.S. population. In addition, the IMM–2 measure has been topped-out for the past three reporting periods, indicating the rate of acute care hospitals assessing admitted patients for influenza vaccination is significantly higher than the national average. Because the IMM–2 measure, as specified, is limited to patients admitted to an acute care hospital, we do not believe continued use of this measure is likely to result in additional improvement in rates of influenza vaccination assessment among admitted hospital patients.

Comment: One commenter noted that accountable care organizations (ACOs) are also required to report on an influenza immunization measure. Accordingly, they may be able to contract with hospitals to incorporate processes or standing orders to immunize patients for influenza, and the alignment between the measures reported by ACOs and hospitals would reinforce incentives to improve immunization rates. Another commenter suggested that the IMM–2 measure should remain in the Program as a required chart-abstracted measure until such a time that CMS develops an eCQM to replace it.

Response: We appreciate the commenter's suggestion that ACOs may be able to contract with hospitals to incorporate processes to immunize for influenza and the recommendation to develop an eCQM version of IMM–2. We will continue to assess opportunities to address influenza vaccination rates outside of the hospital quality programs or through other types of measures.

Comment: One commenter noted that the rationale to remove the IMM–2 measure from the Hospital IQR Program because the HCP measure will be retained contradicts the rationale to remove the HCP measure from the IPFQR Program.

Response: We disagree with the commenter's assertion that removal of IMM–2 contradicts the rationale to retain the HCP measure in the Hospital IQR Program. We believe that the burden of reporting the HCP measure is greater for IPFs compared to the relative burden for acute care hospitals participating in the hospital quality reporting and value-based purchasing programs. The entire burden of registering for and maintaining access to the CDC's NHSN system for IPFs, especially independent or freestanding IPFs, is due to one measure (HCP); whereas a hospital participating in the hospital quality reporting and value-based purchasing programs, for example, must register and maintain NHSN access for purposes of submitting data for several, not just one, healthcare safety measures for the hospital quality reporting and value-based purchasing programs in which it participates. Furthermore, because the topic is addressed in other initiatives, such as state laws [283] and employer programs, we believe that the costs and burden of this measure on IPFs, especially independent or freestanding IPFs, outweighs the benefit of retaining the measure in the IPFQR Program.

Comment: A few commenters did not agree with the timing of the removal of IMM–2 because as proposed, the removal does not align with the collection and reporting of IMM–2 data. Commenters noted that immunization

[282] For more information about the national immunization goals under CDC Healthy People 2020, we refer readers to: *https://www.healthypeople.gov/2020/topics-objectives/topic/immunization-and-infectious-diseases.*

[283] CDC, Menu of State Hospital Influenza Vaccination Laws. Available at: *https://www.cdc.gov/phlp/docs/menu-shfluvacclaws.pdf.*

data is not collected for the ''first three quarters'' of the CY reporting period, but rather influenza data is only collected in Q1 and Q4. Therefore, by removing the measure beginning with the CY 2019 reporting period/FY 2021 payment determination, hospitals would already have collected and reported data in Q4 2018, which is half of the measure's flu season.

Response: We recognize that the influenza season spans the winter months from Q4 to Q1 and those are the data used for public reporting purposes on the *Hospital Compare* website, however, data collection occurs on a quarterly basis for the entire calendar year.[284] Therefore, if this measure were to be removed beginning with the CY 2018 reporting period/FY 2020 payment determination, hospitals would already have collected data for Q4 2017 and Q1 2018, as well as Q2 2018 and Q3 2018, but would not receive credit for reporting that information. Although hospitals would only have collected half of the data that would be used for public reporting purposes by the time of publication of the FY 2019 IPPS/LTCH PPS final rule, removing this measure beginning with the CY 2019 reporting period/FY 2021 payment determination would enable hospitals to get credit for the half-year of data already collected. Therefore, in the interest of ensuring that resources already expended do not go to waste, we believe that removing this measure beginning with the CY 2019 reporting period/FY 2021 payment determination is most appropriate.

After consideration of the public comments we received, we are finalizing our proposal to remove the IMM–2 measure from the Hospital IQR Program for the CY 2019 reporting period/FY 2021 payment determination and subsequent years as proposed.

(b) Incidence of Potentially Preventable Venous Thromboembolism Measure (VTE–6); Median Time From ED Arrival to ED Departure for Admitted ED Patients Measure (NQF #0495) (ED–1); and Admit Decision Time to ED Departure Time for Admitted Patients Measure (NQF #0497) (ED–2)

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51634 through 51636), where we adopted the Incidence of Potentially Preventable Venous Thromboembolism measure (VTE–6), and to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50210 through 50211), where we adopted both the chart-abstracted version of the Median Time from ED Arrival to ED Departure for Admitted ED Patients measure (NQF #0495) (ED–1) and the Admit Decision Time to ED Departure Time for Admitted Patients measure (NQF #0497) (ED–2). In the proposed rule, we proposed to remove VTE–6 and the chart-abstracted version of ED–1 beginning with the CY 2019 reporting period/FY 2021 payment determination; in addition, we proposed to remove the chart-abstracted version of ED–2 beginning with the CY 2020 reporting period/FY 2022 payment determination. We proposed to remove these three measures under proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program.

As discussed in section I.A.2. of the preamble of this final rule, one of the goals of our Meaningful Measures Initiative is to reduce costs associated with payment policy, quality measures, documentation requirements, conditions of participation, and health information technology. We believe the information collection burden associated with manual chart abstraction, as discussed above, outweighs the associated benefit to beneficiaries of receiving information provided by these measures because much of the information provided by these measures is available through other Program measure data (as further discussed below).

Furthermore, in the case of ED–2, hospitals still would have the opportunity to submit data since the eCQM version will remain part of the Hospital IQR Program measure set. We note that in section VIII.A.5.b.(9)(c) of the preamble of the proposed rule, we proposed to remove the eCQM version of ED–1, but to retain the eCQM version of ED–2 due to the continued importance of assessing ED wait times for admitted patients. Although ED–1 is an important metric for patients, ED–2 has greater clinical significance for quality improvement because it provides more actionable information such that hospitals have greater ability to allocate resources to consistently reduce the time between decision to admit and time of inpatient admission. Hospitals have somewhat less control to consistently reduce wait time between ED arrival and decision to admit, as measured by ED–1, due to the need to triage and prioritize more complex or urgent patients. Also, the Hospital OQR Program includes an ED throughput measure, OP–18: Median Time from ED Arrival to ED Departure for Discharged ED Patients (81 FR 79755), which publicly reports similar data as captured by ED–1. Therefore, we believe the costs to providers for submitting data on the chart-abstracted ED–1 and ED–2 measures outweigh the associated benefits of keeping the measures in the program given that other measures in the Hospital IQR Program and in other CMS hospital quality programs are able to capture actionable data on ED wait times.

Furthermore, although the eCQM version of VTE–6 is not included in the Hospital IQR Program, hospitals still would have the opportunity to submit data for two other VTE related measures (eCQMs), which were already adopted in the Hospital IQR Program measure set—Venous Thromboembolism Prophylaxis (VTE–1) (NQF #0371) eCQM (adopted at 78 FR 50809) and Intensive Care Unit Venous Thromboembolism Prophylaxis (VTE–2) (NQF #0372) eCQM (adopted at 78 FR 50809). The VTE–1 eCQM assesses the number of patients who received venous thromboembolism (VTE) prophylaxis or have documentation why no VTE prophylaxis was given the day of or day after hospital admission or surgery end date for surgeries that start the day of or the day after hospital admission; the VTE–2 eCQM assesses the number of patients who received VTE prophylaxis or have documentation why no VTE prophylaxis was given on the day of or the day after the initial admission (or transfer) to the Intensive Care Unit (ICU) or surgery end date for surgeries that start the day of or the day after ICU admission (or transfer). The VTE–1 and VTE–2 measures will be retained in the Hospital IQR Program to encourage best clinical practices to those patients in this high risk population by providing prophylactic steps which will decrease the incidence of preventable VTE. In contrast, the VTE–6 measure assesses the number of patients diagnosed with confirmed VTE during hospitalization (not present at admission) who did not receive VTE prophylaxis between hospital admission and the day before the VTE diagnostic testing order date. While awareness of the occurrence of preventable VTE is valuable knowledge, the prevention of the initial occurrence is more actionable and meaningful for both providers and beneficiaries. Therefore, we believe the costs to providers of submitting data on this chart-abstracted measure outweigh its limited clinical utility given other VTE measures in the Program are able to capture more actionable data on VTE.

As discussed in section VIII.A.4.b. of the preamble of this final rule, one of our main goals is to move the program

[284] We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51640 through 51641), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53536 through 53537), and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50811) for details on the Hospital IQR Program data submission requirements for chart-abstracted measures.

forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients. Therefore, we believe removing the chart-abstracted versions of the VTE–6, ED–1, and ED–2 measures from the Hospital IQR Program measure set helps achieve that goal.

We proposed to remove the VTE–6 measure and chart-abstracted version of the ED–1 measure beginning with the CY 2019 reporting period/FY 2021 payment determination, because hospitals already would have collected and reported data for the first three quarters of the CY 2018 reporting period for the FY 2020 payment determination by the time of publication of the FY 2019 IPPS/LTCH PPS final rule. Moreover, we would not be able to overcome operational limitations associated with updating our systems in time to support removal of the VTE–6 and chart-abstracted version of the ED–1 measures for the CY 2018 reporting period/FY 2020 payment determination. In addition, we proposed to remove the chart-abstracted version of the ED–2 measure beginning with the CY 2020 reporting period/FY 2022 payment determination, because the first results from validation of ED–2 eCQM data will be available beginning with the FY 2021 payment determination. We believe it is important to keep the chart-abstracted version of ED–2 in the program until after the validated data from the eCQM version of ED–2 is available for comparative analysis to evaluate the accuracy and completeness of the eCQM data. Further, removing these three measures on the proposed timelines would allow us to use the data already reported by hospitals in the CY 2018 reporting period for public reporting on our *Hospital Compare* website and for data validation.

Therefore, we proposed to remove: (1) VTE–6 and the chart-abstracted version of ED–1 beginning with the CY 2019 reporting period/FY 2021 payment determination; and (2) the chart-abstracted version of ED–2 beginning with the CY 2020 reporting period/FY 2022 payment determination.

Comment: A few commenters specifically supported CMS' proposal to remove the chart-abstracted version of the VTE–6 measure because it is burdensome and duplicative of other quality measures. Another commenter supported CMS' proposal to remove the chart-abstracted version of the VTE–6 measure, but disagreed with the rationale using proposed removal Factor 8. Instead, the commenter suggested using removal Factor 5—the availability of a measure that is more strongly associated with desired patient outcomes for the particular topic—because the chart-abstracted versions of VTE–1 and VTE–2 measures have previously been removed from the Hospital IQR Program using removal Factor 5.

Response: We thank commenters for their support. With regard to the commenter's suggestion that we remove the VTE–6 measure using removal Factor 5 rather than removal Factor 8, because the chart-abstracted versions of the VTE–1 and VTE–2 measures have previously been removed from the Hospital IQR Program using removal Factor 5, we do not believe this rationale would be appropriate in this case because the eCQM versions of the VTE–1 and VTE–2 measures were retained in the Hospital IQR Program, as the ''measures more strongly associated with desired patient outcomes for the particular topic,'' whereas there is no equivalent eCQM measure to replace VTE–6 remaining in the Program. More generally, we note that applicability of the removal factors is not mutually exclusive and there can be situations where more than one removal factor may apply.

Comment: One commenter suggested that if a related measure replaces the current VTE–6 measure, that the measure steward should modify the list of acceptable VTE risk assessment tools to include the ''three-bucket'' Risk Assessment Model (RAM).

Response: The ''three-bucket'' RAM is a tool that allows hospital providers to categorize patients into one of three groups based on whether they are at low, moderate, or high risk of getting a VTE.[285] The VTE RAM is completed by the physician in a simple order sheet on admission, post-op, and/or transfer. We thank the commenter for its suggestion to modify the list of acceptable VTE risk assessment tools, should we propose a new VTE measure in future rulemaking to replace VTE–6. However, we note that at this time we have no plans to add additional VTE measures to the Hospital IQR Program. We will take this suggestion into consideration if additional VTE measures are proposed for addition to the Hospital IQR Program in the future.

Comment: Another commenter supported CMS' proposal to remove the current VTE–6 measure, but recommended the measure be revised and readopted as an eCQM because it is a clinically important issue, relevant for purposes of improving the quality of care provided in the acute care setting, and one of few outcome measures in the Program. This commenter acknowledged that the cost of the chart-abstracted version of the VTE–6 measure outweighs the benefit of its continued use; however, abstraction burden would be reduced and the measure more cost-effective as an eCQM. The commenter suggested that an eCQM could capture VTE prevention process failures during the hospital stay by measuring an undesirable outcome as patients who are not assessed for VTE risk, not prescribed prophylaxis, miss one or more doses of prescribed prophylaxis, and develop a pulmonary embolism or VTE during the hospitalization. In addition, the commenter urged development of a risk-adjustment model for an eCQM version of the VTE–6 measure, since this is an outcome measure.

Response: We will continue to assess opportunities to address this clinically important issue through other types of measures. We note, however, that a VTE–6 eCQM was previously adopted in the Hospital IQR Program (78 FR 50784) and subsequently removed (81 FR 57120) because a majority of hospitals did not have the ability to capture required data elements, such as diagnostic study results/reports and location of the specific vein in which deep vein thrombosis was diagnosed, in discrete structured data fields to support these eCQMs, because they are often found as free text in clinical notes instead. We also note that we are removing the VTE–6 measure because the VTE–1 and VTE–2 eCQMs will be retained in the Hospital IQR Program to encourage best clinical practices to those patients in this high risk population by providing prophylactic steps which will decrease the incidence of preventable VTE.

Comment: Several commenters supported CMS' proposals to remove the chart-abstracted versions of the ED–1 and ED–2 measures to reduce costs and eliminate overlapping reporting requirements between eCQM and chart-abstracted versions of the same measures. One commenter supported CMS' proposal to remove the chart-abstracted versions of the ED–1 and ED–2 measures, but disagreed with the rationale using proposed removal Factor 8. Instead, the commenter suggested using removal Factor 5—the availability of a measure that is more strongly associated with desired patient outcomes for the particular topic—because the eCQM versions of ED–1 and

[285] Venous Thromboembolism (VTE) Prevention in the Hospital, AHRQ. Available at: *https://archive.ahrq.gov/professionals/quality-patient-safety/quality-resources/value/vtepresentation/maynardtxt.html.*

ED–2 represent measures ''that is more strongly associated with desired patient outcomes for the particular topic.''

Response: We thank the commenters for their support of these removals. We appreciate the commenters' recommendation to remove these measures under removal Factor 5; however, because we are finalizing our proposal to remove the ED–1 eCQM, Factor 5 would not apply to the removal of the chart-abstracted version of the ED–1 measure. We further believe removal Factor 8 is an appropriate removal factor for this measure. More generally, we note that applicability of the removal factors is not mutually exclusive and there can be situations where more than one removal factor may apply.

Comment: One commenter supported CMS' proposal to remove the chart-abstracted version of the ED–1 measure beginning with the CY 2019 reporting period/FY 2021 payment determination and the chart-abstracted version of the ED–2 measure beginning with the CY 2020 reporting period/FY 2022 payment determination, as proposed, in order to complete the validation process for the eCQM versions of the measure and to compare to chart-abstracted measure results before removing the chart-abstracted version of ED–2. Several commenters supported CMS' proposal to remove the chart-abstracted versions of the ED–1 and ED–2 measures, but encouraged CMS to remove both measures in the same year. These commenters argued that the patient's chart must still be reviewed for the ED–2 measure, even when the chart-abstracted version of the ED–1 measure is retired and therefore, retiring one before the other does not reduce provider burden or workload.

Response: We thank the commenter that supported removing the chart-abstracted versions of the ED–1 and ED–2 measures on the proposed timeline and agree that it is a benefit to complete the validation process for the eCQM versus chart-abstracted measure before removing the chart-abstracted version of the ED–2 measure. We appreciate the commenters' position that the chart-abstracted versions of the ED–1 and ED–2 measures should be removed in the same year; however, we disagree that removing one measure before the other will not reduce provider burden. We acknowledge that patient charts will still need to be abstracted to report on the chart-abstracted version of the ED–2 measure up to the CY 2020 reporting period/FY 2022 payment determination, however, the abstractors would only need to review the charts for the ED–2 measure elements, and not the ED–1 elements, which we believe will result in some reduction in provider cost.

Comment: One commenter noted that comparison of ED–2 eCQM data with the ED–2 chart-abstracted data is not feasible because many organizations sample chart-abstracted data due to the large volume of patients, meaning analysis would be comparing the median time of approximately 90 cases per quarter versus over 10,000 eCQM cases. The commenter expressed concern that the median values between the two sets never match and can vary greatly. In addition, the specifications for the admit date/time do not match as the eCQM is limited to selecting a specific data field typically from a registration system and the chart-abstracted version requires an abstractor to take the first documented time in the chart.

Response: We thank the commenter for its feedback on the challenges of direct comparisons between the chart-abstracted and the eCQM versions of the ED–2 measure. We will continue to review and take these concerns into consideration.

Comment: A few commenters did not support CMS' proposals to remove the chart-abstracted versions of the ED–1 and ED–2 measures because the Maryland Health Services Cost Review Commission uses these measures to incentivize progress in improving ED wait times.

Response: We acknowledge the commenters' concern. We clarify that Maryland hospitals do not participate in the Hospital IQR Program, though they do report data pursuant to the all-payer model agreement.[286] We also refer readers to the FY 2010 IPPS/LTCH PPS final rule (74 FR 43881) and FY 2014 IPPS/LTCH PPS final rule (78 FR 50789) for more detailed discussions of Maryland hospitals in relation to the Hospital IQR Program. As discussed in the proposed rule, in assessing the continued use of these specific measures in the Hospital IQR Program, we determined that the costs associated with these measures, particularly the data collection burden for hospitals, outweigh the benefit of their continued use in the program. However, we note that the removal of these measures from the Hospital IQR Program does not preclude their use in other CMS and non-CMS quality programs.

After consideration of the public comments we received, we are finalizing our proposals to remove the VTE–6 measure and the chart-abstracted version of ED–1 beginning with the CY 2019 reporting period/FY 2021 payment determination and the chart-abstracted version of ED–2 beginning with the CY 2020 reporting period/FY 2022 payment determination, as proposed.

(9) Removal of Electronic Clinical Quality Measures (eCQMs)

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20481 through 20484), in alignment with the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs) for eligible hospitals and CAHs, we proposed to reduce the number of electronic Clinical Quality Measures (eCQMs) in the Hospital IQR Program eCQM measure set from which hospitals must select four to report, by proposing to remove seven eCQMs (of the 15 measures currently in the measure set) beginning with the CY 2020 reporting period/FY 2022 payment determination. The seven eCQMs we proposed to remove are:

- Primary PCI Received Within 90 Minutes of Hospital Arrival (AMI–8a) (adopted at 79 FR 50246);
- Home Management Plan of Care Document Given to Patient/Caregiver (CAC–3) (adopted at 79 FR 50243 through 50244);
- Median Time from ED Arrival to ED Departure for Admitted ED Patients (NQF #0495) (ED–1) (adopted at 78 FR 50807 through 50710);
- Hearing Screening Prior to Hospital Discharge (NQF #1354) (EHDI–1a) (adopted at 79 FR 50242);
- Elective Delivery (NQF #0469) (PC–01) (adopted at 78 FR 50807 through 50810);
- Stroke Education (STK–08) (adopted at 78 FR 50807 through 50810); and
- Assessed for Rehabilitation (NQF #0441) (STK–10) (adopted at 78 FR 50807 through 50810).

We proposed to remove all seven eCQMs under proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program. As discussed in section I.A.2. of the preamble of this final rule, two of the goals of our Meaningful Measures Initiative are to: (1) Reduce costs associated with payment policy, quality measures, documentation requirements, conditions of participation, and health information technology; and (2) to apply a parsimonious set of the most meaningful measures available to track patient outcomes and impact. In section VIII.A.11.d.(2) of the preamble of this final rule, for the CY 2019 reporting

[286] For more information regarding the Maryland All-Payer Model, we refer readers to: *https://innovation.cms.gov/initiatives/Maryland-All-Payer-Model/.*

period/FY 2021 payment determination, we discuss our proposal to extend the same eCQM reporting requirements finalized for the CY 2018 reporting period/FY 2020 payment determination, such that hospitals submit one, self-selected calendar quarter of data on four self-selected eCQMs. Thus, we anticipate the collection of information burden associated with eCQM data reporting for the CY 2019 reporting period/FY 2021 payment determination will be the same as for the CY 2018 reporting period/FY 2020 payment determination. However, in section VIII.A.4.b. of the preamble of this final rule, we discuss our belief that costs associated with program requirements are multi-faceted and include not only the burden associated with reporting, but also the costs associated with implementing and maintaining the measures for the Program, such as staying current on clinical guidelines and maintaining measure specifications in hospitals' EHR systems for all of the eCQMs available for use in the Hospital IQR Program. With respect to eCQMs, we believe that a coordinated reduction in the overall number of eCQMs in both the Hospital IQR and Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs) would reduce costs and improve the quality of reported data by enabling hospitals to focus on a smaller, more specific subset of eCQMs, while still allowing hospitals some flexibility to select which eCQMs to report that best reflect their patient populations and support internal quality improvement efforts. We refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57116 through 57120) where we previously removed 13 eCQMs from the eCQM measure set in order to develop a smaller, more specific subset of eCQMs.

In order to move the program forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients, we believe it is appropriate to propose to remove additional eCQMs at this time to develop an even more streamlined set of the most meaningful eCQMs for hospitals. In selecting which eCQMs to propose for removal, we considered the relative benefits and costs associated with each eCQM in the measure set. Individual eCQMs are discussed in more detail below.

(a) AMI–8a

We proposed to remove AMI–8a because the costs associated with implementing and maintaining this eCQM outweigh the associated benefit to beneficiaries because too few hospitals select to report on this measure. Only a single hospital reported on this measure for the CY 2016 reporting period. Because we do not receive enough data to conduct meaningful, statistically significant analysis, we believe the costs of maintaining this measure in the Program outweigh any associated benefit to patients, consumers, and providers—proposed removal Factor 8.

(b) CAC–3, STK–08, and STK–10

We proposed to remove the CAC–3, STK–08, and STK–10 eCQMs, because we believe the costs associated with implementing and maintaining these eCQMs outweigh the benefit to beneficiaries because they do not provide information evaluating the clinical quality of the activity. Home Management Plan of Care Document Given to Patient/Caregiver (CAC–3) assesses the proportion of pediatric asthma patients discharged from an inpatient hospital stay with a Home Management Plan of Care (HMPC) document given to the pediatric asthma patient/caregiver. Stroke Education (STK–08) captures ischemic or hemorrhagic stroke patients or their caregivers who were given educational materials during the hospital stay and at discharge. Assessed for Rehabilitation (STK–10) captures ischemic or hemorrhagic stroke patients who were assessed for rehabilitation.

We have issued guidance that measure developers should avoid selecting or constructing measures that can be met primarily through documentation without evaluating the clinical quality of the activity—often satisfied with a checkbox, date, or code—for example, a completed assessment, care plan, or delivered instruction.[287] CAC–3, STK–08, and STK–10 are examples of those types of measures. In our effort to create a more parsimonious measure set, we assessed which measures are the least costly to report and most effective in particular priority areas, including stroke, and we believe these measures provide less benefit to providers and Beneficiaries, relative to their costs.

Furthermore, we stated that if our proposals to remove the STK–08 and STK–10 eCQMs are finalized as proposed, we believe the resulting set of four stroke eCQMs (STK–02, STK–03, STK–05, and STK–06) will be more meaningful to both patients and providers because they capture the proportion of ischemic stroke patients who are prescribed a statin medication,[288] specific anti-thrombolytic therapy,[289] and/or anticoagulation therapy [290] at hospital discharges, which would address follow-up care and promote future preventative actions. Moreover, these remaining stroke eCQMs continue to be meaningful because ischemic strokes account for 87 percent of all strokes, and strokes are the fifth leading cause of death and disability.[291] We also note that the STK–08 and STK–10 eCQMs already have been removed from The Joint Commission's eCQM measure set.[292]

(c) ED–1

We proposed to remove the Median Time from ED Arrival to ED Departure for Admitted ED Patients (ED–1) eCQM because we believe that among the ED measures in the eCQM measure set, Admit Decision Time to ED Departure Time for Admitted Patients (ED–2) is more effective at driving quality improvement. We note that in section VIII.A.5.b.(8)(b) of the preamble of the proposed rule, we proposed to remove the chart-abstracted versions of ED–1 and ED–2. As stated above, we believe that although ED–1 is an important metric for patients, ED–2 has greater clinical significance for quality improvement because it provides more actionable information—hospitals have greater ability to allocate resources and align inter-departmental communication to consistently reduce the time between decision to admit and time of inpatient admission. Hospitals have somewhat less ability to consistently reduce wait time between ED arrival and decision to admit, as measured by ED–1, due to the need to triage and prioritize more complex or urgent patients, which might inadvertently prolong ED wait times for less urgent patients. Also, the Hospital OQR Program includes an ED

throughput measure, OP–18: Median Time from ED Arrival to ED Departure for Discharged ED Patients (81 FR 79755), which publicly reports similar data as captured by ED–1. Therefore, we believe the costs of implementing and maintaining the eCQM, as discussed above, outweigh the limited benefits of keeping the measure in the Program given that other measures in the Hospital IQR Program and in other CMS hospital quality programs are able to capture actionable data on ED wait times.

(d) EHDI–1a

We proposed to remove the EHDI–1a eCQM because we believe the costs associated with implementing and maintaining the measure, as discussed above, outweigh the benefits to beneficiaries because newborn hearing screening is already widely practiced by hospitals as the standard of care and already mandated by many State laws. Forty-three States currently have statutes or rules related to newborn hearing screening and 28 of the 43 States require babies to be screened.[293] Thus, this measure may be duplicative with local regulations for most hospitals. Therefore, we believe the costs associated with the measure outweigh the associated benefits of keeping the measure in the Hospital IQR Program.

(e) PC–01

We proposed to remove the eCQM version of PC–01. Due to the importance of child and maternal health, we did not propose to also remove the chart-abstracted version of the measure because we believe all hospitals with a sufficient number of cases should be required to report data on this measure (adopted at 77 FR 53530). Although we have expressed in section XIII.A.4.b.ii.(8) of the preamble of the proposed rule our intent to move away from the use of chart-abstracted measures in quality reporting programs, our previously adopted policy requires that hospitals should need less time to submit data for this measure because, unlike the other chart-abstracted measures, hospitals are only required to submit several aggregate counts instead of potentially numerous patient-level charts. We note that submission of this measure places less information collection burden on hospitals than the other chart-abstracted measures because of the ease with which hospitals can simply submit their aggregate counts using our Web-Based Measure Tool through the QualityNet website (77 FR 53537). In addition, if the chart-abstracted version of this measure were removed from the Program, and hospitals could only elect to report the eCQM version of this measure as one of four required eCQMs, we believe that due to the low volume of patients relative to total adult hospital population, we would not receive enough data to produce meaningful analyses. Also, PC–01 is one of only two measures of child and maternal health in the Hospital IQR Program measure set (PC–05 eCQM being the other) and since eCQM data are not currently publicly reported, the chart-abstracted version of PC–01 is currently the only publicly reported measure of child and maternal health in the Program. However, retaining this measure in both eCQM and chart-abstracted form may be duplicative and costly. Consequently, we proposed to remove the eCQM version of PC–01 while retaining the chart-abstracted version of PC–01.

Therefore, we believe the costs associated with implementing and maintaining the eCQM, as discussed above, outweigh the associated benefit to beneficiaries because the information is already collected and publicly reported in the chart-abstracted form of this measure for the Hospital IQR Program.

Thus, we proposed to remove seven eCQMs as discussed above beginning with the CY 2020 reporting period/FY 2022 payment determination. If our proposals are finalized as proposed, the eCQMs remaining in the eCQM measure set would focus on: (a) ED wait times for admitted patients (ED–2), which addresses the Meaningful Measures Initiative quality priority of promoting effective communication and coordination of care; (b) Exclusive Breast Milk Feeding (PC–05), which addresses the Meaningful Measures Initiative quality priority that care is personalized and aligned with patients' goals; and (c) stroke care (STK–02, STK–03, STK–05, and STK–06) and VTE care (VTE–1 and VTE–2), which address the Meaningful Measures Initiative quality priority of promoting effective prevention and treatment.

In crafting our proposals to remove these seven eCQMs from the Hospital IQR Program for the CY 2020 reporting period/FY 2022 payment determination and subsequent years, we also considered proposing to remove these seven eCQMs one year earlier, beginning with the CY 2019 reporting period/FY 2021 payment determination. We establish program requirements considering all hospitals that participate in the Hospital IQR Program at a national level, which involves a wide spectrum of capabilities and resources with respect to eCQM reporting. In establishing our eCQM policies, we must balance the needs of hospitals with variable preferences and capabilities. Overall, across the range of capabilities and resources for eCQM reporting, stakeholders have expressed that they want more time to prepare for eCQM changes. Specifically, as noted in the FY 2018 IPPS/LTCH PPS final rule, we have continued to receive frequent feedback (via email, webinar questions, help desk questions, and conference call discussions) from hospitals and health IT vendors about ongoing challenges of implementing eCQM reporting, including, ''a need for at least one year between new EHR requirements due to the varying 6- to 24-month cycles needed for vendors to code new measures, test and institute measure updates, train hospital staff, and rollout other upgraded features (82 FR 38355).''

We recognize that some hospitals and health IT vendors may prefer earlier removal in order to forgo maintenance on those eCQMs proposed for removal. In preparation for the proposed rule, we weighed the relative burdens and costs associated with removing these measures beginning with the CY 2019 reporting period/FY 2021 payment determination or beginning with the CY 2020 reporting period/FY 2022 payment determination. Ultimately, in order to be responsive to the previous stakeholder feedback we have received, we proposed to remove these seven eCQMs beginning with the CY 2020 reporting period/FY 2022 payment determination and subsequent years, even if as a result some hospitals may have to perform measure maintenance on measures that would be removed the following year. We believe our proposal to remove these eCQMs would spare hospitals that have already allocated and expended resources in 2018 in preparation for the CY 2019 reporting period that begins January 1, 2019 from the burden of unnecessarily expended resources or expending additional time and resources to update their EHR systems or adjust the eCQMs they selected to report for the CY 2019 reporting period/FY 2021 payment determination.

In the proposed rule, we noted that we are striving to establish program requirements that reflect the wide range of capabilities and resources of hospitals for eCQM reporting. Our proposal would allow more advanced notice of eCQMs that would and would not be available to report for the CY 2020 reporting period/FY 2022 payment determination. Therefore, we proposed

[293] *http://www.infanthearing.org/ehdi-ebook/2017_ebook/1b%20Chapter1EvolutionEHDI2017.pdf.*

to remove the AMI–8a, CAC–3, ED–1, EHDI–1a, PC–01, STK–08, and STK–10 eCQMs from the Hospital IQR Program for the CY 2020 reporting period/FY 2022 payment determination and subsequent years. We refer readers to section VIII.A.5.b.(9) of the preamble of the proposed rule for our proposals to remove these seven eCQMs from the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs). We also refer readers to sections VIII.A.11.d. of the preamble of this final rule for our proposals on the eCQM reporting requirements for the CY 2019 reporting period/FY 2021 payment determination, including further discussion on the 2015 Edition of CEHRT.

We invited public comment on our proposal as discussed above, including the specific measures proposed for removal and the timing of removal from the program.

Comment: Many commenters supported CMS' proposals to remove seven eCQMs from the Hospital IQR Program because removal: (1) Aligns with the Meaningful Measures framework to reduce reporting burden by examining measures through a lens that identifies meaningful, outcome-based measures; (2) creates a streamlined measure set and makes it easier for vendors to maintain specifications for the available eCQMs; (3) satisfies the aims of removal Factor 8, in that the expense of implementing and maintaining these measures outweighs the benefit to the healthcare team and Medicare beneficiaries; and (4) gives hospitals more time and resources to accommodate new reporting requirements by enabling them to focus on a more specific subset of eCQMs, while still allowing flexibility in measure selection to best reflect patient populations and support internal quality improvement efforts. Specifically, one commenter supported reducing the number of reportable eCQMs, and instead consolidating some of these additional quality measures into cost metrics such as the Medicare Spending Per Beneficiary (MSPB). Another commenter supported removing these seven eCQMs and further recommended CMS remove all existing eCQMs as they believe they do not fully support the Meaningful Measures framework and moving towards value-based care.

Response: We thank commenters for their support. We appreciate commenters' suggestions to remove additional eCQMs and to consolidate or replace them with more meaningful, outcomes-based measures. It is one of our goals to expand EHR-based quality reporting in the Hospital IQR Program using more meaningful measures, which we believe will ultimately reduce burden on hospitals as compared with chart-abstracted data reporting and improve patient outcomes by providing more robust data to support quality improvement efforts. We intend to introduce additional eCQMs into the program as eCQMs that support our program goals become available and would propose any such measures through future rulemaking.

Comment: A few commenters specifically supported CMS' proposal to remove the AMI–8a eCQM because with a limited number of hospitals reporting this measure, there is a lack of significant data for analysis of patient care and the costs outweigh the benefits. One commenter supported removal of the AMI–8a eCQM, but disagreed with the rationale for removal asserted under proposed removal Factor 8.

Response: We thank commenters for their support and we believe removal Factor 8 provides the appropriate rational for removal of the AMI–8a eCQM because, as some commenters observed, the lack of data reported on the measure precludes meaningful data analysis, and therefore the costs outweigh the benefits of retaining the measure.

Comment: A few commenters specifically supported CMS' proposal to remove the CAC–3 eCQM because it is a ''checkbox'' measure that is based on documentation without evaluation of clinical quality. One commenter supported removal of the CAC–3 eCQM, but disagreed with the rationale for removal asserted under proposed removal Factor 8.

Response: We thank commenters for their support and we believe removal Factor 8 provides the appropriate rational for removal of the CAC–3 eCQM because, as some commenters observed, it is based on documentation without evaluation of clinical quality, and therefore the costs outweigh the benefits of retaining the measure.

Comment: A few commenters specifically supported CMS' proposals to remove the STK–08 and STK–10 eCQMs because they are ''checkbox'' measures that are based on documentation without evaluation of clinical quality. One commenter supported removal of the STK–08 and STK–10 eCQMs, but disagreed with the rationale for removal asserted under proposed removal Factor 8. Another commenter noted that The Joint Commission removed the STK–08 and STK–10 eCQMs for the 2017 reporting year, acknowledging that their value was limited.

Response: We thank commenters for their support and we believe removal Factor 8 provides the appropriate rational for removing the STK–08 and STK–10 eCQM s because, as some commenters observed, they are based on documentation without evaluation of clinical quality, and therefore the costs outweigh the benefits of retaining the measures.

Comment: A few commenters specifically supported CMS' proposals to remove the ED–1 measures (both eCQM and chart-abstracted versions) and ED–2 (chart-abstracted version), as well as removal of the ED–2 eCQM (which was not proposed for removal) due to cost. One commenter explained that their system cannot pull the required times from the required locations (found in algorithm) so it is very difficult to get the true length of wait times. Despite efforts to change the system and educate the staff, the commenter believed these measures fail to improve quality of care because until patients stop misusing the ED and jamming up the system, the measure will not effectuate change. For these reasons, the commenter suggested that although the ED–2 eCQM was not proposed for removal, the ED–2 eCQM should also be removed.

Response: We thank the commenters for their support of these removals. We appreciate the commenter's feedback regarding the difficulty that may be experienced in identifying true length of ED wait times. We will take into consideration the feedback on the ED eCQMs as part of measure maintenance on the ED–2 eCQM. We believe ED–2 is clinically significant because it provides actionable information for quality improvement purposes such that it is important to retain the eCQM version in the measure set; however, we will also take into consideration the recommendation to remove the ED–2 eCQM from the Hospital IQR Program into consideration for future program years.

Comment: One commenter encouraged CMS to exclude CAHs with low ED volume from reporting both chart-abstracted and eCQM versions of the ED–2 measure.

Response: We appreciate the commenter's feedback, but note that under section 1886(b)(3)(B)(viii) of the Act, only subsection (d) hospitals are required to submit data to the Hospital IQR Program, not CAHs. However, we acknowledge that facilitating quality improvement for rural hospitals and small hospitals, such as CAHs, can present unique challenges and is a high

priority under the Meaningful Measures Initiative.

Comment: A few commenters specifically supported CMS' proposal to remove the EHDI–1a eCQM because there is little benefit to measuring a widely practiced standard of care. One commenter supported CMS' proposal to remove the EHDI–1a eCQM, but disagreed with the rationale for removal asserted under proposed removal Factor 8.

Response: We thank commenters for their support and we believe removal Factor 8 provides the appropriate rational for removal of the EHDI–1a eCQM because, as some commenters observed, it is of little benefit to measure a widely practiced standard of care, and therefore the costs outweigh the benefits of retaining the measure.

Comment: A few commenters specifically supported CMS' proposal to remove the PC–01 eCQM because the chart-abstracted version of the measure would be retained. Another commenter specifically supported CMS' proposal to remove PC–01, but requested that removal be aligned with removal of the chart-abstracted version of the measure from the Hospital VBP Program in the same performance year. The commenter asserted the belief that if a measure is topped out or removed in one format, it is most likely topped out in the other format as well.

Response: We thank commenters for their support. We appreciate the suggestion that removal of the PC–01 eCQM from the Hospital IQR Program be aligned with the removal of the chart-abstracted version of the PC–01 measure from the Hospital VBP Program; however, we believe that removing the PC–01 eCQM from the Hospital IQR Program beginning with the CY 2020 reporting period/FY 2022 payment determination and removing the chart-abstracted version of the PC–01 measure from the Hospital VBP Program beginning with the CY 2019 reporting period/FY 2021 payment determination as proposed is the appropriate timeline for removal of each measure from their respective programs. As stated above, we are removing eCQMs beginning with the CY 2020 reporting period/FY 2022 payment determination as a result of stakeholder feedback requesting more notice before making changes to the eCQM measure set in order to give hospitals additional time to select alternate eCQMs, and to modify workflows and systems as necessary, in the case that eCQMs they had previously been reporting are being removed.

We refer readers to section IV.I.2.c.(1) of the preamble of this final rule for a discussion of the reasons we are removing the chart-abstracted version of the PC–01 measure from the Hospital VBP Program as soon as practicable, beginning with the CY 2019 performance period for the FY 2021 program year. We note that the chart-abstracted version of the PC–01 measure will continue to be included in the Hospital IQR Program and therefore, removing the chart-abstracted version of the PC–01 measure from the Hospital VBP Program will have no effect on hospital data collection burden whether it occurs beginning with the CY 2019 performance period or the CY 2020 performance period.

Comment: One commenter was neutral on the proposed removal of the eCQMs, but indicated that it would implement any replacement measures if necessary.

Response: We appreciate the commenter's support.

Comment: One commenter urged CMS to maintain a reasonable proportion of eCQMs applicable in primary care, retain eCQMs that are essential to Federally Qualified Health Center patient populations, and continue to implement measures that are relevant to medically underserved populations.

Response: We acknowledge that facilitating quality improvement for medically underserved patient populations, such as those served by Federally Qualified Health Centers, presents unique challenges and eliminating disparities is a one of the strategic goals under the Meaningful Measures Initiative. For more information about Federal Qualified Health Centers, we refer readers to: *https://www.hrsa.gov/opa/eligibility-and-registration/health-centers/fqhc/index.html.* As stated above, it is also one of our goals to reduce reporting burden by expanding EHR-based quality reporting in the Hospital IQR Program using more meaningful measures, which we believe will ultimately reduce burden on hospitals as compared with chart-abstracted data reporting and improve patient outcomes by providing more robust data to support quality improvement efforts. We intend to introduce additional eCQMs that support our program goals as they become available.

Comment: One commenter expressed concern that reducing the number of required measures may not result in reduced administrative burden for clinicians and staff and urged CMS to reduce the operational burden each specific measure places on clinicians and their medical practice staff by continuing to evaluate associated documentation requirements for measures to effectively reduce the administrative burden facing clinicians.

Response: We believe in enabling hospitals to focus on a smaller, more specific subset of eCQMs, while still allowing hospitals some flexibility to select which eCQMs to report that best reflect their patient populations and support internal quality improvement efforts. In order to move the program forward in the least burdensome manner possible while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients, we believe it is appropriate to remove additional eCQMs at this time to develop an even more streamlined set of the most meaningful eCQMs for hospitals. Creating a streamlined measure set reduces burden by making it easier for vendors to maintain specifications for the available eCQMs and giving hospitals more time and resources to accommodate new reporting requirements, while still allowing flexibility in measures selection to best reflect patient populations and support internal quality improvement efforts. In addition, we will continue to evaluate measure specifications and associated documentation requirements for the eCQMs we are retaining and for potential future eCQMs to ensure that we are moving the Program forward in the least burdensome manner possible while continuing to encourage improvement in the quality of care provided to patients.

Comment: Several commenters did not support removal of the seven eCQMs because of the burden on hospitals associated with selecting different measures to report if they had previously reported on the measures proposed for removal. The remaining measures are being collected, but additional work is needed to streamline data collection and discrete data analysis. One commenter explained that it has a few of the measures proposed for removal built in their system. The commenter expressed concern the measure removals would occur before hospitals have had significant time to really learn how to effectively build, review, and evaluate the eCQMs. A few commenters expressed concern that hospitals would need to fully redevelop measures, pulling scarce resources from ongoing quality improvement efforts and recommended that CMS keep the current set of eCQMs, make the program data public, and allow the industry to learn how to best use the current set of

measures before further modifications are made.

Response: We understand the commenters' concern with removing eCQMs that have been previously reported and implemented in an existing EHR workflow, and we acknowledge the time, effort, and resources that hospitals expend on reporting these measures. However, we believe that removal of these seven eCQMs will be less burdensome to hospitals overall than continuing to keep them in the Hospital IQR Program. As part of agency-wide efforts under the Meaningful Measures Initiative to use a parsimonious set of the most meaningful measures for patients and clinicians in our quality programs and the Patients Over Paperwork initiative to reduce burden, cost, and program complexity as discussed in section I.A.2. of the preamble of this final rule, our decision to remove measures from the Hospital IQR Program is an extension of our programmatic goal to continually refine the measure set.

We will continue working to provide hospitals with the education, tools, and resources necessary to help reduce eCQM reporting burden and more seamlessly account for the removal/addition of eCQMs. Further, we will consider the issues associated with new software, workflow changes, training, et cetera as we continue to improve our education and outreach efforts for eCQM submission and validation. We note that, as stated in the proposed rule, these eCQMs would not be removed until the CY 2020 reporting period/FY 2022 payment determination as a result of stakeholder feedback requesting more notice before making changes to the eCQM measure set in order to give hospitals additional time to select alternate eCQMs, and to modify workflows and systems as necessary, in the case that eCQMs they had previously been reporting are being removed. We will try to be as proactive as possible in providing lead time about the removal of measures from the Hospital IQR Program measure set.

Comment: One commenter did not support CMS' proposals to remove the seven eCQMs because there may be cases where individual eCQMs have value, even if topped out, or that there may be a risk of ''back sliding'' due to a shift in resources from topped-out measures to a new eCQM(s). Another commenter added that some evidence suggests removing certain technological and practice interventions leads to a reduction in desired clinical behavior. The commenter recommended that CMS monitor and evaluate how behaviors may change when eCQMs are removed through the process CMS finalized in its FY 2015 IPPS/LTCH PPS final rule.

Response: We respectfully disagree with the commenter that the removal of ''topped-out'' measures will necessarily result in hospitals no longer focusing on maintaining a high level of performance. We have confidence that hospitals are committed to providing good quality care to patients and we do not have any indication that they will stop doing so in these areas for which the quality of care measured has become standard practice. We also note that the eCQMs we are finalizing for removal are either duplicative of other measures in the program, or are of little benefit in assessing a widely practiced standard of care, or are based on documentation without evaluation of clinical quality, and therefore the costs outweigh the benefits of retaining these measures. We encourage commenters to submit to CMS any evidence suggesting that removing certain technological and practice interventions leads to a reduction in desired clinical behavior.

Comment: Some commenters did not support CMS' proposals to remove the seven eCQMs because they believed the remaining eCQMs do not represent populations for small community hospitals. A few commenters observed that many small and rural hospitals triage and transfer stroke patients (four of the remaining eCQMs), less than half have labor and delivery units (two of the remaining eCQMs), and few have ICUs (one of the remaining eCQMs). A few commenters expressed their belief that for most CAHs, only two of the remaining eCQMs are relevant (ED–2 and VTE–1). Commenters reiterated the need for CMS to develop measures that are relevant for rural hospitals, because removing measures for which hospitals have a reasonable initial population results in a lack of options for hospitals with respect to eCQM reporting. Although hospitals that do not have a sufficient number of patients may submit a zero denominator exemption, commenters noted there is no value to quality or improvement efforts if hospitals are exempted. Commenters believe hospitals need flexibility to choose the measures that are most representative of their patient populations.

In addition, a few commenters noted that reducing the number of available eCQMs may present a challenge for hospitals to select measures that are well developed in data collection, workflow, and add value to the patient population of the organization. Commenters urged CMS to continue to work with stakeholders to develop measures that focus on quality and safety, and to ensure that eCQMs truly provide comparable data across institutions to better assist our hospitals in understanding the methodology and ways to improve patient care.

Response: We acknowledge that facilitating quality improvement for rural hospitals, small hospitals, and CAHs [294] can present unique challenges and is a high priority under the Meaningful Measures Initiative. We understand the commenters' concern that the ability to submit a zero denominator exemption does not provide direct information for supporting quality improvement efforts and that hospitals need flexibility to choose the measures that are most representative of their patient populations. It is one of our goals to expand EHR-based quality reporting in the Hospital IQR Program using more meaningful measures, which we believe will ultimately reduce burden on hospitals as compared with chart-abstracted data reporting and improve patient outcomes by providing more robust data to support quality improvement efforts. We intend to introduce additional eCQMs into the program as ones that support our program goals become available. We also intend to continue to work with stakeholders to develop measures that focus on quality and safety. For more information about quality measurement efforts for rural health settings, we refer readers to the MAP Rural Health Workgroup at: *http://www.qualityforum.org/MAP_Rural_Health_Workgroup.aspx*.

Comment: One commenter recommended that before a significant number of measures are eliminated or there is an increase of measures that are required to be reported to CMS, CMS provide an offering of measures that allows organizations to be able to select the measures that are aligned with the care given without increasing implementation and adoption burden. The commenter stated that one option would be to have a listing of all chart-abstracted measures, claims-based measures, hybrid measures, and eCQMs available for the organization to select from and all reporting agencies would accept a combination of any of these measures (without regard to collection method) for providers to achieve minimum quality compliance.

Alternatively, similar to the Promoting Interoperability Program's

[294] We note that under section 1886(b)(3)(B)(viii) of the Act, only subsection (d) hospitals are required to submit data to the Hospital IQR Program. CAHs participate in the electronic reporting of CQMs under the Promoting Interoperability Programs.

Objectives and Measures, the commenter suggested that CMS could implement a 'point system' in which reporting of each quality measure is granted 3 points for chart-abstracted or claims-based measures, 4 points for hybrid measures, and 5 points for eCQMs. Bonus points could be given (up to 5 points) for voluntary measures that are being considered for inclusion. With a selection choice of 20 total measures, a minimum of 30 points could be required to meet the quality reporting requirement. This could satisfy all reporting programs, including but not limited to, CMS' Promoting Interoperability, Hospital IQR, and Hospital VBP Programs, etc., as well as The Joint Commission. Overall, the idea would be to have the ability to choose measures that are best suited for each organization's quality needs, reduce the requirements for complex chart-abstracted and electronic measures across various programs if eCQMs are easily available, and allow measures to satisfy multiple programs with single data submissions.

Response: We appreciate the commenter's suggestions and will take them into consideration as we continually refine the measure sets for our quality programs, as well as to improve alignment of requirements across our programs whenever possible.

Comment: One commenter specifically did not support CMS' proposal to remove the CAC–3 eCQM because it believed that plan-of-care documents are critical for the continuity of care and outcomes once a patient is discharged from the hospital. The commenter requested additional clarification about how removing the plan of care document reduces costs associated with the policy of Meaningful Measures without affecting patient outcomes.

Response: We agree that continuity of care and outcomes once a patient is discharged are important priorities; however, we disagree that the CAC–3 eCQM accomplishes these priorities. The CAC–3 eCQM assesses the proportion of pediatric asthma patients discharged from an inpatient hospital stay with a Home Management Plan of Care document given to the pediatric asthma patient/caregiver (83 FR 20482). We have previously issued guidance that measure developers should avoid selecting or constructing measures that can be met primarily through documentation without evaluating the clinical quality of the activity—often satisfied with a checkbox, date, or code—for example, the delivery-of-the-care-plan document for the CAC–3 measure.[295] In our effort to create a more parsimonious measure set, we assessed which measures were least costly to report and most effective in particular priority areas. We believe that the CAC–3 eCQM is among the measures that provide less benefit to providers and beneficiaries, relative to the costs of implementing, maintaining, and reporting on this measure.

Comment: A few commenters did not support CMS' proposal to remove the ED–1 eCQM because they believed the measure has significant value and organizations have spent the time and effort to map and use this eCQM.

Response: We appreciate the commenters' position; however, we believe that it is appropriate to remove the ED–1 eCQM because the ED–2 eCQM is more effective at driving quality improvements. Removing the ED–1 eCQM is in keeping with our goal of moving the Hospital IQR Program forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients. We refer readers to section I.A.2. of the preamble of this final rule for a detailed description of those goals.

Comment: A few commenters requested that CMS provide at least 2 years notice prior to proposing to remove an eCQM due to the time and effort it takes to map an eCQM.

Response: We specifically crafted our proposed removal of the eCQMs to reflect stakeholder feedback to have more time to prepare for changes to eCQM reporting requirements, including changes to the eCQM measure set. We believe removal of the seven eCQMs beginning with the CY 2020 reporting period/FY 2022 payment determination, with a data submission deadline of February 28, 2021, provides sufficient notice of eCQMs that will and will not be available for future reporting and allows hospitals enough time to implement changes associated with mapping new eCQMs. We will take the commenters' feedback about the timing of eCQM changes into consideration for future program years.

Comment: A few commenters believed it is difficult to interpret boarding time (ED–2) without measuring total length of stay for admitted patients (ED–1); the time stamp of ''admit decision time'' varies by hospital, and therefore comparing ED–2 between hospitals has little meaning without measuring ED–1. The commenters cautioned there may be potential for gaming by hospitals if just the ED–2 measure is used because hospitals hoping to reduce their ED–2 time might pressure emergency physicians to not indicate a decision to admit until an inpatient bed is available. If the ED–1 measure is retained, CMS may be able to monitor this practice by assessing how ED–1 increases relative to ED–2. Therefore, the commenters believed that both measures are necessary to ensure that patients receive high-quality care and that ED boarding times are appropriate. Finally, the commenters believed that keeping both measures in the program should not add any burden since hospitals do not have to invest additional financial resources reporting ED–1 and both measures are useful for research purposes.

Response: We understand that hospitals may need to collect the total length of stay for admitted patients to interpret boarding time, but we believe that in order to maintain a parsimonious set of the most meaningful measures, it is appropriate at this time to remove the ED–1 eCQM. We note the commenter's concern about potential for gaming the ED–2 eCQM and we encourage stakeholders to share these concerns and any evidence of such instances with us.

We respectfully disagree that removing the ED–1 eCQM would not reduce some burden on providers and their health IT vendors. Focusing on a more streamlined measure set gives hospitals and their health IT vendors more time and resources to accommodate new reporting requirements by reducing measure maintenance and specification requirements. As we have stated above, the ED–2 eCQM captures more actionable information and hospitals have greater control over allocating resources and aligning inter-departmental communication to consistently reduce the time between the decision to admit and the time of admission. In addition, the Hospital OQR Program includes an ED throughput measure which publicly reports similar data as is captured by ED–1.

Comment: One commenter supported retaining the ED–1 eCQM but suggested refining it by adding the Emergency Severity Index to the measure to allow a better review of the length of time the patient is in the ED and to incorporate the acuity of the patient into the measure result.

Response: We thank the commenter for their suggestion to add the

[295] CMS Measures Management System Blueprint (Blueprint v 13.0). CMS. 2017. Available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Blueprint-130.pdf.*

Emergency Severity Index, a five-level triage algorithm,[296] to refine the ED–1 eCQM, and will take it into consideration as we continually refine the measure sets for our quality programs.

Comment: One commenter did not support removal of the ED–1 eCQM because it is one of few eCQMs available for CAHs to meaningfully report on.

Response: We acknowledge the commenter's concern about the sufficient availability of eCQMs, like the ED–1 eCQM, for reporting by CAHs. We note that under section 1886(b)(3)(B)(vii) of the Act, only subsection (d) hospitals are required to submit data to the Hospital IQR Program. CAHs are neither required to submit eCQM measure data to the Hospital IQR Program, nor subject to any payment reduction. However, CAHs participating in the Promoting Interoperability Programs have eCQM reporting requirements with respect to those programs using the same eCQM measure set, and we acknowledge that facilitating quality improvement for rural hospitals, small hospitals, and CAHs can present unique challenges and is a high priority under the Meaningful Measures Initiative. We are exploring opportunities to develop more relevant measures and less burdensome methods to collect quality measure data for use by small and rural hospitals. For more information about quality measurement efforts for rural health settings, we refer readers to the MAP Rural Health Workgroup at: *http://www.qualityforum.org/MAP_Rural_Health_Workgroup.aspx*.

Comment: One commenter did not support CMS' proposal to remove the EHDI–1a and PC–01 eCQMs because the commenter represents a small community hospital that has already expended resources to implement these measures and because they are one of the few available eCQMs for which the hospital has a sufficient number of patients in the initial patient population to allow them to evaluate and maintain quality care and documentation.

Response: As noted above, we acknowledge that facilitating quality improvement for rural hospitals, small hospitals, and CAHs presents unique challenges and is a high priority under the Meaningful Measures Initiative. We further appreciate the commenter's frustration that they have expended resources to implement measures that are being removed. It is one of our goals to expand EHR-based quality reporting in the Hospital IQR Program using more meaningful measures, which we believe will ultimately reduce burden on hospitals as compared with chart-abstracted data reporting and improve patient outcomes by providing more robust data to support quality improvement efforts. We intend to introduce additional eCQMs into the program as eCQMs that support our program goals become available.

Comment: A few commenters did not support CMS' proposal to remove the PC–01 eCQM because they would prefer to report the eCQM version of the measure rather than the chart-abstracted version. One commenter recommended that CMS begin requiring eCQMs rather than chart-abstracted measures as they are seeing significant cost-reductions associated with not having to chart-abstract, and instead be allowed to submit eCQMs. Another commenter observed that retaining the chart-abstracted version of this measure continues the burden of having to manually collect the data, in order to obtain the numerator and denominator to enter into the QualityNet Secure Portal and argued that retaining the PC–01 eCQM while removing the PC–01 chart-abstracted measure would result in reduced burden as healthcare systems have already mapped the PC–01 eCQM. A third commenter noted that data collection for the PC–01 eCQM may reflect better performance on the measure as compared to the chart-abstracted version due to the discrete data requirement and all patient reporting for the eCQM versus the sample method of using any data (discrete and non-discrete) for reporting the chart-abstracted version.

One commenter did not support CMS' proposal to remove the PC–01 eCQM because the commenter believed it could be useful to retain both the eCQM and chart-abstracted versions of the measure to allow for comparison of the data. The commenter recommended CMS work to improve the PC–01 eCQM so that it can replace the chart-abstracted measure in the future. The PC–01 eCQM could collect all the cases in the population rather than sampling of cases as is done with the chart-abstracted measure. In addition, the electronic version of the measure would reduce the burden to the hospitals having to abstract, aggregate, and submit the measure data elements via the CMS web-based tool.

Response: We acknowledge commenters' feedback regarding a preference to use eCQMs rather than chart-abstracted measures in the Hospital IQR Program. We will take these suggestions into consideration for future program years. We are retaining the chart-abstracted version of the PC–01 measure rather than the PC–01 eCQM, because due to the importance of child and maternal health, we believe all hospitals with a sufficient number of cases should be required to report data on this measure. We reiterate our concern that if the eCQM version were retained and the chart-abstracted version removed, we believe that due to the low volume of patients relative to total adult hospital population and the ability of hospitals to select other eCQMs to report other than the PC–01 eCQM, we would not receive enough data to produce meaningful analyses.

Further, hospitals are only required to submit several aggregate counts for the chart-abstracted version of this measure,[297] instead of the potentially numerous patient-level charts, such that submission of this measure places less information collection burden on hospitals than other chart-abstracted measures. Hospitals are able to submit their aggregate counts using our Web-Based Measure Tool through the QualityNet website. In addition, PC–01 is one of only two measures of child and maternal health in the Hospital IQR Program measure set, and is the only publicly reported measure of child and maternal health in the Program. As to the commenter's belief that the PC–01 eCQM may reflect better measure performance as compared to the chart-abstracted version, we note that since eCQM data are not currently publicly reported, the chart-abstracted version of PC–01 is currently the only pathway for publicly reporting these data and is therefore important to retain. We believe it is important to continue to provide publicly reported information on this important topic, but that it would be costly and duplicative to retain both the chart-abstracted version and the eCQM. As discussed in section VIII.A.4.b. of the preamble of this final rule, one of our main goals is to move forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients. We believe retaining the chart-abstracted version and removing the eCQM version best aligns with that goal. We appreciate commenter's recommendation to improve the PC–01 eCQM version to replace the chart-abstracted version and

[296] For more information on the Emergency Severity Index, we refer readers to: *https://www.ahrq.gov/professionals/systems/hospital/esi/index.html*.

[297] FY 2013 IPPS/LTCH PPS final rule (77 FR 53528 through 53530).

will take that into consideration for future program years.

Comment: Many commenters supported CMS' proposals to remove the seven eCQMs beginning with the CY 2020 reporting period/FY 2022 payment determination as proposed, because they stated that hospitals need extensive time and resources to install software, map updates appropriately, and to successfully submit the data to CMS. In particular, commenters noted that the proposed eCQM removal timeline would ensure hospitals currently preparing to report any of the removed measures in 2019 would not be forced to choose new measures with a reduced implementation timeline.

Response: We thank commenters for their support.

Comment: Many commenters supported the alternative considered, for CMS to remove the seven eCQMs sooner beginning with the CY 2019 reporting period/FY 2021 payment determination because they believe earlier removal would alleviate burden from hospitals to report and for health IT vendors to update and certify measures that will not be available to report in the future. Commenters also suggested that measures for which CMS determines that the costs outweigh the benefits should be removed as soon as possible. Several commenters noted that EHR vendors must rewrite all measures in CQL for this reporting period, which would have very limited utility before being phased out. Commenters added that earlier removal would prevent additional work for health IT vendors and hospitals to update internal reporting to the new measure specifications and value sets anticipated in late calendar year 2018.

A few commenters recommended CMS allow hospitals to use the eCQM Extraordinary Circumstances Exception to apply for an exception from the eCQM reporting requirements for the CY 2019 reporting period/FY 2021 payment determination if the hospital cannot use four of the remaining eight eCQMs. One commenter believed that the request to lengthen the time period between changes applies to the updating of specifications or introduction of new eCQMs, not to the complete removal as there is minimal work associated with removing an eCQM compared to updating or implementing an eCQM.

Response: We appreciate commenters' recommendation that we remove the eCQMs sooner than proposed. However, we continue to believe removing these eCQMs beginning with the CY 2020 reporting period/FY 2022 payment determination is the least burdensome choice for the largest number of hospitals participating in the Hospital IQR Program. We note that since hospitals will have the same requirement of reporting 4 eCQMs and one quarter of data as in previous years for the CY 2019 reporting period/FY 2021 payment determination, as finalized in section VIII.A.11.d.(2) of the preamble of this final rule, there will be no increase in reporting burden by removing the seven eCQMs beginning with the CY 2020 reporting period/FY 2022 payment determination, while preserving greater availability of eCQMs to choose from for an additional year, especially for small and rural hospitals and any other hospitals that may benefit from the additional year to plan time and resources for when the eCQMs are ultimately removed from the program. We have previously received feedback from hospitals indicating they would benefit from longer timelines for implementing changes to eCQM requirements because hospitals may need time to adjust workflows and work with health IT vendors to modify support for eCQM implementation, data collection, and reporting. This lead time is particularly important for hospitals that have already developed the necessary IT and workflow plans to report data on the eCQMs being removed from the Hospital IQR Program, as retaining the measures for an additional year will allow those hospitals to submit data as planned for the CY 2019 reporting period that begins January 1, 2019 and begin any necessary updates for subsequent years' reporting well ahead of time. Therefore, in consideration of the time, effort, and resources already expended to report these measures that we are finalizing for removal and the time and resources necessary to update hospital EHR systems to report on different measures in future program years, we believe retaining these eCQMs measures in the Hospital IQR Program until the CY 2020 reporting period/FY 2022 payment determination is the most appropriate timeline for the greatest number of hospitals.

Under the Hospital IQR Program Extraordinary Circumstances Exceptions (ECE) Policy, hospitals may request an exception when they are unable to submit required data due to extraordinary circumstances not within their control. We note that ECE requests for the Hospital IQR Program are considered on a case-by-case basis (81 FR 57182). We will assess the hospital's request on a case-by-case basis to determine if an exception is merited. Therefore, our decision whether or not to grant an ECE will be based on the specific circumstances of the hospital. For additional information about eCQM-related ECE requests, we refer readers to section VIII.A.16 of the preamble of this final rule.

After consideration of the public comments we received, we are finalizing our proposal to remove the AMI–8a, CAC–3, ED–1, EHDI–1a, PC–01, STK–08, and STK–10 eCQMs from the Hospital IQR Program for the CY 2020 reporting period/FY 2022 payment determination and subsequent years as proposed. We refer readers to section VIII.D.9 of the preamble of this final rule where we also remove these seven eCQMs from the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs.

c. Summary of Hospital IQR Program Measures Newly Finalized for Removal

In the proposed rule, we proposed to remove a total of 39 measures from the program, as summarized in the table in section VIII.A.5.c. of the preamble of the proposed rule (83 FR 20484 through 20485). We are finalizing the removal of those 39 measures as they are summarized in the table below:

SUMMARY OF HOSPITAL IQR PROGRAM MEASURES NEWLY FINALIZED FOR REMOVAL

Short name	Measure name	First payment determination year for removal	NQF #
Structural Patient Safety Measures			
Safe Surgery Checklist	Safe Surgery Checklist Use	FY 2020	N/A
Patient Safety Culture	Hospital Survey on Patient Safety Culture	FY 2020	N/A

SUMMARY OF HOSPITAL IQR PROGRAM MEASURES NEWLY FINALIZED FOR REMOVAL—Continued

Short name	Measure name	First payment determination year for removal	NQF #
Patient Safety Measures			
PSI 90	Patient Safety and Adverse Events Composite	FY 2020	0531
CAUTI	National Healthcare Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure.	FY 2022	0138
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure.	FY 2022	1717
CLABSI	National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure.	FY 2022	0139
Colon and Abdominal Hysterectomy SSI.	American College of Surgeons—Centers for Disease Control and Prevention (ACS–CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	FY 2022	0753
MRSA Bacteremia	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure.	FY 2022	1716
Claims-Based Coordination of Care Measures			
READM–30–AMI	Hospital 30-Day All-Cause Risk-Standardized Readmission Rate Following Acute Myocardial Infarction (AMI) Hospitalization.	FY 2020	0505
READM–30–CABG	Hospital 30-Day, All-Cause, Unplanned, Risk-Standardized Readmission Rate Following Coronary Artery Bypass Graft (CABG) Surgery.	FY 2020	2515
READM–30–COPD	Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization.	FY 2020	1891
READM–30–HF	Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate Following Heart Failure (HF) Hospitalization.	FY 2020	0330
READM–30–PNA	Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate Following Pneumonia Hospitalization.	FY 2020	0506
READM–30–THA/TKA	Hospital-Level 30-Day, All-Cause Risk-Standardized Readmission Rate Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	FY 2020	1551
READM–30–STK	30-Day Risk Standardized Readmission Rate Following Stroke Hospitalization.	FY 2020	N/A
Claims-Based Mortality Measures			
MORT–30–AMI	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) Hospitalization.	FY 2020	0230
MORT–30–HF	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Heart Failure (HF) Hospitalization.	FY 2020	0229
MORT–30–COPD	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization.	FY 2021	1893
MORT–30–PN	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization.	FY 2021	0468
MORT–30–CABG	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Coronary Artery Bypass Graft (CABG) Surgery.	FY 2022	2558
Claims-Based Patient Safety Measure			
Hip/Knee Complications	Hospital-Level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	FY 2023	1550
Claims-Based Payment Measures			
MSPB	Medicare Spending Per Beneficiary (MSPB)—Hospital Measure	FY 2020	2158
Cellulitis Payment	Cellulitis Clinical Episode-Based Payment Measure	FY 2020	N/A
GI Payment	Gastrointestinal Hemorrhage Clinical Episode-Based Payment Measure	FY 2020	N/A
Kidney/UTI Payment	Kidney/Urinary Tract Infection Clinical Episode-Based Payment Measure.	FY 2020	N/A
AA Payment	Aortic Aneurysm Procedure Clinical Episode-Based Payment Measure	FY 2020	N/A
Chole and CDE Payment	Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment Measure.	FY 2020	N/A
SFusion Payment	Spinal Fusion Clinical Episode-Based Payment Measure	FY 2020	N/A
Chart-Abstracted Clinical Process of Care Measures			
IMM–2	Influenza Immunization	FY 2021	1659
VTE–6	Incidence of Potentially Preventable VTE [Venous Thromboembolism] ..	FY 2021	+

SUMMARY OF HOSPITAL IQR PROGRAM MEASURES NEWLY FINALIZED FOR REMOVAL—Continued

Short name	Measure name	First payment determination year for removal	NQF #
ED–1	Median Time from ED Arrival to ED Departure for Admitted ED Patients	FY 2021	0495
ED–2 *	Admit Decision Time to ED Departure Time for Admitted Patients	FY 2022	0497
EHR-Based Clinical Process of Care Measures (that is, Electronic Clinical Quality Measures (eCQMs))			
AMI–8a	Primary PCI Received Within 90 Minutes of Hospital Arrival	FY 2022	+
CAC–3	Home Management Plan of Care Document Given to Patient/Caregiver	FY 2022	+
ED–1	Median Time from ED Arrival to ED Departure for Admitted ED Patients	FY 2022	0495
EHDI–1a	Hearing Screening Prior to Hospital Discharge	FY 2022	1354
PC–01	Elective Delivery	FY 2022	0469
STK–08	Stroke Education	FY 2022	+
STK–10	Assessed for Rehabilitation	FY 2022	0441

* Measure is finalized for removal in chart-abstracted form, but will be retained in eCQM form.
+ NQF endorsement removed.

6. Summary of Hospital IQR Program Measures for the FY 2020 Payment Determination

The table below summarizes the Hospital IQR Program measure set for the FY 2020 payment determination (including previously adopted measures, but not including measures finalized for removal beginning with the FY 2020 payment determination in this final rule):

MEASURES FOR THE FY 2020 PAYMENT DETERMINATION *

Short name	Measure name	NQF #
Healthcare-Associated Infection Measures		
CAUTI	National Healthcare Safety Network Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure.	0138
CDI	National Healthcare Safety Network Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure.	1717
CLABSI	National Healthcare Safety Network Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure.	0139
Colon and Abdominal Hysterectomy SSI	American College of Surgeons—Centers for Disease Control and Prevention Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	0753
HCP	Influenza Vaccination Coverage Among Healthcare Personnel	0431
MRSA Bacteremia	National Healthcare Safety Network Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure.	1716
Claims-Based Patient Safety Measures		
Hip/Knee Complications	Hospital-Level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	1550
PSI 04	Death Rate among Surgical Inpatients with Serious Treatable Complications [298]	0351
Claims-Based Mortality Measures		
MORT–30–CABG	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Coronary Artery Bypass Graft (CABG) Surgery.	2558
MORT–30–COPD	Hospital 30-Day, All-Cause, Risk Standardized Mortality Rate Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization.	1893
MORT–30–PN	Hospital 30-Day, All-Cause, Risk Standardized Mortality Rate Following Pneumonia Hospitalization.	0468
MORT–30–STK	Hospital 30-Day, All-Cause, Risk Standardized Mortality Rate Following Acute Ischemic Stroke.	N/A
Claims-Based Coordination of Care Measures		
READM–30–HWR	Hospital-Wide All-Cause Unplanned Readmission Measure (HWR)	1789
AMI Excess Days	Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction	2881
HF Excess Days	Excess Days in Acute Care after Hospitalization for Heart Failure	2880
PN Excess Days	Excess Days in Acute Care after Hospitalization for Pneumonia	2882

MEASURES FOR THE FY 2020 PAYMENT DETERMINATION *—Continued

Short name	Measure name	NQF #
Claims-Based Payment Measures		
AMI Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI).	2431
HF Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care For Heart Failure (HF).	2436
PN Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-day Episode-of-Care For Pneumonia.	2579
THA/TKA Payment	Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective Total Hip Arthroplasty and/or Total Knee Arthroplasty.	N/A
Chart-Abstracted Clinical Process of Care Measures		
ED–1 **	Median Time from ED Arrival to ED Departure for Admitted ED Patients	0495
ED–2 **	Admit Decision Time to ED Departure Time for Admitted Patients	0497
IMM–2	Influenza Immunization	1659
PC–01 **	Elective Delivery	0469
Sepsis	Severe Sepsis and Septic Shock: Management Bundle (Composite Measure)	0500
VTE–6	Incidence of Potentially Preventable Venous Thromboembolism	+
EHR-Based Clinical Process of Care Measures (that is, Electronic Clinical Quality Measures (eCQMs))		
AMI–8a	Primary PCI Received Within 90 Minutes of Hospital Arrival	+
CAC–3	Home Management Plan of Care Document Given to Patient/Caregiver	+
ED–1 **	Median Time from ED Arrival to ED Departure for Admitted ED Patients	0495
ED–2 **	Admit Decision Time to ED Departure Time for Admitted Patients	0497
EHDI–1a	Hearing Screening Prior to Hospital Discharge	1354
PC–01 **	Elective Delivery	0469
PC–05	Exclusive Breast Milk Feeding	0480
STK–02	Discharged on Antithrombotic Therapy	0435
STK–03	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436
STK–05	Antithrombotic Therapy by the End of Hospital Day Two	0438
STK–06	Discharged on Statin Medication	0439
STK–08	Stroke Education	+
STK–10	Assessed for Rehabilitation	0441
VTE–1	Venous Thromboembolism Prophylaxis	0371
VTE–2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
Patient Experience of Care Survey Measures		
HCAHPS ***	Hospital Consumer Assessment of Healthcare Providers and Systems Survey (including Care Transition Measure).	0166 (0228)

* As discussed in section VIII.A.5. of the preamble of this final rule, we are finalizing our proposals to remove 19 measures—17 claims-based measures and two structural measures—beginning with the FY 2020 payment determination. These measures, which had previously been finalized for the FY 2020 payment determination are not included in this summary table.

** Measure listed twice, as both chart-abstracted and eCQM versions.

*** We have proposed to update the HCAHPS Survey by removing the Communication About Pain questions effective with January 2022 discharges, for the FY 2024 payment determination and subsequent years. We refer readers to the CY 2019 OPPS/ASC proposed rule (available at: *https://www.regulations.gov/document?D=CMS-2018-0078-0001*).

+ NQF endorsement has been removed.

7. Summary of Hospital IQR Program Measures for the FY 2021 Payment Determination

The table below summarizes the Hospital IQR Program measure set for the FY 2021 payment determination (including previously adopted measures, but not including measures finalized for removal beginning with the FY 2021 payment determination in this final rule):

[298] We note that measure stewardship of the recalibrated version of the Death Rate among Surgical Inpatients with Serious Treatable Complications measure is transitioning from AHRQ to CMS and, as part of the transition, the measure will be referred to as the CMS Recalibrated Death Rate among Surgical Inpatients with Serious Treatable Complications (CMS PSI 04) when it is used in CMS quality programs.

MEASURES FOR THE FY 2021 PAYMENT DETERMINATION

Short name	Measure name	NQF #
Healthcare-Associated Infection Measures		
CAUTI	National Healthcare Safety Network Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure.	0138
CDI	National Healthcare Safety Network Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure.	1717
CLABSI	National Healthcare Safety Network Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure.	0139
Colon and Abdominal Hysterectomy SSI	American College of Surgeons—Centers for Disease Control and Prevention Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	0753
MRSA Bacteremia	National Healthcare Safety Network Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure.	1716
HCP	Influenza Vaccination Coverage Among Healthcare Personnel	0431
Claims-Based Patient Safety Measures		
Hip/Knee Complications	Hospital-Level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	1550
PSI 04	Death Rate among Surgical Inpatients with Serious Treatable Complications	+
Claims-Based Mortality Measures

MEASURES FOR THE FY 2022 PAYMENT DETERMINATION AND SUBSEQUENT YEARS—Continued

Short name	Measure name	NQF #
Patient Experience of Care Survey Measures		
HCAHPS**	Hospital Consumer Assessment of Healthcare Providers and Systems Survey (including Care Transition Measure)	0166 (0228)

*Finalized for removal from the Hospital IQR Program beginning with the FY 2023 payment determination, as discussed in section VIII.A.5.b.(5) of the preamble of this final rule.

**We have proposed to update the HCAHPS Survey by removing the Communication About Pain questions effective with January 2022 discharges, for the FY 2024 payment determination and subsequent years. We refer readers to the CY 2019 OPPS/ASC proposed rule (available at: *https://www.regulations.gov/document?D=CMS-2018-0078-0001*).

9. Possible New Quality Measures, Measure Topics, and Other Future Considerations

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53510 through 53512), we outlined considerations to guide us in selecting new quality measures to adopt into the Hospital IQR Program. We also refer readers to section I.A.2. of the preamble of this final rule where we describe the Meaningful Measures Initiative—quality priorities that we have identified as high impact measurement areas that are relevant and meaningful to both patients and providers.

In keeping with these considerations, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20489 through 20495), we invited public comment on the potential future inclusion of a hospital-wide mortality measure in the Hospital IQR Program, specifically whether to propose to adopt a Claims-Only, Hospital-Wide, All-Cause, Risk-Standardized Mortality measure or a Hybrid Hospital-Wide, All-Cause, Risk-Standardized Mortality measure. We are also considering a newly specified eCQM for possible concurrent inclusion in future years of the Hospital IQR and Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs), the Opioid Harm Electronic Clinical Quality Measure (eCQM). We also sought public input on the future development and adoption of eCQMs more generally (for example, burdens, incentives). These topics are discussed in more detail below.

a. Potential Inclusion of Claims-Only Hospital-Wide Mortality Measure and/or Hybrid Hospital-Wide Mortality Measure With Electronic Health Record Data

(1) Background

Mortality is an important health outcome that is meaningful to patients and providers, and the vast majority of patients admitted to the hospital have survival as a primary goal. However, estimates using data from 2002 to 2008 suggest that more than 400,000 patients die each year from preventable harm in hospitals.[299] While we do not expect mortality rates to be zero, studies have shown that mortality within 30 days of hospital admission is related to quality of care, and that high and variable mortality rates across hospitals indicate opportunities for improvement.[300] [301] In addition to the harm to individuals, their families, and caregivers resulting from preventable death, there are also significant financial costs to the healthcare system associated with high and variable mortality rates. While capturing monetary savings for preventable mortality events is challenging, using two recent estimates of the number of deaths due to preventable medical errors and assuming an average of ten lost years of life per death (valued at $75,000 per year in lost quality adjusted life years), the annual direct and indirect cost of potentially preventable deaths could be as much as $73.5 to $735 billion.[302] [303] [304]

Existing condition-specific mortality measures adopted into the Hospital IQR Program support quality improvement work targeted toward patients with a set of common medical conditions, such as heart failure, acute myocardial infarction, or pneumonia. The use of these measures may have contributed to national declines in hospital mortality rates for the measured conditions and/or procedures.[305] However, a measure of hospital-wide mortality captures a hospital's performance across a broader set of patients and across more areas of the hospital. Because more patients are included in the measure, a hospital-wide mortality measure also captures the performance for smaller volume hospitals that would otherwise not have sufficient cases to calculate condition- or procedure-specific mortality measures.

We developed two versions of a hospital-wide, all-cause, risk-standardized mortality measure: One that is calculated using only claims data (the Claims-Only Hospital-Wide All-Cause Risk Standardized Mortality Measure (hereinafter referred to as the ''Claims-Only HWM measure'')); and a hybrid version that uses claims data to define the measure cohort and a combination of data from electronic health records (EHRs) and claims for risk adjustment (Hybrid Hospital-Wide All-Cause Risk Standardized Mortality Measure (hereinafter referred to as the ''Hybrid HWM measure'')). The goal of developing hospital-wide mortality measures is to assess hospital performance on patient outcomes among patients for whom mortality is likely to present an important quality signal and those where the hospital can positively influence the outcome for the patient. Both versions of the measure address the Meaningful Measures Initiative quality priority of promoting effective treatment to reduce risk-adjusted mortality.

Several stakeholder groups were engaged throughout the development process, including a Technical Work Group and a Patient and Family Work Group, as well as a national, multi-stakeholder Technical Expert Panel (TEP) consisting of a diverse set of stakeholders, including providers and patients. These groups were convened by the measure developer under contract with us and provided feedback on the measure concept, outcome, cohort, risk model variables, and reporting results. The measure developer also solicited stakeholder feedback during measure development as required in the Measures Management System (MMS) Blueprint.[306]

We developed a Hybrid HWM measure in addition to a Claims-Only HWM measure in order to move toward greater use of EHR data for quality measurement, and in response to stakeholder feedback that is important to include clinical data in outcome measures (80 FR 49702 through 49703). The Hybrid HWM measure is harmonized with the Claims-Only HWM measure. Both measures use the same cohort definition, outcome assessment, and claims-based risk variables (discussed in more detail below). The Hybrid HWM measure builds upon prior efforts to use of a set of core clinical data elements extracted from hospital EHRs for each hospitalized Medicare FFS beneficiary over the age of 65 years, as outlined in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49698). The core clinical data elements are data which are routinely collected on hospitalized adults, extraction from hospital EHRs is feasible, and the data can be utilized as part of specific quality outcome measures. The Hybrid HWM measure's core clinical data elements are very similar to, but not precisely that same as, those used in the Hybrid Hospital-Wide Readmission Measure with Claims and Electronic Health Record Data measure (NQF #2879), for which we are currently collecting data from hospitals on a voluntary basis and are considering proposing as a required measure as early as the FY 2023 payment determination (82 FR 38350 through 38355). For more detail about the core clinical data elements used in the Hybrid Hospital-Wide Readmission Measure with Claims and Electronic Health Record Data measure (NQF #2879), we refer readers to our discussion in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49698 through 49704) and the Hybrid Hospital-Wide Readmission Measure with Electronic Health Record Extracted Risk Factors report (available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*).

The Claims-Only Hospital-Wide All-Cause Risk Standardized Mortality Measure (MUC17–195) and the Hybrid Hospital-Wide All-Cause Risk Standardized Mortality Measure (MUC17–196) were included in a publicly available document entitled ''2017 Measures Under Consideration List'' (available at: *http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367*) and have been reviewed by the NQF MAP Hospital Workgroup. The MAP conditionally supported both measures pending NQF review and endorsement, as referenced in the 2017–2018 Spreadsheet of Final Recommendations to HHS and CMS (available at: *https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86972*). The MAP also recommended the Hybrid HWM measure have a voluntary reporting period before mandatory implementation.[307]

The MAP noted both measures are important measures for patient safety, and that these measures could help reduce deaths due to medical errors.[308] We agree with MAP stakeholder concerns regarding the need for the NQF endorsement process to ensure the measures have appropriate clinical and social risk factors in the risk adjustment models and address necessary exclusions to ensure the measure does not disproportionately penalize facilities that may treat more complex patients.[309] The MAP also expressed concern regarding the potential unintended consequences of unnecessary interventions for patients at the end of life; [310] however, this issue was carefully addressed during measure development by excluding patients at the end of life and for whom survival is unlikely to be the goal of care from the measure cohort based upon the TEP and patient work group input. Specifically, the measure does not include patients enrolled in hospice in the 12 months prior to admission, on admission, or within 2 days of admission; the measure also does not include patients admitted primarily for cancer that are enrolled in hospice at any time during the admission, those admitted primarily for metastatic cancer, and those admitted for specific diagnoses with limited chances of survival.

The MAP further suggested that condition-specific mortality measures may be more actionable for providers and informative for consumers.[311] While service-line divisions may not be as granular as condition-specific measures, we believe a single comprehensive marker of hospital quality encourages organization-wide improvement, allows more hospitals to meet volume requirements for inclusion, offers more rapid detection of changes in performance due to performance being based on the most recent year of data available, and aligns with the Meaningful Measures Initiative by creating the framework for stakeholders to have fewer measures to track and a single score to reference. We plan to submit both measures to NQF for endorsement proceedings as part of the Patient Safety Committee as early as FY 2019, after the measures have been fully specified for use with ICD–10 data.

(2) Overview of Measures

Both the Claims-Only HWM measure and the Hybrid HWM measure capture hospital-level, risk-standardized mortality within 30 days of hospital admission for most conditions or procedures. The measures are reported as a single summary score, derived from the results of risk-adjustment models for 13 mutually exclusive service-line divisions (categories of admissions grouped based on discharge diagnoses or procedures), with a separate risk model for each of the 13 service-line divisions. The 13 service-line divisions include: 8 non-surgical divisions and 5 surgical divisions. The non-surgical divisions are: Cancer; cardiac; gastrointestinal; infectious disease; neurology; orthopedics; pulmonary; and renal. The surgical divisions are: Cancer; cardiothoracic; general; neurosurgery; and orthopedics. Hospitalizations are eligible for inclusion in the measure if the patient was hospitalized at a non-Federal, short-stay acute care hospital. To compare mortality performance across hospitals, the measure accounts for differences in patient characteristics (patient case mix) as well as differences in the medical services provided and procedures performed by hospitals (hospital service

[308] Ibid.

[309] Ibid.

[310] Ibid.

[311] Ibid.

mix). In addition, the Hybrid HWM Measure employs a combination of administrative claims data and clinical EHR data to enhance clinical case mix adjustment with additional clinical data.

Our goal is to more comprehensively measure the mortality rates of hospitals, including to improve the ability to measure mortality rates in smaller volume hospitals. The cohort definition attempts to capture as many admissions as possible for which survival would be a reasonable indicator of quality and for which adequate risk adjustment is possible. We assume survival would be a reasonable indicator of quality for admissions fulfilling two criteria: (1) Survival is most likely the primary goal of the patient when they enter the hospital; and (2) the hospital can reasonably influence the patient's chance of survival through quality of care. These measures would provide information to hospitals that can facilitate quality improvement efforts for hospital settings, types of care, and types of patients not included in currently available condition-and procedure-specific mortality measures. Also, these measures would provide more transparency about the quality of care in clinical areas not captured in the current condition- and procedure-specific measures.

Additional information on the development of both the Claims-Only and Hybrid versions of the HWM measure can be found on the CMS website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/PC-Updates-on-Previous-Comment-Periods.html*.

(3) Data Sources

Both the Claims-Only and Hybrid versions of the HWM measure use Part A Medicare administrative claims data from Medicare FFS beneficiaries aged between 65 and 94 years, and use one year of data. Part A data from the 12 months prior to the index admission are used for risk adjustment.

The Hybrid HWM measure uses two sources of data for the calculation of the measure: Medicare Part A claims and a set of core clinical data elements from hospitals' EHRs. Claims and enrollment data are used to identify index admissions included in the measure cohort, in the risk-adjustment model, and to assess the 30-day mortality outcome. These data are merged with the core clinical data elements for eligible patient admissions from each hospital's EHR. The data elements are the values for a set of vital signs and common laboratory tests collected at presentation and used for risk-adjustment of patients' severity of illness (for Medicare FFS beneficiaries who are aged between 65 and 94 years), in addition to data from claims.

(4) Outcome

The outcome of interest for both the Claims-Only and Hybrid versions of the HWM measure is the same, all-cause 30-day mortality. We define all-cause mortality as death from any cause within 30 days of the index hospital admission date.

(5) Cohort

The cohorts for both the Claims-Only HWM and Hybrid versions of the HWM measure are the same. The measure cohorts consist of Medicare FFS beneficiaries, aged between 65 and 94 years, discharged from non-federal acute care hospitals.

The Claims-Only HWM measure and Hybrid HWM measure were developed using ICD–9 codes. The measures are currently being updated for use with ICD–10 codes; ICD–10 updates will be completed prior to NQF submission and potential future implementation. Similar to the existing Hospital-Wide All-Cause Unplanned Readmission measure (NQF #1789), which was adopted into the Hospital IQR Program in the FY 2013 IPPS/LTCH PPS final rule beginning with the FY 2015 payment determination (77 FR 53521 through 53528), the Claims-Only HWM measure and Hybrid HWM measure include a large and diverse number of admissions represented by thousands of included ICD–9 codes. During measure development, we used the AHRQ Clinical Classification Software (CCS) [312] to group diagnostic and procedural ICD–9 codes into the clinically meaningful categories defined by the AHRQ grouper. The transition of the ICD–9 CCS-based measure specifications to the ICD–10–CM version of the CCS is underway. The ICD–10 to CCS map and tools for its use are currently available at: *https://www.hcup-us.ahrq.gov/toolssoftware/ccs10/ccs10.jsp*. Both the Claims-Only and Hybrid versions of the HWM measure use those CCS categories as part of cohort specification and risk-adjustment, including the 13 service-line risk models.

For the AHRQ CCSs and individual ICD–9–CM codes that define the measure development cohort, we refer readers to the measure methodology reports on our website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/PC-Updates-on-Previous-Comment-Periods.html*.

(6) Inclusion and Exclusion Criteria

The inclusion and exclusion criteria for both the Claims-Only and Hybrid versions of the HWM measure are the same. For both versions of the HWM measure, the cohort currently includes Medicare FFS patients who: (1) Were enrolled in Medicare FFS Part A for the 12 months prior to the date of admission and during the index admission; (2) have not been transferred from another inpatient facility; (3) were admitted for acute care (do not have a principal discharge diagnosis of a psychiatric disease or do not have a principal discharge diagnosis of ''rehabilitation care; fitting of prostheses and adjustment devices''); (4) are aged between 65 and 94 years; (5) are not enrolled in hospice at the time of or in the 12 months prior to their index admission; (6) are not enrolled in hospice within two days of admission; (7) are without a principal diagnosis of cancer and enrolled in hospice during their index admission; (8) are without any diagnosis of metastatic cancer; and (9) are without a principal discharge diagnosis of a condition which hospitals have limited ability to influence survival, including: Anoxic brain damage; persistent vegetative state; prion diseases such as Creutzfeldt-Jakob disease, Cheyne-Stokes respiration; brain death; respiratory arrest; or cardiac arrest without a secondary diagnosis of acute myocardial infarction.

Both the Claims-Only and Hybrid versions of the HWM measure currently exclude the following index admissions for patients: (1) With inconsistent or unknown vital status; (2) discharged against medical advice; (3) with an admission for crush injury, burn, intracranial injury, or spinal cord injury; (4) with specific principal discharge diagnosis codes for which mortality may not be a quality signal; (5) with an admission in a CCS condition or procedure categorized as in the service-line divisions: Other Surgical Procedures or Other Non-Surgical Conditions (this exclusion is being reassessed to include these patients in the final measure); and (6) with an admission in a low-volume CCS (within a particular service-line division), defined as equal to or less than 100 patients with that principle diagnosis across all hospitals.

For both the Claims-Only and Hybrid versions of the HWM measure, each index admission is assigned to one of 13

[312] Clinical Classifications Software (CCS) for ICD–9–CM Fact Sheet. Accessed at: *https://www.hcup-us.ahrq.gov/toolssoftware/ccs/ccsfactsheet.jsp*.

mutually exclusive service-line divisions. For details on how each admission is assigned to a specific service-line division, and for a complete description and rationale of the inclusion and exclusion criteria, we refer readers to the methodology reports found on the CMS website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/PC-Updates-on-Previous-Comment-Periods.html*.

(7) Risk-Adjustment

Both the Claims-Only and Hybrid versions of the HWM measure adjust for both case mix differences (clinical status of the patient, accounted for by adjusting for age and comorbidities) and service-mix differences (the types of conditions and procedures cared for and procedures conducted by the hospital, accounted for by the discharge condition category), and use the same patient comorbidities in the risk models. Patient comorbidities are based on inpatient hospital administrative claims during the 12 months prior to and including the index admission derived from ICD–9 codes grouped into the CMS condition categories (CMS–CCs). The measures are currently being updated for use with ICD–10 codes; ICD–10 updates will be completed prior to NQF submission and potential future adoption.

The Hybrid HWM measure also includes the core clinical data elements from patients' EHRs in the case mix adjustment. The core clinical data elements are derived from information captured in the EHR during the index admission only, and are listed below.

CURRENTLY SPECIFIED CORE CLINICAL DATA ELEMENT VARIABLES

Data elements	Units of measurement	Time window for first captured values (hours)
Heart Rate	Beats per minute	0–2
Systolic Blood Pressure	mmHg	0–2
Temperature	Degrees (Fahrenheit or Celsius)	0–2
Oxygen Saturation	Percent	0–2
Hemoglobin	g/dL	0–24
Platelet	Count	0–24
White Blood Cell Count	Cells/mL	0–24
Sodium	mEq/L	0–24
Bicarbonate	mmol/L	0–24
Creatinine	mg/dL	0–24

The core clinical data elements are clinical information meant to reflect a patient's clinical status upon arrival to the hospital. For more details on how the risk variables in each measure were chosen, we refer readers to the methodology reports found on the CMS website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/PC-Updates-on-Previous-Comment-Periods.html*.

(8) Calculating the Risk-Standardized Mortality Rate (RSMR)

The method for calculating the RSMR for both the Claims-Only and the Hybrid versions of the HWM measure is the same. Index admissions are assigned to one of 13 mutually exclusive service-line divisions consisting of related conditions or procedures. For each service-line division, the standardized mortality ratio (SMR) is calculated as the ratio of the number of ''predicted'' deaths to the number of ''expected'' deaths at a given hospital. For each hospital, the numerator of the ratio is the number of deaths within 30 days predicted based on the hospital's performance with its observed case mix and service mix, and the denominator is the number of deaths expected based on the nation's performance with that hospital's case mix and service mix. This approach is analogous to a ratio of ''observed'' to ''expected'' used in other types of statistical analyses.

The service-line SMRs are then pooled for each hospital using an inverse variance-weighted mean to create a hospital-wide composite SMR. The inverse variance-weighted mean can be interpreted as a weighted average of all SMRs that takes into account the precision of SMRs. The composite SMR is multiplied by the national observed mortality rate to produce the RSMR. For additional details regarding the measure specifications to calculate the RSMR, we refer readers to the Claims-Only Hospital-Wide (All-Condition, All-Procedure) Risk-Standardized Mortality Measure: Measure Methodology for Public Comment report and Hybrid Hospital-Wide (All-Condition, All-Procedure) Risk-Standardized Mortality Measure with Electronic Health Record Extracted Risk Factors: Measure Methodology for Public Comment report, which are posted on the CMS website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/PC-Updates-on-Previous-Comment-Periods.html*.

We invited public comment on the possible future inclusion of one or both hospital-wide mortality measures in the Hospital IQR Program simultaneously. We are also considering possible future inclusion of the Hybrid HWM measure in the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs) for Clinical Quality Measures (CQM) electronic reporting by eligible hospitals and CAHs. We also invited public comment on other aspects of the measure. Specifically, we sought public comment on the following: (1) Feedback about the service-line division structure of the measure; (2) input on the measure testing approach, particularly if there is any additional validity testing that would be meaningful; and (3) how the measure results might be presented to the public, including ways that we could present supplemental hospital performance information in public reporting, such as service-line division-level results, to create a more meaningful and usable measure and ways that we could report more information about hospitals in a No Different From National Average group (defined using 95 percent confidence intervals) to help clinicians and patients use the measure results to improve patient care and make informed choices.

Comment: Several commenters supported future implementation of the hybrid version of the Hospital-Wide Mortality Measure over the claims-only version of the measure. Many commenters commended use of EHR data in the hybrid version of the measure.

Response: We thank commenters for their support of the hybrid version of the measure.

Comment: One commenter supported future implementation of the claims-only version of the measure, expressing concern that hybrid measures have not been sufficiently validated. Another commenter supported the claims-only version, citing the need for improvements to the process of submitting EHR data elements using the Quality Reporting Data Architecture (QRDA) I file format prior to implementation of hybrid measures.

Response: We thank commenters for their support of the claims-only version of the measure. However, in response to concerns that the hybrid measures have not been sufficiently validated, we note that several condition-specific hybrid measures (Hybrid Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Ischemic Stroke with Risk Adjustment for Stroke Severity (NQF #2877) and Hybrid Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (AMI) (NQF #2473)), and the Hybrid Hospital-Wide Readmission Measure with Claims and Electronic Health Record Data (NQF #2879), have all been tested and validated. Their validity and reliability have been reviewed by the NQF and the measures have been endorsed. The Hybrid Hospital-Wide Readmission Measure was implemented in the Hospital IQR Program as a voluntary measure for the CY 2018 reporting period. Hospitals that voluntarily participate will submit 13 EHR data elements for adult inpatients discharged between January and June of 2018. These data elements are nearly identical to those required for the Hybrid Hospital-Wide Mortality Measure. The results from the voluntary reporting will assist in confirming the feasibility of submitting the required data elements. In addition, we continue to work to improve the process of EHR data submission using the QRDA I file format, including the availability of the Pre-Submission Validation Application (PSVA) tool to perform test and production QRDA I file conformance checks.

Comment: Several commenters supported the proposed voluntary reporting of the Hybrid HWM measure following endorsement by the NQF.

Response: We thank commenters for their support. As stated in the proposed rule (83 FR 20490) and above, we plan to submit both versions of the measure to NQF for endorsement proceedings as part of the Patient Safety Committee as early as FY 2019, after the measures have been fully specified for use with ICD–10 data. We have not yet determined the implementation pathway or timeline for these measures. We will consider these suggestions if we move forward with proposing to include either or both of these measures in the Hospital IQR Program in the future through rulemaking.

Comment: Several commenters proposed revisions to the measure methodology, including merging surgical and non-surgical cancer service-line divisions and surgical and non-surgical orthopedic divisions.

Response: We thank commenters for their feedback. By design, the measure separates surgical and non-surgical admissions in order to account for differences in mortality risk between surgical and non-surgical patients. Analyses performed during measure development showed that even for patients with the same discharge condition, patient risk of death was strongly affected by whether a major surgical procedure was performed during hospitalization. Patients undergoing major surgical procedures typically have different risk of mortality than patients admitted with the same discharge condition but who do not undergo a major surgical procedure. For example, a patient admitted for a hip fracture (CCS 226) who undergoes a major surgical procedure such as hip replacement to treat their fracture is likely healthy enough to have the surgery, as compared to patients who are so ill that they either would not survive or choose not to risk undergoing surgery. In this example, surgery is associated with a lower observed mortality rate. The measure has more accurate risk adjustment, and thereby is better at accounting for the underlying risk of the population that the hospital serves, when the surgical and non-surgical patients are separated into distinct risk models.

To demonstrate this further, we note that in the case of surgical and non-surgical orthopedics, as well as surgical and non-surgical cancer, the hospital-level risk-standardized mortality rates (RSMR) are quite different. For example, for non-surgical cancer, the median RSMR in the development sample was 2.5 percent (range 1.3 percent–6.0 percent) for surgical cancer, compared to 19.3 percent (range 9.3 percent–33.7 percent) for non-surgical cancer. Furthermore, prior experience with other quality measures suggests that hospitals do not perform equally well across different service lines, thus it benefits hospitals and consumers to provide quality information on more narrow cohorts. Therefore, in order to make this measure useful in terms of quality improvement and patient choice, we designed the measure to report the surgical and non-surgical divisions separately.

Further, we note that some commenters observed that cancer care is complex and often includes surgical procedures, and advocated for both surgical and non-surgical cancer divisions to better capture cancer patients and allow providers, and possibly consumers, to view more detailed quality information related to cancer.

Comment: Multiple commenters expressed concern about the limitations of claims data including effectiveness in quality measurement. One commenter suggested that the measure should not include claims data and instead be specified entirely using EHR data. One commenter recommended that CMS use specialty specific registry data in the measure.

Response: We thank commenters for their feedback. Administrative claims data are routinely submitted by hospitals for quality measurement and are frequently audited by CMS. This allows for relatively accurate data about patients' acute and chronic conditions while also preventing undue burden on providers to submit additional clinical information. In addition, claims-based measures continue to provide important quality information that cannot currently be captured using EHR data alone. For example, claims data can be linked across care settings to gather complete risk factors for patients. Claims data also enable tracking patient outcomes such as deaths that occur outside of a single care setting, and provide a reliable and valid source of information that supports the development of measures not currently feasible using EHR data alone. For these reasons, we believe that claims-based measures will continue to play a vital role in quality assessment. In addition, for claims-based outcome measures (procedure-specific mortality and readmission measures) we have previously developed, we have found measure scores calculated from data derived from medical records correlate highly with measure scores calculated

with claims.[313] [314] [315] [316] These studies support the use of claims for outcomes such as mortality.

At this time it is not feasible to develop and implement an eCQM measuring the outcome of mortality 30-days after admission to an acute care hospital. Deaths recorded as outcomes in CMS' claims-based mortality measures are derived from the Medicare Enrollment Database which provides information about deaths among Medicare beneficiaries.[317] Hospitals' EHRs do not include information about deaths that occur outside of the hospital and therefore cannot be used in place of Medicare enrollment data. In addition, hospital claims provide a standardized and audited assessment of patients' principal discharge diagnoses, which are the basis for the service-line division assignment in the HWM measures. Therefore, claims and administrative data continue to provide critical information to support these quality measures.

Regarding the use of specialty registry data, we agree that registry data are a useful source of data to consider, in particular because registry data address care for all patients (not limited to Medicare fee-for-service patients). Registry data, however, are generally reported on a voluntary basis among registry participants only, and accordingly are not currently an available source of measurement data from all hospitals. However, we will continue to consider the potential use, feasibility, and availability of registry data for future measures.

Comment: Several commenters expressed concern about risk adjustment, including how the measure accounts for various mortality risks associated with different procedures performed at a hospital. In addition, commenters noted that the measure includes a broad range of conditions and procedures associated with widely varying mortality risk. Commenters expressed concern that these shortcomings could mask preventable hospital harms and lead to inaccurate performance comparisons. One commenter requested a better explanation of the risk adjustment utilized within each of the service line divisions.

Response: We thank commenters for their feedback. We agree that one of the key challenges in developing a hospital-wide mortality measure is to adequately account for the varying risk of mortality for the different populations of patients admitted to hospitals and to adequately adjust for these differences when comparing performance across hospitals. However, we feel our risk adjustment approach appropriately accounts for these differences.

The measure addresses risk adjustment in several ways. First, since the risk of death differs between surgical and non-surgical patients, the measure separates patients who underwent major surgical procedures from those who did not. The measure then further divides the surgical and non-surgical groups into a total of 13 service-line divisions (Surgical divisions: General, Orthopedics, Cardiac, Cancer, and Neurosurgery; Non-surgical divisions: Cardiac, Infectious Disease, Pulmonary, Gastrointestinal, Renal, Orthopedic, Neurology, and Cancer). The surgical divisions are created by combining clinically related groups of procedures, considering the risk of death and the reason for admission (the principal discharge diagnosis) during the combination step. For the non-surgical division, the measure categorizes patients based on medical conditions that would typically be cared for by the same group of clinicians, as well as based on the risk of death.

To further account for differences in risk among patients, the measure adjusts for both patient-level factors (the medical condition of the patient when admitted to the hospital, accounted for by adjusting for illnesses and diagnoses the patient has when admitted) and hospital service mix differences (the types of conditions/procedures cared for by the hospital). Each of the 13 service-line divisions is risk-adjusted independently of the others, which helps account for differences in the mortality risks of procedures in the separate divisions. The hybrid version of the measure uses the same service-line division risk models, patient case mix, and hospital service mix, but adds an additional 10 clinical risk variables extracted from the EHR. Although no measure is perfectly able to assess each harm or death, the detailed approach to risk adjustment of individual groups of procedures and conditions is intended to prevent inaccurate performance assessment by this measure.

The work described above was done with the careful and systematic input of clinicians. In addition, the steps described above were presented to the measure developer's Patient & Family Caregiver workgroup, technical and clinical workgroup, and the TEP, all of whom generally supported the approach. For more details about the risk-adjustment approach, we refer readers to the measure methodology report on the CMS website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/PC-Updates-on-Previous-Comment-Periods.html.*

Comment: Several commenters expressed concern that the measure does not adjust for social risk factors and that no analysis of their impact on the measures was provided. In addition, some commenters recommended additional research on the community-level factors described in the report by the Office of the Assistant Secretary for Planning and Evaluation (ASPE).[318]

Response: We thank commenters for their feedback. As part of our plans to submit this measure to the NQF for endorsement, we intend to provide the results of measure testing that includes assessing the impact of social risk factors on the measure results, as required for all measures seeking NQF endorsement. Specifically, NQF requires developers to present the results of analyses examining the impact of social risk factors on the measure outcome, as well as the degree to which any association is occurring at the patient-level or hospital-level.[319] We understand that the relevant NQF committees will examine the evidence and determine whether the measure is suitable for endorsement with or without adjustment for social risk

factors, including consideration of potential community-level factors. This NQF analysis would be taken into consideration before we move forward with proposing either or both of these measures for inclusion in the Hospital IQR Program in future rulemaking.

Comment: One commenter recommended educating the public about where to obtain information about hospital performance on the measure in order to ensure that the measure is useful once results are made public.

Response: We thank the commenter for the suggestion. Should we decide to move forward with proposing either or both of these measures for inclusion in the Hospital IQR Program in future rulemaking, the results will be publicly reported on the *Hospital Compare* website.

Comment: One commenter requested clarification on how the term ''average'' is derived and the usage of the term by the measure developer.

Response: The term ''average'' is employed in three different circumstances. First, when identifying outlier hospitals, we use the unadjusted national average mortality rate, which is calculated as the total number of deaths divided by the total number of patients; hospitals' risk-standardized mortality rates are considered outliers if they are statistically significantly different from the unadjusted national average mortality rate. Secondly, in calculating the hospital risk-standardized mortality rate, we multiply the standardized mortality ratio (predicted mortality/expected mortality) by the same unadjusted national average mortality rate, which is calculated as the total number of deaths divided by the total number of patients. Lastly, to calculate the denominator of the standardized mortality ratio (expected mortality), we determine the number of deaths among that hospital's patients given the patients' risk factors and the average of all hospital-specific effects in the nation. Specifically, for each patient in the data-set, the estimated regression coefficients are multiplied by the observed characteristics and the average of the hospital-specific intercepts is added to this quantity. In the hierarchal logistic regression model, we modelled hospital specific intercept as deviation from the average which is set to 0, therefore some hospital specific intercepts will be above 0 while some hospital specific intercepts will be below 0. For more details, we refer readers to the measure methodology report on the CMS website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/PC-Updates-on-Previous-Comment-Periods.html*.

Comment: Multiple commenters submitted suggestions about how CMS should implement the hybrid version of the HWM measure, including: (1) Conducting a pilot run of data submission prior to implementation; (2) testing the use of EHR data to risk-adjust the current condition-specific mortality measures; (3) implementing a voluntary reporting period; and (4) publicly reporting service line data.

Response: We thank commenters for their suggestions. We will take all feedback under consideration as we determine future use of these measures in the Hospital IQR Program.

Comment: Some commenters expressed concern about potential unintended consequences of the measure, including incentivizing hospitals to withhold appropriate end-of-life care and penalizing hospitals for mortality that is not related to quality. Several commenters believed that the exclusions, as currently specified, could mask preventable hospital harms and could be improved. One commenter suggested a four-day hospice enrollment window instead of the 2-day window currently specified.

Response: We thank commenters for their feedback. We are committed to examining and avoiding unintended consequences in relation to patient perspectives, and we agree that mortality is not an appropriate assessment of quality for patients or families who have elected to enroll in hospice and are at the end of life.

During measure development, we sought to identify and exclude cases in which survival was not the primary goal and in which hospitals cannot influence survival through quality of care. This was achieved by excluding patients who had enrolled in hospice within the past 12 months of the index hospitalization, upon admission, or within two days after admission to the hospital. Most patients who have enrolled in hospice do not have the same goals of care as those who are not enrolled. In addition, based on feedback from stakeholders and experts consulted during measure development, it is likely that for most patients and/or families who discussed and agreed to enroll in hospice within two days of admission, survival is not the primary goal due to a condition that was present on admission and therefore, mortality should not be used as a marker of quality care. Longer enrollment windows were considered in our discussions with experts, patients, and families. However, the TEP felt that the risk of excluding patients who enrolled in hospice care due to the outcome of poor quality of care provided by a hospital outweighed the potential benefit of extending the window for the exclusion of these patients. We recognize that there is no single, correct approach to identifying patients at the end-of-life and the use of hospice enrollment does not perfectly differentiate between patients who have a goal of survival from those who do not. Similarly, we cannot perfectly distinguish every preventable harm. However, we feel the current approach accurately identifies most patients we intend to assess through the HWM measure and errs on the side of protecting a patient's choice to defer aggressive treatment at the end of life.

Comment: Several commenters expressed concerns that this measure was developed using ICD–9 codes that are not indicative of the current healthcare environment which utilizes ICD–10 codes. One commenter noted there is no longer a specific diagnosis code for ''admission for rehab'' in the ICD–10 codes.

Response: We thank commenters for their feedback. The measures are currently being respecified with ICD–10 data, prior to submission to NQF for endorsement. Identification of admissions for rehabilitation and other exclusion criteria, surgical and non-surgical service-line division placement, and risk adjustment will be updated using ICD–10 data.

Comment: One commenter sought clarification in the cross-over of CEHRT to submit information for hybrid measures.

Response: We have not yet determined any future implementation pathway or timeline for this measure. Any proposal to adopt the Hybrid HWM measure into the Hospital IQR Program measure set would be made through future rulemaking. Should we decide to move forward with proposing to include the Hybrid HWM measure into the Hospital IQR Program in the future, we will consider the certification requirements applicable to hybrid measures at that time.

Comment: Some commenters had concerns about the validity of the hybrid version of the measure given the small sample size it would have as a voluntary measure should only a fraction of the nation's acute care hospitals participate.

Response: We thank the commenters for their feedback. The Hybrid Hospital-Wide Readmission measure, which uses a nearly identical set of EHR data elements, was implemented as a voluntary measure in the Hospital IQR Program for the reporting period from January 2018 through June 2018. We are

actively compiling stakeholder feedback on the electronic specifications for the EHR data elements, their extraction, and on the data submission process. Because the Hybrid HWM measure uses a nearly identical set of data elements, we believe the experience gained through the voluntary reporting of the Hybrid HWR measure would potentially facilitate implementation of the Hybrid HWM measure should we move forward with proposing to include the measure in the Hospital IQR Program through future rulemaking.

Comment: Several commenters did not believe the HWM measure is sensitive enough to accurately capture hospital quality. They noted that there are few performance outliers identified and questioned whether this measure would provide actionable data to inform quality improvement for hospitals or meaningful information to patients about the quality of hospitals. One commenter suggested that preventable mortality represents only a fraction of the overall mortality rates and that the simple variation in rates might be due to non-modifiable factors rather than quality of care. To address this variation, they suggested that the measure score improvement should be reported rather than the measure rate alone.

Response: Although there are not many statistical performance outliers, we believe that the measure can still convey meaningful performance information. Using 95 percent confidence interval (uncertainty) estimates to categorize hospital outliers is conservative by design, meaning that the measure is designed to only declare a hospital as an outlier with a very high degree of certainty. But the overall distribution of mortality rates show meaningful variation. We found that the claims-only overall hospital risk-standardized mortality rates ranged from 5.0 percent to 9.8 percent with a median risk-standardized mortality rate of 7.4 percent.[320] This variation provides information about the range of quality among hospitals and will allow hospitals and consumers to see if a hospital is at the high end or the low end of the range. We believe reporting hospital mortality scores will improve transparency and promote quality improvement efforts. This measure identified 2.6 percent of hospitals as outliers, which is consistent with other CMS condition- and procedure-specific measures that display a range of 2.5 percent to 11.2 percent of hospitals as outliers.

Should we move forward with proposing to include either of these measures for inclusion in the Hospital IQR Program in the future, in advance of public reporting, hospitals would receive confidential, service-line division and patient-level data to support quality improvement. This information would allow for thorough investigation of patient scenarios that resulted in mortality and, therefore, that contributed to each division-level standardized mortality ratios, which are rolled up into the overall risk-standardized mortality rate. We will continue to consider the best approach for communicating meaningful variation in performance and optimizing the usefulness of this measure for the public. This includes consideration of reporting improvement in scores in addition to hospitals' performance in a single measurement period.

Comment: Several commenters did not support the inclusion of either version of the HWM measure in the Hospital IQR Program because they felt these measures are very broad and require more testing. Some commenters felt this measure would fail to enhance quality improvement efforts and noted that the condition-specific measures in the Hospital VBP Program are more actionable.

Response: We appreciate commenters' interest in the information provided by the narrower condition-specific measures, but believe that while the Hospital-Wide Mortality measure assesses a broad population, it serves an important complementary purpose. In contrast to the condition-specific measures, a hospital-wide measure provides a picture of a hospital's overall quality and thereby complements the condition-specific mortality measures. The measure underwent significant testing of the risk variables, performance of the risk models for each service-line division, and the overall measure score. In addition, we compared hospital-level results from the claims-only measure with the Hybrid Hospital-Wide Mortality measure to establish the validity of the claims-only risk model. All testing results support the reliability and validity of the measure construct and methodology.

In addition, the Hospital-Wide Mortality measure was developed to broadly measure the quality of care across hospitals, including the quality of care in smaller volume hospitals that might lack sufficient numbers of patients to be included in condition-specific mortality measures. Mortality is an important health outcome that is meaningful to patients and providers, and updated estimates suggest that more than 400,000 patients die each year from preventable harm in hospitals.[321] In addition, this measure captures a broader group of patients than those included in condition- and procedure-specific mortality measures.

The Hospital-Wide Mortality Measure was also designed to support quality improvement efforts. By giving a hospital-wide quality score, the measure provides hospitals and the public with an overall evaluation of a hospital's performance on an important outcome. The Hospital-Wide Mortality measure, both with respect to the overall score as well as the division-level results, provides actionable information to hospitals that can support important quality improvements. Should we move forward with proposing to include either or both the hybrid or claims-based version of these measures for inclusion in the Hospital IQR Program, hospitals would receive detailed service-line and patient-level data along with their hospital-wide mortality performance scores. This patient-level detail can help a hospital decide where to focus its quality improvement efforts.

We thank the commenters and we will consider their views as we develop future policy regarding the potential inclusion of claims-only hospital-wide mortality measure and hybrid hospital-wide mortality measure with electronic health record data in the Hospital IQR Program.

b. Potential Future Inclusion of the Hospital Harm—Opioid-Related Adverse Events Electronic Clinical Quality Measure (eCQM)

(1) Background

Opioids are among the most frequently implicated medications in adverse drug events among hospitalized patients. The most serious opioid-related adverse events include those with respiratory depression, which can lead to brain damage and death. Opioid-related adverse events have both negative patient impacts and financial implications. These patients have been noted to have 55 percent longer lengths of stay, 47 percent higher costs, 36 percent higher risk of 30-day readmission, and 3.4 times higher payments than patients without these adverse events.[322] While noting that

[320] Claims-Only Hospital-Wide (All-Condition, All-Procedure) Risk-Standardized Mortality Measure: Measure Methodology for Public Comment. Available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/PC-Updates-on-Previous-Comment-Periods.html.*

[321] James JT. A new, evidence-based estimate of patient harms associated with hospital care. *Journal of Patient Safety.* 2013;9(3):122–128.

[322] Kessler ER, Shah M, Gruschkkus SK, et al. Cost and quality implications of opioid-based

data are limited, The Joint Commission suggested that opioid-induced respiratory arrest may contribute substantially to the 350,000–750,000 in-hospital cardiac arrests annually.[323]

Most opioid-related adverse events are preventable. Of the opioid-related adverse drug events reported to The Joint Commission's Sentinel Event database,[324] 47 percent were due to a wrong medication dose, 29 percent to improper monitoring, and 11 percent to other causes (for example, medication interactions and/or drug reactions). In addition, in an analysis of a malpractice claims database, a review of cases in which there was opioid-induced respiratory depression among post-operative surgical patients, 97 percent of these adverse events were judged preventable with better monitoring and response.[325] While hospital quality interventions such as, proper dosing, adequate monitoring, and attention to potential drug interactions that can lead to overdose are key to prevention of opioid-related respiratory events, the use of these practices can vary substantially across hospitals.

Administration of opioids also varies widely by hospital, ranging from 5 percent in the lowest-use hospital to 72 percent in the highest-use hospital.[326] Notably, hospitals that use opioids most frequently have increased adjusted risk of severe opioid-related adverse events.[327] Surgical patients are at particular risk of these adverse events because opioid administration is common in this population. For example, among a diverse group of surgical patients undergoing common surgical procedures at a large medical center, 98.6 percent received opioids and 13.6 percent of those patients experienced an opioid-related adverse drug event.[328] Reduction of adverse events in surgical and non-surgical patients receiving opioids, may be enhanced by measuring the rates of these events at each hospital in a systematic, comparable way. We have developed the Hospital Harm—Opioid-Related Adverse Events eCQM to assess the rates of these adverse events as well as the variation in rates among hospitals.

(2) Overview of Measure

The Hospital Harm—Opioid-Related Adverse Events eCQM outcome measure assesses, by hospital, the proportion of patients who had an opioid-related adverse event. This measure addresses the Meaningful Measures Initiative quality priority of making care safer by reducing harm caused in the delivery of care. The measure uses the administration of naloxone, an opioid reversal agent that has been used in a number of studies as an indicator of opioid-related adverse respiratory events, to indicate a harm to a patient.[329] [330] The intent of this measure is for hospitals to track and improve their monitoring and response to patients administered opioids during hospitalization, and to avoid harm, such as respiratory depression, which can lead to brain damage and death. This measure focuses specifically on in-hospital opioid-related adverse events, rather than opioid overdose events that happen in the community and may bring a patient into the emergency department. We acknowledge that some stakeholders have expressed concern that some providers could withhold the use of naloxone, believing that may help those providers avoid poor performance on this quality measure. This measure is not intended to incentivize hospitals to not administer naloxone to patients who are in respiratory depression, but rather incentivize hospitals to closely monitor patients who receive opioids during their hospitalization to prevent respiratory depression or other symptoms of opioid overdose. In addition, the aim of this measure is not to identify preventability of an individual harm instance or whether each instance of harm was an error, but rather to assess the overall rate of the harm within a hospital incorporating a definition of harm that is likely to be reduced as a result of hospital best practice.

As with all quality measures we develop, testing was performed to establish the feasibility of the measure, data elements, and validity of the numerator. Clinical adjudicators reviewed medical records on each instance of a harm identified through query of the EHR data to confirm naloxone was in fact administered to reverse symptoms of opioid overdose. Additional testing is currently being performed to establish the data element validity using output from the Measure Authoring Tool (MAT) [331] in multiple hospitals, using multiple EHR systems. The MAT is a web-based tool used to develop the electronic measure specifications, which expresses complicated measure logic in several formats including a human-readable document. The electronically extracted data would be validated by comparison to medical chart abstracted data.

This measure addresses the Meaningful Measures Initiative quality priority of making care safer by reducing harm caused in the delivery of care discussed in section I.A.2. of the preamble of the proposed rule. The Hospital Harm—Opioid-related Adverse Events (MUC17–210) was included in a publicly available document entitled ''2017 Measures Under Consideration List'' (available at: *http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367*). This measure was reviewed by the NQF MAP Hospital Workgroup in December 2017 and received the recommendation to refine and resubmit for consideration for programmatic inclusion, as referenced in the 2017–2018 Spreadsheet of Final Recommendations to HHS and CMS (available at: *https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86972*). For additional information and discussion of concerns and considerations raised by the MAP related to this measure, we refer readers to the December 2017 NQF MAP Hospital Workgroup meeting transcript (available at: *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=87148*).

[331] The Measure Authoring Tool (MAT) is a web-based tool used by measure developers in the creation of eMeasures. For additional information, we refer readers to: *https://www.emeasuretool.cms.gov/.*

MAP stakeholders acknowledged the significant health risks associated with opioid-related adverse events, but recommended adjusting the numerator to consider the impact on chronic opioid users.[332] Accordingly, we will address this issue in upcoming testing and NQF review. Regarding MAP stakeholder concern that the measure needs to be tested in more facilities to demonstrate reliability and validity, as stated previously, we are currently testing the MAT output for this measure in multiple hospitals that use a variety of EHR systems.[333] We plan to submit this measure for NQF endorsement as part of the Patient Safety Committee in November 2018.

(3) Cohort

The measure denominator includes all patients 18 years or older discharged from an inpatient hospital encounter during the 1-year measurement period. The measure includes inpatient admissions that were initially seen in the emergency department or in observational status and then admitted to the hospital.

(4) Outcome

The numerator for this electronic outcome measure is the number of patients who received naloxone outside of the operating room either: (1) After 24 hours from hospital arrival; or (2) during the first 24 hours after hospital arrival with evidence of hospital opioid administration prior to the naloxone administration. We narrowed cases to exclude naloxone use in the operating room where it could be part of the sedation plan as administered by an anesthesiologist. Use of naloxone for procedures outside of the operating room (such as bone marrow biopsy) are counted in the numerator as it would indicate the patient was over sedated. These criteria exist to ensure patients are not considered to have experienced harm if they receive naloxone in the first 24 hours due to an opioid overdose that occurred in the community prior to hospital arrival. We do not require the administration of an opioid prior to naloxone after 24 hours from hospital arrival because an event occurring 24 hours after admission is most likely due to hospitals' administration of opioids. By limiting the requirement of documented opioid administration to the first 24 hours of the encounter, we are reducing the complexity of the measure logic and therefore the burden of implementation for hospitals. For more information about the measure specifications, we refer readers to our MAT Header (measure specs) and framing document (available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Public-Comments.html*).

We invited public comment on the possible future inclusion of the Hospital Harm—Opioid-related Adverse Events eCQM in the Hospital IQR Program. Specifically, we sought public comment on whether to: (1) Initially introduce this measure as voluntary; (2) adopt the measure into the existing eCQM measure set from which hospitals currently select four to report; or (3) adopt the measure as mandatory for all hospitals to report. In addition, we sought public comment on ways to address any potential unintended consequences resulting from future implementation of this measure. We are also considering future adoption of this measure in the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs) for Clinical Quality Measures (CQM) electronic reporting by eligible hospitals and CAHs.

Comment: Several commenters expressed either outright or conditional support for the Hospital Harm—Opioid-Related Adverse Events Electronic Clinical Quality Measure (eCQM). Several commenters believed this measure would be useful and important.

Response: We thank the commenters for their support.

Comment: A number of commenters recommended various implementation pathways for the measure. Many commenters recommended that reporting on the Hospital Harm—Opioid-Related Adverse Events Electronic Clinical Quality Measure (eCQM) be made voluntary prior to mandatory reporting in either the Hospital IQR or Promoting Interoperability Programs, specifically until validity and feasibility of the measure has been proven, and the NQF has endorsed it. Several commenters recommended that CMS incorporate this measure into the eCQM measure set from which hospitals select four eCQMs to report, while one commenter specifically supported its inclusion in the Hospital IQR and PI Programs as a mandatory measure. A few commenters noted that if this measure is implemented, measure submission should count toward one of eCQMs required for the PI Program.

One commenter suggested that CMS limit the use of this measure to public reporting and quality improvement programs, rather than value-based purchasing programs. A few commenters recommended that CMS complete measure specification and testing prior to implementation and consider implementation only after the 2018 eCQM annual updates. Several commenters suggested that CMS provide education to hospitals on how to utilize this measure to improve patient safety. A few commenters asked for clarification on whether health IT developers will be required to support or certify the measure if it is introduced on a voluntary basis.

Response: We thank commenters for their feedback and we will consider all suggestions for measure implementation and stakeholder outreach for future program years. We will complete specifications for the measure and measure validity and reliability testing prior to proposing this measure for future inclusion in the Hospital IQR Program. We have performed measure testing in multiple hospitals with various EHR systems to establish the feasibility of this measure as well as the validity of the data elements and the numerator. Additional testing is currently being performed to provide information about the feasibility and data element validity based on output from the Measure Authoring Tool (MAT) in multiple hospitals, using multiple EHR systems. We reiterate that we intend to submit this measure to the NQF for endorsement as part of the Patient Safety Committee as early as FY 2019. We will continue to engage stakeholders in the development of this measure. Any proposals for future adoption of this measure will be announced through rule-making.

Comment: Commenters raised concerns that the measure does not capture opioid-related adverse events that occur outside of the hospital. One commenter expressed concern that including naloxone administered in the hospital to reverse a narcotic overdose that occurred outside of the hospitals would place unwarranted blame on hospitals.

Response: We thank commenters for sharing their concerns. This measure is not intended to measure opioid-related adverse events that occur outside of the hospital. This Hospital Harm eCQM focuses specifically on in-hospital opioid-related adverse events, rather than opioid overdose events that happen in the community. For naloxone administration to be considered a harm, the measure requires documentation of hospital-administered opioids in the

[332] Measure Application Partnership. MAP 2018 Considerations for Implementing Measures in Federal Programs: Hospitals. Washington, DC: NQF; 2018. Available at: *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=87083*.

[333] Ibid.

first 24 hours of a hospitalization (including patients treated in the emergency department or who are in observational status who become inpatient), with the intent to capture only naloxone administrated due to overuse of narcotics that were given in the hospital and to exclude naloxone administered to reverse community-acquired opioid overdoses. The measure is designed to focus on the quality of care and to capture a specific harm: Naloxone given due to opioid administration that occurred within the hospital.

Comment: Commenters suggested several changes to the measure specifications, including excluding instances in which naloxone is administered by an anesthesiologist, or to patients with opioid sensitivity. Two commenters suggested including only patients with documented respiratory failure in presence of narcotic administration. Commenters also advised considering stratification rather than risk adjustment, particularly for chronic opioid users.

Response: We thank commenters for their recommendations regarding potential measure exclusions and stratification. We aim to be as inclusive as possible in defining a measure cohort to ensure the measure will have an impact on the broadest possible group of patients at risk of the outcome. We also intend to minimize the complexity of the measure specifications to reduce burden to hospitals when implementing the measure. The measure does exclude instances in which naloxone is administered in the operating room where it could be part of the sedation plan administered by an anesthesiologist. Regarding the comments on including only patients with documented respiratory failure in presence of narcotic administration, we believe that using EHR data to capture respiratory failure may not be consistently feasible or consistent across different hospital systems. Given that naloxone is primarily administered when a patient has severe responses to an opioid overdose, it has been used as a surrogate for important adverse reactions and is more feasible to capture.[334] We will continue to consider the suggested modifications to the cohort during measure testing.

Regarding commenters' suggestions about measure stratification and risk adjustment, this measure does not require a data element for chronic opioid users. We do not anticipate risk adjusting this measure for chronic opioid use, as most instances of opioid-related adverse events should be preventable for all patients regardless of prior exposure to opioids or chronic opioid use. In addition, there are several risk factors that affect sensitivity to opioids that physicians should consider when dosing opioids. Risk adjustment would only be needed if certain hospitals have patients with distinctly different risk profiles that cannot be mitigated by providing high-quality care. Similarly, the current measure specification does not include stratification of patients for chronic opioid use for three reasons: (1) This is a challenging data element to capture consistently in the EHR; (2) chronic opioid use should be taken into consideration by clinicians in determining dosing in the hospital and theoretically should not be considered a different risk level for patients; and (3) stratification can reduce the effective sample size of a measure and make it less useable.

Comment: Multiple commenters discussed the potential burden of the measure on hospitals, and the feasibility of the required EHR data elements. Several commenters believed all required data elements are readily available in the EHR, while several other commenters disagreed, and noted challenges in mapping the required data elements and the complex measure logic. One commenter questioned whether manual abstraction would be necessary to report this measure. Another commenter noted that some hospitals lack EHRs in procedural or surgical areas, which might bias their results. One commenter noted that the costs associated with this measure outweigh the benefits, which is contrary to the Meaningful Measures Initiative. One commenter noted that many providers will not have enough time to update their reporting systems if detailed specifications are not provided far enough in advance.

Response: We appreciate commenters' concerns. The measure specifications were developed with the end-user in mind and with the goal of minimizing the burden on hospitals. Testing has demonstrated that the data elements and measure logic are feasible and accurately capture opioid-related adverse events using EHR data. This measure should not require manual chart abstraction. To clarify, currently, the measure specifications capture naloxone administration in post-procedural areas as a harm, but not naloxone administered in procedural areas, such as operating rooms. We recognize that stakeholders would require time to prepare for mandatory reporting and we will consider that need as we make decisions about proposing to add measures to the Hospital IQR Program in future years. We aim to provide measure specifications that are simple, useful, and provide as much information as possible to ease the burden of data collection and reporting.

Comment: Many commenters noted the potential negative unintended consequences of the measure, and disagreed with using naloxone as a proxy for opioid-related adverse events. These commenters asserted that the use of naloxone does not necessarily mean a harm was caused by an opioid. One commenter stated that preliminary results presented to the NQF MAP Hospital Workgroup in December 2017 showed a high ''error rate,'' and expressed concern that these results will only be magnified in broader testing. Another commenter noted the low event rate of this harm. One commenter requested additional evidence, based on the tracking of performance on this measure when implemented, to ensure that the measure does not inappropriately incentivize providers to withhold naloxone before the measure is made mandatory. Several commenters expressed interest in whether there is true performance variation for this measure in care across hospitals.

Response: We thank commenters for their feedback. We acknowledge that naloxone administration alone does not conclusively indicate a harm. For example, in some cases naloxone can be given to reverse severe itching related to opioids.[335] The intent of the measure is not to reduce appropriate use of naloxone or to bring the rate of administration to zero. Rather, the measure is intended to identify hospitals that have particularly high rates of naloxone use relative to others, and thereby incentivize improved clinical practices, such as appropriate dosing of opioids and monitoring of patients to reduce the need for naloxone use in patient care. We do not believe that this measure would deter providers from prescribing opioids or using naloxone for patients who require it. The goal is to incentivize hospitals to avoid over-sedation and to closely monitor patients on opioids.

[335] Eckstrand JA, Habib AS, Williamson A, et al. Computerized surveillance of opioid-related adverse drug events in perioperative care: a cross-sectional study. Patient Saf Surg. 2009;3(1):18.

Moreover, naloxone administration has been used in a number of studies as an indicator of opioid-related adverse respiratory events.[336] [337] Prior testing in five hospitals showed the measure captured the intended harm, by assessing whether each harm identified in the measure could be confirmed though clinical review of the patients' medical record. In 93.9 percent of events, adjudicators noted that naloxone was administered because of excessive opioid medication administration. To clarify testing results around an ''error rate,'' we believe the commenter is referring to the success rate of capturing the intended harm, which ranged from 87.2 percent to 95.7 percent across five hospitals. We agree that this measure has a low event rate, nonetheless, we believe hospital-caused opioid overdoses are important to measure. Opioids are among the most frequently implicated medications in adverse drug events among hospitalized patients, with the most serious opioid-related adverse events leading to brain damage and death.[338] Further, this measure addresses the Meaningful Measures Initiative quality priority of making care safer by reducing harm caused in the delivery of care. Regarding commenters' interest in whether there will be true performance variation in care across hospitals, preliminary testing showed variation in event rates across the set of testing hospitals. This measure is undergoing continued testing and we will continue to examine the extent of performance variation captured by the measure. We continue to believe that the measure specifications are appropriate for this measure and if this measure were to be proposed for future inclusion in the Hospital IQR Program, any unintended consequences would be closely monitored during measure reevaluation.

Comment: Commenters voiced additional concerns and sought clarification about the measure specifications. One commenter sought clarification regarding whether patients seen in the emergency department were included in the measure specifications. One commenter noted changes in the measure specifications from what was reviewed by the NQF MAP Hospital Workgroup in December 2017, and the measure specifications outlined in the FY 2019 IPPS/LTCH PPS proposed rule. Two commenters recommended changing the numerator to require documentation of opioid administration prior to naloxone administration in all cases, and noted this would illuminate opportunities for hospital process improvement. One commenter sought clarification on the numerator since this measure only counts one harm per patient, and would not capture multiple harms to the same patient.

Response: We thank the commenters for their feedback. The measure's initial population and denominator includes patients treated in the emergency department or who are in observational status who become inpatients. The Hospital Harm—Opioid-Related Adverse Events eCQM measure specifications were originally submitted to the ''2017 Measures Under Consideration List'' (available at: *http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367*), included documentation on a respiratory stimulant within 24 hours of opioid administration as representative of a harm to a patient, and required documentation of an opioid administration within the hospital within 24-hours of the narcotic antagonist. This measure was simplified after preliminary testing, to not include a respiratory stimulant and only to require documentation of an opioid administration prior to naloxone within the first 24-hours of the hospitalization. Previous testing of the measure indicated that we did not miss harm events when the measure logic was simplified in this manner. These modifications were made to reduce the complexity of the measure specifications while still capturing a signal of hospital quality. The results from hospital testing presented at the NQF MAP Hospital Workgroup meeting in December 2017 represented the final measure specifications as described in this final rule.

The measure does capture only a single harm for each patient and does not capture multiple harms on a single patient during a single inpatient encounter. The numerator captures the number of patients who experience a harm, rather than the number of harms occurring to simplify the measure and limit the reporting burden, while still capturing a signal of hospital quality. For more information on the specifications of this measure, we refer readers to the MAT Header (measure specifications) and framing document (available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Public-Comments.html*).

Comment: Some commenters did not support the Hospital Harm—Opioid-Related Adverse Events eCQM, and proposed alternative measures to address the opioid epidemic. One commenter recommended that CMS consider including non-pharmacologic technologies such as medical devices to serve as alternatives to treat acute and chronic pain. Several commenters suggested providing education to patients to help prevent or reduce the risk of addiction.

Response: We thank commenters for their feedback and suggestions on additional potential opioid measures. We appreciate the suggestions and we intend to consider other ways the Hospital IQR Program can address the opioid crisis. While this measure may not address all root causes of opioid overuse, it addresses the Meaningful Measures Initiative quality priority of making care safer by reducing harm caused in the delivery of care.

We thank the commenters and we will consider their views as we develop future policy regarding the potential inclusion of the Hospital Harm—Opioid-Related Adverse Events Electronic Clinical Quality outcome measure (eCQM) in the Hospital IQR Program.

c. Potential Future Development and Adoption of eCQMs Generally

Stakeholders continue to identify areas for improvement in the implementation of eCQMs under a variety of CMS programs, including the Hospital IQR Program and the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs). While effective utilization of eCQMs promises greater efficiency and more timely access to data to support quality improvement activities, various types of costs associated with these measurement approaches detract from these benefits. Moreover, some providers may have low awareness of the resources and tools available to help address issues that arise in utilizing eCQMs.

Program design and operations associated with measurement aspects of these programs can be a significant source of cost for providers. Uncertainty around rapidly shifting timelines and requirements can pose significant financial and operational planning challenges for organizations, while lack of alignment across programs results in further complexity. In addition, the implementation of eCQMs within the

[336] Eckstrand JA, Habib AS, Williamson A, et al. Computerized surveillance of opioid-related adverse drug events in perioperative care: a cross-sectional study. Patient Saf Surg. 2009; 3:18.

[337] Nwulu U, Nirantharakumar K, Odesanya R, et al. Improvement in the detections of adverse drug events by the use of electronic health and prescription records: an evaluation of two trigger tools. Eur J Clin Pharmacol. 2013; 69(2):255–259.

[338] The Joint Commission. (2012). Safe use of opioids in hospitals. *Sentinel Event Alert, 49,* 1–5.

EHR is a significant source of cost. Health IT products vary widely in the eCQMs they offer, and incorporating new measure specifications into a product, along with validation and testing of the updates, can be challenging and time-consuming. Lack of transparency from developers around data sources within the EHR, mapping, measure calculations, and reporting schemas, can hinder providers' ability to implement eCQMs and ensure the accuracy of results. Moreover, challenges in extracting data from the EHR and integrating with other applications can serve as a source of cost for providers seeking to bring together different technology solutions and work with other third party services to complete reporting and quality improvement activities.

Stakeholders have expressed support for increasing the availability of new eCQMs, developing eCQMs that focus on patient outcomes and higher impact measurement areas, and exploring how eCQMs can reduce the costs and information collection burden associated with chart-abstracted measures. However, they have also identified barriers which may contribute to a lack of adequate development of eCQMs and limit their potential, including long development timelines, lack of guidelines/prioritization of and participation in eCQM development, limited field testing, and program policies that limit innovation by focusing on ''least common denominator'' approaches.

We sought stakeholder feedback on ways that we could address these and other challenges related to eCQM use. Specifically, we invited comment on the following questions: (1) What aspects of the use of eCQMs are most costly to hospitals and health IT vendors?; (2) What program and policy changes, such as improved regulatory alignment, would have the greatest impact on addressing eCQM costs?; (3) What are the most significant barriers to the availability and use of new eCQMs today?; (4) What specifically would stakeholders like to see us do to reduce costs and maximize the benefits of eCQMs?; (5) How could we encourage hospitals and health IT vendors to engage in improvements to existing eCQMs?; (6) How could we encourage hospitals and health IT vendors to engage in testing new eCQMs?; (7) Would hospitals and health IT vendors be interested in or willing to participate in pilots or models of alternative approaches to quality measurement that would explore less burdensome ways of approaching quality measurement, such as sharing data with third parties that use machine learning and natural language processing to classify quality of care or other approaches?; (8) What ways could we incentivize or reward innovative uses of health IT that could reduce costs for hospitals?; and (9) What additional resources or tools would hospitals and health IT vendors like to have publicly available to support testing, implementation, and reporting of eCQMs?

Comment: Question 1. A number of commenters responded to CMS' request for feedback on question (1)—What aspects of the use of eCQMs are most costly to hospitals and health IT vendors? Many commenters believed the costliest aspect of eCQM use is vendor cost to build, develop, implement, adequately test, and maintain eCQMs. This includes vendor support costs to develop and install code updates following changes to measures and program requirements made through rulemaking. A few commenters noted the significant labor cost associated with validation of eCQM reports, including re-validation of those reports, as they need to be re-validated after every software upgrade or enhancement. One commenter noted that there is considerable burden required to map the necessary data elements from the EHR to the appropriate QRDA format, and some vendors are not properly equipped to collect and transmit such data through the CMS portal.

Many commenters also noted high personnel costs, including the personnel time and cost associated with keeping pace with on-going certification, mandated reporting, and annual program update change requirements, as well as the costs associated with training personnel if changes to eCQM reporting requirements are outside out of the normal workflow. A few commenters added that eCQM implementation requires utilization of resources from multiple disciplines, including IT, data science, quality, analytics, clinicians, laboratory, radiology, coding, and billing.

Many commenters believed that eCQMs are costly because of the uncertainty around the reporting and submission requirements, including the high burden associated with making preparations to report measures that have been identified for removal in the near future. In addition, several commenters noted that the time between the finalization of a new quality measure in the rules and its inclusion in a government incentive or penalty program is too short, resulting in heightened resource use and high burden.

A few commenters expressed concern that there are high costs associated with collecting and reporting data on measures that they believe are fundamentally unusable or not valuable because they include errors or do not appropriately serve clinician needs. Other commenters noted that the manual abstraction and documentation requirements associated with some eCQMs add to the total administrative burden placed on clinicians. One commenter explained that there is high burden associated with alignment following a facility's merger with a larger system.

Question 2. A number of commenters responded to CMS' request for feedback on question (2)—What program and policy changes, such as an improved regulatory alignment, would have the greatest impact on addressing eCQM costs? A number of commenters suggested program and policy changes that might impact the costs associated with eCQM reporting, including: (1) Aligning the regulatory and reporting requirements and timeframes for eCQMs across federal and State programs; (2) adopting nationally standardized eCQMs; (3) streamlining and de-duplicating measure sets across CMS programs; (4) providing more time to implement new measures or measure specification updates and reducing the frequency of changes to the reporting requirements; (5) implementing broader eCQM selections and continuing to offer flexibility for hospitals to self-select and submit data on available measures best suited to their needs that would satisfy multiple reporting programs with a single data submission; (6) focusing on current challenges and not adopting new eCQMs for a period of time, then introducing new eCQMs at a slower pace and in lower volumes; (7) creating a single, facility-based quality reporting program that encompasses inpatient, outpatient, and observation statuses; (8) providing more transparency around program changes, including decision-making criteria geared more toward clinicians, for retaining or removing measures; (9) offering scoring bonuses that incentivize technology utilization; (10) utilizing eCQM data already collected to inform future program requirements and stakeholders about successful practices; (11) requiring reporting only on the eCQM version of measures, and not the chart-abstracted versions, and phasing out claims-only outcomes reporting, or implementing a point system which would assess more points for submission of eCQMs than for chart-abstracted measures to satisfy multiple reporting programs; and (12)

identifying quality reporting requirements in a separate rulemaking process.

Several commenters recommended that CMS regulate the amount charged by health IT vendors for new packages and updates, reimburse hospitals for the cost of software updates needed to meet quality reporting requirements, or provide grants to hospitals for these purposes.

Some commenters provided feedback specifically related to eCQM testing, including: (1) Releasing technical measure specifications earlier; (2) allowing vendors to engage in early testing; (3) making the Pre-Submission Validation Application (PSVA) tool and QualityNet secure portal available before the start of the reporting year; (4) facilitating testing through shared infrastructure; and (5) providing timely answers to questions submitted via the JIRA case system.

A number of commenters focused on improvements that could be made regarding measure development, measure specification, and measure standards, including: (1) Developing eCQMs based on available data and the provision of care; (2) working with the Office of the National Coordinator to develop interoperability and EHR data standards, including defining standards for quality reporting and further aligning existing QRDA standards; (3) working with industry stakeholders in the early stages of measure development; (4) promoting accurate provider attribution; and (5) utilizing eCQMs that pull from common data fields rather than data codes.

Some commenters recommended changes that could be made with regards to measure submission, including: (1) Developing a mechanism to allow facilities to manually correct data once pulled; (2) providing updates to the value set and QRDA I file submission in advance; (3) providing more detailed information on submission errors and providing submission reports earlier; (4) providing avenues for data submission other than hospitals submissions, such as having The Joint Commission obtain eCQM data from QualityNet; and (5) creating a single submission reporting platform for multiple CMS programs and State Medicaid agencies to accept quality data submissions provided to CMS.

Question 3. A number of commenters responded to CMS' request for feedback on question (3)—What are the most significant barriers to the availability and use of new eCQMs today? Many commenters observed significant barriers to the availability and use of new eCQMs. Several commenters expressed their belief that the technology costs, including EHR systems upgrades, adapting workflows, aligning documentation of care to capture required data, shifting timelines, building new specifications, testing and validating new measures, purchasing additional modules for reporting, is a barrier to implementation and reporting on new eCQMs. Other commenters identified lack of alignment across programs as another barrier. One commenter suggested that lack of transparency from developers and the variation in eCQM offerings for reporting new eCQMs also presents a barrier to eCQM reporting. A few commenters expressed their belief that the impact on clinical workflows where eCQMs require documentation that is not part of existing workflows, which actually increases burden on hospitals as compared with reporting on non-eCQM measures, is a significant barrier to reporting on new eCQMs, as is the fact that many EHRs allow for narrative documentation which does not flow into the discrete fields required by eCQMs.

One commenter recommended that CMS limit costs by imposing requirements related to pricing or reimbursement for the purchase of additional reporting modules. Another commenter recommended that CMS consolidate available information on eCQMs into one website that would provide both technical and operational information, and requested additional resources to help standardize and simplify the complexity of codes. A few commenters asserted their belief that measure accuracy and the vague wording of measures causes confusion between developers and providers regarding the intent of the measure, which can present a significant barrier to reporting on new eCQMs. A few commenters remarked on their perceived lack of value or impact on quality improvement associated with eCQM reporting.

Some commenters recommended that CMS provide additional support to vendors, to identify how best to capture required eCQM data, and to offer technical expert teams to organizations that lack the resources to participate in eCQM development or testing. One commenter expressed concern that hospitals and vendors are not ready to fully report on eCQMs and recommended that CMS work with EHR vendors, hospital quality staff, and other affected stakeholders to identify underlying structural problems and barriers to successful eCQM reporting. A few commenters noted that a major hurdle to reporting on new eCQMs is that EHR vendors are unwilling to participate in mapping or supporting voluntary measures, or prioritize certifying to report on existing measures above new measures. One commenter suggested that CMS work with the ONC to advance standards for CEHRT to develop robust interoperability and EHR data standards. Several commenters expressed their belief that more time is needed between the adoption of a new eCQM into the Hospital IQR Program and its required implementation by providers in part to accommodate vendors' need to build and test processes and develop reports. One commenter recommended that CMS identify a date by which the QualityNet Secure Portal will open for 2018 testing. One commenter stated that a barrier to the availability of new eCQMs was the measure development process, and suggested that CMS work to improve the development and approval process. One commenter recommended that CMS explore whether the burden of eCQM reporting could be shifted to billing operations.

Question 4. A number of commenters responded to CMS' request for feedback on question (4)—What specifically would stakeholders like to see CMS do to reduce costs and maximize the benefits of eCQMs? Some commenters suggested removing all the eCQMs. Conversely, a few commenters expressed their preference for eCQM reporting and requested that CMS eliminate all chart-abstracted measures, and require all applicable eCQMs be reported for future program years.

A number of commenters provided feedback on how CMS could reduce costs and maximize the benefits of eCQM development, including: (1) Streamlining the measure development process; (2) developing measures that rely on data elements already present in EHRs and that have direct links to improved outcomes; (3) refining current eCQMs to reflect different settings of care and patient populations; (4) refining measures to add exclusions instead of requiring extra chart documentation; (5) considering moving to improved standards-based eCQM development and reporting; (6) working with health IT vendors to identify and implement ways to present eCQM data to support quality improvements; (7) seeking feedback from other industry stakeholders; (8) connecting novice eCQM measure developers with experts; and (9) establishing a national testing infrastructure for eCQMs.

Several commenters provided feedback on how CMS could reduce costs and maximize the benefits of eCQM reporting, including: (1) Making

eCQM tools and resources available before the start of the reporting year; (2) ensuring there are systems in place to receive data seamlessly; (3) providing timely and accurate feedback reports; (4) supplying additional information on the error messages during the submission process; (5) providing detailed measure specifications to ensure data is collected consistently across providers and communicating about individual indicators and their weights; (6) improving access to QualityNet for analytics personnel; (7) giving adequate, early notice of software updates; (8) improving interoperability of EHR systems; and (9) centralizing the proper resource for questions related to eCQMs.

Some commenters provided feedback on how CMS could reduce costs and maximize the benefits of eCQM through policy changes including: (1) Aligning the eCQM reporting requirements across CMS programs; (2) requiring that vendors support reporting on all eCQMs in the Hospital IQR Program; (3) allowing hospitals to voluntarily report on new eCQMs rather than requiring reporting on new measures; (4) refraining from retroactively applying standards that are updated mid-year; (5) requiring reporting of the eCQM version only for measures also available in chart-abstracted form; (6) utilizing other sources of data rather than having hospitals report the eCQM data directly; (7) constraining the costs of vendor services; (8) sharing a plan for future eCQM use in the Hospital IQR Program; (9) changing the eCQM measure set less often and providing a longer time period to implement program changes (including adding new eCQMs or updating existing eCQMs); and (10) reducing the number of eCQMs available for reporting and only including those that are actionable with the highest return on investment.

A number of commenters recommended that CMS develop new eCQMs for specific chart-abstracted measures, including SEP–1, IMM–2, TOB–1, TOB–2, TOB–3, acute renal failure, ventilator use, and stroke. One commenter suggested refinements to EHDI–1a eCQM. One commenter recommended that CMS require reporting on the PC–01 eCQM.

Question 5. A number of commenters responded to CMS' request for feedback on question (5)—How could CMS encourage hospitals and health IT vendors to engage in improvements to existing eCQMs? A number of commenters suggested that hospitals and health IT vendors would be more willing to engage in improvements to existing eCQMs if CMS provided incentives, such as providing a per diem or honorarium for participation in focus groups and other forums.

A few commenters noted that participation would be enriched if hospitals were able to discuss eCQM improvement in the context of data from prior eCQM data submissions and be given an opportunity to inform future eCQM priorities that reduce reporting burden to advance improvements in the quality of care. One commenter suggested that CMS provide real-time feedback to hospitals on eCQM performance in order to encourage participating in eCQM improvement efforts.

Several commenters observed that successfully meeting mandatory eCQM reporting requirements depends on hospitals using the correct version of specifications, which is generally in the control of the EHR vendors, not the hospitals. Commenters urged CMS to continue outreach to EHR vendors, hospital quality staff, and other affected stakeholders to identify underlying structural problems and barriers to successful eCQM reporting. A number of commenters recommended coordinating efforts between CMS, CMS subcontractors, and measure stewards to solicit feedback from hospitals in order to implement a more efficient feedback loop.

One commenter believed that the introduction of voluntary measures has received increased interest and participation by providers, as it allows for more flexibility without the requirement for mandatory submissions.

Question 6. A number of commenters responded to CMS' request for feedback on question (6)—How could CMS encourage hospitals and health IT vendors to engage in testing new eCQMs? A number of commenters suggested that hospitals and health IT vendors would be more willing to engage in testing new eCQMs if CMS provided incentives, such as: (1) Supplementing or reimbursing the costs to trial eCQMs and provide feedback; (2) providing an upside APU adjustment to the hospitals that participate in testing a new eCQM; (3) providing scoring bonuses, or offering ''bonus'' points similar to those being proposed in the Promoting Interoperability Program; (4) allowing providers to receive credit for meeting the eCQM reporting requirement in the Promoting Interoperability Programs; (5) conducting an ''Implementation-A-Thon;'' and (6) granting providers participating in a defined testing and development program relief from other, mandated reporting, such as creating a ''safe harbor'' status for organizations that utilize their own vetted quality measurement systems or reducing the number of required eCQMs if the hospital is testing a measure.

Many commenters suggested that CMS should vet new eCQMs across a selection of vendors and hospitals prior to considering the measures for inclusion in a CMS quality reporting program for implementation.

A few commenters noted that the data produced by chart-abstracted measures varies significantly from eCQM data, and recommended that CMS adopt a validation process and conduct robust testing to ensure eCQM data are accurate and comparable to chart-abstracted information. One commenter proposed a hybrid approach to eCQM adoption in which hospitals would submit eCQM data, but in the event of a measure failure, the hospital could also supplement the data with manual chart abstraction. The commenter noted that this approach would be mutually beneficial, as CMS would receive more accurate data and hospitals would learn their workflows and documentation gaps for improvement efforts. Moreover, this approach would be less burdensome than manual abstraction, without the fear of penalizing hospitals who are still working through the burden to transition to eCQMs. The commenter also advised that completed testing of eCQMs under development should demonstrate reliability and validity in the acute care setting and should also be submitted to NQF for review and endorsement prior to inclusion in CMS quality programs.

A few commenters noted that providers and vendors likely would be encouraged to engage more in testing if additional time were available by, for example, delaying major program changes to a biennial timeframe.

A number of commenters also recommended that CMS create a public ''playbook'' outlining eCQM development and testing activities available for hospitals, as well as issuing standardized expectations and processes for hospitals engaging in testing, and doing so with more advanced notice. One commenter also noted that the legal concerns with release of patient detail files sometimes limits involvement, and thus encouraged CMS to explicitly clarify policies with regard to sharing PHI in a protected and legal manner for testing and development.

Question 7. A number of commenters responded to CMS' request for feedback on question (7)—Would hospitals and health IT vendors be interested in or willing to participate in pilots or models of alternative approaches to quality measurement that would explore less burdensome ways of approaching

quality measurement, such as sharing data with third parties that use machine learning and natural language processing to classify quality of care or other approaches? A number of commenters expressed that hospitals and vendors would be interested in participating in pilots or models of alternative approaches to quality measurement. Several commenters provided suggestions on how to structure pilots, including developing a cross-section of participants, communications, and providing incentives for participants.

A few commenters expressed that hospitals and vendors would not want to participate in pilots because they would not want to divert resources necessary to pilot models that may never be incorporated into quality reporting, or expressed concern about the costs and resource tolls associated with participating.

One commenter specifically did not support research and pilot projects on the use of machine learning and natural language processing.

Question 8. A number of commenters responded to CMS' request for feedback on question (8)—What ways could CMS incentivize or reward innovative uses of health IT that could reduce costs for hospitals? Many commenters shared recommendations about incentives and rewards for innovative uses of health IT, including: (1) Providing an upside adjustment to the hospital APU or a larger increase in the Market Basket Increase for completing certain activities or demonstrating innovative uses of HIT; (2) offering ''bonus points'' for demonstrable innovative uses of health IT; (3) providing scoring bonuses to providers who report more than the required number of measures or who have accurate rates; (4) allowing ''bonus points'' for voluntary or pilot project participation; (5) providing physician providers with credit under the MIPS–QPP Improvement Activities or Advancing Care Information (now called Promoting Interoperability) performance categories for participating in eCQM-related workgroups or development and/or demonstrating innovative uses of HIT; (6) establishing technology 'challenges' to foster innovative developments in health IT; (7) relieving reporting burden; (8) providing hospitals with incentives to recover any IT software costs; (9) excluding measures that are not applicable for CAHs or offering other reporting options for hospitals with low patient volumes; and (10) providing free software to submit the eCQMs and future required measures.

Other commenters suggested that CMS provide standards, and perhaps incentives, for health IT vendors to standardize their practices, particularly with respect to the standardized reports commonly used for quality data and internal quality review. One commenter noted that currently, providers must pay extra and wait for reports to be developed for their EHR.

A few commenters suggested that CMS provide public acknowledgement of organizations who develop or participate in innovative uses of health IT, similar to The Joint Commission's Pioneers in Quality Award or Healthcare Information and Management Systems Society (HIMSS) Davies Award.

A number of commenters suggested that CMS allow providers to receive credit for meeting the eCQM reporting requirement in the Promoting Interoperability Programs, work with hospitals to identify areas of innovative use of health IT that align with the Meaningful Measures framework, and collaborate with federal partners to encourage health IT vendors to support hospitals in their efforts to use eCQMs and health IT to address the highest priority areas for quality measurement and improvement.

One commenter recommended that CMS reward providers and developers working on population health initiatives and require data integration with hospitals with access to adequate data, such as claims data at the patient level. Another commenter recommended that CMS reward the internal quality improvement programs and processes using health IT that already exist and are utilized by hospitals.

A few commenters suggested allowing hospitals to submit and develop quality measures that are meaningful to their patient populations, local needs, and interests, instead of focusing on measures addressing national healthcare quality priorities.

Question 9. A number of commenters responded to CMS' request for feedback on question (9)—What additional resources or tools would hospitals and health IT vendors like to have publicly available to support testing, implementation, and reporting of eCQMs? A number of commenters provided suggestions specific to QualityNet, including: (1) Decreasing wait times for reaching the QualityNet helpdesk; (2) updating QualityNet to improve user-experience; (3) increasing QualityNet's capability to receive submissions and send reports; (4) providing more immediate and detailed error messages; and (5) allowing providers to upload encrypted QRDA I files to QualityNet.

One commenter suggested that CMS grant funding to encourage measure development. Some commenters suggested that CMS could increase efficiency of measure testing by: (1) Improving available testing resources; (2) developing a shared infrastructure to test eCQMs or providing a universal testing tool kit for health IT vendors; (3) providing reports that specifically identify how a hospital ''failed'' reporting on a measure; (4) providing immediate and detailed feedback on all errors; (5) encouraging participation in HL7 FHIR® Development Days and HL7 Connect-a-thons for testing capabilities of vendors; and (6) publicly releasing the criteria used to evaluate success or failure in reporting of eCQMs, along with releasing actual results for new measure development and testing.

Commenters' suggestions for improved guidance included: (1) Providing clearer documentation; (2) offering a single source of information and resource to ask questions related to eCQM reporting; (3) clarifying abstraction questions via QualityNet; (4) providing more avenues of communication with CMS; (5) identifying which tools stakeholders should use for which purposes; (6) providing resources geared toward quality improvement to staff and clinicians; (7) providing novice-level guidance on measure development and additional opportunities for engagement with experts; (8) creating a resource to allow stakeholders to share information such as best practices and codes used; (9) adding guidance related to the use of CQL and other newer standards; (10) creating an eCQM measure specification manual similar to the manual for chart-abstracted measures; (11) providing comparisons of how eCQM specifications change between years; and (12) identifying errors in past iterations when new eCQM measure specifications are released.

Some commenters' suggestions focused on improvements that could be made to measure development and measure specifications, including: (1) Simplifying the measure development tools and measure logic; (2) using a standard approach to capturing data elements; (3) exploring natural language processing to capture discrete data elements; (4) developing a standard for EHRs to help implement eCQM reporting; (5) including thresholds and goals for all measures; (6) defining data fields using the Core Measures Data Dictionary; (7) standardizing references to measure timeframes by referencing the reporting period as well as the

payment determination period when referring to measures; and (8) increasing the transparency of the eCQM calculation process by using open source evaluation codes.

Other commenters focused on how CMS could improve the submissions process, including: (1) Providing workflow documents and technical release notes earlier; (2) opening the portal for eCQM data submissions earlier; and (3) implementing a system through which CMS could pull documents from hospitals using a secure direct file transfer or application.

Some commenters suggested refining the reporting requirements for eCQMs, including: (1) Aligning the regulatory and reporting requirements of CMS quality programs; (2) offering flexibility to allow providers to select measures to submit from a pool of available measures in multiple forms; and (3) allowing more time to implement new and updated eCQMs.

Response: We thank all of the commenters for their feedback and suggestions. We will take them into account and consider commenters' views as we develop future policies regarding the potential future development and adoption of eCQMs generally and for future years of the Hospital IQR Program. We note that our solicitation of public comments is part of a larger effort to collect feedback on areas for improvement in the implementation of eCQMs under a variety of CMS programs. We also have been holding listening sessions with hospitals and health IT vendors about EHR and eCQM issues. We will share all these comments with the Office of the National Coordinator for Health Information Technology (ONC) and other partners.

10. Accounting for Social Risk Factors in the Hospital IQR Program

In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38324 through 38326), we discussed the importance of improving beneficiary outcomes including reducing health disparities. We also discussed our commitment to ensuring that medically complex patients, as well as those with social risk factors, receive excellent care. We discussed how studies show that social risk factors, such as being near or below the poverty level as determined by HHS, belonging to a racial or ethnic minority group, or living with a disability, can be associated with poor health outcomes and how some of this disparity is related to the quality of health care.[339] Among our core objectives, we aim to improve health outcomes, attain health equity for all beneficiaries, and ensure that complex patients as well as those with social risk factors receive excellent care. Within this context, reports by the Office of the Assistant Secretary for Planning and Evaluation (ASPE) and the National Academy of Medicine have examined the influence of social risk factors in our value-based purchasing programs.[340] As we noted in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38404), ASPE's report to Congress, which was required by the IMPACT Act of 2014, found that, in the context of value-based purchasing programs, dual eligibility was the most powerful predictor of poor health care outcomes among those social risk factors that they examined and tested. ASPE is continuing to examine this issue in its second report required by the IMPACT Act of 2014, which is due to Congress in the fall of 2019. In addition, as we noted in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38324), the National Quality Forum (NQF) undertook a 2-year trial period in which certain new measures and measures undergoing maintenance review have been assessed to determine if risk adjustment for social risk factors is appropriate for these measures.[341] The trial period ended in April 2017 and a final report is available at: *http://www.qualityforum.org/SES_Trial_Period.aspx*. The trial concluded that ''measures with a conceptual basis for adjustment generally did not demonstrate an empirical relationship'' between social risk factors and the outcomes measured. This discrepancy may be explained in part by the methods used for adjustment and the limited availability of robust data on social risk factors. NQF has extended the socioeconomic status (SES) trial,[342] allowing further examination of social risk factors in outcome measures.

In the FY 2018 and CY 2018 proposed rules for our quality reporting and value-based purchasing programs, we solicited feedback on which social risk factors provide the most valuable information to stakeholders and the methodology for illuminating differences in outcomes rates among patient groups within a provider that would also allow for a comparison of those differences, or disparities, across providers. Feedback we received across our quality reporting programs included encouraging CMS: To explore other factors that could be used to stratify or risk adjust the measures (beyond dual eligibility); to consider the full range of differences in patient backgrounds that might affect outcomes; to explore risk adjustment approaches; and to offer careful consideration of what type of information display would be most useful to the public. We also sought public comment on confidential reporting and future public reporting of some of our measures stratified by patient dual eligibility. In general, commenters noted that stratified measures could serve as tools for hospitals to identify gaps in outcomes for different groups of patients, improve the quality of health care for all patients, and empower consumers to make informed decisions about health care. Commenters encouraged CMS to stratify measures by other social risk factors such as age, income, and educational attainment. With regard to value-based purchasing programs, commenters also cautioned CMS to balance fair and equitable payment while avoiding payment penalties that mask health disparities or discouraging the provision of care to more medically complex patients. Commenters also noted that value-based purchasing program measure selection, domain weighting, performance scoring, and payment methodology must account for social risk.

Specifically, in the FY 2018 IPPS/LTCH PPS proposed and final rules for the Hospital Inpatient Quality Reporting (IQR) Program, we invited and received public comment on: (1) Which social risk factors provide the most valuable information to stakeholders; (2) providing hospitals with confidential feedback reports containing stratified results for certain Hospital IQR Program measures, specifically the Pneumonia Readmission measure (NQF #0506) and the Pneumonia Mortality measure (NQF #0468); (3) a potential methodology for illuminating differences in outcomes rates among patient groups within a hospital that would also allow for a comparison of those differences, or

disparities, across hospitals; (4) an alternative methodology that compares performance for patient subgroups across hospitals but does not provide information on within hospital disparities and any additional suggested methodologies for calculating stratified results by patient dual eligibility status; and (5) future public reporting of these same measures stratified by patient dual eligibility status on the *Hospital Compare* website (82 FR 38407). For the Hospital IQR Program in general, commenters noted that stratified measures could serve as tools for hospitals to identify gaps in outcomes for different groups of patients, improve the quality of health care for all patients, and empower consumers to make informed decisions about health care (82 FR 38404). Commenters encouraged us to stratify measures by other social risk factors such as age, income, and educational attainment (82 FR 38404).

As a next step, we are considering options to reduce health disparities among patient groups within and across hospitals by increasing the transparency of disparities as shown by quality measures. We are considering implementing the two above-mentioned methods to promote health equity and improve healthcare quality for patients with social risk factors. The first method (the hospital-specific disparity method) would promote quality improvement by calculating differences in outcome rates among patient groups within a hospital while accounting for their clinical risk factors. This method would also allow for a comparison of those differences, or disparities, across hospitals, so hospitals could assess how well they are closing disparities gaps compared to other hospitals. The second methodological approach is complementary and would assess hospitals' outcome rates for subgroups of patients, such as dual eligible patients, across hospitals, allowing for a comparison among hospitals on their performance caring for their patients with social risk factors.

We acknowledge the complexity of interpreting stratified outcome measures. As we discussed in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38404 through 38409), due to this complexity, and prior to any future public reporting of stratified measure data, we plan to stratify the Pneumonia Readmission measure (NQF #0506) data by highlighting both hospital-specific disparities and readmission rates specific for dual-eligible beneficiaries across hospitals for dual-eligible patients in hospitals' confidential feedback reports beginning fall 2018. In FY 2018 IPPS/LTCH PPS final rule (82 FR 38402 through 38409), we explained that we believe the Pneumonia Readmission measure and the Pneumonia Mortality measure are appropriate first measures to stratify, because we currently publicly report the results of both measures for a large cohort of hospitals. In addition, both measures include a large number of admissions per hospital and therefore have sufficiently large sample sizes for most hospitals to support adequate reliability of stratified calculations. As a first step, in the interest of simplicity and to minimize confusion for hospitals, we are planning to provide confidential feedback reports for the Pneumonia Readmission measure only, using both methodologies.

For the future, we are considering: (1) Expanding our efforts to provide stratified data in hospital confidential feedback reports for other measures; (2) including other social risk factors beyond dual-eligible status in hospital confidential feedback reports; and (3) eventually, making stratified data publicly available on the *Hospital Compare* website, as mentioned in previous rules, to allow consumers and other stakeholders to view critical information about the care and outcomes of subgroups of patients with social risk factors. We believe the stratified results will provide hospitals with information that could illuminate disparities in care or outcome, which could subsequently be targeted through quality improvement efforts. We further believe that public display of this information could drive consumer choice and spark additional improvement efforts. A CMS contractor convened a TEP in the spring of 2018 to solicit feedback from stakeholders on approaches to consider for stratification for the Hospital IQR Program.[343] We anticipate receiving additional input from hospitals when they receive confidential feedback reports of the stratified results and will encourage stakeholders to submit comments during this process. We are also considering how these methodologies may be adapted to apply to other CMS quality programs in the future. We refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38403 through 38409) for more details, where we discuss the potential stratification of certain Hospital IQR Program outcome measures. Furthermore, we continue to consider options to address equity and disparities in our value-based purchasing programs.

We plan to continue working with ASPE, the public, and other key stakeholders on this important issue to identify policy solutions that achieve the goals of attaining health equity for all beneficiaries and minimizing unintended consequences.

Comment: Many commenters supported CMS' continued evaluation of social risk factors in quality measurement. Some commenters recommended that CMS consider both stratification and risk adjustment methodologies. A number of commenters made recommendations, including suggestions to: (1) Work with measure developers to determine the most accurate way to include and account for social risk factors within each measure; (2) study social risk factors at a program level; (3) stratify social risk factors at the individual measure level because it would provide a more detailed picture of the costs and quality administered among facilities, noting that when data is publicly reported and assigned to an individual clinician, service line, or facility, it is important to be clear about who is responsible for the reported outcomes and/or performance rates through detailed attribution model specifications; and (4) risk-adjust measures for patient SES status when appropriate, but until risk-adjusted measures are available, publicly report stratified measure performance rates on the *Hospital Compare* website.

Response: We thank commenters for their feedback. Risk adjustment and stratification are two distinct ways of accounting for the importance of social risk factors on quality measures and payment programs. The goal of SES risk adjustment is to take into account the increased risk of poor outcomes for patients with social risk factors.

The Assistant Secretary for Planning and Evaluation (ASPE), as required by the IMPACT Act of 2014, studied the impact of social risk factors, including socioeconomic status, on quality and payment measures used in nine Medicare value-based purchasing programs. The report discussed several strategies to account for social risk factors in these programs.[344] It laid out

[343] This TEP, the Hospital Outcome Measurement for Patients with Social Risk Factors, is still ongoing. TEP members will be participating in several teleconference meetings from May through September 2018. For more information on TEPs, we refer readers to: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/TEP-Current-Panels.html#0510.*

[344] Department of Health and Human Services Office of the Assistant Secretary for Planning and Evaluation (ASPE), ''Report to Congress: Social Risk Factors and Performance Under Medicare's Value-Based Purchasing Programs.'' December 2016. Available at: *https://aspe.hhs.gov/pdf-report/report-congress-social-risk-factors-and-performance-under-medicares-value-based-purchasing-programs.*

potential merits and limitations of risk adjusting for socioeconomic status in quality measurement. Some drawbacks noted included that adjusting measures for social risks could potentially create a lower standard of care for patients with social risk factors, perpetuate disparities, and disincentivize quality improvement for these vulnerable patients. The report did not specifically express a position in favor of or against risk adjustment for SES at the patient level, but did recommend evaluating measures individually to determine if risk adjustment for socioeconomic status is warranted on a conceptual and empirical basis. Likewise, following the SES two-year trial period, the National Quality Forum (NQF) recommended evaluating the appropriateness of SES risk adjustment on a measure-by-measure basis. We note, however, that, in their final report following the conclusion of the SES two-year trial period, the NQF proposed the presentation of stratified results, as we have described in this final rule, as a potential strategy for consideration.[345] [346]

We will continue to work with measure developers to determine the most accurate way to include and account for social risk factors within each measure, including exploring stratification of social risk factors at the individual measure level. We intend to continue to study social risk factors at a program level and evaluate the effect of social risk factors on outcomes measures and quality programs. As to the commenter's request for detailed technical specifications demonstrating a measure's attribution model, such specifications are available on QualityNet for the readmission measures and include information about the attributed hospital.[347]

With regard to commenters' suggestion that we risk-adjust measures for patient SES status when appropriate, but until risk-adjusted measures are available, publicly report stratified measure performance rates on the *Hospital Compare* website, we note that such adjustment is not appropriate in all cases. Recent reports from ASPE, National Academies of Sciences, Engineering, and Medicine (NAM), and NQF do not specifically make recommendations in favor of or against risk adjustment for SES at the patient level.[348] [349] [350] However, they do propose to report stratified results, as we described in the FY 2019 IPPS/LTCH PPS proposed rule and this final rules as a potential strategy to consider.

We will continue to explore multiple options to account for the effect of social risk factors on quality measures and in quality programs.

Comment: Many commenters supported considering factors beyond dual eligibility when accounting for the impact of social risk factors on quality measurement. Several commenters referred CMS to recent reports by ASPE and the National Academies of Sciences, Engineering, and Medicine (NAM). Commenters identified a number of SES and SDS risk factors for consideration, including: (1) Educational attainment; (2) literacy; (3) health literacy; (4) home language and English language proficiency; (5) availability of primary care and physical therapy; (6) access to medications; (7) marital status and whether one lives alone; employment status; (8) income; (9) race and ethnicity; (10) nativity; (11) payor; (12) insurance product; (13) Medicaid beneficiary status; (14) neighborhood deprivation (including the percent of households under the federal poverty level, crime rates); (15) housing insecurity; (16) distance traveled (derived from zip code); (17) availability of transportation; (18) access to appropriate food; and (19) access to supportive services (including availability of a caretaker).

Response: We appreciate commenters' suggestions for additional social risk factors to consider. Consistent with the findings contained in the ASPE and NAM reports, we will explore opportunities for ways to account for additional social risk factors in the future as we continue to engage with stakeholders and determine the availability and feasibility of accounting for appropriate social risk factors, including the availability of potential data sources, that might influence quality outcomes measures such as readmissions.

Comment: Many commenters supported the use of the first proposed method (hospital-specific disparity method) in stratifying measure results. One commenter asserted the data provided under the hospital-specific disparity method would be valuable in communities that have unique patient populations. Another commenter ''cautiously supported'' the hospital-specific disparity method, but noted it would be critical to first ensure that the methodologies work accurately and reliably, and to establish social risk categorization standards that would be used across all quality reporting programs for hospitals to decrease the reporting burden.

Several commenters supported the use of the second proposed method. One commenter requested that CMS utilize the second proposed method as soon as feasibly possible because they wanted comparison data available to drive improvement. One commenter did not support the second proposed approach because it believed patients would choose to avoid facilities that provide care to large volumes of patients with social risk factors. The commenter noted that considering how the data would be presented on the *Hospital Compare* website would be critical in preventing this kind of bias from being introduced.

Response: We thank the commenters for their support and recommendations with respect to the two disparity measures described in the FY 2019 IPPS/LTCH PPS proposed rule.

We will continue to explore a variety of methodological approaches to ensure we produce accurate and reliable disparity results. In addition, we will work to align approaches to risk stratification across measures to minimize burden on providers. We would like to highlight that the proposed disparity measures would not place any additional burden on hospitals. The two proposed methods focus on dual eligibility as the social risk factor. We use this indicator as a proxy of low income and assets. It has the advantage of being readily available in claims data and therefore does not

impose any additional data collection burden.

As to the commenter's concern that the second disparity method might lead patients to avoid hospitals with a large proportion of patients with social risk factors, we note that the goal of the second method (the group-specific outcome rate method) is not to provide patients with information on hospitals' volume of patients with social risk factors, but rather to provide specific outcome rates for patients with social risk factors at the individual hospital level (for example readmission rates for dual eligible patients). Preliminary results have shown that both hospitals caring for a low and a high proportion of patients with social risk factors can perform well or poorly on this measure.

We will also continue to evaluate what may be the best method or methods of publicly displaying stratified outcome measures and disparity information to ensure the public's understanding of the data.

Comment: Many commenters expressly supported CMS' plans to provide stratified Pneumonia Readmissions measure data in confidential, hospital-specific feedback reports because it would allow hospitals adequate time to understand their performance on stratified measures, evaluate the accuracy and impact of the stratification, identify any issues around disparity in the care provided, and inform internal quality improvement efforts. A few commenters requested that CMS allow hospitals sufficient time to review and analyze stratified rates prior to any public reporting, with one commenter requesting receipt of at least two years of confidential feedback reports prior to any public reporting. Commenters also requested that CMS ensure that hospitals have sufficient information to interpret the stratified measures results by providing national and regional benchmarks for the stratifications and detailed specifications of how measures are stratified so that hospitals can replicate this information during their ongoing performance monitoring. A number of commenters suggested that CMS solicit additional feedback from stakeholders before publicly reporting stratified quality data to ensure that data would be reported in a manner that is accurate, reliable, and understandable to patients. A few commenters requested that CMS propose specific measures for stratification through rulemaking.

Response: We thank commenters for their feedback and will take it into consideration. As described in the preamble of this final rule, we are planning to provide confidential reports to hospitals for the Pneumonia Readmission measure (NQF #0506), stratified by patient dual-eligible status. The confidential hospital-specific reports will be provided for hospitals to preview from August 24 through September 24, 2018. During this confidential preview period, we will also provide educational materials to ensure hospitals have sufficient information to understand and interpret their disparity results. Hospital specific reports will include national and regional benchmarks for the two disparity methods. Finally, a technical report will provide detailed specifications on the two disparity methods.

We agree with commenters that the confidential reporting period will allow hospitals to understand the stratified measure data prior to any future public reporting. We acknowledge commenters' concerns about having sufficient time to review and analyze stratified measure data prior to any public reporting on that data. We have not yet determined any future plans with respect to publicly reporting stratified data, and intend to continue to engage with hospitals and relevant stakeholders about their experiences with and recommendations for the stratification of measure data and to ensure the reliability of such data before proposing to publicly display stratified measure data in the future. Any proposal to display stratified quality measure data on the *Hospital Compare* website would be made through future rulemaking.

Comment: A few commenters recommended that CMS consider or incorporate the findings or recommendations from the reports from the APSE, NAM, and a TEP that the NQF convened, per HHS/CMS request. A few commenters suggested that CMS begin incorporating other social risk factors found to be important while also continuing to monitor, study, and refine these efforts over time. Other commenters encouraged the empirical testing and use of neighborhood-level adjustment (that is, integrating patient data with information about contextual factors that influence health outcomes at the community or population level) where the data are available, in order to assess the impact of these adjustments on local provider performance metrics. The commenters noted that based on the results of these tests, CMS and other agencies would be able to prioritize the national collection of data that are most essential for valid risk adjustment methodologies.

A few commenters recommended that CMS work with vendors to collect SES and SDS variables through their EHRs, potentially through the implementation of demonstration projects. The commenters noted that the collected data elements could be used to supplement the claims data already captured by CMS to greatly improve the measure's risk adjustment methodology.

A number of commenters requested that CMS be more transparent during efforts to address social risk factors and to continuously seek stakeholder input, including measure stewards, in order to achieve the goals of attaining health equity for all beneficiaries while also minimizing unintended consequences, as well as to ensure the adjustment approach keeps up with the evolving measurement science around accounting for social risk factors. One commenter requested that CMS provide a work plan and timeline, as well as increase opportunities for collaboration with Medicare Advantage and Medicaid health plans.

Response: We thank commenters for their recommendations. Our work to date on measure stratification and risk-adjustment has been informed by the reports by ASPE, NAM, and the NQF, as recommended by the commenters, as well as feedback directly received from stakeholders such as through the rulemaking public comment process. This includes closely tracking recommendations about social risk factor variables for use and potential methodologies. We are committed to continuing to expand the range of social risk factors incorporated into measure stratification based on the recommendations of the above groups. Consistent with the findings of the ASPE and NAM reports, we will explore accounting for such factors in the future as we continue to engage stakeholders and determine the availability of appropriate community factors that might influence quality outcome measures such as readmission. We will also consider the use of social risk factors obtained through EHRs while balancing concerns about undue data collection and reporting burden on providers.

We also thank commenters for their support on our approach to engaging stakeholders in our stratification methodology development process. As noted, a TEP was convened to receive feedback on the two methods we developed to illuminate disparities. The TEP members came from diverse perspectives and backgrounds, including clinicians, hospitals, purchasers, consumers, and experts in quality improvement and health care disparities. CMS contractors also regularly consulted with an advisory

working group of five patients, family caregivers, and consumer advocates. The working group meetings addressed key issues surrounding the development of the two disparity methods, including the conceptual goal of the methods, their complementarity, and how best to report results for the disparity methods. We also held a webinar to inform hospital and consumer organizations about the two disparity methods and the confidential preview period taking place for the Pneumonia Readmission measure and dual eligibility. We will continue to explore multiple options and will elicit further feedback from stakeholders before determining an approach for public reporting.

Comment: A few commenters did not support the inclusion and modification of risk factors related to socioeconomic status for determining provider reimbursement for Medicare services in all the IPPS programs. One commenter expressed concerns that this approach would not address the underlying disparities that are often associated with poor health outcomes by masking potential disparities or minimizing incentives to improve the outcomes for disadvantaged populations. Specifically, the commenter asserted this approach would create perverse incentives for poor performers to continue with the status quo and for high performers to retreat from their efforts to address disparities in high socioeconomic status populations. Another commenter expressed reservations about adjusting hospitals' performance rates using social factors because it would obscure disparities. Specifically, the commenter disagreed with using the risk-adjustment model because it excludes some important clinical risk factors that cannot be obtained through administrative data, which could have an impact on stratified comparison of disparities if the missing risk factors have different incidence rates across the subgroups. One commenter did not support the use of stratification to account for social risk factors in inpatient quality programs, and recommended the use of risk-adjustment methodology instead, particularly for financial incentive programs.

Response: We thank the commenters for their feedback and appreciate their concerns. In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38324 through 38326) and in this final rule, we affirm our commitment to improving beneficiary outcomes, reducing health disparities, and our commitment to ensuring that medically complex patients, as well as those with social risk factors, receive high quality care. In addition, we seek to ensure that the quality of care furnished by providers and suppliers is assessed as fairly as possible under our programs while ensuring that beneficiaries have adequate access to excellent care. Our efforts, to date, have been undertaken in response to the feedback we have received from stakeholders and based on the findings contained in reports by ASPE, NAM and NQF. These efforts include closely tracking recommendations about social risk factors variables for use and potential methodologies. We continue to believe that it is important to consider options to address equity and disparity in our quality programs, which is why we will continue working with the public and key stakeholders on this important issue to identify policy solutions that achieve the goals of attaining health equity for all beneficiaries and minimizing unintended consequences.

Comment: One commenter, who generally did not support stratification, expressed concern that many hospital quality measures, such as hospital-acquired infection measures, would have limited sample sizes at the individual hospital level, and that this could ultimately limit the statistical reliability of reporting quality measures by race or other sociodemographic characteristics. The commenter also expressed its belief that the quality of race and ethnicity data within the Medicare program is known to be suboptimal for many races outside of white and black, including American Indian/Alaska Native and other races, and recommended that CMS develop a proposal to improve the collection of race and ethnicity data, or propose how to promote public transparency using data that are of mixed quality, before reporting such data publicly.

Response: We thank the commenter for the feedback. We agree with the commenter's concerns about the impact of small samples sizes on the reliability of stratified quality measure results. Furthermore, small sample sizes may be especially challenging for measure stratification because some hospitals may have few patients with social risk factors. Therefore, under the first method (the hospital-specific disparity method), disparities would be reported only for hospitals with at least 25 patients and 10 patients for each sub-group. The second method (the group-specific outcome rate method) would use a cut-off of at least 25 patients for potential public reporting. We note the overall sample size of 25 patients is consistent with the quality outcome measures currently implemented.

We agree with the commenter's concern that race and ethnicity data for Medicare beneficiaries are currently not consistently captured in claims. We believe that examining racial and ethnic disparities in outcomes within hospitals is important since race and ethnicity have been shown to be associated with health care quality, and will continue to examine how best to improve the collection of such data.

We thank the commenters for their views and will take them into consideration as we continue our work on these issues.

11. Form, Manner, and Timing of Quality Data Submission

a. Background

Sections 1886(b)(3)(B)(viii)(I) and (b)(3)(B)(viii)(II) of the Act state that the applicable percentage increase for FY 2015 and each subsequent year shall be reduced by one-quarter of such applicable percentage increase (determined without regard to sections 1886(b)(3)(B)(ix), (xi), or (xii) of the Act) for any subsection (d) hospital that does not submit data required to be submitted on measures specified by the Secretary in a form and manner, and at a time, specified by the Secretary. Previously, the applicable percentage increase for FY 2007 and each subsequent fiscal year until FY 2015 was reduced by 2.0 percentage points for subsection (d) hospitals failing to submit data in accordance with the description above. In accordance with the statute, the FY 2019 payment determination will begin the fifth year that the Hospital IQR Program will reduce the applicable percentage increase by one-quarter of such applicable percentage increase.

In order to participate in the Hospital IQR Program, hospitals must meet specific procedural, data collection, submission, and validation requirements. For each Hospital IQR Program payment determination, we require that hospitals submit data on each specified measure in accordance with the measure's specifications for a particular period of time. The data submission requirements, Specifications Manual, and submission deadlines are posted on the QualityNet website at: *http://www.QualityNet.org/*. The annual update of electronic clinical quality measure (eCQM) specifications and implementation guidance documents are available on the Electronic Clinical Quality Improvement (eCQI) Resource Center website at: *https://ecqi.healthit.gov/*. Hospitals must register and submit quality data through the secure portion of the QualityNet

website. There are safeguards in place in accordance with the HIPAA Security Rule to protect patient information submitted through this website.

b. Procedural Requirements

The Hospital IQR Program's procedural requirements are codified in regulation at 42 CFR 412.140. We refer readers to these codified regulations for participation requirements, as further explained by the FY 2014 IPPS/LTCH PPS final rule (78 FR 50810 through 50811) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57168). In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20496 through 20497), we did not propose any changes to these procedural requirements.

c. Data Submission Requirements for Chart-Abstracted Measures

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51640 through 51641), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53536 through 53537), and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50811) for details on the Hospital IQR Program data submission requirements for chart-abstracted measures. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20497), we did not propose any changes to the data submission requirements for chart-abstracted measures.

d. Reporting and Submission Requirements for eCQMs

For a discussion of our previously finalized eCQMs and policies, we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50807 through 50810; 50811 through 50819), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50241 through 50253; 50256 through 50259; and 50273 through 50276), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49692 through 49698; and 49704 through 49709), the FY 2017 IPPS/LTCH PPS final rule (81 FR 57150 through 57161; and 57169 through 57172), and the FY 2018 IPPS/LTCH PPS final rule (82 FR 38355 through 38361; 38386 through 38394; 38474 through 38485; and 38487 through 38493).

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20497 through 20498), we clarified measure logic used in eCQM development; proposed to extend previously established eCQM reporting and submission requirements for the CY 2019 reporting period/FY 2021 payment determination; and proposed to require hospitals to use the 2015 Edition certification criteria for CEHRT beginning with the CY 2019 reporting period/FY 2021 payment determination. These matters are discussed in detail below.

(1) Clarification of the Measure Logic Used in eCQM Development—Transition to Clinical Quality Language (CQL)

Although the measure logic, which represents the lines of logic that comprise a single AND/OR statement composing each population, used in eCQM development is not generally specified through notice and comment rulemaking, in the proposed rule (83 FR 20497), we notified the public that all eCQM specifications published in CY 2018 for the CY 2019 reporting period/FY 2021 payment determination and subsequent years (beginning with the Annual Update that was published in May 2018 and for implementation in CY 2019) will use the Clinical Quality Language (CQL). CQL is a Health Level Seven (HL7) International standard [351] and aims to unify the expression of logic for eCQMs and Clinical Decision Support (CDS).[352] CQL provides the ability to better express logic defining measure populations to improve the accuracy and clarity of eCQMs. In addition, CQL is a high-level authoring language that is intended to be human-readable and allows measure developers to express data criteria and represent it in a manner suitable for language processing.

Prior to CY 2017, eCQM logic was defined by ''Quality Data Model (QDM) Logic,'' an information model that defines relationships between patients and clinical concepts in a standardized format to enable electronic quality performance measurement.[353] We believe that compared to CQL, QDM logic is more complex and difficult to compute. QDM logic limits a measure developer's ability to express the type of comparisons needed to truly evaluate outcomes of care because QDM logic cannot request patient results that indicate outcomes and assess improvement over time; in contrast, CQL's mathematical expression logic allows this type of comparison over time and is independent of the model.[354] Moreover, CQL: (1) Offers improved expressivity; (2) is more precise/unambiguous; (3) can share logic between measures; (4) allows for measure logic to be shared with CDS tools; (5) can be used with multiple information data models (for example, QDM, Fast Healthcare Interoperability Resources (FHIR) [355]); and (6) simplifies calculation engine implementation.[356] CQL replaces the logic expressions defined in the QDM, and QDM (beginning with v5.3 [357]) includes only the conceptual model for defining the data elements.

Measure developers successfully tested CQL for expressing eCQMs from 2016 through 2017.[358] Based on the results, the Measure Authoring Tool (MAT) [359] and the Bonnie [360] tool have been updated to use CQL. We believe replacing the measure logic used in eCQM development from QDM to CQL will enable measure developers to engineer more precise, more interoperable measures that interface with CDS tools, which in turn, will result in availability of better measures of patient outcomes for use in the Hospital IQR Program and other CMS programs. We note that utilization of CQL for the eCQMs currently available for reporting in the Hospital IQR Program measure set would not affect the intent of the measure, the numerator, denominator, or any measure exclusions or exceptions.

For additional information about the CQL transition and its impact on eCQM development, we refer readers to the eCQI Resource Center website at: *https://ecqi.healthit.gov/cql*.

Comment: Several commenters expressed support for the transition to

[351] Additional details about HL7 are available at: *http://www.hl7.org/about/index.cfm?ref=nav*. In addition, readers may learn more under ''Where can I find more information on CQL'' on the eCQI Resource Center website at: *https://ecqi.healthit.gov/cql*.

[352] Additional details about CDS is available on the eCQI Resource Center website at: *https://ecqi.healthit.gov/cds*.

[353] Additional details about QDM Logic are available at: *https://ecqi.healthit.gov/qdm*.

[354] Additional details about How CQL Logic is Different from QDM Logic are available at: *https://ecqi.healthit.gov/qdm/qdm-Qs%26As#QualityDataModelQDMforusewithClinicalQualityLanguageCQL*.

[355] FHIR, developed by Health Level Seven International (HL7), is designed to enable information exchange to support the provision of healthcare in a wide variety of settings. The specification builds on and adapts modern, widely used RESTful practices to enable the provision of integrated healthcare across a wide range of teams and organizations. Additional information available at: *http://hl7.org/fhir/overview-dev.html*.

[356] Additional details on the benefits of Clinical Quality Language (CQL) are available at: *https://ecqi.healthit.gov/system/files/Benefits_of_CQL_May2017-508.pdf*.

[357] Additional details about QDM v5.3 available at: *https://ecqi.healthit.gov/qdm/qdm-news-0/now-available-quality-data-model-qdm-v53*.

[358] Additional details about the Timeline for the Transition to CQL are available at: *https://ecqi.healthit.gov/cql*.

[359] The Measure Authoring Tool (MAT) is a web-based tool that allows measure developers to author electronic Clinical Quality Measures (eCQMs). Using the tool, authors create Clinical Quality Language (CQL) expressions, which have the conceptual portion of the Quality Data Model (QDM) as their foundation (*https://www.emeasuretool.cms.gov/*).

[360] Bonnie is a tool for testing electronic clinical quality measures (eCQMs) designed to support streamlined and efficient pre-testing of eCQMs, particularly those used in the CMS quality programs (*https://bonnie.healthit.gov/*).

CQL measure logic because it will provide improved specificity, precision, clarity, usability, and value to eCQMs to better align with the clinical intent of the measures. One commenter noted that CQL will provide earlier, longer draft periods that could enable hospitals and vendors to perform more testing and provide more feedback. Another commenter specifically suggested use of Health Level 7 (HL7) Fast Healthcare Interoperability Resources (FHIR) as part of CQL.

Response: We thank commenters for their support. We will consider use of HL7 FHIR as part of CQL in the future.

Comment: A few commenters recommended monitoring the transition to the CQL measure logic.

Response: We will continue to monitor the experiences of hospitals and vendors as they transition to CQL to proactively address any challenges that might arise.

Comment: A few commenters acknowledged the benefits of CQL but expressed concern that the transition to CQL for the CY 2019 reporting period did not provide enough time to implement the complex changes necessary without increasing burden. One commenter suggested a 24 month delay in requiring implementation.

Response: We agree with the commenter that CQL has many benefits including improved expressivity, precision, and interoperability to facilitate sharing logic between measures and with CDS tools. While we try to be as proactive as possible in providing lead time changes to the Hospital IQR Program, we believe that the CY 2019 reporting period is the appropriate time to transition to CQL because we believe these benefits should be actualized as soon as practicable. We will continue working to provide hospitals with the education, tools, and resources necessary to help seamlessly implement necessary changes while minimizing increase in burden. Further, we will also consider the issues associated with new software, workflow changes, training, et cetera as we continue to improve our education and outreach efforts.

(2) Reporting and Submission Requirements for eCQMs for the CY 2019 Reporting Period/FY 2021 Payment Determination

In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38361), we finalized eCQM reporting and submission requirements such that hospitals are required to report only one, self-selected calendar quarter of data for four self-selected eCQMs for the CY 2018 reporting period/FY 2020 payment determination. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20498), in alignment with the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs), we proposed to extend the same eCQM reporting and submission requirements, such that hospitals would be required to report one, self-selected calendar quarter of data for four self-selected eCQMs for the CY 2019 reporting period/FY 2021 payment determination. We believe continuing the same eCQM reporting and submission requirements is appropriate because doing so continues to offer hospitals reporting flexibility and does not increase the information collection burden on data submitters, allowing them to shift resources to support system upgrades, data mapping, and staff training related to eCQM documentation and reporting. We also refer readers to section VIII.D.9. of the preamble of this final rule where similar proposals are discussed for the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs).

Comment: Many commenters supported the proposed eCQM reporting requirements for the CY 2019 reporting period/FY 2021 payment determination, such that hospitals would be required to select and submit one calendar quarter of data for 4 of the available eCQMs. Several comments expressed appreciation for the continued flexibility and consistency CMS has provided for eCQM reporting requirements, acknowledging the operational challenges in implementing eCQM reporting. These commenters noted that maintaining the reporting requirements will make the transition to 2015 Edition CEHRT more seamless, because the upgrade process will make it even more difficult for hospitals to electronically report eCQMs for more than one calendar quarter, especially if they are not able to complete the upgrade to the new CEHRT until the end of the year. One commenter also noted that allowing hospitals to self-select one quarter of data allows for adjustments to assure that the data on which CMS relies for long-term decision-making is accurate.

Response: We thank the commenters for their support.

Comment: Some commenters suggested the proposed eCQM reporting requirements for the CY 2019 reporting period/FY 2021 payment determination should also be finalized for the CY 2020 reporting/FY 2022 payment determination, consistent with the Promoting Interoperability Program proposal.

Response: With respect to extending these reporting requirements for the CY 2020 reporting/FY 2022 payment determination, we will continue to monitor and assess the progress of hospitals implementing eCQM requirements and engage in discussions with hospitals regarding their experiences as we consider policies related to eCQM reporting in future rulemaking. We are committed to staying in alignment with the Promoting Interoperability Program's eCQM-related policies to the greatest extent feasible, and we believe the commenter may have misinterpreted the Promoting Interoperability Program's proposal with regard to eCQM reporting requirements. In alignment with the Hospital IQR Program, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20539), the Promoting Interoperability Program proposed, ''[f]or CY 2019, for eligible hospitals and CAHs that report CQMs electronically, we are proposing the reporting period for the Medicare and Medicaid Promoting Interoperability Programs would be one, self-selected calendar quarter of CY 2019 data.'' Neither the Promoting Interoperability Program, nor the Hospital IQR Program, proposed eCQM reporting requirements for the CY 2020 reporting/FY 2022 payment determination in the FY 2019 IPPS/LTCH PPS proposed rule. We note that the Promoting Interoperability Program had additional proposals related to requirements for attesting to measures and objectives, which may have different requirements and different reporting periods than for reporting CQMs electronically and we refer readers to section VIII.D. of the preamble of this final rule for more information.

Comment: One commenter suggested that eCQMs should be implemented at a faster rate and that the commenter would prefer to report all chart-abstracted measures in an eCQM version because eCQMs are resulting in significant cost-reductions associated with not having to chart-abstract.

Response: We thank the commenter for their suggestion. It is one of our goals to expand EHR-based quality reporting in the Hospital IQR Program using more meaningful measures, which we believe will ultimately reduce burden on hospitals as compared with chart-abstracted data reporting and improve patient outcomes by providing more robust data to support quality improvement efforts. We intend to introduce additional eCQMs into the program as eCQMs that support our program goals become available, but we

want to ensure that we proceed slowly and incrementally to enable hospitals enough time to update systems and workflows in the least burdensome manner possible.

Comment: A few commenters did not support the proposed eCQM reporting requirements for the CY 2019 reporting period/FY 2021 payment determination, such that hospitals would be required to select and submit one calendar quarter of data for 4 of the available eCQMs. Specifically, one commenter recommended that: (1) CMS decrease the number of eCQMs required to be reported to CMS in 2018; and (2) CMS identify one or two specific eCQMs on which it would like all hospitals to report rather than for measures to be removed in subsequent reporting years.

Response: We thank the commenters for their views and suggestions but we believe continuing the same eCQM reporting and submission requirements is appropriate because doing so continues to offer hospitals reporting flexibility and does not increase the information collection burden on data submitters, allowing them to shift resources to support system upgrades, data mapping, and staff training related to eCQM documentation and reporting. Specifically, we do not believe decreasing the number of eCQMs required to be reported is necessary because for the CY 2017 reporting period and the CY 2018 reporting period, over 90 percent of IPPS hospitals successfully reported one quarter of data for 4 eCQMs. As to the suggestion to identify one or two specific eCQMs on which all hospitals would be required to report instead of removing measures for future program years, at this time we believe it is a greater priority to offer flexibility to hospitals in selecting eCQMs that are most relevant to their individual patient populations and quality improvement efforts as they upgrade EHR systems, map data elements, and modify workflows to improve EHR-based quality reporting. We will take this suggestion into consideration and continue to monitor and assess the progress of hospitals implementing eCQM reporting requirements, as well as whether there is a continued need to remove any other eCQMs from the measure set. We will also continue to engage in discussions with hospitals and health IT vendors regarding their experiences as we consider policies related to eCQM reporting in future rulemaking.

Comment: One commenter suggested aligning all Hospital IQR and Promoting Interoperability Program requirements, including requiring one consecutive 90-day reporting period, to eliminate confusion among health care providers.

Response: While we try to align eCQM reporting requirements for the Hospital IQR and Promoting Interoperability Programs to the greatest extent feasible (we refer readers to section VIII.D.9. of the preamble of this final rule where we are finalizing the same eCQM reporting requirements in the Hospital IQR Program as the Promoting Interoperability Programs for the CY 2019 reporting period/FY 2021 payment determination), we are not able to align the Hospital IQR Program with the Promoting Interoperability Program's requirements for attesting to measures and objectives, which allow for one consecutive 90-day reporting period. We note that the Hospital IQR Program can only use quality and cost measures and does not allow for an attestation option.

Comment: One commenter expressed concern that the transition to CQL and the proposed removal of the seven eCQMs would result in considerable burden required to map the necessary data elements from the EHR for 4 eCQMs and some vendors are not properly equipped to collect and transmit such data through the CMS QualityNet secure portal.

Response: We appreciate the commenter's concern that the transition to CQL and removal of the seven eCQMs may result in additional burden required to map the necessary data elements from the EHR for 4 eCQMs, however, hospitals have been successfully reporting one calendar quarter of data for 4 eCQMs and we believe that reporting will become progressively easier with every year of experience, and maintaining these requirements provides continuity, minimizing provider confusion about changing requirements.

After consideration of the public comments we received, we are finalizing our proposal to extend the eCQM reporting and submission requirements previously finalized for the CY 2018 reporting period/FY 2020 payment determination, such that hospitals would be required to report one, self-selected calendar quarter of data for four self-selected eCQMs for the CY 2019 reporting period/FY 2021 payment determination as proposed. We also refer readers to section VIII.D.9. of the preamble of this final rule where we are finalizing similar policy under the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs).

(3) Changes to the Certification Requirements for eCQM Reporting Beginning With the CY 2019 Reporting Period/FY 2021 Payment Determination

In the FY 2018 IPPS/LTCH PPS final rule, we finalized a policy to allow flexibility for hospitals to use the 2014 Edition certification criteria, the 2015 Edition certification criteria, or a combination of both for the CY 2018 reporting period/FY 2020 payment determination only (82 FR 38388). This was a change to the policy previously finalized in the FY 2017 IPPS/LTCH PPS final rule that required hospitals to use the 2015 Edition certification criteria for CEHRT for the CY 2018 reporting period/FY 2020 payment determination and subsequent years (81 FR 57171).

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20498), to align with the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs), for the Hospital IQR Program we proposed to require hospitals to use only the 2015 Edition certification criteria for CEHRT beginning with the CY 2019 reporting period/FY 2021 payment determination. We refer readers to section VIII.D.3. of the preamble of this final rule in which the Medicare and Medicaid Promoting Interoperability Programs discuss more broadly the reasons for and benefits of requiring hospitals to use the 2015 Edition certification criteria for CEHRT, beginning with the CY 2019 reporting period/FY 2021 payment determination. There are certain functionalities in the 2015 Edition of certified electronic health record technology that were not available in the 2014 Edition that we believe will increase interoperability and the flow of information between providers and patients.

In addition, as we discussed in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38387 through 38388), specifically as to eCQM reporting, the 2015 Edition includes updates to standards for structured data capture as well as data elements in the common clinical data set which can be captured in a structured format. We continue to believe the use of relevant, up-to-date, standards-based structured data capture with an EHR certified to the 2015 Edition supports electronic clinical quality measurement.

The 2015 Edition certification criteria (that make up CEHRT) within the certification testing process includes features that are designed to improve the functionality and quality of eCQM

data.[361] Specifically, systems must demonstrate they can import and allow a user to export one or more QRDA files. This allows systems to share files and extract data for reporting into another system or send to another system. In addition, testing coverage is much more robust; all measures have >80 percent of test pathways tested in the test bundle with most >95 percent. In addition, the 2015 Edition includes a revised requirement that products must be able to export data from one patient, a set of patients, or a subset of patients, which is responsive to health care provider feedback that their data is unable to carry over from a previous EHR. The 2014 Edition did not include a requirement that the vendor allow the provider to export the data themselves. In the 2015 Edition, the provider has the autonomy to export data themselves without intervention by their vendor, resulting in increased interoperability and data exchange between the two Editions. This includes a new function that supports increased patient access to their health information through email transmission. The increased interoperability in this requirement provides patients more control of their health data to inform the decisions that they make regarding their health.

The 2015 Edition certification criteria for CEHRT also includes optional certification criteria and program specific testing which can also support electronic clinical quality reporting. The filter criteria ensure a product can filter an electronic file based on demographics like sex or race, based on provider or site characteristics like TIN/NPI, and based on a diagnosis or problem. The testing for this function checks that patients are appropriately aggregated and calculated for this new function which supports flexibility, specificity, and more robust analysis of eCQM data. Finally, the 2015 Edition provides optional testing to CMS requirements for reporting, such as form and manner specifications and implementation guides. For these reasons, in the proposed rule, we proposed to require hospitals to use the 2015 Edition certification criteria for CEHRT when reporting eCQMs beginning with the CY 2019 reporting period/FY 2021 payment determination.

We note that the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs) previously finalized the requirement that hospitals use the 2015 Edition certification criteria for CEHRT beginning with the CY 2019 reporting period/FY 2021 payment determination (80 FR 62873 through 62875), such that hospitals participating in both the Hospital IQR Program and the Medicare and Medicaid Promoting Interoperability Programs already would be required to use the 2015 Edition certification criteria for CEHRT beginning with the CY 2019 reporting period/FY 2021 payment determination.

Comment: Many commenters supported the required use of 2015 Edition of CEHRT because it use enhances interoperability, increases implementation efficiency, shortens product development time, eases provider system integration, addresses health disparities by providing more robust demographic data collection on social determinants of health, includes application programming interfaces (APIs) for consumer access, and promotes a new streamlined approach to privacy and security. For these reasons, commenters believed the benefits outweigh any upgrade costs. Commenters noted that requiring the 2015 Edition CEHRT will help to simplify the Promoting Interoperability Program and eliminate confusion around different objective and measure sets available for reporting. In addition, commenters asserted the 2015 Edition CEHRT will provide patients more control of their health data to inform the decisions that they make regarding their health, helping patients participate as full partners in their care.

Several commenters also believed that a majority of health IT vendors have successfully completed, or are in the process of completing, their certification(s) under the 2015 Edition CEHRT Criteria, and it would significantly and unfairly penalize the diligence of these parties by any delay in order to accommodate those companies who have not complied with the 2015 Edition CEHRT criteria by now.

Response: We thank commenters for their support.

Comment: One commenter urged that, as soon as possible, CMS and ONC ensure that the U.S. Core Data for Interoperability (USCDI) captures more of the patient's full health care record at any given facility, which can then be linked to application programming interfaces (APIs) such as FHIR, enabling even greater functionality of EHRs.

Response: We thank the commenter for the suggestion, and we will consult with ONC regarding interoperability and linking EHRs to APIs, or operating system tools used by developers of software applications. As discussed in section VIII.A.11.d.(1) above, FHIR, or Fast Healthcare Interoperability Resources, is a standards framework developed by Health Level Seven International (HL7) and is designed to enable information exchange to support the provision of healthcare in a wide variety of settings.[362] We will continue to explore this and other opportunities to improve functionality for future years of the Hospital IQR Program.

Comment: A few commenters supported the required use of the 2015 Edition of CEHRT, but recommended CMS delay the requirement until the CY 2020 reporting period/FY 2022 payment determination or allow flexibility for 6 months to a year for implementation. Although most commenters did not anticipate significant labor would be required from providers to implement the new functionalities required, some commenters recommended that CMS grant Extraordinary Circumstances Exceptions (ECEs) to hospitals that are unable to migrate to the 2015 Edition due to vendor backlogs in updating their technology.

Response: We note that, as described above, in both the Hospital IQR and Promoting Interoperability Programs, we have previously delayed requiring the use of the 2015 Edition CEHRT, and do not believe that transition to the 2015 Edition certification criteria for CEHRT for the CY 2019 reporting period will materially impact the percentage of hospitals able to successfully report eCQM data, particularly in light of our change to previously finalized policy to allow flexibility for hospitals to use the 2014 Edition, 2015 Edition, or a combination of both for the CY 2018 reporting period/FY 2020 payment determination. Consistent with the observations of several commenters, we believe a majority of health IT vendors have successfully completed, or are in the process of completing, their certification(s) under the 2015 Criteria, and that the CY 2019 reporting period/FY 2021 payment determination is the appropriate time to require the transition to the 2015 Edition.

With regard to commenters' suggestion that hospitals unable to migrate to the 2015 Edition due to health IT vendor backlogs in updating

[361] For CEHRT definition, we refer readers to 42 CFR 495.4. For additional details about the updates to the 2015 Edition, we refer readers to ONC's Common Clinical Data Set resource, available at: *https://www.healthit.gov/sites/default/files/commonclinicaldataset_ml_11-4-15.pdf.*

[362] FHIR, developed by Health Level Seven International (HL7), is designed to enable information exchange to support the provision of healthcare in a wide variety of settings. The specification builds on and adapts modern, widely used RESTful practices to enable the provision of integrated healthcare across a wide range of teams and organizations. Additional information available at: *http://hl7.org/fhir/overview-dev.html.*

their technology be granted an Extraordinary Circumstances Exception (ECE), we note that if a hospital finds it is unable to meet the eCQM submission deadline or other submission requirements, the hospital should review our criteria for an eCQM-related ECE (81 FR 57182) and consider submitting an ECE request by the ECE request deadline. Our current policy allows hospitals to utilize the existing ECE form to request an exception from the Hospital IQR Program's eCQM reporting requirement for the applicable program year based on hardships preventing hospitals from electronically reporting (81 FR 57182). Such hardships could include, but are not limited to, infrastructure challenges (hospitals must demonstrate that they are in an area without sufficient internet access or face insurmountable barriers to obtaining infrastructure) or unforeseen circumstances, such as vendor issues outside of the hospital's control (including a vendor product losing certification) (80 FR 49695 and 49713). ECE requests for the Hospital IQR Program are considered on a case-by-case basis (81 FR 57182). We will assess the hospital's request on a case-by-case basis to determine if an exception is merited. Therefore, our decision whether or not to grant an ECE will be based on the specific circumstances of the hospital. For additional information about eCQM-related ECE requests, we refer readers to the QualityNet website at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228775554109*.

Comment: Although commenters acknowledged the 2015 Edition of CEHRT includes important updates to facilitate the exchange of data, many commenters did not support the required use of 2015 Edition of CEHRT because of the costs to hospitals and encouraged CMS to continue to allow hospitals to use the 2014 Edition of CEHRT. In particular, several commenters expressed concern about the ability of rural and solo/small group providers to upgrade EHR systems because they struggle to ensure products are triaged, fully tested, and implemented, with staff trained and workflow adjustments validated to ensure safe, effective, and efficient implementation and use. Some commenters suggested flexible approaches that allow clinicians to incorporate technology into their unique clinical workflows, to mitigate data access and functionality issues that might be unique to their practice, and to use EHRs in a manner that more directly responds to their patients' needs and aligns with their clinical workflow. One commenter noted a recent search of the Certified Health IT Product List shows that there are 338 products currently certified to the 2015 Edition. Of these, most are limited modules for providers and specialties or are limited to specific functionalities, such as a patient portal. The commenter noted, in comparison, there are more than 2,400 EHR products still certified to the 2014 Edition.

Response: Although we acknowledge that facilitating quality improvement for rural and small hospitals present unique challenges and is a high priority under the Meaningful Measures Initiative, we believe the increased interoperability and the flow of information between providers and patients resulting from use of the 2015 Edition justifies the costs of implementation. As stated above, there are certain functionalities in the 2015 Edition that were not available in the 2014 Edition, including features that are designed to improve the functionality and quality of eCQM data. As we discussed in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38387 through 38388), specifically as to eCQM reporting, the 2015 Edition includes updates to standards for structured data capture as well as data elements in the common clinical data set which can be captured in a structured format. We continue to believe the use of relevant, up-to-date, standards-based structured data capture with an EHR certified to the 2015 Edition supports electronic clinical quality measurement.

With respect to the commenter's observation that the number of products currently certified to the 2015 Edition are limited as compared to the number of products available certified to the 2014 Edition, we expect that as more hospitals begin to use the 2015 Edition, the number of products included in the Certified Health IT Product List [363] will quickly multiply. We believe our policy to require use of the 2015 Edition for the CY 2019 reporting period/FY 2021 payment determination is likely to expedite the development of these products.

Comment: One commenter requested CMS update a hyperlink in the proposed rule at 83 FR 20498, footnote 330.

Response: We have updated the hyperlink in the footnote above. We also corrected several other hyperlinks in the proposed rule in a correction notice published in the **Federal Register** (83 FR 28603 through 28604).

Comment: Several commenters requested clarification about whether hospitals are required to use 2015 Edition CEHRT for the full calendar year, or for a 90-day reporting period. A few commenters suggested CMS make the reporting period for all programs that require the use of 2015 Edition CEHRT be 90 days for the CY 2019 reporting period, noting that some CMS programs still require the use of 2015 Edition CEHRT for an entire year. One commenter asked CMS to clarify the date on which this must be certified and recommended that date correspond with the beginning of the chosen reporting period.

Response: Hospitals are not required to have their EHRs certified to the 2015 Edition CEHRT standards for the full calendar year; certification should be obtained prior to the end of the eCQM reporting period to meet program requirements (for example, before December 31, 2019 for the CY 2019 reporting period).

With regard to commenters' suggestion that CMS make the reporting period for all programs that require the use of 2015 Edition CEHRT be 90 days for the CY 2019 reporting period, we are committed to the Hospital IQR and Promoting Interoperability Programs' eCQM-related policies staying in alignment to the greatest extent feasible. We refer readers to sections VIII.A.11.d.(2) and VIII.D.9. of the preamble of this final rule where we are finalizing eCQM reporting requirements in both the Hospital IQR Program and the Promoting Interoperability Programs, which will bring them into greater alignment for the CY 2019 reporting period/FY 2021 payment determination, including with regard to the number of eCQMs (4 measures), the number of calendar quarters of data (one calendar quarter of data), and which Edition of CEHRT to use (2015 Edition) for eCQM reporting. However, we are not able to align the Hospital IQR Program with the Promoting Interoperability Program's requirements for attesting to measures and objectives, which allow for one consecutive 90-day reporting period. We refer readers to section VIII.D.4. of the preamble of this final rule for more information on those requirements. We note that the Hospital IQR Program is limited to measures appropriate for the measurement of quality of care and does not allow for an attestation option.

Comment: One commenter sought guidance on whether new measures will be made a part of the certification pathway, and, if so, whether there is

[363] The Certified Health IT Product List is a listing of health IT products, tested and reviewed by the Office of the National Coordinator for Health IT. We refer readers to: *https://chpl.healthit.gov/*.

sufficient time to fold those new requirements into an update to the 2015 Edition.

Response: With respect to the commenter's request for clarification about the certification pathway, we note that CMS does not establish certification processes; we adopt reporting requirements based on standards set by ONC. We will share with ONC the commenter's recommendation to incorporate new measure requirements into an update to the 2015 Edition certification criteria.

Comment: A few commenters recommended that CMS monitor the transition to the 2015 Edition of CEHRT.

Response: We will continue to monitor the experiences of hospitals and health IT vendors as they transition to the 2015 Edition of CEHRT. We will continue to assess the progress of hospitals implementing certification requirements and engage in discussions with hospitals and health IT vendors regarding their experiences as we consider certification policies related to eCQM reporting in future rulemaking.

After consideration of the public comments we received, we are finalizing our proposal to require hospitals to use the 2015 Edition certification criteria for CEHRT when reporting eCQMs beginning with the CY 2019 reporting period/FY 2021 payment determination as proposed.

e. Electronic Submission Deadlines

We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50256 through 50259) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708) for our previously adopted policies to align eCQM data reporting periods and submission deadlines for both the Hospital IQR Program and the Medicare Promoting Interoperability Program (previously known as the Medicare EHR Incentive Program). In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57172), we established eCQM submission deadlines for the Hospital IQR Program. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20498 through 20499), we did not propose any changes to the eCQM submission deadlines.

f. Sampling and Case Thresholds

We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50221), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51641), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53537), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50819), and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49709) for details on our sampling and case thresholds for the FY 2016 payment determination and subsequent years. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20499), we did not propose any changes to our sampling and case threshold policies.

g. HCAHPS Administration and Submission Requirements

We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50220), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51641 through 51643), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53537 through 53538), and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50819 through 50820) for details on previously-adopted HCAHPS requirements. We also refer hospitals and HCAHPS Survey vendors to the official HCAHPS website at: *http://www.hcahpsonline.org* for new information and program updates regarding the HCAHPS Survey, its administration, oversight, and data adjustments. In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38328 through 38342), we finalized refinements to the three questions of the Pain Management measure in the HCAHPS Survey (now referred to as the Communication About Pain measure). In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20499), we did not propose any changes to the HCAHPS Survey administration and submission requirements. However, we refer readers to the CY 2019 OPPS/ASC proposed rule (available at: *https://www.regulations.gov/document?D=CMS-2018-0078-0001*), where we have proposed to update the HCAHPS Survey by removing the Communication About Pain questions effective with January 2022 discharges, for the FY 2024 payment determination and subsequent years. We note that we did not propose any changes to the HCAHPS Survey administration and submission requirements.

h. Data Submission Requirements for Structural Measures

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51643 through 51644) and the FY 2013 IPPS/LTCH PPS final rule (77 FR 53538 through 53539) for details on the data submission requirements for structural measures. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20499), we did not propose any changes to those requirements; however, we refer readers to sections VIII.A.5.a. and VIII.A.5.b.(1) of the preamble of this final rule, in which we discuss finalizing our proposal to remove the Hospital Survey on Patient Safety Culture and Safe Surgery Checklist Use measures as proposed. As a result, no structural measures will remain in the Hospital IQR Program and hospitals will not be required to submit any data for structural measures for the CY 2019 reporting period/FY 2021 payment determination or subsequent years.

i. Data Submission and Reporting Requirements for HAI Measures Reported via NHSN

For details on the data submission and reporting requirements for HAI measures reported via the CDC's NHSN website, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51629 through 51633; 51644 through 51645), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53539), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50821 through 50822), and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50259 through 50262). The data submission deadlines are posted on the QualityNet website at: *http://www.QualityNet.org/*.

While we did not propose any changes to these requirements in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20499), we refer readers to section VIII.A.5.b.(2)(b) of the preamble of this final rule, in which we discuss finalizing our proposal to remove these measures from the Hospital IQR Program with modification to delay removal for one year. As a result, hospitals will not be required to submit any data for HAI measures via NHSN for the Hospital IQR Program for the CY 2020 reporting period/FY 2022 payment determination or subsequent years. We note that the five HAI measures will remain in the HAC Reduction and Hospital VBP Programs and will continue to be reported via NHSN. We further note that the HCP measure remains in the Hospital IQR Program and will continue to be reported via NHSN. We refer readers to section IV.J. of the preamble of this final rule for more information about how the NHSN HAI measures will be collected and validated under the HAC Reduction Program. We also refer readers to section IV.I.2.c.(2) of the preamble of this final rule where we discuss retaining the NHSN HAI measures in the Hospital VBP Program.

12. Validation of Hospital IQR Program Data

a. Background

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53539 through 53553), we finalized the processes and procedures for validation of chart-abstracted measures in the Hospital IQR Program for the FY 2015 payment determination and subsequent years. The FY 2013 IPPS/LTCH PPS final rule also contains a comprehensive summary of all procedures finalized in previous years

that are still in effect. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50822 through 50835), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50262 through 50273), and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49710 through 49712) for detailed information on the modifications to these processes finalized for the FY 2016, FY 2017, and FY 2018 payment determinations and subsequent years. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20499), we did not propose any changes to the existing processes for validation of either eCQM or chart-abstracted measure data.

b. Existing Processes for Validation of Hospital IQR Program eCQM Data

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57173 through 57181), we finalized updates to the validation procedures in order to incorporate a process for validating eCQM data for the FY 2020 payment determination and subsequent years (starting with the validation of CY 2017 eCQM data that would impact FY 2020 payment determinations). We also refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38398 through 38403), in which we finalized several proposals regarding processes and procedures for validation of CY 2017 eCQM data for the FY 2020 payment determination, validation of CY 2018 eCQM data for the FY 2021 payment determination, and eCQM data validation for subsequent years. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20499), we did not propose any changes to the existing processes for validation of Hospital IQR Program eCQM data.

c. Existing Process for Chart-Abstracted Measures Validation

In the FY 2015 IPPS/LTCH PPS final rule, we stated that we rely on hospitals to request an educational review or appeal cases to identify any potential CDAC or CMS errors (79 FR 50260). We refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38402 through 38403) for more details on the formalized Educational Review Process for Chart-Abstracted Measures Validation. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20499 through 20500), we did not propose any changes to the validation of chart-abstracted measures, including the educational review process.

While we did not propose any changes to our previously established validation procedures in the proposed rule (83 FR 20499 through 20500), we refer readers to: (1) Section VIII.A.5.b.(8) of the preamble of this final rule, in which we discuss finalizing our proposal to remove three clinical process of care measures (IMM–2, ED–1, and VTE–6) beginning with the CY 2019 reporting period/FY 2021 payment determination, and one clinical process of care measure (ED–2) beginning with the CY 2020 reporting period/FY 2022 payment determination; and (2) section VIII.A.5.b.(2)(b) of the preamble of this final rule, in which we discuss finalizing our proposals to remove five Hospital-Acquired Infection (HAI) chart-abstracted measures from the Hospital IQR Program with modification, such that removal would be delayed by one year beginning with the CY 2020 reporting period/FY 2022 payment determination. As a result: Two chart-abstracted clinical process of care measures (ED–2 and Sepsis measures) and five HAI chart-abstracted measures (CDI, CAUTI, CLABSI, MRSA Bacteremia, and Colon and Abdominal Hysterectomy SSI measures) will remain in the Hospital IQR Program that will require validation for the FY 2021 and 2022 payment determinations; and only one chart-abstracted clinical process of care measure (Sepsis measure) will remain in the program that would require validation for the FY 2023 payment determination and subsequent years. As our validation processes remain unchanged, we will continue to sample up to 8 cases for each selected chart-abstracted clinical process of care measure. We plan to evaluate our existing validation scoring methodology to ensure that there will be no significant impact to the estimated reliability (ER) of Hospital IQR Program chart-abstracted data validation activities despite any measure removals.

In addition, the CY 2020 reporting period/FY 2022 payment determination will be the last year for which validation will occur under the Hospital IQR Program with respect to the CDI, CAUTI, CLABSI, MRSA Bacteremia, and Colon and Abdominal Hysterectomy SSI measures because, as discussed in section VIII.A.5.b.(2)(b) of the preamble of this final rule, we are finalizing our proposal to remove these measures with modification to delay removal for one year. Beyond the FY 2022 payment determination, validation of those measures will occur under the HAC Reduction Program, as further discussed in section IV.J.4.e. of the preamble of this final rule.

13. Data Accuracy and Completeness Acknowledgement (DACA) Requirements

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53554) for previously adopted details on DACA requirements. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20500), we did not propose any changes to the DACA requirements.

14. Public Display Requirements

We refer readers to the FY 2008 IPPS/LTCH PPS final rule (72 FR 47364), the FY 2011 IPPS/LTCH PPS final rule (75 FR 50230), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51650), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53554), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50836), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50277), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49712 through 49713), and the FY 2018 IPPS/LTCH PPS final rule (82 FR 38403 through 38409) for details on public display requirements. The Hospital IQR Program quality measures are typically reported on the *Hospital Compare* website at: *http://www.medicare.gov/hospitalcompare*, but on occasion are reported on other CMS websites such as: *https://data.medicare.gov*.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20500), we did not propose any changes to the public display requirements. However, we note that in section VIII.A.10. of the preamble of this final rule, we discuss our efforts to provide stratified data by patient dual eligibility status in hospital confidential feedback reports and considerations to make stratified data publicly available on the *Hospital Compare* website in the future.

15. Reconsideration and Appeal Procedures

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51650 through 51651), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50836), and 42 CFR 412.140(e) for details on reconsideration and appeal procedures for the FY 2017 payment determination and subsequent years. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20500), we did not propose any changes to the reconsideration and appeals procedures.

16. Hospital IQR Program Extraordinary Circumstances Exceptions (ECE) Policy

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51651 through 51652), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50836 through 50837), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50277), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49713), the FY 2017 IPPS/LTCH PPS final rule (81 FR 57181 through 57182), the FY 2018 IPPS/LTCH PPS final rule (82 FR 38409 through 38411), and 42 CFR 412.140(c)(2) for details on the current Hospital IQR Program ECE

policy. We also refer readers to the QualityNet website at: *http://www.QualityNet.org/* for our current requirements for submission of a request for an exception. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20500), we did not propose any changes to the ECE policy.

B. PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

1. Background

Section 1866(k) of the Act establishes a quality reporting program for hospitals described in section 1886(d)(1)(B)(v) of the Act (referred to as ''PPS-Exempt Cancer Hospitals'' or ''PCHs'') that specifically applies to PCHs that meet the requirements under 42 CFR 412.23(f). Section 1866(k)(1) of the Act states that, for FY 2014 and each subsequent fiscal year, a PCH must submit data to the Secretary in accordance with section 1866(k)(2) of the Act with respect to such fiscal year.

The PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program strives to put patients first by ensuring they, along with their clinicians, are empowered to make decisions about their own health care using data-driven insights that are increasingly aligned with meaningful quality measures. To this end, we support technology that reduces burden and allows clinicians to focus on providing high quality health care to their patients. We also support innovative approaches to improve quality, accessibility, and affordability of care, while paying particular attention to improving clinicians' and beneficiaries' experiences when participating in CMS programs. In combination with other efforts across the Department of Health and Human Services (HSS), we believe the PCHQR Program incentivizes PCHs to improve their health care quality and value, while giving patients the tools and information needed to make the best decisions.

For additional background information, including previously finalized measures and other policies for the PCHQR Program, we refer readers to the following final rules: The FY 2013 IPPS/LTCH PPS final rule (77 FR 53556 through 53561); the FY 2014 IPPS/LTCH PPS final rule (78 FR 50838 through 50846); the FY 2015 IPPS/LTCH PPS final rule (79 FR 50277 through 50288); the FY 2016 IPPS/LTCH PPS final rule (80 FR 49713 through 49723); the FY 2017 IPPS/LTCH PPS final rule (81 FR 57182 through 57193); and the FY 2018 IPPS/LTCH PPS final rule (82 FR 38411 through 38425).

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20500 through 20510), we proposed a number of new policies for the PCHQR Program. We developed these proposals after conducting an overall review of the program under our new Meaningful Measures Initiative, which is discussed in more detail in section I.A.2. of the preambles of the proposed rule and this final rule. The proposals reflect our efforts to ensure that the PCHQR Program measure set continues to promote improved health outcomes for our beneficiaries while minimizing the following: (1) The reporting burden associated with submitting/reporting quality measures; (2) the burden associated with complying with other programmatic requirements; and/or (3) the burden associated with compliance with other Federal and/or State regulations (if applicable). In addition, we aim to minimize beneficiary confusion by reducing duplicative reporting and streamlining the process of analyzing publicly reported quality measures data. The proposals also reflect our efforts to improve the usefulness of the data that we publicly report in the PCHQR Program, which are guided by the following two goals: (1) To improve the usefulness of CMS quality program data by providing providers with adequate measure information from one program; and (2) to improve consumer understanding of the data publicly reported on *Hospital Compare* or another website by eliminating the reporting of duplicative measure data in more than one program that applies to the same provider setting.

2. Factors for Removal and Retention of PCHQR Program Measures

a. Background and Current Measure Removal Factors

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57182 through 57183), we adopted policies for measure retention and removal. We generally retain measures from the previous year's PCHQR Program measure set for subsequent years' measure sets, except when we specifically propose to remove or replace a measure. We adopted the following measure removal factors [364] for the PCHQR Program, which are based on factors adopted for the Hospital IQR Program (80 FR 49641 through 49642):

- Factor 1. Measure performance among PCHs is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made (that is, ''topped-out'' measures): Statistically indistinguishable performance at the 75th and 90th percentiles; and truncated coefficient of variation ≤ 0.10;
- Factor 2. A measure does not align with current clinical guidelines or practice;
- Factor 3. The availability of a more broadly applicable measure (across settings or populations) or the availability of a measure that is more proximal in time to desired patient outcomes for the particular topic;
- Factor 4. Performance or improvement on a measure does not result in better patient outcomes;
- Factor 5. The availability of a measure that is more strongly associated with desired patient outcomes for the particular topic;
- Factor 6. Collection or public reporting of a measure leads to negative unintended consequences other than patient harm; and
- Factor 7. It is not feasible to implement the measure specifications.

For the purposes of considering measures for removal from the program, we consider a measure to be ''topped-out'' if there is statistically indistinguishable performance at the 75th and 90th percentiles and the truncated coefficient of variation is less than or equal to 0.10.

b. Measure Retention Factors

We have also recognized that there are times when measures may meet some of the outlined criteria for removal from the program, but continue to bring value to the program. Therefore, we adopted the following factors for consideration in determining whether to retain a measure in the PCHQR Program, which also are based on factors established in the Hospital IQR Program (80 FR 49641 through 49642):

- Measure aligns with other CMS and HHS policy goals;
- Measure aligns with other CMS programs, including other quality reporting programs; and
- Measure supports efforts to move PCHs towards reporting electronic measures.

c. New Measure Removal Factor

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20501 through 20502), we proposed to adopt an additional factor to consider when evaluating potential measures for

[364] We note that we previously referred to these factors as ''criteria'' (for example, 81 FR 57182 through 57183); we now use the term ''factors'' in order to align the PCHQR Program terminology with the terminology we use in other CMS quality reporting and pay for performance value-based purchasing programs.

removal from the PCHQR measure set: Factor 8, the costs associated with the measure outweigh the benefit of its continued use in the program.

As we discussed in section I.A.2. of the preambles of the proposed rule and this final rule, with respect to our new Meaningful Measures Initiative, we are engaging in efforts to ensure that the PCHQR measure set continues to promote improved health outcomes for beneficiaries while minimizing the overall costs associated with the program. We believe these costs are multifaceted and include not only the burden associated with reporting, but also the costs associated with implementing and maintaining the program. We have identified several different types of costs, including, but not limited to: (1) Provider and clinician information collection burden and burden associated with the submission/reporting of quality measures to CMS; (2) the provider and clinician cost associated with complying with other programmatic requirements; (3) the provider and clinician cost associated with participating in multiple quality programs, and tracking multiple similar or duplicative measures within or across those programs; (4) the cost to CMS associated with the program oversight of the measure including measure maintenance and public display; and (5) the provider and clinician cost associated with compliance with other Federal and/or State regulations (if applicable). For example, it may be needlessly costly and/or of limited benefit to retain or maintain a measure which our analyses show no longer meaningfully supports program objectives (for example, informing beneficiary choice or payment scoring). It may also be costly for health care providers to track the confidential feedback, preview reports, and publicly reported information on a measure where we use the measure in more than one program. CMS may also have to expend unnecessary resources to maintain the specifications for the measure, as well as the tools we need to collect, validate, analyze, and publicly report the measure data. Furthermore, beneficiaries may find it confusing to see public reporting on the same measure in different programs.

When these costs outweigh the evidence supporting the continued use of a measure in the PCHQR Program, we believe it may be appropriate to remove the measure from the program. Although we recognize that one of the main goals of the PCHQR Program is to improve beneficiary outcomes by incentivizing health care providers to focus on specific care issues and making public data related to those issues, we also recognize that those goals can have limited utility where, for example, the publicly reported data is of limited use because it cannot be easily interpreted by beneficiaries and used to influence their choice of providers. In these cases, removing the measure from the PCHQR Program may better accommodate the costs of program administration and compliance without sacrificing improved health outcomes and beneficiary choice.

We proposed that we would remove measures based on this factor on a case-by-case basis. We might, for example, decide to retain a measure that is burdensome for health care providers to report if we conclude that the benefit to beneficiaries justifies the reporting burden. Our goal is to move the program forward in the least burdensome manner possible, while maintaining a parsimonious set of meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients.

We invited public comment on our proposal to adopt an additional measure removal factor, ''the costs associated with a measure outweigh the benefit of its continued use in the program,'' beginning with the effective date of the FY 2019 IPPS/LTCH PPS final rule.

Comment: One commenter supported the newly proposed measure removal criteria, noting that the broad application of this criterion helps to streamline CMS' quality programs. The commenter encouraged CMS to not remove measures simply because a previously finalized measure was too difficult to implement, thereby creating a gap in the measure set, but rather attempt to identify ways to gather the appropriate data by different means.

Response: We thank the commenter for its support. We note that it is never our intent to remove measures solely based on ease of implementation. Further, implementation concerns are something we take into account when proposing to adopt a measure. As discussed in section VIII.B.2.b of the preamble of this final rule, the removal of measures under the newly proposed Factor 8 will serve to balance the costs of ongoing maintenance, reporting/collection, and public reporting with the benefit associated with the reporting of that data. We intend to be transparent in our assessment of measures under this measure removal factor. As described above, there are various considerations of costs and benefits, direct and indirect, financial and otherwise, that we will evaluate in applying removal Factor 8, and we will take into consideration the perspectives of multiple stakeholders. We believe costs include costs to stakeholders such as patients, caregivers, providers, CMS, and other entities. Additionally, we note that the benefits we will consider center around benefits to patients and consumers as the primary beneficiaries of our quality reporting and value-based payment programs.

Comment: One commenter requested clarification regarding whose benefit is being considered when evaluating whether ''the costs associated with the measure outweigh the benefit of its continued use in the program.'' The commenter noted that there is considerable focus on the cost of the measure, but a transparent process must be put in place to weigh the patient benefit against the cost of the measure. The commenter appreciated that CMS will propose removing measures based on Factor 8 on a case-by-case basis and strongly encouraged CMS to survey patients to understand if they feel the measures are beneficial.

Response: We understand the importance of transparency in our processes, and we reaffirm that we prioritize the impact on patients when assessing the adoption and/or retention of quality metrics in our quality reporting programs. We reiterate that we intend to evaluate each measure on a case-by-case basis, and to balance the costs with the benefits to a variety of stakeholders. These stakeholders include, but are not limited to, patients and their families or caregivers, providers, the healthcare research community, healthcare payers, and patient and family advocates. Because for each measure the relative benefit to each stakeholder may vary, we believe that the benefits to be evaluated for each measure are specific to the measure and the original rationale for including the measure in the program.

Comment: One commenter did not support the proposed adoption and use of Factor 8 in any of CMS' programs, due to lack of transparency around assessment criteria. The commenter noted that the assessment of value must be as transparent as possible with a clear prioritization of the needs of patients/consumers. The commenter urged CMS to develop a standardized evaluation and scoring system with significant multi-stakeholder input, to ensure that Factor 8 appropriately balances the needs of all health care stakeholders.

Response: We thank the commenter for its feedback. We intend to evaluate each measure on a case-by-case basis, while considering input from a variety of stakeholders, including, but not limited to: Patients, caregivers, patient

and family advocates, providers, provider associations, healthcare researchers, data vendors, and other stakeholders with insight into the benefits and costs (financial and otherwise), and will continue to do so in the future when proposing measures for adoption or retention in the PCHQR Program. Further, preliminary stakeholder input on data collection and reporting burden was instrumental in the derivation of the newly proposed removal factor. As discussed in section VIII.B.2.b. of the preamble of this final rule, above, the removal of measures under Factor 8 will function as a balancing test between the cost of ongoing maintenance, reporting/collection, and public reporting against the benefit associated with reporting that data. We note that we intend to assess the costs and benefits to all program stakeholders.

After consideration of the public comments we received, we are finalizing our proposal to adopt the new measure removal Factor 8, ''the costs associated with a measure outweigh the benefit of its continued use in the program,'' beginning with the effective date of the FY 2019 IPPS/LTCH PPS final rule.

3. Retention and Removal of Previously Finalized Quality Measures for PCHs Beginning With the FY 2021 Program Year

a. Background

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53556 through 53561), we finalized five quality measures for the FY 2014 program year and subsequent years. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50837 through 50847), we finalized one new quality measure for the FY 2015 program year and subsequent years and 12 new quality measures for the FY 2016 program year and subsequent years. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50278 through 50280), we finalized one new quality measure for the FY 2017 program year and subsequent years. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49713 through 49719), we finalized three new Centers for Disease Control and Prevention (CDC) National Healthcare Safety Network (NHSN) measures for the FY 2018 program year and subsequent years, and finalized the removal of six previously finalized measures for fourth quarter (Q4) 2015 discharges and subsequent years. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57183 through 57184), for the FY 2019 program year and subsequent years, we finalized one additional quality measure and updated the Oncology: Radiation Dose Limits to Normal Tissues (NQF #0382) measure. In the FY 2018 IPPS/LTCH PPS final rule, we finalized four new quality measures (82 FR 38414 through 38420) for the FY 2020 program year and subsequent years, and finalized the removal of three previously finalized measures (82 FR 38412 through 38414).

b. Removal of Measures From the PCHQR Program Beginning With the FY 2021 Program Year

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20502 through 20503), we proposed to remove four web-based, structural measures from the PCHQR Program beginning with the FY 2021 program year because they are topped-out:

- Oncology: Radiation Dose Limits to Normal Tissues (PCH–14/NQF #0382);
- Oncology: Medical and Radiation—Pain Intensity Quantified (PCH–16/NQF #0384);
- Prostate Cancer: Adjuvant Hormonal Therapy for High Risk Patients (PCH–17/NQF #0390); and
- Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low-Risk Patients (PCH–18/NQF #0389).

We also proposed (83 FR 20503) to apply the newly proposed measure removal factor to two National Healthcare Safety Network (NHSN) chart-abstracted measures and, if that factor is finalized, to remove both measures from the PCHQR Program beginning with the FY 2021 program year because we have concluded that the costs associated with these measures outweigh the benefit of their continued use in the program. The measures we proposed to remove on this basis are as follows:

- NHSN Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (PCH–5/NQF #0138); and
- NHSN Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (PCH–4/NQF #0139).

(1) Removal of Web-Based Structural Measures

We proposed to remove the following web-based, structural measures beginning with the FY 2021 program year because they are topped-out: (1) Oncology: Radiation Dose Limits to Normal Tissues (PCH–14/NQF #0382); (2) Oncology: Medical and Radiation—Pain Intensity Quantified (PCH–16/NQF #0384); (3) Prostate Cancer: Adjuvant Hormonal Therapy for High Risk Patients (PCH–17/NQF #0390); and (4) Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low-Risk Patients (PCH–18/NQF #0389). We first adopted these measures for the FY 2016 program year in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50841 through 50844). We refer readers to that final rule for a detailed discussion of the measures.

Based on an analysis of data from January 1, 2015 through December 31, 2016, we have determined that these three measures meet our topped-out criteria. This analysis evaluated data sets and calculated the 5th, 10th, 25th, 50th, 75th, 90th, and 95th percentiles of national facility performance for each measure. For measures where higher values indicate better performance, the percent relative difference (PRD) between the 75th and 90th percentiles were obtained by taking their absolute difference divided by the average of their values and multiplying the result by 100. To calculate the truncated coefficient of variation (TCV), the lowest 5 percent and the highest 5 percent of hospital rates were discarded before calculating the mean and standard deviation for each measure.

The following criteria were applied to the results:

- For measures ranging from 0–100 percent, with 100 percent being best, national measure data for the 75th and 90th percentiles have a relative difference of <=5 percent, or for measures ranging from 0–100 percent, with 100 percent being the best, performance achieved by the median hospital is >=95 percent, and national measure data have a truncated coefficient of variation <=0.10.
- For measures ranging from 0–100 percent, with 0 percent being best, national measure data for the complement of the 10th and 25th percentiles have a relative difference of <=5 percent, or for measures ranging from 0–100 percent, with 0 percent being best, national measure data for the median hospital is <=5 percent, or for other measures with a low number indicating good performance, national measure data for the 10th and 25th percentiles have a relative difference of <=5 percent, and national measure data have a truncated coefficient of variation <=0.10.

The results for 2015 and 2016 are set out in the tables below.

TOPPED-OUT ANALYSIS RESULTS FOR PCHQR MEASURES (2015)

Measure	Mean	Median	75th percentile	90th percentile	Relative difference (%)	Topped-out
PCH–14	98.4	99.6	100	100	0	Yes.
PCH–16	92.5	92.3	93.1	94.3	1.2	Yes.
PCH–17	99.7	100	100	100	0	Yes.
PCH–18	98.9	99.4	100	100	0	Yes.

TOPPED-OUT ANALYSIS RESULTS FOR PCHQR MEASURES (2016)

Measure	Mean	Median	75th percentile	90th percentile	Relative difference (%)	Topped-out
PCH–14	99.8	100	100	100	0	Yes.
PCH–16	96.8	96.8	97.3	97.4	0.1	Yes.
PCH–17	99.4	99.6	100	100	0	Yes.
PCH–18	99.0	100	100	100	0	Yes.

Based on this analysis, we have concluded that these four measures are topped-out and, as discussed below, we believe that collecting PCH data on these measures does not further program goals.

We also believe that continuing to collect PCH data on these measures does not further program goals of improving quality, given that performance on the measures is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made. We believe that these measures also do not meet the criteria for retention of an otherwise topped-out measure, as they: Do not align with the HHS and CMS policy goal to focus our measure set on outcome measures; do not align with measures used in other CMS programs; and do not support our efforts to develop electronic clinical quality measure reporting for PCHs. If we determine at a subsequent point in the future that PCH adherence to the aforementioned HHS and CMS policy goals, the aforementioned program efforts, and the standard of care established by the measure has unacceptably declined, we may propose to readopt these measures in future rulemaking.

We invited public comment on our proposal to remove these four measures from the PCHQR Program beginning with the FY 2021 program year.

Comment: A few commenters supported the proposed removal of the four web-based, structural measures. The commenters noted that topped-out measures provide little in the way of useful quality differentiation and cannot, by definition, incentivize meaningful quality improvement. Moreover, the removal of these measures will help to reduce the administrative burden of the PCHQR Program.

Response: We thank the commenters for their support.

Comment: One commenter did not support the proposed removal of the Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low-Risk Patients (PCH–18) measure from the PCHQR Program. The commenter indicated that this measure is currently included in the CQMC Oncology measure set. As part of a joint effort to implement meaningful measures that will promote accountability and drive improvement across stakeholders, the commenter recommended retaining the measure in the program until the CQMC is able to jointly re-evaluate the measure's inclusion in the Oncology measure set.

Response: We appreciate the commenter's input. However, as demonstrated by the data provided in the tables displaying the 2015 and 2016 results for this measure above, this measure is statistically topped-out. Consequently, continued reporting of the measure provides limited opportunity for continuing quality improvement, while continuing to incur reporting burden to care providers. We believe that the removal of this measure from the PCHQR Program aligns with one of the governing tenets of the Core Quality Measure Collaborative (CQMC): *Promotion of measurement that is evidence-based and generates valuable information for quality improvement.*[365] We note that topped out status is an example of a situation where Factor 1 could be used for measure removal, but is not a prerequisite to its use. Further, the PCHQR Program is not bound to removing measures solely because they are topped out, however, in this scenario, the data for this measure demonstrate that meaningful distinctions and improvements in performance can no longer be made.

Comment: One commenter indicated that the removal of Oncology: Medical and Radiation—Pain Intensity Quantified (NQF #0384) is unique from the other web-based, structural measures proposed for removal, in that it was validated and endorsed by its measure developer and NQF as a paired measure with the Oncology: Plan of Care for Pain—Medical and Radiation Oncology (NQF #0383). Given that the collection of data for NQF #0384 will continue to be necessary in order to obtain the eligible patient population for NQF #0383, the commenter recommends that these measures either be included or excluded from the PCHQR Program as a pair.

Response: We thank the commenter for its recommendation. While we recognize the pairing of these two measures in the PCHQR Program, the Oncology: Medical and Radiation—Pain Intensity Quantified (NQF #0384) measure remains statistically topped out, while its companion measure, Oncology: Plan of Care for Pain (NQF #0383) is not. We further note that the Oncology: Medical and Radiation—Pain Intensity Quantified (NQF #0384) measure is duplicative as a plan of care for pain measure. We therefore believe that the Oncology: Plan of Care for Pain—Medical and Radiation Oncology (NQF #0383) measure suffices to assess cancer patient pain treatment. Further, we believe the Oncology: Plan of Care for Pain measure will continue to

[365] Centers for Medicare and Medicaid Services: ''*Core Measures.*'' Accessed on: June 26, 2018. Available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityMeasures/Core-Measures.html.*

incentivize continued quality improvement through public reporting in the PCHQR Program. As the commenter noted, the submission of data does not change, which will allow CMS to monitor for unintended consequences related to the removal of the measure.

After consideration of the public comments we received, we are finalizing the removal of the following web-based, structural measures beginning with the FY 2021 program year: (1) Oncology: Radiation Dose Limits to Normal Tissues (PCH–14/NQF #0382); (2) Oncology: Medical and Radiation—Pain Intensity Quantified (PCH–16/NQF #0384); (3) Prostate Cancer: Adjuvant Hormonal Therapy for High Risk Patients (PCH–17/NQF #0390); and (4) Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low-Risk Patients (PCH–18/NQF #0389).

(2) Removal of National Healthcare Safety Network (NHSN) Chart-Abstracted Measures

We proposed to remove two measures from the PCHQR Program beginning with the FY 2021 program year if the measure removal factor ''the costs associated with the measure outweigh the benefit of its continued use in the program,'' proposed for adoption in section VIII.B.2.c. of the preamble of the proposed rule, is finalized because we have concluded that the costs associated with these measures outweigh the benefit of their continued use in the PCHQR Program. These measures are: (1) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (PCH–5/NQF #0138); and (2) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (PCH–4/NQF #0139). We first adopted the CAUTI and CLABSI measures for the FY 2014 program year in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53557 through 53559); we refer readers to this final rule for a detailed discussion of the measures.

As discussed in section I.A.2. of the preambles of the proposed rule and this final rule, above, our Meaningful Measures Initiative is intended to reduce costs and minimize burden. We continue to believe the CAUTI and CLABSI measures provide important data for patients and hospitals in making decisions about care and informing quality improvement efforts. However, we believe that removing these measures in the PCHQR Program will reduce program costs and complexities associated with the use of these data by patients in decision-making. We believe the costs, coupled with the high technical and administrative burden on PCHs, associated with collecting and reporting this measure data outweigh the benefits to continued use in the program. Further, we note that it has become difficult to publicly report these measures due to the low volume of data produced and reported by the small number of facilities participating in the PCHQR Program and the corresponding lack of an appropriate methodology to publicly report this data. Consequently, we have been unable to offer beneficiaries the benefit of pertinent information on how these measures assess hospital-acquired infections and impact patient safety.

As we state in section I.A.2. of the preambles of the proposed rule and this final rule, we strive to ensure that patients are empowered to make decisions about their health care by using information from data-driven insights. We continue to believe that these measures evaluate important aspects of patient safety. However, as discussed earlier, we believe the high costs, reporting burden, and difficulties associated with publicly reporting this data for use by patients in making decisions about their care outweigh the benefit associated with the measures' continued use in the PCHQR Program. Therefore, in the proposed rule we stated that if our proposal to adopt the new measure removal factor described in section VIII.B.2.c. of the preambles of the proposed rule and this final rule is finalized as proposed, we proposed that under that factor, we would remove the CAUTI and CLABSI measures from the PCHQR Program beginning with the FY 2021 program year.

We invited public comment on our proposal to remove these two measures from the PCHQR Program beginning with the FY 2021 program year. We are conducting additional data analyses to assess measure performance based on new information provided by the CDC. In acknowledgement of the importance of these measures in assessing patient safety in the PCH setting, we want to be cautious to not prematurely remove measures from the PCHQR Program. As such, we wish to evaluate these data for trends that link positive improvements (*i.e.,* a decrease in the reporting burden and/or cost, and/or demonstrated feasibility for public reporting) to these measures. We note that the data recently submitted by the CDC were not available at the time we proposed the removal of these measures from the PCHQR Program. Moreover, we will reconcile the comments received on the proposed removal of the Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (PCH–5/NQF #0138) and Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (PCH–4/NQF #0139) measures in a future 2018 final rule, most likely in the CY 2019 OPPS/ASC final rule targeted for release no later than November 2018. We also note that the deferral to the CY 2019 OPPS/ASC final rule will not affect PCH data submission because we proposed to end data collection beginning in CY 2019.

4. New Quality Measures Beginning With the FY 2021 Program Year

a. Considerations in the Selection of Quality Measures

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53556), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50837 through 50838), and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50278), we indicated that we take many principles into consideration when developing and selecting measures for the PCHQR Program, and that many of these principles are modeled on those we use for measure development and selection under the Hospital IQR Program. In section I.A.2. of the preambles of the proposed rule and this final rule, we also discuss our Meaningful Measures Initiative, and its relation to how we will assess and select quality measures for the PCHQR Program.

Section 1866(k)(3)(A) of the Act requires that any measure specified by the Secretary must have been endorsed by the entity with a contract under section 1890(a) of the Act (the NQF is the entity that currently holds this contract). Section 1866(k)(3)(B) of the Act provides an exception under which, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization.

Using these principles for measure selection in the PCHQR Program, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20503 through 20506), we proposed one new measure, described below.

b. New Quality Measure Beginning With the FY 2021 Program Year: 30-Day Unplanned Readmissions for Cancer Patients (NQF #3188)

In an effort to expand the PCHQR Program measure set to include

measures that are less burdensome to report to CMS, but provide valuable information for beneficiaries, we proposed to adopt the 30-Day Unplanned Readmissions for Cancer Patients measure (NQF #3188) for the FY 2021 program year and subsequent years. This measure meets the requirement under section 1866(k)(3)(A) of the Act that measures specified for the PCHQR Program be endorsed by the entity with a contract under section 1890(a) of the Act (currently the NQF). This measure aligns with recent initiatives to incorporate more outcome measures in quality reporting programs. This measure also aligns with the Promote Effective Communication and Coordination of Care domain of our Meaningful Measures Initiative,[366] and would fill an existing gap area of risk-adjusted readmission measures in the PCHQR Program.

In compliance with section 1890A(a)(2) of the Act, the proposed measure was included on a publicly available document entitled ''2017 Measures under Consideration Spreadsheet,'' [367] a list of quality and efficiency measures under consideration for use in various Medicare programs, and was reviewed by the Measures Application Partnership (MAP) Hospital Workgroup.

(1) Background

Cancer is the second leading cause of death in the United States, with nearly 600,000 cancer-related deaths expected this year. It is estimated roughly 1.7 million Americans will be diagnosed with cancer in 2016, and the number of Americans living with a cancer diagnosis reached nearly 14.5 million in 2014.[368] Cancer disproportionately affects older Americans, with 86 percent of all cancers diagnosed in people 50 years of age and older.[369] It is now the leading cause of death among adults age 40 to 79 years nationwide, and the leading cause of death among all adults in 21 States.[370] Oncology care contributes greatly to Medicare spending, and accounted for an estimated $125 billion in health care spending in 2010.[371] This figure is projected to rise to between $173 billion and $207 billion by 2020.[372] A 2012 audit from the U.S. Government Accountability Office (GAO) revealed that the estimated differences in Medicare payment between PCHs and local PPS teaching hospitals varied greatly across the PCHs; with the largest payment difference at 90.9 percent and the smallest payment difference at 6.7 percent. Overall, the difference between the amount Medicare paid PCHs and the estimated amount Medicare would have paid PPS hospitals for treating comparable cancer patients suggests that Medicare would have saved approximately $166 million in 2012.[373] Further, GAO calculated that, if PCHs were paid for outpatient services in the same way as PPS teaching hospitals, Medicare would have saved approximately $303 million in 2012.[374]

Given the current and projected increases in cancer prevalence and costs of care, it is essential that health care providers look for opportunities to lower the costs of cancer care. Reducing readmissions after hospital discharge has been proposed as an effective means of lowering health care costs and improving the outcomes of care.[375] Research suggests that between 9 percent and 48 percent of all hospital readmissions are preventable, owing to inadequate treatment during the patient's original admission or after discharge.[376] It is estimated that all-cause, unplanned readmissions cost the Medicare program $17.4 billion in 2004.[377] Unnecessary hospital readmissions also negatively impact cancer patients by compromising their quality of life, placing them at risk for health-acquired infections, and increasing the costs of their care.[378] Furthermore, unplanned readmissions during treatment can delay treatment completion and, potentially, worsen patient prognosis.[379]

Preventing these readmissions improves the quality of care for cancer patients. Existing studies in cancer patients have largely focused on postoperative readmissions, reporting readmission rates of between 6.5 percent and 25 percent.[380] One study noted that surgical cancer patients were most often readmitted for surgical complications, while nonsurgical patients were typically readmitted for the same condition treated during the index admission.[381] Together, these studies suggest that certain readmissions in cancer patients are preventable and should be routinely measured for purposes of quality improvement and accountability.

(2) Overview of Measure

Readmission rates have been developed for pneumonia, acute myocardial infarction, and heart failure. However, the development of validated readmission rates for cancer patients has lagged. In 2012, the Comprehensive Cancer Center Consortium for Quality Improvement, or C4QI (a group of 18 academic medical centers that collaborate to measure and improve the quality of cancer care in their centers), began development of a cancer-specific unplanned readmissions measure: 30-Day Unplanned Readmissions for Cancer Patients. This measure incorporates the unique clinical characteristics of oncology patients and results in readmission rates that more accurately reflect the quality of cancer care delivery, when compared with broader readmissions measures. Likewise, this measure addresses gaps in existing readmissions measures (such as the Hospital-Wide All-Cause Unplanned Readmission Measure (HWR) stewarded by CMS) related to the evaluation of hospital readmissions associated cancer patients. The 30-Day Unplanned Readmissions for Cancer Patients measure can be used by PCHs to inform their quality improvement efforts. Through adoption in the PCHQR Program, it can increase transparency around the quality of care delivered to patients with cancer.

The 30-Day Unplanned Readmissions for Cancer Patients measure is NQF-

endorsed (NQF #3188). The MAP Hospital Workgroup reviewed this measure on December 14, 2017 and supported the inclusion of this measure in the PCHQR Program. The MAP acknowledged that this measure is fully developed and tested and further noted this measure fills a current gap in the PCHQR Program by addressing unplanned readmissions of cancer patients.[382] [383]

The proposed readmission measure fits within the Promote Effective Communication and Coordination of Care measurement domain (categorical area), and specifically applies to the associated clinical topic of ''Admissions and Readmissions to Hospitals'' of our Meaningful Measures Initiative. This measure is intended to assess the rate of unplanned readmissions among cancer patients treated at PCHs and to support improved care delivery and quality of life for this patient population. By providing an accurate and comprehensive assessment of unplanned readmissions within 30 days of discharge, PCHs can better identify and address preventable readmissions. Through routine monitoring of these performance data by PCHs, this measure can be used to improve patient outcomes and quality of care.

(3) Data Sources

The proposed 30-Day Unplanned Readmissions for Cancer Patients measure is claims-based. Therefore, PCHs would not be required to submit any new data for purposes of reporting this measure. We proposed that we would calculate this measure on a yearly basis using Medicare administrative claims data. Specifically, we proposed that the data collection period for each program year would span from July 1 of the year, three years prior to the program year to June 30 of the year, two years prior to the program year. Therefore, for the FY 2021 program year, we would calculate measure rates using PCH claims data from October 1, 2018 through September 30, 2019.

We assessed the measure's reliability, and set a minimum case count of 50 index admissions (25 per subset) per PCH. There were 3,502 facilities [384] included in the 100 split-half simulations for CY 2013 through CY 2015. In our reliability assessment, we examined the reliability of the measure by testing the hypothesis that the mean S–B statistic from each year was greater than 0.5. The S–B statistic allows us to project what the reliability would be if the entire sample were used instead of the split sample.

Overall, the consistent calculations between the two data randomly-split subsets for each period provided evidence that performance variations between PCHs were attributable to hospital-level factors, rather than patient-level factors. Regarding the validity of this measure, global sensitivity and specificity scores of 0.879 and 0.896, respectively, confirmed the validity of the Type of Admission/Visit reported via the UB–04 Uniform Bill Locator 14 (Claim Inpatient Admission Type Code [385] in the Medicare SAF) to accurately identify planned and unplanned readmissions, as validated by chart review. Together, these statistics indicate that there are opportunities to utilize this measure to reduced unplanned readmissions in cancer patients, making it useful for performance improvement and public reporting. Additional details on the testing results for this measure are provided in the testing attachment, which is available at: *http://www.qualityforum.org/ProjectMeasures.aspx?projectID=86089*.

(4) Measure Calculation

This outcome measure utilizes claims data to demonstrate the rate at which adult cancer patients have unplanned readmissions within 30 days of discharge from an eligible index admission. The numerator includes all eligible unplanned readmissions to the PCH within 30 days of the discharge date from an index admission to the PCH that is included in the measure denominator. The denominator includes inpatient admissions for all adult Medicare fee-for-service (FFS) beneficiaries where the patient is discharged from a short-term acute care hospital (PCH, short-term acute care PPS hospital, or CAH) with a principal or secondary diagnosis (that is, not admitting diagnosis) of malignant cancer within the defined measurement period. The measure excludes readmissions for patients readmitted for chemotherapy or radiation therapy treatment or with disease progression. The measure will be calculated as the numerator divided by the denominator. Measure specifications for the proposed measure can be accessed on the NQF's website at: *http://www.qualityforum.org/ProjectMeasures.aspx?projectID=86089*.

(5) Cohort

This measure includes inpatient admissions for all adult Medicare FFS beneficiaries where the patient is discharged from a short-term acute care hospital (PCH, short-term acute care PPS hospital, or CAH) with a principal or secondary diagnosis (that is, not admitting diagnosis) of malignant cancer within the defined measurement period. Additional methodology and measure development details are available on the NQF's website at: *http://www.qualityforum.org/ProjectMeasures.aspx?projectID=86089*.

(6) Risk Adjustment

This measure is risk-adjusted based on a comparison of observed versus expected readmission rates. Logistic regression analysis is used to estimate the probability of an unplanned readmission, based on the measure specifications and risk factors described herein. The probability of unplanned readmission is then summed over the index admissions for each hospital to calculate the *expected* unplanned readmission rate. Subsequently, the actual or *observed* unplanned readmissions for each hospital are summed and used to calculate the ratio of *observed* unplanned readmissions to *expected* unplanned readmissions for each hospital. Each hospital's ratio was then multiplied by the national or standard unplanned readmissions rate to generate the risk-adjusted *30-Day Unplanned Readmissions for Cancer Patients* rate (as specified in the following formula):

$$Risk-Adjusted\ Rate = \frac{observed\ rate}{expected\ rate} \times national\ or\ standard\ rate$$

[382] 2018 Considerations for Implementing Measures Draft Report-Hospitals. Available at: *http://www.qualityforum.org/Show_Content.aspx?id=30279*.

[383] 2017–2018 Spreadsheet of Final Recommendations to HHS and CMS. Available at: *http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367*.

[384] We note that hospital testing occurred prior to our proposal for PCHQR Program inclusion. As such, the sample size is far greater than the number of applicable PCHs for which implementation this measure is being proposed for use to ensure data reliability.

[385] Claim Inpatient Admission Type Code available at: *https://www.resdac.org/cms-data/variables/Claim-Inpatient-Admission-Type-Code*.

We invited public comment on our proposal to adopt the 30-Day Unplanned Readmissions for Cancer Patients measure (NQF #3188) for the FY 2021 program year and subsequent years.

Comment: Several commenters supported the proposed adoption of the 30-Day Unplanned Readmissions for Cancer Patients measure. The commenters noted that this measure is fully developed, tested, and NQF-endorsed. Further, the commenters noted that: The MAP supported this measure as filling an unmet measure gap for unplanned readmissions that are cancer-specific in the PCHQR Program; this measure incorporates the unique clinical characteristics of oncology patients and will provide specific readmissions data that more accurately reflects the quality of cancer care delivery that will be hugely beneficial information for patients; this measure includes both surgical and non-surgical cancer patients who are admitted urgently or emergently to cancer hospitals or other hospitals within 30 days of an index admission, while, at the same time, it excludes readmissions for chemotherapy or radiation therapy, as well as patients seeking treatment for disease progression. Moreover, the commenters noted that these features allow hospitals to better identify and address preventable readmissions for cancer patients than current readmissions measures. The commenters stated that ultimately, the inclusion of this measure in the PCHQR Program will promote higher-value care for cancer patients and improve patient outcomes in the domain of hospital readmissions.

Response: We thank the commenters for their support.

Comment: One commenter did not support the proposed adoption of the 30-Day Unplanned Readmissions for Cancer Patients measure (NQF #3188). The commenter expressed concerns that assigning accountability will be particularly challenging for this measure. Specifically, the commenter indicated that due to the severity of illness that many patients experience related to their cancer diagnosis, it would be misguided to assign responsibility and penalize other caregivers for readmissions associated with cancer patients. The commenter also requested clarification regarding the proposed data collection period for the measure because the proposed rule stated that the collection for this measure for the FY 2021 program year would begin July 1, 2018 and go through June 30, 2019 while also identifying the first data collection period for the FY 2021 program year as running from October 1, 2018 through September 30, 2019.

Response: We thank the commenter for its views, however, we disagree that assessing accountability would be difficult with this measure. We are finalizing that the data collection period for the FY 2021 program year and subsequent years for this measure will be October 1 through September 30 of the following calendar year, for each respective program year. Specifically, as indicated in section VIII.B.9.b. of the preamble of this final rule, for the FY 2021 program year, this corresponds to a data collection period of October 1, 2018–September 30, 2019. We note that the date range of July 1, 2018–June 30, 2019, provided in section VIII.B.4.b.(3) of the preamble of the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20505) was an error, and we have corrected it in the corresponding section of the preamble in this final rule. Moreover, this one-year timeframe narrows the examination period for the assessment of caregivers, thereby making it less difficult to evaluate where in the process a readmission could have been preempted, and easier to evaluate provider attribution.

With regards to patient illness severity, we understand that there are confounding healthcare factors that contribute to the severity of illness that many patients experience related to their cancer diagnosis; however, we believe that assessing patient readmissions is a proactive method that PCHs can use to hone in on which (if any) of these factors could be remedied and/or prevented with improved quality care. We believe that it is most beneficial to patients to be able to understand causes and/or, where possible, observe trends in cancer patient readmissions, in an effort to establish practices that eliminate readmissions. We reiterate that we are only assessing the care provided within a one-year timeframe. We also reiterate that the measure excludes readmissions for patients readmitted for chemotherapy or radiation therapy treatment or with disease progression.

After consideration of the public comments we received, we are finalizing the adoption of the 30-Day Unplanned Readmissions for Cancer Patients measure (NQF #3188) for the FY 2021 program year and subsequent years. We are also finalizing that the data collection period for the FY 2021 program year and subsequent years for this measure will be October 1 through September 30 of the following calendar year, for each respective program year.

c. Summary of Finalized PCHQR Program Measures for the FY 2021 Program Year and Subsequent Years

The table below summarizes the PCHQR Program measure set for the FY 2021 program year:

FY 2021 PCHQR PROGRAM MEASURE SET

Short name	NQF No.	Measure name
Safety and Healthcare-Associated Infection (HAI)*		
CAUTI*	0138	National Healthcare Safety Network (NHSN) Catheter Associated Urinary Tract Infection (CAUTI) Outcome Measure.
CLABSI*	0139	National Healthcare Safety Network (NHSN) Central Line Associated Bloodstream Infection (CLABSI) Outcome Measure.
Colon and Abdominal Hysterectomy SSI.	0753	American College of Surgeons—Centers for Disease Control and Prevention (ACS–CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure [currently includes SSIs following Colon Surgery and Abdominal Hysterectomy Surgery].
CDI	1717	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure.
MRSA	1716	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* Bacteremia Outcome Measure.
HCP	0431	National Healthcare Safety Network (NHSN) Influenza Vaccination Coverage Among Healthcare Personnel.

FY 2021 PCHQR PROGRAM MEASURE SET—Continued

Short name	NQF No.	Measure name
Clinical Process/Oncology Care Measures		
N/A	0383	Oncology: Plan of Care for Pain—Medical Oncology and Radiation Oncology.
EOL-Chemo	0210	Proportion of Patients Who Died from Cancer Receiving Chemotherapy in the Last 14 Days of Life.
EOL-Hospice	0215	Proportion of Patients Who Died from Cancer Not Admitted to Hospice.
Intermediate Clinical Outcome Measures		
EOL–ICU	0213	Proportion of Patients Who Died from Cancer Admitted to the ICU in the Last 30 Days of Life.
EOL–3DH	0216	Proportion of Patients Who Died from Cancer Admitted to Hospice for Less Than Three Days.
Patient Engagement/Experience of Care		
HCAHPS	0166	HCAHPS.
Clinical Effectiveness Measure		
EBRT	1822	External Beam Radiotherapy for Bone Metastases.
Claims Based Outcome Measures		
N/A	N/A	Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy.
N/A**	3188	30-Day Unplanned Readmissions for Cancer Patients.

*As discussed in section VIII.B.3.b.(2) of this final rule, we are deferring finalization of our policies regarding future use of the CLABSI and CAUTI measures in the PCHQR Program until the CY 2019 OPPS/ASC final rule.
**Measure finalized for adoption for the FY 2021 program year and subsequent years.

5. Accounting for Social Risk Factors in the PCHQR Program

In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38428 through 38429), we discussed the importance of improving beneficiary outcomes including reducing health disparities. We also discussed our commitment to ensuring that medically complex patients, as well as those with social risk factors, receive excellent care. We discussed how studies show that social risk factors, such as being near or below the poverty level as determined by HHS, belonging to a racial or ethnic minority group, or living with a disability, can be associated with poor health outcomes and how some of this disparity is related to the quality of health care.[386] Among our core objectives, we aim to improve health outcomes, attain health equity for all beneficiaries, and ensure that complex patients as well as those with social risk factors receive excellent care. Within this context, reports by the Office of the Assistant Secretary for Planning and Evaluation (ASPE) and the National Academy of Medicine have examined the influence of social risk factors in CMS value-based purchasing programs.[387] As we noted in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38428 through 38429), ASPE's report to Congress found that, in the context of value-based purchasing programs, dual eligibility was the most powerful predictor of poor health care outcomes among those social risk factors that they examined and tested. In addition, as we noted in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38428), the National Quality Forum (NQF) undertook a 2-year trial period in which certain new measures and measures undergoing maintenance review have been assessed to determine if risk adjustment for social risk factors is appropriate for these measures.[388] The trial period ended in April 2017 and a final report is available at: *http://www.qualityforum.org/SES_Trial_Period.aspx*. The trial concluded that ''measures with a conceptual basis for adjustment generally did not demonstrate an empirical relationship'' between social risk factors and the outcomes measured. This discrepancy may be explained in part by the methods used for adjustment and the limited availability of robust data on social risk factors. NQF has extended the socioeconomic status (SES) trial,[389] allowing further examination of social risk factors in outcome measures.

In the FY 2018/CY 2018 proposed rules for our quality reporting and value-based purchasing programs, we solicited feedback on which social risk factors provide the most valuable information to stakeholders and the methodology for illuminating differences in outcomes rates among patient groups within a hospital or provider that would also allow for a comparison of those differences, or disparities, across providers. Feedback we received across our quality reporting programs included encouraging CMS to explore whether factors that could be used to stratify or risk adjust the measures (beyond dual eligibility); considering the full range of differences in patient backgrounds that might affect outcomes; exploring risk adjustment approaches; and offering careful

[389] Available at: *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86357*.

consideration of what type of information display would be most useful to the public. We also sought public comment on confidential reporting and future public reporting of some of our measures stratified by patient dual eligibility. In general, commenters noted that stratified measures could serve as tools for hospitals to identify gaps in outcomes for different groups of patients, improve the quality of health care for all patients, and empower consumers to make informed decisions about health care. Commenters encouraged us to stratify measures by other social risk factors such as age, income, and educational attainment. Regarding value-based purchasing programs, commenters also cautioned to balance fair and equitable payment while avoiding payment penalties that mask health disparities or discouraging the provision of care to more medically complex patients. Commenters also noted that value-based purchasing program measure selection, domain weighting, performance scoring, and payment methodology must account for social risk.

As a next step, CMS is considering options to improve health disparities among patient groups within and across hospitals by increasing the transparency of disparities as shown by quality measures. We also are considering how this work applies to other CMS quality programs in the future. We refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38403 through 38409) for more details, where we discuss the potential stratification of certain Hospital IQR Program outcome measures. Furthermore, we continue to consider options to address equity and disparities in our value-based purchasing programs.

We plan to continue working with ASPE, the public, and other key stakeholders on this important issue to identify policy solutions that achieve the goals of attaining health equity for all beneficiaries and minimizing unintended consequences.

Comment: A few commenters supported CMS' continued efforts to account for social risk factors in its quality reporting programs. The commenters noted that stratifying public reporting of program quality measures would help hospitals to balance the task of identifying some of the differences in the way that patients are receiving and responding to care, with adequately evaluating risk adjusting for the disparities in care. The commenters suggested that CMS explore additional social risk factors beyond dual eligibility, such as employment status, homelessness/type of residence, availability of a caretaker, food insecurity, transportation, crime rates, and other social risk factors as appropriate. Due to the complex and detailed nature of the research being undertaken by ASPE, as well as by measure stewards through the quality measure development process, the commenters encouraged CMS to provide more transparency on its efforts to address this issue. The commenters also strongly encouraged CMS to continue working closely with the measure stewards, and other quality organization stakeholders in developing any permanent risk-adjusted reporting changes as determined appropriate. Lastly, commenters encouraged CMS to include representatives on the Technical Expert Panel from across the wide spectrum of stakeholders that comprise the health care continuum.

Response: We thank the commenters for their support, opinions, and recommendations, and will take them into consideration as we continue our work on these issues.

6. Possible New Quality Measure Topics for Future Years

a. Background

As discussed in sections section I.A.2. of the preambles of the proposed rule and this final rule, we have begun analyzing our programs' measures using the framework we developed for the Meaningful Measures Initiative. We have also discussed future quality measure topics and quality measure domain areas in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50280), the FY 2016 IPPS/LTCH PPS final rule (80 FR4979), the FY 2017 IPPS/LTCH PPS final rule (81 FR 25211), and the FY 2018 IPPS/LTCH PPS final rule (82 FR 38421 through 38423). Specifically, we discussed public comment and suggestions for measure topics addressing: (1) Making care affordable; (2) communication and care coordination; and (3) working with communities to promote best practices of healthy living. In addition, in the FY 2018 IPPS/LTCH PPS final rule, we welcomed public comment and specific suggestions for measure topics that we should consider for future rulemaking, including considerations related to risk adjustment and the inclusion of social risk factors in risk adjustment for any individual performance measures.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20507 through 20508), we again sought public comment on the types of measure topics we should consider for future rulemaking. We also sought public comment on two measures for potential future inclusion in the PCHQR Program:

- Risk-Adjusted Morbidity and Mortality for Lung Resection for Lung Cancer (NQF #1790); and
- Shared Decision Making Process (NQF #2962).

We discuss these measures and measurement topic areas in more detail below.

b. Risk-Adjusted Morbidity and Mortality for Lung Resection for Lung Cancer (NQF #1790)

The Risk-Adjusted Morbidity and Mortality for Lung Resection for Lung Cancer (NQF #1790) measure is an outcome measure. It assesses postoperative complications and operative mortality, which are important negative outcomes associated with lung cancer resection surgery. Specifically, the measure assesses the number of patients 18 years of age or older undergoing elective lung resection (Open or video-assisted thoracoscopic surgery (VATS) wedge resection, segmentectomy, lobectomy, bilobectomy, sleeve lobectomy, pneumonectomy) for lung cancer who developed one of the listed postoperative complications described in the measure's specifications.[390] The lung cancer resection risk model utilized in this measure identifies predictors of these outcomes, including patient age, smoking status, comorbid medical conditions, and other patient characteristics, as well as operative approach and the extent of pulmonary resection. Knowledge of these predictors informs clinical decision-making by enabling physicians and patients to understand the associations between individual patient characteristics and outcomes. Further, with continuous feedback of performance data over time, knowledge of these predictors and their relationship with patient outcomes also will foster quality improvement.

This measure aligns with recent initiatives to incorporate more outcome measures in quality reporting programs. This measure also aligns with the Promote Effective Prevention and Treatment of Chronic Disease domain of our Meaningful Measures Initiative,[391] and would fill an existing gap area of risk-adjusted mortality measures in the PCHQR Program. This measure has not

[390] Risk-Adjusted Morbidity and Mortality for Lung Resection for Lung Cancer (NQF #1790) Measure Specifications. Available at: *http://www.qualityforum.org/Projects/Cancer_Endorsement_Maintenance_2011.aspx#t=2&s=&p=3%7C.*

[391] Overview of CMS ''Meaningful Measures'' Initiative available at: *https://www.cms.gov/Newsroom/MediaReleaseDatabase/Press-releases/2017-Press-releases-items/2017-10-30.html.*

yet been reviewed by the MAP. Additional information on this measure is available at: *http://www.qualityforum.org/Projects/Cancer_Endorsement_Maintenance_2011.aspx#t=2&s=&p=3%7C*, under the ''Candidate Consensus Standards Review: Phase-1'' section.

We requested public comment on the possible inclusion of this measure in future years of the program.

Comment: A few commenters supported the possible inclusion of the Risk-Adjusted Morbidity and Mortality for Lung Resection for Lung Cancer measure in future years of the PCHQR Program, but expressed concern regarding certain aspects of the measure. The commenters noted that not all cancer hospitals perform inpatient thoracic surgeries and, of those that do, not all participate in the Society of Thoracic Surgeons (STS) General Thoracic Surgery program. Further, participation in the STS program incurs cost and considerable burden given that the measure is registry-based and requires manual abstraction of cases. The commenters urged CMS to consider whether this measure can be collected in a less burdensome manner before incorporating it into the PCHQR Program. In addition, the commenters requested that CMS work to clarify the data collection and submission process, measure calculation process, and any appropriate risk adjustment. Commenters also expressed concern about the omission of small volume centers in the model that STS used to validate the risk adjusted morbidity and mortality for lung cancer resection metric as able to sort out high performing vs. acceptable vs. low performing centers. Lastly, the commenters noted that the data used for developing the models are older and may not fit as well with current figures.

Response: We thank the commenters for their support. We will collaborate with the measure steward (where appropriate) to ensure that the measure calculation and risk adjustment methodologies are thoroughly outlined, should we decide to move forward with a proposal to adopt this measure in future years of the PCHQR Program. We will also share the concerns related to data sampling continuity, the inclusion of small volume centers, and the impact of the cost and burden of participation in the STS General Thoracic Surgery Program on data extrapolation with the measure's steward.

Comment: One commenter expressed concern over the possible future inclusion of the Risk-Adjusted Morbidity and Mortality for Lung Resection measure. Specifically, the commenter noted that the measure may have negative implications for lung cancer care. In the absence of a lung cancer risk-adjusted model, the commenter expressed concern that this measure may penalize centers that choose to serve more complex, high-risk patients.

Response: We acknowledge the commenter's concern, and note that this measure does incorporate a lung cancer risk-adjusted model. Specifically, the lung cancer resection risk model utilized in this measure accounts for patient age, smoking status, comorbid medical conditions, and other patient characteristics, as well as operative approach and the extent of pulmonary resection. Additional information on the specifications is available at: *http://www.qualityforum.org/Projects/Cancer_Endorsement_Maintenance_2011.aspx#t=2&s=&p=3%7C*.

We thank the commenters and we will consider their views as we develop future policy regarding the potential inclusion of the Risk-Adjusted Morbidity and Mortality for Lung Resection for Lung Cancer (NQF #1790) measure in the PCHQR Program.

c. Shared Decision Making Process (NQF #2962)

The Shared Decision Making Process (NQF #2962) measure is a patient-reported outcome measure. This measure asks patients who have had any of seven preference-sensitive surgical interventions to report on the interactions they had with their providers when the decision was made to have the surgery. Specifically, this measure assesses patient answers to four questions about whether three essential elements of shared decision-making: (1) Laying out options; (2) discussing the reasons to have the intervention and not to have the intervention; and (3) asking for patient input—were part of the patient's interactions with providers when the decision was made to have the procedure. When faced with a medical problem for which there is more than one reasonable approach to treatment or management, shared decision-making means providers should outline for patients that there is a choice to be made, discuss the pros and cons of the available options, and make sure that patients have input into the final decision. The result will be decisions that align better with patient goals, concerns, and preferences.

This measure aligns with recent initiatives to include patient-reported outcomes and experience of care into quality reporting programs, as well as to incorporate more outcome measures generally. This measure also aligns with the Strengthen Person and Family Engagement as Partners in Their Care domain of our Meaningful Measures Initiative,[392] and would fill an existing gap area of care aligned with the person's goals in the PCHQR Program. This measure has not yet been reviewed by the MAP. Additional information on this measure is available at: *http://www.qualityforum.org/ProjectMeasures.aspx?projectID=80842*.

We requested public comment on the possible inclusion of this measure in future years of the program.

Comment: A few commenters supported the future inclusion of the Shared Decision Making Process measure. The commenters indicated that this measure is essential for cancer patients, as it allows for the opinion of the patient to be a determinant of their care. The commenters were also appreciative of the fact that this measure places strong emphasis on the quality of dialogue between physicians and patients. Moreover, the commenters expressed that adoption of this measure would positively impact physician-patient communication, and thereby improve patient care. Lastly, the commenters suggested that CMS consider the need for expanded psychometric testing of the patient-reported outcome (PRO) survey and further specification and validation of the patient-reported outcome performance measure [393] (PRO–PM) for breast and prostate cancer.

Response: We thank the commenters for their support, and will take these comments into consideration should we propose to adopt this measure in the future.

Comment: Some commenters expressed concerns about the Shared Decision Making Process measure. The commenters indicated that the measure may pose significant tracking, reporting, and validation challenges because data collection for this measure would require significant changes to how Electronic Health Records are currently structured. The commenters also expressed concern that, in the absence of tools to validate the fulfillment of this measure, implementing the measure may not result in the practice change it is intended to achieve. The commenters indicated that most of shared decision-making processes associated with lung cancer resection occurs in an outpatient setting, in a clinic, or in a private office, and may not be easily or even accurately attributed to a particular hospital. This

[392] Ibid.

[393] National Quality Forum. ''Patient-Reported Outcomes Tools & Performance Measures.'' Accessed on: June 25, 2018.

has the potential to require redundant record keeping in order to demonstrate auditable compliance with the metric. The commenters also indicated that the description of the Shared Decision Making Process measure antedates lung cancer screening, which was not included in the data to develop the measure. Lung cancer screening requires a shared decision-making discussion with a health care professional before implementation, which should be considered as this measure is rolled out.

Response: We acknowledge the commenters' concerns. We note that this measure (as currently specified) is not an electronic clinical quality measure (eCQM). Should we propose to include this measure in future years as an eCQM, we will ensure that it is amenable to the existing infrastructure for data capture of eCQMs to avoid any structural or functional challenges. We also recognize the importance of the validity in quality metrics, and will ensure that adequate reliability and validity testing has been conducted, should we move forward with implementing this measure in future program years. Regarding the attribution issue, we note that this measure has been tested on nearly 3,000 patients, across 6 different clinical sites; [394] with most of the usable data coming from the Dartmouth Medical Center,[395] which is comprised of inpatient hospitals as well as outpatient clinical sites. Regarding the consideration of lung cancer screening, we agree that shared decision-making is pertinent in the screening process for this clinical condition. However, we do not believe that the omission of this particular procedure invalidates the measure or undermines its suitability for the PCHQR Program. To be responsive to commenters' concerns, we will communicate with the measure steward about the possible addition of lung cancer screening to the list of procedures as a future refinement of the measure.

Comment: A few commenters expressed concern about the essential elements defined within the Shared Decision Making Process measure. Specifically, the commenters indicated that the measure's essential elements (that is, laying out options, discussing the reasons to have the intervention and not to have the intervention, and asking for patient input) are transactional and lack the specificity required to prevent ''check-the-box'' activity. Further, these essential elements do not go far enough in assessing whether a patient's preferences, goals, and values were integrated into the care decision. Lastly, these essential elements do not address the cost component of the value equation. The commenters expressed concern that the essential elements, as currently specified, are limiting, and as a result, providers will not discuss other options. For example, a cancer patient may want information on prognosis if he or she chooses to not have surgery or whether radiation therapy is an option. The commenters suggested the integration of components that identify whether a patient's preferences, values, and goals were elicited and used to drive the healthcare decision. The commenters also suggested that this measure should require condition- or procedure-specific questions.

Response: We believe that the measure's essential elements are satisfactory as specified. The results for this measure demonstrate that compared to the baseline data, the participating clinical sites showed significant improvement (higher than the current national average [396]), which supports the argument that outcome measures based on patient reports are linked to the way that clinical practices are trying to interact with patients. Further, these results convey that the current questions suffice to capture a patient's preferences, values, and goals when deriving a healthcare decision. Specifically, for the overall scores, the correlations were .50 (p.<.001) and .38 (p=.004) for adjuvant therapy and surgery decisions respectively, and with minimum sample sizes of 25, there was an overall average reliability of .61.[397]

We thank the commenters and we will consider their views related to the inclusion of a question that gauges patients' assessment of cost, and the inclusion of procedure-specific questions as we develop future policy regarding the potential inclusion of the Shared Decision Making Process (NQF #2962) measure in the PCHQR Program.

Comment: A few commenters provided suggested revisions to some of the questions currently utilized in the Shared Decision Making Process measure. The commenters expressed concern with the first two questions. Specifically, the questions include the wording ''how much'', then offer ''a lot'' and ''some'' as response options. The commenters stated that sometimes a treatment plan is very clear and it would not be reasonable to do ''a lot'' of discussion about why not to do a clearly medically indicated, curative-intent procedure outside the normal discussion of possible adverse outcomes. The commenters requested that the two questions be rewritten as such: ''*Were the advantages and disadvantages of the planned procedure and alternative procedures discussed to your satisfaction?*'', with a yes/no response option. The commenters also expressed concern with the third and fourth questions. The commenters noted that these two questions only establish whether the patient understood that he or she had the option to accept or decline the procedure. To better evaluate whether patients engaged in a discussion that would improve the likelihood that care would align with their goals for treatment, the commenters suggested that the survey might instead ask: ''*Did the doctors ask for your input into the decision about whether or not to perform [the intervention]?*'' or, ''*Did the doctors ask you whether [the intervention] was consistent with your values and goals?*''

Response: We acknowledge the commenters' concerns and we thank them for the suggested wording revisions for the specified questions. We will share these suggestions with the measure steward for consideration during the next endorsement maintenance review of this measure with NQF.

Comment: One commenter stated that patients should have the opportunity to engage in a shared-decision making process with their provider, other health care professionals, and loved ones. Because treatment decisions are highly personalized, the commenter asked that CMS include a measure that assesses whether or not providers encourage patients to use shared decision-making tools to develop a set of personalized questions based on what each individual patient values most.

Response: We thank the commenter for its recommendation and will consider the impact of using additional decision-making tools (that is, training modules or toolkits for specialty or primary care) in tandem with the Shared Decision Making Process measure as we develop future policy regarding the potential inclusion of the measure in the PCHQR Program.

We thank the commenters and we will consider their views as we develop future policy regarding the potential inclusion of the Shared Decision Making Process (NQF #2962) measure in the PCHQR Program.

[394] ''Shared Decision Making Process Measure Testing Attachment.'' Accessed on: June 26, 2018. Available at: *http://www.qualityforum.org/ProjectMeasures.aspx?projectID=80842.*

[397] Ibid.

d. Future Measurement Topic Areas

As discussed in section I.A.2. of the preambles of the proposed rule and this final rule, we intend to review and assess the quality measures that we collect and score in our quality programs. As a part of the review process, we are continually evaluating the existing PCHQR measures portfolio and identifying gap areas for future measure adoption and/or development. In tandem with this portfolio evaluation, we have conducted a measure environmental scan. We believe that staying abreast of the cancer measurement environment and staying in communication with the cancer measure development community are vital to the ensure that the PCHQR Program measure portfolio remains aligned with current CMS and HHS goals. As a part of our efforts to include a comprehensive set of cancer measures in the PCHQR Program, we are currently assessing whether we should redefine the scope of new quality metrics we implement in the PCHQR Program in future years. Specifically, we are trying to determine whether the PCHQR Program would most benefit from the inclusion of more quality measures that examine general cancer care (that is, outcome measures that assess cancer care) or more measures that examine cancer-specific clinical conditions (such as prostate cancer, esophageal cancer, colon cancer, or uterine cancer).

We welcomed public comment and specific suggestions on the inclusion of quality measures that examine general cancer care versus the inclusion of quality measures that examine cancer-specific clinical conditions in future rulemaking.

Comment: A few commenters expressed support for the development of a balanced scorecard that includes both general cancer care measures and measures that focus on cancer-specific clinical conditions. The commenters encouraged CMS to continue to advance a portfolio of measures for the PCHQR Program that assess both general cancer care and cancer-specific clinical conditions, such as breast, colon, prostate, lung, and other types of cancer. The commenters also suggested that CMS prioritize the inclusion of new measures based on the importance and utility of the information assessed, which will naturally result in a balanced portfolio of both general and specific measures.

Response: We thank the commenters for their support and suggestions.

Comment: One commenter expressed support for the PCHQR Program moving towards general cancer care measures based on its belief that as cancer care is increasingly built around a multi-disciplinary team, a move toward more general measures is appropriate so that more providers can report them. The commenter also stated that implementing specific cancer measures can be challenging due to the need for PCHs to meet the case minimum necessary for meaningful analysis. In addition, the commenter stated that general cancer measures are a better use of the extensive time and effort needed to develop measures because they are more applicable to a larger number of patients, providers and practices, and can be utilized in multiple quality programs.

Response: We thank the commenter for its insight, and will consider the implications associated with measure implementation feasibility as we examine measures for future inclusion into the PCHQR Program measure set.

Comment: One commenter urged CMS to promote the development and adoption of claims-based metrics of survival for major cancer types, with careful attention to attribution and risk-adjustment, in future rulemaking. The development of a reliable, adequately risk-adjusted metric of survival rates by major cancer type would vastly improve the PCHQR Program's ability to provide meaningful, easily understood information to patients seeking high-quality, high-value care.

Response: We thank the commenter for its feedback, and will consider performance measures that assess cancer patient survival rates as we move forward with expanding the PCHQR Program measure set.

Comment: One commenter noted that there remains a gap in measures that are evaluating the patient experience. The commenter encouraged CMS to adopt measures that document whether providers have assessed patients for distress or other measures that comprehensively evaluate the patient experience.

Response: We thank the commenter for its feedback, and will consider performance measures that assess patient experience and engagement as we move forward with expanding the PCHQR Program measure set.

Comment: One commenter encouraged CMS to develop more measures around end-of-life conversations. The commenter noted that because cancer patients who are hospitalized tend to have advanced disease, complications, or a very aggressive cancer, it is incredibly important that cancer patients are provided with the tools and resources to engage in shared decision-making around end-of-life decisions. The commenter further noted that to ensure that patients receive high-quality, appropriate care throughout the trajectory of their cancer journey, it is essential that they have conversations with their care team and loved ones about what type of care they would like to receive, what they value, and when they would like to transition into hospice or only receive supportive care rather than curative therapy.

Response: We thank the commenter for its feedback. We note that as indicated in section VIII.B.4.c. of the preamble of this final rule, there are currently four measures in the PCHQR measure set that assess end-of-life care. However, we recognize the importance of this type of treatment for cancer patient and will continue to consider the feasibility of implementing additional end-of-life measures as we move forward with expanding the PCHQR Program measure set.

We thank the commenters and we will consider their views as we develop future policy regarding the inclusion of quality measures that examine general cancer care versus the inclusion of quality measures that examine cancer-specific clinical conditions.

7. Maintenance of Technical Specifications for Quality Measures

We maintain technical specifications for the PCHQR Program measures, and we periodically update those specifications. The specifications may be found on the QualityNet website at: *https://qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier2&cid=1228774479863*.

We also refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50281), where we adopted a policy under which we use a subregulatory process to make nonsubstantive updates to measures used for the PCHQR Program.

8. Public Display Requirements

a. Background

Under section 1866(k)(4) of the Act, we are required to establish procedures for making the data submitted under the PCHQR Program available to the public. Such procedures must ensure that a PCH has the opportunity to review the data that are to be made public with respect to the PCH prior to such data being made public. Section 1866(k)(4) of the Act also provides that the Secretary must report quality measures of process, structure, outcome, patients' perspective on care, efficiency, and costs of care that relate to services furnished in such hospitals on the CMS website.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57191 through 57192), we finalized that although we would continue to use rulemaking to establish what year we would first publicly report data on each measure, we would publish the data as soon as feasible during that year. We also stated that our intent is to make the data available on at least a yearly basis, and that the time period for PCHs to review their data before the data are made public would be approximately 30 days in length. We announce the exact data review and public reporting timeframes on a CMS website and/or on our applicable Listservs.

In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38422 through 38424), we listed our finalized public display requirements for the FY 2020 program year.

PREVIOUSLY FINALIZED PUBLIC DISPLAY REQUIREMENTS FOR THE FY 2020 PROGRAM YEAR

Summary of previously finalized public display requirements	
Measures	Public reporting
• Oncology: Radiation Dose Limits to Normal Tissues (NQF #0382)*	2016 and subsequent years.
• Oncology: Plan of Care for Pain—Medical Oncology and Radiation Oncology (NQF #0383).	
• Oncology: Medical and Radiation—Pain Intensity Quantified (NQF #0384).*	
• Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low Risk Prostate Cancer Patients (NQF #0389).*	
• Prostate Cancer: Adjuvant Hormonal Therapy for High Risk Prostate Cancer Patients (NQF #0390).*	
• HCAHPS (NQF #0166).	
• CLABSI (NQF #0139)**	Deferred.
• CAUTI (NQF #0138).**	
• External Beam Radiotherapy for Bone Metastases (NQF #1822)	Beginning when feasible in 2017 and for subsequent years.

* Measure finalized for removal beginning with the FY 2021 program year.

** As discussed in section VIII.B.3.b.(2) of this final rule, we are deferring finalization of our policies regarding future use of the CLABSI and CAUTI measures in the PCHQR Program until the CY 2019 OPPS/ASC final rule. Public reporting of these measures was deferred in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57192).

We recognize the importance of being transparent with stakeholders and keeping them abreast of any changes that arise with the PCHQR Program measure set. As such, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20508 through 20509), we provided a discussion of some recent changes affecting the timetable for the public display of data for specific PCHQR Program measures in the section below.

b. Deferment of Public Display of Four Measures

We adopted the Colon and Abdominal Hysterectomy SSI (NQF #0753) measure in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50839 through 50840) and the MRSA measure (NQF #1716), the CDI measure (NQF #1717) and the HCP measure (NQF #0431) in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49715 through 49718).

At present, all PCHs are reporting Colon and Abdominal Hysterectomy SSI, MRSA, CDI, and HCP data to the NHSN under the PCHQR Program. However, performance data for these measures are new, and do not span a long enough measurement period to draw conclusions about their statistical significance at this point. Specifically, in 2016, the Centers for Disease Control and Prevention (CDC) announced that HAI data reported to NHSN for 2015 will be used as the new baseline, serving as a new ''reference point'' for comparing progress.[398] These current rebaselining efforts make year-to-year data comparisons inappropriate at this time. However, in FY 2019, we will have 2 years of comparable data to properly assess trends.[399] Therefore, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20509), we proposed to delay the public reporting of data for the SSI, MRSA, CDI, and HCP measures until CY 2019.

We invited public comment on our proposal to delay public reporting of these four measures until CY 2019.

Comment: One commenter supported the proposal to defer the public reporting of the SSI, MRSA, CDI, and HCP measures until statistical significance and reliability can be determined.

Response: We thank the commenter for its support.

Comment: One commenter did not support the proposal to delay the public reporting of the Influenza Vaccination Coverage Among Healthcare Personnel measure. The commenter noted that vaccinating healthcare personnel against influenza has been shown to improve patient safety and reduce disease transmission, which is essential for immunocompromised patients in the cancer hospital setting. Empowering patients and caregivers with the ability to assess cancer hospitals based on this measure could ultimately result in improved outcomes for patients through lower complications.

Response: We thank the commenter for its feedback. We agree that empowering patients and caregivers with the ability to assess cancer hospitals could ultimately result in improved outcomes for patients, however, we want to ensure that the information provided to consumers is adequate and accurate. We reiterate that performance data for these measures are new, and do not span a long enough measurement period to draw conclusions about their statistical significance at this point, however, we will modify our proposal, such that we will provide stakeholders with performance data as soon as practicable.

After consideration of the public comments we received, we are finalizing a modification to our proposal to delay public reporting of data for the SSI, MRSA, CDI, and HCP measures until CY 2019. Instead, we are finalizing that we will provide stakeholders with performance data as soon as practicable (that is, if useable data is available sooner than CY 2019, we will publicly report it on Hospital Compare via the next available Hospital Compare release. We will continue to monitor the progress of the current rebaselining efforts being made by CDC.

[398] Centers for Disease Control and Prevention. ''Paving Path Forward: 2015 Rebase line.'' Available at: *https://www.cdc.gov/nhsn/2015rebaseline/index.html.*

[399] Rebase line Timeline FAQ Document. Available at: *https://www.cdc.gov/nhsn/pdfs/rebaseline/faq-timeline-rebaseline.pdf.*

c. Clarification of Public Display of External Beam Radiotherapy for Bone Metastases (EBRT) (NQF #1822) Measure

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50282 through 50283), we finalized that PCHs would begin reporting the External Beam Radiotherapy for Bone Metastases (EBRT) (NQF #1822) measure beginning with January 1, 2015 discharges and for subsequent years. We finalized that PCHs would report this measure to us via a CMS web-based tool on an annual basis (July 1 through August 15 of each respective year). Lastly, we finalized in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57192) that we would begin to display the measure data during CY 2017, and that we would use a CMS website and/or our applicable Listservs to announce the exact timeframe.

We publicly reported data on this measure in December of 2017, and that data can be accessed on *Hospital Compare* at: *https://www.medicare.gov/hospitalcompare/cancer-measures.html*. We note that this measure is updated on an annual basis, and that new *Hospital Compare* data is published four times each year: April, July, October, and December. As such, given the time necessary to assess the data provided for this measure's annual update, we anticipate an update of EBRT measure data to be available in December of 2018.

d. Summary of Public Display Requirements for the FY 2021 Program Year

Our public display requirements for the FY 2021 program year are shown in the following table:

PUBLIC DISPLAY REQUIREMENTS FOR THE FY 2021 PROGRAM YEAR

Summary of newly finalized public display requirements	
Measures	Public reporting
• HCAHPS (NQF #0166)	2016 and subsequent years.
• Oncology: Plan of Care for Pain—Medical Oncology and Radiation Oncology (NQF #0383).	
• American College of Surgeons—Centers for Disease Control and Prevention (ACS–CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure [currently includes SSIs following Colon Surgery and Abdominal Hysterectomy Surgery] (NQF #0753)*.	* Deferred.
• National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* Bacteremia Outcome Measure (NQF #1716).*	
• National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure (NQF #1717).*	
• National Healthcare Safety Network (NHSN) Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431).*	
• CLABSI (NQF #0139).**	
• CAUTI (NQF #0138).**	
• External Beam Radiotherapy for Bone Metastases (EBRT) (NQF #1822)	2017 and subsequent years.

* Newly finalized in this FY 2019 IPPS/LTCH PPS final rule.

** As discussed in section VIII.B.3.b.(2) of this final rule, we are deferring finalization of our policies regarding future use of the CLABSI and CAUTI measures in the PCHQR Program until the CY 2019 OPPS/ASC final rule. Public reporting of these measures was deferred in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57192).

9. Form, Manner, and Timing of Data Submission

a. Background

Data submission requirements and deadlines for the PCHQR Program are posted on the QualityNet website at: *http://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228772864228*.

b. Reporting Requirements for the Newly Finalized 30-Day Unplanned Readmissions for Cancer Patients Measure

As further described in section VIII.B.4.b. of the preamble of this final rule, we are finalizing the adoption of a new measure beginning with the FY 2021 program year, the 30-Day Unplanned Readmissions for Cancer Patients measure. This is a claims-based measure, therefore, there will be no separate data submission requirements for PCHs related to this measure as CMS will calculate measure rates using PCH claims data. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20510), we proposed that the data collection period would be from July 1 of the year, three years prior to the program year to June 30 of the year, two years prior to the program year. Therefore, for the FY 2021 program year, we would collect data from October 1, 2018 through September 30, 2019.

We invited public comment on this proposal.

Comment: One commenter supported the proposed timeframe for the reporting of the 30-Day Unplanned Readmissions for Cancer Patients measure.

Response: We thank the commenter for its support.

After consideration of the public comment we received, we are finalizing the proposal to collect data on this measure from October 1, 2018 through September 30, 2019, for the FY 2021 program year.

10. Extraordinary Circumstances Exceptions (ECE) Policy Under the PCHQR Program

In our experience with other quality reporting and performance programs, we have noted occasions when providers have been unable to submit required quality data due to extraordinary circumstances that are not within their control (for example, natural disasters). We do not wish to increase their burden unduly during these times. Therefore, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50848), we finalized our policy that, for the FY 2014 program year and subsequent years, PCHs may request and we may grant exceptions (formerly referred to as waivers) [400] with respect to the reporting of required quality data when extraordinary circumstances beyond the control of the PCH warrant. The PCH may request a reporting extension or a complete exception from the requirement to submit quality data for one or more quarters. In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38424 through 38425), we finalized modifications to the extraordinary circumstances exceptions (ECE) policy

[400] ECEs were originally referred to as ''waivers.'' This term was changed to ''exceptions'' in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50286).

to extend the deadline for a PCH to submit a request for an extension or exception from 30 days following the date that the extraordinary circumstance occurred to 90 days following the date that the extraordinary circumstance occurred and to allow CMS to grant an exception or extension due to CMS data system issues which affect data submission. In addition, to ensure transparency and understanding of our process, we have clarified that we will strive to provide our response to an ECE request within 90 days of receipt.

C. Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

1. Background

The LTCH QRP is authorized by section 1886(m)(5) of the Act, and it applies to all hospitals certified by Medicare as long-term care hospitals (LTCHs). Under the LTCH QRP, the Secretary reduces by 2 percentage points the annual update to the LTCH PPS standard Federal rate for discharges for an LTCH during a fiscal year if the LTCH has not complied with the LTCH QRP requirements specified for that fiscal year. For more detailed information on the requirements we have adopted for the LTCH QRP, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51743 through 51744), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53614), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50853), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50286), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49723 through 49725), the FY 2017 IPPS/LTCH PPS final rule (81 FR 57193), and the FY 2018 IPPS/LTCH PPS final rule (82 FR 38425 through 38426).

Although we have historically used the preamble to the IPPS/LTCH PPS proposed and final rules each year to remind stakeholders of all previously finalized program requirements, we have concluded that repeating the same discussion each year is not necessary for every requirement, especially if we have codified it in our regulations. Accordingly, the following discussion is limited as much as possible to a discussion of our proposals, responses to comments submitted on those proposals, and policies we are finalizing for future years of the LTCH QRP, and represents the approach we intend to use in our rulemakings for this program going forward.

Comment: Several commenters supported streamlining the LTCH QRP, specifically CMS' effort to align areas of best practices with other quality reporting programs. Another commenter supported the proposed changes to the LTCH QRP, recognizing that these changes are part of a multi-year process to reform patient assessment and quality reporting across multiple levels of care.

Response: We appreciate the commenters' support.

2. General Considerations Used for the Selection of Measures for the LTCH QRP

a. Background

For a detailed discussion of the considerations we historically used for the selection of LTCH QRP quality, resource use, and other measures, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49728).

We received comments related to the IMPACT Act and the availability of data for LTCHs, both of which are summarized and discussed below.

Comment: A few commenters supported the goals and objectives of the IMPACT Act, noting the interdependence of the four post-acute care settings and their respective payment systems and the critical need for sound analysis of data from all levels of care. One commenter supported the delay of the implementation of the IMPACT Act requirements to ensure that measures are valid and valuable.

Commenters also supported the development of standardized patient assessment data elements. One commenter recommended that, as part of the standardized patient assessment data elements that could be incorporated into the post-acute care assessment instruments, CMS streamline adult immunization quality measures across health care settings. One commenter expressed that CMS communicate and collaborate more with LTCHs and other post-acute care providers on IMPACT Act implementation, encouraging CMS to include LTCHs in the development of standardized patient assessment data elements and all other CMS initiatives related to the implementation of the IMPACT Act. The commenter also noted that CMS should develop and refine measures that are either required by the IMPACT Act or will otherwise facilitate cross-setting measurement and eliminate measures that are not required under the IMPACT Act.

Response: While we did not propose changes to the LTCH QRP's policies on standardized patient assessment data elements, quality measures, or public engagement pertaining to the implementation of the IMPACT Act, we will take these comments into account as we engage in future development of these policies. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49723 through 49728) and the FY 2018 IPPS/LTCH PPS final rule (82 FR 38426 through 38433) for additional information on the IMPACT Act and its applicability to LTCHs.

Comment: Some commenters requested that CMS provide opportunity for stakeholders of all post-acute care settings to access aggregate patient assessment data, including LTCH CARE Data Set data, to allow providers to analyze data and to provide meaningful input to CMS, noting that this data is available for SNFs, IRFs, and HHAs, but not, however, for LTCHs.

Response: We acknowledge the commenters' requests to make the LTCH CARE Data Set data publicly available for research purposes. We intend to make the data available as soon as feasible.

b. Accounting for Social Risk Factors in the LTCH QRP

In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38428 through 38429), we discussed the importance of improving beneficiary outcomes including reducing health disparities. We also discussed our commitment to ensuring that medically complex patients, as well as those with social risk factors, receive excellent care. We discussed how studies show that social risk factors, such as being near or below the poverty level as determined by HHS, belonging to a racial or ethnic minority group, or living with a disability, can be associated with poor health outcomes and how some of this disparity is related to the quality of health care.[401] Among our core objectives, we aim to improve health outcomes, attain health equity for all beneficiaries, and ensure that complex patients as well as those with social risk factors receive excellent care. Within this context, reports by the Office of the Assistant Secretary for Planning and Evaluation (ASPE) and the National Academy of Medicine have examined the influence of social risk factors in our value-based purchasing programs.[402] As we noted in the FY

[401] See, for example United States Department of Health and Human Services. ''Healthy People 2020: Disparities. 2014.'' Available at: *http://www.healthypeople.gov/2020/about/foundation-health-measures/Disparities*; or National Academies of Sciences, Engineering, and Medicine. Accounting for Social Risk Factors in Medicare Payment: Identifying Social Risk Factors. Washington, DC: National Academies of Sciences, Engineering, and Medicine 2016.

[402] Department of Health and Human Services Office of the Assistant Secretary for Planning and Evaluation (ASPE), ''Report to Congress: Social Risk Factors and Performance Under Medicare's Value-Based Purchasing Programs.'' December 2016. Available at: *https://aspe.hhs.gov/pdf-report/report-congress-social-risk-factors-and-performance-under-medicares-value-based-purchasing-programs*.

2018 IPPS/LTCH PPS final rule (82 FR 38404), ASPE's report to Congress, which was required by the IMPACT Act, found that, in the context of value-based purchasing programs, dual eligibility was the most powerful predictor of poor health care outcomes among those social risk factors that they examined and tested. ASPE is continuing to examine this issue in its second report required by the IMPACT Act, which is due to Congress in the fall of 2019. In addition, as we noted in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38428), the National Quality Forum (NQF) undertook a 2-year trial period in which certain new measures and measures undergoing maintenance review have been assessed to determine if risk adjustment for social risk factors is appropriate for these measures.[403] The trial period ended in April 2017 and a final report is available at: *http://www.qualityforum.org/SES_Trial_Period.aspx*. The trial concluded that ''measures with a conceptual basis for adjustment generally did not demonstrate an empirical relationship'' between social risk factors and the outcomes measured. This discrepancy may be explained in part by the methods used for adjustment and the limited availability of robust data on social risk factors. NQF has extended the socioeconomic status (SES) trial,[404] allowing further examination of social risk factors in outcome measures.

In the FY 2018/CY 2018 proposed rules for our quality reporting and value-based purchasing programs, we solicited feedback on which social risk factors provide the most valuable information to stakeholders and the methodology for illuminating differences in outcomes rates among patient groups within a provider that would also allow for a comparison of those differences, or disparities, across providers. Feedback we received across our quality reporting programs included encouraging CMS: to explore whether factors that could be used to stratify or risk adjust the measures (beyond dual eligibility); to consider the full range of differences in patient backgrounds that might affect outcomes; to explore risk adjustment approaches; and to offer careful consideration of what type of information display would be most useful to the public.

We also sought public comment on confidential reporting and future public reporting of some of our measures stratified by patient dual eligibility. In general, commenters noted that stratified measures could serve as tools for hospitals to identify gaps in outcomes for different groups of patients, improve the quality of health care for all patients, and empower consumers to make informed decisions about health care. Commenters encouraged us to stratify measures by other social risk factors such as age, income, and educational attainment. With regard to value-based purchasing programs, commenters also cautioned CMS to balance fair and equitable payment while avoiding payment penalties that mask health disparities or discouraging the provision of care to more medically complex patients. Commenters also noted that value-based payment program measure selection, domain weighting, performance scoring, and payment methodology must account for social risk.

As a next step, we are considering options to improve health disparities among patient groups within and across hospitals by increasing the transparency of disparities as shown by quality measures. We also are considering how this work applies to other CMS quality programs in the future. We refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38403 through 38409) for more details, where we discuss the potential stratification of certain Hospital IQR Program outcome measures. Furthermore, we continue to consider options to address equity and disparities in our value-based purchasing programs.

We plan to continue working with ASPE, the public, and other key stakeholders on this important issue to identify policy solutions that achieve the goals of attaining health equity for all beneficiaries and minimizing unintended consequences.

Comment: Many commenters supported the continued evaluation of social risk factors for the LTCH QRP measures, specifically for displaying stratification by social risk factors, expressed willingness to support efforts with CMS or NQF on this issue, and requested that attribution be addressed in technical specifications.

Response: We thank the commenters for their comments and will take these comments into account as we further consider how to appropriately account for social risk factors in the LTCH QRP. We also refer the reader to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38428 through 38429), where we discussed displaying stratification by social risk factors and other related issues.

3. New Measure Removal Factor for Previously Adopted LTCH QRP Measures

As a part of our Meaningful Measures Initiative, discussed in section I.A.2. of the preambles of the proposed rule and this final rule, we strive to put patients first, ensuring that they, along with their clinicians, are empowered to make decisions about their own healthcare using data-driven information that is increasingly aligned with a parsimonious set of meaningful quality measures. We began reviewing the LTCH QRP's measures in accordance with the Meaningful Measures Initiative, and we are working to identify how to move the LTCH QRP forward in the least burdensome manner possible, while continuing to incentivize improvement in the quality of care provided to patients.

Specifically, we believe the goals of the LTCH QRP and the measures used in the program cover most of the Meaningful Measures Initiative priorities, including making care safer, strengthening person and family engagement, promoting coordination of care, promoting effective prevention and treatment, and making care affordable.

We also evaluated the appropriateness and completeness of the LTCH QRP's current measure removal factors. We have previously finalized that we would use notice and comment rulemaking to remove measures from the LTCH QRP based on the following factors:[405]

- Factor 1. Measure performance among LTCHs is so high and unvarying that meaningful distinctions in improvements in performance can no longer be made.
- Factor 2. Performance or improvement on a measure does not result in better patient outcomes.
- Factor 3. A measure does not align with current clinical guidelines or practice.
- Factor 4. A more broadly applicable measure (across settings, populations, or conditions) for the particular topic is available.
- Factor 5. A measure that is more proximal in time to desired patient outcomes for the particular topic is available.
- Factor 6. A measure that is more strongly associated with desired patient outcomes for the particular topic is available.
- Factor 7. Collection or public reporting of a measure leads to negative

[403] Available at: *http://www.qualityforum.org/SES_Trial_Period.aspx*.

[404] Available at: *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86357*.

[405] We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53614 through 53615) for more information on the factors we consider for removing measures.

unintended consequences other than patient harm.

We continue to believe that these measure removal factors are appropriate for use in the LTCH QRP. However, even if one or more of the measure removal factors applies, we may nonetheless choose to retain the measure for certain specified reasons. Examples of such instances could include when a particular measure addresses a gap in quality that is so significant that removing the measure could, in turn, result in poor quality, or in the event that a given measure is statutorily required. We note further that, consistent with other quality reporting programs, we apply these factors on a case-by-case basis.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20511 through 20512), we proposed to adopt an additional factor to consider when evaluating potential measures for removal from the LTCH QRP measure set: Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program.

As we discussed in section I.A.2. of the preambles of the proposed rule and this final rule, with respect to our new Meaningful Measures Initiative, we are engaging in efforts to ensure that the LTCH QRP measure set continues to promote improved health outcomes for beneficiaries while minimizing the overall costs associated with the program. We believe these costs are multi-faceted and include not only the burden associated with reporting, but also the costs associated with implementing and maintaining the program. We have identified several different types of costs, including, but not limited to: (1) The provider and clinician information collection burden and burden associated with the submission/reporting of quality measures to CMS; (2) the provider and clinician cost associated with complying with other programmatic requirements; (3) the provider and clinician cost associated with participating in multiple quality programs, and tracking multiple similar or duplicative measures within or across those programs; (4) the cost to CMS associated with the program oversight of the measure including measure maintenance and public display; and (5) the provider and clinician cost associated with compliance with other federal and/or State regulations (if applicable).

For example, it may be needlessly costly and/or of limited benefit to retain or maintain a measure which our analyses show no longer meaningfully supports program objectives (for example, informing beneficiary choice). It may also be costly for health care providers to track the confidential feedback, preview reports, and publicly reported information on a measure where we use the measure in more than one program. CMS may also have to expend unnecessary resources to maintain the specifications for the measure, as well as the tools we need to collect, validate, analyze, and publicly report the measure data. Furthermore, beneficiaries may find it confusing to see public reporting on the same measure in different programs.

When these costs outweigh the evidence supporting the continued use of a measure in the LTCH QRP, we believe it may be appropriate to remove the measure from the program. Although we recognize that one of the main goals of the LTCH QRP is to improve beneficiary outcomes by incentivizing health care providers to focus on specific care issues and making public data related to those issues, we also recognize that those goals can have limited utility where, for example, the publicly reported data is of limited use because it cannot be easily interpreted by beneficiaries and used to influence their choice of providers. In these cases, removing the measure from the LTCH QRP may better accommodate the costs of program administration and compliance without sacrificing improved health outcomes and beneficiary choice.

We proposed that we would remove measures based on this factor on a case-by-case basis. We might, for example, decide to retain a measure that is burdensome for health care providers to report if we conclude that the benefit to beneficiaries justifies the reporting burden. Our goal is to move the program forward in the least burdensome manner possible, while maintaining a parsimonious set of meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients.

Comment: Many commenters supported the proposal to add measure removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program, in the LTCH QRP. Commenters appreciated the consideration of costs beyond those associated with data collection and submission. One commenter agreed that the burden associated with data collection should be balanced with the value these measures have to providers, patients, and others. Another commenter suggested that CMS also consider the costs associated with tracking performance and resources invested for quality improvement. A few commenters encouraged CMS to continue to apply the measure removal factors to other measures in the LTCH QRP, including those more recently adopted in the program, to reduce regulatory burden on providers so that they may focus instead on improving patient outcomes.

Response: We appreciate the support and suggestions regarding the addition of this measure removal factor to the LTCH QRP. With respect to considering the costs associated with tracking performance and resources invested for quality improvement, we believe that investing resources in quality improvement is an inherent part of delivering high-quality, patient-centered care and, therefore, is generally not considered a part of the quality reporting program requirements.

Comment: A few commenters noted the existing seven removal factors are sufficient for appropriate measure evaluation.

Response: While we acknowledge that there are seven factors currently adopted that may be used for considering measure removal from the LTCH QRP, we believe the proposed new measure removal factor adds a new criterion that is not captured in the other seven factors. The proposed new measure removal factor will help advance the goals of the Meaningful Measures Initiative, which aims to improve outcomes for patients, their families, and health care providers while reducing burden and costs for clinicians and providers.

Comment: One commenter questioned the process involved with Factor 1, or ''topped-out'' measures, and requested clarity on the process and timeline for determining whether a measure is ''topped out.''

Response: While we did not use Factor 1 as justification for removing any LTCH QRP measures in the proposed rule, we acknowledge the commenter's request for clarification about the process and timeline for this measure removal factor. In our evaluation of LTCH QRP measures, we look at measure performance using methodology and a timeline that are appropriate, based on each measure's specifications. If we determine that measure performance is so high and unvarying that meaningful distinctions in improvements in performance can no longer be made, we will detail our process in the proposed rule and solicit public comment after making such a determination.

Comment: Some commenters expressed concern related to proposed Factor 8. A few commenters stated that the measure removal factor only

accounts for the cost of reporting without considering the cost to patients, their families, and the Medicare program. The commenters requested more measures and financial incentives to spur higher quality care and hold providers accountable if they fail to prevent errors and infections.

One commenter cautioned that measure removal should not be solely based on associated cost and recommended that CMS implement measures even at a high cost if it benefits patients. Another commenter requested clarification about the methods or criteria used to assess when the measure cost or burden outweighs the benefits of retaining it.

Lastly, one commenter expressed concern that Factor 8 compares the costs with the ''use in the program,'' indicating that the usefulness of the measures should be self-evident and directly relate to the purpose of the program. The commenter believed that the removal of a measure would decrease the ability of that measure to improve patient care and reduce Medicare costs and, as a result, would reduce the effectiveness of the quality reporting program. The commenter also noted that Factor 8 does not describe a specific method to be used to evaluate the usefulness of a measure or describe how the number of measures kept within the program shall be determined.

Response: We intend to apply measure removal Factor 8 on a case-by-case basis because the costs and benefits associated with each measure are unique to that measure. However, we believe these costs include costs to all stakeholders, including but not limited to, patients, caregivers, providers, CMS, and other entities. We agree with the commenter's observation that for measures that serve beneficiaries, the costs may be outweighed by the benefits, and intend to evaluate measures on a case-by-case basis to achieve this balance.

With regard to the request for clarification about criteria used to assess costs and burden, we provided examples of five different costs that could be considered in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20512). We note that we intend to assess the costs and benefits to all program stakeholders, including but not limited to, those listed above. We intend to be transparent in our assessment of costs and burden for each measure. As described above, there are various considerations of costs and benefits, direct and indirect, financial and otherwise, that we will evaluate when evaluating a measure under removal Factor 8, and we will take into consideration the perspectives of multiple stakeholders. However, because we intend to evaluate each measure on a case-by-case basis, and because each measure has been adopted to fill different needs in the LTCH QRP, we do not believe it would be meaningful to identify a specific set of assessment criteria to apply to all measures.

Lastly, in response to the comment that the removal of measures would reduce the effectiveness of the LTCH QRP, we do not believe that more measures equate to better care. Retaining a strong measure set that addresses critical issues is one benefit that we would consider in analyzing measures for potential removal from the LTCH QRP measure set. We will continue to monitor and evaluate our programs to identify their benefit with respect to quality of care and patient safety as well as their costs.

After consideration of the public comments we received, we are finalizing our proposal to adopt an additional measure removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program, in the LTCH QRP.

We also proposed to codify both the removal factors we previously finalized for the LTCH QRP, as well as the new the measure removal Factor 8 that we are finalizing in this final rule, at § 412.560(b)(3) of our regulations.

Comment: A few commenters supported the proposal to codify all eight measure removal factors, including the proposed Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to codify both the removal factors we previously finalized for the LTCH QRP, as well as the new the measure removal factor that we are finalizing in this final rule, at § 412.560(b)(3) of our regulations. We are also making minor grammatical edits to the LTCH QRP measure removal factor language to align with the language of other programs.

4. Quality Measures Currently Adopted for the FY 2020 LTCH QRP

The LTCH QRP currently has 19 measures for the FY 2020 program year, which are outlined in the following table:

QUALITY MEASURES CURRENTLY ADOPTED FOR THE FY 2020 LTCH QRP

Short name	Measure name and data source
LTCH CARE Data Set	
Pressure Ulcer	Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678).*
Pressure Ulcer/Injury	Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury.
Patient Influenza Vaccine	Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680).
Application of Falls	Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (NQF #0674).
Functional Assessment	Percent of Long-Term Care Hospital (LTCH) Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631).
Application of Functional Assessment	Application of Percent of Long-Term Care Hospital (LTCH) Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631).
Change in Mobility	Functional Outcome Measure: Change in Mobility Among Long-Term Care Hospital (LTCH) Patients Requiring Ventilator Support (NQF #2632).
DRR	Drug Regimen Review Conducted With Follow-Up for Identified Issues—Post Acute Care (PAC) Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP).
Compliance with SBT	Compliance with Spontaneous Breathing Trial (SBT) by Day 2 of the LTCH Stay.
Ventilator Liberation	Ventilator Liberation Rate.

QUALITY MEASURES CURRENTLY ADOPTED FOR THE FY 2020 LTCH QRP—Continued

Short name	Measure name and data source
NHSN	
CAUTI	National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (NQF #0138).
CLABSI	National Healthcare Safety Network (NHSN) Central Line-associated Bloodstream Infection (CLABSI) Outcome Measure (NQF #0139).
MRSA	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716).
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure (NQF #1717).
HCP Influenza Vaccine	Influenza Vaccination Coverage among Healthcare Personnel (NQF #0431).
VAE	National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure.
Claims-Based	
MSPB LTCH	Medicare Spending Per Beneficiary (MSPB)-Post Acute Care (PAC) Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP).
DTC	Discharge to Community-Post Acute Care (PAC) Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP).
PPR	Potentially Preventable 30-Day Post-Discharge Readmission Measure for Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP).

* The measure was replaced with the Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury measure, effective July 1, 2018.

Comment: One commenter suggested that CMS consider adding Kennedy terminal ulcers as an item in the LTCH CARE Data Set in order to differentiate a Kennedy ulcer from a facility-acquired pressure ulcer/injury.

Response: While we did not solicit comments on the items on the LTCH CARE Data Set, we appreciate the commenter's suggestion for additional pressure ulcer/injury items and will take this into consideration as we continue our evaluation and refinement of pressure ulcer/injury items used to calculate skin integrity quality measures for PAC settings. Kennedy terminal ulcers, which are unavoidable skin breakdown that occur as part of the dying process, are not considered to be pressure ulcers/injuries and are therefore not currently coded on the LTCH CARE Data Set and not included in the calculation of the skin integrity measure, Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678), or the replacement measure, Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury. We will continue to provide training and clarification regarding coding of pressure ulcer/injury items through training events, FAQs, and help desk.

Comment: One commenter requested a more precise definition of the phrase ''potential clinically significant medication issues'' under the Drug Regimen Review Conducted with Follow-Up for Identified Issues measure. This commenter was concerned that policies in other CMS programs would hinder appropriate prescribing of antipsychotic medications.

Response: While we did not propose any changes to the previously finalized measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues—PAC LTCH QRP, we responded to comments regarding the definition of a clinically significant medication issue in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57219 through 57223), and we refer readers to that detailed discussion. We also refer readers to the LTCH QRP Manual Version 4.0 for more information about coding the drug regimen review data elements, available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-CARE-Data-Set-and-LTCH-QRP-Manual.html*.

Comment: A few commenters supported maintaining the Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431) quality measure in the LTCH QRP. A commenter also supported the public reporting of the quality measure.

Response: We appreciate the commenters' support.

Comment: A few commenters expressed views on measures for future consideration for the LTCH QRP. One commenter suggested a measure that addresses mental health. Another commenter encouraged CMS to move forward with the development and adoption of a standardized patient experience survey given CMS' focus on strengthening person and family engagement as part of the Meaningful Measures framework.

Response: While we did not solicit public comment about future measures, we appreciate the input and will take it into consideration in future LTCH QRP measure development.

5. Removal of Three LTCH QRP Measures

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20513 through 20515), we proposed to remove three measures from the LTCH QRP measure set. Beginning with the FY 2020 LTCH QRP, we proposed to remove two measures: (1) National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716); and (2) National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure. We proposed to remove one measure beginning with the FY 2021 LTCH QRP: Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680). We discuss these proposals below.

a. Removal of the National Healthcare Safety Network (NHSN) Facility-Wide Inpatient Hospital-Onset Methicillin-Resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716)

We proposed to remove the measure, National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-Resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF

#1716), from the LTCH QRP beginning with the FY 2020 LTCH QRP.

As discussed in section VIII.C.3. of the preambles of the proposed rule and this final rule, one of the main goals of our Meaningful Measures Initiative is to apply a parsimonious set of the most meaningful measures available to track patient outcomes and impact. We currently collect data on two measures of healthcare-associated bacteremia infections in the LTCH QRP: (1) NHSN Central line-associated Bloodstream Infection (CLABSI) Outcome Measure (NQF #0139); and (2) NHSN Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716).

In our review of these measures used in the LTCH QRP, we believe that it is appropriate to remove the NHSN Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716) based on: (1) Factor 6, a measure that is more strongly associated with desired patient outcomes for the particular topic is available; and (2) Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program.

We believe that the NHSN CLABSI Outcome Measure (NQF #0139) is more strongly associated with the desired patient outcome for bloodstream infections than the NHSN Facility-wide Inpatient Hospital-Onset MRSA Bacteremia Outcome Measure (NQF #1716). Bloodstream infections are serious infections typically causing a prolongation of hospital stay and increased cost and risk of mortality. The NHSN CLABSI Outcome Measure (NQF #0139) assesses the results of the quality of care provided to patients, and it is risk-adjusted to compare the infection rate for a particular location or locations in a hospital with an expected infection rate for those locations (which is calculated using national NHSN data for those locations in a predictive model). The NHSN CLABSI Outcome Measure (NQF #0139) is more strongly associated with the desired patient outcome of better results in the quality of care provided to patients because it covers a wide range of blood-stream infections, while the NHSN Facility-wide Inpatient Hospital-Onset MRSA Bacteremia Outcome Measure (NQF #1716) only covers MRSA observed hospital-onset unique blood source MRSA laboratory-identified events. The NHSN CLABSI Outcome Measure (NQF #0139) also captures the MRSA blood-stream events, creating potential duplicative collection and reporting.

We also believe that the costs associated with the NHSN Facility-wide Inpatient Hospital-Onset MRSA Bacteremia Outcome Measure (NQF #1716) outweigh the benefit of its continued use in the LTCH QRP. The NHSN Facility-wide Inpatient Hospital-Onset MRSA Bacteremia Outcome Measure (NQF #1716) was adopted to assess MRSA infections caused by a strain of MRSA bacteremia that has become resistant to antibiotics commonly used to treat MRSA infections. The NHSN Facility-wide Inpatient Hospital-Onset MRSA Bacteremia Outcome Measure (NQF #1716) and NHSN CLABSI Outcome Measure (NQF #0139) capture the same type of MRSA infection. This overlap results in the data submission on two measures that cover the same quality issue. We believe that this results in redundant efforts on the part of LTCHs that are costly and burdensome. In addition, the maintenance of these two measures in the LTCH QRP is costly for CMS. Lastly, we believe that the removal of the NHSN Facility-wide Inpatient Hospital-Onset MRSA Bacteremia Outcome Measure (NQF #1716) would benefit the public by eliminating the potential confusion of seeing two different measure rates on LTCH Compare that capture MRSA bacteremia.

We stated in the proposed rule that if our proposal is finalized, LTCHs would continue to report MRSA bacteremia events associated with central line use as part of the NHSN CLABSI Outcome Measure (NQF #0139), and LTCHs would also report as part of that measure other acquired central line-associated bloodstream infections. As a result, duplication of data submission of the same MRSA bacteremia event for these two measures would be eliminated and only a single bacteremia outcome measure would be publicly reported on *LTCH Compare.*

For these reasons, we proposed to remove the NHSN Facility-wide Inpatient Hospital-onset MRSA Bacteremia Outcome Measure (NQF #1716) from the LTCH QRP beginning with the FY 2020 LTCH QRP under: (1) Factor 6, a measure that is more strongly associated with desired patient outcomes for the particular topic is available; and (2) Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program.

We stated in the proposed rule that if our proposal is finalized as proposed, LTCHs would no longer be required to submit data on this measure for the purposes of the LTCH QRP beginning with October 1, 2018 admissions and discharges.

Comment: Several commenters, including MedPAC, supported the proposed removal of the National Healthcare Safety Network (NHSN) Facility-Wide Inpatient Hospital-Onset Methicillin-Resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716) from the LTCH QRP. Commenters noted that this removal aligns with CMS' focus on the Meaningful Measures Initiative and expressed that the removal of this measure would decrease costs and administrative burden for LTCHs, allowing them more time to focus on patient care.

In addition, several commenters agreed that the NHSN CLABSI Outcome Measure (NQF #0139) is more strongly associated with the desired patient outcome for bloodstream infections than the NHSN MRSA Bacteremia Outcome Measure (NQF #1716) and that maintaining both measures in the LTCH QRP would represent duplicative data collection and reporting. Another commenter qualified its support with a recommendation that CMS study the overlap between MRSA and CLABSI since MRSA bacteremias are often, but not always, CLABSIs.

Response: We appreciate the support from MedPAC and other commenters for the proposed removal of the NHSN Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716) from the LTCH QRP. We are aligned with the Centers for Disease Control and Prevention's (CDC's) interest in examining the CDC NHSN measures, and the CDC is considering further study on the overlap of bacteremias within the MRSA and CLABSI measures.

Comment: Some commenters expressed concern with the proposed removal of the National Healthcare Safety Network (NHSN) Facility-Wide Inpatient Hospital-Onset Methicillin-Resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716) from the LTCH QRP.

Some commenters expressed concern that removing this measure would decrease the ability of providers to continually monitor and address critical patient safety issues and the ability of patients and families, employers, and payers to make informed decisions about their health care. These commenters stated that the public reporting of patient safety measures helps focus and strengthen efforts to improve healthcare quality and safety.

Commenters also stated that patient safety should continue to be assessed in

a manner which provides minimal interruption to data collection and burden on LTCHs. In addition, several commenters noted that, with such a small measure set, CMS should strive to maintain key outcome measures.

Other commenters believed that the NHSN CLABSI Outcome Measure (NQF #0139), alone, was not sufficient to capture the desired outcome of bloodstream infections, and stated that the two measures on this topic address different issues which are dependent upon different processes for prevention.

Response: We would like to clarify that providers have the ability to continually monitor and address patient safety issues with the continued public reporting of the NHSN CLABSI Outcome Measure (NQF #0139), which captures MRSA bloodstream events, on *LTCH Compare,* even with the removal of the NHSN Facility-Wide Inpatient Hospital-Onset Methicillin-Resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716).

We agree with the commenters that patient safety should continue to be assessed in a manner that provides minimal interruption to data collection and burden on LTCHs. Through the Meaningful Measures Initiative, it is our goal to maximize patient safety with minimal burden on providers. We continue to monitor hospital acquired infections in the LTCH setting through the NHSN Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (NQF #0138), the NHSN Central Line-associated Bloodstream Infection (CLABSI) Outcome Measure (NQF #0139), and the NHSN Facility-wide Inpatient Hospital-onset Clostridium difficile Infection (CDI) Outcome Measure (NQF #1717). In addition, we agree with several commenters that CMS should strive to maintain key outcome measures, and we will continually review, evaluate, and amend, if necessary, these measures within our quality programs.

Lastly, we disagree with the commenter who stated that the CLABSI and MRSA measures address different issues which are dependent upon different processes for prevention. We are clarifying that MRSA bacteremia LabID event reporting is only based on the proxy measure of a positive laboratory finding with no clinical consideration. MRSA bacteremia LabID event reporting is different from CLABSI reporting, which is based on specific infection criteria. Since CLABSI reporting is based on standardized case definitions, there is confidence in the data that can be used to impact prevention efforts as well as increased comparability between clinical settings.

For example, an increased CLABSI standardized infection ratio (SIR) would be viewed as an opportunity for improvement in overall standard of care practices. In addition, the monitoring conducted under CLABSI reporting is not limited to MRSA bloodstream infections and includes all organisms identified in blood culture collection, pathogens and common commensal organisms. Thus, the CLABSI measure data can inform broader preventive programs than the NHSN Facility-wide Inpatient Hospital-Onset Methicillin-Resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716).

After consideration of the public comments we received, we are finalizing our proposal to remove the NHSN Facility-wide Inpatient Hospital-onset MRSA Bacteremia Outcome Measure (NQF #1716) from the LTCH QRP beginning with the FY 2020 LTCH QRP. LTCHs will no longer be required to submit data on this measure for the purposes of the LTCH QRP beginning with October 1, 2018 admissions and discharges.

b. Removal of the National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure

We proposed to remove the National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure from the LTCH QRP beginning with the FY 2020 LTCH QRP based on Factor 6, a measure that is more strongly associated with desired patient outcomes for the particular topic is available.

We finalized the National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50301 through 50305) to assess whether LTCHs monitor ventilator use and identify improvements in preventing complications associated with mechanical ventilation. We have also adopted for the LTCH QRP three other assessment-based quality measures on the topic of ventilator support: (1) Functional Outcome Measure: Change in Mobility among Long-Term Care Hospital Patients Requiring Ventilator Support (NQF #2632) (79 FR 50298 through 50301); (2) Compliance with Spontaneous Breathing Trials (SBT) by Day 2 of the LTCH Stay (82 FR 38439 through 38443); and (3) Ventilator Liberation Rate (82 FR 38443 through 38446).

We believe that these three other assessment-based quality measures are more strongly associated with desired patient outcomes than the National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure that we proposed to remove. The three assessment-based measures assess activities that reduce the potential for serious complications and other adverse events as a result of mechanical ventilation. Specifically, the Functional Outcome Measure: Change in Mobility among Long-Term Care Hospital Patients Requiring Ventilator Support (NQF #2632) focuses on improvement in functional mobility for patients requiring mechanical ventilation. The Compliance with SBT by Day 2 of the LTCH Stay measure focuses on successfully liberating patients from mechanical ventilation as soon as possible, which reduces the risk associated with events as a result of prolonged ventilator support. The Ventilator Liberation Rate measure assesses whether the patient was fully liberated from mechanical ventilation at discharge. Together, these three ventilator-related assessment-based quality measures assess positive outcomes and track patient goals of avoiding adverse outcomes associated with mechanical ventilation and successful ventilator weaning.

The inclusion in the LTCH QRP measure set of these three ventilator-related assessment-based measures, which focus on quality of care through promotion of positive outcomes, have reduced poor outcomes associated with the complications of ventilator care, which is the same focus of the National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure (for example, worsening oxygenation, infection or inflammation, ventilator-associated pneumonia, or even death). As a result, we do not believe that it is necessary to retain all four of these measures in the LTCH QRP. By retaining the three ventilator-related assessment-based measures but removing the National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure, we believe that we can focus on the topic of mechanical ventilation measures that promote positive outcomes while indirectly promoting a reduction in ventilator support complications.

For these reasons, we proposed to remove the National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure from the LTCH QRP beginning with the FY 2020 LTCH QRP under Factor 6, the measure that is more strongly associated with

desired patient outcomes for the particular topic is available.

We stated in the proposed rule that if our proposal is finalized as proposed, LTCHs would no longer be required to submit data on this measure for the purposes of the LTCH QRP beginning with October 1, 2018 admissions and discharges.

Comment: Several commenters, including MedPAC, supported the proposed removal of the NHSN VAE Outcome Measure from the LTCH QRP. Commenters agreed that this removal aligns with CMS' Meaningful Measures Initiative and the removal of this measure would decrease costs and administrative burden for LTCHs, allowing them more time to focus on patient care. Several commenters agreed that the measure is duplicative of the three ventilator-related assessment-based quality measures and that the NHSN VAE Outcome Measure might not be as strongly associated with the desired patient outcomes as these three measures.

Response: We appreciate the support and suggestions from MedPAC and other commenters for the proposed removal of the NHSN VAE Outcome Measure from the LTCH QRP.

Comment: A few commenters were appreciative of the removal of the NHSN VAE Outcome Measure and agreed that it overlaps unnecessarily with the other ventilator-related measures in the LTCH QRP, but recommended that CMS instead remove the process measure, Compliance with Spontaneous Breathing Trial (SBT) by Day 2 of the LTCH Stay, from the LTCH QRP.

Response: We appreciate the commenters' feedback; however, we disagree with the recommendation to remove the Compliance with SBT by Day 2 of the LTCH Stay measure instead of the NHSN VAE Outcome Measure that we proposed to remove. The Compliance with SBT by Day 2 of the LTCH Stay measure, when taken together with the two other ventilator-related assessment-based quality measures Functional Outcome Measure: Change in Mobility among Long-Term Care Hospital Patients Requiring Ventilator Support (NQF #2632) and Ventilator Liberation Rate, assesses positive outcomes and track patient goals of avoiding adverse outcomes associated with mechanical ventilation and successful liberation off the ventilator.

As we stated in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38439 through 38440), the Compliance with SBT by Day 2 of the LTCH Stay measure is important for encouraging implementation of evidence-based weaning protocols that reduces the risk of negative ventilator-associated outcomes such as ventilator-associated pneumonia.

Comment: Several commenters expressed concern with the proposed removal of the NHSN VAE Outcome Measure from the LTCH QRP. Some commenters were concerned that removing this measure would decrease the ability of providers to continually monitor and address critical patient safety issues, patients and families to make informed decisions about their health care, and employers and purchasers to obtain better value for their contracts and purchasing programs. The commenters stated that public reporting of patient safety measures helps focus and strengthen efforts to improve healthcare quality and safety.

Several commenters stated that patient safety should continue to be assessed in a manner that provides minimal interruption to data collection and burden on LTCHs. In addition, several commenters noted that, with such a small measure set, CMS should strive to maintain key outcome measures. Several commenters also emphasized the importance of the NHSN VAE Outcome Measure for epidemiological tracking, with a few commenters adding that this measure has only been required since January 2016 and that only a baseline has been established. Another commenter advised CMS to monitor rates of worsening oxygenation, infection, inflammation, and ventilator-associated pneumonia to ensure that the measure's removal does not unintentionally lead to a rising trend in these events. A few commenters stated that preventing VAEs requires different processes than preventing central line infections and thus, should continue to be monitored in addition to the three current ventilator assessment-based quality measures currently in the LTCH QRP.

Response: We acknowledge the concerns raised by the commenters. As we note above, the other three ventilator assessment-based quality measures currently in the LTCH QRP measure set (Functional Outcome Measure: Change in Mobility among Long-Term Care Hospital Patients Requiring Ventilator Support (NQF #2632); Compliance with Spontaneous Breathing Trials (SBT) by Day 2 of the LTCH Stay; and Ventilator Liberation Rate) assess activities that reduce the potential for serious complications and other adverse events to occur as a result of mechanical ventilation. We believe that encouraging implementation of evidence-based weaning protocols, improving mobility, and liberating patients off mechanical ventilation addresses critical patient safety issues, allows patients and families to make informed decisions based on positive outcomes, and strengthens the value of healthcare.

We agree with the commenters that patient safety should continue to be assessed in a manner which provides minimal interruption to data collection and burden on LTCHs. Through the Meaningful Measures Initiative, one of our goals is to ensure that our measures are strongly associated with the desired patient outcomes. We are continuing to monitor hospital acquired infections in the LTCH setting with the NHSN Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (NQF #0138), the NHSN Central Line-associated Bloodstream Infection (CLABSI) Outcome Measure (NQF #0139) and the NHSN Facility-wide Inpatient Hospital-onset Clostridium difficile Infection (CDI) Outcome Measure (NQF #1717). In addition, we agree with several commenters that CMS should strive to maintain key outcome measures, and we will continually review, evaluate, and amend, if necessary, these measures within our quality programs.

We also agree that epidemiological tracking of VAE is important and that providers should be able to continue monitoring events such as worsening oxygenation, infection, inflammation, and ventilator-associated pneumonia to ensure these events will not rise. LTCHs can continue to report VAE data to NHSN on a voluntary basis, as well as use NHSN for their own internal tracking of local VAE incidence.

Data on LTCH QRP measures that are also collected by the CDC for other purposes are reported by LTCHs to the CDC through the NHSN, and the CDC then transmits the relevant data to CMS. Even with the removal of the National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure from the LTCH QRP, the CDC will continue to use VAE data in the production of national and State-level SIRs as a way to track progress towards prevention goals. We recognize that preventing VAEs requires different processes than preventing central line infections. However, as noted above, we believe that the other LTCH QRP VAE-related measures assess positive outcomes and track patient goals of avoiding adverse outcomes associated with mechanical ventilation and successful liberation off the ventilator.

After consideration of the public comments we received, we are finalizing our proposal to remove the National Healthcare Safety Network

(NHSN) Ventilator-Associated Event (VAE) Outcome Measure from the LTCH QRP beginning with the FY 2020 LTCH QRP. LTCHs will no longer be required to submit data on this measure for the purposes of the LTCH QRP beginning with October 1, 2018 admissions and discharges.

c. Removal of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) Measure

We proposed to remove the process measure, Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680), beginning with the FY 2021 LTCH QRP under measure removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program.

This process measure reports the percentage of stays in which a patient was assessed and appropriately given the influenza vaccine for the most recent influenza vaccination season and was adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53624 through 53627) to assess vaccination rates among older adults with the goal of reducing the incidence of influenza in this population. Specifically, adoption of the measure in the LTCH QRP was intended to act as a safeguard for patients who did not receive vaccinations prior to admission to an LTCH, since many patients receiving care in the LTCH setting are older adults (those 65 years and older) and are considered to be the target population for the influenza vaccination.

In our evaluation of the LTCH QRP measure set, our analysis of this particular measure revealed that for the 2016–2017 influenza season, nearly every patient was assessed by the LTCH upon admission and that less than 0.04 percent of patients were not assessed for the vaccination. Of those assessed, the data show that most patients who could receive the vaccine had already received the vaccine outside of the LTCH facility, prior to admission.

In addition, we have heard from stakeholders that the data collection associated with this measure is administratively costly and burdensome for LTCHs, and that the process of assessing whether vaccination is needed is often a duplicative process for patients who were already screened during their proximal stay at an acute care facility. We believe that removing this measure would reduce provider costs and burden by eliminating duplicative patient assessments across healthcare settings, minimizing data collection and reporting, and avoiding potentially confusing public reporting of other influenza-related quality measures, such as the Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431) measure.

We recognize that influenza is a major public health issue. However, based on our analysis of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) measure, including data showing that most LTCH patients are vaccinated before they are admitted to the LTCH, we believe that LTCH patients will continue to be assessed and immunized when appropriate in the absence of this measure. As a result, removal of this measure would alleviate the operational costs and burden that LTCHs currently incur with respect to collecting the data necessary to report this measure.

Therefore, we proposed to remove this measure from the LTCH QRP beginning with the FY 2021 LTCH QRP under measure removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program.

We stated in the proposed rule that if our proposal is finalized as proposed, LTCHs would no longer be required to report the data elements necessary to calculate this measure beginning with October 1, 2018 [406] admissions and discharges. We stated in the proposed rule that we plan to remove the data elements from the LTCH CARE Data Set as soon as feasible. We also proposed that beginning with October 1, 2018 admissions and discharges, LTCHs should enter a dash (–) for O0250A, O0250B, and O0250C until the next LTCH CARE Data Set is released.

Comment: Several commenters, including MedPAC, supported the proposal to remove the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) measure from the LTCH QRP. The commenters emphasized that collecting data on this measure is costly, burdensome, and duplicative since many patients admitted to LTCHs are transferred from the acute care setting where influenza vaccinations are already being tracked. Other commenters stated that if providers are successfully meeting the established standards set by CMS, then data collection is an unnecessary process. In addition, the commenters stated that removing the measure will result in less administrative burden without compromising the quality of care and will allow providers to focus on more meaningful measures to promote better health outcomes for patients and to align with the Meaningful Measures Initiative.

Response: We appreciate the support from MedPAC and other commenters for the proposed removal of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) measure from the LTCH QRP.

Comment: Several commenters did not support the removal of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) measure from the LTCH QRP. Commenters were concerned with consequences related to patient care, suggesting that the benefits of the measure far outweigh the costs of retaining the measure. One commenter stated that the high performance of the measure is a clear indicator of the success of the measure and continuing to track immunizations should be a priority because patients in LTCHs are susceptible to the acquisition and spread of infectious diseases. Another commenter suggested that an outbreak is more likely to occur and would be costlier than the burden of reporting the measure. Another commenter noted that confusion between the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) measure and the Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431) measure is unlikely and should not be used as a rationale to remove the measure.

Response: We recognize that assessing and appropriately vaccinating patients is an important component of the care process, and the vaccination of the majority of patients before admission to LTCHs protects against the spread of infectious disease. Our analysis has shown that most patients admitted to LTCHs are admitted from an acute-care setting where influenza vaccinations are

[406] The target period for the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) measure is the influenza season, which begins July 1 and ends June 30 of the following year. The influenza vaccination season falls within the influenza season of a given year and starts October 1 and ends March 31 of the following year. This measure includes all patients who were in an LTCH at least one day during the influenza vaccination season. The October 1, 2018 date is proposed as the date in which LTCHs would no longer be required to report the data elements necessary to calculate this measure because October 1, 2018 marks the start of the influenza vaccination season for the 2018–2019 influenza season.

being tracked, which is why we believe that collecting and reporting data on this measure would be duplicative. Further, high performance of the measure across LTCHs is positive, which makes assessing variations in provider performance difficult.

We strive to align with the Meaningful Measures Initiative by prioritizing measures most vital to improving patient outcomes and focusing on issues that are most meaningful to patients and their families. We considered feedback from subject matter experts who have noted the potential for confusion between the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) and the Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431) measures. Removal of measures will ultimately ease provider burden and allow LTCHs to devote more time to provide efficient and effective care to improve patient outcomes.

After consideration of the public comments we received, we are finalizing our proposal to remove the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) measure from the LTCH QRP, beginning with the FY 2021 LTCH QRP. LTCHs will no longer be required to report the data elements necessary to calculate this measure beginning with October 1, 2018 admissions and discharges.

6. IMPACT Act Implementation Update

In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38449), we stated that we intended to specify two measures that would satisfy the domain of accurately communicating the existence and provision of the transfer of health information and care preferences under section 1899B(c)(1)(E) of the Act no later than October 1, 2018, and intended to propose to adopt them for the FY 2021 LTCH QRP with data collection beginning on or about April 1, 2019.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20515), we stated that as a result of the input provided during a public comment period between November 10, 2016 and December 11, 2016, input provided by a technical expert panel (TEP), and pilot measure testing conducted in 2017, we are engaging in continued development work on these two measures, including supplementary measure testing and providing the public with an opportunity for comment in 2018. We stated that we would reconvene a TEP for these measures in mid-2018 which occurred in April 2018. We stated that we now intend to specify the measures under section 1899B(c)(1)(E) of the Act no later than October 1, 2019 and intend to propose to adopt the measures for the FY 2022 LTCH QRP, with data collection beginning with April 1, 2020 admissions and discharges. For more information on the pilot testing, we refer readers to: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/IMPACT-Act-of-2014/IMPACT-Act-Downloads-and-Videos.html*.

We did not receive any public comments regarding this IMPACT Act implementation update.

7. Form, Manner, and Timing of Data Submission Under the LTCH QRP

Under our current policy, LTCHs report data on LTCH QRP assessment-based measures and standardized patient assessment data by reporting the designated data elements for each applicable patient on the LTCH CARE Data Set patient assessment instrument and then submitting the completed instruments to CMS using the Quality Improvement and Evaluation System (QIES) Assessment and Submission Processing (ASAP) system. Data on LTCH QRP measures that are also collected by the CDC for other purposes are reported by LTCHs to the CDC through the NHSN, and the CDC then transmits the relevant data to CMS. We refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38454 through 38456) for the data collection and submission timeframes that we finalized for the LTCH QRP.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20515), we sought input on whether we should move the implementation date of any new version of the LTCH CARE Data Set from the usual release date of April to October in the future.

Comment: Some commenters supported moving the implementation date of the LTCH CARE Data Set from April to October. One commenter supported the proposal as long as significant changes are noted in proposed rulemaking and CMS provides additional time to prepare and comply with new reporting requirements. Another commenter had no position in support of or against the concept of moving the implementation date of a new LTCH CARE Data Set from April to October. Another commenter encouraged CMS to keep the LTCH CARE Data Set update in April as it would allow for changes or comments to be included in the proposed rule.

Response: We appreciate the commenters' input as we determine whether to propose moving the implementation date of the LTCH CARE Data Set from April to October. We would like to clarify that in proposing any updates to the LTCH CARE Data Set, the implementation date of the new version of the LTCH CARE Data Set would not occur until the following year at the earliest. For example, if we propose this change in April 2019, then the implementation of the new version of the LTCH CARE Data Set would not occur until October 1, 2020 at the earliest, as opposed to April 1, 2020. This would give LTCHs an additional 6 months (April-October) to update their systems so that they can comply with new reporting requirements.

8. Changes to the LTCH QRP Reconsideration Requirements

Section 412.560(d)(1) of our regulations states that CMS will send an LTCH written notification of a decision of noncompliance with the measures data and standardized patient assessment data reporting requirements for a particular fiscal year. It also states that CMS will use the QIES ASAP system to provide notification of noncompliance to the LTCH.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20515), we proposed to revise § 412.560(d)(1) to expand the methods by which we would notify an LTCH of noncompliance with the LTCH QRP requirements for a program year. Revised § 412.560(d)(1) would state that we would notify LTCHs of noncompliance with the LTCH QRP requirements via a letter sent through at least one of the following notification methods: the QIES ASAP system, the United States Postal Service, or via an email from the Medicare Administrative Contractor (MAC). We believe this change will address feedback from providers who requested additional methods for notification.

We also proposed to revise § 412.560(d)(3) to clarify that we will notify LTCHs, in writing, of our final decision regarding any reconsideration request using the same notification process.

Comment: Many commenters supported the efforts by CMS to provide more methods of communication for notifying LTCHs of LTCH QRP noncompliance and reconsideration decisions. The commenters requested additional details about the timelines and logistics of these methods of notification, such as how providers should specify the recipients of notifications from the MAC. Another

commenter recommended that CMS work with providers to develop a formal notification protocol and, at a minimum, clarify how the proposal will affect current notification procedures before finalizing the proposal.

In addition, some commenters expressed concerns that multiple notification methods and lack of specificity would cause confusion, add uncertainty, and cause delays in the notification process. One commenter suggested that CMS revise the process so that: (1) LTCHs can designate one person at the hospital or within the hospital organization to receive these notices, and (2) LTCHs can choose one method of notification from CMS out of the three options.

Response: We thank commenters for their support. We will use at least one method of notification, and providers will be notified regarding the specific method of communication that we will use via the LTCH QRP Reconsideration and Exception & Extension website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Reconsideration-and-Exception-and-Extension.html* and announcements via the PAC listserv. The announcements will be posted annually following the May 15th data submission deadline prior to the distribution of the initial notices of noncompliance determination in late spring/early summer. Messaging will include the method of communication for the notices of noncompliance, instructions for sending a reconsideration request, and the final deadline for submitting the request. This policy would be effective October 1, 2018.

In response to the concerns regarding the multiple notification methods, it is our intent that the announcements posted on our website and sent via the PAC listserv will alleviate any confusion regarding noncompliance decisions and the reconsideration process. With regard to the comment about specifying the recipients of notifications for a specific facility, our notifications are sent to the point of contact on file in the QIES database. This information is populated via the Automated Survey Processing Environment (ASPEN) system. It is the responsibility of the facility to ensure that this information is up-to-date. For information regarding how to update provider information in QIES, we refer providers to: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/Downloads/How-to-Update-LTCH-Demographic-Data-1-4-18-Final.pdf*.

After consideration of the public comments we received, we are finalizing our proposal to revise § 412.560(d)(1) of our regulations to state that we will notify LTCHs of noncompliance with the LTCH QRP via a notification sent through at least one of the following methods: the QIES ASAP system, the United States Postal Service, or via an email from the MAC. We are also finalizing our proposal to revise § 412.560(d)(3) of our regulations to clarify that we will notify LTCHs, in writing, of our final decision regarding any reconsideration request using the same notification process.

D. Changes to the Medicare and Medicaid EHR Incentive Programs (Now Referred to as the Medicare and Medicaid Promoting Interoperability Programs)

1. Background and Summaries of Final Policies Included in This Final Rule

a. Background

The HITECH Act (Title IV of Division B of the ARRA, together with Title XIII of Division A of the ARRA) authorizes incentive payments under Medicare and Medicaid for the adoption and meaningful use of certified electronic health record technology (CEHRT). Incentive payments under Medicare are available to eligible hospitals and CAHs for certain payment years (as authorized under sections 1886(n) and 1814(l) of the Act, respectively) if they successfully demonstrate meaningful use of CEHRT, which includes reporting on clinical quality measures (CQMs or eCQMs) using CEHRT. Incentive payments are available to Medicare Advantage (MA) organizations under section 1853(m)(3) of the Act for certain affiliated hospitals that meaningfully use CEHRT.

Sections 1886(b)(3)(B)(ix) and 1814(l)(4) of the Act also establish downward payment adjustments under Medicare, beginning with FY 2015, for eligible hospitals and CAHs that do not successfully demonstrate meaningful use of CEHRT for certain associated reporting periods. Section 1853(m)(4) of the Act establishes a negative payment adjustment to the monthly prospective payments of a qualifying MA organization if its affiliated eligible hospitals are not meaningful users of CEHRT, beginning in 2015. Section 1903(a)(3)(F)(i) of the Act establishes 100 percent Federal financial participation (FFP) to States for providing incentive payments to eligible Medicaid providers (described in section 1903(t)(2) of the Act) to adopt, implement, upgrade and meaningfully use CEHRT.

b. Summaries of Final Policies Included in This Final Rule

In this final rule, we are adopting final policies based on proposals in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20515 through 20544) to continue advancement of CEHRT utilization, focusing on burden reduction, interoperability and patient access to their health information.

For the reasons discussed in section VIII.D.4. of the preamble of this final rule, we are finalizing an EHR reporting period of a minimum of any continuous 90-day period in CY 2019 and 2020 for new and returning participants attesting to CMS or their State Medicaid agency.

For the reasons discussed in sections VIII.D.5. and VIII.D.6. of the preamble of this final rule, we are finalizing with modification the proposed performance-based scoring methodology, which consists of a smaller set of objectives including e-Prescribing, Health Information Exchange, Provider to Patient Exchange and Public Health and Clinical Data Exchange. We are finalizing the Query of PDMP measure as proposed.

We are finalizing the Verify Opioid Treatment Agreement measure as optional in CY 2019 and CY 2020, with the ability to earn 5 bonus points per year. In addition, eligible hospitals and CAHs must earn a minimum total score of 50 points in order to satisfy the requirement to report on the objectives and measures of meaningful use, which is one of the requirements for an eligible hospital or CAH to be considered a meaningful EHR user and earn an incentive payment and/or avoid a Medicare payment reduction.

For the reasons discussed in section VIII.D.6. of the preamble of this final rule, we are finalizing the new measures Query of PDMP, Verify Opioid Treatment Agreement, and Support Electronic Referral Loops by Receiving and Incorporating Health Information. In addition, we are finalizing the removal of the Coordination of Care Through Patient Engagement objective and its associated measures Secure Messaging, View, Download or Transmit, and Patient Generated Health Data as well as the measures Request/Accept Summary of Care, Clinical Information Reconciliation and Patient-Specific Education. Finally, we are renaming measures within the Health Information Exchange objective. These changes include changing the name from Send a Summary of Care to Support Electronic Referral Loops by Sending Health Information and

renaming the Public Health and Clinical Data Registry Reporting objective to Public Health and Clinical Data Exchange objective with the requirement to report on any two measures of the eligible hospital or CAH's choice. In addition, we are renaming the Patient Electronic Access to Health Information objective to Provider to Patient Exchange objective, and renaming the remaining measure, Provide Patient Access to Provide Patients Electronic Access to Their Health Information. We are also finalizing the removal of the exclusion criteria from all of the Stage 3 measures retained except for the measures associated with the Electronic Prescribing objective, Public Health and Clinical Data Exchange objective and the new measure, Support Electronic Referral Loops by Receiving and Incorporating Health Information.

For reasons discussed in section VIII.D.9. of the preamble of this final rule, we are finalizing the removal of certain CQMs beginning with the reporting period in CY 2020 as well as the CY 2019 reporting requirements as proposed to align the CQM reporting requirements for the Promoting Interoperability Programs with the Hospital IQR Program.

For reasons discussed in sections VIII.D.10. and VIII.D.11. of the preamble of this final rule, we are finalizing the proposed codification of policies for subsection (d) Puerto Rico hospitals and amending our regulations under Parts 412 and 495 such that the provisions that apply to eligible hospitals would include subsection (d) Puerto Rico hospitals unless otherwise indicated.

For reasons discussed in section VIII.D.12. of the preamble of this final rule, we are finalizing the $500,000 prior approval threshold for contracts and RFPs by amending §§ 495.324(b)(2) and (3) and 495.324(d). We are also finalizing the deadlines for enhanced FFP under the Medicaid Promoting Interoperability Programs,

We also note that we received many comments that were unrelated to the Promoting Interoperability Programs or otherwise outside the scope of the proposed rule, and we have not responded to these comments in this final rule. These comments included requirements specific to the Merit-based Incentive Payment System (MIPS), regulation pertaining to vendors, information blocking clarification, functionality requirements for application programming interfaces (APIs), the 2015 Edition of CEHRT and issuance of Medicaid incentive payments in CY 2021. We thank all the commenters for their suggestions and feedback on the Promoting Interoperability Programs.

2. Renaming the EHR Incentive Program

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20516), we proposed scoring and measurement policies to move beyond the three stages of meaningful use to a new phase of EHR measurement with an increased focus on interoperability and improving patient access to health information. To better reflect this focus, we have changed the name of the Medicare and Medicaid EHR Incentive Programs to the Promoting Interoperability (PI) Programs, and the new name applies for Medicare fee-for-service, Medicare Advantage, and Medicaid. We believe this change will help highlight the enhanced goals of the program and better contextualize the program changes discussed in the following sections. We also noted that the former name, Medicare and Medicaid EHR Incentive Programs, does not adequately reflect the current status of the programs, as the incentive payments under Medicare generally have ended (with the exception of subsection (d) Puerto Rico hospitals as discussed in section VIII.D.10. of the preambles of the proposed rule and this final rule) and will end under Medicaid in 2021.

3. Certification Requirements Beginning in 2019

Beginning with the EHR reporting period in CY 2019, participants in the Promoting Interoperability Programs are required to use the 2015 Edition of CEHRT pursuant to the definition of CEHRT under § 495.4. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20516 through 20517), we did not propose to change this policy, and we continue to believe it is appropriate to require the use of 2015 Edition CEHRT beginning in CY 2019. In reviewing the state of health information technology, it is clear the 2014 Edition certification criteria are out of date and insufficient for provider needs in the evolving health IT industry. In addition, we indicated it would be beneficial to health IT developers and health care providers to move to more up-to-date standards and functions that better support interoperable exchange of health information and improve clinical workflows.

Eligible hospitals and CAHs will see a reduction in burden through relief from being required to certify to a legacy system, and can use the 2015 Edition to better streamline workflows and utilize more comprehensive functions to meet patient safety goals and improve care coordination across the continuum. Maintaining only one edition of certification requirements would also reduce the burden for health IT developers as well as ONC-authorized testing laboratories and certification bodies because they would no longer have to support two, increasingly distant sets of requirements.

One of the major improvements in the 2015 Edition is the API functionality. API functionality supports health care providers and patient electronic access to health information, contributes to quality improvement, and offers greater interoperability between systems.

The 2015 Edition also includes certification criterion specifying a core set of data that health care providers have noted are critical to interoperable exchange and can be exchanged across a wide variety of other settings and use cases, known as the Common Clinical Data Set (C–CDS) (80 FR 62603). The US Core Data for Interoperability (USCDI) builds off the Common Clinical Data Set definition adopted for the 2015 Edition of certified health IT and referenced in the EHR Incentive Program, for instance as the data which must be included in a summary care record. The USCDI aims to support the goals set forth in the 21st Century Cures Act by specifying a common set of data classes that are required for interoperable exchange and identifying a predictable, transparent, and collaborative process for achieving those goals. The USCDI is referenced by the Draft Trusted Exchange Framework,[407] which is intended to enable HINs and Qualified HINs to securely exchange electronic health information in support of a range of permitted purposes, including treatment, payment, operations, individual access, public health, and benefits determination.

We also note that the Provide Patients Electronic Access to Their Health Information measure's technical requirements are updated in the 2015 Edition and support health care providers' interest in providing patients with access to their data in a manner that is helpful to the patient and aligns with the API requirement in the Promoting Interoperability Program. This includes a new function that supports patient access to their health information through email transmission to any third party the patient chooses and through a second encrypted method of transmission.

In working with ONC we were able to estimate the percentage of eligible clinicians, eligible hospitals and CAHs that have 2015 Edition CEHRT available

[407] *https://www.healthit.gov/sites/default/files/draft-trusted-exchange-framework.pdf.*

to them based on vendor readiness and information, and it appears that the transition from the 2014 Edition to the 2015 Edition is on schedule for the EHR reporting period in CY 2019.

We continue to recognize there is a burden associated with development and deployment of new technology, but we believe requiring use of the most recent version of CEHRT is important in ensuring health care providers use technology that has improved interoperability features and up-to-date standards to collect relevant patient health information. The 2015 Edition includes key updates to functions and standards that support improved interoperability and clinical effectiveness through the use of health IT.

We received many comments regarding the requirement to use the 2015 Edition of CEHRT beginning in 2019. As we stated in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20516), we were not proposing to change the requirement. Because the requirement was not a subject of this rulemaking, we are not responding to the comments we received, although we will consider them to inform our future policy making in this subject area.

4. Revisions to the EHR Reporting Period in 2019 and 2020

For the reasons discussed in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20517 through 20518), we proposed that the EHR reporting periods in 2019 and 2020 for new and returning participants attesting to CMS or their State Medicaid agency would be a minimum of any continuous 90-day period within each of the respective calendar years. Eligible professionals (EPs) that attest to a State for the State's Medicaid Promoting Interoperability Program and eligible hospitals and CAHs attesting to CMS or the State's Medicaid Promoting Interoperability Program would attest to meaningful use of CEHRT for an EHR reporting period of a minimum of any continuous 90-day period from January 1, 2019 through December 31, 2019 and from January 1, 2020 through December 31, 2020, respectively.

We proposed corresponding changes to the definition of ''EHR reporting period'' and ''EHR reporting period for a payment adjustment year'' at 42 CFR 495.4.

Comment: The majority of commenters strongly supported CMS' proposal to use a 90-day EHR reporting period in 2019 and 2020 in order to maximize the time available to implement and roll out system revisions.

Response: We appreciate the commenters' support of a 90-day EHR reporting period in 2019 and 2020 and believe this will reduce the burden on health care providers, EHR developers and vendors by allowing sufficient time for system upgrades, testing and implementation of the 2015 Edition of CEHRT functionalities and adjustment to the new scoring methodology, objectives and measures that we are finalizing in section VIII.D.5 and VIII.D.6.

Comment: Multiple commenters requested clarification on whether the 2015 Edition of CEHRT has to be in place by January 1, 2019 for the 2019 reporting year.

Response: For the Promoting Interoperability Programs, the 2015 Edition of CEHRT must be implemented for an EHR reporting period in CY 2019, which will be a minimum of 90 days as established in this final rule. It does not need to be implemented on January 1, 2019.

Comment: A few commenters requested a 90-day EHR reporting period in 2021 for both the objectives and measures and CQMs.

Response: We believe it is premature to establish policy beyond CY 2020 and decline to extend the 90-day EHR reporting period beyond CY 2020. We are finalizing the EHR reporting period specific to CYs 2019 and 2020 in order to provide the additional flexibility for vendors and health care providers that are in the process of implementing the 2015 Edition of CEHRT for an EHR reporting period beginning in CY 2019, reduce burden and allow eligible hospitals and CAHs to adjust to the new scoring and reporting methodology.

After consideration of the public comments we received, we are finalizing as proposed that the EHR reporting period is a minimum of any continuous 90-day period in CY 2019 and 2020 for new and returning participants in the Promoting Interoperability Programs attesting to CMS or their State Medicaid agency. Eligible professionals, eligible hospitals, and CAHs may select an EHR reporting period of a minimum of any continuous 90-day period in CY 2019 from January 1, 2019 through December 31, 2019 and in CY 2020 from January 1, 2020 through December 31, 2020.

The applicable incentive payment year and payment adjustment years for the EHR reporting period in 2019 and 2020, as well as the deadlines for attestation and other related program requirements, will remain the same as established in prior rulemaking.

We are finalizing as proposed the corresponding changes to the definition of ''EHR reporting period'' and ''EHR reporting period for a payment adjustment year'' at 42 CFR 495.4.

5. Scoring Methodology for Eligible Hospitals and CAHs Attesting Under the Medicare Promoting Interoperability Program

a. Background

As we considered the future direction of EHR reporting for the Promoting Interoperability Program, we considered how to increase the focus of EHR reporting on interoperability and sharing data with patients. We also considered the history of the program stages, as well as the increased flexibility provided by Public Law 115–123, the Bipartisan Budget Act of 2018. We refer readers to section VIII.D.5. of the preamble of the proposed rule for a discussion of the program stages. In light of these considerations, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20518 through 20524), we proposed a new performance-based scoring methodology with fewer measures, which would move away from the threshold-based methodology that we currently use. We stated that we believe this change would provide a more flexible, less burdensome structure, allowing eligible hospitals and CAHs to put their focus back on patients. The introduction of a performance-based scoring methodology would continue to encourage hospitals to push themselves on measures that we continue to hear are most applicable to how they deliver care to patients, instead of increasing thresholds on measures that may not be as applicable to an individual hospital. We stated that our goal is to provide increased flexibility to eligible hospitals and CAHs without compromising the integrity of the Medicare Promoting Interoperability Program and enable them to focus more on patient care and health data exchange through interoperability.

We proposed that the performance-based scoring methodology would apply to eligible hospitals and CAHs that submit an attestation to CMS under the Medicare Promoting Interoperability Program beginning with the EHR reporting period in CY 2019. This would include ''Medicare-only'' eligible hospitals and CAHs (those that are eligible for an incentive payment under Medicare for meaningful use of CEHRT and/or subject to the Medicare payment reduction for failing to demonstrate meaningful use) as well as ''dual-eligible'' eligible hospitals and CAHs (those that are eligible for an incentive payment under Medicare for meaningful use of CEHRT and/or subject to the

Medicare payment reduction for failing to demonstrate meaningful use, and are also eligible to earn a Medicaid incentive payment for meaningful use).

We did not propose to apply the performance-based scoring methodology to ''Medicaid-only'' eligible hospitals (those that are only eligible to earn a Medicaid incentive payment for meaningful use of CEHRT, and are not eligible for an incentive payment under Medicare for meaningful use and/or subject to the Medicare payment reduction for failing to demonstrate meaningful use) that submit an attestation to their State Medicaid agency for the Medicaid Promoting Interoperability Program. Instead, as discussed in section VIII.D.7. of the preambles of the proposed rule and this final rule, we proposed to give States the option to adopt the performance-based scoring methodology along with the measure proposals discussed in section VIII.D.6. of the preambles of the proposed rule and this final rule for their Medicaid Promoting Interoperability Programs through their State Medicaid HIT Plans.

To accomplish our goal of a performance-based program that reduces burden while promoting interoperability, and taking into account the feedback from our stakeholders, we outlined a proposal using a performance-based scoring methodology in the proposed rule and the following sections of the preamble of this final rule. We believe the proposal promotes interoperability, helps to maintain a focus on patients, reduces burden and provides greater flexibility. The proposal takes an approach that weighs each measure based on performance, and allows eligible hospitals and CAHs to emphasize measures that are most applicable to their care delivery methods, while putting less emphasis on those measures that may be less applicable.

We stated that if we did not finalize a new scoring methodology, we would maintain the current Stage 3 methodology with the same objectives, measures and requirements, but we would include the two new opioid measures proposed in section VIII.D.6.b. of the preamble of the proposed rule, if finalized. The current structure of the Stage 3 objectives and measures under § 495.24(c) for eligible hospitals and CAHs attesting to CMS requires them to report on six objectives that include 16 measures. This structure requires the eligible hospital or CAH to report on all measures and meet the thresholds for most of the measures or claim an exclusion as part of demonstrating meaningful use to avoid the payment adjustment, or to earn an incentive in the case of subsection (d) Puerto Rico hospitals. A general summary overview of the current objectives, measures, and reporting requirements is included in the table below.

EXISTING STAGE 3 OBJECTIVES, MEASURES AND REPORTING REQUIREMENTS FOR THE MEDICARE EHR INCENTIVE PROGRAM FOR ELIGIBLE HOSPITALS AND CAHS

Objective	Measure (stage 3 threshold)	Reporting requirement
Protect Patient Health Information	Security Risk Analysis (Yes/No)	Report.
Electronic Prescribing	e-Prescribing (>25%)	Report and meet threshold.
Patient Electronic Access to Health Information.	Provide Patient Access (>50%) Patient Specific Education (>10%).	Report and meet thresholds.
Coordination of Care Through Patient Engagement.	View, Download or Transmit (at least one patient) Secure Messaging (>5%). Patient Generated Health Data (>5%).	Report all, but only meet the threshold for two.
Health Information Exchange	Send a Summary of Care (>10%) Request/Accept Summary of Care (>10%). Clinical Information Reconciliation (>50%).	Report all, but only meet the threshold for two.
Public Health and Clinical Data Registry Reporting.	Immunization Registry Reporting Syndromic Surveillance Reporting. Electronic Case Reporting. Public Health Registry Reporting. Clinical Data Registry Reporting. Electronic Reportable Laboratory Result Reporting.	Report Yes/No to Three Registries.

b. Performance-Based Scoring Methodology

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20518 through 20524), we proposed a new scoring methodology to include a combination of new measures, as well as the existing Stage 3 measures of the EHR Incentive Program, broken into a smaller set of four objectives and scored based on performance and participation. We believe this is a significant overhaul of the existing program requirements, which include six objectives, scored on a pass/fail basis. The smaller set of objectives would include e-Prescribing, Health Information Exchange, Provider to Patient Exchange, and Public Health and Clinical Data Exchange. We proposed these objectives to promote specific HHS priorities. We included the e-Prescribing and Health Information Exchange objectives in part to capture what we believe are core goals for the 2015 Edition in line with section 1886(n)(3)(A) of the Act. These core goals promote interoperability between health care providers and health IT systems to support safer, more coordinated care. The Provider to Patient Exchange objective promotes patient awareness and involvement in their health care through the use of APIs, and ensures patients have access to their medical data. Finally, the Public Health and Clinical Data Exchange objective supports the ongoing systematic collection, analysis, and interpretation of data that may be used in the prevention and controlling of disease through the estimation of health status and behavior. The integration of health IT systems into the national network of health data tracking and promotion improves the efficiency, timeliness, and effectiveness of public health surveillance.

Under the proposed scoring methodology, eligible hospitals and CAHs would be required to report certain measures from each of the four objectives, with performance-based scoring occurring at the individual measure-level. Each measure would be scored based on the eligible hospital or CAH's performance for that measure, except for the Public Health and Clinical Data Exchange objective, which requires a yes/no attestation. Each

measure would contribute to the eligible hospital or CAH's total Promoting Interoperability score. The scores for each of the individual measures would be added together to calculate the total Promoting Interoperability score of up to 100 possible points for each eligible hospital or CAH. A total score of 50 points or more would satisfy the requirement to report on the objectives and measures of meaningful use under § 495.24, which is one of the requirements for an eligible hospital or CAH to be considered a meaningful EHR user under § 495.4 and thus earn an incentive payment and/or avoid a Medicare payment reduction. Eligible hospitals and CAHs scoring below 50 points would not be considered meaningful EHR users.

While this approach maintains some of the same requirements of the EHR Incentive Program, we note that we proposed to reduce the overall number of required measures from 16 to 6. We also note that the measures we proposed to include contribute to the goal of increased interoperability and patient access, and no longer require the burdensome predefined thresholds of the EHR Incentive Program, and thus allow new flexibility for eligible hospitals and CAHs in how they are scored. We stated that we believe this proposal allows eligible hospitals and CAHs to achieve high performance in one area where they excel, in order to offset performance in an area where they may need additional improvement. In this manner, we stated that we believe eligible hospitals and CAHs could still be considered meaningful EHR users while continuing to monitor their progress on each of the measures. This approach also helps further promote interoperability by requiring all measures and thus all forms of interoperability across the three objectives.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20520), we also considered an alternative approach in which scoring would occur at the objective level, instead of the individual measure level, and eligible hospitals or CAHs would be required to report on only one measure from each objective to earn a score for that objective. Under this scoring methodology, instead of six required measures, the eligible hospital or CAH's total Promoting Interoperability score would be based on only four measures, one measure from each objective. Each objective would be weighted similarly to how the objectives are weighted in our proposed methodology, and bonus points would be awarded for reporting any additional measures beyond the required four. In the proposed rule, we sought public comment on this alternative approach, and whether additional flexibilities should be considered, such as allowing eligible hospitals and CAHs to select which measures to report on within an objective and how those objectives should be weighted, as well as whether additional scoring approaches or methodologies should be considered.

In our proposed scoring methodology, the Electronic Prescribing objective would contain three measures each weighted differently to reflect their potential availability and applicability to the hospital community. In addition to the existing e-Prescribing measure, we proposed to add two new measures to the Electronic Prescribing objective: Query of Prescription Drug Monitoring Program (PDMP) and Verify Opioid Treatment Agreement. For more information about these two proposed measures, we refer readers to section VIII.D.6.b. of the preambles of the proposed rule and this final rule. The e-Prescribing measure would be required for reporting and weighted at 10 points in CY 2019, because we believe it would be applicable to most eligible hospitals and CAHs. In the event that an eligible hospital or CAH meets the criteria and claims the exclusion for the e-Prescribing measure in 2019, the 10 points available for that measure would be redistributed equally among the measures under the Health Information Exchange objective:

- Support Electronic Referral Loops By Sending Health Information Measure (25 points)
- Support Electronic Referral Loops By Receiving and Incorporating Health Information (25 points)

In the proposed rule, we sought public comment on whether this redistribution is appropriate for 2019, or whether the points should be distributed differently.

We stated that the Query of Prescription Drug Monitoring Program (PDMP) and Verify Opioid Treatment Agreement measures would be optional for EHR reporting periods in 2019. These new measures may not be available to all eligible hospitals and CAHs for an EHR reporting period in 2019 as they may not have been fully developed by their health IT vendor, or not fully implemented in time for data capture and reporting. Therefore, we did not propose to require these two new measures in 2019, although eligible hospitals and CAHs may choose to report them and earn up to 5 bonus points for each measure. We proposed to require these measures beginning with the EHR reporting period in 2020, and we sought public comment on this proposal. We note that due to varying State requirements, not all eligible hospitals and CAHs would be able to e-prescribe controlled substances, and thus these measures would not be available to them. For these reasons, we proposed an exclusion for these two measures beginning with the EHR reporting period in 2020. The exclusion would provide that any eligible hospital or CAH that is unable to report the measure in accordance with applicable law would be excluded from reporting the measure, and the 5 points assigned to that measure would be redistributed to the e-Prescribing measure.

As the two new opioid measures become more broadly available in CEHRT, we proposed each of the three measures within the Electronic Prescribing objective would be worth 5 points beginning in 2020. We note that requiring these two measures would add 10 points to the maximum total score as these measures would no longer be eligible for optional bonus points. To maintain a maximum total score of 100 points, beginning with the EHR reporting period in 2020, we proposed to reweight the e-Prescribing measure from 10 points down to 5 points, and reweight the Provide Patients Electronic Access to Their Health Information measure from 40 points down to 35 points as illustrated in the table below. We proposed that if the eligible hospital or CAH qualifies for the e-Prescribing exclusion and is excluded from reporting all three of the measures associated with the Electronic Prescribing objective as described in section VIII.D.6.b. of the preambles of the proposed rule and this final rule, the 15 points for the Electronic Prescribing objective would be redistributed evenly among the two measures associated with the Health Information Exchange objective and the Provide Patients Electronic Access to Their Health Information measure by adding 5 points to each measure.

In the proposed rule, we sought public comment on the proposed distribution of points beginning with the EHR reporting period in 2020, but we did not receive any comments on this proposal.

After consideration of the public comments we received, we are finalizing our proposed scoring for the Electronic Prescribing objective as proposed but with the modifications discussed at the end of this section VIII.D.5. of the preamble of this final rule. The e-Prescribing measure is finalized as proposed, the Query of PDMP measure is finalized as proposed, and the Verify Opioid Treatment Agreement measure is finalized with

modification. We are finalizing the regulation text for the Electronic Prescribing objective scoring at § 495.24(e)(5). In addition, we refer readers to section VIII.D.6.b. of the preamble of this final rule where we discuss our reasons for adopting the Query of PDMP measure as proposed and the Verify Opioid Treatment Agreement measure with modification.

For the Health Information Exchange objective, we proposed to change the name of the existing Send a Summary of Care measure to Support Electronic Referral Loops by Sending Health Information, and proposed a new measure which combines the functionality of the existing Request/Accept Summary of Care and Clinical Information Reconciliation measures into a new measure, Support Electronic Referral Loops by Receiving and Incorporating Health Information. For more information about the proposed measure and measure changes, we refer readers to section VIII.D.6.c. of the preambles of the proposed rule and this final rule. Eligible hospitals and CAHs would be required to report both of these measures, each worth 20 points toward their total Promoting Interoperability score. These measures are weighted heavily to emphasize the importance of sharing health information through interoperable exchange in an effort to promote care coordination and better patient outcomes. Similar to the two new measures in the Electronic Prescribing objective, the new Support Electronic Referral Loops by Receiving and Incorporating Health Information measure may not be available to all eligible hospitals and CAHs as it may not have been fully developed by their health IT vendor, or not fully implemented in time for an EHR reporting period in 2019. For these reasons, we proposed an exclusion for the Support Electronic Referral Loops by Receiving and Incorporating Health Information measure; any eligible hospital or CAH that is unable to implement the measure for an EHR reporting period in 2019 would be excluded from having to report this measure.

In the event that an eligible hospital or CAH claims an exclusion for the Support Electronic Referral Loops by Receiving and Incorporating Health Information measure, the 20 points would be redistributed to the Support Electronic Referral Loops by Sending Health Information measure, and that measure would then be worth 40 points. In the proposed rule, we sought public comment on whether this redistribution is appropriate, or whether the points should be redistributed to other measures instead.

We did not receive any comments regarding the redistribution of points if an exclusion is claimed for the Support Electronic Referral Loops by Receiving and Incorporating Health Information measure.

We are finalizing our proposed scoring of the Health Information Exchange objective as proposed. We are finalizing the regulation text for the Health Information Exchange objective and measure scoring at § 495.24(e)(6). In addition, measure specification details can also be found in section VIII.D.6.c. of the preamble of this final rule.

We proposed to weight the one measure in the Provider to Patient Exchange objective, the Provide Patients Electronic Access to Their Health Information measure, at 40 points toward the total Promoting Interoperability score in 2019 and 35 points beginning in 2020. We proposed that this measure would be weighted at 35 points beginning in 2020 to account for the two new opioid measures, which would be worth 5 points each beginning in 2020 as proposed above. We believe this objective and its associated measure get to the core of improved access and exchange of patient data in promoting interoperability and are the crux of the Medicare Promoting Interoperability Program. This exchange of data between health care provider and patient is imperative in order to continue to improve interoperability, data exchange and improved health outcomes. We believe that it is important for patients to have control over their own health information, and through this highly weighted objective, we are aiming to show our dedication to this effort.

Comment: Many commenters supported CMS' proposed weighting of the Provide Patients Electronic Access to Their Health Information measure.

Response: We appreciate the support regarding the weight of this measure. We agree that it is an essential part of the Promoting Interoperability Program and therefore deserves to be highly weighted.

Comment: One commenter suggested that reporting on the Provide Patients Electronic Access to Their Health Information measure should be similar to the Security Risk Analysis measure in that it would be attested to by eligible hospitals and CAHs, but would not be scored.

Response: We thank the commenter for its recommendation. We decline to follow the approach the commenter recommended for the Provide Patients Electronic Access to Their Health Information measure. As we indicated in the proposed rule (83 FR 20516), we were increasing our focus on interoperability and improving patient access to health information. In addition, in the proposed rule (83 FR 20521) we stated that we believe the measure gets to the core of improved access and exchange of patient data in promoting interoperability and is the crux of the Medicare Promoting Interoperability Program, therefore it was heavily weighted due to its importance and focus. We will consider this recommendation in future policy decisions regarding the Promoting Interoperability Program.

Comment: One commenter requested that CMS score the Provide Patients Electronic Access to Their Health Information measure based on the total percentage of their patient population who have electronic access to their medical records, as opposed to the proposed number/denominator performance-based scoring that includes the entire patient population.

Response: We believe that is important that every patient has access to their health information electronically, we also believe that as we are moving forward to improving interoperability the patient should be the main partner in their health. We are committed to making sure that patients have access to their data electronically and believe this number will increase rapidly over the years. Therefore, we think that it is in the best interest of the Promoting Interoperability Program to include all patients in the denominator in part in order to ensure every patient is provided access and to better understand the amount of patients accessing their data electronically. As a result we will continue with the numerator/denominator performance-based scoring methodology.

After consideration of the comments, we are finalizing with modification the Provider to Patient Exchange objective scoring. The Provide Patients Electronic Access to Their Health Information measure will be worth up to 40 points beginning in CY 2019. We are finalizing the regulation text for this final policy at § 495.24(e)(7). For additional measure information, we refer readers to section VIII.6.d. of the preamble of this final rule.

The measures under the Public Health and Clinical Data Exchange objective are reported using yes/no responses and thus cannot be scored based on performance. We proposed that for this objective, the eligible hospital or CAH would be required to meet this objective in order to receive a score and be considered a meaningful user of EHR. We proposed that the eligible hospital

or CAH will be required to report the Syndromic Surveillance Reporting measure and one additional measure of the eligible hospital or CAH's choosing from the following: Immunization Registry Reporting, Electronic Case Reporting, Public Health Registry Reporting, Clinical Data Registry Reporting, Electronic Reportable Laboratory Result Reporting. We proposed an eligible hospital or CAH would receive 10 points for the objective if they attest a ''yes'' response for both the Syndromic Surveillance Reporting measure and one additional measure of their choosing. If the eligible hospital or CAH fails to report either one of the two measures required for this objective, the eligible hospital or CAH would receive a score of zero for the objective, and a total score of zero for the Promoting Interoperability Program. We understand that some hospitals may not be able to report the Syndromic Surveillance Reporting measure, or may not be able to report some of the other measures under this objective. Therefore, we proposed to maintain the current exclusions for these measures that were finalized in previous rulemaking. If an eligible hospital or CAH claims an exclusion for one or both measures required for this objective, we proposed the 10 points for this objective would be redistributed to the Provide Patients Electronic Access to Their Health Information measure under the proposed Provider to Patient Exchange objective, making that measure worth 50 points in 2019 and 45 points beginning in 2020. Reporting more than two measures for this objective would not earn the eligible hospital or CAH any additional points. We refer readers to section VIII.D.6.e. of the preambles of the proposed rule and this final rule in regards to the proposals for the current Public Health and Clinical Data Exchange objective and its associated measures.

Comment: A few commenters expressed concern that the Public Health and Clinical Data Exchange measures would be deemphasized if a minimum score of 50 points is required for reporting on the Promoting Interoperability objectives and measures or if the number of measures that must be reported is reduced from three to two.

Response: We appreciate the commenters' feedback. We value the importance of the Public Health and Clinical Data Exchange objective. As we noted in the proposed rule (83 FR 20535 through 20536), stakeholders have indicated that some of the existing active engagement requirements are complicated and confusing and contribute to unintended burden, and our proposals were intended to address these concerns. We disagree that our proposals would deemphasize the Public Health and Clinical Data Exchange measures because eligible hospitals and CAHs would be required to report on (or claim exclusions for) two of these measures. Failure to do so would result in a score of zero for the Promoting Interoperability Program. Requiring the measures to be reported as part of the program confirms the importance of the Public Health and Clinical Data Exchange objective. While it would not be required, eligible hospitals and CAHs may choose to report on additional Public Health and Clinical Data Exchange measures, as they deem appropriate for their daily workflow, although they would not receive additional points for such reporting.

After consideration of the public comments we received, we are finalizing our proposal for scoring the Public Health and Clinical Data Exchange objective as proposed but with the following modification. Instead of requiring eligible hospitals and CAHs to report the Syndromic Surveillance Reporting measure and one additional measure of their choosing, we will allow them to choose both of the measures that they will report. Eligible hospitals and CAHs must select two of the following measures to report on: Syndromic Surveillance Reporting, Immunization Registry Reporting, Electronic Case Reporting, Public Health Registry Reporting, Clinical Data Registry Reporting, and Electronic Reportable Laboratory Result Reporting. As stated in section VIII.6.e. of the preamble of this final rule, we believe the Syndromic Surveillance Reporting measure should not be required as we understand some hospitals and local jurisdictions are not able to send and receive syndromic surveillance files. In addition, allowing eligible hospitals and CAHs to report on any two measures of their choice promotes flexibility in reporting and allows them to focus on the public health measures that are most relevant to them and their patient populations. For additional measure information, we refer readers to section VIII.6.e. of the preamble of this final rule. We are finalizing the regulation text for this policy at § 495.24(e)(8).

We proposed that the Stage 3 objective, Protect Patient Health Information, and its associated measure, Security Risk Analysis, would remain part of the program, but would no longer be scored as part of the objectives and measures, and would not contribute to the hospital's total score for the objectives and measures. To earn any score in the Promoting Interoperability Program, we proposed eligible hospitals and CAHs would have to attest that they completed the actions included in the Security Risk Analysis measure at some point during the calendar year in which the EHR reporting period occurs. We believe the Security Risk Analysis measure involves critical tasks and note that the Health Insurance Portability and Accountability Act (HIPAA) Security Rule requires covered entities to conduct a risk assessment of their health care organization. This risk assessment will help eligible hospitals and CAHs comply with HIPAA's administrative, physical, and technical safeguards.[408] Therefore, we believe that every eligible hospital and CAH should already be meeting the requirements for this objective and measure as they are required by HIPAA. We still believe this objective and its associated measure is imperative in ensuring the safe delivery of patient health data. As a result, we would maintain the Security Risk Analysis measure as part of the Promoting Interoperability Program, but we would not score the measure. We sought public comment on whether the Security Risk Analysis measure should remain part of the program as an attestation with no associated score, or whether there should be points associated with this measure.

Comment: A few comments suggested that CMS should assign points for completing the actions of the Security Risk Analysis measure.

Response: As we discussed in the proposed rule (83 FR 20521 through 20522), we do not believe that the Security Risk Analysis measure should be scored because it includes actions required under HIPAA and ensures in part that the eligible hospitals and CAHs are in compliance with administrative, physical, and technical safeguards. We believe no additional points should be awarded because eligible hospitals and CAHs should already have been performing these actions.

Comment: The majority of commenters supported CMS' proposal to require eligible hospitals and CAHs to attest to the completion of the actions of the Security Risk Analysis measure with no associated score in order to be eligible to receive an overall score in the Promoting Interoperability Program as they believed this measure is a requirement in order to safely transmit their patient data and successfully participate in the Promoting Interoperability Program.

[408] *https://www.hhs.gov/hipaa/for-professionals/security/guidance/index.html.*

Response: As discussed in the preceding response, we agree that this measure should not be scored.

After consideration of the public comments we received, we are finalizing our proposal to require, as a condition of earning a score in the Promoting Interoperability Program, eligible hospitals and CAHs to attest that they completed the actions included in the Security Risk Analysis measure at some point during the calendar year in which the EHR reporting period occurs. We are finalizing the regulation text for this policy at § 495.24(e)(4).

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20522), we stated that, similar to how eligible hospitals and CAHs currently submit data, the eligible hospital or CAH would submit their numerator and denominator data for each performance measure, and a yes/no response for each of the two reported measures under the proposed Public Health and Clinical Data Exchange objective. To earn a score greater than zero, in addition to completing the activities required by the Security Risk Analysis measure, the hospital would submit their complete numerator and denominator or yes/no data for all required measures. The numerator and denominator for each performance measure would then translate to a performance rate for that measure and would be applied to the total possible points for that measure. For example, the e-Prescribing measure is worth 10 points. A numerator of 200 and denominator of 250 would yield a performance rate of (200/250) = 80 percent. This 80 percent would be applied to the 10 total points available for the e-Prescribing measure to determine the performance score. A performance rate of 80 percent for the e-Prescribing measure would equate to a measure score of 8 points (performance rate * total possible measure points = points awarded toward the total Promoting Interoperability score; 80 percent * 10 = 8 points). These calculations and application to the total Promoting Interoperability score, as well as an example of how they would apply are set out in the tables below.

When calculating the performance rates and measure and objective scores, we stated that we would generally round to the nearest whole number. For example, if an eligible hospital or CAH received a score of 8.53 the nearest whole number would be 9. Similarly, if the eligible hospital or CAH received a score of 8.33 the nearest whole number would be 8. In the event that the eligible hospital or CAH receives a performance rate or measure score of less than 0.5, as long as the eligible hospital or CAH reported on at least one patient for a given measure, a score of 1 would be awarded for that measure. We stated that we believe this is the best method for the issues that might arise with the decimal points and is the easiest for computations.

In order to meet statutory requirements and HHS priorities, we stated that the eligible hospital or CAH would need to report on all of the required measures across all objectives in order to earn any score at all. Failure to report the numerator and denominator of any required measure, or reporting a ''no'' response on a required yes/no response measure, unless an exclusion applies would result in a score of zero.

As stated earlier, an eligible hospital or CAH would need to earn a total Promoting Interoperability score of 50 points or more in order to satisfy the requirement to report on the objectives and measures of meaningful use under § 495.4. Our aim is that every patient has control of and access to their health data, and we believe that the proposed minimum Promoting Interoperability score is consistent with the current goals of the program that focus on interoperability and providing patients access to their health information. Our vision is for every eligible hospital and CAH to perform at 100 percent for all of the objectives and associated measures. However, we understand the constraints that health care providers face in providing care to patients and seek to provide flexibility for hospitals to create their own score using measures that are best suited to their practice. We also believe it is important to be realistic about what can be achieved. This required score may be adjusted over time as eligible hospitals and CAHs adjust to the new focus and scoring methodology of the Medicare Promoting Interoperability Program. We believe that the 50-point minimum Promoting Interoperability score provides the necessary benchmark to encourage progress in interoperability and also allows us to continue to adjust this benchmark as eligible hospitals and CAHs progress in health IT. We believe that this approach allows eligible hospitals and CAHs to achieve high performance in one area to offset performance in an area where a participant may need additional improvement. In the proposed rule, we sought public comment on whether this minimum score is appropriate, or whether a higher or lower minimum score would be better suited for the first year of this new scoring methodology.

Comment: The majority of commenters supported the proposed 50-point minimum Promoting Interoperability score to satisfy the requirement to report on the objectives and measures of meaningful use under § 495.4. A few commenters requested a lower minimum score so that eligible hospitals and CAHs would have an opportunity to adjust to the new measures and scoring methodology.

Response: We appreciate the feedback regarding the proposed minimum 50-point score. We decline to lower the minimum score as we continue to believe that 50 points is a necessary benchmark to encourage progress in interoperability and also allows us to continue to adjust this benchmark as eligible hospitals and CAHs progress in health IT. We believe that this approach allows eligible hospitals and CAHs to achieve high performance in one area to offset performance in an area where a participant may need additional improvement.

After consideration of the public comments we received, we are finalizing that for an eligible hospital or CAH to earn a score greater than zero, in addition to completing the activities required by the Security Risk Analysis measure, the hospital must submit their complete numerator and denominator or yes/no data for all required measures. The numerator and denominator for each performance measure will translate to a performance rate for that measure and will be applied to the total possible points for that measure. In addition, we are finalizing that an eligible hospital or CAH must earn a total Promoting Interoperability score of 50 points or more in order to satisfy the requirement to report on the objectives and measures of meaningful use under § 495.24, which is one of the requirements for an eligible hospital or CAH to be considered a meaningful EHR user under § 495.4. We are finalizing regulatory text at § 495.24(e) to reflect this final policy.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20522), we stated that we believe our proposal increases flexibility and helps to ease the burden on eligible hospitals and CAHs as well as provide additional options for meeting the required objectives. The proposed changes would allow the eligible hospital or CAH to focus on the measures that are more appropriate for the ways in which they deliver care to patients and types of services that they provide and improve on areas in which an eligible hospital or CAH might need some support. We believe that with this new proposed approach we are reducing administrative burden and allowing

health care providers to focus more on their patients. The tables below illustrate our proposal for the new scoring methodology and an example of application of the proposed scoring methodology.

PROPOSED PERFORMANCE-BASED SCORING METHODOLOGY FOR EHR REPORTING PERIODS IN 2019

Objectives	Measures	Maximum points
e-Prescribing	e-Prescribing	10 points.
	Bonus: Query of Prescription Drug Monitoring Program (PDMP)	5 points bonus.
	Bonus: Verify Opioid Treatment Agreement	5 points bonus.
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information	20 points.
	Support Electronic Referral Loops by Receiving and Incorporating Health Information.	20 points.
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	40 points.
Public Health and Clinical Data Exchange.	Syndromic Surveillance Reporting (Required)	10 points.
	Choose one or more additional:	
	Syndromic Surveillance Reporting.	
	Immunization Registry Reporting.	
	Electronic Case Reporting.	
	Public Health Registry Reporting.	
	Clinical Data Registry Reporting.	
	Electronic Reportable Laboratory Result Reporting.	

PROPOSED PERFORMANCE-BASED SCORING METHODOLOGY BEGINNING WITH EHR REPORTING PERIODS IN 2020

Objectives	Measures	Maximum points
e-Prescribing	e-Prescribing	5 points.
	Query of Prescription Drug Monitoring Program (PDMP)	5 points.
	Verify Opioid Treatment Agreement	5 points.
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information	20 points.
	Support Electronic Referral Loops by Receiving and Incorporating Health Information.	20 points.
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	35 points.
Public Health and Clinical Data Exchange.	Syndromic Surveillance Reporting (Required)	10 points.
	Choose one or more additional:	
	Immunization Registry Reporting.	
	Electronic Case Reporting.	
	Public Health Registry Reporting.	
	Clinical Data Registry Reporting.	
	Electronic Reportable Laboratory Result Reporting.	

In the proposed rule, we sought public comment on whether these measures are weighted appropriately, or whether a different weighting distribution, such as equal distribution across all measures would be better suited to this program and this proposed scoring methodology. We also sought public comment on other scoring methodologies such as the alternative we considered and described earlier in this section.

PROPOSED SCORING METHODOLOGY EXAMPLE

Objective	Measures	Numerator/ denominator	Performance rate	Score
e-Prescribing	e-Prescribing	200/250	80%	8 points.
	Query of Prescription Drug Monitoring Program	150/175	86%	5 bonus points.
	Verify Opioid Treatment Agreement	N/A	N/A	0 points.
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information.	135/185	73%	15 points.
	Support Electronic Referral Loops by Receiving and Incorporating Health Information.	145/175	83%	17 points.
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information.	350/500	70%	28 points
Public Health and Clinical Data Exchange.	Syndromic Surveillance Reporting (Required)	Yes.		
	Choose one or more additional:			
	Immunization Registry Reporting Electronic Case Reporting. Public Health Registry Reporting. Clinical Data Registry Reporting. Electronic Reportable Laboratory Result Reporting.	Yes	N/A	10 points.
Total Score				83 points.

We also sought public comment on the feasibility of the new scoring methodology in 2019 and whether eligible hospitals and CAHs would be able to implement the new measures and reporting requirements under this performance-based scoring methodology. In addition, we note that in section VIII.D.8. of the preamble of the proposed rule, we sought public comment on how the Promoting Interoperability Program should evolve in future years regarding the future of the new scoring methodology and related aspects of the program.

We proposed to codify the proposed new scoring methodology in a new paragraph (e) under § 495.24. We also proposed to revise the introductory text of § 495.24 and the heading to paragraph (c) of this section to provide that the criteria specified in proposed new paragraph (e) would be applicable for eligible hospitals and CAHs attesting to CMS for 2019 and subsequent years. Further, we proposed to revise the introductory text of § 495.24 and the heading to paragraph (d) of this section to provide that the criteria specified in paragraph (d) would be applicable for eligible hospitals and CAHs attesting to a State for the Medicaid Promoting Interoperability Program for 2019 and subsequent years.

Comment: Many commenters supported CMS' proposed scoring methodology in which eligible hospitals and CAHs would be required to report certain measures from each of the four objectives, with performance-based scoring occurring at the individual measure-level.

Some commenters supported CMS' alternative approach to scoring in which scoring would occur at the objective level, instead of the individual measure level, and eligible hospitals or CAHs would be required to report on only one measure from each objective to earn a score for that objective.

Response: We appreciate the many commenters who supported the proposed scoring methodology. We decline to finalize the alternative approach to scoring. Many commenters suggested that the Public Health and Clinical Data Exchange objective would be deemphasized by reducing the reporting requirement to only one measure. In addition, the other objectives containing more than one measure are the Electronic Prescribing objective and the Health Information Exchange objective. For the Electronic Prescribing objective, we note that both the Query of PDMP and Verify Opioid Treatment Agreement measures are optional for reporting for CY 2019; therefore we believe this objective could require reporting on only one measure as opposed to multiple measures.

Comment: Many commenters supported CMS' proposal to reduce the number of measures to be reported as part of the Promoting Interoperability Program.

Response: We appreciate commenters support of our proposal to reduce the number of measures required to be reported as part of the Promoting Interoperability Program. We believe the reduction in reporting will relieve provider burden through a more flexible, performance-based approach.

Comment: One commenter asked if CMS was removing the Stage 3 requirements and indicated that the timeframe for implementation of the proposed scoring methodology and measure proposals were not adequate considering the historical timeframes needed for upgrades, workflow changes and training.

Response: We did not propose to remove all the Stage 3 requirements; we proposed to change the Stage 3 methodology by removing, adding, changing or maintaining certain objectives and measures. The Query of PDMP measure will be optional for CY 2019. This will allow additional time to develop, test and refine certification criteria and standards and workflows, while taking an aggressive stance to combat the opioid epidemic. While we appreciate the work that needs to be done to fully operationalize this measure, we believe this measure is a critical step in combatting the opioid crisis. Therefore, we are moving forward with requiring the measure beginning in CY 2020. The Verify Opioid Treatment Agreement measure will be optional for an EHR reporting period in 2019 and 2020 The Support Electronic Referral Loops by Receiving and Incorporating Health Information includes exclusion criteria for health care providers that are unable implement this measure for an EHR reporting period in 2019. In addition, we believe that maintaining the same certification criteria and standards currently required for the Stage 3 measures would reduce the time necessary to implement the new measure requirements.

Comment: One commenter requested clarification on whether the required reporting of at least one patient for each measure refers to one patient in the denominator or the numerator.

One commenter disagreed with the scoring methodology of reporting ''at least one unique patient'' for each proposed measure and recommended that CMS maintain threshold scoring for measures.

Response: As we stated in the proposed rule (83 FR 20522), the eligible hospital or CAH would submit their numerator and denominator data for each performance measure, and a yes/no response for each of the two reported measures under the Public Health and Clinical Data Exchange objective. For measures that include a numerator and denominator, the eligible hospital or CAH must submit a numerator of at least one patient.

We decline to maintain the current threshold based scoring methodology. In changing the scoring methodology to a performance-based, we are allowing hospitals the flexibility to focus on measures that are most applicable to how they delivery care to patients. This flexibility allows eligible hospitals and CAHs the opportunity to push themselves on measures they do well in, while continuing to improve in challenging areas. This provides them the opportunity to reach the minimum total score of 50 points in order to satisfy the requirement to report on the objectives and measures of meaningful use. This is one of the requirements for an eligible hospital or CAH to be considered a meaningful EHR user and earn an incentive payment and/or avoid a Medicare payment reduction.

Comment: One commenter expressed concern about vendors' ability to change the reporting structure to fit the new scoring methodology and costs associated with the changes.

Reponses: The proposed scoring methodology primarily would eliminate or revise existing measures, which should only require consolidation of existing workflows and actions. In addition, the certification criteria and standards remain the same as finalized in the October 16, 2015 final rule titled ''2015 Edition Health Information Technology (Health IT) Certification Criteria, 2015 Edition Base Electronic Health Record (EHR) Definition, and ONC Health IT Certification Program Modifications.''

In addition, we proposed two new opioid measures, which we are finalizing as optional for EHR reporting periods in 2019. We are requiring reporting on the Query of PDMP measure in CY 2020. This will allow additional time for vendors to update EHR systems. The Verify Opioid Treatment Agreement measure will remain as optional in CY 2020. For additional information regarding our rationale we refer readers to section VIII.D.6.b. of the preamble of this final rule. The Support Electronic Referral Loops by Receiving and Incorporating Health information combines the functionality of the existing Request/

Accept Summary of Care and Clinical Information Reconciliation measures into a new measure, which also includes exclusion criteria for 2019 for eligible hospitals and CAHs that cannot implement the measure in 2019. Lastly, we are finalizing an EHR reporting period of a minimum of any continuous 90-day period in 2019 and 2020 to provide flexibility to health care providers as they are becoming familiar with the new scoring methodology and measures finalized in this rule. We believe that this will allow EHR developers and vendors adequate development time to test and incorporate the new scoring system and measures for deployment and implementation.

Comment: A commenter noted that measures without a numerator and denominator are less burdensome for eligible hospitals and CAHs.

Response: We appreciate the comment and will consider this feedback in the future development of policy for the Promoting Interoperability Program.

Comment: A commenter requested clarification on reporting for eligible hospitals and CAHs with multiple CEHRTs, who switch CEHRT mid-reporting, or merge CEHRTs.

Response: As established in this final rule, the EHR reporting period for eligible hospitals and CAHs is a minimum of any continuous 90-day period in CY 2019 and 2020. Therefore, we would expect hospitals to select and plan their EHR reporting period with respect to the switching and/or merging of their CEHRT. For those who have multiple CEHRTs, the measure specifications remain the same.

c. Summary of Final Scoring Methodology

As discussed above, after consideration of the comments we received, we are finalizing our proposed performance-based scoring methodology for eligible hospitals and CAHs that submit an attestation to CMS under the Medicare Promoting Interoperability Program beginning with the EHR reporting period in CY 2019, with modifications, as described below.

For additional measure-specific information, we refer readers to section VIII.D.6. of the preamble of this final rule.

Promoting Interoperability Score

We are finalizing that eligible hospitals and CAHs are required to report certain measures from each of the four objectives, with performance-based scoring occurring at the individual measure-level. Each measure is scored based on the eligible hospital or CAH's performance for that measure, except for the measures associated with the Public Health and Clinical Data Exchange objective, which require a yes/no attestation. Each measure will contribute to the eligible hospital or CAH's total Promoting Interoperability score. The scores for each of the individual measures are added together to calculate the total Promoting Interoperability score of up to 100 possible points for each eligible hospital or CAH. A total score of 50 points or more will satisfy the requirement to report on the objectives and measures of meaningful use under § 495.24, which is one of the requirements for an eligible hospital or CAH to be considered a meaningful EHR user under § 495.4 and thus earn an incentive payment and/or avoid a Medicare payment reduction. Eligible hospitals and CAHs scoring below 50 points will not be considered meaningful EHR users.

We are finalizing that for an eligible hospital or CAH to earn a score greater than zero, in addition to completing the actions included in the Security Risk Analysis measure, the hospital must submit their complete numerator and denominator or yes/no data for all required measures. The numerator and denominator for each performance measure will translate to a performance rate for that measure and will be applied to the total possible points for that measure. The eligible hospital or CAH must report on all of the required measures across all of the objectives in order to earn any score at all. Failure to report any required measure, or reporting a ''no'' response on a yes/no response measure, unless an exclusion applies will result in a score of zero. We are finalizing the regulation text for this final policy is at § 495.24(e).

Security Risk Analysis Measure

We are finalizing our proposal that eligible hospitals and CAHs must attest to having completed the actions included in the Security Risk Analysis measure at some point during the calendar year in which the EHR reporting period occurs. The Security Risk Analysis measure is not scored and does not contribute any points to the hospital's total score for the objectives and measures. We are finalizing the regulation text for this final policy is at § 495.24(e)(4).

Electronic Prescribing Objective Scoring

We are finalizing the Electronic Prescribing objective as proposed with the following modifications. The e-Prescribing measure is worth up to 10 points in CY 2019 and up to 5 points in CY 2020. The Query of Prescription Drug Monitoring Program (PDMP) measure is optional in CY 2019 and worth up to 5 bonus points and is a required measure beginning in CY 2020, worth up to 5 points.

The Verify Opioid Treatment Agreement measure is optional in CY 2019 and 2020, and worth up to five bonus points. We intend to reevaluate the status of the Verify Opioid Treatment Agreement measure for subsequent years in future rulemaking.

An exclusion is available for the e-Prescribing measure as described in section VIII.D.6. of the preamble of this final rule. If an exclusion is claimed for the e-Prescribing measure for CY 2019, the 10 points for the e-Prescribing measure will be redistributed equally among the measures associated with the Health Information Exchange objective. We are finalizing a policy beginning in CY 2020 that an eligible hospital or CAH that qualifies for the e-Prescribing measure exclusion is also excluded from reporting on the Query of PDMP measure.

In addition, separate exclusion criteria are available for the Query of PDMP measure beginning in CY 2020 as described in section VIII.D.6. of the preamble of this final rule. If an exclusion is claimed for the Query of PDMP measure in CY 2020, the points will be equally redistributed among the measures associated with the Health Information Exchange objective. Since the Verify Opioid Treatment Agreement measure is optional and eligible for bonus points, no exclusions are available. We are finalizing our proposal with modification and finalizing § 495.24(e)(5) of the regulation text to reflect this policy.

Health Information Exchange Objective Scoring

We are finalizing the Health Information Exchange objective as proposed. The Support Electronic Referral Loops by Sending Health Information measure is worth up to 20 points. There are no exclusions available for the measure. The new measure, Support Electronic Referral Loops by Receiving and Incorporating Health Information, is worth up to 20 points. An exclusion is available for this measure in CY 2019, as described in section VIII.D.6. of the preamble of this final rule. If the exclusion is claimed, the 20 points would be redistributed to the other measure within this objective, the Support Electronic Referral Loops by Sending Health Information measure, which would be worth up to 40 points. We are finalizing the regulation text for this final policy is at § 495.24(e)(6).

Provider to Patient Exchange Objective Scoring

We are finalizing the Provider to Patient Exchange objective with modifications. The Provide Patients Electronic Access to Their Health Information measure is worth up to 40 points beginning with the EHR reporting period in CY 2019. No exclusions are available for this measure. We are finalizing the regulation text for this final policy is § 495.24(e)(7).

Public Health and Clinical Data Exchange Objective Scoring

We are finalizing the Public Health and Clinical Data Exchange objective as proposed with the following modifications. Eligible hospitals and CAHs must submit a yes/no response for any two measures associated with the Public Health and Clinical Data Exchange objective to earn 10 points for the objective. Failure to report on two measures or submitting a ''no'' response for a measure will earn a score of zero. Exclusions available for this objective are discussed in section VII.6.e. of the preamble of this final rule. If an exclusion is claimed for one measure, but the eligible hospital or CAH submits a ''yes'' response for another measure, they would earn the 10 points for the Public Health and Clinical Data Exchange objective. If an eligible hospital or CAH claims exclusions for both measures they select to report on, the 10 points would be redistributed to the Provide Patients Electronic Access to Their Health Information measure under the Provider to Patient Exchange objective. We are finalizing the regulation text for this policy at § 495.24(e)(8).

The tables below reflects the final policy for the objectives, measures, and maximum points available for the EHR reporting periods in CY 2019 and CY 2020. Please note, the maximum points available do not include points that would be redistributed in the event that an exclusion is claimed:

FINAL PERFORMANCE-BASED SCORING METHODOLOGY FOR EHR REPORTING PERIODS IN CY 2019

Objectives	Measures	Maximum points
e-Prescribing	e-Prescribing	10 points.
	Bonus: Query of Prescription Drug Monitoring Program (PDMP)	5 points *bonus*.
	Bonus: Verify Opioid Treatment Agreement	5 points *bonus*.
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information	20 points.
	Support Electronic Referral Loops by Receiving and Incorporating Health Information.	20 points.
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	40 points.
Public Health and Clinical Data Exchange.	*Choose any two of the following:*	10 points.
	Syndromic Surveillance Reporting.	
	Immunization Registry Reporting.	
	Electronic Case Reporting.	
	Public Health Registry Reporting.	
	Clinical Data Registry Reporting.	
	Electronic Reportable Laboratory Result Reporting.	

Note: Security Risk Analysis is retained, but not included as part of the scoring methodology.

FINAL PERFORMANCE-BASED SCORING METHODOLOGY FOR EHR REPORTING PERIODS IN CY 2020

Objectives	Measures	Maximum points
e-Prescribing	e-Prescribing	5 points.
	Query of Prescription Drug Monitoring Program (PDMP)	5 points.
	Bonus: Verify Opioid Treatment Agreement	5 points *bonus*.
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information	20 points.
	Support Electronic Referral Loops by Receiving and Incorporating Health Information.	20 points.
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	40 points.
Public Health and Clinical Data Exchange.	*Choose any two of the following:*	10 points.
	Syndromic Surveillance Reporting.	
	Immunization Registry Reporting.	
	Electronic Case Reporting.	
	Public Health Registry Reporting.	
	Clinical Data Registry Reporting.	
	Electronic Reportable Laboratory Result Reporting.	

Note: Security Risk Analysis is retained, but not included as part of the scoring methodology.

We are finalizing the codification of the scoring methodology in new paragraph (e) under § 495.24. We are finalizing the revisions to the introductory text of § 495.24 and the heading to paragraph (c) of this section to provide that the criteria specified in the new paragraph (e) are applicable for eligible hospitals and CAHs attesting to CMS for CY 2019 and subsequent years. Further, we are finalizing the revisions to the introductory text of § 495.24 and the heading to paragraph (d) of this section to provide that the criteria specified in paragraph (d) are applicable for eligible hospitals and CAHs attesting to a State for the Medicaid Promoting Interoperability Program for 2019 and subsequent years.

6. Measures for Eligible Hospitals and CAHs Attesting Under the Medicare Promoting Interoperability Program

a. Measure Summary Overview

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20524 through 20537), we proposed a number of changes to the Stage 3 objectives and measures in connection with the proposed scoring methodology for

eligible hospitals and CAHs discussed in the preceding section. Our intent was to ensure the measures better focus on the effective use of health IT, particularly for interoperability, and to address concerns stakeholders have raised through public forums and in public comments related to the perceived burden associated with the current measures in the program.

We proposed three new measures: Query of PDMP; Verify Opioid Treatment Agreement; and Support Electronic Referral Loops by Receiving and Incorporating Health Information.

We proposed to remove the Coordination of Care Through Patient Engagement objective and its three associated measures (Secure Messaging; View, Download or Transmit; and Patient Generated Health Data), as well as the measures Request/Accept Summary of Care, Clinical Information Reconciliation, and Patient-Specific Education.

Finally, we proposed to rename the Send a Summary of Care measure to Support Electronic Referral Loops by Sending Health Information; rename the Public Health and Clinical Data Registry Reporting objective to Public Health and Clinical Data Exchange; rename the Patient Electronic Access to Health Information objective to Provider to Patient Exchange; and rename the Provide Patient Access measure to Provide Patients Electronic Access to Their Health Information.

We proposed to remove the exclusion criteria from all of the Stage 3 measures we are retaining, except for the measures associated with the Electronic Prescribing objective, Public Health and Clinical Data Exchange objective, and the new measures (Query of PDMP, Verify Opioid Treatment Agreement, and Support Electronic Referral Loops by Receiving and Incorporating Health Information), which would include exclusion criteria.

We proposed the changes as certain measures have proven burdensome to health care providers in ways that were unintended and detract from health care providers' progress on current program priorities, align with broader HHS priorities and/or focus on program priorities related to increasing interoperability, exchange of health care information, patient access to their health information and advanced functions of CEHRT.

We indicated in the proposed rule that the measures would no longer need to be attested to if we finalize the proposal to remove them, although health care providers may still continue to use the standards and functions of those measures based on their preferences and practice needs.

In addition, we sought public comment on a potential new measure Health Information Exchange Across the Care Continuum under the Health Information Exchange objective in which an eligible hospital or CAH would send an electronic summary of care record, or receive and incorporate an electronic summary of care record, for transitions of care and referrals with a provider of care other than an eligible hospital or CAH including but not limited to long term care facilities, and postacute care providers such as skilled nursing facilities, home health, and behavioral health settings.

We proposed that all of these measure proposals would apply to eligible hospitals and CAHs that submit an attestation to CMS under the Medicare Promoting Interoperability Program beginning with the EHR reporting period in CY 2019, including Medicare-only and dual-eligible eligible hospitals and CAHs. We did not propose to apply these measure proposals to Medicaid-only eligible hospitals that submit an attestation to their State Medicaid agency for the Medicaid Promoting Interoperability Program. Instead, as discussed in section VIII.D.7. of the preambles of the proposed rule and this final rule, we proposed to give States the option to adopt these measure proposals along with the proposed performance-based scoring methodology for the Medicaid Promoting Interoperability Program through their State Medicaid HIT Plans.

We proposed that if we did not finalize a new scoring methodology, we would maintain the current Stage 3 methodology with the same objectives, measures and requirements, but we would include the two new opioid measures, if they are finalized. In addition, we proposed if we did not finalize a new scoring methodology, the proposals to remove objectives and measures as well as proposals to change objective and measure names would no longer be applicable.

Comment: The majority of commenters supported the removal of the patient action measures and overall reduction to the number of measures.

Response: We appreciate the support for the proposal to remove the measures including those requiring patient action, such as View, Download or Transmit, Patient Generated Health Data and Secure Messaging. Previous stakeholder feedback through correspondence, public forums, and listening sessions indicated there is ongoing concern with measures, which require health care providers to be accountable for patient actions. We further understand that there are barriers, which could negatively impact an eligible hospital or CAHs ability to successfully meet a measure requiring patient action, such as a patient's location in remote, rural areas and their inability to access technology such as computers, internet and/or email. As the issues described contribute to reporting burden and could negatively impact an eligible hospital or CAH's successful participation in the Promoting Interoperability Programs, we agree that removing the patient action measures reduces reporting burden and allows for focus on program goals which include improving interoperability, prioritizing actions completed electronically, use of advanced CEHRT functionalities and patient access to their health information.

Comment: One commenter requested that removed measure functionalities remain in CEHRT moving forward.

Response: We have stated in previous rulemaking (80 FR 62786) that functions and standards related to measures that are no longer required for the Promoting Interoperability Programs could still hold value for some healthcare providers and may be utilized as best suits their practice and the preferences of their patient population. We did not propose to remove the functionality from CEHRT. Removal of measures that are not aligned with the current emphasis of the Medicare Promoting Interoperability Program, which aim to increase interoperability and leverage the most current health IT functions and standards, is primarily to reduce reporting burden and is not intended to reflect upon the utility of the measure concepts for other purposes, such as providers' internal performance monitoring and improvement activities. Removal of a measure from program requirements does not require providers to remove the measures, associated data, or any functionalities from the health IT that they use.

Comment: A few commenters disagreed with the proposed removal of the exclusion criteria related to broadband availability and the number of transitions or referrals received and patient encounters in which the provider has never previously encountered the patient because they believed it would limit flexibility.

Response: As discussed in the proposed rule (83 FR 20525), we believe that there are valid reasons for the removal of the exclusion criteria. We do not believe the exclusion criteria would impact flexibility as we noted there are currently no counties that have less than 4 Mbps of broadband availability,

therefore, the exclusion could not be claimed. Also as we noted during the review of the 2016 Modified Stage 2 attestation data for eligible hospitals and CAHs, no eligible hospital or CAH claimed an exclusion based on broadband availability. In addition, based on our review of the 2016 Modified Stage 2 attestation data, we noted that we did not believe the exclusion criteria specific to transitions or referrals received and patient encounters in which the provider has never previously encountered the patient would be necessary.

Comment: One commenter stated that CMS should include a new exclusion for eligible hospitals and CAHs who cannot attest to a measure due to actions beyond their control.

Response: We decline to implement a new exclusion based on actions beyond the control of health care providers. We note that under our existing policy, eligible hospitals and CAHs may request a significant hardship exception based on extreme and uncontrollable circumstances.

Comment: One commenter requested that CMS retain the exclusion criteria related to broadband availability because the commenter indicated that tele-health services are dependent on the bandwidth of the internet for many applications, and the commenter believes an exclusion for increased bandwidth may be necessary in the future. The commenter noted that certain tele-health applications can require higher minimal speeds than what is currently part of the exclusion criteria.

Response: We decline to retain the exclusion criteria related to broadband availability. As we stated in the proposed rule (83 FR 20525), the Fixed Broadband Deployment Data from Federal Communications Commission (FCC) form 477 [409] indicate no counties have less than 4 Mbps of broadband availability, and no eligible hospital or CAH claimed an exclusion based on broadband availability according to the 2016 Modified Stage 2 attestation data. In addition, eligible hospitals and CAHs may request a significant hardship exception in cases of insufficient internet connectivity. We will reevaluate in the future the minimum broadband speed required to provide tele-health services and determine whether an exclusion would be warranted, but as stated above, we decline to retain the existing exclusion criteria.

Comment: Many commenters supported the proposed changes to the measures including the removal of certain measures and renaming of certain measures.

Response: We thank the commenters for their support and reiterate the proposed changes were meant to remove measures that were burdensome to health care providers in ways that were unintended and detract from health care providers' progress on current program priorities, align with broader HHS priorities and/or focus on program priorities related to increasing interoperability, exchange of health care information, patient access to their health information and advanced functions of CEHRT. We believe the changes more accurately reflect the goals of the program moving forward.

Comment: One commenter requested that CMS not propose additional changes to the objectives and measures that will apply beginning in CY 2019 for at least two years.

Response: We acknowledge that changes we finalize to objectives and measures require additional time and resources for EHR developers, vendors and health care providers to perform necessary updates to CEHRT and workflows, as well as training of staff. We are committed to reducing burden as well as being responsive to the concerns of stakeholders in the Promoting Interoperability Programs and consider many factors prior to proposing changes to the requirements.

Comment: One commenter requested that CMS provide data to eligible hospitals and CAHs on their performance with respect to current program measures before proposing changes.

Response: We will continue to work to promote data transparency and provide data on health care provider participation and performance and post data files for public use on the data and reports web page of the CMS website at: *https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/DataAndReports.html*.

After consideration of the public comments we received, we are finalizing the changes to the objectives, measures, and exclusion criteria as proposed for eligible hospitals and CAHs that submit an attestation to CMS under the Medicare Promoting Interoperability Program beginning with the EHR reporting period in CY 2019, including Medicare-only and dual-eligible eligible hospitals and CAHs, with the modifications described in the sections below.

We are finalizing amendments to the regulation text at § 495.24(e) and § 495.24(c) to reflect these final policies.

(2) Summary of Finalized Measures Beginning With the EHR Reporting Period in CY 2019

The table below provides a summary of the measures we are finalizing in this final rule.

SUMMARY OF REMOVED AND FINAL MEASURES BEGINNING WITH THE EHR REPORTING PERIOD IN CY 2019

Measure status	Measure
Measures retained from Stage 3 with no modifications *	e-Prescribing. Immunization Registry Reporting. Syndromic Surveillance Reporting. Electronic Case Reporting. Public Health Registry Reporting. Clinical Data Registry Reporting. Electronic Reportable Laboratory Result Reporting.
Measures retained from Stage 3 with modifications	Supporting Electronic Referral Loops by Sending Health Information (formerly Send a Summary of Care). Provide Patients Electronic Access to Their Health Information (formerly Provide Patient Access).

[409] *https://www.fcc.gov/general/broadband-deployment-data-fcc-form-477*.

SUMMARY OF REMOVED AND FINAL MEASURES BEGINNING WITH THE EHR REPORTING PERIOD IN CY 2019—Continued

Measure status	Measure
Removed measures	Request/Accept Summary of Care. Clinical Information Reconciliation. Patient-Specific Education. Secure Messaging. View, Download or Transmit. Patient Generated Health Data.
New measures	Query of Prescription Drug Monitoring Program (PDMP). Verify Opioid Treatment Agreement. Support Electronic Referral Loops by Receiving and Incorporating Health Information.

* Security Risk Analysis is retained, but not included as part of the scoring methodology.

b. Final Policy for the Electronic Prescribing Objective

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20526 through 20530), we proposed to add two new measures to the Electronic Prescribing objective under § 495.24(e)(5)(iii) that are based on electronic prescribing for controlled substances (EPCS): Query of PDMP, and Verify Opioid Treatment Agreement, which align with the broader HHS efforts to increase the use of PDMPs to reduce inappropriate prescriptions, improve patient outcomes and promote more informed prescribing practices. We refer readers to the proposed rule for a detailed discussion of the rationale for these proposals. These measures build upon the meaningful use of CEHRT as well as the security of electronic prescribing of Schedule II controlled substances while preventing diversion. For both measures, we proposed to define opioids as Schedule II controlled substances under 21 CFR 1308.12, as they are recognized as having a high potential for abuse with potential for severe psychological or physical dependence. We also proposed to apply the same policies for the existing e-Prescribing measure under § 495.24(e)(5)(iii) to both the Query of PDMP and Verify Opioid Treatment Agreement measures, including the requirement to use CEHRT as the sole means of creating the prescription and for transmission to the pharmacy. Eligible hospitals and CAHs have the option to include or exclude controlled substances in the e-Prescribing measure denominator as long as they are treated uniformly across patients and all available schedules and in accordance with applicable law (80 FR 62834; 81 FR 77227). However, we indicated because the intent of these two new measures is to improve prescribing practices for controlled substances, eligible hospitals and CAHs would have to include Schedule II opioid prescriptions in the numerator and denominator of the Query of PDMP and Verify Opioid Treatment Agreement measures or claim the applicable exclusion.

In addition, we stated if we finalized the new scoring methodology proposed in the proposed rule, eligible hospitals and CAHs that claim the broader exclusion under the e-Prescribing measure would automatically receive an exclusion for all three of the measures under the Electronic Prescribing objective; they would not have to also claim exclusions for the other two measures—Query of PDMP and Verify Opioid Treatment Agreement.

However, we stated if we did not finalize the new scoring methodology we proposed in the proposed rule, but we finalized the proposed measures of Query of Prescription Drug Monitoring Program and Verify Opioid Treatment Agreement under the Electronic Prescribing objective, we would continue to apply the Stage 3 requirements finalized in previous rulemaking, and we proposed that eligible hospitals and CAHs would be required to report all three measures under the Electronic Prescribing objective, but would only be required to meet the threshold for the e-Prescribing measure, or claim an exclusion. In addition, if the new scoring methodology we proposed was not finalized, we would retain the existing e-Prescribing measure threshold of 25 percent under § 495.24(c)(2)(ii).

In addition to comments specific to each proposed measure, we received general public comments on both these proposals, which we summarize below.

Comment: Several commenters supported the addition of the Query of PDMP and Verify Opioid Treatment Agreement measures, indicating they are important measures for reducing inappropriate prescriptions and improving patient outcomes.

Response: We thank the commenters for their support and feedback of the proposed new measures under the Electronic Prescribing objective. We believe the measures are important to promoting care coordination between health care providers and reducing inappropriate prescribing practices. We anticipate that integration of PDMPs into certified EHR technology will become more widespread increasing efficiency with health care provider workflows.

Comment: One commenter requested that CMS work with ONC to harmonize consistency in interoperability requirements, as there are differences in e-Prescribing standards for the 2015 Edition (Script 10.6) and Medicare Advantage final rule (Script 2017071).

Response: We intend to continue collaboration with ONC on the certification and standards criteria. Any proposed revisions to the e-prescribing certification criteria and standards would be included in separate rulemaking.

Comment: A commenter requested clarification on the e-Prescribing measure calculation for 2019 and whether or not hospitals can choose to exclude controlled substances.

Response: We did not propose any changes to the e-Prescribing measure specifications. As we stated in the proposed rule (83 FR 20527), eligible hospitals and CAHs have the option to include or exclude controlled substances in the e-Prescribing measure denominator as long as they are treated uniformly across patients and all available schedules and in accordance with applicable law (80 FR 62834; 81 FR 77227). Eligible hospitals and CAHs reporting on the Query of PDMP and Verify Opioid Treatment Agreement measures would have to include Schedule II opioid prescriptions in the numerator and denominator.

Comment: Many commenters requested that the Query of PDMP and Verify Opioid Treatment Agreement measures remain as optional in CY 2020 with an associated bonus score as the timeline for implementation is unreasonable especially without certification criteria and standards.

Response: We understand that the Query of PDMP and Verify Opioid Treatment Agreement measures could require eligible hospitals and CAHs to incur additional burden due to workflow changes at the point of care. In addition, we understand eligible hospitals and CAHs that have integrated PDMPs within an EHR may be required to manually calculate the measure, as automated functionality for this measure is not currently supported through certification criteria for Health IT Modules. However, we also stated in the proposed rule that health care providers would have the flexibility to query the PDMP in any manner allowed under their State law (83 FR 20527). This would include using relevant included capabilities of their CEHRT, such as those required by the 2015 Edition electronic prescribing criterion at 45 CFR 170.315(b)(3).

We are finalizing the Query of PDMP measure as proposed. As stated above, we anticipate that integration of PDMPs into certified EHR technology will become more widespread increasing efficiency with health care provider workflows. We believe that requiring the Query of PDMP measure beginning in CY 2020 promotes specific HHS priorities. These priorities include encouraging the increased use of PDMPs to reduce prescription drug abuse and diversion, improving patient outcomes and allowing for more informed prescribing practices. Therefore, we are finalizing this measure as proposed.

Under the final policy we are adopting, the Verify Opioid Treatment Agreement measure will be optional for both CYs 2019 and 2020 with bonus point scoring as finalized in section VIII.D.5. of the preamble of this final rule. We plan to re-evaluate the status of the Verify Opioid Treatment Agreement measure for an EHR reporting period beginning in CY 2021.

We also believe that extending the optional reporting status into CY 2020 for the Verify Opioid Treatment Agreement measure will give health care providers the additional time required to research and implement methods for verification of such agreements in practice and development of system changes and clinical workflows. We also believe the extension of the optional reporting status will provide additional time for CMS and ONC to review and assess findings from pilot studies as described in the proposed rule (83 FR 20529). We will also consider additional feedback from stakeholders and consider further advancement in developing standards. We further discuss the rationale in section VIII.D.6. of the preamble of this final rule.

Comment: Several commenters stated that certification criteria and standards should be adopted prior to finalization of the Query of PDMP and Verify Opioid Treatment Agreement measures.

Response: We agree that availability of specific mature consensus technical standards relevant to the use cases these measures represent would facilitate health IT developers' ability to offer technical solutions that enable providers both to perform the actions expected by the measures and automatically capture the data needed to calculate both of these measures. We will continue to evaluate the progress in the integration of PDMPs within providers' CEHRT, additional advances toward development of standards and are finalizing exclusion criteria as noted below.

For the Query of PDMP measure, in the proposed rule (83 FR 20528), we proposed that in order to meet the measure, eligible hospitals and CAH must use the capabilities and standards as defined for CEHRT at 45 CFR 170.315(b)(3) and 170.315(a)(10)(ii), therefore, certification and standards criteria would be associated with this measure. We stated in the proposed rule that there were no current exact certification and standards criteria available for querying a PDMP but believe the use of structured data in CEHRT could support querying through broader use of health IT (83 FR 20528). As previously stated, health care providers would have the flexibility to query the PDMP in any manner allowed as legal and practicable under their State law (83 FR 20527) which we believe provides more flexibility for health care providers to successfully demonstrate meaningful use and be able to report on this measure beginning in CY 2020.

In the proposed rule (83 FR 20530), we proposed that in order to meet the Verify Opioid Treatment Agreement measure eligible hospitals and CAHs must use the capabilities and standards as defined for CEHRT at 45 CFR 170.315(b)(3), 170.315(a)(10) and 170.205(b)(2), however, there are no current exact standards for identification or exchange of treatment agreements. As we noted in the proposed rule (83 FR 20529 through 20530), there are a variety of standards available within CEHRT that may be able to support the electronic exchange of opioid abuse related treatment data such as the Consolidated Clinical Document Architecture (C–CDA) care plan template.

For these reasons, we are finalizing the Query of PDMP as proposed and the Verify Opioid Treatment Agreement measure as optional for CYs 2019 and CY 2020. For more information, we refer readers to the discussion in section VIII.D.6. of the preamble of this final rule. In addition, we intend to propose specific certification criteria and standards in separate future rulemaking for the Query of PDMP and the Verify Opioid Treatment Agreement measures.

We are finalizing the definition of opioids as Schedule II controlled substances under 21 CFR 1308.12 as proposed.

We are finalizing the proposal to apply the same policies for the existing e-Prescribing measure under § 495.24(e)(5)(iii) to the Query of PDMP measure and Verify Opioid Treatment Agreement measure, including the requirement to use CEHRT as the sole means of creating the prescription and for transmission to the pharmacy, except that unlike the e-Prescribing measure, eligible hospitals and CAHs must include Schedule II opioid prescriptions in the numerator and denominator of the Query of PDMP and Verify Opioid Treatment Agreement measures if they choose to report on them.

In addition, we are finalizing that an eligible hospital or CAH that qualifies for the e-Prescribing measure exclusion is excluded from reporting on the Query of PDMP measure beginning in CY 2020.

(1) Measure: Query of Prescription Drug Monitoring Program (PDMP)

A PDMP is an electronic database that tracks prescriptions of controlled substances at the State level and play an important role in patient safety by assisting in the identification of patients who have multiple prescriptions for controlled substances or may be misusing or overusing them. Querying the PDMP is important for tracking the prescribed controlled substances and improving prescribing practices. The intent of the Query of PDMP measure is to build upon the current PDMP initiatives from Federal partners focusing on prescriptions generated and dispensing of opioids.

Proposed Measure Description: For at least one Schedule II opioid electronically prescribed using CEHRT during the EHR reporting period, the eligible hospital or CAH uses data from CEHRT to conduct a query of a Prescription Drug Monitoring Program (PDMP) for prescription drug history, except where prohibited and in accordance with applicable law.

We proposed that the query of the PDMP for prescription drug history

must be conducted prior to the electronic transmission of the Schedule II opioid prescription and that eligible hospitals and CAHs would have flexibility to query the PDMP using CEHRT in any manner allowed under their State law.

We proposed to include in this measure all permissible prescriptions and dispensing of Schedule II opioids regardless of the amount prescribed during an encounter and that multiple Schedule II opioid prescriptions prescribed on the same date by the same eligible hospital or CAH would not require multiple queries of the PDMP. In the proposed rule, we requested comment on whether we should further refine the measure to limit queries of the PDMP to once during a hospital stay regardless of whether multiple eligible medications are prescribed during this time.

CMS and ONC worked together to define the following:

Denominator: Number of Schedule II opioids electronically prescribed using CEHRT by the eligible hospital or CAH during the EHR reporting period.

Numerator: The number of Schedule II opioid prescriptions in the denominator for which data from CEHRT is used to conduct a query of a PDMP for prescription drug history except where prohibited and in accordance with applicable law.

Exclusion: Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions for controlled substances and is not located within 10 miles of any pharmacy that accepts electronic prescriptions for controlled substances at the start of their EHR reporting period.

We proposed that the exclusion criteria would be limited to prescriptions of controlled substances as the measure action is specific to prescriptions of Schedule II opioids only and does not include any other types of electronic prescriptions.

We stated that if we finalized the new scoring methodology we proposed in section VIII.D.5. of the preamble of the proposed rule, an additional exclusion would be available beginning in 2020 for eligible hospitals and CAHs that could not report on this measure in accordance with applicable law.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20528), we stated that we understood PDMP integration is not currently in widespread use for CEHRT, and many eligible hospitals and CAHs may require additional time and workflow changes at the point of care before they can meet this measure without experiencing significant burden and that manual data entry and manual calculation of the measure may be necessary. We also acknowledged that there are no existing certification criteria for the query of a PDMP but we believed the use of structured data captured in the CEHRT, could support querying a PDMP through the broader use of health IT. In the proposed rule, we sought public comment on whether ONC should consider adopting standards and certification criteria to support the query of a PDMP, and if such criteria were to be adopted, on what timeline should CMS require their use to meet this measure.

We sought public comment especially from health care providers and health IT developers on whether they believe use of the NCPDP SCRIPT 2017071 standard for e-prescribing could support eligible hospitals and CAHs seeking to report on this measure, and whether HHS should encourage use of this standard through separate rulemaking.

In the proposed rule, we sought public comment on the challenges associated with querying the PDMP with and without CEHRT integration and whether this proposed measure should require certain standards, methods or functionalities to minimize burden.

In including EPCS as a component of the measure we proposed, we acknowledged and sought input on perceived and real technological barriers as part of its effective implementation including but not limited to input on two-factor authentication and on the effective and appropriate uses of technology, including the use of telehealth modalities to support established patient provider relationships subsequent to in-person visit(s) and for prescribing purposes.

In the proposed rule, we also requested comment on limiting the exclusion criteria to electronic prescription for controlled substances and whether there are circumstances which may justify any additional exclusions for the Query of PDMP measure and what those circumstances might be.

We noted that under the new scoring methodology we proposed in section VIII.D.5. of the preamble of the proposed rule, measures would not have required thresholds for reporting. Therefore, if the proposed scoring methodology and this measure were finalized, this measure would not have a reporting threshold. We proposed a threshold of at least one prescription for this measure if we did not finalize the proposed scoring methodology as varying State laws related to integration of a PDMP into CEHRT can lead to differing standards for querying.

We also proposed that in order to meet this measure, an eligible hospital or CAH must use the capabilities and standards as defined for CEHRT at 45 CFR 170.315(b)(3) and 170.315(a)(10)(ii).

We proposed to codify the Query of PDMP measure at § 495.24(e)(5)(iii)(B).

Comment: A commenter indicated that CMS should work with stakeholders to determine feasibility and testing of EPCS measures prior to finalizing.

Response: We agree that there should be testing of the measures prior to requiring them as part of the Promoting Interoperability Programs. We note that we are finalizing the Query of PDMP measure as proposed which is discussed in the section VIII.D.5. of the preamble of this final rule. The optional reporting for this measure in CY 2019 allows additional time for expansion of PDMP integration into EHRs, implementation of system changes and workflows and for health IT developers to work with health care providers on additional methods for CEHRT to capture and calculate actions specific to the PDMP query.

Comment: Several commenters agreed with the addition of the Query of PDMP measure indicating it was important for reducing inappropriate prescriptions and improving patient outcomes.

Response: We thank the commenters for their support and feedback of the proposed new measure. We believe that PDMPs currently provide valuable information on prescribed controlled substances including dosages, quantity and combinations of prescriptions. In addition, we believe PDMPs will continue to progress to achieve full integration on a widespread scale resulting in more informed prescribing practices, reduced inappropriate prescribing of opioids, and improved patient outcomes while reducing workflow and time needed for querying.

Comment: Several commenters supported the Query of PDMP measure but stated standards should be developed due to varying integration efforts across the nation. Another comment stated that CMS should collaborate with the DEA on standards and capabilities including use of mobile devices for cost control and increased flexibility.

One commenter indicated that standards should include PDMP onboarding, interstate access agreements, improved access to PDMPs via national brokers, support for patient and user ID matching between CEHRT and PDMPs. One commenter stated that

costs and incentives associated with onboarding should be a priority consideration.

Response: We thank the commenters for their support of the Query of PDMP measure and recognize that integration efforts are in various stages. While a number of these comments raise issues outside the scope of this rule, we appreciate the feedback on challenges and barriers relevant to effectively implementing the measure, which we requested in the proposed rule. This input will help to inform our future work as we continue collaborating with our colleagues across HHS, and with other public-and private-sector partners as appropriate, as we all work to advance the maturity and capabilities of America's health information infrastructure to seamlessly integrate with CEHRT and efficient clinician workflows. This is important not only for PDMP query functionality but for also other relevant tools, such as automated clinical decision support, that facilitate more informed prescribing practices and improved patient outcomes.

Our goal on burden reduction also includes consideration of costs associated with meeting the Promoting Interoperability Programs requirements. We will continue to listen to stakeholders on concerns related to costs and work to mitigate burdens whenever practicable within our programs' responsibilities and authorities.

Comment: One commenter indicated that health care providers should be able to continue to use a health information exchange to access Schedule II opioid prescription drug history in order to earn points for the Query of PDMP measure.

Response: Neither of the proposed measures, including the Query of PDMP measure specifies whether providers' CEHRT connects to PDMPs directly or through HIEs. Therefore, use of HIEs to access Schedule II opioid prescription drug history is acceptable.

Comment: One commenter also requested consideration for use of an open API by PDMPs to enable EHR access to Schedule II opioid prescription drug history.

Response: Noting that we understand ''open API'' to mean an API for which the PDMP has made freely and publicly available the specific business and technical documentation necessary to interact with the API, we agree that implementing such an API is a step PDMPs can take to make it easier for providers to connect their CEHRT to PDMPs. We are aware of some States having already taken this step to support efforts to integrate PDMP with health IT used by prescribers and pharmacists in the course of their clinical work.

Comment: A commenter stated that CMS should remove the requirement to use the capabilities and standards of CEHRT for querying the PDMP due to the absence of technology and infrastructure supporting electronic querying.

Response: We thank the commenter for this suggestion. However, we disagree that the Query of PDMP measure should not include a requirement to use the capabilities and standards of CEHRT. We proposed that, in order to report on the Query of PDMP and receive a score, eligible hospitals and CAHs must use the capabilities and standards at 45 CFR 170.315(b)(3) for electronic prescribing and 170.315(a)(10)(ii) for drug formulary checks which are required under the e-Prescribing measure. In the proposed rule (83 FR 20527), we proposed that the query of PDMP for prescription drug history must be conducted prior to the electronic transmission of the Schedule II opioid prescription. The certification criteria at 45 CFR 170.315(b)(3) would allow a health care provider to create a new prescription, change a prescription, cancel a prescription, refill a prescription, request fill status notifications and request and receive medication history information which we believe could support the query for a prescription drug history of the patient.

In addition, 45 CFR 170.315(a)(10)(ii) drug formulary checks are most useful when performed in combination with e-prescribing which could increase the efficiency and safety of care and lower costs. We believe that the use of capabilities and standards at 45 CFR 170.315(b)(3) for electronic prescribing for Query of PDMP, which include the ability of the user to reconcile a patient's active medication list, medication allergy list, and problem list, are key to system interoperability. This reconciliation will allow for the seamless flow of medication history data between disparate systems to help prescribers and pharmacists improve patient outcomes. As noted in the proposed rule and elsewhere in this final rule, given the variance in State level requirements and actions used to perform the query, health care providers have flexibility to satisfy this measure by querying the PDMP in any manner legal and practicable in their State.

Comment: A few commenters stated that the Query of PDMP measure should not be finalized as part of the Promoting Interoperability Programs, and the integration of the PDMP with health information technology should remain as part of State requirements only.

Response: We believe finalizing the Query of PDMP measure would be instrumental in furthering widespread implementation of PDMP query capabilities within EHRs. We noted in the proposed rule that several Federal agencies have had integral roles in the expansion of PDMPs with health information technology systems and we believe that this measure will encourage continued progress on integrating PDMP queries into EHR work flows, and reinforce the importance of prescribers seeking and using PDMP information where it is relevant to making more informed opioid prescribing decisions.

Comment: A few commenters supported the use of NCPDP Script Standard Implementation Guide Version 2017071 medication history transactions for PDMP queries and response. One commenter proposed convergence on the use of HL7 FHIR such as CDS Hooks for other consumer facing apps to more extensively connect EHRs and consumer facing apps with PDMPs as a long term goal.

Response: We appreciate the commenters' views. In partnership with colleagues across HHS, we encourage and applaud advances in standards and their use to deliver innovative, interoperable solutions that will seamlessly integrate PDMP query functionality and other relevant tools, such as automated clinical decision support, into clinician-friendly, patient-centered CEHRT-enabled workflows that facilitate safer, more informed prescribing practices and improved patient outcomes.

Comment: One commenter requested an additional exclusion for the Query of PDMP measure specific to States that do not have a Statewide PDMP. Another commenter requested exclusion criteria for hospitals whose States do not allow direct integration with an API as workflows that are not interoperable will increase reporting burden.

Response: We decline to finalize additional exclusion criteria, as recommended by the commenters. We stated that health care providers may query the PDMP in any manner that is allowed by their State, which we believe would reduce the burden of instituting new workflows. In addition, we are adopting exclusion criteria below for hospitals not able to report on this measure in accordance with applicable law when the measure is required beginning in CY 2020. We will continue to monitor health care provider use and querying of PDMPs and consider whether additional exclusion criteria

are necessary in future rulemaking, as the measure is optional for CY 2019.

We decline to finalize exclusion criteria for eligible hospitals and CAHs whose States do not allow for direct integration through an API. We believe that finalization of exclusion criteria such as this would enable a significant number of health care providers to avoid reporting on the measure, even though they would have the ability to query a PDMP through other means. In addition, we believe that although additional time and workflow changes may be necessary in order for health care providers to meet the measure, it is still possible without direct integration as long as it is conducted using CERHT in accordance with applicable State law.

Comment: One commenter stated that CMS should work with State and other Federal agencies to develop a common set of formulary schedules, common data set and common set of interoperability standards that can easily work at an interstate level.

Response: We recognize that there is work to be done to resolve various real and perceived barriers to achieving the full potential of interoperable health IT and health information exchange to improve patient care and outcomes. We plan to continue collaborating with our colleagues across HHS, including ONC, on standards and requirements specific to the Promoting Interoperability Programs. We believe that the pilots and projects discussed in the proposed rule at (83 FR 20527) which include collaboration between the agencies of ONC, SAMHSA, DOJ and CDC for example, have had integral roles in the progression of health IT as related to the opioid crisis. Likewise, the ONC and CDC have been integral in development of Promoting Interoperability Program requirements, including interoperability standards and certification criteria; therefore, we will continue to work with our colleagues on future requirements specific to interoperability standards, data sets and formulary schedules.

Comment: One commenter stated that PDMP view-only access is insufficient and data exchange that can enable clinical decision support to assist health care providers is needed.

Response: We understand where PDMP query is implemented in a way that does not return data in a computable format consistent with standards the CEHRT supports, providers and their patients will not be able to benefit from advanced capabilities of EHRs, such as clinical decision support.

We agree that the ability to automate real-time clinical decision support informed by a patient's complete prescription drug history would be helpful to providers. We believe that as the measure is more widely implemented, and concurrently as advanced CDS functionalities become more widely available to providers via their CEHRT, both are vital to successfully combating the opioid crisis. To that end, we will continue to work across HHS and with our stakeholders to develop the necessary standards and complementary resources that will support such use. This will include further development of technical interoperability standards and may include revisions to this measure in future rulemaking.

Comment: One commenter stated that the Query of PDMP measure should be prescription-based for simplicity, not evaluating medications administered during the admission or presentation to the ED. Another commenter stated the denominator should reference discharged patients during the EHR reporting period not the number of opioids prescribed during the EHR reporting period, and recommended the denominator be changed to ''Discharges where Schedule II medications were prescribed.''

Response: The denominator for the measure is based on the Schedule II opioids that are electronically prescribed using CEHRT during the EHR reporting period rather than medications administered as the intent is to identify multiple provider episodes (physician shopping), prescriptions of dangerous combinations of drugs, prescribing rates and controlled substances prescribed in high quantities. In addition, we decline to revise the denominator of the measure as it could include prescriptions upon discharge as well as electronic prescriptions generated during the admission.

Comment: One commenter stated that the numerator definition does not follow typical workflow for PDMP queries as some States require logging into an external portal making data capture and measure calculation difficult.

Response: We understand that for PDMPs that do not currently allow for integration with EHR systems, prescribers may be required to take additional actions to complete the query, such as logging into an external portal. We acknowledged in the proposed rule that due to the varying integration of PDMPs into EHR systems, additional time, workflow changes and manual data capture and calculation would be needed to complete the query and could contribute to overall reporting burden. Therefore, this measure allows health care providers the flexibility to query the PDMP using CEHRT in any manner legal and practicable in their State.

Comment: A few commenters stated that CERHT should also be able to support workflow integration such as querying the PDMP on demand. Another commenter indicated there are challenges associated with non-consolidated responses, which present a patient-centric view of all prescribing activities.

Response: It is our understanding that PDMP query integration with prescriber workflow can be accomplished with CEHRT on the market today. However, we acknowledge that it may not be an automatic capability of CEHRT and may not be possible in all States due to variations in laws and technical approaches. As the measure will be required beginning in CY 2020, we will review those variations over the next year and consider whether additional exclusion criteria would be necessary.

Comment: One commenter requested clarification on whether hospitals must query multiple registries if the hospital's location is close to a State border.

Response: We are not requiring eligible hospitals and CAHs to query multiple registries if the location is close to the State border, as we believe this would serve to increase the burden by requiring additional workflows and time requirements. We defer to the hospital and/or prescriber on whether multiple queries should be performed based on clinical relevance in specific circumstances.

In addition, next year we intend to propose in rulemaking that EHR-integrated PDMP querying would be required beginning in CY 2020 as part of this measure. In connection with that proposed requirement, we also intend to propose an additional exclusion for providers in States where integration with a Statewide PDMP is not yet feasible or not yet widely available. This exclusion would require confirmation from the State acknowledging that PDMP integration of EHRs is not yet in place. We will seek comment and suggestions in future rulemaking to ascertain if additional exclusions are needed for eligible hospitals or CAHs located in one of the States where PDMPs are not integrated into EHRs. We understand the lack of certification criteria and standards that are currently available as it relates to the Query of PDMP measure, but believe that this measure is essential to ensuring that we are working to combat the opioid crisis. We will continue to collaborate with our Federal partners to advance the capabilities, standards and

functionalities for querying PDMPs as well as to facilitate more informed prescribing practices and improvement of patient outcomes.

After consideration of the public comments we received, we are finalizing the Query of PDMP measure as proposed.

We are finalizing that in order to meet this measure, an eligible hospital or CAH must use the capabilities and standards as defined for CEHRT at 45 CFR 170.315(b)(3) and 170.315(a)(10)(ii).

We are codifying the Query of PDMP measure at § 495.24(e)(5)(iii)(B).

We are adopting the measure as follows:

Query of PDMP

Measure Description: For at least one Schedule II opioid electronically prescribed using CEHRT during the EHR reporting period, the eligible hospital or CAH uses data from CEHRT to conduct a query of a Prescription Drug Monitoring Program (PDMP) for prescription drug history, except where prohibited and in accordance with applicable law.

Denominator: Number of Schedule II opioids electronically prescribed using CEHRT by the eligible hospital or CAH during the EHR reporting period.

Numerator: The number of Schedule II opioid prescriptions in the denominator for which data from CEHRT is used to conduct a query of a PDMP for prescription drug history except where prohibited and in accordance with applicable law.

Exclusions beginning with an EHR reporting period in CY 2020: Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions for controlled substances and is not located within 10 miles of any pharmacy that accepts electronic prescriptions for controlled substances at the start of their EHR reporting period; and

Any eligible hospital and CAH that could not report on this measure in accordance with applicable law.

(2) Measure: Verify Opioid Treatment Agreement

The intent of this measure is for eligible hospitals and CAHs to identify whether there is an existing opioid treatment agreement when they electronically prescribe a Schedule II opioid using CEHRT if the total duration of the patient's Schedule II opioid prescriptions is at least 30 cumulative days. We believe seeking to identify an opioid treatment agreement will further efforts to coordinate care between health care providers and foster a more informed review of patient therapy.

In the proposed rule (83 FR 20529), we stated that we understood there are varied opinions regarding opioid treatment agreements amongst health care providers. Because of the debate among practitioners, we requested comment on the challenges this proposed measure may create for health care providers, how those challenges might be mitigated, and whether this measure should be included as part of the Promoting Interoperability Program. We also acknowledged challenges related to prescribing practices and multiple State laws, which may present barriers to the uniform implementation of this proposed measure. In the proposed rule, we sought public comment on the challenges and concerns associated with opioid treatment agreements and how they could impact the feasibility of the proposal.

Proposed Measure Description: For at least one unique patient for whom a Schedule II opioid was electronically prescribed by the eligible hospital or CAH using CEHRT during the EHR reporting period, if the total duration of the patient's Schedule II opioid prescriptions is at least 30 cumulative days within a 6-month look-back period, the eligible hospital or CAH seeks to identify the existence of a signed opioid treatment agreement and incorporates it into CEHRT.

We proposed this measure would include all Schedule II opioids prescribed for a patient electronically using CEHRT by the eligible hospital or CAH during the EHR reporting period, as well as any Schedule II opioid prescriptions identified in the patient's medication history request and response transactions during a 6 month look-back period, where the total number of days for which a Schedule II opioid was prescribed for the patient is at least 30 days.

In the proposed rule, we acknowledged in part, that completing the Verify Opioid Treatment Agreement measure might prove burdensome to health care providers as it could be difficult to identify an existing treatment agreement. Attempting to identify whether there is a treatment agreement in place would likely require additional time and changes to existing workflows. In the proposed rule, we sought public comment on pathways to facilitate the identification and exchange of treatment agreements and opioid abuse treatment planning.

We proposed that the 6-month look-back period would begin on the date on which the eligible hospital or CAH electronically transmits its Schedule II opioid prescription using CEHRT.

We proposed a 6-month look-back period in order to identify more egregious cases of potential overutilization of opioids and to cover timeframes for use outside the EHR reporting period. We proposed that the 6-month look-back period would utilize at a minimum the industry standard NCDCP SCRIPT v10.6 medication history request and response transactions codified at 45 CFR 170.205(b)(2).

In the proposed rule, we did not propose to define an opioid treatment agreement as a standardized electronic document; nor did we propose to define the data elements, content structure, or clinical purpose for a specific document to be considered a ''treatment agreement.'' We sought public comment on what characteristics should be included in an opioid treatment agreement and incorporated into CEHRT, such as clinical data, information about the patient's care team, and patient goals and objectives, as well as which functionalities could be utilized to accomplish the incorporation of this information. In the proposed rule, we also sought public comment on methods or processes for incorporation of the treatment agreement into CEHRT, including which functionalities could be utilized to accomplish this. We sought public comment on whether there are specific data elements that are currently standardized that should be incorporated via reconciliation and if the ''patient health data capture'' functionality could be used to incorporate a treatment plan that is not a structured document with structured data elements.

Denominator: Number of unique patients for whom a Schedule II opioid was electronically prescribed by the eligible hospital or CAH using CEHRT during the EHR reporting period and the total duration of Schedule II opioid prescriptions is at least 30 cumulative days as identified in the patient's medication history request and response transactions during a 6-month look-back period.

Numerator: The number of unique patients in the denominator for whom the eligible hospital or CAH seeks to identify a signed opioid treatment agreement and, if identified, incorporates the agreement in CEHRT.

Exclusions: Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions for controlled substances and is not located within 10 miles of any pharmacy that accepts electronic

prescriptions for controlled substances at the start of its EHR reporting period.

We proposed that the exclusion criteria would be limited to prescriptions of controlled substances as the measure action is specific to electronic prescriptions of Schedule II opioids only and does not include any other types of electronic prescriptions and that an additional exclusion would be available beginning in 2020 for eligible hospitals and CAHs that could not report on this measure in accordance with applicable law under the proposed scoring methodology in the proposed rule. We requested public comment on limiting the exclusion criteria to electronic prescriptions for controlled substances and whether there are circumstances which may require an additional exclusion for the Verify Opioid Treatment Agreement measure and what those circumstances might be.

We stated in the proposed rule that if the proposed scoring methodology and measure were finalized, this measure would not have a reporting threshold. We also proposed that if we did not finalize the proposed scoring methodology, but we finalized this proposed measure, that there would be a threshold of at least one unique patient for this new measure. We also noted there are medical diagnoses and conditions that could necessitate prescribing Schedule II opioids for a cumulative period of more than 30 days.

We also proposed that, in order to meet this measure, an eligible hospital or CAH must use the capabilities and standards as defined for CEHRT at 45 CFR 170.315(b)(3), 170.315(a)(10) and 170.205(b)(2).

Lastly, we requested comment on whether we should explore adoption of a measure focused only on the number of Schedule II opioids prescribed and the successful use of EPCS for permissible prescriptions electronically prescribed. We sought public comment about the feasibility of such a measure, and whether stakeholders believe this would help to encourage broader adoption of EPCS.

We proposed to codify the Verify Opioid Treatment Agreement measure at § 495.24(e)(5)(iii)(C).

Comment: A few commenters supported the Verify Opioid Treatment Agreement measure and indicated that it was an important measure for reducing inappropriate prescriptions.

Response: We thank the commenters for their support of the measure. We believe the Verify Opioid Treatment Agreement measure could have some benefit for promoting care coordination between health care providers. We also agree that this measure will help in reducing inappropriate prescribing practices. In addition, we believe there are merits to combatting the opioid crises through various means including health care providers verifying if there is an opioid treatment agreement in place before prescribing.

However, we also have considered the lack of standards and agreement on the effectiveness of opioid treatment agreements. Therefore, we are finalizing the Verify Opioid Treatment Agreement measure as optional for 2019 and 2020. We will reevaluate the status of the measure for an EHR reporting period beginning in CY 2021.

Comment: Many commenters requested that CMS not finalize the Verify Opioid Treatment Agreement measure due to the lack of defined data elements, structure, and standards and certification criteria. Some of those commenters indicated the measure would be administratively burdensome as most patients are discharged with no more than a week's prescription of schedule II controlled substances.

In addition, a few commenters were concerned that finalization of this measure may result in unintended negative consequences such as a decline of pain management therapies and treatment for patients who are post-surgical or recovering from acute illnesses, reluctance of patients to seek treatment or health care related to pain or reluctance on part of health care providers to prescribe short term opioids when appropriate.

Another commenter stated there are no current standards for exchange of opioid treatment agreements, they are not usually based on clinical information, and are primarily provider requested. One commenter stated there is no evidence that opioid treatment agreements improve patient outcomes. One commenter stated opioid treatment agreements are more commonly used by outpatient programs where use of CEHRT is limited.

Response: We understand the concerns voiced by the commenters and acknowledged the lack of defined data elements, structure, standards and criteria. We also understand the concerns of the commenters that discussed the unintended consequences and the potential administrative burden associated with this measure. We also are well aware of the varying evidence regarding the efficacy of the opioid treatment agreements. All of these concerns voiced by commenters were acknowledged in the proposed rule (83 FR 20528 through 20530). However, we believe there are health care providers who are already verifying if there is an opioid treatment agreement in place before prescribing opioids. We also believe it is important to continue to improve prescribing practices for controlled substances using currently available methods, and that this particular measure can help lead to improvement in prescribing practices.

As noted in the proposed rule (83 FR 20529), there are a number of ways certified health IT may be able to support the electronic exchange of opioid abuse related treatment data, such as use of the C–CDA care plan template that is currently optional in CEHRT. This template contains information on health concerns, goals, interventions, health status evaluation & outcomes sections that could support the development of an opioid treatment agreement. In addition, the ''patient health data capture'' functionality which is part of the 2015 Edition (45 CFR 170.315(e)(3)) could be used to incorporate a treatment plan that is not a structured document with structured data elements.

We disagree that this measure will result in unintended consequences, such as the decline of pain management therapies. As we discussed in the proposed rule (83 FR 20530), we are only including patients where the total duration of the patient's Schedule II opioid prescriptions is at least 30 cumulative days within a 6-month look-back period. We also believe this measure could encourage discussion and additional treatment options between health care providers and patients. In addition, this measure would help to rule out issues related to pain management therapies for certain post-surgical patients and those recovering from acute illnesses. We also understand that certain medical conditions and diagnoses could necessitate prescribing for over 30 days, including some terminal illnesses, recovery from some surgeries or their underlying conditions, and other diagnoses that cause pain requiring alleviation by opioids. It is not our intention to be a barrier to the most effective and clinically appropriate pain alleviating therapies available to patients in need, or to impose an undue burden on health care providers. Our goal is to work on improving patient outcomes and we do believe that this measure has merits, as the opioid treatment agreement can be an integral part of clinically effective, patient-empowering pain management plans developed and implemented in the course of shared decision-making by a clinical team and a patient with serious, chronic pain.

Opioid treatment agreements may be more commonly used by outpatient

programs where use of CEHRT is limited, however we believe their verification in other care settings such as hospitals would improve prescribing practices through identification of overutilization of controlled substances.

Finally, we reiterate that this measure will be optional for hospitals in 2019 and 2020. We acknowledge many providers may not find this measure applicable for their setting, and believe it is most likely to be adopted by those providers already engaged in treatment scenarios where the verification of an Opioid Treatment Agreement would be beneficial, such as providers offering treatment for substance use disorders, or providers closely integrated with behavioral health treatment facilities.

Comment: One commenter stated that the measure could present challenges in the context of Part 2 programs as data sharing restrictions complicate feasibility of the measure.

Response: We do understand that 42 CFR part 2 protects the confidentiality for substance use disorder patient records. However, we note that the disclosure of such information may be possible under certain conditions, including upon patient consent or request for the disclosure of such information.

Comment: One commenter requested an additional exclusion for Verify Opioid Treatment Agreement measure to include patients with certain diagnoses or settings including but not limited to terminal or end stage conditions, cancer and hospice settings.

One commenter disagreed with use of medication history transaction for the measure denominator as this does not support the concept of prescription days but uses a duration, which has no start or stop date.

Response: We decline to add an additional exclusion as this measure is optional for CY 2019 and 2020. We are not finalizing the proposed exclusion criteria (83 FR 20530) as we are finalizing this measure as optional for both CY 2019 and 2020.

Moreover, as we discuss in more detail in reference to the preceding comment, we do not believe that confirming an opioid treatment agreement is inconsistent with sound clinical practices for developing and implementing holistic, patient-centered pain management plans for patients affected by conditions causing pain for which opioid treatment for more than 30 days is a clinically appropriate component of an effective overall treatment approach.

We decline to the modify the denominator for this measure as we indicated that we are seeking the cumulative days for an opioid prescription over a 6 month look back period to identify egregious cases (83 FR 20529). We understand that each prescription would include a quantity based on the number of doses allowed. However, the intent is to also look at prescriptions from other health care providers as well for episodes of prescription shopping. As we indicated in the proposed rule (83 FR 20529), the 6 month look back would begin on the date in which the eligible hospital or CAH electronically transmits its Schedule II Opioid prescription using CEHRT.

Comment: A few commenters stated that this measure may not be possible to calculate as the NCPDP 10.6 Medication History query does not contain a field for prescription days and relies on third party data that may not be discrete.

Response: We recognize that the capabilities to which health IT must be certified in order for it to meet the minimum requirements for CEHRT under this program do not include the ability to automatically track prescriber behaviors addressed by this measure. However, we disagree that this measure cannot be implemented at this time, and believe that some health care providers are currently verifying if there is an opioid treatment agreement in place before they prescribe. As we noted that in the proposed rule (83 FR 20529), the adoption of the NCPDP 10.6 standard does not preclude developers from also incorporating and using technology standards or services not required by regulation in their health IT product which could result in development of a workflow which more closely resembles types that health care provider are currently using. However we do understand the limitations for those health care providers that have chosen not to implement such standards and functionalities beyond the minimum to which their CEHRT is required to be certified to meet the requirements of this program.

We also recognize that a provider's attempt to verify whether a treatment agreement is in place may be difficult to capture in an automated fashion in cases where a machine readable treatment agreement cannot be queried. While we believe some providers do currently have the ability to query for an electronic treatment agreement, which could support machine capture of this data, we recognize that for most health care providers this will require additional workflow steps.

As a result of these issues, we are also finalizing this measure as optional for CYs 2019 and 2020, and expect this measure is likely to be adopted by a limited set of providers in treatment arrangements that already possess the infrastructure to support capture and calculation of this measure. We intend to revisit this measure along with the necessary data elements in future rulemaking.

Comment: A few commenters stated that the measure would contain unreliable data and suspect calculations as it would be possible for CEHRT to receive duplicative medication history data from various systems. One commenter requested information on how the EHR would machine calculate duplicative data and cumulative days.

One commenter stated the patient's medical history is not clearly laid out in external prescription history and may require manual calculation with no system ability to determine if users are identifying applicable patients or not.

Response: We recognize that this measure would be technically complex and potentially burdensome for providers to implement. However, we believe that some health care providers may be able to verify if there is an opioid treatment agreement in place through various means such as C–CDA based information exchange. We understand that there is a potential for duplicative medication history data but believe that the reconciliation burden this currently poses for clinicians not only in context of prescribing long-term opioid therapy but a variety of more general clinical situations and thus is one that the market should already be working to address.

Moreover, as the clinical practice this measure tracks is more widely adopted, we believe health care providers and their health IT vendors will develop innovative solutions to accurately capture needed data elements and calculate the measure while reducing workflow complexity and inconvenience to prescribers and other personnel involved in the care and/or measurement process. Therefore, we are taking into account these limitations and are finalizing this measure as optional for CYs 2019 and 2020 and will reevaluate the status of the measure for an EHR reporting period beginning in CY 2021.

After consideration of the comments we received, and for the reasons stated above, we are finalizing the Verify Opioid Treatment Agreement measure as proposed with the modification discussed in section VIII.D.6. of the preamble of this final rule, that the measure will be optional in CYs 2019 and 2020. We are codifying the measure at § 495.24(e)(5)(iii)(C). In addition, we are finalizing that, in order to meet this measure, an eligible hospital or CAH

must use the capabilities and standards as defined for CEHRT at 45 CFR 170.315(b)(3), 170.315(a)(10) and 170.205(b)(2).

We are adopting the measure as follows:

Verify Opioid Treatment Agreement

Measure Description: For at least one unique patient for whom a Schedule II opioid was electronically prescribed by the eligible hospital or CAH using CEHRT during the EHR reporting period, if the total duration of the patient's Schedule II opioid prescriptions is at least 30 cumulative days within a 6-month look-back period, the eligible hospital or CAH seeks to identify the existence of a signed opioid treatment agreement and incorporates it into CEHRT.

Denominator: Number of unique patients for whom a Schedule II opioid was electronically prescribed by the eligible hospital or CAH using CEHRT during the EHR reporting period and the total duration of Schedule II opioid prescriptions is at least 30 cumulative days as identified in the patient's medication history request and response transactions during a 6-month look-back period.

Numerator: The number of unique patients in the denominator for whom the eligible hospital or CAH seeks to identify a signed opioid treatment agreement and, if identified, incorporates the agreement in CEHRT.

c. Final Policy for the Health Information Exchange (HIE) Objective

The Health Information Exchange measures for eligible hospitals and CAHs hold particular importance because of the role they play within the care continuum. In addition, these measures encourage and leverage interoperability on a broader scale and promote health IT-based care coordination. However, through our review of existing measures, we determined that we could potentially improve the measures to further reduce burden and better focus the measures on interoperability in provider to provider exchange. Such modifications would address a number of concerns raised by stakeholders including:

- Supporting the implementation of effective health IT supported workflows based on a specific organization's needs;
- Reducing complexity and burden associated with the manual tracking of workflows to support health IT measures; and
- Emphasizing within these measures the importance of using health IT to support closing the referral loop to improve care coordination.

The Health Information Exchange objective currently includes three measures under § 495.24(c)(7)(ii) (in the proposed rule (83 FR 20530) we inadvertently referred to § 495.24(e)(6)(ii)), and we believe we can potentially improve each to streamline measurement, remove redundancy, reduce complexity and burden, and address stakeholders' concerns about the focus and impact of the measures on the interoperable use of health IT.

As discussed in section VIII.D.6.a. of the preamble of the proposed rule, we proposed to remove the exclusions from all three of the measures associated with the Health Information Exchange objective under § 495.24(c)(7)(iii), as reflected in the two measures proposed under § 495.24(e)(6). However, we stated that if we finalized the new scoring methodology we proposed, eligible hospitals and CAHs would be able to claim an exclusion under the Support Electronic Referral Loops by Receiving and Incorporating Health Information measure.

We proposed several changes to the current measures under the Stage 3 Health Information Exchange objective. First, we proposed to change the name of Send a Summary of Care measure to Support Electronic Referral Loops by Sending Health Information. We also proposed to remove the current Stage 3 Clinical Information Reconciliation measure and combine it with the Request/Accept Summary of Care measure to create a new measure, Support Electronic Referral Loops by Receiving and Incorporating Health Information. This proposed new measure would include actions from both the current Request/Accept Summary of Care measure and Clinical Information Reconciliation measure and focus on the exchange of the health care information while reducing the administrative burden of reporting on two separate measures.

We stated that if we did not finalize the new scoring methodology we proposed in section VIII.D.5. of the preamble of the proposed rule, we would maintain the current Health Information Exchange objective, associated measures and exclusions under § 495.24(c)(7) as described in section VIII.D.5. of the preamble of the proposed rule and as outlined in the table in that section which describes Stage 3 objectives and measures if new scoring methodology is not finalized.

Comment: One commenter suggested retaining the previous names of the Request/Accept Summary of Care and Clinical Information Reconciliation measures for consistency and to prevent confusion with the HIPAA electronic transaction for ''Referrals'' which also uses the terminology ''loops.''

Response: We respectfully decline to retain the previous name of the measures Request/Accept Summary of Care and Clinical Information Reconciliation as the overall intent is to combine the functionalities and actions of both measures to reduce the burden of having to report on two separate measures thereby simplifying reporting. We noted in the proposed rule that the separate Clinical Information Reconciliation measure does not include the exchange of health care information nor use of CEHRT to successfully complete the measure action and is redundant in the action to incorporate summary of care records with the Request/Accept Summary of Care measure. As previously indicated in the proposed rule and this final rule, the focus of the program is on reducing burden, increasing interoperability, exchange of health care information and the advanced use of CEHRT.

We disagree the measure name will create undue confusion with the HIPAA electronic transaction as both fall under separate programs and are associated with differing actions.

Comment: A few commenters agreed with use of any C–CDA document templates available within the C–CDA which contains the most clinically relevant information that may be required by the recipient of the transition or referral. The commenters stated this proposal supports increased flexibility, enables increased information sharing between care providers, and will help providers better understand their patient's history.

Response: We appreciate the feedback by the commenter and agree that this proposal will provide further flexibility for health care providers to focus on clinically relevant information and decrease burden associated with reporting requirements.

Comment: A few commenters requested that CMS allow for flexibility to use any HL7 C–CDA formats available to meet the HIE measures to create and electronically send summary of care records. A few commenters stated all CEHRT does not support every document types within the HL7 C–CDA nor are they applicable in every setting.

One commenter stated that since other document types/templates for the 2015 Edition are not required, availability and delivery within the suggested timeframe for implementation of the 2015 Edition may be unlikely; therefore, healthcare providers should not be limited to the three document types as part of the 2015 Edition.

Another commenter stated that CEHRT should be tested for the ability to generate and send the needed C–CDA template as well as the ability to receive and accept any C–CDA template; therefore, standard templates should be required.

Response: We appreciate commenters' support for the proposal to allow use of any document template within the C–CDA standard for purposes of the measures under the Health Information Exchange objective. We believe this proposal will provide further flexibility for health care providers to focus on clinically relevant information. We note that CEHRT supports the ability to send and receive C–CDA documents according to Releases 1.1 and 2.1 to support interoperability and exchange. The 2015 Edition transitions of care certification criterion at § 170.315(b)(1) requires Health IT Modules support the Continuity of Care Document, Referral Note, and (inpatient settings only) Discharge Summary document templates.

At a minimum, all CEHRT will be able to support exchange of those three document types therefore, testing should not be necessary. However, that does not preclude developers of CEHRT in supporting additional document templates.

While eligible hospitals' and CAHs' CEHRT must be capable of sending the full C–CDA upon request, we believe this additional flexibility will help support clinicians efforts to ensure the information supporting a transition is relevant. We note that in the use of a document template beyond those available in the certification program, the provider would need to work with their developer to determine appropriate technical workflows and implementation.

Comment: One commenter stated that C–CDA standards used for referrals should be required to include data to link a referral request to consult report, a universal referral tracking or index number, better patient identity matching and use of common titles for the document.

Response: We appreciate the comment and encourage the commenter to participate in the standards development-enhancement process of HL7, the steward of the HL7 Implementation Guide for CDA Release 2.

Comment: A commenter recommended support for the widespread availability of patient identifiers for the health information exchange measures in the Promoting Interoperability Programs.

Response: We appreciate the comment and will consider the recommendation for future rulemaking to the extent permissible by law.

(1) Modifications To Send a Summary of Care Measure

In the proposed rule (83 FR 20531), we proposed to change the name of the Send a Summary of Care measure at 42 CFR 495.24(c)(7)(ii)(A) to Support Electronic Referral Loops by Sending Health Information at 42 CFR 495.24(e)(6)(ii)(A), to better reflect the emphasis on completing the referral loop and improving care coordination. We proposed to change the measure description only to remove the previously defined threshold from Stage 3, in alignment with our proposed implementation of a performance-based scoring system, to require that the eligible hospital or CAH create a summary of care record using CEHRT and electronically exchange the summary of care record for at least one transition of care or referral.

Proposed name and measure description: Support Electronic Referral Loops by Sending Health Information: For at least one transition of care or referral, the eligible hospital or CAH that transitions or refers their patient to another setting of care or provider of care: (1) Creates a summary of care record using CEHRT; and (2) electronically exchanges the summary of care record.

We stated in the proposed rule that if an eligible hospital or CAH is the recipient of a transition of care or referral, and subsequent to providing care the eligible hospital or CAH transitions or refers the patient back to the referring provider of care, this transition of care should be included in the denominator of the measure for the eligible hospital or CAH.

We proposed that eligible hospitals and CAHs may use any document template within the C–CDA standard for purposes of the measures under the Health Information Exchange objective. While eligible hospitals' and CAHs' CEHRT must be capable of sending the full C–CDA upon request, we believe this additional flexibility will help support efforts to ensure the information supporting a transition is relevant.

For instance, when the eligible hospital or CAH is referring to another health care provider, the recommended document is the ''Referral Note,'' which is designed to communicate pertinent information from a health care provider who is requesting services of another health care provider of clinical or nonclinical services. When the receiving health care provider sends back the information, the most relevant C–CDA document template may be the ''Consultation Note,'' which is generated by a request from a clinician for an opinion or advice from another clinician. However, eligible hospitals and CAHs may choose to utilize other documents within the C–CDA to support transitions, for instance the ''Discharge Summary'' document.

We noted that if the new scoring methodology and measure were finalized, this measure would not have a reporting threshold and if we did not finalize the proposed scoring methodology, we would maintain the current Stage 3 requirements finalized in previous rulemaking. Therefore, eligible hospitals and CAHs would be required report on the Stage 3 Send a Summary of Care measure under the Health Information Exchange objective codified at § 495.24(c)(7)(ii)(A).

Comment: A few commenters supported the name change to Supporting Electronic Referral Loops by Sending Health Information. A few commenters agreed with the focus on patient outcomes with this measure. These commenters believed that the measure focuses on ensuring that the patient's health data is accurately shared between health care providers thereby improving care coordination and patient outcomes.

Response: We appreciate the support for the name change and focus and believe this reflects our emphasis on improving care coordination and communication between health care providers, as it relates to completing the referral loop. We believe that the emphasis on closing the referral loop will positively influence patient outcomes due to improved exchange of clinically relevant patient health information for care performed by other parties.

Comment: One commenter voiced concerned that many providers do not have interoperable EHRs and sending a summary of care to these providers should not be counted towards meeting requirements under the Promoting Interoperability Program.

Response: We thank the commenter for its feedback. We are committed to the use of certified health IT to effectively support the interoperable electronic exchange across the care continuum. While we recognize that not all of the provider types to whom a hospital or CAH might send a care summary currently use technology certified under the ONC Health IT Certification Program, we believe that it is important that eligible hospitals and CAHs are including these workflows in their everyday practice. Since the

beginning of the EHR Incentive Program, hospital efforts to engage in and expand health information exchange across the care continuum have helped to build and evolve health IT infrastructure across the nation. We note that eligible hospitals have achieved near-universal adoption of certified health IT, with 96 percent of Medicare- and Medicaid-participating non-Federal acute care hospitals having adopted certified EHRs with the capability to electronically export a summary of clinical care as of 2015. We also note that there may be many cases where this information is valuable to health care providers even if they are not capable of receiving and incorporating the information when it is transmitted from interoperable health IT according to applicable interoperability standards.

After consideration of the public comments we received, we are finalizing the name change of Send a Summary of Care to Support Electronic Referral Loops by Sending Health Information and codifying this measure at 42 CFR 495.24(e)(6)(ii)(A).

We are finalizing that eligible hospitals and CAHs may use any document template within the C–CDA standard for purposes of the measures under the Health Information Exchange objective.

We are adopting the measure description as proposed, in alignment with the scoring methodology in section VIII.D.5. of the preamble of this final rule:

Support Electronic Referral Loops by Sending Health Information: For at least one transition of care or referral, the eligible hospital or CAH that transitions or refers their patient to another setting of care or provider of care: (1) Creates a summary of care record using CEHRT; and (2) electronically exchanges the summary of care record.

We are finalizing the proposal to remove the exclusion from this measure.

(2) Removal of the Request/Accept Summary of Care Measure

In the proposed rule (83 FR 20531), we proposed to remove the Request/Accept Summary of Care measure at § 495.24(c)(7)(ii)(B) under the proposed § 495.24(e)(6). Our analysis of the existing measure and stakeholder input indicated the measure specification does not effectively identify when health care providers are engaging with other providers of care or care team members to obtain up-to-date patient health information and to subsequently incorporate relevant data into the patient record, resulting in unintended consequences where health care providers implement either:

- A burdensome workflow to document the manual action to request or obtain an electronic record, for example, clicking a check box to document each phone call or similar manual administrative task, or
- A workflow which is limited to only querying internal resources for the existence of an electronic document.

Further, stakeholder feedback highlights the fact that the requirement to incorporate data is insufficiently clear regarding what data must be incorporated.

In addition, as indicated in the proposed rule, stakeholders noted that when approached separately, the incorporate portion of the Request/Accept Summary of Care measure is both inconsistent with and redundant to the Clinical Information Reconciliation measure which causes unnecessary burden and duplicative measure calculation.

Comment: One commenter stated that the removal of this measure would not reduce burden as the Request/Accept Summary of Care measure would be included in the Support Electronic Referral Loops By Receiving and Incorporating Health Information which was thought to be a more complex measure to calculate.

Several commenters disagreed with the new Support Electronic Referrals Loops By Receiving and Incorporating Health Information measure as they believed it is too burdensome under one measure and does not align with their current workflows creating a potential for errors.

A few commenters stated this measure would be more complex and difficult to calculate as it includes multiple actions under one measure. One commenter stated there was not enough time allowed for implementation since it is a new measure and requires testing and certification.

Response: We disagree that removing this measure would not reduce burden. We believe that the current separation of the Request/Accept Summary of Care measure from the Clinical Information Reconciliation measure is burdensome and redundant in the action of incorporation of the summary of care record. In addition, stakeholder concerns indicated the separate Request/Accept Summary of Care and Clinical Information Reconciliation measures were not reflective of clinical and care coordination workflows.

For instance, under the prior Request/Accept Summary of Care measure, a provider receiving a transition of care was required to obtain the patient's record (if not already received via a Direct message), through querying for the record or a manual request (such as a phone call). Once received, the provider was then required to ''incorporate'' this information into the patient's record. Each individual action in this process, from querying and requesting to incorporating, had to be tracked for each individual use case in order to calculate the measure. Under the Clinical Information Reconciliation measure, the provider was required to review a record received electronically or by other means, or capture information through verbal discussion with the patient, and then use this information to reconcile the medications, medication allergies, and problem list within the record. As with the Request/Accept Summary of Care measure, each of these actions had to be tracked in order to calculate the measure.

The combined measure, Support Electronic Referral Loops by Receiving and Incorporating Health Information, significantly simplifies these actions, specifying that upon receipt of an electronic record, the provider must reconcile information regarding medications, medication allergies, and problem list. Rather than tracking individual actions as required by existing measures, this new measure would instead focus on the result of these actions when an electronic summary of care record is successfully identified, received, and reconciled with the patient record. We believe that moving away from the actions requiring manual or other tracking in the existing measures will reduce burden for providers and developers and more closely align with provider workflows.

In addition, with regard to the commenter's concerns about implementation timing, we are establishing an exclusion to this measure for 2019. We believe that all eligible hospitals and CAHs should be able to perform the actions required by this measure by 2020. We also note that this measure aligns with our goals to have a truly interoperable system which includes the free flow of health information between EHR systems.

After consideration of the public comments we received, we are finalizing the removal of the Request/Accept Summary of Care measure as proposed.

(3) Removal of the Clinical Information Reconciliation Measure

In the proposed rule (83 FR 20532), we proposed to remove the Clinical Information Reconciliation measure at

§ 495.24(c)(7)(ii)(C) from the new measures at proposed § 495.24(e)(6) to reduce redundancy, complexity, and provider burden.

As discussed in the proposed rule, we believe the Clinical Information Reconciliation measure is redundant in regard to the requirement to ''incorporate'' electronic summaries of care in light of the requirements of the Request/Accept Summary of Care measure. In addition, the measure is not fully health IT based as the exchange of health care information is not required to complete the measure action and the measure specification is not limited to only the reconciliation of electronic information in health IT supported workflows. In addition, feedback from hospitals, clinicians, and health IT developers indicates that because the measure is not fully based on the use of health IT to meet the measurement requirements, eligible hospitals and CAHs must engage in burdensome tracking of manual workflows.

Comment: Multiple commenters supported the removal of this measure and stated the removal of this measure would reduce burden.

Response: We appreciate the support and agree that it will help to reduce provider burden and refocus on the use of health IT to meet the measure requirements.

After consideration of the public comments we received, we are finalizing the removal of the Clinical Information Reconciliation measure as proposed.

(4) New HIE Measure: Support Electronic Referral Loops by Receiving and Incorporating Health Information

In the proposed rule (83 FR 20532 through 20533), we proposed to add the following new measure for inclusion in the Health Information Exchange objective at § 495.24(e)(6)(ii)(B): Support Electronic Referral Loops by Receiving and Incorporating Health Information. This measure would build upon and replace the existing Request/Accept Summary of Care and Clinical Information Reconciliation measures.

Proposed measure name and description: Support Electronic Referral Loops by Receiving and Incorporating Health Information: For at least one electronic summary of care record received for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the receiving party of a transition of care or referral, or for patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient, the eligible hospital or CAH conducts clinical information reconciliation for medication, medication allergy, and current problem list.

We proposed to combine two existing measures, the Request/Accept Summary of Care measure and the Clinical Information Reconciliation measure, in this new Support Electronic Referral Loops by Receiving and Incorporating Health Information measure to focus on the exchange of health care information as the current Clinical Information Reconciliation measure is not reliant on the exchange of health care information nor use of CEHRT to complete the measure action. We did not propose to change the actions associated with the existing measures; rather, we proposed to combine the two measures to focus on the exchange of the health care information, reduce administrative burden, and streamline and simplify reporting.

CMS and ONC worked together to define the following for this measure:

Denominator: Number of electronic summary of care records received using CEHRT for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the receiving party of a transition of care or referral, and for patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient.

Numerator: The number of electronic summary of care records in the denominator for which clinical information reconciliation is completed using CEHRT for the following three clinical information sets: (1) Medication—Review of the patient's medication, including the name, dosage, frequency, and route of each medication; (2) Medication allergy—Review of the patient's known medication allergies; and (3) Current Problem List—Review of the patient's current and active diagnoses.

We proposed the denominator would increment on the receipt of an electronic summary of care record after the eligible hospital or CAH engages in workflows to obtain an electronic summary of care record for a transition, referral or patient encounter in which the health care provider has never before encountered the patient and the numerator would increment upon completion of clinical information reconciliation of the electronic summary of care record for medications, medication allergies, and current problems. The eligible hospital or CAH would no longer be required to manually count each individual non-health-IT-related action taken to engage with other providers of care and care team members to identify and obtain the electronic summary of care record. Instead, the measure would focus on the result of these actions when an electronic summary of care record is successfully identified, received, and reconciled with the patient record. We believe this approach would allow eligible hospitals and CAHs to determine and implement appropriate workflows supporting efforts to receive the electronic summary of care record consistent with the implementation of effective health IT information exchange at an organizational level.

Finally, we proposed to apply our existing policy for cases in which the eligible hospital or CAH determines no update or modification is necessary within the patient record based on the electronic clinical information received, and the eligible hospital or CAH may count the reconciliation in the numerator without completing a redundant or duplicate update to the record. We sought public comment on methods by which this specific action could potentially be electronically measured by the provider's health IT system—such as incrementing on electronic signature or approval by an authorized provider—to mitigate the risk of burden associated with manual tracking of the action.

In addition, we sought public comment on methods and approaches to quantify the reduction in burden for eligible hospitals and CAHs implementing streamlined workflows for this proposed measure. We also sought public comment on the impact these proposals may have for health IT developers in updating, testing, and implementing new measure calculations related to these proposed changes. Specifically, we sought public comment on whether ONC should require developers to recertify their EHR technology as a result of the changes proposed, or whether they should be able to make the changes and engage in testing without recertification. Finally, we sought public comment on whether this proposed new measure that combines the Request/Accept Summary of Care and Clinical Information Reconciliation measures should be adopted, or whether either or both of the existing Request/Accept Summary of Care and Clinical Information Reconciliation measures should be retained in lieu of this proposed new measure.

We stated if we finalize the new scoring methodology we proposed in section VIII.D.5. of the preamble of the proposed rule, an exclusion would be available for eligible hospitals and CAHs that could not implement the Support Electronic Referral Loops by Receiving and Incorporating Health

Information measure for an EHR reporting period in CY 2019.

We proposed that we would maintain the current Stage 3 requirements finalized in previous rulemaking if we did not finalize the new scoring methodology proposed in section VIII.D.5. of the preamble of the proposed rule. Therefore, eligible hospitals and CAHs would be required report on the Stage 3 Request/Accept Summary of Care measure and Clinical Information Reconciliation measures under the Health Information Exchange objective codified at § 495.24(c)(7)(ii)(B) and (C).

We also proposed that, in order to meet this measure, an eligible hospital or CAH must use the capabilities and standards as defined for CEHRT at 45 CFR 170.315(b)(1) and (b)(2).

Comment: One commenter supported the exclusion for Support Electronic Referrals Loops by Receiving and Incorporating Health Information.

Response: We appreciate the support and believe the exclusion will benefit health care providers who are unable to implement the measure for an EHR reporting period in 2019 due to additional time needed to perform necessary updates and workflow changes.

Comment: A few commenters requested that CMS not finalize this measure and maintain the Request/Accept Summary of Care information and Clinical Information Reconciliation measures separately. These commenters believed that clinical information reconciliation presents many challenges including partially automated reconciliation and functionalities for problem list, which require some manual actions. These commenters suggested that the actions required for the combined measure would create a complex workflow and would not result in improved interoperability.

Response: We believe that the current separation of the measures is burdensome and redundant in the action of incorporation of the summary of care record. In addition, we listened to stakeholder concerns regarding the separate Request/Accept Summary of Care and Clinical Information Reconciliation measures, which indicated that the separation between receiving and reconciling patient health information is not reflective of clinical and care coordination workflows and the incorporation aspect is redundant to both measures. We agree the process of clinical information reconciliation includes both automated and manual reconciliation to allow the receiving health care provider to work with both the electronic data provided with any necessary review, and to work directly with the patient to reconcile their health information. We also indicated in previous rulemaking (80 FR 62861) that if no update is necessary, the process of reconciliation may consist of simply verifying that fact or reviewing a record received on referral and determining that such information is merely duplicative of existing information in the patient record, which we believe would reduce burden. In addition, we believe that combining the measures of Request/Accept Summary of Care and Clinical Information Reconciliation retains the focus on interoperability and exchange of health information as opposed to the separation of the measures where health information exchange and interoperability was not a focus for clinical information reconciliation.

Comment: One commenter stated that health care providers should not be held accountable for performance scores that depend on actions of another health care provider to receive credit.

One commenter stated that health care providers are querying for external data but not consistently ''closing the referral loop'' by sending information back, and recommended automating a closed loop referral workflow process.

Response: We disagree with the commenter's concern regarding being accountable for another health care provider's actions. We stated in the proposed rule (83 FR 20516) that we were moving to a new phase of EHR measurement with an increased focus on interoperability and improving patient access to health information. The Health Information Exchange measures focus on interoperability and coordination of care. Therefore, we do not believe health care providers are being held accountable for the actions of another health care provider, rather, we are focusing on improving interoperability and patient outcomes through exchange of health care information. In addition, we note that the denominator language includes ''the number of summary of care records received using CEHRT,'' therefore, an eligible hospital or CAH would not increment the denominator if a summary of care record was not received; however, we encourage the eligible hospital or CAH to make a reasonable effort to acquire the summary of care, such as a request to the referring provider and a query of any HIE or service. To that end, we believe that if information is not received after a referral, the eligible hospital or CAH who referred the patient should also make a reasonable effort to acquire the summary of care from the referral. We believe this will effectively improve closing the referral loop after a referral. We believe that in order to have an interoperable system, EHRs should have a free flow of data between systems. We also note that this measure takes into account the entire cycle of care and helps to foster agreement among healthcare providers.

Similarly, we believe that it is up to the referring provider to ensure that they are taking into account the care of their patients in order to make necessary and relevant clinical decisions. We believe that this consolidated measure gets to that end.

We appreciate the commenter's support for efforts to improve processes and technology solutions around closing referral loops. We believe that the measures finalized in this rule will help incentivize further innovation around interoperable exchange of information to support these processes. We also encourage providers to work with health IT developers to pursue products that deliver greater automation around key care coordination functions.

We will continue to collaborate with ONC in future rulemaking on possible functionalities which could support an automated processes for closing the referral loop.

Comment: One commenter stated that there should be a model for incorporation of health information including attachment/incorporation into the record, parse and group. The commenter further added that it should at least require data domains for the summary of care record (Medications, Medication Allergies, Problem Lists) with the ability to compare for duplication and advance informatics analytics against all data from all sources.

Response: Health IT certified to the ONC 2015 Edition criteria at § 170.315(b)(2) will have the model capabilities recommended by the commenter. The ONC 2015 Edition includes requirements for health IT to be capable of the reconciliation and incorporation of health information from multiple sources. Health IT certified to the 2015 Edition must demonstrate that a transition of care/referral summary artifact received by a system can be properly matched to the correct patient, and then simultaneously display (in a single view) the data from at least two sources. The certified health IT must enable a user to create a single reconciled list of each of the following: Medications; medication allergies; problems; enable a user to review and validate the accuracy of a final set of data, and with the user's confirmation, automatically update the list, and

incorporate the reconciled data. The 2015 Edition requirement is codified at § 170.315(b)(2) (Clinical information reconciliation and incorporation).

Comment: A commenter requested clarification on the definition of a new patient.

Response: As we stated in the proposed rule (83 FR 20532), this measure refers to patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient.

After consideration of the public comments we received, we are finalizing the Support Electronic Referral Loops by Receiving and Incorporating Health Information measure as proposed and codifying this measure at § 495.24(e)(6)(ii)(B). We are finalizing the proposal to apply the existing policy for cases in which the eligible hospital or CAH determines no update or modification is necessary within the patient record based on the electronic clinical information received, and the eligible hospital or CAH may count the reconciliation in the numerator without completing a redundant or duplicate update to the record.

We are finalizing an eligible hospital or CAH must use the capabilities and standards as defined for CEHRT at 45 CFR 170.315(b)(1) and (b)(2).

We are adopting the Support Electronic Referral Loops by Receiving and Incorporating Health Information measure as follows:

Measure Description: Support Electronic Referral Loops by Receiving and Incorporating Health Information: For at least one electronic summary of care record received for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the receiving party of a transition of care or referral, or for patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient, the eligible hospital or CAH conducts clinical information reconciliation for medication, mediation allergy, and current problem list.

Denominator: Number of electronic summary of care records received using CEHRT for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the receiving party of a transition of care or referral, and for patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient.

Numerator: The number of electronic summary of care records in the denominator for which clinical information reconciliation is completed using CEHRT for the following three clinical information sets: (1) Medication—Review of the patient's medication, including the name, dosage, frequency, and route of each medication; (2) Medication allergy—Review of the patient's known medication allergies; and (3) Current Problem List—Review of the patient's current and active diagnoses.

We are finalizing an exclusion for eligible hospitals and CAHs that could not implement the Support Electronic Referral Loops by Receiving and Incorporating Health Information measure for an EHR reporting period in CY 2019.

d. Final Policy for the Provider to Patient Exchange Objective

The Provider to Patient Exchange objective for eligible hospitals and CAHs builds upon the goal of improved access and exchange of patient health information, patient centered communication and coordination of care using CEHRT. In section VIII.D.5. of the preamble of the proposed rule, we proposed to rename the Patient Electronic Access to Health Information objective to Provider to Patient Exchange, remove the Patient Specific Education measure and rename the Provide Patient Access measure to Provide Patients Electronic Access to Their Health Information. In addition, we proposed to remove the Coordination of Care through Patient Engagement objective and all associated measures. The existing Stage 3 Patient Electronic Access to Health Information objective includes two measures under § 495.24(c)(5)(ii) and the existing Stage 3 Coordination of Care through Patient Engagement objective includes three measures under § 495.24(c)(6)(ii).

We reviewed the existing Stage 3 requirements and determined that the proposals for the Patient Electronic Access to Health Information objective and Coordination of Care through Patient Engagement objective could reduce program complexity and burden and better focus on leveraging the most current health IT functions and standards for patient flexibility of access and exchange of health information. We proposed the Provider to Patient Exchange objective would include one measure, the existing Stage 3 Provide Patient Access measure, which we proposed to rename to Provide Patients Electronic Access to Their Health Information. In addition, we proposed to revise the measure description for the Provide Patients Electronic Access to Their Health Information measure to change the threshold from more than 50 percent to at least one unique patient in accordance with the proposed scoring methodology proposed in section VIII.D.5. of the preamble of the proposed rule. As discussed in section VIII.D.6.a. of the preamble of the proposed rule, we proposed to remove the exclusion for the Provide Patients Electronic Access to Their Health Information measure.

We proposed that if we finalized the new scoring methodology we proposed in section VIII.D.5. of the preamble of the proposed rule, we would remove all of the other measures currently associated with the Patient Electronic Access to Health Information objective and the Coordination of Care through Patient Engagement objective.

We stated that if we did not finalize the new scoring methodology we proposed in section VIII.D.5. of the preamble of the proposed rule, we would maintain the existing Stage 3 requirements finalized in previous rulemaking as outlined in the table in that section which describes Stage 3 objectives and measures if new scoring methodology is not finalized. Therefore, we would retain the existing Patient Electronic Access to Health Information objective, associated measures and exclusions under § 495.24(c)(5) and the existing Coordination of Care through Patient Engagement objective, associated measures and exclusions under § 495.24(c)(6).

(1) Modifications To Provide Patient Access Measure

In the proposed rule (83 FR 20534), we proposed to change the name of the Provide Patient Access measure at 42 CFR 495.24(c)(5)(ii)(A) to Provide Patients Electronic Access to Their Health Information at proposed 42 CFR 495.24(e)(7)(ii) (in the proposed rule (83 FR 20534), we inadvertently referred to 42 CFR 495.24(e)(7)(ii)(A)) to better reflect the emphasis on patient engagement in their health care and patient's electronic access of their health information through use of APIs. We proposed to change the measure description only to remove the previously established threshold from Stage 3, in alignment with our proposed implementation of a performance-based scoring methodology, to require that the eligible hospital or CAH provide timely access for viewing, downloading or transmitting their health information for at least one unique patient discharged using any application of the patient's choice.

Proposed name and measure description: Provide Patients Electronic Access to Their Health Information: For at least one unique patient discharged

from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23):

- The patient (or the patient authorized representative) is provided timely access to view online, download, and transmit his or her health information; and
- The eligible hospital or CAH ensures the patient's health information is available for the patient (or patient-authorized representative) to access using any application of their choice that is configured to meet the technical specifications of the API in the eligible hospital or CAH's CEHRT.

We proposed to change the measure name to emphasize electronic access of patient health information as opposed to use of paper based actions in accordance with the 2015 EHR Incentive Programs final rule policy for Stage 3 to discontinue inclusion of paper based formats and limit the focus to only health IT solutions to encourage adoption and innovation in use of CEHRT (80 FR 62783 through 62784). In addition, we are committed to promoting patient engagement with their health care information and ensuring access in an electronic format upon discharge from the eligible hospital or CAH.

We noted that under the new scoring methodology we proposed in section VIII.D.5. of the preamble of the proposed rule, measures would not have required thresholds for reporting. Therefore, if the new scoring methodology and measure were finalized, this measure would not have a reporting threshold. We stated that if we did not finalize the proposed scoring methodology, we would maintain the existing Stage 3 requirements finalized in previous rulemaking. Therefore, eligible hospitals and CAHs would be required report on the Stage 3 Provide Patient Access measure under the Patient Electronic Access to Health Information objective codified at § 495.24(c)(5)(ii)(A).

Comment: Several commenters supported the renaming of the measure as proposed.

Response: We thank the commenters for their support and believe the name change effectively focuses the electronic aspect of the measure and our focus on leveraging advanced used of health IT.

Comment: One commenter indicated concern over the current software available for this objective, which results in difficult and burdensome record submission and patient access. The commenter recommended vendor-specific regulations to address the software concern that does not increase costs for health care providers.

Response: We appreciate the commenter's feedback and have emphasized increasing interoperability, burden reduction and improving patient's electronic access to their health information. We believe that the new functionalities of the 2015 Edition such as the health care provider's ability to make patient data accessible through an API to other third party applications, will increase interoperability as well as communication and information between providers and patients. We will continue to review program requirements and work with our partners to focus on burden reduction.

Comment: One commenter recommended that eligible hospitals and CAHs should be required to share all results with patients through the use of API functionality and that failure to do so should be considered to be information blocking. One commenter felt that eligible hospitals and CAHs should not be able to turn off any API functionality which could limit patient access to their health care information.

Response: Patients should be able to access their health information on demand, and we encourage health care providers to maintain the appropriate functionalities for patient access to their health information at all times unless the system is undergoing scheduled maintenance, which should be limited to the least amount of time necessary to perform the maintenance. Furthermore, we noted in previous rulemaking (80 FR 62779) that the actions and workflows that support the requirements of the EHR Incentive Programs are intended to be in effect continuously, not enabled and implemented for only 90 days.

Comment: One commenter supported no longer including paper-based methods in measure calculations.

Response: We thank the commenter for the support and believe the removal of paper-based actions in part supports the discontinuation of manual paper-based calculation and chart abstraction and leverages the advanced use of CEHRT.

Comment: A commenter recommended an exclusion for the Provide Patients Electronic Access to Their Health Information measure for eligible hospitals and CAHs that cannot successfully identify an app that meets the security needs of their system.

Response: We decline to implement exclusion criteria for the Provide Patients Electronic Access to Their Health Information measure as we believe eligible hospitals and CAHs should work with their health IT vendors to identify applications that meet their security needs.

Comment: A commenter requested that the definition of ''timely'' should be increased to 72 hours from 36 hours.

Response: We decline to change the definition of ''timely'' and note that providing patients access to their health information is a top priority for the program and we have not received compelling evidence to indicate that 36 hours is not feasible. We continue to believe that 36 hours is a reasonable timeframe because it allows for immediate access and a reasonable amount of time for health care providers to review any information necessary before it is made available to the patient as provided in previous rulemaking (80 FR 62813 through 62814).

Comment: A commenter requested that CMS provide privacy language and guidance that health care providers can use to present to patients who choose to access their health information via an API.

Response: A resource titled ''Key Privacy and Security Considerations for Healthcare Application Programming Interfaces (APIs)'' dated December 2017 is available on ONC's *https://www.HealthIT.gov* website and includes information on this issue. We refer readers to additional resources that may be useful from the HHS Office for Civil Rights through the ''HIPAA for Individuals'' selection under the ''HIPAA—Health Information Privacy'' selection at the *https://www.hhs.gov/* website.

Comment: One commenter requested that CMS address parental/guardian proxy rights related to a child's personal health information, privacy rights, and adolescent confidentiality. The commenter also requested clarification on the definition of ''timely access'' specific to pediatric providers.

Response: We did not make specific proposals related to parental/guardian proxy rights, privacy rights, and adolescent confidentiality, and we encourage the commenter to consult existing sources of applicable law with regard to these topics. We did not propose to change the definition of ''timely access'' to health care information under this rule and the definition will remain within 36 hours as finalized in the 2015 EHR Incentive Programs final rule (80 FR 62813 through 62814).

Commenter: One commenter stated electronic connectivity for sharing of records is optimal but not always possible—and never will be. The commenter further stated that even while there is movement to a more efficient, interoperable system, there will still be myriad situations from frontier health care delivery to computer

failure that require a ''paper'' alternative and that many of these situations are critical for the patient involved.

Response: We appreciate the commenter's concerns and understand that health care providers have an obligation to do their best to serve patients even during times of minor disruptions, such as a computer downtime or failure, or in major dislocations, such as those that may result from natural disasters. Therefore, contingency planning is prudent for continuity of all essential aspects of health care services, including the electronic health record. One available resource to assist with this issue is the ONC Safety Assurance Factors for EHR Resilience (SAFER) Guides (*https://www.healthit.gov/topic/safety/safer-guides*), specifically the Contingency Planning Guide (*https://www.healthit.gov/sites/default/files/safer/guides/safer_contingency_planning.pdf*). This guide identifies recommended safety practices associated with planned or unplanned EHR unavailability—instances in which clinicians or other end users cannot access all or part of the EHR and provides useful recommendations from backup procedures for potential clinical or administrative data loss to recommendations around use of paper forms to replace key EHR functions during downtimes.

Comment: Multiple commenters requested that the measure should allow health care providers to offer access to at least one application or limit applications to ones deemed secure by the healthcare provider rather than any application configured to meet the technical specifications of the API in the CEHRT.

Response: It was not our intent to imply that eligible hospitals and CAHs and their technology suppliers would not be permitted to take reasonable steps to protect the privacy and security of their patients' information. Such measures might include vetting application developers prior to allowing their applications to connect to the API functionality of the provider's health IT. We also remind stakeholders that even in the case where a health care provider or its CEHRT developer/vendor chooses not to vet application developers, any application would not have unmitigated access to data in the health care provider's CEHRT. To the contrary, each application should be registered and thus be identifiable so that the health care provider, or their CEHRT developer/vendor that supplies the API technology to the provider, can deactivate any application's access if the application functions in anomalous or malicious ways (for example, denial of service attack). We also anticipate that a patient seeking access to their data using any application may need to authenticate (using credentials previously issued by a healthcare provider or trusted source) and authorize the application to connect to the API server. In addition, the measure does not require that the eligible hospital or CAH provide an application for its patients' use.

Comment: A few commenters requested that CMS slow the implementation and requirements for use of APIs secondary to risks for systems security and confidentiality of health information.

Response: We believe that we are moving along with the current implementation of APIs and as a result are revising elements of the Promoting Interoperability Programs to take into account the new innovations. In addition, we believe that we are providing ample time for health care providers to incorporate the necessary system securities and confidentiality provisions.

Comment: A commenter recommended creation of a site, list or address where health care providers may report and obtain information on suspicious applications.

Response: We appreciate the commenter's recommendation, and we refer readers to the Health IT Feedback submission mechanism, at: *https://www.healthit.gov/form/healthit-feedback-form*.

Comment: A few commenters requested additional guidance on how information blocking requirements would be viewed in relation to security of systems with use of APIs, specifically that health care provider determination of an unsecure API should not fall under information blocking.

Response: We thank the commenters for the input and will continue to consider how any policy related to information blocking should treat issues involving the use of APIs.

Comment: One commenter stated that CMS should work with ONC to specify required standards for API access to promote evolution of relevant patient facing applications.

Response: We thank the commenter for the input and will continue to work across HHS and with partners on API standards to support patient access to their electronic health information.

After consideration of the public comments we received, we are finalizing the Provide Patients Electronic Access to Their Health Information measure as proposed and codifying this measure at 42 CFR 495.24(e)(7)(ii).

We are finalizing the measure description in alignment with the scoring methodology in section VIII.D.5. of the preamble of this final rule:

Measure description: Provide Patients Electronic Access to Their Health Information: For at least one unique patient discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23):

- The patient (or the patient authorized representative) is provided timely access to view online, download, and transmit his or her health information; and
- The eligible hospital or CAH ensures the patient's health information is available for the patient (or patient-authorized representative) to access using any application of their choice that is configured to meet the technical specifications of the API in the eligible hospital or CAH's CEHRT.

(2) Removal of the Patient Generated Health Data Measure

In the proposed rule (83 FR 20534), we proposed to remove the Patient Generated Health Data (PGHD) measure at 42 CFR 495.24(c)(6)(ii)(C) at proposed § 495.24(e)(7) to reduce complexity and focus on the goal of using advanced EHR technology and functionalities to advance interoperability and health information exchange.

As finalized in the 2015 EHR Incentive Programs final rule (80 FR 62851), the measure is not fully health IT based as we did not specify the manner in which health care providers would incorporate the data received. Instead, we finalized that health care providers could work with their EHR developers to establish the methods and processes that work best for their practice and needs. We indicated that this could include incorporation of the information using a structured format (such as an existing field in the EHR or maintaining an isolation between the data and the patient record such as incorporation as an attachment, link or text reference which would not require the advanced use of CEHRT. We note that although this measure requires use of the 2015 Edition, it does not require key updates to functions and standards of health IT, therefore, it does not align with the current program goals of improving interoperability, prioritizing actions completed electronically and use of advanced CEHRT functionalities.

Comment: Several commenters supported the removal of the measure indicating the standards and processes were immature.

Response: We agree that the Patient Generated Health Data did not focus on the advanced use of CEHRT as it was not fully health IT-based nor were the actions associated with the measure fully electronic and may have included paper-based actions, which did not align with the focus of Stage 3 to remove paper based actions. In addition, stakeholder feedback we received through correspondence and listening sessions indicated there was confusion related to the types of data that would be applicable and the situations in which the patient data would apply. We also believe removal of this measure will decrease reporting burden as it could require aspects of manual processes to incorporate the data and did not focus on the advanced use of CEHRT.

Comment: One commenter requested that CMS retain the functionality of this measure if removed due to the benefits of receiving patient generated health data.

Response: We have previously stated to healthcare providers in rulemaking (80 FR 62786) that functions and standards related to measures that are no longer required for the Promoting Interoperability Programs could still hold value for some healthcare providers and may be utilized as best suits their practice and the preferences of their patient population. The removal of measures is not intended to discourage the use of the standards, the implementation of best practices, or conducting and tracking the information for providers' own quality improvement goals.

After consideration of the public comments we received, we are finalizing the removal of this measure as proposed.

(3) Removal of the Patient-Specific Education Measure

In the proposed rule (83 FR 20534), we proposed to remove the Patient-Specific Education measure at § 495.24(c)(5)(ii)(B) at proposed § 495.24(e)(7) as it has proven burdensome to eligible hospitals and CAHs in ways that were unintended and detract from health care providers' progress on current program priorities.

We believe that the Patient-Specific Education measure does not align with the current emphasis of the Medicare Promoting Interoperability Program to increase interoperability, leverage the most current health IT functions and standards or reduce burden for eligible hospitals and CAHs. For example, the Patient-Specific Education measure's primary focus is on use of CEHRT for patient resources specific to their health care and diagnosis as well as patient centered care. However, the education resources do not need to be maintained within or generated by CEHRT. Therefore, even though the CEHRT identifies the patient educational resources, the process to generate them could take additional time and interrupt health care provider's workflows. In addition, there could be redundancy in providing educational materials based on resources identified by the CEHRT as CEHRT identifies educational resources using the patient's medication list and problem list but can also include other elements as well. If there are no changes to a patient's health status or treatment based on his or her health care information, there would likely be many resources and materials that present the same type of information and could increase burden to the health care provider in seeking additional resources to provide.

Comment: A few commenters recommended keeping the Patient-Specific Education measure as research conducted indicates the measure improves patient outcomes and improves quality of care, and reduces costs through patient knowledge of their health conditions. In addition, the commenters indicated the Patient-Specific Education measure instantly produces materials for patients increasing efficiency and lowering costs associated with manual procurement of those materials.

Response: We disagree that the Patient-Specific Education measure should be retained as a required measure. While we believe that there are merits to the Patient-Specific Education measure, we affirm our position that the Patient-Specific Education measure does not align with the current emphasis of the Medicare Promoting Interoperability Program which aims to increase interoperability, leverage the most current health IT functions and standards and reduce burden for eligible hospitals and CAHs. In addition, as we stated in the proposed rule (83 FR 20525), although the measure would no longer be required for reporting, eligible hospitals and CAHs may continue to use the standards and functions of those measures no longer required for successful demonstration of meaningful use if they are beneficial for them. We believe that if health care providers find value in the Patient-Specific Education measure, they will continue to use the standards and functions, even if not required.

Comment: A few commenters supported the removal of the Patient-Specific Education measure, but stated that CMS should encourage use of its functionality.

Response: We thank the commenters for their support of the removal. As we indicated in the preceding response, providers may choose to continue to use the functionalities that support the measure even if the measure is no longer required.

After consideration of the public comments we received, we are finalizing the removal of this measure as proposed.

(4) Removal of the Secure Messaging Measure

In the proposed rule (83 FR 20534 through 20535), we proposed to remove the Secure Messaging measure at § 495.24(c)(6)(ii)(B) at proposed § 495.24(e)(7) as it has proven burdensome to eligible hospitals and CAHs in ways that were unintended and detract from health care providers' progress on current program priorities.

Secure Messaging was finalized as a Stage 3 measures for eligible hospitals and CAHs in the 2015 EHR Incentive Programs final rule with the intent to build upon the Stage 2 policy goals of using CEHRT for provider-patient communication (80 FR 62841 through 62849). As mentioned above, we believe that Secure Messaging does not align with the current emphasis of the Medicare Promoting Interoperability Program to increase interoperability or reduce burden for eligible hospitals and CAHs.

In addition, we believe there is burden associated with tracking secure messages, including the unintended consequences of workflows designed for the measure rather than for clinical and administrative effectiveness. We believe that because this measure is not required under Modified Stage 2, removal would not negatively impact patient engagement nor care coordination and serve to decrease burden.

In addition, after further review, we believe that this measure may not be practical for eligible hospitals and CAHs as the patient would likely receive follow up care from another health care provider such as the patient's primary care physician, a rehabilitation facility, or home health after discharge. The patient would communicate with those health care providers instead of the hospital for information related to their health post-discharge.

Comment: A few commenters supported the removal of the secure messaging measure, indicating it would be burdensome to eligible hospitals and CAHs as follow up should be conducted

with the health care provider the patient is transitioning to.

Response: We thank the commenters for their support. We agree this measure would detract from health care providers' progress on current program priorities and follow up after discharge should be with the health care provider to whom the patient's care is transitioned such as the patient's primary care provider, a rehabilitation facility, or home health provider. The patient would communicate with those health care providers instead of the hospital for information related to their health post-discharge.

After consideration of the public comments we received, we are finalizing the removal of this measure as proposed.

(5) Removal of the View, Download or Transmit Measure

In the proposed rule (83 FR 20535), we proposed to remove the View, Download or Transmit measure at § 495.24(c)(6)(ii)(A) at proposed § 495.24(e)(7) as it has proven burdensome to eligible hospitals and CAHs in ways that were unintended and detract from eligible hospitals and CAHs progress on current program priorities.

We received health care provider and stakeholder feedback through correspondence, public forums, and listening sessions indicating there is ongoing concern with measures which require patient action for successful attestation. We have noted that data analysis on the patient action measures supports stakeholder concerns regarding the barriers that exist, which impact a provider's ability to meet the measure. We note that we have heard from these stakeholders that certain demographics of their patient populations which may include low-income, patients in rural areas, and an aging population, all contribute to the barriers of not having access to computers, internet and/or email. These barriers have resulted in certain patient actions measures being outside of the purview and control of the health care provider. They have also noted that this particular population is concerned with having their health information online. After additional review, we note that successful attestation predicated solely on a patient's action has inadvertently created burdens to health care providers and detracts from progress on the Promoting Interoperability Program's measure goals of focusing on patient care, interoperability and leveraging advanced used of health IT. Therefore, we proposed to remove the View, Download or Transmit measure.

Comment: Many commenters supported removal of the View, Download or Transmit measure as proposed.

Response: We appreciate support for removal of the measure. Previous stakeholder feedback through correspondence, public forums, and listening sessions indicated there is ongoing concern with measures which require health care providers to be accountable for patient actions such as VDT. We further understand that there are barriers which could negatively impact an eligible hospital or CAHs ability to successfully meet a measure requiring patient action, such as location in remote, rural areas and access to technology including computers, internet and/or email. As the issues described contribute to reporting burden and could negatively impact an eligible hospital or CAHs successful demonstration in the Promoting Interoperability Programs, we agree that removing the patient action measures will allow for focus on program goals of increasing interoperability and patient access to their health information.

After consideration of the public comments we received, we are finalizing the removal of this measure as proposed.

e. Modifications to the Public Health and Clinical Data Registry Reporting Objective and Measures

In connection with the new scoring methodology we proposed in section VIII.D.5. of the preamble of proposed rule (83 FR 20535 through 20536), we proposed changes to the Public Health and Clinical Data Registry Reporting objective and six associated measures under 42 CFR 495.24(c)(8)(ii)(A) through (F) in proposed 42 CFR 495.24(e)(8) (in the proposed rule (83 FR 20535), we inadvertently referred to 42 CFR 495.24(e)(7)). We believe that public health reporting through EHRs will extend the use of electronic reporting solutions to additional events and care processes, increase timeliness and efficiency of reporting and replace manual data entry.

We proposed to change the name of the objective to Public Health and Clinical Data Exchange. Under the new scoring methodology proposed in section VIII.D.5. of the preamble of the proposed rule, in aligning with our goal to increase flexibility, improve value, and focus on burden reduction, we proposed that eligible hospitals and CAHs would be required to attest to the Syndromic Surveillance Reporting measure and at least one additional measure from the following options: Immunization Registry Reporting; Clinical Data Registry Reporting; Electronic Case Reporting; Public Health Registry Reporting; and Electronic Reportable Laboratory Result Reporting.

We proposed to require the Syndromic Surveillance Reporting measure under the Public Health and Clinical Data Exchange objective because the CDC indicates the primary source of data for syndromic surveillance comes from EHRs in emergency care settings. Typically, EHR data transmitted from health care facilities to public health agencies for syndromic surveillance are not filtered or categorized. As a result, public health agencies can use the same data that support delivery of care for an all-hazards surveillance approach.

In addition, syndromic surveillance reporting via CEHRT leverages the wealth and depth of clinical information that has not been captured before to study emerging health conditions like the rising opioid overdose epidemic. The data will also provide a unique opportunity to examine rare conditions and new procedures.

While we believe that it is important to leverage health IT through advanced use of CEHRT, for public health and clinical data registries reporting, we also want to reduce burden. Through stakeholder feedback, we understand that some of the existing active engagement requirements are complicated and confusing, and contributed to unintended burden due to issues related to readiness or onboarding for electronic exchange with registries. Therefore, under the new scoring methodology proposed in section VIII.D.5. of the preamble of the proposed rule, we proposed to require attestation to only two measures under the Public Health and Clinical Data Exchange objective instead of three, which is currently required under Stage 3.

In addition, we stated that we intend to propose in future rulemaking to remove the Public Health and Clinical Data Exchange objective and measures no later than CY 2022, and sought public comment on whether hospitals will continue to share such data with public health entities once the Public Health and Clinical Data Exchange objective and measures are removed, as well as other policy levers outside of the Promoting Interoperability Program that could be adopted for continued reporting to public health and clinical data registries, if necessary. Therefore, we are also interested in identifying other appropriate venues in which reporting to public health and clinical data registries could be reported. We sought public comment on the role that

each of the public health and clinical data registries should have in the future of the Promoting Interoperability Programs and whether the submission of this data should still be required when the incentive payments for meaningful use of CEHRT will end in 2021.

Lastly, we sought public comment on whether the Promoting Interoperability Programs are the best means for promoting the sharing of clinical data with public health entities.

In the proposed rule, we stated that if we did not finalize the new scoring methodology we proposed in section VIII.D.5. of the preamble of the proposed rule, we would maintain the existing Stage 3 requirements finalized in previous rulemaking and outlined in the table in that section which describes Stage 3 objectives and measures. Therefore, we would retain the existing Public Health and Clinical Data Registry Reporting objective and associated measures and exclusions under § 495.24(c)(8).

Comment: Many commenters requested that eligible hospitals and CAHs be able to report on any two measures to meet the Public Health and Clinical Data Exchange objective, and disagreed with the proposed requirement to report on the Syndromic Surveillance Reporting measure and one other measure because they indicated not all eligible hospitals can report on the Syndromic Surveillance Reporting measure because some States do not accept Syndromic Surveillance files.

Response: We understand the concerns of the commenters and are committed to reducing provider burden while increasing flexibility. We believe the ability to report on any two measures associated with the objective would promote flexibility in reporting and enables eligible hospitals and CAHs to focus on the measures that are most relevant to them and their patient population. In addition, we understand that some eligible hospitals and local jurisdictions are not able to send and receive Syndromic Surveillance files, including Oklahoma, Iowa, Minnesota and some counties in Colorado. With the ability to report on any two measures, eligible hospitals and CAHs will not have to claim an exclusion if they are unable to report on the Syndromic Surveillance Reporting measure. Rather, they will be able to select measures they have the ability to report on and therefore not claim exclusions, unless necessary. For these reasons, we are finalizing our proposal with the modification to allow eligible hospitals and CAHs to choose any two measures associated with the Public Health and Clinical Data Exchange objective to report. We will continue to monitor the ability of health care providers to report on Syndromic Surveillance Reporting measures and consider requiring Syndromic Surveillance reporting in future rulemaking.

Comment: One commenter agreed with the Public Health and Clinical Data Exchange reporting requirements proposed, stating it would continue to advance interoperability and improve early detection of outbreaks as well as promote population health strategies.

Response: We appreciate the supportive comments and reiterate that our priority is to improve the flexibility of the Promoting Interoperability Programs, reducing the reporting burden and promoting interoperability between health care providers and health IT systems.

Comment: A few commenters inquired why the Syndromic Surveillance Reporting measure was proposed as a required measure.

Response: We worked in conjunction with the CDC and ONC to identify public health reporting requirements that would be valuable to eligible hospitals and CAHs. As discussed in the proposed rule (83 FR 20535 through 20536), the CDC indicated the primary source of syndromic surveillance data comes from EHRs in emergency care settings and reporting via CEHRT has been instrumental in the capture and study of emerging health conditions such as the opioid overdose epidemic. In addition, syndromic surveillance reporting has improved data collection efforts resulting in the ability of public health agencies to more closely monitor trends in emergency department visits with greater precision and allowing communities to respond to emerging health threats more expeditiously.

Comment: One commenter stated that changes to the reporting requirements has resulted in less emphasis on Immunization Registry Reporting.

Response: We disagree that changes to the reporting requirements have resulted in less emphasis on immunization reporting. Instead, EHR data has improved efficiencies of reporting from health care providers to immunization registries. For example providers no longer have to duplicate data entry into a website for the IIS and their EHR system as the data is directly sent from the EHR to the registry. Although we proposed to reduce reporting from three measures to two measures with Syndromic Surveillance Reporting being required as one of the measures, eligible hospitals and CAHs would have the ability to select Immunization Registry Reporting as the other measure. In addition, eligible hospitals and CAHs may attest to additional Public Health and Clinical Data Exchange measures; however, reporting on additional measures would not increase their score.

Comment: A few commenters requested that CMS retain or increase the current public health reporting requirements for eligible hospitals and CAHs of attesting to at least three public health measures or as many as four as they believe reducing the amount of required measures de-emphasizes this objective.

One commenter requested CMS limit the Public Health and Clinical Data Exchange measure reporting requirements to one measure to further reduce reporting burden.

Response: We decline to increase the reporting requirements for the Public Health and Clinical Data Exchange objective. As we had stated in the proposed rule (83 FR 20535), our goals include increasing flexibility, improving value and reducing burden to providers. In addition, based on stakeholder feedback, we understand the active engagement requirements were complicated or confusing, therefore we are reducing provider burden through requiring attestation to only two measures. We reiterate that eligible hospitals and CAHs may attest to additional measures under the Public Health and Clinical Data Exchange objective; however it would not increase their score.

We decline to reduce the required number of measures for reporting to one Public Health and Clinical Data Exchange measure. While we are focusing on increasing flexibility, improving value and reducing burden to providers, we also want to balance those goals with maintaining communication and value in public health registry and bidirectional data exchange between providers and public health agencies and clinical data registries.

Comment: Many commenters strongly opposed CMS intent to remove public health measures in the future of the program as they believed that interoperability of public health data is still evolving and incentivizes health care providers to share data with public health agencies.

Response: We appreciate the feedback and understand the importance of reporting to public health and clinical data registries. We are continuing to focus on burden reduction as well as other platforms and venues for reporting data to public health and clinical data registries outside of the Promoting Interoperability Programs. We will

continue to monitor the data we compile specific to the public health reporting requirements and take the commenters' concerns into consideration related to future actions.

Comment: One commenter indicated that the Public Health and Clinical Data Exchange objective should include additional methods for data capture or reporting.

Response: Certification criteria and standards that support the Public Health and Clinical Data Exchange measures are established by ONC and we will work with them on future considerations for the Promoting Interoperability Programs.

Comment: A few commenters requested clarification on whether claiming an exclusion would count toward meeting the objective. A few commenters requested clarification regarding whether a health care provider needed to select another measure to report on if claiming an exclusion.

Response: For the Public Health and Clinical Data Exchange objective, health care providers are only required to attest to two measures total, regardless of whether an exclusion is claimed. Therefore, for example, a health care provider could attest to the Immunization Registry Reporting measure and claim an exclusion for the Electronic Case Reporting measure and meet the requirements for the objective. Providers may attest to additional Public Health and Clinical Data Exchange measures if they choose to; however, it would not increase their overall score for the objective. For additional information on the reporting and scoring methodology, we refer readers to section VIII.D.6. of the preamble of this final rule.

Comment: One commenter requested that the public health measures should change from a yes/no response to reporting on the number of times a health care provider shares unique patient clinical data with public health entities regarding each of the six measures within the Public Health and Clinical Data exchange objective.

Response: We decline to revise the attestation response for the Public Health and Clinical Data Exchange objective. We believe changing the attestation response would cause confusion and possibly increase burden to health care providers who are familiar with the current attestation process.

After consideration of the public comments we received, we are finalizing the Public Health and Clinical Data Exchange objective proposals as proposed with the following modification, as discussed above.

We are finalizing the objective name change from Public Health and Clinical Data Registry Reporting to Public Health and Clinical Data Exchange and to codify this change at 42 CFR 495.24(c)(8)(ii)(A) through (F).

We are modifying our proposed policy and finalizing that eligible hospitals and CAHs must report on any two Public Health and Clinical Data Exchange measures of their choice.

f. Request for Comment—Potential New Measures for HIE Objective: Health Information Exchange Across the Care Continuum

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20536 through 20537), we sought public comment on a potential concept for two additional measure options for the Health Information Exchange objective for eligible hospitals and CAHs who refer or transition care of patients to health care providers in long-term care and postacute care settings, skilled nursing facilities, and behavioral health settings. Many current Promoting Interoperability Program participants are now engaged in bi-directional exchange of patient health information with these health care providers and settings of care and many more sought to incorporate these workflows as part of efforts to improve care team coordination or to support alternative payment models.

For these reasons, we sought public comment on two potential new measures for inclusion in the program to enable eligible hospitals and CAHs to exchange health information through health IT supported care coordination across a wide range of settings.

New Measure Description for Support Electronic Referral Loops by Sending Health Information Across the Care Continuum: For at least one transition of care or referral to a provider of care other than an eligible hospital or CAH, the eligible hospital or CAH creates a summary of care record using CEHRT; and electronically exchanges the summary of care record.

New Measure Denominator: Number of transitions of care and referrals during the EHR reporting period for which the eligible hospital or CAH inpatient or emergency department (POS 21 or 23) was the transitioning or referring provider to a provider of care other than an eligible hospital or CAH.

New Measure Numerator: The number of transitions of care and referrals in the denominator where a summary of care record was created and exchanged electronically using CEHRT.

New Measure Description for Support Electronic Referral Loops by Receiving and Incorporating Health Information Across the Care Continuum: For at least one electronic summary of care record received by an eligible hospital or CAH from a transition of care or referral from a provider of care other than an eligible hospital or CAH, the eligible hospital or CAH conducts clinical information reconciliation for medications, mediation allergies, and problem list.

New Measure Denominator: The number of electronic summary of care records received for a patient encounter during the EHR reporting period for which an eligible hospital or CAH was the recipient of a transition of care or referral from a provider of care other than an eligible hospital or CAH.

New Measure Numerator: The number of electronic summary of care records in the denominator for which clinical information reconciliation was completed using CEHRT for the following three clinical information sets: (1) Medication—Review of the patient's medication, including the name, dosage, frequency, and route of each medication; (2) Medication allergy—Review of the patient's known medication allergies; and (3) Current Problem List—Review of the patient's current and active diagnoses.

We sought public comment on whether these two measures should be combined into one measure so that an eligible hospital or CAH that is engaged in exchanging health information across the care continuum may include any such exchange in a single measure. We sought public comment on whether the denominators should be combined to a single measure including both transitions of care from a hospital and transitions of care to a hospital. We also sought public comment on whether the numerators should be combined to a single measure including both the sending and receiving of electronic patient health information. We sought public comment on whether the potential new measures should be considered for inclusion in a future program year or whether stakeholders believe there is sufficient readiness and interest in these measures to adopt them as early as 2019. For the purposes of focusing the denominator, we sought public comment regarding whether the potential new measures should be limited to transitions of care and referrals specific to long-term and postacute care, skilled nursing care, and behavioral health care settings. We also sought public comment on whether additional settings of care should be considered for inclusion in the denominators and if a provider should

be allowed to limit the denominators to a specific type of care setting based on their organizational needs, clinical improvement goals, or participation in an alternative payment model. Finally, we sought public comment on the impact the potential new measures may have for health IT developers to develop, test, and implement a new measure calculation for a future program year.

Comment: Many commenters opposed the addition of this type of measure as they believed that the current measures in the Health Information Exchange objective accurately capture the exchange of health information to other settings such as long term care facilities and an additional measure such as this would be redundant. Other commenters requested that CMS to convene stakeholder discussions with health care providers who would be included in this type of measure to identify what data elements are most valuable for them. Some commenters provided feedback that adoption of CERHT in postacute care settings could be a slow process. One commenter recommended that CMS focus on adoption of CEHRT in postacute care settings under the PFS rulemaking.

In addition, commenters asked specific follow up questions regarding what providers of care would be included, and how CMS would develop the care setting elements into the measure.

Response: We thank the commenters and we will consider their views as we develop future policy regarding the potential new measures that focus on health information exchange across the care continuum.

7. Application of Final Scoring Methodology and Measures Under the Medicaid Promoting Interoperability Program

As indicated in sections VIII.D.5. and VIII.D.6. of the preamble of the proposed rule (83 FR 20518 through 20537), we did not propose to require States to adopt the new scoring methodology and measures that we proposed. Instead, we proposed to give States the option to adopt the new scoring methodology we proposed in section VIII.D.5. of the preamble of the proposed rule together with the measures proposals included in section VIII.D.6. of the preamble of the proposed rule for their Medicaid Promoting Interoperability Programs. Any State that wishes to exercise this option must submit a change to its State Medicaid HIT Plan (SMHP) for CMS' approval, as specified in § 495.332. If a State chooses not to submit such a change, or if the change is not approved, the objectives, measures, and scoring would remain the same as currently specified under § 495.24. We believe that States are unlikely to choose this option due to concerns with burden, time constraints and costs associated with implementing updates to technology and reporting systems, as very few eligible hospitals will be eligible to receive an incentive payment under the Medicaid Promoting Interoperability Program in 2019 and subsequent years. However, our proposal to extend this option to States would allow them flexibility to benefit from the improvements to meaningful use scoring outlined in the proposed rule, if they so choose. Similarly, in the proposed rule, we also requested public comment on whether we should modify the objectives and measures for eligible professionals (EPs) in the Medicaid Promoting Interoperability Program in order to encourage greater interoperability for Medicaid EPs. In the proposed rule, we stated that we are interested in policy options that should be considered, including the benefits of greater alignment with the Merit-Based Incentive Payment System requirements for eligible clinicians. We also invited comments on the burdens and hurdles that such policy changes might create for EPs and States.

In connection with these proposals regarding the scoring methodology and measures, we proposed to require under § 495.40(b)(2)(vii) ''dual-eligible'' eligible hospitals and CAHs (those that are eligible for an incentive payment under Medicare for meaningful use of CEHRT and/or subject to the Medicare payment reduction for failing to demonstrate meaningful use, and are also eligible to earn a Medicaid incentive payment for meaningful use) to demonstrate meaningful use for the Promoting Interoperability Program to CMS, and not to their respective State Medicaid agency, beginning with the EHR reporting period in CY 2019. This includes all attestation requirements, including the objectives and measures of meaningful use, in addition to reporting clinical quality measures. In the past, we have generally adopted a common definition of meaningful use under Medicare and Medicaid (for example, 77 FR 44324 through 44326). If we adopt the proposals made in the proposed rule, there would not be a common definition of meaningful use, unless a State chooses to exercise the option described above and receives approval from CMS. In light of these changes, we believe it would be more efficient and straightforward in terms of program administration and operations if all dual-eligible eligible hospitals and CAHs demonstrate meaningful use to CMS. If a dual-eligible eligible hospital or CAH instead demonstrates meaningful use to its State Medicaid agency, it would only qualify for an incentive payment under Medicaid (assuming it meets all eligibility and other program requirements), and it would not qualify for an incentive payment under Medicare and/or avoid the Medicare payment reduction. The proposals in the proposed rule would not change the deeming policy under the definition of meaningful EHR user under § 495.4, under which an eligible hospital or CAH that successfully demonstrates meaningful use to CMS would be deemed a meaningful EHR user for purposes of the Medicaid incentive payment.

We also proposed to amend the requirements for State reporting to CMS under the Medicaid Promoting Interoperability Program under § 495.316(g), so that States would not be required to report, for program years after 2018, provider-level attestation data for each eligible hospital that attests to the State to demonstrate meaningful use.

Comment: One commenter requested clarification on whether States have only two options: (1) Continue with the existing meaningful use measures, or (2) adopt the Medicare QPP measures. The commenter supported having only two options, and stated that anything beyond those options creates confusion and burden for all stakeholders.

Response: We confirm that the commenter is correct in describing the two options proposed for States. There is no option to adopt some of the revisions to the hospital scoring system, but not others.

Comment: One commenter expressed concern that requirements around APIs are less stringent for Medicaid EPs compared to the MIPS program.

Response: While the requirements differ across different programs, we are committed to promoting API access. For example, Medicaid EPs have the opportunity to use APIs to meet Stage 3, EP Objective 6, Measure 1 (View, download or transmit). In addition, we expressly support States' use of open APIs in their Medicaid enterprise architecture in 42 CFR 433.112.

Comment: Several commenters stated that the Medicaid Stage 3 requirements are too stringent and suggested that these requirements be aligned with those for Medicare clinicians under MIPS. In addition, one commenter suggested that CMS allow providers to attest to Meaningful Use Modified Stage

2 Objectives, using 2015 Edition CEHRT, through the end of the Promoting Interoperability Program (CY 2021).

Response: We thank the commenters for their input about the program requirements. However, we did not propose any changes to Stage 3 or for EPs in the proposed rule, but did ask for comments on ways we can align and reduce the burden for EPs who also participate in MIPS. We will take these comments into consideration for future rulemaking. As for CEHRT, the 2015 Edition does not have the capability to meet the Modified Stage 2 meaningful use objectives and measures.

After consideration of the public comments we received, we are finalizing the our proposals as proposed.

8. Promoting Interoperability Program Future Direction

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20537 through 20538), we sought comments on the future direction of the Promoting Interoperability Program. In future years of the Promoting Interoperability Program, we will continue to consider changes which support a variety of HHS goals, including: Reducing administrative burden; supporting alignment with the Quality Payment Program; advancing interoperability and the exchange of health information; and promoting innovative uses of health IT. We believe a focus on interoperability and simplification will reduce health care provider burden while allowing flexibility to pursue innovative applications that improve care delivery. One strategy we are exploring is creating a set of priority health IT activities that would serve as alternatives to the traditional EHR Incentive Program measures.

We specifically sought public comments on the following questions:

- What health IT activities should CMS consider recognizing in lieu of reporting on objectives that would most effectively advance priorities for nationwide interoperability and spur innovation? What principles should CMS employ to identify health IT activities?
- Do stakeholders believe that introducing health IT activities in lieu of reporting on measures would decrease burden associated with the Promoting Interoperability Programs?
- If additional measures were added to the program, what measures would be beneficial to add to promote our goals of care coordination and interoperability?
- How can the Promoting Interoperability Program for eligible hospitals and CAHs further align with the Quality Payment Program (for example, requirements for eligible clinicians under MIPS and Advanced APMs) to reduce burden for health care providers, especially hospital-based MIPS eligible clinicians?
- What other steps can HHS take to further reduce the administrative burden associated with the Promoting Interoperability Program?

Comment: Many commenters expressed support for introducing health IT activities in lieu of reporting on measures and indicated an approach such as this would reduce provider burden associated with these reporting activities. The commenters also noted that supporting improved interoperability through this approach is an important goal.

Some commenters requested clarification on how interoperability is defined and requested that CMS work with stakeholders on identification of benchmarks and have a reasonable and predictable pathway for changing Health IT policies. Other commenters indicated a single set of standards by the Federal government is needed to ensure all health care providers are exchanging data in a uniform manner.

Some commenters disagreed with introducing health IT activities in lieu of reporting on measures as this approach could create additional burden if its required additional documentation to validate that the provider had performed the activity. Some commenters also recommended that such an approach should be left optional, as many providers may not be able to perform the activities identified. Finally, commenters expressed concerns regarding specific potential activities, for instance, one commenter expressed concern about whether participation in the Trusted Exchange Framework and Common Agreement (TEFCA) would be available by the time this approach was finalized.

Some commenters supported participation in the TEFCA and indicated it should be considered a health IT activity that could count for credit within the Health Information Exchange objective in lieu of reporting on measures for this objective.

Some commenters suggested CMS realign efforts with ''Patient Centered'' interoperability.

A few commenters indicated CMS should include a measure for data quality based on the USCDI which would set expectations for content, not just exchange of data.

Some commenters indicated the 2015 CEHRT needs to be updated to support integration of SNOMED, LOINC and RxNorm (and other terminology standards) into a single system.

Response: We thank the commenters for their input and we will consider their views as we develop future policy regarding the future direction of the Promoting Interoperability Program.

9. Clinical Quality Measurement for Eligible Hospitals and Critical Access Hospitals (CAHs) Participating in the Medicare and Medicaid Promoting Interoperability Programs

a. Background and Current CQMs

Under sections 1814(l)(3)(A), 1886(n)(3)(A), and 1903(t)(6)(C)(i)(II) of the Act and the definition of ''meaningful EHR user'' under 42 CFR 495.4, eligible hospitals and CAHs must report on clinical quality measures (referred to as CQMs or eCQMs) selected by CMS using CEHRT, as part of being a meaningful EHR user under the Medicare and Medicaid Promoting Interoperability Programs.

The table below lists the 16 CQMs available for eligible hospitals and CAHs to report under the Medicare and Medicaid Promoting Interoperability Programs beginning in CY 2017 (81 FR 57255).

CQMs for Eligible Hospitals and CAHs Beginning With CY 2017

Short name	Measure name	NQF No.
AMI–8a	Primary PCI Received Within 90 Minutes of Hospital Arrival	0163
ED–3	Median Time from ED Arrival to ED Departure for Discharged ED Patients	0496
CAC–3	Home Management Plan of Care Document Given to Patient/Caregiver	(+)
ED–1	Median Time from ED Arrival to ED Departure for Admitted ED Patients	0495
ED–2	Admit Decision Time to ED Departure Time for Admitted Patients	0497
EHDI–1a	Hearing Screening Prior to Hospital Discharge	1354

CQMS FOR ELIGIBLE HOSPITALS AND CAHS BEGINNING WITH CY 2017—Continued

Short name	Measure name	NQF No.
PC–01	Elective Delivery (Collected in aggregate, submitted via web-based tool or electronic clinical quality measure).	0469
PC–05	Exclusive Breast Milk Feeding*	0480
STK–02	Discharged on Antithrombotic Therapy	0435
STK–03	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436
STK–05	Antithrombotic Therapy by the End of Hospital Day Two	0438
STK–06	Discharged on Statin Medication	0439
STK–08	Stroke Education	(+)
STK–10	Assessed for Rehabilitation	0441
VTE–1	Venous Thromboembolism Prophylaxis	0371
VTE–2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372

+ NQF endorsement has been removed.
* Measure name has been shortened. We refer readers to annually updated measure specifications on the CMS eCQI Resource Center web page for further information at: *https://www.healthit.gov/newsroom/ecqi-resource-center*.

b. CQMs for Reporting Periods Beginning With CY 2020

As we have stated previously in rulemaking (82 FR 38479), we plan to continue to align the CQM reporting requirements for the Promoting Interoperability Programs with the Hospital IQR Program. In order to move the program forward in the least burdensome manner possible, while maintaining a set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients, we stated the we believe it is appropriate to propose to remove certain eCQMs at this time to develop an even more streamlined set of the most meaningful eCQMs for hospitals. To align with the Hospital IQR Program, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20539), we proposed to reduce the number of eCQMs in the Medicare and Medicaid Promoting Interoperability Programs eCQM measure set from which eligible hospitals and CAHs report, by proposing to remove eight eCQMs (from the 16 eCQMs currently in the measure set) beginning with the reporting period in CY 2020. The eight eCQMs we proposed to remove are:

- Primary PCI Received Within 90 Minutes of Hospital Arrival (NQF #0163) (AMI–8a);
- Home Management Plan of Care Document Given to Patient/Caregiver (CAC–3);
- Median Time from ED Arrival to ED Departure for Admitted ED Patients (NQF #0495) (ED–1);
- Hearing Screening Prior to Hospital Discharge (NQF #1354) (EHDI–1a);
- Elective Delivery (NQF #0469) (PC–01);
- Stroke Education (STK–08) (adopted at 78 FR 50807;
- Assessed for Rehabilitation (NQF #0441) (STK–10); and
- Median Time from ED Arrival to ED Departure for Discharged ED Patients (NQF 0496) (ED–3).

We note that the first seven eCQMs on this list are currently included in the Hospital IQR Program, and in section VIII.A.5.b.(9) of the preamble of the proposed rule, we proposed to remove them from the Hospital IQR Program beginning in CY 2020. For more information on the first seven eCQMs selected for removal, we refer readers to section VIII.A.5.b.(9) of the preambles of the proposed rule and this final rule.

We believe that a coordinated reduction in the overall number of eCQMs in both the Hospital IQR Program and Medicare and Medicaid EHR Promoting Interoperability will reduce certification burden on hospitals, improve the quality of reported data by enabling eligible hospitals and CAHs to focus on a smaller, more specific subset of CQMs while still allowing eligible hospitals and CAHs some flexibility to select which eCQMs to report that best reflect their patient populations and support internal quality improvement efforts. With respect to the Median Time from ED Arrival to ED Departure for Discharged ED Patients measure (NQF 0496) (ED–3), this is an outpatient measure and is not included as an eCQM in the Hospital IQR Program. We proposed to remove it so the eCQMs would align completely between the two programs in order to reduce burden and enable eligible hospitals and CAHs to easily report electronically through the Hospital IQR Program submission mechanism.

As we stated in section VIII.A.5.b.(9) of the preambles of the proposed rule and this final rule, with regard to the Hospital IQR Program proposal for the CY 2020 reporting period and subsequent years, we also considered proposing to remove these eCQMs one year earlier, beginning with the CY 2019 reporting period/FY 2021 payment determination. In establishing our eCQM policies, we must balance the needs of eligible hospitals and CAHs with variable preferences and capabilities. Overall, across the range of capabilities and resources for eCQM reporting, stakeholders have expressed that they want more time to prepare for eCQM changes.

We recognize that some hospitals and health IT vendors may prefer earlier removal in order to forgo maintenance on those eCQMs proposed for removal. In preparation for the proposed rule, we weighed the relative burdens associated with removing these measures beginning with the CY 2019 reporting period or beginning with the CY 2020 reporting period. In the event we finalize our proposal to remove these eCQMs, we intend to align the timing of the removal for the Medicare and Medicaid Promoting Interoperability Programs with the Hospital IQR Program.

We invited public comment on our proposal, including the specific measures proposed for removal and the timing of removal from the Medicare and Medicaid Promoting Interoperability Programs.

Comment: Several commenters supported the reduction in the number of eCQMs stating that it would create a streamlined measure set. The majority of commenters addressed the reduction in the number of eCQMs in general and not specifically related to the Promoting Interoperability Program.

Response: We thank the commenters for their support and refer readers to section VIII.A.5.b. of the preamble of this final rule for more information on the eCQM proposals and for additional comments and responses. We are committed to staying in alignment with the Hospital IQR Program policies to the greatest extent feasible.

Comment: One commenter supports the use of eCQMs to measure quality of

care. In addition, the commenter suggests that proposed e-measures be carefully validated by EHR vendors in advance to determine if data elements are readily available, to eliminate documentation and burden redundancies.

Response: We appreciate the commenter's position that e-measures should carefully validated prior to implementation. Our goal is to closely align the Promoting Interoperability Programs with the Hospital IQR Program, while reducing the burden on hospitals. By focusing on a smaller subset of measures, the eligible hospitals and CAHs will have some flexibility regarding eCQMs they choose to report best reflect their patient population and support internal quality improvement efforts.

We encourage eligible hospitals and CAHs to submit measures during the Annual Call for measures. This process reinforces our commitment to engaging stakeholders to process reinforces our commitment to engaging with stakeholders to further advance meaningful use of CEHRT by eligible hospitals and CAHs participating in the Promoting Interoperability Programs.

Comment: One commenter disagreed with the proposed reduction in the number of eCQMs available for reporting, indicating this would be very limiting in selection and creates additional costs, especially for small hospitals with a limited daily census.

Response: While we understand this concern, we believe that is important to align the eCQM requirements for the Promoting Interoperability Programs with those of the Hospital IQR Program. The removal of these measures is consistent with CMS' commitment to using a smaller set of more meaningful measures. CMS is focusing on measures that provide opportunities to reduce both paperwork and reporting burden on health care providers and patient-centered outcome measures, rather than process measures. For further discussion of our policy reasons for eliminating these eCQMs for the Hospital IQR Program, which we believe also apply in the context of the Promoting Interoperability Programs, we refer readers to section VIII.A.5.b. of the preamble of this final rule.

After consideration of the public comments we received, we are adopting our proposal as proposed.

c. CQM Reporting Periods and Criteria for the Medicare and Medicaid Promoting Interoperability Programs in CY 2019

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20539 through 20540), for CY 2019, we proposed the same CQM reporting periods and criteria as established in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38479 through 38483) for the Medicare and Medicaid EHR Incentive Programs in CY 2018, which would be as follows:

For CY 2019, for eligible hospitals and CAHs that report CQMs electronically, we proposed the reporting period for the Medicare and Medicaid Promoting Interoperability Programs would be one, self-selected calendar quarter of CY 2019 data, and the submission period for the Medicare Promoting Interoperability Program would be the 2 months following the close of the calendar year, ending February 29, 2020. For eligible hospitals and CAHs that report CQMs by attestation under the Medicare Promoting Interoperability Program as a result of electronic reporting not being feasible, and for eligible hospitals and CAHs that report CQMs by attestation under their State's Medicaid Promoting Interoperability Program, we previously established a CQM reporting period of the full CY 2019 (consisting of 4 quarterly data reporting periods) (80 FR 62893). We also established an exception to this full-year reporting period for eligible hospitals and CAHs demonstrating meaningful use for the first time under their State's Medicaid EHR Incentive Program. Under this exception, the CQM reporting period is any continuous 90-day period within CY 2019 (80 FR 62893). We proposed that the submission period for eligible hospitals and CAHs reporting CQMs by attestation under the Medicare EHR Incentive Program would be the 2 months following the close of the CY 2019 CQM reporting period, ending February 29, 2020. In regard to the Medicaid EHR Incentive Program, we provide States with the flexibility to determine the method of reporting CQMs (attestation or electronic reporting) and the submission periods for reporting CQMs, subject to prior approval by CMS.

For the CY 2019 reporting period, we proposed that the reporting criteria under the Medicare and Medicaid Promoting Interoperability Program for eligible hospitals and CAHs reporting CQMs electronically would be as follows: For eligible hospitals and CAHs participating only in the Promoting Interoperability Program, or participating in both the Promoting Interoperability Program and the Hospital IQR Program, report on at least 4 self-selected CQMs from the set of 16 available CQMs listed in the table above.

We proposed the following reporting criteria for eligible hospitals and CAHs that report CQMs by attestation under the Medicare Promoting Interoperability Program as a result of electronic reporting not being feasible, and for eligible hospitals and CAHs that report CQMs by attestation under their State's Medicaid Promoting Interoperability Program, for the reporting period in CY 2019—report on all 16 available CQMs listed in the table in section VIII.D.9.a. of the preamble of the proposed rule.

Comment: A few commenters supported the proposed self-selected calendar quarter of CY 2019 data for CQM reporting as it aligns to the proposed 90-day EHR reporting period for the objectives and measures of the Promoting Interoperability Program.

Response: We appreciate the support for our proposal and agree that reporting periods of similar length may help simplify data submission and reduce burden.

After consideration of the public comments we received, we are adopting our proposal as proposed.

d. CQM Reporting Form and Method for the Medicare Promoting Interoperability Program in CY 2019

As we stated in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49759 through 49760), for the reporting periods in 2016 and future years, we are requiring QRDA–I for CQM electronic submissions for the Medicare EHR Incentive (now Promoting Interoperability) Program. As noted in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49760), States would continue to have the option, subject to our prior approval, to allow or require QRDA–III for CQM reporting.

The form and method of electronic submission are further explained in sub-regulatory guidance and the certification process. For example, the following documents are updated annually to reflect the most recent CQM electronic specifications: The CMS Implementation Guide for QRDA; program specific performance calculation guidance; and CQM electronic specifications and guidance documents. These documents are located on the eCQI Resource Center web page at: *https://ecqi.healthit.gov/*. For further information on CQM reporting, we refer readers to the EHR Incentive Program (now Promoting Interoperability Program) website where guides and tip sheets are located at: *http://www.cms.gov/ehrincentiveprograms*.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20540), for the reporting period in CY 2019, we

proposed the following for CQM submission under the Medicare Promoting Interoperability Program:

- Eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program (single program participation)—electronically report CQMs through QualityNet Portal.
- Eligible hospital and CAH options for electronic reporting for multiple programs (that is, Promoting Interoperability Program and Hospital IQR Program participation)—electronically report through QualityNet Portal.

As noted in the 2015 EHR Incentive Programs final rule (80 FR 62894), starting in 2018, eligible hospitals and CAHs participating in the Medicare EHR Incentive Program must electronically report CQMs where feasible; and attestation to CQMs will no longer be an option except in certain circumstances where electronic reporting is not feasible. For the Medicaid Promoting Interoperability Program, States continue to be responsible for determining whether and how electronic reporting of CQMs would occur, or if they wish to allow reporting through attestation. Any changes that States make to their CQM reporting methods must be submitted through the State Medicaid Health IT Plan (SMHP) process for CMS review and approval prior to being implemented.

For CY 2019, we proposed to continue our policy regarding the electronic submission of CQMs, which requires the use of the most recent version of the CQM electronic specification for each CQM to which the EHR is certified. For the CY 2019 electronic reporting of CQMs, this means eligible hospitals and CAHs are required to use the Spring 2017 version of the CQM electronic specifications and any applicable addenda available on the eCQI Resource Center web page at: *https://ecqi.healthit.gov/*. In addition, we proposed that eligible hospitals or CAHs must have their EHR technology certified to all 16 available CQMs listed in the table above. As discussed in section VIII.D.3. of the preamble of the proposed rule, eligible hospitals and CAHs are required to use 2015 Edition CEHRT for the Medicare and Medicaid Promoting Interoperability Programs in CY 2019. We reiterate that an EHR certified for CQMs under the 2015 Edition certification criteria does not have to be recertified each time it is updated to a more recent version of the CQMs (82 FR 38485).

We did not receive any comments on these proposals and we are adopting our proposal as proposed.

e. Request for Comment

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20540 through 20541), we requested comments on a number of issues regarding eCQMs. Specifically, we invited comment on the following:

- What aspects of the use of eCQMs are most burdensome to hospitals and health IT vendors?
- What program and policy changes, such as improved regulatory alignment, would have the greatest impact on addressing eCQM burden?
- What are the most significant barriers to the availability and use of new eCQMs today?
- What specifically would stakeholders like to see us do to reduce burden and maximize the benefits of eCQMs?
- How could we encourage hospitals and health IT vendors to engage in improvements to existing eCQMs?
- How could we encourage hospitals and health IT vendors to engage in testing new eCQMs?
- Would hospitals and health IT vendors be interested in or willing to participate in pilots or models of alternative approaches to quality measurement that would explore less burdensome ways of approaching quality measurement, such as sharing data with third parties that use machine learning and natural language processing to classify quality of care or other approaches?
- What ways could we incentivize or reward innovative uses of health IT that could reduce burden for hospitals?
- What additional resources or tools would hospitals and health IT vendors like to have publicly available to support testing, implementation, and reporting of eCQMs?

We received numerous comments in response to our request for comment.

Comment: Several commenters supported the goals of using EHRs to reduce the burden of quality reporting and use of the data to support their quality improvement initiatives. Several commenters supported the following improvements in quality measurement: Uniform calculation of eCQMs across various CEHRT systems and practices; addressing misalignment between the eCQM reporting requirements and availability of eCQMs by vendors; improved methods of reporting to support the needs of the program participants; development of strategies to apply the Meaningful Measures framework to eCQMs; development of metrics that inform readiness of eCQM data for public reporting; and increased opportunities for eligible hospitals and CAHs to participate in eCQM testing using processes, methods and/or innovated use of health IT. A few commenters suggested rewarding hospitals who already implemented innovative quality improvement programs and processes using health IT. A few commenters indicated that future eCQMs should be based on data elements that are already captured within CEHRT.

A few commenters indicated that burdens related to use of eCQMs included exclusions and data availability and many eCQMs are not developed based on data available or created during routine care. A few commenters indicated it is burdensome to test eCQMs due to time, effort and resource requirements. A few commenters requested simplification of the measure development process which would include strict selection criteria and endorsement processes as the current development process was noted to create significant barrier related to availability and use.

A few commenters suggested CMS work with stakeholders to establish research and pilot programs to reduce quality measurement burden and leverage data captured by all members of the care team, other electronic means or by the patients themselves.

Response: We thank the commenters and we will consider their views as we develop future policy regarding eCQMs.

10. Participation in the Medicare Promoting Interoperability Program for Subsection (d) Puerto Rico Hospitals

a. Background

In the Stage 1 final rule (77 FR 44448), we noted that subsection (d) Puerto Rico hospitals as defined in section 1886(d)(9)(A) of the Act were not ''eligible hospitals'' as defined in section 1886(n)(6)(B) of the Act, and therefore were not eligible for the incentive payments for the meaningful use of CEHRT under section 1886(n) of the Act. Section 602(a) of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) subsequently amended section 1886(n)(6)(B) of the Act to include subsection (d) Puerto Rico hospitals in the definition of ''eligible hospital,'' which made subsection (d) Puerto Rico hospitals eligible for the incentive payments under section 1886(n) of the Act for hospitals that are meaningful EHR users and subject to the payment reductions under section 1886(b)(3)(B)(ix) of the Act for hospitals that are not meaningful EHR users. In order to take into account delays in implementation, section 602(d) of the Consolidated

Appropriations Act, 2016 adjusted the existing timelines for the incentive payments by five years and payment reductions by seven years for subsection (d) Puerto Rico hospitals, as further discussed in the sections below.

As authorized under section 602(c) of the Consolidated Appropriations Act, 2016, we have previously elected to implement the amendments made by section 602 as applied to subsection (d) Puerto Rico hospitals through program instruction. In doing so we have sought to align the policies for subsection (d) Puerto Rico hospitals with our existing policies for eligible hospitals under the Medicare Promoting Interoperability Program to the greatest extent possible, while taking into account the unique circumstances applicable to hospitals on Puerto Rico. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20541 through 20542), we proposed to codify the program instructions we have issued to subsection (d) Puerto Rico hospitals and to amend our regulations under Parts 412 and 495 such that the provisions that apply to eligible hospitals would include subsection (d) Puerto Rico hospitals unless otherwise indicated.

b. Definitions

(1) Eligible Hospital: Subsection (d) Puerto Rico Hospitals

We proposed to define a ''Puerto Rico eligible hospital'' under § 495.100 as a subsection (d) Puerto Rico hospital as defined in section 1886(d)(9)(A) of the Act.

We proposed to amend the definition of ''eligible hospital'' under § 495.100 to include Puerto Rico eligible hospitals unless otherwise indicated.

We proposed to amend the general provisions under § 412.200 as related to prospective payment rates for inpatient operating costs for subsection (d) Puerto Rico hospitals.

We did not receive any comments on these proposals and are finalizing our proposals as proposed.

(2) EHR Reporting Period: Subsection (d) Puerto Rico Hospitals

Section 602(d) of the Consolidated Appropriations Act, 2016 provides that for subsection (d) Puerto Rico hospitals, FY 2016 is the first payment year under section 1886(n)(2)(G)(i) of the Act for which an incentive payment could be made to a hospital that is a meaningful EHR user. The definition of ''EHR reporting period'' under § 495.4 specifies for eligible hospitals for the FY 2016 payment year an EHR reporting period of any continuous 90-day period in CY 2016, which is consistent with the program instructions we issued to subsection (d) Puerto Rico hospitals, so we do not believe any amendment is necessary. We proposed to amend the definition of ''EHR reporting period'' under § 495.4 to specify for Puerto Rico eligible hospitals for the FY 2017 payment year an EHR reporting period of a minimum of any continuous 14-day period in CY 2017, which is consistent with the program instructions we issued to subsection (d) Puerto Rico hospitals. We allowed for a 14-day EHR reporting period in CY 2017 to acknowledge and account for the devastation to Puerto Rico caused by Hurricane Maria. We have not issued program instructions to subsection (d) Puerto Rico hospitals concerning the EHR reporting periods for the payment years after FY 2017. For the FY 2018, 2019, and 2020 payment years, we proposed an EHR reporting period of a minimum of any continuous 90-day period in CYs 2018, 2019, and 2020 respectively for Puerto Rico eligible hospitals, and we proposed corresponding amendments to the definition of ''EHR reporting period'' under § 495.4.

Comment: Several commenters supported the proposed codification of the policies for subsection (d) Puerto Rico hospitals for the Promoting Interoperability Program. One commenter expressed gratitude for the reduction of the EHR reporting period from 90 days to 14 days in CY 2017 after Hurricane María as the commenter indicated it helped hospitals in Puerto Rico demonstrate meaningful use and find relief within the difficult situation.

Response: We appreciate the commenters' support.

After consideration of the public comment we received, we are finalizing our proposals as proposed.

(3) EHR Reporting Period for a Payment Adjustment Year for Eligible Hospitals: Subsection (d) Puerto Rico Hospitals

Section 602(d) of the Consolidated Appropriations Act, 2016 provides that the payment reductions under section 1886(b)(3)(B)(ix) of the Act would apply beginning with FY 2022 for subsection (d) Puerto Rico hospitals that are not meaningful EHR users for the applicable EHR reporting period for the payment adjustment year. Because Puerto Rico eligible hospitals would be considered eligible hospitals, the EHR reporting periods for payment adjustment years and related policies, including deadlines and requests for significant hardship exceptions, that we establish for eligible hospitals would also apply to Puerto Rico eligible hospitals beginning with the FY 2022 payment adjustment year.

We did not receive any comments on this topic.

(4) Payment Year for Subsection (d) Puerto Rico Hospitals

Section 602(d) of the Consolidated Appropriations Act, 2016 provides that for subsection (d) Puerto Rico hospitals, FY 2016 is the first payment year under section 1886(n)(2)(G)(i) of the Act for which an incentive payment could be made to a hospital that is a meaningful EHR user. We proposed to amend the definition of ''payment year'' under § 495.4 to specify for Puerto Rico eligible hospitals, payment year means a Federal FY beginning with 2016.

We did not receive any comments on this proposal and are finalizing our proposal as proposed.

(5) Payment Adjustment Year for Subsection (d) Puerto Rico Hospitals

Section 602(d) of the Consolidated Appropriations Act, 2016 provides that the payment reductions under section 1886(b)(3)(B)(ix) of the Act will apply beginning with FY 2022 for subsection (d) Puerto Rico hospitals that are not meaningful EHR users for the applicable EHR reporting period for the payment adjustment year. We proposed to amend the definition of ''payment adjustment year'' under § 495.4 to specify for Puerto Rico eligible hospitals, payment adjustment year means a Federal fiscal year beginning with 2022.

We did not receive any comments on this proposal and are finalizing our proposal as proposed.

c. Duration and Timing of Incentive Payments for Subsection (d) Puerto Rico Hospitals—Transition Periods and Transition Factors

Section 602(d) of the Consolidated Appropriations Act, 2016 provides for a phase down under section 1886(n)(2)(E)(ii) of the Act for subsection (d) Puerto Rico hospitals whose first payment year is after 2018. We proposed to amend § 495.104(b) to specify the following years for which Puerto Rico eligible hospitals may receive incentive payments under section 1886(n) of the Act:

- Puerto Rico eligible hospitals whose first payment year is FY 2016 may receive such payments for FYs 2016 through 2019.
- Puerto Rico eligible hospitals whose first payment year is FY 2017 may receive such payments for FYs 2017 through 2020.
- Puerto Rico eligible hospitals whose first payment year is FY 2018 may receive such payments for FYs 2018 through 2021.

• Puerto Rico eligible hospitals whose first payment year is FY 2019 may receive such payments for FY 2019 through 2021.

• Puerto Rico eligible hospitals whose first payment year is FY 2020 may receive such payments for FY 2020 through 2021.

We proposed to amend § 495.104(c)(5) to specify the following transition factors under section 1886(n)(2)(E)(i) of the Act for Puerto Rico eligible hospitals:

PROPOSED TRANSITION FACTORS FOR SUBSECTION (D) PUERTO RICO HOSPITALS

	First payment year (FY)				
	2016	2017	2018	2019	2020
2016	1.00				
2017	0.75	1.00			
2018	0.50	0.75	1.00		
2019	0.25	0.50	0.75	0.75	
2020		0.25	0.50	0.50	0.50
2021			0.25	0.25	0.25

We did not receive any comments on these proposals and are finalizing our proposals as proposed.

d. Market Basket Adjustment for Subsection (d) Puerto Rico Hospitals

Section 602(d) of the Consolidated Appropriations Act, 2016 provides that the payment reductions under section 1886(b)(3)(B)(ix) of the Act would apply beginning with FY 2022 for subsection (d) Puerto Rico hospitals. We proposed for a subsection (d) Puerto Rico hospital that is not a meaningful EHR user for the EHR reporting period for the FY, three-quarters of the applicable percentage increase otherwise applicable for such FY shall be reduced by 33⅓ percent for FY 2022, 66⅔ percent for FY 2023, and 100 percent for FY 2024 and each subsequent FY. We proposed to amend § 412.64(d)(3) to reflect these proposed reductions.

We did not receive any comments on these proposals and are finalizing our proposals as proposed.

11. Modifications to the Medicare Advantage Promoting Interoperability Program

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20542 through 20543), we proposed several modifications to the Medicare Advantage Promoting Interoperability Program.

a. Participation in the Medicare Advantage Promoting Interoperability Program for Subsection (d) Puerto Rico Hospitals

Section 1853(m) of the Act provides for incentive payments to qualifying Medicare Advantage (MA) organizations for certain affiliated eligible hospitals (as defined in section 1886(n)(6)(B)) that meaningfully use certified EHR technology, and for application of downward payment adjustments to qualifying MA organizations for their affiliated hospitals that are not meaningful users of certified EHR technology, beginning in FY 2015. As noted in section VIII.D.8. of the preamble of the proposed rule, section 602(a) of the Consolidated Appropriations Act, 2016 amended section 1886(n)(6)(B) of the Act to include subsection (d) Puerto Rico hospitals in the definition of ''eligible hospital.'' We note that the definition of ''qualifying MA-affiliated hospital'' in § 495.200 means an eligible hospital under section 1866(n)(6) that meets certain other criteria. Therefore, the amendment to section 1866(n)(6) by the Consolidated Appropriations Act to include subsection (d) Puerto Rico hospitals renders such hospitals potentially eligible as qualifying MA-affiliated hospitals for purposes of the Medicare Advantage Promoting Interoperability incentives and payment adjustments. We proposed certain changes to our regulations under 42 CFR part 495 so that the incentive payment and payment adjustment provisions that apply to MA-affiliated eligible hospitals are applicable to MA-affiliated eligible hospitals in Puerto Rico.

b. Definitions

(1) Payment Year for MA-Affiliated Eligible Hospitals in Puerto Rico

Section 602(d) of the Consolidated Appropriations Act, 2016 provides that for subsection (d) Puerto Rico hospitals, FY 2016 is the first payment year for which an EHR incentive payment could be made to an eligible hospital that is a meaningful EHR user. We proposed, under section 1871 of the Act and to implement that amendment to the EHR provisions, to amend the definition of ''payment year'' under § 495.200 to specify that, with respect to MA-affiliated eligible hospitals in Puerto Rico, payment year means a Federal FY beginning with 2016 and ending with FY 2021.

We did not receive any comments on this proposal so we are adopting the amendments to the definition of ''payment year'' in § 495.200 as proposed to be consistent with the statute.

(2) MA Payment Adjustment Year for MA-Affiliated Eligible Hospitals in Puerto Rico

Section 602(d) of the Consolidated Appropriations Act, 2016 provides for payment reductions to subsection (d) Puerto Rico hospitals that are not meaningful EHR users for the applicable EHR reporting period for the payment adjustment year, beginning with FY 2022. We proposed to amend the definition of ''MA payment adjustment year'' under § 495.200 to specify that, for qualifying MA organizations that first receive an MA EHR incentive payment for at least 1 payment year for an MA-affiliated eligible hospital in Puerto Rico, payment adjustment year means a calendar year starting with 2022.

We solicited feedback on whether we should amend the definition of ''MA payment adjustment year'' to specify that the duration of the reporting period for MA-affiliated eligible hospitals for purposes of determining whether a qualifying MA organization is subject to a payment adjustment should be other than the full Federal fiscal year ending in the MA payment adjustment year. We also requested comments on an alternative approach under which we would use the same reporting period that is used for the Medicare Promoting Interoperability Program.

We did not receive any comments on this proposal so we are finalizing the amendment to the definition of ''MA payment adjustment year'' under § 495.200 as proposed.

c. Payment Adjustments Effective for 2015 and Subsequent MA Payment Years With Respect to MA-Affiliated Eligible Hospitals

Under § 495.211, beginning for MA payment adjustment year 2015, payment adjustments set are made to prospective payments (issued under section 1853(a)(1)(A) of the Act) of qualifying MA organizations that previously received incentive payments under the MA EHR Incentive (now Promoting Interoperability) Program, if all or a portion of the MA-affiliated eligible hospitals that would meet the definition of qualifying MA-affiliated eligible hospitals (but for their demonstration of meaningful use) are not meaningful EHR users. Section 495.211(e) sets forth the formula for calculating payment adjustments for 2015 and subsequent years with respect to MA-affiliated eligible hospitals. We proposed to amend paragraph (e) by adding a new subparagraph (4), which specifies that, prior to payment adjustment year 2022, subsection (d) Puerto Rico hospitals are neither qualifying nor potentially qualifying MA-affiliated eligible hospitals for purposes of applying the payment adjustments under § 495.211.

We solicited comment on whether further regulatory amendments are necessary or appropriate so that the EHR incentive payment and payment adjustment provisions that apply to MA-affiliated eligible hospitals are applicable to MA-affiliated eligible hospitals in Puerto Rico in a manner that is consistent with the Consolidated Appropriations Act, 2016.

Comment: One commenter requested that the Medicare Advantage benchmarks be updated so that the 2019 Medicare Advantage benchmark payments can reflect any payment updates in fee for service resulting from 2019 FFS payment rules.

Response: The request for CMS to immediately conform MA benchmarks to reflect payment updates in FFS Medicare is outside the scope of the proposed rule. We address updates to MA benchmarks through the annual Advance Notice and Rate Announcement process.

After consideration of the public comment we received, we are finalizing the amendment to § 495.211(e) (that is, adding paragraph (e)(4)) as proposed.

12. Modifications to the Medicaid Promoting Interoperability Program

In section VIII.E.12. of the preamble of the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20543 through 20544), we proposed modifications to the Medicaid Promoting Interoperability Program. The policies proposed in that section would apply only in the Medicaid EHR Incentive (now Promoting Interoperability) Program.

Comment: One commenter stated that changing the program name from the Medicaid EHR Incentive Program to the Medicaid Promoting Interoperability Program would create confusion and lead to lower participation rates.

Response: The program name change was announced in the proposed rule. The name change was intended to highlight the efforts within CMS to promote interoperability between patients, health care providers and health insurers. We are working to educate stakeholders that the name change does not signal an end to Medicaid incentive payments for meaningful use prior to the deadlines finalized in this final rule and to alleviate any potential confusion regarding the name change.

a. Requirements Regarding Prior Approval of Requests for Proposals (RFPs) and Contracts in Support of the Medicaid Promoting Interoperability Program

Section 1903(a)(3)(F)(ii) of the Act establishes an enhanced Federal matching rate of 90 percent for State expenditures related to the administration of Medicaid Promoting Interoperability Program payments. On July 28, 2010, in the Stage 1 final rule (75 FR 44313, 44507), we established prior approval requirements for State funding, planning documents, proposed budgets, project schedules, and certain implementation activities that a State may wish to pursue in support of the Medicaid Promoting Interoperability Program, as a condition of receipt of the 90 percent FFP available to States under section 1903(a)(3)(F)(ii) of the Act. To minimize the burden on States, we designed the prior approval conditions and prior approval process to mirror what was at the time used in support of acquiring automated data processing (ADP) equipment and services in conjunction with development and operation of States' Medicaid Management Information Systems (MMIS), which are the States' automated mechanized claims processing and information retrieval systems approved by CMS. Specifically, at § 495.324(b)(2) we established that, as a condition of receiving 90 percent FFP for administration of their Medicaid Promoting Interoperability Programs, States must receive prior approval for requests for proposals and contracts used to complete activities under 42 CFR part 495, subpart D, unless specifically exempted by HHS, before release of the request for proposal or execution of the contract. This was consistent with the requirement then in place for MMIS at 45 CFR 95.611(a)(2). At § 495.324(b)(3) we established that unless specifically exempted by HHS, States must receive prior approval for contract amendments involving contract cost increases exceeding $100,000 or contract time extensions of more than 60 days, prior to execution of the contract amendment. This was consistent with the requirement then in place at 45 CFR 95.611(b)(2)(iv).

Subsequently, in the final rule titled ''State Systems Advance Planning Document (APD) Process'' (75 FR 66319, October 28, 2010), HHS amended 45 CFR 95.611(b)(2)(iii) to establish a $500,000 threshold for prior HHS approval of acquisition solicitation documents and contracts for ADP equipment or services for which States would seek enhanced Federal matching funds (75 FR 66331). In the same rule, HHS also established at 45 CFR 95.611(b)(2)(iv) a $500,000 prior approval threshold for contract amendments for which States would seek enhanced Federal match (75 FR 66324). In the final rule titled ''Medicaid Program; Mechanized Claims Processing and Information Retrieval Systems (90/10)'' (80 FR 75817, 75836 through 75837, December 4, 2015), 45 CFR 95.611(a)(2) was amended to establish a $500,000 threshold for prior approval of acquisitions related to ADP equipment and services matched at the enhanced rate for MMIS authorized under 42 CFR part 433, subpart C. There was previously no threshold dollar amount for prior approvals related to such acquisitions in 45 CFR 95.611(a)(2).

In the proposed rule, we proposed to amend 42 CFR 495.324(b)(2) and 495.324(b)(3) to align with current prior approval policy for MMIS and ADP systems at 45 CFR 95.611(a)(2)(ii), and (b)(2)(iii) and (iv), and to minimize burden on States. Specifically, we proposed that the prior approval dollar threshold in § 495.324(b)(3) would be increased to $500,000, and that a prior approval threshold of $500,000 would be added to § 495.324(b)(2). We also proposed minor amendments to the language of 495.324(b)(2) and (3) to better align it with the language of 45 CFR 95.611(b)(2)(iii) and (iv). In addition, in light of these proposed changes, we proposed a conforming amendment to amend the threshold in § 495.324(d) for prior approval of justifications for sole source acquisitions to be the same $500,000 threshold. That threshold is currently aligned with the $100,000 threshold in

current § 495.324(b)(3). We explained that we believe that amending § 495.324(d) to preserve alignment with § 495.324(b)(3) would reduce burden on States and maintain the consistency of our prior approval requirements. This proposal would not affect the other requirements that States must comply with when making acquisitions in support of the Medicaid Promoting Interoperability Program under the Federal provisions contained in 42 CFR part 495, subpart D, and specifically 42 CFR 495.348, regardless of conditions for prior approval.

We explained in the proposed rule that we believe that this proposal would reduce burden on States by raising the prior approval thresholds and generally aligning them with the thresholds for prior approval of MMIS and ADP acquisitions costs.

We did not receive any comments on this proposal and are finalizing the proposal as proposed.

b. Funding Availability to States To Conclude the Medicaid Promoting Interoperability Program

Under section 1903(a)(3)(F) and (t) of the Act, State Medicaid programs may receive FFP in expenditures for incentive payments to certain Medicaid providers to adopt, implement, upgrade, and meaningfully use CEHRT. In addition, FFP is available to States for reasonable administrative expenses related to administration of those incentive payments as long as the State meets certain conditions. Specifically, section 1903(a)(3)(F)(i) of the Act establishes 100 percent FFP to States for incentive payments to eligible Medicaid providers (described in section 1903(t)(1) and (2) of the Act) to adopt, implement, upgrade, and meaningfully use CEHRT. Section 1903(a)(3)(F)(ii) of the Act establishes 90 percent FFP to States for administrative expenses related to administration of the incentive payments.

In § 495.320 and § 495.322, we provide the general rule that States may receive: (1) 100 percent FFP in State expenditures for EHR incentive payments; and (2) 90 percent FFP in State expenditures for administrative activities in support of implementing incentive payments to Medicaid eligible providers. Section 495.316 establishes State monitoring and reporting requirements regarding activities required to receive an incentive payment. Subject to § 495.332, the State is responsible for tracking and verifying the activities necessary for a Medicaid EP or eligible hospital to receive an incentive payment for each payment year, as described in § 495.314.

To date, we have not established a date beyond which 90 percent FFP is no longer available to States for their expenditures related to administering the Medicaid Promoting Interoperability Program. In the Stage 1 final rule (75 FR 44319), we established that, in accordance with sections 1903(t)(4)(A)(iii) and (5)(D) of the Act, in no case may any Medicaid EP or eligible hospital receive an incentive payment after 2021 (42 CFR 495.310(a)(2)(v) and 495.310(f)).

Because December 31, 2021 is the last date that States could make Medicaid Promoting Interoperability incentive payments to Medicaid EPs and eligible hospitals (other than pursuant to a successful appeal related to 2021 or a prior year), we believe it is reasonable for States to conclude most administrative activities related to the Medicaid Promoting Interoperability Program, including submitting final required reports to CMS, by September 30, 2022. Therefore, we proposed to amend § 495.322 to provide that the 90 percent FFP for Medicaid Promoting Interoperability Program administration would no longer be available for most State expenditures incurred after September 30, 2022.

We proposed a later sunset date for the availability of 90 percent enhanced match for State administrative costs related to Medicaid Promoting Interoperability Program audit and appeals activities, as well as costs related to administering incentive payment disbursements and recoupments that might result from those activities. States have a responsibility to conduct audits of the payments made to Medicaid providers participating in the Medicaid Promoting Interoperability Program, in accordance with § 495.368, in order to combat fraud and abuse, and States also must provide a process for EHR incentive payment appeals in accordance with § 495.370. We expect that these activities will require administration for some time after, but at most a year, beyond September 30, 2022. Because provider incentive payments could be disbursed up until December 31, 2021, we anticipate that States would need additional time to review provider risk factors, select samples, and conduct audits. Once post-payment audits are completed, States would also need time to work with any providers who choose to appeal their audit findings. Collectively, the post-payment audit process and/or appeals process could take several months, and in some cases might take more than one year. Therefore, we proposed that the 90 percent FFP would continue to be available for State administrative expenditures related to Medicaid Promoting Interoperability Program audit and appeals activities until September 30, 2023. States would not be able to claim any Medicaid Promoting Interoperability Program administrative match for expenditures incurred after September 30, 2023.

States should be aware that under this proposal, they would need to incur the expenditures for which they would claim the 90 percent FFP for Medicaid Promoting Interoperability Program administrative activities no later than the sunset dates of September 30, 2022 or September 30, 2023, as applicable. This means that for States to claim the 90 percent FFP for goods and services related to Medicaid Promoting Interoperability Program administrative activities, States would have to ensure that the goods and services are provided no later than close of business September 30, 2022 or close of business September 30, 2023, as applicable. Thus, for example, if an amount that is related to administration of a Medicaid Promoting Interoperability Program audit or appeal has been obligated by September 30, 2023, but the good or service has not yet been furnished by that date, then the expenditure could not be claimed at the enhanced 90 percent FFP.

We invited public comments on this proposal, especially on whether the timelines proposed provide States with a reasonable amount of time to wind down their Medicaid Promoting Interoperability Programs.

Comment: Many commenters expressed concerns about the December 31, 2021 deadline for disbursing all incentive payments for the Medicaid Promoting Interoperability Program, particularly that it would be burdensome for States to issue incentive payments by December 31, 2021 for Program Year 2021, and that EPs and eligible hospitals would not have time for a full reporting period before the attestation deadline. Several commenters suggested extending the December 31, 2021 deadline.

Response: Under sections 1903(t)(4)(A)(iii) and (5)(D) of the Act, all Medicaid Promoting Interoperability Program incentive payments must be made by December 31, 2021. Because this is a statutory deadline, we do not have the authority to change it. We note that in the ''Medicare Program: Revisions to Payment Policies under the Physician Fee Schedule and Other Revisions to Part B for CY 2019, Medicare Shared Savings Program Requirements; Quality Payment Program, and Medicaid Promoting

Interoperability Program'' proposed rule, we are seeking comment on proposed flexibilities to the EHR reporting period and eCQM reporting period for the Medicaid Promoting Interoperability Program in CY 2021 (83 FR 35872 through 35873). This proposed rule is available at: *https://www.federalregister.gov/documents/2018/07/27/2018-14985/medicare-program-revisions-to-payment-policies-under-the-physician-fee-schedule-and-other-revisions*.

Comment: Several commenters suggested that 90 percent administrative FFP for HIE activities be extended beyond the proposed deadline.

Response: Consistent with section 1903(a)(3)(F) and (t) of the Act, enhanced administrative FFP under the Medicaid Promoting Interoperability Program for HIE must be directly correlated to the Medicaid EHR Incentive Program. That is, enhanced administrative FFP for HIE must be directly tied to promoting EPs' and eligible hospitals' adoption and meaningful use of CEHRT. Once the deadline for making incentive payments (December 31, 2021) has passed, we are concerned that there would be no basis for continuing enhanced administrative FFP for HIE consistent with section 1903(a)(3)(F)(ii) of the Act. We intend to issue information regarding incurring expenditures that could be matched at enhanced administrative FFP under section 1903(a)(3)(F)(ii) of the Act for HIE under the Medicaid Promoting Interoperability Program. However, we are committed to promoting interoperability, and we are continuing to look for ways for Medicaid to support HIE initiatives.

For additional information on FFP for State administrative expenses related to pursuing initiatives to encourage the adoption of CEHRT to promote health care quality and the exchange of health care information, we refer readers to State Medicaid Director letters #10–016, 11–004, and #16–003. We understand the ongoing importance of HIE to State Medicaid programs, but again, we are concerned that we do not have the authority to extend the availability of enhanced administrative FFP under section 1903(a)(3)(F)(ii) of the Act for HIE beyond the December 31, 2021 deadline for making incentive payments.

Comment: One commenter suggested that CMS allow continued 90 percent FFP for States to complete administrative work, such as annual and quarterly reporting to CMS, beyond December 31, 2021.

Response: We note that we proposed and are finalizing that FFP is available at 90 percent for administrative activities in support of implementing incentive payments to Medicaid eligible providers only for expenditures incurred on or before September 30, 2022, except for expenditures related to audit and appeal activities, which must be incurred before September 30, 2023 to qualify for FFP at 90 percent. There are two sets of reports that are required from States for the Medicaid Promoting Interoperability Program, the annual report at § 495.316(c) and quarterly reports at § 495.352. As we approach 2021 and 2022, we will take the deadlines we are finalizing in this final rule into consideration as we set reporting requirements and deadlines for 2021 and 2022, so that States will be able to conclude administrative activities by the September 30, 2022 in a manner that will allow them to claim 90 percent FFP.

Comment: Several commenters supported the deadline of September 30, 2023 for incurring expenditures related to audit and appeals activities that can be matched at 90 percent FFP, including directly-related technical assistance and administrative activities. A few commenters suggested extending that September 30, 2023 deadline by another year.

Response: We thank the commenters for their input. We acknowledge that some States are several years behind their auditing targets. However, we believe that timely auditing is important and encourage those States to accelerate their auditing timelines. We note that hiring additional auditing staff or contractors would be eligible for enhanced FFP. In addition, we note that any expenditures related to audits and appeals, will be eligible for enhanced administrative FFP until September 30, 2023.

After consideration of the public comments we received, we are finalizing the proposed policies as proposed. We are amending § 495.322 to provide that the 90 percent FFP for Medicaid Promoting Interoperability Program administration would no longer be available for most State expenditures incurred after September 30, 2022.

The availability of 90 percent match for State administrative costs related to Medicaid Promoting Interoperability Program audit and appeals activities, as well as costs related to administering incentive payment disbursements and recoupments that might result from those activities, will continue until September 30, 2023. States would not be able to claim any Medicaid Promoting Interoperability Program administrative match for expenditures incurred after September 30, 2023.

States should be aware that under this final rule, they will need to incur the expenditures for which they would claim the 90 percent FFP for Medicaid Promoting Interoperability Program administrative activities no later than the sunset dates of September 30, 2022 or September 30, 2023, as applicable. This means that for States to claim the 90 percent FFP for goods and services related to Medicaid Promoting Interoperability Program administrative activities, States will have to ensure that the goods and services are provided no later than close of business September 30, 2022 or close of business September 30, 2023, as applicable.

IX. Revisions of the Supporting Documentation Required for Submission of an Acceptable Medicare Cost Report

A. Background

Sections 1815(a) and 1833(e) of the Act provide that no Medicare payments will be made to a provider unless it has furnished the information, as may be requested by the Secretary, to determine the amount of payments due the provider under the Medicare program. In general, providers submit this information through annual cost reports [410] that cover a 12-month period of time. Under the regulations at 42 CFR 413.20(b) and 413.24(f), providers are required to submit cost reports annually, with the reporting period based on the provider's accounting year. For cost years beginning on or after October 1, 1989, section 1886(f)(1) of the Act and § 413.24(f)(4) of the regulations require hospitals to submit cost reports in a standardized electronic format, and the same requirement was later imposed for other types of providers.

All providers participating in the Medicare program are required under § 413.20(a) to maintain sufficient

[410] There are currently nine Medicare cost reports: the Hospital and Health Care Complex Cost Report, Form CMS–2552, OMB No. 0938–0050; the Skilled Nursing Facility and Skilled Nursing Facility Health Care Complex Cost Report, Form CMS–2540, OMB No. 0938–0463; the Home Health Agency Cost Report, Form CMS–1728, OMB No. 0938–0022; the Outpatient Rehabilitation Provider Cost Report, Form CMS–2088, OMB No. 0938–0037; the Independent Rural Health Clinic and Freestanding Federally Qualified Health Center Cost Report (prior to October 1, 2014), Form CMS–222, OMB No. 0938–0107; the Federally Qualified Health Center Cost Report (beginning on or after October 1, 2014), Form CMS–224, OMB No. 0938–1298; the Organ Procurement Organizations and Histocompatibility Laboratory, Form CMS–216, OMB No. 0938–0102; the Independent Renal Dialysis Facility Cost Report, Form CMS–265, OMB No. 0938–0236; and the Hospice Cost and Data Report, Form CMS–1984, OMB No. 0938–0758.

financial records and statistical data for proper determination of costs payable under the program. Moreover, providers must use standardized definitions and follow accounting, statistical, and reporting practices that are widely accepted in the hospital and related fields. Upon receipt of a provider's cost report, the Medicare Administrative Contractor (herein referred to as ''contractor'') reviews the cost report to determine its acceptability in accordance with § 413.24(f)(5). Each cost report submission by a provider to its contractor, including an amended cost report, is considered to be a separate cost report submission under § 413.24(f)(5). Each cost report submission requires the supporting documentation specified in § 413.24(f)(5)(i). A cost report submitted without the required supporting documentation is rejected under § 413.24(f)(5)(i). Under § 413.24(f)(5)(iii), when the cost report is rejected, it is deemed an unacceptable submission and treated as if it had never been filed.

Several provisions in the regulations requiring supporting documentation for the Medicare cost report to be acceptable need to be updated to reflect current practices, to improve the accuracy of these reports, and to facilitate more efficient contractor review of cost reports. The regulations at § 413.24(f)(5)(i) provides that a provider's cost report is rejected if the provider does not complete and submit the Provider Cost Reimbursement Questionnaire (a questionnaire independent of the cost report, OMB No. 0938–0301, also known as Form CMS–339). The Form CMS–339 requires the provider to submit supporting documents, as applicable, for items such as Medicare bad debt, approved educational activities, and cost allocation from a home office or chain organization.

Beginning in 2011, as cost report forms were updated for various provider types, the Form CMS–339 was incorporated as a worksheet in the Medicare cost report (the worksheet title and placement within the cost report vary by provider type), and is no longer submitted as a separate supporting document. The Form CMS–339 has been incorporated into all Medicare cost reports except for the Organ Procurement Organization (OPO) and Histocompatibility Laboratory cost report, Form CMS–216. In section IX.B. of the preamble of the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20544 through 20548), we proposed to incorporate the Form CMS–339 into the OPO and Histocompatibility cost report, Form CMS–216.

The cost report worksheet that incorporated the Form CMS–339 continues to require the provider to submit supporting documents for Medicare bad debt, approved educational activities, and certain cost allocation information from a home office or chain organization, as applicable. However, our regulations at § 413.24(f)(5)(i) do not reflect that the Provider Cost Reimbursement Questionnaire, Form CMS–339, has been incorporated into the Medicare cost report as a worksheet because the regulations require the Form CMS–339 to be submitted as a supporting document to the cost report.

Section 413.24(f)(5)(i) also provides that a cost report is rejected for a teaching hospital if a copy of the Intern and Resident Information System (IRIS) diskette is not included as supporting documentation. However, diskettes are no longer used by providers to furnish these data to contractors.

Section 413.20 of the regulations requires providers to maintain sufficient financial records and statistical data for the proper determination of costs payable under the program as well as an adequate ongoing system for furnishing records needed to provide accurate cost data and other information capable of verification by qualified auditors. In accordance with § 413.20(d), the provider must furnish such information to the contractor as may be necessary to assure proper payment. Information from the provider relating to Medicaid days used in the calculation of DSH payments, charity care charges, uninsured discounts, and home office cost allocations are necessary to assure proper payment. While our regulations require that these supporting documents be maintained by the provider and furnished to the contractor to assure proper payment, § 413.24(f)(5) does not require submission of supporting documentation for Medicaid days used in the calculation of DSH payments, charity care charges, uninsured discounts, or home office cost allocations reported on a provider's cost report for the provider to have an acceptable cost report submission. These supporting documents are often subsequently requested by the contractor, and must be submitted by the provider in order to assure proper payment, which can delay payments and prolong audits.

Our specific proposals for revising our regulations that were included in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20544 through 20548) are discussed below, along with the public comments we received and our responses and the policies that we are finalizing in this final rule.

B. Revisions to Regulations

1. Provider Cost Reimbursement Questionnaire

Section 413.24(f)(5)(i) of the regulations provides that a provider's Medicare cost report is rejected for lack of supporting documentation if it does not include the Provider Cost Reimbursement Questionnaire (also known as Form CMS–339). As discussed in section IX.A. of the preamble of the proposed rule and this final rule, beginning in 2011, as cost report forms were updated, the Provider Cost Reimbursement Questionnaire, Form CMS–339, was incorporated into all Medicare cost reports as a worksheet, except the OPO and Histocompatibility Laboratory cost report, Form CMS–216. In the FY 2019 IPPS/LTCH PPS proposed rule, we proposed to incorporate the Provider Cost Reimbursement Questionnaire, Form CMS–339, into the OPO and Histocompatibility Laboratory cost report, Form CMS–216. The incorporation of the Form CMS–339 into the Form CMS–216 will complete our incorporation of the Form CMS–339 into all Medicare cost reports.

In addition, in the proposed rule, we proposed to revise § 413.24(f)(5)(i) by removing the reference to the Provider Cost Reimbursement Questionnaire so that § 413.24(f)(5)(i) no longer states that a cost report will be rejected for lack of supporting documentation if it does not include a Provider Cost Reimbursement Questionnaire (Form CMS–339). Furthermore, we proposed to add language to the first sentence of § 413.24(f)(5)(i) to clarify that a provider must submit all necessary supporting documents for its cost report. We stated in the proposed rule that we believe the proposal is consistent with the recordkeeping requirements in §§ 413.20 and 413.24.

Comment: Several commenters supported the incorporation of the Provider Cost Reimbursement Questionnaire, Form CMS–339 into the OPO and Histocompatibility Laboratory cost report, Form CMS–216 because of the ease of completing the Provider Cost Reimbursement Questionnaire as an incorporated worksheet within the Medicare cost report.

Response: We appreciate the commenters' support for our proposals.

Comment: Many commenters agreed with the proposal to add language to the first sentence of § 413.24(f)(5)(i) to clarify that a provider must submit all necessary supporting documents for its

cost report. Some commenters who were in agreement cited the need for data integrity within the Medicare cost report. However, several commenters disagreed with the proposal, citing increased burden upon providers to submit all necessary supporting documents for its cost report at the time of the cost report submission. Some commenters believed the supporting documents should only be submitted to the contractor during an audit of the cost report. Several commenters stated that the cost report should not be rejected when the provider fails to submit it with the supporting documentation.

Response: We agree with the commenters that accuracy of the data reported in the Medicare cost report is necessary. We note that many Medicare payment systems are based upon data reported in the cost report. We disagree with the commenters that submitting supporting documents with the cost report is burdensome, as these data are recorded and maintained by the provider and are available to providers at the time of completion of the Medicare cost report. This documentation that is recorded and maintained by the provider is necessary to complete the cost report and supports the amounts reported in the cost report. When a cost report is audited, the provider's records are tested for accuracy and at that point additional detailed documents may be requested. Because not all cost reports are audited, the submission of supporting documents that agree with the amounts reported in the cost report at the time of submission is necessary so that contractors can pay providers promptly and accurately.

After consideration of the public comments we received, for the reasons discussed above and in the proposed rule, we are finalizing our proposal, without modification, to incorporate the Provider Cost Reimbursement Questionnaire, Form CMS–339 into the OPO and Histocompatibility Laboratory cost report, Form CMS–216, and to revise § 413.24(f)(5)(i) by removing the reference to the Provider Cost Reimbursement Questionnaire so that § 413.24(f)(5)(i) no longer states that a cost report will be rejected for lack of supporting documentation if it does not include a Provider Cost Reimbursement Questionnaire (Form CMS–339). In addition, we are finalizing the addition of language to the first sentence of § 413.24(f)(5)(i) to clarify that a provider must submit all necessary supporting documents for its cost report.

2. Intern and Resident Information System (IRIS) Data

Section 413.24(f)(5)(i) also provides that a Medicare cost report for a teaching hospital is rejected for lack of supporting documentation if the cost report does not include a copy of the Intern and Resident Information System (IRIS) diskette.

Section 1886(h) of the Act, as added by section 9202 of the Consolidated Omnibus Budget Reconciliation Act of 1985 (COBRA), Public Law 99–272, establishes a methodology for determining payments to hospitals for the GME programs (which is currently implemented in the regulations at 42 CFR 413.75 through 413.83). To account for the higher indirect patient care costs of teaching hospitals relative to nonteaching hospitals, section 1886(d)(5)(B) of the Act provides for a payment adjustment known as the IME adjustment under the IPPS for hospitals that have residents in an approved GME program. The regulation regarding the calculation of this additional payment is located at 42 CFR 412.105. (We refer readers to sections IV.E. and L. of the preamble of this final rule for additional background on IME and direct GME payments.)

In accordance with § 413.78(b) for direct GME and § 412.105(f)(1)(iii)(A) for IME, no individual may be counted as more than one full-time equivalent (FTE). A hospital cannot claim the time spent by residents training at another hospital; if a resident spends time in more than one hospital or in a nonprovider setting, the resident counts as a partial FTE based on the proportion of time worked at the hospital to the total time worked. A part-time resident counts as a partial FTE based on the proportion of allowable time worked compared to the total time necessary to fill a full-time internship or residency slot.

In 1990, we established the IRIS, under the authority of sections 1886(d)(5)(B) and 1886(h) of the Act, in order to facilitate proper counting of FTE residents by hospitals that rotate their FTE residents from one hospital or nonprovider setting to another. Teaching hospitals use the IRIS to collect and report information on residents training in approved residency programs. Section 413.24(f)(5)(i) requires teaching hospitals to submit the IRIS data along with their Medicare cost reports in order to have an acceptable cost report submission. The IRIS can be downloaded from CMS' website at: *https://www.cms.gov/Research-Statistics-Data-and-Systems/Computer-Data-and-Systems/IRIS/index.html?redirect=/iris*. We are currently in the process of producing a new Extensible Markup Language (XML)-based IRIS file format that captures FTE resident count data consistent with the manner in which FTEs are reported on the Medicare cost report.

After receiving the IRIS data along with each teaching hospital's cost report, the contractors upload the data to a national database housed at CMS, which can be used to identify ''duplicates,'' that is, FTE residents being claimed by more than one hospital for the same rotation. Identifying duplicates allows the contractors to approach the hospitals that simultaneously claimed the same FTE, and correct the duplicate reporting on the respective hospitals' cost reports for direct GME and IME payment purposes.

Historically, we would collect the IRIS data from hospitals on a diskette, as referenced in § 413.24(f)(5)(i). Because diskettes are no longer used by providers to furnish these data to contractors, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20545 and 20546), we proposed to remove the reference in the regulations to a diskette and instead reference ''Intern and Resident Information System data.'' Specifically, we proposed to amend § 413.24(f)(5)(i) by adding a new paragraph (A) to include this proposed revised language (83 FR 20546).

In addition, to enhance the contractors' ability to review duplicates and to ensure residents are not being double-counted, we stated that we believe it is necessary and appropriate to require that the total unweighted and weighted FTE counts on the IRIS for direct GME and IME respectively, for all applicable allopathic, osteopathic, dental, and podiatric residents that a hospital may train, must equal the same total unweighted and weighted FTE counts for direct GME and IME reported on Worksheet E–4 and Worksheet E, Part A. The need to verify and maintain the integrity of the IRIS data has been the subject of reviews by the Office of the Inspector General (OIG) over the years. An August 2014 OIG report cited the need for CMS to develop procedures to ensure that no resident is counted as more than one FTE in the calculation of Medicare GME payments (OIG Report No. A–02–13–01014, August 2014). More recently, a July 2017 OIG report recommended that procedures be developed to ensure that no resident is counted as more than one FTE in the calculation of Medicare GME payments (OIG Report No. A–02–15–01027, July 2017).

Therefore, effective for cost reports filed on or after October 1, 2018, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20546), we proposed to add the requirement that IRIS data contain the same total counts of direct GME FTE residents (unweighted and weighted) and of IME FTE residents as the total counts of direct GME and IME FTE residents reported in the cost report. Specifically, we proposed to specify in a new paragraph (A) of § 413.24(f)(5)(i) that, effective for cost reports filed on or after October 1, 2018, the IRIS data must contain the same total counts of direct GME FTE residents (unweighted and weighted) and of IME FTE residents as the total counts of direct GME FTE and IME FTE residents reported in the hospital's cost report, or the cost report will be rejected for lack of supporting documentation (83 FR 20569).

Comment: Some commenters expressed concern that the current IRIS does not calculate the total amounts of direct GME FTE and IME FTE residents, leaving teaching hospitals unable to ensure that the IRIS direct GME FTE totals and the IME FTE totals are the same as what a teaching hospital reports in its hospital cost report. The commenters suggested that the IRIS program be updated to calculate the total resident FTEs.

Response: We understand and agree with the commenters' concerns that the current IRIS program does not calculate the totals of the hospital's resident FTEs and therefore it would be difficult to require that a hospital's resident FTEs in the IRIS equate to the resident FTEs in the hospital's cost report. The number of direct GME FTE residents and IME FTE residents in the current IRIS is self-reported by the teaching hospitals from their resident data records. We believe that the IRIS data should represent the total of direct GME FTE residents, weighted and unweighted, and the total of IME FTE residents. As we noted in the proposed rule, we are in the process of producing a new XML-based IRIS that will capture FTE resident count data consistent with the manner in which FTEs are reported on the Medicare cost report. It was our intention that the new XML-based IRIS would capture both weighted and unweighted direct GME FTE and IME FTE residents and totals. It was also our intention that the new XML-based IRIS would be available by October 1, 2018 and that hospitals would be able to comply with our proposal by ensuring that the weighted and unweighted direct GME FTE and IME FTE residents and totals calculated in the new XML-based IRIS would correspond with the weighted and unweighted direct GME FTE and IME FTE residents and totals the hospital reports in its cost report. However, because of extenuating circumstances, the new XML-based IRIS will not be able to calculate the GME (weighted and unweighted) FTE counts and IME FTE counts by October 1, 2018. Therefore, due to the concerns expressed in the comments, we are not finalizing our proposal that a teaching hospital's IRIS data must contain the same total counts of direct GME FTE residents (unweighted and weighted) and of IME FTE residents as the total counts of direct GME FTE and IME FTE residents reported in the hospital's cost report, or the cost report will be rejected for lack of supporting documentation. We will consider making this proposal at a future time when the new XML-based IRIS has the capability to capture the total counts of direct GME FTE residents (unweighted and weighted) and of IME FTE residents.

As we noted in the proposed rule, teaching hospitals no longer submit IRIS data on diskettes. Instead, teaching hospitals submit IRIS data with their cost reports in order to have an acceptable cost report. In this final rule, we are finalizing a change to the regulation at § 413.24 to specify that, in order for teaching hospitals to have an acceptable cost report, teaching hospitals must submit their IRIS ''data,'' given that IRIS diskettes are no longer used by providers to furnish these data to contractors.

Comment: A few commenters suggested that the goal of ensuring that resident FTEs are not double counted requires a review of all hospitals that train residents and can only be done by the contractors during the cost report review and reconciliation period.

Response: We agree that ensuring that resident FTEs are not double counted among hospitals requires a review of IRIS data for all hospitals that train residents, and the review of these data is completed by the contractors during the cost report review and reconciliation period. We believe the current IRIS can be used to ascertain duplicate counting of resident FTEs, by ensuring that the IRIS FTE counts correspond to the FTE counts reported in the teaching hospital's cost report. However, any review of these data first requires that the data reported in the hospital's cost report be accurate and correspond to what is reported in the IRIS.

Comment: One commenter requested that the hospital cost report and the IRIS have abilities to differentiate between new residents and those residents in existing resident programs as a way to account for instances when the number of a hospital's resident FTEs may exceed the hospital's FTE slots.

Response: We agree with the commenter's objective to account for instances when the number of a hospital's resident FTEs may exceed its resident FTE slots. However, there is no requirement that the cost report FTE count be limited to the number of accredited slots. There is a general rule that only residents training in accredited programs can be reported. There are times when a hospital trains more residents in a program than the number of residents the program is actually accredited for, and if they do, hospitals are supposed to inform the ACGME of such an occurrence. Therefore, even in the case where the number of FTEs exceeds the accredited slots, the FTEs represented in IRIS should equal the cost report count.

Comment: One commenter expressed concern that the Medicare Cost Report e-Filing (MCReF) program requires IRIS data as a separate upload and suggested building a functionality in MCReF that would read the IRIS uploaded data and compare the data to what is reported in the cost report and produce an immediate flag upon the cost report submission if the IRIS data do not match.

Response: We appreciate the commenter's suggestion to build a functionality in MCReF that would read the IRIS uploaded data and compare them to what is reported in the cost report. We will explore this suggestion in the future with regard to the MCReF program and the feasibility for it to interface with the new XML-based IRIS program.

Comment: One commenter asked whether providers would be required to purchase the new XML-based IRIS program.

Response: We appreciate the commenter's inquiry and assure that the new XML-based IRIS software will be available for hospitals' use at no cost. However, as we explain earlier, we are not finalizing our proposal that the IRIS data must contain the same total counts of direct GME FTE residents (unweighted and weighted) and of IME FTE residents as the total counts of direct GME FTE and IME FTE residents reported in the hospital's cost report, pending development of the new XML-based IRIS file and completion of the Paperwork Reduction Act (PRA) approval process. Providers will have an opportunity to comment during the comment period that is specified in the IRIS PRA notice.

Comment: Some commenters requested clarification of the effective date of the proposed provision that the

IRIS data must contain the same total counts of direct GME FTE residents (unweighted and weighted) and of IME FTE residents as the total counts of direct GME FTE and IME FTE residents reported in the hospital's cost report, or the cost report will be rejected for lack of supporting documentation.

Response: We stated in the proposed rule that the effective date for the proposed provision that the IRIS data must contain the same total counts of direct GME FTE residents (unweighted and weighted) and of IME FTE residents as the total counts of direct GME FTE and IME FTE residents reported in the hospital's cost report, or the cost report will be rejected for lack of supporting documentation, would be for cost reports filed on or after October 1, 2018. However, as explained above, because the new XML-based IRIS program is not yet available, we are not finalizing this portion of the proposal.

After consideration of the public comments we received, for the reasons discussed earlier and in the proposed rule, we are finalizing our proposals with modifications. As proposed, we are removing the reference in the regulations to an IRIS diskette and instead referencing ''Intern and Resident Information System data.'' Specifically, we are amending § 413.24(f)(5)(i) by adding a new paragraph (A) to provide that a teaching hospital's cost report is rejected for lack of supporting documentation if the cost report does not include the IRIS data. For the reasons discussed above, we are not finalizing our proposal that the IRIS data must contain the same total counts of direct GME FTE residents (unweighted and weighted) and of IME FTE residents as the total counts of direct GME FTE and IME FTE residents reported in the hospital's cost report, or the cost report will be rejected for lack of supporting documentation.

3. Medicare Bad Debt Reimbursement

Under section 1861(v)(1) of the Act and the regulations at § 413.89, Medicare may reimburse a portion of the uncollectible deductible and coinsurance amounts to those entities eligible to receive reimbursement for Medicare bad debt. The Medicare Provider Reimbursement Manual (PRM–1, CMS Pub. 15–1), Chapter 3, provides guidance to providers that claim Medicare bad debt reimbursement.

Section 413.24(f)(5)(i) provides that an acceptable cost report submission requires the provider to submit a Provider Cost Reimbursement Questionnaire, Form CMS–339. The Form CMS–339, which has been incorporated into all Medicare cost reports (except the OPO and Histocompatibility Laboratory cost report, Form CMS–216, which we proposed (and are finalizing) to incorporate into the cost report, as discussed in section IX.B.1. of the preamble of the proposed rule and this final rule), requires the provider to submit supporting documentation with the cost report to substantiate its claims for Medicare bad debt reimbursement. For example, the hospital cost report, which incorporated the Form CMS–339, instructs hospitals to submit a ''completed Exhibit 2 or internal schedules duplicating the documentation requested on Exhibit 2 to support the bad debts claimed'' (Section 4004.2 of CMS Pub. 15–2). This ''completed Exhibit 2 or internal schedules duplicating the documentation requested on Exhibit 2 to support the bad debts claimed'' is also known as the Medicare bad debt listing and requires information such as the patient's name, dates of service, the beneficiary's Medicaid status, if applicable, the date that collection effort ceased, and the deductible and coinsurance amounts.

Because the Provider Cost Reimbursement Questionnaire is incorporated into the cost report as a worksheet, the bad debt listing continues to be required for an acceptable cost report under § 413.24(f)(5). In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20547 and 20548), we proposed to require that the Medicare bad debt listing correspond to the bad debt amount claimed in the provider's cost report, in order for the provider to have an acceptable cost report submission under § 413.24(f)(5). We stated that this proposal is also consistent with a provider's recordkeeping and cost reporting requirements of §§ 413.20 and 413.24, and will facilitate the contractor's review and verification of the cost report. Specifically, we proposed to amend § 413.24(f)(5)(i) by adding a new paragraph (B) to specify that, effective for cost reporting periods beginning on or after October 1, 2018, for providers claiming Medicare bad debt reimbursement, a cost report would be rejected for lack of supporting documentation if it does not include a detailed bad debt listing that corresponds to the bad debt amounts claimed in the provider's cost report.

Comment: Some commenters generally supported the proposal, while other commenters suggested that a standardized format be established and required for the submission of the bad debt listing that corresponds to the bad debt amounts claimed in the provider's cost report. One commenter suggested that the format of the bad debt list follow the format of the bad debt listing from the exhibit to the Form CMS–339.

Response: We appreciate the commenters' support and agree with the suggestion that a standardized format be required for the submission of the bad debt listing. The standardized format, that we will continue to use, for the bad debt listing is currently submitted by the provider as a required exhibit to the CMS Form-339 which, with the finalization of this rule, will be incorporated into all of the Medicare cost reports in the Provider Reimbursement Manual (PRM–2, CMS Pub. 15–2). We will continue to use the exhibit to the incorporated CMS Form-339 as the standardized format of the bad debt listing. Any amendments to the format of the bad debt listing will be published with amendments to the cost report in the PRM–2, CMS Pub. 15–2.

Comment: Some commenters cited the need to revise the bad debt listing following the submission of the cost report and suggested that cost reports be permitted to be amended for this purpose.

Response: We disagree that the bad debt listing needs to be revised following the submission of the cost report. Providers are required under § 413.20(a) to maintain sufficient financial records and statistical data for proper determination of costs payable under the program. It is our expectation that the bad debt listing providers use to complete the cost report and that they submit with the cost report is complete and accurate. The Provider Reimbursement Manual, CMS Pub. 15–1, Chapter 3, section 314, provides that uncollectible deductibles and coinsurance amounts are recognized as allowable bad debts in the reporting period in which the debts are determined to be worthless. Because, pursuant to § 413.24(f)(2)(i), cost reports are due on or before the last day of the fifth month following the close of the period covered by the report, we believe there is sufficient time for the provider to accurately report bad debts. However, pursuant to 42 CFR 405.1885(a), providers are permitted, and contractors have the discretion to grant, a reopening of a contractor determination in order to revise an item in the cost report. Also, pursuant to § 413.24(f), amended cost reports to revise cost report information that has been previously submitted by a provider may be permitted by the contractor.

Comment: Other commenters suggested that the bad debt listing be submitted only when the cost report is audited instead of being submitted with

the cost report as a supporting documentation in order to have an acceptable cost report.

Response: We disagree that the bad debt listing should only be submitted when the cost report is audited. Because not all cost reports are audited, the submission of the bad debt listing with the cost report is necessary for contractors to ensure the veracity and accuracy of the bad debts claimed in the cost report and to ensure there is no duplicate reporting of bad debts from a provider's prior fiscal year cost report.

After consideration of the public comments we received, for the reasons discussed earlier and in the proposed rule, we are finalizing our proposals without modification. Effective for cost reporting periods beginning on or after October 1, 2018, for providers claiming Medicare bad debt reimbursement, a cost report will be rejected for lack of supporting documentation if it does not include a detailed bad debt listing that corresponds to the bad debt amounts claimed in the provider's cost report.

4. Disproportionate Share Hospital (DSH) Payment Adjustment

The DSH payment adjustment provision under section 1886(d)(5)(F) of the Act was enacted by section 9105 of COBRA and became effective for discharges occurring on or after May 1, 1986. Under section 1886(d)(5)(F) of the Act, the primary method by which a hospital qualifies for a Medicare DSH payment is based on the hospital's disproportionate patient percentage, which is determined using a statutory formula. This statutory formula incorporates the hospital's number of patient days for patients who are eligible for Medicaid, but were not entitled to benefits under Medicare Part A (''Medicaid eligible days''), which hospitals are required to submit on their cost reports.

Currently, in order for a DSH eligible hospital to have an acceptable cost report submission, there is no requirement for the hospital to also submit a listing of its Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the hospital's cost report, as a supporting document. DSH eligible hospitals have always been required to collect and maintain these data for completion of the cost report, and to submit it when requested. However, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20547), we proposed that, in order to have an acceptable cost report submission, DSH eligible hospitals must submit these supporting data with their cost reports. We indicated that, to ensure accurate DSH payments, additional information regarding Medicaid eligible days is required in order to validate the number of Medicaid eligible days the hospital reports in its cost report. Currently, when this information regarding Medicaid eligible days is not submitted by the DSH eligible hospitals with the cost report, contractors must request it. An audit may reveal an overstatement of a hospital's Medicaid eligible days. However, we stated that an audit of these data may not take place for more than a year after the cost report has been submitted, and tentative program reimbursement payments are often issued to a provider upon the submission of the cost report. Because the existing burden estimate for a DSH eligible hospital's cost report already reflects the requirement that these hospitals collect, maintain, and submit these data when requested, we stated in the proposed rule that there is not additional burden.

We explained in the proposed rule (83 FR 20547) that requiring a provider to submit, as a supporting document with its cost report, a listing of the provider's Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the DSH eligible hospital's cost report would provide contractors with the DSH eligible hospital's source document listing the Medicaid eligible days claimed on its cost report and would be consistent with the recordkeeping and cost reporting requirements of §§ 413.20 and 413.24, which require a provider to substantiate its costs. A requirement to submit this supporting documentation also would facilitate the contractor's review and verification of the cost report without the need to request additional data from the provider. We stated in the proposed rule that this proposal would not affect a hospital's ability to submit an amended cost report, within 12 months after the hospital's cost report is due, that reflects updated information on Medicaid eligible patient days after the hospital receives updated Medicaid eligibility information from the State (CY 2016 OPPS/ASC final rule with comment period (80 FR 70560)).

Therefore, in the FY 2019 IPPS/LTCH PPS proposed rule, we proposed that, effective for cost reporting periods beginning on or after October 1, 2018, in order for a hospital eligible for a Medicare DSH payment adjustment to have an acceptable cost report submission in accordance with § 413.24(f)(5), the provider must submit a detailed listing of its Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the provider's cost report, as a supporting document with the provider's cost report. In addition, we proposed that if the provider submits an amended cost report that changes its Medicaid eligible days, an amended listing or an addendum to the original listing of the provider's Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the provider's amended cost report would also need to be submitted as a supporting document with the amended cost report.

Consistent with this proposal, we proposed to amend § 413.24(f)(5)(i) by adding a new paragraph (C) to specify that, effective for cost reporting periods beginning on or after October 1, 2018, for hospitals claiming a DSH payment adjustment, a cost report will be rejected for lack of supporting documentation if it does not include a detailed listing of the hospital's Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the hospital's cost report. If the hospital submits an amended cost report that changes its Medicaid eligible days, an amended listing or an addendum to the original listing of the hospital's Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the hospital's amended cost report would be required.

Comment: Some commenters pointed out that, in some instances, the State may not have made information regarding the Medicaid eligible days available to the provider at the time the cost report is submitted and that hospitals have the ability to submit an amended cost report within 12 months after the hospital's cost report is due that reflects updated information on Medicaid eligible patient days if the hospital receive updated Medicaid eligibility information from the State (CY 2016 OPPS/ASC final rule with comment period (80 FR 70560)). Commenters expressed opposition to the requirement that hospitals submit a listing of the hospital's Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the hospital's cost report because it would require the provider to submit knowingly incomplete information with the cost report and also would require a duplication of efforts if an amended cost report is submitted with an updated listing of the Medicaid eligible days in the 12 months following the hospital's cost report due date.

Response: We disagree with the commenters' assertion that our proposal would require that the provider knowingly submit incomplete information if a hospital were to submit the cost report with a listing of the hospital's Medicaid eligible days that corresponds to the Medicaid eligible

days claimed in the hospital's cost report. The proposal to require a hospital to submit a listing of the hospital's Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the hospital's cost report does not require providers to submit incomplete information. Currently, the provider is required to submit the cost report with the known Medicaid eligible days for the hospital's fiscal year. This proposal would require hospitals to substantiate those days by requiring the hospital to also submit a listing of the hospital's Medicaid eligible days that corresponds to the days claimed in the hospital's cost report. This requirement would not change the current requirements with respect to reporting on the cost report of the Medicaid eligible days known by the hospital at the time of the cost report submission. If the Medicaid eligible days change once the hospital receives the documentation from the State, the hospital may amend its cost report. The contractor must accept the amended cost report with the amended listing of the Medicaid eligible days that substantiates the revised Medicaid eligible days reported in the amended cost report if it is submitted within 12 months after the hospital's cost report is due. As a result, the requirement that hospitals submit a listing of the Medicaid eligible days with their cost report does not require the hospital to perform any duplicative actions and, in fact, only requires that in the case where a hospital submits an amended cost report that changes its Medicaid eligible days, the hospital also submit documentation to support the additional Medicaid days.

Comment: One commenter requested that hospitals that are DSH eligible, but do not actually receive DSH, be excluded from the requirement to submit a listing of the Medicaid eligible days that substantiates the Medicaid eligible days reported in the hospital's cost report. The commenter provided sole community hospitals (SCHs) and Medicare dependent small rural hospitals (MDHs) as an example and requested that they be excluded.

Response: We agree with the commenter that the requirement to submit a listing of the Medicaid eligible days that corresponds to the Medicaid eligible days reported in the hospital's cost report is not applicable to SCHs that are paid under the hospital-specific rate and are not eligible to receive DSH payment adjustments. However, because MDHs are eligible to receive DSH payment adjustments, this proposal applies to them if they are claiming a DSH payment adjustment. Similarly, an SCH that is not paid under its hospital-specific rate and is eligible to receive a DSH payment adjustment must submit a listing of the Medicaid eligible days that corresponds to the Medicaid eligible days reported in the hospital's cost report if it is claiming a DSH payment adjustment.

After consideration of the public comments we received, for the reasons discussed earlier and in the proposed rule, we are finalizing our proposals without modification. Therefore, effective for cost reporting periods beginning on or after October 1, 2018, for hospitals claiming a disproportionate share payment adjustment, a cost report will be rejected for lack of supporting documentation if it does not include a detailed listing of the hospital's Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the hospital's cost report. In addition, if the hospital submits an amended cost report that changes its Medicaid eligible days, the hospital must submit an amended listing or an addendum to the original listing of the hospital's Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the hospital's amended cost report. We are finalizing § 413.24(f)(5)(i)(C) as proposed to reflect these policies.

5. Charity Care and Uninsured Discounts

Section 3133 of the Affordable Care Act amended the Medicare DSH payment adjustment provision at section 1886(d)(5)(F) of the Act, and established section 1886(r) of the Act which provides for an additional payment that reflects a hospital's uncompensated care (which includes charity care and discounts given to uninsured patients who qualify under the hospital's charity care policy or financial assistance policy). In accordance with the FY 2018 IPPS/LTCH PPS final rule (82 FR 38201 through 38208), starting in FY 2018, Worksheet S–10 of the cost report is used as a data source for calculating uncompensated care payments.

Currently there is no requirement for a DSH eligible hospital to submit supporting documentation with its cost report, to substantiate its charity care or discounts given to uninsured patients who qualify under the hospital's charity care policy or financial assistance policy, in order for its cost report submission to be acceptable in accordance with § 413.24(f)(5). Uncompensated care data reported on a hospital's cost report did not have an impact on the determination of uncompensated care payments before FY 2018 when the agency first began using Worksheet S–10 data to calculate uncompensated care payments. However, because the Worksheet S–10 data are now utilized to make uncompensated care payments to DSH-eligible hospitals, documentation to substantiate charity care or discounts given to uninsured patients who qualify under the hospital's charity care or financial assistance policy is needed to complete the cost report and to ensure there is no duplication when hospitals report Medicare bad debt, charity care, and uninsured discounts. All hospitals, including DSH eligible hospitals, have always been required to collect and maintain these data for completion of the cost report, and submit it when requested. However, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20547 and 20548), we proposed that, in order to have an acceptable cost report submission, DSH eligible hospitals must submit these supporting data with their cost reports. We stated that, to ensure accurate uncompensated care payments, additional supporting information regarding charity care and uninsured discounts is required in order to validate the amounts reported in the cost report. Currently, when the documentation to support the charity care charges and uninsured discounts is not submitted by DSH eligible hospitals with the cost report, contractors must request it. We stated that because the existing burden estimate for a DSH eligible hospital's cost report already reflects the requirement that these hospitals collect, maintain, and submit these data when requested, there is no additional burden.

We stated in the FY 2019 IPPS/LTCH PPS proposed rule that we believe that requiring a DSH eligible hospital to submit, with its cost report, a detailed listing of its charity care and uninsured discounts that corresponds to the amount claimed in the hospital's cost report would be consistent with the recordkeeping and cost reporting requirements of §§ 413.20 and 413.24, which require a provider to substantiate its costs. We stated that this supporting documentation also would facilitate the contractor's review and verification of the cost report without the need to request additional data from the provider.

Therefore, in the FY 2019 IPPS/LTCH PPS proposed rule, we proposed that, effective for cost reporting periods beginning on or after October 1, 2018, in order for hospitals reporting charity care and/or uninsured discounts to have an acceptable cost report submission under § 413.24(f)(5), the provider must submit a detailed listing of charity care and/or

uninsured discounts that contains information such as the patient name, dates of service, insurer (if applicable), and the amount of charity care and/or uninsured discount given that corresponds to the amount claimed in the hospital's cost report as a supporting document with the hospital's cost report.

Consistent with this proposal, we proposed to amend § 413.24(f)(5)(i) by adding a new paragraph (D) to specify that, effective for cost reporting periods beginning on or after October 1, 2018, for hospitals reporting charity care and/or uninsured discounts, a cost report will be rejected for lack of supporting documentation if it does not include a detailed listing of charity care and/or uninsured discounts that corresponds to the amounts claimed in the provider's cost report.

Comment: Some commenters supported the proposal while other commenters believed it was burdensome for providers to submit the supporting documentation that corresponds to the amounts claimed in the provider's cost report for charity care and/or uninsured discounts at the time of the cost report submission.

Response: We appreciate the commenters' support. We disagree that requiring hospitals that report charity care and/or uninsured discounts to submit the supporting documentation that corresponds to the amounts claimed in the provider's cost report for charity care and/or uninsured discounts is burdensome to providers. As stated in the FY 2019 IPPS/LTCH PPS proposed rule, we believe that requiring a DSH eligible hospital to submit, with its cost report, a detailed listing of its charity care and/or uninsured discounts that corresponds to the amount claimed in the hospital's cost report is consistent with the recordkeeping and cost reporting requirements of §§ 413.20 and 413.24, which require a provider to maintain records of its cost data and produce them to substantiate its costs. These data must be recorded and maintained by the provider and are available to providers at the time of completion of the Medicare cost report. In previous years, we have received many comments in response to IPPS proposed rules where stakeholders have requested that CMS ensure the accuracy of the amounts providers report on the Worksheet S–10, and that are used to calculate uncompensated care. Because not all cost reports are audited, the submission of supporting documents with the cost report that correspond to the amounts reported in the cost report for charity care and/or uninsured discounts is necessary so that contractors can pay providers promptly and accurately.

Comment: Some commenters suggested that CMS establish a standardized format that hospitals would be required to use when submitting the supporting documentation for the charity care and/or uninsured discounts that corresponds to the amounts claimed in their cost report. Commenters believed that including such a requirement would ensure consistency of the supporting documentation submitted by hospitals.

Response: We agree that a standardized format should be established and required for the submission of the supporting documentation for the charity care and/or uninsured discounts that corresponds to the amounts claimed in the provider's cost report. We agree that requiring this information to be submitted in a standardized format would ensure consistency of the documentation and facilitate the contractor's review and verification of the cost report. As stated in the FY 2019 IPPS/LTCH PPS proposed rule, for hospitals reporting charity care and/or uninsured discounts, we believe the documentation must include information such as the patient name, dates of service, insurer (if applicable), and the amount of the charity care and/or uninsured discount given to the patient that corresponds to the amounts reported in the hospital's cost report. We will work toward developing a standard format to include in a subsequent Paperwork Reduction Act (PRA) notice to request public comment. Until a standard format is adopted, in order to have an acceptable cost report submission, hospitals should submit a listing that includes information, such as the aforementioned data elements, with its cost report submission as necessary to support the amounts reported in their cost report.

Comment: One commenter indicated that a hospital's submission of a detailed listing of the hospital's charity care/uninsured discounts with its cost report would be time and resource intensive.

Response: We disagree that a hospital's submission of a listing of charity care/uninsured discounts that corresponds to the amount of the charity care and/or uninsured discounts reported in the hospital's cost report would be time consuming and resource intensive. As previously stated, this is information already in the possession of hospitals, developed in the normal course of hospital operations, and is already needed in order to report charity care and/or uninsured discounts on the Worksheet S–10 of the cost report. As a result, the proposal would simply require a hospital to submit this supporting documentation, which has already been developed in the normal course of hospital operations, with its cost report in order to have an acceptable cost report submission.

After consideration of the public comments we received, for the reasons discussed earlier and in the proposed rule, we are finalizing our proposed policy, without modification, that, effective for cost reporting periods beginning on or after October 1, 2018, for DSH eligible hospitals reporting charity care and/or uninsured discounts, a cost report will be rejected for lack of supporting documentation if it does not include a detailed listing of charity care and/or uninsured discounts that corresponds to the amounts claimed in the hospital's cost report. We are finalizing § 413.24(f)(5)(i)(D) as proposed to reflect this final policy. In addition, as discussed earlier, until a standard format is adopted, a hospital must submit a listing with its cost report submission that supports the amounts reported in its cost report including information, such as: Patient name, dates of service, insurer (if applicable), and the amount of the charity care and/or uninsured discount given to the patient.

6. Home Office Allocations

A chain organization consists of a group of two or more health care facilities which are owned, leased, or through any other device, controlled by one organization (Provider Reimbursement Manual 1 (PRM–1), CMS Pub. 15–1, Chapter 21, Section 2150). Chain organizations include, but are not limited to, chains operated by proprietary organizations and chains operated by various religious, charitable, and governmental organizations. A chain organization may also include business organizations which are engaged in other activities not directly related to health care.

When a provider claims costs on its cost report that are allocated from a home office (also known as a chain home office or chain organization), the Home Office Cost Statement constitutes the documentary support required of the provider to be reimbursed for home office costs in the provider's cost report as set forth in Section 2153, Chapter 21, of the PRM–1. Section 2153 states that each contractor servicing a provider in a chain must be furnished with a detailed Home Office Cost Statement as a basis for reimbursing the provider for cost allocations from a home office or chain organization. However, many cost

reports that have home office costs allocated to them are submitted without a Home Office Cost Statement as a supporting document. In addition, there are home offices or chain organizations that are not completing a Home Office Cost Statement to support the costs they are allocating to the provider cost reports. Lack of this documentation should result in a disallowance of costs. It is our understanding that some providers paid under a PPS mistakenly believe that a Home Office Cost Statement is no longer required. However, the home office costs reported in the provider's cost report may have an impact on future rate-setting and payment refinement activities. We stated in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20748) that we believe that requiring a home office or chain organization to complete a Home Office Cost Statement and a provider to submit, with its cost report, a copy of the Home Office Cost Statement completed by the home office or chain organization that corresponds to the amounts allocated from the home office or chain organization to the provider's cost report, is consistent with Section 2153 of the PRM–1 and would be consistent with a provider's recordkeeping and cost reporting requirements of §§ 413.20 and 413.24, which require a provider to substantiate its costs.

Therefore, in the FY 2019 IPPS/LTCH PPS proposed rule, we proposed that, effective for cost reporting periods beginning on or after October 1, 2018, in order for a provider claiming costs on its cost report that are allocated from a home office or chain organization to have an acceptable cost report submission under § 413.24(f)(5), a Home Office Cost Statement completed by the home office or chain organization that corresponds to the amounts allocated from the home office or chain organization to the provider's cost report must be submitted as a supporting document with the provider's cost report. We stated that this proposal would facilitate the contractor's review and verification of the cost report without needing to request additional data from the provider. We stated that with our proposal, we anticipate more providers will submit the Home Office Cost Statement to support the amounts reported in their cost reports, in order to have an acceptable cost report submission. We further stated that because the existing burden estimate for a provider's cost report already reflects the requirement that providers collect, maintain, and submit these data, there is no additional burden.

Consistent with this proposal, we proposed to amend § 413.24(f)(5)(i) by adding a new paragraph (E) to specify that, effective for cost reporting periods beginning on or after October 1, 2018, for providers claiming costs on their cost report that are allocated from a home office or chain organization, a cost report will be rejected for lack of supporting documentation if it does not include a Home Office Cost Statement completed by the home office or chain organization that corresponds to the amounts allocated from the home office or chain organization to the provider's cost report.

Comment: A few commenters supported this proposal. However, several commenters indicated that the proposal was not feasible because a home office may have a fiscal year that differs from the fiscal year of the providers in its chain. The commenters stated that because of the possible differing fiscal years, a Home Office Cost Statement may not include all costs allocated from the home office to the provider for the time period covering a provider's cost report, requiring the provider to submit the Home Office Cost Statement that is subsequently due that covers the remaining time period of the provider's cost report.

Response: We acknowledge the commenters' concerns that where a provider and its home office have differing fiscal year ends, a Home Office Cost Statement may not be available to substantiate all of a provider's costs. For example, a provider with a fiscal year that begins on October 1, 2018 and ends on September 30, 2019, whose home office has a fiscal year that begins on January 1 and ends on December 31 of each year, may have a portion of costs allocated to it from the Home Office Cost Statement that begins on January 1, 2018 and ends on December 31, 2018 and a portion of costs allocated to it from the Home Office Cost Statement that begins on January 1, 2019 and ends on December 31, 2019. We understand the provider's concern and are revising the regulation text of proposed § 413.24(f)(5)(i)(E) to provide that when the provider and its home office have differing fiscal year ends, the provider's home office costs for a portion of the cost reporting period (as reflected on the Home Office Cost Statement) must correspond to a portion of the amount reported in the provider's cost report. When the provider and its home office have the same fiscal year end, the provider's home office costs for the same time period (as reflected on the Home Office Cost Statement) must correspond to the costs reported in the provider's cost report.

Comment: Some commenters suggested that the Home Office Cost Statement be submitted by the chain's home office on behalf of all providers in the chain instead of requiring each provider in the chain to submit a Home Office Cost Statement with its cost report, in order to ensure accuracy and reduce burden to the providers in a chain.

Response: We appreciate the commenters' concerns regarding reducing burden to the providers in a chain organization and ensuring accuracy when a provider substantiates costs allocated to it from its home office. We agree with the commenters' suggestion that the home office should instead submit the Home Office Cost Statement directly to the servicing contractors for its providers when the home office has allocated costs to its providers, instead of requiring the providers to submit the Home Office Cost Statement individually with their cost report submission. Requiring the home office to instead submit the Home Office Cost Statement to the servicing contractors of its providers will reduce burden upon the individual providers within a chain organization by not requiring each provider within the chain to submit the Home Office Cost Statement with its cost report submission. Because the Home Office Cost Statement lists the providers in the chain and each of the providers' servicing contractors, the contractors to whom the Home Office Cost Statement should be sent are known to the home office. We plan to update the PRM to reflect this policy.

Comment: One commenter suggested that requiring the Home Office Cost Statement submission with the provider's cost report will make the information contained in the Home Office cost statement subject to a Freedom of Information Act (FOIA) request as opposed to the information currently being protected and exempt from a FOIA request.

Response: We appreciate the commenters' concerns. The policy finalized in this final rule, as discussed below, does not affect whether a Home Office Cost Statement may or may not be produced in response to a FOIA request. We note that both the proposed and finalized policy requires that the provider substantiate costs allocated to it from its home office in order to have an acceptable cost report.

After consideration of the public comments we received, for the reasons discussed earlier and in the proposed rule, we are finalizing our proposal with

modifications as follows: First, instead of requiring providers to submit the Home Office Cost Statement individually with their cost report submission, we are requiring instead that the home office or chain organization submit the Home Office Cost Statement directly to the servicing contractors for its providers when the home office or chain organization has allocated costs to its providers. When the home office submits its Home Office Cost Statement to its servicing contractor, the home office must also submit a copy of the Home Office Cost Statement to each of the contractors of its chain providers. For example, if a chain organization has 25 providers serviced by 2 different contractors, the home office must submit its Home Office Cost Statement to each contractor. We note that only one copy of the Home Office Cost Statement is required to be submitted by the home office to a provider's contractor, regardless of the number of providers in the chain the contractor is servicing. Second, we are applying different rules for situations where the provider and the home office have the same fiscal year end and where the provider and the home office have a different fiscal year end. Thus, effective for cost reporting periods beginning on or after October 1, 2018, for providers claiming costs on their cost report that are allocated from a home office or chain organization with the same fiscal year end, a cost report will be rejected for lack of supporting documentation if the home office or chain organization has not completed and submitted to the chain provider's contractor a Home Office Cost Statement that corresponds to the amounts allocated from the home office or chain organization to the provider's cost report. Effective for cost reporting periods beginning on or after October 1, 2018, for providers claiming costs on their cost report that are allocated from a home office or chain organization that has a different fiscal year end, a cost report will be rejected for lack of supporting documentation if the home office or chain organization has not completed and submitted to the chain provider's contractor a Home Office Cost Statement that corresponds to some portion of the amounts allocated from the home office or chain organization to the provider's cost report. These policies are reflected in new § 413.24(f)(5)(i)(E)(*1*) and (*2*), respectively. Thus, when the provider and its home office have differing fiscal year ends, the provider's home office costs for a portion of the cost reporting period (as reflected in the Home Office Cost Statement) must correspond to a portion of the amount reported in the provider's cost report. When the provider and its home office have the same fiscal year end, the provider's home office's cost for the same time period (as reflected in the Home Office Cost Statement) must correspond to the costs reported in the provider's cost report.

X. Requirements for Hospitals To Make Public a List of Their Standard Charges via the Internet

In the FY 2015 IPPS/LTCH proposed rule and final rule (79 FR 28169 and 79 FR 50146, respectively), we discussed the implementation of section 2718(e) of the Public Health Service Act, which aims to improve the transparency of hospital charges. We noted that section 2718(e) of the Public Health Service Act, which was enacted as part of the Affordable Care Act, requires that each hospital operating within the United States, for each year, establish (and update) and make public (in accordance with guidelines developed by the Secretary) a list of the hospital's standard charges for items and services provided by the hospital, including for diagnosis-related groups established under section 1886(d)(4) of the Social Security Act. We reminded hospitals of their obligation to comply with the provisions of section 2718(e) of the Public Health Service Act and provided guidelines for its implementation. We stated that hospitals are required to either make public a list of their standard charges (whether that be the chargemaster itself or in another form of their choice) or their policies for allowing the public to view a list of those charges in response to an inquiry.

We encouraged hospitals to undertake efforts to engage in consumer friendly communication of their charges to help patients understand what their potential financial liability might be for services they obtain at the hospital, and to enable patients to compare charges for similar services across hospitals. We also stated that we expect that hospitals will update the information at least annually, or more often as appropriate, to reflect current charges. We further noted that we are confident that hospital compliance with this statutory transparency requirement will greatly improve the public accessibility of charge information. Finally, we stated that we would continue to review and post relevant charge data in a consumer-friendly way, as we previously have done by posting hospital and physician charge information on the CMS website.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20548 and 20549), we indicated that we are concerned that challenges continue to exist for patients due to insufficient price transparency. Such challenges include patients being surprised by out-of-network bills for physicians, such as anesthesiologists and radiologists, who provide services at in-network hospitals, and patients being surprised by facility fees and physician fees for emergency department visits. We also are concerned that chargemaster data are not helpful to patients for determining what they are likely to pay for a particular service or hospital stay. In order to promote greater price transparency for patients, we stated that we are considering ways to improve the accessibility and usability of the charge information that hospitals are required to disclose under section 2718(e) of the Public Health Service Act.

Therefore, as one step to further improve the public accessibility of charge information, effective January 1, 2019, we announced the update to our guidelines to require hospitals to make available a list of their current standard charges via the internet in a machine readable format and to update this information at least annually, or more often as appropriate. This could be in the form of the chargemaster itself or another form of the hospital's choice, as long as the information is in machine readable format.

We note that it was sometimes difficult to determine when certain commenters who submitted comments on the FY 2019 IPPS/LTCH PPS proposed rule were responding to the broader price transparency request for information (RFI) and when they were responding specifically to the updated guidelines. To the extent we believed that a comment addressed the updated guidelines, we summarized it below. Comments on the broader price transparency initiative and suggestions for additional future actions that we may take with the guidelines, including enforcement actions, will be addressed in future rulemaking.

Comment: Many commenters addressed the announcement of the CMS update to guidelines on price transparency. Some of these commenters supported the update and indicated that many hospitals already make their standard charges available voluntarily or under applicable State law.

Response: We appreciate the support from some commenters regarding our updated guidelines and agree that many hospitals already make their standard charges publicly available either voluntarily or under applicable State law. For example, the 2014 American

Hospital Association State Transparency Survey data indicated that 35 States required hospitals to release information on some charges and 7 States relied on voluntary disclosure of charge data (*http://www.ahacommunity connections.org/content/ 14transparency-trendwatch.pdf*). We also appreciate the public support for hospitals to undertake efforts to engage in consumer friendly communication to help patients understand what their potential financial liability might be for services they obtain at the hospital, and to enable patients to compare costs for similar services across hospitals. Improving the public accessibility to charge information is one aspect of our broader price transparency initiative.

Comment: Some commenters stated that the information contained in the chargemaster would not be useful to patients and would only increase confusion, as it would not inform them of their out-of-pocket costs for a particular service. The commenters stated that the chargemaster typically contains terms that are difficult for patients to understand, does not depict negotiated discounts with insurers, and lacks contextual information that patients would need. To the extent that such information would be published in a payer-specific manner, the commenters stated that such information is proprietary and confidential, and that publishing this information could undermine competition. Some commenters stated that certain hospitals are already providing patients with cost estimates that are specific to the payer and the patient's circumstances, and suggested that hospitals be required to provide this type of information instead. Other commenters noted programs by specific hospitals, including web-based tools, which enable patients to estimate their out-of-pocket costs. Other commenters suggested that CMS focus on ''shoppable'' health care services that can typically be scheduled in advance. Some commenters suggested that CMS conduct further research and work with stakeholders to determine the best approach to making information available to consumers.

Response: We disagree with commenters that the information contained in the chargemaster would not be useful to patients. As pointed out by commenters, many hospitals have price transparency initiatives beyond the provision of the chargemaster and we encourage hospitals to provide context surrounding the chargemaster information. We note that we are not requiring at this time that any information be published in a payer-specific manner, and we disagree that transparent charge information undermines competition. We agree that hospitals should and can provide information on ''shoppable'' health care services that can typically be scheduled in advance. However, nothing in our guidelines precludes a hospital from providing this information to patients and the public. We also agree with commenters that CMS should continue to work with stakeholders to determine the best approach to making price transparency information available to consumers and we intend to do so. One step in that process is the broad request for information from the public that CMS is currently making.

We acknowledge that providing patients with more specific information on their potential financial liability is needed and commend the hospitals that already do so. However, we believe that this more specific need does not justify a delay in the provision of chargemaster information to the public. We note that making charge information more easily accessible to patients and the public does not preclude hospitals from taking additional steps or continuing to provide the information they currently provide.

Comment: Many commenters explained that, for insured patients, payers are a better source of information about the cost of care and should be the primary source of information for out-of-pocket costs for patients. Some commenters stated that payers can provide the information that patients require without compromising competition among providers. Other commenters suggested that payers and providers work together to make this information more accessible to patients. Some commenters noted that payers can provide information as to whether patients have met the plan deductible or out-of-pocket spending limits and what their cost-sharing will be. One commenter suggested requiring insurance companies to provide cost calculators or other tools that patients can use to calculate costs specific to their situation. For uninsured patients, commenters noted that many patients receive free or discounted care through the hospital's charity care policies.

Response: With respect to the commenters who indicated that, for insured patients, payers are a better source of information about the cost of care and should be the primary source of information for out-of-pocket costs for patients, we note that nothing in our guidelines precludes hospitals and payers from working together to provide information on out-of-pocket costs for patients and to improve price transparency for patients. We also recognize that sometimes uninsured patients receive free or discounted care through a hospital's charity care policies and again commend hospitals for those policies. Nothing in our guidelines precludes a hospital from providing charity care to uninsured patients.

Comment: Several commenters expressed concern about the updated guidelines conflicting with State requirements and increasing administrative burden if hospitals are required to report charge information in multiple incongruent ways. Commenters stated that CMS should not require hospitals to duplicate or replace existing publically available resources and that the updated requirement would significantly increase provider burden to provide information that is not useful to patients. Other commenters noted that some State efforts are already providing patients with much more information than they could obtain from a chargemaster, and suggested that CMS instead encourage State level price transparency efforts.

Response: We encourage State efforts in the area of price transparency. As noted earlier, we commend the many hospitals that already make their standard charges publicly available either voluntarily or under applicable State law. This demonstrates that the disclosure of standard charges under our updated guidelines can exist in a complementary manner with State regulatory initiatives.

Comment: Some commenters stated that the definition of standard charges is unclear, as hospitals often have many negotiated rates for the same service. The commenters identified several terms, ''charges'', ''payments'', ''cost'', and ''prices'', that, according to the commenters, can have different meanings but are often used interchangeably. The commenters believed that, absent a standard definition of these terms, patients could not make accurate comparisons between hospitals.

Response: As noted earlier, we are not at this time requiring payer-specific information under our guidelines, and our updated guidelines are unchanged in this area compared to the prior guidelines. The new guidelines, when compared to the prior guidelines, merely require that this information be made available via the internet in a machine readable format and that hospitals update this information at least annually, or more often as appropriate.

Comment: A few commenters expressed concern that patients may forgo needed care if they were informed

of the charges in advance. Other commenters noted that price information in the absence of quality information can be misleading to patients in a variety of ways.

Response: We disagree that patients may forgo needed care if they were informed of the charges in advance if that information is placed in the proper context by hospitals. We agree with the commenters that price information and quality information are both important to provide to patients. We note that nothing precludes hospitals or other entities from incorporating quality information such as the publicly available CMS Hospital Compare quality information found on the website at: *https://www.medicare.gov/hospitalcompare/search.html*.

After consideration of the public comments we received, we currently do not believe there is a need to further update our guidelines beyond the updated guidelines that we previously announced would be effective January 1, 2019, which are that hospitals' list of standard charges be made available to the public via the internet in a machine readable format and that hospitals update this information at least annually, or more often as appropriate.

XI. Revisions Regarding Physician Certification and Recertification of Claims

Our Medicare regulations at 42 CFR 424.11, which implement sections 1814(a)(2) and 1835(a)(2) of the Act, specify the requirements for physician statements that certify and periodically recertify as to the medical necessity of certain types of covered services provided to Medicare beneficiaries. The regulation provision under § 424.11(c) specifies that when supporting information for the required physician statement is available elsewhere in the records (for example, in the physician's progress notes), the information need not be repeated in the statement itself. The last sentence of § 424.11(c) further provides that it will suffice for the statement to indicate where the information is to be found.

As we discussed in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20550), as part of our ongoing initiative to identify Medicare regulations that are unnecessary, obsolete, or excessively burdensome on health care providers and suppliers—and thereby free up resources that could be used to improve or enhance patient care—we have been made aware that the provisions of § 424.11(c) which state that it will suffice for the statement to indicate where the information is to be found may be resulting in unnecessary denials of Medicare claims. As currently worded, this last sentence of § 424.11(c) can result in a claim being denied merely because the physician statement technically fails to identify a specific location in the file for the supporting information, even when that information nevertheless may be readily apparent to the reviewer. We believe that continuing to require the location to be specified in this situation is unnecessary. Certifications and recertifications continue to be based on the criteria for the service being certified, and the medical record must contain adequate documentation of the relevant criteria for which the physician is providing certification or recertification, even if the precise location of the information within the medical record is not included. Moreover, the need for the precise location is becoming increasingly obsolete with the growing utilization of electronic health records (EHRs)—which, by their nature, are readily searchable. Accordingly, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20550), we proposed to delete the last sentence of § 424.11(c). In addition, we proposed to relocate the second sentence of § 424.11(c) (indicating that supporting information contained elsewhere in the provider's records need not be repeated in the certification or recertification statement itself) to the end of the immediately preceding paragraph (b), which describes similar kinds of flexibility that are currently afforded in terms of completing the required statement.

Comment: Commenters supported the proposed changes to § 424.11(c) of the regulations.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing, without modification, our proposed changes. Specifically, we are deleting the last sentence of § 424.11(c) and relocating the second sentence of § 424.11(c) to the end of the immediately preceding paragraph (b).

XII. Request for Information on Promoting Interoperability and Electronic Healthcare Information Exchange Through Possible Revisions to the CMS Patient Health and Safety Requirements for Hospitals and Other Medicare- and Medicaid-Participating Providers and Suppliers

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20550 through 20553), we included a Request for Information (RFI) related to promoting interoperability and electronic health care information exchange. We received approximately 313 timely pieces of correspondence on this RFI. We appreciate the input provided by commenters.

XIII. MedPAC Recommendations

Under section 1886(e)(4)(B) of the Act, the Secretary must consider MedPAC's recommendations regarding hospital inpatient payments. Under section 1886(e)(5) of the Act, the Secretary must publish in the annual proposed and final IPPS rules the Secretary's recommendations regarding MedPAC's recommendations. We have reviewed MedPAC's March 2018 ''Report to the Congress: Medicare Payment Policy'' and have given the recommendations in the report consideration in conjunction with the policies set forth in this final rule. MedPAC recommendations for the IPPS for FY 2019 are addressed in Appendix B to this final rule.

For further information relating specifically to the MedPAC reports or to obtain a copy of the reports, contact MedPAC at (202) 653–7226, or visit MedPAC's website at: *http://www.medpac.gov*.

XIV. Other Required Information

A. Publicly Available Files

IPPS-related data are available on the internet for public use. The data can be found on the CMS website at: *http://www.cms.hhs.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. We listed the IPPS-related data files that are available in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20553 through 20554).

Commenters interested in discussing any data files used in construction of this final rule should contact Michael Treitel at (410) 786–4552.

B. Collection of Information Requirements

1. Statutory Requirement for Solicitation of Comments

Under the Paperwork Reduction Act of 1995, we are required to provide 60-day notice in the **Federal Register** and solicit public comment before a collection of information requirement is submitted to the Office of Management and Budget (OMB) for review and approval. In order to fairly evaluate whether an information collection should be approved by OMB, section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995 requires that we solicit comment on the following issues:

- The need for the information collection and its usefulness in carrying out the proper functions of our agency.

- The accuracy of our estimate of the information collection burden.
- The quality, utility, and clarity of the information to be collected.
- Recommendations to minimize the information collection burden on the affected public, including automated collection techniques.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20554 through 20564), we solicited public comment on each of these issues for the following sections of this document that contain information collection requirements (ICRs).

2. ICRs for Application for GME Resident Slots

The information collection requirements associated with the preservation of resident cap positions from closed hospitals, addressed in section IV.K.3. of the preamble of the proposed rule (83 FR 20439 through 20440) and this final rule, are not subject to the Paperwork Reduction Act, as stated in section 5506 of the Affordable Care Act.

3. ICRs for the Hospital Inpatient Quality Reporting (IQR) Program

a. Background

The Hospital IQR Program (formerly referred to as the Reporting Hospital Quality Data for Annual Payment (RHQDAPU) Program) was originally established to implement section 501(b) of the MMA, Public Law 108–173. The collection of information associated with the original starter set of quality measures was previously approved under OMB control number 0938–0918. All of the information collection requirements previously approved under OMB control number 0938–0918 have been combined with the information collection request currently approved under OMB control number 0938–1022. OMB has currently approved 3,637,282 hours of burden and approximately $133 million under OMB control number 0938–1022, accounting for information collection burden experienced by 3,300 IPPS hospitals and 1,100 non-IPPS hospitals for the FY 2020 payment determination.[411] We no longer use OMB control number 0938–0918. Below, we describe the burden changes with regards to collection of information under OMB control number 0938–1022 for IPPS hospitals due to the finalized policies in this final rule.

In section VIII.A. of the preambles of the proposed rule (83 FR 20470 through 20500) and this final rule, we discuss the following finalized policies that we expect to affect our collection of information burden estimates: (1) eCQM reporting and submission requirements for the CY 2019 reporting period/FY 2021 payment determination; (2) removal of three chart-abstracted measures beginning with the CY 2019 reporting period/FY 2021 payment determination; and (3) removal of six chart-abstracted measures beginning with the CY 2020 reporting period/FY 2022 payment determination. Details on these policies, as well as the expected burden changes, are discussed below.

This final rule also includes policies with respect to claims-based and other measures to: (1) Remove 17 claims-based measures beginning with the CY 2018 reporting period/FY 2020 payment determination; (2) remove two claims-based measures beginning with the CY 2019 reporting period/FY 2021 payment determination; (3) remove one claims-based measure beginning with CY 2020 reporting period/FY 2022 payment determination; (4) remove one claims-based measure beginning with the CY 2021 reporting period/FY 2023 payment determination; (5) remove two structural measures beginning with the CY 2018 reporting period/FY 2020 payment determination; and (6) remove seven eCQMs beginning with the CY 2020 reporting period/FY 2022 payment determination. As discussed further below, we do not expect these policies to affect our information collection burden estimates.

b. Information Collection Burden Estimate for the Removal of Chart-Abstracted Measures

(1) Information Collection Burden Estimate for the Removal of Three Chart-Abstracted Measures Beginning With the CY 2019 Reporting Period/FY 2021 Payment Determination

In section VIII.A.5.b.(8)(b) of the preamble of this final rule, we discuss our finalized proposals to remove three chart-abstracted clinical process of care measures beginning with the CY 2019 reporting period/FY 2021 payment determination:

- Median Time from ED Arrival to ED Departure for Admitted ED Patients (ED–1) (NQF #0495);
- Influenza Immunization (IMM–2) (NQF #1659); and
- Incidence of Potentially Preventable Venous Thromboembolism (VTE–6).

We anticipate a reduction in information collection burden for all IPPS hospitals of 741,074 hours, or 225 hours per hospital, as a result of our finalized proposals to remove the ED–1 and IMM–2 chart-abstracted measures beginning with the CY 2019 reporting period/FY 2021 payment determination. This estimate was calculated by considering the previously approved information collection burden estimate for reporting the combined global population set (ED–1, ED–2, and IMM–2) of 1,599,074 hours, minus the estimated information collection reporting burden for only the ED–2 measure[412] ([15 minutes per record × 260 records per hospital per quarter × 4 quarters]/60 minutes per hour × 3,300 IPPS hospital = 858,000 hours). Through these calculations (1,599,074 hours − 858,000 hours), we estimate a reduction of 741,074 hours, or 225 hours per hospital per year (741,074 hours/3,300 hospitals) across all IPPS hospitals for the CY 2019 reporting period/FY 2021 payment determination because we are finalizing our proposals to remove the ED–1 and IMM–2 measures from the Hospital IQR Program.

We anticipate our finalized proposal to remove the VTE–6 measure will result in an information collection burden reduction of 304,997 hours for all IPPS hospitals, or 92 hours per hospital, for the CY 2019 reporting period/FY 2021 payment determination. We have previously estimated a reporting burden of 92 hours (7 minutes per record × 198 records per hospital per quarter × 4 quarters/60 minutes) per hospital per year, or 304,997 hours (92 hours per hospital × 3,300 hospitals) across all hospitals associated with abstracting and reporting VTE–6. Therefore, we estimate an information collection burden decrease of 304,997 hours for the CY 2019 reporting period/FY 2021 payment determination because we are finalizing our proposal to remove this measure from the Hospital IQR Program.

In summary, as a result of our finalized proposals in section VIII.A.5.b.(8) of the preamble of this final rule to remove IMM–2, ED–1, and VTE–6, we estimate an information collection burden reduction of 1,046,071 hours (−741,074 hours for ED–1 and IMM–2 removal + −304,997 hours for VTE–6 removal) and approximately $38.3 million (1,046,071 hours × $36.58 per hour[413]) across all

[411] The information collection burden associated with submitting data for the HCP and HAI measures (CDI, CAUTI, CLABSI, MRSA Bacteremia, and Colon and Abdominal Hysterectomy SSI) via the CDC's NHSN system is captured under a separate OMB control number, 0920–0666. The information collection burden associated with submitting data for the HCAHPS Survey measure is captured under OMB control number 0938–0981.

[412] Estimated 15 minutes per case for reporting ED–2 measure based on average Clinical Data Abstraction Center abstraction times for 3Q 2016, 4Q 2016, and 1Q 2017 discharge data.

[413] In the FY 2017 IPPS/LTCH PPS final rule (82 FR 38501), we finalized an hourly wage estimate of $18.29 per hour, plus 100 percent overhead and

Continued

3,300 IPPS hospitals participating in the Hospital IQR Program for the CY 2019 reporting period/FY 2021 payment determination.

(2) Information Collection Burden Estimate for the Removal of Six Chart-Abstracted Measures Beginning With the CY 2020 Reporting Period/FY 2022 Payment Determination

In sections VIII.A.5.b.(2)(b) and VIII.A.5.b.(8)(b) of the preamble of this final rule, we are finalizing the removal of five chart-abstracted National Healthcare Safety Network (NHSN) hospital-acquired infection (HAI) measures [414] and one chart-abstracted clinical process of care measure beginning with the CY 2020 reporting period/FY 2022 payment determination:

- National Healthcare Safety Network Facility-Wide Inpatient Hospital-Onset *Clostridium difficile* Infection (CDI) Outcome Measure (NQF #1717);
- National Healthcare Safety Network Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (NQF #0138);
- National Healthcare Safety Network Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (NQF #0139);
- National Healthcare Safety Network Facility-Wide Inpatient Hospital-Onset Methicillin-Resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716);
- American College of Surgeons—Centers for Disease Control and Prevention Harmonized Procedure-Specific Surgical Site Infection (SSI) Outcome Measure (Colon and Abdominal Hysterectomy SSI) (NQF #0753); and
- Admit Decision Time to ED Departure Time for Admitted Patients Measure (ED–2) (NQF #0497).

We note that as discussed in section VIII.A.5.b.(2)(b) of the preamble of this final rule, we proposed to remove the NHSN HAI measures beginning with the CY 2019 reporting period/FY 2021 payment determination, but are finalizing a modified version of our proposal which delays their removal until the CY 2020 reporting period/FY 2022 payment determination. Our estimates below have been updated to reflect this change. Because the burden associated with submitting data for the NHSN HAI measures (CDI, CAUTI, CLABSI, MRSA Bacteremia, and Colon and Abdominal Hysterectomy SSI) is captured under separate OMB control number 0920–0666, we do not provide an independent estimate of the information collection burden associated with these measures for the Hospital IQR Program. Because the NHSN HAI measures will be retained in the HAC Reduction and Hospital VBP Programs, we do not anticipate a reduction in data collection and reporting burden associated with the CDC NHSN's OMB control number 0920–0666. We note, however, that we anticipate a reduction in burden associated with the Hospital IQR Program validation activities we conduct for these NHSN HAI measures, as discussed further below.

We further anticipate removing the chart-abstracted ED–2 measure will reduce the reporting burden for all IPPS hospitals by a total of 858,000 hours, or 260 hours per hospital. As discussed above, we estimate reporting the ED–2 measure takes approximately 260 hours (15 minutes per record × 260 records per hospital per quarter × 4 quarters/60 minutes = 260 hours) per hospital per year, or 858,000 hours (260 hours × 3,300 hospitals) across all IPPS hospitals. Therefore, we estimate an 858,000 hour information collection burden decrease for the CY 2020 reporting period/FY 2022 payment determination because we are finalizing our proposal to remove this measure from the Hospital IQR Program.

In summary, because we are finalizing our proposal in section VIII.A.5.b.(8)(b) of the preamble of this final rule to remove ED–2, we estimate an information collection burden reduction of 858,000 hours and approximately $31.4 million (858,000 hours × $36.58 per hour [415]) across all 3,300 IPPS hospitals participating in the Hospital IQR Program for the CY 2020 reporting period/FY 2022 payment determination.

(3) Information Collection Impacts on Data Validation Resulting From Chart-Abstracted Measure Removal

While we did not propose any changes to our validation requirements related to chart-abstracted measures, because we are finalizing our proposals with modification in section VIII.A.5.b.(2)(b) [416] and section VIII.A.5.b.(8) of the preamble of this final rule to remove five NHSN HAIs and four clinical process of care measures, we believe that hospitals will experience an overall reduction in information collection burden associated with chart-abstracted measure validation beginning with the FY 2023 payment determination.

As noted in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49762 and 49763), we reimburse hospitals directly for expenses associated with submission of charts for clinical process of care measure data validation (we reimburse hospitals at 12 cents per photocopied page; for hospitals providing charts digitally via a rewritable disc, such as encrypted CD–ROMs, DVDs, or flash drives, we reimburse hospitals at a rate of 40 cents per disc); we do not believe any additional information collection burden is associated with submitting this information via web portal or PDF (79 FR 50346). Therefore, because we directly reimburse, we do not anticipate any net change in burden associated with the cost of submission of validation charts as a result of our finalized proposals to remove four clinical process of care measures. Hospitals will no longer be required to submit, or be reimbursed for submitting, these data to CMS.

Because we are finalizing our proposals to remove all of the NHSN HAI measures from the Hospital IQR Program and because hospitals selected for validation currently are required to submit validation templates for the NHSN HAI measures, we anticipate a reduction in information collection burden under the Hospital IQR Program associated with the NHSN HAI data validation effort. We note that the burden associated with data collection for the NHSN HAI measures (CDI, CAUTI, CLABSI, MRSA Bacteremia, and Colon and Abdominal Hysterectomy SSI) is accounted for under the CDC NHSN OMB control number 0920–0666. Because the NHSN HAI measures will be retained in the HAC Reduction and Hospital VBP Programs, we do not anticipate a change in data collection and reporting burden associated with this OMB control number due to our finalized proposals under the Hospital IQR Program.

The data validation activities, however, are conducted by CMS. Since

fringe benefits, for the Hospital IQR Program. Accordingly, we calculate cost burden to hospitals using a wage plus benefits estimate of $36.58 per hour.

[414] As discussed in section VIII.A.5.b.(2)(b) of the preamble of this final rule, we proposed to remove the NHSN HAI measures beginning with the CY 2019 reporting period/FY 2021 payment determination, but are delaying their removal until the CY 2020 reporting period/FY 2022 payment determination.

[415] In the FY 2017 IPPS/LTCH PPS final rule (82 FR 38501), we finalized an hourly wage estimate of $18.29 per hour, plus 100 percent overhead and fringe benefits, for the Hospital IQR Program. Accordingly, we calculate cost burden to hospitals using a wage plus benefits estimate of $36.58 per hour.

[416] As discussed in section VIII.A.5.b.(2)(b) of the preamble of this final rule, we proposed to remove the NHSN HAI measures beginning with the CY 2019 reporting period/FY 2021 payment determination, but are delaying their removal until the CY 2020 reporting period/FY 2022 payment determination.

the measures were adopted into the Hospital IQR Program, CMS has validated the data for purposes of the Hospital IQR Program. Therefore, this burden has been captured under the Hospital IQR Program's OMB control number 0938–1022. We have previously estimated a reporting burden of 80 hours (1,200 minutes per record × 1 record per hospital per quarter × 4 quarters/60 minutes) per hospital selected for chart-abstracted measure validation per year to submit the CLABSI and CAUTI templates, and 64 hours (960 minutes per record × 1 record per hospital per quarter × 4 quarters/60 minutes) per hospital selected for chart-abstracted measure validation per year to submit the MRSA and CDI templates. Therefore, we estimate a total validation burden decrease of 43,200 hours ([−80 hours per hospital to submit CLABSI and CAUTI templates + −64 hours per hospital to submit MRSA and CDI templates] × 300 hospitals selected for validation) and approximately $1.6 million (43,200 hours × $36.58 per hour[417]) for the FY 2023 payment determination because of the removal of these measures from the Hospital IQR Program beginning with the CY 2020 reporting period/FY 2022 payment determination and the secondary effects on validation. We note that the HAC Reduction Program is finalizing the proposal to begin validation of these NHSN HAI measures as discussed in section IV.J. of the preamble of this final rule.

c. Information Collection Burden Estimate for Finalized Removal of Two Structural Measures

In sections VIII.A.5.a. and b.(1) of the preamble of this final rule, we are finalizing our proposals to remove two structural measures (Hospital Survey on Patient Safety Culture and Safe Surgery Checklist Use) beginning with the CY 2018 reporting period/FY 2020 payment determination. We anticipate removing these measures will result in a minimal information collection burden reduction for hospitals. Specifically, we do anticipate a very slight reduction in information collection burden associated with the finalized removal of the Safe Surgery Checklist measure because completion of this measure takes hospitals approximately 2 minutes each year (77 FR 53666). Similarly, we anticipate a very slight reduction in information collection burden associated with the finalized removal of the Patient Safety Checklist measure (80 FR 49762 through 49873). Consistent with previous years (80 FR 49762), we estimate a collection of information burden of 15 minutes per hospital to report all four previously finalized structural measures and to complete other forms (such as the Extraordinary Circumstances Exceptions Request Form). Therefore, our information collection burden estimate of 15 minutes per hospital remains unchanged because we believe the reduction in information collection burden associated with removing these two structural measures is sufficiently minimal that it will not substantially impact this estimate, and we want to retain a conservative estimate of the information collection burden associated with the use of our forms.

Comment: One commenter believed that the collection of information burden estimate for structural measures should take into account time hospitals spend on overall assurance that data are accurate, reported correctly, validated, and submitted.

Response: We appreciate the commenter's feedback. We note the burden estimate of 15 minutes per hospital is specific to the reporting of information for structural measures in the Hospital IQR Program, as opposed to the general work providers perform to address data collection and internal quality assurance. Further, we are finalizing our proposal to remove the two remaining structural measures from the Hospital IQR Program so that no structural measures will remain in the program, but we will take commenter's feedback into consideration should the Hospital IQR Program propose to adopt additional structural measures in the future. We refer readers to section I.K. of Appendix A of this final rule for a detailed discussion of the costs associated with the Hospital IQR Program, including costs that are not strictly information collection burden.

d. Burden Estimate for Removal of Claims-Based Measures

In section VIII.A.5.b.(2)(a), (3), (4), (6), and (7) of the preamble of this final rule, we are finalizing our proposals to remove the following 17 claims-based measures beginning with the CY 2018 reporting period/FY 2020 payment determination:

- Patient Safety and Adverse Events Composite Measure (PSI 90) (NQF #0531);
- Hospital 30-Day All-Cause Risk-Standardized Readmission Rate Following Acute Myocardial Infarction (AMI) Hospitalization (NQF #0505) (READM–30–AMI);
- Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization (NQF #1891) (READM–30–COPD);
- Hospital 30-Day, All-Cause, Unplanned, Risk-Standardized Readmission Rate Following Coronary Artery Bypass Graft (CABG) Surgery (NQF #2515) (READM–30–CABG);
- Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate Following Heart Failure Hospitalization (NQF #0330) (READM–30–HF);
- Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate Following Pneumonia Hospitalization (NQF #0506) (READM–30–PN);
- 30-day Risk-Standardized Readmission Rate Following Stroke Hospitalization (READM–30–STK);
- Hospital-Level 30-Day, All-Cause Risk-Standardized Readmission Rate Following Elective Primary Total Hip Arthroplasty and/or Total Knee Arthroplasty (NQF #1551) (READM–30–THA/TKA);
- Hospital 30-day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) Hospitalization for Patients 18 and Older (NQF #0230) (MORT–30–AMI);
- Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Heart Failure Hospitalization (NQF #0229) (MORT–30–HF);
- Medicare Spending Per Beneficiary (MSPB)—Hospital (NQF #2158);
- Cellulitis Clinical Episode-Based Payment Measure (Cellulitis Payment);
- Gastrointestinal Hemorrhage Clinical Episode-Based Payment Measure (GI Payment);
- Kidney/Urinary Tract Infection Clinical Episode-Based Payment Measure (Kidney/UTI Payment);
- Aortic Aneurysm Procedure Clinical Episode-Based Payment Measure (AA Payment);
- Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment Measure (Chole and CDE Payment); and
- Spinal Fusion Clinical Episode-Based Payment Measure (SFusion Payment).

In addition, we are finalizing our proposals to remove two claims-based measures beginning with the CY 2019 reporting period/FY 2021 payment determination: (1) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization (NQF #1893); and (2)

[417] In the FY 2017 IPPS/LTCH PPS final rule (82 FR 38501), we finalized an hourly wage estimate of $18.29 per hour, plus 100 percent overhead and fringe benefits, for the Hospital IQR Program. Accordingly, we calculate cost burden to hospitals using a wage plus benefits estimate of $36.58 per hour.

Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization (NQF #0468). We are also finalizing our proposal to remove one claims-based measure, Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Coronary Artery Bypass Graft (CABG) Surgery measure (NQF #2558), beginning with the CY 2020 reporting period/FY 2022 payment determination, and one claims-based measure, Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty and/or Total Knee Arthroplasty, beginning with the CY 2021 reporting period/FY 2023 payment determination.

Because these claims-based measures are calculated using only data already reported to the Medicare program for payment purposes, we do not anticipate that removing these measures will affect information collection burden on hospitals. However, we refer readers to section VIII.A.5.b.(2)(a), (3), (4), (6) and (7) of the preamble of this final rule for a discussion of the reduction in costs associated with these measures unrelated to the information collection burden.

e. Information Collection Burden Estimate for Finalized Removal of eCQMs

In section VIII.A.5.b.(9) of the preamble of this final rule, we are finalizing our proposals to remove the following seven eCQMs from the eCQM measure set beginning with the CY 2020 reporting period/FY 2022 payment determination:

- Primary PCI Received within 90 Minutes of Hospital Arrival (AMI–8a);
- Home Management and Plan of Care Document Given to Patient/Caregiver (CAC–3);
- Median Time from ED Arrival to ED Departure for Admitted ED Patients (ED–1) (NQF #0495);[418]
- Hearing Screening Prior to Hospital Discharge (EHDI–1a) (NQF #1354);
- Elective Delivery (PC–01) (NQF #0469);
- Stroke Education (STK–08); and
- Assessed for Rehabilitation (STK–10) (NQF #0441).

Because these eCQMs being finalized for removal were among a set of 15 eCQMs available for reporting, we believe that reducing the number of eCQMs from which hospitals choose will enable hospitals to focus on and maintain a smaller subset of measures (8 instead of 15), but this will not have an effect on the burden of submitting information to CMS. Hospitals will still be required to submit 4 eCQMs of their choice from the eCQM measure set. While the information collection burden will not change, we refer readers to section VIII.A.4.b. of the preamble of this final rule where we acknowledge that costs are multi-faceted and include not only the burden associated with reporting, but also the costs associated with implementing and maintaining Hospital IQR Program requirements.

f. Information Collection Burden Estimates for the Finalized Updates to the eCQM Reporting Requirements

In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38355 through 38361), we finalized eCQM reporting requirements, such that hospitals submit one, self-selected calendar quarter of data for 4 eCQMs in the Hospital IQR Program measure set for the CY 2018 reporting period/FY 2020 payment determination. In section VIII.A.10.d.(2) of the preamble of this final rule, we are finalizing our proposal to require that hospitals continue to submit one, self-selected calendar quarter of data for 4 eCQMs in the Hospital IQR Program measure set for the CY 2019 reporting period/FY 2021 payment determination. Therefore, we believe there will be no change to the burden estimate because the previous burden estimate of 40 minutes per hospital per year (10 minutes per record × 4 eCQMs × 1 quarter) associated with eCQM reporting requirements finalized for the CY 2018 reporting period/FY 2020 payment determination will continue to apply to the CY 2019 reporting period/FY 2021 payment determination.

g. Information Collection Burden Estimate for the Finalized Modifications to EHR Certification Requirements

In section VIII.A.10.d.(3) of the preamble of this final rule, we are finalizing our proposal to update the EHR certification requirements by requiring the use of EHR technology certified to the 2015 Edition beginning with the CY 2019 reporting period/FY 2021 payment determination, to align with the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs) for eligible hospitals and CAHs. We do not expect this finalized proposal to affect our information collection burden estimates because this policy does not require hospitals to submit new data to CMS. With respect to any costs unrelated to data submission, we refer readers to section I.K. of Appendix A of this final rule.

h. Summary of Information Collection Burden Estimates for the Hospital IQR Program

In summary, under OMB control number 0938–1022, we estimate: (1) A total information collection burden reduction of 1,046,138 hours (−1,046,071 hours due to the removal of ED–1, IMM–2, and VTE–6 measures for the CY 2019 reporting period/FY 2021 payment determination and −67 hours for no longer collecting data for the voluntary Hybrid HWR measure[419]) and a total cost reduction related to information collection of approximately $38.3 million (−1,046,138 hours × $36.58 per hour[420]) for the CY 2019 reporting period/FY 2021 payment determination; (2) a total information collection burden reduction of 858,000 hours (−858,000 hours due to the removal of ED–2) and a total information collection cost reduction of approximately $31.3 million (−858,000 hours × $36.58 per hour[421]) for the CY 2020 reporting period/FY 2022 payment determination; and (3) a total information collection burden reduction of 43,200 hours (−43,200 hours due to no longer needing to validate NHSN HAI measures under the Hospital IQR Program) and a total information collection cost reduction of approximately $1.6 million (−43,200 hours × $36.58 per hour) for the CY 2021 reporting period/FY 2023 payment determination. These are the total information collection burden reduction estimates for which we are requesting OMB approval under OMB number 0938–1022.

[418] Median Time from ED Arrival to ED Departure for Admitted ED Patients (ED–1) is finalized for removal in both chart-abstracted and eCQM forms in sections VIII.A.5.b.(8)(b) and VIII.A.5.(b)(9)(c) of the preamble of this final rule, respectively.

[419] In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38350 through 38355), we finalized our proposal to collect data on a voluntary basis for the Hybrid HWR measure for the CY 2018 reporting period/FY 2020 payment determination. We estimated that approximately 100 hospitals would voluntarily report data for this measure, resulting in a total burden of 67 hours across all hospitals for the CY 2018 reporting period/FY 2020 payment determination (82 FR 38504). Because we only finalized voluntary collection of data for one year, voluntary collection of this data will no longer occur, beginning with the CY 2019 reporting period/FY 2021 payment determination and subsequent years, resulting in a reduction in burden of 67 hours across all hospitals.

[420] In the FY 2017 IPPS/LTCH PPS final rule (82 FR 38501), we finalized an hourly wage estimate of $18.29 per hour, plus 100 percent overhead and fringe benefits, for the Hospital IQR Program. Accordingly, we calculate cost burden to hospitals using a wage plus benefits estimate of $36.58 per hour.

[421] Ibid.

HOSPITAL IQR PROGRAM CY 2019 REPORTING PERIOD/FY 2021 PAYMENT DETERMINATION INFORMATION COLLECTION BURDEN ESTIMATES

Activity	Annual recordkeeping and reporting requirements under OMB control number 0938–1022 for CY 2019 reporting period/FY 2021 payment determination							
	Estimated time per record (minutes)	Number reporting quarters per year	Number of IPPS hospitals reporting	Average number records per hospital per quarter	Annual burden (hours) per hospital	Newly finalized annual burden (hours) across IPPS hospitals	Previously finalized annual burden (hours) across IPPS hospitals	Net difference in annual burden hours
Reporting on Emergency department throughput (ED–1)/Immunizations (IMM–2)	13	4	3,300	260	225	858,000	1,599,074	−741,074
Venous thromboembolism (VTE)	7	4	3,300	198	92	0	304,997	−304,997
Voluntary HWR Reporting[422]	10	4	100	1	0.67	0	67	−67

Total Change in Information Collection Burden Hours: −1,046,138.
Total Cost Estimate: Updated Hourly Wage ($36.58) × Change in Burden Hours (−1,046,138) = −$38,267,728.

HOSPITAL IQR PROGRAM CY 2020 REPORTING PERIOD/FY 2022 PAYMENT DETERMINATION INFORMATION COLLECTION BURDEN ESTIMATES

Activity	Annual recordkeeping and reporting requirements under OMB control number 0938–1022 for CY 2020 reporting period/FY 2022 payment determination							
	Estimated time per record (minutes)	Number reporting quarters per year	Number of IPPS hospitals reporting	Average number records per hospital per quarter	Annual burden (hours) per hospital	Newly finalized annual burden (hours) across IPPS hospitals	Previously finalized annual burden (hours) across IPPS hospitals	Net difference in annual burden hours
Reporting on Emergency department throughput (ED–2 only)	15	4	3,300	260	260	0	858,000	−858,000

Total Change in Information Collection Burden Hours:—858,000.
Total Cost Estimate: Updated Hourly Wage ($36.58) × Change in Burden Hours (−858,000) = −$31,385,640.

HOSPITAL IQR PROGRAM CY 2021 REPORTING PERIOD/FY 2023 PAYMENT DETERMINATION INFORMATION COLLECTION BURDEN ESTIMATES

Activity	Annual recordkeeping and reporting requirements under OMB control number 0938–1022 for CY 2021 reporting period/FY 2023 payment determination							
	Estimated time per record (minutes)	Number reporting quarters per year	Number of IPPS hospitals reporting	Average number records per hospital per quarter	Annual burden (hours) per hospital	Newly finalized annual burden (hours) across IPPS hospitals	Previously finalized annual burden (hours) across IPPS hospitals	Net difference in annual burden hours
HAI Validation Templates (CLABSI, CAUTI)	1,200	4	300	1	80	0	24,000	−24,000
HAI Validation Templates (MRSA, CDI)	960	4	300	1	64	0	19,200	−19,200

[422] In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38350 through 38355), we finalized our proposal to collect data on a voluntary basis for the Hybrid HWR measure for the CY 2018 reporting period/FY 2020 payment determination. We estimated that approximately 100 hospitals would voluntarily report data for this measure, resulting in a total burden of 67 hours across all hospitals for the CY 2018 reporting period/FY 2020 payment determination (82 FR 38504). Because we only finalized voluntary collection of data for one year, voluntary collection of this data will no longer occur beginning with the CY 2019 reporting period/FY 2021 payment determination and subsequent years resulting in a reduction in burden of 67 hours across all hospitals.

HOSPITAL IQR PROGRAM CY 2021 REPORTING PERIOD/FY 2023 PAYMENT DETERMINATION INFORMATION COLLECTION BURDEN ESTIMATES—Continued

Activity	Annual recordkeeping and reporting requirements under OMB control number 0938–1022 for CY 2021 reporting period/FY 2023 payment determination							
	Estimated time per record (minutes)	Number reporting quarters per year	Number of IPPS hospitals reporting	Average number records per hospital per quarter	Annual burden (hours) per hospital	Newly finalized annual burden (hours) across IPPS hospitals	Previously finalized annual burden (hours) across IPPS hospitals	Net difference in annual burden hours
Total Change in Information Collection Burden Hours: −43,200.								
Total Cost Estimate: Updated Hourly Wage ($36.58) ×Change in Burden Hours (−43,200) = −$1,580,256.								

4. ICRs for PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

a. Background

As discussed in sections VIII.B. of the preambles of the proposed rule (83 FR 20500 through 20510) and this final rule, section 1866(k)(1) of the Act requires, for purposes of FY 2014 and each subsequent fiscal year, that a hospital described in section 1886(d)(1)(B)(v) of the Act (a PPS-exempt cancer hospital, or a PCH) submit data in accordance with section 1866(k)(2) of the Act with respect to such fiscal year. There is no financial impact to PCH Medicare payment if a PCH does not participate. Below we discuss only changes in burden that will result from the proposals that we are finalizing in this final rule.

b. Revision of Time Estimate for Structural and Web-Based Tool Measures for the FY 2021 Program Year and Subsequent Years

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20559), we proposed to revise our burden calculation methodology. With all the parameters considered when PCHs submit data on PCHQR Program measures (training of appropriate staff members on National Healthcare Safety Network (NHSN) reporting and the CMS Web Measures Tool for the reporting of the clinical process/oncology care measures; the time required for collection and aggregation of data; and the time required for reporting of the data by the PCH's representative), we strive to achieve continuity in how we calculate and analyze burden data. In prior years, we have based our burden estimates on the notion that all 11 PCHs would report on all measures for all cases (78 FR 50958). These assumptions were made in order to be as comprehensive as possible given a lack of PCH-specific data available at the time. However, we believe it is more appropriate to use estimates developed using data available in other quality reporting programs wherever possible, because we believe these estimates will provide a more accurate estimate of burden associated with data collection and reporting. Our proposal to update the estimate the time required to collect and report data for structural measures and measures that use a web-based tool is discussed below.

We initially adopted five clinical process/cancer specific treatment measures that utilized a web-based tool for the FY 2016 program year in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50841 through 50844). In that rule, we did not specify burden estimates based on the measure type, but instead provided estimates ''for submitting all quality measure data'' (78 FR 50958). Since then, we have been able to better understand and differentiate the various levels of effort associated with data abstraction and submission for specific types of measures. Moreover, in understanding that certain measure types prove more burdensome than others (that is, chart-abstracted measures), we believe it is necessary to provide burden estimates that better reflect the type of measure being discussed.

Using historical data from its validation contractor, the Hospital IQR Program has previously estimated that it takes 15 minutes per hospital to report on four structural measures (80 FR 49762). We believe this estimate is appropriate for the PCHQR Program because data submission for measures that utilize a web-based tool is similar to the data submission for a structural measure, in that both types of measures use the same reporting mechanism, the QualityNet Secure Portal. In addition, we wish to account for the time associated with data collection and aggregation for individual measures when considering burden, and believe 15 minutes per measure is an appropriately conservative estimate for the measures submitted via a web-based tool in the PCHQR Program. Therefore, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20559), we proposed to apply this burden estimate to four measures that utilize a web-based tool: (1) Oncology: Radiation Dose Limits to Normal Tissues (PCH–14/NQF #0382); (2) Oncology: Medical and Radiation—Pain Intensity Quantified (PCH–16/NQF #0384); (3) Prostate Cancer: Adjuvant Hormonal Therapy for High Risk Patients (PCH–17/NQF #0390); and (4) Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low-Risk Patients (PCH–18/NQF #0389).

We invited public comment on our proposal to utilize a burden estimate of 15 minutes per measure, per PCH, with respect to the burden estimates we discuss below for the FY 2021 program year and subsequent years.

We did not receive any public comments on this proposal. We are therefore finalizing that we will use a burden estimate of 15 minutes per measure, per PCH, with respect to the burden estimates for web-based and/or structural measures for the FY 2021 program year and subsequent years.

c. Estimated Burden of PCHQR Program Proposals for the FY 2021 Program Year

In section VIII.B.3. of the preamble of this final rule, we are finalizing our proposal to remove six measures beginning with the FY 2021 program year—four web-based, structural measures: (1) Oncology: Radiation Dose Limits to Normal Tissues (PCH–14/NQF #0382); (2) Oncology: Medical and Radiation—Pain Intensity Quantified (PCH–16/NQF #0384); (3) Prostate Cancer: Adjuvant Hormonal Therapy for High Risk Patients (PCH–17/NQF #0390); (4) Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low-Risk Patients (PCH–18/NQF #0389), and two chart-abstracted, NHSN measures: (5) NHSN Catheter-Associated Urinary Tract Infection

(CAUTI) Outcome Measure (PCH–5/NQF #0138) and (6) NHSN Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (PCH–4/NQF #0139). In addition, in section VIII.B.4.b. of the preamble of this final rule, we are finalizing our proposal to adopt one claims-based measure, 30-Day Unplanned Readmissions for Cancer Patients (NQF #3188), beginning with the FY 2021 program year. As a result of these finalized measure removals, the PCHQR Program measure set will consist of 13 measures for the FY 2021 program year.

(1) Removal of Web-Based Structural Measures

We estimate that the removal of four web-based, structural measures will reduce the burden associated with quality reporting on PCHs. We estimate a reduction of 1 hour (or 60 minutes) per PCH (15 minutes per measure × 4 measures = 60 minutes), and a total annual reduction of approximately 11 hours for all 11 PCHs (60 minutes × 11 PCHs/60 minutes per hour), due to the finalized removal of these four measures.

(2) Maintenance of Chart-Abstracted NHSN Measures

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20503), we proposed to remove two NHSN measures, Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (PCH–5/NQF #0138) and (2) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (PCH–4/NQF #0139), from the PCHQR Program. As discussed in section VIII.B.3.b.(2) of the preamble of this final rule, we are deferring finalization of our policies regarding future use of the Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (PCH–5/NQF #0138) and Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (PCH–4/NQF #0139) in the PCHQR Program to a future 2018 final rule, most likely in the CY 2019 OPPS/ASC final rule targeted for release no later than November 2018. We will therefore address any change in burden associated with this policy decision, most likely, in the CY 2019 OPPS/ASC final rule.

We note that we have also reconciled the burden estimates associated with the remaining NHSN measures (CLABSI, CAUTI, CDI, HCP, MRSA and Colon and Abdominal Hysterectomy SSI) included in the PCHQR Program measure, which were previously accounted for under OMB Control Number 0938–1175. The burden associated with data collection for these measures is accounted for under the CDC NHSN OMB control number 0920–0666; for this reason, we have removed the duplicative burden estimate from the PCHQR Program's OMB Control Number, 0938–1175.

(3) Adoption of 30-Day Unplanned Readmissions for Cancer Patients Measure (NQF #3188)

We do not anticipate any increase in burden on PCHs related to our finalized proposal to adopt the claims-based 30-Day Unplanned Readmissions for Cancer Patients measure (NQF #3188), beginning with the FY 2021 program year, because this measure is claims-based and does not require PCHs to submit any additional data.

In summary, we estimate a total reduction of 11 hours of burden per year for all 11 PCHs (−1 hours per PCH × 11 PCHs) associated with the removal of the four web-based, structural measures beginning with the FY 2021 program year. Coupled with our estimated salary costs, we estimate that these finalized changes will result in a reduction in annual labor costs of $402 (11 hours × $36.58 hourly labor cost[423]) across the 11 PCHs beginning with the FY 2021 PCHQR Program. The burden associated with these reporting requirements is currently approved under OMB control number 0938–1175. The information collection will be revised and submitted to OMB.

5. ICRs for the Hospital Value-Based Purchasing (VBP) Program

In section IV.I. of the preambles of the proposed rule (83 FR 20407 through 20426) and this final rule, we discuss requirements for the Hospital VBP Program. Specifically, in this final rule, with respect to quality measures, we are finalizing our proposals to remove three claims-based measures (AMI Payment, HF Payment, and PN Payment) effective with the effective date of the FY 2019 IPPS/LTCH PPS final rule. Because these claims-based measures are calculated using only data already reported to the Medicare program for payment purposes, we do not anticipate that removing these measures will increase or decrease the reporting burden on hospitals. However, we believe removal of these measures from the Hospital VBP Program will reduce other costs associated with the program, such as: (1) Costs for health care providers and clinicians to track the confidential feedback preview reports and publicly reported information on the measures in more than one program; (2) costs for CMS to analyze and publicly report the measures' data in multiple programs; and (3) confusion for beneficiaries to see public reporting on the same measures in different programs. As discussed in section IV.I.2.c.(2) of the preamble of this final rule, we are not finalizing our proposal to remove a fourth claims-based measure—Patient Safety and Adverse Events (Composite) (PSI 90) (NQF #0531).

In addition, in this final rule, we are finalizing our proposal to remove one chart-abstracted measure (Elective Delivery (NQF #0469) (PC–01)) beginning with the FY 2021 program year. Because this chart-abstracted measure used data required for and collected under the Hospital IQR Program (OMB control number 0938–1022), there was no additional data collection burden associated with this measure under the Hospital VBP Program. Therefore, we do not anticipate removing this measure will increase or decrease the reporting burden on hospitals. However, we believe removal of this measure from the Hospital VBP Program will reduce other costs associated with the program, such as: (1) Costs for health care providers and clinicians to track the confidential feedback preview reports and publicly reported information on the measures in more than one program; (2) costs for CMS to analyze, and publicly report the measures' data in multiple programs; and (3) confusion for beneficiaries to see public reporting on the same measures in different programs.

As discussed in section IV.I.2.c.(2) of the preamble of this final rule, we are not finalizing our proposal to remove five other chart-abstracted measures (CAUTI, CLABSI, Colon and Abdominal Hysterectomy SSI, MRSA Bacteremia, and CDI). Because these chart-abstracted measures use data that will continue to be required for and collected under the Hospital IQR Program through the CY 2019 reporting period/FY 2021 payment determination, there is no change to the data collection burden associated with these measures under the Hospital VBP Program.

We note that we are finalizing our proposals to remove eight claims-based measures from the Hospital IQR Program, which have been finalized previously for, and will remain in, the Hospital VBP Program. However, we do not believe retaining these claims-based measures in the Hospital VBP Program will create any change in burden for

[423] In the FY 2017 IPPS/LTCH PPS final rule (82 FR 38504 through 38505), we finalized an hourly wage estimate of $18.29 per hour, plus 100 percent overhead and fringe benefits, for the Hospital IQR Program. Accordingly, we calculate cost burden to hospitals using a wage plus benefits estimate of $36.58 per hour.

hospitals because the measure data will continue to be collected using Medicare FFS claims hospitals are already submitting to the Medicare program for payment purposes.

6. ICRs for the Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

In section VIII.C.5. of the preambles of the proposed rule (83 FR 20510 through 20515) and this final rule, we discuss our finalized policies to remove two measures from the LTCH QRP beginning with the FY 2020 LTCH QRP and to remove one measure from the LTCH QRP beginning with the FY 2021 LTCH QRP.

In section VIII.C.5.a. and b. of the preamble of this final rule, we are finalizing our proposals to remove two CDC NHSN measures: National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-Onset Methicillin-Resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716) and National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure beginning with the FY 2020 LTCH QRP. LTCHs will no longer be required to submit data on these measures beginning with October 1, 2018 admissions and discharges. As a result, the burden and cost specifically for LTCHs for complying with the requirements of the LTCH QRP will be reduced. While the overall burden estimates are accounted for under OMB control number (0920–0666), to specifically account for burden reductions, the CDC provided more detailed estimates for LTCH reporting on the data for the measures we are finalizing for removal.

Based on estimates provided by the CDC, which is based on the frequency of actual reporting on such data, we estimate that the removal of the National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716) will result in a 3-hour (15 minutes per MRSA submission × 12 estimated submissions per LTCH per year) reduction in clinical staff time annually to report data, which equates to a decrease of 1,260 hours (3 hours burden per LTCH per year × 420 total LTCHs) in burden for all LTCHs. Given 10 minutes of registered nurse time at $69.40 per hour, and 5 minutes of medical records or health information technician time at $39.86 per hour, for the submission of MRSA data to the NHSN per LTCH per year, we estimate that the total cost of complying with the requirements of the LTCH QRP will be reduced by $178.66 per LTCH annually, or $75,037.20 for all LTCHs annually.

Applying the same approach on burden reduction estimations, we estimate that the removal of the National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure from the LTCH QRP will result in a 4.4 hour (22 minutes per VAE submission × 12 estimated submissions per LTCH per year) reduction in clinical staff time to report data, which equates to a decrease of 1,848 hours (4.4 hours burden per LTCH per year × 420 total LTCHs) in burden for all LTCHs. Given the registered nurse hourly rate of $69.40 per hour, and medical records or health information technician rate of $39.86 per hour for the submission of VAE data to the NHSN per LTCH per year, we estimate that the total cost of complying with the LTCH QRP will be reduced by $293.54 per LTCH annually, or $123,288.48 for all LTCHs annually.

In addition, in section VIII.C.5.c. of the preamble of this final rule, we are finalizing our proposal to remove the measure, Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680), beginning with the FY 2021 LTCH QRP. LTCHs will no longer be required to submit data on this measure beginning with October 1, 2018 admissions and discharges. As a result, the estimated burden and cost for LTCHs for complying with requirements of the LTCH QRP will be reduced. Specifically, we believe that there will be a 1.8 minute reduction in clinical staff time to report data per patient stay. We estimate 136,476 discharges from 420 LTCHs annually. This equates to a decrease of 4,094 hours in burden for all LTCHs (0.03 hours per assessment × 136,476 discharges). Given 1.8 minutes of registered nurse time at $69.40 per hour completing an average of 325 sets of LTCH CARE Data Set assessments per LTCH per year, we estimate that the total cost will be reduced by $676.53 per LTCH annually, or $284,143.03 for all LTCHs annually. This decrease in burden will be accounted for in the information collection under OMB control number 0938–1163.

Overall, the cost associated with the finalized changes to the LTCH QRP is estimated at a reduction of $1,148.73 per LTCH annually or $482,468.71 for all LTCHs.

7. ICRs Relating to the Hospital-Acquired Condition (HAC) Reduction Program

In section IV.J. of the preambles of the proposed rule (83 FR 20426 through 20437) and this rule, we discuss requirements for the HAC Reduction Program. In the proposed rule, we did not propose to adopt any new measures into the HAC Reduction Program. In this final rule, the Hospital IQR Program is finalizing its proposal to remove the claims-based Patient Safety and Adverse Events Composite (PSI 90) measure effective with the effective date of the FY 2019 IPPS/LTCH PPS final rule and finalizing with modification, its proposal five NHSN HAI measures (CDI, CAUTI, CLABSI, MRSA, and Colon and Abdominal Hysterectomy SSI), with the removal of these measures beginning with the CY 2020 reporting period/FY 2022 payment determination. These measures had been previously adopted for, and will remain in, the HAC Reduction Program.

We do not believe that retaining the claims-based PSI 90 measure in the HAC Reduction Program will create or reduce any burden for hospitals because it will continue to be collected using Medicare FFS claims hospitals are already submitting to the Medicare program for payment purposes.

We note the burden associated with collecting and submitting data for the HAI measures (CDI, CAUTI, CLABSI, MRSA, and Colon and Abdominal Hysterectomy SSI) via the NHSN system is captured under a separate OMB control number, 0920–0666, and therefore will not impact our burden estimates.

We anticipate the finalized discontinuation of the HAI measure validation process under the Hospital IQR Program will result in a net burden decrease to the Hospital IQR Program, but will result in an off-setting net burden increase to the HAC Reduction Program because hospitals selected for validation will continue to be required to submit validation templates for the HAI measures. Therefore, because of our finalized proposals in sections VIII.A.5.b.(2)(b) and IV.J.4.e. of the preamble of this final rule to remove the HAI chart-abstracted measures from the Hospital IQR Program, data validation for the measures will transfer to the HAC Reduction Program, and this is will result in a net neutral shift of 43,200 hours and approximately $1.6 million from the Hospital IQR Program to the HAC Reduction Program, with no overall net change in burden.

Under the Hospital IQR Program, we have previously estimated a reporting burden of 80 hours (1,200 minutes per record × 1 record per hospital per quarter × 4 quarters/60 minutes) per hospital selected for validation per year to submit the CLABSI and CAUTI templates, and 64 hours (960 minutes

per record × 1 record per hospital per quarter × 4 quarters/60 minutes) per hospital selected for validation per year to submit the MRSA and CDI templates. Therefore, we estimate a total burden shift of 43,200 hours ([80 hours per hospital to submit CLABSI and CAUTI templates + 64 hours per hospital to submit MRSA and CDI templates] × 300 hospitals selected for validation) and approximately $1.6 million (43,200 hours × $36.58 per hour[424]) as a result of our finalized proposals to discontinue HAI validation under the Hospital IQR Program and begin a validation process under the HAC Reduction Program.

8. ICRs Relating to the Hospital Readmissions Reduction Program

In section IV.H. of the preamble of this final rule, we discuss our finalized proposals for the Hospital Readmissions Reduction Program. In this final rule, we did not adopt any new measures into the Hospital Readmissions Reduction Program. However, we are finalizing our proposals to remove six claims-based measures from the Hospital IQR Program, which have been finalized previously for, and will remain in, the Hospital Readmissions Reduction Program. We do not believe that these claims-based measures remaining in the Hospital Readmissions Reduction Program will create any additional burden for hospitals because they will continue to be collected using Medicare FFS claims hospitals are already submitting to the Medicare program for payment purposes.

9. ICRs for the Promoting Interoperability Programs

a. Background and Finalized Update to Hourly Wage Rate

In section VIII.D. of the preambles of the proposed rule (83 FR 20515 through 20544) and this final rule, we discuss our proposals and newly finalized policies for a new performance-based scoring methodology and changes to the Stage 3 objectives and measures for eligible hospitals and CAHs that attest to CMS for the Medicare Promoting Interoperability Program. We also discuss our proposal and final policy to change the EHR reporting period to a minimum of any continuous 90-day period in CYs 2019 and 2020 for all new and returning participants attesting to CMS or their State Medicaid agency. In addition, we establish the CQM reporting period and criteria for CY 2019 and the removal of eight CQMs beginning in CY 2020. Lastly, we codify the policies for subsection (d) Puerto Rico hospitals who participate in the Medicare Promoting Interoperability Program for eligible hospitals, including policies previously implemented through program instruction. We did not propose to change the requirement for the 2015 Edition of CEHRT to be used beginning in CY 2019. In this final rule, we discuss and finalize our proposals with a few modifications regarding a new performance-based scoring methodology and changes to the Stage 3 objectives and measures for eligible hospitals and CAHs that attest to CMS under the Medicare Promoting Interoperability Program. We are finalizing the new measures Query of PDMP and Support Electronic Referral Loops by Receiving and Incorporating Health Information. We are finalizing the removal of the Coordination of Care Through Patient Engagement objective and its associated measures Secure Messaging, View, Download or Transmit, and Patient Generated Health Data as well as the measures Request/Accept Summary of Care, Clinical Information Reconciliation and Patient-Specific Education. We are renaming measures within the Health Information Exchange objective. These changes include changing the name from Send a Summary of Care, to Support Electronic Referral Loops by Sending Health Information; renaming the Public Health and Clinical Data Registry Reporting objective to Public Health and Clinical Data Exchange with the requirement to report on any two measures options; renaming the name the Patient Electronic Access to Health Information objective to Provider to Patient Exchange objective, and renaming the remaining measure, Provide Patient Access measure to Provide Patients Electronic Access to Their Health Information measure.

In prior rules (81 FR 57260), we have estimated that the electronic reporting of CQM data could be accomplished by staff with a mean hourly wage of $16.42 per hour.[425] Because this wage rate is based on Bureau of Labor Statistics (BLS) data dating to 2012, in the proposed rule (83 FR 20562), we proposed to update the wage rate to the most recent data available from the BLS, which is the 2016 wage rate of $19.93.[426] We are calculating the cost of overhead, including fringe benefits, at 100 percent of the mean hourly wage. This is an estimated adjustment, since both fringe benefits and overhead costs vary significantly from employer-to-employer and the methods of estimating such costs vary widely from study-to-study. Nonetheless, we believe that doubling the hourly wage rate ($19.44 × 2 = $39.86) to estimate total cost is a reasonably accurate estimation method and allows for a conservative estimate of hourly costs. We refer readers to the Hospital IQR Program discussion in section XIV.B.3. the preamble of this final rule, for more information regarding the information collection burden related to reporting of CQMs.

We did not receive any public comments regarding this information collection. For the expected effects relating to the above proposals, we refer readers to section I.N. of Appendix A of this final rule.

b. Burden Estimates

In sections VIII.D.5. and 6. of the preamble of this final rule, we discuss our finalized policies for a new scoring methodology for eligible hospitals and CAHs that attest to CMS for the Promoting Interoperability Program, and the addition of one new opioid measure that is optional in 2019 and 2020. This scoring approach requires eligible hospitals and CAHs to report by attestation on only six measures. We consider this scoring methodology to be based more on performance and not solely on whether an eligible hospital or CAH meets the thresholds for measures. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20562 through 20564), we estimated that the new scoring methodology reduces the necessary response time by .25 hours. This is a reduction to the previous burden estimate provided in the 2015 EHR Incentive Programs final rule (80 FR 62928). In the proposed rule, we updated the burden estimate to take into account the reduced burden associated with the proposed new requirements for eligible hospitals and CAHs for Stage 3 of meaningful use.

We believe the burden will be different for eligible hospitals that attest to a State for purposes of receiving a Medicaid incentive payment because the existing Stage 3 requirements will continue to apply to them. We note that under section 101(b)(1) of the Medicare Access and CHIP Reauthorization Act of 2015 (Pub. L. 114–10), the Medicare EHR Incentive Program was sunset for EPs in 2018, and now many of these EPs are subject to the requirements of the Quality Payment Program (QPP). Currently the burden is estimated at $388,408,189 annually. We estimate the

[424] In the FY 2017 IPPS/LTCH PPS final rule (82 FR 38501), we finalized an hourly wage estimate of $18.29 per hour, plus 100 percent overhead and fringe benefits, for the Hospital IQR Program. Accordingly, we calculate cost burden to hospitals using a wage plus benefits estimate of $36.58 per hour.

[425] Occupational Outlook Handbook. Available at: *http://www.bls.gov/oes/2012/may/oes292071.htm.*

[426] Occupational Outlook Handbook. Available at: *https://www.bls.gov/oes/current/oes292071.htm.*

burden for all participants in the Medicare and Medicaid Promoting Interoperability Programs represents a total cost of $61,113,527.80, which is a reduction of $327,294,661 annually. We also note that the currently approved burden in hours are 4,230,155 and as a result of this finalized proposal we believe it will be reduced to 623,562.19 hours. This burden reduction will occur as a result of the reduced numbers of EPs and the new scoring methodology for eligible hospitals and CAHs proposed in the proposed rule. The burden estimate includes subsection (d) Puerto Rico hospitals. Below is the burden table where we take into account these changes and the burden that will ensue as a result of the changes. We note that the information collection request (OMB Control number 0938–1278) has been revised and submitted to OMB.

BURDEN AND COST ESTIMATES ASSOCIATED WITH INFORMATION COLLECTION

Reg section	Number of respondents	Number of responses	Burden per response (hours)	Total annual burden (hours)	Hourly labor cost of reporting ($)	Total cost ($)
§ 495.24(d)—Objectives/Measures (Medicaid EPs)	80,000	80,000	7.43	594,400	$100	$59,440,000
§ 495.24(d)—Objectives/Measures Medicaid (eligible hospitals/CAHs)	133	133	7.43	988.19	67.25	66,455.78
§ 495.24(e)—Objectives/Measures Medicare (eligible hospitals/CAHs)	3300	3300	7.18	23,694	67.25	1,593,421.50
§ 495.316—Quarterly Reporting (Medicaid)	56	224	20	4,480	3.047	13,650.56
Totals	83,489	83,489		623,562.19		61,113,527.80

There are 3,300 eligible hospitals and CAHs that attest to CMS (Medicare-only and dual-eligible) under the Medicare Promoting Interoperability Program. Therefore, the total estimated annual cost burden for all eligible hospitals and CAHs in the Medicare Promoting Interoperability Program to attest to meaningful use will be $,1,593,421.5 (3,300 eligible hospitals and CAHs × 7 hours 18 minutes × $67.25).[427]

In this final rule, we are finalizing our proposal that the new scoring methodology and changes to the Stage 3 objectives and measures for eligible hospitals and CAHs that attest to CMS will be optional for States to implement through changes to their State Medicaid HIT Plans approved by CMS for eligible hospitals participating in their Medicaid Promoting Interoperability Program. If States choose not to align, eligible hospitals in those States will continue to attest to the objectives and measures as currently specified under § 495.24(d). Extending this option to States will allow them flexibility to benefit from the improvements to meaningful use scoring outlined in this final rule, if they so choose. If States choose to take this option, we anticipate the same burden reduction for Medicaid eligible hospitals as discussed above, but a significant burden increase for States that choose to overhaul their systems to collect data. If States do not take the option, they will face no burden increase or decrease.

In section VIII.D.7. of the preamble of this final rule, we are finalizing our proposal that the EHR reporting periods in CYs 2019 and 2020 for new and returning participants attesting to CMS or their State Medicaid agency will be a minimum of any continuous 90-day period within each of the CYs 2019 and 2020. This means that EPs that attest to a State for the State's Medicaid Promoting Interoperability Program and eligible hospitals and CAHs attesting to CMS or the State's Medicaid Promoting Interoperability Program will attest to meaningful use of CEHRT for an EHR reporting period of a minimum of any continuous 90-day period from January 1, 2019 through December 31, 2019 and from January 1, 2020 through December 31, 2020, respectively. The applicable incentive payment year and payment adjustment years for the EHR reporting periods in 2019 and 2020, as well as the deadlines for attestation and other related program requirements, will remain the same as established in prior rulemaking. We finalizing our proposals to make corresponding changes to the definition of ''EHR reporting period'' and ''EHR reporting period for a payment adjustment year'' at 42 CFR 495.4. We do not expect these finalized policies to affect our burden estimates because we have never required a different EHR reporting period.

In section VIII.D.9. of the preamble of this final rule, we are finalizing our proposal that the reporting period for Medicare and Medicaid eligible hospitals and CAHs that report CQMs electronically will be one, self-selected calendar quarter of CY 2019 data. We are also finalizing our proposal that eligible hospitals and CAHs participating in only the EHR Program, or participating in both the Promoting Interoperability Programs and the Hospital IQR Program, report on at least 4 self-selected CQMs. We are also finalizing our proposals to remove eight CQMs beginning in 2020. We believe to report on the 4 self-selected CQMs electronically will cost ($39.86 × 40 min) 1,594.4 per hospital times 3,300 hospitals results in a total burden of $5,261,520 for all eligible hospitals and CAHs.

In section VIII.D.10. of the preamble of this final rule, we are finalizing our proposals to incorporate into our regulations program guidance regarding subsection (d) Puerto Rico hospitals. Because we did not propose any new requirements, we not believe that these proposals will affect burden.

In section VIII.D.12.a. of the preamble of this final rule, we are finalizing our proposals to amend 42 CFR 495.324(b)(2) and 495.324(b)(3) to align with current prior approval policy for MMIS and ADP systems at 45 CFR 95.611(a)(2)(ii), and (b)(2)(iii) and (iv), and to minimize burden on States. Specifically, we are finalizing our proposals that the prior approval dollar threshold in § 495.324(b)(3) be increased to $500,000, and that a prior approval threshold of $500,000 be added to § 495.324(b)(2). In addition, in light of these finalized changes, we are finalizing our proposal to make a conforming amendment to amend the threshold in § 495.324(d) for prior approval of justifications for sole source acquisitions to be the same $500,000 threshold. That threshold is currently

[427] *https://www.bls.gov/oes/current/oes231011.htm.*

aligned with the $100,000 threshold in current § 495.324(b)(3). Amending § 495.324(d) to preserve alignment with § 495.324(b)(3) will reduce burden on States and maintain the consistency of our prior approval requirements. We believe that this finalized proposal will reduce burden on States by raising the prior approval thresholds and generally aligning them with the thresholds for prior approval of MMIS and ADP acquisitions costs.

In section VIII.D.12.b. of the preamble of this final rule, we are finalizing our proposal that the 90 percent FFP for Medicaid Promoting Interoperability Program administration will no longer be available for most State expenditures incurred after September 30, 2022. We are finalizing a later sunset date, September 30, 2023, for the availability of 90 percent enhanced match for State administrative costs related to Medicaid Promoting Interoperability Program audit and appeals activities, as well as costs related to administering incentive payment disbursements and recoupments that might result from those activities. States will not be able to claim any Medicaid Promoting Interoperability Program administrative match for expenditures incurred after September 30, 2023. We do not believe that these finalized proposals will impose any additional burdens on States, because they only affect the timing of State expenditures.

We did not receive any public comments specific to Medicaid information collection.

10. ICRs for Revisions to the Supporting Documentation Requirements for Medicare Cost Reports

In section IX.B.1. of the preambles of the proposed rule (83 FR 20545) and this final rule, we discuss our proposal and finalized policy to incorporate the Provider Cost Reimbursement Questionnaire, Form CMS–339 (OMB No. 0938–0301) into the Organ Procurement Organization (OPO) and Histocompatibility Laboratory cost report, Form CMS–216 (OMB No. 0938–0102), which will complete our incorporation of the Form CMS–339 into all Medicare cost reports. We also discuss our finalized policy to update § 413.24(f)(5)(i) to reflect that an acceptable cost report would no longer require the provider to separately submit a Provider Cost Reimbursement Questionnaire, Form CMS–339, by removing the reference to the questionnaire.

There are 58 OPOs and 47 histocompatibility laboratories. This finalized proposal does not require additional data collection from OPOs or histocompatibility laboratories. This policy will benefit OPOs and histocompatibility laboratories because they will no longer be required to complete and submit the Form CMS–339 as a separate form independent of the Medicare cost report in order to have an acceptable cost report submission under § 413.24(f)(5)(i).

Currently, all OPOs and histocompatibility laboratories are required to complete Form CMS–339. The finalized policy to incorporate the Provider Cost Reimbursement Questionnaire, Form CMS–339, into the OPO and Histocompatibility Laboratory cost report will eliminate the requirement to complete the Form CMS–339. The estimated annual burden associated with Form CMS–339 is 3 hours per respondent. The time required by an OPO or a histocompatibility laboratory to complete the Form CMS–339 is reduced because the form is incorporated into the cost report. The incorporation of the Form CMS–339 into the cost report as a cost report worksheet will decrease burden upon OPOs and histocompatibility laboratories. These entities will no longer be required to review multiple pages of questions not applicable to them. This finalized policy will result in an overall burden reduction to the 58 OPOs and 47 histocompatibility laboratories of a total of 289 hours.

Instead, these entities are required to respond to 5 questions, which we estimate will take 15 minutes per entity. The total estimated burden across all respondents is 26 hours ((105 respondents) × (0.25 hours/response)). By eliminating the requirement to complete the inapplicable parts of the Form CMS–339, each OPO or histocompatibility laboratory will experience a net burden decrease of 2.75 hours.

Based on the most recent Bureau of Labor Statistics (BLS) 2016 Occupational Outlook Handbook, the mean hourly wage for Category 43–3031 (bookkeeping, accounting, and auditing clerk) is $19.34. We added 100 percent of the mean hourly wage to account for fringe benefits and overhead, which calculates to a total hourly wage of $38.68 ($19.34 + $19.34). The overall decrease in costs to the 58 OPOs and 47 histocompatibility laboratories is $11,178.52 ($38.68 × 289 hours).

In section IX.B.6. of the preamble of this final rule, we discuss our final policy (with modifications to the proposal) in § 413.24(f)(5)(i)(E) that, effective for cost reporting periods beginning on or after October 1, 2018, for providers claiming costs on their cost report that are allocated from a home office or chain organization with the same fiscal year end, a cost report will be rejected for lack of supporting documentation if the home office or chain organization has not submitted, to the provider's contractor, a Home Office Cost Statement that corresponds to the amounts it has allocated to the provider's cost report. Effective for cost reporting periods beginning on or after October 1, 2018, for providers claiming costs on their cost report that are allocated from a home office or chain organization with a different fiscal year end, a cost report will be rejected for lack of supporting documentation if the home office or chain organization has not submitted, to the provider's contractor, a Home Office Cost Statement that corresponds to some portion of the amounts it has allocated to the provider's cost report. When the provider and its home office have differing fiscal year ends, the provider's home office costs for a portion of the cost reporting period (as reflected on the Home Office Cost Statement) must correspond to a portion of the amount reported in the provider's cost report. When the provider and its home office have the same fiscal year end, the provider's home office's cost for the same time period (as reflected on the Home Office Cost Statement) must correspond to the costs reported in the provider's cost report.

With our final policy, we anticipate that a home office with costs allocated to providers' cost reports within its chain organization will submit a Home Office Cost Statement to the providers' contractors in order for those providers in the chain organization to have an acceptable cost report submission. Based on the most recent available FY 2016 data in CMS' System for Tracking Audit and Reimbursement, there were approximately 94 providers that claimed costs on their cost reports that were allocated from approximately 13 home offices or chain organizations, but did not submit a Home Office Cost Statement with their cost reports to substantiate these allocated costs. Because the existing burden estimate for a Home Office Cost Statement already reflects the requirement that a home office collect, maintain, and submit a list of the providers' contractors within its chain organization on the Home Office Cost Statement, the contractors to whom the Home Office Cost Statement should be sent is already known to the home office, and thus there is no additional burden placed upon home offices as a result of our finalized policy to require the home office or chain organization to submit to the providers'

contractor the Home Office Cost Statement that corresponds to all or any portion of the costs it has allocated to the provider, in order for the providers within its chain organization to have an acceptable cost report submission. To account for the anticipated increase in Home Office Cost Statement submissions, we will adjust the number of respondents in the Home Office Cost Statement (OMB Control number 0938–0202) information collection request that is currently being developed for reinstatement.

11. Summary of All Burden in This Final Rule

Below is a chart reflecting the total burden and associated costs for the provisions included in this final rule.

Information collection requests	Burden hours increase/ decrease (−)*	Cost (+/−)*
Application for GME Resident Slots	N/A	N/A
Changes—Medicare Cost Report	−289	−$10,907
Hospital Inpatient Quality Reporting Program	−1,947,338	−71,233,624
Hospital Value-Based Purchasing Program[1]	N/A	N/A
HAC Reduction Program[2]	43,200	1,580,256
Hospital Readmissions Reduction Program[3]	N/A	N/A
Promoting Interoperability Programs	−3,606,593	−327,294,661
LTCH Quality Reporting Program	−7,202	−482,468
PPS-Exempt Hospital Quality Reporting Program	−27,709	−1,013,595
Total	−5,545,931	−396,428,082

* Numbers rounded.

[1] Because the Hospital VBP Program uses quality measure collected under other programs or via Medicare fee-for-service claims hospitals are already submitting to CMS for payment purposes, the program does not anticipate any change in burden associated with finalizing removal of measures from the Program or retaining claims-based measures in the Hospital VBP Program that will be removed from the Hospital IQR Program.

[2] We note that the net costs reflected in the table for the HAC Reduction Program do not constitute a new information collection requirement on participating hospitals, but a transition of the NHSN HAI measure validation process from one program to another based on our efforts to reduce measure duplication across programs.

[3] Because the Hospital Readmissions Reduction Program measures are all collected via Medicare fee-for-service claims hospitals are already submitting to CMS for payment purposes, there is no unique information collection burden associated with the program.

List of Subjects

42 CFR Part 412

Administrative practice and procedure, Health facilities, Medicare, Puerto Rico, Reporting and recordkeeping requirements.

42 CFR Part 413

Health facilities, Kidney diseases, Medicare, Puerto Rico, Reporting and recordkeeping requirements.

42 CFR Part 424

Emergency medical services, Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 495

Administrative practice and procedure, Electronic health records, Health facilities, Health professions, Health maintenance organizations (HMO), Medicaid, Medicare, Penalties, Privacy, Reporting and recordkeeping requirements.

For the reasons set forth in the preamble of this final rule, the Centers for Medicare and Medicaid Services is amending 42 CFR Chapter IV as set forth below:

PART 412—PROSPECTIVE PAYMENT SYSTEMS FOR INPATIENT HOSPITAL SERVICES

■ 1. The authority citation for part 412 is revised to read as follows:

Authority: Secs. 1102 and 1871 of the Social Security Act (42 U.S.C. 1302 and 1395hh); secs. 123 and 124 of subtitle A of Title I of Pub. L. 106–113 (113 Stat. 1501A–332); sec. 307 of Subtitle A of Title III of Pub. L. 106–554; sec. 114 of 110–173; sec. 4302 of Pub. L. 111–5; secs. 3106 and 10312 of Pub. L. 111–148; sec. 1206 of Pub. L. 113–67; sec. 112 of Pub. L. 113–93; sec. 231 of Pub. L. 114–113; secs. 15004, 15006, 15007, 15008, 15009, and 15010 of Pub. L. 114–255; and sec. 51005 of Division E of Title X of Pub. L. 115–123.

■ 2. Section 412.3 is amended by revising paragraph (a) to read as follows:

§ 412.3 Admissions.

(a) For purposes of payment under Medicare Part A, an individual is considered an inpatient of a hospital, including a critical access hospital, if formally admitted as an inpatient pursuant to an order for inpatient admission by a physician or other qualified practitioner in accordance with this section and §§ 482.24(c), 482.12(c), and 485.638(a)(4)(iii) of this chapter for a critical access hospital. In addition, inpatient rehabilitation facilities also must adhere to the admission requirements specified in § 412.622.

* * * * *

■ 3. Section 412.4 is amended by adding paragraph (c)(4) to read as follows:

§ 412.4 Discharges and transfers.

* * * * *

(c) * * *

(4) For discharges occurring on or after October 1, 2018, to hospice care provided by a hospice program.

* * * * *

■ 4. Section 412.22 is amended by adding paragraph (h)(2)(iii)(A)(*4*) to read as follows:

§ 412.22 Excluded hospitals and hospital units: General rules.

* * * * *

(h) * * *

(2) * * *

(iii) * * *

(A) * * *

(*4*) On or after October 1, 2018, a satellite facility that is part of a hospital excluded from the prospective payment systems specified in § 412.1(a)(1) that provides inpatient services in a building also used by another hospital that is excluded from the prospective payment systems specified in § 412.1(a)(1), or in one or more entire buildings located on the same campus as buildings used by another hospital that is excluded from the prospective payment systems

specified in § 412.1(a)(1), is not required to meet the criteria specified in paragraphs (h)(2)(iii)(A)(*1*) through (*3*) of this section in order to be excluded from the inpatient prospective payment system. A satellite facility that is part of a hospital excluded from the prospective payment systems specified in § 412.1(a)(1) which is located in a building also used by another hospital that is not excluded from the prospective payment systems specified in § 412.1(a)(1), or in one or more entire buildings located on the same campus as buildings used by another hospital that is not excluded from the prospective payment systems specified in § 412.1(a)(1), is required to meet the criteria specified in paragraphs (h)(2)(iii)(A)(*1*) through (*3*) of this section in order to be excluded from the prospective payment systems specified in § 412.1(a)(1).

* * * * *

■ 5. Section 412.23 is amended by revising paragraph (e)(3)(i) and adding paragraph (e)(3)(vii) to read as follows:

§ 412.23 Excluded hospitals: Classifications

* * * * *

(e) * * *

(3) *Calculation of average length of stay.* (i) Subject to the provisions of paragraphs (e)(3)(ii) through (vii) of this section, the average Medicare inpatient length of stay specified under paragraph (e)(2)(i) of this section is calculated by dividing the total number of covered and noncovered days of stay of Medicare inpatients (less leave or pass days) by the number of total Medicare discharges for the hospital's most recent complete cost reporting period. Subject to the provisions of paragraphs (e)(3)(ii) through (vii) of this section, the average inpatient length of stay specified under paragraph (e)(2)(ii) of this section is calculated by dividing the total number of days for all patients, including both Medicare and non-Medicare inpatients (less leave or pass days) by the number of total discharges for the hospital's most recent complete cost reporting period.

* * * * *

(vii) For cost reporting periods beginning on or after October 1, 2019, the Medicare inpatient days and discharges that are associated with patients discharged from a unit of the hospital will not be included in the calculation of the Medicare inpatient average length of stay specified under paragraph (e)(2)(i) of this section.

* * * * *

■ 6. Section 412.25 is amended by—

■ a. Revising paragraphs (a)(1)(ii) and (iii), (d), and (e)(2)(iii)(A); and

■ b. Adding paragraph (e)(2)(iv).

The revisions and addition read as follows:

§ 412.25 Excluded hospital units: Common requirements.

(a) * * *

(1) * * *

(ii) Prior to October 1, 2019, is not excluded in its entirety from the prospective payment systems; and

(iii) Unless it is a unit in a critical access hospital, the hospital of which an IRF is a unit must have at least 10 staffed and maintained hospital beds that are paid under the applicable payment system under which the hospital is paid, or at least 1 staffed and maintained hospital bed for every 10 certified inpatient rehabilitation facility beds, whichever number is greater. Otherwise, the IRF will be classified as an IRF hospital, rather than an IRF unit. In the case of an inpatient psychiatric facility unit, the hospital must have enough beds that are paid under the applicable payment system under which the hospital is paid to permit the provision of adequate cost information, as required by § 413.24(c) of this chapter.

* * * * *

(d) *Number of excluded units.* Each hospital may have only one unit of each type (psychiatric or rehabilitation) excluded from the prospective payment systems specified in § 412.1(a)(1). A hospital excluded from the prospective payment systems as specified in § 412.1(a)(1) may not have an excluded unit (psychiatric or rehabilitation) that is excluded on the same basis as the hospital.

(e) * * *

(2) * * *

(iii) * * *

(A) Except as provided in paragraph (e)(2)(iv) of this section, it is not under the control of the governing body or chief executive officer of the hospital in which it is located, and it furnishes inpatient care through the use of medical personnel who are not under the control of the medical staff or chief medical officer of the hospital in which it is located.

* * * * *

(iv) Effective for cost reporting periods beginning on or after October 1, 2019, the requirements of paragraph (e)(2)(iii)(A) of this section do not apply to a satellite facility of a unit that is part of a hospital excluded from the prospective payment systems specified in § 412.1(a)(1) that does not furnish services in a building also used by another hospital that is not excluded from the prospective payment systems specified in § 412.1(a)(1), or in one or more entire buildings located on the same campus as buildings used by another hospital that is not excluded from the prospective payment systems specified in § 412.1(a)(1).

* * * * *

■ 7. Section 412.64 is amended by revising paragraphs (d)(1)(vii) and (d)(3) to read as follows:

§ 412.64 Federal rates for inpatient operating costs for Federal fiscal year 2005 and subsequent fiscal years.

* * * * *

(d) * * *

(1) * * *

(vii) For fiscal years 2017, 2018, and 2019, the percentage increase in the market basket index (as defined in § 413.40(a)(3) of this chapter) for prospective payment hospitals, subject to the provisions of paragraphs (d)(2) and (3) of this section, less a multifactor productivity adjustment (as determined by CMS) and less 0.75 percentage point.

* * * * *

(3)(i) Beginning fiscal year 2015, in the case of a ''subsection (d) hospital,'' as defined under section 1886(d)(1)(B) of the Act, that is not a meaningful electronic health record (EHR) user as defined in part 495 of this chapter for the applicable EHR reporting period and does not receive an exception, three-fourths of the percentage increase in the market basket index (as defined in § 413.40(a)(3) of this chapter) for prospective payment hospitals is reduced—

(A) For fiscal year 2015, by 33⅓ percent;

(B) For fiscal year 2016, by 66⅔ percent; and

(C) For fiscal year 2017 and subsequent fiscal years, by 100 percent.

(ii) Beginning fiscal year 2022, in the case of a ''subsection (d) Puerto Rico hospital,'' as defined under section 1886(d)(9)(A) of the Act, that is not a meaningful EHR user as defined in part 495 of this chapter for the applicable EHR reporting period and does not receive an exception, three-fourths of the percentage increase in the market basket index (as defined in § 413.40(a)(3) of this chapter) for prospective payment hospitals is reduced—

(A) For fiscal year 2022, by 33⅓ percent;

(B) For fiscal year 2023, by 66⅔ percent; and

(C) For fiscal year 2024 and subsequent fiscal years, by 100 percent.

* * * * *

■ 8. Section 412.90 is amended by revising paragraph (j) to read as follows:

§ 412.90 General rules.

* * * * *

(j) *Medicare-dependent, small rural hospitals.* For cost reporting periods beginning on or after April 1, 1990, and before October 1, 1994, and for discharges occurring on or after October 1, 1997 and before October 1, 2022, CMS adjusts the prospective payment rates for inpatient operating costs determined under subparts D and E of this part if a hospital is classified as a Medicare-dependent, small rural hospital.

* * * * *

§ 412.92 [Amended]

■ 9. Section 412.92 is amended—
■ a. In paragraph (a)(1)(ii) by removing the term ''intermediary'' and adding the term ''MAC'' in its place;
■ b. By adding paragraph (a)(4);
■ c. In paragraph (b)(1)(i) by removing the term ''fiscal intermediary'' and adding the term ''MAC'' in its place;
■ d. In paragraphs (b)(1)(iii)(B) and (b)(1)(iv) by removing the term ''intermediary'' and adding the term ''MAC'' in its place;
■ e. In paragraph (b)(1)(v) by removing the term ''intermediary's'' and adding the term ''MAC's'' in its place, and removing the term ''intermediary'' and adding the term ''MAC'' in its place;
■ f. By revising paragraphs (b)(2)(i) and (ii) introductory text and (b)(2)(ii)(B);
■ g. By adding paragraph (b)(2)(ii)(C);
■ h. By revising paragraph (b)(2)(iv);
■ i. In paragraphs (b)(3)(i), (ii) and (iii) by removing the term ''fiscal intermediary'' and adding the term ''MAC'' in its place;
■ j. In paragraph (b)(3)(iv) by removing the phrase ''fiscal intermediary or'';
■ k. In paragraph (d)(2) introductory text and (e)(1) and (3) by removing the term ''intermediary'' wherever it appears and adding the term ''MAC'' in its place;
■ l. In paragraph (e)(2) introductory text by removing the term ''intermediary's'' and adding the term ''MAC's'' in its place;
■ m. In paragraph (e)(2)(i) by removing the term ''intermediary'' and adding the term ''MAC'' in its place; and
■ n. In paragraphs (e)(3)(i), (ii), and (iii) by removing the term ''intermediary'' and adding the term ''MAC'' in its place.

The revisions and addition read as follows:

§ 412.92 Special treatment: Sole community hospitals.

(a) * * *

(4) For a hospital with a main campus and one or more remote locations under a single provider agreement where services are provided and billed under the inpatient hospital prospective payment system and that meets the provider-based criteria at § 413.65 of this chapter as a main campus and a remote location of a hospital, combined data from the main campus and its remote location(s) are required to demonstrate that the criteria specified in paragraphs (a)(1)(i) and (ii) of this section are met. For the mileage and rural location criteria in paragraph (a) of this section and the mileage, accessibility, and travel time criteria specified in paragraphs (a)(1) through (3) of this section, the hospital must demonstrate that the main campus and its remote location(s) each independently satisfy those requirements.

(b) * * *

(2) * * *

(i) For applications received on or before September 30, 2018, sole community hospital status is effective 30 days after the date of CMS' written notification of approval, except as provided in paragraph (b)(2)(v) of this section. For applications received on or after October 1, 2018, sole community hospital status is effective as of the date the MAC receives the complete application, except as provided in paragraph (b)(2)(v) of this section.

(ii) When a court order or a determination by the Provider Reimbursement Review Board (PRRB) reverses a CMS denial of sole community hospital status and no further appeal is made, the sole community hospital status is effective as follows:

* * * * *

(B) If the hospital's application for sole community hospital status was received on or after October 1, 1983 and on or before September 30, 2018, the effective date is 30 days after the date of CMS' original written notification of denial.

(C) If the hospital's application for sole community hospital status was received on or after October 1, 2018, the effective date is the date the MAC receives the complete application.

* * * * *

(iv) For applications received on or before September 30, 2018, a hospital classified as a sole community hospital receives a payment adjustment, as described in paragraph (d) of this section, effective with discharges occurring on or after 30 days after the date of CMS' approval of the classification. For applications received on or after October 1, 2018, a hospital classified as a sole community hospital receives a payment adjustment, as described in paragraph (d) of this section, effective with discharges occurring on or after the date the MAC receives the complete application.

* * * * *

■ 10. Section 412.96 is amended by redesignating paragraph (d) as paragraph (e) and adding a new paragraph (d) to read as follows:

§ 412.96 Special treatment: Referral centers.

* * * * *

(d) *Criteria for hospitals that have remote location(s).* For a hospital with a main campus and one or more remote locations under a single provider agreement where services are provided and billed under the inpatient hospital prospective payment system and that meets the provider-based criteria at § 413.65 of this chapter as a main campus and a remote location of a hospital, combined data from the main campus and its remote location(s) are required to demonstrate that the criteria specified in paragraphs (b)(1) and (2) and (c)(1) through (5) of this section are met. For the rural location criteria specified in paragraphs (b)(1) and (c) of this section and the mileage criteria specified in paragraphs (b)(2)(ii) and (c)(4) of this section, the hospital must demonstrate that the main campus and its remote locations each independently satisfy those requirements.

* * * * *

■ 11. Section 412.101 is amended by—
■ a. Revising paragraph (b)(2);
■ b. Revising paragraphs (c)(1) and (2) introductory text;
■ c. Adding paragraph (c)(3); and
■ d. Revising paragraph (d).

The revisions and addition read as follows:

§ 412.101 Special treatment: Inpatient hospital payment adjustment for low-volume hospitals.

* * * * *

(b) * * *

(2) In order to qualify for this adjustment, a hospital must meet the following criteria, subject to the provisions of paragraph (e) of this section:

(i) For FY 2005 through FY 2010 and FY 2023 and subsequent fiscal years, a hospital must have fewer than 200 total discharges, which includes Medicare and non-Medicare discharges, during the fiscal year, based on the hospital's most recently submitted cost report, and be located more than 25 road miles (as defined in paragraph (a) of this section) from the nearest ''subsection (d)'' (section 1886(d) of the Act) hospital.

(ii) For FY 2011 through FY 2018, a hospital must have fewer than 1,600 Medicare discharges, as defined in

paragraph (a) of this section, during the fiscal year, based on the hospital's Medicare discharges from the most recently available MedPAR data as determined by CMS, and be located more than 15 road miles, as defined in paragraph (a) of this section, from the nearest ''subsection (d)'' (section 1886(d) of the Act) hospital.

(iii) For FY 2019 through FY 2022, a hospital must have fewer than 3,800 total discharges, which includes Medicare and non-Medicare discharges, during the fiscal year, based on the hospital's most recently submitted cost report, and be located more than 15 road miles (as defined in paragraph (a) of this section) from the nearest ''subsection (d)'' (section 1886(d) of the Act) hospital.

* * * * *

(c) * * *

(1) For FY 2005 through FY 2010 and FY 2023 and subsequent fiscal years, the adjustment is an additional 25 percent for each Medicare discharge.

(2) For FY 2011 through FY 2018, the adjustment is as follows:

* * * * *

(3) For FY 2019 through FY 2022, the adjustment is as follows:

(i) For low-volume hospitals with 500 or fewer total discharges, which includes Medicare and non-Medicare discharges, during the fiscal year, based on the hospital's most recently submitted cost report, the adjustment is an additional 25 percent for each Medicare discharge.

(ii) For low-volume hospitals with more than 500 and fewer than 3,800 total discharges, which includes Medicare and non-Medicare discharges, during the fiscal year, based on the hospital's most recently submitted cost report, the adjustment for each Medicare discharge is an additional percent calculated using the formula [(95/330) − (number of total discharges/13,200)]. ''Total discharges'' is determined as described in paragraph (b)(2)(iii) of this section.

(d) *Eligibility of new hospitals for the adjustment.* For FYs 2005 through 2010 and FY 2019 and subsequent fiscal years, a new hospital will be eligible for a low-volume adjustment under this section once it has submitted a cost report for a cost reporting period that indicates that it meets discharge requirements during the applicable fiscal year and has provided its Medicare administrative contractor with sufficient evidence that it meets the distance requirement, as specified in paragraph (b)(2) of this section.

* * * * *

■ 12. Section 412.103 is amended by adding paragraph (a)(7) and revising paragraph (b)(6) to read as follows:

§ 412.103 Special treatment: Hospitals located in urban areas and that apply for reclassification as rural.

(a) * * *

(7) For a hospital with a main campus and one or more remote locations under a single provider agreement where services are provided and billed under the inpatient hospital prospective payment system and that meets the provider-based criteria at § 413.65 of this chapter as a main campus and a remote location of a hospital, the hospital is required to demonstrate that the main campus and its remote location(s) each independently satisfy the location conditions specified in paragraphs (a)(1) and (2) of this section.

(b) * * *

(6) *Lock-in date for the wage index calculation and budget neutrality.* In order for a hospital to be treated as rural in the wage index and budget neutrality calculations under § 412.64(e)(1)(ii), (e)(2) and (4), and (h) for the payment rates for the next Federal fiscal year, the hospital's application must be approved by the CMS Regional Office in accordance with the requirements of this section no later than 60 days after the public display date at the Office of the Federal Register of the inpatient prospective payment system proposed rule for the next Federal fiscal year.

* * * * *

§ 412.105 [Amended]

■ 13. Section 412.105 is amended in paragraph (f)(1)(vii) by removing the reference ''§§ 413.79(e)(1) through (e)(4)'' and adding in its place the reference ''§ 413.79(e)''.

■ 14. Section 412.106 is amended by adding paragraph (g)(1)(iii)(C)(*5*) to read as follows:

§ 412.106 Special treatment: Hospitals that serve a disproportionate share of low-income patients.

* * * * *

(g) * * *

(1) * * *

(iii) * * *

(C) * * *

(*5*) For fiscal year 2019, CMS will base its estimates of the amount of hospital uncompensated care on utilization data for Medicaid and Medicare SSI patients, as determined by CMS in accordance with paragraphs (b)(2)(i) and (4) of this section, using data on Medicaid utilization from 2013 cost reports from the most recent HCRIS database extract and the most recent available year of data on Medicare SSI utilization (or, for Puerto Rico hospitals, a proxy for Medicare SSI utilization data), and for hospitals other than Puerto Rico hospitals, IHS or Tribal hospitals, and all-inclusive rate providers, data on uncompensated care costs, defined as charity care costs plus non-Medicare and nonreimbursable Medicare bad debt costs from 2014 and 2015 cost reports from the most recent HCRIS database extract.

* * * * *

§ 412.108 [Amended]

■ 15. Section 412.108 is amended—

■ a. By revising paragraph (a)(1);

■ b. By adding paragraph (a)(3);

■ c. By revising paragraph (b)(4) introductory text;

■ d. In paragraphs (b)(1) and (3), and (b)(4)(i), (ii), and (iii), (b)(5), (6), (7), (8), and (9), and (d)(1), (d)(2)(i), (d)(3) introductory text, and (d)(3)(i), (ii), and (iii) by removing the terms ''fiscal intermediary'' and ''intermediary'' wherever they appear and adding the term ''MAC'' in their place;

■ e. In paragraph (b)(8) and (9) and (d)(2) introductory text by removing the terms ''fiscal intermediary's'' and ''intermediary's'' and adding the term ''MAC's'' in their place; and

■ f. By revising paragraph (c)(2)(iii) introductory text.

The revisions and additions read as follows:

§ 412.108 Special treatment: Medicare-dependent, small rural hospitals.

(a) * * *

(1) *General considerations.* For cost reporting periods beginning on or after April 1, 1990, and ending before October 1, 1994, or for discharges occurring on or after October 1, 1997, and before October 1, 2022, a hospital is classified as a Medicare-dependent, small rural hospital if it meets all of the following conditions:

(i) It is located in a rural area (as defined in subpart D of this part) or it is located in a State with no rural area and satisfies any of the criteria under § 412.103(a)(1) or (3) or under § 412.103(a)(2) as of January 1, 2018.

(ii) The hospital has 100 or fewer beds as defined in § 412.105(b) during the cost reporting period.

(iii) The hospital is not also classified as a sole community hospital under § 412.92.

(iv) At least 60 percent of the hospital's inpatient days or discharges were attributable to individuals entitled to Medicare Part A benefits during the hospital's cost reporting period or periods as follows, subject to the provisions of paragraph (a)(1)(v) of this section:

(A) The hospital's cost reporting period ending on or after September 30, 1987 and before September 30, 1988.

(B) If the hospital does not have a cost reporting period that meets the criterion set forth in paragraph (a)(1)(iv)(A) of this section, the hospital's cost reporting period beginning on or after October 1, 1986, and before October 1, 1987.

(C) At least two of the last three most recent audited cost reporting periods for which the Secretary has a settled cost report.

(v) If the cost reporting period determined under paragraph (a)(1)(iv) of this section is for less than 12 months, the hospital's most recent 12-month or longer cost reporting period before the short period is used.

* * * * *

(3) *Criteria for hospitals that have remote location(s).* For a hospital with a main campus and one or more remote locations under a single provider agreement where services are provided and billed under the inpatient hospital prospective payment system and that meets the provider-based criteria at § 413.65 of this chapter as a main campus and a remote location of a hospital, combined data from the main campus and its remote location (s) are required to demonstrate that the criteria in paragraphs (a)(1) and (2) of this section are met. For the location requirement specified in paragraph (a)(1)(i) of this section, the hospital must demonstrate that the main campus and its remote locations each independently satisfy this requirement.

(b) * * *

(4) For applications received on or before September 30, 2018, a determination of MDH status made by the MAC is effective 30 days after the date the MAC provides written notification to the hospital. For applications received on or after October 1, 2018, a determination of MDH status made by the MAC is effective as of the date the MAC receives the complete application. An approved MDH status determination remains in effect unless there is a change in the circumstances under which the status was approved.

* * * * *

(c) * * *

(2) * * *

(iii) For discharges occurring during cost reporting periods (or portions thereof) beginning on or after October 1, 2006, and before October 1, 2022, 75 percent of the amount that the Federal rate determined under paragraph (c)(1) of this section is exceeded by the highest of the following:

* * * * *

■ 16. Section 412.152 is amended by adding, in alphabetical order, definitions of ''Applicable period for dual-eligibility'', ''Dual-eligible'', and ''Proportion of dual-eligibles'' to read as follows:

§ 412.152 Definitions for the Hospital Readmissions Reduction Program.

* * * * *

Applicable period for dual-eligibility is the 3-year data period corresponding to the applicable period as established by the Secretary for the Hospital Readmissions Reduction Program.

* * * * *

Dual-eligible is a patient beneficiary who has been identified as having full benefit status in both the Medicare and Medicaid programs in the State Medicare Modernization Act (MMA) files for the month the beneficiary was discharged from the hospital.

* * * * *

Proportion of dual-eligibles is the number of dual-eligible patients among all Medicare Fee-for-Service and Medicare Advantage stays during the applicable period.

* * * * *

■ 17. Section 412.164 is amended by revising paragraph (a) to read as follows:

§ 412.164 Measure selection under the Hospital Value-Based Purchasing (VBP) Program.

(a) CMS will select measures, other than measures of readmissions, for purposes of the Hospital VBP Program. The measures will be selected from the measures specified under section 1886(b)(3)(B)(viii) of the Act (the Hospital Inpatient Quality Reporting Program).

* * * * *

■ 18. Section 412.200 is revised to read as follows:

§ 412.200 General provisions.

Beginning with discharges occurring on or after October 1, 1987, hospitals located in Puerto Rico are subject to the rules governing the prospective payment system for inpatient operating costs. Except as provided in this subpart, the provisions of subparts A, B, C, F, G, and H of this part apply to hospitals located in Puerto Rico. Except for § 412.60, which deals with DRG classification and weighting factors, or as otherwise specified, the provisions of subparts D and E, which describe the methodology used to determine prospective payment rates for inpatient operating costs for hospitals, do not apply to hospitals located in Puerto Rico. Instead, the methodology for determining prospective payment rates for inpatient operating costs for these hospitals is set forth in §§ 412.204 through 412.212.

■ 19. Section 412.230 is amended by revising paragraph (d)(5) to read as follows:

§ 412.230 Criteria for an individual hospital seeking redesignation to another rural area or an urban area.

* * * * *

(d) * * *

(5) *Single hospital MSA exception.* The requirements of paragraph (d)(1)(iii) of this section do not apply if a hospital is the single hospital in its MSA with published 3-year average hourly wage data included in the current fiscal year inpatient prospective payment system final rule.

■ 20. Section 412.500 is amended by adding paragraphs (a)(9) and (10) to read as follows:

§ 412.500 Basis and scope of subpart.

(a) * * *

(9) Section 51005(a) of Public Law 115–123 which extended the blended payment rate for the site neutral payment rate cases to apply to discharges occurring in cost reporting periods beginning in FYs 2018 and 2019.

(10) Section 51005(b) of Public Law which reduces the IPPS comparable amount for the site neutral payment rate cases by 4.6 percent for FYs 2018 through 2026.

* * * * *

■ 21. Section 412.522 is amended by—

■ a. Adding paragraph (c)(1)(iii);

■ b. Removing paragraph (c)(2)(v); and

■ c. Revising paragraph (c)(3) introductory text.

The addition and revision read as follows:

§ 412.522 Application of site neutral payment rate.

* * * * *

(c) * * *

(1) * * *

(iii) For discharges occurring in fiscal years 2018 through 2026, the amount in paragraph (c)(1)(i) of this section is reduced by 4.6 percent.

* * * * *

(3) *Transition.* For discharges occurring in cost reporting periods beginning on or after October 1, 2015 and on or before September 30, 2019, payment for discharges under paragraph (c)(1) of this section are made using a blended payment rate, which is determined as—

* * * * *

■ 22. Section 412.523 is amended by adding paragraphs (c)(3)(xv) and (d)(6) to read as follows:

§ 412.523 Methodology for calculating the Federal prospective payment rates.

* * * * *

(c) * * *

(3) * * *

(xv) *For long-term care hospital prospective payment system fiscal year beginning October 1, 2018, and ending September 30, 2019.* The LTCH PPS standard Federal payment rate for the long-term care hospital prospective payment system beginning October 1, 2018, and ending September 30, 2019, is the standard Federal payment rate for the previous long-term care hospital prospective payment system fiscal year updated by 1.35 percent and further adjusted, as appropriate, as described in paragraph (d) of this section.

* * * * *

(d) * * *

(6) *Adjustment for the elimination of the limitation on long-term care hospital admissions from referring hospitals.* The standard Federal payment rate determined in paragraph (c)(3) of this section is adjusted as follows:

(i) For discharges occurring on or after October 1, 2018 and before October 1, 2019, by a one-time factor so that estimated aggregate payments to LTCH PPS standard Federal rate cases in FY 2019, and the portion of estimated aggregate payments to site neutral cases that are paid based on the LTCH PPS standard Federal rate in FY 2019, are projected to equal estimated aggregate payments that would have been paid for such cases without regard to the elimination of the limitation on long-term care hospital admissions from referring hospitals. This adjustment only applies to the fiscal year involved and will not be taken into account in computing the standard Federal payment rate for a subsequent fiscal year.

(ii) For discharges occurring on or after October 1, 2019 and before October 1, 2020, by a one-time factor so that estimated aggregate payments to LTCH PPS standard Federal rate cases in FY 2020, and the portion of estimated aggregate payments to site neutral payment rate cases that are paid based on the LTCH PPS standard Federal rate in FY 2020, are projected to equal estimated aggregate payments that would have been paid for such cases without regard to the elimination of the limitation on long-term care hospital admissions from referring hospitals. This adjustment only applies to the fiscal year involved and will not be taken into account in computing the standard Federal payment rate for a subsequent fiscal year.

(iii) For discharges occurring on or after October 1, 2020, by a permanent, one-time factor so that estimated aggregate payments to LTCH PPS standard Federal rate cases in FY 2021 are projected to equal estimated aggregate payments that would have been paid for such cases without regard to the elimination of the limitation on long-term care hospital admissions from referring hospitals.

* * * * *

§ 412.525 [Amended]

■ 22. Section 412.525 is amended by removing paragraph (d)(6).

§ 412.538 [Removed and reserved]

■ 23. Section 412.538 is removed and reserved.

■ 24. Section 412.560 is amended by—

■ a. Adding paragraph (b)(3); and

■ b. Revising paragraphs (d)(1) and (3).

The addition and revisions read as follows:

§ 412.560 Requirements under the Long-Term Care Hospital Quality Reporting Program (LTCH QRP).

* * * * *

(b) * * *

(3) CMS may remove a quality measure from the LTCH QRP based on one or more of the following factors:

(i) Measure performance among long-term care hospitals is so high and unvarying that meaningful distinctions in improvements in performance can no longer be made.

(ii) Performance or improvement on a measure does not result in better patient outcomes.

(iii) A measure does not align with current clinical guidelines or practice.

(iv) The availability of a more broadly applicable (across settings, populations, or conditions) measure for the particular topic.

(v) The availability of a measure that is more proximal in time to desired patient outcomes for the particular topic.

(vi) The availability of a measure that is more strongly associated with desired patient outcomes for the particular topic.

(vii) Collection or public reporting of a measure leads to negative unintended consequences other than patient harm.

(viii) The costs associated with a measure outweigh the benefit of its continued use in the program.

* * * * *

(d) * * *

(1) *Written letter of non-compliance decision.* Long-term care hospitals that do not meet the requirement in paragraph (b) of this section for a program year will receive a notification of non-compliance sent through at least one of the following methods: Quality Improvement and Evaluation System (QIES) Assessment Submission and Processing (ASAP) system, the United States Postal Service, or via an email from the MAC.

* * * * *

(3) *CMS decision on reconsideration request.* CMS will notify long-term care hospitals, in writing, of its final decision regarding any reconsideration request through at least one of the following methods: The QIES ASAP system, the United States Postal Service, or via an email from the MAC.

* * * * *

PART 413—PRINCIPLES OF REASONABLE COST REIMBURSEMENT; PAYMENT FOR END-STAGE RENAL DISEASE SERVICES; PROSPECTIVELY DETERMINED PAYMENT RATES FOR SKILLED NURSING FACILITIES; PAYMENT FOR ACUTE KIDNEY INJURY DIALYSIS

■ 25. The authority citation for part 413 continues to read as follows:

Authority: Secs. 1102, 1812(d), 1814(b), 1815, 1833(a), (i), and (n), 1861(v), 1871, 1881, 1883 and 1886 of the Social Security Act (42 U.S.C. 1302, 1395d(d), 1395f(b), 1395g, 1395l(a), (i), and (n), 1395x(v), 1395hh, 1395rr, 1395tt, and 1395ww); and sec. 124 of Public Law 106–113, 113 Stat. 1501A–332; sec. 3201 of Public Law 112–96, 126 Stat. 156; sec. 632 of Public Law 112–240, 126 Stat. 2354; sec. 217 of Public Law 113–93, 129 Stat. 1040; and sec. 204 of Public Law 113–295, 128 Stat. 4010; and sec. 808 of Public Law 114–27, 129 Stat. 362.

■ 26. Section 413.24 is amended by revising paragraph (f)(5)(i) to read as follows:

§ 413.24 Adequate cost data and cost finding.

* * * * *

(f) * * *

(5) * * *

(i) All providers—The provider must accurately complete and submit the required cost reporting forms, including all necessary signatures and supporting documents. For providers claiming costs on their cost reports that are allocated from a home office or chain organization, the Home Office Cost statement must be submitted by the home office or chain organization as set forth in paragraph (f)(5)(i)(E) of this section. A cost report is rejected for lack of supporting documentation if it does not include the following, except as provided in paragraph (f)(5)(i)(E) of this section:

(A) *Teaching hospitals*—For teaching hospitals, the Intern and Resident Information System (IRIS) data.

(B) *Bad debt*—Effective for cost reporting periods beginning on or after October 1, 2018, for providers claiming Medicare bad debt reimbursement, a detailed bad debt listing that corresponds to the amount of bad debt claimed in the provider's cost report.

(C) *DSH eligible hospitals*—Effective for cost reporting periods beginning on or after October 1, 2018, for hospitals claiming a disproportionate share hospital payment adjustment, a detailed listing of the hospital's Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the hospital's cost report. If the hospital submits an amended cost report that changes its Medicaid eligible days, the hospital must submit an amended listing or an addendum to the original listing of the hospital's Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the hospital's amended cost report.

(D) *Charity care and uninsured discounts*—Effective for cost reporting periods beginning on or after October 1, 2018, for DSH eligible hospitals reporting charity care and/or uninsured discounts, a detailed listing of charity care and/or uninsured discounts that corresponds to the amounts claimed in the DSH eligible hospital's cost report.

(E) *Home office cost allocation.* (*1*) *Same fiscal year end.* Effective for cost reporting periods beginning on or after October 1, 2018, for providers claiming costs on their cost report that are allocated from a home office or chain organization with the same fiscal year end, a Home Office Cost Statement completed and submitted by the home office or chain organization to its chain provider's servicing contractor that corresponds to the amounts allocated from the home office or chain organization to the provider's cost report.

(*2*) *Differing fiscal year end.* Effective for cost reporting periods beginning on or after October 1, 2018, for providers claiming costs on their cost report that are allocated from a home office or chain organization with a different fiscal year end, a Home Office Cost Statement completed and submitted by the home office or chain organization to its chain provider's servicing contractor that corresponds to some portion of the amounts allocated from the home office or chain organization to the provider's cost report.

* * * * *

■ 27. Section 413.79 is amended by revising paragraph (e)(1)(iv) to read as follows:

§ 413.79 Direct GME payments: Determination of the weighted number of FTE residents.

* * * * *

(e) * * *

(1) * * *

(iv)(A) Effective for Medicare GME affiliation agreements entered into on or after October 1, 2005, exceptas provided in paragraph (e)(1)(iv)(B) of this section, an urban hospital that qualifies for an adjustment to its FTE cap under paragraph (e)(1) of this section is permitted to be part of a Medicare GME affiliated group for purposes of establishing an aggregate FTE cap only if the adjustment that results from the affiliation is an increase to the urban hospital's FTE cap.

(B) Effective for Medicare GME affiliation agreements entered into on or after July 1, 2019, an urban hospital that qualifies for an adjustment to its FTE cap under paragraph (e)(1) of this section is permitted to be part of a Medicare GME affiliated group for purposes of establishing an aggregate FTE cap and receive an adjustment that is a decrease to the urban hospital's FTE cap, provided the Medicare GME affiliated group meets one of the following conditions:

(*1*) The Medicare GME affiliated group consists solely of two or more urban hospitals that qualify for adjustments to their FTE caps under paragraph (e)(1) of this section.

(*2*) The Medicare GME affiliated group includes an urban hospital(s) that received FTE cap(s) under paragraph (c)(2)(i) of this section or § 412.105(f)(1)(iv)(A) of this subchapter, or both. This Medicare GME affiliated group must be established effective with a July 1 date (the residency training year) that is at least 5 years after the start of the cost reporting period that coincides with or follows the start of the sixth program year of the first new program for which the hospital's FTE cap was adjusted in accordance with paragraph (e)(1) of this section or § 412.105(f)(1)(v)(C) or (D) of this subchapter, or both.

PART 424—CONDITIONS FOR MEDICARE PAYMENT

■ 28. The authority citation for part 424 continues to read as follows:

Authority: Secs. 1102 and 1871 of the Social Security Act (42 U.S.C. 1302 and 1395hh).

■ 29. Section 424.11 is amended by revising paragraphs (b) and (c) to read as follows:

§ 424.11 General procedures.

* * * * *

(b) *Obtaining the certification and recertification statements.* No specific procedures or forms are required for certification and recertification statements. The provider may adopt any method that permits verification. The certification and recertification statements may be entered on forms, notes, or records that the appropriate individual signs, or on a special separate form. Except as provided in paragraph (d) of this section for delayed certifications, there must be a separate signed statement for each certification or recertification. If supporting information for the signed statement is contained in other provider records (such as physicians' progress notes), it need not be repeated in the statement itself.

(c) *Required information.* The succeeding sections of this subpart set forth specific information required for different types of services.

* * * * *

PART 495—STANDARDS FOR THE ELECTRONIC HEALTH RECORD TECHNOLOGY INCENTIVE PROGRAM

■ 30. The authority citation for part 495 continues to read as follows:

Authority: Secs. 1102 and 1871 of the Social Security Act (42 U.S.C. 1302 and 1395hh).

■ 31. Section 495.4 is amended—

■ a. In the definition of ''EHR reporting period'' by revising paragraph (1)(iii), adding paragraph (1)(iv), revising paragraphs (2)(ii)(C) and (D) and (2)(iii), and adding paragraph (2)(iv);

■ b. In the definition of ''EHR reporting period for a payment adjustment year'' by revising paragraph (2)(iii) and adding paragraph (2)(iv), revising paragraph (3)(iii), and adding paragraph (3)(iv); and

■ c. By revising the definitions of ''Payment adjustment year'' and ''Payment year''.

The revisions and additions read as follows:

§ 495.4 Definitions.

* * * * *

EHR reporting period. * * *

(1) * * *

(iii) For the CY 2019 payment year under the Medicaid Promoting Interoperability Program:

(A) For the EP first demonstrating he or she is a meaningful EHR user, any continuous 90-day period within CY 2019.

(B) For the EP who has successfully demonstrated he or she is a meaningful

EHR user in any prior year, any continuous 90-day period within CY 2019.

(iv) For the CY 2020 payment year under the Medicaid Promoting Interoperability Program:

(A) For the EP first demonstrating he or she is a meaningful EHR user, any continuous 90-day period within CY 2020.

(B) For the EP who has successfully demonstrated he or she is a meaningful EHR user in any prior year, any continuous 90-day period within CY 2020.

(2) * * *

(ii) * * *

(C) For the FY 2017 payment year as follows:

(*1*) Under the Medicaid EHR Incentive Program:

(*i*) For the eligible hospital or CAH first demonstrating it is a meaningful EHR user, any continuous 90-day period within CY 2017.

(*ii*) For the eligible hospital or CAH that has successfully demonstrated it is a meaningful EHR user in any prior year, any continuous 90-day period within CY 2017.

(*iii*) For the eligible hospital or CAH demonstrating the Stage 3 objectives and measures at § 495.24, any continuous 90-day period within CY 2017.

(*2*) Under the Medicare EHR Incentive Program, for a Puerto Rico eligible hospital, any continuous 14-day period within CY 2017.

(D) For the FY 2018 payment year as follows:

(*1*) Under the Medicaid Promoting Interoperability Program:

(*i*) For the eligible hospital or CAH first demonstrating it is a meaningful EHR user, any continuous 90-day period within CY 2018.

(*ii*) For the eligible hospital or CAH that has successfully demonstrated it is a meaningful EHR user in any prior year, any continuous 90-day period within CY 2018.

(*2*) Under the Medicare Promoting Interoperability Program, for a Puerto Rico eligible hospital, any continuous 90-day period within CY 2018.

(iii) For the FY 2019 payment year as follows:

(A) Under the Medicaid Promoting Interoperability Program:

(*1*) For the eligible hospital or CAH first demonstrating it is a meaningful EHR user, any continuous 90-day period within CY 2019.

(*2*) For the eligible hospital or CAH that has successfully demonstrated it is a meaningful EHR user in any prior year, any continuous 90-day period within CY 2019.

(B) Under the Medicare Promoting Interoperability Program, for a Puerto Rico eligible hospital, any continuous 90-day period within CY 2019.

(iv) For the FY 2020 payment year as follows:

(A) Under the Medicaid Promoting Interoperability Program:

(*1*) For the eligible hospital or CAH first demonstrating it is a meaningful EHR user, any continuous 90-day period within CY 2020.

(*2*) For the eligible hospital or CAH that has successfully demonstrated it is a meaningful EHR user in any prior year, any continuous 90-day period within CY 2020.

(B) Under the Medicare Promoting Interoperability Program, for a Puerto Rico eligible hospital, any continuous 90-day period within CY 2020.

* * * * *

EHR reporting period for a payment adjustment year. * * *

(2) * * *

(iii) The following are applicable for 2019:

(A) If an eligible hospital has not successfully demonstrated it is a meaningful EHR user in a prior year, the EHR reporting period is any continuous 90-day period within CY 2019 and applies for the FY 2020 and 2021 payment adjustment years. For the FY 2020 payment adjustment year, the EHR reporting period must end before and the eligible hospital must successfully register for and attest to meaningful use no later than October 1, 2019.

(B) If in a prior year an eligible hospital has successfully demonstrated it is a meaningful EHR user, the EHR reporting period is any continuous 90-day period within CY 2019 and applies for the FY 2021 payment adjustment year.

(iv) The following are applicable for 2020:

(A) If an eligible hospital has not successfully demonstrated it is a meaningful EHR user in a prior year, the EHR reporting period is any continuous 90-day period within CY 2020 and applies for the FY 2021 and 2022 payment adjustment years. For the FY 2021 payment adjustment year, the EHR reporting period must end before and the eligible hospital must successfully register for and attest to meaningful use no later than October 1, 2020.

(B) If in a prior year an eligible hospital has successfully demonstrated it is a meaningful EHR user, the EHR reporting period is any continuous 90-day period within CY 2020 and applies for the FY 2022 payment adjustment year.

(3) * * *

(iii) The following are applicable for 2019:

(A) If a CAH has not successfully demonstrated it is a meaningful EHR user in a prior year, the EHR reporting period is any continuous 90-day period within CY 2019 and applies for the FY 2019 payment adjustment year.

(B) If in a prior year a CAH has successfully demonstrated it is a meaningful EHR user, the EHR reporting period is any continuous 90-day period within CY 2019 and applies for the FY 2019 payment adjustment year.

(iv) The following are applicable for 2020:

(A) If a CAH has not successfully demonstrated it is a meaningful EHR user in a prior year, the EHR reporting period is any continuous 90-day period within CY 2020 and applies for the FY 2020 payment adjustment year.

(B) If in a prior year a CAH has successfully demonstrated it is a meaningful EHR user, the EHR reporting period is any continuous 90-day period within CY 2020 and applies for the FY 2020 payment adjustment year.

* * * * *

Payment adjustment year means the following:

(1) For an EP, a calendar year beginning with CY 2015.

(2) For a CAH or an eligible hospital, a Federal fiscal year beginning with FY 2015.

(3) For a Puerto Rico eligible hospital, a Federal fiscal year beginning with FY 2022.

Payment year means the following:

(1) For an EP, a calendar year beginning with CY 2011.

(2) For a CAH or an eligible hospital, a Federal fiscal year beginning with FY 2011.

(3) For a Puerto Rico eligible hospital, a Federal fiscal year beginning with FY 2016.

* * * * *

■ 32. Section 495.24 is amended by revising the introductory text, paragraphs (c) and (d) headings and adding paragraph (e) to read as follows:

§ 495.24 Stage 3 meaningful use objectives and measures for EPs, eligible hospitals and CAHs for 2019 and subsequent years.

The criteria specified in paragraphs (c) and (d) of this section are optional for 2017 and 2018 for EPs, eligible hospitals, and CAHs that have successfully demonstrated meaningful use in a prior year. The criteria specified in paragraph (d) of this section are applicable for all EPs for 2019 and subsequent years, and for eligible hospitals and CAHs attesting to a State for the Medicaid Promoting

Interoperability Program for 2019 and subsequent years. The criteria specified in paragraph (e) of this section are applicable for eligible hospitals and CAHs attesting to CMS for 2019 and subsequent years.

* * * * *

(c) *Stage 3 objectives and measures for eligible hospitals and CAHs attesting to CMS—*

* * * * *

(d) *Stage 3 objectives and measures for all EPs for 2019 and subsequent years, and for eligible hospitals and CAHs attesting to a State for the Medicaid Promoting Interoperability Program for 2019 and subsequent years—*

* * * * *

(e) *Stage 3 objectives and measures for eligible hospitals and CAHs attesting to CMS for 2019 and subsequent years—* (1) *General rule.* Except as specified in paragraph (e)(2) of this section, eligible hospitals and CAHs must meet all objectives and associated measures of the Stage 3 criteria specified in this paragraph (e) and earn a total score of at least 50 points to meet the definition of a meaningful EHR user.

(2) *Exclusion for nonapplicable measures.* (i) An eligible hospital or CAH may exclude a particular measure that includes an option for exclusion contained in this paragraph (e) if the eligible hospital or CAH meets the following requirements:

(A) Meets the criteria in the applicable measure that would permit the exclusion.

(B) Attests to the exclusion.

(ii) *Distribution of points for nonapplicable measures.* For eligible hospitals or CAHs that claim such exclusion, the points assigned to the excluded measure will be distributed to other measures as outlined in this paragraph (e).

(3) *Objectives and associated measures in this paragraph (e) that rely on measures that count unique patients or actions.* (i) If a measure (or associated objective) in this paragraph (e) references paragraph (e)(3) of this section, the measure may be calculated by reviewing only the actions for patients whose records are maintained using CEHRT. A patient's record is maintained using CEHRT if sufficient data were entered in the CEHRT to allow the record to be saved, and not rejected due to incomplete data.

(ii) If the objective and associated measure does not reference this paragraph (e)(3), the measure must be calculated by reviewing all patient records, not just those maintained using CEHRT.

(4) *Protect patient health information*—(i) *Objective.* Protect electronic protected health information (ePHI) created or maintained by the CEHRT through the implementation of appropriate technical, administrative, and physical safeguards.

(ii) *Measure scoring.* Eligible hospitals and CAHs are required to report on the security risk analysis measure in paragraph (e)(4)(iii) of this section, but no points are available for this measure.

(iii) *Security risk analysis measure.* Conduct or review a security risk analysis in accordance with the requirements under 45 CFR 164.308(a)(1), including addressing the security (including encryption) of data created or maintained by CEHRT in accordance with requirements under 45 CFR 164.312(a)(2)(iv) and 45 CFR 164.306(d)(3), implement security updates as necessary, and correct identified security deficiencies as part of the provider's risk management process.

(5) *Electronic prescribing*—(i) *Objective.* Generate and transmit permissible discharge prescriptions electronically (eRx).

(ii) *Measures scoring.* (A) In 2019, eligible hospitals and CAHs must meet the e-Prescribing measure in paragraph (e)(5)(iii)(A) of this section and have the option to report on the query of PDMP measure and verify opioid treatment agreement measure in paragraphs (e)(5)(iii)(B) and (C) of this section. The electronic prescribing objective in paragraph (e)(5)(i) of this section is worth up to 20 points.

(B) In 2020 and subsequent years, eligible hospitals and CAHs must meet the e-Prescribing measure in paragraph (e)(5)(iii)(A) of this section and the query of PDMP measure in paragraph (e)(5)(iii)(B) of this section. In 2020, eligible hospitals and CAHs have the option to report on the verify opioid treatment agreement measure in paragraph (e)(5)(iii)(C) of this section. In 2020, the electronic prescribing objective in paragraph (e)(5)(i) of this section is worth up to 15 points.

(iii) *Measures.* (A) *e-Prescribing measure.* Subject to paragraph (e)(3) of this section, at least one hospital discharge medication order for permissible prescriptions (for new and changed prescriptions) is queried for a drug formulary and transmitted electronically using CEHRT. This measure is worth up to 10 points in 2019 and 5 points in subsequent years.

(B) *Query of prescription drug monitoring program (PDMP) measure.* Subject to paragraph (e)(3) of this section, for at least one Schedule II opioid electronically prescribed using CEHRT during the EHR reporting period, the eligible hospital or CAH uses data from CEHRT to conduct a query of a Prescription Drug Monitoring Program (PDMP) for prescription drug history, except where prohibited and in accordance with applicable law. This measure is worth up to 5 bonus points in CY 2019 and 5 points in subsequent years.

(C) *Verify opioid treatment agreement measure.* Subject to paragraph (e)(3) of this section, for at least one unique patient for whom a Schedule II opioid was electronically prescribed by the eligible hospital or CAH using CEHRT during the EHR reporting period, if the total duration of the patient's Schedule II opioid prescriptions is at least 30 cumulative days within a 6-month look-back period, the eligible hospital or CAH seeks to identify the existence of a signed opioid treatment agreement and incorporates it into the patient's electronic health record using CEHRT. This measure is worth up to 5 bonus points in CY 2019 and CY 2020.

(iv) *Exclusions in accordance with paragraph (e)(2) of this section and redistribution of points.* An exclusion claimed under paragraph (e)(5)(v)(A) of this section will redistribute 10 points in CY 2019 and 5 points in CY 2020 equally among the measures associated with the health information exchange objective under paragraph (e)(6) of this section. Beginning in CY 2020, an exclusion claimed under paragraph (e)(5)(v)(B), (C), or (D) of this section will redistribute 5 points from the measure specified in paragraph (e)(5)(iii)(B) of this section to the e-Prescribing measure under paragraph (e)(5)(iii)(A) of this section.

(v) *Exclusions in accordance with paragraph (e)(2) of this section.* (A) Beginning with the EHR reporting period in CY 2019, any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions and there are no pharmacies that accept electronic prescriptions within 10 miles at the start of the eligible hospital or CAH's EHR reporting period may be excluded from the measure specified in paragraph (e)(5)(iii)(A) of this section.

(B) Beginning with the EHR reporting period in CY 2020, an eligible hospital or CAH that qualifies for the exclusion in paragraph (e)(5)(v)(A) of this section is also excluded from the measure specified in paragraph (e)(5)(iii)(B) of this section.

(C) Beginning with the EHR reporting period in CY 2020, any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions for controlled substances

and is not located within 10 miles of any pharmacy that accepts electronic prescriptions for controlled substances at the start of their EHR reporting period may be excluded from the measure specified in paragraph (e)(5)(iii)(B) of this section.

(D) Beginning with the EHR reporting period in CY 2020, any eligible hospital and CAH that is unable to report on the measure specified in paragraph (e)(5)(iii)(B) of this section in accordance with applicable law may be excluded from that measure.

(6) *Health information exchange*—(i) *Objective.* The eligible hospital or CAH provides a summary of care record when transitioning or referring their patient to another setting of care, receives or retrieves a summary of care record upon the receipt of a transition or referral or upon the first patient encounter with a new patient, and incorporates summary of care information from other providers into their EHR using the functions of CEHRT.

(ii) *Measures.* Eligible hospitals and CAHs must meet both of the following measures (each worth up to 20 points), and could receive up to 40 points for this objective:

(A) *Support electronic referral loops by sending health information measure:* Subject to paragraph (e)(3) of this section, for at least one transition of care or referral, the eligible hospital or CAH that transitions or refers its patient to another setting of care or provider of care—

(*1*) Creates a summary of care record using CEHRT; and

(*2*) Electronically exchanges the summary of care record.

(B) *Support electronic referral loops by receiving and incorporating health information measure:* Subject to paragraph (e)(3) of this section, for at least one electronic summary of care record received for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the receiving party of a transition of care or referral, or for patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient, the eligible hospital or CAH conducts clinical information reconciliation for medication, mediation allergy, and current problem list.

(iii) *Exclusions in accordance with paragraph (e)(2) of this section.* Any eligible hospital or CAH that is unable to implement the support electronic referral loops by receiving and incorporating health information measure under paragraph (e)(6)(ii)(B) of this section for an EHR reporting period in 2019 may be excluded from that measure. Claiming the exclusion will redistribute 20 points to the support electronic referral loops by sending health information measure under paragraph (e)(6)(ii)(A) of this section.

(7) *Provider to patient exchange.*—(i) *Objective.* The eligible hospital or CAH provides patients (or patient-authorized representative) with timely electronic access to their health information.

(ii) *Provide patients electronic access to their health information measure.* Eligible hospitals and CAHs must meet the following measure, and could receive up to 40 points for this objective beginning in CY 2019. For at least one unique patient discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23)—

(A) The patient (or patient-authorized representative) is provided timely access to view online, download, and transmit his or her health information; and

(B) The eligible hospital or CAH ensures the patient's health information is available for the patient (or patient-authorized representative) to access using any application of their choice that is configured to meet the technical specifications of the API in the eligible hospital or CAH's CEHRT. This measure is worth up to 40 points beginning in CY 2019.

(8) *Public health and clinical data exchange.*—(i) *Objective.* The eligible hospital or CAH is in active engagement with a public health agency (PHA) or clinical data registry (CDR) to submit electronic public health data in a meaningful way using CEHRT, except where prohibited, and in accordance with applicable law and practice.

(ii) *Measures.* In order to meet the objective under paragraph (e)(8)(i) of this section, an eligible hospital or CAH must meet any two measures specified in paragraphs (e)(8)(ii)(A) through (F) of this section. Eligible hospitals and CAHs could receive a total of 10 points for this objective.

(A) *Syndromic surveillance reporting measure.* The eligible hospital or CAH is in active engagement with a public health agency to submit syndromic surveillance data from an urgent care setting.

(B) *Immunization registry reporting measure.* The eligible hospital or CAH is in active engagement with a public health agency to submit immunization data and receive immunization forecasts and histories from the public health immunization registry/immunization information system (IIS).

(C) *Electronic case reporting measure.* The eligible hospital or CAH is in active engagement with a public health agency to submit case reporting of reportable conditions.

(D) *Public health registry reporting measure.* The eligible hospital or CAH is in active engagement with a public health agency to submit data to public health registries.

(E) *Clinical data registry reporting measure.* The eligible hospital or CAH is in active engagement to submit data to a clinical data registry.

(F) *Electronic reportable laboratory result reporting measure.* The eligible hospital or CAH is in active engagement with a public health agency to submit electronic reportable laboratory results.

(iii) *Exclusions in accordance with paragraph (e)(2) of this section.* If an exclusion is claimed under paragraphs (e)(8)(iii)(A) through (F) of this section for each of the two measures selected for reporting, the 10 points for the objective specified in paragraph (e)(8)(i) of this section will be redistributed to the provide patients electronic access to their health information measure under paragraph (e)(7)(ii) of this section.

(A) Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the syndromic surveillance reporting measure specified in paragraph (e)(8)(ii)(A) of this section if the eligible hospital or CAH—

(*1*) Does not have an emergency or urgent care department.

(*2*) Operates in a jurisdiction for which no public health agency is capable of receiving electronic syndromic surveillance data in the specific standards required to meet the CEHRT definition at the start of the EHR reporting period.

(*3*) Operates in a jurisdiction where no public health agency has declared readiness to receive syndromic surveillance data from eligible hospitals or CAHs as of 6 months prior to the start of the EHR reporting period.

(B) Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from to the immunization registry reporting measure specified in paragraph (e)(8)(ii)(B) of this section if the eligible hospital or CAH—

(*1*) Does not administer any immunizations to any of the populations for which data is collected by its jurisdiction's immunization registry or immunization information system during the EHR reporting period.

(*2*) Operates in a jurisdiction for which no immunization registry or immunization information system is capable of accepting the specific standards required to meet the CEHRT definition at the start of the EHR reporting period.

(*3*) Operates in a jurisdiction where no immunization registry or immunization information system has declared readiness to receive immunization data as of 6 months prior to the start of the EHR reporting period.

(C) Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the electronic case reporting measure specified in paragraph (e)(8)(ii)(C) of this section if the eligible hospital or CAH—

(*1*) Does not treat or diagnose any reportable diseases for which data is collected by their jurisdiction's reportable disease system during the EHR reporting period.

(*2*) Operates in a jurisdiction for which no public health agency is capable of receiving electronic case reporting data in the specific standards required to meet the CEHRT definition at the start of their EHR reporting period.

(*3*) Operates in a jurisdiction where no public health agency has declared readiness to receive electronic case reporting data as of 6 months prior to the start of the EHR reporting period.

(D) Any eligible hospital or CAH meeting at least one of the following criteria may be excluded from the public health registry reporting measure specified in paragraph (e)(8)(ii)(D) of this section if the eligible hospital or CAH—

(*1*) Does not diagnose or directly treat any disease or condition associated with a public health registry in its jurisdiction during the EHR reporting period.

(*2*) Operates in a jurisdiction for which no public health agency is capable of accepting electronic registry transactions in the specific standards required to meet the CEHRT definition at the start of the EHR reporting period.

(*3*) Operates in a jurisdiction where no public health registry for which the eligible hospital or CAH is eligible has declared readiness to receive electronic registry transactions as of 6 months prior to the start of the EHR reporting period.

(E) Any eligible hospital or CAH meeting at least one of the following criteria may be excluded from the clinical data registry reporting measure specified in paragraph (e)(8)(ii)(E) of this section if the eligible hospital or CAH—

(*1*) Does not diagnose or directly treat any disease or condition associated with a clinical data registry in their jurisdiction during the EHR reporting period.

(*2*) Operates in a jurisdiction for which no clinical data registry is capable of accepting electronic registry transactions in the specific standards required to meet the CEHRT definition at the start of the EHR reporting period.

(*3*) Operates in a jurisdiction where no clinical data registry for which the eligible hospital or CAH is eligible has declared readiness to receive electronic registry transactions as of 6 months prior to the start of the EHR reporting period.

(F) Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the electronic reportable laboratory result reporting measure specified in paragraph (e)(8)(ii)(F) of this section if the eligible hospital or CAH—

(*1*) Does not perform or order laboratory tests that are reportable in its jurisdiction during the EHR reporting period.

(*2*) Operates in a jurisdiction for which no public health agency that is capable of accepting the specific ELR standards required to meet the CEHRT definition at the start of the EHR reporting period.

(*3*) Operates in a jurisdiction where no public health agency has declared readiness to receive electronic reportable laboratory results from an eligible hospital or CAH as of 6 months prior to the start of the EHR reporting period.

■ 33. Section 495.40 is amended by adding paragraph (b)(2)(vii) to read as follows:

§ 495.40 Demonstration of meaningful use criteria.

* * * * *

(b) * * *

(2) * * *

(vii) *Exception for dual-eligible eligible hospitals and CAHs beginning in CY 2019.* (A) Beginning with the EHR reporting period in CY 2019, dual-eligible eligible hospitals and CAHs (those that are eligible for an incentive payment under Medicare for meaningful use of CEHRT and/or subject to the Medicare payment reduction for failing to demonstrate meaningful use, and are also eligible to earn a Medicaid incentive payment for meaningful use) must satisfy the requirements under paragraph (b)(2) of this section by attestation and reporting information to CMS, not to their respective state Medicaid agency.

(B) Dual-eligible eligible hospitals and CAHs that demonstrate meaningful use to their state Medicaid agency may only qualify for an incentive payment under Medicaid and will not qualify for an incentive payment under Medicare and/or avoid the Medicare payment reduction.

* * * * *

■ 34. Section 495.100 is amended by revising the definition of ''Eligible hospital'' and adding a definition of ''Puerto Rico eligible hospital'' in alphabetical order to read as follows:

§ 495.100 Definitions.

* * * * *

Eligible hospital means a hospital subject to the prospective payment system specified in § 412.1(a)(1) of this chapter, excluding those hospitals specified in § 412.23 of this chapter, excluding those hospital units specified in § 412.25 of this chapter, and including Puerto Rico eligible hospitals unless otherwise indicated.

* * * * *

Puerto Rico eligible hospital means a subsection (d) Puerto Rico hospital as defined in section 1886(d)(9)(A) of the Social Security Act.

* * * * *

■ 35. Section 495.104 is amended by adding paragraphs (b)(6) through (10) and (c)(5)(vi) through (x) to read as follows:

§ 495.104 Incentive payments to eligible hospitals.

* * * * *

(b) * * *

(6) Puerto Rico eligible hospitals whose first payment year is FY 2016 may receive such payments for FYs 2016 through 2019.

(7) Puerto Rico eligible hospitals whose first payment year is FY 2017 may receive such payments for FYs 2017 through 2020.

(8) Puerto Rico eligible hospitals whose first payment year is FY 2018 may receive such payments for FYs 2018 through 2021.

(9) Puerto Rico eligible hospitals whose first payment year is FY 2019 may receive such payments for FYs 2019 through 2021.

(10) Puerto Rico eligible hospitals whose first payment year is FY 2020 may receive such payments for FYs 2020 through 2021.

(c) * * *

(5) * * *

(vi) For Puerto Rico eligible hospitals whose first payment year is FY 2016—

(A) 1 for FY 2016;

(B) ¾ for FY 2017;

(C) ½ for FY 2018; and

(D) ¼ for FY 2019.

(vii) For Puerto Rico eligible hospitals whose first payment year is FY 2017—

(A) 1 for FY 2017;

(B) ¾ for FY 2018;

(C) ½ for FY 2019; and

(D) ¼ for FY 2020;

(viii) For Puerto Rico eligible hospitals whose first payment year is FY 2018—

(A) 1 for FY 2018;

(B) ¾ for FY 2018;

(C) ½ for FY 2019; and

(D) ¼ for FY 2020.

(ix) For Puerto Rico eligible hospitals whose first payment year is FY 2019—

(A) ¾ for FY 2019;

(B) ½ for FY 2020; and

(C) ¼ for FY 2021.

(x) For Puerto Rico eligible hospitals whose first payment year is FY 2020—

(A) ½ for FY 2020; and

(B) ¼ for FY 2021.

* * * * *

■ 36. Section 495.200 is amended by revising the definitions of ''MA payment adjustment year'' and ''Payment year'' to read as follows:

§ 495.200 Definitions.

* * * * *

MA payment adjustment year means—

(1) Except as provided in paragraph (2) of this definition, for qualifying MA organizations that receive an MA EHR incentive payment for at least 1 payment year, calendar years beginning with CY 2015.

(2) For qualifying MA organizations that receive an MA EHR incentive payment for a qualifying MA-affiliated eligible hospital in Puerto Rico for at least 1 payment year, and that have not previously received an MA EHR incentive payment for a qualifying MA-affiliated eligible hospital not in Puerto Rico, calendar years beginning with CY 2022.

(3) For MA-affiliated eligible hospitals, the applicable EHR reporting period for purposes of determining whether the MA organization is subject to a payment adjustment is the Federal fiscal year ending in the MA payment adjustment year.

(4) For MA EPs, the applicable EHR reporting period for purposes of determining whether the MA organization is subject to a payment adjustment is the calendar year concurrent with the payment adjustment year.

* * * * *

Payment year means—

(1) For a qualifying MA EP, a calendar year beginning with CY 2011 and ending with CY 2016; and

(2) For an eligible hospital, a Federal fiscal year beginning with FY 2011 and ending with FY 2016; and

(3) For an eligible hospital in Puerto Rico, a Federal fiscal year beginning with FY 2016 and ending with FY 2021.

* * * * *

■ 37. Section 495.211 is amended by adding paragraph (e)(4) to read as follows:

§ 495.211 Payment adjustments effective for 2015 and subsequent MA payment years with respect to MA EPs and MA-affiliated eligible hospitals.

* * * * *

(e) * * *

(4) For MA payment adjustment years prior to 2022, subsection (d) Puerto Rico hospitals are neither potentially qualifying MA-affiliated eligible hospitals nor qualifying MA-affiliated eligible hospitals for purposes of applying the payment adjustments under paragraph (e) of this section.

■ 38. Section 495.316 is amended by revising paragraph (g)(2) to read as follows:

§ 495.316 State monitoring and reporting regarding activities required to receive an incentive payment.

* * * * *

(g) * * *

(2) Subject to paragraph (h)(2) of this section, provider-level attestation data for each eligible hospital that attests to demonstrating meaningful use for each payment year beginning with 2013 and ending after 2018.

* * * * *

■ 39. Section 495.322 is revised to read as follows:

§ 495.322 FFP for reasonable administrative expenses.

(a) Subject to prior approval conditions at § 495.324, FFP is available at 90 percent in State expenditures for administrative activities in support of implementing incentive payments to Medicaid eligible providers.

(b) FFP available under paragraph (a) of this section is available only for expenditures incurred on or before September 30, 2022, except for expenditures related to audit and appeal activities required under this subpart, which must be incurred on or before September 30, 2023.

■ 40. Section 495.324 is amended by revising paragraphs (b)(2) and (3) and (d) to read as follows:

§ 495.324 Prior approval conditions.

* * * * *

(b) * * *

(2) For the acquisition solicitation documents and any contract that a State may utilize to complete activities under this subpart, unless specifically exempted by the Department of Health and Human Services, prior to release of the acquisition solicitation documents or prior to execution of the contract, when the contract is anticipated to or will exceed $500,000.

(3) For contract amendments, unless specifically exempted by the Department of Health and Human Services, prior to execution of the contract amendment, involving contract cost increases exceeding $500,000 or contract time extensions of more than 60 days.

* * * * *

(d) A State must obtain prior written approval from HHS of its justification for a sole source acquisition, when it plans to acquire noncompetitively from a nongovernmental source HIT equipment or services, with proposed FFP under this subpart if the total State and Federal acquisition cost is more than $500,000.

Dated: July 27, 2018.

Seema Verma,

Administrator, Centers for Medicare and Medicaid Services.

Dated: July 30, 2018.

Alex M. Azar II,

Secretary, Department of Health and Human Services.

Note: The following Addendum and Appendixes will not appear in the Code of Federal Regulations.

Addendum—Schedule of Standardized Amounts, Update Factors, Rate-of-Increase Percentages Effective With Cost Reporting Periods Beginning on or After October 1, 2018, and Payment Rates for LTCHs Effective for Discharges Occurring on or After October 1, 2018

I. Summary and Background

In this Addendum, we are setting forth a description of the methods and data we used to determine the prospective payment rates for Medicare hospital inpatient operating costs and Medicare hospital inpatient capital-related costs for FY 2019 for acute care hospitals. We also are setting forth the rate-of-increase percentage for updating the target amounts for certain hospitals excluded from the IPPS for FY 2019. We note that, because certain hospitals excluded from the IPPS are paid on a reasonable cost basis subject to a rate-of-increase ceiling (and not by the IPPS), these hospitals are not affected by the figures for the standardized amounts, offsets, and budget neutrality factors. Therefore, in this final rule, we are setting forth the rate-of-increase percentage for updating the target amounts for certain hospitals excluded from the IPPS that will be effective for cost reporting periods beginning on or after October 1, 2018.

In addition, we are setting forth a description of the methods and data we used to determine the LTCH PPS standard Federal payment rate that will be applicable to Medicare LTCHs for FY 2019.

In general, except for SCHs and MDHs, for FY 2019, each hospital's payment per discharge under the IPPS is based on 100 percent of the Federal national rate, also

known as the national adjusted standardized amount. This amount reflects the national average hospital cost per case from a base year, updated for inflation.

SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: The Federal national rate (including, as discussed in section IV.G. of the preamble of this final rule, uncompensated care payments under section 1886(r)(2) of the Act); the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on FY 2006 costs per discharge.

Under section 1886(d)(5)(G) of the Act, MDHs historically were paid based on the Federal national rate or, if higher, the Federal national rate plus 50 percent of the difference between the Federal national rate and the updated hospital-specific rate based on FY 1982 or FY 1987 costs per discharge, whichever was higher. However, section 5003(a)(1) of Public Law 109–171 extended and modified the MDH special payment provision that was previously set to expire on October 1, 2006, to include discharges occurring on or after October 1, 2006, but before October 1, 2011. Under section 5003(b) of Public Law 109–171, if the change results in an increase to an MDH's target amount, we must rebase an MDH's hospital specific rates based on its FY 2002 cost report. Section 5003(c) of Public Law 109–171 further required that MDHs be paid based on the Federal national rate or, if higher, the Federal national rate plus 75 percent of the difference between the Federal national rate and the updated hospital specific rate. Further, based on the provisions of section 5003(d) of Public Law 109–171, MDHs are no longer subject to the 12-percent cap on their DSH payment adjustment factor. Section 50205 of the Bipartisan Budget Act of 2018 extended the MDH program for discharges on or after October 1, 2017 through September 30, 2022.

As discussed in section IV.B. of the preamble of this final rule, in accordance with section 1886(d)(9)(E) of the Act as amended by section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113), for FY 2019, subsection (d) Puerto Rico hospitals will continue to be paid based on 100 percent of the national standardized amount. Because Puerto Rico hospitals are paid 100 percent of the national standardized amount and are subject to the same national standardized amount as subsection (d) hospitals that receive the full update, our discussion below does not include references to the Puerto Rico standardized amount or the Puerto Rico-specific wage index.

As discussed in section II. of this Addendum, as we proposed, we are making changes in the determination of the prospective payment rates for Medicare inpatient operating costs for acute care hospitals for FY 2019. In section III. of this Addendum, we discuss our policy changes for determining the prospective payment rates for Medicare inpatient capital-related costs for FY 2019. In section IV. of this Addendum, we are setting forth the rate-of-increase percentage for determining the rate-of-increase limits for certain hospitals excluded from the IPPS for FY 2019. In section V. of this Addendum, we discuss policy changes for determining the LTCH PPS standard Federal rate for LTCHs paid under the LTCH PPS for FY 2019. The tables to which we refer in the preamble of this final rule are listed in section VI. of this Addendum and are available via the internet on the CMS website.

II. Changes to Prospective Payment Rates for Hospital Inpatient Operating Costs for Acute Care Hospitals for FY 2019

The basic methodology for determining prospective payment rates for hospital inpatient operating costs for acute care hospitals for FY 2005 and subsequent fiscal years is set forth under § 412.64. The basic methodology for determining the prospective payment rates for hospital inpatient operating costs for hospitals located in Puerto Rico for FY 2005 and subsequent fiscal years is set forth under §§ 412.211 and 412.212. Below we discuss the factors we used for determining the prospective payment rates for FY 2019.

In summary, the standardized amounts set forth in Tables 1A, 1B, and 1C that are listed and published in section VI. of this Addendum (and available via the internet on the CMS website) reflect—

- Equalization of the standardized amounts for urban and other areas at the level computed for large urban hospitals during FY 2004 and onward, as provided for under section 1886(d)(3)(A)(iv)(II) of the Act.
- The labor-related share that is applied to the standardized amounts to give the hospital the highest payment, as provided for under sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act. For FY 2019, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act (hereafter referred to as a hospital that submits quality data) and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act (hereafter referred to as a hospital that is a meaningful EHR user), there are four possible applicable percentage increases that can be applied to the national standardized amount. We refer readers to section IV.B. of the preamble of this final rule for a complete discussion on the FY 2019 inpatient hospital update. Below is a table with these four options:

FY 2019	Hospital submitted quality data and is a meaningful EHR user	Hospital submitted quality data and is NOT a meaningful EHR user	Hospital did NOT submit quality data and is a meaningful EHR user	Hospital did NOT submit quality data and is NOT a meaningful EHR user
Market Basket Rate-of-Increase	2.9	2.9	2.9	2.9
Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0.0	0.0	−0.725	−0.725
Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0.0	−2.175	0.0	−2.175
MFP Adjustment under Section 1886(b)(3)(B)(xi) of the Act	−0.8	−0.8	−0.8	−0.8
Statutory Adjustment under Section 1886(b)(3)(B)(xii) of the Act	−0.75	−0.75	−0.75	−0.75
Applicable Percentage Increase Applied to Standardized Amount	1.35	−0.825	0.625	−1.55

We note that section 1886(b)(3)(B)(viii) of the Act, which specifies the adjustment to the applicable percentage increase for ''subsection (d)'' hospitals that do not submit quality data under the rules established by the Secretary, is not applicable to hospitals located in Puerto Rico.

In addition, section 602 of Public Law 114–113 amended section 1886(n)(6)(B) of the Act to specify that Puerto Rico hospitals are eligible for incentive payments for the meaningful use of certified EHR technology, effective beginning FY 2016, and also to apply the adjustments to the applicable percentage increase under section 1886(b)(3)(B)(ix) of the Act to Puerto Rico hospitals that are not meaningful EHR users, effective FY 2022. Accordingly, because the provisions of section 1886(b)(3)(B)(ix) of the Act are not applicable to hospitals located in Puerto Rico until FY 2022, the adjustments under this provision are not applicable for FY 2019.

- An adjustment to the standardized amount to ensure budget neutrality for DRG recalibration and reclassification, as provided for under section 1886(d)(4)(C)(iii) of the Act.
- An adjustment to ensure the wage index and labor-related share changes (depending on the fiscal year) are budget neutral, as provided for under section 1886(d)(3)(E)(i) of the Act (as discussed in the FY 2006 IPPS

final rule (70 FR 47395) and the FY 2010 IPPS final rule (74 FR 44005)). We note that section 1886(d)(3)(E)(i) of the Act requires that when we compute such budget neutrality, we assume that the provisions of section 1886(d)(3)(E)(ii) of the Act (requiring a 62-percent labor-related share in certain circumstances) had not been enacted.

- An adjustment to ensure the effects of geographic reclassification are budget neutral, as provided for under section 1886(d)(8)(D) of the Act, by removing the FY 2018 budget neutrality factor and applying a revised factor.
- A positive adjustment of 0.5 percent in FYs 2019 through 2023 as required under section 414 of the MACRA.
- An adjustment to ensure the effects of the Rural Community Hospital Demonstration program required under section 410A of Public Law 108–173, as amended by sections 3123 and 10313 of Public Law 111–148, which extended the demonstration program for an additional 5 years, as amended by section 15003 of Public Law 114–255 which amended section 410A of Public Law 108–173 to provide for a 10-year extension of the demonstration program (in place of the 5-year extension required by the Affordable Care Act) beginning on the date immediately following the last day of the initial 5-year period under section 410A(a)(5) of Public Law 108–173, are budget neutral as required under section 410A(c)(2) of Public Law 108–173.
- An adjustment to remove the FY 2018 outlier offset and apply an offset for FY 2019, as provided for in section 1886(d)(3)(B) of the Act.

For FY 2019, consistent with current law, as we proposed, we applied the rural floor budget neutrality adjustment to hospital wage indexes. Also, consistent with section 3141 of the Affordable Care Act, instead of applying a State-level rural floor budget neutrality adjustment to the wage index, as we proposed, we applied a uniform, national budget neutrality adjustment to the FY 2019 wage index for the rural floor. We note that, in section III.H.2.b. of the preamble to this final rule, as we proposed, we are not extending the imputed floor policy (neither the original methodology nor the alternative methodology) for FY 2019. Therefore, for FY 2019, in this final rule, we are not including the imputed floor (calculated under the original methodology and alternative methodology) in calculating the uniform, national rural floor budget neutrality adjustment, which is reflected in the FY 2019 wage index.

A. Calculation of the Adjusted Standardized Amount

1. Standardization of Base-Year Costs or Target Amounts

In general, the national standardized amount is based on per discharge averages of adjusted hospital costs from a base period (section 1886(d)(2)(A) of the Act), updated and otherwise adjusted in accordance with the provisions of section 1886(d) of the Act. The September 1, 1983 interim final rule (48 FR 39763) contained a detailed explanation of how base-year cost data (from cost reporting periods ending during FY 1981) were established for urban and rural hospitals in the initial development of standardized amounts for the IPPS.

Sections 1886(d)(2)(B) and 1886(d)(2)(C) of the Act require us to update base-year per discharge costs for FY 1984 and then standardize the cost data in order to remove the effects of certain sources of cost variations among hospitals. These effects include case-mix, differences in area wage levels, cost-of-living adjustments for Alaska and Hawaii, IME costs, and costs to hospitals serving a disproportionate share of low-income patients.

For FY 2019, as we proposed, we are continuing to use the national labor-related and nonlabor-related shares (which are based on the 2014-based hospital market basket) that were used in FY 2018. Specifically, under section 1886(d)(3)(E) of the Act, the Secretary estimates, from time to time, the proportion of payments that are labor-related and adjusts the proportion (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs of the DRG prospective payment rates. We refer to the proportion of hospitals' costs that are attributable to wages and wage-related costs as the ''labor-related share.'' For FY 2019, as discussed in section III. of the preamble of this final rule, as we proposed, we are continuing to use a labor-related share of 68.3 percent for the national standardized amounts for all IPPS hospitals (including hospitals in Puerto Rico) that have a wage index value that is greater than 1.0000. Consistent with section 1886(d)(3)(E) of the Act, as we proposed, we applied the wage index to a labor-related share of 62 percent of the national standardized amount for all IPPS hospitals (including hospitals in Puerto Rico) whose wage index values are less than or equal to 1.0000.

The standardized amounts for operating costs appear in Tables 1A, 1B, and 1C that are listed and published in section VI. of the Addendum to this final rule and are available via the internet on the CMS website.

2. Computing the National Average Standardized Amount

Section 1886(d)(3)(A)(iv)(II) of the Act requires that, beginning with FY 2004 and thereafter, an equal standardized amount be computed for all hospitals at the level computed for large urban hospitals during FY 2003, updated by the applicable percentage update. Accordingly, as we proposed, we calculated the FY 2019 national average standardized amount irrespective of whether a hospital is located in an urban or rural location.

3. Updating the National Average Standardized Amount

Section 1886(b)(3)(B) of the Act specifies the applicable percentage increase used to update the standardized amount for payment for inpatient hospital operating costs. We note that, in compliance with section 404 of the MMA, in this final rule, as we proposed, we used the 2014-based IPPS operating and capital market baskets for FY 2019. As discussed in section IV.B. of the preamble of this final rule, in accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, as we proposed, we reduced the FY 2019 applicable percentage increase (which for this final rule is based on IGI's second quarter 2018 forecast of the 2014-based IPPS market basket) by the MFP adjustment (the 10-year moving average of MFP for the period ending FY 2019) of 0.8 percentage point, which for this final rule is also calculated based on IGI's second quarter 2018 forecast.

In addition, in accordance with section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, as we proposed, we further updated the standardized amount for FY 2019 by the estimated market basket percentage increase less 0.75 percentage point for hospitals in all areas. Sections 1886(b)(3)(B)(xi) and (xii) of the Act, as added and amended by sections 3401(a) and 10319(a) of the Affordable Care Act, further state that these adjustments may result in the applicable percentage increase being less than zero. The percentage increase in the market basket reflects the average change in the price of goods and services required as inputs to provide hospital inpatient services.

Based on IGI's 2018 second quarter forecast of the hospital market basket increase (as discussed in Appendix B of this final rule), the forecast of the hospital market basket increase for FY 2019 for this final rule is 2.9 percent. As discussed earlier, for FY 2019, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act, there are four possible applicable percentage increases that can be applied to the standardized amount. We refer readers to section IV.B. of the preamble of this final rule for a complete discussion on the FY 2019 inpatient hospital update to the standardized amount. We also refer readers to the table above for the four possible applicable percentage increases that will be applied to update the national standardized amount. The standardized amounts shown in Tables 1A through 1C that are published in section VI. of this Addendum and that are available via the internet on the CMS website reflect these differential amounts.

Although the update factors for FY 2019 are set by law, we are required by section 1886(e)(4) of the Act to recommend, taking into account MedPAC's recommendations, appropriate update factors for FY 2019 for both IPPS hospitals and hospitals and hospital units excluded from the IPPS. Section 1886(e)(5)(A) of the Act requires that we publish our recommendations in the **Federal Register** for public comment. Our recommendation on the update factors is set forth in Appendix B of this final rule.

4. Methodology for Calculation of the Average Standardized Amount

The methodology we used to calculate the FY 2019 standardized amount is as follows:

- To ensure we are only including hospitals paid under the IPPS in the calculation of the standardized amount, we applied the following inclusion and exclusion criteria: Include hospitals whose last four digits fall between 0001 and 0879 (section 2779A1 of Chapter 2 of the State Operations Manual on the CMS website at:

https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/som107c02.pdf); exclude CAHs at the time of this proposed rule; exclude hospitals in Maryland (because these hospitals are paid under an all payer model under section 1115A of the Act); and remove PPS-excluded cancer hospitals that have a ''V'' in the fifth position of their provider number or a ''E'' or ''F'' in the sixth position.

• As in the past, as we proposed, we adjusted the FY 2019 standardized amount to remove the effects of the FY 2018 geographic reclassifications and outlier payments before applying the FY 2019 updates. We then applied budget neutrality offsets for outliers and geographic reclassifications to the standardized amount based on FY 2019 payment policies.

• We do not remove the prior year's budget neutrality adjustments for reclassification and recalibration of the DRG relative weights and for updated wage data because, in accordance with sections 1886(d)(4)(C)(iii) and 1886(d)(3)(E) of the Act, estimated aggregate payments after updates in the DRG relative weights and wage index should equal estimated aggregate payments prior to the changes. If we removed the prior year's adjustment, we would not satisfy these conditions.

Budget neutrality is determined by comparing aggregate IPPS payments before and after making changes that are required to be budget neutral (for example, changes to MS–DRG classifications, recalibration of the MS–DRG relative weights, updates to the wage index, and different geographic reclassifications). We include outlier payments in the simulations because they may be affected by changes in these parameters.

• Consistent with our methodology established in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50422 through 50433), because IME Medicare Advantage payments are made to IPPS hospitals under section 1886(d) of the Act, we believe these payments must be part of these budget neutrality calculations. However, we note that it is not necessary to include Medicare Advantage IME payments in the outlier threshold calculation or the outlier offset to the standardized amount because the statute requires that outlier payments be not less than 5 percent nor more than 6 percent of total ''operating DRG payments,'' which does not include IME and DSH payments. We refer readers to the FY 2011 IPPS/LTCH PPS final rule for a complete discussion on our methodology of identifying and adding the total Medicare Advantage IME payment amount to the budget neutrality adjustments.

• Consistent with the methodology in the FY 2012 IPPS/LTCH PPS final rule, in order to ensure that we capture only fee-for-service claims, we are only including claims with a ''Claim Type'' of 60 (which is a field on the MedPAR file that indicates a claim is an FFS claim).

• Consistent with our methodology established in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57277), in order to further ensure that we capture only FFS claims, we are excluding claims with a ''GHOPAID'' indicator of 1 (which is a field on the MedPAR file that indicates a claim is not an FFS claim and is paid by a Group Health Organization).

• Consistent with our methodology established in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50422 through 50423), we examine the MedPAR file and remove pharmacy charges for anti-hemophilic blood factor (which are paid separately under the IPPS) with an indicator of ''3'' for blood clotting with a revenue code of ''0636'' from the covered charge field for the budget neutrality adjustments. We also remove organ acquisition charges from the covered charge field for the budget neutrality adjustments because organ acquisition is a pass-through payment not paid under the IPPS.

• For FY 2019, the Bundled Payments for Care Improvement (BPCI) Initiative will have ended and a new model, the BPCI Advanced model will have begun. The BPCI Advanced model, tested under the authority of section 3021 of the Affordable Care Act (codified at section 1115A of the Act), is comprised of a single payment and risk track, which bundles payments for multiple services beneficiaries receive during a Clinical Episode. Acute care hospitals may participate in the BPCI Advanced model in one of two capacities: As a model Participant or as a downstream Episode Initiator. Regardless of the capacity in which they participate in the BPCI Advanced model, participating acute care hospitals will continue to receive IPPS payments under section 1886(d) of the Act. Acute care hospitals that are Participants also assume financial and quality performance accountability for Clinical Episodes in the form of a reconciliation payment. For additional information on the BPCI Advanced model, we refer readers to the BPCI Advanced web page on the CMS Center for Medicare and Medicaid Innovation's website at: *https://innovation.cms.gov/initiatives/bpci-advanced/*.

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53341 through 53343), for FY 2013 and subsequent fiscal years, we finalized a methodology to treat hospitals that participate in the BPCI Initiative the same as prior fiscal years for the IPPS payment modeling and ratesetting process (which includes recalibration of the MS–DRG relative weights, ratesetting, calculation of the budget neutrality factors, and the impact analysis) without regard to a hospital's participation within these bundled payment models (that is, as if they are not participating in those models under the BPCI initiative). For FY 2019, consistent with how we have treated hospitals that participated in the BPCI Initiative, as we proposed, we are including all applicable data from subsection (d) hospitals participating in the BPCI Advanced model in our IPPS payment modeling and ratesetting calculations. We believe it is appropriate to include all applicable data from the subsection (d) hospitals participating in the BPCI Advanced model in our IPPS payment modeling and ratesetting calculations because these hospitals are still receiving IPPS payments under section 1886(d) of the Act.

• Consistent with our methodology established in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53687 through 53688), we believe that it is appropriate to include adjustments for the Hospital Readmissions Reduction Program and the Hospital VBP Program (established under the Affordable Care Act) within our budget neutrality calculations.

Both the hospital readmissions payment adjustment (reduction) and the hospital VBP payment adjustment (redistribution) are applied on a claim-by-claim basis by adjusting, as applicable, the base-operating DRG payment amount for individual subsection (d) hospitals, which affects the overall sum of aggregate payments on each side of the comparison within the budget neutrality calculations.

In order to properly determine aggregate payments on each side of the comparison, consistent with the approach we have taken in prior years, for FY 2019 and subsequent years, as we proposed, we are continuing to apply a proxy hospital readmissions payment adjustment and a proxy hospital VBP payment adjustment on each side of the comparison, consistent with the methodology that we adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53687 through 53688). That is, we applied a proxy readmissions payment adjustment factor and a proxy hospital VBP payment adjustment factor on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

For the purpose of calculating the proxy FY 2019 readmissions payment adjustment factors, for both the proposed rule and this final rule, as discussed in section IV.H. of the preamble of this final rule, as we proposed, we used the proportion of dually-eligible Medicare beneficiaries, excess readmission ratios, and aggregate payments for excess readmissions from the prior fiscal year's applicable period because, at the time of the development of the final rule, hospitals have not yet had the opportunity to review and correct the data (program calculations based on the FY 2019 applicable period of July 1, 2014 to June 30, 2017) before the data are made public under our policy regarding the reporting of hospital-specific readmission rates, consistent with section 1886(q)(6) of the Act. (For additional information on our general policy for the reporting of hospital-specific readmission rates, consistent with section 1886(q)(6) of the Act, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53399 through 53400) and section IV.H. of the preamble of this final rule.)

In addition, for FY 2019, for the purpose of modeling aggregate payments when determining all budget neutrality factors, as we proposed, we used proxy hospital VBP payment adjustment factors for FY 2019 that are based on data from a historical period because hospitals have not yet had an opportunity to review and submit corrections for their data from the FY 2019 performance period. (For additional information on our policy regarding the review and correction of hospital-specific measure rates under the Hospital VBP Program, consistent with section 1886(o)(10)(A)(ii) of the Act, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53578 through 53581), the CY 2012 OPPS/ASC final rule with comment

period (76 FR 74544 through 74547), and the Hospital Inpatient VBP final rule (76 FR 26534 through 26536).)

• The Affordable Care Act also established section 1886(r) of the Act, which modifies the methodology for computing the Medicare DSH payment adjustment beginning in FY 2014. Beginning in FY 2014, IPPS hospitals receiving Medicare DSH payment adjustments receive an empirically justified Medicare DSH payment equal to 25 percent of the amount that would previously have been received under the statutory formula set forth under section 1886(d)(5)(F) of the Act governing the Medicare DSH payment adjustment. In accordance with section 1886(r)(2) of the Act, the remaining amount, equal to an estimate of 75 percent of what otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals who are uninsured and an additional statutory adjustment, will be available to make additional payments to Medicare DSH hospitals based on their share of the total amount of uncompensated care reported by Medicare DSH hospitals for a given time period. In order to properly determine aggregate payments on each side of the comparison for budget neutrality, prior to FY 2014, we included estimated Medicare DSH payments on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

To do this for FY 2019 (as we did for the last 5 fiscal years), as we proposed, we included estimated empirically justified Medicare DSH payments that will be paid in accordance with section 1886(r)(1) of the Act and estimates of the additional uncompensated care payments made to hospitals receiving Medicare DSH payment adjustments as described by section 1886(r)(2) of the Act. That is, we considered estimated empirically justified Medicare DSH payments at 25 percent of what would otherwise have been paid, and also the estimated additional uncompensated care payments for hospitals receiving Medicare DSH payment adjustments on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

• When calculating total payments for budget neutrality, to determine total payments for SCHs, we model total hospital-specific rate payments and total Federal rate payments and then include whichever one of the total payments is greater. As discussed in section IV.F. of the preamble to this final rule and below, as we proposed, we are continuing to use the FY 2014 finalized methodology under which we take into consideration uncompensated care payments in the comparison of payments under the Federal rate and the hospital-specific rate for SCHs. Therefore, we included estimated uncompensated care payments in this comparison.

Similarly, for MDHs, as discussed in section IV.F. of the preamble of this final rule, when computing payments under the Federal national rate plus 75 percent of the difference between the payments under the Federal national rate and the payments under the updated hospital-specific rate, as we proposed, we continued to take into consideration uncompensated care payments in the computation of payments under the Federal rate and the hospital-specific rate for MDHs.

• As we proposed, we include an adjustment to the standardized amount for those hospitals that are not meaningful EHR users in our modeling of aggregate payments for budget neutrality for FY 2019. Similar to FY 2018, we are including this adjustment based on data on the prior year's performance. Payments for hospitals will be estimated based on the applicable standardized amount in Tables 1A and 1B for discharges occurring in FY 2019.

• In our determination of all budget neutrality factors described in section II.A.4. of this Addendum, we used transfer-adjusted discharges. Specifically, we calculated the transfer-adjusted discharges using the statutory expansion of the postacute care transfer policy to include discharges to hospice care by a hospice program as discussed in section IV.A.2.b. of the preamble of this final rule.

Comment: Based on their review of the rate information CMS made available with the proposed rule, a few commenters noted that there appeared to be an error in the determination of the hospital-specific payment rates for SCHs and MDHs that resulted in hospital-specific payment rates that are too low. These commenters urged CMS to carefully reexamine its calculations and correct the apparent error in the determination of hospital-specific payment rates.

Response: We appreciate these commenters' analysis and their bringing this to our attention. Upon review, we found that we inadvertently omitted the applicable FY 2013 factors needed to update the hospital-specific payment rates in the PSF from FY 2012 dollars. We have corrected this inadvertent omission in the determination of the hospital-specific payment rates used for this final rule.

a. Recalibration of MS–DRG Relative Weights

Section 1886(d)(4)(C)(iii) of the Act specifies that, beginning in FY 1991, the annual DRG reclassification and recalibration of the relative weights must be made in a manner that ensures that aggregate payments to hospitals are not affected. As discussed in section II.G. of the preamble of this final rule, we normalized the recalibrated MS–DRG relative weights by an adjustment factor so that the average case relative weight after recalibration is equal to the average case relative weight prior to recalibration. However, equating the average case relative weight after recalibration to the average case relative weight before recalibration does not necessarily achieve budget neutrality with respect to aggregate payments to hospitals because payments to hospitals are affected by factors other than average case relative weight. Therefore, as we have done in past years, as we proposed, we are making a budget neutrality adjustment to ensure that the requirement of section 1886(d)(4)(C)(iii) of the Act is met.

For FY 2019, to comply with the requirement that MS–DRG reclassification and recalibration of the relative weights be budget neutral for the standardized amount and the hospital-specific rates, we used FY 2017 discharge data to simulate payments and compared the following:

• Aggregate payments using the FY 2018 labor-related share percentages, the FY 2018 relative weights, and the FY 2018 pre-reclassified wage data, and applied the FY 2019 hospital readmissions payment adjustments and estimated FY 2019 hospital VBP payment adjustments; and

• Aggregate payments using the FY 2018 labor-related share percentages, the FY 2019 relative weights, and the FY 2018 pre-reclassified wage data, and applied the FY 2019 hospital readmissions payment adjustments and estimated FY 2019 hospital VBP payment adjustments applied above. (We note that these FY 2019 relative weights reflect our temporary measure for FY 2019, as discussed in section II.G. of the preamble of this final rule, to set the FY 2019 relative weight at the FY 2018 final relative weight for MS–DRGs where the FY 2018 relative weight declined by 20 percent from the FY 2017 relative weight and the FY 2019 relative weight would have declined by 20 percent or more from the FY 2018 relative weight.)

Based on this comparison, we computed a budget neutrality adjustment factor equal to 0.997192 and applied this factor to the standardized amount. As discussed in section IV. of this Addendum, as we also proposed, we applied the MS–DRG reclassification and recalibration budget neutrality factor of 0.997192 to the hospital-specific rates that are effective for cost reporting periods beginning on or after October 1, 2018.

b. Updated Wage Index—Budget Neutrality Adjustment

Section 1886(d)(3)(E)(i) of the Act requires us to update the hospital wage index on an annual basis beginning October 1, 1993. This provision also requires us to make any updates or adjustments to the wage index in a manner that ensures that aggregate payments to hospitals are not affected by the change in the wage index. Section 1886(d)(3)(E)(i) of the Act requires that we implement the wage index adjustment in a budget neutral manner. However, section 1886(d)(3)(E)(ii) of the Act sets the labor-related share at 62 percent for hospitals with a wage index less than or equal to 1.0000, and section 1886(d)(3)(E)(i) of the Act provides that the Secretary shall calculate the budget neutrality adjustment for the adjustments or updates made under that provision as if section 1886(d)(3)(E)(ii) of the Act had not been enacted. In other words, this section of the statute requires that we implement the updates to the wage index in a budget neutral manner, but that our budget neutrality adjustment should not take into account the requirement that we set the labor-related share for hospitals with wage indexes less than or equal to 1.0000 at the more advantageous level of 62 percent. Therefore, for purposes of this budget neutrality adjustment, section 1886(d)(3)(E)(i) of the Act prohibits us from taking into account the fact that hospitals with a wage

index less than or equal to 1.0000 are paid using a labor-related share of 62 percent. Consistent with current policy, for FY 2019, as we proposed, we are adjusting 100 percent of the wage index factor for occupational mix. We describe the occupational mix adjustment in section III.E. of the preamble of this final rule.

To compute a budget neutrality adjustment factor for wage index and labor-related share percentage changes, we used FY 2017 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2019 relative weights and the FY 2018 pre-reclassified wage indexes, applied the FY 2018 labor-related share of 68.3 percent to all hospitals (regardless of whether the hospital's wage index was above or below 1.0000), and applied the FY 2019 hospital readmissions payment adjustment and the estimated FY 2019 hospital VBP payment adjustment; and
- Aggregate payments using the FY 2019 relative weights and the FY 2019 pre-reclassified wage indexes, applied the labor-related share for FY 2019 of 68.3 percent to all hospitals (regardless of whether the hospital's wage index was above or below 1.0000), and applied the same FY 2019 hospital readmissions payment adjustments and estimated FY 2019 hospital VBP payment adjustments applied above.

In addition, we applied the MS–DRG reclassification and recalibration budget neutrality adjustment factor (derived in the first step) to the payment rates that were used to simulate payments for this comparison of aggregate payments from FY 2018 to FY 2019. By applying this methodology, we determined a budget neutrality adjustment factor of 1.000748 for changes to the wage index.

c. Reclassified Hospitals—Budget Neutrality Adjustment

Section 1886(d)(8)(B) of the Act provides that certain rural hospitals are deemed urban. In addition, section 1886(d)(10) of the Act provides for the reclassification of hospitals based on determinations by the MGCRB. Under section 1886(d)(10) of the Act, a hospital may be reclassified for purposes of the wage index.

Under section 1886(d)(8)(D) of the Act, the Secretary is required to adjust the standardized amount to ensure that aggregate payments under the IPPS after implementation of the provisions of sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act are equal to the aggregate prospective payments that would have been made absent these provisions. We note that the wage index adjustments provided for under section 1886(d)(13) of the Act are not budget neutral. Section 1886(d)(13)(H) of the Act provides that any increase in a wage index under section 1886(d)(13) shall not be taken into account in applying any budget neutrality adjustment with respect to such index under section 1886(d)(8)(D) of the Act. To calculate the budget neutrality adjustment factor for FY 2019, we used FY 2017 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2019 labor-related share percentages, the FY 2019 relative weights, and the FY 2019 wage data prior to any reclassifications under sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act, and applied the FY 2019 hospital readmissions payment adjustments and the estimated FY 2019 hospital VBP payment adjustments; and
- Aggregate payments using the FY 2019 labor-related share percentages, the FY 2019 relative weights, and the FY 2019 wage data after such reclassifications, and applied the same FY 2019 hospital readmissions payment adjustments and the estimated FY 2019 hospital VBP payment adjustments applied above.

We note that the reclassifications applied under the second simulation and comparison are those listed in Table 2 associated with this final rule, which is available via the internet on the CMS website. This table reflects reclassification crosswalks for FY 2019, and applies the policies explained in section III. of the preamble of this final rule. Based on these simulations, we calculated a budget neutrality adjustment factor of 0.985932 to ensure that the effects of these provisions are budget neutral, consistent with the statute.

The FY 2019 budget neutrality adjustment factor was applied to the standardized amount after removing the effects of the FY 2018 budget neutrality adjustment factor. We note that the FY 2019 budget neutrality adjustment reflects FY 2019 wage index reclassifications approved by the MGCRB or the Administrator at the time of development of this final rule.

d. Rural Floor Budget Neutrality Adjustment

Under § 412.64(e)(4), we make an adjustment to the wage index to ensure that aggregate payments after implementation of the rural floor under section 4410 of the BBA (Pub. L. 105–33) is equal to the aggregate prospective payments that would have been made in the absence of this provision. Consistent with section 3141 of the Affordable Care Act and as discussed in section III.G. of the preamble of this final rule and codified at § 412.64(e)(4)(ii), the budget neutrality adjustment for the rural floor is a national adjustment to the wage index.

As noted above and as discussed in section III.G.2. of the preamble of this final rule, the imputed floor is set to expire effective October 1, 2018, and as we proposed, we are not extending the imputed floor policy.

Similar to our calculation in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50369 through 50370), for FY 2019, as we proposed, we are calculating a national rural Puerto Rico wage index. Because there are no rural Puerto Rico hospitals with established wage data, our calculation of the FY 2019 rural Puerto Rico wage index is based on the policy adopted in the FY 2008 IPPS final rule with comment period (72 FR 47323). That is, we used the unweighted average of the wage indexes from all CBSAs (urban areas) that are contiguous (share a border with) to the rural counties to compute the rural floor (72 FR 47323; 76 FR 51594). Under the OMB labor market area delineations, except for Arecibo, Puerto Rico (CBSA 11640), all other Puerto Rico urban areas are contiguous to a rural area. Therefore, based on our existing policy, the FY 2019 rural Puerto Rico wage index is calculated based on the average of the FY 2019 wage indexes for the following urban areas: Aguadilla-Isabela, PR (CBSA 10380); Guayama, PR (CBSA 25020); Mayaguez, PR (CBSA 32420); Ponce, PR (CBSA 38660); San German, PR (CBSA 41900); and San Juan-Carolina-Caguas, PR (CBSA 41980).

To calculate the national rural floor budget neutrality adjustment factor, we used FY 2017 discharge data to simulate payments and the post-reclassified national wage indexes and compared the following:

- National simulated payments without the national rural floor; and
- National simulated payments with the national rural floor.

Based on this comparison, we determined a national rural floor budget neutrality adjustment factor of 0.993142. The national adjustment was applied to the national wage indexes to produce a national rural floor budget neutral wage index.

e. Rural Community Hospital Demonstration Program Adjustment

In section IV.L. of the preamble of this final rule, we discuss the Rural Community Hospital Demonstration program, which was originally authorized for a 5-year period by section 410A of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) (Pub. L. 108–173), and extended for another 5-year period by sections 3123 and 10313 of the Affordable Care Act (Pub. L. 111–148). Subsequently, section 15003 of the 21st Century Cures Act (Pub. L. 114–255), enacted December 13, 2016, amended section 410A of Public Law 108–173 to require a 10-year extension period (in place of the 5-year extension required by the Affordable Care Act, as further discussed below). We make an adjustment to the standardized amount to ensure the effects of the Rural Community Hospital Demonstration program are budget neutral as required under section 410A(c)(2) of Public Law 108–173. We refer the reader to section IV.L. of the preamble of this final rule for complete details regarding the Rural Community Hospital Demonstration.

With regard to budget neutrality, as mentioned earlier, we make an adjustment to the standardized amount to ensure the effects of the Rural Community Hospital Demonstration are budget neutral, as required under section 410A(c)(2) of Public Law 108–173. For FY 2019, the total amount that we are applying to make an adjustment to the standardized amounts to ensure the effects of the Rural Community Hospital Demonstration program are budget neutral is $58,129,609. Accordingly, using the most recent data available to account for the estimated costs of the demonstration program, for FY 2019, we computed a factor of 0.999467 for the Rural Community Hospital Demonstration budget neutrality adjustment that will be applied to the IPPS standard Federal payment rate. We refer readers to section IV.L. of the preamble of this final rule on complete details regarding the calculation of the amount we are applying to make an adjustment to the standardized amount.

We note that, as discussed in section IV.L. of the preamble of this final rule, as we proposed, we used updated data to the extent

appropriate to determine the budget neutrality offset amount for FY 2019. We refer readers to section IV.L. of the preamble of this final rule on complete details regarding the availability of additional data prior to the FY 2019 IPPS/LTCH PPS final rule.

f. Adjustment for FY 2019 Required Under Section 414 of Public Law 114–10 (MACRA)

As stated in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56785), once the recoupment required under section 631 of the ATRA was complete, we had anticipated making a single positive adjustment in FY 2018 to offset the reductions required to recoup the $11 billion under section 631 of the ATRA. However, section 414 of the MACRA (which was enacted on April 16, 2015) replaced the single positive adjustment we intended to make in FY 2018 with a 0.5 percent positive adjustment for each of FYs 2018 through 2023. (As noted in the FY 2018 IPPS/LTCH PPS proposed and final rules, section 15005 of the 21st Century Cures Act (Pub. L. 114–255), which was enacted December 13, 2016, reduced the adjustment for FY 2018 from 0.5 percentage points to 0.4588 percentage points.) Therefore, for FY 2019, as we proposed, we are implementing the required +0.5 percent adjustment to the standardized amount. This is a permanent adjustment to the payment rates.

g. Outlier Payments

Section 1886(d)(5)(A) of the Act provides for payments in addition to the basic prospective payments for ''outlier'' cases involving extraordinarily high costs. To qualify for outlier payments, a case must have costs greater than the sum of the prospective payment rate for the MS–DRG, any IME and DSH payments, uncompensated care payments, any new technology add-on payments, and the ''outlier threshold'' or ''fixed-loss'' amount (a dollar amount by which the costs of a case must exceed payments in order to qualify for an outlier payment). We refer to the sum of the prospective payment rate for the MS–DRG, any IME and DSH payments, uncompensated care payments, any new technology add-on payments, and the outlier threshold as the outlier ''fixed-loss cost threshold.'' To determine whether the costs of a case exceed the fixed-loss cost threshold, a hospital's CCR is applied to the total covered charges for the case to convert the charges to estimated costs. Payments for eligible cases are then made based on a marginal cost factor, which is a percentage of the estimated costs above the fixed-loss cost threshold. The marginal cost factor for FY 2019 is 80 percent, or 90 percent for burn MS–DRGs 927, 928, 929, 933, 934 and 935. We have used a marginal cost factor of 90 percent since FY 1989 (54 FR 36479 through 36480) for designated burn DRGs as well as a marginal cost factor of 80 percent for all other DRGs since FY 1995 (59 FR 45367).

In accordance with section 1886(d)(5)(A)(iv) of the Act, outlier payments for any year are projected to be not less than 5 percent nor more than 6 percent of total operating DRG payments (which does not include IME and DSH payments) plus outlier payments. When setting the outlier threshold, we compute the 5.1 percent target by dividing the total operating outlier payments by the total operating DRG payments plus outlier payments. We do not include any other payments such as IME and DSH within the outlier target amount. Therefore, it is not necessary to include Medicare Advantage IME payments in the outlier threshold calculation. Section 1886(d)(3)(B) of the Act requires the Secretary to reduce the average standardized amount by a factor to account for the estimated proportion of total DRG payments made to outlier cases. More information on outlier payments may be found on the CMS website at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/outlier.htm*.

(1) FY 2019 Outlier Fixed-Loss Cost Threshold

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50977 through 50983), in response to public comments on the FY 2013 IPPS/LTCH PPS proposed rule, we made changes to our methodology for projecting the outlier fixed-loss cost threshold for FY 2014. We refer readers to the FY 2014 IPPS/LTCH PPS final rule for a detailed discussion of the changes.

As we have done in the past, to calculate the FY 2019 outlier threshold, we simulated payments by applying FY 2019 payment rates and policies using cases from the FY 2017 MedPAR file. As noted in section II.C. of this Addendum, we specify the formula used for actual claim payment which is also used by CMS to project the outlier threshold for the upcoming fiscal year. The difference is the source of some of the variables in the formula. For example, operating and capital CCRs for actual claim payment are from the PSF while CMS uses an adjusted CCR (as described below) to project the threshold for the upcoming fiscal year. In addition, charges for a claim payment are from the bill while charges to project the threshold are from the MedPAR data with an inflation factor applied to the charges (as described earlier).

In order to determine the FY 2019 outlier threshold, we inflated the charges on the MedPAR claims by 2 years, from FY 2017 to FY 2019. As discussed in the FY 2015 IPPS/LTCH PPS final rule, we believe a methodology that is based on 1-year of charge data will provide a more stable measure to project the average charge per case because our prior methodology used a 6-month measure, which inherently uses fewer claims than a 1-year measure and makes it more susceptible to fluctuations in the average charge per case as a result of any significant charge increases or decreases by hospitals. As finalized in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57282), we are using the following methodology to calculate the charge inflation factor for FY 2019:

- To produce the most stable measure of charge inflation, we applied the following inclusion and exclusion criteria of hospitals claims in our measure of charge inflation: Include hospitals whose last four digits fall between 0001 and 0899 (section 2779A1 of Chapter 2 of the State Operations Manual on the CMS website at *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/som107c02.pdf*); include CAHs that were IPPS hospitals for the time period of the MedPAR data being used to calculate the charge inflation factor; include hospitals in Maryland; and remove PPS-excluded cancer hospitals who have a ''V'' in the fifth position of their provider number or a ''E'' or ''F'' in the sixth position.
- We excluded Medicare Advantage IME claims for the reasons described in section I.A.4. of this Addendum. We refer readers to the FY 2011 IPPS/LTCH PPS final rule for a complete discussion on our methodology of identifying and adding the total Medicare Advantage IME payment amount to the budget neutrality adjustments.
- In order to ensure that we capture only FFS claims, we included claims with a ''Claim Type'' of 60 (which is a field on the MedPAR file that indicates a claim is an FFS claim).
- In order to further ensure that we capture only FFS claims, we excluded claims with a ''GHOPAID'' indicator of 1 (which is a field on the MedPAR file that indicates a claim is not an FFS claim and is paid by a Group Health Organization).
- We examined the MedPAR file and removed pharmacy charges for anti-hemophilic blood factor (which are paid separately under the IPPS) with an indicator of ''3'' for blood clotting with a revenue code of ''0636'' from the covered charge field. We also removed organ acquisition charges from the covered charge field because organ acquisition is a pass-through payment not paid under the IPPS.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49779 through 49780), we stated that commenters were concerned that they were unable to replicate the calculation of the charge inflation factor that CMS used in the proposed rule. In response to those comments, we stated that we continue to believe that it is optimal to use the most recent period of charge data available to measure charge inflation. In response to those comments, similar to FY 2016, FY 2017, and FY 2018, for FY 2019, we grouped claims data by quarter in the table below in order that the public would be able to replicate the claims summary for the claims with discharge dates through September 30, 2017, that are available under the current limited data set (LDS) structure. In order to provide even more information in response to the commenters' request, similar to FY 2016, FY 2017, and FY 2018, for FY 2019, we made available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* (click on the links on the left titled ''FY 2019 IPPS Proposed Rule Home Page'' and then click the link ''FY 2019 Proposed Rule Data Files'') more detailed summary tables by provider with the monthly charges that were used to compute the charge inflation factor. In the proposed rule, we stated that we continue to work with our systems teams and privacy office to explore expanding the information available in the current LDS, perhaps through the provision of a supplemental data file for future rulemaking.

Quarter	Covered charges (January 1, 2016, through December 31, 2016)	Cases (January 1, 2016, through December 31, 2016)	Covered charges (January 1, 2017, through December 31, 2017)	Cases (January 1, 2017, through December 31, 2017)
1	$140,753,065,878	2,506,525	$149,358,509,178	2,551,065
2	135,409,469,345	2,414,710	140,445,911,726	2,397,110
3	132,239,610,957	2,356,131	135,004,161,478	2,293,958
4	138,440,787,173	2,412,708	108,175,925,297	1,821,225
Total	546,842,933,353	9,690,074	532,984,507,679	9,063,358

Under this methodology, to compute the 1-year average annualized rate-of-change in charges per case for FY 2019, we compared the average covered charge per case of $56,433 ($546,842,933,353/9,690,074) from the second quarter of FY 2016 through the first quarter of FY 2017 (January 1, 2016, through December 31, 2016) to the average covered charge per case of $58,806.52 ($532,984,507,679/9,063,358) from the second quarter of FY 2017 through the first quarter of FY 2018 (January 1, 2017, through December 31, 2017). This rate-of-change was 4.2 percent (1.04205) or 8.6 percent (1.085868) over 2 years. (We note that in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20581) we inadvertently stated the rate-of-change over 2 years as 9.5 percent instead of 8.6 percent. However, the factor in the parenthetical, 1.085868, was shown correctly.) The billed charges are obtained from the claim from the MedPAR file and inflated by the inflation factor specified above.

Comment: Several commenters were concerned with what they stated was a lack of transparency with respect to the charge inflation component of the fixed-loss threshold calculation. The commenters concluded that, in the absence of access to the data or more specific data and information about how CMS arrived at the totals used in the charge inflation calculation, their ability to comment is limited. Several commenters requested that CMS add the claims data used to compute the charge inflation factor to the list of limited data set (LDS) files that can be ordered through the usual LDS data request process.

Another commenter stated that it was unable to match the figures in the table from the proposed rule with publicly available data sources and that CMS did not disclose the source of the data. The commenter further stated that CMS has not made the necessary data available, or any guidance that describes whether and how CMS edited such data to arrive at the total of quarterly charges and charges per case used to measure charge inflation. Consequently, the commenter stated that the table provided in the proposed rule was not useful in assessing the accuracy of the charge inflation figure that CMS used in the proposed rule to calculate the outlier threshold. The commenter noted that CMS provided a detailed summary table by provider with the monthly charges that were used to compute the charge inflation factor. The commenters appreciated the additional data, but still believed that CMS had not provided enough specific information and data to allow the underlying numbers used in CMS' calculation of the charge inflation factor to be replicated and/or tested for accuracy.

Response: We responded to a similar comment in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50375), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49779 through 49780), the FY 2017 IPPS/LTCH PPS final rule (81 FR 57283), and the FY 2018 IPPS/LTCH PPS final rule (82 FR 38524) and refer readers to those final rules for our complete response. We have not yet been able to restructure the files (such as ensuring that personal identification information is compliant with privacy regulations) for release with the publication of the proposed rule and this final rule. As we stated in last year's final rule and prior rulemaking, while the charge data may not be immediately available after the issuance of this final rule, we believe the data and supporting files we have provided do provide the commenters with additional information that can be verified once the charge data are available. We have produced the actual figures we used and disclosed our formula. We intend to post the actual charge data as soon as possible so that the public can verify the raw data with the figures we used in the calculation. As stated earlier and in the proposed rule, the charge data used to calculate the charge inflation factor are sourced from our MedPAR database. In addition, as stated in the FY 2018 final rule and prior rulemaking, for this final rule we continue to believe that it is optimal to use the most recent period of charge data available to measure charge inflation. Similar to FY 2018, the commenters did not recommend using charge data from a different period to compute the charge inflation factor. If we computed the charge inflation factor using the latest data available to the public at the time of issuance of this final rule, we would need to compare charge data from FY 2016 (October 2015 through September 2016) to FY 2017 (October 2016 through September 2017), data which would be at least 10 months old compared to the charge data we use for the final rule under our current approach, which are 4 months old.

With respect to those comments requesting that CMS add the claims data used to compute the charge inflation factor to the list of LDS files that can be ordered through the usual LDS data request process, we note that the commenters' views were similar to comments received and we responded to in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38524 through 38525) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49779 through 49780), and we refer readers to those rules for additional details our response. As we stated in response to a similar comment in last year's final rule (82 FR 38525), there are limitations on how expeditiously we can add the charge data to the LDS, and we do not anticipate being able to provide the charge data we currently use to calculate the charge inflation factor within the commenters' requested timeframe. We continue to be confronted with the dilemma of either using older data that commenters can access earlier, or using the most up-to-date data which will be more accurate, but will not be available to the public until after publication of the proposed and final rules. We again invite commenters to inform us if they believe their need to have complete access to the data we use in our methodology outweighs the greater accuracy provided by the use of more up-to-date data. We continue to prefer using the latest data available at the time of the proposed and final rules to compute the charge inflation factor because we believe it leads to greater accuracy in the calculation of the fixed-loss cost outlier threshold. However, for the FY 2020 IPPS/LTCH PPS proposed rule, we are continuing to consider using data that commenters can access earlier.

For these reasons, we disagree that CMS has not provided adequate information to allow for meaningful comment, and continue to believe that our current methodology is the most appropriate way to measure charge inflation to result in the most accurate calculation of the outlier threshold based on the best available data.

As we have done in the past, in the FY 2019 IPPS/LTCH PPS proposed rule (8 FR 20581), we proposed to establish the proposed FY 2019 outlier threshold using hospital CCRs from the December 2017 update to the Provider-Specific File (PSF)—the most recent available data at the time of the development of that proposed rule. We proposed to apply the following edits to providers' CCRs in the PSF. We believe these edits are appropriate in order to accurately model the outlier threshold. We first search for Indian Health Service providers and those providers assigned the statewide average CCR from the current fiscal year. We then replace these CCRs with the statewide average CCR for the upcoming fiscal year. We also assign the statewide average CCR (for the upcoming fiscal year) to those providers that have no value in the CCR field in the PSF or whose CCRs exceed the ceilings described later in this section (3.0 standard deviations from the mean of the log distribution of CCRs for all hospitals). We do not apply the adjustment factors described below to hospitals assigned the statewide average CCR. For FY 2019, we also proposed to continue to apply an

adjustment factor to the CCRs to account for cost and charge inflation (as explained below). In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20581), we also proposed that, if more recent data become available, we would use that data to calculate the final FY 2019 outlier threshold.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979), we adopted a new methodology to adjust the CCRs. Specifically, we finalized a policy to compare the national average case-weighted operating and capital CCR from the most recent update of the PSF to the national average case-weighted operating and capital CCR from the same period of the prior year.

Therefore, as we have done since FY 2014, we proposed to adjust the CCRs from the December 2017 update of the PSF by comparing the percentage change in the national average case-weighted operating CCR and capital CCR from the December 2016 update of the PSF to the national average case-weighted operating CCR and capital CCR from the December 2017 update of the PSF. We note that, in the proposed rule, we used total transfer-adjusted cases from FY 2017 to determine the national average case-weighted CCRs for both sides of the comparison. As stated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979), we believe that it is appropriate to use the same case count on both sides of the comparison because this will produce the true percentage change in the average case-weighted operating and capital CCR from one year to the next without any effect from a change in case count on different sides of the comparison.

Using the proposed methodology above, for the proposed rule, we calculated a proposed December 2016 operating national average case-weighted CCR of 0.266065 and a proposed December 2017 operating national average case-weighted CCR of 0.262830. We then calculated the percentage change between the two national operating case-weighted CCRs by subtracting the December 2016 operating national average case-weighted CCR from the December 2017 operating national average case-weighted CCR and then dividing the result by the December 2016 national operating average case-weighted CCR. This resulted in a proposed national operating CCR adjustment factor of 0.987842.

We used the same methodology proposed above to adjust the capital CCRs. Specifically, we calculated a December 2016 capital national average case-weighted CCR of 0.023104 and a December 2017 capital national average case-weighted CCR of 0.022076. We then calculated the percentage change between the two national capital case-weighted CCRs by subtracting the December 2016 capital national average case-weighted CCR from the December 2017 capital national average case-weighted CCR and then dividing the result by the December 2016 capital national average case-weighted CCR. This resulted in a proposed national capital CCR adjustment factor of 0.955517.

As discussed in section III.B.3. of the preamble of the FY 2011 IPPS/LTCH PPS final rule (75 FR 50160 and 50161) and in section III.G.3. of the preamble of this final rule, in accordance with section 10324(a) of the Affordable Care Act, we created a wage index floor of 1.0000 for all hospitals located in States determined to be frontier States. We note that the frontier State floor adjustments were applied after rural floor budget neutrality adjustments were applied for all labor market areas, in order to ensure that no hospital in a frontier State would receive a wage index less than 1.0000 due to the rural floor adjustment. In accordance with section 10324(a) of the Affordable Care Act, the frontier State adjustment will not be subject to budget neutrality, and will only be extended to hospitals geographically located within a frontier State. However, for purposes of estimating the outlier threshold for FY 2019, it was necessary to adjust the wage index of those eligible hospitals in a frontier State when calculating the outlier threshold that results in outlier payments being 5.1 percent of total payments for FY 2019. If we did not take the above into account, our estimate of total FY 2019 payments would be too low, and, as a result, our outlier threshold would be too high, such that estimated outlier payments would be less than our projected 5.1 percent of total payments.

As we did in establishing the FY 2009 outlier threshold (73 FR 57891), in our projection of FY 2019 outlier payments, we proposed not to make any adjustments for the possibility that hospitals' CCRs and outlier payments may be reconciled upon cost report settlement. We continue to believe that, due to the policy implemented in the June 9, 2003 Outlier Final Rule (68 FR 34494), CCRs will no longer fluctuate significantly and, therefore, few hospitals will actually have these ratios reconciled upon cost report settlement. In addition, it is difficult to predict the specific hospitals that will have CCRs and outlier payments reconciled in any given year. We note that we have instructed MACs to identify for CMS any instances where: (1) A hospital's actual CCR for the cost reporting period fluctuates plus or minus 10 percentage points compared to the interim CCR used to calculate outlier payments when a bill is processed; and (2) the total outlier payments for the hospital exceeded $500,000.00 for that period. Our simulations assume that CCRs accurately measure hospital costs based on information available to us at the time we set the outlier threshold. For these reasons, we proposed not to make any assumptions regarding the effects of reconciliation on the outlier threshold calculation.

Comment: Commenters expressed concern with CMS' decision not to consider outlier reconciliation in developing the outlier threshold and stated that CMS did not provide any statistics or analysis concerning the number of hospitals that have been subjected to reconciliation and the amounts recovered during this process.

In addition to the cited resources received in previous iterations of this comment, one commenter referenced and provided an OIG report from September of 2017 (available on the website at: *https://oig.hhs.gov/oas/reports/region7/71402800.pdf*) focused on the reconciliation of outlier payments titled ''Vulnerabilities Remain in Medicare Hospital Outlier Payments.'' The commenter stated that CMS now has 15 full fiscal years of experience with reconciliation, from which to project the impact of its reconciliation in the upcoming fiscal year. The commenter noted that the amount of outlier payments subject to reconciliation does not appear to be de minimis. The commenter cited a 2012 OIG Report (available on the website at: *https://oig.hhs.gov/oas/reports/region7/71002764.pdf*) which identified approximately $664 million in unreconciled outlier payments. Therefore, the commenter concluded that the impact of reconciliation that should not be ignored when setting the threshold. The commenter asserted that CMS' policy of refusing to account for the impact of reconciliation in setting the FY 2019 outlier fixed-loss cost threshold is neither reasonable nor consistent with the outlier statute.

Response: The commenters' views were similar to comments received and we responded to in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979 to 509080) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50376 through 50377), and we refer readers to those rules for our responses. In the FY 2014 IPPS/LTCH PPS final rule, we stated that outlier reconciliation is a function of the cost report and Medicare contractors record the outlier reconciliation amount on each provider's cost report. Therefore, as the MACs continue to perform these outlier reconciliations, they record these amounts on the cost report, which are then publicly available through the HCRIS database. Therefore, the outlier reconciliation data and information that the commenter requested should be publicly available through the cost report.

Outlier cases are, by definition, out of the ordinary, and the occurrence of an individual outlier case is not easily predicted. It is also difficult to predict their occurrence for each hospital in the country. This alone makes incorporating reconciliation into the modeling of the outlier threshold challenging and even more so when combined with the challenges of predicting not only outliers for use at hospital level, but which of those hospitals in the future will be reconciled. We note that the commenter did not specifically address how any projection of the impact of reconciliation would account for these issues, but we welcome recommendations or suggestions from the commenter or other members of the public based on the cost report data on how to account for reconciliation in the calculation of the outlier threshold. We intend to revisit this issue in next year's proposed rule as we continue to consider the feasibility of including outlier reconciliation in the modeling of the outlier threshold.

Lastly, we note that the $664 million estimated figure from the OIG report was an aggregate estimate over an older 10-year period from 2002 to 2012 and was not a single year estimate. We note this to avoid any suggestion that if we were able to feasibly incorporate an estimate of outlier reconciliations in the modelling of the outlier threshold in future years, such an estimate would be of this magnitude.

Comment: One commenter cited CMS' response in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49781 and 49782) which stated in regard to the OIG's November 13, 2013 report (available on the website at: *https://oig.hhs.gov/oei/reports/oei-06-10-00520.pdf*) that ''we note that the OIG report used CCRs from 2008–2011. The CCRs are updated in the PSF at the time the MAC tentatively settles the hospital cost report, which is approximately 6 to 7 months after the cost report has been submitted. * * * Because hospitals typically increase their charges, over time CCRs will decrease but, due to the lag these lower CCRs will not be reflected in the PSF until the following tentative settlement. Thus, it is possible that the PSF will reflect CCRs that are similar for hospitals with high and low outlier payments. In addition, providers determine what they will charge for items, services, and procedures provided to patients, and these charges are the amount that the providers bill for an item, service, or procedure. Moreover, different hospitals can have similar lengths of stay but different CCRs. * * * In addition, as the commenter noted, there are mechanisms to avoid outlier overpayments or underpayments as CMS and the MACs have the authority to specify an alternative CCR. Also, in addition to the examples cited by the commenter, as we note in every proposed and final rule, hospitals can also request alternative CCRs. Therefore, if hospitals make these requests, these CCRs would be reflected in the PSF which would be used to compute the fixed-loss threshold.''

The commenter stated that this response infers that the findings from the 2013 OIG report (that high-outlier hospitals charge Medicare substantially more for the same MS–DRGs, even though their patients had similar lengths of stay as those in all other hospitals) are no longer an area of concern because the report was based on CCRs from 2008 through 2011. The commenter stated that it conducted an analysis of the MedPAR data which concludes that the findings from the 2013 OIG Report have continued without interruption to present. The commenter also stated that CMS' response that providers may determine their charges overlooks section 2202.4.2 of the Provider Reimbursement Manual, Part I, Chapter 22, that provides that charges should reflect ''the regular rates established by the provider for services rendered to both beneficiaries and to other paying patients,'' and they ''should be related consistently to the cost of the services and uniformly applied to all patients whether inpatient or outpatient.'' The commenter asserted that CMS' failure to reconcile ''high-outlier'' payments effectively condones charging decisions based on maximizing outlier payments.

The commenter also cited CMS' statement from the FY 2015 IPPS/LTCH PPS final rule (79 FR 50377 and 50378) which stated ''that the CCRs will reflect these low costs and high charges that the commenter referred to, and when applied to the charges on the claim will result in less outlier payments for such cases because the costs of the case will be lower when compared to the total MS–DRG payments excluding outlier payments.'' The commenter disagreed with this statement and cited the OIG's 2013 report. The commenter stated that the 2103 report revealed that ''high-outlier hospitals charged Medicare substantially more for the same MS–DRGs, yet had similar average lengths of stay and CCRs,'' which the commenter asserted is directly opposite CMS' statement.

The commenter also asserted that it is neither consistent with the outlier statute nor reasonable for CMS, in modeling outlier payments for the upcoming fiscal year, to include outlier payments that were based on excessively high charges for particular MS–DRGs and not based on truly unusually high costs.

The commenter also asserted that CMS is fully authorized to reconcile the ''high-outlier'' payments and that according to its position in *Clarian Health* v. *Price,* No. 16–5307 (D.C. Cir.), all outlier payments are subject to reconciliation, regardless of whether they satisfy the reconciliation criteria. The commenter asserted that the discretion to subject all outlier payments to reconciliation is necessary to respond to hospitals, like those identified in the 2013 OIG Report, that seek to ''inappropriately maximize outlier payments'' by ''operating just below the threshold to avoid detection.''

Response: It is challenging to evaluate the assertion regarding a possible current correlation between high outlier hospitals and hospital charges because the commenter provided no information regarding its analysis. Also, even if there is some degree of correlation between the two, it does not necessarily mean categorically that these hospitals are inappropriately charging for purposes of Medicare outlier payments. In the absence of audits and analysis of these hospitals, the commenter is incorrect in concluding from any degree of correlation that every high outlier hospital must have charges not relative to their costs.

We also note we simply indicated that providers determine what they will charge for items, services, and procedures provided to patients, and these charges are the amount that the providers bill for an item, service, or procedure. We never stated that providers should disregard the PRM when setting those charges. Any assertion or suggestion that CMS condones hospitals inappropriately charging to maximize outlier payments is incorrect. In the June 9, 2003 final rule, we implemented the use of tentatively settled CCRs and the reconciliation policy directly in response to inappropriate charging. In addition, the PRM cited above states that charges should reflect ''the regular rates established by the provider for services rendered to both beneficiaries and to other paying patients,'' and they ''should be related consistently to the cost of the services and uniformly applied to all patients whether inpatient or outpatient.'' We expect hospitals to follow these guidelines and the manual when setting their charges.

With respect our statement from the FY 2015 IPPS/LTCH PPS final rule regarding CCRs, it is correct: CCRs will reflect low costs and high charges and, when applied to the charges on the claim, will result in less outlier payments because the costs of the case will be lower when compared to the total MS–DRG payments, excluding outlier payments. There are many factors that influence outlier payments. Consider a simplified example of two hospitals. One higher outlier hospital with average charges of $100,000 and average costs of $33,000 and a resulting CCR of 0.33, and another lower outlier hospital with average charges of $60,000 and average costs of $20,000 which also will result in a CCR of 0.33. As noted above, in the absence of audits and analysis of these hospitals, the commenter is incorrect in concluding from the fact that one hospital has higher charges and costs but the same CCR that the higher outlier hospital must have charges not relative to their costs. The higher outlier hospital may treat more resource intensive patients, which would factor into the aggregate outlier payments the hospital receives. Length of stay is not an exclusive measure of resource intensity.

For similar reasons, the commenter is incorrect that the inclusion of hospitals with higher charges in our estimation of the outlier threshold means that we include ''excessively high charges for particular MS–DRGs and not based on truly unusually high costs.''

We agree with the commenter that CMS has broad authority to reconcile outlier payments. However, we disagree that it is necessary to reconcile all outlier payments in order to address any individual circumstances where we believe reconciliation may be appropriate. As discussed in the June 9, 2003 Outlier Final Rule (68 FR 34503), we acknowledged the commenters' concerns about the administrative costs associated with reprocessing and reconciling all inpatient claims and the desirability of limiting which hospitals' outlier payments will be reconciled. Therefore, we agreed that any reconciliation of outlier payments should be done on a limited basis. As described in sections IV.H. and IV.I., respectively, of the preamble of this final rule, sections 1886(q) and 1886(o) of the Act establish the Hospital Readmissions Reduction Program and the Hospital VBP Program, respectively. We do not believe that it is appropriate to include the hospital VBP payment adjustments and the hospital readmissions payment adjustments in the outlier threshold calculation or the outlier offset to the standardized amount. Specifically, consistent with our definition of the base operating DRG payment amount for the Hospital Readmissions Reduction Program under § 412.152 and the Hospital VBP Program under § 412.160, outlier payments under section 1886(d)(5)(A) of the Act are not affected by these payment adjustments. Therefore, outlier payments will continue to be calculated based on the unadjusted base DRG payment amount (as opposed to using the base-operating DRG payment amount adjusted by the hospital readmissions payment adjustment and the hospital VBP payment adjustment). Consequently, we proposed to exclude the hospital VBP payment adjustments and the estimated hospital readmissions payment adjustments from the calculation of the outlier fixed-loss cost threshold.

We note that, to the extent section 1886(r) of the Act modifies the DSH payment

methodology under section 1886(d)(5)(F) of the Act, the uncompensated care payment under section 1886(r)(2) of the Act, like the empirically justified Medicare DSH payment under section 1886(r)(1) of the Act, may be considered an amount payable under section 1886(d)(5)(F) of the Act such that it would be reasonable to include the payment in the outlier determination under section 1886(d)(5)(A) of the Act. As we have done since the implementation of uncompensated care payments in FY 2014, for FY 2019, we proposed allocating an estimated per-discharge uncompensated care payment amount to all cases for the hospitals eligible to receive the uncompensated care payment amount in the calculation of the outlier fixed-loss cost threshold methodology. We continue to believe that allocating an eligible hospital's estimated uncompensated care payment to all cases equally in the calculation of the outlier fixed-loss cost threshold would best approximate the amount we would pay in uncompensated care payments during the year because, when we make claim payments to a hospital eligible for such payments, we would be making estimated per-discharge uncompensated care payments to all cases equally. Furthermore, we continue to believe that using the estimated per-claim uncompensated care payment amount to determine outlier estimates provides predictability as to the amount of uncompensated care payments included in the calculation of outlier payments. Therefore, consistent with the methodology used since FY 2014 to calculate the outlier fixed-loss cost threshold, for FY 2019, we proposed to include estimated FY 2019 uncompensated care payments in the computation of the outlier fixed-loss cost threshold. Specifically, we proposed to use the estimated per-discharge uncompensated care payments to hospitals eligible for the uncompensated care payment for all cases in the calculation of the outlier fixed-loss cost threshold methodology.

Using this methodology, we used the formula described in section I.C.1 of this Addendum to simulate and calculate the Federal payment rate and outlier payments for all claims. We proposed a threshold of $27,545 and calculated total operating Federal payments of $92,908,351,672 and total outlier payments of $4,738,377,622. We then divided total outlier payments by total operating Federal payments plus total outlier payments and determined that this threshold met the 5.1 percent target. As a result, we proposed an outlier fixed-loss cost threshold for FY 2019 equal to the prospective payment rate for the MS–DRG, plus any IME, empirically justified Medicare DSH payments, estimated uncompensated care payment, and any add-on payments for new technology, plus $27,545.

Comment: One commenter stated that, in the proposed rule, CMS indicated that it divided total outlier payments ($4,738,377,622) by total operating Federal payments plus total outlier payments ($92,908,351,672 + $4,738,377,622) to calculate the Agency's 5.1 percent target. However, the commenter stated, $4,738,377,622/($92,908,351,672 + $4,738,377,622) does not yield 5.1 percent. Instead, the commenter strared, it yields approximately 4.85 percent. The commenter added that, in fact, 5.1 percent is the quotient of $4,738,377,622/$92,908,351,672. Thus, based on that description, the commenter stated that it appears that CMS has mistakenly based the proposed outlier threshold on outlier payments totaling only 4.85 percent and, consequently, set the proposed outlier threshold too high.

Response: The commenter is correct. We inadvertently referred to total operating payments of $92,908,351,672 in the proposed rule, when that figure reflected the sum of total operating Federal payments and total outlier payments. The corrected total operating Federal payments for the proposed rule is $88,169,974,050. Dividing the proposed total outlier payments of $4,738,377,622 by the corrected proposed total operating Federal payments of $88,169,974,050 plus proposed total outlier payments of $4,738,377,622 yields the 5.1 percent target. Therefore we believe that the proposed outlier threshold and the subsequent outlier payments were appropriately calculated. We thank the commenter for noting this error.

Comment: One commenter believed that it is important that CMS accurately calculate prior year actual payment comparisons to the 5.1 percent target. The commenter asserted that it is not possible for CMS to appropriately modify the methodology to achieve an accurate result if CMS is not aware of, or misinformed about, inaccuracies resulting from the prior year's methodology. The commenter cited the FY 2017 IPPS/LTCH PPS proposed rule as an example where CMS indicated that actual outlier payments for FY 2015 were approximately 4.68 percent of overall payments. The commenter stated that it was concerned that CMS believed the Agency would reach the 5.1 percent target for FY 2015 only to learn that the original estimate was overestimated and still raise the threshold for the subsequent year.

One commenter noted that the final outlier threshold established by CMS is always significantly lower than the threshold set forth in the proposed rule. The commenter believed the decline is most likely due to the use of updated CCRs or other data in calculating the final threshold. The commenter questioned whether CMS used more updated data for the FY 2017 and FY 2018 proposed rules as compared to prior years to calculate the proposed threshold. The commenter stated that, if this was the case, the use of more updated data may account for the decreased variance seen between the proposed and final thresholds in FYs 2017 and 2018 as compared to prior years. The commenter stated that this emphasizes that CMS must use the most recent data available when the Agency calculates the outlier threshold.

Response: We responded to similar comments in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50378 through 50379) and refer readers to that rule for our response. Regarding the data used for the FY 2017 proposed rule and final rule, we used the same update of the MedPAR data as in prior fiscal years. Specifically, we use the December update of the MedPAR for the proposed rule and the March update of the MedPAR for the final rule. Also, in addition to the CCRs that can change from the proposed rule to the final rule, other factors such as the market basket typically change. For example, in the proposed rule, the market basket was 2.8 percent, and for this final rule, the market basket is 2.9 percent. Focusing only on the market basket, a higher market basket will increase the amount of Federal payments (a higher standardized amount) and lower the amount of total outlier payments requiring a lower outlier threshold to meet the 5.1 percent target. Therefore, the result of a lower or higher outlier threshold in the final rule when comparing to the proposed rule can be as a result of different variables.

Comment: Commenters expressed concerned with the increase of the outlier threshold from $26,601 in FY 2018 to $27,545 in FY 2019. They stated that the continued rise in the outlier threshold results in hospitals experiencing higher losses in order to receive payment relief, in particular.

One commenter requested CMS to examine the reasons for the continued rise in the outlier threshold and to identify whether interventions can be taken to ensure outlier payments remain equitable for hospitals. Another commenter suggested a reduction to the outlier threshold amount. Another commenter noted that the proposed FY 2019 outlier threshold of $27,545 is a 3.5 percent increase over the FY 2018 outlier threshold. This commenter stated that while CMS has not made any methodological changes to its determination of the outlier threshold, its rise is resulting in hospitals having to experience higher losses in order to receive any payment relief.

One commenter noted that CMS' estimate of FY 2017 outlier payments in the proposed rule was 5.53 percent, which is above the 5.1 percent target but falls within the statutory 5.0 to 6.0 percent outlier payment range. The commenter favored a simplified methodology and believed that, by applying a 2-year charge inflation factor and a 1-year CCR factor, CMS is inadvertently compounding its charge increase with lower costs and overstating the outlier threshold. The commenter suggested that CMS apply the following formula to compute the FY 2019 outlier threshold: FFY 2019 charge inflator Error = (9.5% − 8.5868% = 0.9132%)/9.5% = 9.61% Overstatement *Suggested FY 2019 Outlier Threshold* = $27,545 (proposed 2019) * (100% − 9.61% = 90.39%) = $24,897. The commenter concluded that the FY 2019 fixed-loss cost threshold should not exceed $24,897.

Response: We responded to similar comments in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50379) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49783) and refer readers to those final rules for our complete responses. We also note that the final outlier threshold for FY 2019 (finalized below at $25,769) is lower than the final threshold for FY 2018 ($26,537).

Comment: One commenter asked that CMS consider whether it is appropriate to include extreme cases when calculating the

threshold. The commenter explained that high charge cases have a significant impact on the threshold. The commenter observed that the amount of cases with over $1.5 million in charges has increased significantly from FY 2011 (926 cases) to FY 2017 (2,291 cases). The commenter believed that the impact of these cases will cause the threshold to rise and recommended that CMS consider the removal of high charge cases from the calculation of the threshold.

Response: As we explained when responding to a similar comment in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38526), the methodology used to calculate the outlier threshold includes all claims in order to account for all different types of cases, including high charge cases, to ensure that CMS meets the 5.1 percent target. As the commenter pointed out, the volume of these cases continues to rise, making their impact on the threshold significant. We believe excluding these cases would artificially lower the threshold. We believe it is important to include all cases in the calculation of the threshold no matter how high or low the charges. Including these cases with high charges lends more accuracy to the threshold, as these cases have an impact on the threshold and continue to rise in volume. Therefore, we disagree with the commenter.

Comment: Some commenters believe that an error exists in the calculation of the proposed FY 2019 outlier threshold related to the use of an incorrect national average CCR. These commenters did not provide any additional details on the possible nature of the error, but urged CMS to reevaluate the outlier calculation process.

Response: We appreciate commenters pointing this potential error. However, we were unable to identify such error. We have reviewed our outlier calculations for this final rule to ensure the national average CCR was calculated using the most recent available data at the time of the development of the final rule.

After consideration of the public comments we received, we are not making any changes to our methodology in this final rule for FY 2019. Therefore, we are using the same methodology we proposed to calculate the final outlier threshold. We note that, as stated above, we will consider for FY 2020 using data that commenters can access earlier to validate the charge inflation factor.

Similar to the table provided in the proposed rule, for this final rule, we are providing the following table that displays covered charges and cases by quarter in the periods used to calculate the charge inflation factor based on the latest claims data from the MedPAR file.

Quarter	Covered charges (April 1, 2016, through March 31, 2017)	Cases (April 1, 2016, through March 31, 2017)	Covered charges (April 1, 2017, through March 31, 2018)	Cases (April 1, 2017, through March 31, 2018)
April–June	$133,106,496,424	2,356,775	$137,726,975,443	2,319,109
July–September	139,415,422,805	2,413,871	142,676,638,337	2,363,685
October–December	151,053,166,855	2,559,371	121,360,081,623	1,983,155
January–March	136,264,070,864	2,415,120	142,121,633,027	2,407,887
Total	559,839,156,948	9,745,137	543,885,328,430	9,073,836

Under our current methodology, to compute the 1-year average annualized rate-of-change in charges per case for FY 2019, we compared the average covered charge per case of $57,448 ($559,839,156,948/9,745,137) from the third quarter of FY 2016 through the second quarter of FY 2017 (April 1, 2016, through March 31, 2017) to the average covered charge per case of $59,939.96 ($543,885,328,430/9,073,836) from the third quarter of FY 2017 through the second quarter of FY 2018 (April 1, 2017, through March 31, 2018). This rate-of-change was 4.3 percent (1.04338) or 8.9 percent (1.08864) over 2 years. The billed charges are obtained from the claim from the MedPAR file and inflated by the inflation factor specified above.

Similar to the proposed rule, for this final rule, we have made available a more detailed summary table by provider with the monthly charges that were used to compute the charge inflation factor on the CMS website at: *https://www.cms.gov/Medicare/MedicareFee-for-Service-Payment/AcuteInpatientPPS/index.html* (click on the link on the left titled ''FY 2019 IPPS Final Rule Home Page'' and then click the link ''FY 2019 Final Rule Data Files'').

As we have done in the past, we are establishing the FY 2019 outlier threshold using hospital CCRs from the March 2018 update to the Provider-Specific File (PSF)—the most recent available data at the time of the development of the final rule. We applied the following edits to providers' CCRs in the PSF. We believe these edits are appropriate in order to accurately model the outlier threshold. We first search for Indian Health Service providers and those providers assigned the statewide average CCR from the current fiscal year. We then replaced these CCRs with the statewide average CCR for the upcoming fiscal year. We also assigned the statewide average CCR (for the upcoming fiscal year) to those providers that have no value in the CCR field in the PSF or whose CCRs exceed the ceilings described later in this section (3.0 standard deviations from the mean of the log distribution of CCRs for all hospitals). We did not apply the adjustment factors described below to hospitals assigned the statewide average CCR. For FY 2019, we also are continuing to apply an adjustment factor to the CCRs to account for cost and charge inflation (as explained below).

For this final rule, as we have done since FY 2014, we are adjusting the CCRs from the March 2018 update of the PSF by comparing the percentage change in the national average case-weighted operating CCR and capital CCR from the March 2017 update of the PSF to the national average case-weighted operating CCR and capital CCR from the March 2018 update of the PSF. We note that we used total transfer-adjusted cases from FY 2017 to determine the national average case-weighted CCRs for both sides of the comparison. As stated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979), we believe that it is appropriate to use the same case count on both sides of the comparison because this will produce the true percentage change in the average case-weighted operating and capital CCR from one year to the next without any effect from a change in case count on different sides of the comparison.

Using the methodology above, for this final rule, we calculated a March 2017 operating national average case-weighted CCR of 0.265819 and a March 2018 operating national average case-weighted CCR of 0.260874. We then calculated the percentage change between the two national operating case-weighted CCRs by subtracting the March 2017 operating national average case-weighted CCR from the March 2018 operating national average case-weighted CCR and then dividing the result by the March 2017 national operating average case-weighted CCR. This resulted in a national operating CCR adjustment factor of 0.981397.

We used the same methodology above to adjust the capital CCRs. Specifically, for this final rule, we calculated a March 2017 capital national average case-weighted CCR of 0.022671 and a March 2018 capital national average case-weighted CCR of 0.021554. We then calculated the percentage change between the two national capital case-weighted CCRs by subtracting the March 2017 capital national average case-weighted CCR from the March 2018 capital national average case-weighted CCR and then dividing the result by the March 2017 capital national average case-weighted CCR. This resulted in a national capital CCR adjustment factor of 0.950739.

As discussed above, similar to the proposed rule, for FY 2019, we applied the following policies (as discussed in more details above):

- In accordance with section 10324(a) of the Affordable Care Act, we created a wage index floor of 1.0000 for all hospitals located in States determined to be frontier States.
- As we did in establishing the FY 2009 outlier threshold (73 FR 57891), in our projection of FY 2019 outlier payments, we

did not make any adjustments for the possibility that hospitals' CCRs and outlier payments may be reconciled upon cost report settlement.

- We excluded the hospital VBP payment adjustments and the hospital readmissions payment adjustments from the calculation of the outlier fixed-loss cost threshold.
- We used the estimated per-discharge uncompensated care payments to hospitals eligible for the uncompensated care payment for all cases in the calculation of the outlier fixed-loss cost threshold methodology.

Using this methodology, we used the formula described in section I.C.1 of this Addendum to simulate and calculate the Federal payment rate and outlier payments for all claims. We used a threshold of $25,769 and calculated total operating Federal payments of $88,484,589,041 and total outlier payments of $4,755,375,555. We then divided total outlier payments by total operating Federal payments plus total outlier payments and determined that this threshold met the 5.1 percent target (($88,484,589,041/$93,239,964,596) × 100 = 5.1 percent). As a result, we are finalizing an outlier fixed-loss cost threshold for FY 2019 equal to the prospective payment rate for the MS–DRG, plus any IME, empirically justified Medicare DSH payments, estimated uncompensated care payment, and any add-on payments for new technology, plus $25,769.

(2) Other Changes Concerning Outliers

As stated in the FY 1994 IPPS final rule (58 FR 46348), we establish an outlier threshold that is applicable to both hospital inpatient operating costs and hospital inpatient capital-related costs. When we modeled the combined operating and capital outlier payments, we found that using a common threshold resulted in a lower percentage of outlier payments for capital-related costs than for operating costs. We project that the thresholds for FY 2019 will result in outlier payments that will equal 5.1 percent of operating DRG payments and 5.06 percent of capital payments based on the Federal rate.

In accordance with section 1886(d)(3)(B) of the Act, as we proposed, we reduced the FY 2019 standardized amount by the same percentage to account for the projected proportion of payments paid as outliers.

The outlier adjustment factors applied to the standardized amount based on the FY 2019 outlier threshold are as follows:

	Operating standardized amounts	Capital federal rate
National	0.948999	0.949431

We applied the outlier adjustment factors to the FY 2019 payment rates after removing the effects of the FY 2018 outlier adjustment factors on the standardized amount.

To determine whether a case qualifies for outlier payments, we currently apply hospital-specific CCRs to the total covered charges for the case. Estimated operating and capital costs for the case are calculated separately by applying separate operating and capital CCRs. These costs are then combined and compared with the outlier fixed-loss cost threshold.

Under our current policy at § 412.84, we calculate operating and capital CCR ceilings and assign a statewide average CCR for hospitals whose CCRs exceed 3.0 standard deviations from the mean of the log distribution of CCRs for all hospitals. Based on this calculation, for hospitals for which the MAC computes operating CCRs greater than 1.159 or capital CCRs greater than 0.151, or hospitals for which the MAC is unable to calculate a CCR (as described under § 412.84(i)(3) of our regulations), statewide average CCRs are used to determine whether a hospital qualifies for outlier payments. Table 8A listed in section VI. of this Addendum (and available only via the internet on the CMS website) contains the statewide average operating CCRs for urban hospitals and for rural hospitals for which the MAC is unable to compute a hospital-specific CCR within the above range. These statewide average ratios will be effective for discharges occurring on or after October 1, 2018 and will replace the statewide average ratios from the prior fiscal year. Table 8B listed in section VI. of this Addendum (and available via the internet on the CMS website) contains the comparable statewide average capital CCRs. As previously stated, the CCRs in Tables 8A and 8B will be used during FY 2019 when hospital-specific CCRs based on the latest settled cost report either are not available or are outside the range noted above. Table 8C listed in section VI. of this Addendum (and available via the internet on the CMS website) contains the statewide average total CCRs used under the LTCH PPS as discussed in section V. of this Addendum.

We finally note that we published a manual update (Change Request 3966) to our outlier policy on October 12, 2005, which updated Chapter 3, Section 20.1.2 of the Medicare Claims Processing Manual. The manual update covered an array of topics, including CCRs, reconciliation, and the time value of money. We encourage hospitals that are assigned the statewide average operating and/or capital CCRs to work with their MAC on a possible alternative operating and/or capital CCR as explained in Change Request 3966. Use of an alternative CCR developed by the hospital in conjunction with the MAC can avoid possible overpayments or underpayments at cost report settlement, thereby ensuring better accuracy when making outlier payments and negating the need for outlier reconciliation. We also note that a hospital may request an alternative operating or capital CCR at any time as long as the guidelines of Change Request 3966 are followed. In addition, as mentioned above, we published an additional manual update (Change Request 7192) to our outlier policy on December 3, 2010, which also updated Chapter 3, Section 20.1.2 of the Medicare Claims Processing Manual. The manual update outlines the outlier reconciliation process for hospitals and Medicare contractors. To download and view the manual instructions on outlier reconciliation, we refer readers to the CMS website: *http://www.cms.hhs.gov/manuals/downloads/clm104c03.pdf.*

(3) Alternative Considered for a Potential Change to the CCRs Used for Outliers, New Technology Add-on Payments, and Payments to IPPS-Excluded Cancer Hospitals for Chimeric Antigen Receptor (CAR) T-Cell Therapy

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20583), we stated we believe that, in the context of the pending new technology add-on payment applications for KYMRIAH® and YESCARTA®, there may also be merit in the suggestion from the public to allow hospitals to utilize a CCR specific to procedures involving the ICD–10–PCS procedures codes describing CAR T-cell therapy drugs for FY 2019 as part of the determination of the cost of a case for purposes of calculating outlier payments for individual FY 2019 cases, new technology add-on payments, if approved, for individual FY 2019 cases, and payments to IPPS-excluded cancer hospitals beginning in FY 2019.

We invited public comments on this alternative approach for FY 2019. We also invited public comments on how this payment alternative would affect access to care, as well as how it affects incentives to encourage lower drug prices, which is a high priority for this Administration. In addition, we stated that we were considering alternative approaches and authorities to encourage value-based care and lower drug prices. We solicited comments on how the payment methodology alternatives may intersect and affect future participation in any such alternative approaches. A summary of those comments and our responses can be found in section II.F.2.d. of the preamble of this final rule.

As also discussed in section II.F.2.d. of the preamble of this final rule, building on President Trump's *Blueprint to Lower Drug Prices and Reduce Out-of-Pocket Costs,* the CMS Center for Medicare and Medicaid Innovation (Innovation Center) solicited public comment in the CY 2019 OPPS/ASC proposed rule on key design considerations for developing a potential model that would test private market strategies and introduce competition to improve quality of care for beneficiaries, while reducing both Medicare expenditures and beneficiaries' out of pocket spending. Given the relative newness of CAR T-cell therapy, the potential model, and our request for feedback on this model approach, we believe it would be premature to adopt changes to our existing payment mechanisms for FY 2019, including allowing hospitals to utilize a CCR specific to procedures involving the ICD–10–PCS procedures codes describing CAR T-cell therapy drugs for FY 2019 as part of the determination of the cost of a case for purposes of calculating outlier payments for individual FY 2019 cases, new technology add-on payments for individual FY 2019 cases, and payments to IPPS-excluded cancer hospitals beginning in FY 2019.

(4) FY 2017 Outlier Payments

Our current estimate, using available FY 2017 claims data, is that actual outlier payments for FY 2017 were approximately 5.57 percent of actual total MS–DRG payments. Therefore, the data indicate that,

for FY 2017, the percentage of actual outlier payments relative to actual total payments is higher than we projected for FY 2017. Consistent with the policy and statutory interpretation we have maintained since the inception of the IPPS, we do not make retroactive adjustments to outlier payments to ensure that total outlier payments for FY 2017 are equal to 5.1 percent of total MS–DRG payments. As explained in the FY 2003 Outlier Final Rule (68 FR 34502), if we were to make retroactive adjustments to all outlier payments to ensure total payments are 5.1 percent of MS–DRG payments (by retroactively adjusting outlier payments), we would be removing the important aspect of the prospective nature of the IPPS. Because such an across-the-board adjustment would either lead to more or less outlier payments for all hospitals, hospitals would no longer be able to reliably approximate their payment for a patient while the patient is still hospitalized. We believe it would be neither necessary nor appropriate to make such an aggregate retroactive adjustment. Furthermore, we believe it is consistent with the statutory language at section 1886(d)(5)(A)(iv) of the Act not to make retroactive adjustments to outlier payments. This section states that outlier payments be equal to or greater than 5 percent and less than or equal to 6 percent of projected or estimated (not actual) MS–DRG payments. We believe that an important goal of a PPS is predictability. Therefore, we believe that the fixed-loss outlier threshold should be projected based on the best available historical data and should not be adjusted retroactively. A retroactive change to the fixed-loss outlier threshold would affect all hospitals subject to the IPPS, thereby undercutting the predictability of the system as a whole.

We note that, because the MedPAR claims data for the entire FY 2018 will not be available until after September 30, 2018, we are unable to provide an estimate of actual outlier payments for FY 2018 based on FY 2018 claims data in this final rule. We will provide an estimate of actual FY 2018 outlier payments in the FY 2020 IPPS/LTCH PPS proposed rule.

Comment: One commenter noted that, in the proposed rule, CMS stated that actual outlier payments for FY 2017 were approximately 5.53 percent of total MS–DRG payments. The commenter performed its own analysis and concluded that outlier payments for FY 2017 are approximately 5.30 percent of total MS–DRG payments. The commenter was concerned that CMS' estimate was overstated.

Response: We thank the commenter for the comments. We reviewed our data to ensure the estimate provided is accurate. Therefore, we believe we have provided a reliable estimate of the outlier percentage for FY 2017. The commenter did not provide details regarding the discrepancy. We welcome additional suggestions from the public, including the commenter, to improve the accuracy of our estimate of actual outlier payments.

5. FY 2019 Standardized Amount

The adjusted standardized amount is divided into labor-related and nonlabor-related portions. Tables 1A and 1B listed and published in section VI. of this Addendum (and available via the internet on the CMS website) contain the national standardized amounts that we are applying to all hospitals, except hospitals located in Puerto Rico, for FY 2019. The standardized amount for hospitals in Puerto Rico is shown in Table 1C listed and published in section VI. of this Addendum (and available via the internet on the CMS website). The amounts shown in Tables 1A and 1B differ only in that the labor-related share applied to the standardized amounts in Table 1A is 68.3 percent, and the labor-related share applied to the standardized amounts in Table 1B is 62 percent. In accordance with sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act, we are applying a labor-related share of 62 percent, unless application of that percentage would result in lower payments to a hospital than would otherwise be made. In effect, the statutory provision means that we will apply a labor-related share of 62 percent for all hospitals whose wage indexes are less than or equal to 1.0000.

In addition, Tables 1A and 1B include the standardized amounts reflecting the applicable percentage increases for FY 2019.

The labor-related and nonlabor-related portions of the national average standardized amounts for Puerto Rico hospitals for FY 2019 are set forth in Table 1C listed and published in section VI. of this Addendum (and available via the internet on the CMS website). Similar to above, section 1886(d)(9)(C)(iv) of the Act, as amended by section 403(b) of Public Law 108–173, provides that the labor-related share for hospitals located in Puerto Rico be 62 percent, unless the application of that percentage would result in lower payments to the hospital.

The following table illustrates the changes from the FY 2018 national standardized amount to the FY 2019 national standardized amount. The second through fifth columns display the changes from the FY 2018 standardized amounts for each applicable FY 2019 standardized amount. The first row of the table shows the updated (through FY 2018) average standardized amount after restoring the FY 2018 offsets for outlier payments and the geographic reclassification budget neutrality. The MS–DRG reclassification and recalibration and wage index budget neutrality adjustment factors are cumulative. Therefore, those FY 2018 adjustment factors are not removed from this table.

CHANGES FROM FY 2018 STANDARDIZED AMOUNTS TO THE FY 2019 STANDARDIZED AMOUNTS

	Hospital submitted quality data and is a meaningful EHR user	Hospital submitted quality data and is NOT a meaningful EHR user	Hospital did NOT submit quality data and is a meaningful EHR user	Hospital did NOT submit quality data and is NOT a meaningful EHR user
FY 2018 Base Rate after removing: 1. FY 2018 Geographic Reclassification Budget Neutrality (0.987985) 2. FY 2018 Operating Outlier Offset (0.948998)	If Wage Index is Greater Than 1.0000: Labor (68.3%): $4,059.36. Nonlabor (30.4%): $1,884.07. If Wage Index is less Than or Equal to 1.0000: Labor (62%): $3,684.92. Nonlabor (38%): $2,258.50.	If Wage Index is Greater Than 1.0000: Labor (68.3%): $4,059.36. Nonlabor (30.4%): $1,884.07. If Wage Index is less Than or Equal to 1.0000: Labor (62%): $3,684.92. Nonlabor (38%): $2,258.50.	If Wage Index is Greater Than 1.0000: Labor (68.3%): $4,059.36. Nonlabor (30.4%): $1,884.07. National Standardized Amount for FY 2019 if Wage Index is Greater Than 1.0000; Labor/Non-Labor Share Percentage (68.3/31.7).	Labor: $3,858.62 Nonlabor: $1,790.90	Labor: $3,775.81 Nonlabor: $1,752.47	Labor: $3,831.02 Nonlabor: $1,778.09	Labor: $3,748.21. Nonlabor: $1,739.66.

CHANGES FROM FY 2018 STANDARDIZED AMOUNTS TO THE FY 2019 STANDARDIZED AMOUNTS—Continued

	Hospital submitted quality data and is a meaningful EHR user	Hospital submitted quality data and is NOT a meaningful EHR user	Hospital did NOT submit quality data and is a meaningful EHR user	Hospital did NOT submit quality data and is NOT a meaningful EHR user
National Standardized Amount for FY 2019 if Wage Index is Less Than or Equal to 1.0000; Labor/Non-Labor Share Percentage (62/38).	Labor: $3,502.70 ..... Nonlabor: $2,146.82	Labor: $3,427.53 ..... Nonlabor: $2,100.75	Labor: $3,477.65 ..... Nonlabor: $2,131.46	Labor: $3,402.48. Nonlabor: $2,085.39.

B. Adjustments for Area Wage Levels and Cost-of-Living

Tables 1A through 1C, as published in section VI. of this Addendum (and available via the internet on the CMS website), contain the labor-related and nonlabor-related shares that we used to calculate the prospective payment rates for hospitals located in the 50 States, the District of Columbia, and Puerto Rico for FY 2019. This section addresses two types of adjustments to the standardized amounts that are made in determining the prospective payment rates as described in this Addendum.

1. Adjustment for Area Wage Levels

Sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act require that we make an adjustment to the labor-related portion of the national prospective payment rate to account for area differences in hospital wage levels. This adjustment is made by multiplying the labor-related portion of the adjusted standardized amounts by the appropriate wage index for the area in which the hospital is located. For FY 2019, as discussed in section IV.B.3. of the preamble of this final rule, we are applying a labor-related share of 68.3 percent for the national standardized amounts for all IPPS hospitals (including hospitals in Puerto Rico) that have a wage index value that is greater than 1.0000. Consistent with section 1886(d)(3)(E) of the Act, we are applying the wage index to a labor-related share of 62 percent of the national standardized amount for all IPPS hospitals (including hospitals in Puerto Rico) whose wage index values are less than or equal to 1.0000. In section III. of the preamble of this final rule, we discuss the data and methodology for the FY 2019 wage index.

2. Adjustment for Cost-of-Living in Alaska and Hawaii

Section 1886(d)(5)(H) of the Act provides discretionary authority to the Secretary to make adjustments as the Secretary deems appropriate to take into account the unique circumstances of hospitals located in Alaska and Hawaii. Higher labor-related costs for these two States are taken into account in the adjustment for area wages described above. To account for higher nonlabor-related costs for these two States, we multiply the nonlabor-related portion of the standardized amount for hospitals in Alaska and Hawaii by an adjustment factor.

In the FY 2013 IPPS/LTCH PPS final rule, we established a methodology to update the COLA factors for Alaska and Hawaii that were published by the U.S. Office of Personnel Management (OPM) every 4 years (at the same time as the update to the labor-related share of the IPPS market basket), beginning in FY 2014. We refer readers to the FY 2013 IPPS/LTCH PPS proposed and final rules for additional background and a detailed description of this methodology (77 FR 28145 through 28146 and 77 FR 53700 through 53701, respectively).

For FY 2018, in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38530 through 38531), we updated the COLA factors published by OPM for 2009 (as these are the last COLA factors OPM published prior to transitioning from COLAs to locality pay) using the methodology that we finalized in the FY 2013 IPPS/LTCH PPS final rule.

Based on the policy finalized in the FY 2013 IPPS/LTCH PPS final rule, for FY 2019, as we proposed, we are continuing to use the same COLA factors in FY 2019 that were used in FY 2018 to adjust the nonlabor-related portion of the standardized amount for hospitals located in Alaska and Hawaii. Below is a table listing the COLA factors for FY 2019.

FY 2019 COST-OF-LIVING ADJUSTMENT FACTORS: ALASKA AND HAWAII HOSPITALS

Area	Cost of living adjustment factor
Alaska:	
City of Anchorage and 80-kilometer (50-mile) radius by road	1.25
City of Fairbanks and 80-kilometer (50-mile) radius by road	1.25
City of Juneau and 80-kilometer (50-mile) radius by road	1.25
Rest of Alaska	1.25
City and County of Honolulu	1.25
County of Hawaii	1.21
County of Kauai	1.25
County of Maui and County of Kalawao	1.25

Based on the policy finalized in the FY 2013 IPPS/LTCH PPS final rule, the next update to the COLA factors for Alaska and Hawaii would occur at the same time as the update to the labor-related share of the IPPS market basket (no later than FY 2022).

C. Calculation of the Prospective Payment Rates

General Formula for Calculation of the Prospective Payment Rates for FY 2019

In general, the operating prospective payment rate for all hospitals (including hospitals in Puerto Rico) paid under the IPPS, except SCHs and MDHs, for FY 2019 equals the Federal rate (which includes uncompensated care payments).

Section 205 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10, enacted on April 16, 2015) extended the MDH program (which, under previous law, was to be in effect for discharges on or before March 31, 2015 only) for discharges occurring on or after April 1, 2015, through FY 2017 (that is, for discharges occurring on or before September 30, 2017). Section 50205 of the Bipartisan Budget Act of 2018 (Pub. L. 115–123), enacted February 9, 2018, extended the MDH program for discharges on or after October 1, 2017 through September 30, 2022.

SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: The Federal national rate (which, as discussed in section V.G. of the preamble of this final rule, includes uncompensated care payments); the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on FY 2006 costs per discharge to determine the rate that yields the greatest aggregate payment.

The prospective payment rate for SCHs for FY 2019 equals the higher of the applicable

Federal rate, or the hospital-specific rate as described below. The prospective payment rate for MDHs for FY 2019 equals the higher of the Federal rate, or the Federal rate plus 75 percent of the difference between the Federal rate and the hospital-specific rate as described below. For MDHs, the updated hospital-specific rate is based on FY 1982, FY 1987, or FY 2002 costs per discharge, whichever yields the greatest aggregate payment.

1. Operating and Capital Federal Payment Rate and Outlier Payment Calculation

Note: The formula below is used for actual claim payment and is also used by CMS to project the outlier threshold for the upcoming fiscal year. The difference is the source of some of the variables in the formula. For example, operating and capital CCRs for actual claim payment are from the PSF while CMS uses an adjusted CCR (as described above) to project the threshold for the upcoming fiscal year. In addition, charges for a claim payment are from the bill while charges to project the threshold are from the MedPAR data with an inflation factor applied to the charges (as described earlier).

Step 1—Determine the MS–DRG and MS–DRG relative weight for each claim based on the ICD–10–CM procedure and diagnosis codes on the claim.

Step 2—Select the applicable average standardized amount depending on whether the hospital submitted qualifying quality data and is a meaningful EHR user, as described above.

Step 3—Compute the operating and capital Federal payment rate:

—Federal Payment Rate for Operating Costs = MS–DRG Relative Weight × [(Labor-Related Applicable Standardized Amount × Applicable CBSA Wage Index) + (Nonlabor-Related Applicable Standardized Amount × Cost-of-Living Adjustment)] × (1 + IME + (DSH * 0.25))
—Federal Payment for Capital Costs = MS–DRG Relative Weight × Federal Capital Rate × Geographic Adjustment Fact × (l + IME + DSH)

Step 4—Determine operating and capital costs:

—Operating Costs = (Billed Charges × Operating CCR)
—Capital Costs = (Billed Charges × Capital CCR).

Step 5—Compute operating and capital outlier threshold (CMS applies a geographic adjustment to the operating and capital outlier threshold to account for local cost variation):

—Operating CCR to Total CCR = (Operating CCR)/(Operating CCR + Capital CCR)
—Operating Outlier Threshold = [Fixed Loss Threshold × ((Labor-Related Portion × CBSA Wage Index) + Nonlabor-Related portion)] × Operating CCR to Total CCR + Federal Payment with IME, DSH + Uncompensated Care Payment + New Technology Add-On Payment Amount
—Capital CCR to Total CCR = (Capital CCR)/(Operating CCR + Capital CCR)
—Capital Outlier Threshold = (Fixed Loss Threshold × Geographic Adjustment Factor × Capital CCR to Total CCR) + Federal Payment with IME and DSH

Step 6—Compute operating and capital outlier payments:

—Marginal Cost Factor = 0.80 or 0.90 (depending on the MS–DRG)
—Operating Outlier Payment = (Operating Costs—Operating Outlier Threshold) × Marginal Cost Factor
—Capital Outlier Payment = (Capital Costs—Capital Outlier Threshold) × Marginal Cost Factor

The payment rate may then be further adjusted for hospitals that qualify for a low-volume payment adjustment under section 1886(d)(12) of the Act and 42 CFR 412.101(b). The base-operating DRG payment amount may be further adjusted by the hospital readmissions payment adjustment and the hospital VBP payment adjustment as described under sections 1886(q) and 1886(o) of the Act, respectively. Payments also may be reduced by the 1-percent adjustment under the HAC Reduction Program as described in section 1886(p) of the Act. We also make new technology add-on payments in accordance with section 1886(d)(5)(K) and (L) of the Act. Finally, we add the uncompensated care payment to the total claim payment amount. As noted in the formula above, we take uncompensated care payments and new technology add-on payments into consideration when calculating outlier payments.

2. Hospital-Specific Rate (Applicable Only to SCHs and MDHs)

a. Calculation of Hospital-Specific Rate

Section 1886(b)(3)(C) of the Act provides that SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: The Federal rate; the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on FY 2006 costs per discharge to determine the rate that yields the greatest aggregate payment.

As noted above, as discussed in section IV.G. of the preamble of this FY 2019 IPPS/LTCH PPS final rule, section 205 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10, enacted on April 16, 2015) extended the MDH program (which, under previous law, was to be in effect for discharges on or before March 31, 2015 only) for discharges occurring on or after April 1, 2015, through FY 2017 (that is, for discharges occurring on or before September 30, 2017). Section 50205 of the Bipartisan Budget Act of 2018, enacted February 9, 2018, extended the MDH program for discharges on or after October 1, 2017 through September 30, 2022. For MDHs, the updated hospital-specific rate is based on FY 1982, FY 1987, or FY 2002 costs per discharge, whichever yields the greatest aggregate payment.

For a more detailed discussion of the calculation of the hospital-specific rates, we refer readers to the FY 1984 IPPS interim final rule (48 FR 39772); the April 20, 1990 final rule with comment period (55 FR 15150); the FY 1991 IPPS final rule (55 FR 35994); and the FY 2001 IPPS final rule (65 FR 47082).

b. Updating the FY 1982, FY 1987, FY 1996, FY 2002 and FY 2006 Hospital-Specific Rate for FY 2019

Section 1886(b)(3)(B)(iv) of the Act provides that the applicable percentage increase applicable to the hospital-specific rates for SCHs and MDHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS). Because the Act sets the update factor for SCHs and MDHs equal to the update factor for all other IPPS hospitals, the update to the hospital-specific rates for SCHs and MDHs is subject to the amendments to section 1886(b)(3)(B) of the Act made by sections 3401(a) and 10319(a) of the Affordable Care Act. Accordingly, the applicable percentage increases to the hospital-specific rates applicable to SCHs and MDHs are the following:

FY 2019	Hospital submitted quality data and is a meaningful EHR user	Hospital submitted quality data and is NOT a meaningful EHR user	Hospital did NOT submit quality data and is a meaningful EHR user	Hospital did NOT submit quality data and is NOT a meaningful EHR user
Market Basket Rate-of-Increase	2.9	2.9	2.9	2.9
Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0	0	−0.725	−0.725
Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0	−2.175	0	−2.175
MFP Adjustment under Section 1886(b)(3)(B)(xi) of the Act	−0.8	−0.8	−0.8	−0.8
Statutory Adjustment under Section 1886(b)(3)(B)(xii) of the Act	−0.75	−0.75	−0.75	−0.75
Applicable Percentage Increase Applied to Standardized Amount	1.35	−0.825	0.625	−1.55

For a complete discussion of the applicable percentage increase applied to the hospital-specific rates for SCHs and MDHs, we refer readers to section IV.B. of the preamble of this final rule.

In addition, because SCHs and MDHs use the same MS–DRGs as other hospitals when they are paid based in whole or in part on the hospital-specific rate, the hospital-specific rate is adjusted by a budget neutrality factor to ensure that changes to the MS–DRG classifications and the recalibration of the MS–DRG relative weights are made in a manner so that aggregate IPPS payments are unaffected. Therefore, the hospital-specific rate for an SCH or an MDH is adjusted by the MS–DRG reclassification and recalibration budget neutrality factor of 0.997192, as discussed in section III. of this Addendum. The resulting rate is used in determining the payment rate that an SCH or MDH will receive for its discharges beginning on or after October 1, 2018. We note that, in this final rule, for FY 2019, we are not making a documentation and coding adjustment to the hospital-specific rate. We refer readers to section II.D. of the preamble of this final rule for a complete discussion regarding our policies and previously finalized policies (including our historical adjustments to the payment rates) relating to the effect of changes in documentation and coding that do not reflect real changes in case-mix.

III. Changes to Payment Rates for Acute Care Hospital Inpatient Capital-Related Costs for FY 2019

The PPS for acute care hospital inpatient capital-related costs was implemented for cost reporting periods beginning on or after October 1, 1991. The basic methodology for determining Federal capital prospective rates is set forth in the regulations at 42 CFR 412.308 through 412.352. Below we discuss the factors that we used to determine the capital Federal rate for FY 2019, which will be effective for discharges occurring on or after October 1, 2018.

All hospitals (except ''new'' hospitals under § 412.304(c)(2)) are paid based on the capital Federal rate. We annually update the capital standard Federal rate, as provided in § 412.308(c)(1), to account for capital input price increases and other factors. The regulations at § 412.308(c)(2) also provide that the capital Federal rate be adjusted annually by a factor equal to the estimated proportion of outlier payments under the capital Federal rate to total capital payments under the capital Federal rate. In addition, § 412.308(c)(3) requires that the capital Federal rate be reduced by an adjustment factor equal to the estimated proportion of payments for exceptions under § 412.348. (We note that, as discussed in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53705), there is generally no longer a need for an exceptions payment adjustment factor.) However, in limited circumstances, an additional payment exception for extraordinary circumstances is provided for under § 412.348(f) for qualifying hospitals. Therefore, in accordance with § 412.308(c)(3), an exceptions payment adjustment factor may need to be applied if such payments are made. Section 412.308(c)(4)(ii) requires that the capital standard Federal rate be adjusted so that the effects of the annual DRG reclassification and the recalibration of DRG weights and changes in the geographic adjustment factor (GAF) are budget neutral.

Section 412.374 provides for payments to hospitals located in Puerto Rico under the IPPS for acute care hospital inpatient capital-related costs, which currently specifies capital IPPS payments to hospitals located in Puerto Rico are based on 100 percent of the Federal rate.

A. Determination of the Federal Hospital Inpatient Capital-Related Prospective Payment Rate Update for FY 2019

In the discussion that follows, we explain the factors that we used to determine the capital Federal rate for FY 2019. In particular, we explain why the FY 2019 capital Federal rate will increase approximately 1.27 percent, compared to the FY 2018 capital Federal rate. As discussed in the impact analysis in Appendix A to this final rule, we estimate that capital payments per discharge will increase approximately 2.1 percent during that same period. Because capital payments constitute approximately 10 percent of hospital payments, a 1-percent change in the capital Federal rate yields only approximately a 0.1 percent change in actual payments to hospitals.

1. Projected Capital Standard Federal Rate Update

a. Description of the Update Framework

Under § 412.308(c)(1), the capital standard Federal rate is updated on the basis of an analytical framework that takes into account changes in a capital input price index (CIPI) and several other policy adjustment factors. Specifically, we adjust the projected CIPI rate of change as appropriate each year for case-mix index-related changes, for intensity, and for errors in previous CIPI forecasts. The update factor for FY 2019 under that framework is 1.4 percent based on a projected 1.4 percent increase in the 2014-based CIPI, a 0.0 percentage point adjustment for intensity, a 0.0 percentage point adjustment for case-mix, a 0.0 percentage point adjustment for the DRG reclassification and recalibration, and a forecast error correction of 0.0 percentage point. As discussed in section III.C. of this Addendum, we continue to believe that the CIPI is the most appropriate input price index for capital costs to measure capital price changes in a given year. We also explain the basis for the FY 2019 CIPI projection in that same section of this Addendum. Below we describe the policy adjustments that we are applying in the update framework for FY 2019.

The case-mix index is the measure of the average DRG weight for cases paid under the IPPS. Because the DRG weight determines the prospective payment for each case, any percentage increase in the case-mix index corresponds to an equal percentage increase in hospital payments.

The case-mix index can change for any of several reasons:

- The average resource use of Medicare patient changes (''real'' case-mix change);
- Changes in hospital documentation and coding of patient records result in higher-weighted DRG assignments (''coding effects''); and
- The annual DRG reclassification and recalibration changes may not be budget neutral (''reclassification effect'').

We define real case-mix change as actual changes in the mix (and resource requirements) of Medicare patients, as opposed to changes in documentation and coding behavior that result in assignment of cases to higher-weighted DRGs, but do not reflect higher resource requirements. The capital update framework includes the same case-mix index adjustment used in the former operating IPPS update framework (as discussed in the May 18, 2004 IPPS proposed rule for FY 2005 (69 FR 28816)). (We no longer use an update framework to make a recommendation for updating the operating IPPS standardized amounts, as discussed in section II. of Appendix B to the FY 2006 IPPS final rule (70 FR 47707).)

For FY 2019, we are projecting a 0.5 percent total increase in the case-mix index. We estimated that the real case-mix increase will equal 0.5 percent for FY 2019. The net adjustment for change in case-mix is the difference between the projected real increase in case-mix and the projected total increase in case-mix. Therefore, the net adjustment for case-mix change in FY 2019 is 0.0 percentage point.

The capital update framework also contains an adjustment for the effects of DRG reclassification and recalibration. This adjustment is intended to remove the effect on total payments of prior year's changes to the DRG classifications and relative weights, in order to retain budget neutrality for all case-mix index-related changes other than those due to patient severity of illness. Due to the lag time in the availability of data, there is a 2-year lag in data used to determine the adjustment for the effects of DRG reclassification and recalibration. For example, we have data available to evaluate the effects of the FY 2017 DRG reclassification and recalibration as part of our update for FY 2019. We assume, for purposes of this adjustment, that the estimate of FY 2017 DRG reclassification and recalibration resulted in no change in the case-mix when compared with the case-mix index that would have resulted if we had not made the reclassification and recalibration changes to the DRGs. Therefore, as we proposed, we are making a 0.0 percentage point adjustment for reclassification and recalibration in the update framework for FY 2019.

The capital update framework also contains an adjustment for forecast error. The input price index forecast is based on historical trends and relationships ascertainable at the time the update factor is established for the upcoming year. In any given year, there may be unanticipated price fluctuations that may result in differences between the actual increase in prices and the forecast used in calculating the update factors. In setting a prospective payment rate under the framework, we make an adjustment for forecast error only if our estimate of the change in the capital input

price index for any year is off by 0.25 percentage point or more. There is a 2-year lag between the forecast and the availability of data to develop a measurement of the forecast error. Historically, when a forecast error of the CIPI is greater than 0.25 percentage point in absolute terms, it is reflected in the update recommended under this framework. A forecast error of 0.0 percentage point was calculated for the FY 2017 update, for which there are historical data. That is, current historical data indicated that the forecasted FY 2017 CIPI (1.2 percent) used in calculating the FY 2017 update factor was 0.0 percentage point higher than actual realized price increases (1.2 percent). As this does not exceed the 0.25 percentage point threshold, as we proposed, we are not making an adjustment for forecast error in the update for FY 2019.

Under the capital IPPS update framework, we also make an adjustment for changes in intensity. Historically, we calculated this adjustment using the same methodology and data that were used in the past under the framework for operating IPPS. The intensity factor for the operating update framework reflected how hospital services are utilized to produce the final product, that is, the discharge. This component accounts for changes in the use of quality-enhancing services, for changes within DRG severity, and for expected modification of practice patterns to remove noncost-effective services. Our intensity measure is based on a 5-year average.

We calculate case-mix constant intensity as the change in total cost per discharge, adjusted for price level changes (the CPI for hospital and related services) and changes in real case-mix. Without reliable estimates of the proportions of the overall annual intensity changes that are due, respectively, to ineffective practice patterns and the combination of quality-enhancing new technologies and complexity within the DRG system, we assume that one-half of the annual change is due to each of these factors. The capital update framework thus provides an add-on to the input price index rate of increase of one-half of the estimated annual increase in intensity, to allow for increases within DRG severity and the adoption of quality-enhancing technology.

In this final rule, as we proposed, we are continuing to use a Medicare-specific intensity measure that is based on a 5-year adjusted average of cost per discharge for FY 2019 (we refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50436) for a full description of our Medicare-specific intensity measure). Specifically, for FY 2019, we are using an intensity measure that is based on an average of cost per discharge data from the 5-year period beginning with FY 2012 and extending through FY 2016. Based on these data, we estimated that case-mix constant intensity declined during FYs 2012 through 2016. In the past, when we found intensity to be declining, we believed a zero (rather than a negative) intensity adjustment was appropriate. Consistent with this approach, because we estimated that intensity will decline during that 5-year period, we believe it is appropriate to continue to apply a zero intensity adjustment for FY 2019. Therefore, as we proposed, we are making a 0.0 percentage point adjustment for intensity in the update for FY 2019.

Above we described the basis of the components we used to develop the 1.4 percent capital update factor under the capital update framework for FY 2019, as shown in the following table.

CMS FY 2019 UPDATE FACTOR TO THE CAPITAL FEDERAL RATE

Capital Input Price Index*	1.4
Intensity	0.0
Case-Mix Adjustment Factors:	
Real Across DRG Change	0.5
Projected Case-Mix Change	0.5
Subtotal	1.4
Effect of FY 2017 Reclassification and Recalibration	0.0
Forecast Error Correction	0.0
Total Update	1.4

*The capital input price index represents the 2014-based CIPI.

b. Comparison of CMS and MedPAC Update Recommendation

In its March 2018 Report to Congress, MedPAC did not make a specific update recommendation for capital IPPS payments for FY 2019. (We refer readers to MedPAC's Report to the Congress: Medicare Payment Policy, March 2018, Chapter 3, available on the website at: *http://www.medpac.gov*.)

2. Outlier Payment Adjustment Factor

Section 412.312(c) establishes a unified outlier payment methodology for inpatient operating and inpatient capital-related costs. A single set of thresholds is used to identify outlier cases for both inpatient operating and inpatient capital-related payments. Section 412.308(c)(2) provides that the standard Federal rate for inpatient capital-related costs be reduced by an adjustment factor equal to the estimated proportion of capital-related outlier payments to total inpatient capital-related PPS payments. The outlier thresholds are set so that operating outlier payments are projected to be 5.1 percent of total operating IPPS DRG payments.

For FY 2018, we estimated that outlier payments for capital would equal 5.17 percent of inpatient capital-related payments based on the capital Federal rate in FY 2018. Based on the thresholds, as set forth in section II.A. of this Addendum, we estimate that outlier payments for capital-related costs will equal 5.06 percent for inpatient capital-related payments based on the capital Federal rate in FY 2019. Therefore, we are applying an outlier adjustment factor of 0.9494 in determining the capital Federal rate for FY 2019. Thus, we estimate that the percentage of capital outlier payments to total capital Federal rate payments for FY 2019 will be lower than the percentage for FY 2018.

The outlier reduction factors are not built permanently into the capital rates; that is, they are not applied cumulatively in determining the capital Federal rate. The FY 2019 outlier adjustment of 0.9494 is a 0.12 percent change from the FY 2018 outlier adjustment of 0.9483. Therefore, the net change in the outlier adjustment to the capital Federal rate for FY 2019 is 1.0012 (0.9494/0.9483) so that the outlier adjustment will increase the FY 2019 capital Federal rate by 0.12 percent compared to the FY 2018 outlier adjustment.

3. Budget Neutrality Adjustment Factor for Changes in DRG Classifications and Weights and the GAF

Section 412.308(c)(4)(ii) requires that the capital Federal rate be adjusted so that aggregate payments for the fiscal year based on the capital Federal rate, after any changes resulting from the annual DRG reclassification and recalibration and changes in the GAF, are projected to equal aggregate payments that would have been made on the basis of the capital Federal rate without such changes. The budget neutrality factor for DRG reclassifications and recalibration nationally is applied in determining the capital IPPS Federal rate, and is applicable for all hospitals, including those hospitals located in Puerto Rico.

To determine the factors for FY 2019, we compared estimated aggregate capital Federal rate payments based on the FY 2018 MS–DRG classifications and relative weights and the FY 2018 GAF to estimated aggregate capital Federal rate payments based on the FY 2018 MS–DRG classifications and relative weights and the FY 2019 GAFs. To achieve budget neutrality for the changes in the GAFs, based on calculations using updated data, we are applying an incremental budget neutrality adjustment factor of 0.9986 for FY 2019 to the previous cumulative FY 2018 adjustment factor.

We then compared estimated aggregate capital Federal rate payments based on the FY 2018 MS–DRG relative weights and the FY 2019 GAFs to estimate aggregate capital Federal rate payments based on the cumulative effects of the FY 2019 MS–DRG classifications and relative weights and the FY 2019 GAFs. The incremental adjustment factor for DRG classifications and changes in relative weights is 0.9989. The incremental adjustment factors for MS–DRG classifications and changes in relative weights and for changes in the GAFs through FY 2019 is 0.9975. We note that all the values are calculated with unrounded numbers.

The GAF/DRG budget neutrality adjustment factors are built permanently into the capital rates; that is, they are applied cumulatively in determining the capital Federal rate. This follows the requirement under § 412.308(c)(4)(ii) that estimated aggregate payments each year be no more or less than they would have been in the absence of the annual DRG reclassification and recalibration and changes in the GAFs.

The methodology used to determine the recalibration and geographic adjustment factor (GAF/DRG) budget neutrality adjustment is similar to the methodology used in establishing budget neutrality adjustments under the IPPS for operating costs. One difference is that, under the operating IPPS, the budget neutrality adjustments for the effect of geographic reclassifications are determined separately from the effects of other changes in the hospital wage index and the MS–DRG

relative weights. Under the capital IPPS, there is a single GAF/DRG budget neutrality adjustment factor for changes in the GAF (including geographic reclassification) and the MS–DRG relative weights. In addition, there is no adjustment for the effects that geographic reclassification has on the other payment parameters, such as the payments for DSH or IME.

The incremental adjustment factor of 0.9975 (the product of the incremental national GAF budget neutrality adjustment factor of 0.9986 and the incremental DRG budget neutrality adjustment factor of 0.9989) accounts for the MS–DRG reclassifications and recalibration and for changes in the GAFs. It also incorporates the effects on the GAFs of FY 2019 geographic reclassification decisions made by the MGCRB compared to FY 2018 decisions. However, it does not account for changes in payments due to changes in the DSH and IME adjustment factors.

4. Capital Federal Rate for FY 2019

For FY 2018, we established a capital Federal rate of $453.95 (82 FR 46144 through 46145). We are establishing an update of 1.4 percent in determining the FY 2019 capital Federal rate for all hospitals. As a result of this update and the budget neutrality factors discussed earlier, we are establishing a national capital Federal rate of $459.72 for FY 2019. The national capital Federal rate for FY 2019 was calculated as follows:

- The FY 2019 update factor is 1.014; that is, the update is 1.4 percent.
- The FY 2019 budget neutrality adjustment factor that is applied to the capital Federal rate for changes in the MS–DRG classifications and relative weights and changes in the GAFs is 0.9975.
- The FY 2019 outlier adjustment factor is 0.9494.

We are providing the following chart that shows how each of the factors and adjustments for FY 2019 affects the computation of the FY 2019 national capital Federal rate in comparison to the FY 2018 national capital Federal rate as presented in the FY 2018 IPPS/LTCH PPS Correction Notice (82 FR 46144 through 46145). The FY 2019 update factor has the effect of increasing the capital Federal rate by 1.4 percent compared to the FY 2018 capital Federal rate. The GAF/DRG budget neutrality adjustment factor has the effect of decreasing the capital Federal rate by 0.25 percent. The FY 2019 outlier adjustment factor has the effect of increasing the capital Federal rate by 0.12 percent compared to the FY 2018 capital Federal rate. The combined effect of all the changes will increase the national capital Federal rate by approximately 1.27 percent, compared to the FY 2018 national capital Federal rate.

COMPARISON OF FACTORS AND ADJUSTMENTS: FY 2018 CAPITAL FEDERAL RATE AND FY 2019 CAPITAL FEDERAL RATE

	FY 2018	FY 2019	Change	Percent change
Update Factor [1]	1.0130	1.0140	1.014	1.40
GAF/DRG Adjustment Factor [1]	0.9987	0.9975	0.9975	−0.25
Outlier Adjustment Factor [2]	0.9483	0.9494	1.0012	0.12
Capital Federal Rate	$453.95	$459.72	1.0127	1.27 [3]

[1] The update factor and the GAF/DRG budget neutrality adjustment factors are built permanently into the capital Federal rates. Thus, for example, the incremental change from FY 2018 to FY 2019 resulting from the application of the 0.9975 GAF/DRG budget neutrality adjustment factor for FY 2019 is a net change of 0.9975 (or –0.25 percent).

[2] The outlier reduction factor is not built permanently into the capital Federal rate; that is, the factor is not applied cumulatively in determining the capital Federal rate. Thus, for example, the net change resulting from the application of the FY 2019 outlier adjustment factor is 0.9494/0.9483 or 1.0012 (or 0.12 percent).

[3] Percent change may not sum due to rounding.

In this final rule, we also are providing the following chart that shows how the final FY 2019 capital Federal rate differs from the proposed FY 2019 capital Federal rate as presented in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20587 through 20589).

COMPARISON OF FACTORS AND ADJUSTMENTS: PROPOSED FY 2019 CAPITAL FEDERAL RATE AND FINAL FY 2019 CAPITAL FEDERAL RATE

	Proposed FY 2019	Final FY 2019	Change	Percent change *
Update Factor	1.0120	1.0140	1.0020	0.20
GAF/DRG Adjustment Factor	0.9997	0.9975	−0.0022	−0.22
Outlier Adjustment Factor	0.9494	0.9494	0.0000	0.00
Capital Federal Rate	$459.78	$459.72	0.9999	−0.01

* Percent change may not sum due to rounding.

B. Calculation of the Inpatient Capital-Related Prospective Payments for FY 2019

For purposes of calculating payments for each discharge during FY 2019, the capital Federal rate is adjusted as follows: (Standard Federal Rate) × (DRG weight) × (GAF) × (COLA for hospitals located in Alaska and Hawaii) × (1 + DSH Adjustment Factor + IME Adjustment Factor, if applicable). The result is the adjusted capital Federal rate.

Hospitals also may receive outlier payments for those cases that qualify under the thresholds established for each fiscal year. Section 412.312(c) provides for a single set of thresholds to identify outlier cases for both inpatient operating and inpatient capital-related payments. The outlier thresholds for FY 2019 are in section II.A. of this Addendum. For FY 2019, a case will qualify as a cost outlier if the cost for the case plus the (operating) IME and DSH payments (including both the empirically justified Medicare DSH payment and the estimated uncompensated care payment, as discussed in section II.A.4.g.(1) of this Addendum) is greater than the prospective payment rate for the MS–DRG plus the fixed-loss amount of $25,769.

Currently, as provided under § 412.304(c)(2), we pay a new hospital 85 percent of its reasonable costs during the first 2 years of operation, unless it elects to receive payment based on 100 percent of the capital Federal rate. Effective with the third year of operation, we pay the hospital based on 100 percent of the capital Federal rate (that is, the same methodology used to pay all other hospitals subject to the capital PPS).

C. Capital Input Price Index

1. Background

Like the operating input price index, the capital input price index (CIPI) is a fixed-weight price index that measures the price changes associated with capital costs during a given year. The CIPI differs from the operating input price index in one important aspect—the CIPI reflects the vintage nature of capital, which is the acquisition and use of capital over time. Capital expenses in any given year are determined by the stock of capital in that year (that is, capital that remains on hand from all current and prior

capital acquisitions). An index measuring capital price changes needs to reflect this vintage nature of capital. Therefore, the CIPI was developed to capture the vintage nature of capital by using a weighted-average of past capital purchase prices up to and including the current year.

We periodically update the base year for the operating and capital input price indexes to reflect the changing composition of inputs for operating and capital expenses. For this FY 2019 IPPS/LTCH PPS final rule, we are using the rebased and revised IPPS operating and capital market baskets that reflect a 2014 base year. For a complete discussion of this rebasing, we refer readers to section IV. of the preamble of the FY 2018 IPPS/LTCH PPS final rule (82 FR 38170).

2. Forecast of the CIPI for FY 2019

Based on IHS Global Inc.'s second quarter 2018 forecast, for this final rule, we are forecasting the 2014-based CIPI to increase 1.4 percent in FY 2019. This reflects a projected 1.6 percent increase in vintage-weighted depreciation prices (building and fixed equipment, and movable equipment), and a projected 3.9 percent increase in other capital expense prices in FY 2019, partially offset by a projected 1.2 percent decline in vintage-weighted interest expense prices in FY 2019. The weighted average of these three factors produces the forecasted 1.4 percent increase for the 2014-based CIPI in FY 2019.

IV. Changes to Payment Rates for Excluded Hospitals: Rate-of-Increase Percentages for FY 2019

Payments for services furnished in children's hospitals, 11 cancer hospitals, and hospitals located outside the 50 States, the District of Columbia and Puerto Rico (that is, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) that are excluded from the IPPS are made on the basis of reasonable costs based on the hospital's own historical cost experience, subject to a rate-of-increase ceiling. A per discharge limit (the target amount, as defined in § 413.40(a) of the regulations) is set for each hospital, based on the hospital's own cost experience in its base year, and updated annually by a rate-of-increase percentage specified in § 413.40(c)(3). In addition, as specified in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38536), effective for cost reporting periods beginning during FY 2018, the annual update to the target amount for extended neoplastic disease care hospitals (hospitals described in § 412.22(i) of the regulations) also is the rate-of-increase percentage specified in § 413.40(c)(3). (We note that, in accordance with § 403.752(a), religious nonmedical health care institutions (RNHCIs) are also subject to the rate-of-increase limits established under § 413.40 of the regulations.)

The FY 2019 rate-of-increase percentage for updating the target amounts for the 11 cancer hospitals, children's hospitals, the short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, RNHCIs, and extended neoplastic disease care hospitals is the estimated percentage increase in the IPPS operating market basket for FY 2019, in accordance with applicable regulations at § 413.40. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20449), based on IGI's 2017 fourth quarter forecast, we estimated that the 2014-based IPPS operating market basket update for FY 2019 was 2.8 percent (that is, the estimate of the market basket rate-of-increase). However, we proposed that if more recent data became available for the final rule, we would use them to calculate the IPPS operating market basket update for FY 2019. For this final rule, based on IGI's 2018 second quarter forecast (which is the most recent available data), we estimated that the 2014-based IPPS operating market basket update for FY 2019 is 2.9 percent (that is, the estimate of the market basket rate-of-increase). Therefore, for children's hospitals, the 11 cancer hospitals, hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa), extended neoplastic disease care hospitals, and RNHCIs, the FY 2019 rate-of-increase percentage that will be applied to the FY 2018 target amounts, in order to determine the FY 2019 target amounts is 2.9 percent.

The IRF PPS, the IPF PPS, and the LTCH PPS are updated annually. We refer readers to section VII. of the preamble of this final rule and section V. of the Addendum to this final rule for the updated changes to the Federal payment rates for LTCHs under the LTCH PPS for FY 2019. The annual updates for the IRF PPS and the IPF PPS are issued by the agency in separate **Federal Register** documents.

V. Changes to the Payment Rates for the LTCH PPS for FY 2019

A. LTCH PPS Standard Federal Payment Rate for FY 2019

1. Overview

In section VII. of the preamble of this final rule, we discuss our annual updates to the payment rates, factors, and specific policies under the LTCH PPS for FY 2019.

Under § 412.523(c)(3) of the regulations, for LTCH PPS FYs 2012 through 2017, we updated the standard Federal payment rate by the most recent estimate of the LTCH PPS market basket at that time, including additional statutory adjustments required by sections 1886(m)(3)(A)(i) (citing sections 1886(b)(3)(B)(xi)(II), 1886(m)(3)(A)(ii), and 1886(m)(4) of the Act as set forth in the regulations at § 412.523(c)(3)(viii) through (c)(3)(xiii)). (For a summary of the payment rate development prior to FY 2012, we refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38310 through 38312).)

Sections 1886(m)(3)(A) and 1886(m)(3)(C) of the Act specify that, for rate year 2010 and each subsequent rate year, except FY 2018, any annual update to the standard Federal payment rate shall be reduced:

- For rate year 2010 through 2019, by the ''other adjustment'' specified in section 1886(m)(3)(A)(ii) and (m)(4) of the Act; and
- For rate year 2012 and each subsequent year, by the productivity adjustment described in section 1886(b)(3)(B)(xi)(II) of the Act (which we refer to as ''the multifactor productivity (MFP) adjustment'') as discussed in section VII.D.2. of the preamble of this final rule.

This section of the Act further provides that the application of section 1886(m)(3)(B) of the Act may result in the annual update being less than zero for a rate year, and may result in payment rates for a rate year being less than such payment rates for the preceding rate year. (As noted in section VII.D.2.a. of the preamble of this final rule, the annual update to the LTCH PPS occurs on October 1 and we have adopted the term ''fiscal year'' (FY) rather than ''rate year'' (RY) under the LTCH PPS beginning October 1, 2010. Therefore, for purposes of clarity, when discussing the annual update for the LTCH PPS, including the provisions of the Affordable Care Act, we use the term ''fiscal year'' rather than ''rate year'' for 2011 and subsequent years.)

For LTCHs that fail to submit the required quality reporting data in accordance with the LTCH QRP, the annual update is reduced by 2.0 percentage points as required by section 1886(m)(5) of the Act.

2. Development of the FY 2019 LTCH PPS Standard Federal Payment Rate

Consistent with our historical practice, for FY 2019, as we proposed, we are applying the annual update to the LTCH PPS standard Federal payment rate from the previous year. Furthermore, in determining the LTCH PPS standard Federal payment rate for FY 2019, we also are making certain regulatory adjustments, consistent with past practices. Specifically, in determining the FY 2019 LTCH PPS standard Federal payment rate, as we proposed, we are applying a budget neutrality adjustment factor for the changes related to the area wage adjustment (that is, changes to the wage data and labor-related share) in accordance with § 412.523(d)(4) and a temporary budget neutrality adjustment factor to LTCH PPS standard Federal payment rate cases only for the cost of the elimination of the 25-percent threshold policy for FY 2019 (discussed in VII.E. of the preamble of this final rule).

In this FY 2019 IPPS/LTCH PPS final rule, we are establishing an annual update to the LTCH PPS standard Federal payment rate of 1.35 percent. Accordingly, under § 412.523(c)(3)(xv), we are applying a factor of 1.0135 to the FY 2018 LTCH PPS standard Federal payment rate of $41,415.11 to determine the FY 2019 LTCH PPS standard Federal payment rate. Also, under § 412.523(c)(3)(xv), applied in conjunction with the provisions of § 412.523(c)(4), we are establishing an annual update to the LTCH PPS standard Federal payment rate of -0.65 percent (that is, an update factor of 0.9935) for FY 2019 for LTCHs that fail to submit the required quality reporting data for FY 2019 as required under the LTCH QRP. Consistent with § 412.523(d)(4), we also are applying an area wage level budget neutrality factor to the FY 2019 LTCH PPS standard Federal payment rate of 0.999713 based on the best available data at this time, to ensure that any changes to the area wage level adjustment (that is, the annual update of the wage index values and labor-related share) would not result in any change (increase or decrease) in estimated aggregate LTCH PPS standard

Federal rate payments. Finally, we are applying a temporary budget neutrality adjustment factor of 0.990884 to LTCH PPS standard Federal payment rate cases only for the cost of the elimination of the 25-percent threshold policy for FY 2019 (discussed in VII.E. of the preamble of this final rule). Accordingly, we are establishing an LTCH PPS standard Federal payment rate of $41,579.65 (calculated as $41,415.11 × 1.0135 × 0.999713 × 0.990884) for FY 2019 (calculations performed on rounded numbers). For LTCHs that fail to submit quality reporting data for FY 2019, in accordance with the requirements of the LTCH QRP under section 1866(m)(5) of the Act, we are establishing an LTCH PPS standard Federal payment rate of $40,759.12 (calculated as $41,415.11 × 0.9935 × 0.999713 × 0.990884) (calculations performed on rounded numbers) for FY 2019.

We did not receive any public comments on the proposed development of the FY 2019 LTCH PPS standard Federal payment rate. Therefore, we are finalizing our proposals as described above, without modification.

B. Adjustment for Area Wage Levels Under the LTCH PPS for FY 2019

1. Background

Under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we established an adjustment to the LTCH PPS standard Federal payment rate to account for differences in LTCH area wage levels under § 412.525(c). The labor-related share of the LTCH PPS standard Federal payment rate is adjusted to account for geographic differences in area wage levels by applying the applicable LTCH PPS wage index. The applicable LTCH PPS wage index is computed using wage data from inpatient acute care hospitals without regard to reclassification under section 1886(d)(8) or section 1886(d)(10) of the Act.

2. Geographic Classifications (Labor Market Areas) for the LTCH PPS Standard Federal Payment Rate

In adjusting for the differences in area wage levels under the LTCH PPS, the labor-related portion of an LTCH's Federal prospective payment is adjusted by using an appropriate area wage index based on the geographic classification (labor market area) in which the LTCH is located. Specifically, the application of the LTCH PPS area wage level adjustment under existing § 412.525(c) is made based on the location of the LTCH—either in an ''urban area,'' or a ''rural area,'' as defined in § 412.503. Under § 412.503, an ''urban area'' is defined as a Metropolitan Statistical Area (MSA) (which includes a Metropolitan division, where applicable), as defined by the Executive OMB and a ''rural area'' is defined as any area outside of an urban area. (Information on OMB's MSA delineations based on the 2010 standards can be found at: *https://obamawhitehouse.archives.gov/sites/default/files/omb/assets/fedreg_2010/06282010_metro_standards-Complete.pdf.*)

The CBSA-based geographic classifications (labor market area definitions) currently used under the LTCH PPS, effective for discharges occurring on or after October 1, 2014, are based on the OMB labor market area delineations based on the 2010 Decennial Census data. The current statistical areas (which were implemented beginning with FY 2015) are based on revised OMB delineations issued on February 28, 2013, in OMB Bulletin No. 13–01. We adopted these labor market area delineations because they are based on the best available data that reflect the local economies and area wage levels of the hospitals that are currently located in these geographic areas. We also believe that these OMB delineations will ensure that the LTCH PPS area wage level adjustment most appropriately accounts for and reflects the relative hospital wage levels in the geographic area of the hospital as compared to the national average hospital wage level. We noted that this policy was consistent with the IPPS policy adopted in FY 2015 under § 412.64(b)(1)(ii)(D) of the regulations (79 FR 49951 through 49963). (For additional information on the CBSA-based labor market area (geographic classification) delineations currently used under the LTCH PPS and the history of the labor market area definitions used under the LTCH PPS, we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50180 through 50185).)

In general, it is our historical practice to update the CBSA-based labor market area delineations annually based on the most recent updates issued by OMB. Generally, OMB issues major revisions to statistical areas every 10 years, based on the results of the decennial census. However, OMB occasionally issues minor updates and revisions to statistical areas in the years between the decennial censuses. On July 15, 2015, OMB issued OMB Bulletin No. 15–01, which provided updates to and superseded OMB Bulletin No. 13–01 that was issued on February 28, 2013. The attachment to OMB Bulletin No. 15–01 provided detailed information on the update to statistical areas since February 28, 2013. We adopted the updates contained in OMB Bulletin No. 15–01, as discussed in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56913 through 56914). On August 15, 2017, OMB issued OMB Bulletin No. 17–01 that updated and superseded Bulletin No. 15–01. As discussed in the proposed rule and in section III.A.2. of the preamble of this final rule, OMB Bulletin No. 17–01 and its attachments provide detailed information on the update to statistical areas since the July 15, 2015 release of Bulletin No. 15–01 and are based on the application of the 2010 Standards for Delineating Metropolitan and Micropolitan Statistical Areas to Census Bureau population estimates for July 1, 2014, and July 1, 2015. A copy of this bulletin may be obtained on the website at: *https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/bulletins/2017/b-17-01.pdf.*

OMB Bulletin No. 17–01 made the following change that is relevant to the LTCH PPS CBSA-based labor market area (geographic classification) delineations:

- Twin Falls, ID, with principal city Twin Falls, ID and consisting of counties Jerome County, ID and Twin Falls County, ID, which was a Micropolitan (geographically rural) area, now qualifies as an urban area under new CBSA 46300 entitled Twin Falls, ID.

This change affects all providers located in CBSA 46300, but our database shows no LTCHs located in CBSA 46300.

We believe that this revision to the CBSA-based labor market area delineations will ensure that the LTCH PPS area wage level adjustment most appropriately accounts for and reflects the relative hospital wage levels in the geographic area of the hospital as compared to the national average hospital wage level based on the best available data that reflect the local economies and area wage levels of the hospitals that are currently located in these geographic areas (81 FR 57298). Therefore, as we proposed, we are adopting this revision under the LTCH PPS, effective October 1, 2018. Accordingly, the FY 2019 LTCH PPS wage index values in Tables 12A and 12B listed in section VI. of the Addendum to this final rule (which are available via the internet on the CMS website) reflect the revision to the CBSA-based labor market area delineations described above. We note that, as discussed in section III.A.2. of the preamble of this final rule, the revision to the CBSA-based delineations also is being used under the IPPS.

We did not receive any public comments in response to our proposal.

3. Labor-Related Share for the LTCH PPS Standard Federal Payment Rate

Under the payment adjustment for the differences in area wage levels under § 412.525(c), the labor-related share of an LTCH's standard Federal payment rate payment is adjusted by the applicable wage index for the labor market area in which the LTCH is located. The LTCH PPS labor-related share currently represents the sum of the labor-related portion of operating costs and a labor-related portion of capital costs using the applicable LTCH PPS market basket. Additional background information on the historical development of the labor-related share under the LTCH PPS can be found in the RY 2007 LTCH PPS final rule (71 FR 27810 through 27817 and 27829 through 27830) and the FY 2012 IPPS/LTCH PPS final rule (76 FR 51766 through 51769 and 51808).

For FY 2013, we rebased and revised the market basket used under the LTCH PPS by adopting a 2009-based LTCH-specific market basket. In addition, beginning in FY 2013, we determined the labor-related share annually as the sum of the relative importance of each labor-related cost category of the 2009-based LTCH-specific market basket for the respective fiscal year based on the best available data. (For more details, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53477 through 53479).) As noted previously, we rebased and revised the 2009-based LTCH-specific market basket to reflect a 2013 base year. In conjunction with that policy, as discussed in section VII.D. of the preamble of this FY 2019 IPPS/LTCH PPS final rule, as we proposed, we are establishing that the LTCH PPS labor-related share for FY 2019 is the sum of the FY 2019 relative importance of each labor-related cost category in the 2013-based LTCH market basket using the most recent available data.

In the proposed rule, we proposed to establish that the labor-related share for FY 2019 includes the sum of the labor-related

portion of operating costs from the 2013-based LTCH market basket (that is, the sum of the FY 2019 relative importance share of Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; All Other: Labor-related Services) and a portion of the Capital-Related cost weight from the 2013-based LTCH PPS market basket. Based on IGI's fourth quarter 2017 forecast of the 2013-based LTCH market basket, we proposed to establish a labor-related share under the LTCH PPS for FY 2019 of 66.2 percent. (We noted that a proposed labor-related share of 66.2 percent was the same as the labor-related share for FY 2018, and although the relative importance of some components of the market basket have changed, the proposed labor-related share remained at 66.2 percent when aggregating these components and rounding to one decimal.) This proposed labor-related share was determined using the same methodology as employed in calculating all previous LTCH PPS labor-related shares. Consistent with our historical practice, we also proposed that if more recent data became available, we would use that data, if appropriate, to determine the final FY 2019 labor-related share in the final rule.

We did not receive any public comments in response to our proposals. Therefore, we are finalizing our proposals, without modification.

In this final rule, we are establishing that the labor-related share for FY 2019 includes the sum of the labor-related portion of operating costs from the 2013-based LTCH market basket (that is, the sum of the FY 2019 relative importance share of Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; All Other: Labor-related Services) and a portion of the Capital-Related cost weight from the 2013-based LTCH PPS market basket. Based on IGI's second quarter 2018 forecast of the 2013-based LTCH market basket, consistent with our proposal, we are establishing a labor-related share under the LTCH PPS for FY 2019 of 66.0 percent. This labor-related share is determined using the same methodology as employed in calculating all previous LTCH PPS labor-related shares.

The labor-related share for FY 2019 is the sum of the FY 2019 relative importance of each labor-related cost category, and reflects the different rates of price change for these cost categories between the base year (2013) and FY 2019. The sum of the relative importance for FY 2019 for operating costs (Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; All Other: Labor-Related Services) is 61.8 percent. The portion of capital-related costs that is influenced by the local labor market is estimated to be 46 percent (the same percentage applied to the 2009-based LTCH-specific market basket). Because the relative importance for capital-related costs under our policies is 9.1 percent of the 2013-based LTCH market basket in FY 2019, as we proposed, we are taking 46 percent of 9.1 percent to determine the labor-related share of capital-related costs for FY 2019 (0.46×9.1). The result is 4.2 percent, which we added to 61.8 percent for the operating cost amount to determine the total labor-related share for FY 2019. Therefore, as we proposed, we are establishing that the labor-related share under the LTCH PPS for FY 2019 is 66.0 percent.

4. Wage Index for FY 2019 for the LTCH PPS Standard Federal Payment Rate

Historically, we have established LTCH PPS area wage index values calculated from acute care IPPS hospital wage data without taking into account geographic reclassification under sections 1886(d)(8) and 1886(d)(10) of the Act (67 FR 56019). The area wage level adjustment established under the LTCH PPS is based on an LTCH's actual location without regard to the ''urban'' or ''rural'' designation of any related or affiliated provider.

In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38538 through 38539), we calculated the FY 2018 LTCH PPS area wage index values using the same data used for the FY 2018 acute care hospital IPPS (that is, data from cost reporting periods beginning during FY 2014), without taking into account geographic reclassification under sections 1886(d)(8) and 1886(d)(10) of the Act, as these were the most recent complete data available at that time. In that same final rule, we indicated that we computed the FY 2018 LTCH PPS area wage index values, consistent with the urban and rural geographic classifications (labor market areas) that were in place at that time and consistent with the pre-reclassified IPPS wage index policy (that is, our historical policy of not taking into account IPPS geographic reclassifications in determining payments under the LTCH PPS). As with the IPPS wage index, wage data for multicampus hospitals with campuses located in different labor market areas (CBSAs) are apportioned to each CBSA where the campus (or campuses) are located. We also continued to use our existing policy for determining area wage index values for areas where there are no IPPS wage data.

Consistent with our historical methodology, as discussed in the FY 2019 IPPS/LTCH PPS proposed rule, to determine the applicable area wage index values for the FY 2019 LTCH PPS standard Federal payment rate, under the broad authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we proposed to use wage data collected from cost reports submitted by IPPS hospitals for cost reporting periods beginning during FY 2015, without taking into account geographic reclassification under sections 1886(d)(8) and 1886(d)(10) of the Act because these data were the most recent complete data available. We also note that these are the same data we are using to compute the FY 2019 acute care hospital inpatient wage index, as discussed in section III. of the preamble of this final rule. We proposed to compute the FY 2019 LTCH PPS standard Federal payment rate area wage index values consistent with the ''urban'' and ''rural'' geographic classifications (that is, labor market area delineations, including the updates, as previously discussed in section V.B. of this Addendum) and our historical policy of not taking into account IPPS geographic reclassifications under sections 1886(d)(8) and 1886(d)(10) of the Act in determining payments under the LTCH PPS. We also proposed to continue continuing to apportion wage data for multicampus hospitals with campuses located in different labor market areas to each CBSA where the campus or campuses are located, consistent with the IPPS policy. Lastly, consistent with our existing methodology for determining the LTCH PPS wage index values, for FY 2019, we proposed to continue to use our existing policy for determining area wage index values for areas where there are no IPPS wage data. Under our existing methodology, the LTCH PPS wage index value for urban CBSAs with no IPPS wage data will be determined by using an average of all of the urban areas within the State, and the LTCH PPS wage index value for rural areas with no IPPS wage data will be determined by using the unweighted average of the wage indices from all of the CBSAs that are contiguous to the rural counties of the State.

We did not receive any public comments in response to our proposals. Therefore, we are finalizing our proposals, without modification.

Based on the FY 2015 IPPS wage data that we used to determine the FY 2019 LTCH PPS standard Federal payment rate area wage index values, there are no IPPS wage data for the urban area of Hinesville, GA (CBSA 25980). Consistent with the methodology discussed above, we calculated the FY 2019 wage index value for CBSA 25980 as the average of the wage index values for all of the other urban areas within the State of Georgia (that is, CBSAs 10500, 12020, 12060, 12260, 15260, 16860, 17980, 19140, 23580, 31420, 40660, 42340, 46660 and 47580), as shown in Table 12A, which is listed in section VI. of the Addendum to this final rule and available via the internet on the CMS website). We note that, as IPPS wage data are dynamic, it is possible that urban areas without IPPS wage data will vary in the future.

Based on the FY 2015 IPPS wage data that we used to determine the FY 2019 LTCH PPS standard Federal payment rate area wage index values in this final rule, there are no rural areas without IPPS hospital wage data. Therefore, it is not necessary to use our established methodology to calculate a LTCH PPS standard Federal payment rate wage index value for rural areas with no IPPS wage data for FY 2019. We note that, as IPPS wage data are dynamic, it is possible that the number of rural areas without IPPS wage data will vary in the future. The FY 2019 LTCH PPS standard Federal payment rate wage index values that will be applicable for LTCH PPS standard Federal payment rate discharges occurring on or after October 1, 2018, through September 30, 2019, are presented in Table 12A (for urban areas) and Table 12B (for rural areas), which are listed in section VI. of the Addendum to this final rule and available via the internet on the CMS website.

5. Budget Neutrality Adjustment for Changes to the LTCH PPS Standard Federal Payment Rate Area Wage Level Adjustment

Historically, the LTCH PPS wage index and labor-related share are updated annually based on the latest available data. Under § 412.525(c)(2), any changes to the area wage index values or labor-related share are to be made in a budget neutral manner such that estimated aggregate LTCH PPS payments are unaffected; that is, will be neither greater than nor less than estimated aggregate LTCH PPS payments without such changes to the area wage level adjustment. Under this policy, we determine an area wage-level adjustment budget neutrality factor that will be applied to the standard Federal payment rate to ensure that any changes to the area wage level adjustments are budget neutral such that any changes to the area wage index values or labor-related share would not result in any change (increase or decrease) in estimated aggregate LTCH PPS payments. Accordingly, under § 412.523(d)(4), we apply an area wage level adjustment budget neutrality factor in determining the standard Federal payment rate, and we also established a methodology for calculating an area wage level adjustment budget neutrality factor. (For additional information on the establishment of our budget neutrality policy for changes to the area wage level adjustment, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51771 through 51773 and 51809).)

In the FY 2019 IPS/LTCH PPS proposed rule, we set forth the proposed methodologies we would use to determine an area wage level adjustment budget factor that would be applied to the LTCH PPS standard Federal payment rate for FY 2019. We did not receive any public comments in response to our proposals. Therefore, we are finalizing our proposals, without modification.

In this final rule, for FY 2019 LTCH PPS standard Federal payment rate cases, in accordance with § 412.523(d)(4), we are applying an area wage level adjustment budget neutrality factor to adjust the LTCH PPS standard Federal payment rate to account for the estimated effect of the adjustments or updates to the area wage level adjustment under § 412.525(c)(1) on estimated aggregate LTCH PPS payments using a methodology that is consistent with the methodology we established in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51773). Specifically, we determined an area wage level adjustment budget neutrality factor that will be applied to the LTCH PPS standard Federal payment rate under § 412.523(d)(4) for FY 2019 using the following methodology:

Step 1—We simulated estimated aggregate LTCH PPS standard Federal payment rate payments using the FY 2018 wage index values and the FY 2018 labor-related share of 66.2 percent (as established in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38314 and 38315)).

Step 2—We simulated estimated aggregate LTCH PPS standard Federal payment rate payments using the FY 2019 wage index values (as shown in Tables 12A and 12B listed in the Addendum to this final rule and available via the internet on the CMS website) and the FY 2019 labor-related share of 66.0 percent (based on the latest available data as previously discussed in this Addendum).

Step 3—We calculated the ratio of these estimated total LTCH PPS standard Federal payment rate payments by dividing the estimated total LTCH PPS standard Federal payment rate payments using the FY 2018 area wage level adjustments (calculated in Step 1) by the estimated total LTCH PPS standard Federal payment rate payments using the FY 2019 area wage level adjustments (calculated in Step 2) to determine the area wage level adjustment budget neutrality factor for FY 2019 LTCH PPS standard Federal payment rate payments.

Step 4—We then applied the FY 2019 area wage level adjustment budget neutrality factor from Step 3 to determine the FY 2019 LTCH PPS standard Federal payment rate after the application of the FY 2019 annual update (discussed previously in section V.A. of this Addendum).

We note that, with the exception of cases subject to the transitional blend payment rate provisions and certain temporary exemptions for certain spinal cord specialty hospitals and certain severe wound cases, under the dual rate LTCH PPS payment structure, only LTCH PPS cases that meet the statutory criteria to be excluded from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) are paid based on the LTCH PPS standard Federal payment rate. Because the area wage level adjustment under § 412.525(c) is an adjustment to the LTCH PPS standard Federal payment rate, we only used data from claims that would have qualified for payment at the LTCH PPS standard Federal payment rate if such rate had been in effect at the time of discharge to calculate the FY 2019 LTCH PPS standard Federal payment rate area wage level adjustment budget neutrality factor described above.

For this final rule, using the steps in the methodology previously described, we determined a FY 2019 LTCH PPS standard Federal payment rate area wage level adjustment budget neutrality factor of 0.999713. Accordingly, in section V.A. of the Addendum to this final rule, to determine the FY 2019 LTCH PPS standard Federal payment rate, we are applying an area wage level adjustment budget neutrality factor of 0.999713, in accordance with § 412.523(d)(4). The FY 2019 LTCH PPS standard Federal payment rate shown in Table 1E of the Addendum to this final rule reflects this adjustment factor.

C. LTCH PPS Cost-of-Living Adjustment (COLA) for LTCHs Located in Alaska and Hawaii

Under § 412.525(b), a cost-of-living adjustment (COLA) is provided for LTCHs located in Alaska and Hawaii to account for the higher costs incurred in those States. Specifically, we apply a COLA to payments to LTCHs located in Alaska and Hawaii by multiplying the nonlabor-related portion of the standard Federal payment rate by the applicable COLA factors established annually by CMS. Higher labor-related costs for LTCHs located in Alaska and Hawaii are taken into account in the adjustment for area wage levels previously described. The methodology used to determine the COLA factors for Alaska and Hawaii is based on a comparison of the growth in the Consumer Price Indexes (CPIs) for Anchorage, Alaska, and Honolulu, Hawaii, relative to the growth in the CPI for the average U.S. city as published by the Bureau of Labor Statistics (BLS). It also includes a 25-percent cap on the CPI-updated COLA factors. Under our current policy, we update the COLA factors using the methodology described above every 4 years (at the same time as the update to the labor-related share of the IPPS market basket), and we last updated the COLA factors for Alaska and Hawaii published by OPM for 2009 in FY 2018 (82 FR 38539 through 38540).

We continue to believe that determining updated COLA factors using this methodology would appropriately adjust the nonlabor-related portion of the LTCH PPS standard Federal payment rate for LTCHs located in Alaska and Hawaii. Therefore, in the FY 2019 IPPS/LTCH PPS proposed rule, for FY 2019, under the broad authority conferred upon the Secretary by section 123 of the BBRA, as amended by section 307(b) of the BIPA, to determine appropriate payment adjustments under the LTCH PPS, we proposed to continue to use the COLA factors based on the 2009 OPM COLA factors updated through 2016 by the comparison of the growth in the CPIs for Anchorage, Alaska, and Honolulu, Hawaii, relative to the growth in the CPI for the average U.S. city as established in the FY 2018 IPPS/LTCH PPS final rule. (For additional details on our current methodology for updating the COLA factors for Alaska and Hawaii and for a discussion on the FY 2018 COLA factors, we refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38539 through 38540).)

We did not receive any public comments on our proposal. Therefore, we are adopting our proposal, without modification. Consistent with our historical practice, we are establishing that the COLA factors shown in the following table will be used to adjust the nonlabor-related portion of the LTCH PPS standard Federal payment rate for LTCHs located in Alaska and Hawaii under § 412.525(b).

COST-OF-LIVING ADJUSTMENT FACTORS FOR ALASKA AND HAWAII UNDER THE LTCH PPS FOR FY 2019

Area	FY 2018 and FY 2019
Alaska:	
City of Anchorage and 80-kilometer (50-mile) radius by road	1.25
City of Fairbanks and 80-kilometer (50-mile) radius by road	1.25
City of Juneau and 80-kilometer (50-mile) radius by road	1.25
Rest of Alaska	1.25
City and County of Honolulu	1.25
County of Hawaii	1.21
County of Kauai	1.25
County of Maui and County of Kalawao	1.25

D. Adjustment for LTCH PPS High Cost Outlier (HCO) Cases

1. HCO Background

From the beginning of the LTCH PPS, we have included an adjustment to account for cases in which there are extraordinarily high costs relative to the costs of most discharges. Under this policy, additional payments are made based on the degree to which the estimated cost of a case (which is calculated by multiplying the Medicare allowable covered charge by the hospital's overall hospital CCR) exceeds a fixed-loss amount. This policy results in greater payment accuracy under the LTCH PPS and the Medicare program, and the LTCH sharing the financial risk for the treatment of extraordinarily high-cost cases.

We retained the basic tenets of our HCO policy in FY 2016 when we implemented the dual rate LTCH PPS payment structure under section 1206 of Public Law 113–67. LTCH discharges that meet the criteria for exclusion from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) are paid at the LTCH PPS standard Federal payment rate, which includes, as applicable, HCO payments under § 412.523(e). LTCH discharges that do not meet the criteria for exclusion are paid at the site neutral payment rate, which includes, as applicable, HCO payments under § 412.522(c)(2)(i). In the FY 2016 IPPS/LTCH PPS final rule, we established separate fixed-loss amounts and targets for the two different LTCH PPS payment rates. Under this bifurcated policy, the historic 8-percent HCO target was retained for LTCH PPS standard Federal payment rate cases, with the fixed-loss amount calculated using only data from LTCH cases that would have been paid at the LTCH PPS standard Federal payment rate if that rate had been in effect at the time of those discharges. For site neutral payment rate cases, we adopted the operating IPPS HCO target (currently 5.1 percent) and set the fixed-loss amount for site neutral payment rate cases at the value of the IPPS fixed-loss amount. Under the HCO policy for both payment rates, an LTCH receives 80 percent of the difference between the estimated cost of the case and the applicable HCO threshold, which is the sum of the LTCH PPS payment for the case and the applicable fixed-loss amount for such case.

In order to maintain budget neutrality, consistent with the budget neutrality requirement for HCO payments to LTCH PPS standard Federal rate payment cases, we also adopted a budget neutrality requirement for HCO payments to site neutral payment rate cases by applying a budget neutrality factor to the LTCH PPS payment for those site neutral payment rate cases. (We refer readers to § 412.522(c)(2)(i) of the regulations for further details.) We note that, during the 2-year transitional period, the site neutral payment rate HCO budget neutrality factor did not apply to the LTCH PPS standard Federal payment rate portion of the blended payment rate at § 412.522(c)(3) payable to site neutral payment rate cases. (For additional details on the HCO policy adopted for site neutral payment rate cases under the dual rate LTCH PPS payment structure, including the budget neutrality adjustment for HCO payments to site neutral payment rate cases, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49617 through 49623).)

2. Determining LTCH CCRs Under the LTCH PPS

a. Background

As noted above, CCRs are used to determine payments for HCO adjustments for both payment rates under the LTCH PPS and also are used to determine payments for site neutral payment rate cases. As noted earlier, in determining HCO and the site neutral payment rate payments (regardless of whether the case is also an HCO), we generally calculate the estimated cost of the case by multiplying the LTCH's overall CCR by the Medicare allowable charges for the case. An overall CCR is used because the LTCH PPS uses a single prospective payment per discharge that covers both inpatient operating and capital-related costs. The LTCH's overall CCR is generally computed based on the sum of LTCH operating and capital costs (as described in Section 150.24, Chapter 3, of the Medicare Claims Processing Manual (Pub. 100–4)) as compared to total Medicare charges (that is, the sum of its operating and capital inpatient routine and ancillary charges), with those values determined from either the most recently settled cost report or the most recent tentatively settled cost report, whichever is from the latest cost reporting period. However, in certain instances, we use an alternative CCR, such as the statewide average CCR, a CCR that is specified by CMS, or one that is requested by the hospital. (We refer readers to § 412.525(a)(4)(iv) of the regulations for further details regarding HCO adjustments for either LTCH PPS payment rate and § 412.522(c)(1)(ii) for the site neutral payment rate.)

The LTCH's calculated CCR is then compared to the LTCH total CCR ceiling. Under our established policy, an LTCH with a calculated CCR in excess of the applicable maximum CCR threshold (that is, the LTCH total CCR ceiling, which is calculated as 3 standard deviations from the national geometric average CCR) is generally assigned the applicable statewide CCR. This policy is premised on a belief that calculated CCRs above the LTCH total CCR ceiling are most likely due to faulty data reporting or entry, and CCRs based on erroneous data should not be used to identify and make payments for outlier cases.

b. LTCH Total CCR Ceiling

Consistent with our historical practice, as we proposed, we used the most recent data available to determine the LTCH total CCR ceiling for FY 2019 in this final rule. Specifically, in this final rule, using our established methodology for determining the LTCH total CCR ceiling based on IPPS total CCR data from the March 2018 update of the Provider Specific File (PSF), which is the most recent data available, we are establishing an LTCH total CCR ceiling of 1.27 under the LTCH PPS for FY 2019 in accordance with § 412.525(a)(4)(iv)(C)(*2*) for HCO cases under either payment rate and § 412.522(c)(1)(ii) for the site neutral payment rate. (For additional information on our methodology for determining the LTCH total CCR ceiling, we refer readers to the FY 2007 IPPS final rule (71 FR 48118 through 48119).

We did not receive any public comments on our proposals. Therefore, we are finalizing our proposals as described above, without modification.

c. LTCH Statewide Average CCRs

Our general methodology for determining the statewide average CCRs used under the LTCH PPS is similar to our established methodology for determining the LTCH total CCR ceiling because it is based on ''total'' IPPS CCR data. (For additional information on our methodology for determining statewide average CCRs under the LTCH PPS, we refer readers to the FY 2007 IPPS final rule (71 FR 48119 through 48120).) Under the LTCH PPS HCO policy for cases paid under either payment rate at § 412.525(a)(4)(iv)(C)(*2*), the current SSO policy at § 412.529(f)(4)(iii)(B), and the site neutral payment rate at § 412.522(c)(1)(ii), the MAC may use a statewide average CCR, which is established annually by CMS, if it

is unable to determine an accurate CCR for an LTCH in one of the following circumstances: (1) New LTCHs that have not yet submitted their first Medicare cost report (a new LTCH is defined as an entity that has not accepted assignment of an existing hospital's provider agreement in accordance with § 489.18); (2) LTCHs whose calculated CCR is in excess of the LTCH total CCR ceiling; and (3) other LTCHs for whom data with which to calculate a CCR are not available (for example, missing or faulty data). (Other sources of data that the MAC may consider in determining an LTCH's CCR include data from a different cost reporting period for the LTCH, data from the cost reporting period preceding the period in which the hospital began to be paid as an LTCH (that is, the period of at least 6 months that it was paid as a short-term, acute care hospital), or data from other comparable LTCHs, such as LTCHs in the same chain or in the same region.)

Consistent with our historical practice of using the best available data, in this final rule, using our established methodology for determining the LTCH statewide average CCRs, based on the most recent complete IPPS ''total CCR'' data from the March 2018 update of the PSF, as we proposed, we are establishing LTCH PPS statewide average total CCRs for urban and rural hospitals that will be effective for discharges occurring on or after October 1, 2018, through September 30, 2019, in Table 8C listed in section VI. of the Addendum to this final rule (and available via the internet on the CMS website). Consistent with our historical practice, as we also proposed, we used more recent data to determine the LTCH PPS statewide average total CCRs for FY 2019 in this final rule.

Under the current LTCH PPS labor market areas, all areas in Delaware, the District of Columbia, New Jersey, and Rhode Island are classified as urban. Therefore, there are no rural statewide average total CCRs listed for those jurisdictions in Table 8C. This policy is consistent with the policy that we established when we revised our methodology for determining the applicable LTCH statewide average CCRs in the FY 2007 IPPS final rule (71 FR 48119 through 48121) and is the same as the policy applied under the IPPS. In addition, although Connecticut has areas that are designated as rural, in our calculation of the LTCH statewide average CCRs, there was no data available from short-term, acute care IPPS hospitals to compute a rural statewide average CCR or there were no short-term, acute care IPPS hospitals or LTCHs located in that area as of March 2018. Therefore, consistent with our existing methodology, as we proposed, we used the national average total CCR for rural IPPS hospitals for rural Connecticut in Table 8C. While Massachusetts also has rural areas, the statewide average CCR for rural areas in Massachusetts is based on one IPPS provider whose CCR is an atypical 1.215. Because this is much higher than the statewide urban average and furthermore implies costs exceeded charges, as with Connecticut, as we proposed, we used the national average total CCR for rural hospitals for hospitals located in rural Massachusetts. Furthermore, consistent with our existing methodology, in determining the urban and rural statewide average total CCRs for Maryland LTCHs paid under the LTCH PPS, as we proposed, we are continuing to use, as a proxy, the national average total CCR for urban IPPS hospitals and the national average total CCR for rural IPPS hospitals, respectively. We are using this proxy because we believe that the CCR data in the PSF for Maryland hospitals may not be entirely accurate (as discussed in greater detail in the FY 2007 IPPS final rule (71 FR 48120)).

We did not receive any public comments on our proposals. Therefore, we are finalizing our proposals as described above, without modification.

d. Reconciliation of HCO Payments

Under the HCO policy for cases paid under either payment rate at § 412.525(a)(4)(iv)(D), the payments for HCO cases are subject to reconciliation. Specifically, any such payments are reconciled at settlement based on the CCR that was calculated based on the cost report coinciding with the discharge. For additional information on the reconciliation policy, we refer readers to Sections 150.26 through 150.28 of the Medicare Claims Processing Manual (Pub. 100–4), as added by Change Request 7192 (Transmittal 2111; December 3, 2010), and the RY 2009 LTCH PPS final rule (73 FR 26820 through 26821).

3. High-Cost Outlier Payments for LTCH PPS Standard Federal Payment Rate Cases

a. Changes to High-Cost Outlier Payments for LTCH PPS Standard Federal Payment Rate Cases

Under the regulations at § 412.525(a)(2)(ii) and as required by section 1886(m)(7) of the Act, the fixed-loss amount for HCO payments is set each year so that the estimated aggregate HCO payments for LTCH PPS standard Federal payment rate cases are 99.6875 percent of 8 percent (that is, 7.975 percent) of estimated aggregate LTCH PPS payments for LTCH PPS standard Federal payment rate cases. (For more details on the requirements for high-cost outlier payments in FY 2018 and subsequent years under section 1886(m)(7) of the Act and additional information regarding high-cost outlier payments prior to FY 2018, we refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38542 through 38544).)

b. Establishment of the Fixed-Loss Amount for LTCH PPS Standard Federal Payment Rate Cases for FY 2019

When we implemented the LTCH PPS, we established a fixed-loss amount so that total estimated outlier payments are projected to equal 8 percent of total estimated payments under the LTCH PPS (67 FR 56022 through 56026). When we implemented the dual rate LTCH PPS payment structure beginning in FY 2016, we established that, in general, the historical LTCH PPS HCO policy would continue to apply to LTCH PPS standard Federal payment rate cases. That is, the fixed-loss amount and target for LTCH PPS standard Federal payment rate cases would be determined using the LTCH PPS HCO policy adopted when the LTCH PPS was first implemented, but we limited the data used under that policy to LTCH cases that would have been LTCH PPS standard Federal payment rate cases if the statutory changes had been in effect at the time of those discharges.

To determine the applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases, we estimate outlier payments and total LTCH PPS payments for each LTCH PPS standard Federal payment rate case (or for each case that would have been a LTCH PPS standard Federal payment rate case if the statutory changes had been in effect at the time of the discharge) using claims data from the MedPAR files. In accordance with § 412.525(a)(2)(ii), the applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases results in estimated total outlier payments being projected to be equal to 7.975 percent of projected total LTCH PPS payments for LTCH PPS standard Federal payment rate cases. We use MedPAR claims data and CCRs based on data from the most recent PSF (or from the applicable statewide average CCR if an LTCH's CCR data are faulty or unavailable) to establish an applicable fixed-loss threshold amount for LTCH PPS standard Federal payment rate cases.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20595), we proposed to continue to use our current methodology to calculate an applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2019 using the best available data that would maintain estimated HCO payments at the projected 7.975 percent of total estimated LTCH PPS payments for LTCH PPS standard Federal payment rate cases (based on the payment rates and policies for these cases presented in that proposed rule).

Specifically, based on the most recent complete LTCH data available at that time (that is, LTCH claims data from the December 2017 update of the FY 2017 MedPAR file and CCRs from the December 2017 update of the PSF), we determined a proposed fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2019 of $30,639 that would result in estimated outlier payments projected to be equal to 7.975 percent of estimated FY 2019 payments for such cases. Under this proposal, we would continue to make an additional HCO payment for the cost of an LTCH PPS standard Federal payment rate case that exceeds the HCO threshold amount that is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the adjusted LTCH PPS standard Federal payment rate payment and the fixed-loss amount for LTCH PPS standard Federal payment rate cases of $30,639).

Comment: Several commenters expressed concerns with the proposed fixed-loss amount for HCO cases paid under the LTCH PPS standard Federal payment rate, noting that the proposed fixed-loss amount, 11.9 percent greater than the fixed-loss amount in FY 2018, is the third consecutive year with a greater than 10-percent increase. Moreover, some commenters noted that the provider data used for the proposed rule included one new provider with a CCR of 1.029 which accounted for 2.65 percent of all outlier payments, despite accounting for only 0.116 percent of all LTCH PPS standard Federal

payment rate cases. Commenters attributed approximately $1,100 of the proposed increase to the fixed-loss amount to this one provider.

Response: In the FY 2019 IPPS/LTCH PPPS proposed rule (83 FR 20595), we noted that the proposed fixed-loss amount for HCO cases paid under the LTCH PPS standard Federal payment rate in FY 2019 of $30,639 is higher than the FY 2018 fixed-loss amount of $27,381 for LTCH PPS standard Federal payment rate cases. However, based on the most recent available data at the time of the development of the proposed rule, we found that the current FY 2018 HCO threshold of $27,381 results in estimated HCO payments for LTCH PPS standard Federal payment rate cases of approximately 7.988 percent of the estimated total LTCH PPS payments in FY 2018, which exceeds the 7.975 percent target by 0.01 percentage points.

As described in the FY 2019 IPPS/LTCH PPS proposed rule (82 FR 20595), we used CCRs from the December 2017 update of the PSF as they were the best available data at that time, which included the provider with a CCR of 1.029 as point out by some commenters. We note that while a CCR over 1.0 is generally considered high, and is significantly higher than prior CCRs for that provider, a CCR of 1.029 is within the current CCR ceiling of 1.280 established in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38541). In addition, that provider's CCR was in the PSF with an effective date of July 1, 2016 and, therefore, was the CCR used to determine that provider's LTCH PPS payments (such as outliers and site neutral payment rate payments) until it was updated with an effective date of January 1, 2018, which, as anticipated by some commenters, has resulted in lowering the fixed-loss amount for FY 2019 as compared to the proposed FY 2019 fixed-loss amount of $30,639 (as described in more detail below). For these reasons, we did not believe it was inappropriate to use that provider's CCR for the calculations in the proposed rule.

Consistent with our historical practice of using the best data available, as we proposed, for this final rule we are using the best available data, including CCRs from the March 2018 update of the PSF as described below. We note that the CCR for the provider noted by the commenters has decreased from 1.029 to 0.323, which we used for the calculations in this final rule.

Comment: A few commenters requested that CMS provide more information regarding the fixed-loss amount for HCO cases paid under the LTCH PPS standard Federal payment rate, specifically requesting the charge inflation factor for LTCH PPS standard Federal payment rate cases and an explanation on its calculation.

Response: We regret the inadvertent omission of the 2-year inflation factor from FY 2017 to FY 2019 in the FY 2019 IPPS/LTCH PPS proposed rule. Consistent with our historical approach, in the proposed rule we applied a factor based on IGI's most recent estimate of the 2013-based LTCH market basket increase from FY 2017 to FY 2019, which, at that time, was 5.3 percent. For this FY 2019 IPPS/LTCH PPS final rule, based on the Office of Actuary's most recent second quarter 2018 forecast of the 2013-based of the LTCH market basket increase from FY 2017 to FY 2019, we are using an inflation factor of 5.7 percent.

Comment: One commenter stated that, with the increasing the fixed-loss amount for HCO cases paid under the LTCH PPS standard Federal payment rate over the past 5 years, the ''additional 'days of losses' covered by the HCO amount is now approaching 10 days'', and requested that CMS evaluate if the 8-percent outlier target is satisfactory under the LTCH PPS.

Response: We agree that an increase in the HCO amount can lead to an increase in the ''days of losses.'' However, a change to the HCO payment target for LTCH PPS standard Federal payment rate cases can only be accomplished through statute. Specifically, section 1886(m)(7) of the Act, requires that the fixed-loss amount for HCO payments is set each year so that the estimated aggregate HCO payments for LTCH PPS standard Federal payment rate cases are 99.6875 percent of 8 percent (that is, 7.975 percent) of estimated aggregate LTCH PPS payments for LTCH PPS standard Federal payment rate cases.

Consistent with our historical practice of using the best data available, as we proposed, when determining the fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2019 in this final rule, we used the most recent available LTCH claims data and CCR data. In this FY 2019 IPPS/LTCH PPS final rule, we are continuing to use our current methodology to calculate an applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2019 using the best available data that will maintain estimated HCO payments at the projected 7.975 percent of total estimated LTCH PPS payments for LTCH PPS standard Federal payment rate cases (based on the payment rates and policies for these cases presented in this final rule). Specifically, based on the most recent complete LTCH data available at this time (that is, LTCH claims data from the March 2018 update of the FY 2017 MedPAR file and CCRs from the March 2018 update of the PSF), we determined a fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2019 of $27,124 that will result in estimated outlier payments projected to be equal to 7.975 percent of estimated FY 2019 payments for such cases. Under the broad authority of section 123(a)(1) of the BBRA and section 307(b)(1) of the BIPA, we are establishing a fixed-loss amount of $27,124 for LTCH PPS standard Federal payment rate cases for FY 2019. Under this policy, we would continue to make an additional HCO payment for the cost of an LTCH PPS standard Federal payment rate case that exceeds the HCO threshold amount that is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the adjusted LTCH PPS standard Federal payment rate payment and the fixed-loss amount for LTCH PPS standard Federal payment rate cases of $27,124).

We note that the fixed-loss amount for HCO cases paid under the LTCH PPS standard Federal payment rate in FY 2019 of $27,124 is significantly lower than proposed FY 2019 fixed-loss amount of $30,639, and slightly lower than the FY 2018 fixed-loss amount for LTCH PPS standard Federal payment rate cases of $27,381. This decrease is primarily attributable to the updated CCRs used for this final rule, including the provider discussed above whose CCR decreased from 1.029 to 0.323.

Based on the most recent available data at the time of this final rule, we found that the current FY 2018 HCO threshold of $27,381 results in estimated HCO payments for LTCH PPS standard Federal payment rate cases of approximately 7.4 percent of the estimated total LTCH PPS payments in FY 2018, which is below the 7.975 percent target by approximately 0.6 percentage points. We also note the change in our estimate of FY 2018 HCO payments between the proposed and final rule decreased from 8.0 percent to 7.4 percent, and this change is largely attributable to updates to CCRs, from the December 2017 update of the PSF to the March 2018 update of the PSF and includes the provider discussed above whose CCR decreased from 1.029 to 0.323.

4. High-Cost Outlier Payments for Site Neutral Payment Rate Cases

Under § 412.525(a), site neutral payment rate cases receive an additional HCO payment for costs that exceed the HCO threshold that is equal to 80 percent of the difference between the estimated cost of the case and the applicable HCO threshold (80 FR 49618 through 49629). In the following discussion, we note that the statutory transitional payment method for cases that are paid the site neutral payment rate for LTCH discharges occurring in cost reporting periods beginning during FY 2016 through FY 2019 uses a blended payment rate, which is determined as 50 percent of the site neutral payment rate amount for the discharge and 50 percent of the LTCH PPS standard Federal payment rate amount for the discharge (§ 412.522(c)(3)). As such, for FY 2019 discharges paid under the transitional payment method, the discussion below pertains only to the site neutral payment rate portion of the blended payment rate under § 412.522(c)(3)(i).

When we implemented the application of the site neutral payment rate in FY 2016, in examining the appropriate fixed-loss amount for site neutral payment rate cases issue, we considered how LTCH discharges based on historical claims data would have been classified under the dual rate LTCH PPS payment structure and the CMS' Office of the Actuary projections regarding how LTCHs will likely respond to our implementation of policies resulting from the statutory payment changes. We again relied on these considerations and actuarial projections in FY 2017 and FY 2018 because the historical claims data available in each of these years were not all subject to the LTCH PPS dual rate payment system. Similarly, for FY 2019, we continue to rely on these considerations and actuarial projections because, due to the transitional blended payment policy for site neutral payment rate cases, FY 2017 claims for these cases were not subject to the full effect of the site neutral payment rate.

For FYs 2016 through 2018, at that time our actuaries projected that the proportion of

cases that would qualify as LTCH PPS standard Federal payment rate cases versus site neutral payment rate cases under the statutory provisions would remain consistent with what is reflected in the historical LTCH PPS claims data. Although our actuaries did not project an immediate change in the proportions found in the historical data, they did project cost and resource changes to account for the lower payment rates. Our actuaries also projected that the costs and resource use for cases paid at the site neutral payment rate would likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate and would likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG, regardless of whether the proportion of site neutral payment rate cases in the future remains similar to what is found based on the historical data. As discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49619), this actuarial assumption is based on our expectation that site neutral payment rate cases would generally be paid based on an IPPS comparable per diem amount under the statutory LTCH PPS payment changes that began in FY 2016, which, in the majority of cases, is much lower than the payment that would have been paid if these statutory changes were not enacted. In light of these projections and expectations, we discussed that we believed that the use of a single fixed-loss amount and HCO target for all LTCH PPS cases would be problematic. In addition, we discussed that we did not believe that it would be appropriate for comparable LTCH PPS site neutral payment rate cases to receive dramatically different HCO payments from those cases that would be paid under the IPPS (80 FR 49617 through 49619 and 81 FR 57305 through 57307). For those reasons, we stated that we believed that the most appropriate fixed-loss amount for site neutral payment rate cases for FYs 2016 through 2018 would be equal to the IPPS fixed-loss amount for that particular fiscal year. Therefore, we established the fixed-loss amount for site neutral payment rate cases as the corresponding IPPS fixed-loss amounts for FYs 2016 through 2018. In particular, in FY 2018, we established the fixed-loss amount for site neutral payment rate cases as the FY 2018 IPPS fixed-loss amount of $26,537 (82 FR 46145).

As noted earlier, because not all claims in the data used for this final rule were subject to the site neutral payment rate, we continue to rely on the same considerations and actuarial projections used in FYs 2016 through 2018 when developing a fixed-loss amount for site neutral payment rate cases for FY 2019. Because our actuaries continue to project that site neutral payment rate cases in FY 2019 will continue to mirror an IPPS case paid under the same MS–DRG, we continue to believe that it would be inappropriate for comparable LTCH PPS site neutral payment rate cases to receive dramatically different HCO payments from those cases that would be paid under the IPPS. More specifically, as with FYs 2016 through 2018, our actuaries project that the costs and resource use for FY 2019 cases paid at the site neutral payment rate would likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate and will likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG, regardless of whether the proportion of site neutral payment rate cases in the future remains similar to what is found based on the historical data. (Based on the most recent FY 2017 LTCH claims data, approximately 64 percent of LTCH cases would have been paid the LTCH PPS standard Federal payment rate and approximately 36 percent of LTCH cases would have been paid the site neutral payment rate for discharges occurring in FY 2017.)

For these reasons, we continue to believe that the most appropriate fixed-loss amount for site neutral payment rate cases for FY 2019 is the IPPS fixed-loss amount for FY 2019. Therefore, consistent with past practice, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20595 and 20596), for FY 2019, we proposed that the applicable HCO threshold for site neutral payment rate cases is the sum of the site neutral payment rate for the case and the IPPS fixed-loss amount. That is, we proposed a fixed-loss amount for site neutral payment rate cases of $27,545, which is the same proposed FY 2019 IPPS fixed-loss amount discussed in section II.A.4.g.(1) of the Addendum to the proposed rule. We continue to believe that this policy would reduce differences between HCO payments for similar cases under the IPPS and site neutral payment rate cases under the LTCH PPS and promote fairness between the two systems. Accordingly, for FY 2019, we proposed to calculate a HCO payment for site neutral payment rate cases with costs that exceed the HCO threshold amount that is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the proposed site neutral payment rate payment and the proposed fixed-loss amount for site neutral payment rate cases of $27,545).

We did not receive any public comments on our proposals to use the FY 2019 IPPS fixed-loss amount and 5.1 percent HCO target for LTCH discharges paid at the site neutral payment rate in FY 2019. In this final rule, we are finalizing these proposals without modification.

Therefore, for FY 2019, as we proposed, we are establishing that the applicable HCO threshold for site neutral payment rate cases is the sum of the site neutral payment rate for the case and the IPPS fixed loss amount. That is, we are establishing a fixed-loss amount for site neutral payment rate cases of $25,769, which is the same FY 2019 IPPS fixed-loss amount discussed in section II.A.4.g.(1). of the Addendum to this final rule. We continue to believe that this policy will reduce differences between HCO payments for similar cases under the IPPS and site neutral payment rate cases under the LTCH PPS and promote fairness between the two systems. Accordingly, under this policy, for FY 2019, we will calculate a HCO payment for site neutral payment rate cases with costs that exceed the HCO threshold amount, which is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of site neutral payment rate payment and the fixed loss amount for site neutral payment rate cases of $25,769).

In establishing a HCO policy for site neutral payment rate cases, we established a budget neutrality adjustment under § 412.522(c)(2)(i). We established this requirement because we believed, and continue to believe, that the HCO policy for site neutral payment rate cases should be budget neutral, just as the HCO policy for LTCH PPS standard Federal payment rate cases is budget neutral, meaning that estimated site neutral payment rate HCO payments should not result in any change in estimated aggregate LTCH PPS payments.

To ensure that estimated HCO payments payable to site neutral payment rate cases in FY 2019 would not result in any increase in estimated aggregate FY 2019 LTCH PPS payments, under the budget neutrality requirement at § 412.522(c)(2)(i), it is necessary to reduce site neutral payment rate payments (or the portion of the blended payment rate payment for FY 2018 discharges occurring in LTCH cost reporting periods beginning before October 1, 2017) by 5.1 percent to account for the estimated additional HCO payments payable to those cases in FY 2019. In order to achieve this, for FY 2019, in general, as we proposed, we are continuing to use the policy adopted for FY 2018.

As discussed earlier, consistent with the IPPS HCO payment threshold, we estimate our fixed-loss threshold of $25,769 results in HCO payments for site neutral payment rate cases to equal 5.1 percent of the site neutral payment rate payments that are based on the IPPS comparable per diem amount. As such, to ensure estimated HCO payments payable for site neutral payment rate cases in FY 2019 would not result in any increase in estimated aggregate FY 2019 LTCH PPS payments, under the budget neutrality requirement at § 412.522(c)(2)(i), it is necessary to reduce the site neutral payment rate amount paid under § 412.522(c)(1)(i) by 5.1 percent to account for the estimated additional HCO payments payable for site neutral payment rate cases in FY 2019. In order to achieve this, for FY 2019, we proposed to apply a budget neutrality factor of 0.949 (that is, the decimal equivalent of a 5.1 percent reduction, determined as $1.0 - 5.1/100 = 0.949$) to the site neutral payment rate for those site neutral payment rate cases paid under § 412.522(c)(1)(i). We noted that, consistent with the policy adopted for FY 2018, this proposed HCO budget neutrality adjustment would not be applied to the HCO portion of the site neutral payment rate amount (81 FR 57309).

Comment: As was the case in the FY 2016 through FY 2018 rulemaking cycles, commenters again objected to the proposed site neutral payment rate HCO budget neutrality adjustment, claiming that it results in savings to the Medicare program instead of being budget neutral. The commenters' primary objection was again based on their belief that, because the IPPS base rates used in the IPPS comparable per diem amount calculation of the site neutral payment rate include a budget neutrality adjustment for IPPS HCO payments (that is, a 5.1 percent adjustment on the operating IPPS

standardized amount), an ''additional'' budget neutrality factor is not necessary and is, in fact, duplicative.

Response: We continue to disagree with the commenters that a budget neutrality adjustment for site neutral payment rate HCO payments is inappropriate, unnecessary, or duplicative. As we discussed in response to similar comments (82 FR 38545 through 38546, 81 FR 57308 through 57309, and 80 FR 49621 through 49622), we have the authority to adopt the site neutral payment rate HCO policy in a budget neutral manner. More importantly, we continue to believe this budget neutrality adjustment is appropriate for reasons outlined in our response to the nearly identical comments in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57308 through 57309) and our response to similar comments in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49621 through 49622).

After consideration of the public comments we received, we are finalizing our proposal to apply a budget neutrality adjustment for HCO payments made to site neutral payment rate cases. Therefore, to ensure that estimated HCO payments payable to site neutral payment rate cases in FY 2019 will not result any increase in estimated aggregate FY 2019 LTCH PPS payments, under the budget neutrality requirement at § 412.522(c)(2)(i), it is necessary to reduce the site neutral payment rate portion of the blended rate payment by 5.1 percent to account for the estimated additional HCO payments payable to those cases in FY 2019. In order to achieve this, for FY 2019, in this final rule, as proposed, we are applying a budget neutrality factor of 0.949 (that is, the decimal equivalent of a 5.1 percent reduction, determined as 1.0 − 5.1/100 = 0.949) to the site neutral payment rate (without any applicable HCO payment).

E. Update to the IPPS Comparable Amount To Reflect the Statutory Changes to the IPPS DSH Payment Adjustment Methodology

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50766), we established a policy to reflect the changes to the Medicare IPPS DSH payment adjustment methodology made by section 3133 of the Affordable Care Act in the calculation of the ''IPPS comparable amount'' under the SSO policy at § 412.529 and the ''IPPS equivalent amount'' under the 25-percent threshold payment adjustment policy at § 412.534 and § 412.536. Historically, the determination of both the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' includes an amount for inpatient operating costs ''for the costs of serving a disproportionate share of low-income patients.'' Under the statutory changes to the Medicare DSH payment adjustment methodology that began in FY 2014, in general, eligible IPPS hospitals receive an empirically justified Medicare DSH payment equal to 25 percent of the amount they otherwise would have received under the statutory formula for Medicare DSH payments prior to the amendments made by the Affordable Care Act. The remaining amount, equal to an estimate of 75 percent of the amount that otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals who are uninsured, is made available to make additional payments to each hospital that qualifies for Medicare DSH payments and that has uncompensated care. The additional uncompensated care payments are based on the hospital's amount of uncompensated care for a given time period relative to the total amount of uncompensated care for that same time period reported by all IPPS hospitals that receive Medicare DSH payments.

To reflect the statutory changes to the Medicare DSH payment adjustment methodology in the calculation of the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' under the LTCH PPS, we stated that we will include a reduced Medicare DSH payment amount that reflects the projected percentage of the payment amount calculated based on the statutory Medicare DSH payment formula prior to the amendments made by the Affordable Care Act that will be paid to eligible IPPS hospitals as empirically justified Medicare DSH payments and uncompensated care payments in that year (that is, a percentage of the operating Medicare DSH payment amount that has historically been reflected in the LTCH PPS payments that is based on IPPS rates). We also stated that the projected percentage will be updated annually, consistent with the annual determination of the amount of uncompensated care payments that will be made to eligible IPPS hospitals. We believe that this approach results in appropriate payments under the LTCH PPS and is consistent with our intention that the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' under the LTCH PPS closely resemble what an IPPS payment would have been for the same episode of care, while recognizing that some features of the IPPS cannot be translated directly into the LTCH PPS (79 FR 50766 through 50767).

For FY 2019, as discussed in greater detail in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20596) as well as in section IV.F.3. of the preamble of this final rule, based on the most recent data available, our estimate of 75 percent of the amount that would otherwise have been paid as Medicare DSH payments (under the methodology outlined in section 1886(r)(2) of the Act) is adjusted to 67.51 percent of that amount to reflect the change in the percentage of individuals who are uninsured. The resulting amount is then used to determine the amount available to make uncompensated care payments to eligible IPPS hospitals in FY 2018. In other words, the amount of the Medicare DSH payments that would have been made prior to the amendments made by the Affordable Care Act will be adjusted to 50.63 percent (the product of 75 percent and 67.51 percent) and the resulting amount will be used to calculate the uncompensated care payments to eligible hospitals. As a result, for FY 2019, we projected that the reduction in the amount of Medicare DSH payments pursuant to section 1886(r)(1) of the Act, along with the payments for uncompensated care under section 1886(r)(2) of the Act, will result in overall Medicare DSH payments of 75.63 percent of the amount of Medicare DSH payments that would otherwise have been made in the absence of the amendments made by the Affordable Care Act (that is, 25 percent + 50.63 percent = 75.63 percent).

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20596), for FY 2019, we proposed to establish that the calculation of the ''IPPS comparable amount'' under § 412.529 would include an applicable operating Medicare DSH payment amount that is equal to 75.63 percent of the operating Medicare DSH payment amount that would have been paid based on the statutory Medicare DSH payment formula absent the amendments made by the Affordable Care Act. Furthermore, consistent with our historical practice, we proposed that if more recent data became available, if appropriate, we would use that data to determine this factor in this final rule.

We did not receive any public comments in response to our proposal. In addition, there are no more recent data available to use that would affect the calculations determined in the proposed rule. Therefore, we are finalizing our proposal that, for FY 2019, the calculation of the ''IPPS comparable amount'' under § 412.529 includes an applicable operating Medicare DSH payment amount that is equal to 75.63 percent of the operating Medicare DSH payment amount that would have been paid based on the statutory Medicare DSH payment formula absent the amendments made by the Affordable Care Act. (We note that we also proposed that the ''IPPS equivalent amount'' under § 412.538 would include an applicable operating Medicare DSH payment amount that is equal to 75.63 percent of the operating Medicare DSH payment amount that would have been paid based on the statutory Medicare DSH payment formula absent the amendments made by the Affordable Care Act. However, as discussed in section VII.E. of the preamble of this final rule, we are finalizing our proposal to remove the provisions of § 412.538, and reserving this section.)

F. Computing the Adjusted LTCH PPS Federal Prospective Payments for FY 2019

Section 412.525 sets forth the adjustments to the LTCH PPS standard Federal payment rate. Under the dual rate LTCH PPS payment structure, only LTCH PPS cases that meet the statutory criteria to be excluded from the site neutral payment rate are paid based on the LTCH PPS standard Federal payment rate. Under § 412.525(c), the LTCH PPS standard Federal payment rate is adjusted to account for differences in area wages by multiplying the labor-related share of the LTCH PPS standard Federal payment rate for a case by the applicable LTCH PPS wage index (the FY 2019 values are shown in Tables 12A through 12B listed in section VI. of the Addendum to this final rule and are available via the internet on the CMS website). The LTCH PPS standard Federal payment rate is also adjusted to account for the higher costs of LTCHs located in Alaska and Hawaii by the applicable COLA factors (the FY 2019 factors are shown in the chart in section V.C. of this Addendum) in accordance with § 412.525(b). In this final rule, as we proposed, we are establishing an LTCH PPS standard Federal payment rate for FY 2019 of $41,579.65, as discussed in section V.A. of the Addendum to this final rule. We illustrate the

methodology to adjust the LTCH PPS standard Federal payment rate for FY 2019 in the following example:

Example:

During FY 2019, a Medicare discharge that meets the criteria to be excluded from the site neutral payment rate, that is, an LTCH PPS standard Federal payment rate case, is from an LTCH that is located in Chicago, Illinois (CBSA 16974). The FY 2019 LTCH PPS wage index value for CBSA 16974 is 1.0511 (obtained from Table 12A listed in section VI. of the Addendum to this final rule and available via the internet on the CMS website). The Medicare patient case is classified into MS–LTC–DRG 189 (Pulmonary Edema & Respiratory Failure), which has a relative weight for FY 2019 of 0.9583 (obtained from Table 11 listed in section VI. of the Addendum to this final rule and available via the internet on the CMS website). The LTCH submitted quality reporting data for FY 2019 in accordance with the LTCH QRP under section 1886(m)(5) of the Act.

To calculate the LTCH's total adjusted Federal prospective payment for this Medicare patient case in FY 2019, we computed the wage-adjusted Federal prospective payment amount by multiplying the unadjusted FY 2019 LTCH PPS standard Federal payment rate ($41,579.65) by the labor-related share (66.0 percent) and the wage index value (1.0511). This wage-adjusted amount was then added to the nonlabor-related portion of the unadjusted LTCH PPS standard Federal payment rate (34.0 percent; adjusted for cost of living, if applicable) to determine the adjusted LTCH PPS standard Federal payment rate, which is then multiplied by the MS–LTC–DRG relative weight (0.9583) to calculate the total adjusted LTCH PPS standard Federal prospective payment for FY 2019 ($41,189.62). The table below illustrates the components of the calculations in this example.

Unadjusted LTCH PPS Standard Federal Prospective Payment Rate	$41,579.65
Labor-Related Share	× 0.660
Labor-Related Portion of the LTCH PPS Standard Federal Payment Rate	= $27,442.57
Wage Index (CBSA 16974)	× 1.0511
Wage-Adjusted Labor Share of LTCH PPS Standard Federal Payment Rate	= $28,844.89
Nonlabor-Related Portion of the LTCH PPS Standard Federal Payment Rate ($41,579.65 × 0.340)	+ $14,137.08
Adjusted LTCH PPS Standard Federal Payment Amount	= $42,981.97
MS–LTC–DRG 189 Relative Weight	× 0.9583
Total Adjusted LTCH PPS Standard Federal Prospective Payment	= $41,189.62

VI. Tables Referenced in This Rule Generally Available Through the Internet on the CMS Website

This section lists the tables referred to throughout the preamble of this final rule and in the Addendum. In the past, a majority of these tables were published in the **Federal Register**, as part of the annual proposed and final rules. However, similar to FYs 2012 through 2018, for the FY 2019 rulemaking cycle, the IPPS and LTCH PPS tables will not be published in the **Federal Register** in the annual IPPS/LTCH PPS proposed and final rules and will be available through the internet. Specifically, all IPPS tables listed below, with the exception of IPPS Tables 1A, 1B, 1C, and 1D, and LTCH PPS Table 1E, will generally be available through the internet. IPPS Tables 1A, 1B, 1C, and 1D, and LTCH PPS Table 1E are displayed at the end of this section and will continue to be published in the **Federal Register**, as part of the annual proposed and final rules.

As discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49807), we streamlined and consolidated the wage index tables for FY 2016 and subsequent fiscal years.

As discussed in section III. J. of the preamble to this FY 2019 IPPS/LTCH PPS final rule, we are adding a new Table 4, ''List of Counties Eligible for the Out-Migration Adjustment under Section 1886(d)(13) of the Act—FY 2019,'' associated with this final rule. This table consists of the following: A list of counties that are eligible for the out-migration adjustment for FY 2019 identified by FIPS county code, the FY 2019 out-migration adjustment, and the number of years the adjustment will be in effect. We believe this new table will make the information more transparent and provide the public with easier access to this information. We intend to make the information available annually, via Table 4 in the IPPS/LTCH PPS proposed and final rules, and are including it among the tables associated with this FY 2019 IPPS/LTCH PPS final rule that are available via the internet on the CMS website.

As discussed in sections II.F.13., II.F.15.b. and d., II.F.16., and II.F.18. of the preamble of this final rule, we have developed the following ICD–10–CM and ICD–10–PCS code tables for FY 2019: Table 6A.—New Diagnosis Codes; Table 6B.—New Procedure Codes; Table 6C.—Invalid Diagnosis Codes; Table 6D.—Invalid Procedure Codes; Table 6E.—Revised Diagnosis Code Titles; Table 6F.—Revised Procedure Code Titles; Table 6G.1.—Secondary Diagnosis Order Additions to the CC Exclusion List; Table 6G.2.—Principal Diagnosis Order Additions to the CC Exclusion List; Table 6H.1.—Secondary Diagnosis Order Deletions to the CC Exclusion List; Table 6H.2.—Principal Diagnosis Order Deletions to the CC Exclusion List; Table 6I.—Complete MCC List; Table 6I.1.—Additions to the MCC List; Table 6I.2.—Deletions to the MCC List; Table 6J.—Complete CC List; Table 6J.1.—Additions to the CC List; Table 6J.2.—Deletions to the CC List; Table 6K.—Complete List of CC Exclusions; and Table 6P.—ICD–10–CM and ICD–10–PCS Codes for MS–DRG Changes. Table 6P contains multiple tables, 6P.1c. through 6P.1f., that include the ICD–10–CM and ICD–10–PCS code lists relating to specific MS–DRG changes.

In addition, under the HAC Reduction Program, established by section 3008 of the Affordable Care Act, a hospital's total payment may be reduced by 1 percent if it is in the lowest HAC performance quartile. However, as discussed in section IV.K. of the preamble of this final rule, we are not providing the hospital-level data as a table associated with this final rule. The hospital-level data for the FY 2019 HAC Reduction Program will be made publicly available once it has undergone the review and corrections process.

As discussed in section II.H.1. of the preamble of this final rule, Table 10 that we have released in prior fiscal years contained the thresholds that we use to evaluate applications for new medical service and technology add-on payments for the fiscal year that follows the fiscal year that is otherwise the subject of the rulemaking. In an effort to clarify for the public that the listed thresholds will be used for new technology add-on payment applications for the next fiscal year (in this case, for FY 2020) rather than the fiscal year that is otherwise the subject of the rulemaking (in this case, for FY 2019), we are providing the thresholds previously included in Table 10 as one of the publicly available data files posted via the internet on the CMS website for the rulemaking for the upcoming fiscal year at: *http://www.cms.hhs.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*, which is the same URL where the impact data files associated with the rulemaking for the applicable fiscal year are posted. We refer readers to section II.H.1. of the preamble of this final rule regarding our inclusion of the thresholds previously included in Table 10 as one of our public data files.

As discussed in section VII.B of the preamble of this final rule, in previous fiscal years, Table 13A.—Composition of Low-Volume Quintiles for MS–LTC–DRGs (which was listed in section VI. of the Addendum to the proposed and final rules and available via the internet on the CMS website) listed the composition of the low-volume quintiles for MS–LTC–DRGs for the respective year, and Table 13B.—No Volume MS–LTC–DRG Crosswalk (also listed in section VI. of the Addendum to the proposed and final rules and available via the internet on the CMS website) listed the no-volume MS–LTC–DRGs and the MS–LTC–DRGs to which each was cross-walked (that is, the cross-walked MS–LTC–DRGs). The information contained in Tables 13A and 13B is used in the development of Table 11.—MS–LTC–DRGs, Relative Weights, Geometric Average Length of Stay, and Short-Stay Outlier (SSO) Threshold for LTCH PPS Discharges, which

contains the MS–LTC–DRGs and their respective relative weights, geometric mean length of stay, and five-sixths of the geometric mean length of stay (used to identify SSO cases) for the respective fiscal year (and also is listed in section VI. of the Addendum to this final rule and available via the internet on the CMS website). Because the information contained in Tables 13A and 13B does not contain payment rates or factors for the applicable payment year, we are generally providing the data previously published in Tables 13A and 13B for each annual proposed rule and final rule as one of our supplemental data files via the internet on the CMS website for the respective rule and fiscal year (that is, FY 2019 and subsequent fiscal years) at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/LongTermCareHospitalPPS/index.html* (that is, the same URL address where the impact data files associated with the rule are posted). To streamline the information made available to the public that is used in the annual development of Table 11, we believe that this change in the presentation of the information contained in Tables 13A and 13B will make it easier for the public to navigate and find the relevant data and information used for the development of payment rates or factors for the applicable payment year, while continuing to furnish the same information contained in the tables provided in previous fiscal years.

As discussed in section IV.H. of the preamble of this final rule, the final FY 2019 readmissions payment adjustment factors, which are typically included in Table 15 of the final rule, are not available at this time because hospitals have not yet had the opportunity to review and correct the data (program calculations based on the FY 2019 applicable period of July 1, 2014 to June 30, 2017) before the data are made public under our policy regarding the reporting of hospital-specific data. After hospitals have been given an opportunity to review and correct their calculations for FY 2019, we will post Table 15 (which will be available via the internet on the CMS website) to display the final FY 2019 readmissions payment adjustment factors that will be applicable to discharges occurring on or after October 1, 2018. We expect Table 15 will be posted on the CMS website in the fall of 2018.

In addition, Table 18 associated with this final rule contains the Factor 3 for purposes of determining the FY 2019 uncompensated care payment for all hospitals and identifies whether or not a hospital is projected to receive Medicare DSH payments and, therefore, eligible to receive the additional payment for uncompensated care for FY 2019. A hospital's Factor 3 determines the proportion of the aggregate amount available for uncompensated care payments that a Medicare DSH eligible hospital will receive under section 3133 of the Affordable Care Act.

Readers who experience any problems accessing any of the tables that are posted on the CMS websites identified below should contact Michael Treitel at (410) 786–4552.

The following IPPS tables for this final rule are generally available through the internet on the CMS website at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. Click on the link on the left side of the screen titled, ''FY 2019 IPPS Final Rule Home Page'' or ''Acute Inpatient—Files for Download.''

[(National: 62 percent labor share/38 percent nonlabor share because wage index is less than or equal to 1)—FY 2019]

Standardized amount	Rates if wage index is greater than 1		Rates if wage index is less than or equal to 1	
	Labor	Nonlabor	Labor	Nonlabor
National [1]	Not Applicable	Not Applicable	$3,502.70	$2,146.82

[1] For FY 2019, there are no CBSAs in Puerto Rico with a national wage index greater than 1.

TABLE 1D—CAPITAL STANDARD FEDERAL PAYMENT RATE

[FY 2019]

	Rate
National	$459.72

TABLE 1E—LTCH PPS STANDARD FEDERAL PAYMENT RATE

[FY 2019]

	Full update (1.35 percent)	Reduced update * (−0.65 percent)
Standard Federal Rate	$41,579.65	$40,759.12

* For LTCHs that fail to submit quality reporting data for FY 2019 in accordance with the LTCH Quality Reporting Program (LTCH QRP), the annual update is reduced by 2.0 percentage points as required by section 1886(m)(5) of the Act.

Appendix A: Economic Analyses

I. Regulatory Impact Analysis

A. Statement of Need

This final rule is necessary in order to make payment and policy changes under the Medicare IPPS for Medicare acute care hospital inpatient services for operating and capital-related costs as well as for certain hospitals and hospital units excluded from the IPPS. This final rule also is necessary to make payment and policy changes for Medicare hospitals under the LTCH PPS. Also as we note below, the primary objective of the IPPS and the LTCH PPS is to create incentives for hospitals to operate efficiently and minimize unnecessary costs, while at the same time ensuring that payments are sufficient to adequately compensate hospitals for their legitimate costs in delivering necessary care to Medicare beneficiaries. In addition, we share national goals of preserving the Medicare Hospital Insurance Trust Fund.

We believe that the changes in this final rule, such as the updates to the IPPS and LTCH PPS rates, are needed to further each of these goals while maintaining the financial viability of the hospital industry and ensuring access to high quality health care for Medicare beneficiaries. We expect that these changes will ensure that the outcomes of the prospective payment systems are reasonable and equitable, while avoiding or minimizing unintended adverse consequences.

B. Overall Impact

We have examined the impacts of this final rule as required by Executive Order 12866 on Regulatory Planning and Review (September 30, 1993), Executive Order 13563 on Improving Regulation and Regulatory Review (January 18, 2011), the Regulatory Flexibility Act (RFA) (September 19, 1980, Pub. L. 96–354), section 1102(b) of the Social Security Act, section 202 of the Unfunded Mandates Reform Act of 1995 (March 22, 1995; Pub. L. 104–4), Executive Order 13132 on Federalism (August 4, 1999), the Congressional Review Act (5 U.S.C. 804(2), and Executive Order 13771 on Reducing Regulation and Controlling Regulatory Costs (January 30, 2017).

Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). Section 3(f) of Executive Order 12866 defines a ''significant regulatory action'' as an action that is likely to result in a rule: (1) Having an annual effect on the economy of $100 million or more in any 1 year, or adversely and materially affecting a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local or tribal governments or communities (also referred to as ''economically significant''); (2) creating a serious inconsistency or otherwise interfering with an action taken or planned by another agency; (3) materially altering the budgetary impacts of entitlement grants, user fees, or loan programs or the rights and obligations of recipients thereof; or (4) raising novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

We have determined that this final rule is a major rule as defined in 5 U.S.C. 804(2). We estimate that the changes for FY 2019 acute care hospital operating and capital payments will redistribute amounts in excess of $100 million to acute care hospitals. The applicable percentage increase to the IPPS rates required by the statute, in conjunction with other payment changes in this final rule, will result in an estimated $4.8 billion increase in FY 2019 payments, primarily

driven by a combined $4.4 billion increase in FY 2019 operating payments and uncompensated care payments, and a combined $0.4 billion increase in FY 2019 capital payments, new technology add-on payments, and low-volume hospital payments. These changes are relative to payments made in FY 2018. The impact analysis of the capital payments can be found in section I.I. of this Appendix. In addition, as described in section I.J. of this Appendix, LTCHs are expected to experience an increase in payments by $39 million in FY 2019 relative to FY 2018.

Our operating impact estimate includes the 0.5 percent adjustment required under section 414 of the MACRA applied to the IPPS standardized amount, as discussed in section II.D. of the preamble of this final rule. In addition, our operating payment impact estimate includes the 1.35 percent hospital update to the standardized amount (which includes the estimated 2.9 percent market basket update less 0.8 percentage point for the multifactor productivity adjustment and less 0.75 percentage point required under the Affordable Care Act). The estimates of IPPS operating payments to acute care hospitals do not reflect any changes in hospital admissions or real case-mix intensity, which will also affect overall payment changes.

The analysis in this Appendix, in conjunction with the remainder of this document, demonstrates that this final rule is consistent with the regulatory philosophy and principles identified in Executive Orders 12866 and 13563, the RFA, and section 1102(b) of the Act. This final rule will affect payments to a substantial number of small rural hospitals, as well as other classes of hospitals, and the effects on some hospitals may be significant. Finally, in accordance with the provisions of Executive Order 12866, the Executive Office of Management and Budget has reviewed this final rule.

C. Objectives of the IPPS and the LTCH PPS

The primary objective of the IPPS and the LTCH PPS is to create incentives for hospitals to operate efficiently and minimize unnecessary costs, while at the same time ensuring that payments are sufficient to adequately compensate hospitals for their legitimate costs in delivering necessary care to Medicare beneficiaries. In addition, we share national goals of preserving the Medicare Hospital Insurance Trust Fund.

We believe that the changes in this final rule will further each of these goals while maintaining the financial viability of the hospital industry and ensuring access to high quality health care for Medicare beneficiaries. We expect that these changes will ensure that the outcomes of the prospective payment systems are reasonable and equitable, while avoiding or minimizing unintended adverse consequences.

Because this final rule contains a range of policies, we refer readers to the section of the final rule where each policy is discussed. These sections include the rationale for our decisions, including the need for the policy.

D. Limitations of Our Analysis

The following quantitative analysis presents the projected effects of our policy changes, as well as statutory changes effective for FY 2019, on various hospital groups. We estimate the effects of individual policy changes by estimating payments per case, while holding all other payment policies constant. We use the best data available, but, generally unless specifically indicated, we do not attempt to make adjustments for future changes in such variables as admissions, lengths of stay, case-mix, changes to the Medicare population, or incentives. In addition, we discuss limitations of our analysis for specific policies in the discussion of those policies as needed.

E. Hospitals Included in and Excluded From the IPPS

The prospective payment systems for hospital inpatient operating and capital-related costs of acute care hospitals encompass most general short-term, acute care hospitals that participate in the Medicare program. There were 29 Indian Health Service hospitals in our database, which we excluded from the analysis due to the special characteristics of the prospective payment methodology for these hospitals. Among other short-term, acute care hospitals, hospitals in Maryland are paid in accordance with the Maryland All-Payer Model, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, 5 short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) receive payment for inpatient hospital services they furnish on the basis of reasonable costs, subject to a rate-of-increase ceiling.

As of July 2018, there were 3,256 IPPS acute care hospitals included in our analysis. This represents approximately 54 percent of all Medicare-participating hospitals. The majority of this impact analysis focuses on this set of hospitals. There also are approximately 1,398 CAHs. These small, limited service hospitals are paid on the basis of reasonable costs, rather than under the IPPS. IPPS-excluded hospitals and units, which are paid under separate payment systems, include IPFs, IRFs, LTCHs, RNHCIs, children's hospitals, 11 cancer hospitals, extended neoplastic disease care hospitals, and 5 short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa. Changes in the prospective payment systems for IPFs and IRFs are made through separate rulemaking. Payment impacts of changes to the prospective payment systems for these IPPS-excluded hospitals and units are not included in this final rule. The impact of the update and policy changes to the LTCH PPS for FY 2019 is discussed in section I.J. of this Appendix.

F. Effects on Hospitals and Hospital Units Excluded From the IPPS

As of July 2018, there were 98 children's hospitals, 11 cancer hospitals, 5 short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands and American Samoa, 1 extended neoplastic disease care hospital, and 18 RNHCIs being paid on a reasonable cost basis subject to the rate-of-increase ceiling under § 413.40. (In accordance with § 403.752(a) of the regulation, RNHCIs are paid under § 413.40.) Among the remaining providers, 280 rehabilitation hospitals and 846 rehabilitation units, and approximately 417 LTCHs, are paid the Federal prospective per discharge rate under the IRF PPS and the LTCH PPS, respectively, and 538 psychiatric hospitals and 1,084 psychiatric units are paid the Federal per diem amount under the IPF PPS. As stated previously, IRFs and IPFs are not affected by the rate updates discussed in this final rule. The impacts of the changes on LTCHs are discussed in section I.J. of this Appendix.

For children's hospitals, the 11 cancer hospitals, the 5 short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, extended neoplastic disease care hospitals, and RNHCIs, the update of the rate-of-increase limit (or target amount) is the estimated FY 2019 percentage increase in the 2014-based IPPS operating market basket, consistent with section 1886(b)(3)(B)(ii) of the Act, and §§ 403.752(a) and 413.40 of the regulations. Consistent with current law, based on IGI's 2018 second quarter forecast of the 2014-based IPPS market basket increase, we are estimating the FY 2019 update to be 2.9 percent (that is, the estimate of the market basket rate-of-increase). We used the most recent data available for this final rule to calculate the IPPS operating market basket update for FY 2019. However, the Affordable Care Act requires an adjustment for multifactor productivity (0.8 percentage point for FY 2019) and a 0.75 percentage point reduction to the market basket update, resulting in a 1.35 percent applicable percentage increase for IPPS hospitals that submit quality data and are meaningful EHR users, as discussed in section IV.B. of the preamble of this final rule. Children's hospitals, the 11 cancer hospitals, the 5 short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, extended neoplastic disease care hospitals, and RNHCIs that continue to be paid based on reasonable costs subject to rate-of-increase limits under § 413.40 of the regulations are not subject to the reductions in the applicable percentage increase required under the Affordable Care Act. Therefore, for those hospitals paid under § 413.40 of the regulations, the update is the percentage increase in the 2014-based IPPS operating market basket for FY 2019, estimated at 2.9 percent, without the reductions described previously under the Affordable Care Act.

The impact of the update in the rate-of-increase limit on those excluded hospitals depends on the cumulative cost increases experienced by each excluded hospital since its applicable base period. For excluded hospitals that have maintained their cost increases at a level below the rate-of-increase limits since their base period, the major effect is on the level of incentive payments these excluded hospitals receive. Conversely, for excluded hospitals with cost increases above the cumulative update in their rate-of-increase limits, the major effect is the amount of excess costs that would not be paid.

We note that, under § 413.40(d)(3), an excluded hospital that continues to be paid under the TEFRA system and whose costs exceed 110 percent of its rate-of-increase limit receives its rate-of-increase limit plus the lesser of: (1) 50 percent of its reasonable costs in excess of 110 percent of the limit; or (2) 10 percent of its limit. In addition, under the various provisions set forth in § 413.40, hospitals can obtain payment adjustments for justifiable increases in operating costs that exceed the limit.

G. Quantitative Effects of the Policy Changes Under the IPPS for Operating Costs

1. Basis and Methodology of Estimates

In this final rule, we are announcing policy changes and payment rate updates for the IPPS for FY 2019 for operating costs of acute care hospitals. The FY 2019 updates to the capital payments to acute care hospitals are discussed in section I.I. of this Appendix.

Based on the overall percentage change in payments per case estimated using our payment simulation model, we estimate that total FY 2019 operating payments will increase by 2.4 percent, compared to FY 2018. In addition to the applicable percentage increase, this amount reflects the 0.5 percent permanent adjustment to the standardized amount required under section 414 of the MACRA. The impacts do not reflect changes in the number of hospital admissions or real case-mix intensity, which will also affect overall payment changes.

We have prepared separate impact analyses of the changes to each system. This section deals with the changes to the operating inpatient prospective payment system for acute care hospitals. Our payment simulation model relies on the most recent available claims data to enable us to estimate the impacts on payments per case of certain changes in this final rule. However, there are other changes for which we do not have data available that would allow us to estimate the payment impacts using this model. For those changes, we have attempted to predict the payment impacts based upon our experience and other more limited data.

The data used in developing the quantitative analyses of changes in payments per case presented in this section are taken from the FY 2017 MedPAR file and the most current Provider-Specific File (PSF) that is used for payment purposes. Although the analyses of the changes to the operating PPS do not incorporate cost data, data from the most recently available hospital cost reports were used to categorize hospitals. Our analysis has several qualifications. First, in this analysis, we do not make adjustments for future changes in such variables as admissions, lengths of stay, or underlying growth in real case-mix. Second, due to the interdependent nature of the IPPS payment components, it is very difficult to precisely quantify the impact associated with each change. Third, we use various data sources to categorize hospitals in the tables. In some cases, particularly the number of beds, there is a fair degree of variation in the data from the different sources. We have attempted to construct these variables with the best available source overall. However, for individual hospitals, some miscategorizations are possible.

Using cases from the FY 2017 MedPAR file, we simulate payments under the operating IPPS given various combinations of payment parameters. As described previously, Indian Health Service hospitals and hospitals in Maryland were excluded from the simulations. The impact of payments under the capital IPPS, and the impact of payments for costs other than inpatient operating costs, are not analyzed in this section. Estimated payment impacts of the capital IPPS for FY 2019 are discussed in section I.I. of this Appendix.

We discuss the following changes:

- The effects of the application of the adjustment required under section 414 of the MACRA and the applicable percentage increase (including the market basket update, the multifactor productivity adjustment, and the applicable percentage reduction in accordance with the Affordable Care Act) to the standardized amount and hospital-specific rates.
- The effects of the changes to the relative weights and MS–DRG GROUPER.
- The effects of the changes in hospitals' wage index values reflecting updated wage data from hospitals' cost reporting periods beginning during FY 2015, compared to the FY 2014 wage data, to calculate the FY 2019 wage index.
- The effects of the geographic reclassifications by the MGCRB (as of publication of this final rule) that will be effective for FY 2019.
- The effects of the rural floor with the application of the national budget neutrality factor to the wage index, and the expiration of the imputed floor.
- The effects of the frontier State wage index adjustment under the statutory provision that requires hospitals located in States that qualify as frontier States to not have a wage index less than 1.0. This provision is not budget neutral.
- The effects of the implementation of section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, which provides for an increase in a hospital's wage index if a threshold percentage of residents of the county where the hospital is located commute to work at hospitals in counties with higher wage indexes for FY 2019. This provision is not budget neutral.
- The total estimated change in payments based on the FY 2019 policies relative to payments based on FY 2018 policies that include the applicable percentage increase of 1.35 percent (or 2.9 percent market basket update with a reduction of 0.8 percentage point for the multifactor productivity adjustment, and a 0.75 percentage point reduction, as required under the Affordable Care Act).

To illustrate the impact of the FY 2019 changes, our analysis begins with a FY 2018 baseline simulation model using: The FY 2018 applicable percentage increase of 1.35 percent, the 0.4588 percent adjustment to the Federal standardized amount, and the adjustment factor of (1/1.006) to both the national standardized amount and the hospital-specific rate; the FY 2018 MS–DRG GROUPER (Version 35); the FY 2018 CBSA designations for hospitals based on the OMB definitions from the 2010 Census; the FY 2018 wage index; and no MGCRB reclassifications. Outlier payments are set at 5.1 percent of total operating MS–DRG and outlier payments for modeling purposes.

Section 1886(b)(3)(B)(viii) of the Act, as added by section 5001(a) of Public Law 109–171, as amended by section 4102(b)(1)(A) of the ARRA (Pub. L. 111–5) and by section 3401(a)(2) of the Affordable Care Act (Pub. L. 111–148), provides that, for FY 2007 and each subsequent year through FY 2014, the update factor will include a reduction of 2.0 percentage points for any subsection (d) hospital that does not submit data on measures in a form and manner, and at a time specified by the Secretary. Beginning in FY 2015, the reduction is one-quarter of such applicable percentage increase determined without regard to section 1886(b)(3)(B)(ix), (xi), or (xii) of the Act, or one-quarter of the market basket update. Therefore, for FY 2019, hospitals that do not submit quality information under rules established by the Secretary and that are meaningful EHR users under section 1886(b)(3)(B)(ix) of the Act will receive an applicable percentage increase of 0.625 percent. At the time this impact was prepared, 49 hospitals are estimated to not receive the full market basket rate-of-increase for FY 2019 because they failed the quality data submission process or did not choose to participate, but are meaningful EHR users. For purposes of the simulations shown later in this section, we modeled the payment changes for FY 2019 using a reduced update for these hospitals.

For FY 2019, in accordance with section 1886(b)(3)(B)(ix) of the Act, a hospital that has been identified as not a meaningful EHR user will be subject to a reduction of three-quarters of such applicable percentage increase determined without regard to section 1886(b)(3)(B)(ix), (xi), or (xii) of the Act. Therefore, for FY 2019, hospitals that are identified as not meaningful EHR users and do submit quality information under section 1886(b)(3)(B)(viii) of the Act will receive an applicable percentage increase of −0.825 percent. At the time this impact analysis was prepared, 137 hospitals are estimated to not receive the full market basket rate-of-increase for FY 2019 because they are identified as not meaningful EHR users that do submit quality information under section 1886(b)(3)(B)(viii) of the Act. For purposes of the simulations shown in this section, we modeled the payment changes for FY 2019 using a reduced update for these hospitals.

Hospitals that are identified as not meaningful EHR users under section 1886(b)(3)(B)(ix) of the Act and also do not submit quality data under section 1886(b)(3)(B)(viii) of the Act will receive an applicable percentage increase of –1.55 percent, which reflects a one-quarter reduction of the market basket update for failure to submit quality data and a three-quarter reduction of the market basket update for being identified as not a meaningful EHR user. At the time this impact was prepared, 40 hospitals are estimated to not receive the full market basket rate-of-increase for FY 2019 because they are identified as not meaningful EHR users that do not submit quality data under section 1886(b)(3)(B)(viii) of the Act.

Each policy change, statutory or otherwise, is then added incrementally to this baseline, finally arriving at an FY 2019 model incorporating all of the changes. This simulation allows us to isolate the effects of each change.

Our comparison illustrates the percent change in payments per case from FY 2018 to FY 2019. Two factors not discussed separately have significant impacts here. The first factor is the update to the standardized amount. In accordance with section 1886(b)(3)(B)(i) of the Act, we are updating the standardized amounts for FY 2019 using an applicable percentage increase of 1.35 percent. This includes our forecasted IPPS operating hospital market basket increase of 2.9 percent with a 0.8 percentage point reduction for the multifactor productivity adjustment and a 0.75 percentage point reduction, as required, under the Affordable Care Act. Hospitals that fail to comply with the quality data submission requirements and are meaningful EHR users will receive an update of 0.625 percent. This update includes a reduction of one-quarter of the market basket update for failure to submit these data. Hospitals that do comply with the quality data submission requirements but are not meaningful EHR users will receive an update of −0.825 percent, which includes a reduction of three-quarters of the market basket update. Furthermore, hospitals that do not comply with the quality data submission requirements and also are not meaningful EHR users will receive an update of −1.55 percent. Under section 1886(b)(3)(B)(iv) of the Act, the update to the hospital-specific amounts for SCHs and MDHs is also equal to the applicable percentage increase, or 1.35 percent, if the hospital submits quality data and is a meaningful EHR user.

A second significant factor that affects the changes in hospitals' payments per case from FY 2018 to FY 2019 is the change in hospitals' geographic reclassification status from one year to the next. That is, payments may be reduced for hospitals reclassified in FY 2018 that are no longer reclassified in FY 2019. Conversely, payments may increase for hospitals not reclassified in FY 2018 that are reclassified in FY 2019.

2. Analysis of Table I

Table I displays the results of our analysis of the changes for FY 2019. The table categorizes hospitals by various geographic and special payment consideration groups to illustrate the varying impacts on different types of hospitals. The top row of the table shows the overall impact on the 3,256 acute care hospitals included in the analysis.

The next four rows of Table I contain hospitals categorized according to their geographic location: All urban, which is further divided into large urban and other urban; and rural. There are 2,483 hospitals located in urban areas included in our analysis. Among these, there are 1,302 hospitals located in large urban areas (populations over 1 million), and 1,181 hospitals in other urban areas (populations of 1 million or fewer). In addition, there are 773 hospitals in rural areas. The next two groupings are by bed-size categories, shown separately for urban and rural hospitals. The last groupings by geographic location are by census divisions, also shown separately for urban and rural hospitals.

The second part of Table I shows hospital groups based on hospitals' FY 2019 payment classifications, including any reclassifications under section 1886(d)(10) of the Act. For example, the rows labeled urban, large urban, other urban, and rural show that the numbers of hospitals paid based on these categorizations after consideration of geographic reclassifications (including reclassifications under sections 1886(d)(8)(B) and 1886(d)(8)(E) of the Act that have implications for capital payments) are 2,264, 1,317, 947, and 992, respectively.

The next three groupings examine the impacts of the changes on hospitals grouped by whether or not they have GME residency programs (teaching hospitals that receive an IME adjustment) or receive Medicare DSH payments, or some combination of these two adjustments. There are 2,157 nonteaching hospitals in our analysis, 849 teaching hospitals with fewer than 100 residents, and 250 teaching hospitals with 100 or more residents.

In the DSH categories, hospitals are grouped according to their DSH payment status, and whether they are considered urban or rural for DSH purposes. The next category groups together hospitals considered urban or rural, in terms of whether they receive the IME adjustment, the DSH adjustment, both, or neither.

The next three rows examine the impacts of the changes on rural hospitals by special payment groups (SCHs, MDHs and RRCs). There were 327 RRCs, 312 SCHs, 140 MDHs, 134 hospitals that are both SCHs and RRCs, and 16 hospitals that are both MDHs and RRCs.

The next series of groupings are based on the type of ownership and the hospital's Medicare utilization expressed as a percent of total inpatient days. These data were taken from the FY 2016 or FY 2015 Medicare cost reports.

The next two groupings concern the geographic reclassification status of hospitals. The first grouping displays all urban hospitals that were reclassified by the MGCRB for FY 2019. The second grouping shows the MGCRB rural reclassifications.

TABLE I—IMPACT ANALYSIS OF CHANGES TO THE IPPS FOR OPERATING COSTS FOR FY 2019

	Number of hospitals [1]	Hospital rate update and adjustment under MACRA (1) [2]	FY 2019 weights and DRG changes with application of recalibration budget neutrality (2) [3]	FY 2019 wage data with application of wage budget neutrality (3) [4]	FY 2019 MGCRB reclassifications (4) [5]	Rural floor with application of national rural floor budget neutrality (5) [6]	Application of the frontier wage index and out-migration adjustment (6) [7]	All FY 2019 changes (7) [8]
All Hospitals	3,256	1.8	0	0	0	0	0.1	2.4
By Geographic Location:								
Urban hospitals	2,483	1.8	0	0	−0.1	0	0.1	2.5

TABLE I—IMPACT ANALYSIS OF CHANGES TO THE IPPS FOR OPERATING COSTS FOR FY 2019—Continued

	Number of hospitals [1]	Hospital rate update and adjustment under MACRA (1) [2]	FY 2019 weights and DRG changes with application of recalibration budget neutrality (2) [3]	FY 2019 wage data with application of wage budget neutrality (3) [4]	FY 2019 MGCRB reclassifications (4) [5]	Rural floor with application of national rural floor budget neutrality (5) [6]	Application of the frontier wage index and out-migration adjustment (6) [7]	All FY 2019 changes (7) [8]
Rural Non-Reclassified Hospitals Full Year	455	1.4	−0.5	−0.1	−0.4	−0.1	0.3	0.8
All Section 401 Reclassified Hospitals	266	1.7	0	0.1	2.3	−0.1	0.1	3.4
Other Reclassified Hospitals (Section 1886(d)(8)(B))	47	1.7	−0.2	−0.1	2.8	−0.3	0	1.5

[1] Because data necessary to classify some hospitals by category were missing, the total number of hospitals in each category may not equal the national total. Discharge data are from FY 2017, and hospital cost report data are from reporting periods beginning in FY 2016 and FY 2015.

[2] This column displays the payment impact of the hospital rate update and other adjustments, including the 1.35 percent adjustment to the national standardized amount and the hospital-specific rate (the estimated 2.9 percent market basket update reduced by 0.8 percentage point for the multifactor productivity adjustment and the 0.75 percentage point reduction under the Affordable Care Act), and the 0.5 percent adjustment to the national standardized amount required under section 414 of the MACRA.

[3] This column displays the payment impact of the changes to the Version 36 GROUPER, the changes to the relative weights and the recalibration of the MS–DRG weights based on FY 2017 MedPAR data in accordance with section 1886(d)(4)(C)(iii) of the Act. This column displays the application of the recalibration budget neutrality factor of 0.997192 in accordance with section 1886(d)(4)(C)(iii) of the Act.

[4] This column displays the payment impact of the update to wage index data using FY 2015 cost report data and the OMB labor market area delineations based on 2010 Decennial Census data. This column displays the payment impact of the application of the wage budget neutrality factor, which is calculated separately from the recalibration budget neutrality factor, and is calculated in accordance with section 1886(d)(3)(E)(i) of the Act. The wage budget neutrality factor is 1.000748.

[5] Shown here are the effects of geographic reclassifications by the Medicare Geographic Classification Review Board (MGCRB). The effects demonstrate the FY 2019 payment impact of going from no reclassifications to the reclassifications scheduled to be in effect for FY 2019. Reclassification for prior years has no bearing on the payment impacts shown here. This column reflects the geographic budget neutrality factor of 0.985932.

[6] This column displays the effects of the rural floor and expiration of the imputed floor. The Affordable Care Act requires the rural floor budget neutrality adjustment to be 100 percent national level adjustment. The rural floor budget neutrality factor applied to the wage index is 0.993142.

[7] This column shows the combined impact of the policy required under section 10324 of the Affordable Care Act that hospitals located in frontier States have a wage index no less than 1.0 and of section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, which provides for an increase in a hospital's wage index if a threshold percentage of residents of the county where the hospital is located commute to work at hospitals in counties with higher wage indexes. These are not budget neutral policies.

[8] This column shows the estimated change in payments from FY 2018 to FY 2019.

a. Effects of the Hospital Update and Other Adjustments (Column 1)

As discussed in section IV.B. of the preamble of this final rule, this column includes the hospital update, including the 2.9 percent market basket update, the reduction of 0.8 percentage point for the multifactor productivity adjustment, and the 0.75 percentage point reduction, in accordance with the Affordable Care Act. In addition, as discussed in section II.D. of the preamble of this final rule, this column includes the FY 2019 +0.5 percent adjustment required under section 414 of the MACRA. As a result, we are making a 1.85 percent update to the national standardized amount. This column also includes the update to the hospital-specific rates which includes the 2.9 percent market basket update, the reduction of 0.8 percentage point for the multifactor productivity adjustment, and the 0.75 percentage point reduction in accordance with the Affordable Care Act. As a result, we are making a 1.35 percent update to the hospital-specific rates.

Overall, hospitals will experience a 1.8 percent increase in payments primarily due to the combined effects of the hospital update to the national standardized amount and the hospital update to the hospital-specific rate. Hospitals that are paid under the hospital-specific rate will experience a 1.35 percent increase in payments; therefore, hospital categories containing hospitals paid under the hospital specific rate will experience a lower than average increase in payments.

b. Effects of the Changes to the MS–DRG Reclassifications and Relative Cost-Based Weights With Recalibration Budget Neutrality (Column 2)

Column 2 shows the effects of the changes to the MS–DRGs and relative weights with the application of the recalibration budget neutrality factor to the standardized amounts. Section 1886(d)(4)(C)(i) of the Act requires us annually to make appropriate classification changes in order to reflect changes in treatment patterns, technology, and any other factors that may change the relative use of hospital resources. Consistent with section 1886(d)(4)(C)(iii) of the Act, we calculated a recalibration budget neutrality factor to account for the changes in MS–DRGs and relative weights to ensure that the overall payment impact is budget neutral.

As discussed in section II.E. of the preamble of this final rule, the FY 2019 MS–DRG relative weights will be 100 percent cost-based and 100 percent MS–DRGs. For FY 2019, the MS–DRGs are calculated using the FY 2017 MedPAR data grouped to the Version 36 (FY 2019) MS–DRGs. The methodology to calculate the relative weights and the reclassification changes to the GROUPER are described in more detail in section II.G. of the preamble of this final rule.

The ''All Hospitals'' line in Column 2 indicates that changes due to the MS–DRGs and relative weights will result in a 0.0 percent change in payments with the application of the recalibration budget neutrality factor of 0.997192 to the standardized amount. Hospital categories that generally treat more medical cases than surgical cases will experience a decrease in their payments under the relative weights. For example, rural hospitals will experience a 0.3 percent decrease in payments in part because rural hospitals tend to treat fewer surgical cases than medical cases. Conversely, teaching hospitals with more than 100 residents will experience an increase in payments of 0.2 percent as those hospitals treat more surgical cases than medical cases.

c. Effects of the Wage Index Changes (Column 3)

Column 3 shows the impact of updated wage data using FY 2015 cost report data, with the application of the wage budget neutrality factor. The wage index is calculated and assigned to hospitals on the basis of the labor market area in which the hospital is located. Under section 1886(d)(3)(E) of the Act, beginning with FY 2005, we delineate hospital labor market areas based on the Core Based Statistical Areas (CBSAs) established by OMB. The current statistical standards used in FY 2019 are based on OMB standards published on February 28, 2013 (75 FR 37246 and 37252), and 2010 Decennial Census data (OMB Bulletin No. 13–01), as updated in OMB Bulletin Nos. 15–01 and 17–01. (We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 49951 through 49963) for a full discussion on our adoption of the OMB labor market area delineations, based on the 2010 Decennial Census data, effective beginning with the FY 2015 IPPS wage index, to section III.A.2. of the preamble of the FY 2017 IPPS/

LTCH PPS final rule (81 FR 56913) for a discussion of our adoption of the CBSA updates in OMB Bulletin No. 15–01, which were effective beginning with the FY 2017 wage index, and to section III.A.2. of this final rule for a discussion of our adoption of the CBSA update in OMB Bulletin No. 17–01 for the FY 2019 wage index.)

Section 1886(d)(3)(E) of the Act requires that, beginning October 1, 1993, we annually update the wage data used to calculate the wage index. In accordance with this requirement, the wage index for acute care hospitals for FY 2019 is based on data submitted for hospital cost reporting periods, beginning on or after October 1, 2014 and before October 1, 2015. The estimated impact of the updated wage data using the FY 2015 cost report data and the OMB labor market area delineations on hospital payments is isolated in Column 3 by holding the other payment parameters constant in this simulation. That is, Column 3 shows the percentage change in payments when going from a model using the FY 2018 wage index, based on FY 2014 wage data, the labor-related share of 68.3 percent, under the OMB delineations and having a 100-percent occupational mix adjustment applied, to a model using the FY 2019 pre-reclassification wage index based on FY 2015 wage data with the labor-related share of 68.3 percent, under the OMB delineations, also having a 100-percent occupational mix adjustment applied, while holding other payment parameters, such as use of the Version 36 MS–DRG GROUPER constant. The FY 2019 occupational mix adjustment is based on the CY 2016 occupational mix survey.

In addition, the column shows the impact of the application of the wage budget neutrality to the national standardized amount. In FY 2010, we began calculating separate wage budget neutrality and recalibration budget neutrality factors, in accordance with section 1886(d)(3)(E) of the Act, which specifies that budget neutrality to account for wage index changes or updates made under that subparagraph must be made without regard to the 62 percent labor-related share guaranteed under section 1886(d)(3)(E)(ii) of the Act. Therefore, for FY 2019, we calculated the wage budget neutrality factor to ensure that payments under updated wage data and the labor-related share of 68.3 percent are budget neutral, without regard to the lower labor-related share of 62 percent applied to hospitals with a wage index less than or equal to 1.0. In other words, the wage budget neutrality is calculated under the assumption that all hospitals receive the higher labor-related share of the standardized amount. The FY 2019 wage budget neutrality factor is 1.000748, and the overall payment change is 0 percent.

Column 3 shows the impacts of updating the wage data using FY 2015 cost reports. Overall, the new wage data and the labor-related share, combined with the wage budget neutrality adjustment, will lead to no change for all hospitals, as shown in Column 3.

In looking at the wage data itself, the national average hourly wage will increase 1.02 percent compared to FY 2018. Therefore, the only manner in which to maintain or exceed the previous year's wage index was to match or exceed the 1.02 percent increase in the national average hourly wage. Of the 3,252 hospitals with wage data for both FYs 2018 and 2019, 1,475 or 45.4 percent will experience an average hourly wage increase of 1.02 percent or more.

The following chart compares the shifts in wage index values for hospitals due to changes in the average hourly wage data for FY 2019 relative to FY 2018. Among urban hospitals, 10 will experience a decrease of 10 percent or more, and 3 urban hospitals will experience an increase of 10 percent or more. One hundred five urban hospitals will experience an increase or decrease of at least 5 percent or more but less than 10 percent. Among rural hospitals, 3 will experience an increase of 10 percent or more, and 2 will experience a decrease of 10 percent or more. Nine rural hospitals will experience an increase or decrease of at least 5 percent or more but less than 10 percent. However, 726 rural hospitals will experience increases or decreases of less than 5 percent, while 2,360 urban hospitals will experience increases or decreases of less than 5 percent. No urban hospitals and 34 rural hospitals will experience no change to their wage index. These figures reflect changes in the ''pre-reclassified, occupational mix-adjusted wage index,'' that is, the wage index before the application of geographic reclassification, the rural floor, the out-migration adjustment, and other wage index exceptions and adjustments. (We refer readers to sections III.G. through III.L. of the preamble of this final rule for a complete discussion of the exceptions and adjustments to the wage index.) We note that the ''post-reclassified wage index'' or ''payment wage index,'' which is the wage index that includes all such exceptions and adjustments (as reflected in Tables 2 and 3 associated with this final rule, which are available via the internet on the CMS website) is used to adjust the labor-related share of a hospital's standardized amount, either 68.3 percent or 62 percent, depending upon whether a hospital's wage index is greater than 1.0 or less than or equal to 1.0. Therefore, the pre-reclassified wage index figures in the following chart may illustrate a somewhat larger or smaller change than will occur in a hospital's payment wage index and total payment.

The following chart shows the projected impact of changes in the area wage index values for urban and rural hospitals.

FY 2019 percentage change in area wage index values	Number of hospitals	
	Urban	Rural
Increase 10 percent or more	3	3
Increase greater than or equal to 5 percent and less than 10 percent	62	3
Increase or decrease less than 5 percent	2,360	726
Decrease greater than or equal to 5 percent and less than 10 percent	43	6
Decrease 10 percent or more	10	2
Unchanged	0	34

d. Effects of MGCRB Reclassifications (Column 4)

Our impact analysis to this point has assumed acute care hospitals are paid on the basis of their actual geographic location (with the exception of ongoing policies that provide that certain hospitals receive payments on bases other than where they are geographically located). The changes in Column 4 reflect the per case payment impact of moving from this baseline to a simulation incorporating the MGCRB decisions for FY 2019.

By spring of each year, the MGCRB makes reclassification determinations that will be effective for the next fiscal year, which begins on October 1. The MGCRB may approve a hospital's reclassification request for the purpose of using another area's wage index value. Hospitals may appeal denials of MGCRB decisions to the CMS Administrator. Further, hospitals have 45 days from the date the IPPS proposed rule is issued in the **Federal Register** to decide whether to withdraw or terminate an approved geographic reclassification for the following year (we refer readers to the discussion of our clarification of this policy in section III.I.2. of the preamble to this final rule.

The overall effect of geographic reclassification is required by section 1886(d)(8)(D) of the Act to be budget neutral. Therefore, for purposes of this impact analysis, we are applying an adjustment of 0.985932 to ensure that the effects of the reclassifications under sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act are budget neutral (section II.A. of the Addendum to this final rule). Geographic reclassification generally benefits hospitals in rural areas. We estimate that the geographic reclassification will increase payments to rural hospitals by an average of 1.2 percent. By region, with the exception of rural providers in the Mountain region which will experience no change, all the rural hospital categories will experience increases in payments due to MGCRB reclassifications.

Table 2 listed in section VI. of the Addendum to this final rule and available via

the internet on the CMS website reflects the reclassifications for FY 2019.

e. Effects of the Rural Floor, Including Application of National Budget Neutrality (Column 5)

As discussed in section III.B. of the preamble of the FY 2009 IPPS final rule, the FY 2010 IPPS/RY 2010 LTCH PPS final rule, the FYs 2011 through 2018 IPPS/LTCH PPS final rules, and this FY 2019 IPPS/LTCH PPS final rule, section 4410 of Public Law 105–33 established the rural floor by requiring that the wage index for a hospital in any urban area cannot be less than the wage index received by rural hospitals in the same State. We will apply a uniform budget neutrality adjustment to the wage index. As discussed in section III.G. of the preamble of this final rule, we are not extending the imputed floor policy. Therefore, Column 5 shows the effects of the rural floor only.

The Affordable Care Act requires that we apply one rural floor budget neutrality factor to the wage index nationally. We have calculated a FY 2019 rural floor budget neutrality factor to be applied to the wage index of 0.993142, which will reduce wage indexes by 0.69 percent.

Column 5 shows the projected impact of the rural floor with the national rural floor budget neutrality factor applied to the wage index based on the OMB labor market area delineations. The column compares the post-reclassification FY 2019 wage index of providers before the rural floor adjustment and the post-reclassification FY 2019 wage index of providers with the rural floor adjustment based on the OMB labor market area delineations. Only urban hospitals can benefit from the rural floors. Because the provision is budget neutral, all other hospitals (that is, all rural hospitals and those urban hospitals to which the adjustment is not made) will experience a decrease in payments due to the budget neutrality adjustment that is applied nationally to their wage index.

We estimate that 263 hospitals will receive the rural floor in FY 2019. All IPPS hospitals in our model will have their wage index reduced by the rural floor budget neutrality adjustment of 0.993142. We project that, in aggregate, rural hospitals will experience a 0.2 percent decrease in payments as a result of the application of the rural floor budget neutrality because the rural hospitals do not benefit from the rural floor, but have their wage indexes downwardly adjusted to ensure that the application of the rural floor is budget neutral overall. We project hospitals located in urban areas will experience no change in payments because increases in payments by hospitals benefitting from the rural floor offset decreases in payments by nonrural floor urban hospitals whose wage index is downwardly adjusted by the rural floor budget neutrality factor. Urban hospitals in the New England region will experience a 2.5 percent increase in payments primarily due to the application of the rural floor in Massachusetts. Twenty nine urban providers in Massachusetts are expected to receive the rural floor wage index value, including the rural floor budget neutrality adjustment, increasing payments overall to hospitals in Massachusetts by an estimated $121 million. We estimate that Massachusetts hospitals will receive approximately a 3.3 percent increase in IPPS payments due to the application of the rural floor in FY 2019. We note that the significant increase in overall payments to hospitals in Massachusetts compared to past years is due primarily to the increase in the Massachusetts rural floor as a result of the recent reclassification of Brigham and Women's Hospital in the city of Boston as a rural hospital under § 412.103. We also note that this table does not reflect all of the additional Medicare payments resulting from the reclassification of Brigham and Women's Hospital in Boston as a rural hospital under § 412.103. Some of this payment impact is reflected in column 4 (Reclassifications) in Table I– Impact Analysis of Changes to the IPPS for Operating Costs for FY 2019.

Urban Puerto Rico hospitals are expected to experience a 0.1 percent increase in payments as a result of the application of the rural floor.

In response to a public comment addressed in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51593), we are providing the payment impact of the rural floor with budget neutrality at the State level. Column 1 of the following table displays the number of IPPS hospitals located in each State. Column 2 displays the number of hospitals in each State that will receive the rural floor wage index for FY 2019. Column 3 displays the percentage of total payments each State will receive or contribute to fund the rural floor with national budget neutrality. The column compares the post-reclassification FY 2019 wage index of providers before the rural floor adjustment and the post-reclassification FY 2019 wage index of providers with the rural floor adjustment. Column 4 displays the estimated payment amount that each State will gain or lose due to the application of the rural floor with national budget neutrality.

FY 2019 IPPS Estimated Payments Due to Rural Floor With National Budget Neutrality

State	Number of hospitals (1)	Number of hospitals that will receive the rural floor (2)	Percent change in payments due to application of rural floor with budget neutrality (3)	Difference (in $ millions) (4)
Alabama	84	3	−0.3	$−5
Alaska	6	3	0.1	0
Arizona	56	45	3.0	58

f. Effects of the Application of the Frontier State Wage Index and Out-Migration Adjustment (Column 6)

This column shows the combined effects of the application of section 10324(a) of the Affordable Care Act, which requires that we establish a minimum post-reclassified wage index of 1.00 for all hospitals located in ''frontier States,'' and the effects of section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, which provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county, but work in a different area with a higher wage index. These two wage index provisions are not budget neutral and will increase payments overall by 0.1 percent compared to the provisions not being in effect.

The term ''frontier States'' is defined in the statute as States in which at least 50 percent of counties have a population density less than 6 persons per square mile. Based on these criteria, 5 States (Montana, Nevada, North Dakota, South Dakota, and Wyoming) are considered frontier States and 49 hospitals located in those States will receive a frontier wage index of 1.0000. Overall, this provision is not budget neutral and is estimated to increase IPPS operating payments by approximately $62 million. Rural and urban hospitals located in the West North Central region will experience an increase in payments by 0.2 and 0.6 percent, respectively, because many of the hospitals located in this region are frontier State hospitals.

In addition, section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county, but work in a different area with a higher wage index. Hospitals located in counties that qualify for the payment adjustment will receive an increase in the wage index that is equal to a weighted average of the difference between the wage index of the resident county, post-reclassification and the higher wage index work area(s), weighted by the overall percentage of workers who are employed in an area with a higher wage index. There are an estimated 220 providers that will receive the out-migration wage adjustment in FY 2019. Rural hospitals generally will qualify for the adjustment, resulting in a 0.1 percent increase in payments. This provision appears to benefit section 401 hospitals and RRCs in that they will each experience a 0.1 and 0.2 percent increase in payments, respectively. (We note that there has been an increase in the number of RRCs as a result of the decision by the Court of Appeals for the Third Circuit in *Geisinger Community Medical Center vs. Secretary, United States Department of Health and Human Services,* 794 F.3d 383 (3d Cir. 2015) and subsequent regulatory changes (81 FR 23428).) This out-migration wage adjustment also is not budget neutral, and we estimate the impact of these providers receiving the out-migration increase will be approximately $42 million.

g. Effects of All FY 2019 Changes (Column 7)

Column 7 shows our estimate of the changes in payments per discharge from FY 2018 and FY 2019, resulting from all changes reflected in this final rule for FY 2019. It includes combined effects of the year-to-year change of the previous columns in the table.

The average increase in payments under the IPPS for all hospitals is approximately 2.4 percent for FY 2019 relative to FY 2018 and for this row is primarily driven by the changes reflected in Column 1. Column 7 includes the annual hospital update of 1.35 percent to the national standardized amount. This annual hospital update includes the 2.9 percent market basket update, the 0.8 percentage point reduction for the multifactor productivity adjustment, and the 0.75 percentage point reduction under section 3401 of the Affordable Care Act. As discussed in section II.D. of the preamble of this final rule, this column also includes the +0.5 percent adjustment required under section 414 of the MACRA. Hospitals paid

under the hospital-specific rate will receive a 1.35 percent hospital update. As described in Column 1, the annual hospital update with the +0.5 percent adjustment for hospitals paid under the national standardized amount, combined with the annual hospital update for hospitals paid under the hospital-specific rates, will result in a 2.4 percent increase in payments in FY 2019 relative to FY 2018. There are also interactive effects among the various factors comprising the payment system that we are not able to isolate, which contribute to our estimate of the changes in payments per discharge from FY 2018 and FY 2019 in Column 7.

Overall payments to hospitals paid under the IPPS due to the applicable percentage increase and changes to policies related to MS–DRGs, geographic adjustments, and outliers are estimated to increase by 2.4 percent for FY 2019. Hospitals in urban areas will experience a 2.5 percent increase in payments per discharge in FY 2019 compared to FY 2018. Hospital payments per discharge in rural areas are estimated to increase by 1.2 percent in FY 2019.

3. Impact Analysis of Table II

Table II presents the projected impact of the changes for FY 2019 for urban and rural hospitals and for the different categories of hospitals shown in Table I. It compares the estimated average payments per discharge for FY 2018 with the estimated average payments per discharge for FY 2019, as calculated under our models. Therefore, this table presents, in terms of the average dollar amounts paid per discharge, the combined effects of the changes presented in Table I. The estimated percentage changes shown in the last column of Table II equal the estimated percentage changes in average payments per discharge from Column 7 of Table I.

TABLE II—IMPACT ANALYSIS OF CHANGES FOR FY 2019 ACUTE CARE HOSPITAL OPERATING PROSPECTIVE PAYMENT SYSTEM

[Payments per discharge]

	Number of hospitals	Estimated average FY 2018 payment per discharge	Estimated average FY 2019 payment per discharge	FY 2019 changes
	(1)	(2)	(3)	(4)
All Hospitals	3,256	12,172	12,463	2.4
By Geographic Location:

Other Reclassified Hospitals (Section 1886(d)(8)(B))	47	8,609	8,736	1.5

H. Effects of Other Policy Changes

In addition to those policy changes discussed previously that we are able to model using our IPPS payment simulation model, we are making various other changes in this final rule. As noted in section I.G. of this Regulatory Impact Analysis, our payment simulation model uses the most recent available claims data to estimate the impacts on payments per case of certain changes in this final rule. Generally, we have limited or no specific data available with which to estimate the impacts of these changes using that payment simulation model. For those changes, we have attempted to predict the payment impacts based upon our experience and other more limited data. Our estimates of the likely impacts associated with these other changes are discussed in this section.

1. Effects of Policy Relating to New Medical Service and Technology Add-On Payments

In section II.H. of the preamble to this final rule, we discuss 11 technologies for which we received applications for add-on payments for new medical services and technologies for FY 2019. We note that three applicants withdrew their applications prior to the issuance of this final rule, and one applicant did not receive FDA approval for its technology by the July 1 deadline. We also discuss the status of the new technologies that were approved to receive new technology add-on payments in FY 2018. As explained in the preamble to this final rule, add-on payments for new medical services and technologies under section 1886(d)(5)(K) of the Act are not required to be budget neutral.

As discussed in section II.H.5. of the preamble of this final rule, we are approving the following nine applications for new technology add-on payments for FY 2019: KYMRIAH® (Tisagenlecleucel) and YESCARTA® (Axicabtagene Ciloleucel); VYXEOS™ (Cytarabine and Daunorubicin Liposome for Injection); VABOMERE™ (meropenem-vaborbactam); remedē® System; ZEMDRI™ (Plazomicin); GIAPREZA™; Sentinel® Cerebral Protection System; The AQUABEAM System (Aquablation); and AndexXa™ (Andexanet alfa). In addition, as we proposed, in this final rule, we are continuing to make new technology add-on payments for Defitelio® (Defibrotide), Ustekinumab (Stelara®) and Bezlotoxumab (Zinplava™) in FY 2019 because these technologies are still considered new. (As discussed in section II.H.5. of the preamble of this final rule, as we proposed, we are discontinuing new technology add-on payments for Idarucizumab, GORE® EXCLUDER® Iliac Branch Endoprosthesis (IBE), Edwards/Perceval Sutureless Valves, and Vistogard™ (Uridine Triacetate) for FY

2019 because these technologies will have been on the U.S. market for 3 years.)

We note that new technology add-on payments for each case are limited to the lesser of (1) 50 percent of the costs of the new technology or (2) 50 percent of the amount by which the costs of the case exceed the standard MS–DRG payment for the case. Because it is difficult to predict the actual new technology add-on payment for each case, our estimates below are based on the increase in new technology add-on payments for FY 2019 as if every claim that would qualify for a new technology add-on payment would receive the maximum add-on payment.

The following are estimates for FY 2019 for the three technologies for which we are continuing to make new technology add-on payments in FY 2019:

- Based on the applicant's estimate from FY 2017 and the updated cost information provided by the applicant (discussed in section II.H.4.a. of the preamble of this final rule), we currently estimate that new technology add-on payments for Defitelio® will increase overall FY 2019 payments by $5,474,000 (maximum add-on payment of $80,500 * 68 patients).
- Based on the applicant's estimate from FY 2018, we currently estimate that new technology add-on payments for Ustekinumab (Stelara®) will increase overall FY 2019 payments by $400,800 (maximum add-on payment of $2,400 * 167 patients).
- Based on the applicant's estimate for FY 2018, we currently estimate that new technology add-on payments for Bezlotoxumab (Zinplava™) will increase overall FY 2019 payments by $2,857,600 (maximum add-on payment of $1,900 * 1,504 patients).

The following are estimates for FY 2019 for the nine technologies that we are approving for new technology add-on payments beginning with FY 2019.

- Based on both applicants' estimates of the average cost for an administered dose for FY 2019, we currently estimate that new technology add-on payments for KYMRIAH® and YESCARTA® will increase overall FY 2019 payments by $71,989,000 (maximum add-on payment of $186,500 * 373 patients).
- Based on the applicant's estimate for FY 2019, we currently estimate that new technology add-on payments for VYXEOS™ will increase overall FY 2019 payments by $34,968,000 (maximum add-on payment of $36,425 * 960 patients).
- Based on the applicant's estimate for FY 2019, we currently estimate that new technology add-on payments for VABOMERE™ will increase overall FY 2019 payments by $14,680,512 (maximum add-on payment of $5,544 * 2,648 patients).
- Based on the applicant's estimate for FY 2019, we currently estimate that new technology add-on payments for remedē® System will increase overall FY 2019 payments by $1,380,000 (maximum add-on payment of $17,250 * 80 patients).
- Based on the applicant's estimate for FY 2019, we currently estimate that new technology add-on payments for ZEMDRI™ will increase overall FY 2019 payments by $6,806,250 (maximum add-on payment of $2,722.50 * 2,500 patients).
- Based on the applicant's estimate for FY 2019, we currently estimate that new technology add-on payments for GIAPREZA™ will increase overall FY 2019 payments by $8,595,000 (maximum add-on payment of $1,500 * 5,730 patients).
- Based on the applicant's estimate for FY 2019, we currently estimate that new technology add-on payments for Sentinel® Cerebral Protection System will increase overall FY 2019 payments by $9,100,000 (maximum add-on payment of $1,400 * 6,500 patients).
- Based on the applicant's estimate for FY 2019, we currently estimate that new technology add-on payments for the AquaBeam System (Aquablation) will increase overall FY 2019 payments by $521,250 (maximum add-on payment of $1,250 * 417 patients).
- Based on the applicant's estimate for FY 2019, we currently estimate that new technology add-on payments for AndexXa™ will increase overall FY 2019 payments by $75,965,625 (maximum add-on payment of $14,062.50 * 5,402 patients).

2. Effects of Changes to MS–DRGs Subject to the Postacute Care Transfer Policy and the MS–DRG Special Payment Policy

In section IV.A. of the preamble of this final rule, we discuss our changes to the list of MS–DRGs subject to the postacute care transfer policy and the MS–DRG special payment policy. As reflected in Table 5 listed in section VI. of the Addendum to this final rule (which is available via the internet on the CMS website), using criteria set forth in regulations at 42 CFR 412.4, we evaluated MS–DRG charge, discharge, and transfer data to determine which new or revised MS–DRGs will qualify for the postacute care transfer and MS–DRG special payment policies. As a result of our policies to revise the MS–DRG classifications for FY 2019, which are discussed in section II.F. of the preamble of this final rule, we are including additions to the list of MS–DRGs subject to the MS–DRG special payment policy. Column 2 of Table I in this Appendix A shows the effects of the changes to the MS–DRGs and the relative payment weights and the application of the recalibration budget neutrality factor to the standardized amounts. Section 1886(d)(4)(C)(i) of the Act requires us annually to make appropriate DRG classification changes in order to reflect changes in treatment patterns, technology, and any other factors that may change the relative use of hospital resources. The analysis and methods for determining the changes due to the MS–DRGs and relative payment weights account for and include changes as a result of the changes to the MS–DRGs subject to the MS–DRG postacute care transfer and MS–DRG special payment policies. We refer readers to section I.G. of this Appendix A for a detailed discussion of payment impacts due to the MS–DRG reclassification policies for FY 2019.

In section IV.A.2.b. of the preamble of this final rule, we discuss our conforming changes to the regulations at § 412.4(c) to reflect the amendments to section 1886(d)(5)(J) of the Act made by section 53109 of the Bipartisan Budget Act of 2018. Section 53109 of the Bipartisan Budget Act of 2018 amended section 1886(d)(5)(J) of the Act to include discharges to hospice services provided by a hospice program as a ''qualified discharge'' under the postacute care transfer policy, effective for discharges occurring on or after October 1, 2018. To implement this change, we are establishing that discharges using Patient Discharge Status code of 50 (Discharged/Transferred to Hospice—Routine or Continuous Home Care) or 51 (Discharged/Transferred to Hospice, General Inpatient Care or Inpatient Respite) will be subject to the postacute care transfer policy, effective for discharges occurring on or after October 1, 2018. Our actuaries estimate that this change in the postacute care transfer policy will generate an annual savings of approximately $240 million in Medicare payments in FY 2019, and up to $540 million annually by FY 2028.

3. Effects of Changes to Low-Volume Hospital Payment Adjustment Policy

In section IV.D. of the preamble of this final rule, we discuss the changes to the low-volume hospital payment policy for FY 2019 to implement the provisions of section 50204 of the Bipartisan Budget Act of 2018. Specifically, for FY 2019, qualifying hospitals must have less than 3,800 combined Medicare and non-Medicare discharges (instead of 1,600 Medicare discharges) and must be located more than 15 road miles from another subsection (d) hospital. Section 50204 of the Bipartisan Budget Act of 2018 also modified the methodology for calculating the payment adjustment for low-volume hospitals for FYs 2019 through 2022. To implement these requirements, we are establishing that the low-volume hospital payment adjustment will be determined as follows:

- For low-volume hospitals with 500 or fewer total discharges during the fiscal year, an additional 25 percent for each Medicare discharge.
- For low-volume hospitals with total discharges during the fiscal year of more than 500 and fewer than 3,800, an additional percent calculated using the formula [(95/330) − (number of total discharges/13,200)] for each Medicare discharge.

Based upon the best available data at this time, we estimate the changes to the low-volume hospital payment adjustment policy that we are implementing in accordance with section 50204 of the Bipartisan Budget Act of 2018 will increase Medicare payments by $75 million in FY 2019 as compared to FY 2018. More specifically, in FY 2019, we estimate that 628 providers will receive approximately $426 million compared to our estimate of 612 providers receiving approximately $350 million in FY 2018. These payment estimates were determined by identifying providers that, based on the best available data, are expected to qualify under the criteria that will apply in FY 2019 (that is, are located at least 15 miles from the nearest subsection (d) hospital and have less than 3,800 total discharges), and were determined from the same data used in developing the quantitative analyses of changes in payments per case discussed previously in section I.G. of this Appendix A.

4. Effects of the Changes to Medicare DSH and Uncompensated Care Payments for FY 2019

As discussed in section IV.F. of the preamble of this final rule, under section 3133 of the Affordable Care Act, hospitals that are eligible to receive Medicare DSH payments will receive 25 percent of the amount they previously would have received under the statutory formula for Medicare DSH payments under section 1886(d)(5)(F) of the Act. The remainder, equal to an estimate of 75 percent of what formerly would have been paid as Medicare DSH payments (Factor 1), reduced to reflect changes in the percentage of uninsured individuals and additional statutory adjustments (Factor 2), is available to make additional payments to each hospital that qualifies for Medicare DSH payments and that has uncompensated care. Each hospital eligible for Medicare DSH payments will receive an additional payment based on its estimated share of the total amount of uncompensated care for all hospitals eligible for Medicare DSH payments. The uncompensated care payment methodology has redistributive effects based on the proportion of a hospital's amount of uncompensated care relative to the aggregate amount of uncompensated care of all hospitals eligible for Medicare DSH payments (Factor 3). The change to Medicare DSH payments under section 3133 of the Affordable Care Act is not budget neutral.

In this final rule, we are establishing the amount to be distributed as uncompensated care payments to DSH eligible hospitals, which for FY 2019 is $8,272,872,447.22. This figure represents 75 percent of the amount that otherwise would have been paid for Medicare DSH payment adjustments adjusted by a Factor 2 of 67.51 percent. For FY 2018, the amount available to be distributed for uncompensated care was $6,766,695,163.56, or 75 percent of the amount that otherwise would have been paid for Medicare DSH payment adjustments adjusted by a Factor 2 of 58.01 percent. To calculate Factor 3 for FY 2019, we used an average of data computed using Medicaid days from hospitals' 2013 cost reports from the HCRIS database as updated through June 30, 2018, uncompensated care costs from hospitals' 2014 and 2015 cost reports from the same extract of HCRIS, and SSI days from the FY 2016 SSI ratios. For each eligible hospital, with the exception of Puerto Rico hospitals, all-inclusive rate providers, and Indian Health Service and Tribal hospitals, we calculated a Factor 3 using information from cost reports for FYs 2013, 2014, and 2015. To calculate Factor 3 for Puerto Rico hospitals, all-inclusive rate providers, and Indian Health Service and Tribal hospitals, we used data regarding low-income insured days for FY 2013. For a complete discussion of the methodology for calculating Factor 3, we refer readers to section IV.F.4. of the preamble of this final rule.

To estimate the impact of the combined effect of changes in Factors 1 and 2, as well as the changes to the data used in determining Factor 3, on the calculation of Medicare uncompensated care payments (UCP), we compared total UCP estimated in the FY 2018 IPPS/LTCH PPS final rule to total UCP estimated in this FY 2019 IPPS/LTCH PPS final rule. For FY 2018, for each hospital, we calculated 75 percent of the estimated amount that would have been paid as Medicare DSH payments in the absence of section 3133 of the Affordable Care Act, adjusted by a Factor 2 of 58.01 percent and multiplied by a Factor 3 calculated as described in the FY 2018 IPPS/LTCH PPS final rule. For FY 2019, we calculated 75 percent of the estimated amount that would be paid as Medicare DSH payments absent section 3133 of the Affordable Care Act, adjusted by a Factor 2 of 67.51 percent and multiplied by a Factor 3 calculated using the methodology described previously.

Our analysis included 2,448 hospitals that are projected to be eligible for DSH in FY 2019. It did not include hospitals that terminated their participation from the Medicare program as of January 1, 2018, Maryland hospitals, new hospitals, MDHs, and SCHs that are expected to be paid based on their hospital-specific rates. The 29 hospitals participating in the Rural Community Hospital Demonstration Program were excluded in this final rule, as participating hospitals are not eligible to receive empirically justified Medicare DSH payments and uncompensated care payments. In addition, low-income insured days and uncompensated care costs from merged or acquired hospitals were combined into the surviving hospital's CMS certification number (CCN), and the nonsurviving CCN was excluded from the analysis. The estimated impact of the changes in Factors 1, 2, and 3 on uncompensated care payments across all hospitals projected to be eligible for DSH payments in FY 2019, by hospital characteristic, is presented in the following table.

MODELED UNCOMPENSATED CARE PAYMENTS FOR ESTIMATED FY 2019 DSHS BY HOSPITAL TYPE: MODEL UCP $ (IN MILLIONS) * FROM FY 2018 TO FY 2019

Source: Dobson | DaVanzo analysis of 2013–2015 Hospital Cost Reports.

* Dollar UCP calculated by [0.75 * estimated section 1886(d)(5)(F) payments * Factor 2 * Factor 3]. When summed across all hospitals projected to receive DSH payments, uncompensated care payments are estimated to be $6,767 million in FY 2018 and $8,273 million in FY 2019.

** Percentage change is determined as the difference between Medicare UCP payments modeled for this FY 2019 IPPS/LTCH PPS final rule (column 3) and Medicare UCP payments modeled for the FY 2018 IPPS/LTCH PPS final rule correction notice (column 2) divided by Medicare UCP payments modeled for the FY 2018 final rule correction notice (column 2) times 100 percent.

*** Hospitals with Missing or Unknown Medicare Utilization are not shown in table.

Changes in projected FY 2019 uncompensated care payments from payments in FY 2018 are driven by increases in Factor 1 and Factor 2, as well as by an increase in the number of hospitals eligible to receive DSH in FY 2019 relative to FY 2018. Factor 1 has increased from $11.665 billion to $12.254 billion, and the percent change in the percent of individuals who are uninsured (Factor 2) has increased from 58.01 percent to 67.51 percent. Based on the increases in these two factors, the impact analysis found that, across all projected DSH eligible hospitals, FY 2019 uncompensated care payments are estimated at approximately $8.273 billion, or an increase of approximately 22.26 percent from FY 2018 uncompensated care payments (approximately $6.767 billion). While these changes will result in a net increase in the amount available to be distributed in uncompensated care payments, the projected payment increases vary by hospital type. This redistribution of uncompensated care payments is caused by changes in Factor 3.

As seen in the above table, percent increases smaller than 22.26 percent indicate that hospitals within the specified category are projected to experience a smaller increase in uncompensated care payments, on average, compared to the universe of projected FY 2019 DSH hospitals. Conversely, percent increases that are greater than 22.26 percent indicate a hospital type is projected to have a larger increase than the overall average. The variation in the distribution of payments by hospital characteristic is largely dependent on a given hospital's number of Medicaid days and SSI days, as well as its uncompensated care costs as reported in the Worksheet S–10, used in the Factor 3 computation.

Many rural hospitals are projected to experience larger increases in uncompensated care payments than their urban counterparts. Overall, rural hospitals are projected to receive a 36.66 percent increase in uncompensated care payments, while urban hospitals are projected to receive a 21.48 percent increase in uncompensated care payments.

By bed size, smaller hospitals are projected to receive larger increases in uncompensated care payments than larger hospitals, in both rural and urban settings. Rural hospitals with 0–99 beds are projected to receive a 39.52 percent payment increase, rural hospitals with 100–249 beds are projected to see a 36.35 percent increase, and larger rural hospitals with 250+ beds are projected to experience a 24.35 percent payment increase. These increases for rural hospitals are all greater than the overall hospital average. This trend is consistent with urban hospitals, in which the smallest urban hospitals (0–99 beds) are projected to receive an increase in uncompensated care payments of 44.83 percent, and urban hospitals with 100–250 beds are projected to receive an increase of 25.23 percent, both of which are greater than the overall average. Larger urban hospitals with 250+ beds are projected to receive a 19.40 percent increase in uncompensated care payments, which is smaller than the overall average.

By region, rural hospitals are expected to receive a wide range of payment increases. Rural hospitals in the Mountain region are expected to receive a larger than average increase in uncompensated care payments, as are rural hospitals in the West South Central,

South Atlantic, East North Central, West North Central, and Pacific regions. Rural hospitals in the New England, East South Central, and Middle Atlantic regions are projected to receive smaller than average payment increases. Regionally, urban hospitals are projected to receive a narrower range of payment changes. Smaller than average increases in uncompensated care payments are projected in the Pacific, Middle Atlantic, New England, and East North Central regions. Urban hospitals in the West South Central, South Atlantic, and Mountain regions are projected to receive a larger than average increase in uncompensated payments, as are hospitals in Puerto Rico. The projected increases in the East South Central and West North Central regions are generally consistent with the overall average increase of 22.26 percent.

Nonteaching hospitals are projected to receive a larger than average payment increase of 28.62 percent. Teaching hospitals with fewer than 100 residents are projected to receive a payment increase of 22.14 percent, which is consistent with the overall average, while those teaching hospitals with 100+ residents have a projected payment increase of 17.23 percent, lower than the overall average. Government and proprietary hospitals are projected to receive larger than average increases (31.26 percent and 24.06 percent, respectively), while voluntary hospitals are expected to receive increases lower than the overall average at 18.30 percent. Hospitals with 0 to 25 percent Medicare utilization are projected to receive increases in uncompensated care payments slightly below the overall average, while hospitals with higher levels of Medicare utilization are projected to receive larger increases.

5. Effects of Reductions Under the Hospital Readmissions Reduction Program for FY 2019

In section IV.H. of the preamble of the this final rule, we discuss our finalized policies for the FY 2019 Hospital Readmissions Reduction Program. This program requires a reduction to a hospital's base operating DRG payment to account for excess readmissions of selected applicable conditions. The table and analysis below illustrate the estimated financial impact of the Hospital Readmissions Reduction Program payment adjustment methodology by hospital characteristic. As outlined in section IV.H. of the preamble of this final rule, hospitals are stratified into quintiles based on the proportion of dual-eligible stays among Medicare fee-for-service (FFS) and managed care stays between July 1, 2014 and June 30, 2017 (that is, the FY 2019 Hospital Readmissions Reduction Program's performance period). Hospitals' excess readmission ratios (ERRs) are assessed relative to their peer group median and a neutrality modifier is applied in the payment adjustment factor calculation to maintain budget neutrality. To analyze the results by hospital characteristic, we used the FY 2019 IPPS/LTCH Proposed Rule Impact File.

These analyses include 3,062 non-Maryland hospitals eligible to receive a penalty during the performance period. Hospitals are eligible to receive a penalty if they have 25 or more eligible discharges for at least one measure between July 1, 2014 and June 30, 2017. The second column in the table indicates the total number of non-Maryland hospitals with available data for each characteristic that have an estimated payment adjustment factor less than 1 (that is, penalized hospitals).

The third column in the table indicates the percentage of penalized hospitals among those eligible to receive a penalty by hospital characteristic. For example, 82.26 percent of eligible hospitals characterized as non-teaching hospitals are expected to be penalized. Among teaching hospitals, 88.60 percent of eligible hospitals with fewer than 100 residents and 93.95 percent of eligible hospitals with 100 or more residents are expected to be penalized.

The fourth column in the table estimates the financial impact on hospitals by hospital characteristics. The table shows the share of penalties as a percentage of all base operating Diagnosis Related-Group (DRG) payments for hospitals with each characteristic. This is calculated as the sum of penalties for all hospitals with that characteristic over the sum of all base operating DRG payments for those hospitals between October 1, 2016 and September 30, 2017 (FY 2017). For example, the penalty as a share of payments for urban hospitals is 0.70 percent. This means that total penalties for all urban hospitals are 0.70 percent of total payments for urban hospitals. Measuring the financial impact on hospitals as a percentage of total base operating DRG payments accounts for differences in the amount of base operating DRG payments for hospitals within the characteristic when comparing the financial impact of the program on different groups of hospitals.

ESTIMATED PERCENTAGE OF HOSPITALS PENALIZED AND PENALTY AS SHARE OF PAYMENTS FOR FY 2019 HOSPITAL READMISSIONS REDUCTION PROGRAM

[By hospital characteristic]

Hospital characteristic	Number of eligible hospitals [a]	Number of penalized hospitals [b]	Percentage of hospitals penalized [c] (%)	Penalty as a share of payments [d] (%)

Mountain	217	163	75.12	0.57
Pacific	364	290	79.67	0.48

Source: The table results are based on the estimated FY 2019 payment adjustment factors of open, non-Maryland, subsection (d) hospitals only. FY 2019 payment adjustment factors are based on discharges between July 1, 2014 and June 30, 2017. Although data from all subsection (d) and Maryland hospitals are used in calculations of each hospital's ERR, this table does not include results for Maryland hospitals and hospitals that are not open as of the October 2018 public reporting open hospital list since these hospitals are not eligible for a penalty under the program. Hospitals are stratified into quintiles based on the proportion of FFS and managed care dual-eligible stays for the 3-year FY 2019 performance period. Hospital characteristics are from the FY 2019 IPPS/LTCH Proposed Rule Impact File.

[a] This column is the number of applicable hospitals within the characteristic that are eligible for a penalty (that is, they have 25 or more eligible discharges for at least one measure).

[b] This column is the number of applicable hospitals that are penalized (that is, they have 25 or more eligible discharges for at least one measure and an estimated payment adjustment factor less than 1) within the characteristic.

[c] This column is the percentage of applicable hospitals that are penalized among hospitals that are eligible to receive a penalty by characteristic.

[d] This column is calculated as the sum of all penalties for the group of hospitals with that characteristic divided by total base operating DRG payments for all those hospitals. MedPAR data from October 1, 2016 through September 30, 2017 (FY 2017) are used to calculate the total base operating DRG payments.

[e] The total number of hospitals with hospital characteristics data may not add up to the total number of hospitals because not all hospitals have data for all characteristics. All hospitals had information for: Geographic location, bed size by geographic region, teaching status, safety-net status, DSH patient percentage, and region (n=3,062). Not all hospitals had data for ownership type (n=3,043; missing=19) and MCR percent (n=3,048; missing=14).

[f] A hospital is considered a teaching hospital if it has an Indirect Medical Education adjustment factor for Operation PPS (TCHOP) greater than zero.

[g] A hospital is considered a safety-net hospital if it is in the top DSH quintile.

[h] DSH patient percentage is the sum of the percentage of Medicare inpatient days attributable to patients entitled to both Medicare Part A and Supplemental Security Income (SSI), and the percentage of total inpatient days attributable to patients eligible for Medicaid but not entitled to Medicare Part A.

[i] MCR percent is the percentage of total inpatient stays from Medicare patients.

6. Effects of Changes Under the FY 2019 Hospital Value-Based Purchasing (VBP) Program

a. Effects of Proposed Changes for FY 2019

In section IV.I. of the preamble of this final rule, we discuss the Hospital VBP Program under which the Secretary makes value-based incentive payments to hospitals based on their performance on measures during the performance period with respect to a fiscal year. These incentive payments will be funded for FY 2019 through a reduction to the FY 2019 base operating DRG payment amount for the discharge for the hospital for such fiscal year, as required by section 1886(o)(7)(B) of the Act. The applicable percentage for FY 2019 and subsequent years is 2 percent. The total amount available for value-based incentive payments must be equal to the total amount of reduced payments for all hospitals for the fiscal year, as estimated by the Secretary.

In section IV.I.1.b. of the preamble of this final rule, we estimate the available pool of funds for value-based incentive payments in the FY 2019 program year, which, in accordance with section 1886(o)(7)(C)(v) of the Act, will be 2.00 percent of base operating DRG payments, or a total of approximately $1.9 billion. This estimated available pool for FY 2019 is based on the historical pool of hospitals that were eligible to participate in the FY 2018 program year and the payment information from the March 2018 update to the FY 2017 MedPAR file.

The proposed estimated impacts of the FY 2019 program year by hospital characteristic, found in the table below, are based on historical TPSs. We used the FY 2018 program year's TPSs to calculate the proxy adjustment factors used for this impact analysis. These are the most recently available scores that hospitals were given an opportunity to review and correct. The proxy adjustment factors use estimated annual base operating DRG payment amounts derived from the March 2018 update to the FY 2017 MedPAR file. The proxy adjustment factors can be found in Table 16A associated with this final rule (available via the internet on the CMS website).

The impact analysis shows that, for the FY 2019 program year, the number of hospitals that would receive an increase in their base operating DRG payment amount is higher than the number of hospitals that would receive a decrease. On average, urban hospitals in the West North Central region and rural hospitals in Mountain region would have the highest positive percent

change in base operating DRG. Urban Middle Atlantic, urban South Atlantic, and urban East South Central regions would experience an average negative percent change in base operating DRG. All other regions, both urban and rural, would have an average positive percent change in base operating DRG.

As DSH percent increases, the average percent change in base operating DRG would decrease. With respect to hospitals' Medicare utilization as a percent of inpatient days (MCR), as the MCR percent increases, the percent change in base operating DRG would tend to increase. On average, teaching hospitals would have a negative percent change in base operating DRG, while non-teaching hospitals would have a positive percent change in base operating DRG.

IMPACT ANALYSIS OF BASE OPERATING DRG PAYMENT AMOUNTS RESULTING FROM THE FY 2019 HOSPITAL VBP PROGRAM

	Number of hospitals	Average net percentage payment adjustment
By Geographic Location:		
All Hospitals	2,808	0.163

By MCR Percent:		
0–25	431	0.117
25–50	1,958	0.151
50–65	392	0.261
Over 65	27	0.292
Missing	.....	.....
BY DSH Percent:		
0–25	1,049	0.251
25–50	1,421	0.136
50–65	187	−0.003
Over 65	151	0.001
By Teaching Status:		
Non-Teaching	1,751	0.279
Teaching	1,057	−0.031

Actual FY 2019 program year's TPSs will not be reviewed and corrected by hospitals until after the FY 2019 IPPS/LTCH PPS final rule has been published. Therefore, the same historical universe of eligible hospitals and corresponding TPSs from the FY 2018 program year were used for the updated impact analysis in this final rule.

b. Effects of Proposed Domain Weighting and Alternative Considered Beginning With the FY 2021 Program Year

In section IV.I.4.b. of the preamble of the proposed rule, we discussed our proposed

changes to the Hospital VBP Program domain weighting beginning with the FY 2021 program year. We note that we did not propose to make any changes to the domain weighting for the FY 2019 or FY 2020 program years. The estimated impacts of the proposed domain weighting and alternative considered for three domains beginning with the FY 2021 program year, by hospital characteristic, based on historical TPSs, were provided in the proposed rule (83 FR 20620 through 20621). However, as discussed in section IV.I.4.b. of the preamble of this final rule, we are not finalizing any changes to the domain weighting for the FY 2021 year or subsequent years, and therefore we did not provide an updated analysis here.

7. Effects of Requirements Under the HAC Reduction Program for FY 2019

In section IV.J. of the preamble of this final rule, we discuss finalized requirements for the HAC Reduction Program. In the proposed rule, we did not propose to adopt any new measures into the HAC Reduction Program, and are therefore not finalizing any changes to the HAC Reduction Program measure set. However, the Hospital IQR Program is finalizing its proposals to remove the claims-based Patient Safety and Adverse Events Composite (PSI–90) beginning with the CY 2018 reporting period/FY 2020 payment determination and five NHSN HAI measures, although the NHSN HAI measures removal is being delayed by one year (until the CY 2020 reporting period/FY 2022 payment determination). These measures had been previously adopted for, and will remain in, the HAC Reduction Program. We are therefore finalizing our proposal to begin validation of these NHSN HAI measures under the HAC Reduction Program, but are delaying implementation to begin with Q3 2020 discharges for FY 2023 in order to align with a corresponding delay in removing these NHSN HAI measures from the Hospital IQR Program.

We note the burden associated with collecting and submitting data via the NHSN system is captured under a separate OMB control number, 0920–0666, and therefore will not impact our burden estimates. We anticipate the removal of the NHSN HAI measures from the Hospital IQR Program will result in a net burden decrease to the Hospital IQR Program, but will result in an off-setting net burden increase to the HAC Reduction Program because hospitals selected for validation will continue to be required to submit validation templates for the HAI measures. Therefore, with the finalized policies discussed in section VIII.A.5.b.(1) and IV.J.4.e. of the preamble of this final rule to remove NHSN HAI chart-abstracted measures from the Hospital IQR Program and adopt validation process for the HAC Reduction Program, we anticipate a shift in burden associated with this data validation effort to the HAC Reduction Program beginning in FY 2021. We discuss the associated burden hours (43,200 hours over 600 hospitals) in section XIV.B.7. of the preamble of this final rule, and note the burden associated with these requirements is captured in an information collection request currently available for review and comment, OMB control number 0938—NEW.

The table and analysis below illustrate the estimated cumulative effect of the measures and scoring methodology for the Hospital-Acquired Condition (HAC) Reduction Program, as outlined in this FY 2019 IPPS/LTCH PPS final rule. We are presenting the estimated impact of the FY 2019 HAC Reduction Program on hospitals by hospital characteristic.

These FY 2019 HAC Reduction Program results were calculated using the Winsorized z-score methodology finalized in the FY 2017 IPPS/LTCH PPS final rule (80 FR 57022 through 57025). Each hospital's Total HAC Score was calculated as the weighted average of the hospital's Domain 1 score (15 percent) and Domain 2 score (85 percent). Non-Maryland hospitals with a Total HAC Score greater than the 75th percentile Total HAC Score were identified as being in the worst-performing quartile. The table below presents the estimated proportion of hospitals in the worst-performing quartile of the Total HAC Scores by hospital characteristic. We are not providing hospital-level data or payment impact in conjunction with this FY 2019 IPPS/LTCH PPS final rule because CMS gives hospitals a 30-day Scoring Calculations Review and Corrections Period to review their scores, which will not conclude until after the publication of this FY 2019 IPPS/LTCH PPS final rule.

Each hospital's Domain 1 score is based on its CMS Patient Safety Indicator (PSI) 90 Composite measure results, which are based on Medicare fee-for-service (FFS) discharges from October 1, 2015 through June 30, 2017 and recalibrated version 8.0 of the CMS PSI software. Each hospital's Domain 2 score is composed of CDC Central Line-Associated Bloodstream Infection (CLABSI), Catheter-Associated Urinary Tract Infection (CAUTI), Colon and Abdominal Hysterectomy Surgical Site Infection (SSI), Methicillin-resistant *Staphylococcus aureus* (MRSA) bacteremia, and *Clostridium difficile* Infection (CDI) measure results. The Domain 2 scores are derived from standardized infection ratios (SIRs) calculated from hospital surveillance data reported to the National Healthcare Safety Network (NHSN) for infections occurring between January 1, 2016 and December 31, 2017.

To analyze the results by hospital characteristic, we used the FY 2019 Proposed Rule Impact File. This table includes 3,219 non-Maryland hospitals with a FY 2019 Total HAC Score. Of these 3,219 hospitals: 3,201 hospitals had information for geographic location, bed size, Disproportionate Share Hospital (DSH) percent, and teaching status; 3,217 had information on region; 3,173 had information for ownership; and 3,175 had information for Medicare Cost Report percent. The first column has a breakdown of each characteristic.

The second column in the table indicates the total number of non-Maryland hospitals with a FY 2019 Total HAC Score and available data for each characteristic. For example, with regard to teaching status, 2,121 hospitals are characterized as non-teaching hospitals, 832 are characterized as teaching hospitals with fewer than 100 residents, and 248 are characterized as teaching hospitals with at least 100 residents. This only represents a total of 3,201 hospitals because the other 18 hospitals are missing from the FY 2019 Proposed Rule Impact File.

The third column in the table indicates the number of hospitals for each characteristic that would be in the worst-performing quartile of Total HAC Scores. These hospitals would receive a payment reduction under the FY 2019 HAC Reduction Program. For example, with regard to teaching status, 484 hospitals out of 2,121 hospitals characterized as non-teaching hospitals would be subject to a payment reduction. Among teaching hospitals, 196 out of 832 hospitals with fewer than 100 residents and 113 out of 248 hospitals with 100 or more residents would be subject to a payment reduction.

The fourth column in the table indicates the percentage of hospitals for each characteristic that would be in the worst-performing quartile of Total HAC Scores and would receive a payment reduction under the FY 2019 HAC Reduction Program. For example, 22.8 percent of the 2,121 hospitals characterized as non-teaching hospitals, 23.6 percent of the 832 teaching hospitals with fewer than 100 residents, and 45.6 percent of the 248 teaching hospitals with 100 or more residents would be subject to a payment reduction.

ESTIMATED PROPORTION OF HOSPITALS IN THE WORST-PERFORMING QUARTILE (>75TH PERCENTILE) OF THE TOTAL HAC SCORES FOR THE FY 2019 HAC REDUCTION PROGRAM

[By hospital characteristic]

Hospital characteristic	Number of hospitals	Number of hospitals in the worst-performing quartile [a]	Percent of hospitals in the worst-performing quartile [b]
Total [c]	3,219	804	25.0
By Geographic Location (n=3,201): [d]			
Urban hospitals	2,416	6,628	26.0

ESTIMATED PROPORTION OF HOSPITALS IN THE WORST-PERFORMING QUARTILE (>75TH PERCENTILE) OF THE TOTAL HAC SCORES FOR THE FY 2019 HAC REDUCTION PROGRAM—Continued

[By hospital characteristic]

Hospital characteristic	Number of hospitals	Number of hospitals in the worst-performing quartile [a]	Percent of hospitals in the worst-performing quartile [b]
1–99 beds	6,622	1,133	221.4
100–199 beds	7,728	1,182	225.0
200–299 beds	4,430	1,119	227.7
300–399 beds	2,278	780	28.8
400–499 beds	1,145	439	326.9
500 or more beds	213	775	335.2
Rural hospitals	7,785	1,165	221.0
1–49 beds	304	568	122.4
50–99 beds	2,282	656	219.9
100–149 beds	116	222	119.0
150–199 beds	44	810	122.7
200 or more beds	39	79	123.1
By Safety-Net Status [e] (n=3,201):			
Non-safety net	2,555	5576	22.5
Safety-net	6,646	2,217	333.6
By DSH Percent [f] (n=3,201):			
0–24	1,313	2,292	222.2

Mountain	2,229	660	26.2
Pacific	3,397	1,118	329.7

Source: FY 2019 HAC Reduction Program Final Rule Results are based on CMS PSI 90 Composite data from October 2015 through June 2017 and CDC CLABSI, CAUTI, SSI, CDI, and MRSA results from January 2016 through December 2017. Hospital Characteristics are based on the FY 2019 Proposed Rule Impact File.

[a] This column is the number of non-Maryland hospitals with a Total HAC Score within the corresponding characteristic that are estimated to be in the worst-performing quartile.

[b] This column is the percent of non-Maryland hospitals within each characteristic that are estimated to be in the worst-performing quartile. The percentages are calculated by dividing the number of non-Maryland hospitals with a Total HAC Score in the worst-performing quartile by the total number of non-Maryland hospitals with a Total HAC Score within that characteristic.

[c] The number of non-Maryland hospitals with a FY 2019 Total HAC Score (N=3,219). Note that not all hospitals have data for all hospital characteristics.

[d] The number of hospitals that had information for geographic location with bed size, Safety-net status, Disproportionate Share Hospital (DSH) percent, teaching status, and ownership status (n=3,201).

[e] A hospital is considered a Safety-net hospital if it is in the top quintile for DSH percent.

[f] The DSH patient percentage is equal to the sum of (1) the percentage of Medicare inpatient days attributable to patients eligible for both Medicare Part A and Supplemental Security Income and (2) the percentage of total inpatient days attributable to patients eligible for Medicaid but not Medicare Part A.

[g] A hospital is considered a teaching hospital if it has an Indirect Medical Education adjustment factor for Operation PPS (TCHOP) greater than zero.

[h] Not all hospitals had data for MCR percent (n=3,175).

[i] Not all hospitals had data for Region (n=3,217).

8. Effects of Changes to Medicare GME Affiliated Groups for New Urban Teaching Hospitals

In section IV.K.2. of the preamble of this final rule, we discuss our final policy to provide new urban teaching hospitals with greater flexibility under the regulation governing Medicare GME affiliation agreements. Currently, if a new urban teaching hospital participates in a Medicare GME affiliation agreement, § 413.79(e)(1)(iv) provides that the new urban teaching hospital(s) is only permitted to receive in increase in its FTE cap(s). We are finalizing our proposal to revise the regulation to specify that, effective for Medicare GME affiliation agreements entered into on or after July 1, 2019, a new urban teaching hospital may enter into a Medicare GME affiliated group for purposes of establishing an aggregate FTE cap and receive an adjustment that is a decrease to the urban hospital's FTE caps if the decrease results from a Medicare GME affiliated group consisting solely of two or more new urban teaching hospitals. In addition, effective for Medicare GME affiliation agreements entered into on or after July 1, 2019, a new urban teaching hospital may participate in a Medicare GME affiliated group with an existing teaching hospital and receive an adjustment that is a decrease to the urban hospital's FTE caps, provided the Medicare GME affiliation agreement is effective with a July 1 date (the residency training year) that is at least 5 years after the start of the new urban teaching hospital's cost reporting period that coincides with or follows the start of the sixth program year of the first new program. Rather than create new FTE cap slots to cross train residents, Medicare GME affiliation agreements use existing cap slots to allow residents to rotate to various hospitals. Because Medicare GME affiliation agreements use existing FTE cap slots, we do not anticipate any significant cost impact associated with this policy.

9. Effects of Implementation of the Rural Community Hospital Demonstration Program in FY 2019

In section IV.L. of the preamble of this final rule for FY 2019, we discussed our implementation and budget neutrality methodology for section 410A of Public Law 108–173, as amended by sections 3123 and 10313 of Public Law 111–148, and more recently, by section 15003 of Public Law 114–255, which requires the Secretary to conduct a demonstration that would modify payments for inpatient services for up to 30 rural hospitals.

Section 15003 of Public Law 114–255 requires the Secretary to conduct the Rural Community Hospital Demonstration for a 10-year extension period (in place of the 5-year extension period required by the Affordable Care Act), beginning on the date immediately following the last day of the initial 5-year period under section 410A(a)(5) of Public Law 108–173. Specifically, section 15003 of Public Law 114–255 amended section 410A(g)(4) of Public Law 108–173 to require that, for hospitals participating in the demonstration as of the last day of the initial 5-year period, the Secretary shall provide for continued participation of such rural community hospitals in the demonstration during the 10-year extension period, unless the hospital makes an election to discontinue participation. Furthermore, section 15003 of Public Law 114–255 requires that, during the second 5 years of the 10-year extension period, the Secretary shall provide for participation under the demonstration during the second 5 years of the 10 year extension period for hospitals that are not described in subsection 410A(g)(4).

Section 15003 of Public Law 114–255 also requires that no later than 120 days after enactment of Public Law 114–255 that the Secretary issue a solicitation for applications to select additional hospitals to participate in the demonstration program for the second 5 years of the 10-year extension period so long as the maximum number of 30 hospitals stipulated by Public Law 111–148 is not exceeded. Section 410A(c)(2) requires that in conducting the demonstration program under this section, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration program under this section was not implemented (budget neutrality).

In the preamble to this IPPS/LTCH PPS final rule, we described the terms of participation for the extension period authorized by Public Law 114–255. In the FY 2018 IPPS/LTCH PPS final rule, we finalized our policy with regard to the effective date for the application of the reasonable cost-based payment methodology under the demonstration for those among the hospitals that had previously participated and were choosing to participate in the second 5-year extension period. According to our finalized policy, each of these previously participating hospitals began the second 5 years of the 10-year extension period on the date immediately after the date the period of performance under the 5-year extension period ended. However, by the time of the FY 2018 IPPS/LTCH PPS final rule, we had not been able to verify which among the previously participating hospitals would be continuing participation, and thus were not able to estimate the costs of the demonstration for that year's final rule. We stated in the final rule that we would instead include the estimated costs of the demonstration for all participating hospitals for FY 2018, along with those for FY 2019, in the budget neutrality offset amount for the FY 2019 proposed and final rules.

Seventeen of the 21 hospitals that completed their periods of participation under the extension period authorized by the Affordable Care Act have elected to continue in the second 5-year extension period, while 13 additional hospitals have been selected to participate. Apart from one hospital, which has withdrawn from the demonstration, each of these newly participating hospitals began its 5-year period of participation effective the start of the first cost reporting period on or after October 1, 2017. Thus, 29 hospitals are participating in the demonstration during FY 2018.

In the FY 2018 IPPS/LTCH PPS final rule, we finalized the budget neutrality methodology in accordance with our policies for implementing the demonstration, adopting the general methodology used in previous years, whereby we estimated the additional payments made by the program for each of the participating hospitals as a result of the demonstration. In order to achieve budget neutrality, we adjusted the national IPPS rates by an amount sufficient to account for the added costs of this demonstration. In other words, we have applied budget neutrality across the payment system as a whole rather than across the participants of this demonstration. The language of the statutory budget neutrality requirement permits the agency to implement the budget neutrality provision in this manner. The statutory language requires that aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration was not implemented, but does not identify the range across which aggregate payments must be held equal.

Because we were unable to confirm the hospitals that would be participating in the second extension period in time for including the estimates of the cost of the demonstration in FY 2018 in the FY 2018 final rule, we are including this estimate in the FY 2019 IPPS/LTCH PPS final rule. For this final rule, the resulting amounts applicable to FYs 2018 and 2019, respectively, are $31,070,880 and $70,929,313, which we are including in the budget neutrality offset adjustment for FY 2019.

In addition, we will determine the costs of the demonstration for the previously participating hospitals for the period from when their period of performance ended for the first 5-year extension period and the start of the cost report year in FY 2018 when finalized cost reports for this period are available. We will include these costs for the demonstration in future rulemaking.

In previous years, we have incorporated a second component into the budget neutrality offset amounts identified in the final IPPS rules. As finalized cost reports became available, we determined the amount by which the actual costs of the demonstration for an earlier, given year differed from the estimated costs for the demonstration set forth in the final IPPS rule for the corresponding fiscal year, and we incorporated that amount into the budget neutrality offset amount for the upcoming fiscal year. We have calculated this difference for FYs 2005 through 2010 between the actual costs of the demonstration as determined from finalized cost reports once available, and estimated costs of the demonstration as identified in the applicable IPPS final rules for these years.

With the extension of the demonstration for another 5-year period, as authorized by section 15003 of Public Law 114–255, we will continue this general procedure. The actual costs of the demonstration for FY 2011 as determined from the finalized cost reports fell short of the estimated amount that was finalized in the FY 2011 IPPS/LTCH PPS final rule for FY 2011 by $29,971,829; the actual costs of the demonstration for FY 2012 fell short of the amount that was finalized in the FY 2012 final rule by $8,500,373; in addition, the actual costs of the

demonstration for FY 2013 fell short of the amount that was finalized in the FY 2013 final rule by $5,398,382.

We note that, for this final rule, the amounts identified for the actual costs of the demonstration for each of FYs 2011, 2012 and 2013 (determined from current finalized cost reports) are less than the amounts that were identified in the final rule for each of these fiscal years. Therefore, in keeping with previous policy finalized in similar situations when the costs of the demonstration fell short of the amount estimated in the corresponding year's final rule, we are including this component as a negative adjustment to the budget neutrality offset amount for the current fiscal year.

Therefore, for FY 2019, the total amount that we are applying to the national IPPS rates is $58,129,609.

10. Effect of Revision of the Hospital Inpatient Admission Order Documentation Requirements

In section IV.M. of the preamble of this final rule, we discuss our policy to revise the admission order documentation requirements. Specifically, we are revising the inpatient admission order policy to no longer require the presence of a written inpatient admission order in the medical record as a specific condition of Medicare Part A payment. Our actuaries estimate that any increase in Medicare payments due to the change will be negligible, given the anticipated low volume of claims that will be payable under this policy that would not have been paid under the current policy.

11. Effect of Policy Changes Relating to Satellite Facilities and Excluded Units

In section VI.B. of the preamble of this final rule, we discuss the revisions we are making to the regulations applicable to satellite facilities so that the separateness and control requirements will only apply to IPPS-excluded satellite facilities that are co-located with IPPS hospitals beginning in FY 2019. This policy change is premised on the belief that the policy concerns that underlie our existing satellite facility regulations (that is, inappropriate patient shifting and hospitals acting as illegal de facto units) are sufficiently moderated in situations where IPPS-excluded hospitals are co-located with each other but not IPPS hospitals, in large part due to the payment system changes that have occurred over the intervening years for IPPS-excluded hospitals, the requirements in the hospital conditions of participation (CoPs) (which are still present regardless of these changes), and because such changes will be consistent with the revisions to our HwH policy that were finalized in the FY 2018 IPPS/LTCH PPS final rule, which was estimated to have a *de minimis* effect on Medicare payments due to the administrative nature of the changes. We also are revising our regulations to allow IPPS-excluded hospitals to operate IPPS-excluded units, as discussed in section VI.C. of the preamble to this final rule, effective with cost reporting periods beginning on or after October 1, 2019. We believe that this policy is also consistent with the revisions to our HwH policy that were finalized in the FY 2018 IPPS/LTCH PPS final rule and the changes to the satellite regulation discussed previously. We do not expect any significant payment impact as a result of either of these policies because these policies are primarily administrative in nature and are not expected to result in additional Medicare expenditures that would have been made, regardless of our changes, because IPPS hospital co-location is already allowed under existing regulations.

12. Effects of Continued Implementation of the Frontier Community Health Integration Project (FCHIP) Demonstration

In section VI.D.2. of the preamble of this final rule, we discuss that, for FY 2019, section 123 of the Medicare Improvements for Patients and Providers Act of 2008 (Pub. L. 110–275), as amended by section 3126 of the Affordable Care Act, authorizes a demonstration project to allow eligible entities to develop and test new models for the delivery of health care services in eligible counties in order to improve access to and better integrate the delivery of acute care, extended care and other health care services to Medicare beneficiaries. The demonstration is titled ''Demonstration Project on Community Health Integration Models in Certain Rural Counties,'' and is commonly known as the Frontier Community Health Integration Project (FCHIP) demonstration.

The authorizing statute limits participation in the demonstration to eligible entities in not more than 4 States, and requires it to be conducted for a 3-year period. In addition, the demonstration is required to be budget neutral. Specifically, this provision states that in conducting the demonstration project, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project under the section were not implemented.

The authorizing statute states that the Secretary may waive such requirements of titles XVIII and XIX of the Act as may be necessary and appropriate for the purpose of carrying out the demonstration project, thus allowing the waiver of Medicare payment rules encompassed in the demonstration. Ten CAHs are participating in the demonstration, which started on August 1, 2016.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57064 through 57065) and FY 2018 IPPS/LTCH PPS final rule (82 FR 38294 through 38296), we finalized a policy to address the budget neutrality requirement for the demonstration. As explained in the FY 2018 IPPS/LTCH PPS final rule, we based our selection of CAHs for participation with the goal of maintaining the budget neutrality of the demonstration on its own terms (that is, the demonstration will produce savings from reduced transfers and admissions to other health care providers, thus offsetting any increase in payments resulting from the demonstration). However, we have also adopted a contingency plan to ensure that the budget neutrality requirement is met. If analysis of claims data for Medicare beneficiaries receiving services at each of the participating CAHs, as well as from other data sources, including cost reports for these CAHs, shows that increases in Medicare payments under the demonstration during the 3-year period are not sufficiently offset by reductions elsewhere, we will recoup the additional expenditures attributable to the demonstration through a reduction in payments to all CAHs nationwide. Therefore, in the event that this demonstration is found to result in aggregate payments in excess of the amount that would have been paid if this demonstration were not implemented, we will comply with the budget neutrality requirement by reducing payments to all CAHs, not just those participating in the demonstration. We believe that the language of the statutory budget neutrality requirement permits the agency to implement the budget neutrality provision in this manner. The statutory language merely refers to ensuring that aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project was not implemented, and does not identify the range across which aggregate payments must be held equal.

Based on actuarial analysis using cost report settlements for FYs 2013 and 2014, the demonstration is projected to satisfy the budget neutrality requirement and likely yield a total net savings. As we estimated for the FY 2019 IPPS/LTCH PPS proposed rule, for this FY 2019 IPPS/LTCH PPS final rule, we estimate that the total impact of the payment recoupment will be no greater than 0.03 percent of CAHs' total Medicare payments within one fiscal year (that is, Medicare Part A and Part B). The final budget neutrality estimates for the FCHIP demonstration will be based on the demonstration period, which is August 1, 2016 through July 31, 2019.

The demonstration is projected to impact payments to participating CAHs under both Medicare Part A and Part B. As stated in the FY 2018 IPPS/LTCH PPS final rule, in the event the demonstration is found not to have been budget neutral, any excess costs will be recouped over a period of 3 cost reporting years, beginning in CY 2020. The 3-year period for recoupment will allow for a reasonable timeframe for the payment reduction and to minimize any impact on CAHs' operations. Therefore, because any reduction to CAH payments in order to recoup excess costs under the demonstration will not begin until CY 2020, this policy will have no impact for any national payment system for FY 2019.

13. Effects of Revisions of the Supporting Documentation Required for Submission of an Acceptable Medicare Cost Report

In section IX.B.1. of the preamble of this final rule, we are incorporating the Provider Cost Reimbursement Questionnaire, Form CMS–339 (OMB No. 0938–0301), into the Organ Procurement Organization (OPO) and Histocompatibility Laboratory cost report, Form CMS–216 (OMB No. 0938–0102), which will complete our incorporation of the Form CMS–339 into all Medicare cost reports. We also are updating § 413.24(f)(5)(i) to reflect that an acceptable cost report will no longer require the provider to separately submit a Provider Cost Reimbursement Questionnaire, Form CMS–339, by removing the reference to the questionnaire. There are 58 OPOs and 47 histocompatibility laboratories. This policy will not require

additional data collection from OPOs or histocompatibility laboratories. This policy will benefit OPOs and histocompatibility laboratories because they would no longer be required to complete and submit the Form CMS–339 as a separate form independent of the Medicare cost report in order to have an acceptable cost report submission under § 413.24(f)(5)(i). As discussed in detail in section IX.B.10. of the preamble of this final rule, this policy will decrease overall costs to the 58 OPOs and 47 histocompatibility laboratories by $11,178.52.

In section IX.B.2. of the preamble of this final rule, we also are finalizing a change to the regulation to note that a cost report is rejected for teaching hospitals for lack of supporting documentation if it does not include the IRIS data rather than the IRIS diskette, which is no longer required. We continue to require all teaching hospitals to submit the IRIS data under § 413.24(f)(5) to have an acceptable cost report submission.

In section IX.B.3. of the preamble of this final rule, we are establishing that, effective for cost reporting periods beginning on or after October 1, 2018, for providers claiming Medicare bad debt reimbursement, a cost report is rejected for lack of supporting documentation if it does not include a Medicare bad debt listing that corresponds to the bad debt amounts claimed in the provider's Medicare cost report. This policy will not require providers claiming Medicare bad debt reimbursement to collect additional data. Providers are required under §§ 413.20 and 413.24 to maintain data that substantiates their costs. The cost report worksheet that incorporated Form CMS–339 continues to require providers who claim Medicare bad debt reimbursement to submit a bad debt listing with the cost report in order to have an acceptable cost report submission. Because of the existing requirement, there are no additional burdens or expenses placed upon providers to ensure that the supporting documentation, the bad debt listing, corresponds to the amounts reported in the cost report in order to have an acceptable cost report submission.

In section IX.B.4. of the preamble of this final rule, we are establishing that, effective for cost reporting periods beginning on or after October 1, 2018, for DSH eligible hospitals claiming a disproportionate share hospital payment adjustment, a cost report is rejected for lack of supporting documentation if it does not include a detailed listing of the hospital's Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the hospital's cost report. Providers are required under §§ 413.20 and 413.24 to maintain data that substantiates their costs. The provider must furnish such information to the contractor as may be necessary to assure proper payment by the program. Currently, when the supporting documentation regarding Medicaid eligible days is not submitted by DSH eligible hospitals with their cost report, contractors must request it. Tentative program reimbursement payments are often issued to providers upon the submission of the cost report, and a subsequent submission of supporting documentation may reveal an overstatement of a hospital's Medicaid eligible days with a resulting overpayment to the provider.

Requiring a provider to submit, as a supporting document with its cost report, a listing of the provider's Medicaid eligible days that corresponds to the Medicaid eligible days claimed in the DSH eligible hospital's cost report would be consistent with the recordkeeping and cost reporting requirements of §§ 413.20 and 413.24, which require providers to maintain data that substantiates their costs. This policy to require providers to submit the supporting documentation with the cost report will also facilitate accurate provider payment and the contractor's review and verification of the cost report.

This policy will not require hospitals claiming a DSH payment adjustment to collect additional data. Hospitals claiming a DSH payment adjustment are already collecting the data in order to report the hospital's Medicaid eligible days in the hospital's cost report. Because the existing burden estimate for a DSH eligible hospital's cost report already reflects the requirement that these hospitals collect, maintain, and submit this data when requested, there is no additional burden placed upon hospitals as a result of our policy to require them to submit these supporting documents along with their cost report, and to ensure the supporting documentation corresponds to the amounts reported in the cost report in order to have an acceptable cost report submission.

In section IX.B.5. of the preamble of this final rule, we are establishing that, effective for cost reporting periods beginning on or after October 1, 2018, for DSH eligible hospitals reporting charity care and/or uninsured discounts, a cost report is rejected for lack of supporting documentation if it does not include a detailed listing of charity care and/or uninsured discounts that corresponds to the amounts claimed in the provider's cost report. Providers are required under §§ 413.20 and 413.24 to maintain data that substantiates their costs. The provider must furnish such information to the contractor as may be necessary to assure proper payment by the program. Contractors regularly request that hospitals claiming charity care and/or uninsured discounts submit documentation to support their charity care and/or uninsured discounts reported in their cost report. This policy to require providers to submit this supporting documentation with the cost report will facilitate accurate payment to the provider and the contractor's review and verification of the cost report.

This policy will not require DSH eligible hospitals reporting charity care and/or uninsured discounts to collect additional data but will require them to submit the supporting documentation with the cost report rather than at a later time. Because the existing burden estimate for a DSH eligible hospital's cost report already reflects the requirement that these hospitals collect, maintain, and submit this data when requested, there is no additional burden placed upon DSH eligible hospitals as a result of our policy to require them to submit these supporting documents along with their cost report and to ensure the supporting documentation corresponds to the amounts reported in the cost report in order to have an acceptable cost report submission.

In section IX.B.6. of the preamble of this final rule, we are establishing that, effective for cost reporting periods beginning on or after October 1, 2018, for a provider reporting costs on its cost report that are allocated from a home office or chain organization, a cost report is rejected for lack of supporting documentation if the home office or the chain organization has not submitted to the provider's contractor a Home Office Cost Statement that corresponds to either all or any portion of the costs it has allocated to the provider, depending on the fiscal year end dates of the provider and its home office. This policy will not require providers reporting costs on their cost report that are allocated from a home office or chain organization to collect additional data. Likewise, this policy will not require home offices to collect additional data. Instead, this policy codifies our longstanding policy in Section 2153, Chapter 21, of the PRM–1, requiring costs allocated from a home office or chain organization to a provider be substantiated on the provider's cost report and that the Home Office Cost Statement be submitted to the home office's servicing contractor, as well as the servicing contractors of the providers within its chain. Only one copy of the Home Office Cost Statement is required to be submitted to a provider's contractor, regardless of the number of providers in the chain the contractor is servicing. Providers are required under §§ 413.20 and 413.24 to maintain data that substantiates their costs. Home offices are required to complete a Home Office Cost statement that details the allocations of costs to the providers in its chain and submit its Home Office Cost Statement to its contractor. With our policy, we anticipate that home offices will submit the Home Office Cost Statement to support the amounts reported in the cost reports of the providers in its chain, in order for the providers to have an acceptable cost report submission. Because the Home Office Cost Statement already requires the home office to list the providers in the chain and each of the providers' servicing contractors, the contractors to whom the Home Office Cost Statement should be sent is already known to the home office. Thus, there is no additional burden placed on home offices as a result of our policy to require the home office to submit a copy of its Home Office Cost Statement that corresponds to either all or any portion of the costs it has allocated to the provider, to each of its chain providers' servicing contractors, in order for the providers in its chain to have an acceptable cost report submission.

14. Effect of Revisions Regarding Physician Certification and Recertification of Claims

In section XI. of the preamble of this final rule, we discuss our policy to remove from the regulations the requirement that a physician statement of certification or recertification must itself indicate where that supporting information is to be found in the medical record. While moving this provision will have no substantive impact, we have examined the impact of eliminating the provision pertaining to where the supporting

information is to be found and believe that substantial time and money will be saved by physicians when completing both certification and recertification statements. Based on conversations with various providers, on average, we estimate that it requires approximately 9 minutes for the precise location of the various elements to be identified and recorded in the statements. This time currently is expended not only with the completion of an initial certification statement but each time a recertification statement is completed.

While the elimination of this provision will benefit physicians in terms of reducing the amount of time expended in completing certification and recertification statements, it will also benefit physicians whose claims have been denied either because the physician failed to include this information in the certification and/or recertification statement or failed to accurately account for the information in the statements. In fact, these claims are routinely denied even in situations where the location of the information within a paper medical record is readily apparent to the reviewer. Given the improved capabilities of searchable electronic health records, these types of denials are increasingly unnecessary. We also expect a positive impact for beneficiaries because beneficiaries will no longer receive notices that these claims were denied, which inevitably caused confusion given the nature of these denials.

Moreover, the denial of claims due to the failure to include the location of information within a paper medical record results in appeals. As an example, these denials are significant for skilled nursing facility (SNF) claims. In the SNF setting, a required element of the certification and recertification statement is the required estimated length of need (ELON) element. The table below shows in Row 1 the SNF improper payment rates for claims in error (certification statement does not indicate where in the medical record the required information of ELON is to be found; however the medical record contains the missing information); and in Row 2, the error rate if these claims are no longer considered to be erroneous (due to removal of the provision in the regulations). The data shown in the table are from the 2017 CERT reporting period and includes claims from July 1, 2015 through June 30, 2016.

Provider type	Label	Projected dollars in error	Projected dollars paid	Improper payment rate (%)	95 Percent confidence interval
SNF	ELON Claims in Error	$3,259,219,132	$34,949,922,572	9.3	7.6–11.0
SNF	ELON Claims Not in Error	2,776,135,742	34,949,922,572	7.9	6.3–9.5

Overall, there is a 1.4 percentage point reduction in the improper payment rate in the SNF setting alone. This policy, when applied uniformly across all provider settings, could potentially reduce improper payments, lower appeals, and reduce the number of denials sent to beneficiaries. Moreover, by eliminating these denials and subsequent appeals, MACs will have more time to dedicate to other more pertinent appeal issues.

I. Effects of Changes in the Capital IPPS

1. General Considerations

For the impact analysis presented below, we used data from the March 2018 update of the FY 2017 MedPAR file and the March 2018 update of the Provider-Specific File (PSF) that was used for payment purposes. Although the analyses of the changes to the capital prospective payment system do not incorporate cost data, we used the March 2018 update of the most recently available hospital cost report data (FYs 2015 and 2016) to categorize hospitals. Our analysis has several qualifications. We use the best data available and make assumptions about case-mix and beneficiary enrollment, as described later in this section.

Due to the interdependent nature of the IPPS, it is very difficult to precisely quantify the impact associated with each change. In addition, we draw upon various sources for the data used to categorize hospitals in the tables. In some cases (for instance, the number of beds), there is a fair degree of variation in the data from different sources. We have attempted to construct these variables with the best available sources overall. However, it is possible that some individual hospitals are placed in the wrong category.

Using cases from the March 2018 update of the FY 2017 MedPAR file, we simulated payments under the capital IPPS for FY 2018 and the payments for FY 2019 for a comparison of total payments per case. Any short-term, acute care hospitals not paid under the general IPPS (for example, hospitals in Maryland) are excluded from the simulations.

The methodology for determining a capital IPPS payment is set forth at § 412.312. The basic methodology for calculating the capital IPPS payments in FY 2019 is as follows:

(Standard Federal Rate) × (DRG weight) × (GAF) × (COLA for hospitals located in Alaska and Hawaii) × (1 + DSH Adjustment Factor + IME adjustment factor, if applicable).

In addition to the other adjustments, hospitals may receive outlier payments for those cases that qualify under the threshold established for each fiscal year. We modeled payments for each hospital by multiplying the capital Federal rate by the GAF and the hospital's case-mix. We then added estimated payments for indirect medical education, disproportionate share, and outliers, if applicable. For purposes of this impact analysis, the model includes the following assumptions:

- An estimated increase in the Medicare case-mix index of 2.0 percent in FY 2018 and by 0.5 percent in FY 2019 based on preliminary FY 2018 data.
- We estimate that Medicare discharges will be approximately 11.0 million in both FYs 2018 and 2019.
- The capital Federal rate was updated, beginning in FY 1996, by an analytical framework that considers changes in the prices associated with capital-related costs and adjustments to account for forecast error, changes in the case-mix index, allowable changes in intensity, and other factors. As discussed in section III.A.1.a. of the Addendum to this final rule, the update is 1.4 percent for FY 2019.
- In addition to the FY 2019 update factor, the FY 2019 capital Federal rate was calculated based on a GAF/DRG budget neutrality adjustment factor of 0.9975 and an outlier adjustment factor of 0.9494.

2. Results

We used the actuarial model previously described in section I.I. of Appendix A of this final rule to estimate the potential impact of the changes for FY 2019 on total capital payments per case, using a universe of 3,256 hospitals. As previously described, the individual hospital payment parameters are taken from the best available data, including the March 2018 update of the FY 2017 MedPAR file, the March 2018 update to the PSF, and the most recent cost report data from the March 2018 update of HCRIS. In Table III, we present a comparison of estimated total payments per case for FY 2018 and estimated total payments per case for FY 2019 based on the FY 2019 payment policies. Column 2 shows estimates of payments per case under our model for FY 2018. Column 3 shows estimates of payments per case under our model for FY 2019. Column 4 shows the total percentage change in payments from FY 2018 to FY 2019. The change represented in Column 4 includes the 1.4 percent update to the capital Federal rate and other changes in the adjustments to the capital Federal rate. The comparisons are provided by: (1) Geographic location; (2) region; and (3) payment classification.

The simulation results show that, on average, capital payments per case in FY 2019 are expected to increase as compared to capital payments per case in FY 2018. This expected increase overall is largely due to the 1.4 percent update to the capital Federal rate for FY 2019. Hospitals within both rural and urban regions may experience an increase or a decrease in capital payments per case due to changes in the GAFs. These regional effects of the changes to the GAFs on capital payments are consistent with the projected changes in payments due to changes in the wage index (and policies affecting the wage index), as shown in Table I in section I.G. of this Appendix A.

The net impact of these changes is an estimated 2.1 percent change in capital

payments per case from FY 2018 to FY 2019 for all hospitals (as shown in Table III).

The geographic comparison shows that, on average, hospitals in urban classifications will experience an increase in capital IPPS payments per case in FY 2019 as compared to FY 2018, while those hospitals in rural classifications would experience a decrease in capital IPPS payments. Capital IPPS payments per case would increase by an estimated 2.3 percent for hospitals in large urban areas and by 3.2 percent for hospitals in other urban areas, while payments to hospitals in rural areas would decrease by 0.9 percent, from FY 2018 to FY 2019.

The comparisons by region show that the estimated increases in capital payments per case from FY 2018 to FY 2019 in urban areas range from a 1.4 percent increase for the East North Central urban region to a 3.8 percent increase for the New England region. For rural regions, the Mountain rural region is projected to experience an increase in capital IPPS payments per case of 1.2 percent, while the East South Central rural region is projected to experience a decrease in capital IPPS payments per case of 2.6 percent.

Hospitals of all types of ownership (that is, voluntary hospitals, government hospitals, and proprietary hospitals) are expected to experience an increase in capital payments per case from FY 2018 to FY 2019. The increase in capital payments for voluntary hospitals is estimated to be 1.8 percent. Government hospitals and proprietary hospitals are expected to experience an increase in capital IPPS payments of 3.1 and 2.3 percent, respectively.

Section 1886(d)(10) of the Act established the MGCRB. Hospitals may apply for reclassification for purposes of the wage index for FY 2019. Reclassification for wage index purposes also affects the GAFs because that factor is constructed from the hospital wage index. To present the effects of the hospitals being reclassified as of the publication of this final rule for FY 2019, we show the average capital payments per case for reclassified hospitals for FY 2019. Urban reclassified hospitals are expected to experience an increase in capital payments of 1.0 percent; urban nonreclassified hospitals are expected to experience an increase in capital payments of 3.0 percent. The estimated percentage decrease for rural reclassified hospitals is 1.8 percent, and for rural nonreclassified hospitals, the estimated percentage increase in capital payments is 0.2 percent.

TABLE III—COMPARISON OF TOTAL PAYMENTS PER CASE

[FY 2018 payments compared to FY 2019 payments]

	Number of hospitals	Average FY 2018 payments/ case	Average FY 2019 payments/ case	Percent change
By Geographic Location:				
All hospitals	3,256	$943	$963	2.1
Large urban areas (populations over 1 million)	2,483	974	997	2.3
Other urban areas (populations of 1 million of fewer)	1,302	1,011	1,043	3.2
Urban hospitals	1,181	939	952	1.4
0–99 beds	644	789	812	3.0
100–199 beds	763	835	854	2.4
200–299 beds	433	902	922	2.2
300–499 beds	424	981	1,003	2.2
500 or more beds	219	1,170	1,197	2.3
Rural hospitals	773	666	660	−0.9
0–49 beds	306	542	556	2.6
50–99 beds	274	606	620	2.3
100–149 beds	108	677	654	−3.3
150–199 beds	45	729	706	−3.2
200 or more beds	40	808	781	−3.3
By Region:				
Urban by Region	2,483	974	997	2.3
New England	113	1,068	1,108	3.8

J. Effects of Payment Rate Changes and Policy Changes Under the LTCH PPS

1. Introduction and General Considerations

In section VII. of the preamble of this final rule and section V. of the Addendum to this final rule, we set forth the annual update to the payment rates for the LTCH PPS for FY 2019. In the preamble of this final rule, we specify the statutory authority for the provisions that are presented, identify the final policies, and present rationales for our decisions as well as alternatives that were considered. In this section of Appendix A to this final rule, we discuss the impact of the changes to the payment rate, factors, and other payment rate policies related to the LTCH PPS that are presented in the preamble of this final rule in terms of their estimated fiscal impact on the Medicare budget and on LTCHs.

There are 409 LTCHs included in this impact analysis. We note that, although there are currently approximately 417 LTCHs, for purposes of this impact analysis, we excluded the data of all-inclusive rate providers consistent with the development of the FY 2019 MS–LTC–DRG relative weights (discussed in section VII.B.3.c. of the preamble of this final rule. Moreover, in the claims data used for this final rule, 1 of these 409 LTCHs only have claims for site neutral payment rate cases and, therefore, are not included in our impact analysis for LTCH PPS standard Federal payment rate cases.) In the impact analysis, we used the final payment rate, factors, and policies presented in this final rule, the 1.0135 percent annual update to the LTCH PPS standard Federal payment rate, the update to the MS–LTC–DRG classifications and relative weights, the update to the wage index values and labor-related share, the elimination of the 25-pecent threshold policy and corresponding one-time temporary budget neutrality adjustment for FY 2019 (discussed in VII.E. of the preamble of this final rule), and the best available claims and CCR data to estimate the change in payments for FY 2019.

Under the dual rate LTCH PPS payment structure, payment for LTCH discharges that meet the criteria for exclusion from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) is based on the LTCH PPS standard Federal payment rate. Consistent with the statute, the site neutral payment rate is the lower of the IPPS comparable per diem amount as determined under § 412.529(d)(4), including any applicable outlier payments as specified in § 412.525(a); or 100 percent of the estimated cost of the case as determined under existing § 412.529(d)(2). In addition, there are two separate HCO targets—one for LTCH PPS standard Federal payment rate cases and one for site neutral payment rate cases. The statute also establishes a transitional payment method for cases that are paid the site neutral payment rate for LTCH discharges occurring in cost reporting periods beginning during FY 2016 through FY 2019. The transitional payment amount for site neutral payment rate cases is a blended payment rate, which is calculated as 50 percent of the applicable site neutral payment rate amount for the discharge as determined under § 412.522(c)(1) and 50 percent of the applicable LTCH PPS standard Federal payment rate for the discharge determined under § 412.523.

Based on the best available data for the 409 LTCHs in our database that were considered in the analyses used for this final rule, we estimate that overall LTCH PPS payments in FY 2019 will increase by approximately 0.9 percent (or approximately $39 million) based on the final rates and factors presented in section VII. of the preamble and section V. of the Addendum to this final rule.

Based on the FY 2017 LTCH cases that were used for the analysis in this final rule, approximately 36 percent of those cases were classified as site neutral payment rate cases (that is, 36 percent of LTCH cases did not meet the patient-level criteria for exclusion from the site neutral payment rate). Our Office of the Actuary currently estimates that the percent of LTCH PPS cases that will be paid at the site neutral payment rate in FY 2018 will not change significantly from the most recent historical data. Taking into account the transitional blended payment rate and other changes that will apply to the site neutral payment rate cases in FY 2019, we estimate that aggregate LTCH PPS payments for these site neutral payment rate cases will increase by approximately 0.4 percent (or approximately $4 million).

Approximately 64 percent of LTCH cases are expected to meet the patient-level criteria for exclusion from the site neutral payment rate in FY 2019, and will be paid based on the LTCH PPS standard Federal payment rate for the full year. We estimate that total LTCH PPS payments for these LTCH PPS standard Federal payment rate cases in FY 2019 will increase approximately 1.0 percent (or approximately $35 million). This estimated increase in LTCH PPS payments for LTCH PPS standard Federal payment rate cases in FY 2019 is primarily due to the 1.35 percent annual update to the LTCH PPS standard Federal payment rate for FY 2019 (discussed in section V.A. of the Addendum to this final rule) in conjunction with the 0.9 percent one-time temporary budget neutrality adjustment factor for FY 2019 under our final policy to eliminate the 25-percent threshold policy, and the estimated 0.6 percent increase in HCO payments discussed in section V.D.3.b.(3). of the Addendum to this final rule.

Based on the 409 LTCHs that were represented in the FY 2017 LTCH cases that were used for the analyses in this final rule presented in this Appendix, we estimate that aggregate FY 2019 LTCH PPS payments will be approximately $4.540 billion, as compared to estimated aggregate FY 2018 LTCH PPS payments of approximately $4.502 billion, resulting in an estimated overall increase in LTCH PPS payments of approximately $39 million. We note that the estimated $39 million increase in LTCH PPS payments in FY 2019 does not reflect changes in LTCH admissions or case-mix intensity, which will also affect the overall payment effects of the final policies in this final rule.

The LTCH PPS standard Federal payment rate for FY 2018 is $41,415.11. For FY 2019, we are establishing an LTCH PPS standard Federal payment rate of $41,579.65 which reflects the 1.35 percent annual update to the LTCH PPS standard Federal payment rate, the area wage budget neutrality factor of 0.999713 to ensure that the changes in the wage indexes and labor-related share do not influence aggregate payments, and the FY 2019 one-time temporary budget neutrality adjustment factor of 0.990884 to ensure that the elimination of the 25-percent threshold policy (discussed in VII.E. of the preamble of this final rule) does not influence aggregate FY 2019 LTCH PPS payments. For LTCHs that fail to submit data for the LTCH QRP, in accordance with section 1886(m)(5)(C) of the Act, we are establishing an LTCH PPS standard Federal payment rate of $40,759.12. This LTCH PPS standard Federal payment rate reflects the updates and factors previously described, as well as the required 2.0 percentage point reduction to the annual update for failure to submit data under the LTCH QRP. We note that the factors previously described to determine the FY 2019 LTCH PPS standard Federal payment rate are applied to the FY 2018 LTCH PPS standard Federal rate set forth under § 412.523(c)(3)(xiv) (that is, $41,415.11).

Table IV shows the estimated impact for LTCH PPS standard Federal payment rate cases. The estimated change attributable solely to the annual update of 1.35 percent to the LTCH PPS standard Federal payment rate is projected to result in an increase of 1.3 percent in payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2018 to FY 2019, on average, for all LTCHs (Column 6). In addition to the annual update to the LTCH PPS standard Federal payment rate for FY 2019, the estimated increase of 1.3 percent shown in Column 6 of Table IV also includes estimated payments for SSO cases, a portion of which are not affected by the annual update to the LTCH PPS standard Federal payment rate, as well as the reduction that is applied to the annual update of LTCHs that do not submit the required LTCH QRP data. Therefore, for all hospital categories, the projected increase in payments based on the LTCH PPS standard Federal payment rate to LTCH PPS standard Federal payment rate cases is somewhat less than the 1.35 percent annual update for FY 2019.

For FY 2019, we are updating the wage index values based on the most recent available data, and we are continuing to use labor market areas based on the CBSA delineations (as discussed in section V.B. of the Addendum to this final rule). In addition, we are updating the labor-related share at 66.0 percent under the LTCH PPS for FY 2019, based on the most recent available data on the relative importance of the labor-related share of operating and capital costs of the 2013-based LTCH market basket. We also applied an area wage level budget neutrality factor of 0.999713 to ensure that the changes to the wage data and labor-related share do not result in any change in estimated aggregate LTCH PPS payments to LTCH PPS standard Federal payment rate cases.

As we discuss in VII.E. of the preamble of this final rule, as we proposed, we are eliminating the 25-percent threshold policy in a budget neutral manner. Therefore, for FY 2019, we applied a one-time temporary budget neutrality adjustment factor of 0.990884 to ensure the elimination of the 25-percent threshold policy does not result in any change in estimated aggregate LTCH PPS payments.

We currently estimate total HCO payments for LTCH PPS standard Federal payment rate cases will increase from FY 2018 to FY 2019. Based on the FY 2017 LTCH cases that were used for the analyses in this final rule, we estimate that the FY 2018 HCO threshold of $27,381 (as established in the FY 2018 IPPS/LTCH PPS final rule) will result in estimated HCO payments for LTCH PPS standard Federal payment rate cases in FY 2018 that are below the 7.975 percent target. Specifically, we currently estimate that HCO payments for LTCH PPS standard Federal payment rate cases would be approximately 7.41 percent of the estimated total LTCH PPS standard Federal payment rate payments in FY 2018. Combined with our estimate that FY 2019 HCO payments for LTCH PPS standard Federal payment rate cases would be 7.975 percent of estimated total LTCH PPS standard Federal payment rate payments in FY 2019, this will result in an estimated increase in HCO payments of 0.6 percent between FY 2018 and FY 2019. We note that, consistent with past practice, in calculating these estimated HCO payments, we increased estimated costs by the projected market basket percentage increase factor, as discussed in section V.D.3.b.(3). of the Addendum to this final rule.

Table IV shows the estimated impact of the final payment rate and final policy changes on LTCH PPS payments for LTCH PPS standard Federal payment rate cases for FY 2019 by comparing estimated FY 2018 LTCH PPS payments to estimated FY 2019 LTCH PPS payments. (As noted earlier, our analysis does not reflect changes in LTCH admissions or case-mix intensity.) We note that these impacts do not include LTCH PPS site neutral payment rate cases for the reasons discussed in section I.J.4. of this Appendix.

As we discuss in detail throughout this final rule, based on the most recent available data, we believe that the provisions of this final rule relating to the LTCH PPS, which are projected to result in an overall increase in estimated aggregate LTCH PPS payments, and the resulting LTCH PPS payment amounts will result in appropriate Medicare payments that are consistent with the statute.

Comment: Some commenters objected to our expectation that costs and resource use for cases paid at the site neutral payment rate will likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG based on a comparison of FY 2017 LTCH site neutral payment rate cases. These commenters also believed that LTCH site neutral payment rate cases continue to be misaligned from a clinical and resource use perspective with respective IPPS-comparable amount payments, and requested CMS conduct a DRG-level study comparing the relative levels of clinical severity, lengths of stay, cost, and Medicare payment.

Response: As we stated above, we believe that LTCH PPS payment amounts will result in appropriate Medicare payments that are consistent with the statute. Furthermore, the site neutral payment rate is established by statute. Section 1886(m)(6)(B)(i)(II) of the Act defines the site neutral payment rate as the lower of the IPPS comparable per diem amount as determined under § 412.529(d)(4), including any applicable outlier payments as

specified in § 412.525(a); or 100 percent of the estimated cost of the case as determined under existing § 412.529(d)(2). In addition, LTCH discharges from FY 2017 for site neutral payment rate cases were not fully subject to the site neutral payment rate because of the transitional blended payment period provided by the statute (meaning that all claims which were subject to the site neutral payment rate in FY 2017 were paid under the transitional blended payment rate, which was based on 50 percent of the LTCH PPS standard Federal payment rate). Therefore, the analysis presented by commenters based on FY 2017 claims data does not invalidate our assumptions regarding the costs and resource use for site neutral payment rate cases because the FY 2017 claims appear to not yet reflect the expected change in cost and resources once the payment for site neutral payment rate cases is fully based on the site neutral payment rate. We will also take this opportunity to remind commenters, as we have stated in the past in response to similar comments (82 FR 38574 through 38575), our assumption on the costs and resources used for site neutral payment rate cases is based upon full implementation of the site neutral payment rate, and since discharges in FY 2017 were not subject to the full site neutral payment rate, this data does not reflect that assumption. We will continue to monitor the data and provide stakeholders with such information as appropriate, while guarding against drawing conclusions from limited or ''immature'' data.

2. Impact on Rural Hospitals

For purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of an urban area and has fewer than 100 beds. As shown in Table IV, we are projecting no change in estimated payments for LTCH PPS standard Federal payment rate cases for LTCHs located in a rural area. This estimated impact is based on the FY 2017 data for the 21 rural LTCHs (out of 409 LTCHs) that were used for the impact analyses shown in Table IV.

3. Anticipated Effects of LTCH PPS Payment Rate Changes and Policy Changes

a. Budgetary Impact

Section 123(a)(1) of the BBRA requires that the PPS developed for LTCHs ''maintain budget neutrality.'' We believe that the statute's mandate for budget neutrality applies only to the first year of the implementation of the LTCH PPS (that is, FY 2003). Therefore, in calculating the FY 2003 standard Federal payment rate under § 412.523(d)(2), we set total estimated payments for FY 2003 under the LTCH PPS so that estimated aggregate payments under the LTCH PPS were estimated to equal the amount that would have been paid if the LTCH PPS had not been implemented.

Section 1886(m)(6)(A) of the Act establishes a dual rate LTCH PPS payment structure with two distinct payment rates for LTCH discharges beginning in FY 2016. Under this statutory change, LTCH discharges that meet the patient-level criteria for exclusion from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) are paid based on the LTCH PPS standard Federal payment rate. LTCH discharges paid at the site neutral payment rate are generally paid the lower of the IPPS comparable per diem amount, including any applicable HCO payments, or 100 percent of the estimated cost of the case. The statute also establishes a transitional payment method for cases that are paid at the site neutral payment rate for LTCH discharges occurring in cost reporting periods beginning during FY 2016 through FY 2019, under which the site neutral payment rate cases are paid based on a blended payment rate calculated as 50 percent of the applicable site neutral payment rate amount for the discharge and 50 percent of the applicable LTCH PPS standard Federal payment rate for the discharge.

As discussed in section I.J. of this Appendix, we project an increase in aggregate LTCH PPS payments in FY 2019 of approximately $39 million. This estimated increase in payments reflects the projected increase in payments to LTCH PPS standard Federal payment rate cases of approximately $35 million and the projected increase in payments to site neutral payment rate cases of approximately $4 million under the dual rate LTCH PPS payment rate structure required by the statute beginning in FY 2016.

As discussed in section V.D. of the Addendum to this final rule, our actuaries project cost and resource changes for site neutral payment rate cases due to the site neutral payment rates required under the statute. Specifically, our actuaries project that the costs and resource use for cases paid at the site neutral payment rate will likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate, and will likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG. While we are able to incorporate this projection at an aggregate level into our payment modeling, because the historical claims data that we are using in this final rule to project estimated FY 2019 LTCH PPS payments (that is, FY 2017 LTCH claims data) do not reflect this actuarial projection, we are unable to model the impact of the change in LTCH PPS payments for site neutral payment rate cases at the same level of detail with which we are able to model the impacts of the changes to LTCH PPS payments for LTCH PPS standard Federal payment rate cases. Therefore, Table IV only reflects changes in LTCH PPS payments for LTCH PPS standard Federal payment rate cases and, unless otherwise noted, the remaining discussion in section I.J.4. of this Appendix refers only to the impact on LTCH PPS payments for LTCH PPS standard Federal payment rate cases. In the following section, we present our provider impact analysis for the changes that affect LTCH PPS payments for LTCH PPS standard Federal payment rate cases.

b. Impact on Providers

The basic methodology for determining a per discharge payment for LTCH PPS standard Federal payment rate cases is currently set forth under §§ 412.515 through 412.538. In addition to adjusting the LTCH PPS standard Federal payment rate by the MS–LTC–DRG relative weight, we make adjustments to account for area wage levels and SSOs. LTCHs located in Alaska and Hawaii also have their payments adjusted by a COLA. Under our application of the dual rate LTCH PPS payment structure, the LTCH PPS standard Federal payment rate is generally only used to determine payments for LTCH PPS standard Federal payment rate cases (that is, those LTCH PPS cases that meet the statutory criteria to be excluded from the site neutral payment rate). LTCH discharges that do not meet the patient-level criteria for exclusion are paid the site neutral payment rate, which we are calculating as the lower of the IPPS comparable per diem amount as determined under § 412.529(d)(4), including any applicable outlier payments, or 100 percent of the estimated cost of the case as determined under existing § 412.529(d)(2). In addition, when certain thresholds are met, LTCHs also receive HCO payments for both LTCH PPS standard Federal payment rate cases and site neutral payment rate cases that are paid at the IPPS comparable per diem amount.

To understand the impact of the changes to the LTCH PPS payments for LTCH PPS standard Federal payment rate cases presented in this final rule on different categories of LTCHs for FY 2019, it is necessary to estimate payments per discharge for FY 2018 using the rates, factors, and the policies established in the FY 2018 IPPS/LTCH PPS final rule and estimate payments per discharge for FY 2019 using the rates, factors, and the policies in this FY 2019 IPPS/LTCH PPS final rule (as discussed in section VII. of the preamble of this final rule and section V. of the Addendum to this final rule). As discussed elsewhere in this final rule, these estimates are based on the best available LTCH claims data and other factors, such as the application of inflation factors to estimate costs for HCO cases in each year. The resulting analyses can then be used to compare how our policies applicable to LTCH PPS standard Federal payment rate cases affect different groups of LTCHs.

For the following analysis, we group hospitals based on characteristics provided in the OSCAR data, cost report data in HCRIS, and PSF data. Hospital groups included the following:

- Location: Large urban/other urban/rural.
- Participation date.
- Ownership control.
- Census region.
- Bed size.

c. Calculation of LTCH PPS Payments for LTCH PPS Standard Federal Payment Rate Cases

For purposes of this impact analysis, to estimate the per discharge payment effects of our final policies on payments for LTCH PPS standard Federal payment rate cases, we simulated FY 2018 and FY 2019 payments on a case-by-case basis using historical LTCH claims from the FY 2017 MedPAR files that met or would have met the criteria to be paid at the LTCH PPS standard Federal payment rate if the statutory patient-level criteria had been in effect at the time of discharge for all cases in the FY 2017 MedPAR files. For modeling FY 2018 LTCH PPS payments, we

used the FY 2018 standard Federal payment rate of $41,415.11 (or $ 40,595.02 for LTCHs that failed to submit quality data as required under the requirements of the LTCH QRP). Similarly, for modeling payments based on the FY 2019 LTCH PPS standard Federal payment rate, we used the FY 2019 standard Federal payment rate of $41,579.65 (or $40,759.12 for LTCHs that failed to submit quality data as required under the requirements of the LTCH QRP). In each case, we applied the applicable adjustments for area wage levels and the COLA for LTCHs located in Alaska and Hawaii. Specifically, for modeling FY 2018 LTCH PPS payments, we used the current FY 2018 labor-related share (66.2 percent), the wage index values established in the Tables 12A and 12B listed in the Addendum to the FY 2018 IPPS/LTCH PPS final rule (which are available via the internet on the CMS website), the FY 2018 HCO fixed-loss amount for LTCH PPS standard Federal payment rate cases of $27,381 (as discussed in section V.D. of the Addendum to that final rule), and the FY 2018 COLA factors (shown in the table in section V.C. of the Addendum to that final rule) to adjust the FY 2018 nonlabor-related share (33.8 percent) for LTCHs located in Alaska and Hawaii. Similarly, for modeling FY 2019 LTCH PPS payments, we used the FY 2019 LTCH PPS labor-related share (66.0 percent), the FY 2019 wage index values from Tables 12A and 12B listed in section VI. of the Addendum to this final rule (which are available via the internet on the CMS website), the FY 2019 fixed-loss amount for LTCH PPS standard Federal payment rate cases of $27,124 (as discussed in section V.D.3. of the Addendum to this final rule), and the FY 2019 COLA factors (shown in the table in section V.C. of the Addendum to this final rule) to adjust the FY 2019 nonlabor-related share (34.0 percent) for LTCHs located in Alaska and Hawaii. We note that in modeling payments for HCO cases for LTCH PPS standard Federal payment rate cases, we applied an inflation factor of 5.7 percent (determined by the Office of the Actuary) to update the 2017 costs of each case.

The impacts that follow reflect the estimated ''losses'' or ''gains'' among the various classifications of LTCHs from FY 2018 to FY 2019 based on the final payment rates and policy changes applicable to LTCH PPS standard Federal payment rate cases presented in this final rule. Table IV illustrates the estimated aggregate impact of the change in LTCH PPS payments for LTCH PPS standard Federal payment rate cases among various classifications of LTCHs. (As discussed previously, these impacts do not include LTCH PPS site neutral payment rate cases.)

- The first column, LTCH Classification, identifies the type of LTCH.
- The second column lists the number of LTCHs of each classification type.
- The third column identifies the number of LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria.
- The fourth column shows the estimated FY 2018 payment per discharge for LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria (as described previously).
- The fifth column shows the estimated FY 2019 payment per discharge for LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria (as described previously).
- The sixth column shows the percentage change in estimated payments per discharge for LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria from FY 2018 to FY 2019 due to the annual update to the standard Federal rate (as discussed in section V.A.2. of the Addendum to this final rule).
- The seventh column shows the percentage change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2018 to FY 2019 for changes to the area wage level adjustment (that is, the wage indexes and the labor-related share), including the application of the area wage level budget neutrality factor (as discussed in section V.B. of the Addendum to this final rule).
- The eighth column shows the percentage change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2018 (Column 4) to FY 2019 (Column 5) for all changes.

TABLE IV—IMPACT OF PAYMENT RATE AND POLICY CHANGES TO LTCH PPS PAYMENTS FOR LTCH PPS STANDARD FEDERAL PAYMENT RATE CASES FOR FY 2019

[Estimated FY 2018 payments compared to estimated FY 2019 payments]

[1] Estimated FY 2019 LTCH PPS payments for LTCH PPS standard Federal payment rate criteria based on the payment rate and factor changes applicable to such cases presented in the preamble of and the Addendum to this final rule.

[2] Percent change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2018 to FY 2019 for the annual update to the LTCH PPS standard Federal payment rate.

[3] Percent change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2018 to FY 2019 for changes to the area wage level adjustment under § 412.525(c) (as discussed in section V.B. of the Addendum to this final rule).

[4] Percent change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2018 (shown in Column 4) to FY 2019 (shown in Column 5), including all of the changes to the rates and factors applicable to such cases presented in the preamble and the Addendum to this final rule. We note that this column, which shows the percent change in estimated payments per discharge for all changes, does not equal the sum of the percent changes in estimated payments per discharge for the annual update to the LTCH PPS standard Federal payment rate (Column 6) and the changes to the area wage level adjustment with budget neutrality (Column 7) due to the effect of estimated changes in estimated payments to aggregate HCO payments for LTCH PPS standard Federal payment rate cases (as discussed in this impact analysis), as well as other interactive effects that cannot be isolated.

d. Results

Based on the FY 2017 LTCH cases (from 409 LTCHs) that were used for the analyses in this final rule, we have prepared the following summary of the impact (as shown in Table IV) of the LTCH PPS payment rate and policy changes for LTCH PPS standard Federal payment rate cases presented in this final rule. The impact analysis in Table IV shows that estimated payments per discharge for LTCH PPS standard Federal payment rate cases are projected to increase 1.0 percent, on average, for all LTCHs from FY 2018 to FY 2019 as a result of the payment rate and policy changes applicable to LTCH PPS standard Federal payment rate cases presented in this final rule. This estimated 1.0 percent increase in LTCH PPS payments per discharge was determined by comparing estimated FY 2019 LTCH PPS payments (using the payment rates and factors discussed in this final rule) to estimated FY 2018 LTCH PPS payments for LTCH discharges which will be LTCH PPS standard Federal payment rate cases if the dual rate LTCH PPS payment structure was or had been in effect at the time of the discharge (as described in section I.J.4. of this Appendix).

As stated previously, we are updating the LTCH PPS standard Federal payment rate for FY 2019 by 1.35 percent. For LTCHs that fail to submit quality data under the requirements of the LTCH QRP, as required by section 1886(m)(5)(C) of the Act, a 2.0 percentage point reduction is applied to the annual update to the LTCH PPS standard Federal payment rate. Consistent with § 412.523(d)(4), we also are applying an area wage level budget neutrality factor to the FY 2019 LTCH PPS standard Federal payment rate of 0.999713, based on the best available data at this time, to ensure that any changes to the area wage level adjustment (that is, the annual update of the wage index values and labor-related share) will not result in any change (increase or decrease) in estimated aggregate LTCH PPS standard Federal payment rate payments. Finally, we are making a budget neutrality adjustment of 0.990884 for the elimination of the 25-percent threshold policy (discussed in VII.E. of the preamble of this final rule). As we also explained earlier in this section, for most categories of LTCHs (as shown in Table IV, Column 6), the estimated payment increase due to the 1.35 percent annual update to the LTCH PPS standard Federal payment rate is projected to result in approximately a 1.3 percent increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases for all LTCHs from FY 2018 to FY 2019. This is because our estimate of the changes in payments due to the update to the LTCH PPS standard Federal payment rate also reflects estimated payments for SSO cases that are paid using a methodology that is not entirely affected by the update to the LTCH PPS standard Federal payment rate. Consequently, for certain hospital categories, we estimate that payments to LTCH PPS standard Federal payment rate cases may increase by less than 1.35 percent due to the annual update to the LTCH PPS standard Federal payment rate for FY 2019.

(1) Location

Based on the most recent available data, the vast majority of LTCHs are located in urban areas. Only approximately 5 percent of the LTCHs are identified as being located in a rural area, and approximately 3 percent of all LTCH PPS standard Federal payment rate cases are expected to be treated in these rural hospitals. The impact analysis presented in Table IV shows that the overall average percent increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2018 to FY 2019 for all hospitals is 1.0 percent. For rural LTCHs, estimated payments for LTCH PPS standard Federal payment rate cases are expected to increase 0.9 percent. For urban LTCHs, we estimate an increase of 1.0 percent from FY 2018 to FY 2019. Among the urban LTCHs, large urban LTCHs are projected to experience an increase of 1.1 percent in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2018 to FY 2019, and such payments for the remaining urban LTCHs are projected to increase 0.9 percent, as shown in Table IV.

(2) Participation Date

LTCHs are grouped by participation date into four categories: (1) Before October 1983; (2) between October 1983 and September 1993; (3) between October 1993 and September 2002; and (4) October 2002 and after. Based on the most recent available data, the categories of LTCHs with the largest expected percentage of LTCH PPS standard Federal payment rate cases (approximately 43 percent) are in LTCHs that began participating in the Medicare program after October 2002, and they are projected to experience a 1.0 percent increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2018 to FY 2019, as shown in Table IV.

Approximately 3 percent of LTCHs began participating in the Medicare program before October 1983, and these LTCHs are projected to experience an average percent increase of 0.4 percent in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2018 to FY 2019. Approximately 10 percent of LTCHs began participating in the Medicare program between October 1983 and September 1993, and these LTCHs are projected to experience an increase of 1.5 percent in estimated payments for LTCH PPS standard Federal payment rate cases from FY 2018 to FY 2019. LTCHs that began participating in the Medicare program between October 1993 and October 1, 2002, which treat approximately 42 percent of all LTCH PPS standard Federal payment rate cases, are projected to experience a 0.9 percent increase in estimated payments from FY 2018 to FY 2019.

(3) Ownership Control

LTCHs are grouped into four categories based on ownership control type: Voluntary, proprietary, government and unknown.

Based on the most recent available data, approximately 19 percent of LTCHs are identified as voluntary (Table IV). The majority (approximately 78 percent) of LTCHs are identified as proprietary, while government owned and operated LTCHs represent approximately 3 percent of LTCHs. Based on ownership type, voluntary LTCHs are expected to experience a 1.6 percent increase in payments to LTCH PPS standard Federal payment rate cases, while proprietary LTCHs are expected to experience an average increase of 0.9 percent in payments to LTCH PPS standard Federal payment rate cases. Government owned and operated LTCHs, meanwhile, are expected to experience a 1.5 percent increase in payments to LTCH PPS standard Federal payment rate cases from FY 2018 to FY 2019.

(4) Census Region

Estimated payments per discharge for LTCH PPS standard Federal payment rate cases for FY 2019 are projected to increase across all census regions. LTCHs located in the Pacific are projected to experience the largest increase at 1.9 percent. The New England and Mountain regions are projected to experience the smallest increase of 0.3 and 0.4 percent, respectively. These regional variations are largely due to updates in the wage index.

(5) Bed Size

LTCHs are grouped into six categories based on bed size: 0–24 Beds; 25–49 beds; 50–74 beds; 75–124 beds; 125–199 beds; and greater than 200 beds. We project that LTCHs with 0–24 beds will experience the smallest increase in payments for LTCH PPS standard Federal payment rate cases of 0.6 percent. We expect LTCHs with 200 or more beds to experience the largest increase at 1.5 percent.

4. Effect on the Medicare Program

As stated previously, we project that the provisions of this final rule will result in an increase in estimated aggregate LTCH PPS payments to LTCH PPS standard Federal payment rate cases in FY 2019 relative to FY 2018 of approximately $35 million (or approximately 1.0 percent) for the 409 LTCHs in our database. Although, as stated previously, the hospital-level impacts do not include LTCH PPS site neutral payment rate cases, we estimate that the provisions of this final rule will result in an increase in estimated aggregate LTCH PPS payments to site neutral payment rate cases in FY 2019 relative to FY 2018 of approximately $4 million (or approximately 0.4 percent) for the 409 LTCHs in our database. Therefore, we project that the provisions of this final rule will result in an increase in estimated aggregate LTCH PPS payments for all LTCH cases in FY 2019 relative to FY 2018 of approximately $39 million (or approximately 0.9 percent) for the 409 LTCHs in our database.

5. Effect on Medicare Beneficiaries

Under the LTCH PPS, hospitals receive payment based on the average resources consumed by patients for each diagnosis. We do not expect any changes in the quality of care or access to services for Medicare beneficiaries as a result of this final rule, but we continue to expect that paying prospectively for LTCH services will enhance the efficiency of the Medicare program. As discussed above, we do not expect the continued implementation of the site neutral payment system to have a negative impact access to or quality of care, as demonstrated in areas where there is little or no LTCH presence, general short-term acute care hospitals are effectively providing treatment for the same types of patients that are treated in LTCHs.

K. Effects of Requirements for the Hospital Inpatient Quality Reporting (IQR) Program

1. Background

In section VIII.A. of the preambles of the proposed rule (83 FR 20470 through 20500) and this final rule, we discuss our current and proposed requirements for hospitals to report quality data under the Hospital IQR Program in order to receive the full annual percentage increase for the FY 2021 payment determination.

In this final rule, we are finalizing our policies to: (1) Extend eCQM reporting requirements to the CY 2019 reporting period/FY 2021 payment determination; (2) require the 2015 Edition of CEHRT for eCQMs begiVIIInning with the CY 2019 reporting period/FY 2021 payment determination; (3) remove 17 claims-based measures beginning with the CY 2018 reporting period/FY 2020 payment determination; (4) remove two structural measures beginning with the CY 2018 reporting period/FY 2020 payment determination; (5) remove two claims-based measures beginning with the CY 2019 reporting period/FY 2021 payment determination; (6) remove three chart-abstracted measures beginning with the CY 2019 reporting period/FY 2021 payment determination; (7) remove one claims-based measure beginning with the CY 2020 reporting period/FY 2022 payment determination; (8) remove six chart-abstracted measures beginning with the CY 2020 reporting period/FY 2022 payment determination; (9) remove seven eCQMs beginning with CY 2020 reporting period/FY 2022 payment determination; (10) remove one claims-based measure beginning with the CY 2021 reporting period/FY 2023 payment determination; and (11) adopt a new measure removal factor.

We do not believe our finalized proposal to adopt a new measure removal factor will directly affect burden. However, as further explained in section XIV.B.3. of the preamble of this final rule, we believe that there will be an overall decrease in the estimated information collection burden for hospitals due to the other proposed policies. We refer readers to section XIV.B.3. of the preamble of this final rule for a summary of our information collection burden estimate calculations. The effects of these proposals are discussed in more detail below.

2. Impact of Extension of eCQM Reporting Requirements

In the FY 2018 IPPS/LTCH PPS final rule, we finalized policies to require hospitals to submit one, self-selected calendar quarter of data for four eCQMs in the Hospital IQR Program measure set for the CY 2018 reporting period/FY 2020 payment determination (82 FR 38355 through 38361). In section VIII.A.11.d.(2) of the preamble of this final rule, we are finalizing our proposal to extend those reporting requirements for the CY 2019 reporting period/FY 2021 payment determination, such that hospitals will be required to submit one, self-selected calendar quarter of data for four eCQMs in the Hospital IQR Program measure set. Therefore, we believe our burden estimate of 40 minutes per hospital per year (10 minutes per record $\times$ 4 eCQMs $\times$ 1 quarter) associated with eCQM reporting requirements finalized for the CY 2018 reporting period/FY 2020 payment determination will also apply to the CY 2019 reporting period/FY 2021 payment determination.

3. Impact of Requirement To Certify EHR to the 2015 Edition

In section VIII.A.11.d.(3) of the preamble of this final rule, we discuss our finalized proposal to require use of EHR technology certified to the 2015 Edition beginning with the CY 2019 reporting period/FY 2021 payment determination, which aligns with previously established requirements in the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs). As described in section XIV.B.3.g. of the preamble of this final rule, we expect this finalized proposal to have no impact on information collection burden for the Hospital IQR Program because this policy does not require hospitals to submit new data to CMS.

With respect to any costs unrelated to data submission, although this finalized proposal will require some investment in systems updates, the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs) previously finalized a requirement that hospitals use the 2015 Edition of CEHRT beginning with the CY 2019 reporting period/FY 2021 payment determination (80 FR 62761 through 62955). Because all hospitals participating in the Hospital IQR Program are subsection (d) hospitals that also participate in the Medicare and Medicaid Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs), we do not anticipate any additional costs as a result of this finalized proposal.

4. Impact of Removal of Chart-Abstracted Measures

In section VIII.A.5.b.(8) of the preamble of this final rule, beginning with the CY 2019 reporting period/FY 2021 payment determination, we are finalizing our proposals to remove three chart-abstracted clinical process of care measures (ED–1, IMM–2, and VTE–6). In sections VIII.A.5.b.(2)(b)[428] and VIII.A.5.b.(8)(b) of the preamble of this final rule, beginning with

[428] As discussed in section VIII.A.5.b.(2)(b) of the preamble of this final rule, we proposed to remove the NHSN HAI measures beginning with the CY 2019 reporting period/FY 2021 payment determination, but are delaying their removal until the CY 2020 reporting period/FY 2022 payment determination.

the CY 2020 reporting period/FY 2022 payment determination, we also are finalizing our proposals to remove five National Healthcare Safety Network (NHSN) hospital-acquired infection (HAI) measures (CDI, CAUTI, CLABSI, MRSA Bacteremia, and Colon and Abdominal Hysterectomy SSI) and one chart-abstracted clinical process of care measure (ED–2). We note that as we discussed in section VIII.A.5.b.(2)(b) of the preamble of this final rule, we proposed to remove the NHSN HAI measures beginning with the CY 2019 reporting period/FY 2021 payment determination, but are finalizing a modified version of our proposal delaying the measures' removal until the CY 2020 reporting period/FY 2022 payment determination. Our estimates below have been updated to reflect this change.

As described in detail in section XIV.B.3. of the preamble of this final rule, we expect our finalized proposals to remove the clinical process of care chart-abstracted measures will reduce the information collection burden by 1,046,071 hours and approximately $38.3 million for the CY 2019 reporting period/FY 2021 payment determination, and an additional 858,000 hours and approximately $31.3 million for the CY 2020 reporting period/FY 2022 payment determination for the Hospital IQR Program. We note that the burden of data collection for the NHSN HAI measures (CDI, CAUTI, CLABSI, MRSA Bacteremia, and Colon and Abdominal Hysterectomy SSI) is accounted for under the Centers for Disease Control and Prevention (CDC) National Health and Safety Network (NHSN) OMB control number 0920–0666. Because burden associated with submitting data for the NHSN HAI measures is captured under a separate OMB control number, we do not provide an independent estimate of the information collection burden associated with these measures for the Hospital IQR Program.

The data validation activities, however, are conducted by CMS. Since the measures were adopted into the Hospital IQR Program, CMS has validated the data for purposes of the Program. Therefore, this burden has been captured under the Hospital IQR Program's OMB control number 0938–1022. While we did not propose any changes directly to the validation process related to chart-abstracted measures, based on our finalized proposals to remove five NHSN HAI and four clinical process of care chart-abstracted measures (in sections VIII.A.5.b.(2)(b) and VIII.A.5.b.(8) of the preamble of this final rule), we believe that hospitals will experience an overall reduction in burden associated with validation of chart-abstracted measures beginning with the FY 2023 payment determination because hospitals selected for validation are currently required to submit validation templates for the NHSN HAI measures for the Hospital IQR Program. In addition, based on our finalized proposals to remove the NHSN HAI measures, the information collection burden associated with submission of these validation templates will be eliminated from the Hospital IQR Program. As described in detail in section XIV.B.3.b.(3) of the preamble of this final rule, we estimate a total decrease of 43,200 hours and approximately $1.6 million as a result of discontinuing submission of NHSN HAI validation templates under the Hospital IQR Program. The finalized removal of NHSN HAI measures from the Hospital IQR Program, the subsequent cessation of validation processes for the NHSN HAI measures, the retention of these measures in the HAC Reduction Program, and the finalized implementation of a validation process for these measures under the HAC Reduction Program, represent no net change in information collection burden for the NHSN HAI measures across CMS hospital quality programs. Therefore, we do not anticipate any change under the CDC NHSN's OMB control number 0920–0666 due to our finalized proposals.

Furthermore, we anticipate that the costs to hospitals participating in the Hospital IQR Program, beyond that associated with information collection, will be reduced because hospitals will no longer need to review feedback reports for the NHSN HAI measures with slightly different measure rates for the same measures (under the Hospital IQR Program, a rolling four quarters of data are used to update the *Hospital Compare* website; under the Hospital VBP Program, 1-year periods are used for each of the baseline period and the performance period; and under the HAC Reduction Program, a 2-year performance period is used).

5. Impact of Removal of Two Structural Measures

In section VIII.A.5.a. and VII.A.5.b.(1) of the preamble of this final rule, we are finalizing our proposals to remove two structural measures, Hospital Survey on Patient Safety Culture and Safe Surgery Checklist, beginning with the CY 2018 reporting period/FY 2020 payment determination. We believe these finalized proposals will result in a minimal information collection burden reduction, which is addressed in section XIV.B.3. of the preamble of this final rule. In addition, we refer readers to VIII.A.4.b. of the preamble of this final rule, where we acknowledge that costs are multi-faceted and include not only the burden associated with reporting, but also the costs associated with implementing and maintaining Program requirements. We believe it may be unnecessarily costly and/or of limited benefit to retain or maintain a measure which our analyses show no longer meaningfully supports program objectives (for example, informing beneficiary choice or payment scoring). As discussed in sections VIII.A.5.a. and VIII.A.5.b.(1) of the preamble of this final rule, we believe these measures are of limited utility for internal hospital quality improvement efforts because they do not provide individual patient level data or any information on patient outcomes. In addition, our analyses show that use of patient safety culture surveys and safe surgery checklists is widely in practice among hospitals. Therefore, we do not believe that these measures support the program objectives of facilitating internal hospital quality improvement efforts or informing beneficiary choice.

6. Impact of the Removal of Claims-Based Measures

In sections VIII.A.5.b.(2)(a), (3), (4), (6), and (7) of the preamble of this final rule, we are finalizing our proposals to remove 17 claims-based measures PSI–90 (NQF #0531), READM–30–AMI (NQF #0505), READM–30–CABG (NQF #2515), READM–30–COPD (NQF #1891), READM–30–HF (NQF #0330), READM–30–PN (NQF #0506), READM–30–THA/TKA (NQF #1551), READM–30–STK, MORT–30–AMI (NQF #0230), MORT–30–HF (NQF #0229), MSPB (NQF #2158), Cellulitis Payment, GI Payment, Kidney/UTI Payment, AA Payment, Chole and CDE Payment, and SFusion Payment) beginning with the CY 2018 reporting period/CY 2020 payment determination. In addition, in section VIII.A.5.b.(4) of the preamble of this final rule, we are finalizing our proposals to remove two claims-based measures (MORT–30–COPD (NQF #1893) and MORT–30–PN (NQF #0468)) beginning with the CY 2019 reporting period/FY 2021 payment determination. Furthermore, in sections VIII.A.5.b.(4) and VIII.A.5.b.(5), respectively, of the preamble of this final rule, we are finalizing our proposals to remove one-claims based measure (MORT–30–CABG (NQF #2558)) beginning with the CY 2020 reporting period/FY 2022 payment determination and one claims-based measure (Hip/Knee Complications (NQF #1550)) beginning with the CY 2021 reporting period/FY 2023 payment determination.

These claims-based measures are calculated using only data already reported to the Medicare program for payment purposes, therefore, we do not believe removing these measures will impact the information collection burden on hospitals. Nonetheless, we anticipate that hospitals will experience a general cost reduction associated with these proposals stemming from no longer having to review and track various program requirements or measure information in multiple confidential feedback and preview reports from multiple programs that reflect multiple measure rates due to varying scoring methodologies and reporting periods.

7. Impact of the Removal of eCQMs

In section VIII.A.5.b.(9) of the preamble of this final rule, we are finalizing our proposals to remove seven eCQMs from the Hospital IQR Program eCQM measure set beginning with the CY 2020 reporting period/FY 2022 payment determination. As described in section XIV.B.3. of this final rule, we do not anticipate that removal of these seven eCQMs will affect the information collection burden for hospitals. However, as discussed in section VIII.A.4.b. of the preamble of this final rule, we believe costs are multifaceted and include not only the burden associated with reporting, but also the costs associated with implementing and maintaining Program requirements, such as maintaining measure specifications in hospitals' EHR systems for all of the eCQMs available for use in the Hospital IQR Program. We further discuss costs unrelated to information collection associated with eCQM removal in section VIII.A.5.b.(9) of the preamble of this final rule.

8. Summary of Effects

In summary, we estimate: (1) A total information collection burden reduction of 1,046,138 hours (−1,046,071 hours due to the finalized removal of ED–1, IMM–2, and VTE–6 measures for the CY 2019 reporting period/FY 2021 payment determination and −67 hours for no longer collecting data for the voluntary Hybrid HWR measure [429]) and a total cost reduction related to information collection of approximately $38.3 million (−1,046,138 hours × $36.58 per hour [430]) for the CY 2019 reporting period/FY 2021 payment determination; (2) a total information collection burden reduction of 858,000 hours (−858,000 hours due to the finalized removal of ED–2) and a total cost reduction related to information collection of approximately $31.3 million (−858,000 hours × $36.58 per hour [431]) for the CY 2020 reporting period/FY 2022 payment determination; and (3) a total information collection burden reduction of 43,200 hours (−43,200 hours due to no longer needing to validate NHSN HAI measures under the Hospital IQR Program) and a total information collection cost reduction of approximately $1.6 million (−43,200 hours × $36.58 per hour) for the CY 2021 reporting period/FY 2023 payment determination. As stated earlier, we also anticipate additional cost reductions unrelated to the information collection burden associated with our proposals, including, for example, no longer having to review and track measure information in multiple feedback reports from multiple programs and maintaining measure specifications in hospitals' EHR systems for all eCQMs available for use in the program.

Historically, 100 hospitals, on average, that participate in the Hospital IQR Program do not receive the full annual percentage increase in any fiscal year due to the failure to meet all requirements of this Program. We anticipate that the number of hospitals not receiving the full annual percentage increase will be approximately the same as in past years or slightly decrease. We believe that reducing the number of chart-abstracted measures used in the Hospital IQR Program will, at least in part, help increase hospitals' chances to meet all Program requirements and receive their full annual percentage increase.

We refer readers to section XIV.B.3. of the preamble of this final rule (information collection requirements) for a detailed discussion of the burden of the requirements for submitting data to the Hospital IQR Program.

L. Effects of Requirements for the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

In section VIII.B. of the preambles of the proposed rule (83 FR 20500 through 20510) and this final rule, we discuss our proposed and finalized policies for the quality data reporting program for PPS-exempt cancer hospitals (PCHs), which we refer to as the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program. The PCHQR Program is authorized under section 1866(k) of the Act, which was added by section 3005 of the Affordable Care Act. There is no financial impact to PCH Medicare reimbursement if a PCH does not submit data.

In section VIII.B.3.b. of the preamble of this final rule, we are finalizing our proposals to remove four web-based, structural measures: (1) Oncology: Radiation Dose Limits to Normal Tissues (PCH–14/NQF #0382); (2) Oncology: Medical and Radiation—Pain Intensity Quantified (PCH–16/NQF #0384); (3) Prostate Cancer: Adjuvant Hormonal Therapy for High Risk Patients (PCH–17/NQF #0390); and (4) Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low-Risk Patients (PCH–18/NQF #0389) beginning with the FY 2021 program year. As discussed in section VIII.B.3.b.(2) of the preamble of this final rule, we are deferring finalization of our policies regarding future use of the Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (PCH–5/NQF #0138) and Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (PCH–4/NQF #0139) in the PCHQR Program to a future 2018 final rule, most likely in the CY 2019 OPPS/ASC final rule targeted for release no later than November 2018. We will therefore address any change in burden associated with this policy decision, most likely, in the CY 2019 OPPS/ASC final rule. In addition, in section VIII.B.4. of the preamble of this final rule, we are finalizing our proposal to adopt one claims-based measure for the FY 2021 program year and subsequent years: 30-Day Unplanned Readmissions for Cancer Patients measure (NQF #3188). Based on the finalized measure removals and addition, the PCHQR Program measure set will consist of 13 measures for the FY 2021 program. Further, in section XIV.B.4.b. of the preamble of this final rule, we are finalizing our proposal to adopt a new time burden estimate, to be applied to structural and web-based tool measures for the FY 2021 program year and subsequent years. Specifically, we are finalizing our proposal to adopt the estimate of 15 minutes per measure, per PCH, for reporting these types of measures, which is the time estimate utilized by the Hospital IQR Program (80 FR 49762).

a. Summary of Burden Effects for the FY 2021 Program Year

(1) Removal of Web-Based Structural Measures

As explained in section XIV.B.4.c. of the preamble of this final rule, we anticipate that these finalized new requirements will reduce the overall burden on participating PCHs. Because we are finalizing our proposal to apply 15 minutes per measure as a burden estimate for structural measures and web-based tool measures and our proposal to remove the following web-based structural measures: (1) Oncology: Radiation Dose Limits to Normal Tissues (PCH–14/NQF #0382); (2) Oncology: Medical and Radiation—Pain Intensity Quantified (PCH–16/NQF #0384); (3) Prostate Cancer: Adjuvant Hormonal Therapy for High Risk Patients (PCH–17/NQF #0390); and (4) Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low-Risk Patients (PCH–18/NQF #0389)), we estimate a reduction of 1 hour (or 60 minutes) per PCH (15 minutes per measure × 4 measures = 60 minutes), and a total annual reduction of approximately 11 hours for all 11 PCHs (60 minutes × 11 PCHs/60 minutes per hour), as a result of the finalized removal of these four measures.

(2) Removal of Chart-Abstracted NHSN Measures

As discussed in section VIII.B.3.b.(2) of the preamble of this final rule, we are deferring finalization of our policies regarding future use of the Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (PCH–5/NQF #0138) and Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (PCH–4/NQF #0139) in the PCHQR Program to a future 2018 final rule, most likely in the CY 2019 OPPS/ASC final rule targeted for release no later than November 2018. We will therefore address any change in burden associated with this policy decision, most likely, in the CY 2019 OPPS/ASC final rule.

(3) Adoption of 30-Day Unplanned Readmissions for Cancer Patients Measure (NQF #3188)

We do not anticipate any change in burden on the PCHs associated with our finalized proposal to adopt a claims-based measure into the PCHQR Program beginning with the FY 2021 program year. This measure is claims-based and does not require facilities to report any additional data beyond that already submitted on Medicare administrative claims for payment purposes. Therefore, we do not believe that there is any associated change in burden resulting from the finalization of this proposal.

In summary, because we are finalizing our proposals to remove 4 web-based, structural measures, we estimate a total burden reduction of 11 hours of burden per year for all 11 PCHs beginning with the FY 2021 program year.

M. Effects of Requirements for the Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

Under the LTCH QRP, the Secretary reduces by 2 percentage points the annual

[429] In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38350 through 38355), we finalized our proposal to collect data on a voluntary basis for the Hybrid HWR measure for the CY 2018 reporting period/FY 2020 payment determination. We estimated that approximately 100 hospitals would voluntarily report data for this measure, resulting in a total burden of 67 hours across all hospitals for the CY 2018 reporting period/FY 2020 payment determination (82 FR 38504). Because we only finalized voluntary collection of data for 1 year, voluntary collection of these data would no longer occur beginning with the CY 2019 reporting period/FY 2021 payment determination and subsequent years resulting in a reduction in burden of 67 hours across all hospitals.

[430] In the FY 2017 IPPS/LTCH PPS final rule (82 FR 38501), we finalized an hourly wage estimate of $18.29 per hour, plus 100 percent overhead and fringe benefits, for the Hospital IQR Program. Accordingly, we calculate cost burden to hospitals using a wage plus benefits estimate of $36.58 per hour.

[431] Ibid.

update to the LTCH PPS standard Federal rate for discharges for an LTCH during a fiscal year if the LTCH has not complied with the LTCH QRP requirements specified for that fiscal year. Information is not available to determine the precise number of LTCHs that will not meet the requirements to receive the full annual update for the FY 2019 payment determination.

We believe that the burden and costs associated with the LTCH QRP is the time and effort associated with complying with the requirements of the LTCH QRP. We intend to closely monitor the effects of this quality reporting program on LTCHs and to help facilitate successful reporting outcomes through ongoing stakeholder education, national trainings, and help desks.

We refer readers to section XIV.B.6. of the preamble of this final rule for details discussing information collection requirements for the LTCH QRP.

N. Effects of Requirements Regarding the Promoting Interoperability Programs

In section VIII.D. of the preambles of the proposed rule (83 FR 20515 through 20544) and this final rule, we discuss and finalize our proposals with a few modifications regarding a new performance-based scoring methodology and changes to the Stage 3 objectives and measures for eligible hospitals and CAHs that attest to CMS under the Medicare Promoting Interoperability Program. We are finalizing the new measure Query of PDMP and the Support Electronic Referral Loops by Receiving and Incorporating Health Information. We are finalizing the removal of the Coordination of Care Through Patient Engagement objective and its associated measures Secure Messaging, View, Download or Transmit, and Patient Generated Health Data as well as the measures Request/Accept Summary of Care, Clinical Information Reconciliation and Patient-Specific Education. We are renaming measures within the Health Information Exchange objective. These changes include changing the name from Send a Summary of Care, to Support Electronic Referral Loops by Sending Health Information; renaming the Public Health and Clinical Data Registry Reporting objective to Public Health and Clinical Data Exchange with the requirement to report on any two measures options; renaming the name the Patient Electronic Access to Health Information objective to Provider to Patient Exchange objective, and renaming the remaining measure, Provide Patient Access measure to Provide Patients Electronic Access to Their Health Information measure. We also are finalizing an any minimum 90-day EHR reporting period in CYs 2019 and 2020 for new and returning participants attesting to CMS or their State Medicaid agency; the CQM reporting period and criteria for CY 2019; and our proposal to codify the policies for subsection (d) Puerto Rico hospitals to participate in the Medicare Promoting Interoperability Program for eligible hospitals, including policies previously implemented through program instruction.

We believe that, overall, these finalized proposals will reduce burden. We refer readers to section XIV.B.9. of the preamble of this final rule for additional discussion on the information collection effects associated with these finalized proposals.

In section VIII.D.12.a. of the preamble of this final rule, we are finalizing our proposal to amend 42 CFR 495.324(b)(2) and 495.324(b)(3) to align with current prior approval policy for MMIS and ADP systems at 45 CFR 95.611(a)(2)(ii), and (b)(2)(iii) and (iv), and to minimize burden on States. Specifically, we finalizing our proposals that the prior approval dollar threshold in § 495.324(b)(3) will be increased to $500,000, and that a prior approval threshold of $500,000 will be added to § 495.324(b)(2). In addition, in light of these finalized changes, we are finalizing our proposal to make a conforming amendment to the threshold in § 495.324(d) for prior approval of justifications for sole source acquisitions to be the same $500,000 threshold. That threshold is currently aligned with the $100,000 threshold in current 495.324(b)(3). Amending § 495.324(d) to preserve alignment with § 495.324(b)(3) maintains the consistency of our prior approval requirements. We believe that these finalized proposals also will reduce burden on States by raising the prior approval thresholds and generally aligning them with the thresholds for prior approval of MMIS and ADP acquisitions costs.

In section VIII.D.12.b. of the preamble of this final rule, we are finalizing our proposal to amend 42 CFR 495.322 to provide that the 90 percent FFP for Medicaid Promoting Interoperability Program administration will no longer be available for most State expenditures incurred after September 30, 2022. We are finalizing a later sunset date, September 30, 2023, for the availability of 90 percent enhanced match for State administrative costs related to Medicaid Promoting Interoperability Program audit and appeals activities, as well as costs related to administering incentive payment disbursements and recoupments that might result from those activities. States will not be able to claim any Medicaid Promoting Interoperability Program administrative match for expenditures incurred after September 30, 2023. We do not believe that these finalized proposals will impose any additional burdens on States. We refer readers to section XIV.B.9. of the preamble of this final rule for additional discussion on the information collection effects associated with these proposals.

O. Alternatives Considered

This final rule contains a range of policies. It also provides descriptions of the statutory provisions that are addressed, identifies the proposed policies, and presents rationales for our decisions and, where relevant, alternatives that were considered.

For example, as discussed in section II.F.2.d. of the preamble of this final rule, section II.H.5.a. of the preamble of this final rule, and section II.A.4.g. of the Addendum to this final rule, we considered the comments regarding the creation of a new MS–DRG for the assignment of procedures involving the utilization of CAR T-cell therapy drugs and cases representing patients who receive treatment involving CAR T-cell therapy as an alternative to our proposed MS–DRG assignment to MS–DRG 016 for FY 2019, and we considered comments to allow hospitals to utilize an alternative CCR specific to procedures involving CAR T-cell therapy drugs for purposes of outlier payments, new technology add-on payments, and payments to IPPS excluded cancer hospitals.

As discussed in section II.A.4.g. of the Addendum to the proposed rule, the impact of an alternative CCR specific to procedures involving CAR T-cell therapy drugs is dependent on the relationship between the CCR that would otherwise be used and the alternative CCR used. For illustrative purposes, in the proposed rule, we discussed an example where if a hospital charged $400,000 for a procedure involving the utilization of the CAR T-cell therapy drug described by ICD–10–PCS code XW033C3, the application of a hypothetical CCR of 0.25 results in a cost of $100,000 (= $400,000 * 0.25), while the application of a hypothetical CCR of 1.00 results in a cost of $400,000 (= $400,000 * 1.0).

The impact of the creation of a separate MS–DRG for procedures involving the utilization of CAR T-cell therapy drugs and cases representing patients receiving treatment involving CAR T-cell therapy is dependent on the relative weighting factor determined for the separate MS–DRG. In the proposed rule, we invited public comments on the most appropriate approach for determining the relative weighting factor under this alternative, such as an approach based on taking into account an appropriate portion of the average sales price (ASP) for these drugs, or other approaches.

Comments also suggested other alternative changes under the IPPS for FY 2019, including, but not limited to, the creation of a pass-through payment, and structural changes in new technology add-on payments for the drug therapy. The impacts of these would depend on the basis for the pass-through payment amount (for example, cost or average sales price) or on the revised methodology for the new technology add-on payment (for example, a revision to the percentage of cost paid.)

As described more fully in section II.F.2.d. of the preamble of this final rule, given the potential for a new CMMI model and our request for feedback on this approach, we believe it would be premature to adopt changes to our existing payment mechanisms, either under the IPPS or for IPPS-excluded cancer hospitals, specifically for CAR T-cell therapy. Therefore, we did not adopt the alternatives discussed above that we considered for CAR T-cell therapy for FY 2019, including, but not limited to, the creation of a pass-through payment; structural changes in new technology add-on payments for the drug therapy; changes in the usual cost-to-charge ratios (CCRs) used in ratesetting and payment, including those used in determining new technology add-on payments, outlier payments, and payments to IPPS excluded cancer hospitals; and the creation of a new MS–DRG specifically for CAR T-cell therapy.

As discussed in section VIII.A.5.b.(9) of the preamble of this final rule, in the context of

removing seven eCQMs from the Hospital IQR Program for the CY 2020 reporting period/FY 2022 payment determination and subsequent years, we considered proposing to remove these seven eCQMs 1 year earlier, beginning with the CY 2019 reporting period/FY 2021 payment determination. Our analyses indicated no estimated change in average information collection reporting burden between these two options. The lack of difference is due to the low number of hospitals that have historically selected those eCQMs as part of their 4 required eCQMs for submission. Because the alternatives considered do not impact the collection of information for hospitals, we do not expect these alternatives to affect the reporting burden on hospitals associated with the Hospital IQR Program. We considered these alternatives and sought public comment on them.

As discussed in section IV.I.4.b. of the preamble of the proposed rule, in the context of scoring hospitals for purposes of the Hospital VBP Program for the FY 2021 program year and subsequent years, we analyzed two domain weighting options based on our proposals to remove 10 measures and the Safety domain from the Hospital VBP Program. As an alternative to our proposal to weight the three remaining domains as Clinical Outcomes domain (proposed name change)—50 percent; Person and Community Engagement domain—25 percent; and Efficiency and Cost Reduction domain—25 percent, we considered weighting each of the three remaining domains equally, meaning each of the three domains would be weighted as one-third of a hospital's Total Performance Score (TPS), beginning with the FY 2021 program year. As discussed in section IV.I.4.b. of the preamble of the proposed rule, we also considered keeping the current domain weighting (25 percent for each of the four domains—Safety, Clinical Outcomes (proposed name change), Person and Community Engagement, and Efficiency and Cost Reduction—with proportionate reweighting if a hospital has sufficient data on only three domains), which would require keeping at least one or more of the measures in the Safety domain and the Safety domain itself. As discussed in sections IV.I.4.a.(2) and IV.I.4.b. of the preamble of this final rule, we are not finalizing our proposal to remove the Safety domain and are keeping the current domain weighting described above, as previously finalized.

As summarized in section IV.I.4.b. of the preambles of the proposed rule and this final rule, to understand the potential impacts of the proposed domain weighting on hospitals' TPSs, we conducted analyses using FY 2018 program data that estimated the potential impacts of our proposed domain weighting policy to increase the weight of the Clinical Outcomes domain from 25 percent to 50 percent of a hospital's TPS and an alternative weighting policy we considered of equal weights whereby each domain would constitute one-third (⅓) of a hospital's TPS. In the proposed rule (83 FR 20537), we provided a table showing the estimated average TPSs and unweighted domain scores under these alternatives. That table is set out below and provides an overview of the estimated impact on hospitals' TPS by certain hospital characteristics and as they would compare to actual FY 2018 TPSs, which include scoring on four domains, including the Safety domain, and applying proportionate reweighting if a hospital has sufficient data on only three domains.

COMPARISON OF ESTIMATED AVERAGE TPSS AND UNWEIGHTED DOMAIN SCORES *

Hospital characteristic	Actual FY 2018 average clinical care domain score	Actual FY 2018 average person and community engagement domain score	Actual FY 2018 average efficiency and cost reduction domain score	Actual FY 2018 average TPS (4 domains) +	Proposed increased weighting of clinical care domain: estimated average TPS	Alternative weighting: estimated average TPS
All Hospitals **	43.2	33.5	18.8	37.4	34.6	31.8
Bed Size:						
1–99	33.4	46.0	35.7	44.6	37.2	38.4
100–199	42.2	34.5	21.0	39.2	35.0	32.6
200–299	44.5	27.9	12.9	34.4	32.4	28.4
300–399	48.2	27.3	10.0	33.3	33.4	28.5

* Analysis based on FY 2018 Hospital VBP Program data.

** Only eligible hospitals are included in this analysis. Excluded hospitals (for example, hospitals not meeting the minimum domains required for calculation, hospitals receiving three or more immediate jeopardy citations in the FY 2018 performance period, hospitals subject to payment reductions under the Hospital IQR Program in FY 2018, and hospitals located in the state of Maryland) were removed from this analysis.

+ Based on current policies, which includes the Safety domain, and proportionate reweighting for hospitals with sufficient data on only three domains.

*** For purposes of this analysis, 'safety net' status is defined as those hospitals with top 10 percentile of Disproportionate Share Hospital (DSH) patient percentage from the FY 2018 IPPS/LTCH PPS final rule impact file: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2018-IPPS-Final-Rule-Home-Page-Items/FY2018-IPPS-Final-Rule-Data-Files.html?DLPage=1&DLEntries=10&DLSort=0&DLSortDir=ascending*.

The table below provides a summary of the estimated impacts on average TPSs and payment adjustments for all hospitals,[432] including as they would compare to actual FY 2018 program results under current domain weighting policies.

Summary of estimated impacts on average TPS and payment adjustments using FY 2018 program data	Actual (4 domains) +	Proposed increased weight for clinical outcomes (3 domains)	Equal weighting alternative (3 domains)
Total number of hospitals with a payment adjustment	2,808	2,701	2,701.
Number of hospitals receiving a positive payment adjustment (percent)	1,597 (57 percent)	1,209 (45 percent)	1,337 (50 percent).
Average positive payment adjustment percentage	0.60 percent	0.58 percent	0.70 percent.
Estimated average positive payment adjustment	$128,161	$233,620	$204,038.
Number of hospitals receiving a negative payment adjustment (percent)	1,211 (43 percent)	1,492 (55 percent)	1,364 (50 percent).
Average negative payment adjustment percentage	−0.41 percent	−0.60 percent	−0.57 percent.
Estimated average negative payment adjustment	$169,011	$189,307	$200,000.
Number of hospitals receiving a positive payment adjustment with a composite quality score * below the median (percent).	341 (21 percent)	134 (11 percent)	266 (20 percent).
Average TPS	37.4	34.6	31.8.
Lowest TPS receiving a positive payment adjustment	34.6	35.9	30.9.
Slope of the linear exchange function	2.8908851882	2.7849297316	3.2405954322.

+ Based on current policies, which includes the Safety domain, and proportionate reweighting for hospitals with sufficient data on only three domains.

* ''Composite quality score'' is defined as a hospital's TPS minus the hospital's weighted Efficiency and Cost Reduction domain score.

We also refer readers to section I.H.6.b. of Appendix A to the proposed rule (83 FR 20620 through 20621) for a detailed discussion regarding the estimated impacts of the proposed domain weighting and equal weighting alternative on hospital percentage payment adjustments. Because the alternatives considered did not impact the collection of information for hospitals, we did not expect these alternatives to affect the reporting burden on hospitals. We considered these alternatives and sought public comment on them.

As discussed in section IV.J.5. of the preamble of this final rule, in the context of scoring hospitals for the purposes of the HAC Reduction Program, we analyzed two alternative scoring options to the current methodology for the FY 2020 program year and subsequent years. The alternative scoring methodologies considered were an Equal Measure Weights methodology, which would remove the domains and assign equal weight to each measure for which a hospital has a score, and a Variable Domain Weighting methodology, which would vary the weighting of Domain 1 and 2 based on the number of measures in each domain. We considered these alternative approaches to allow the HAC Reduction Program to continue to fairly assess all hospitals' performance under the Program.

We simulated results under each scoring approach using FY 2019 HAC Reduction Program data.[433] We compared the percentage of hospitals in the worst-performing quartile in FY 2019 to the percentage that would be in the worst-performing quartile under each scoring approach. The table below provides a high-level overview of the estimated impact of these approaches on several key groups of hospitals.

ESTIMATED IMPACT OF SCORING APPROACHES ON PERCENTAGE OF HOSPITALS IN WORST-PERFORMING QUARTILE BY HOSPITAL GROUP

Hospital group [a]	Equal measure weights (%)	Variable domain weights (%)
Teaching hospitals: 100 or more residents (N=248)	3.6	1.6
Safety-net [b] (N=646)	0.9	0.8
Urban hospitals: 400 or more beds (N=358)	2.5	0.8
Hospitals with fewer than 100 beds (N=1,208)	−1.7	−1.0
Hospitals with a measure score for:		
Zero Domain 2 measures (N=223)	0.4	0.0
One Domain 2 measure (N=340)	−4.1	−2.9
Two Domain 2 measures (N=211)	−3.8	−3.3
Three Domain 2 measures (N=188)	−0.5	0.5
Four Domain 2 measures (N=253)	0.0	0.4
Five Domain 2 measures (N=2,004)	1.1	0.7

[a] The number of hospitals in the given hospital group for FY 2019 is specified in parenthesis in this column (for example, N=248).

[b] Hospitals are considered safety-net hospitals if they are in the top quintile for DSH percent.

Note: This table is updated from the FY 2019 IPPS/LTCH PPS proposed rule, which used FY 2018 data. To see that table, we refer readers to 83 FR 20434 through 20437; 83 FR 20638 through 20639.

As shown in the table above, the Equal Measure Weights approach generally has a larger impact than the Variable Domain Weights approach. Under the Equal Measure Weights approach, as compared to the current methodology using FY 2019 HAC

[432] Only eligible hospitals are included in this analysis. Excluded hospitals (for example, hospitals not meeting the minimum domains required for calculation, hospitals receiving three or more immediate jeopardy citations in the FY 2018 performance period, hospitals subject to payment reductions under the Hospital IQR Program in FY 2018, and hospitals located in the state of Maryland) were removed from this analysis.

[433] In the FY 2019 IPPS/LTCH PPS proposed rule, we used FY 2018 data to complete the analysis. We have since updated our analysis using FY 2019 data. To see prior table, we refer readers to 83 FR 20434 through 20437; 83 FR 20638 through 20639.

Reduction Program data, the percentage of hospitals in the worst-performing quartile decreases by 1.7 percent for small hospitals (that is, fewer than 100 beds), 4.1 percent for hospitals with one Domain 2 measure, 3.8 percent for hospitals with two Domain 2 measures, while it increases by 2.5 percent for large urban hospitals (that is, 400 or more beds) and 3.6 percent for large teaching hospitals (that is, 100 or more residents). The Variable Domain Weights approach decreases the percentage of hospitals in the worst-performing quartile by 1.0 percent for small hospitals, 2.9 percent for hospitals with one Domain 2 measure, and 3.3 for hospitals with two Domain 2 measures, while it increases the percentage of hospitals in the worst-performing quartile by 0.8 percent for large urban hospitals and 1.6 percent for large teaching hospitals.

To understand the potential impacts of these alternatives on hospitals' Total HAC Reduction Program Penalty Amount, we conducted an analysis that estimated the potential impacts of these alternatives using FY 2017 payment data annualized by a factor to estimate in FY 2019 payment dollars. Based on this analysis, we expect that aggregate penalty amounts would slightly increase under both alternative methodologies proposed in the proposed rule. We also expect an increase in the penalty amount under both methodologies because some larger hospitals may move into the worst-performing quartile and smaller hospitals may move out of the worst-performing quartile. Because the 1-percent penalty applies uniformly to hospitals in the worst-performing quartile, we anticipate that overall program penalties would rise slightly if larger hospitals move into the penalty quartile. The alternative weighting approach considered, variable weighting, would have increased estimated total penalties by approximately $11,125,845. The finalized weighting approach will increase estimated total penalties by $20,159,043, over $9 million more than the alternative weighting approach considered. The table below displays the results of our analysis in FY 2019 dollars and as a percentage difference.

ESTIMATED FISCAL IMPACT OF FINALIZED AND ALTERNATIVE WEIGHTING APPROACHES RELATIVE TO CURRENT METHODOLOGY **

Scenario	Total HAC reduction program penalty amount (FY 2019 dollars) *	Percentage difference from FY 2019	Difference from FY 2019 (FY 2019 dollars) *
FY 2019 HAC Reduction Program—Before Proposed Weighting Change	$380,999,808	N/A	N/A
Variable Domain Weights	392,125,653	2.9	$11,125,845
Equal Measure Weights	401,158,851	5.3	20,159,043

* Applied an annual increase to DRG payments to convert estimated FY 2017 DRG payments to estimated FY 2019 DRG payments. Source: Payment estimates based on FY 2017 Medicare Provider Analysis and Review (MedPAR) files.

** In the FY 2019 IPPS/LTCH PPS proposed rule, we used FY 2018 Program data and FY 2013 payment to complete the analysis. We have since updated our analysis using FY 2019 Program data and FY 2017 payment data. To see that table, we refer readers to 83 FR 20638 through 20639.

In the proposed rule, after consideration of the current policy, Equal Measure Weights and Variable Domain Weighting methodologies, we sought public comment on these approaches. In this final rule, after consideration of the public comments we received, we are adopting the Equal Measure Weights methodology. However, because the alternatives considered do not impact the collection of information for hospitals, we did not expect either of these alternatives to affect the reporting burden on hospitals associated with the HAC Reduction Program. Therefore, we believe that the finalized policy will not affect burden.

P. Reducing Regulation and Controlling Regulatory Costs

Executive Order 13771, titled Reducing Regulation and Controlling Regulatory Costs, was issued on January 30, 2017. This final rule, is considered an E.O. 13771 deregulatory action. We estimate that this rule generates $72 million in annualized cost savings, discounted at 7 percent relative to fiscal year 2016, over a perpetual time horizon. We discuss the estimated burden and cost reductions for the Hospital IQR Program in section XIV.B.3. of the preamble of this final rule, and estimate that the impact of these changes is a reduction in costs of approximately $21,585 per hospital annually or approximately $71,233,624 for all hospitals annually. We note that in section VIII.A.5.c.(1). of the preamble of this final rule, we are finalizing our proposal to remove the hospital-acquired infection (HAI) measures from the Hospital IQR Program and, therefore, discontinue validation of these measures under the Hospital IQR Program. However, these measures will remain in the HAC Reduction Program and, therefore, we are finalizing our proposal to begin validation of these measures under the HAC Reduction Program using the same processes and information collection requirements previously used under the Hospital IQR Program. As a result, the net costs reflected in the table below for the HAC Reduction Program do not constitute a new information collection requirement on participating hospitals, but a transition of the HAI measure validation process from one program to another based on our efforts to reduce measure duplication across programs. We discuss the estimated burden and cost impacts for the finalized transition of HAI data validation from the Hospital IQR Program to the HAC Reduction Program in section XIV.B.7. of the preamble of this final rule. We discuss the estimated burden and cost reductions for the PCHQR Program in section XIV.B.4. of the preamble of this final rule, and estimate that the impact of these proposed changes is a reduction in costs of approximately $92,145 per PCH annually or approximately $1,013,595 for all participating PCHs annually. We discuss the estimated burden and cost reductions for the proposed LTCH QRP measure removals in section XIV.B.6. of the preamble of this final rule, and estimate that the impact of these proposed changes is a reduction in costs of approximately $1,148 per LTCH annually or approximately $482,469 for all LTCHs annually. Also, as noted in section I.R. of this Appendix, the regulatory review cost for this final rule is $8,809,182.

Section of the proposed rule	Description	Amount of costs or savings
Section XIV.B.3. of the preamble	ICRs for the Hospital IQR Program	($71,233,624)
Section XIV.B.4. of the preamble	ICRs for the PCHQR Program	(1,013,595)
Section XIV.B.6. of the preamble	ICRs for the LTCH QRP	(482,469)
Section XIV.B.7. of the preamble	ICRs for the HAC Reduction Program*	1,580,256

Section of the proposed rule	Description	Amount of costs or savings
Total		(72 million)

*We note that the net costs reflected in this table for the HAC Reduction Program do not constitute a new information collection requirement on participating hospitals, but a transition of the HAI measure validation process from one program to another based on our efforts to reduce measure duplication across programs.

Q. Overall Conclusion

1. Acute Care Hospitals

Acute care hospitals are estimated to experience an increase of approximately $4.8 billion in FY 2019, taking into account operating, capital, new technology, and low volume hospital payments as modeled for this final rule. Approximately $4.4 billion of this estimated increase is due to the changes in operating payments, including $1.5 billion in uncompensated care payments (discussed in sections I.G. and I.H. of this Appendix), approximately $0.2 billion is due to the change in capital payments (discussed in section I.I of this Appendix), approximately $0.2 billion is due to the change in new technology add-on payments (discussed in section I.H of this Appendix), and approximately $0.1 billion is due to the change in low-volume hospital payments (discussed in section I.H of this Appendix). Total differs from the sum of the components due to rounding.

Table I of section I.G. of this Appendix also demonstrates the estimated redistributional impacts of the IPPS budget neutrality requirements for the MS–DRG and wage index changes, and for the wage index reclassifications under the MGCRB.

We estimate that hospitals will experience a 2.3 percent increase in capital payments per case, as shown in Table III of section I.I. of this Appendix. We project that there will be a $193 million increase in capital payments in FY 2019 compared to FY 2018.

The discussions presented in the previous pages, in combination with the remainder of this final rule, constitute a regulatory impact analysis.

2. LTCHs

Overall, LTCHs are projected to experience an increase in estimated payments per discharge in FY 2019. In the impact analysis, we are using the rates, factors, and policies presented in this final rule based on the best available claims and CCR data to estimate the change in payments under the LTCH PPS for FY 2019. Accordingly, based on the best available data for the 417 LTCHs in our database, we estimate that overall FY 2019 LTCH PPS payments will increase approximately $39 million relative to FY 2018 as a result of the payment rates and factors presented in this final rule.

R. Regulatory Review Costs

If regulations impose administrative costs on private entities, such as the time needed to read and interpret a rule, we should estimate the cost associated with regulatory review. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20640), due to the uncertainty involved with accurately quantifying the number of entities that would review the proposed rule, we assumed that the total number of timely pieces of correspondence on last year's proposed rule would be the number of reviewers of the proposed rule. We acknowledged that this assumption may understate or overstate the costs of reviewing the rule. It is possible that not all commenters reviewed last year's rule in detail, and it is also possible that some reviewers chose not to comment on the proposed rule. For those reasons, and consistent with our approach in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38585), we believe that the number of past commenters would be a fair estimate of the number of reviewers of the proposed rule. We welcomed any public comments on the approach in estimating the number of entities that will review this final rule. We did not receive any public comments specific to our solicitation.

We also recognized that different types of entities are in many cases affected by mutually exclusive sections of the proposed rule. Therefore, for the purposes of our estimate, and consistent with our approach in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38585), we assumed that each reviewer read approximately 50 percent of the proposed rule. We welcomed public comments on this assumption. We did not receive any public comments specific to our solicitation.

We have used the number of timely pieces of correspondence on the FY 2019 proposed rule as our estimate for the number of reviewers of this final rule. We continue to acknowledge the uncertainty involved with using this number, but we believe it is a fair estimate due to the variety of entities affected and the likelihood that some of them choose to rely (in full or in part) on press releases, newsletters, fact sheets, or other sources rather than the comprehensive review of preamble and regulatory text. Using the wage information from the BLS for medical and health service managers (Code 11–9111), we estimate that the cost of reviewing the proposed rule is $105.16 per hour, including overhead and fringe benefits (*https://www.bls.gov/oes/current/oes_nat.htm*). Assuming an average reading speed, we estimate that it would take approximately 19 hours for the staff to review half of this final rule. For each IPPS hospital or LTCH that reviews this final rule, the estimated cost is $1,998 (19 hours × $105.16). Therefore, we estimate that the total cost of reviewing this final rule is $8,809,182 ($1,998 × 4,409 reviewers).

II. Accounting Statements and Tables

A. Acute Care Hospitals

As required by OMB Circular A–4 (available at *https://obamawhitehouse.archives.gov/omb/circulars_a-004_a-4/* and *https://georgewbush-whitehouse.archives.gov/omb/circulars/a004/a-4.html*), in the following Table V., we have prepared an accounting statement showing the classification of the expenditures associated with the provisions of this final rule as they relate to acute care hospitals. This table provides our best estimate of the change in Medicare payments to providers as a result of the proposed changes to the IPPS presented in this final rule. All expenditures are classified as transfers to Medicare providers.

As shown below in Table V., the net costs to the Federal Government associated with the policies in this final rule are estimated at $4.8 billion.

TABLE V—ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES UNDER THE IPPS FROM FY 2018 TO FY 2019

Category	Transfers
Annualized Monetized Transfers.	$4.8 billion.
From Whom to Whom	Federal Government to IPPS Medicare Providers.

B. LTCHs

As discussed in section I.J. of this Appendix, the impact analysis of the payment rates and factors presented in this final rule under the LTCH PPS is projected to result in an increase in estimated aggregate LTCH PPS payments in FY 2019 relative to FY 2018 of approximately $39 million based on the data for 417 LTCHs in our database that are subject to payment under the LTCH PPS. Therefore, as required by OMB Circular A–4 (available at *https://obamawhitehouse.archives.gov/omb/circulars_a004_a-4/* and *https://georgewbush-whitehouse.archives.gov/omb/circulars/a004/a-4.html*), in Table VI., we have prepared an accounting statement showing the classification of the expenditures associated with the provisions of this final rule as they relate to the changes to the LTCH PPS. Table VI. provides our best estimate of the estimated change in Medicare payments under the LTCH PPS as a result of the payment rates and factors and other provisions presented in this final rule based on the data for the 417 LTCHs in our database. All expenditures are classified as transfers to Medicare providers (that is, LTCHs).

As shown in Table VI. below, the net cost to the Federal Government associated with the policies for LTCHs in this final rule are estimated at $39 million.

TABLE VI—ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES FROM THE FY 2018 LTCH PPS TO THE FY 2019 LTCH PPS

Category	Transfers
Annualized Monetized Transfers.	$39 million.
From Whom to Whom	Federal Government to LTCH Medicare Providers.

III. Regulatory Flexibility Act (RFA) Analysis

The RFA requires agencies to analyze options for regulatory relief of small entities. For purposes of the RFA, small entities include small businesses, nonprofit organizations, and small government jurisdictions. We estimate that most hospitals and most other providers and suppliers are small entities as that term is used in the RFA. The great majority of hospitals and most other health care providers and suppliers are small entities, either by being nonprofit organizations or by meeting the SBA definition of a small business (having revenues of less than $7.5 million to $38.5 million in any 1 year). (For details on the latest standards for health care providers, we refer readers to page 36 of the Table of Small Business Size Standards for NAIC 622 found on the SBA website at: *http://www.sba.gov/sites/default/files/files/Size_Standards_Table.pdf*.)

For purposes of the RFA, all hospitals and other providers and suppliers are considered to be small entities. Individuals and States are not included in the definition of a small entity. We believe that the provisions of this final rule relating to acute care hospitals will have a significant impact on small entities as explained in this Appendix. For example, because all hospitals are considered to be small entities for purposes of the RFA, the hospital impacts described in this final rule are impacts on small entities. For example, we refer readers to ''Table I.—Impact Analysis of Changes to the IPPS for Operating Costs for FY 2019.'' Because we lack data on individual hospital receipts, we cannot determine the number of small proprietary LTCHs. Therefore, we are assuming that all LTCHs are considered small entities for the purpose of the analysis in section I.J. of this Appendix. MACs are not considered to be small entities because they do not meet the SBA definition of a small business. Because we acknowledge that many of the affected entities are small entities, the analysis discussed throughout the preamble of this final rule constitutes our regulatory flexibility analysis. This final rule contains a range of policies. It provides descriptions of the statutory provisions that are addressed, identifies the finalized policies, and presents rationales for our decisions and, where relevant, alternatives that were considered.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20640), we solicited public comments on our estimates and analysis of the impact of our proposals on those small entities. Any public comments that we received and our responses are presented throughout this final rule.

IV. Impact on Small Rural Hospitals

Section 1102(b) of the Social Security Act requires us to prepare a regulatory impact analysis for any proposed or final rule that may have a significant impact on the operations of a substantial number of small rural hospitals. This analysis must conform to the provisions of section 604 of the RFA. With the exception of hospitals located in certain New England counties, for purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of an urban area and has fewer than 100 beds. Section 601(g) of the Social Security Amendments of 1983 (Pub. L. 98–21) designated hospitals in certain New England counties as belonging to the adjacent urban area. Thus, for purposes of the IPPS and the LTCH PPS, we continue to classify these hospitals as urban hospitals. (We refer readers to Table I in section I.G. of this Appendix for the quantitative effects of the policy changes under the IPPS for operating costs.)

V. Unfunded Mandates Reform Act Analysis

Section 202 of the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4) also requires that agencies assess anticipated costs and benefits before issuing any rule whose mandates require spending in any 1 year of $100 million in 1995 dollars, updated annually for inflation. In 2019, that threshold level is approximately $146 million. This final rule would not mandate any requirements for State, local, or tribal governments, nor would it affect private sector costs.

VI. Executive Order 13175

Executive Order 13175 directs agencies to consult with Tribal officials prior to the formal promulgation of regulations having tribal implications. This final rule contains provisions applicable to hospitals and facilities operated by the Indian Health Service or Tribes or Tribal organizations under the Indian Self-Determination and Education Assistance Act and, thus, has tribal implications. Therefore, in accordance with Executive Order 13175 and the CMS Tribal Consultation Policy (December 2015), CMS has consulted with Tribal officials on these Indian-specific provisions of the proposed rule prior to the formal promulgation of this rule.

VII. Executive Order 12866

In accordance with the provisions of Executive Order 12866, the Executive Office of Management and Budget reviewed this final rule.

COMPARISON OF ESTIMATED AVERAGE TPSS AND UNWEIGHTED DOMAIN SCORES *

Hospital characteristic	Actual FY 2018 average clinical care domain score	Actual FY 2018 average person and community engagement domain score	Actual FY 2018 average efficiency and cost reduction domain score	Actual FY 2018 average TPS (4 domains) +	Proposed increased weighting of clinical care domain: estimated average TPS	Alternative weighting: estimated average TPS
All Hospitals **	43.2	33.5	18.8	37.4	34.6	31.8
Bed Size:						
1–99	33.4	46.0	35.7	44.6	37.2	38.4
100–199	42.2	34.5	21.0	39.2	35.0	32.6
200–299	44.5	27.9	12.9	34.4	32.4	28.4
300–399	48.2	27.3	10.0	33.3	33.4	28.5
400+	50.9	26.9	7.6	31.9	34.1	28.5
Geographic Location:						
Urban	46.8	30.7	13.7	35.7	34.5	30.4
Rural	33.7	40.5	31.7	41.9	34.9	35.3
Safety Net Status ***:						
Non-Safety Net	42.7	35.4	19.0	37.9	34.9	32.4
Safety Net	45.1	25.7	18.1	35.6	33.5	29.6
Teaching Status:						
Non-Teaching	39.9	36.7	22.9	39.4	34.9	33.2
Teaching	48.7	27.9	11.8	34.1	34.3	29.5

* Analysis based on FY 2018 Hospital VBP Program data.

** Only eligible hospitals are included in this analysis. Excluded hospitals (for example, hospitals not meeting the minimum domains required for calculation, hospitals receiving three or more immediate jeopardy citations in the FY 2018 performance period, hospitals subject to payment reductions under the Hospital IQR Program in FY 2018, and hospitals located in the state of Maryland) were removed from this analysis.

+ Based on current policies, which includes the Safety domain, and proportionate reweighting for hospitals with sufficient data on only three domains.

*** For purposes of this analysis, 'safety net' status is defined as those hospitals with top 10 percentile of Disproportionate Share Hospital (DSH) patient percentage from the FY 2018 IPPS/LTCH PPS final rule impact file: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2018-IPPS-Final-Rule-Home-Page-Items/FY2018-IPPS-Final-Rule-Data-Files.html?DLPage=1&DLEntries=10&DLSort=0&DLSortDir=ascending*.

The table below provides a summary of the estimated impacts on average TPSs and payment adjustments for all hospitals,[434] including as they would compare to actual FY 2018 program results under current domain weighting policies.

Summary of estimated impacts on average TPS and payment adjustments using FY 2018 program data	Actual (4 domains) +	Proposed increased weight for clinical outcomes (3 domains)	Equal weighting alternative (3 domains)
Total number of hospitals with a payment adjustment	2,808	2,701	2,701.
Number of hospitals receiving a positive payment adjustment (percent)	1,597 (57 percent)	1,209 (45 percent)	1,337 (50 percent).
Average positive payment adjustment percentage	0.60 percent	0.58 percent	0.70 percent.
Estimated average positive payment adjustment	$128,161	$233,620	$204,038.
Number of hospitals receiving a negative payment adjustment (percent)	1,211 (43 percent)	1,492 (55 percent)	1,364 (50 percent).
Average negative payment adjustment percentage	−0.41 percent	−0.60 percent	−0.57 percent.
Estimated average negative payment adjustment	$169,011	$189,307	$200,000.
Number of hospitals receiving a positive payment adjustment with a composite quality score * below the median (percent).	341 (21 percent)	134 (11 percent)	266 (20 percent).
Average TPS	37.4	34.6	31.8.
Lowest TPS receiving a positive payment adjustment	34.6	35.9	30.9.
Slope of the linear exchange function	2.8908851882	2.7849297316	3.2405954322.

+ Based on current policies, which includes the Safety domain, and proportionate reweighting for hospitals with sufficient data on only three domains.

* ''Composite quality score'' is defined as a hospital's TPS minus the hospital's weighted Efficiency and Cost Reduction domain score.

We also refer readers to section I.H.6.b. of Appendix A to the proposed rule (83 FR 20620 through 20621) for a detailed discussion regarding the estimated impacts of the proposed domain weighting and equal weighting alternative on hospital percentage payment adjustments. Because the alternatives considered did not impact the collection of information for hospitals, we did not expect these alternatives to affect the reporting burden on hospitals. We considered these alternatives and sought public comment on them.

As discussed in section IV.J.5. of the preamble of this final rule, in the context of scoring hospitals for the purposes of the HAC Reduction Program, we analyzed two alternative scoring options to the current methodology for the FY 2020 program year and subsequent years. The alternative scoring methodologies considered were an Equal Measure Weights methodology, which would remove the domains and assign equal weight to each measure for which a hospital has a score, and a Variable Domain Weighting methodology, which would vary the weighting of Domain 1 and 2 based on the number of measures in each domain. We considered these alternative approaches to allow the HAC Reduction Program to continue to fairly assess all hospitals' performance under the Program.

We simulated results under each scoring approach using FY 2019 HAC Reduction Program data.[435] We compared the percentage of hospitals in the worst-performing quartile in FY 2019 to the percentage that would be in the worst-performing quartile under each scoring approach. The table below provides a high-level overview of the estimated impact of these approaches on several key groups of hospitals.

ESTIMATED IMPACT OF SCORING APPROACHES ON PERCENTAGE OF HOSPITALS IN WORST-PERFORMING QUARTILE BY HOSPITAL GROUP

Hospital group [a]	Equal measure weights (percent)	Variable domain weights (percent)
Teaching hospitals: 100 or more residents (N=248)	3.6	1.6
Safety-net [b] (N=646)	0.9	0.8
Urban hospitals: 400 or more beds (N=358)	2.5	0.8
Hospitals with fewer than 100 beds (N=1,208)	−1.7	−1.0
Hospitals with a measure score for:		
Zero Domain 2 measures (N=223)	0.4	0.0
One Domain 2 measure (N=340)	−4.1	−2.9
Two Domain 2 measures (N=211)	−3.8	−3.3
Three Domain 2 measures (N=188)	−0.5	0.5
Four Domain 2 measures (N=253)	0.0	0.4
Five Domain 2 measures (N=2,004)	1.1	0.7

[a] The number of hospitals in the given hospital group for FY 2019 is specified in parenthesis in this column (for example, N=248).

[b] Hospitals are considered safety-net hospitals if they are in the top quintile for DSH percent.

[434] Only eligible hospitals are included in this analysis. Excluded hospitals (for example, hospitals not meeting the minimum domains required for calculation, hospitals receiving three or more immediate jeopardy citations in the FY 2018 performance period, hospitals subject to payment reductions under the Hospital IQR Program in FY 2018, and hospitals located in the state of Maryland) were removed from this analysis.

[435] In the FY 2019 IPPS/LTCH PPS proposed rule, we used FY 2018 data to complete the analysis. We have since updated our analysis using FY 2019 data. To see prior table, we refer readers to 83 FR 20434 through 20437; 83 FR 20638 through 20639.

This table is updated from the FY 2019 IPPS/LTCH PPS proposed rule, which used FY 2018 data. To see that table, we refer readers to 83 FR 20434 through 20437; 83 FR 20638 through 20639.

As shown in the table above, the Equal Measure Weights approach generally has a larger impact than the Variable Domain Weights approach. Under the Equal Measure Weights approach, as compared to the current methodology using FY 2019 HAC Reduction Program data, the percentage of hospitals in the worst-performing quartile decreases by 1.7 percent for small hospitals (that is, fewer than 100 beds), 4.1 percent for hospitals with one Domain 2 measure, 3.8 percent for hospitals with two Domain 2 measures, while it increases by 2.5 percent for large urban hospitals (that is, 400 or more beds) and 3.6 percent for large teaching hospitals (that is, 100 or more residents). The Variable Domain Weights approach decreases the percentage of hospitals in the worst-performing quartile by 1.0 percent for small hospitals, 2.9 percent for hospitals with one Domain 2 measure, and 3.3 for hospitals with two Domain 2 measures, while it increases the percentage of hospitals in the worst-performing quartile by 0.8 percent for large urban hospitals and 1.6 percent for large teaching hospitals.

To understand the potential impacts of these alternatives on hospitals' Total HAC Reduction Program Penalty Amount, we conducted an analysis that estimated the potential impacts of these alternatives using FY 2017 payment data annualized by a factor to estimate in FY 2019 payment dollars. Based on this analysis, we expect that aggregate penalty amounts would slightly increase under both alternative methodologies proposed in the proposed rule. We also expect an increase in the penalty amount under both methodologies because some larger hospitals may move into the worst-performing quartile and smaller hospitals may move out of the worst-performing quartile. Because the 1-percent penalty applies uniformly to hospitals in the worst-performing quartile, we anticipate that overall program penalties would rise slightly if larger hospitals move into the penalty quartile. The alternative weighting approach considered, variable weighting, would have increased estimated total penalties by approximately $11,125,845. The finalized weighting approach will increase estimated total penalties by $20,159,043, over $9 million more than the alternative weighting approach considered. The table below displays the results of our analysis in FY 2019 dollars and as a percentage difference.

ESTIMATED FISCAL IMPACT OF FINALIZED AND ALTERNATIVE WEIGHTING APPROACHES RELATIVE TO CURRENT METHODOLOGY **

Scenario	Total HAC reduction program penalty amount (FY 2019 dollars) *	Percentage difference from FY 2019	Difference from FY 2019 (FY 2019 dollars) *
FY 2019 HAC Reduction Program—Before Proposed Weighting Change	$380,999,808	N/A	N/A
Variable Domain Weights	392,125,653	2.9	$11,125,845
Equal Measure Weights	401,158,851	5.3	20,159,043

* Applied an annual increase to DRG payments to convert estimated FY 2017 DRG payments to estimated FY 2019 DRG payments. Source: Payment estimates based on FY 2017 Medicare Provider Analysis and Review (MedPAR) files.

** In the FY 2019 IPPS/LTCH PPS proposed rule, we used FY 2018 Program data and FY 2013 payment to complete the analysis. We have since updated our analysis using FY 2019 Program data and FY 2017 payment data. To see that table, we refer readers to 83 FR 20638 through 20639.

In the proposed rule, after consideration of the current policy, Equal Measure Weights and Variable Domain Weighting methodologies, we sought public comment on these approaches. In this final rule, after consideration of the public comments we received, we are adopting the Equal Measure Weights methodology. However, because the alternatives considered do not impact the collection of information for hospitals, we did not expect either of these alternatives to affect the reporting burden on hospitals associated with the HAC Reduction Program. Therefore, we believe that the finalized policy will not affect burden.

P. Reducing Regulation and Controlling Regulatory Costs

Executive Order 13771, titled Reducing Regulation and Controlling Regulatory Costs, was issued on January 30, 2017. This final rule, is considered an E.O. 13771 deregulatory action. We estimate that this rule generates $72 million in annualized cost savings, discounted at 7 percent relative to fiscal year 2016, over a perpetual time horizon. We discuss the estimated burden and cost reductions for the Hospital IQR Program in section XIV.B.3. of the preamble of this final rule, and estimate that the impact of these changes is a reduction in costs of approximately $21,585 per hospital annually or approximately $71,233,624 for all hospitals annually. We note that in section VIII.A.5.c.(1). of the preamble of this final rule, we are finalizing our proposal to remove the hospital-acquired infection (HAI) measures from the Hospital IQR Program and, therefore, discontinue validation of these measures under the Hospital IQR Program. However, these measures will remain in the HAC Reduction Program and, therefore, we are finalizing our proposal to begin validation of these measures under the HAC Reduction Program using the same processes and information collection requirements previously used under the Hospital IQR Program. As a result, the net costs reflected in the table below for the HAC Reduction Program do not constitute a new information collection requirement on participating hospitals, but a transition of the HAI measure validation process from one program to another based on our efforts to reduce measure duplication across programs. We discuss the estimated burden and cost impacts for the finalized transition of HAI data validation from the Hospital IQR Program to the HAC Reduction Program in section XIV.B.7. of the preamble of this final rule. We discuss the estimated burden and cost reductions for the PCHQR Program in section XIV.B.4. of the preamble of this final rule, and estimate that the impact of these proposed changes is a reduction in costs of approximately $92,145 per PCH annually or approximately $1,013,595 for all participating PCHs annually. We discuss the estimated burden and cost reductions for the proposed LTCH QRP measure removals in section XIV.B.6. of the preamble of this final rule, and estimate that the impact of these proposed changes is a reduction in costs of approximately $1,148 per LTCH annually or approximately $482,469 for all LTCHs annually. Also, as noted in section I.R. of this Appendix, the regulatory review cost for this final rule is $8,809,182.

Section of the proposed rule	Description	Amount of costs or savings
Section XIV.B.3. of the preamble	ICRs for the Hospital IQR Program	($71,233,624)
Section XIV.B.4. of the preamble	ICRs for the PCHQR Program	(1,013,595)
Section XIV.B.6. of the preamble	ICRs for the LTCH QRP	(482,469)

Section of the proposed rule	Description	Amount of costs or savings
Section XIV.B.7. of the preamble	ICRs for the HAC Reduction Program *	1,580,256
Total		(72 million)

* We note that the net costs reflected in this table for the HAC Reduction Program do not constitute a new information collection requirement on participating hospitals, but a transition of the HAI measure validation process from one program to another based on our efforts to reduce measure duplication across programs.

Q. Overall Conclusion

1. Acute Care Hospitals

Acute care hospitals are estimated to experience an increase of approximately $4.8 billion in FY 2019, taking into account operating, capital, new technology, and low volume hospital payments as modeled for this final rule. Approximately $4.4 billion of this estimated increase is due to the changes in operating payments, including $1.5 billion in uncompensated care payments (discussed in sections I.G. and I.H. of this Appendix), approximately $0.2 billion is due to the change in capital payments (discussed in section I.I of this Appendix), approximately $0.2 billion is due to the change in new technology add-on payments (discussed in section I.H of this Appendix), and approximately $0.1 billion is due to the change in low-volume hospital payments (discussed in section I.H of this Appendix). Total differs from the sum of the components due to rounding.

Table I of section I.G. of this Appendix also demonstrates the estimated redistributional impacts of the IPPS budget neutrality requirements for the MS–DRG and wage index changes, and for the wage index reclassifications under the MGCRB.

We estimate that hospitals will experience a 2.3 percent increase in capital payments per case, as shown in Table III of section I.I. of this Appendix. We project that there will be a $193 million increase in capital payments in FY 2019 compared to FY 2018.

The discussions presented in the previous pages, in combination with the remainder of this final rule, constitute a regulatory impact analysis.

2. LTCHs

Overall, LTCHs are projected to experience an increase in estimated payments per discharge in FY 2019. In the impact analysis, we are using the rates, factors, and policies presented in this final rule based on the best available claims and CCR data to estimate the change in payments under the LTCH PPS for FY 2019. Accordingly, based on the best available data for the 417 LTCHs in our database, we estimate that overall FY 2019 LTCH PPS payments will increase approximately $39 million relative to FY 2018 as a result of the payment rates and factors presented in this final rule.

R. Regulatory Review Costs

If regulations impose administrative costs on private entities, such as the time needed to read and interpret a rule, we should estimate the cost associated with regulatory review. In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20640), due to the uncertainty involved with accurately quantifying the number of entities that would review the proposed rule, we assumed that the total number of timely pieces of correspondence on last year's proposed rule would be the number of reviewers of the proposed rule. We acknowledged that this assumption may understate or overstate the costs of reviewing the rule. It is possible that not all commenters reviewed last year's rule in detail, and it is also possible that some reviewers chose not to comment on the proposed rule. For those reasons, and consistent with our approach in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38585), we believe that the number of past commenters would be a fair estimate of the number of reviewers of the proposed rule. We welcomed any public comments on the approach in estimating the number of entities that will review this final rule. We did not receive any public comments specific to our solicitation.

We also recognized that different types of entities are in many cases affected by mutually exclusive sections of the proposed rule. Therefore, for the purposes of our estimate, and consistent with our approach in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38585), we assumed that each reviewer read approximately 50 percent of the proposed rule. We welcomed public comments on this assumption. We did not receive any public comments specific to our solicitation.

We have used the number of timely pieces of correspondence on the FY 2019 proposed rule as our estimate for the number of reviewers of this final rule. We continue to acknowledge the uncertainty involved with using this number, but we believe it is a fair estimate due to the variety of entities affected and the likelihood that some of them choose to rely (in full or in part) on press releases, newsletters, fact sheets, or other sources rather than the comprehensive review of preamble and regulatory text. Using the wage information from the BLS for medical and health service managers (Code 11–9111), we estimate that the cost of reviewing the proposed rule is $105.16 per hour, including overhead and fringe benefits (*https://www.bls.gov/oes/current/oes_nat.htm*). Assuming an average reading speed, we estimate that it would take approximately 19 hours for the staff to review half of this final rule. For each IPPS hospital or LTCH that reviews this final rule, the estimated cost is $1,998 (19 hours × $105.16). Therefore, we estimate that the total cost of reviewing this final rule is $8,809,182 ($1,998 × 4,409 reviewers).

II. Accounting Statements and Tables

A. Acute Care Hospitals

As required by OMB Circular A–4 (available at *https://obamawhitehouse.archives.gov/omb/circulars_a-004_a-4/* and *https://georgewbush-whitehouse.archives.gov/omb/circulars/a004/a-4.html*), in the following Table VII., we have prepared an accounting statement showing the classification of the expenditures associated with the provisions of this final rule as they relate to acute care hospitals. This table provides our best estimate of the change in Medicare payments to providers as a result of the proposed changes to the IPPS presented in this final rule. All expenditures are classified as transfers to Medicare providers.

As shown below in Table VII., the net costs to the Federal Government associated with the policies in this final rule are estimated at $4.8 billion.

TABLE VII—ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES UNDER THE IPPS FROM FY 2018 TO FY 2019

Category	Transfers
Annualized Monetized Transfers.	$4.8 billion.
From Whom to Whom	Federal Government to IPPS Medicare Providers.

B. LTCHs

As discussed in section I.J. of this Appendix, the impact analysis of the payment rates and factors presented in this final rule under the LTCH PPS is projected to result in an increase in estimated aggregate LTCH PPS payments in FY 2019 relative to FY 2018 of approximately $39 million based on the data for 417 LTCHs in our database that are subject to payment under the LTCH PPS. Therefore, as required by OMB Circular A–4 (available at *https://obamawhitehouse.archives.gov/omb/circulars_a004_a-4/* and *https://georgewbush-whitehouse.archives.gov/omb/circulars/a004/a-4.html*), in Table VI., we have prepared an accounting statement showing the classification of the expenditures associated with the provisions of this final rule as they relate to the changes to the LTCH PPS. Table VI. provides our best estimate of the estimated change in Medicare payments under the LTCH PPS as a result of the payment rates and factors and other provisions presented in this final rule based on the data for the 417 LTCHs in our database. All expenditures are classified as transfers to Medicare providers (that is, LTCHs).

As shown in Table VIII. below, the net cost to the Federal Government associated with the policies for LTCHs in this final rule are estimated at $39 million.

TABLE VIII—ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES FROM THE FY 2018 LTCH PPS TO THE FY 2019 LTCH PPS

Category	Transfers
Annualized Monetized Transfers.	$39 million.
From Whom to Whom	Federal Government to LTCH Medicare Providers.

III. Regulatory Flexibility Act (RFA) Analysis

The RFA requires agencies to analyze options for regulatory relief of small entities. For purposes of the RFA, small entities include small businesses, nonprofit organizations, and small government jurisdictions. We estimate that most hospitals and most other providers and suppliers are small entities as that term is used in the RFA. The great majority of hospitals and most other health care providers and suppliers are small entities, either by being nonprofit organizations or by meeting the SBA definition of a small business (having revenues of less than $7.5 million to $38.5 million in any 1 year). (For details on the latest standards for health care providers, we refer readers to page 36 of the Table of Small Business Size Standards for NAIC 622 found on the SBA website at: *http://www.sba.gov/sites/default/files/files/Size_Standards_Table.pdf.*)

For purposes of the RFA, all hospitals and other providers and suppliers are considered to be small entities. Individuals and States are not included in the definition of a small entity. We believe that the provisions of this final rule relating to acute care hospitals will have a significant impact on small entities as explained in this Appendix. For example, because all hospitals are considered to be small entities for purposes of the RFA, the hospital impacts described in this final rule are impacts on small entities. For example, we refer readers to ''Table I—Impact Analysis of Changes to the IPPS for Operating Costs for FY 2019.'' Because we lack data on individual hospital receipts, we cannot determine the number of small proprietary LTCHs. Therefore, we are assuming that all LTCHs are considered small entities for the purpose of the analysis in section I.J. of this Appendix. MACs are not considered to be small entities because they do not meet the SBA definition of a small business. Because we acknowledge that many of the affected entities are small entities, the analysis discussed throughout the preamble of this final rule constitutes our regulatory flexibility analysis. This final rule contains a range of policies. It provides descriptions of the statutory provisions that are addressed, identifies the finalized policies, and presents rationales for our decisions and, where relevant, alternatives that were considered.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20640), we solicited public comments on our estimates and analysis of the impact of our proposals on those small entities. Any public comments that we received and our responses are presented throughout this final rule.

IV. Impact on Small Rural Hospitals

Section 1102(b) of the Social Security Act requires us to prepare a regulatory impact analysis for any proposed or final rule that may have a significant impact on the operations of a substantial number of small rural hospitals. This analysis must conform to the provisions of section 604 of the RFA. With the exception of hospitals located in certain New England counties, for purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of an urban area and has fewer than 100 beds. Section 601(g) of the Social Security Amendments of 1983 (Pub. L. 98–21) designated hospitals in certain New England counties as belonging to the adjacent urban area. Thus, for purposes of the IPPS and the LTCH PPS, we continue to classify these hospitals as urban hospitals. (We refer readers to Table I in section I.G. of this Appendix for the quantitative effects of the policy changes under the IPPS for operating costs.)

V. Unfunded Mandates Reform Act Analysis

Section 202 of the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4) also requires that agencies assess anticipated costs and benefits before issuing any rule whose mandates require spending in any 1 year of $100 million in 1995 dollars, updated annually for inflation. In 2019, that threshold level is approximately $146 million. This final rule would not mandate any requirements for State, local, or tribal governments, nor would it affect private sector costs.

VI. Executive Order 13175

Executive Order 13175 directs agencies to consult with Tribal officials prior to the formal promulgation of regulations having tribal implications. This final rule contains provisions applicable to hospitals and facilities operated by the Indian Health Service or Tribes or Tribal organizations under the Indian Self-Determination and Education Assistance Act and, thus, has tribal implications. Therefore, in accordance with Executive Order 13175 and the CMS Tribal Consultation Policy (December 2015), CMS has consulted with Tribal officials on these Indian-specific provisions of the proposed rule prior to the formal promulgation of this rule.

VII. Executive Order 12866

In accordance with the provisions of Executive Order 12866, the Executive Office of Management and Budget reviewed this final rule.

Appendix B: Recommendation of Update Factors for Operating Cost Rates of Payment for Inpatient Hospital Services

I. Background

Section 1886(e)(4)(A) of the Act requires that the Secretary, taking into consideration the recommendations of MedPAC, recommend update factors for inpatient hospital services for each fiscal year that take into account the amounts necessary for the efficient and effective delivery of medically appropriate and necessary care of high quality. Under section 1886(e)(5) of the Act, we are required to publish update factors recommended by the Secretary in the proposed and final IPPS rules. Accordingly, this Appendix provides the recommendations for the update factors for the IPPS national standardized amount, the hospital-specific rate for SCHs, and the rate-of-increase limits for certain hospitals excluded from the IPPS, as well as LTCHs. In prior years, we made a recommendation in the IPPS proposed rule and final rule for the update factors for the payment rates for IRFs and IPFs. However, for FY 2019, consistent with our approach for FY 2018, we are including the Secretary's recommendation for the update factors for IRFs and IPFs in separate **Federal Register** documents at the time that we announce the annual updates for IRFs and IPFs. We also discuss our response to MedPAC's recommended update factors for inpatient hospital services.

II. Inpatient Hospital Update for FY 2019

A. FY 2019 Inpatient Hospital Update

As discussed in section IV.B. of the preamble to this final rule, for FY 2019, consistent with section 1886(b)(3)(B) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, we are setting the applicable percentage increase by applying the following adjustments in the following sequence. Specifically, the applicable percentage increase under the IPPS is equal to the rate-of-increase in the hospital market basket for IPPS hospitals in all areas, subject to a reduction of one-quarter of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals that fail to submit quality information under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act and a reduction of three-quarters of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals not considered to be meaningful electronic health record (EHR) users in accordance with section 1886(b)(3)(B)(ix) of the Act, and then subject to an adjustment based on changes in economy-wide productivity (the multifactor productivity (MFP) adjustment), and an additional reduction of 0.75 percentage point as required by section 1886(b)(3)(B)(xii) of the Act. Sections 1886(b)(3)(B)(xi) and (b)(3)(B)(xii) of the Act, as added by section 3401(a) of the Affordable Care Act, state that application of the MFP adjustment and the additional FY 2019 adjustment of 0.75 percentage point may result in the applicable percentage increase being less than zero.

We note that, in compliance with section 404 of the MMA, in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38587), we replaced the FY 2010-based IPPS operating and capital market baskets with the rebased and revised 2014-based IPPS operating and capital market baskets effective with FY 2018.

In the FY 2019 IPPS/LTCH PPS proposed rule, in accordance with section 1886(b)(3)(B)

of the Act, we proposed to base the proposed FY 2019 market basket update used to determine the applicable percentage increase for the IPPS on IGI's fourth quarter 2017 forecast of the 2014-based IPPS market basket rate-of-increase with historical data through third quarter 2017, which was estimated to be 2.8 percent. Based on the most recent data available for this FY 2019 IPPS/LTCH PPS final rule, in accordance with section 1886(b)(3)(B) of the Act, we are establishing the FY 2019 market basket update used to determine the applicable percentage increase for the IPPS on IGI's second quarter 2018 forecast of the 2014-based IPPS market basket rate-of-increase with historical data through first quarter 2018, which is estimated to be 2.9 percent.

In accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, in section IV.B. of the preamble of the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20382), we proposed an MFP adjustment of 0.8 percent for FY 2019 based on IGI's fourth quarter 2017 forecast. We also proposed that if more recent data subsequently became available, we would use such data, if appropriate, to determine the FY 2019 market basket update and MFP adjustment for the final rule. Based on the most recent data available for this FY 2019 IPPS/LTCH PPS final rule, in accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, in section IV.B. of the preamble of this final rule, we are establishing a MFP adjustment (the 10-year moving average percent change of MFP for the period ending FY 2019) of 0.8 percent.

In the FY 2019 IPPS/LTCH PPS proposed rule, based on IGI's fourth quarter 2017 forecast of the 2014-based IPPS market basket and the MFP adjustment, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act (hereafter referred to as a hospital that submits quality data) and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act (hereafter referred to as a hospital that is a meaningful EHR user), we presented four possible applicable percentage increases that could be applied to the standardized amount.

In accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, in section IV.B. of the preamble of this final rule, we are establishing the applicable percentages increases for the FY 2019 updates based on IGI's second quarter 2018 forecast of the 2014-based IPPS market basket and the MFP adjustment, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act, as shown in the table below.

FY 2019	Hospital submitted quality data and is a meaningful EHR user	Hospital submitted quality data and is NOT a meaningful EHR user	Hospital did NOT submit quality data and is a meaningful EHR user	Hospital did NOT submit quality data and is NOT a meaningful EHR user
Market Basket Rate-of-Increase	2.9	2.9	2.9	2.9
Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0.0	0.0	−0.725	−0.725
Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0.0	−2.175	0.0	−2.175
MFP Adjustment under Section 1886(b)(3)(B)(xi) of the Act	−0.8	−0.8	−0.8	−0.8
Statutory Adjustment under Section 1886(b)(3)(B)(xii) of the Act	−0.75	−0.75	−0.75	−0.75
Applicable Percentage Increase Applied to Standardized Amount	1.35	−0.825	0.625	−1.55

B. Update for SCHs and MDHs for FY 2019

Section 1886(b)(3)(B)(iv) of the Act provides that the FY 2019 applicable percentage increase in the hospital-specific rate for SCHs and MDHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS). As discussed in section IV.G. of the preamble of this final rule, section 205 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10) extended the MDH program through FY 2017 (that is, for discharges occurring on or before September 30, 2017). Section 50205 of the Bipartisan Budget Act of 2018 (Pub. L. 115–123), enacted on February 9, 2018, extended the MDH program for discharges on or after October 1, 2017 through September 30, 2022.

As previously mentioned, the update to the hospital specific rate for SCHs and MDHs is subject to section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act. Accordingly, depending on whether a hospital submits quality data and is a meaningful EHR user, we are establishing the same four possible applicable percentage increases in the table above for the hospital-specific rate applicable to SCHs and MDHs.

C. FY 2019 Puerto Rico Hospital Update

As discussed in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56939), prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. Section 601 of Public Law 114–113 amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount under the amendments to section 1886(d)(9)(E) of the Act, there is no longer a need for us to make an update to the Puerto Rico standardized amount. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the same update to the national standardized amount discussed under section IV.B.1. of the preamble of this final rule. Accordingly, for FY 2019, we are establishing an applicable percentage increase of 1.35 percent to the standardized amount for hospitals located in Puerto Rico.

D. Update for Hospitals Excluded From the IPPS for FY 2019

Section 1886(b)(3)(B)(ii) of the Act is used for purposes of determining the percentage increase in the rate-of-increase limits for children's hospitals, cancer hospitals, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and America Samoa). Section 1886(b)(3)(B)(ii) of the Act sets the percentage increase in the rate-of-increase limits equal to the market basket percentage increase. In accordance with § 403.752(a) of the regulations, RNHCIs are paid under the provisions of § 413.40, which also use section 1886(b)(3)(B)(ii) of the Act to update the percentage increase in the rate-of-increase limits.

Currently, children's hospitals, PPS-excluded cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa are among the remaining types of hospitals still paid under the reasonable cost methodology, subject to the rate-of-increase limits. In addition, in accordance with § 412.526(c)(3) of the regulations, extended neoplastic disease care hospitals (described in § 412.22(i) of the regulations) also are subject to the rate-of-increase limits. As discussed in section VI. of the preamble of this final rule,

in the FY 2018 IPPS/LTCH PPS final rule, we finalized the use of the percentage increase in the 2014-based IPPS operating market basket to update the target amounts for children's hospitals, PPS-excluded cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa for FY 2018 and subsequent fiscal years. In addition, as discussed in section IV.B. of the preamble of this final rule, the update to the target amount for extended neoplastic disease care hospitals for FY 2019 is the percentage increase in the 2014-based IPPS operating market basket. Accordingly, for FY 2019, the rate-of-increase percentage to be applied to the target amount for these children's hospitals, cancer hospitals, RNHCIs, neoplastic disease care hospitals, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa is the FY 2019 percentage increase in the 2014-based IPPS operating market basket. For this final rule, the current estimate of the IPPS operating market basket percentage increase for FY 2019 is 2.9 percent.

E. Update for LTCHs for FY 2019

Section 123 of Public Law 106–113, as amended by section 307(b) of Pub. L. 106–554 (and codified at section 1886(m)(1) of the Act), provides the statutory authority for updating payment rates under the LTCH PPS.

As discussed in section V.A. of the Addendum to this final rule, we are establishing an update to the LTCH PPS standard Federal payment rate of 1.35 percent for FY 2019, consistent with the amendments to section 1886(m)(3) of the Act provided by section 411 of MACRA. In accordance with the LTCHQR Program under section 1886(m)(5) of the Act, we are reducing the annual update to the LTCH PPS standard Federal rate by 2.0 percentage points for failure of a LTCH to submit the required quality data. Accordingly, we are establishing an update factor of 1.0135 in determining the LTCH PPS standard Federal rate for FY 2019. For LTCHs that fail to submit quality data for FY 2019, we are establishing an annual update to the LTCH PPS standard Federal rate of –0.65 percent (that is, the annual update for FY 2019 of 1.35 percent less 2.0 percentage points for failure to submit the required quality data in accordance with section 1886(m)(5)(C) of the Act and our rules) by applying a update factor of 0.9935 in determining the LTCH PPS standard Federal rate for FY 2019. (We note that, as discussed in section VII.D. of the preamble of this final rule, the update to the LTCH PPS standard Federal payment rate of 1.35 percent for FY 2019 does not reflect any budget neutrality factors, such as the offset for the elimination of the LTCH PPS 25-percent threshold policy.)

III. Secretary's Recommendations

MedPAC is recommending an inpatient hospital update in the amount specified in current law for FY 2019. MedPAC's rationale for this update recommendation is described in more detail below. As mentioned above, section 1886(e)(4)(A) of the Act requires that the Secretary, taking into consideration the recommendations of MedPAC, recommend update factors for inpatient hospital services for each fiscal year that take into account the amounts necessary for the efficient and effective delivery of medically appropriate and necessary care of high quality. Consistent with current law, depending on whether a hospital submits quality data and is a meaningful EHR user, we are recommending the four applicable percentage increases to the standardized amount listed in the table under section II. of this Appendix B. We are recommending that the same applicable percentage increases apply to SCHs and MDHs.

In addition to making a recommendation for IPPS hospitals, in accordance with section 1886(e)(4)(A) of the Act, we are recommending update factors for certain other types of hospitals excluded from the IPPS. Consistent with our policies for these facilities, we are recommending an update to the target amounts for children's hospitals, cancer hospitals, RNHCIs, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa and extended neoplastic disease care hospitals of 2.9 percent.

For FY 2019, consistent with policy set forth in section VII. of the preamble of this final rule, for LTCHs that submit quality data, we are recommending an update of 1.35 percent to the LTCH PPS standard Federal rate. For LTCHs that fail to submit quality data for FY 2019, we are recommending an annual update to the LTCH PPS standard Federal rate of –0.65 percent.

IV. MedPAC Recommendation for Assessing Payment Adequacy and Updating Payments in Traditional Medicare

In its March 2018 Report to Congress, MedPAC assessed the adequacy of current payments and costs, and the relationship between payments and an appropriate cost base. MedPAC recommended an update to the hospital inpatient rates in the amount specified in current law. We refer readers to the March 2018 MedPAC report, which is available for download at *www.medpac.gov*, for a complete discussion on this recommendation.

Response: We agree with MedPAC, and consistent with current law, we are applying an applicable percentage increase for FY 2019 of 1.35 percent, provided the hospital submits quality data and is a meaningful EHR user, consistent with statutory requirements.

We note that, because the operating and capital prospective payment systems remain separate, we are continuing to use separate updates for operating and capital payments. The update to the capital rate is discussed in section III. of the Addendum to this final rule.

Medicare Program; Medicare Shared Savings Program; Accountable Care Organizations—Pathways to Success

AGENCY: Centers for Medicare & Medicaid Services (CMS), HHS.

ACTION: Proposed rule.

SUMMARY: Under the Medicare Shared Savings Program (Shared Savings Program), providers of services and suppliers that participate in an Accountable Care Organization (ACO) continue to receive traditional Medicare fee-for-service (FFS) payments under Parts A and B, but the ACO may be eligible to receive a shared savings payment if it meets specified quality and savings requirements. The policies included in this proposed rule would provide a new direction for the Shared Savings Program by establishing pathways to success through redesigning the participation options available under the program to encourage ACOs to transition to two-sided models (in which they may share in savings and are accountable for repaying shared losses). These proposed policies are designed to increase savings for the Trust Funds and mitigate losses, reduce gaming opportunities, and promote regulatory flexibility and free-market principles. The proposed rule also would provide new tools to support coordination of care across settings and strengthen beneficiary engagement; ensure rigorous benchmarking; promote interoperable electronic health record technology among ACO providers/suppliers; and improve information sharing on opioid use to combat opioid addiction.

DATES: To be assured consideration, comments must be received at one of the addresses provided below, no later than 5 p.m. on October 16, 2018.

ADDRESSES: In commenting, please refer to file code CMS–1701–P. Because of staff and resource limitations, we cannot accept comments by facsimile (FAX) transmission.

Comments, including mass comment submissions, must be submitted in one of the following three ways (please choose only one of the ways listed):

1. *Electronically.* You may submit electronic comments on this regulation to *https://www.regulations.gov.* Follow the ''Submit a comment'' instructions.

2. *By regular mail.* You may mail written comments to the following address ONLY: Centers for Medicare & Medicaid Services, Department of Health and Human Services, Attention: CMS–1701–P, P.O. Box 8013, Baltimore, MD 21244–8013.

Please allow sufficient time for mailed comments to be received before the close of the comment period.

3. *By express or overnight mail.* You may send written comments to the following address ONLY: Centers for Medicare & Medicaid Services, Department of Health and Human Services, Attention: CMS–1701–P, Mail Stop C4–26–05, 7500 Security Boulevard, Baltimore, MD 21244–1850.

For information on viewing public comments, see the beginning of the **SUPPLEMENTARY INFORMATION** section.

FOR FURTHER INFORMATION CONTACT: Elizabeth November, (410) 786–8084 or via email at *aco@cms.hhs.gov.*

SUPPLEMENTARY INFORMATION:

Inspection of Public Comments: All comments received before the close of the comment period are available for viewing by the public, including any personally identifiable or confidential business information that is included in a comment. We post all comments received before the close of the comment period on the following website as soon as possible after they have been received: *https://www.regulations.gov.* Follow the search instructions on that website to view public comments.

Comments received timely will also be available for public inspection as they are received, generally beginning approximately 3 weeks after publication of a document, at the headquarters of the Centers for Medicare & Medicaid Services, 7500 Security Boulevard, Baltimore, Maryland 21244, Monday through Friday of each week from 8:30 a.m. to 4 p.m. To schedule an appointment to view public comments, phone 1–800–743–3951.

I. Executive Summary and Background

A. Executive Summary

1. Purpose

Currently, 561 ACOs participate in the Medicare Shared Savings Program (Shared Savings Program). CMS continues to monitor and evaluate program results to look for additional ways to streamline program operations, reduce burden, and facilitate transition to risk that promote a competitive and accountable marketplace, while improving the quality of care for Medicare beneficiaries. This proposed rule would make changes to the regulations for the Shared Savings Program that were promulgated through rulemaking between 2011 and 2017, and are codified in 42 CFR part 425. The changes in this proposed rule are based on the additional program experience we have gained and on lessons learned from testing of Medicare ACO initiatives by the Center for Medicare and Medicaid Innovation (Innovation Center). If these changes are finalized, we will continue to monitor the program's ability to reduce healthcare spending and improve care quality to inform future program developments, including whether the program provides beneficiaries with the value and choice demonstrated by other Medicare options such as Medicare Advantage (MA). We also propose changes to address the new requirements of the Bipartisan Budget Act of 2018 (Pub. L. 115–123) (herein referred to as the Bipartisan Budget Act).

Section 1899 of the Social Security Act (the Act) established the Medicare Shared Savings Program, which promotes accountability for a patient population, fosters coordination of items and services under Medicare Parts A and B, encourages investment in infrastructure and redesigned care processes for high quality and efficient health care service delivery, and promotes higher value care. The Shared Savings Program is a voluntary program that encourages groups of doctors, hospitals, and other health care providers to come together as an ACO to lower growth in expenditures and improve quality. An ACO agrees to be held accountable for the quality, cost, and experience of care of an assigned Medicare FFS beneficiary population. ACOs that successfully meet quality and savings requirements share a percentage of the achieved savings with Medicare.

Shared Savings Program ACOs are an important innovation for moving CMS's payment systems away from paying for volume and towards paying for value and outcomes because ACOs are held accountable for spending in relation to a historical benchmark and for quality performance, including performance on outcome and patient experience measures. The program began in 2012, and as of January 2018, 561 ACOs are participating in the program and serving over 10.5 million Medicare FFS beneficiaries. (See the Medicare Shared Savings Program website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/sharedsavingsprogram/* for information about the program, the program's statutory authority, regulations and guidance, the

program's application process, participating ACOs, and program performance data.)

The Shared Savings Program currently includes three financial models that allow ACOs to select an arrangement that makes the most sense for their organization. The vast majority of Shared Savings Program ACOs, 82 percent in 2018,[1] have chosen to enter and maximize the allowed time under a one-sided, shared savings-only model (Track 1), under which eligible ACOs receive a share of any savings under their benchmark, but are not required to pay back a share of spending over the benchmark. In comparison, there is relatively low participation in the program's two-sided, shared savings and shared losses models, under which eligible ACOs share in a larger portion of any savings under their benchmark, but are required to share losses if spending exceeds the benchmark. Participation in Track 2 (introduced at the start of the program in 2012) has slowly declined in recent years, particularly following the availability of Track 3 (beginning in 2016), although participation in Track 3, the program's highest-risk track, remains modest.

Recently, the Innovation Center designed an additional option available to eligible Track 1 ACOs, referred to as the Track 1+ Model, to facilitate ACOs' transition to performance-based risk. The Track 1+ Model, a time-limited model, began on January 1, 2018, and is based on Shared Savings Program Track 1, but tests a payment design that incorporates more limited downside risk, as compared to Track 2 and Track 3. Our early experience with the design of the Track 1+ Model demonstrates that the availability of a lower-risk, two-sided model is an effective way to encourage Track 1 ACOs (including ACOs within a current agreement period, initial program entrants, and renewing ACOs) to progress more rapidly to performance-based risk. Fifty-five ACOs entered into Track 1+ Model agreements effective on January 1, 2018, the first time the model was offered. These ACOs represent our largest cohort of performance-based risk ACOs to date.

ACOs in two-sided models have shown significant savings to the Medicare program while advancing the quality of care furnished to FFS beneficiaries; but, the majority of ACOs have yet to assume any performance-based risk although they benefit from waivers of certain federal requirements in connection with their participation in the Shared Savings Program. Even more concerning is the finding that one-sided model ACOs, which are not accountable for sharing in losses, have actually increased Medicare spending relative to their benchmarks. Further, the presence of an ''upside-only'' track may be encouraging consolidation in the marketplace, reducing competition and choice for Medicare FFS beneficiaries. While we understand that systems need time to adjust, Medicare cannot afford to continue with models that are not producing desired results.

Our results to date have shown that ACOs in two-sided models perform better over time than one-sided model ACOs, low revenue ACOs, which are typically physician-led, perform better than high revenue ACOs, which often include hospitals, and the longer ACOs are in the program the better they do at achieving the program goals of lowering growth in expenditures and improving quality. For example, in performance year 2016, about 68 percent of Shared Savings Program ACOs in two-sided models (15 of 22 ACOs) shared savings compared to 29 percent of Track 1 ACOs; 41 percent of low revenue ACOs shared savings compared to 23 percent of high revenue ACOs; and 42 percent of April and July 2012 starters shared savings, compared to 36 percent of 2013 and 2014 starters, 26 percent of 2015 starters, and 18 percent of 2016 starters.

We believe that additional policy changes to the Shared Savings Program and its financial models are required to support the move to value, achieve savings for the Medicare program, and promote a competitive and accountable healthcare marketplace. Accordingly, we are proposing to redesign the Shared Savings Program to provide pathways to success in the future through a combination of policy changes, informed by the following guiding principles:

- Accountability—Increase savings for the Medicare Trust Funds, mitigate losses by accelerating the move to two-sided risk by ACOs, and ensure rigorous benchmarking.
- Competition—Promote free-market principles by encouraging the development of physician-only and rural ACOs in order to provide a pathway for physicians to stay independent, thereby preserving beneficiary choice.
- Engagement—Promote regulatory flexibility to allow ACOs to innovate and be successful in coordinating care, improving quality, and engaging with and incentivizing beneficiaries to achieve and maintain good health.
- Integrity—Reduce opportunities for gaming.
- Quality—Improve quality of care for patients with an emphasis on promoting interoperability and the sharing of healthcare data between providers, focusing on meaningful quality measures, and combatting opioid addiction.

The need for a new approach or pathway to transition Track 1 ACOs to performance-based risk is particularly relevant at this time, given the current stage of participation for the initial entrants to the Shared Savings Program under the program's current design. The program's initial entrants are nearing the end of the time allowed under Track 1 (a maximum of two, 3-year agreement periods). Among the program's initial entrants (ACOs that first entered the program in 2012 and 2013), there are 82 ACOs that would be required to renew their participation agreements to enter a third agreement period beginning in 2019, and they face transitioning from a one-sided model to a two-sided model with significant levels of risk that some are not prepared to accept. Another 114 ACOs that have renewed for a second agreement period under a one-sided model, including 59 ACOs that started in 2014 and 55 ACOs that started in 2015, will face a similar transition to a two-sided model with significant levels of risk in 2020 and 2021, respectively. The transition to performance-based risk remains a pressing concern for ACOs, as evidenced by a recent survey of the 82 ACOs that would be required to move to a two-sided payment model in their third agreement period beginning in 2019. The survey results, based on a 43 percent response rate, indicate that these Track 1 ACOs are reluctant to move to two-sided risk under the current design of the program. See National Association of ACOs, Press Release (May 2018), available at *https://www.naacos.com/press-release-may-2-2018.*

We believe the long term success and sustainability of the Shared Savings Program is affected by a combination of key program factors: The savings and losses potential of the program established through the design of the program's tracks; the methodology for setting and resetting the benchmark, which is the basis for determining shared savings and shared losses; the length of the agreement period, which determines the amount of time an ACO remains under a financial model; and the frequency of benchmark rebasing. We believe it is necessary to carefully consider each of these factors to create, on balance, sufficient incentives for participation in a voluntary program,

[1] See, for example, Medicare Shared Savings Program Fast Facts (January 2018), available at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/sharedsavingsprogram/Downloads/SSP-2018-Fast-Facts.pdf.*

while also achieving program goals to increase quality of care for Medicare beneficiaries and reduce expenditure growth to protect the Trust Funds.

In order to achieve these program goals and preserve the long term success and sustainability of the program, we believe it is necessary to create a pathway for ACOs to more rapidly transition to performance-based risk. ACOs and other program stakeholders have urged CMS to smooth the transition to risk by providing more time to gain experience with risk and more incremental levels of risk. The goal of the proposed program redesign is to create a pathway for success that facilitates ACOs' transition to performance-based risk more quickly and makes this transition smooth by phasing-in risk more gradually. Through the creation of a new BASIC track, we would allow ACOs to gain experience with more modest levels of performance-based risk on their way to accepting greater levels of performance-based risk over time (as the proposed BASIC track's maximum level of risk is the same as the Track 1+ Model, which is substantially less than the proposed ENHANCED track). As stakeholders have suggested, we would provide flexibility to allow ACOs that are ready to accelerate their move to higher risk within agreement periods, and enable such ACOs to qualify as Advanced APM entities for purposes of the Quality Payment Program. We would streamline the program and simplify the participation options by retiring Track 1 and Track 2. We would retain Track 3, which we would rename as the ENHANCED track, to encourage ACOs that are able to accept higher levels of potential risk and reward to drive the most significant systematic change in providers' and suppliers' behavior. We would further strengthen the program by establishing policies to deter gaming by limiting more experienced ACOs to higher-risk participation options; more rigorously screening for good standing among ACOs seeking to renew their participation in the program or re-enter the program after termination or expiration of their previous agreement; identifying ACOs re-forming under new legal entities as re-entering ACOs if greater than 50 percent of their ACO participants have recent prior participation in the same ACO in order to hold these ACO accountable for their ACO participants' experience with the program; and holding ACOs in two-sided models accountable for partial-year losses if either the ACO or CMS terminates the agreement before the end of the performance year.

Under the proposed redesign of the program, our policies would recognize the relationship between the ACO's degree of control over total Medicare Parts A and B FFS expenditures for its assigned beneficiaries and its readiness to accept higher or lower degrees of performance-based risk. Comparisons of ACO participants' total Medicare Parts A and B FFS revenue to a factor based on total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries would be used in determining the maximum amount of losses (loss sharing limit) under the BASIC track, the estimated amount of repayment mechanism arrangements for BASIC track ACOs (required for ACOs entering or continuing their participation in a two-sided model to assure CMS of the ACO's ability to repay shared losses), and in determining participation options for ACOs. Using revenue-based loss sharing limits and repayment mechanism amounts for eligible BASIC track ACOs would help to ensure that low revenue ACOs have a meaningful pathway to participate in a two-sided model that may be more consistent with their capacity to assume risk. By basing participation options on the ACO's degree of control over total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries, low revenue ACOs, which tend to be smaller and have less capital, would be able to continue in the program longer under lower levels of risk; whereas high revenue ACOs, which tend to include institutional providers and are typically larger and better capitalized, would be required to move more quickly to higher levels of performance-based risk in the ENHANCED track, because they should be able to exert more influence, direction, and coordination over the full continuum of care. By requiring high revenue ACOs to enter higher levels of performance-based risk under the ENHANCED track after no more than one agreement period under the BASIC track, we aim to drive more meaningful systematic change in these ACOs, which have greater potential to control their assigned beneficiaries' Medicare Parts A and B FFS expenditures by coordinating care across care settings, and thus to achieve significant change in spending. Further, allowing low revenue ACOs a longer period of participation under the lower level of performance-based risk in the BASIC track, while challenging high revenue ACOs to more quickly move to higher levels of performance-based risk, could give rise to more innovative arrangements for lowering growth in expenditures and improving quality, particularly among low revenue ACOs that tend to be composed of independent physician practices.

The program's benchmarking methodology, a complex calculation that incorporates the ACO's risk-adjusted historical expenditures and reflects either national or regional spending trends, is a central feature of the program's financial models. We are proposing to continue to refine the benchmarking approach based on our experience using factors based on regional FFS expenditures in resetting the benchmark in an ACO's second or subsequent agreement period, and to address ACOs' persistent concerns over the risk adjustment methodology. Through the proposed redesign of the program, we would provide for more accurate benchmarks for ACOs that are protective of the Trust Funds by ensuring that ACOs do not unduly benefit from any one aspect of the benchmark calculations, while also helping to ensure the program continues to remain attractive to ACOs, especially those caring for the most complex and highest risk patients who could benefit from high-quality, coordinated care from an ACO.

We would accelerate the use of factors based on regional FFS expenditures in establishing the benchmark by applying this methodology in setting an ACO's benchmark beginning with its first agreement period. This would allow the benchmark to be a more accurate representation of the ACO's costs in relation to its localized market (or regional service area), and could strengthen the incentives of the program to drive meaningful change by ACOs. Further, allowing agreement periods of at least 5 years, as opposed to the current 3-year agreement periods, would provide greater predictability for benchmarks by reducing the frequency of benchmark rebasing, and therefore provide greater opportunity for ACOs to achieve savings against these benchmarks. In combination, these policies would protect the Trust Funds, provide more accurate and predictable benchmarks, and reduce selection costs, while creating incentives for ACOs to transition to performance-based risk.

Currently, the regional adjustment can provide overly inflated benchmarks for ACOs that are relatively low spending compared to their region, while ACOs with higher spending compared to their region may find little value in remaining in the program when faced with a significantly reduced benchmark. To address this dynamic, we would reduce the maximum weight used in calculating the regional adjustment, and cap the adjustment amount for all

agreement periods, so as not to excessively reward or punish an ACO based on where the ACO is located. This would make the benchmark more achievable for ACOs that care for medically complex patients and are high spending compared to their region, thereby encouraging their continued participation, while at the same time preventing windfall shared savings payments for ACOs that have relatively low spending levels relative to their region.

We would also seek to provide more sustainable trend factors for ACOs with high penetration in markets with lower spending growth compared to the nation, and less favorable trend factors for ACOs with high penetration in markets with higher spending growth compared to the nation. This approach would have little impact on ACOs with relatively low to medium penetration in counties in their regional service area.

ACOs and other program stakeholders continue to express concerns that the current methodology for risk adjusting the benchmark for each performance year does not adequately account for changes in acuity and health status of patients over time. We would modify the current approach to risk adjustment to allow changes in health status to be more fully recognized during the agreement period, providing further incentives for continued participation by ACOs faced with higher spending due to the changing health status of their population.

ACOs and other program stakeholders have urged CMS to allow additional flexibility of program and payment policies to engage beneficiaries and provide the care for beneficiaries in the most appropriate care setting. It is also critical that patients have the tools to be more engaged with their doctors in order to play a more active role in their care coordination and the quality of care they receive, and that ACOs empower and incentivize beneficiaries to achieve good health. The recent Bipartisan Budget Act allows for certain new flexibilities for Shared Savings Program ACOs to support these aims, including new beneficiary incentive programs, telehealth services furnished in accordance with section 1899(l) of the Act, and a choice of beneficiary assignment methodology. We would establish policies in accordance with the new law in these areas. For example, in accordance with section 1899(m)(1)(A) of the Act (as added by section 50341 of the Bipartisan Budget Act), we would allow certain ACOs under two-sided risk to establish CMS-approved beneficiary incentive programs, through which an ACO would provide incentive payments to assigned beneficiaries who receive qualifying primary care services. We would establish policies to govern telehealth services furnished in accordance with 1899(l) of the Act by physicians and practitioners in eligible two-sided model ACOs. We would also allow broader access to the program's existing SNF 3-day rule waiver for ACOs under performance-based risk.

Other timely modifications to the program's regulations addressed in this proposed rule, include changes to the program's claims-based assignment methodology and the process for allowing beneficiaries to voluntarily align to ACOs in which the physician or other practitioner they have designated as their primary clinician is an ACO professional, and extending the program's recently finalized policy for addressing extreme and uncontrollable circumstances to performance year 2018 and all subsequent performance years. Further, feedback from the public sought in this rule would inform development of the program's quality measure set to support CMS's Meaningful Measures initiative for reducing provider reporting burden and promoting positive outcomes, and help to identify ways to improve existing data sharing and the quality measure set to address the nation's opioid emergency. Changes to the program's requirements regarding the use of certified electronic health record technology would help ensure Shared Savings Program ACOs are held accountable for using technology that promotes more effective population management and sharing of data among providers, and will ultimately lead to value-based and better care for patients. Lastly, through this proposed rule we seek comment on how Medicare ACOs and the sponsors of stand-alone Part D prescription drug plans (PDPs) could be encouraged to collaborate so as to improve the coordination of pharmacy care for Medicare FFS beneficiaries.

2. Summary of the Major Provisions

This proposed rule would restructure the participation options for ACOs applying to participate in the program in 2019 by discontinuing Track 1 (one-sided shared savings-only model), and Track 2 (two-sided shared savings and shared losses model) while maintaining Track 3 (renamed the ENHANCED track) and offering a new BASIC track. Under the proposed approach, the program's two tracks would be: (i) A BASIC track, offering a path from a one-sided model for eligible ACOs to progressively higher increments of risk and potential reward within a single agreement period, and (ii) an ENHANCED track based on the existing Track 3 (two-sided model), for ACOs that take on the highest level of risk and potential reward. This approach includes proposals for replacing the current 3-year agreement period structure with an agreement period of at least 5 years, allowing eligible BASIC track ACOs greater flexibility to select their level of risk within an agreement period in the glide path, and allowing all BASIC track and ENHANCED track ACOs the flexibility to change their selection of beneficiary assignment methodology prior to the start of each performance year, consistent with the requirement under the Bipartisan Budget Act to provide ACOs with a choice of prospective assignment.

To provide ACOs time to consider the new participation options and prepare for program changes, make investments and other business decisions about participation, obtain buy-in from their governing bodies and executives, and to complete and submit a Shared Savings Program application for a performance year beginning in 2019, we propose to offer a July 1, 2019 start date for the first agreement period under the proposed new participation options. This midyear start in 2019 would also allow both new applicants and ACOs currently participating in the program an opportunity to make any changes to the structure and composition of their ACO as may be necessary to comply with the new program requirements for the ACO's preferred participation option, if changes to the participation options are finalized as proposed. We would forgo the application cycle in 2018 for an agreement start date of January 1, 2019. ACOs entering a new agreement period on July 1, 2019, would have the opportunity to participate in the program under agreement periods spanning 5 years and 6 months, with a 6-month first performance year. Additionally, we would offer ACOs with a participation agreement ending on December 31, 2018 an opportunity to extend their current agreement period for an additional 6-month performance year (January 1, 2019–June 30, 2019). These ACOs would then have the opportunity to apply for a new agreement under the BASIC track or ENHANCED track beginning on July 1, 2019.

We propose modifications to the repayment mechanism arrangement requirements applicable to ACOs in performance-based risk tracks, including changes to update these policies to address new participation options under the BASIC track and, in certain circumstances, allow a renewing

ACO to extend the use of its current repayment mechanism into the next agreement period, which would reduce the financial burden of maintaining two concurrent repayment mechanisms. Repayment mechanism arrangements provide CMS assurance that an ACO can repay losses for which it may be liable. The proposed changes include: (1) Adding a provision that could lower the required repayment mechanism amount for BASIC track ACOs in Levels C, D, or E; (2) adding a provision to permit recalculation of the estimated amount of the repayment mechanism each performance year to account for changes in ACO participant composition; (3) codifying the required duration of repayment mechanism arrangements; (4) adding a provision to allow a renewing ACO the flexibility to maintain a single, existing repayment mechanism arrangement to support its ability to repay shared losses in the new agreement period so long as it is sufficient to cover any increase to the repayment mechanism amount during the new agreement period; and (5) establishing requirements regarding the issuing institutions for a repayment mechanism arrangement.

This proposed rule would establish regulations in accordance with the Bipartisan Budget Act on the use of telehealth services furnished on or after January 1, 2020, by physicians and other practitioners participating in an ACO under performance-based risk that has selected prospective assignment. This policy would allow for payment for telehealth services furnished to prospectively assigned beneficiaries receiving telehealth services in non-rural areas, and allow beneficiaries to receive certain telehealth services at their home, to support care coordination across settings. The proposed rule would also provide for limited waivers of the originating site and geographic requirements to allow for payment for otherwise covered telehealth services provided to beneficiaries who are no longer prospectively assigned to an applicable ACO (and therefore no longer eligible for payment for these services under section 1899(l) of the Act) during a 90-day grace period. In addition, ACO participants would be prohibited, under certain circumstances, from charging beneficiaries for telehealth services, where CMS does not pay for those telehealth services under section 1899(l) solely because the beneficiary was never prospectively assigned to the applicable ACO or was prospectively assigned, but the 90-day grace period has lapsed.

We propose to allow eligible ACOs under performance-based risk under either prospective assignment or preliminary prospective assignment with retrospective reconciliation to use the program's existing SNF 3-day rule waiver. We also propose to amend the existing SNF 3-day rule waiver to allow critical access hospitals (CAHs) and other small, rural hospitals operating under a swing bed agreement to be eligible to partner with eligible ACOs as SNF affiliates for purposes of the SNF 3-day rule waiver.

We propose policies to expand the role of choice and incentives in engaging beneficiaries in their health care. First, we propose to establish regulations in accordance with section 1899(m)(1)(A) of the Act, as added by section 50341 of the Bipartisan Budget Act, to permit ACOs under certain two-sided models to operate CMS-approved beneficiary incentive programs. The beneficiary incentive programs would encourage beneficiaries assigned to certain ACOs to obtain medically necessary primary care services while requiring such ACOs to comply with program integrity and other requirements, as the Secretary determines necessary. Any ACO that operates a CMS-approved beneficiary incentive program would be required to ensure that certain information about its beneficiary incentive program is made available to CMS and the public on its public reporting web page. Second, we propose modifications to the program's existing policies on voluntary alignment in order to comply with the Bipartisan Budget Act, by allowing beneficiaries to designate a broader range of ACO professionals as their ''primary clinician'' responsible for coordinating their overall care, and providing that we will continue to use a beneficiary's designation to align the beneficiary to the ACO in which their primary clinician participates even if the beneficiary does not continue to receive primary care services from an ACO professional in that ACO. We also seek comment on an alternative beneficiary assignment methodology to make the assignment methodology more patient-centered, and strengthen the engagement of beneficiaries in their health care. Under such an approach, a beneficiary would be assigned to an ACO if the beneficiary ''opted-in'' to the ACO. These selections would be supplemented by voluntary alignment and a modified claims-based assignment methodology. Third, to empower beneficiary choice and further program transparency, we are proposing to revise policies related to beneficiary notifications. Specifically, we propose that ACO participants be required to include information on voluntary alignment in the written notifications they must provide to beneficiaries. ACO participants would be required to provide such notifications during each beneficiary's first primary care visit of each performance year, in addition to having such information posted in the ACO participant's facility and available upon request (as currently required).

We propose new policies for determining participation options for ACOs based on the degree to which ACOs control total Medicare Parts A and B FFS expenditures for their assigned beneficiaries (low revenue ACO versus high revenue ACO), and the experience of the ACO's legal entity and ACO participants with the Shared Savings Program and performance-based risk Medicare ACO initiatives.

We also propose to revise the criteria for evaluating the eligibility of ACOs seeking to renew their participation in the program for a subsequent agreement period and ACOs applying to re-enter the program after termination or expiration of the ACO's previous agreement, based on the ACO's prior participation in the Shared Savings Program. We also propose to identify new ACOs as re-entering ACOs if greater than 50 percent of their ACO participants have recent prior participation in the same ACO in order to hold these ACO accountable for their participants' experience with the program. We would use the same criteria to review applications from renewing and re-entering ACOs to more consistently consider ACOs' prior experience in the Shared Savings Program. Under this proposal, we would modify existing review criteria, such as the ACO's history of meeting the quality performance standard and the ACO's timely repayment of shared losses that currently apply to particular performance years of a 3-year agreement period, to ensure applicability to ACOs with an agreement period that is not less than 5 years. We also seek to strengthen the program's requirements for monitoring ACOs within an agreement period for poor financial performance and to ensure that ACOs with poor financial performance are not allowed to continue their participation in the program, or to re-enter the program after being terminated, without addressing the deficiencies that resulted in termination.

We propose to update program policies related to termination of ACOs' participation in the program. We propose to reduce the amount of notice an ACO must provide CMS of its decision to voluntarily terminate. We also address the timing of an ACO's re-entry into the program after termination.

Specifically, we seek to modify current requirements that prevent an ACO from terminating its participation agreement and quickly re-entering the program to allow the flexibility for an ACO in a current 3-year agreement period to terminate its participation agreement and immediately enter a new agreement period of not less than 5 years under one of the redesigned participation options proposed in this rule. We also propose policies that would prevent ACOs from taking advantage of this flexibility to avoid transitioning to risk by repeatedly participating in the BASIC track's glide path for a short time, terminating, and then entering a one-sided model in a future agreement period under the BASIC track. Specifically, we propose to restrict eligibility for the BASIC track's glide path to ACOs inexperienced with performance-based risk Medicare ACO initiatives, which we propose to define to include all levels of the BASIC track's glide path. We also propose to differentiate between initial entrants (ACOs entering the program for the first time), ''re-entering ACOs'' (ACOs re-entering after a break in participation following termination or expiration of a prior participation agreement, and new ACOs identified as re-entering ACOs because greater than 50 percent of their ACO participants have recent prior participation in the same ACO), and ''renewing ACOs'' (ACOs that participate continuously in the program, without interruption, including ACOs that choose to renew early by terminating their current agreement and immediately entering a new agreement period). This differentiation is relevant for determining the agreement period the ACO is entering for purposes of applying policies that phase-in over time (benchmarking methodology and quality performance standards) and for determining whether an ACO can extend the use of its existing repayment mechanism when it enters a new agreement period.

Further, we would impose payment consequences for early termination by proposing to hold ACOs in two-sided models liable for pro-rated shared losses. This approach would apply to ACOs that voluntarily terminate their participation more than midway through a 12-month performance year and all ACOs that are involuntarily terminated by CMS. ACOs would be ineligible to share in savings for a performance year if the effective date of their termination from the program is prior to the last calendar day of the performance year, although we would allow an exception for ACOs that are participating in the program as of January 1, 2019, that terminate their agreement with an effective date of June 30, 2019, and enter a new agreement period under the BASIC track or ENHANCED track beginning July 1, 2019. In these cases, we would perform separate reconciliations to determine shared savings and shared losses for the ACO's first 6 months of participation in 2019 and for the ACO's 6-month performance year from July 1, 2019, to December 31, 2019, under the subsequent participation agreement.

To strengthen ACO financial incentives for continued program participation and improve the sustainability of the program, we propose changes to the methodology for establishing, adjusting, updating and resetting benchmarks for agreement periods beginning on July 1, 2019, and in subsequent years, to include the following:

- Application of factors based on regional FFS expenditures to establish, adjust, and update the ACO's benchmark beginning in an ACO's first agreement period, to move benchmarks away from being based solely on the ACO's historical costs and allow them to better reflect costs in the ACO's region.
- Mitigating the effects of excessive positive or negative regional adjustment used to establish and reset the benchmark by—

++ Reducing the maximum weight used in calculating the regional adjustment from 70 percent to 50 percent (within the existing phase-in schedule for applying increased weights in calculating the regional adjustment); and

++ Capping the amount of the adjustment based on a percentage of national FFS expenditures.

- Calculating growth rates used in trending expenditures to establish the benchmark and in updating the benchmark each performance year as a blend of regional and national expenditure growth rates with increasing weight placed on the national component of the blend as the ACO's penetration in its region increases.
- Better accounting for certain health status changes by using full CMS-Hierarchical Condition Category (HCC) risk scores to adjust the benchmark each performance year, although restricting the upward and downward effects of these adjustments to positive or negative 3 percent over the new agreement period.

This rule also includes proposals for updating the program's policies in a variety of subject areas. We propose to expand the definition of primary care services used in beneficiary assignment to add new codes and revise how we determine whether evaluation and management services were furnished in a SNF. We also propose to extend the policies to address quality performance scoring and determination of shared losses owed by ACOs participating under performance-based risk in the event of extreme or uncontrollable circumstances that were adopted for performance year 2017 to apply for performance year 2018 and subsequent years. We also discuss the potential effects of extreme and uncontrollable circumstances on benchmark year expenditures and the determination of the historical benchmark and seek comment on this issue.

We seek comment on approaches to developing the program's quality measure set in response to the agency's Meaningful Measures initiative as well as to support ACOs and their participating providers/suppliers in addressing opioid utilization within the FFS population. We describe existing sources of program data that may be useful for ACOs to monitor trends in opioid utilization, and solicit comment on suggestions for providing additional aggregate data to ACOs. We also seek comment on quality measures that could be used to assess factors related to opioid utilization, including patient reported outcome measures.

We propose to establish a new program requirement related to the adoption of Certified Electronic Health Record Technology (CEHRT) by eligible clinicians participating in the ACO. Specifically, we propose to require ACOs to certify, upon application to the program and annually thereafter, that the percentage of eligible clinicians participating in the ACO who use CEHRT to document and communicate clinical care to their patients or other health care providers meets or exceeds a specified threshold. For ACOs that are participating in a track (or payment model within a track) that meets the financial risk standard to be an Advanced APM, we further propose to align this requirement with the CEHRT use requirement for Advanced APMs under the Quality Payment Program. In conjunction with this proposal, we propose to discontinue the use of the double-weighted quality measure assessing the percentage of eligible clinicians that successfully meet the Promoting Interoperability Performance Category Base Score (Use of CEHRT, ACO–11) in order to reduce burden and align with the requirements of the Quality Payment Program. We also propose conforming revisions to the CEHRT requirement for Shared Savings

Program ACOs in the Quality Payment Program's regulations under 42 CFR part 414.

Lastly, we seek comment on approaches for encouraging Medicare ACOs to collaborate with the sponsors of stand-alone Part D PDPs (Part D sponsors) to improve the coordination of pharmacy care for Medicare FFS beneficiaries to reduce the risk of adverse events and improve medication adherence. In particular, we seek to understand how Medicare ACOs, and specifically Shared Savings Program ACOs, and Part D sponsors could work together and be encouraged to improve the coordination of pharmacy care for Medicare FFS beneficiaries to achieve better health outcomes, what clinical and pharmacy data may be necessary to support improved coordination of pharmacy care for Medicare FFS beneficiaries, and approaches to structuring financial arrangements to reward ACOs and Part D sponsors for improved health outcomes and lower growth in expenditures for Medicare FFS beneficiaries.

3. Summary of Costs and Benefits

As detailed in section IV of this proposed rule, the proposed faster transition from one-sided model agreements to performance-based risk arrangements, tempered by the option for eligible ACOs of a gentler exposure to downside risk calculated as a percentage of ACO participants' total Medicare Parts A and B FFS revenue and capped at a percentage of the ACO's benchmark, can affect broader participation in performance-based risk in the Shared Savings Program and reduce overall claims costs. A second key driver of estimated net savings is the reduction in shared savings payments from the proposed limitation on the amount of the regional adjustment to the ACO's historical benchmark. Such reduction in overall shared savings payments is projected to result despite the benefit of higher net adjustments expected for a larger number of ACOs from the use of a simpler HCC risk adjustment methodology, the blending of national and regional expenditure growth rates for certain benchmark calculations, and longer (at least 5 years, instead of 3-year) agreement periods that allow ACOs a longer horizon from which to benefit from efficiency gains before benchmark rebasing. Overall, the decreases in claims costs and shared saving payments to ACOs are projected to result in $2.24 billion in federal savings over 10 years.

B. Statutory and Regulatory Background

On March 23, 2010, the Patient Protection and Affordable Care Act (Pub. L. 111–148) was enacted, followed by enactment of the Health Care and Education Reconciliation Act of 2010 (Pub. L. 111–152) on March 30, 2010, which amended certain provisions of Public Law 111–148.

Section 3022 of the Affordable Care Act amended Title XVIII of the Act (42 U.S.C. 1395 *et seq.*) by adding section 1899 to the Act to establish the Shared Savings Program to facilitate coordination and cooperation among health care providers to improve the quality of care for Medicare FFS beneficiaries and reduce the rate of growth in expenditures under Medicare Parts A and B. See 42 U.S.C. 1395jjj.

The final rule establishing the Shared Savings Program appeared in the November 2, 2011 **Federal Register** (Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations; Final Rule (76 FR 67802) (hereinafter referred to as the ''November 2011 final rule'')). We viewed this final rule as a starting point for the program, and because of the scope and scale of the program and our limited experience with shared savings initiatives under FFS Medicare, we built a great deal of flexibility into the program rules.

Through subsequent rulemaking, we have revisited and amended Shared Savings Program policies in light of the additional experience we gained during the initial years of program implementation as well as from testing through the Pioneer ACO Model, the Next Generation ACO Model and other initiatives conducted by the Center for Medicare and Medicaid Innovation (Innovation Center) under section 1115A of the Act. A major update to the program rules appeared in the June 9, 2015 **Federal Register** (Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations; Final Rule (80 FR 32692) (hereinafter referred to as the ''June 2015 final rule'')). A final rule addressing changes related to the program's financial benchmark methodology appeared in the June 10, 2016 **Federal Register** (Medicare Program; Medicare Shared Savings Program; Accountable Care Organizations—Revised Benchmark Rebasing Methodology, Facilitating Transition to Performance-Based Risk, and Administrative Finality of Financial Calculations (81 FR 37950) (hereinafter referred to as the ''June 2016 final rule'')). We have also made use of the annual calendar year (CY) Physician Fee Schedule (PFS) rules to address updates to the Shared Savings Program quality measures, scoring, and quality performance standard, the program's beneficiary assignment methodology and certain other issues.[2]

Policies applicable to Shared Savings Program ACOs have continued to evolve based on changes in the law. The Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) established the Quality Payment Program (Pub. L. 114–10). In the CY 2017 Quality Payment Program final rule with comment period (81 FR 77008), CMS established regulations for the Merit-Based Incentive Payment System (MIPS) and Advanced Alternative Payment Models (APMs) and related policies applicable to eligible clinicians who participate in the Shared Savings Program.

The requirements for assignment of Medicare FFS beneficiaries to ACOs participating under the program were amended by the 21st Century Cures Act (Pub. L. 114–255). Accordingly, we revised the program's regulations in the CY 2018 PFS final rule to reflect these new requirements.

On February 9, 2018, the Bipartisan Budget Act of 2018 was enacted (Pub. L. 115–123), amending section 1899 of the Act to provide for the following: expanded use of telehealth services by physicians or practitioners participating in an applicable ACO to a prospectively assigned beneficiary, greater flexibility in the assignment of Medicare FFS beneficiaries to ACOs by allowing ACOs in tracks under retrospective beneficiary assignment a choice of prospective assignment for the agreement period, permitting Medicare FFS beneficiaries to voluntarily identify an ACO professional as their primary care provider and mandating that any such voluntary identification will supersede claims-based assignment, and allowing ACOs under certain two-sided models

[2] See for example, Medicare Program; Revisions to Payment Policies under the Physician Fee Schedule, Clinical Laboratory Fee Schedule & Other Revisions to Part B for CY 2014; Final Rule (78 FR 74230, Dec. 10, 2013). Medicare Program; Revisions to Payment Policies under the Physician Fee Schedule, Clinical Laboratory Fee Schedule & Other Revisions to Part B for CY 2015; Final Rule (79 FR 67548, Nov. 13, 2014). Medicare Program; Revisions to Payment Policies under the Physician Fee Schedule, Clinical Laboratory Fee Schedule & Other Revisions to Part B for CY 2016; Final Rule (80 FR 70886, Nov. 16, 2015). Medicare Program; Revisions to Payment Policies under the Physician Fee Schedule, Clinical Laboratory Fee Schedule & Other Revisions to Part B for CY 2017; Final Rule (81 FR 80170, Nov. 15, 2016). Medicare Program; Revisions to Payment Policies under the Physician Fee Schedule, Clinical Laboratory Fee Schedule & Other Revisions to Part B for CY 2018; Final Rule (82 FR 52976, Nov. 15, 2017).

to establish CMS-approved beneficiary incentive programs.

II. Provisions of the Proposed Regulations

A. Redesigning Participation Options To Facilitate Transition to Performance-Based Risk

In this section, we discuss a series of interrelated proposals around transition to risk, including: (1) Length of time an ACO may remain under a one-sided model, (2) the levels of risk and reward under the program's participation options, (3) the duration of the ACO's agreement period, and (4) the degree of flexibility ACOs have to choose their beneficiary assignment methodology and also to select their level of risk within an agreement period.

1. Background on Shared Savings Program Participation Options

In this section we review the statutory and regulatory background for the program's participation options by track and the length of the ACO's agreement period for participation in the program, and also provide an overview of current ACO participation in the program for performance year 2018.

a. Background on Development of Track 1, Track 2 and Track 3

Section 1899(d) of the Act establishes the general requirements for shared savings payments to participating ACOs. Specifically, section 1899(d)(1)(A) of the Act specifies that providers of services and suppliers participating in an ACO will continue to receive payment under the original Medicare FFS program under Parts A and B in the same manner as they would otherwise be made, and that an ACO is eligible to receive payment for a portion of savings generated for Medicare provided that the ACO meets both the quality performance standards established by the Secretary and achieves savings against its historical benchmark based on average per capita Medicare FFS expenditures during the 3 years preceding the start of the agreement period. Additionally, section 1899(i) of the Act authorizes the Secretary to use other payment models rather than the one-sided model described in section 1899(d) of the Act, as long as the Secretary determines that the other payment model will improve the quality and efficiency of items and services furnished to Medicare beneficiaries without additional program expenditures.

In the November 2011 final rule establishing the Shared Savings Program (76 FR 67909), we created two tracks from which ACOs could choose to participate: The one-sided model (Track 1) that is based on the statutory payment methodology under section 1899(d) of the Act, and a two-sided model (Track 2) that is also based on the payment methodology under section 1899(d) of the Act, but incorporates performance-based risk using the authority under section 1899(i)(3) of the Act to use other payment models. Under the one-sided model, ACOs can qualify to share in savings but are not responsible for losses. Under a two-sided model, ACOs can qualify to share in savings with an increased sharing rate, but also must take on risk for sharing in losses. ACOs entering the program or renewing their agreement may elect to enter a two-sided model. Once an ACO has elected to participate under a two-sided model, the ACO cannot go into Track 1 for subsequent agreement periods (see § 425.600).

In the initial rulemaking for the program, we considered several approaches to designing the program's participation options, principally: (1) Base the program on a two-sided model, thereby requiring all participants to accept risk from the first program year; (2) allow applicants to choose between program tracks, either a one-sided model or two-sided model, for the duration of the agreement; or (3) allow a choice of tracks, but require ACOs electing the one-sided model to transition to the two-sided model during their initial agreement period (see, for example, 76 FR 19618). We proposed a design for Track 1 whereby ACOs would enter a 3-year agreement period under the one-sided model and would automatically transition to the two-sided model (under Track 2) in the third year of their initial agreement period. Thereafter, those ACOs that wished to continue participating in the Shared Savings Program would only have the option of participating under performance-based risk (see 76 FR 19618). We explained our belief that this approach would have the advantage of providing an entry point for organizations with less experience with risk models, such as some physician-driven organizations or smaller ACOs, to gain experience with population management before transitioning to a risk-based model while also providing an opportunity for more experienced ACOs that are ready to share in losses to enter a sharing arrangement that provides the potential for greater reward in exchange for assuming greater potential responsibility. A few commenters favored this proposed approach, indicating the importance of performance-based risk in the health care delivery system transformation necessary to achieve the program's aims and for ''good stewardship'' of Medicare Trust Fund dollars. However, most commenters expressed concerns about requiring ACOs to quickly accept performance-based risk and we finalized a policy where an ACO could remain under the one-sided model for the duration of its first agreement period (see 76 FR 67904 through 67909).

In earlier rulemaking, we explained that offering multiple tracks with differing degrees of risk across the Shared Savings Program tracks would create an ''on-ramp'' for the program to attract both providers and suppliers that are new to value-based purchasing, as well as more experienced entities that are ready to share performance-based risk. We stated our belief that a one-sided model would have the potential to attract a large number of participants to the program and introduce value-based purchasing broadly to providers and suppliers, many of whom may never have participated in a value-based purchasing initiative before (see, for example, 76 FR 67904 through 67909).

Another reason we included the option for a one-sided track with no downside risk was that this model would be accessible to and attract small, rural, safety net, and/or physician-only ACOs (see 80 FR 32759). Commenters identified groups that may be especially challenged by the upfront costs of ACO formation and operations, including: private primary care practitioners, small to medium sized physician practices, small ACOs, safety net providers (that is, Rural Health Clinics (RHCs), CAHs, Federally Qualified Health Centers (FQHCs), community-funded safety net clinics), and other rural providers (that is, Method II CAHs, rural prospective payment system hospitals designated as rural referral centers, sole community hospitals, Medicare dependent hospitals, or rural primary care providers) (see 76 FR 67834 through 67835). Further, commenters also indicated that ACOs that are composed of small- and medium-sized physician practices, loosely formed physician networks, safety net providers, and small and/or rural ACOs would be encouraged to participate in the program based on the availability of a one-sided model (see, for example, 76 FR 67906). Commenters also expressed concerns about requiring ACOs that may lack experience with care management or managing performance-based risk to quickly transition to performance-based risk, with some commenters suggesting that small, rural and physician-only

ACOs be exempt from downside risk (see, for example, 76 FR 67906).

In establishing the program's initial two track approach, we acknowledged that ACOs new to the accountable care model—and particularly small, rural, safety net, and physician-only ACOs—would benefit from additional time under the one-sided model before being required to accept risk (76 FR 67907). However, we also noted that although a one-sided model could provide incentives for participants to improve quality, it might not be sufficient incentive for participants to improve the efficiency and cost of health care delivery (76 FR 67904 and 80 FR 32759). We explained our belief that payment models where ACOs bear a degree of financial risk have the potential to induce more meaningful systematic change in providers' and suppliers' behavior (see, for example, 76 FR 67907). We also explained our belief that performance-based risk options could have the advantage of providing more experienced ACOs an opportunity to enter a sharing arrangement with the potential for greater reward in exchange for assuming greater potential responsibility (see, for example, 76 FR 67907).

We note that in earlier rulemaking we have used several terms to refer to participation options in the Shared Savings Program under which an ACO is potentially liable to share in losses with Medicare. In the initial rulemaking for the program, we defined ''two-sided model'' to mean a model under which the ACO may share savings with the Medicare program, if it meets the requirements for doing so, and is also liable for sharing any losses incurred (§ 425.20). We have also used the term ''performance-based risk'' to refer to the type of risk an ACO participating in a two-sided model undertakes. As we explained in the November 2011 final rule (76 FR 67945), in a two-sided model under the Shared Savings Program, the Medicare program retains the insurance risk and responsibility for paying claims for the services furnished to Medicare beneficiaries. It is only shared savings payments (and shared losses in a two-sided model) that will be contingent upon ACO performance. The agreement to share risk against the benchmark would be solely between the Medicare program and the ACO. As a result, we have tended to use the terms ''two-sided model'' and ''performance-based risk'' interchangeably, considering them to be synonymous when describing payment models offered under the Shared Savings Program and Medicare ACO initiatives more broadly.

In the June 2015 final rule, we modified the existing policies to allow eligible Track 1 ACOs to renew for a second agreement period under the one-sided model, and to require they enter a performance-based risk track in order to remain in the program for a third or subsequent agreement period. We explained the rationale for these policies in the prior rulemaking and we refer readers to the December 2014 proposed rule and June 2015 final rule for more detailed discussion. (See, for example, 79 FR 72804, and 80 FR 32760 through 32761.) In developing these policies, we considered, but did not finalize, approaches to make Track 1 less attractive for continued participation, in order to support progression to risk, including offering a reduced sharing rate to ACOs remaining under the one-sided model for a second agreement period.[3] We also modified the two-sided performance-based risk track (Track 2) and began to offer an alternative two-sided performance-based risk track (Track 3) for agreement periods beginning on or after January 1, 2016 (80 FR 32771 through 32781). Compared to Track 2, which uses the same preliminary prospective beneficiary assignment methodology with retrospective reconciliation as Track 1, Track 3 includes prospective beneficiary assignment and a higher sharing rate for shared savings as well as the potential for greater liability for shared losses. Further, we established a SNF 3-day rule waiver (discussed further in section II.B of this proposed rule), for use by eligible Track 3 ACOs.

The Innovation Center has tested progressively higher levels of risk for more experienced ACOs through the Pioneer ACO Model (concluded December 31, 2016) and the Next Generation ACO Model (ongoing).[4] Lessons learned from the Pioneer ACO Model were important considerations in the development of Track 3, which incorporates several features of the Pioneer ACO Model, including prospective beneficiary assignment, higher levels of risk and reward (compared to Track 2), and the availability of a SNF–3-day rule waiver. Since Track 3 was introduced as a participation option under the Shared Savings Program, we have seen a growing interest, with 16 Track 3 ACOs completing PY 2016 and 38 Track 3 ACOs participating in PY 2018. The continued increase in the number of ACOs participating in Track 3, a higher proportion of which have achieved shared savings compared to Track 1 ACOs, suggests that the track offers a pathway to improve care for beneficiaries at a level of risk and reward sufficient to induce ACOs to improve their financial performance. For example, for performance year 2016, about 56 percent of Track 3 ACOs (9 of 16 ACOs) achieved shared savings compared to 29 percent of Track 1 ACOs (119 of 410 ACOs). See 2016 Shared Savings Program Accountable Care Organization Public Use File, available at *https://www.cms.gov/Research-Statistics-Data-and-Systems/Downloadable-Public-Use-Files/SSPACO/index.html.*

Further, the Innovation Center has tested two models for providing up-front funding to eligible small, rural, or physician-only Shared Savings Program ACOs. Initially, CMS offered the Advance Payment ACO Model, beginning in 2012 and concluding December 31, 2015. See *https://innovation.cms.gov/initiatives/Advance-Payment-ACO-Model/.* The ACO Investment Model (AIM), which began in 2015, builds on the experience with the Advance Payment ACO Model. The AIM is ongoing, with 45 participating ACOs. See *https://innovation.cms.gov/initiatives/ACO-Investment-Model/.*

In the June 2016 final rule, to further encourage ACOs to transition to performance-based risk, we finalized a participation option for eligible Track 1 ACOs to defer by one year their entrance into a second agreement period under a two-sided model (Track 2 or Track 3) by extending their first agreement period under Track 1 for a fourth performance

[3] See 79 FR 72805 (discussing proposal to reduce the sharing rate by 10 percentage points for ACOs in a second agreement period under Track 1 to make staying in the one-sided model less attractive than moving forward along the risk continuum); 80 FR 32766 (In response to our proposal in the December 2014 proposed rule to offer a 40 percent sharing rate to ACOs that remained in Track 1 for a second agreement period, several commenters recommended dropping the sharing rate under the one-sided model even further to encourage ACOs to more quickly accept performance-based risk, for example to 20 percent, 25 percent or 30 percent under the second agreement period, or making a 5 percentage point reduction for each year under the second agreement period).

[4] See Pioneer ACO Model website, *https://innovation.cms.gov/initiatives/Pioneer-aco-model/* (the Pioneer ACO Model ''was designed for health care organizations and providers that were already experienced in coordinating care for patients across care settings''); see also CMS Press Release, New Participants Join Several CMS Alternative Payment Models (January 18, 2017), available at *https://www.cms.gov/Newsroom/MediaReleaseDatabase/Press-releases/2017-Press-releases-items/2017-01-18.html* (the ''Next Generation ACO Model was designed to test whether strong financial incentives for ACOs can improve health outcomes and reduce expenditures for Medicare fee-for-service beneficiaries. Provider groups in this model assume higher levels of financial risk and reward than are available under the Shared Savings Program.'').

year (§ 425.200(e); 81 FR 37994 through 37997). Under this deferred renewal option, we defer resetting the benchmark as specified at § 425.603 until the beginning of the ACO's second agreement period. This participation option became available to ACOs seeking to enter their second agreement period beginning in 2017 and in subsequent years. However, only a small number of ACOs have made use of this option.

In prior rulemaking for the Shared Savings Program, we have indicated that we would continue to evaluate the appropriateness and effectiveness of our incentives to encourage ACOs to transition to a performance-based risk track and, as necessary, might revisit alternative participation options through future notice and comment rulemaking (81 FR 37995 through 37996). We believe it is timely to reconsider the participation options available under the program in light of the financial and quality results for the first four performance years under the program, participation trends by ACOs, and feedback from ACOs and other program stakeholders' about factors that encourage transition to risk.

b. Background on Factors Affecting Transition to Performance-Based Risk

Based on comments submitted by ACOs and other program stakeholders in response to earlier rulemaking and our experience with implementing the Shared Savings Program, we believe a combination of factors affect ACOs' transition to performance-based risk.[5] These factors include:

(1) Length of time allowed under a one-sided model and availability of options to transition from a one-sided model to a two-sided model within an ACO's agreement period. (Discussed in detail within this section. See also discussion of related background in section II.A.1.a. of this proposed rule.)

(2) An ACO's level of experience with the accountable care model and the Shared Savings Program.[6]

(3) Choice of methodology used to assign beneficiaries to ACOs, which determines the beneficiary population for which the ACO is accountable for both the quality and cost of care. (Background on choice of assignment methodology is discussed within this section; see also section II.A.4 of this proposed rule.) Specifically, the assignment methodology is used to determine the populations that are the basis for determining the ACO's historical benchmark and the population assigned to the ACO each performance year, which is the basis for determining whether the ACO will share in savings or losses for that performance year.

(4) Availability of program and payment flexibilities to ACOs participating under performance-based risk to support beneficiary engagement and the ACO's care coordination activities (see discussion in sections II.B and II.C of this proposed rule).

(5) Financial burden on ACOs in meeting program requirements to enter into two-sided models, specifically the requirement to establish an adequate repayment mechanism (see discussion in section II.A.6.c. of this proposed rule).

(6) Value proposition of the program's financial model under one-sided and two-sided models.

The value proposition of the program's financial models raises a number of key considerations that pertain to an ACO's transition to risk. One consideration is the level of potential reward under the one-sided model in relation to the levels of potential risk and reward under a two-sided model. A second consideration is the availability of asymmetrical levels of risk and reward, such as in the Medicare ACO Track 1+ Model (Track 1+ Model), where, for certain eligible ACOs, the level of risk is determined based on a percentage of ACO participants' total Medicare Parts A and B FFS revenue, not to exceed a percentage of the ACO's benchmark (determined based on historical expenditures for its assigned population). A third consideration is the interactions between the ACO's participation in a two-sided model of the Shared Savings Program and incentives available under other CMS value-based payment initiatives; in particular, eligible clinicians participating in an ACO under a two-sided model of the Shared Savings Program may qualify to receive an APM incentive payment under the Quality Payment Program for sufficient participation in an Advanced APM. Lastly, the value proposition of the program is informed by the methodology for setting and resetting the benchmark, which is the basis for determining shared savings and shared losses, and the length of agreement period, which determines the amount of time an ACO remains under a financial model and the frequency of benchmark rebasing. See discussion in sections II.D. (benchmarking) and II.A.1.c. (length of agreement period) of this proposed rule.

Currently, the design of the program locks in the ACO's choice of financial model, which also determines the applicable beneficiary assignment methodology, for the duration of the ACO's 3-year agreement period. For an ACO's initial or subsequent agreement period in the Shared Savings Program, an ACO applies to participate in a particular financial model (or ''track'') of the program as specified under § 425.600(a). If the ACO's application is accepted, the ACO must remain under that financial model for the duration of its 3-year agreement period. Beneficiary assignment and the level of performance-based risk (if applicable) are determined consistently for all ACOs participating in a particular track. Under Track 1 and Track 2, we assign beneficiaries using preliminary prospective assignment with retrospective reconciliation (§ 425.400(a)(2)). Under Track 3, we prospectively assign beneficiaries (§ 425.400(a)(3)).

As described in earlier rulemaking, commenters have urged that we offer greater flexibility for ACOs in their choice of assignment methodology.[7] In the June 2015 final rule, we acknowledged there is additional complexity and administrative burden to implementing an approach under which ACOs in any track may choose either prospective assignment or preliminary prospective assignment with retrospective reconciliation, with an opportunity to switch their selection on an annual basis. At that time, we declined to implement prospective assignment in Track 1 and Track 2, and

[5] See, for example, 80 FR 32761 (summarizing comments suggesting a combination of factors could make the program more attractive and encourage ACOs to transition to risk, such as: the level of risk and reward offered under the program's financial models, tools to enable ACOs to more effectively control and manage their patient populations, opportunity for ACOs to gain experience with the program under the one-sided model under the same rules that would be applied under a two-sided model, including the assignment methodology, allowing ACOs to move to two-sided risk within an agreement period, and allowing for longer agreement periods).

[6] See discussion in section II.A.1.a of this proposed rule. See also 81 FR 37996 (summarizing comments suggesting that if a Track 1 ACO is uncertain about its ability to successfully manage financial risk, the ACO would more likely simply choose to continue under Track 1 for a second agreement period.)

[7] See, for example, 76 FR 67864 (summarizing comments suggesting allowing ACOs a choice of prospective or retrospective assignment); 80 FR 32772 through 32774 (In response to our proposal to use a prospective assignment methodology in Track 3, many commenters generally encouraged CMS to extend the option for prospective assignment beyond Track 3 to Track 1 and Track 2. Other commenters saw the value in retaining both assignment methodologies, and encouraged CMS to allow all ACOs, regardless of track, a choice of prospective or retrospective assignment. Several commenters suggested CMS allow ACOs a choice of retrospective or prospective assignment annually, within the ACO's 3-year agreement period).

we also declined to give ACOs in Track 3 a choice of either prospective assignment or preliminary prospective assignment with retrospective reconciliation. Further, we explained our belief that implementing prospective assignment only in a two-sided model track may encourage Track 1 ACOs that prefer this assignment methodology, and the other features of Track 3, to more quickly transition to performance-based risk (80 FR 32773).

We also have considered alternative approaches to allow ACOs greater flexibility in the timing of their transition to performance-based risk, including within an ACO's agreement period. For example, as described in earlier rulemaking, commenters suggested approaches that would allow less than two 3-year agreement periods under Track 1.[8] Some commenters recommended that CMS allow ACOs to ''move up'' the risk tracks (that is, move from Track 1 to Track 2 or Track 3, or move from Track 2 to Track 3) between performance years without being required to wait for the start of a new agreement period, to provide more flexibility for ACOs prepared to accept performance-based risk, or a higher level of performance-based risk. These commenters suggested that allowing an ACO to accept varying degrees of risk within an agreement period would position the ACO to best balance its exposure to and tolerance for financial risk and would create a true glide path for participating healthcare providers (81 FR 37995 through 37996).

Transition to performance-based risk has taken on greater significance with the introduction of the Quality Payment Program. Under the CY 2017 Quality Payment Program final rule with comment period,[9] ACO initiatives that require ACOs to bear risk for monetary losses of more than a nominal amount, and that meet additional criteria, can qualify as Advanced APMs beginning in performance year 2017. Eligible clinicians who sufficiently participate in Advanced APMs such that they are Qualifying APM Participants (QPs) for a performance year receive APM Incentive Payments in the corresponding payment year between 2019 through 2024, and then higher fee schedule updates starting in 2026. Track 2 and Track 3 of the Shared Savings Program, and the Track 1+ Model, are currently Advanced APMs under the Quality Payment Program.

ACOs and other program stakeholders continue to express a variety of concerns about the transition to risk under Track 2 and Track 3. For example, as described in the CY 2017 Quality Payment Program final rule with comment period (see, for example, 81 FR 77421 through 77422), commenters suggested a new Shared Savings Program track as a meaningful middle path between Track 1 and Track 2 (''Track 1.5''), that meets the Advanced APM generally applicable nominal amount standard, to create an option for ACOs with relatively low revenue or small numbers of participating eligible clinicians to participate in an Advanced APM without accepting the higher degrees of risk involved in Track 2 and Track 3. Commenters suggested this track would be a viable on-ramp for ACOs to assume greater amounts of risk in the future. Commenters' suggestions for Track 1.5 included prospective beneficiary assignment, asymmetric levels of risk and reward, and payment rule waivers, such as the SNF 3-day rule waiver available to ACOs participating in Shared Savings Program Track 3.[10] Another key component of commenters' suggestions was to allow Track 1 ACOs to transition to Track 1.5 within their current agreement periods.[11] These commenters' suggestions were considered in developing the Track 1+ Model, which began on January 1, 2018. This Model, which is being tested by the Innovation Center, includes a two-sided payment model that incorporates the upside of Track 1 with more limited downside risk than is currently present in Track 2 or Track 3 of the Shared Savings Program. The Track 1+ Model is currently an Advanced APM under the Quality Payment Program.

The Track 1+ Model is designed to encourage ACOs, especially those made up of small physician practices, to advance to performance-based risk. ACOs that include hospitals, including small rural hospitals, are also allowed to participate. See CMS Fact Sheet, New Accountable Care Organization Model Opportunity: Medicare ACO Track 1+ Model, Updated July 2017 (herein Track 1+ Model Fact Sheet), available at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/sharedsavingsprogram/Downloads/New-Accountable-Care-Organization-Model-Opportunity-Fact-Sheet.pdf.* In performance year 2018, 55 ACOs began in the Track 1+ Model, demonstrating strong interest in this financial model design. The availability of the Track 1+ Model increased the number of ACOs participating under a two-sided risk model in connection with their participation in the Shared Savings Program to approximately 18 percent, with approximately 22.7 percent of assigned beneficiaries receiving care through an ACO in a two-sided model. Of the 55 Track 1+ Model ACOs, based on the ACOs' self-reported composition: 58.2 percent attested to the presence of an ownership or operational interest by an inpatient prospective payment system (IPPS) hospital, cancer center or rural hospital with more than 100 beds among their ACO participants, and therefore these ACOs were under a benchmark-based loss sharing limit; and 41.8 percent attested to the absence of such ownership or operational interests by these institutional providers among their ACO participants (likely ACOs composed of independent physician practices and/or ACOs that include small rural hospitals), which qualified these ACOs for generally lower levels of risk under the Track 1+ Model's revenue-based loss sharing limit.

c. Background on Length of Agreement Period

Section 1899(b)(2)(B) of the Act requires participating ACOs to enter into an agreement with CMS to participate in the program for not less than a 3-year period referred to as the agreement period. Further, section 1899(d)(1)(B)(ii) of the Act requires us to reset the benchmark at the start of each agreement period. In initial rulemaking for the program, we limited participation agreements to 3-year periods (see 76 FR 19544, and 76 FR 67807). We have considered the length of the ACO's agreement period in the context of the amount of time an ACO may remain in a one-sided model and

[8] See, for example, 76 FR 67907 through 67909 (discussing comments suggesting ACOs be allowed 3, 4, 5, or 6 years under Track 1 prior to transitioning to a performance-based risk track).

[9] See Merit-Based Incentive Payment System (MIPS) and Alternative Payment Model (APM) Incentive under the Physician Fee Schedule, and Criteria for Physician-Focused Payment Models final rule with comment period, 81 FR 77008 (Nov. 4, 2016), herein referred to as the CY 2017 Quality Payment Program final rule with comment period.

[10] See CY 2017 Quality Payment Program final rule with comment period for summary of comments and responses. Individual comments are available at *https://www.regulations.gov,* search on file code CMS–5517–P, docket ID CMS–2016–0060 (*https://www.regulations.gov/docketBrowser?rpp=25&so=DESC&sb=commentDueDate&po=0&dct=PS&D=CMS-2016-0060*). See for example, Letter from Clif Gaus, NAACOS to Andrew Slavitt, Acting Administrator, Centers for Medicare & Medicaid Services, regarding CMS–5517–P (June 27, 2016); Letter from Tonya K. Wells, Trinity Health to Slavitt regarding CMS–5517–P (June 27, 2016); Letter from Joseph Bisordi, M.D., Ochsner Health System to Slavitt regarding CMS–5517–P (June 27, 2016); Letter from Kevin Bogari, Lancaster General Health Community Care Collaborative to Slavitt regarding CMS–5517–P (June 27, 2016).

[11] See 81 FR 77421 (describing comments suggesting CMS adopt a Track 1.5 and also suggesting that Track 1 ACOs should be permitted to move into this suggested Track 1.5 before the end of their current agreement period).

also the frequency with which we reset (or rebase) the ACO's historical benchmark. For example, in the June 2015 final rule, we discussed commenters' suggestions that we extend the agreement period from the current 3 years to a 5-year agreement period, for all tracks, including not only the initial agreement period, but all subsequent agreement periods.[12] These commenters explained that extending the length of the agreement period would make the program more attractive by increasing program stability and providing ACOs with the necessary time to achieve the desired quality and financial outcomes. We declined to adopt these suggestions, believing at that time it was more appropriate to maintain a 3-year agreement period to provide continuity with the initial design of the program. At that time we did not find it necessary to extend agreement periods past 3 years to address the renewal of initial program entrants, particularly in light of the policies we finalized in the June 2015 final rule allowing Track 1 ACOs to apply to continue under the one-sided model for a second 3-year agreement period and modifying the benchmark rebasing methodology. However, we explained that longer agreement periods could increase the likelihood that ACOs would build on the success or continue the failure of their current agreement period. For this reason we noted our belief that rebasing every 3 years, at the start of each 3-year agreement period, is important to protect both the Trust Funds and ACOs. See 80 FR 32763. See also 81 FR 37957 (noting commenters' suggestions that we eliminate rebasing or reducing the frequency of rebasing).

d. Background on Shared Savings Program Participation

There remains a high degree of interest in participation in the Shared Savings Program. Although most ACOs continue to participate in the program's one-sided model (Track 1), ACOs have demonstrated significant interest in the Track 1+ Model. Table 1 summarizes the total number of ACOs that are participating in the Shared Savings Program, including those also participating in the Track 1+ Model, for performance year 2018 with the total number of assigned beneficiaries by track.[13] Of the 561 ACOs participating in the program as of January 1, 2018, 55 were in the Track 1+ Model, 8 were in Track 2, 38 were in Track 3, and 460 were in Track 1. As of performance year 2018, there are over 20,000 ACO participant Taxpayer Identification Numbers (TINs) that include 377,515 clinicians (physicians, physician assistants, nurse practitioners and clinical nurse specialists) some of whom are in small and solo practices. About half of ACOs are provider networks, and 66 ACOs include rural providers. See Medicare Shared Savings Program Fast Facts (January 2018) available at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/sharedsavingsprogram/Downloads/SSP-2018-Fast-Facts.pdf.*

Based on the program's existing requirements, ACOs can participate in Track 1 for a maximum of two agreement periods. There are a growing number of ACOs that have entered into their second agreement period, and, starting in 2019, many that will begin a third agreement period and will be required to enter a risk-based track.

The progression by some ACOs to performance-based risk within the Shared Savings Program remains relatively slow, with approximately 82 percent of ACOs participating in Track 1 in 2018, 43 percent (196 of 460) of which are within a second agreement period in Track 1.

TABLE 1—ACOs BY TRACK AND NUMBER OF ASSIGNED BENEFICIARIES FOR PERFORMANCE YEAR 2018

Track	Number of ACOs	Number of assigned beneficiaries
Track 1	460	8,147,234
Track 1+ Model	55	1,212,417
Track 2	8	122,995
Track 3	38	993,533
Total	561	10,476,179

However, the recent addition of the Track 1+ Model provided a significant boost in Shared Savings Program ACOs taking on performance-based risk, with over half of the 101 ACOs participating in the Shared Savings Program and taking on performance-based risk opting for the Track 1+ Model in 2018. The lower level of risk offered under the Track 1+ Model has been positively received by the industry and provided a pathway to risk for many ACOs.

2. Proposals for Modified Participation Options Under 5-Year Agreement Periods

In developing the proposed policies described in this section, we considered a number of factors related to the program's current participation options in light of the program's financial results and stakeholders' feedback on program design, including the following.

First, we considered the program's existing policy allowing ACOs up to 6 years of participation in a one-sided model. We have found that the policy has shown limited success in encouraging ACOs to advance to performance-based risk. By the fifth year of implementing the program, only about 18 percent of the program's participating ACOs are under a two-sided model, over half of which are participating in the Track 1+ Model (see Table 1).

As discussed in detail in the Regulatory Impact Analysis (see section IV. of this proposed rule), our experience with the program indicates

[12] See 80 FR 32763. See also 80 FR 32761 (discussing several commenters' recommendation to move to 5 or 6 year agreements for ACOs and the suggestion that ACOs have the opportunity to move to a performance-based risk model during their first agreement period, for example, after their first 3 years under the one-sided model. A commenter suggested encouraging ACOs to transition to two-sided risk by offering lower loss sharing rates for ACOs that move from Track 1 to the two-sided model during the course of an agreement period, and phasing-in loss sharing rates for these ACOs (for example, 15 percent in year 1, 30 percent in year 2, 60 percent in year 3). Another commenter suggested that CMS allow all ACOs (regardless of track) the option to increase their level of risk annually during the agreement period.)

[13] See Performance Year 2018 Medicare Shared Savings Program Accountable Care Organizations available at Data.CMS.gov, *https://data.cms.gov/Special-Programs-Initiatives-Medicare-Shared-Savin/Performance-Year-2018-Medicare-Shared-Savings-Prog/28n4-k8qs/data.*

that ACOs in two-sided models generally perform better than ACOs that participate under a one-sided model. For example, for performance year 2016, about 68 percent of Shared Savings Program ACOs in two-sided models (15 of 22 ACOs) shared savings compared to 29 percent of Track 1 ACOs. For performance year 2015, prior to the first year of Track 3, one of the three remaining Track 2 ACOs shared savings, while about 30 percent of Track 1 ACOs (118 of 389 ACOs) shared savings. For performance year 2014, two of the three remaining Track 2 ACOs shared savings while about 25 percent of Track 1 ACOs (84 of 330 ACOs) shared savings. In the program's first year, concluding December 31, 2013, 40 percent of Track 2 ACOs (2 of 5 ACOs) compared to 23 percent of Track 1 ACOs (50 of 215 ACOs) shared savings. See Shared Savings Program Accountable Care Organization Public Use Files, available at *https://www.cms.gov/Research-Statistics-Data-and-Systems/Downloadable-Public-Use-Files/SSPACO/index.html*. These observations, in combination with participation trends that show ACOs prefer to remain in Track 1 for a second 3-year agreement period, suggests that a requirement for ACOs to more rapidly transition to performance-based risk could be effective in creating incentives for ACOs to more quickly meet the program's goals.

The program's current design lacks a sufficiently incremental progression to performance-based risk, the need for which is evidenced by robust participation in the new Track 1+ Model. We believe a significant issue that contributes to some ACOs' reluctance to participate in Track 2 or Track 3 is that the magnitude of potential losses is very high compared to the ACO's degree of control over the total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries, particularly when its ACO participants have relatively low total Medicare Parts A and B FFS revenue. We are encouraged by the interest in the Track 1+ Model as indicated by the 55 Shared Savings Program ACOs participating in the Model for the performance year beginning on January 1, 2018; the largest group of Shared Savings Program ACOs to enter into performance-based risk for a given performance year to date. Based on the number of ACOs participating in the Track 1+ Model for performance year 2018, a lower risk option appears to be important for Track 1 ACOs with experience in the program seeking to transition to performance-based risk, as well as ACOs seeking to enter an initial agreement period in the program under a lower risk model.

Interest in the Track 1+ Model suggests that the opportunity to participate in an Advanced APM while accepting more moderate levels of risk (compared to Track 2 and Track 3) is an important financial model design for ACOs. Allowing more manageable levels of risk within the Shared Savings Program is an important pathway for helping organizations to gain experience with managing risk as well as participating in Advanced APMs under the Quality Payment Program. The high uptake we have observed with the Track 1+ Model also suggests that the current design of Track 1 may be unnecessarily generous since the Track 1+ Model has the same level of upside as Track 1 but under which ACOs must also assume performance-based risk.

Second, under the program's current design, CMS lacks adequate tools to properly address ACOs with patterns of negative financial performance. Track 1 ACOs are not liable for repaying any portion of their losses to CMS, and therefore may have potentially weaker incentives to improve quality and reduce growth in FFS expenditures within the accountable care model. These ACOs may take advantage of the potential benefits of continued program participation (including the receipt of program data and the opportunity to enter into certain contracting arrangements with ACO participants and ACO providers/suppliers in connection with their participation in the Shared Savings Program), without providing a meaningful benefit to the Medicare program. ACOs under two-sided models may similarly benefit from program participation and seek to continue their participation despite owing shared losses.

Third, differences in performance of ACOs indicate a pattern where low revenue ACOs outperformed high revenue ACOs. As discussed in the Regulatory Impact Analysis (see section IV. of this proposed rule), we have observed a pattern of performance, across tracks and performance years, where low revenue ACOs show better average results compared to high revenue ACOs. We believe high revenue ACOs, which typically include hospitals, have a greater opportunity to control assigned beneficiaries' total Medicare Parts A and B FFS expenditures, as they coordinate a larger portion of the assigned beneficiaries' care across care settings, and have the potential to perform better than what has been demonstrated in performance trends from 2012 through 2016. We conclude that the trends in performance by high revenue ACOs in relation to their expected capacity to control growth in expenditures are indications that these ACOs' performance would improve through greater incentives, principally a requirement to take on higher levels of performance-based risk, and thus drive change in FFS utilization for their Medicare FFS populations. This conclusion is further supported by our initial experience with the Track 1+ Model, for which our preliminary findings support the conclusion that the degree of control an ACO has over expenditures for its assigned beneficiaries is an indication of the level of performance-based risk an ACO is prepared to accept and manage, where control is determined by the relationship between ACO participants' total Medicare Parts A and B FFS revenue and the total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries. Our experience with the Track 1+ Model has also shown that ACO participants' total Medicare Parts A and B FFS revenue as a percentage of the total Medicare Parts A and B FFS expenditures of the assigned beneficiaries can serve as a proxy for ACO composition (that is, whether the ACO includes one or more institutional providers as an ACO participant, and therefore is likely to control a greater share of Medicare Parts A and B FFS expenditures and to have greater ability to coordinate care across settings for its assigned beneficiaries).

Fourth, permitting choice of level of risk and assignment methodology within an ACO's agreement period would create redundancy in some participation options, and eliminating this redundancy would allow CMS to streamline the number of tracks offered while allowing ACOs greater flexibility to design their participation to meet the needs of their organizations. ACOs and stakeholders have indicated a strong preference for maintaining an option to select preliminary prospective assignment with retrospective reconciliation as an alternative to prospective assignment for ACOs under performance-based risk within the Shared Savings Program. We considered what would occur if we retained Track 2 in addition to the ENHANCED track and offered a choice of prospective assignment and preliminary prospective assignment (see section II.A.4.c. of this proposed rule) for both tracks. We believe that ACOs prepared to accept higher levels of benchmark-based risk would be more likely to enter the ENHANCED track (which allows the greatest risk and potential reward). This

is suggested by participation statistics, where 8 ACOs are participating in Track 2 compared to the 38 ACOs participating in Track 3 as of January 1, 2018. We note that for agreement periods beginning in 2018, only 2 ACOs entered Track 2, both of which had deferred renewal in 2017, while 4 ACOs entered Track 3 (for their first or second agreement period). ACOs may be continuing to pick Track 2 because of the preliminary prospective assignment methodology, and we would expect participation in Track 2 to decline further if we finalize the proposal to allow a choice of assignment methodology in the ENHANCED track, since we would expect ACOs ready for higher risk (that is, a level of risk that is higher than the highest level of risk and potential reward under the proposed BASIC track) to prefer the ENHANCED track over Track 2.

Fifth, longer agreement periods could improve program incentives and support ACOs' transition into performance-based risk when coupled with changes to improve the accuracy of the program's benchmarking methodology. Extending agreement periods for more than 3 years could provide more certainty over benchmarks and in turn give ACOs a greater chance to succeed in the program by allowing them more time to understand their performance, gain experience and implement redesigned care processes before rebasing of the ACO's historical benchmark. Shared Savings Program results show that ACOs tend to perform better the longer they remain in the program. Further, under longer agreement periods, historical benchmarks would become more predictable, since the benchmark would continue to be based on the expenditures for beneficiaries who would have been assigned to the ACO in the 3 most recent years prior to the start of the ACO's agreement period (see §§ 425.602(a) and 425.603(c)) and the benchmark would be risk adjusted and updated each performance year relative to benchmark year 3. However, a number of factors can affect the amount of the benchmark, and therefore its predictability, during the agreement period regardless of whether the agreement period spans 3 or 5 years, including: adjustments to the benchmark during the ACO's agreement period resulting from changes in the ACO's certified ACO participant list and regulatory changes to the assignment methodology; as well as variation in the benchmark value that occurs each performance year as a result of annual risk adjustment to the ACO's benchmark (§§ 425.602(a)(9) and 425.603(c)(10)) and annual benchmark updates (§§ 425.602(b) and 425.603(d)). Further, as discussed in section II.D of this proposed rule, we believe the proposed approach to incorporating factors based on regional FFS expenditures in establishing, adjusting and updating the benchmark beginning with the ACO's first agreement period will result in more accurate benchmarks. This improved accuracy of benchmarks would mitigate the impact of the more generous updated benchmarks that could result in the later years of longer agreement periods.

In summary, taking these factors into consideration, we propose to redesign the program's participation options by discontinuing Track 1, Track 2 and the deferred renewal option, and instead offering two tracks that eligible ACOs would enter into for an agreement period of at least 5 years: (1) BASIC track, which would include an option for eligible ACOs to begin participation under a one-sided model and incrementally phase-in risk (calculated based on ACO participant revenue and capped at a percentage of the ACO's updated benchmark) and potential reward over the course of a single agreement period, an approach referred to as a glide path; and (2) ENHANCED track, based on the program's existing Track 3, for ACOs that take on the highest level of risk and potential reward.

We propose to require ACOs to enter one of two tracks for agreement periods beginning on July 1, 2019, and in subsequent years (as described in section II.A.7 of this proposed rule): either the ENHANCED track, which would be based on Track 3 as currently designed and implemented under § 425.610, or the new BASIC track, which would offer eligible ACOs a glide path from a one-sided model to incrementally higher performance-based risk as described in section II.A.3 of this proposed rule. (Herein, we refer to this participation option for eligible ACOs entering the BASIC track as the BASIC track's glide path, or simply the glide path.)

We propose to add a new provision to the Shared Savings Program regulations at § 425.605 to establish the requirements for this BASIC track. The BASIC track would offer lower levels of risk compared to the levels of risk currently offered in Track 2 and Track 3, and the same maximum level of risk as offered under the Track 1+ Model. Compared to the design of Track 1, we believe this glide path approach, which requires assumption of gently increasing levels of risk and potential reward beginning no later than an ACO's fourth performance year under the BASIC track for agreement periods starting on July 1, 2019 (as discussed in section II.A.7 of this proposed rule) or third performance year under the BASIC track for agreement periods starting in 2020 and all subsequent years, could provide stronger incentives for ACOs to improve their performance.

For agreement periods beginning on July 1, 2019, and in subsequent years, we propose to modify the regulations at §§ 425.600 and 425.610 to designate Track 3 as the ENHANCED track. We propose that all references to the ENHANCED track in the program's regulations would be deemed to include Track 3. Within the preamble of this proposed rule, we intend references to the ENHANCED track to apply to Track 3 ACOs, unless otherwise noted.

As part of the redesign of the program's participation options, we believe it is timely to provide the program's tracks with more descriptive and meaningful names. We believe ''enhanced'' is indicative of the increased levels of risk and potential reward available to ACOs under the current design of Track 3, the new tools and flexibilities available to performance-based risk ACOs, and the relative incentives for ACOs under this financial model design to improve the quality of care for their assigned beneficiaries (for example, through the availability of the highest sharing rates based on quality performance under the program) and their potential to drive towards reduced costs for Medicare FFS beneficiaries and therefore increased savings for the Medicare Trust Funds. In contrast, ''basic'' suggests a foundational level, which is reflected in the opportunity under the BASIC track to provide a starting point for ACOs on a pathway to success from a one-sided shared savings model to two-sided risk.

We propose that for agreement periods beginning on July 1, 2019, the length of the agreement would be 5 years and 6 months (as discussed in section II.A.7 of this proposed rule). For agreement periods beginning on January 1, 2020, and in subsequent years, the length of the agreement would be 5 years.

Currently, under § 425.20, we define ''agreement period'' to mean the term of the participation agreement, which is 3 performance years unless otherwise specified in the participation agreement. We propose to revise this definition to more broadly mean the term of the participation agreement. Additionally, we propose to specify the term of participation agreements beginning on July 1, 2019 and in subsequent years in

revisions to § 425.200, which currently specifies the term of the participation agreement for each agreement start date since the beginning of the program. For consistency, we propose to revise the heading in § 425.200(b) from ''term of the participation agreement'' to ''agreement period,'' based on the modification to the definition of ''agreement period'' in § 425.20.

We also propose to revise § 425.502(e)(4)(v), specifying calculation of the quality improvement reward as part of determining the ACO's quality score, which includes language based on 3-year agreement periods. Through these revisions, we would specify that the comparison for performance in the first year of the new agreement period would be the last year in the previous agreement period, rather than the third year of the previous agreement period.

The regulation on renewal of participation agreements (§ 425.224(b)) includes criteria regarding an ACO's quality performance and repayment of shared losses that focus on specific years in the ACO's prior 3-year agreement period. In section II.A.5.c of this proposed rule, we discuss proposals to revise these evaluation criteria to be more relevant to assessing prior participation of ACOs under an agreement period of at least 5 years, among other factors.

For ACOs entering agreement periods beginning on July 1, 2019, and in subsequent years, we propose to allow ACOs annually to elect the beneficiary assignment methodology (preliminary prospective assignment with retrospective reconciliation, or prospective assignment) to apply for each remaining performance year within their agreement period. See discussion in section II.A.4.c of this proposed rule.

For ACOs entering agreement periods beginning on July 1, 2019, and in subsequent years, we propose to allow eligible ACOs in the BASIC track's glide path the option to elect entry into a higher level of risk and potential reward under the BASIC track for each performance year within their agreement period. See discussion in section II.A.4.b.

We propose to discontinue Track 1 as a participation option for the reasons described elsewhere in this section. We propose to amend § 425.600 to limit availability of Track 1 to agreement periods beginning before July 1, 2019.

We propose to discontinue Track 2 as a participation option. We propose to amend § 425.600 to limit availability of Track 2 to agreement periods beginning before July 1, 2019. We based these proposals on the following considerations.

For one, the proposal to allow ACOs to select their assignment methodology (section II.A.4.c) and the availability of the proposed BASIC track with relatively low levels of risk compared to the ENHANCED track would ensure the continued availability of a participation option with moderate levels of risk and potential reward in combination with the optional availability of the preliminary prospective beneficiary assignment in the absence of Track 2. We believe that maintaining Track 2 as a participation option between the lower risk of the proposed BASIC track and the higher risk of the ENHANCED track would create redundancy in participation options, while removing Track 2 would offer an opportunity to streamline the tracks offered.

Although Track 2 was the initial two-sided model of the Shared Savings Program, the statistics on Shared Savings Program participation by track (and in the Track 1+ Model) summarized in Table 1 show few ACOs entering and completing their risk bearing agreement period under Track 2 in recent years, and suggest that ACOs prefer either a lower level of risk and potential reward under the Track 1+ Model or a higher level of risk and potential reward under Track 3 than the Track 2 level of risk and potential reward.

Further, under the proposed modifications to the regulations (see section II.A.5.c of this proposed rule), Track 2 ACOs prepared to take on higher risk would have the option to elect to enter the ENHANCED track by completing their agreement period in Track 2 and applying to renew for a subsequent agreement period under the ENHANCED track or by voluntarily terminating their current 3-year agreement and entering a new agreement period under the ENHANCED track, without waiting until the expiration of their current 3-year agreement period. Certain Track 2 ACOs that may not be prepared for the higher level of risk under the ENHANCED track could instead elect to enter the proposed BASIC track at the highest level of risk and potential reward, under the same circumstances.

We propose to discontinue the policy that allows Track 1 ACOs in their first agreement period to defer renewal for a second agreement period in a two-sided model by 1 year, to remain in their current agreement period for a fourth performance year, and to also defer benchmark rebasing. We propose to amend § 425.200(e) to discontinue the deferred renewal option, so that it would be available to only those Track 1 ACOs that began a first agreement period in 2014 and 2015 and have already renewed their participation agreement under the deferred renewal option and therefore this option would not be available to Track 1 ACOs seeking to renew for a second agreement period beginning on July 1, 2019, or in subsequent years. We propose to amend § 425.200(b)(3) to specify that the extension of a first agreement period in Track 1 under the deferred renewal option is available only for ACOs that began a first agreement period in 2014 or 2015 and therefore deferred renewal in 2017 or 2018 (respectively). We considered the following issues in developing this proposal.

For one, continued availability of this option is inconsistent with our proposed redesign of the program, which encourages rapid transition to performance-based risk and requires ACOs on the BASIC track's glide path to enter performance-based risk within their first agreement period under the BASIC track.

Deferral of benchmark rebasing was likely a factor in some ACOs' decisions to defer renewal, particularly for ACOs concerned about the effects of the rebasing methodology on their benchmark. Under the proposal to extend the length of agreement periods from 3 years to not less than 5 years, benchmark rebasing would be delayed by 2 years (relative to a 3-year agreement), rather than 1 year, as provided under the current deferred renewal policy.

Eliminating the deferred renewal option would streamline the program's participation options and operations. Very few ACOs have elected the deferred renewal participation option, with only 8 ACOs that began participating in the program in either 2014 or 2015 renewing their Shared Savings Program agreement under this option to defer entry into a second agreement period under performance-based risk until 2018 or 2019, respectively. We believe the very low uptake of this option demonstrates that it is not effective at facilitating ACOs' transition to performance-based risk. The proposed timing of applicability would prevent ACOs from electing to defer renewal in 2019 for a second agreement period beginning in 2020.

Further, as discussed in section II.A.5.c of this proposed rule, we are proposing to discontinue the ''sit-out'' period under § 425.222(a), which is cross-referenced in the regulation at § 425.200(e) establishing the deferred renewal option. Under the proposed modifications to § 425.222(a), ACOs that have already been approved to defer renewal until 2019 under this

participation option (ACOs with 2015 start dates in the Shared Savings Program that deferred entering a second agreement period under two-sided risk until January 1, 2019), would have the option of terminating their participation agreement for their second agreement period under Track 2 or Track 3 and applying to enter the BASIC track at the highest level of risk and potential reward (Level E), or the ENHANCED track, for a new agreement period.

Modifying the participation options in the Shared Savings Program to offer a new performance-based risk track requires the use of our authority under section 1899(i)(3) of the Act. To add the BASIC track, we must determine that it will improve the quality and efficiency of items and services furnished to Medicare beneficiaries, without additional program expenditures. Consistent with our earlier discussions of the use of this authority to establish the current two-sided models in the Shared Savings Program (see 76 FR 67904 and 80 FR 32771), we believe that the BASIC track would provide an additional opportunity for organizations to enter a risk-sharing arrangement and accept greater responsibility for beneficiary care.

This proposed restructuring of participation options, more generally, would help ACOs transition to performance-based risk more quickly than under the program's current design. This proposed rule would eliminate Track 1 (under which a one-sided model currently is available for up to 6 years), offering instead a glide path with up to 2 performance years under a one-sided model (three, for ACOs that enter the glide path on July 1, 2019), followed by the incremental phase-in of risk and increasing potential for reward over the remaining 3 performance years of the agreement period. As described in section II.A.5.c. of this proposed rule, we propose that ACOs that previously participated in Track 1, or new ACOs identified as re-entering ACOs because more than 50 percent of their ACO participants have recent prior experience in a Track 1 ACO, entering the BASIC track's glide path would be eligible for a single performance year under a one-sided model (two, for ACOs that enter the glide path on July 1, 2019). As described in section II.A.7. of this proposed rule, we propose a one-time exception to be specified in revisions to § 425.600, under which the automatic advancement policy would not apply to the second performance year for an ACO entering the BASIC track's glide path for an agreement period beginning on July 1, 2019. For performance year 2020, the ACO may remain in the same level of the BASIC track's glide path that it entered for the performance year beginning on July 1, 2019 (6-month period). The ACO would be automatically advanced to the next level of the BASIC track's glide path at the start of performance year 2021 and all subsequent performance years of the agreement period, unless the ACO elects to advance to a higher level of risk and potential reward under the glide path more quickly, as proposed in section II.A.4.b of this proposed rule. The glide path concludes with the ACO entering a level of potential reward that is the same as is currently available under Track 1, with a level of risk that matches the lesser of either the revenue-based or benchmark-based loss sharing limit under the Track 1+ Model.

Further, we believe a significant incentive for ACOs to transition more quickly to the highest level of risk and reward under the BASIC track is the opportunity to participate in an Advanced APM for purposes of the Quality Payment Program. Under the BASIC track's Level E, an ACO's eligible clinicians would have the opportunity to receive APM Incentive Payments and ultimately higher fee schedule updates starting in 2026, in the payment year corresponding to each performance year in which they attain QP status.

As noted in the Regulatory Impact Analysis (section IV. of this proposed rule), the proposed BASIC track is expected to increase participation in performance-based risk by ACOs that may not otherwise take on the higher exposure to risk required in the ENHANCED track (or in the current Track 2). Such added participation in performance-based risk is expected to include a significant number of low revenue ACOs, including physician-led ACOs. These ACOs have shown stronger performance in the first years of the program despite mainly opting to participate in Track 1. Furthermore, the option for BASIC track ACOs to progress gradually toward risk within a single agreement period or accelerate more quickly to the BASIC track's Level E is expected to further expand eventual participation in performance-based risk by ACOs that would otherwise hesitate to immediately transition to this level of risk because of uncertainty related to benchmark rebasing.

Therefore, we do not believe that adding the BASIC track as a participation option under the Shared Savings Program would result in an increase in spending beyond the expenditures that would otherwise occur under the statutory payment methodology in section 1899(d) (as discussed in the Regulatory Impact Analysis in section IV. of this proposed rule). Further, we believe that adding the BASIC track would continue to lead to improvement in the quality of care furnished to Medicare FFS beneficiaries because participating ACOs would have an incentive to perform well on the quality measures in order to maximize the shared savings they may receive and minimize any shared losses they must pay.

This proposed rule includes policy proposals that require that we reassess the policies adopted under the authority of section 1899(i)(3) of the Act to ensure that they comply with the requirements under section 1899(i)(3)(B) of the Act, as discussed in the Regulatory Impact Analysis (see section IV. of this proposed rule). As described in the Regulatory Impact Analysis, the elimination of Track 2 as an on-going participation option, the addition of the BASIC track, the benchmarking changes described in section II.D. of this proposed rule, and the proposal in section II.A.7. of this proposed rule to determine shared savings and shared losses for the 6-month performance years starting on January 1, 2019 and July 1, 2019, using expenditures for the entire calendar year 2019 and then pro-rating these amounts to reflect the shorter performance year, require the use of our authority under section 1899(i) of the Act. These proposed changes to our payment methodology are not expected to result in a situation in which all policies adopted under the authority of section 1899(i) of the Act, when taken together, result in more spending under the program than would have resulted under the statutory payment methodology in section 1899(d) of the Act. We will continue to reexamine this projection in the future to ensure that the requirement under section 1899(i)(3)(B) of the Act that an alternative payment model not result in additional program expenditures continues to be satisfied. In the event that we later determine that the payment model established under section 1899(i)(3) of the Act no longer meets this requirement, we would undertake additional notice and comment rulemaking to make adjustments to the payment model to assure continued compliance with the statutory requirements.

3. Creating a BASIC Track With Glide Path to Performance-Based Risk

a. Overview

We propose that the BASIC track would be available as a participation option for agreement periods beginning on July 1, 2019 and in subsequent years.

Special considerations and proposals with respect to the midyear start of the first BASIC track performance year and the limitation of this first performance year to a 6-month period are discussed in section II.A.7. and, as needed, throughout this preamble.

In general, unless otherwise stated, we are proposing to model the BASIC track on the current provisions governing Shared Savings Program ACOs under 42 CFR part 425, including the general eligibility requirements (subpart B), application procedures (subpart C), program requirements and beneficiary protections (subpart D), beneficiary assignment methodology (subpart E), quality performance standards (subpart F), data sharing opportunities and requirements (subpart H), and benchmarking methodology (which as discussed in section II.D of this proposed rule, we propose to specify in a new section of the regulations at § 425.601). Further, we propose that the policies on reopening determinations of shared savings and shared losses to correct financial reconciliation calculations (§ 425.315), the preclusion of administrative and judicial review (§ 425.800), and the reconsideration process (subpart I) would apply to ACOs participating in the BASIC track in the same manner as for all other Shared Savings Program ACOs. Therefore, we propose to amend certain existing regulations to incorporate references to the BASIC track and the proposed new regulation at § 425.605. This includes amendments to §§ 425.100, 425.315, 425.600, and 425.800. As part of the revisions to § 425.800, we propose to clarify that the preclusion of administrative and judicial review with respect to certain financial calculations applies only to the extent that a specific calculation is performed in accordance with section 1899(d) of the Act.

As discussed in section II.A.4.c. of this proposed rule, we are proposing that ACOs in the BASIC track would have an opportunity to annually elect their choice of beneficiary assignment methodology. As discussed in section II.B. of this proposed rule, we propose to make the SNF 3-day rule waiver available to ACOs in the BASIC track under two-sided risk. If these ACOs select prospective beneficiary assignment, their physicians and practitioners billing under ACO participant TINs would also have the opportunity to provide telehealth services under section 1899(l) of the Act, starting in 2020. As described in section II.C. of this proposed rule, BASIC track ACOs under two-sided risk (Levels C, D, or E) would be allowed to apply for and, if approved, establish a CMS-approved beneficiary incentive program to provide incentive payments to eligible beneficiaries for qualifying services.

We propose that, unless otherwise indicated, all current policies that apply to ACOs under a two-sided model would apply also to ACOs participating under risk within the BASIC track. This includes the selection of a Minimum Savings Rate (MSR)/Minimum Loss Rate (MLR) consistent with the options available under the ENHANCED track, as specified in § 425.610(b)(1) (with related proposals discussed in section II.A.6.b. of this proposed rule), and the requirement to establish and maintain an adequate repayment mechanism under § 425.204(f) (with related proposals discussed in section II.A.6.c. of this proposed rule). ACOs participating under the one-sided models of the BASIC track's glide path (Level A and Level B), would be required to select a MSR/MLR and establish an adequate repayment mechanism prior to their first performance year in performance-based risk. Additionally, the same policies regarding notification of savings and losses and the timing of repayment of any shared losses that apply to ACOs in the ENHANCED track (see § 425.610(h)) would apply to ACOs in two-sided risk models under the BASIC track, including the requirement that an ACO must make payment in full to CMS within 90 days of receipt of notification of shared losses.

As described in section II.E.4 of this proposed rule, we are proposing to extend the policies for addressing the impact of extreme and uncontrollable circumstances on ACO quality and financial performance, as established for performance year 2017 to 2018 and subsequent years. We propose that these policies would also apply to BASIC track ACOs. Section 425.502(f) specifies the approach to calculating an ACO's quality performance score for all affected ACOs. Further, we propose that the policies regarding the calculation of shared losses for ACOs under a two-sided risk model that are affected by extreme and uncontrollable circumstances (see § 425.610(i)) would also apply to BASIC track ACOs under performance-based risk. We also propose to specify that policies to adjust shared losses for extreme and uncontrollable circumstances would also apply to BASIC track ACOs that are reconciled for a 6-month performance year under § 425.609 or a partial year of performance under § 425.221(b)(2) as a result of early termination as described in section II.E.4 and II.A.6.d of this proposed rule.

b. Proposals for Phase-in of Performance-Based Risk in the BASIC Track

(1) Background on Levels of Risk and Reward

To qualify for shared savings, an ACO must have savings equal to or above its MSR, meet the minimum quality performance standards established under § 425.502, and otherwise maintain its eligibility to participate in the Shared Savings Program (§§ 425.604(a)(7), (b) and (c), 425.606(a)(7), (b) and (c), 425.610(a)(7), (b) and (c)). If an ACO qualifies for savings by meeting or exceeding its MSR, then the final sharing rate (based on quality performance) is applied to the ACO's savings on a first dollar basis, to determine the amount of shared savings up to the performance payment limit (§§ 425.604(d) and (e), 425.606(d) and (e), 425.610(d) and (e)).

Under the current program regulations, an ACO that meets all of the requirements for receiving shared savings under the one-sided model can qualify to receive a shared savings payment of up to 50 percent of all savings under its updated benchmark, as determined on the basis of its quality performance, not to exceed 10 percent of its updated benchmark. A Track 2 ACO can potentially receive a shared savings payment of up to 60 percent of all savings under its updated benchmark, not to exceed 15 percent of its updated benchmark. A Track 3 ACO can potentially receive a shared savings payment of up to 75 percent of all savings under its updated benchmark, not to exceed 20 percent of its updated benchmark. The higher sharing rates and performance payment limits under Track 2 and Track 3 were established as incentives for ACOs to accept greater financial risk for their assigned beneficiaries in exchange for potentially higher financial rewards. (See 76 FR 67929 through 67930, 67934 through 67936; 80 FR 32778 through 32779.)

Under the current two-sided models of the Shared Savings Program, an ACO is responsible for sharing losses with the Medicare program when the ACO's average per capita Medicare expenditures for the performance year are above its updated benchmark costs for the year by at least the MLR established for the ACO (§§ 425.606(b)(3), 425.610(b)(3)). For an ACO that is required to share losses with the Medicare program for expenditures over its updated benchmark, the shared loss rate (also

referred to as the loss sharing rate) is determined based on the inverse of its final sharing rate, but may not be less than 40 percent. The loss sharing rate is applied to an ACO's losses on a first dollar basis, to determine the amount of shared losses up to the loss recoupment limit (also referred to as the loss sharing limit) (§§ 425.606(f) and (g), 425.610(f) and (g)).

In earlier rulemaking, we discussed considerations related to establishing the loss sharing rate and loss sharing limit for Track 2 and Track 3. See 76 FR 67937 (discussing shared loss rate and loss sharing limit for Track 2) and 80 FR 32778 through 32779 (including discussion of shared loss rate and loss sharing limit for Track 3). Under Track 2 and Track 3, the loss sharing rate is determined as 1 minus the ACO's final sharing rate based on quality performance, up to a maximum of 60 percent or 75 percent, respectively (except that the loss sharing rate may not be less than 40 percent for Track 3). This creates symmetry between the sharing rates for savings and losses. The 40 percent floor on the loss sharing rate under both Track 2 and Track 3 ensures comparability in the minimum level of performance-based risk that ACOs accept under these tracks. The higher ceiling on the loss sharing rate under Track 3 reflects the greater risk Track 3 ACOs accept in exchange for the possibility of greater reward compared to Track 2.

Under Track 2, the limit on the amount of shared losses phases in over 3 years starting at 5 percent of the ACO's updated historical benchmark in the first performance year of participation in Track 2, 7.5 percent in year 2, and 10 percent in year 3 and any subsequent year. Under Track 3, the loss sharing limit is 15 percent of the ACO's updated historical benchmark, with no phase-in. Losses in excess of the annual limit would not be shared.

The level of risk under both Track 2 and Track 3 exceeds the Advanced APM generally applicable nominal amount standard under § 414.1415(c)(3)(i)(B) (set at 3 percent of the expected expenditures for which an APM Entity is responsible under the APM). CMS has determined that Track 2 and Track 3 meet the Advanced APM criteria under the Quality Payment Program, and are therefore Advanced APMs. Eligible clinicians that sufficiently participate in Advanced APMs such that they are QPs for a performance year receive APM Incentive Payments in the corresponding payment year between 2019 through 2024, and then higher fee schedule updates starting in 2026.

The Track 1+ Model is testing whether combining the upside sharing parameters of the popular Track 1 with limited downside risk sufficient for the model to qualify as an Advanced APM will encourage more ACOs to advance to performance-based risk. The Track 1+ Model has reduced risk in two main ways relative to Track 2 and Track 3. First, losses under the Track 1+ Model are shared at a flat 30 percent loss sharing rate, which is 10 percentage points lower than the minimum quality-adjusted loss sharing rate used in both Track 2 and Track 3. Second, a bifurcated approach is used to set the loss sharing limit for a Track 1+ Model ACO, depending on the ownership and operational interests of the ACO's ACO participants, as identified by TINs and CMS Certification Numbers (CCNs).

The applicable loss sharing limit under the Track 1+ Model is determined based on whether the ACO includes an ACO participant (TIN/CCN) that is an IPPS hospital, cancer center or a rural hospital with more than 100 beds, or that is owned or operated, in whole or in part, by such a hospital or by an organization that owns or operates such a hospital. If at least one of these criteria is met, then a potentially higher level of performance-based risk applies, and the loss sharing limit is set at 4 percent of the ACO's updated historical benchmark (described herein as the benchmark-based loss sharing limit). For the Track 1+ Model, this is a lower level of risk than is required under either Track 2 or Track 3, and greater than the Advanced APM generally applicable nominal amount standard under § 414.1415(c)(3)(i)(B) for 2018, 2019 and 2020. If none of these criteria is met, as may be the case with some ACOs composed of independent physician practices and/or ACOs that include small rural hospitals, then a potentially lower level of performance-based risk applies, and the loss sharing limit is determined as a percentage of the total Medicare Parts A and B FFS revenue of the ACO participants (described herein as the revenue-based loss sharing limit). For Track 1+ Model ACOs under a revenue-based loss sharing limit, in performance years 2018, 2019 and 2020, total liability for shared losses is limited to 8 percent of total Medicare Parts A and B FFS revenue of the ACO participants. If the loss sharing limit, as a percentage of the ACO participants' total Medicare Parts A and B FFS revenue, exceeds the amount that is 4 percent of the ACO's updated historical benchmark, then the loss sharing limit is capped and set at 4 percent of the updated historical benchmark. For performance years 2018 through 2020, this level of performance-based risk qualifies the Track 1+ Model as an Advanced APM under § 414.1415(c)(3)(i)(A). In subsequent years of the Track 1+ Model, if the relevant percentage specified in the Quality Payment Program regulations changes, the Track 1+ Model ACO would be required to take on a level of risk consistent with the percentage required in § 414.1415(c)(3)(i)(A) for an APM to qualify as an Advanced APM.

The loss sharing limit under this bifurcated structure is determined by CMS near the start of an ACO's agreement period under the Track 1+ Model (based on the ACO's application to the Track 1+ Model), and re-determined annually based on an annual certification process prior to the start of each performance year under the Track 1+ Model. The Track 1+ Model ACO's loss sharing limit could be adjusted up or down on this basis. See Track 1+ Model Fact Sheet for more detail.

Since the start of the Shared Savings Program, we have heard a variety of concerns and suggestions from ACOs and other program stakeholders about the transition from a one-sided model to performance-based risk (see discussion in section II.A.1.). Through rulemaking, we developed a one-sided shared savings only model and extended the allowable time in this track to support ACOs' readiness to take on performance-based risk. As a result, the vast majority of Shared Savings Program ACOs have chosen to enter and remain in the one-sided model. We believe that our early experience with the design of the Track 1+ Model demonstrates that the availability of a lower-risk, two-sided model is effective to encourage a large cohort of ACOs to rapidly progress to performance-based risk.

(2) Levels of Risk and Reward in the BASIC Track's Glide Path

In general, we propose the following participation options within the BASIC track.

First, we propose the BASIC track's glide path as an incremental approach to higher levels of risk and potential reward. The glide path includes 5 levels: a one-sided model available only for the first 2 consecutive performance years of a 5-year agreement period (Level A and B), each year of which is identified as a separate level; and three levels of progressively higher risk and potential reward in performance years 3 through 5 of the agreement period (Level C, D, and E). ACOs would be automatically advanced at the start of each participation year along the

progression of risk/reward levels, over the course of a 5-year agreement period, until they reach the track's maximum level of risk/reward (designed to be the same as the level of risk and potential reward as under the Track 1+ Model). The automatic advancement policy would not apply to the second performance year for an ACO entering the BASIC track's glide path for an agreement period beginning July 1, 2019. Such an ACO would enter the BASIC track for its first performance year of July 1, 2019 through December 31, 2019, at its chosen level of the glide path. For performance year 2020, the ACO may remain in the same level of the BASIC track's glide path that it entered for the performance year beginning July 1, 2019 (6-month period). The ACO would be automatically advanced to the next level of the BASIC track's glide path at the start of performance year 2021 and all subsequent performance years of the agreement period (discussed in section II.A.7. of this proposed rule).

We propose that the participation options in the BASIC track's glide path would depend on an ACO's experience with the Shared Savings Program, as described in section II.A.5.c. of this proposed rule. ACOs eligible for the BASIC track's glide path that are new to the program would have the flexibility to enter the glide path at any one of the five levels. However, ACOs that previously participated in Track 1, or a new ACO identified as a re-entering ACO because more than 50 percent of its ACO participants have recent prior experience in a Track 1 ACO, would be ineligible to enter the glide path at Level A, thereby limiting their opportunity to participate in a one-sided model of the glide path. We also propose ACOs would be automatically transitioned to progressively higher levels of risk and potential reward (if higher levels are available) within the remaining years of the agreement period. We propose to allow ACOs in the BASIC track's glide path to more rapidly transition to higher levels of risk and potential reward within the glide path during the agreement period. As described in section II.A.4.b. of this proposed rule, ACOs in the BASIC track may annually elect to take on higher risk and potential reward within their current agreement period, to more rapidly progress along the glide path.

Second, we propose the BASIC track's highest level of risk and potential reward (Level E) may be elected for any performance year by ACOs that enter the BASIC track's glide path, but it will be required no later than the ACO's fifth performance year of the glide path (sixth performance year for eligible ACOs starting participation in Level A of the BASIC track on July 1, 2019, see section II.A.7.). ACOs in the BASIC track's glide path that previously participated in Track 1, or new ACOs identified as re-entering ACOs because more than 50 percent of their ACO participants have recent prior experience in a Track 1 ACO, would be eligible to begin in Level B, and therefore would be required to participate in Level E no later than the ACO's fourth performance year of the glide path (fifth performance year for ACOs starting participation in the BASIC track on July 1, 2019). The level of risk/reward under Level E of the BASIC track is also required for low revenue ACOs eligible to enter an agreement period under the BASIC track that are determined to be experienced with performance-based risk Medicare ACO initiatives (discussed in section II.A.5. of this proposed rule).

We believe that designing a glide path to performance-based risk that concludes with the level of risk and potential reward offered under the Track 1+ Model balances ACOs' interest in remaining under lower-risk options with our goal of more rapidly transitioning ACOs to performance-based risk. The BASIC track's glide path offers a pathway through which ACOs inexperienced with performance-based risk Medicare ACO initiatives can participate under a one-sided model before entering relatively low levels of risk and asymmetrical potential reward for several years, concluding with the lowest level of risk and potential reward available under a current Medicare ACO initiative. We believe the opportunity for eligible ACOs to participate in a one-sided model for up to 2 years (3 performance years, in the case of an ACO entering at Level A of the BASIC track's glide path on July 1, 2019) could offer new ACOs a chance to become experienced with the accountable care model and program requirements before taking on risk. The proposed approach also recognizes that ACOs that gained experience with the program's requirements during prior participation under Track 1, would need less additional time under a one-sided model before making the transition to performance-based risk. However, we also believe the glide path should provide strong incentives for ACOs to quickly move along the progression towards higher performance-based risk, and therefore prefer an approach that significantly limits the amount of potential shared savings in the one-sided model years of the BASIC track's glide path, while offering incrementally higher potential reward in relation to each level of higher risk. Under this approach ACOs would have reduced incentive to enter or remain in the one-sided model of the BASIC track's glide path if they are prepared to take on risk, and we would anticipate that these ACOs would seek to accept greater performance-based risk in exchange for the chance to earn greater reward.

As described in detail in this section, we are proposing a similar asymmetrical two-sided risk design for the BASIC track as is available under the Track 1+ Model, with key distinguishing features based on early lessons learned from the Track 1+ Model. Unless indicated otherwise, we propose that savings would be calculated based on the same methodology used to determine shared savings under the program's existing tracks (see § 425.604). The maximum amount of potential reward under the BASIC track would be the same as the upside of Track 1 and the Track 1+ Model. The methodology for determining shared losses would be a bifurcated approach similar to the approach used under the Track 1+ Model, as discussed in more detail elsewhere in this section. In all years under performance-based risk, we propose to apply asymmetrical levels of risk and reward, where the maximum potential reward would be greater than the maximum level of performance-based risk.

For the BASIC track's glide path, the phase-in schedule of levels of risk/reward by year would be as follows, and are summarized in comparison to the ENHANCED track in Table 2. This progression assumes an ACO enters the BASIC track's glide path under a one-sided model for 2 years and follows the automatic progression of the glide path through each of the 5 years of its agreement period.

- Level A and Level B: Eligible ACOs entering the BASIC track would have the option of being under a one-sided model for up to 2 consecutive performance years (3 consecutive performance years for ACOs that enter the BASIC track's glide path on July 1, 2019). As described elsewhere in this proposed rule, ACOs that previously participated in Track 1, or new ACOs identified as re-entering ACOs because more than 50 percent of their ACO participants have recent prior experience in a Track 1 ACO, would be ineligible to enter the glide path under Level A, although they could enter the under Level B. Under this proposed one-sided model, a final sharing rate not to exceed 25 percent based on quality performance would apply to first dollar shared savings for ACOs that meet or

exceed their MSR. This sharing rate is one-half of the maximum sharing rate of 50 percent currently available under Track 1. Savings would be shared at this rate not to exceed 10 percent of the ACO's updated benchmark, consistent with the current policy for Track 1. For subsequent years, ACOs that wished to continue participating in the Shared Savings Program would be required to participate under performance-based risk.

- Level C risk/reward:

++ Shared Savings: a final sharing rate not to exceed 30 percent based on quality performance would apply to first dollar shared savings for ACOs that meet or exceed their MSR, not to exceed 10 percent of the ACO's updated historical benchmark.

++ Shared Losses: a loss sharing rate of 30 percent regardless of the quality performance of the ACO would apply to first dollar shared losses for ACOs with losses meeting or exceeding their MLR, not to exceed 2 percent of total Medicare Parts A and B FFS revenue for ACO participants. If the loss sharing limit as a percentage of total Medicare Parts A and B FFS revenue for ACO participants exceeds the amount that is 1 percent of the ACO's updated historical benchmark, then the loss sharing limit would be capped and set at 1 percent of the ACO's updated historical benchmark for the applicable performance year. This level of risk is not sufficient to meet the generally applicable nominal amount standard for Advanced APMs under the Quality Payment Program specified in § 414.1415(c)(3)(i).

- Level D risk/reward:

++ Shared Savings: A final sharing rate not to exceed 40 percent based on quality performance would apply to first dollar shared savings for ACOs that meet or exceed their MSR, not to exceed 10 percent of the ACO's updated historical benchmark.

++ Shared Losses: A loss sharing rate of 30 percent regardless of the quality performance of the ACO would apply to first dollar shared losses for ACOs with losses meeting or exceeding their MLR, not to exceed 4 percent of total Medicare Parts A and B FFS revenue for ACO participants. If the loss sharing limit as a percentage of total Medicare Parts A and B FFS revenue for ACO participants exceeds the amount that is 2 percent of the ACO's updated historical benchmark, then the loss sharing limit would be capped and set at 2 percent of the ACO's updated historical benchmark for the applicable performance year. This level of risk is not sufficient to meet the generally applicable nominal amount standard for Advanced APMs under the Quality Payment Program specified in § 414.1415(c)(3)(i).

- Level E risk/reward: The ACO would be under the highest level of risk and potential reward for this track, which is the same level of risk and potential reward being tested in the Track 1+ Model. Further, ACOs that are eligible to enter the BASIC track, but that are ineligible to enter the glide path (as discussed in section II.A.5 of this proposed rule) would enter and remain under Level E risk/reward for the duration of their BASIC track agreement period.

++ Shared Savings: A final sharing rate not to exceed 50 percent based on quality performance would apply to first dollar shared savings for ACOs that meet or exceed their MSR, not to exceed 10 percent of the ACO's updated historical benchmark. This is the same level of potential reward currently available under Track 1 and Track 1+ Model.

++ *Shared Losses:* A loss sharing rate of 30 percent regardless of the quality performance of the ACO would apply to first dollar shared losses for ACOs with losses meeting or exceeding their MLR. The percentage of ACO participants' total Medicare Parts A and B FFS revenue used to determine the revenue-based loss sharing limit would be set for each performance year consistent with the generally applicable nominal amount standard for an Advanced APM under § 414.1415(c)(3)(i)(A) to allow eligible clinicians participating in a BASIC track ACO subject to this level of risk the opportunity to earn the APM incentive payment and ultimately higher fee schedule updates starting in 2026, in the payment year corresponding to each performance year in which they attain QP status. For example, for performance years 2019 and 2020, this would be 8 percent. However, if the loss sharing limit, as a percentage of the ACO participants' total Medicare Parts A and B FFS revenue exceeds the expenditure-based nominal amount standard, as a percentage of the ACO's updated historical benchmark, then the loss sharing limit would be capped at 1 percentage point higher than the expenditure-based nominal amount standard specified under § 414.1415(c)(3)(i)(B), which is calculated as a percentage of the ACO's updated historical benchmark. For example, for performance years 2019 and 2020, the expenditure-based nominal amount standard is 3 percent; therefore, the loss sharing limit for Level E of the BASIC track in these same years would be 4 percent of the ACO's updated historical benchmark. The proposed BASIC track at Level E risk/reward would meet all of the Advanced APM criteria and would be an Advanced APM. (See Table 2 and related notes for additional information and an overview of the Advanced APM criteria.)

This approach initially maintains consistency between the level of risk and potential reward offered under Level E of the BASIC track and the popular Track 1+ Model. We believe this approach to determining the maximum amount of shared losses under Level E of the BASIC track strikes a balance between (1) placing ACOs under a higher level of risk to recognize the greater potential reward under this financial model and the additional tools and flexibilities available to BASIC track ACOs under performance-based risk and (2) establishing an approach to help ensure the maximum level of risk under the BASIC track remains moderate. Specifically, this approach differentiates the level of risk and potential reward under Level E compared to Levels C and D of the BASIC track, by requiring greater risk in exchange for the greatest potential reward under the BASIC track, while still offering more manageable levels of benchmark-based risk than currently offered under Track 2 (in which the loss sharing limit phase-in begins at 5 percent of the ACO's updated benchmark) and Track 3 (15 percent of the ACO's updated benchmark). Further this approach recognizes that eligible ACOs in Level E have the opportunity to earn the greatest share of savings under the BASIC track, and should therefore be accountable for a higher level of losses, particularly in light of their access to tools for care coordination and beneficiary engagement, including furnishing telehealth services in accordance with 1899(l) of the Act, the SNF 3-day rule waiver (as discussed in section II.B of this proposed rule), and the opportunity to implement a CMS-approved beneficiary incentive program (as discussed in section II.C of this proposed rule).

We propose that ACOs entering the BASIC track's glide path would be automatically advanced along the progression of risk/reward levels, at the start of each performance year over the course of the agreement period (except at the start of performance year 2020 for ACOs that start in the BASIC track on July 1, 2019), until they reach the track's maximum level of risk and potential reward. As discussed in section II.A.4.b, BASIC track ACOs in the glide path would also be permitted to elect to advance more quickly to higher levels of

risk and potential reward within their agreement period. The longest possible glide path would be 5 performance years for eligible new ACOs entering the BASIC track (6 performance years for ACOs beginning their participation in the BASIC track on July 1, 2019). The maximum allowed time in Levels A, B, C and D of the glide path would be one performance year (with the exception that ACOs beginning their participation in the BASIC track on July 1, 2019, would have the option to remain at their chosen level of risk and potential reward for their first 2 performance years in the BASIC track). Once the highest level of risk and potential reward is reached on the glide path (Level E), ACOs would be required to remain under the maximum level of risk/reward for all subsequent years of participation in the BASIC track, which includes all years of a subsequent agreement period under the BASIC track for eligible ACOs. Further, an ACO within the BASIC track's glide path could not elect to return to lower levels of risk/reward or the one-sided model within an agreement period under the glide path.

To participate under performance-based risk in the BASIC track, an ACO would be required to establish a repayment mechanism and select a MSR/MLR to be applicable for the years of the agreement period under a two-sided model (as discussed in section II.A.6. of this proposed rule). We propose that an ACO that is unable to meet the program requirements for accepting performance-based risk would not be eligible to enter into a two-sided model under the BASIC track. If an ACO enters the BASIC track's glide path in a one-sided model and is unable to meet the requirements to participate under performance-based risk prior to being automatically transitioned to a performance year under risk, CMS would terminate the ACO's agreement under § 425.218. For example, if an ACO is participating in the glide path in Level B and is unable to establish an adequate repayment mechanism before the start of its performance year under Level C, the ACO would not be permitted to continue its participation in the program.

In section II.A.5.c of this proposed rule, we describe our proposed requirements for determining an ACO's eligibility for participation options in the BASIC track and ENHANCED track based on a combination of factors: ACO participants' Medicare FFS revenue (low revenue ACOs versus high revenue ACOs) and the experience of the ACO legal entity and its ACO participants with performance-based risk Medicare ACO initiatives. Tables 6 and 7 summarize the participation options available to ACOs under the BASIC track and ENHANCED track. As with current program policy, an ACO would apply to enter an agreement period under a specific track. If the ACO's application is accepted, the ACO would remain under that track for the duration of its agreement period.

TABLE 2—COMPARISON OF RISK AND REWARD UNDER BASIC TRACK AND ENHANCED TRACK

	BASIC Track's Glide Path				ENHANCED track (current track 3)
	Level A & Level B (one-sided model)	Level C (risk/reward)	Level D (risk/reward)	Level E (risk/reward)	
Shared Savings (once MSR met or exceeded).	1st dollar savings at a rate of up to 25% based on quality performance; not to exceed 10% of updated benchmark.	1st dollar savings at a rate of up to 30% based on quality performance, not to exceed 10% of updated benchmark.	1st dollar savings at a rate of up to 40% based on quality performance, not to exceed 10% of updated benchmark.	1st dollar savings at a rate of up to 50% based on quality performance, not to exceed 10% of updated benchmark.	No change. 1st dollar savings at a rate of up to 75% based on quality performance, not to exceed 20% of updated benchmark.
Shared Losses (once MLR met or exceeded).	N/A	1st dollar losses at a rate of 30%, not to exceed 2% of ACO participant revenue capped at 1% of updated benchmark.	1st dollar losses at a rate of 30%, not to exceed 4% of ACO participant revenue capped at 2% of updated benchmark.	1st dollar losses at a rate of 30%, not to exceed the percentage of revenue specified in the revenue-based nominal amount standard under the Quality Payment Program (for example, 8% of ACO participant revenue in 2019–2020), capped at a percentage of updated benchmark that is 1 percentage point higher than the expenditure-based nominal amount standard (for example, 4% of updated benchmark in 2019–2020).	No change. 1st dollar losses at a rate of 1 minus final sharing rate (between 40%–75%), not to exceed 15% of updated benchmark.
Annual choice of beneficiary assignment methodology? (see section II.A.4.c).	Yes	Yes	Yes	Yes	Yes.
Annual election to enter higher risk? (see section II.A.4.b).	Yes	Yes	No; ACO will automatically transition to Level E at the start of the next performance year.	No; maximum level of risk/reward under the BASIC track.	No; highest level of risk under Shared Savings Program.
Advanced APM status under the Quality Payment Program? [1] [2].	No	No	No	Yes	Yes.

Notes: [1] To be an Advanced APM, an APM must meet the following three criteria: 1. CEHRT criterion: Requires participants to use certified electronic health record technology (CEHRT); 2. Quality Measures criterion: Provides payment for covered professional services based on quality measures comparable to those used in the quality performance category of the Merit-based Incentive Payment System (MIPS); and 3. Financial Risk criterion: Either (1) be a Medical Home Model expanded under CMS Innovation Center authority; or (2) require participating APM Entities to bear more than a nominal amount of financial risk for monetary losses. See, for example Alternative Payment Models in the Quality Payment Program as of February 2018, available at *https://www.cms.gov/Medicare/Quality-Payment-Program/Resource-Library/Comprehensive-List-of-APMs.pdf.*

[2] As proposed, BASIC track Levels A, B, C and D would not meet the Financial Risk criterion and therefore would not be Advanced APMs. BASIC track Level E and the ENHANCED track would meet all three Advanced APM criteria and thus would qualify as Advanced APMs. These preliminary assessments reflect the policies discussed in this proposed rule. CMS will make a final determination based on the policies adopted in the final rule.

We propose to codify these policies in a new section of the Shared Savings Program regulations governing the BASIC track, at § 425.605. We seek comment on these proposals.

(3) Calculation of Loss Sharing Limit

As we described earlier in this section, under the Track 1+ Model, either a revenue-based or a benchmark-based loss sharing limit is applied based on the Track 1+ Model ACO's self-reported composition of ACO participants as identified by TINs and CCNs, and the ownership of and operational interests in those ACO participants. We have concerns about use of self-reported information for purposes of determining the loss sharing limit in the context of the permanent, national program. The purpose of capturing information on the types of entities that are Track 1+ Model ACO participants and the ownership and operational interests of those ACO participants, as reported by ACOs applying to or participating in the Track 1+ Model, is to differentiate between those ACOs that are eligible for the lower level of risk potentially available under the revenue-based loss sharing limit and those that are subject to the benchmark-based loss sharing limit. For purposes of our proposal to establish the BASIC track in the permanent program, we reconsidered this method of identifying which ACOs are eligible for the revenue-based or benchmark-based loss sharing limits. One concern regarding the Track 1+ Model approach is the burden imposed on ACOs and CMS resulting from reliance on self-reported information. Under the Track 1+ Model, ACOs must collect information about their ACO participant composition and about ownership and operational interests from ACO participants, and potentially others in the TINs' and CCNs' ownership and operational chains, and assess this information to accurately answer questions as required by CMS.[14] These questions are complex and ACOs' ability to respond accurately could vary. Self-reported information is also more complex for CMS to audit. As a result, the use of ACOs' self-reported information in the permanent program could become burdensome for CMS to validate and monitor to ensure program integrity.

Based on CMS's experience with the initial application cycle for the Track 1+ Model, we believe a simpler approach that achieves similar results to the use of self-reported information would be to consider the total Medicare Parts A and B FFS revenue of ACO participants (TINs and CCNs) based on claims data, without directly considering their ownership and operational interests (or those of related entities). As part of the application cycle for the 2018 performance year under the Track 1+ Model, CMS gained experience with calculating estimates of ACO participant revenue to compare with estimates of ACO benchmark expenditures, for purposes of determining the repayment mechanism amounts for the Track 1+ Model (as described in section II.A.6.c of this proposed rule). The methodology for determining repayment mechanism amounts follows a similar bifurcated approach to the one used to determine the applicable loss sharing limit under the Track 1+ Model. Specifically, for ACOs eligible for a revenue-based loss sharing limit, when the specified percentage of estimated total Medicare Parts A and B FFS revenue for ACO participants exceeds a specified percentage of estimated historical benchmark expenditures, the benchmark-based methodology is applied to determine the ACO's loss sharing limit, which serves to cap the revenue-based amount (see Track 1+ Model Fact Sheet for a brief description of the repayment mechanism estimation methodology). Based on our calculations of repayment mechanism amounts for Track 1+ Model ACOs, we observed a high correlation between the loss sharing limits determined using an ACO's self-reported composition, and its ACO participants' total Medicare Parts A and B FFS revenue. For ACOs that reported including an ACO participant that was an IPPS hospital, cancer center or rural hospital with more than 100 beds, or that was owned or operated by, in whole or in part, such a hospital or by an organization that owns or operates such a hospital, the estimated total Medicare Parts A and B FFS revenue for the ACO participants tended to exceed an estimate of the ACO's historical benchmark expenditures for assigned beneficiaries. For ACOs that reported that they did not include an ACO participant that met these ownership and operational criteria, the estimated total Medicare Parts A and B FFS revenue for the ACO participants tended to be less than an estimate of the ACO's historical benchmark expenditures.

We recognize that this analysis was informed by the definitions for ownership and operational interests, and the definitions for IPPS hospital, cancer center and rural hospital with 100 or more beds, used in the Track 1+ Model. However, we believe these observations from the Track 1+ Model support a more generalizable principle about the extent to which ACOs can control total Medicare Parts A and B FFS expenditures for their assigned beneficiaries, and therefore their readiness to take on lower or higher levels of performance-based risk.

In this proposed rule, we use the phrases ''ACO participants' total Medicare Parts A and B FFS revenue'' and ''total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries'' in the discussion of certain proposed policies. For brevity, we sometimes use shorter phrases instead. For instance, we may refer to ACO participant Medicare FFS revenue, or expenditures for the ACO's assigned beneficiaries.

Based on our experience with the Track 1+ Model, we are proposing an approach under which the loss sharing limit for BASIC track ACOs would be determined as a percentage of ACO participants' total Medicare Parts A and B FFS revenue that is capped at a percentage of the ACO's updated historical benchmark expenditures when the amount that is a certain percentage of ACO participant FFS revenue (depending on the BASIC track risk/reward level) exceeds the specified percentage of the ACO's updated historical benchmark expenditures for the relevant BASIC track risk/reward level. Under our proposed approach, we would not directly consider the types of entities included as ACO participants or ownership and operational interests in ACO participants in determining the loss sharing limit that would apply to ACOs under Levels C, D, and E of the BASIC track. We believe that ACOs whose ACO participants have greater total Medicare Parts A and B FFS revenue relative to the ACO's benchmark are better financially prepared to move to greater levels of risk. Accordingly, this comparison of revenue to benchmark would provide a more accurate method for determining an ACO's preparedness to take on additional risk than an ACO's self-reported information regarding the composition of its ACO participants and any ownership and operational interests in those ACO participants.

[14] See Medicare Shared Savings Program, Medicare ACO Track 1+ Model, and SNF 3-Day Rule Waiver, 2018 Application Reference Manual, version #3, July 2017 (herein 2018 Application Reference Manual), available at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/sharedsavingsprogram/Downloads/MSSP-Reference-Table.pdf* (see ''Appendix F. Application Reference Table—For Medicare ACO Track 1+ Model Applicants'', including definitions for institutional providers and ownership and operational interests for the purpose of the Track 1+ Model).

We also believe that ACOs that include a hospital billing through an ACO participant TIN are generally more capable of accepting higher risk given their control over a generally larger amount of their assigned beneficiaries' total Medicare Parts A and B FFS expenditures relative to their ACO participants' total Medicare Parts A and B FFS revenue. As a result, we believe that our proposed approach would tend to place ACOs that include hospitals under a benchmark-based loss sharing limit because their ACO participants typically have higher total Medicare Parts A and B FFS revenue compared to the ACO's benchmark. Less often, the ACO participants in an ACO that includes a hospital billing through an ACO participant TIN have low total Medicare Part A and B FFS revenue compared to the ACO's benchmark. Under a claims-based approach to determining the ACO's loss sharing limit, ACOs with hospitals billing through ACO participant TINs and relatively low ACO participant FFS revenue would be under a revenue-based loss sharing limit.

To illustrate, Table 3 compares two approaches to determining loss liability: a claims-based approach (proposed approach) and self-reported composition (approach used for the Track 1+ Model). The table summarizes information regarding ACO participant composition reported by the Track 1+ Model applicants for performance year 2018 and identifies the percentages of applicants whose self-reported composition would have placed the ACO under a revenue-based loss sharing limit or a benchmark-based loss sharing limit. The table then indicates the outcomes of a claims-based analysis applied to this same cohort of applicants. This analysis indicates the proposed claims-based method produces a comparable result to the self-reported composition method. Further, this analysis suggests that under a claims-based method, ACOs that include institutional providers with relatively low Medicare Parts A and B FFS revenue would be placed under a revenue-based loss sharing limit, which may be more consistent with their capacity to assume risk than an approach that considers only the inclusion of certain institutional providers among the ACO participants and their providers/suppliers (TINs and CCNs).

TABLE 3—DETERMINATION OF LOSS SHARING LIMIT BY SELF-REPORTED COMPOSITION VERSUS CLAIMS-BASED APPROACH FOR TRACK 1+ MODEL APPLICANTS

Approach to determining loss liability	Revenue-based loss sharing limit (%)	Benchmark-based loss sharing limit (%)
Use of applicants' self-reported composition (Track 1+ Model approach)	34	66
Use of claims: percentage of ACO participant revenue compared to percentage of ACO benchmark	38	62

We believe that using ACO participant Medicare FFS revenue to determine the ACO's loss sharing limit balances several concerns. For one, it allows CMS to make a claims-based determination about the ACO's loss limit instead of depending on self-reported information from ACOs. This approach would also alleviate the burden on ACOs of gathering information from ACO participants about their ownership and operational interests and reporting that information to CMS, and would address CMS's concerns about the complexity of auditing the information reported by ACOs.

We are proposing to establish the revenue-based loss sharing limit as the default for ACOs in the BASIC track and to phase-in the percentage of ACO participants' total Medicare Parts A and B FFS revenue as described in section II.A.3.b.2 of this proposed rule. However, if the amount that is the applicable percentage of ACO participants' total Medicare Parts A and B FFS revenue exceeds the amount that is the applicable percentage of the ACO's updated benchmark based on the previously described phase-in schedule, then the ACO's loss sharing limit would be capped and set at this percentage of the ACO's updated historical benchmark. We seek comment on this proposal.

We considered issues related to the generally applicable nominal amount standard for Advanced APMs in our development of the revenue-based loss sharing limit under Level E of the proposed BASIC track. Under § 414.1415(c)(3)(i)(A), the revenue-based nominal amount standard is set at 8 percent of the average estimated total Medicare Parts A and B revenue of all providers and suppliers in a participating APM Entity for QP Performance Periods 2017, 2018, 2019, and 2020. We propose that, for the BASIC track, the percentage of ACO participants' FFS revenue used to determine the revenue-based loss sharing limit for the highest level of risk (Level E) would be set for each performance year consistent with the generally applicable nominal amount standard for an Advanced APM under § 414.1415(c)(3)(i)(A), to allow eligible clinicians participating in a BASIC track ACO subject to the revenue-based loss sharing limit the opportunity to earn the APM incentive payment when the ACO is participating under Level E. For example, for performance years 2019 and 2020, this would be 8 percent. As a result, the proposed BASIC track at Level E risk/reward would meet all of the criteria and be an Advanced APM.

Further, in the CY 2018 Quality Payment Program final rule with comment period, we revised § 414.1415(c)(3)(i)(A) to more clearly indicate that the revenue-based nominal amount standard is determined as a percentage of the revenue of all providers and suppliers in the participating APM Entity (see 82 FR 53836 through 53838). Under the Shared Savings Program, ACOs are composed of one or more ACO participant TINs, which include all providers and suppliers that bill Medicare for items and services that are participating in the ACO. See definitions at § 425.20. In accordance with § 425.116(a)(3), ACO participants must agree to ensure that each provider/supplier that bills through the TIN of the ACO participant agrees to participate in the Shared Savings Program and comply with all applicable requirements. Because all providers/suppliers billing through an ACO participant TIN must agree to participate in the program, for purposes of calculating ACO revenue under the nominal amount standard for Shared Savings Program ACOs, the FFS revenue of the ACO participant TINs is equivalent to the FFS revenue for all providers/suppliers participating in the ACO. Therefore, we intend to perform

these revenue calculations at the ACO participant level.

We propose to calculate the loss sharing limit for BASIC track ACOs in generally the same manner that is used under the Track 1+ Model. However, as discussed elsewhere in this section, we would not rely on an ACO's self-reported composition as used in the Track 1+ Model to determine if the ACO is subject to a revenue-based or benchmark-based loss sharing limit. Instead, we would calculate a revenue-based loss sharing limit for all BASIC track ACOs, and cap this amount as a percentage of the ACO's updated historical benchmark. Generally, calculation of the loss sharing limit would include the following steps:

- Determine ACO participants' total Medicare FFS revenue, which includes total Parts A and B FFS revenue for all providers and suppliers that bill for items and services through the TIN, or a CCN enrolled in Medicare under the TIN, of each ACO participant in the ACO for the applicable performance year.
- Apply the applicable percentage under the proposed phase-in schedule (described in section II.A.3.b.2. of this proposed rule) to this total Medicare Parts A and B FFS revenue for ACO participants to derive the revenue-based loss sharing limit.
- Use the applicable percentage of the ACO's updated benchmark, instead of the revenue-based loss sharing limit, if the loss sharing limit as a percentage of total Medicare Parts A and B FFS revenue for ACO participants exceeds the amount that is the specified percentage of the ACO's updated historical benchmark, based on the phase-in schedule. In that case, the loss sharing limit is capped and set at the applicable percentage of the ACO's updated historical benchmark for the applicable performance year.

To illustrate, Table 4 provides a hypothetical example of the calculation of the loss sharing limit for an ACO participating under Level E of the BASIC track. This example would be relevant, under the proposed policies, for an ACO participating in BASIC track Level E for the performance years beginning on July 1, 2019, and January 1, 2020, based on the percentages of revenue and ACO benchmark expenditures specified in generally applicable nominal amount standards in the Quality Payment Program regulations. In this scenario, the ACO's loss sharing limit would be set at $1,090,479 (8 percent of ACO participant revenue) because this amount is less than 4 percent of the ACO's updated historical benchmark expenditures.

TABLE 4—HYPOTHETICAL EXAMPLE OF LOSS SHARING LIMIT AMOUNTS FOR ACO IN BASIC TRACK LEVEL E

[A] ACO's Total updated benchmark expenditures	[B] ACO Participants' total medicare parts A and B FFS revenue	[C] 8 percent of ACO Participants' total medicare parts A and B FFS revenue ([B] x .08)	[D] 4 percent of ACO's updated benchmark expenditures ([A] x .04)
$93,411,313	$13,630,983	$1,090,479	$3,736,453

More specifically, ACO participants' total Medicare Parts A and B FFS revenue would be calculated as the sum of Medicare paid amounts on all non-denied claims associated with TINs on the ACO's certified ACO participant list, or the CCNs enrolled under an ACO participant TIN as identified in the Provider Enrollment, Chain, and Ownership System (PECOS), for all claim types used in program expenditure calculations that have dates of service during the performance year, using 3 months of claims run out. ACO participant Medicare FFS revenue would not be limited to claims associated with the ACO's assigned beneficiaries, and would instead be based on the claims for all Medicare FFS beneficiaries furnished services by the ACO participant. Further in calculating ACO participant Medicare FFS revenue, we would not truncate a beneficiary's total annual FFS expenditures or adjust to remove indirect medical education (IME), disproportionate share hospital (DSH), or uncompensated care payments or to add back in reductions made for sequestration. ACO participant Medicare FFS revenue would include any payment adjustments reflected in the claim payment amounts (for example, under MIPS or Hospital Value Based Purchasing Program) and would also include individually identifiable final payments made under a demonstration, pilot, or time-limited program, and would be determined using the same completion factor used for annual expenditure calculations.

This approach to calculating ACO participant Medicare FFS revenue is different from our approach to calculating benchmark and performance year expenditures for assigned beneficiaries, which we truncate at the 99th percentile of national Medicare FFS expenditures for assignable beneficiaries, and from which we exclude IME, DSH and uncompensated care payments (see subpart G of the program's regulations). We truncate expenditures to minimize variation from catastrophically large claims. We note that truncation occurs based on an assigned beneficiary's total annual Parts A and B FFS expenditures, and is not apportioned based on services furnished by ACO participant TINs. See Medicare Shared Savings Program, Shared Savings and Losses and Assignment Methodology Specifications (May 2018, version 6) available at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/sharedsavingsprogram/program-guidance-and-specifications.html* (herein Shared Savings and Losses and Assignment Methodology Specifications, version 6). As discussed in earlier rulemaking, we exclude IME, DSH and uncompensated care payments from ACOs' assigned beneficiary expenditure calculations because we do not wish to incentivize ACOs to avoid the types of providers that receive these payments, and for other reasons described in earlier rulemaking (see 76 FR 67919 through 67922, and 80 FR 32796 through 32799). But to accurately determine ACO participants' revenue for purposes of determining a revenue-based loss sharing limit, we believe it is important to include total revenue uncapped by truncation and to include IME, DSH and uncompensated care payments. These payments represent resources available to ACO participants to support their operations and offset their costs and potential shared losses, thereby increasing the ACO's capacity to bear performance-based risk, which we believe should be reflected in the ACO's loss sharing limit. Excluding such payments could undercount revenue and also could be challenging to implement, particularly truncation, since it likely would require

apportioning responsibility for large claims among the ACO participants and non-ACO participants from which the beneficiary may have received the services resulting in the large claims.

Currently, for Track 2 and Track 3 ACOs, the loss sharing limit (as a percentage of the ACO's updated benchmark) is determined each performance year, at the time of financial reconciliation. Consistent with this approach, we would determine the loss sharing limit for BASIC track ACOs annually, at the time of financial reconciliation for each performance year. Further, under the existing policies for the Shared Savings Program, we adjust the historical benchmark annually for changes in the ACO's certified ACO participant list. See §§ 425.602(a)(8) and 425.603(b), (c)(8). See also the Shared Savings and Losses and Assignment Methodology Specifications, version 6. Similarly, the annual determination of a BASIC track ACO's loss sharing limit would reflect changes in ACO composition based on changes to the ACO's certified ACO participant list.

We propose to codify these policies in a new section of the Shared Savings Program regulations governing the BASIC track, at § 425.605. We seek comment on these proposals.

4. Permitting Annual Participation Elections

a. Overview

Background on our consideration of and stakeholders' interest in allowing ACOs the flexibility to elect different participation options within their current agreement period is described in section II.A.1 of this proposed rule. In this section, we propose policies to allow ACOs in the BASIC track's glide path to annually elect to take on higher risk and to allow ACOs in the BASIC track and ENHANCED track to annually elect their choice of beneficiary assignment methodology (either preliminary prospective assignment with retrospective reconciliation or prospective assignment).

b. Proposals for Permitting Election of Differing Levels of Risk Within the BASIC Track's Glide Path

We are proposing to incorporate additional flexibility in participation options by allowing ACOs that enter an agreement period under the BASIC track's glide path an annual opportunity to elect to enter higher levels of performance-based risk within the BASIC track within their agreement period. We believe this flexibility would be important for ACOs entering the glide path under either the one-sided model (Level A or Level B) or the lowest level of risk (Level C) that may seek to transition more quickly to higher levels of risk and potential reward. (We note that an ACO entering the glide path at Level D would be automatically transitioned to Level E in the following year, and an ACO that enters the glide path at Level E must remain at this level for the duration of its agreement period.)

In developing this proposal, we considered that an ACO under performance-based risk has the potential to induce more meaningful systematic change in providers' and suppliers' behavior. We also considered that an ACO's readiness for greater performance-based risk may vary depending on a variety of factors, including the ACO's experience with the program (for example, in relation to its elected beneficiary assignment methodology, composition of ACO participants, and benchmark value) and its ability to coordinate care and carry out other interventions to improve quality and financial performance. Lastly, we considered that an ACO may seek to more quickly take advantage of the features of higher levels of risk and potential reward within the BASIC track's glide path, including: Potential for greater shared savings; increased ability to use telehealth services as provided under section 1899(l) of the Act, use of a SNF 3-day rule waiver, and the opportunity to establish a CMS-approved beneficiary incentive program (described in sections II.B and II.C of this proposed rule); and the opportunity to participate in an Advanced APM under the Quality Payment Program after progressing to Level E of the BASIC track's glide path.

We believe it would be protective of the Trust Funds to restrict ACOs from moving from the BASIC track to the ENHANCED track within their current agreement period. This would guard against selective participation in a financial model with the highest potential level of reward while the ACO remains subject to a benchmark against which it is very confident of its ability to generate shared savings. However, under the proposal to eliminate the sit-out period for re-entry into the program after termination (see discussion in section II.A.5.c of this proposed rule), an ACO (such as a BASIC track ACO) may terminate its participation agreement and quickly enter a new agreement period under a different track (such as the ENHANCED track).

We propose to add a new section of the Shared Savings Program regulations at § 425.226 to govern annual participation elections. Specifically, we propose to allow an ACO in the BASIC track's glide path to annually elect to accept higher levels of performance-based risk, available within the glide path, within its current agreement period. We propose that the annual election for a change in the ACO's level of risk and potential reward must be made in the form and manner, and according to the timeframe, established by CMS. We also propose that an ACO executive who has the authority to legally bind the ACO must certify the election to enter a higher level of risk and potential reward within the agreement period. We propose that the ACO must meet all applicable requirements for the newly selected level of risk, which in the case of ACOs transitioning from a one-sided model to a two-sided model include establishing an adequate repayment mechanism and electing the MSR/MLR that will apply for the remainder of their agreement period under performance-based risk. (See section II.A.6 for a detailed discussion of these requirements.) We propose that the ACO must elect to change its participation option before the start of the performance year in which the ACO wishes to begin participating under a higher level of risk and potential reward. We envision that the timing of an ACO's election would generally follow the timing of the Shared Savings Program's application cycle.

The ACO's participation in the newly selected level of risk and potential reward, if approved, would be effective at the start of the next performance year. In subsequent years, the ACO may again choose to elect a still higher level of risk and potential reward (if a higher risk/reward option is available within the glide path). Otherwise, the automatic transition to higher levels of risk and potential reward in subsequent years would continue to apply to the remaining years of the ACO's agreement period in the glide path. We also propose related changes to § 425.600 to reflect the opportunity for ACOs in the BASIC track's glide path to transition to higher risk and potential reward during an agreement period.

For example, if an eligible ACO enters the glide path in year 1 at Level A (one-sided model) and elects to enter Level D (two-sided model) for year 2, the ACO would automatically transition to Level E (highest level of risk/reward under the BASIC track) for year 3, and would remain in Level E for year 4 and year 5 of the agreement period. We note that ACOs starting in the BASIC track's glide path for an agreement period beginning July 1, 2019 could elect to enter a higher level of risk/reward within the BASIC

track in advance of the performance year beginning January 1, 2020.

In general, we wish to clarify that the proposal to allow ACOs to elect to transition to higher levels risk and potential reward within an agreement period in the BASIC track's glide path does not alter the timing of benchmark rebasing under the proposed new section of the regulations at § 425.601. For example, if an ACO participating in the BASIC track's glide path transitions to a higher level of risk and potential reward during its agreement period, the ACO's historical benchmark would not be rebased as a result of this change. We would continue to assess the ACO's financial performance using the historical benchmark established at the start of the ACO's current agreement period, as adjusted and updated consistent with the benchmarking methodology under the proposed new provision at § 425.601.

c. Proposals for Permitting Annual Election of Beneficiary Assignment Methodology

Section 1899(c)(1) of the Act, as amended by section 50331 of the Bipartisan Budget Act of 2018, provides that the Secretary shall determine an appropriate method to assign Medicare FFS beneficiaries to an ACO based on utilization of primary care services furnished by physicians in the ACO and, in the case of performance years beginning on or after January 1, 2019, services provided by a FQHC or RHC. The provisions of section 1899(c) govern beneficiary assignment under all tracks of the Shared Savings Program. Although, to date, we have designated which beneficiary assignment methodology will apply for each track of the Shared Savings Program, section 1899(c) of the Act (including as amended by the Bipartisan Budget Act) does not expressly require that the beneficiary assignment methodology be determined by track.

Under the Shared Savings Program regulations, we have established two claims-based beneficiary assignment methods (prospective assignment and preliminary prospective assignment with retrospective reconciliation) that currently apply to different program tracks, as well as a non-claims based process for voluntary alignment (discussed in section II.E.2 of this proposed rule) that applies to all program tracks and is used to supplement claims-based assignment. The regulations governing the assignment methodology under the Shared Savings Program are in 42 CFR part 425, subpart E. In the November 2011 final rule, we adopted a claims-based hybrid approach (called preliminary prospective assignment with retrospective reconciliation) for assigning beneficiaries to an ACO (76 FR 67851 through 67870), which is currently applicable to ACOs participating under Track 1 or Track 2 of the Shared Savings Program (except for Track 1 ACOs that are also participating in the Track 1+ Model for which we use a prospective assignment methodology in accordance with our authority under section 1115A of the Act). Under this approach, beneficiaries are preliminarily assigned to an ACO, based on a two-step assignment methodology, at the beginning of a performance year and quarterly thereafter during the performance year, but final beneficiary assignment is determined after the performance year based on where beneficiaries chose to receive the plurality of their primary care services during the performance year. Subsequently, in the June 2015 final rule, we implemented an option for ACOs to participate in a new performance-based risk track, Track 3 (80 FR 32771 through 32781). Under Track 3, beneficiaries are prospectively assigned to an ACO at the beginning of the performance year using the same two-step methodology used in the preliminary prospective assignment approach, based on where the beneficiaries have chosen to receive the plurality of their primary care services during a 12-month assignment window offset from the calendar year that reflects the most recent 12 months for which data are available prior to the start of the performance year. The ACO is held accountable for beneficiaries who are prospectively assigned to it for the performance year. Under limited circumstances, a beneficiary may be excluded from the prospective assignment list, such as if the beneficiary enrolls in MA during the performance year or no longer lives in the United States or U.S. territories and possessions (as determined based on the most recent available data in our beneficiary records regarding residency at the end of the performance year).

Finally, in the CY 2017 PFS final rule (81 FR 80501 through 80510), we augmented the claims-based beneficiary assignment methodology by finalizing a policy under which beneficiaries, beginning in 2017 for assignment for performance year 2018, may voluntarily align with an ACO by designating a ''primary clinician'' (referred to as a ''main doctor'' in the prior rulemaking) they believe is responsible for coordinating their overall care using MyMedicare.gov, a secure, online, patient portal. Notwithstanding the assignment methodology in § 425.402(b), beneficiaries who designate an ACO professional whose services are used in assignment as responsible for their overall care will be prospectively assigned to the ACO in which that ACO professional participates, provided the beneficiary meets the eligibility criteria established at § 425.401(a) and is not excluded from assignment by the criteria in § 425.401(b), and has had at least one primary care service during the assignment window with an ACO professional in the ACO who is a primary care physician or a physician with one of the primary specialty designations included in § 425.402(c). Such beneficiaries will be added prospectively to the ACO's list of assigned beneficiaries for the subsequent performance year. See section II.E.2 of this proposed rule for a discussion of the new provisions regarding voluntary alignment added to section 1899(c) of the Act by section 50331 of the Bipartisan Budget Act, and our related proposed regulatory changes.

Section 50331 of the Bipartisan Budget Act specifies that, for agreement periods entered into or renewed on or after January 1, 2020, ACOs in a track that provides for retrospective beneficiary assignment will have the opportunity to choose a prospective assignment methodology, rather than the retrospective assignment methodology, for the applicable agreement period. The Bipartisan Budget Act incorporates this requirement as a new provision at section 1899(c)(2)(A) of the Act.

In this proposed rule, we are proposing to implement this provision of the Bipartisan Budget Act to provide all ACOs with a choice of prospective assignment for agreement periods beginning July 1, 2019 and in subsequent years. We are also proposing to incorporate additional flexibility into the beneficiary assignment methodology consistent with the Secretary's authority under section 1899(c)(1) of the Act to determine an appropriate beneficiary assignment methodology. We do not believe that section 1899(c) of the Act, as amended by the Bipartisan Budget Act, requires that we must continue to specify the applicable beneficiary assignment methodology for each track of the Shared Savings Program. Although section 1899(c)(2)(A) of the Act now provides that ACOs must be permitted to choose prospective assignment for each agreement period, we do not believe this requirement limits our discretion to allow ACOs the

additional flexibility to change beneficiary assignment methodologies more frequently during an agreement period. As summarized in section II.A.1 of this proposed rule and as described in detail in earlier rulemaking, commenters have urged us to allow greater flexibility for ACOs to select their assignment methodology. Accordingly, we are proposing an approach that separates the choice of beneficiary assignment methodology from the choice of participation track (financial model), and that allows ACOs to make an annual election of assignment methodology. Such an approach would afford greater flexibility for ACOs to choose between assignment methodologies for each year of the agreement period, without regard to their participation track. We believe we are able to begin offering all Shared Savings Program ACOs the opportunity to select their assignment methodology annually, starting with agreement periods beginning July 1, 2019, while meeting the requirements of the Bipartisan Budget Act.

As an approach to meeting the requirements of the Bipartisan Budget Act while building on them to offer greater flexibility, we propose to offer ACOs entering agreement periods in the BASIC track or ENHANCED track, beginning July 1, 2019 and in subsequent years, the option to choose either prospective assignment or preliminary prospective assignment with retrospective reconciliation, prior to the start of their agreement period (at the time of application). We also propose to provide an opportunity for ACOs to switch their selection of beneficiary assignment methodology on an annual basis. Under this approach, in addition to the requirement under the Bipartisan Budget Act that ACOs be permitted to change from retrospective assignment to prospective assignment, an ACO would have the added flexibility to change from prospective assignment to preliminary prospective assignment with retrospective reconciliation. As an additional flexibility that further builds on the Bipartisan Budget Act, ACOs would be allowed to retain the same beneficiary assignment methodology for an entire agreement period or to change the methodology annually. An individual ACO's preferred choice of beneficiary assignment methodology may vary depending on the ACO's experience with the two assignment methodologies used under the Shared Savings Program. Therefore, we believe this proposed approach implements the requirements of the Bipartisan Budget Act and will also be responsive to stakeholders' suggestions that we allow additional flexibility around choice of beneficiary assignment methodology to facilitate ACOs' transition to performance-based risk (as discussed earlier in this section). Further, allowing this additional flexibility for choice of beneficiary assignment methodology within the proposed BASIC track and ENHANCED track would enable ACOs to select a combination of participation options that would overlap with certain features of Track 2, and thus lessen the need to maintain Track 2 as a separate participation option. Accordingly, as discussed in section II.A.2 of this proposed rule, we are proposing to discontinue Track 2. Finally, we believe it is appropriate and reasonable to start offering the choice of beneficiary assignment to ACOs in the BASIC track or ENHANCED track for agreement periods beginning July 1, 2019, in order to align with the availability of these two tracks under the proposed redesign of the Shared Savings Program.

We propose that, in addition to choosing the track to which it is applying, an ACO would choose the beneficiary assignment methodology at the time of application to enter or re-enter the Shared Savings Program or to renew its participation for another agreement period. If the ACO's application is accepted, the ACO would remain under that beneficiary assignment methodology for the duration of its agreement period, unless the ACO chooses to change the beneficiary assignment methodology through the annual election process. We also propose that the ACO must indicate its desire to change assignment methodology before the start of the performance year in which it wishes to begin participating under the alternative assignment methodology. The ACO's selection of a different assignment methodology would be effective at the start of the next performance year, and for the remaining years of the agreement period, unless the ACO again chooses to change the beneficiary assignment methodology. For example, if an ACO selects preliminary prospective assignment with retrospective reconciliation at the time of its application to the program for an agreement period beginning July 1, 2019, this methodology would apply in the ACO's first performance year (6-month performance year from July 2019–December 2019) and all subsequent performance years of its agreement period, unless the ACO selects prospective assignment in advance of the start of performance year 2020, 2021, 2022, 2023, or 2024. To continue this example, during its first performance year, the ACO would have the option to select prospective assignment to be applicable beginning with performance year 2020. If selected, this assignment methodology would continue to apply unless the ACO again selects a different methodology.

We propose to incorporate the requirements governing the ACO's initial selection of beneficiary assignment methodology and the annual opportunity for an ACO to notify CMS that it wishes to change its beneficiary assignment methodology within its current agreement period, in a new section of the Shared Savings Program regulations at § 425.226 along with the other annual elections described elsewhere in this proposed rule. We propose that the initial selection of, and any annual selection for a change in, beneficiary assignment methodology must be made in the form and manner, and according to the timeframe, established by CMS. We also propose that an ACO executive who has the authority to legally bind the ACO must certify the selection of beneficiary assignment methodology for the ACO. We envision that the timing of this opportunity for an ACO to change assignment methodology would generally follow the Shared Savings Program's application cycle. For consistency, we also propose to make conforming changes to regulations that currently identify assignment methodologies according to program track. Specifically, we propose to revise §§ 425.400 and 425.401 (assignment of beneficiaries), § 425.702 (aggregate reports) and § 425.704 (beneficiary-identifiable claims data) to reference either preliminary prospective assignment with retrospective reconciliation or prospective assignment instead of referencing the track to which a particular assignment methodology applies (currently Track 1 and Track 2, or Track 3, respectively).

We wish to clarify that this proposal would have no effect on the voluntary alignment process under § 425.402(e). Because beneficiaries may voluntarily align with an ACO through their designation of a ''primary clinician,'' and eligible beneficiaries will be prospectively assigned to that ACO regardless of the ACO's track or claims-based beneficiary assignment methodology, an ACO's choice of claims-based assignment methodology under this proposal would not alter the voluntary alignment process.

As part of the proposed approach to allow ACOs to elect to change their assignment methodology within their

agreement period, we also propose to adjust the ACO's historical benchmark to reflect the ACO's election of a different assignment methodology. Section 1899(d)(1)(B)(ii) of the Act addresses how ACO benchmarks are to be established. This provision specifies that the Secretary shall estimate a benchmark for each agreement period for each ACO using the most recent available 3 years of per beneficiary expenditures for Parts A and B services for Medicare FFS beneficiaries assigned to the ACO. Such benchmark shall be adjusted for beneficiary characteristics and such other factors as the Secretary determines appropriate.

As we explained in earlier rulemaking, we currently use differing assignment windows to determine beneficiary assignment for the benchmark years and performance years, according to the ACO's track and the beneficiary assignment methodology used under that track. The assignment window for ACOs under prospective assignment is a 12-month period off-set from the calendar year, while for ACOs under preliminary prospective assignment with retrospective reconciliation, the assignment window is the 12-month period based on the calendar year (see 80 FR 32699, and 80 FR 32775 through 32776). However, for all ACOs, the claims used to determine the per capita expenditures for a benchmark or performance year are the claims for services furnished to assigned beneficiaries from January 1 through December 31 of the calendar year that corresponds to the applicable benchmark or performance year (see for example, 79 FR 72812 through 72813, see also 80 FR 32776 through 32777). We explained that this approach removes actuarial bias between the benchmarking and performance years for assignment and financial calculations, since the same method would be used to determine assignment and the financial calculations for each benchmark and performance year. Further, basing the financial calculations on the calendar year is necessary to align with actuarial analyses with respect to risk score calculations and other data inputs based on national FFS expenditures used in program financial calculations, which are determined on a calendar year basis (79 FR 72813). We continue to believe it is important to maintain symmetry between the benchmark and performance year calculations, and therefore believe it is necessary to adjust the benchmark for ACOs that change beneficiary assignment methodology within their current agreement period to reflect changes in beneficiary characteristics due to the change in beneficiary assignment methodology, as provided in section 1899(d)(1)(B)(ii) of the Act. For example, if an ACO were to elect to change its applicable beneficiary assignment methodology during its initial agreement period from preliminary prospective assignment with retrospective reconciliation to prospective assignment, we would adjust the ACO's historical benchmark for the current agreement period to reflect the expenditures of beneficiaries that would have been assigned to the ACO during the benchmark period using the prospective assignment methodology, instead of the expenditures of the beneficiaries assigned under the preliminary prospective assignment methodology that were used to establish the benchmark at the start of the agreement period. Therefore, we propose to specify in the proposed new section of the regulations at § 425.601 that would govern establishing, adjusting, and updating the benchmark for all agreement periods beginning July 1, 2019 and in subsequent years that we will adjust an ACO's historical benchmark to reflect a change in the ACO's beneficiary assignment methodology within an agreement period. However, any adjustment to the benchmark to account for a change in the ACO's beneficiary assignment methodology would not alter the timing of benchmark rebasing under § 425.601; the historical benchmark would not be rebased as a result of a change in the ACO's beneficiary assignment methodology.

We seek comment on these proposals.

5. Determining Participation Options Based on Medicare FFS Revenue and Prior Participation

a. Overview

In this section, we describe considerations related to, and proposed policies for, distinguishing among ACOs based on their degree of control over total Medicare Parts A and B FFS expenditures for their assigned beneficiaries by identifying low revenue versus high revenue ACOs, experience of the ACO's legal entity and ACO participants with the Shared Savings Program and performance-based risk Medicare ACO initiatives, and prior performance in the Shared Savings Program. Based on operational experience and considerations related to our proposal to extend the length of an agreement period under the program from 3 to not less than 5 years for agreement periods beginning on July 1, 2019 and in subsequent years, we aim to strengthen the following programmatic areas by further policy development.

First, we believe that differentiating between ACOs based on their degree of control over total Medicare Parts A and B FFS expenditures for their assigned beneficiaries would allow us to transition high revenue ACOs more quickly to higher levels of performance-based risk under the ENHANCED track, rather than remaining in a lower level of risk under the BASIC track. We aim to drive more meaningful systematic change in high revenue ACOs which have greater potential to control total Medicare Parts A and B FFS expenditures for their assigned beneficiaries and in turn the potential to drive significant change in spending and coordination of care for assigned beneficiaries across care settings. We also aim to encourage continued participation by low revenue ACOs, which control a smaller proportion of total Medicare Parts A and B FFS expenditures for their assigned beneficiaries, and thus may be encouraged to continue participation in the program by having additional time under the BASIC track's revenue-based loss sharing limits before transitioning to the ENHANCED track.

Second, we believe that differentiating between ACOs that are experienced and inexperienced with performance-based risk Medicare ACO initiatives to determine their eligibility for participation options would allow us to prevent experienced ACOs from taking advantage of options designed for inexperienced ACOs, namely lower levels of performance-based risk.

Third, we believe it is timely to clarify the differences between ACOs applying to renew their participation agreements and ACOs applying to re-enter the program after a break in participation, and to identify new ACOs as re-entering ACOs if greater than 50 percent of their ACO participants have recent prior participation in the same ACO in order to hold these ACOs accountable for their ACO participants' experience with the program. We aim to provide a more consistent evaluation of these ACOs' prior performance in the Shared Savings Program at the time of re-application. We also aim to update policies to identify the agreement period an ACO is entering into for purposes of benchmark calculations and quality performance requirements that phase-in as the ACO gains experience in the program, as appropriate for renewing ACOs, re-entering ACOs, and new program entrants.

Fourth, and lastly, we believe it is appropriate to modify the evaluation criteria for prior quality performance to be relevant to ACOs' participation in longer agreement periods and introduce a monitoring approach for and evaluation criterion related to financial performance to prevent underperforming ACOs from remaining in the program.

b. Differentiating Between Low Revenue ACOs and High Revenue ACOs

In this section, we propose to differentiate between the participation options available to low revenue ACOs and high revenue ACOs, through the following: (1) Proposals for defining ''low revenue ACO'' and ''high revenue ACO'' relative to a threshold of ACO participants' total Medicare Parts A and B FFS revenue compared to total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries for the same 12 month period; (2) proposals for establishing distinct participation options for low revenue ACOs and high revenue ACOs, with the availability of multiple agreement periods under the BASIC track as the primary distinction; and (3) consideration of approaches to allow greater potential for reward for low revenue ACOs, such as by reducing the MSR ACOs must meet to share in savings during one-sided model years of the BASIC track's glide path, or allowing higher sharing rates based on quality performance during the first 4 years in the glide path.

(1) Identifying Low Revenue ACOs and High Revenue ACOs

To define low revenue ACOs and high revenue ACOs for purposes of determining ACO participation options, we believe it is important to consider the relationship between an ACO's degree of control over the Medicare Parts A and B FFS expenditures for its assigned beneficiaries and its readiness to accept higher or lower degrees of performance-based risk. Elsewhere in this proposed rule, we explain that an ACO's ability to control the expenditures of its assigned beneficiary population can be gauged by comparing the total Medicare Parts A and B FFS revenue of its ACO participants to total Medicare Parts A and B FFS expenditures of its assigned beneficiary population. Thus, high revenue ACOs, which typically include a hospital billing through an ACO participant TIN, are generally more capable of accepting higher risk, given their control over a generally larger amount of their assigned beneficiaries' total Medicare Parts A and B FFS expenditures. In contrast, lower risk options could be more suitable for low revenue ACOs, which have control over a smaller amount of their assigned beneficiaries' total Medicare Parts A and B FFS expenditures.

In the Regulatory Impact Analysis (section IV. of this proposed rule), we describe an approach for differentiating low revenue versus high revenue ACOs that reflects the amount of control ACOs have over total Medicare Parts A and B FFS expenditures for their assigned beneficiaries. Under this analysis, an ACO was identified as low revenue if its ACO participants' total Medicare Parts A and B FFS revenue for assigned beneficiaries was less than 10 percent of the ACO's assigned beneficiary population's total Medicare Parts A and B FFS expenditures. In contrast, an ACO was identified as high revenue if its ACO participants' total Medicare Parts A and B FFS revenue for assigned beneficiaries was at least 10 percent of the ACO's assigned beneficiary population's total Medicare Parts A and B FFS expenditures. As further explained in section IV, nationally, evaluation and management spending accounts for about 10 percent of total Parts A and B per capita spending. Because beneficiary assignment principally is based on allowed charges for primary care services, which are highly correlated with evaluation and management spending, we concluded that identifying low revenue ACOs by applying a 10 percent limit on the ACO participants' Medicare FFS revenue for assigned beneficiaries in relation to total Medicare Parts A and B expenditures for these beneficiaries would be likely to capture all ACOs that were solely comprised of ACO providers/suppliers billing for Medicare PFS services, and generally exclude ACOs with ACO providers/suppliers that bill for inpatient or other institutional services for their assigned beneficiaries. We considered this approach as an option for distinguishing between low revenue and high revenue ACOs.

However, we are concerned that this approach does not sufficiently account for ACO participants' total Medicare Parts A and B FFS revenue (as opposed to their revenue for assigned beneficiaries), and therefore could misrepresent the ACO's overall risk bearing potential, which would diverge from other aspects of the proposed design of the BASIC track. We believe it is important to consider ACO participants' total Medicare Parts A and B FFS revenue for all FFS beneficiaries, not just assigned beneficiaries, as a factor in assessing an ACO's readiness to accept performance-based risk. The total Medicare Parts A and B FFS revenue of the ACO participants could be indicative of whether the ACO participants, and therefore potentially the ACO, are more or less capitalized. For example, ACO participants with high levels of total Medicare Parts A and B FFS revenue are presumed to be better capitalized, and may be better positioned to contribute to repayment of any shared losses owed by the ACO. Further, the proposed methodologies for determining the loss sharing limit under the BASIC track (see section II.A.3 of this proposed rule) and the estimated repayment mechanism values for BASIC track ACOs (see section II.A.6.c of this proposed rule), include a comparison of a specified percentage of ACO participants' total Medicare Parts A and B FFS revenue for all Medicare FFS beneficiaries to a percentage of the ACO's updated historical benchmark expenditures for its assigned beneficiary population.

Accordingly, we propose that if ACO participants' total Medicare Parts A and B FFS revenue exceeds a specified threshold of total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries, the ACO would be considered high revenue, while ACOs with a percentage less than the threshold amount would be considered low revenue. In determining the appropriate threshold, we considered our claims-based analysis comparing estimated revenue and benchmark values for Track 1+ Model applicants, as described in section II.A.3. of this proposed rule. We believe setting the threshold at 25 percent would tend to categorize ACOs that include institutional providers as ACO participants or as ACO providers/suppliers billing through the TIN of an ACO participant, as high revenue because their ACO participants' total Medicare Parts A and B FFS revenue would likely significantly exceed 25 percent of total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries. Among Track 1+ Model ACOs that self-reported as eligible for the Model's benchmark-based loss sharing limit because of the presence of an ownership or operational interest by an IPPS hospital, cancer center or rural hospital with more than 100 beds among their ACO participants, we compared estimated total Medicare Parts A and B FFS revenue for ACO participants to estimated total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries. We found that self-reported composition and high-revenue determinations made using the 25 percent threshold were in agreement

for 96 percent of ACOs. For two ACOs, the proposed approach would have categorized the ACOs as low revenue ACOs and therefore allowed for a potentially lower loss sharing limit than the self-reported method.

We believe small, physician-only and rural ACOs would tend to be categorized as low revenue ACOs because their ACO participants' total Medicare Parts A and B FFS revenue would likely be significantly less than total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries. Among Track 1+ Model ACOs that self-reported to be eligible for the Model's revenue-based loss sharing limit because of the absence of an ownership or operational interest by the previously described institutional providers among their ACO participants, we compared estimated total Medicare Parts A and B FFS revenue for ACO participants to estimated total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries. We found the self-reported composition and low-revenue determinations made using the 25 percent threshold were in agreement for 88 percent of ACOs. The proposed approach would move ACOs with higher revenue to a higher loss sharing limit, while continuing to categorize low revenue ACOs, which are often composed of small physician practices, rural providers, and those serving underserved areas, as eligible for potentially lower loss sharing limits. Further, based on initial modeling with performance year 2016 program data, ACOs for which the total Medicare Parts A and B FFS revenue of their ACO participants was less than 25 percent of the total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries tended to have either no or almost no inpatient revenue and generally showed stronger than average financial results compared to higher revenue ACOs.

We believe these observations are generalizable and suggest our proposal to use ACO participants' total Medicare Parts A and B FFS revenue to classify ACOs would serve as a proxy for ACO participant composition. The proposed approach generally would categorize ACOs that include hospitals, health systems or other providers and suppliers that furnish Part A services as ACO participants or ACO providers/suppliers as high revenue ACOs, while categorizing ACOs with ACO participants and ACO providers/suppliers that mostly furnish Part B services as low revenue ACOs. Accordingly, we propose to use a 25 percent threshold to determine low revenue versus high revenue ACOs by comparing total Medicare Parts A and B FFS revenue of ACO participants to the total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries. Consistent with this proposal, we also propose to add new definitions at § 425.20 for ''low revenue ACO,'' and ''high revenue ACO.''

We propose to define ''high revenue ACO'' to mean an ACO whose total Medicare Parts A and B FFS revenue of its ACO participants based on revenue for the most recent calendar year for which 12 months of data are available, is at least 25 percent of the total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries based on expenditures for the most recent calendar year for which 12 months of data are available.

We propose to define ''low revenue ACO'' to mean an ACO whose total Medicare Parts A and B FFS revenue of its ACO participants based on revenue for the most recent calendar year for which 12 months of data are available, is less than 25 percent of the total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries based on expenditures for the most recent calendar year for which 12 months of data are available.

We also considered using a lower or higher percentage as the threshold for determining low revenue ACOs and high revenue ACOs. Specifically, we considered instead setting the threshold for ACO participant revenue lower, for example at 15 percent or 20 percent of total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries. However, we are concerned a lower threshold could categorize ACOs with more moderate revenue as high revenue, for example because of the presence of multi-specialty physician practices or certain rural or safety net providers/suppliers (such as CAHs, FQHCs and RHCs). Categorizing these moderate revenue ACOs as high revenue, could require ACOs that have a smaller degree of control over the expenditures of their assigned beneficiaries, and ACOs that are not as adequately capitalized, to participate in a level of performance-based risk that the ACO would not be prepared to manage. We also considered setting the threshold higher, for example at 30 percent. We are concerned a higher threshold could inappropriately categorize ACOs as low revenue when their ACO participants have substantial total Medicare Parts A and B FFS revenue and therefore an increased ability to influence expenditures for their assigned beneficiaries and also greater access to capital to support participation under higher levels of performance-based risk. We seek comment on these alternative thresholds for defining ''low revenue ACO'' and ''high revenue ACO.''

The proposed 12 month comparison period for determining whether an ACO is low revenue or high revenue is consistent with the proposed 12 month period for determining repayment mechanism amounts (as described in section II.A.6.c of this proposed rule). Such an approach could allow us to use the same sources of revenue and expenditure data during the program's annual application cycle to estimate the ACO's repayment mechanism amount and to determine the ACO's participation options according to whether the ACO is categorized as a low revenue or high revenue ACO. Additionally, for ACOs with a participant agreement start date of July 1, 2019, we also propose to determine whether the ACO is low revenue or high revenue using expenditure data from the most recent calendar year for which 12 months of data are available.

We note that under this proposed approach to using claims data to determine participation options, it would be difficult for ACOs to determine at the time of application submission whether they would be identified as a low revenue or high revenue ACO. However, after an ACO's application is submitted and before the ACO would be required to execute a participation agreement, we would determine how the ACO participants' total Medicare Parts A and B FFS revenue for the applicable calendar year compare to total Medicare Parts A and B FFS expenditures for the ACO's assigned Medicare beneficiaries in the same calendar year, provide feedback and then notify the applicant of our determination of its status as a low revenue ACO or high revenue ACO.

We also considered using a longer look back period, for example, using multiple years of revenue and expenditure data to identify low revenue ACOs and high revenue ACOs. For example, instead of using a single year of data, we considered instead using 2 years of data (such as the 2 most recent calendar years for which 12 months of data are available). In evaluating ACOs applying to enter a new agreement period in the Shared Savings Program, the 2 most recent calendar years for which 12 months of data are available would align with the ACOs' first and second benchmark years. While this approach could allow us to take into account changes in the ACO's composition over multiple years, it could also make the policy more

complex because it could require determinations for each of the 2 calendar years and procedures to decide how to categorize ACOs if there were different determinations for each year, for example, as a result of changes in ACO participants. We seek comment on the alternative of using multiple years of data in determining whether an ACO is a low revenue ACO or a high revenue ACO.

ACO participant list changes during the agreement period could affect the categorization of ACOs, particularly for ACOs close to the threshold percentage. We considered that an ACO may change its composition of ACO participants each performance year, as well as experience changes in the providers/suppliers billing through ACO participants, during the course of its agreement period. Any approach under which we would apply different policies to ACOs based on a determination of ACO participant revenue would need to recognize the potential for an ACO to add or remove ACO participants, and for the providers/suppliers billing through ACO participants to change, which could affect whether an ACO meets the definition of a low revenue ACO or high revenue ACO. We are especially concerned about the possibility that an ACO may be eligible to continue for a second agreement period in the BASIC track because of a determination that it is a low revenue ACO at the time of application, and then quickly thereafter seek to add higher-revenue ACO participants, thereby avoiding the requirement under our proposed participation options to participate under the ENHANCED track.

To protect against these circumstances, we propose to monitor low revenue ACOs experienced with performance-based risk Medicare ACO initiatives participating in the BASIC track, to determine if they continue to meet the definition of low revenue ACO. This is because high revenue ACOs experienced with performance-based risk Medicare ACO initiatives are restricted to participation in the ENHANCED track only. We propose to monitor these low revenue ACOs for changes in the revenue of ACO participants and assigned beneficiary expenditures that would cause an ACO to be considered a high revenue ACO and ineligible for participation in the BASIC track. We are less concerned about the circumstance where an ACO inexperienced with performance-based risk Medicare ACO initiatives enters an agreement period under the BASIC track and becomes a high revenue ACO during the course of its agreement because inexperienced, high revenue ACOs are also eligible for a single agreement period of participation in the BASIC track.

We propose the following approach to ensuring continued compliance of ACOs with the proposed eligibility requirements for participation in the BASIC track, for an ACO that was accepted into the BASIC track's Level E because the ACO was experienced with performance-based risk Medicare ACO initiatives and determined to be low revenue at the time of application. If, during the agreement period, the ACO meets the definition of a high revenue ACO, we propose that the ACO would be permitted to complete the remainder of its current performance year under the BASIC track, but would be ineligible to continue participation in the BASIC track after the end of that performance year unless it takes corrective action, for example by changing its ACO participant list. We propose to take compliance action, up to and including termination of the participation agreement, as specified in §§ 425.216 and 425.218, to ensure the ACO does not continue in the BASIC track for subsequent performance years of the agreement period. For example, we may take pre-termination actions as specified in § 425.216, such as issuing a warning notice or requesting a corrective action plan. To remain in the BASIC track, the ACO would be required to remedy the issue. For example, if the ACO participants' total Medicare Parts A and B FFS revenue has increased in relation to total Medicare Parts A and B FFS expenditures for the ACO's assigned beneficiaries, the ACO could remove an ACO participant from its ACO participant list, so that the ACO can meet the definition of low revenue ACO. If corrective action is not taken, CMS would terminate the ACO's participation under § 425.218. We propose to revise § 425.600 to include these requirements to account for changes in ACO participant revenue during an agreement period.

We also considered two alternatives to the proposed claims-based approach to differentiating low revenue versus high revenue ACOs, which, as discussed, can also serve as a proxy for ACO participant composition. One alternative would be to differentiate ACOs based directly on ACO participant composition using Medicare provider enrollment data and certain other data. Under this option we could define ''physician-led ACO'' and ''hospital-based ACO'' based on an ACO's composition of ACO participant TINs, including any CCNs identified as billing through an ACO participant TIN, as determined using Medicare enrollment data and cost report data for rural hospitals. A second alternative to the claims-based approach to distinguishing between ACOs based on their revenue would be to differentiate between ACOs based on the size of their assigned population (that is, small versus large ACOs).

First, we considered differentiating between physician-led and hospital-based ACOs by ACO composition, determined based on the presence or absence of certain institutional providers as ACO participants. This approach deviates from the Track 1+ Model design to determining ACO composition for the purposes of identifying whether the ACO is eligible to participate under a benchmark-based or a revenue-based loss sharing limit (described elsewhere in this proposed rule) by using Medicare enrollment data and certain other data to determine ACO composition rather than relying on ACOs' self-reported information, and by using a different approach to identifying institutional providers than applies under the Track 1+ Model.

Under this alternative approach, we could define a hospital-based ACO as an ACO that includes a hospital or cancer center, but excluding an ACO whose only hospital ACO participants are rural hospitals. As used in this definition, a hospital could be defined according to § 425.20. As defined under § 425.20, ''hospital'' means a hospital as defined in section 1886(d)(1)(B) of the Act. A cancer center could be defined as a prospective payment system-exempt cancer hospital as defined under section 1886(d)(1)(B)(v) of the Act (see CMS website on PPS-exempt cancer hospitals, available at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/PPS_Exc_Cancer_Hospasp.html*). Rural hospital could be a hospital defined according to § 425.20 that meets both of the following requirements: (1) The hospital is classified as being in a rural area for purposes of the CMS area wage index (as determined in accordance with section 1886(d)(2)(d) or section 1886(d)(8)(E) of the Act); and (2) The hospital reports total revenue of less than $30 million a year. We could determine total revenue based on the most recently available hospital 2552–10 cost report form or any successor form. In contrast, we could define physician-led ACO as an ACO that does not include a hospital or cancer center, except for a hospital that is a rural hospital (as we previously described). Physician-led ACOs therefore could also

include certain hospitals that are not cancer centers, such as CAHs.

Under this alternative approach to differentiating between ACOs we would identify hospitals and cancer centers in our Medicare provider enrollment files based on their Medicare enrolled TINs and/or CCNs. We would include any CCNs identified as billing through an ACO participant TIN, as determined using PECOS enrollment data and claims data. We believe this alternative approach would provide increased transparency to ACOs because ACOs could work with their ACO participants to identify all facilities enrolled under their TINs to tentatively determine the composition of their ACO, and thus, the available participation options under the Shared Savings Program. However, this alternative approach to categorizing ACOs deviates from the proposed claims-based approaches to determining loss sharing limits and the repayment mechanism estimate amounts for ACOs in the BASIC track using ACO participant Medicare FFS revenue and expenditures for the ACO's assigned beneficiaries.

Second, we also considered differentiating between ACOs based on the size of their assigned beneficiary population, as small versus large ACOs. Under this approach, we could determine an ACO's participation options based on the size of its assigned population. We recognize that an approach that distinguishes between ACOs based on population size would require that we set a threshold for determining small versus large ACOs as well as to determine the assignment data to use in making this determination (such as the assignment data used in determining an ACO's eligibility to participate in the program under the requirement that the ACO have at least 5,000 assigned beneficiaries under § 425.110). For instance, we considered whether an ACO with fewer than 10,000 assigned beneficiaries could be defined as a small ACO whereas an ACO with 10,000 or more assigned beneficiaries could be defined as a large ACO. However, we currently have low revenue ACOs participating in the program that have well over 10,000 assigned beneficiaries, as well as high revenue ACOs that have fewer than 10,000 assigned beneficiaries. As described in detail throughout this section of this proposed rule, we believe a revenue-based approach is a more accurate means to measure the degree of control that ACOs have over total Medicare Parts A and B FFS expenditures for their assigned beneficiaries compared to an approach that only considers the size of the ACO's assigned population.

We seek comment on the proposed definitions of ''low revenue ACO'' and ''high revenue ACO''. We also seek comment on the alternatives considered. Specifically, we seek comment on the alternative of defining hospital-based ACO and physician-led ACO based on an ACO's composition of ACO participant TINs, including any CCNs identified as billing through an ACO participant TIN, as determined using Medicare enrollment data and cost report data for rural hospitals. In addition, we seek comment on the second alternative of differentiating between ACOs based on the size of their assigned population (that is, small versus large ACOs).

(2) Restricting ACOs' Participation in the BASIC Track Prior to Transitioning to Participation in the ENHANCED Track

As discussed in section II.A.5.c of this proposed rule, we propose to use factors based on ACOs' experience with performance-based risk to determine their eligibility for the BASIC track's glide path, or to limit their participation options to either the highest level of risk and potential reward under the BASIC track (Level E) or the ENHANCED track. We also propose to differentiate between low revenue ACOs and high revenue ACOs with respect to the continued availability of the BASIC track as a participation option. This approach would allow low revenue ACOs, new to performance-based risk arrangements, additional time under the BASIC track's revenue-based loss sharing limits, while requiring high revenue ACOs to more rapidly transition to the ENHANCED track under which they would assume relatively higher, benchmark-based risk. We believe that all ACOs should ultimately transition to the ENHANCED track, the highest level of risk and potential reward under the program, which could drive ACOs to more aggressively pursue the program's goals of improving quality of care and lowering growth in FFS expenditures for their assigned beneficiary populations.

We considered that some low revenue ACOs may need additional time to prepare to take on the higher levels of performance-based risk required under the ENHANCED track. Low revenue ACOs, which could include small, physician-only and rural ACOs, may be encouraged to enter and remain in the program based on the availability of lower-risk options. For example, small, physician-only and rural ACOs may have limited experience submitting quality measures or managing patient care under two-sided risk arrangements, which could deter their participation in higher-risk options. ACOs and other program stakeholders have suggested that the relatively lower levels of risk available under the Track 1+ Model (an equivalent level of risk and potential reward to the payment model available under Level E of the BASIC track) encourages transition to risk by providing a more manageable level of two-sided risk for small, physician-only, and rural ACOs, compared to the levels of risk and potential reward currently available under Track 2 and Track 3, and that would be offered under the proposed ENHANCED track.

We also considered that, without limiting high revenue ACOs to a single agreement period under the BASIC track, they could seek to remain under a relatively low level of performance-based risk for a longer period of time, and thereby curtail their incentive to drive more meaningful and systematic changes to improve quality of care and lower growth in FFS expenditures for their assigned beneficiary populations. Further, high revenue ACOs, whose composition likely includes institutional providers, particularly hospitals and health systems, are expected generally to have greater opportunity to coordinate care for assigned beneficiaries across care settings among their ACO participants than low revenue ACOs. One approach to ensure high revenue ACOs accept a level of risk commensurate with their degree of control over total Medicare Parts A and B FFS expenditures for their assigned beneficiaries, and to further encourage these ACOs to more aggressively pursue the program's goals, is to require these ACOs to transition to higher levels of risk and potential reward.

We propose to limit high revenue ACOs to, at most, a single agreement period under the BASIC track prior to transitioning to participation under the ENHANCED track. We believe an approach that allows high revenue ACOs that are inexperienced with the accountable care model the opportunity to become experienced with program participation within the BASIC track's glide path prior to undertaking the higher levels of risk and potential reward in the ENHANCED track offers an appropriate balance between allowing ACOs time to become experienced with performance-based risk and protecting the Medicare Trust Funds. This approach recognizes that high revenue ACOs control a relatively large share of assigned beneficiaries'

total Medicare Parts A and B FFS expenditures and generally are positioned to coordinate care for beneficiaries across care settings, and is protective of the Medicare Trust Funds by requiring high revenue ACOs to more quickly transition to higher levels of performance-based risk.

In contrast, we propose to limit low revenue ACOs to, at most, two agreement periods under the BASIC track. These agreement periods would not be required to be sequential, which would allow low revenue ACOs that transition to the ENHANCED track after a single agreement period under the BASIC track the opportunity to return to the BASIC track if the ENHANCED track initially proves too high of risk. An experienced ACO may also seek to participate in a lower level of risk if, for example, it makes changes to its composition to include providers/suppliers that are less experienced with the accountable care model and the program's requirements. Once an ACO has participated under the BASIC track's glide path (if eligible), a subsequent agreement period under the BASIC track would be required to be at the highest level of risk and potential reward (Level E), according to the proposed approach to identifying ACOs experienced with performance-based Medicare ACO initiatives as described in section II.A.5.c of this proposed rule.

Therefore, we propose that in order for an ACO to be eligible to participate in the BASIC track for a second agreement period, the ACO must meet the requirements for participation in the BASIC track as described in this proposed rule (as determined based on whether an ACO is low revenue versus high revenue and inexperienced versus experienced with performance-based risk Medicare ACO initiatives) and either of the following: (1) The ACO is the same legal entity as a current or previous ACO that previously entered into a participation agreement for participation in the BASIC track only one time; or (2) for a new ACO identified as a re-entering ACO because at least 50 percent of its ACO participants have recent prior participation in the same ACO, the ACO in which the majority of the new ACO's participants were participating previously entered into a participation agreement for participation in the BASIC track only one time.

Several examples illustrate this proposed approach. First, for an ACO legal entity with previous participation in the program, we would consider the ACO's current and prior participation in the program. For example, if a low revenue ACO enters the program in the BASIC track's glide path, and remains an eligible, low revenue ACO, it would be permitted to renew in Level E of the BASIC track for a second agreement period. Continuing this example, for the ACO to continue its participation in the program for a third or subsequent agreement period, it would need to renew its participation agreement under the ENHANCED track. As another example, a low revenue ACO that enters the program in the BASIC track's glide path could participate for a second agreement under the ENHANCED track, and enter a third agreement period under the Level E of the BASIC track before being required to participate in the ENHANCED track for its fourth and any subsequent agreement period.

Second, for ACOs identified as re-entering ACOs because greater than 50 percent of their ACO participants have recent prior participation in the same ACO, we would determine the eligibility of the ACO to participate in the BASIC track based on the prior participation of this other entity. For example, if ACO A is identified as a re-entering ACO because more than 50 percent of its ACO participants previously participated in ACO B during the relevant look back period, we would consider ACO B's prior participation in the BASIC track in determining the eligibility of ACO A to enter a new participation agreement in the program under the BASIC track. For example, if ACO B had previously participated in two different agreement periods under the BASIC track, regardless of whether ACO B completed these agreement periods, ACO A would be ineligible to enter the program for a new agreement period under the BASIC track and would be limited to participating in the ENHANCED track. Changing the circumstances of this example, if ACO B had previously participated under the BASIC track during a single agreement period, ACO A may be eligible to participate in the BASIC track under Level E, the track's highest level of risk and potential reward, but would be ineligible to enter the BASIC track's glide path because ACO A would have been identified as experienced with performance-based risk Medicare ACO initiatives as described in section II.A.5.c of this proposed rule.

We recognize that the difference in the level of risk and potential reward under the BASIC track, Level E compared to the payment model under the ENHANCED track could be substantial for low revenue ACOs. Therefore, we also considered and seek comment on an approach that would allow low revenue ACOs to gradually transition from the BASIC track's Level E up to the level of risk and potential reward under the ENHANCED track. For example, we seek comment on whether it would be helpful to devise a glide path that would be available to low revenue ACOs entering the ENHANCED track. We also considered, and seek comment on, whether such a glide path under the ENHANCED track should be available to all ACOs. As another alternative, we considered allowing low revenue ACOs to continue to participate in the BASIC track under Level E for longer periods of time, such as a third or subsequent agreement period. However, we believe that without a time limitation on participation in the BASIC track, ACOs may not prepare to take on the highest level of risk that could drive the most meaningful change in providers'/suppliers' behavior toward achieving the program's goals.

As an alternative to the proposed approach for allowing low revenue ACOs to participate in the BASIC track in any two agreement periods (non-sequentially), we seek comment on an approach that would require participation in the BASIC track to occur over two consecutive agreement periods before the ACO enters the ENHANCED track. This approach would prevent low revenue ACOs that entered the ENHANCED track from participating in a subsequent agreement period under the BASIC track. That is, it would prevent an ACO from moving from a higher level of risk to a lower level of risk. However, given changes in ACO composition, among other potential factors, we believe it is important to offer low revenue ACOs some flexibility in their choice of level of risk from one agreement period to the next.

We propose to specify these proposed requirements for low revenue ACOs and high revenue ACOs in revisions to § 425.600, along with other requirements for determining participation options based on the experience of the ACO and its ACO participants, as discussed in section II.A.5.c of this proposed rule. We propose to use our determination of whether an ACO is a low revenue ACO or high revenue ACO in combination with our determination of whether the ACO is experienced or inexperienced with performance-based risk (which we propose to determine based on the experience of both the ACO legal entity and the ACO participant TINs with performance-based risk), in determining the participation options available to the ACO. We seek comment on these proposals.

More generally, we note that the proposed approach to redesigning the

program's participation options maintains flexibility for ACOs to elect to enter higher levels of risk and potential reward more quickly than is required under the proposed participation options. Any ACO may choose to apply to enter the program under or renew its participation in the ENHANCED track. Further, ACOs eligible to enter the BASIC track's glide path may choose to enter at the highest level of risk and potential reward under the BASIC track (Level E), or advance to that level more quickly than is provided for under the automatic advancement along the glide path.

(3) Allowing Greater Potential for Reward for Low Revenue ACOs

In this section, we describe and seek comment on several approaches to allowing for potentially greater access to shared savings for low revenue ACOs compared to high revenue ACOs, but do not make any specific proposals at this time. The approaches to rewarding low revenue ACOs discussed in this section recognize the performance trends of low revenue ACOs based on program results and the potential that low revenue ACOs would need additional capital, as a means of encouraging their continued participation in the program.

Although low revenue ACOs generally have control over a smaller share of the total Medicare Parts A and B FFS expenditures for their assigned beneficiaries compared to high revenue ACOs, they have tended to perform better financially than high revenue ACOs, demonstrating their ability to more quickly meet the program's aim of lowering growth in expenditures. High revenue ACOs, in comparison, despite having the advantage of generally controlling a greater share of total Medicare Parts A and B FFS expenditures for their assigned beneficiaries, and having more institutional capacity to affect care processes and better manage care across settings, have demonstrated comparatively poor financial performance.

As previously described in section I of this proposed rule, using the methodology for identifying low revenue and high revenue ACOs described in the Regulatory Impact Analysis (section IV. of this proposed rule), program results for performance year 2016 show that low revenue ACOs outperformed high revenue ACOs, as 41 percent of low revenue ACOs shared savings compared to 23 percent of high revenue ACOs. Among ACOs with four performance years of program results, low revenue ACOs in Track 1 outperformed high revenue ACOs, generating average gross savings of 2.9 percent compared to 0.5 percent for high revenue ACOs. Low revenue ACOs in Track 2 and Track 3 also outperformed high revenue ACOs. The four Track 3 ACOs that owed losses in performance year 2016 were all high revenue. These results suggest high revenue ACOs may be underperforming in containing growth in expenditures, while taking advantage of other aspects of program participation.

We believe low revenue ACOs, identified as proposed previously in this section (that is, using a threshold of 25 percent of Medicare Parts A and B FFS expenditures for assigned beneficiaries), which may tend to be small, physician-only and rural ACOs, are likely less capitalized organizations and may be relatively risk-averse. These ACOs may be encouraged to participate and remain in the program under performance-based risk based on the availability of additional incentives, such as the opportunity to earn a greater share of savings.

We believe that offering increased potential for low revenue ACOs to earn shared savings would support their success in meeting the program's goals by allowing these organizations to maximize their return on investment, which may be needed to support start-up and operational expenses, and to facilitate their participation in performance-based risk. For example, shared savings payments received by low revenue ACOs could be used to support funding of a repayment mechanism required for their participation in performance-based risk, support meeting the program's quality reporting requirements, or support, when eligible, implementation of an approved beneficiary incentive program as discussed in section II.C.2 of this proposed rule. Any additional incentive would complement previously described proposals that would provide low revenue ACOs a longer pathway to participation under the highest level of risk and potential reward in the ENHANCED track.

One approach we considered would be to allow for a lower MSR for low revenue ACOs in the BASIC track. In section II.A.6.b of this proposed rule, we propose that under Level A and Level B of the BASIC track, under a one-sided model, ACOs with at least 5,000 assigned beneficiaries will have a MSR that varies between 2 percent and 3.9 percent based on the size of the ACO's assigned beneficiary population (which is the same MSR methodology currently used in Track 1). In performance years under a two-sided model of either the BASIC track or the ENHANCED track, we propose to apply a symmetrical MSR/MLR, as chosen by the ACO prior to entering into performance-based risk. As an alternative, to provide a greater incentive for low revenue ACOs, we considered applying a lower MSR during the one-sided model years (Level A and B) for low revenue ACOs that have at least 5,000 assigned beneficiaries for the performance year. For example, we considered a policy under which we would apply a MSR that is a fixed 1 percent. We also considered setting the MSR at a fixed 2 percent, or effectively removing the threshold by setting the MSR at zero percent. However, we would apply a variable MSR based on the ACO's number of assigned beneficiaries in the event the ACO's population falls below 5,000 assigned beneficiaries for the performance year, consistent with our proposal in section II.A.6.b of this proposed rule.

A lower MSR (such as a fixed 1 percent) would reduce the threshold level of savings the ACO must generate to be eligible to share in savings. This would give low revenue ACOs greater confidence that they would be eligible to share in savings, once generated. This may be especially important for small ACOs, which would otherwise have MSRs towards the higher end of the range (closer to 3.9 percent, for an ACO with at least 5,000 assigned beneficiaries) for years in which the ACO participates under a one-sided model. However, we do not believe a lower MSR would be needed to encourage participation by high revenue ACOs. For one, high revenue ACOs are likely to have larger numbers of assigned beneficiaries and therefore more likely to have lower MSRs (ranging from 3 percent to 2 percent, for ACOs with 10,000 or more assigned beneficiaries). Further, their control over a significant percentage of the total Medicare Parts A and B FFS expenditures for their assigned beneficiaries may provide a sufficient incentive for participation as they would have an opportunity to generate significant savings.

Another approach we considered is to allow for a relatively higher final sharing rate under the first four levels of the BASIC track's glide path for low revenue ACOs. For example, rather than the proposed approach under which the final sharing rate would phase in from a maximum of 25 percent in Level A to a maximum of 50 percent in Level E, we could allow a maximum 50 percent sharing rate based on quality performance to be available at all levels within the BASIC track's glide path for low revenue ACOs.

For any policies that would apply differing levels of potential reward to ACOs based on factors such as ACO participants' revenue and expenditures for the ACO's assigned beneficiaries, we prefer an approach under which we would annually re-evaluate whether an ACO is low revenue or high revenue, taking into consideration any changes to the ACO's list of ACO participants or to the providers/suppliers billing through the TINs of the ACO participants that are made during the agreement period. This approach would help ensure, for example, that ACOs do not omit certain institutional providers or other high revenue providers/suppliers from their initial ACO participant list for the purpose of securing their participation in a more favorable financial model, only to subsequently add these organizations to their ACO in subsequent years of the same agreement period.

We seek comment on these considerations. We will carefully consider the comments received regarding these options during the development of the final rule, and may consider adopting one or more of these options in the final rule.

c. Determining Participation Options Based on Prior Participation of ACO Legal Entity and ACO Participants

(1) Overview

In this section of the proposed rule we describe proposed modifications to the regulations to address the following:

- Allowing flexibility for ACOs currently within a 3-year agreement period under the Shared Savings Program to transition quickly to a new agreement period that is not less than 5 years under the BASIC track or ENHANCED track.
- Establishing definitions to more clearly differentiate ACOs applying to renew for a second or subsequent agreement period and ACOs applying to re-enter the program after their previous Shared Savings Program participation agreement expired or was terminated resulting in a break in participation, and to identify new ACOs as re-entering ACOs if greater than 50 percent of their ACO participants have recent prior participation in the same ACO in order to hold these ACO accountable for their ACO participants' experience with the program.
- Revising the criteria for evaluating an ACO's prior participation in the Shared Savings Program to determine the eligibility of ACOs seeking to renew their participation in the program for a subsequent agreement period, ACOs applying to re-enter the program after termination or expiration, and ACOs that are identified as re-entering ACOs based on their ACO participants' recent experience with the program.
- Establishing criteria for determining the participation options available to an ACO based on its experience with performance-based risk Medicare ACO initiatives and on whether the ACO is low revenue or high revenue.
- Establishing policies that more clearly differentiate the participation options, and the applicability of program requirements that phase-in over time based on the ACO's and ACO participants' prior experience in the Shared Savings Program or with other Medicare ACO initiatives.

The regulatory background for the proposed policies in this section of the proposed rule includes multiple sections of the program's regulations, as developed over several rulemaking cycles.

(2) Background on Re-Entry Into the Program After Termination

In the initial rulemaking for the program, we specified criteria for terminated ACOs that are re-entering the program in § 425.222 (see 76 FR 67960 through 67961). In the June 2015 final rule, we revised this section to address eligibility for continued participation in Track 1 by previously terminated ACOs (80 FR 32767 through 32769). Currently, this section prohibits ACOs re-entering the program after termination from participating in the one-sided model beyond a second agreement period and from moving back to the one-sided model after participating in a two-sided model. This section also specifies that terminated ACOs may not re-enter the program until after the date on which their original agreement period would have ended if the ACO had not been terminated (the ''sit-out'' period). This policy was designed to restrict re-entry into the program by ACOs that voluntarily terminate their participation agreement, or have been terminated for failing to meet program integrity or other requirements (see 76 FR 67960 and 67961). Under the current regulations, we only consider whether an ACO applying to the program is the same legal entity as a previously terminated ACO, as identified by TIN (see definition of ACO under § 425.20), for purposes of determining whether the appropriate ''sit-out'' period of § 425.222(a) has been observed and the ACO's eligibility to participate under the one-sided model. Section 425.222 also provides criteria to determine the applicable agreement period when a previously terminated ACO re-enters the program. We explained the rationale for these policies in prior rulemaking and refer readers to the November 2011 and June 2015 final rules for more detailed discussions.

Additionally, under § 425.204(b), the ACO must disclose to CMS whether the ACO or any of its ACO participants or ACO providers/suppliers have participated in the Shared Savings Program under the same or a different name, or are related to or have an affiliation with another Shared Savings Program ACO. The ACO must specify whether the related participation agreement is currently active or has been terminated. If it has been terminated, the ACO must specify whether the termination was voluntary or involuntary. If the ACO, ACO participant, or ACO provider/supplier was previously terminated from the Shared Savings Program, the ACO must identify the cause of termination and what safeguards are now in place to enable the ACO, ACO participant, or ACO provider/supplier to participate in the program for the full term of the participation agreement (§ 425.204(b)(3)).

The agreement period in which an ACO is placed upon re-entry into the program has ramifications not only for its risk track participation options, but also for the benchmarking methodology that is applied and the quality performance standard against which the ACO will be assessed. ACOs in a second or subsequent agreement period receive a rebased benchmark as currently specified under § 425.603. For ACOs that renew for a second or subsequent agreement period beginning in 2017 and subsequent years, the rebased benchmark incorporates regional expenditure factors, including a regional adjustment. The weight applied in calculating the regional adjustment depends in part on the agreement period for which the benchmark is being determined (see § 425.603(c)), with relatively higher weights applied over time. Further, for an ACO's first agreement period, the benchmark expenditures are weighted 10 percent in benchmark year 1, 30 percent in benchmark year 2, and 60 percent in benchmark year 3 (see § 425.602(a)(7)). In contrast, for an ACO's second or subsequent agreement period we equally weight each year of the benchmark (§ 425.603). With respect to quality performance, the quality performance standard for ACOs in the first performance year of their first agreement period is set at the level of complete and accurate reporting of all quality measures. Pay-for-performance is phased in over the remaining years of the first agreement period, and

continues to apply in all subsequent performance years (see § 425.502(a)).

We believe the regulations as currently written create flexibilities that allow more experienced ACOs to take advantage of the opportunity to re-form and re-enter the program under Track 1 or to re-enter the program sooner or in a different agreement period than otherwise permissible. In particular, terminated ACOs may re-form as a different legal entity and apply to enter the program as a new organization to extend their time in Track 1 or enter Track 1 after participating in a two-sided model. These ACOs would effectively circumvent the requisite ''sit-out'' period (the remainder of the term of an ACO's previous agreement period), benchmark rebasing, including the application of equal weights to the benchmark years and the higher weighted regional adjustment that applies in later agreement periods, or the pay-for-performance quality performance standard that is phased in over an ACO's first agreement period in the program.

(3) Background on Renewal for Uninterrupted Program Participation

In the June 2015 final rule, we established criteria in § 425.224 applicable to ACOs seeking to renew their agreements, including requirements for renewal application procedures and factors CMS uses to determine whether to renew a participation agreement (see 80 FR 32729 through 32730). Under our current policies, we consider a renewing ACO to be an organization that continues its participation in the program for a consecutive agreement period, without interruption resulting from termination of the participation agreement by CMS or by the ACO (see §§ 425.218 and 425.220). Therefore, to be considered for timely renewal, an ACO within its third performance year of an agreement period is required to meet the application requirements, including submission of a renewal application, by the deadline specified by CMS, during the program's typical annual application process. If the ACO's renewal application is approved by CMS, the ACO would have the opportunity to enter into a new participation agreement with CMS for the agreement period beginning on the first day of the next performance year (typically January 1 of the following year), and thereby to continue its participation in the program without interruption.

In evaluating the application of a renewing ACO, CMS considers the ACO's history of compliance with program requirements generally, whether the ACO has established that it is in compliance with the eligibility and other requirements of the Shared Savings Program, including the ability to repay shared losses, if applicable, and whether it has a history of meeting the quality performance standard in its previous agreement period, as well as whether the ACO satisfies the criteria for operating under the selected risk track, including whether the ACO has repaid shared losses generated during the prior agreement period.

Under § 425.600(c), an ACO experiencing a net loss during a previous agreement period may reapply to participate under the conditions in § 425.202(a), except the ACO must also identify in its application the cause(s) for the net loss and specify what safeguards are in place to enable the ACO to potentially achieve savings in its next agreement period. In the initial rulemaking establishing the Shared Savings Program, we proposed, but did not finalize, a requirement that would prevent an ACO from reapplying to participate in the Shared Savings Program if it previously experienced a net loss during its first agreement period. We explained that this proposed policy would ensure that under-performing organizations would not get a second chance (see 76 FR 19562, 19623). However, we were persuaded by commenters' suggestions that barring ACOs that demonstrate a net loss from continuing in the program could serve as a disincentive for ACO formation, given the anticipated high startup and operational costs of ACOs (see 76 FR 67908 and 67909). We finalized the provision at § 425.600(c) that would allow for continued participation by ACOs despite their experience of a net loss.

(4) Proposals for Streamlining Regulations

We seek to modify the requirements for ACOs applying to renew their participation in the program (§ 425.224) and re-enter the program after termination (§ 425.222) or expiration of their participation agreement by both eliminating regulations that would restrict our ability to ensure that ACOs quickly migrate to the redesigned tracks of the program and strengthening our policies for determining the eligibility of ACOs to renew their participation in the program (to promote consecutive and uninterrupted participation in the program) or to re-enter the program after a break in participation. We also seek to establish criteria to identify as re-entering ACOs new ACOs for which greater than 50 percent of ACO participants have recent prior participation in the same ACO, and to hold these ACO accountable for their ACO participants' experience in the program.

(a) Defining Renewing and Re-Entering ACOs

We propose to define a renewing ACO and an ACO re-entering after termination or expiration of their participation agreement. Under the program's regulations, there is currently no definition of a renewing ACO, and based on our operational experience, this has caused some confusion among applicants. For example, there is confusion as to whether an ACO that has terminated from the program would be considered a first time applicant into the program or a renewing ACO. The definition of these terms is also important for identifying the agreement period that an ACO is applying to enter, which is relevant to determining the applicability of certain factors used in calculating the ACO's benchmark that phase-in over the span of multiple agreement periods as well as the phase-in of pay-for-performance under the program's quality performance standards. We believe having definitions that clearly distinguish renewing ACOs from ACOs that are applying to re-enter the program after a termination, or other break in participation will help us more easily differentiate between these organizations in our regulations and other programmatic material. We propose to define renewing ACO and re-entering ACO in new definitions in § 425.20.

We propose to define renewing ACO to mean an ACO that continues its participation in the program for a consecutive agreement period, without a break in participation, because it is either: (1) An ACO whose participation agreement expired and that immediately enters a new agreement period to continue its participation in the program; or (2) an ACO that terminated its current participation agreement under § 425.220 and immediately enters a new agreement period to continue its participation in the program. This proposed definition is consistent with current program policies for ACOs applying to timely renew their agreement under § 425.224 to continue participation following the expiration of their participation agreement. This proposed definition would include a new policy that would consider an ACO to be renewing in the circumstance where the ACO voluntarily terminates its current participation agreement and enters a new agreement period under

the BASIC track or ENHANCED track, beginning immediately after the termination date of its previous agreement period thereby avoiding an interruption in participation. We would consider these ACOs to have effectively renewed their participation early. This part of the definition is consistent with the proposal to discontinue use of the ''sit out'' period after termination under § 425.222(a).
